
1. Introduction

The production and interpretation of human action, and the part played by language in that process, is a central topic for pragmatics. Frequently, analysis proceeds by treating language as both primary and autonomous, and lumping everything that isn't language into the category 'context', e.g., a surround that provides resources for the anchoring of deictics or relevant social categories. In this paper. I argue against the usual analytic and disciplinary boundaries that isolate language from its environment and create a dichotomy between text and context. This paper proposes and develops an approach to the analysis of action within human interaction that takes into account the simultaneous use of multiple semiotic resources by participants (e.g., a range of structurally different kinds of sign phenomena in both the stream of speech and the body, graphic and socially sedimented structure in the surround, sequential organization, encompassing activity systems, etc.). It is argued that actions are both assembled and understood through a process in which different kinds of sign phenomena instantiated in diverse media, what I call semiotic fields, are juxtaposed in a way that enables them to mutually elaborate each other. A particular, locally relevant array of semiotic fields that participants demonstrably orient to (not simply a hypothetical set of fields that an analyst might impose to code context) is called a *contextual configuration.* As action unfolds, new semiotic fields can be added, while others are treated as no longer relevant, with the effect that the contextual configurations which frame, make visible, and constitute the actions of the moment undergo a continuous process of change. From a slightly different perspective, contextual configurations provide a systematic framework for investigating the

public visibility of the body as a dynamically unfolding, interactively organized locus for the production and display of meaning and action.

When action is investigated in terms of contextual configurations, domains of phenomena that are usually treated as so distinct that they are the subject matter of entirely separate academic disciplines, e.g., language and material structure in the environment, can be analyzed as integrated components of a common process for the social production of meaning and action. This also provides an alternative geography of cognition to one that views all cognitive phenomena as situated within the mental life of the individual. Here, cognition is a reflexively situated process that encompasses both the sign-making capacity of the individual, for example through the production of talk, and different kinds of semiotic phenomena, from sequential organization to graphic fields, lodged within the material and social environment. This emphasis on cognition as a public, social process embedded within an historically shaped material world is quite consistent with both Vygotskian perspectives and recent work in the social and anthropological study of scientific and workplace practice (which Hutchins, 1995, in a groundbreaking study, has called 'cognition in the wild'), but adds to such perspectives an equally strong focus on the details of language use and conversational organization.

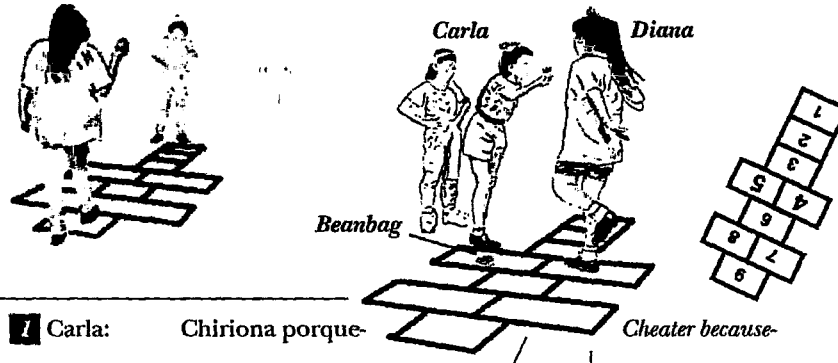
A central question posed for the analysis of how social action is constructed and understood through talk is determining what it is relevant to include within such a study. Frequently, scholars with an interest in pragmatics have focused almost exclusively on phenomena within the stream of speech, or in the mental life of the speaker. Thus in Searle's (1970) analysis of speech acts the hearer exists only as a figment of the speaker's imagination, not as an active co-participant in her own right, e.g., someone who herself engages in conduct that contributes to the constitution and ongoing development of the action(s) being accomplished through the talk of the moment. In the human sciences in general, language and the material world are treated as entirely separate domains of inquiry. Thus, within anthropology departments one finds one group of scholars, which focuses on language as the defining attribute of the human species, working in happy isolation from archaeologists down the hall, who argue that what makes human beings unique is the capacity to reshape the material environment in ways that structure human action on an historical time scale. Each of these proposals about what makes human beings a distinctive species is at best a partial truth. A theory of action must come to terms with both the details of language use and the way in which the social, cultural, material and sequential structure of the environment where action occurs, figure into its organization.

The accomplishment of social action requires that not only the party producing an action, but also that others present, such as its addressee, be able to systematically recognize the shape and character of what is occurring. Without this it would be impossible for separate parties to recognize in common not only what is happening at the moment, but more crucially, what range of events are

someone else has just done.[1] The necessity of social action having this public, prospectively relevant visibility, so that multiple participants can collaborate in an ongoing course of coordinated action, casts doubt on the adequacy of any model of pragmatic action that focuses exclusively on the mental life of a single participant such as the speaker. Within this process the production of action is linked reflexively to its interpretation; to establish the public, recognizable visibility of what they are doing speakers must build action that takes into account the particulars of what their addressees can and do know. This does not by any means ensure that congruent interpretation will automatically follow, or that relevant participants positioned at different perspectives will view events in the same way (see C. Goodwin, 1995, for an analysis of how the accomplishment of ongoing collaborative action can on occasion systematically require that different kinds of participants view the same event in alternative ways). However, the organization of talk-in-interaction provides for the contingent achievement of relevant intersubjectivity through the continuing availability of processes such as repair (Schegloff, 1992 et al., 1977). When the term *action* is used in this paper, it should be understood as encompassing this interactively organized process of public recognition of meaningful events reflexively linked to the ongoing production of these same events through the use of appropriate semiotic resources within an unfolding temporal horizon.

In this paper, it will be suggested that a primordial site for the analysis of human language, cognition, and action consists of a situation in which multiple participants are attempting to carry out courses of action in concert with each other through talk, while attending to both the larger activities that their current actions are embedded within, and relevant phenomena in their surround. Using as data video recordings of young girls playing hopscotch and archaeologists classifying color, it will be argued that the production and interpretation of human social action is built through the simultaneous deployment of a range of quite different kinds of semiotic resources.[2]

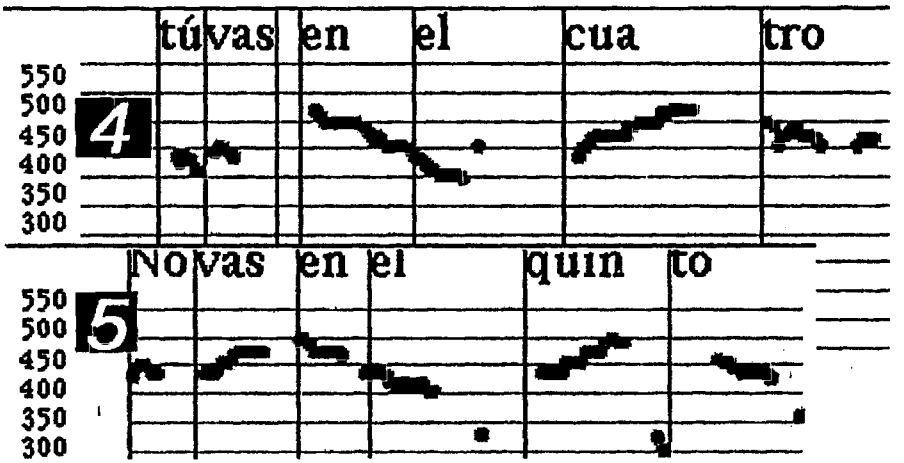
Talk itself contains multiple sign systems with alternative properties. Strips of talk gain their power as social action via their placement within larger sequential structures, encompassing activities, social structural arrangements, and participation frameworks constituted through displays of mutual orientation made by the actors' bodies. The body is used in a quite different way to perform gesture, again a class of phenomena that encompasses structurally different types of sign systems. Both talk and gesture can index, construe, or treat as irrelevant, entities in the participants' surround. Moreover, material structure in the surround, such as graphic fields of various types, can provide semiotic structure without which the constitution of particular kinds of action being invoked through talk would be impossible. In brief, it will be argued that the construction of action through talk within situated interaction is accomplished through the temporally unfolding juxtaposition of quite different kinds of semiotic resources, and that moreover, through this process, the human body is made publicly visible as the site for a range of structurally different kinds of displays implicated in the constitution of the actions of the moment.



2. Talk-in-Interaction

To explore some of the different kinds of phenomena implicated in the organization of face-to-face interaction within a setting that is the focus of the participant's orientation, I will use the following brief dispute which occurred while three young girls were playing hopscotch. One of the girls, Rosa, played only a peripheral role in the events that will be examined here, and analysis will focus on the actions of the other two. I will call the party whose actions are being challenged *D*iana (i.e. the *D*efendant), and her *C*hallenger *C*arla.[3] In hopscotch, players jump through an ordered grid of squares drawn on the ground. If the player's foot touches a line, or if she fails to land on the correct square, she is 'out' and her turn is over. A player is prohibited from landing on a square with a marker, such as a stone or a beanbag on it. After a successful jump through the grid, the next jump is made more difficult by throwing markers on squares in a particular sequence.[4]

The dispute being examined here begins when Diana stands at the top of the hopscotch grid (she has already successfully navigated the entire grid from the bottom), throws her beanbag into a particular square, and starts to hop through the grid. Right after the beanbag lands (in what will be argued to be the wrong square) and as Diana starts to jump, Carla walks into the grid, physically stops Diana from continuing, and then argues that Diana has made an illegal move by throwing her beanbag onto the fifth square instead of the fourth. (Note that the squares could have become confused if Diana, who is throwing from the top of the grid, instead of the usual throwing position at the foot/start of the grid, had assigned numbers to the row in dispute so that they read from her current left to right, and thus failed to take into account that she was now looking at the grid from a reverse angle).

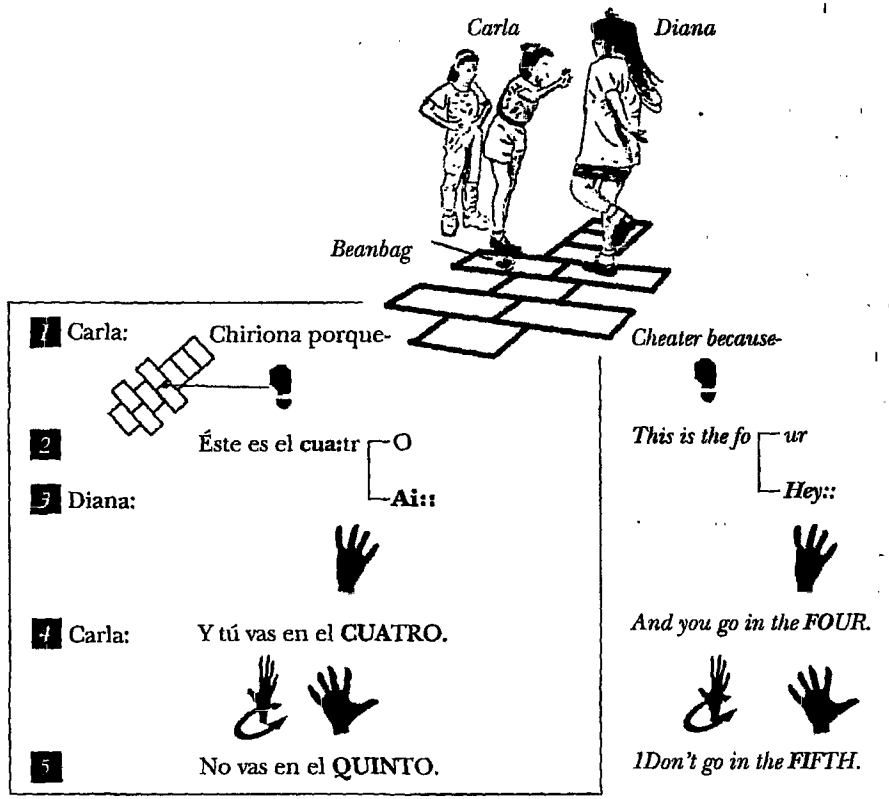


The following is a transcript of the talk that occurs here, with an English translation on the right, and a diagram of how the participants have been numbering the squares in the grid in their current game (the actual grid on the ground contains no numbers, only blank squares):

A number of different kinds of phenomena have to be taken into account in order to describe the interactive organization of the dispute that is occurring here. I want to focus on how some of these phenomena consist of sign systems that are built through use of the distinctive properties of a specific medium. For example, spoken language builds signs within the stream of speech, gestures uses the body in a particular way, while posture and orientation uses the body in another, etc. To have a way of talking about these sybsystems I'll refer to them as *semiotic fields*. The term *semiotic* is intended to note the way in which signs are being deployed, while *field* provides a rough term for pointing to the encompassing medium within which specific signs are embedded. What I want to demonstrate now is that the action that occurs here is built through the visible, public deployment of multiple semiotic fields that mutually elaborate each other. Subsequent analysis will investigate the way in which additional fields with [illegible]
added to [illegible]

1 Carla:	Chiriona porque-		*Cheater because-*
2	**Éste es el cua:**tr	O	*This is the fo* ur
3 Diana:		Ai::	*Hey::*
4 Carla:	Y tú vas en el CUATRO.		*And you go in the **FOUR**.*
5	No vas en el QUINTO.		*Don't go in the FIFTH.*

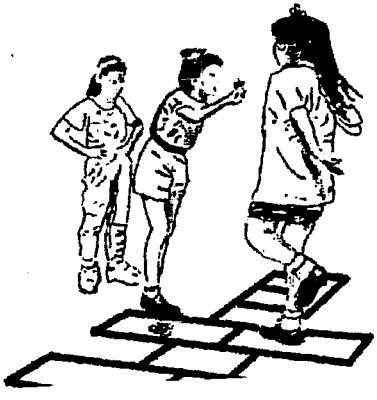
Carla builds her action by deploying a number of different semiotic fields simultaneously. First, the lexico-semantic content of the talk provides Carla with resources for characterizing her opponent, *Chiriona*, ('*cheater*' line 1)[5] and for formulating the squares on the grid as particular kinds of entities, ***el Cuatro*** ('*the four*' line 4) and ***el Quinto*** ('*the fifth*' line 5). A term such as 'the fifth' explicitly constitutes the square being talked about as a consequential item within a larger sequence of similar items. Second, these descriptions are embedded within larger syntactic structures that contrast what Diana actually did, with what she should have done. Moreover this contrast is made more salient, and indeed shaped as a contrast, by the reuse of a common syntactic frame (e.g. '*Y tú vas en NUMBER||No vas en NUMBER*'), which highlights as significantly different both the negation at the beginning of the second unit, and the numbers being disputed which occur in the same slot at the end of each unit. Third, prosodically the numbers being disputed are further highlighted by the heightened, contrastive stress that each receives within a larger framework of parallelism, displayed by producing each line with the same pitch contour. Thus, in both lines 4 and 5 Carla's pitch makes a high jump just after *vas*, then falls over *en el*, then raises over the first syllable of each number, the space where contrast is being marked, and [illegible] the final syllable



In building her utterance, Carla combines lexico-semantic content, a common syntactic frame, and reuse of a rhythmic pitch contour capable of vividly highlighting the central point of an argument being built through contrast, to tell Carla why what she has done is wrong.

Fifth, this exchange is embedded within a larger course of action within a particular activity, playing hopscotch. Carla begins the dispute by using her own body to stop Diana's movement through the grid. The characterization of Diana as a cheater uses the game-relevant action that Diana has just performed as the contextual point of departure for the current action and characterization.[6] Carla's subsequent talk provides a warrant for why she is entitled to both provide such a categorization, and prevent Diana from continuing. She argues that Diana has just made an illegal move. Note that in Spanish, a pro-drop language, the second person pronoun found in line 4 *tú* *'you'* is not required grammatically, and indeed no such pronoun occurs in the almost identical syntactic frame produced a moment later in line 5. The fact that the pronoun is being produced when it could have been omitted suggests that it is doing some special work. One component of this may be rhythmic, and indeed dropping the pronoun when *No* occupies the same slot, – just before *vas* – at the beginning of line 5, enables Carla to build a pair of parallel utterances. However, the pronoun may also help to shape the talk beginning at line 4, not as a *description* of what Diana just did (e.g. 'You went in the Five'), but instead as an utterance that carries a *deontic* force, i.e. an argument about how her actual behavior contrasts with what was called for by the rules of the game in progress ('You [should] go in the Four. Don't go in the Fifth'), with the *tú* perhaps referencing not Diana as a unique individual, but instead a player in her position who should act in a particular way. Through such structure in the talk, the game in progress is formulated as a rule-governed institution with normative consequences for discriminating permitted from illegal behavior. The structure of the encompassing activity is thus explicitly oriented to, and drawn upon as a resource for, the constitution of action within the detailed

activity, while simultaneously constituting action within it, e.g. denying Diana the opportunity to complete her turn.



Sixth, this talk occurs within a particular participation framework (C. Goodwin, 1981; M.H. Goodwin, 1990, 1997; Heath, 1986; Kendon, 1990). With both their bodies and their gaze, Carla and Diana orient toward each other. Note that this framework is not itself a speech act, such as a challenge. Instead, it builds through embodied stance a public field of mutual orientation within which a wide variety of speech acts can occur. Rather than being itself a momentary action within an exchange, it constitutes part of the interactive ground from which actions emerge, and within which they are situated (see also Kendon, 1990). However, as we shall see later in this sequence, this framework is built and sustained through the visible embodied actions of the participants. As such, like the actions that occur within it, the framework is open to challenge, negotiation, and modification. Though it surrounds larger strips of diverse individual actions, it is itself a dynamic, interactively organized field.

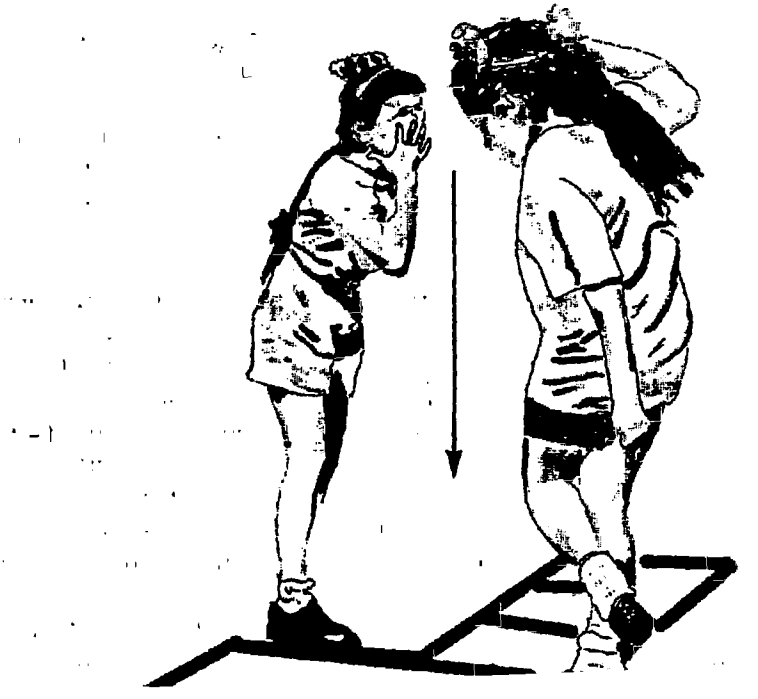
Seventh, this framework of embodied mutual orientation makes it possible for sign systems other than talk to also function. As Carla pronounces ***Cuatro*** and ***Quinto***, she displays these same numbers with handshapes:

Unlike many gestures which display aspects of meaning that are not present in the stream of speech (Kendon, 1997; McNeill, 1992), these hand gestures provide visual versions of the numbers being spoken by Carla, i.e., ***Cuatro*** and the simultanous four-fingered handshape, and are alternative instantiations of a common lexical item, the number *four*. This tight overlap makes it possible to investigate with clarity one issue posed for the analysis of embodied action. If one conceptualizes action as the communication of propositional content, and/or as providing the addressee with the resources necessary to recognize some action being instantiated in the current talk (for example something that might be very loosely glossed here as a challenge), then the hand gesture is entirely redundant with the information provided in the stream of speech, and thus need not be taken into account in the analysis of the action occurring here; embodiment except in the stream of speech is irrelevant.

In opposition to such a position, it will be argued here that the handshapes displaying the numbers present in the accompanying speech are not simply a visual mirror of the lexical content of the talk, but a semiotic modality in their own right. Analytically, it is not sufficient to simply characterize their content with a lexical gloss that describes the handshapes as redundant versions of the numbers in the talk (e.g. as alternative signifiers for a common signified such as *five*). Instead, the issues posed for a participant attempting to use such signs to build social action involve the organization of relevant phenomena within specific media, e.g. Carla has to use her body in a quite precise way while taking into account the visible body of her co-participant. She is faced with the task of using not only her talk, but also her body, to structure the local environment such that her gestures can themselves count as forms of social action. What precisely does this involve? Unlike talk, gestures can't be heard. In looking at the data we find that Carla actively works to position her hand gestures so that they will be perceived by Diana. Unlike many accompanying gestures, Carla's hand is explicitly positioned in Diana's line of sight. Indeed, the work of thrusting the gesturing hand toward Diana's face twists Carla's body into a configuration in which her hand, arm and the upper part of her torso are actually leaning toward Diana:

Carla's gesture is thus organized with reference to a specific embodied configuration, one that includes not only her own body, but also that of her addressee.

Though the content being displayed here is congruent with what is being said within the talk, a quite different kind of work, involving the precise deployment of semiotic resources with properties quite unlike the structure of speech, is required in order to build social action with the gesturing hand.[7] This same process of making visible congruent meaning through the articulation of different kinds of semiotic materials is also found in the production of the contrast found in lines 4 and 5. The number handshapes are framed by contrastive movements of Carla's arm and hand. As Carla says *'Y tú vas en el Cuatro'*, she stretches her arm forward with the palm toward Diana. However, as she begins the next phrase, she turns her hand around, while keeping the elbow which anchors the gesturing arm in the same position, and moves the upper arm to a new position closer to her own body, while still maintaining the forward thrust of her torso. By using the visual and rhythmic structure of her moving body, Carla is able to establish a contrast within a larger gestural frame that parallels the one produced through reuse of common syntactic and prosodic frames in the talk. In brief, Carla is performing her action not only vocally, but also through a simultaneous sequence of gestural and body displays. Though done with quite different media, these displays make visible the same two numbers that occur in the vocal stream, and highlight the contrast between them through a congruent display of contrastive items within a larger framework of parallel equivalence (e.g. the common syntactic frame in the talk, and the arm and torso establishing the variable hand-shapes as alternative values within a common framework of visible, embodied action).[8]



Given all of this embodied organization, the question still remains: why isn't the action that Carla is performing done entirely within the stream of speech? Why does she go to all of this extra semiotic work? Within interaction, participants don't produce talk or build action into the air, but instead actively work to secure the orientation of a hearer (C. Goodwin, 1981), and design the current action and utterance in fine detail for the particularities of the current addressee (C. Goodwin, 1981; Sacks et al., 1974). What Carla is doing here will fail as a form of pragmatic action if Diana does not take it into account. Through use of the gesture, Carla is able to specifically organize central components of her current action with reference to Diana's current visible orientation, i.e. positioning them right in Diana's line of sight. The gestures provide Carla with a semiotic modality for *insisting* that Diana take what she is doing and saying into account, indeed a way of quite literally getting into Diana's face with the particulars of the action. The way in which Carla thrusts her gestures toward Diana's face, as well as her walking into the grid when Diana is in the process of making a jump, help constitute what she is doing as a challenge to Diana. Carla's thrusted gestures are a proxemic challenge to Diana's personal space, as is her incursion into the game-relevant territory of the grid in the course of Diana's attempt to move through it. These proxemic and territorial dimensions may be quite consequential in that Diana has actively attempted to continue her movement through the hopscotch grid despite Carla's challenge by continuing to jump until Carla pushes her in

a posture that could allow her to pursue her turn at jumping further. On another level the gestural movements enhance and amplify the indignant force of the action.

In brief, talk and gesture mutually elaborate each other within (1) a larger sequence of action and (2) an embodied participation framework constituted through mutual orientation between speaker and addressee. It would seem that something like this set of concurrently relevant semiotic fields is what is being pointed to by the phrase 'face-to-face interaction'. However, this is by no means a fixed array of fields. Thus on many occasions, such as phone calls, or when participants are dispersed in a large visually inaccessible environment (e.g., a hunting party, or a workgroup interacting through computers), visible co-orientation may not be present. I'll call some particular subset of possible fields that is being oriented to at a particular moment as relevant to the organization of a particular action a *contextual configuration.*

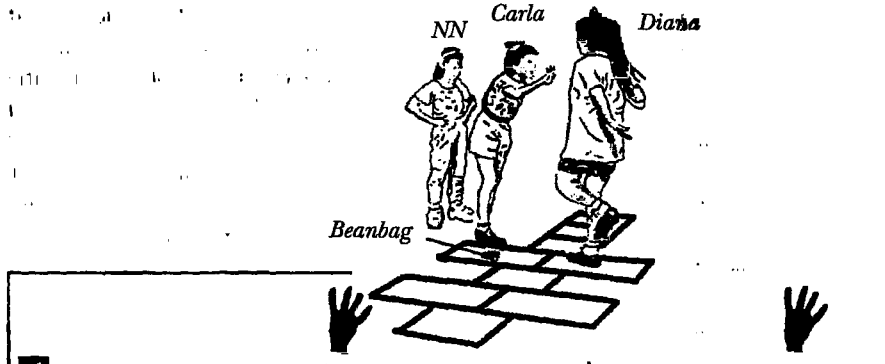
3. Changing Contextual Configurations

What happens next provides the opportunity to investigate in more detail how the shape of the current contextual configuration has consequences for the organization of action. As Carla says '*Quinto*' in line 5, Diana looks down, moving her gaze away from Carla's face and gesturing hand, and toward the grid.

The participation framework which provided an essential ground for Carla's use of her gesturing hand is no longer operative. When Diana looks away, Carla finds herself in the position of looking and gesturing toward someone who is now publicly dis-attending her. Such phenomena demonstrate how any participation framework is an ongoing contingent accomplishment, something not under the control of a single party (who can at best make proposals about the structure of participation that should be operative at the moment), but rather something that has to be continuously achieved through public displays of orientation within ongoing processes of interaction.

Not only the gesture but also the action Carla is performing, the challenge to Diana, is called into question by virtue of the way in which Diana is no longer visibly acting as a recipient to it. Let me note in passing that here, unlike in some approaches to 'speech acts', action is being analyzed here as a multi-party interactive phenomenon.

Does Carla in fact analyze these events in this way? Does she treat what Diana has done as undermining her current action, and if so what can she do about this?



As can be seen in the transcript on p. 401 without the slightest break in her fluent, dynamic production of speech Carla restates the argument she has just made in a different way with a different kind of gesture. As Diana's head moves downward Carla drops her gesturing hand. However, she now uses her foot to do a deictic stomp at a place constituted by the intersection of three different, mutually relevant, semiotic fields:

- First, the place where Diana is now looking, the target of her gaze, and thus the place that she is visibly displaying to be the current focus of her orientation and attention.
- Second, one of the squares in the hopscotch grid that is the focus of the current dispute, indeed the square where Diana threw her beanbag
- Third, a square that is explicitly being talked about within Carla's current speech.

The structure of Carla's talk also changes in ways that adapt it to this new configuration of orientation and gesture. In lines 4 and 5 Carla used numeric expressions functioning as names to specify the entities being disputed: ***el Cuatro*** and ***el Quinto***. Such language talked about these phenomena, but did not in any way presuppose that the participants were actually looking at the grid squares being talked about. Though available in the local scene, the grid was not being put into play as something that had to be actively attended to and scrutinized in order to properly constitute the actions in progress at the moment. One could look elsewhere, and indeed this is precisely what Carla and Diana both did by gazing toward each other, and it was this structure of mutual orientation that Carla exploited by placing her numeric handshapes directly in Diana's line of sight.

By way of contrast, after Diana looks down, Carla uses the deictic expressions 'this' and 'that' (lines 6, 7) to specify the particular squares at issue while

Such deictic expressions presuppose that their addressee is positioned to see what is being pointed at (which is being further specified by the concurrent foot point), and indeed the entities being pointed to are located precisely at the target of Diana's gaze. Orientation to the grid is now an explicit, crucial component of the operations that have to be performed to properly constitute the action currently in progress. The grid as something to be actively scrutinized is now in play as a relevant semiotic field implicated in the organization of the actions of the moment in ways that it wasn't a moment earlier.

4	Carla:	Ytú vas en el **CUATRO.**	*And you go in the **FOUR.***
5		No vas en el **QUINTO.**	*You don't **go in** the **FIFTH.***

6		Este es el quinto	*This is the fifth*
7		y ese ┌ es el **qua:tro.**	*And that ┌ is the four*
8	Diana:	└ No- (uhmm)	*└ No- (uhmm)*
9	Diana:	Pero éste **es el cua:tro?**	*But this is the **four**?*
10	NN:	N ┌ o. °Estás en el cinco	*N ┌ o °This is the five*

In brief, what one finds within this single turn at talk is a switch from one contextual configuration to another.[10] The second contextual configuration contains a new semiotic field, the grid as something to be looked at, that wasn't necessary for the first. Despite the addition of this field, most of the semiotic fields in play during lines 4–5 remain relevant. The way in which contextual configurations are constituted through specific, somewhat contingent mixes of particular semiotic fields provides for the possibility of underlying continuity, even while relevant change is occurring (e.g., sets of fields can overlap from one configuration to another). Rather than replacing one perceptual world with an entirely different one, there is relevant change in a continuing contextual gestalt as configurations are reconfigured. Despite this continuity, the shifts that do occur are both significant and consequential for how participants build appropriate action. Thus, the shift in focus to the grid that occurs here also involves changes in the kinds of sign systems, in both talk and gesture, used to refer to the entities being talked about. Though Carla is still pursuing her challenge, there has been a change in context or more precisely, the particular contextual configuration of relevant semiotic resources that are providing organization of the action of the moment.

Through the shift, Carla can pursue her argument in a different arena and this might be quite relevant. Suppose that Carla and Diana are in fact counting and labeling the squares on the grid in different ways (this in fact seems quite likely). If Diana is numbering squares from her left to right at the top of grid, while Carla is numbering them from the bottom of the grid, they are each labeling the squares where the beanbag was thrown and where Diana is now standing differently (e.g. for Diana the beanbag is in square four, while for Carla it landed in square five; see the diagrams on the first data display). Simply telling Diana not to go in the fifth can be quite ineffective if Diana believes that she didn't do this, and in fact threw her beanbag to square four. By physically stomping on relevant squares while she names them, as happens in lines 6–7, Carla can visibly show exactly how she is counting and labeling the squares in dispute. Though the shift to the grid may have been triggered by Diana's dropping her gaze there, this provides Carla with a new way of making, and publicly displaying, the grounds for her initial argument.

The most crucial property relevant to the organization of action displayed through what happens here is *reflexive awareness.* Central to Carla's construction of action is ongoing analysis of how her recipient is positioned to co-participate in the interactive frameworks necessary for the constitution of that action. When Diana looks away, Carla takes into account what Diana is doing and reorganizes her action in terms of it (see also C. Goodwin, 1981). This reflexive awareness is not simply an 'interior' element of the mental processes necessary for defining the action (as it could be analyzed for example within traditional speech act analysis), but a public, visible component of the ongoing practices used to build the action, something that leads to systematic, relevant changes in the shape of the action. Moreover, within this process the addressee, as an embodied actor in her own right, is as crucial a player as the speaker.

such rapid, reflexive adapt-

is appropriate to specific contextual configurations. Here, Carla is able to refer to and identify the same entities – specific positions in the hopscotch grid – with a number of different sign systems, each of which has quite distinctive properties. These include numeric linguistic expressions functioning as names (which do not require looking at the entity being referred to – lines 4–5, though this can be built into their structure through syntactic affiliation with a deictic expression – lines 6–7), iconic hand gestures (which presuppose orientation toward the hand rather than the entity being described through the hand), deictic linguistic expressions and deictic or indexical gestures (both of which make relevant gaze toward the entity being pointed to). Not all of these resources are relevant and in play at any particular moment. However, the ability to rapidly call upon alternative structures from a larger, ready at hand tool kit of diverse semiotic resources, is crucial to the ability of human beings to demonstrate in the ongoing organization of their action reflexive awareness of each other and the contextual configurations that constitute the situation of the moment.

Looking at these same phenomena from another perspective, we find that the analyst cannot simply take an inventory of all semiotic resources in a setting that could potentially be brought into play, and use this inventory as a frame to describe a relevant context. As these data demonstrate, not all possible and relevant resources are in play at any particular moment. Indeed what happens here depends crucially on the way in which the grid *replaces* the hand displaying numbers and focus on each other's face, as what is being oriented to at the moment. To describe the context we have to track in detail the temporal unfolding of the interaction, while attending to what the participants themselves are constituting for each other as the phenomena to be taken into account for the organization of the action of the moment (see also Schegloff, 1993). We are thus faced with the task of describing both the larger set of possibilities from which choices are being made, and the way in which alternative choices from that set structure the events of the moment in consequentially different ways.

4. Semiotic Structure in the Environment

Another crucial component of this process is the hopscotch grid being talked about and pointed at. The grid differs radically from both talk and gesture in many important respects. Unlike the fleeting, evanescent decay of speech, which disappears as material substance as soon as it is spoken (unless captured in another medium such as writing or tape recording), the hopscotch grid has both an extended temporal duration – it is there in exactly the same form throughout the game, and in the present case of a painted grid on a playground, day after day for new games – and is built of concrete material so durable that it can support the weight of multiple actors jumping through it. Rather than constituting a mental representation, it is as corporeal, solid, and enduring as the ground the players are walking upon. However, it is simultaneously a thoroughly semiotic structure. Indeed, it provid[illegible]

that make up the game are impossible in a hypothetical 'natural environment' unstructured by human practice, e.g. a field without the visible structure provided by the gridlines. Simultaneously, the game is just as impossible without embodiment of the semiotic structure provided by the grid in a medium that can be actually jumped on. The notion that the primary focus for the analysis of human action should be the isolated mental states of individual actors here becomes impossible. As demonstrated quite powerfully in the work of Hutchins (1995), human cognitive activity is situated within historically shaped social systems that encompass both actors and crucial semiotic artifacts such as the maps needed to navigate ships.

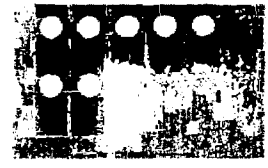
Like a map, the hopscotch grid does not produce single actions (a particular 'out' for example), but instead provides a public framework for the constitution of diverse, game-relevant classes of action (outs, successful jumps, etc.). Moreover, the medium in which it exists is crucial for the specific kinds of action that actors perform, such as jumping through it and visually inspecting the feet of other actors to see if a line has been stepped on etc. However, though constructed in a medium with properties quite unlike those of speech, the grid nonetheless parses its structure into relevant units that are comparable to those being picked out with the language structures used to refer it. Thus the deictic terms used to talk about particular squares presuppose bounded entities (e.g. 'this' as visibly contrastive with 'that'), and some of the numeric expressions presuppose elements in a larger series of equivalent units, precisely the structure displayed visibly by the building of the grid as an ordered series of smaller identical squares. More generally, once the grid as a relevant semiotic system is taken into account, our framework for the analysis of the organization of action encompasses not only sequences of talk and the bodies of actors, but also the material structure in the surround. Participants visibly attend to such graphic fields as crucial to the organization of the events and action that make up activity reflexively situated within a setting, and which contribute structure to that action.[11]

5. Embodiment in Institutional and Scientific Practice

Viewing action as something accomplished through the juxtaposition of diverse semiotic materials provides resources for specifying in detail precisely those semiotic materials that provide for the uniqueness of culturally situated activities. However, with this framework it is also possible to demonstrate how activities that might initially appear to be quite unique and esoteric, such as the details of scientific work, are in fact built through use of far more pervasive, indeed generic practices for the accomplishment of action within situated human interaction. To demonstrate this we will now look at some archaeologists using a Munsell color chart to code the color of the dirt they are excavating.[12]

1 Pam: Okay that should be, ***wet*** enough.
2 (1.5)

4 Jeff: We're lookin at that right there?
5 (0.3)
6 Pam: Mmm,
7 (0.4)
8 Jeff: Much darker than tha:t.
9 Pam: Yeah. [I'm not-=
10 Jeff: [There
11 Pam: =I'm just tryin ta put it ***in*** the:re.=
12 =eh hih an(h)ywhere. °hih heh huh



Munsell Book

Most of the same semiotic fields that we saw in the hopscotch example are relevant here. Two participants using their bodies to sustain a participation framework for common, joint activity are clearly using both talk and gesture to carry out some larger sequence of action. However, despite these similarities, this scene has an opaqueness that the hopscotch dispute hadn't. Though we can understand (1) the talk of the participants, which consists of quite simple, ordinary English phrases and not a technical vocabulary; (2) the frameworks of orientation being displayed through their bodies; and (3) crucial aspects of the gestures being used – for example that they are pointing gestures – we don't quite understand what the participants are doing.

28 Jeff: mm[h,

This sense of basic, recognizable interactive organization running smack into an opaque wall, a domain of phenomena which seems absolutely crucial to what the participants are doing, but which I don't understand simply by speaking the same language or living in the same country, is what has struck me almost every time I've done fieldwork in a new professional or scientific workplace. These difficulties, the gnawing sense of not being able to adequately understand what's happening, arise not from a general unfamiliarity with the community or setting. Instead, my inability to understand what is happening is made apparent by the way in which the partici-

access to. Here these two archaeologists are staring intently at a weird little book with holes, pointing to it and arguing as they move a trowel with dirt under it.

In essence, the visible actions of the participants show that they are orienting to a new, semiotic field which is crucial to the local constitution of action, but which cannot be understood without more detailed knowledge of the setting and activities in progress. This same argument could be made about the documents, television and computer screens, and other tools that participants in other settings, such as an Airlines Operations Room, an oceanographic ship, a chemistry lab, etc. attend to in performing the distinctive work that constitutes those settings. Quite clearly, ethnography is required (Cicourel, 1992). However, the parameters of that ethnography, what has to be known, emerge from the visible organization of the activity in progress. The issue is not what life is like in general for archaeologists, but rather what precisely is the structure of the specific semiotic fields and activity systems that are providing organization for the actions they are performing in order to do the work that constitutes their lifeworld. What is going on with that little book and why is it so important? Note that though lodged within professional settings, these charts and documents have structural similarity to the hopscotch grid. In all cases, the participants are using a semiotically structured built environment as a constitutive component of the actions in progress.

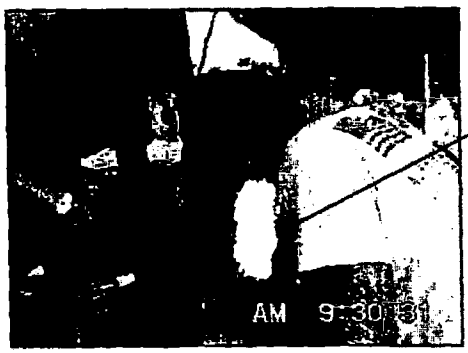
In brief, the opaqueness of this setting, the way in which its status as something lodged within a specific, technical profession emerges as consequential, is visible through the way in which the participants are attending to a special semiotic field as criterial for what they are doing, while in other respects continuing to make use of more general interactive resources for the organization of talk and action within human interaction. Their simultaneous orientation to, and use of, this semiotic field as a constitutive feature of the actions that give their work its professional character, makes it relevant for researchers to include that field in their analysis if they want to come to terms with its institutional properties, or even to get a handle on just what it is that these people are doing. Were this field to be omitted, it would be like describing the actions of Carla and Diana without taking into account the game they are playing and the resources that make both that game, and their arguments about it, possible (e.g. the ability to adapt to changes in an interactive participation framework by using the grid to insistently pursue an action, while changing the structure of that action so that it remains visible and appropriate to the contextual configuration of the moment).

Before proceeding to a brief discussion of what the archaeologists are pointing at, two additional points will be briefly noted. First, it is possible to adequately come to terms with much, perhaps most, of what is happening in many interactions while leaving some fields opaque and unanalyzed. An audio tape of the hopscotch game would preserve a great deal of the structure of talk-in-interaction. Indeed, this acceptance of partial opaqueness is not only a possibility for analysts, but one that is systematically exploited by participants themselves in professional settings characterized by asymmetries in knowledge and access to the resources that make up the setting. Patients not only can't see many of the documents, instruments and representations that doctors focus on during an encounter, but

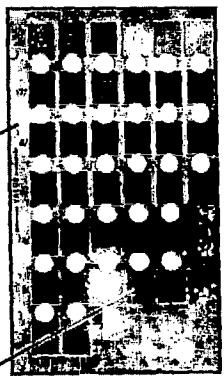
can see them (e.g., an electrocardiogram). Such asymmetries are central to work settings as mundane as checking out in a supermarket, where the clerk is focused on machines for ringing up the transaction, while the customer stands by with bored resignation. However, in the archaeological sequence, all relevant participants are using a specific field as a central resource for the actions that give their work both its professional character and its local organization as a sequence of interaction.

Second, what we have to investigate emerges from the way in which the participants themselves display a particular field to be consequential and relevant through the orientation of their bodies and the organization of their action. Rather than wandering onto the fieldsite as disinterested observers, attempting the impossible task of trying to catalog everything in the setting, we can use the visible orientation of the participants as a spotlight to show us just those features of context that we have to come to terms with if we are to adequately describe the organization of their action. This has methodological as well as theoretical implications. For example the participants' visible orientation provides a guide for what should be included within the frame of the video image, and what materials should be collected from the setting (e.g. the book they are looking at) to facilitate subsequent analysis.

6. The Munsell Chart as an Historically Shaped Field for the Production of Action

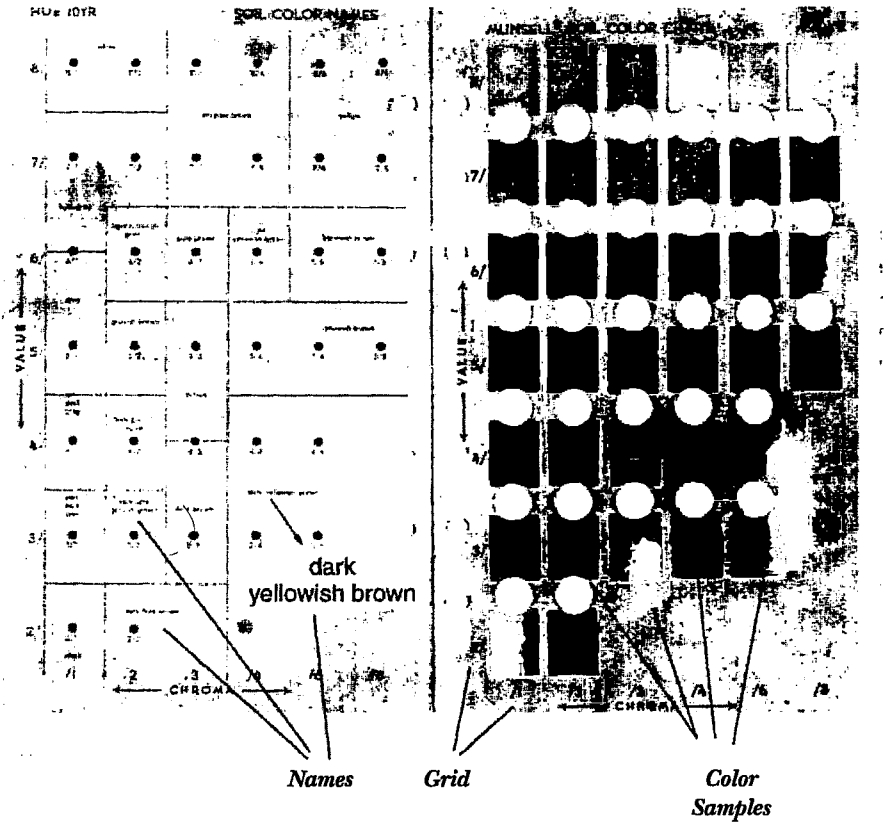


The activity the archaeologists are engaged in is classifying the color of the dirt they are excavating. They are doing this for a number of different reasons. Many phenomena of interest to archaeologists, what they call *features*, are visible only as color changes in the dirt they are excavating. For example the cinders produced by an ancient hearth will leave a black stain and the decaying wood of a post and rubble used to hold it up will produce a tube of dirt with color systematically different from the soil around the post.



The very activity of excavating features systematically destroys them. As dirt is removed to dig deeper the patterns of visible color difference are destroyed. In part because of this, careful records have to be kept of each stage in the excavation. The documentary proof that a feature existed is to be found in not only photographs, but also records describing in detail how the color of the dirt surrounding a feature differed from that within it. These two student archaeologists are coding the color of the dirt in order to fill out one of the forms that tracks their excavation.

To code the color of dirt, archaeologists use as a standard reference the subsection of the Munsell color chart (a tool used by many professions concerned with the accurate description of color) that covers the range of colors that will be found in soil.[13] This is carried to the field in a small loose-leaf notebook, and this is what these archaeologists are looking at here.



SOIL DESCRIPTION: A ZONE upper plow zone	D M85 backdirt	B lower plow zone	C subsoil	plow scar
Color (Wet) 10YR 3/4 dk yellowish brown	10YR 4/3 brown to dk brown	10YR 3/6 dark yellowish brown	10YR 4/3 brown to dark brown	10YR 4/3 brown to dark brown
Texture sandy silty loam	sandy loam	loamy sand	sandy loam	loamy sand
Consistency somewhat sticky somewhat plastic	fairly sticky fairly plastic	sticky somewhat plastic	slightly sticky, plastic	sticky, plastic
Mottles scattered light	heavily w/ 10YR 5/4 sand and areas of 10YR 3/3 silty loam. Scattered charcoal and burnt earth.	lightly w/ lighter soil.	heavily lighter and darker	somewhat light and dark

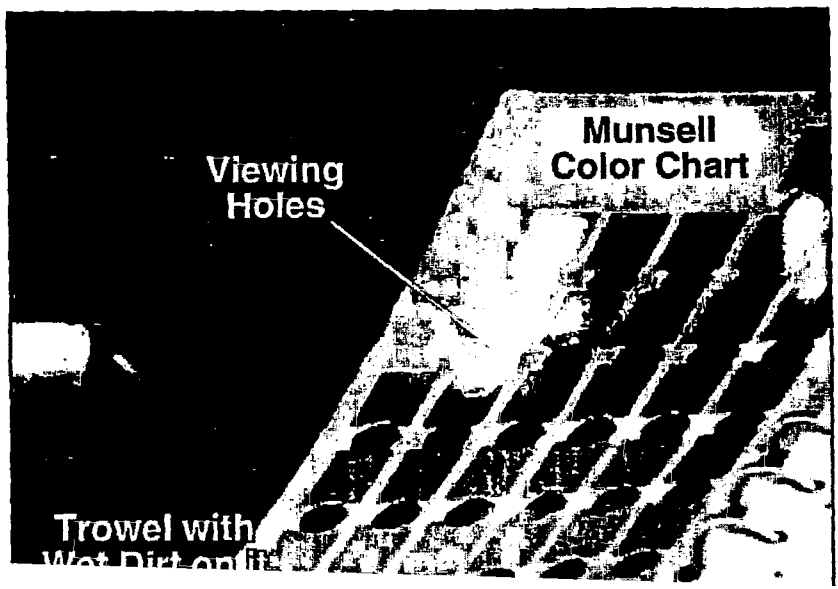
square on the grid. Moreover the material characteristics of the sign system were crucial to the operations that could be performed with it (e.g. looking at the conjunction of a foot and a line to see if a girl was out). The Munsell chart has exactly these same properties. It contains not one but three different sign systems for describing each point in the color space it represents: first, an actual color sample; second a specification of that point as the intersection of three underlying variables for Hue, Chroma and Value (each page in the book is organized as a grid of Chroma and Value samples for a single Hue); and third, a color name such as *dark yellowish brown.* Each of these sign system makes possible different operations and each is embedded within different strands of the larger suite of activities that intersect at the work sites where the chart is used. Thus the color sample allows direct visual comparison with the dirt, something that is not possible with the phonetic or graphic structure of a color name. It is the most useful and appropriate medium for doing the job of actually classifying the dirt.



However, providing such an iconic representation of the color of each bit of dirt excavated on each coding form and each published report about the site would be prohibitively tedious and expensive. For these tasks, which involve transporting information about the color from this site to other relevant work-

grid coordinates is ideal. The grid coordinates provide a form of precise reference that transcends the color systems of specific languages. However, tying such numbers to the colors they identify requires access to the chart itself (though differences in numbers can be observed without the chart). For general discussion and publication, the color names are both most economical and perfectly adequate. In brief, rather than simply specifying unique points in a larger color space, the Munsell chart is used in multiple overlapping activities (comparing a reference color and a patch of dirt as part of the work of classification, transporting those results back to the lab, comparing samples, publishing reports, etc.), and thus represents the 'same' entity, a particular color, in multiple ways, each of which makes possible different kinds of operations because of the unique properties of each representational system.[14]

7. Heterotopias

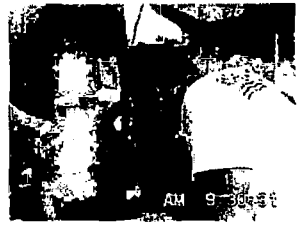
Adjacent to each color patch on the Munsell chart is a hole. To classify the color of the dirt they are examining, the archaeologists put a small amount of dirt on the tip of a trowel, wet it, and then move the trowel from hole to hole until the closest match between the dirt and an adjacent color patch is found.

Foucault (1970, 1986) uses the term *heterotopia* to mark "a relatively segregated place in which several spatial settings coexist, each being both concrete and symbolically loaded" (Ophir and Shapin, 1991: 13). With elegant simplicity, the Munsell page with its holes for viewing the sample of dirt on the trowel juxtaposes

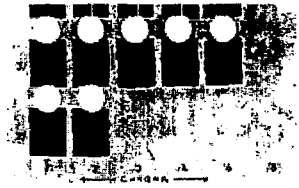
in a single visual field two quite different kinds of spaces: (1) actual dirt from the site at the archaeologists' feet is framed by (2) a theoretical space for the rigorous, replicable classification of color. The latter is both a conceptual space, the product of considerable research into properties of color, and an actual physical space instantiated in the orderly modification of variables arranged in a grid on the Munsell page. It is simultaneously a material object and a conceptual tool. It relies upon the specific properties of material media to build cognitive structure that could not exist within the confines of the skull: for example, the arrangement of possibilities for color classification into an ordered grid that can be repeatedly scanned, the production of actual reference samples that can be visually compared both with each other and with the material being classified, the preservation of the reference samples across time and space, etc. All of these operations depend upon the properties of specific physical objects. However, such objects do not exist, and could not exist, in a pure 'natural' word, e.g. a domain not structured by human practices.

By juxtaposing unlike spaces, but ones relevant to the accomplishment of a specific cognitive task, the chart creates a new, distinctively human, kind of space. It is precisely here, as bits of dirt are shaped into the work-relevant categories of a specific social group, that 'nature' is transformed into culture.[15]

8. Building Action within Talk-in-Interaction with the Munsell Chart



We will now investigate how the resources provided by the chart are made visible and relevant within talk-in-interaction. At line 17 Pam moves her hand to the space above the Munsell chart and points to a particular color patch while saying 'En this one'.



Pam's action at line 17 has structural affinities with the way in which Carla pointed out phenomena on the hopscotch grid in lines 6–7 of that example. Both actions use deictic terms that characterize the entity being pointed at as one bounded region within a larger set of similar spaces; both are affiliated with pointing gestures which specify the region indicated by the talk, and in both cases what is being indicated and pointed at is a built environment for the production of meaning and action (see also Heath and Luff, 1996; Hindmarsh and Heath, in press: Hutchins, 1995; Hutchins and Palen, 1997; Ochs et al., 1996), and indeed in both cases this environment is structured as a grid. Both moves are embedded within larger sequences of action.

13 Jeff: I'll take it. ((*takes trowel*))
14 (2.0)
15 Pam: Down.
16 (1.2)
17 Pam: En this one. ((*Points*))

19 Jeff: nuhhh?
20 (1.8)
21 Pam: Or t[hat one? (whoops) *((Points))*
22 (0.8)
23 Pam: Fou:r.
24 (0.8)
25 Pam: Is it that?
26 Na: That's- not-
27 Wh[at was the ***br***owness of that?
28 Jeff: mm[h,

Within the field of action created by the activity of color classification, what Pam does here is not simply an indexical gesture, but a proposal that the indicated color might be the one they are searching for. By virtue of such conditional relevance (Schegloff, 1968), it creates a new context in which a reply from Jeff is the expected next action.

In line 19 Jeff rejects the proposed color. His move occurs after a noticeable silence in line 18. Dispreferred actions in conversation, such as this rejection, are frequently preceded by gaps (Pomerantz, 1984). However, when the tape is examined, something else seems to be going on. The silence is not an empty space, but a place occupied by its own relevant activity (M.H. Goodwin, 1980). Before a competent answer to Pam's proposal in line 17 can be made, the dirt being evaluated has to be placed under the viewing hole next to the sample she indicated, so that the two can be compared. During line 18 Jeff moves the trowel to this position. Because of the spatial organization of this activity, specific actions have to be performed before a relevant task, a color comparison, can be competently performed. In brief, in this activity the spatial organization of the tools being worked with, and the sequential organization of talk in interaction, interact with each other in the production of relevant action (e.g. getting to a place where one can make an expected answer requires rearrangement of the visual field being scrutinized, so that the judgment being requested can be competently performed). Here, socially organized vision requires embodied manipulation of the environment being scrutinized.

This has a number of additional consequences. First, Pam's own ability to evaluate the appropriateness of the color she proposed changes when Jeff moves the sample to the correct viewing hole. Only then is she in a position to rigorously compare the dirt with the Munsell color. Pam's action of pointing to a particular color patch at line 17 could be heard as a request to perform *this* action, that is, to put them both in a position where that patch might be evaluated, rather than a definitive judgment that is subsequently disagreed with. Indeed, a moment later, in line 23, Pam suggests another possible color. However when the trowel

The process of color classification involves a sequence of embodied movements through space and time. Contextual fields, including both talk and the possibilities for seeing and categorization provided by the Munsell chart, are being continuously reshaped in order to accomplish relevant action. The range of phenomena that can be seen and evaluated changes at each step in this process. The relevant locus for analyzing the problematic status of a specific proposal is not primarily the mental state of a particular actor, but instead the different possibilities for seeing relevant phenomena that alternative positions in this sequence provide.

Analogous to what we saw in the hopscotch example, the gestures that occur here are situated within multiple semiotic fields simultaneously. First, pointing at a color sample, rather than, say, identifying it with a spoken color name, selects a representational system from a larger set and by this heightens focus on its relevant visual properties, which is precisely the task of the moment. Second, in addition to the way that the pointing finger locates a particular patch within the larger array, which we can gloss as the *reference space*, the hand carrying the gesture also constitutes a relevant action within the *participation space* being sustained through the orientation of the participants bodies toward the material (chart and dirt sample) that are the focus of their attention.

Pam: En this one.

Pam's hand moves right into Jeff's line of sight as he gazes toward the chart. Rather than telling him what color to look at, she shows him. Third, as noted above, Pam's proposal constitutes a request that he move the sample to the viewing hole for his patch. By pointing at the patch she makes a relevant move within the *local action space* (e.g., a spatial locus that can specify an action through its embeddedness within a locally relevant activity) by showing him where to position the sample next.

9. Using Graphic Fields to Build Action

It is common to talk about structures such as the Munsell chart as 'representations'. However, exclusive focus on [illegible]

embedded within the organization of human practice. With its viewholes for scrutinizing samples, the page is not simply a perspicuous representation of current knowledge about the organization of color, but a space designed for the ongoing production of particular kinds of *action.* In this respect it has close structural affinities with the hopscotch grid.

What kinds of analytic frameworks are necessary for systematic investigation of how phenomena such as the Munsell chart and the Hopscotch grid contribute to the organization of action within human interaction? Shifting focus from how a graphic field, such as the hopscotch grid or Munsell chart represents something, to how it constitutes a framework for action in its own right, does in some ways parallel Austin's (1962) argument that talk should be analyzed as a form of action, rather than as simply a way of describing the world. However, unlike speech acts these grids do not constitute particular actions, but instead provide frameworks for building *classes* of action (e.g. outs, successful jumps, illegal moves, a range of diverse color categorizations, etc.). Their structure and temporal organization is quite different from that found in individual acts (though they are analogous to the underlying semiotic frameworks used to constitute speech acts). The accomplishment of particular concrete actions requires that these structures be deployed in conjunction with other relevant meaning-making practices, such as the game-relevant body of an actor jumping through the hopscotch grid, pointing elaborated by relevant talk, or dirt being moved under the Munsell chart, while an archaeologist attempts to find the best match in order to code that bit of dirt with a specific category provided by the chart. What is required is a framework for the analysis of action in general, including what has traditionally been analyzed as speech acts, that takes into account the quite different kinds of materials that are juxtaposed to each other in order to accomplish action within situated human interaction. Moreover, though it is convenient to gloss a range of quite disparate phenomena, e.g. both gesture and inscribed grids, as *visual,* it is by no means clear that what is being pointed at is confined to a single embodied modality. Gesture has not only visual, but also crucial kinesthetic components, and as Streeck (1996) argues, these may be crucial to the way in which the body knows the world through the hand.

Though the Munsell chart and the hopscotch grid do not themselves construct specific actions, their role in the hybrid systems I have described is absolutely crucial to the process through which precisely those actions that constitute the detailed particulars of the endogenous settings in which they are embedded are accomplished (e.g. seeing and classifying dirt as an archaeologist). If these frameworks are absent, the relevant actions cannot occur. A body jumping on a surface that does not contain a hopscotch grid is not playing hopscotch, and is deprived of the public, visible semiotic resources that would allow her and her coparticipants to judge whether her foot landed successfully or out. Rather than functioning simply as representations, the structures being examined here, including the scientific description and analysis of color provided by the Munsell chart, are lived spaces inhabited by actors who move through them while using the structure

10. Conclusion

Despite its simplicity, the mix of semiotic fields found in a scene such as the hopscotch game locates a perspicuous site for developing an approach to the analysis of human action that takes into account simultaneously the details of language use, the semiotic structure provided by the historically built material world, the body as an unfolding locus for the display of meaning and action, and the temporally unfolding organization of talk-in-interaction.

Analyzing action as something accomplished through the temporally unfolding juxtaposition of multiple semiotic fields with quite diverse structure and properties, has a range of consequences. First, the analytic boundaries between language, cognitive processes, and structure in the material world dissolve. The actions made visible in both Carla's talk and that of the archaeologists were not constituted in any single field, such as the talk, but rather within a larger configuration in which a range of different fields (the talk, the pointing foot or finger, the semiotic structure provided by the grid or Munsell chart, the larger encompassing activity, etc.) mutually elaborated each other. In both settings, the participants use as complementary resources both the specifics of different kinds of sign systems provided by language, and historically shaped structure instantiated in artifacts and the physical environment.

This framework is analytically different from many approaches to both cognition and embodiment that focus primarily on phenomena lodged within the individual. For example, much study of metaphor has taken as its point of departure the embodied *experience* of the speaker, e.g. the way in which metaphor emerges from the structure of the human body, its position in a world structured by phenomena such as gravity (e.g. the pervasive relevance of *Up* and *Down* in human cognition and language) and 'preconceptual structures of experience' (Johnson, 1987: 15). While providing valuable insight into many kinds of conceptual organization, such focus on the interior life of a single actor does not develop a systematic framework for investigating the *public* visibility of the body as a dynamically unfolding, interactively organized locus for the production and display of relevant meaning and action.

Crucial to the organization of the events being investigated here is the ability of *other* participants to systematically see how a co-participant's body is doing specific things by virtue of its positioning within a changing array of diverse semiotic fields.[16] Diana is seen to be following or not following the rules of the game in progress by virtue of how her body is positioned within the hopscotch grid. Such actions are public and accountable (as demonstrated by Carla's challenge and attempt to prevent Diana from continuing). Their analysis requires a framework that focuses not primarily on Diana's interior life (though what she wants to do is visible to all), but instead on the visible juxtaposition of her body and the grid, within a recognizable course of activity. Proposing a possible match by pointing to a particular square on the Munsell chart has an analogous structure, e.g. analysis requires specification of the properties of the chart being pointed at, the detailed sequential [illegible]

within, the semiotic structure provided by historically shaped frameworks for action, instantiated in both material media and the systematic practices of a group performing the activities that constitute its lifeworld. Such public visibility is also crucial to analysis of how the body is used to perform action within interaction. Carla takes into account the patterns of orientation visibly displayed by Diana's gaze and posture by changing her own actions in response to them. Central to what is occurring in these data (and in face-to-face interaction in general) are socially organized, interactively sustained configurations of multiple participants who use the public visibility of the actions being performed by each others' bodies, the unfolding sequential organization of their talk, and semiotic structure in the settings they inhabit to organize courses of action in concert with each other.

Second, because of the flexibility provided by the way in which different kinds of semiotic fields can be juxtaposed to each other, there is a continuity between vernacular and institutional interaction.[17] The work-relevant fields that provide any setting with its unique institutional character, and which are central to the accomplishment of the specific work being done there, are but one crucial element in a larger matrix of meaning and action that includes as well far more pervasive frameworks for the organization of talk and action within interaction (e.g. the different kinds of indexical and representational sign systems provided by the structure of talk, sequential organization, gesture with variable mixes of iconic and deictic features, bodily orientation as a public framework for the construal of task relevant intentionality, etc.). Thus, the historical specificity of the Munsell chart is articulated through quite general practices for the production of talk and deictic pointing. Action in both settings draws upon many of the same resources for building semiotic structure and incorporating it into relevant courses of action (multiple ways of designating the same entities, each relevant to alternative contextual configurations and activity complexes, deictic gestures that are simultaneously embedded within both referential spaces constituted through built semiotic environments and participation frameworks constituted through the displayed orientation of the participants' bodies, the distinctive temporal and spatial properties of semiotic structure instantiated in a material visual field, etc.). The particulars that give institutional settings their distinctive character are built through the use of more pervasive resources which have underlying formal similarities. More generally, what has been presented here has tried to demonstrate the relevance of using *situated activity systems* (Goffman, 1961; M.H. Goodwin, 1990; C. Goodwin, 1996b; Goodwin and C. Goodwin, 1987; Levinson, 1992) to investigate the organization of human action, cognition, and talk-in-interaction. Such systems constitute an environment within which the analyst can investigate in detail how participants deploy the diverse resources provided by talk (for example access to a variety of sign systems with structurally different properties), sequential organization, posture, gaze, gesture, and consequential phenomena in the environment that is focus of their work in order to accomplish the courses of action that constitute their lifeworld.

Finally, the human body is unlike most other phenomena in the scene. Within

in progress. Moreover, the actions made visible by the body are quite diverse. Some, such as a display of orientation toward another participant or a relevant feature of the surround, have a temporal organization that extends over multiple actions occurring within an extended strip of interaction. Gestures, including both iconic representations such as the numeric handshapes and the deictic points found here, can have a far shorter temporal duration. Moreover, these two kinds of action function at different levels of organization. Gestures can carry propositional information and function as individual actions, or as components of multimodal actions. By way of contrast, the displays of postural orientation used to build participation frameworks help establish the interactive ground that frames and makes possible the production, reception, and joint constitution of a variety of different kinds of action built through gesture and talk. The body functions in yet another way when prosody and intonation are used to display alignment and stance (Couper-Kuhlen and Selting, 1996; M.H. Goodwin, 1998). Rather than locating a homogeneous field for analysis, the notion of embodiment encompasses many different kinds of phenomena.

The same is true for context. The constitution of relevant context (Goodwin and Duranti, 1992) is in the first instance an issue for the participants, and not primarily for the analyst (a point long emphasized by conversational analysts, e.g. Sacks, 1995 [1992]; Schegloff, 1987). As the rearrangement of contextual configurations in both the hopscotch and the Munsell data demonstrated, context is not simply a set of features presupposed or invoked by a strip of talk, but is itself a dynamic, temporally unfolding process accomplished through the ongoing rearrangement of structures in the talk, participants' bodies, relevant artifacts, spaces, and features of the material surround that are the focus of the participants' scrutiny. Crucial to this process is the way in which the detailed structure of talk, as articulated through sequential organization, provides for the continuous updating and rearrangement of contexts for the production and interpretation of action. Within the rich matrix of diverse semiotic resources that create relevant contextual configurations, action, setting, and the meaningful body reflexively constitute each other through temporally unfolding processes of situated human interaction.

Acknowledgements

Earlier versions of this paper were presented at the 1998 Conference for the American Association for Applied Linguistics, Seattle March 14–17, 1998, and at the International Graduate School in Language and Communication, Odense University, Denmark, June 22–26, 1998. I am most indebted to Dr. Gail Wagner, and the students at her archaeological field school, and to the girls playing hopscotch, for allowing me access to relevant events in their lives, which made the analysis developed in this paper possible. Candy Goodwin, Ceci Ford, Makoto Hayashi, Elizabeth Keating, David Olsher, Jeff Robinson, Jack Sidnell and one anonymous reviewer provided most [illegible]

Notes

1. The study and theoretical formulation how such multi-party social action is recognized and accomplished has been a major topic in Conversation Analysis. See for example Schegloff's (1968) early formulation of *conditional relevance*, the analysis of Adjacency Pairs in Sacks (1995 [1992]) and Schegloff and Sacks (1973), the study of how hearers make projections about what is about to happen in an unfolding utterance in Jefferson (1973) and Goodwin and Goodwin (1987), and much other work in the field (see Heritage, 1984, 1989, for descriptions of work in the field, and the theoretical issues being dealt with).
2. See Agha (1996, 1997) for other most relevant analysis of how action is built through the conjunction of multiple semiotic resources.
3. Ideally, I would like the readers of this paper to be able to actually view the data clips being analyzed so that they can check out my analysis of the sequence for themselves. With the development of Quick-time movies and CD ROM's this is becoming possible, though issues of confidentiality must also be addressed.
4. For more detailed exposition of the rules of hopscotch see M.H. Goodwin (1998). Girls' games, such as hopscotch, have traditionally been offered as evidence that girls' social organization, capacity to deal with rules, and ability to successfully engage in disputes is inferior to that of boys (see for example Lever, 1978). For example it is argued that a game such as football has more players who occupy an array of structurally different positions than hopscotch or jumprope. Note that if this stereotype is true, girls, and the women they become, should be less fit than men to engage in the dispute forums, such as the legal system and politics, that define power in a society. M.H. Goodwin's studies of girls' actual interaction in the midst of games strongly contradicts such a view. She demonstrates that the disputes that systematically emerge within a game such as hopscotch provide girls with a rich arena for the analysis of each other's actions in terms of rules, with a place where rules can be challenged and negotiated, and with an opportunity to develop an embodied habitus of power as girls use the full resources of forceful argument to oppose each other's positions (see for example M.H. Goodwin, 1985, 1994, 1995, 1998, 1999). Carla's actions in the present data are certainly consistent with such an argument. In a more general study of the social worlds built by children through their talk-in-interaction on the street, M.H. Goodwin (1990) found that some of the dispute processes of girls, such as the He-said-she-said, were in fact far more extended and complex than those of boys.
5. Norma Mendoza-Denton (personal communication, 1995) points out that this example shows how the bilingual phonology of the children operates, taking the English word *cheater* and codeswitching in the middle of it at a morphological boundary by changing the /t/ of *cheat* to /r/. Although the vowel quality is primarily Spanish, the word has an English phonologial process operating within it, with the intervocalic flapping of /t/.
6. The way in which utterances derive both their meaning, and their status as particular kinds of actions from their placement within larger sequences, has long been the subject of sustained analysis within conversation analysis. See for example Sacks et al. (1974), Schegloff (1968), and Heritage (1984).
7. Describing these movements in writing is not entirely effective. The rhythmic and visual patterning of these movements can be seen much clearly on the video. Ideally I would like be able include video clips with a paper such as this.
8. This contrast is also displayed through crucial rhythmic components (Erickson, 1992)

9. Carla also used a deictic stomp accompanied by *éste* in line 2 to indicate a relevant square in the grid. At this point Carla is actually pushing Diana in an attempt to stop her progress through the grid. As the two moved apart Carla switched to the iconic handshapes thrust into Diana's face, an action that had the effect of leading Diana to gaze up toward Carla and her outstretched hand.
10. See Goodwin (1981) for analysis of how ongoing talk is reorganized to make it appropriate to a new contextual configuration defined by a structural change in the type of recipient located as the addressee of the moment. See Hanks (1996a, b) for analysis of both deixis and the relevance of the organization of spaces in the environment to the organization of action. For analysis of narrative spaces relevant to the organization of pointing see Haviland (1996). The issue of relevance, posed by the pervasive possibility of alternative categorizations of the same entity, has long been a central theme of work in conversation analysis. See for example Schegloff (1972).
11. See also analyses by anthropologists such as Duranti (1992) and Frake (1975) investigating how the social and cultural space within which an interaction occurs contributes organization to the speech actions that occur within that space.
12. The analysis presented here is drawn in part from a more extensive study of how color practices are socially organized through use of artifacts such as the Munsell chart (C. Goodwin, 1996a, 1999). Such situated activity systems for the classification of color are lodged within the work practices of a community, and are explicitly contrasted with traditional study of color categories, which analyzes them as psychological or physiological phenomenon shaped by the cultural and linguistic differences visible in the semantic systems of different languages (for example Berlin and Kay. 1969). For other relevant analysis of how the Munsell chart is used to organize scientific practice, see Latour (1995).
13. For more extended analysis of a range of different ways that visual images and documents provide scientists with what Lynch (1988) has called an 'externalized retina', that is a site for publicly and visibly constituting the social objects that are the focus of scientific work, see the papers in Lynch and Woolgar (1988).
14. See Sacks (1995 [1992]) and Schegloff (1972) for a relevant demonstration of how alternative reference forms for phenomena such as persons and places make it possible for speakers in conversation to design reference for different kinds of addressees, activities, and relevancies.
15. A vast amount of research in feminist scholarship, anthropology, and the study of scientific practice has demonstrated that what counts as *nature* is very much a cultural construal. For this reason, the term *nature* has been put in quotes. The way in which *nature*, like any category, is a human semiotic construal, does not, however, undercut the fact that for archaeologists themselves a contrast between 'natural' phenomena and cultural artifacts is central to the organization of their practice. The prototypical work done in excavating a site is precisely separating cultural remains, which are taken back to the lab, from what are classified as natural phenomena, such as dirt, which are left in the field. What is at issue is a distinction that the participants themselves are using to organize their work.
16. Such public visibility and construal of relevant events is crucial to many areas of human social life. See C. Goodwin (1994a) for analysis of how such public practices for organizing vision enabled lawyers defending the policemen who beat Rodney King to shape what the jury saw on the tape, in a way that exonerated the policemen while shifting the focus of attention to the actions of Rodney King.

Constructing Inferences during Narrative Text Comprehension

Arthur C. Graesser, Murray Singer and Tom Trabasso

An adequate psychological theory of text comprehension should be able to account for the generation of inferences when readers construct a *situation model* of what a text is about. A situation model is a mental representation of the people, setting, actions, and events that are mentioned in explicit clauses or that are filled in inferentially by world knowledge (Bower, 1989; Garnham & Oakhill, in press; Glenberg, Meyer, & Lindem, 1987; Johnson-Laird, 1983; Kintsch, 1988; Morrow, Greenspan, & Bower, 1987; Singer, 1990; van Dijk & Kintsch, 1983). For example, suppose that an adult reads a novel. Several classes of knowledge-based inferences are potentially constructed during comprehension: The goals and plans that motivate characters' actions, characters' knowledge and beliefs, traits, emotions, the causes of events, properties of objects, spatial relationships among entities, expectations about future episodes in the plot, referents of nouns and pronouns, attitudes of the writer, emotional reactions of the reader, and so on. Some of these inferences are normally generated "on-line" (i.e., during the course of comprehension), whereas others are normally "off-line" (i.e., generated during a later retrieval task but not during comprehension). Researchers in cognitive psychology and discourse processing have attempted to identify and explain which classes of inferences are normally generated on-line (Balota, Flores d'Arcais, & Rayner, 1990; Graesser & Bower, 1990; Graesser & Kreuz, 1993; Kintsch, 1993; Magliano & Graesser, 1991; McKoon & Ratcliff, 1992; Singer, 1988, in press; Whitney, 1987).

In this article, we present a constructionist theory that makes decisive predictions about the classes of inferences that are constructed on-line during the comprehension of narrative text. One of the shortcomings of early constructionist theories (Anderson & Ortony, 1975; Bartlett, 1932; Bransford, Barclay, &

Franks, 1972; Schmidt, 1982; Weimer & Palermo, 1974) is that they failed to make specific predictions about the inferences and meaning representations that are constructed during encoding. Because of this shortcoming, some researchers (e.g., McKoon & Ratcliff, 1992) have concluded that constructionist theories assume that a complete, lifelike cognitive representation is constructed and that virtually all classes of inferences are generated on-line. During the past decade, however, the research conducted by constructionist theorists has revealed that only a subset of inferences are on-line. The constructionist theory presented in the present article accommodates these empirical findings and thereby positions constructionism on more solid footing.

The proposed constructionist theory embraces a principle that has a long history in experimental psychology and that distinguishes it from other contemporary psychological theories in discourse processing: *Search (or effort) after meaning* (Bartlett, 1932; Berlyne, 1949, 1960; Spiro, 1980; Stein & Trabasso, 1985). A more precise specification of this search-after-meaning principle has three critical assumptions:

1. *The reader goal assumption.* The reader constructs a meaning representation that addresses the reader's goals. These goals and meaning representations are normally pitched at deep levels of processing (e.g., semantics and the referential situation model) rather than at shallow levels (e.g., wording; and syntax).

2. *The coherence assumption.* The reader attempts to construct a meaning representation that is coherent at both local and global levels. Local coherence refers to structures and processes that organize elements, constituents, and referents of adjacent clauses or short sequences of clauses. Global coherence is established when local chunks of information are organized and interrelated into higher order chunks.

3. *The explanation assumption.* The reader attempts to explain why actions, events, and states are mentioned in the text. These explanations involve naive theories of psychological and physical causality in an effort to achieve coherence in understanding.

Thus, readers attempt to construct a meaningful referential situation model that addresses the readers' goals, that is coherent, and that explains why actions, events, and states are mentioned in the text.

Previous constructionist theories have either explicitly or implicitly adopted one or more of these assumptions. The proposed constructionist theory is distinctive because it explicitly adopts all three assumptions and it directly focuses on the problem of inference generation. Previous constructionist theories have been vague or indecisive in delimiting the classes of inferences that are generated on-line. This was not a salient objective for these theories in the past because there was very little research on inference generation two decades ago. Now that inference generation has received more attention in the fields of experimental psychology, cognitive science, and discourse processing, it is time to sort out what a constructionist theory would provide. The three assumptions of the search-after-meaning principle

A constructionist theory that embraces the search-after-meaning principle offers predictions that are not uniquely shared by alternative theoretical frameworks in the discourse-processing literature. By way of illustration, the proposed constructionist theory predicts that the following three classes of inferences are generated on-line under most processing conditions:

1. *Superordinate goals* of characters that motivate explicit actions in the text. For example, the superordinate goal of "getting revenge" motivates the action of a victim killing a villain; getting revenge explains why the victim kills the villain.
2. *Causal antecedents* that explain why an action, event, or state is explicitly mentioned in the text. For example, the event of a character becoming ill is explained by the causal antecedent "the character went bankrupt."
3. *Global thematic inferences* that integrate major chunks of the text or that convey the point of a message. For example, a story might be an instantiation of the virtue "practice what you preach."

In contrast, the theory predicts that readers do not normally construct inferences that forecast future episodes in the plot and inferences that track the spatial locations of objects within a spatial region.

According to the proposed constructionist theory, those inferences that are predicted to be generated on-line are not generated under all conditions of reading. Readers abandon such attempts at search-after-meaning under one or more of the following conditions: (a) if the reader is convinced that the text is "inconsiderate" (i.e., lacks global coherence and a message), (b) if the reader lacks the background knowledge that permits the establishment of explanations and global coherence, or (c) if the reader has goals that do not require the construction of a meaningful situation model (e.g., proofreading the text for spelling errors).

Our primary focus is on narrative text rather than on other discourse genres (such as expository, persuasive, and descriptive texts). This emphasis is nonarbitrary. Narrative text has a close correspondence to everyday experiences in contextually specific situations (Britton & Pelligrini, 1990; Bruner, 1986; Kintsch, 1980; Nelson, 1986; Schank, 1986). Both narrative: texts and everyday experiences involve people performing actions in pursuit of goals, the occurrence of obstacles to goals, and emotional reactions to events. Knowledge about these actions, goals, events, and emotions are deeply embedded in our perceptual and social experience because it is adaptive to understand the actions and events in our social and physical environment. The inferencing mechanisms and world knowledge structures that are tapped during the comprehension of everyday experiences are also likely to be tapped during the comprehension of narratives; there is no justifiable reason to believe that readers would turn off these pervasive interpretive mechanisms during reading. Of course, this claim does not imply that there is a perfect overlap between the inferences generated during everyday experiences and the inferences generated during narrative comprehension. In particular, global thematic inferences may not be generated when we com-

In contrast to narrative text, expository text is decontextualized and is normally written to inform the reader about new concepts, generic truths, and technical material (Brewer, 1980; Bruner, 1986; Nystrand, 1986). The typical reader does not have extensive background knowledge about the topics in expository texts, so readers generate fewer inferences than they generate during the comprehension of narrative text (Britton & Gülgöz, 1991; Graesser, 1981). Narrative text is an important genre to study, given that we are interested in inference generation and the construction of referential situation models.

One major goal of this article is to present a constructionist theory that makes decisive predictions about the knowledge-based inferences that are generated on-line during narrative comprehension. These knowledge-based inferences are critical building blocks in the referential situation model that readers construct. It is beyond the scope of this article to dissect the vast number of shallow-level inferences that are needed to "flesh out" linguistic code and explicit propositional code. It is widely acknowledged that most of these shallow-level inferences are reliably generated on-line (Frazier & Flores d'Arcais, 1989; Perfetti, 1993; Swinney & Osterhout, 1990), perhaps automatically (McKoon & Ratcliff, 1992). Most of the uncertainty and controversy addresses the status of deeper knowledge-based inferences that presumably are generated during the construction of situation models. It is also beyond the scope of this article to discriminate between those inferences that are automatically versus strategically generated on-line. The distinction between automatic and strategic inferences was central to McKoon and Ratcliff's (1992) *minimalist hypothesis*, but it is not central to the proposed constructionist theory. Instead, the relevant contrast is between on line and off-line inferences while readers *comprehend* text.

A greater appreciation of the constructionist theory is achieved when it is contrasted with alternative hypotheses, models, and theories. Therefore, in this article, we compare the predictions of the constructionist theory with the predictions of alternative theoretical frameworks: an explicit textbase position, a minimalist hypothesis, a current-state selection (CSS) strategy, a prediction–substantiation model, and a promiscuous inference generation position. The fact that these frameworks furnish different predictions about the on-line status of inferences supports the claim that the constructionist theory offers nontrivial predictions.

A second major goal of this article is to review the empirical evidence that tests the proposed constructionist theory and alternative theoretical frameworks. As it turns out, the fact that we are investigating knowledge-based inferences has some critical methodological consequences. In particular, a satisfactory empirical test of these models must ensure that the readers have adequate world knowledge to generate the inferences. We therefore advocate a *three-pronged method* (Magliano & Graesser, 1991; Suh & Trabasso, 1993; Trabasso & Suh, 1993) that coordinates (a) the collection of verbal protocols that expose candidate inferences, (b) the articulation of alternative theoretical frameworks concerning inference generation, and (c) the collection of time-based behavioral measures that test [illegible] inferences [illegible]

reads text, sentence by sentence. If an inference is exposed by these verbal protocols, then there is some assurance that the readers have adequate background knowledge to make the inference.

In this article, we do not articulate the constructionist theory to the point of covering all levels of language processing and of furnishing a detailed processing trace of the construction of inferences. In principle, the constructionist theory could be integrated with more comprehensive psychological models of text processing, such as Kintsch's construction–integration model (Kintsch, 1988), Just and Carpenter's READER model (1992), or Gernsbacher's structure-building framework (Gernsbacher, 1990). In principle, we also could present a detailed processing model that traces the construction of particular inferences on the basis of the text, relevant world knowledge structures, and the reader's goals (see Graesser & Clark, 1985, for one attempt). Although it is beyond the scope of this article to furnish this level of detail, the key components of a processing mechanism are described in sufficient detail to show how it narrows down the set of potential knowledge-based inferences.

Comprehension and Knowledge-based Inferences

It is important to clarify what we mean by "comprehension" and "knowledge-based inferences" because they are central ideas in the constructionist theory. As mentioned earlier, the constructionist theory is applicable only in cases when the reader attempts to comprehend the meaning of a text. All bets are off when, for example, the reader is merely proofreading the text for spelling errors or the reader is scanning the text for a particular word. As mentioned earlier, the constructionist theory makes predictions about those knowledge-based inferences that participate in the construction of a situation model. The distinctive properties of the theory are not pitched at the shallow-level inferences that are needed to construct syntactic code, propositional code, and the explicit textbase.

What Does It Mean to Comprehend?

Comprehension has traditionally been one of the elusive, controversial constructs in cognitive science (Kintsch, 1980; Schank, 1986; Weizenbaum, 1976; Winograd & Flores, 1986). It is perhaps impossible to propose a definition that is complete and that would be accepted by all researchers in all disciplines. Everyone agrees that comprehension consists of the construction of multi-level representations of texts. Everyone agrees that comprehension improves when the reader has adequate background knowledge to assimilate the text, but what else exists or occurs when comprehension succeeds? How does a researcher determine whether a computer really understands a text or whether one person really understands another person?

Comprehension improves to the extent that the reader constructs more levels

> The truck driver saw the policeman hold up his hand. The truck driver's vehicle stopped, but a car rear-ended the truck driver.

The *textbase* level of representation would include a propositional description of the explicit text (Kintsch, 1992; Kintsch & van Dijk, 1978). For example, the first sentence would have the following propositional representation:

> PROPOSITION 1: saw (truck driver, PROPOSITION 2)
> PROPOSITION 2: hold-up (policeman, hand)

Each proposition has a predicate (i.e., verb, adjective, or connective) and one or more arguments (i.e., noun or embedded proposition). The textbase level would also connect the explicit sentences by argument overlap. The first sentence would be connected to the second sentence by the overlapping argument "truck driver."

The textbase provides a shallow representation of the explicit text but does not go the distance in capturing the deeper meaning of the text. Deeper meaning is achieved by computing a *referential* specification for each noun. For example, he car would rear-end the vehicle of the truck driver rather than the body of the truck driver. Deeper comprehension is achieved when the reader constructs *causes and motives* that explain why events and actions occurred. Readers would infer that an abrupt stop of the truck caused the car to rear-end the truck, even though the text never states that there was an abrupt stop. The reader would infer that the truck driver had the goal of stopping the truck and performed some intentional action to stop it, even though this was never explicitly stated. Deeper comprehension is achieved when the reader infers the *global message*, or *point*, of the text, such as "accidents occur even when people follow society's rules." However, this level of representation may be difficult to construct without the pragmatic context of the text, such as who wrote the text, why it was written, who read the text, and why it was read. Nevertheless, according to our definition of comprehension, readers attempt to construct representations at all of these levels.

A definition of comprehension is incomplete without a principled way of determining what content to elaborate at the various levels. The proposed constructionist theory was indeed developed to provide a more discriminating specification of content elaboration. Most readers would not normally construct a detailed description of the subplan that the truck driver executed to stop the truck (e.g., he moved his foot to the brake pedal, he pumped the brake, he calculated the distance between the truck and the policeman). These details would normally be omitted from the constructed representation. Yet it might be important to construct these details when the reader is an insurance agent trying to settle an insurance claim for the accident. Thus, the goals of the reader and the pragmatic context of the message must also be considered. It is widely acknowledged that it is not sufficient to build a theory of comprehension on the basis of the text alone.

Some researchers have enriched the definition of comprehension by adopting a "systemic" perspective that

coherence of the text; comprehension succeeds when there is harmony among explicit ideas within the text (Britton & Eisenhart, 1993). A second sense of harmony addresses the compatibility among the three major components of a communication system: the author, the text, and the reader (Britton & Gülgöz, 1991; Rosenblatt, 1978; Tierney & Shanahan, 1991). That is, comprehension succeeds to the extent that there is harmony among three representations: (a) the author's intended meaning of the text, (b) the explicit text, and (c) the reader's constructed meaning of the text. Writers compose the content and wording of text in service of their communication goals, whereas readers attempt to recover the writers' goals during comprehension. Comprehension breaks down to the extent that there is discord among the author's intended meaning, the explicit text, and the reader's constructed meaning. Inconsiderate text is incoherent and underspecified, so it fails to deliver a successful transmission of information from author to reader.

There are several important benefits when comprehension succeeds. The reader draws inferences that are relevant and correct. The reader asks good questions that tap potential knowledge gaps, anomalies, and contradictions. The reader's answers to questions are relevant, correct, and informative. The reader can paraphrase the message and generate good summaries. In fact, inference generation, question asking, question answering, paraphrasing, and summary generation have traditionally been the litmus tests of whether computers can understand text in the field of artificial intelligence (Kass, 1992; Lehnert, Dyer, Johnson, Young, & Harley, 1983; Schank & Abelson, 1977). When comprehension succeeds, the reader is able to detect whether an incoming statement in the text involves a contradiction, anomaly, or irrelevancy with respect to the earlier information (Glenberg, Wilkinson & Epstein, 1982; Graesser & McMahen, 1993; Markman, 1979; Otero & Kintsch, 1992). However, sometimes comprehension does not succeed and the reader settles for a simplistic, shallow representation of the text. A reader may have the illusion of successful comprehension even though the reader's simplistic representation fails to capture all of the explicit text and the depth of the material (Glenberg & Epstein, 1987; Weaver, 1990).

What is a Knowledge-based Inference?

The purpose of this section is to delimit the classes of inferences that our constructionist theory addresses rather than to offer a complete and perfectly accurate taxonomy of inferences. Researchers in psycholinguistics and discourse processing have proposed several taxonomies of inferences (Clark, 1977; Graesser & Kreuz, 1993; Harris & Monaco, 1978; Kintsch, 1993; Magliano & Graesser, 1991; Nicholas & Trabasso, 1981; Reiger, 1975; Singer, 1988), but a consensus has hardly emerged.

Knowledge-based inferences are constructed when background knowledge structures in long-term memory (LTM) are activated, and a subset of this information is encoded in the meaning representation of the text. The meaning rep-

(Kintsch, 1988, 1992, 1993; Kintsch, Welsch, Schmalhofer, & Zimny, 1990; Schmalhofer & Glavanov, 1986; van Dijk & Kintsch, 1983). The background knowledge consists of specific and generic knowledge structures that are relevant to the text. The specific knowledge structures include memory representations of particular experiences, of other texts, and of previous excerpts within the same text. The generic knowledge structures include schemata (J. M. Mandler, 1984; Rumelhart & Ortony, 1977), scripts (Bower, Black, & Turner, 1979; Schank & Abelson, 1977), frames (Minsky, 1975), stereotypes (Wyer & Gordon, 1984), and other structured packets of generic knowledge. Most background knowledge structures are meaningful and contextually rich. That is, they are grounded in experience, with content organized by meaningful relations, for example, a script of eating at a restaurant. These rich structures furnish much of the content needed to interpret, explain, predict, and understand narrative events. However, other background knowledge structures are abstract and decontextualized, such as the schema for the thetorical format of a fairy tale (J. M. Mandler, 1984; Stein & Glenn, 1979). Background knowledge structures (either specific or generic) are activated through pattern recognition processes by explicit content words, combinations of content words, and interpreted text constituents. When a background knowledge structure is very familiar and therefore overlearned, much of its content is automatically activated in working memory (WM) at very little cost to the processing resources in WM (Graesser & Clark, 1985; Kintsch, 1988, 1993).

When a knowledge-based inference is directly inherited or copied from a background knowledge structure, the process of incorporating it into the meaning representation of the text imposes small or intermediate costs to WM. However, sometimes a novel knowledge-based inference is constructed. A novel inference is a product of several incremental, cognitive cycles of searching memory and accumulating information from multiple information sources (Just & Carpenter, 1992). The precise mechanisms of constructing these novel knowledge-based inferences are not well understood, although several researchers have offered speculations (Graesser & Clark, 1985; Graesser & Zwaan, in press; Johnson-Laird, 1983; Schank & Abelson, 1977; Wilensky, 1983). These novel knowledge-based inferences are believed to place more burdens on WM. A potential inference has a lower likelihood of being generated online to the extent that its generation imposes greater demands on WM.

Examples of knowledge-based inferences are presented in the context of the following parable by Ambrose Bierce, entitled "How Leisure Came."

> A Man to Whom Time was Money, and who was bolting his breakfast in order to catch a train, had leaned his newspaper against the sugar bowl and was reading as he ate. In his haste and abstraction he stuck a pickle-fork into his right eye, and on removing the fork the eye came with it. In buying spectacles the needless outlay for the right lens soon reduced him to poverty, and the Man to Whom Time was Money had to sustain life by fishing from the end of the wharf.

Inferences relevant to "How Leisure Came"

nference	Brief description	Text that elicits inference	Inferences
Referential	A word or phrase is referentially tied to a previous element or constituent in the text (explicit or inferred).	". . .on removing the *fork* the eye came with *it*"	Fork is the referent for it.
Case structure ssignment	An explicit noun phrase is assigned to a particular case structure role, e.g., agent, recipient, object, location, time.	"the man leaned his newspaper against the sugarbowl"	Against the sugarbowl is assigned to a location role.
: Causal :edent	The inference is on a causal chain (bridge) between the current explicit action, event, or state and the previous passage context.	"In his haste and abstraction he stuck a pickle fork into his right eye. . ."	The man was careless and mis-aimed his fork.
.: Superordinate	The inference is a goal that motivates an agent's intentional action.	"A Man to Whom Time was Money, and who was bolting his breakfast in order to catch a train. . ."	The man wanted to get to work and earn money.
5: Thematic	This is a main point or moral of the text.	The entire passage	Haste makes waste.
6: Character tional reaction	The inference is an emotion experienced by a character, caused by or in response to an event or action.	". . .the needless outlay reduced him to poverty"	The man became sad.
7: Causal sequence	The inference is on a forecasted causal chain, including physical events and new plans of agents. These inferences do not include the character emotions in class 6.	". . .on removing the fork the eye came with it"	The man became blind in his right eye.

8: Instantiation noun category	The inference is a subcategory or a particular exemplar that instantiates an explicit noun or an implicit case role that is required by the verb.	". . .breakfast. . ."	Bacon and eggs.
9: Instrument	The inference is an object, part of the body, or resource used when an agent executes an intentional action.	". . .the Man to Whom Time was Money had to sustain life by fishing from the end of a wharf"	The man used a rod and reel (to fish).
10: Subordinate al–action	The inference is a goal, plan, or action that specifies how an agent's action is achieved.	". . .who was bolting his breakfast"	The man grasped his fork and moved it toward his mouth.
11: State	The inference is an ongoing state, from the time frame of the text, that is not causally related to the story plot. The states include an agent's traits, knowledge, and beliefs; the properties of objects and concepts; and the spatial location of entities.	". . .the Man to Whom Time was Money had to sustain life by fishing from the end of a wharf"	Fishermen are poor; the city has a wharf.
12: Emotion of der	The inference is the emotion that the reader experiences when reading a text.	". . .on removing the fork the eye came with it"	The reader is disgusted.
13: Author's nt	The inference is the author's attitude or motive in writing.	The entire passage	Bierce wants to lambaste workaholics.

of the inference and its relation to the explicit text. These classes do not exhaust all of the potential inferences during comprehension, but they do provide an initial foundation for discussing the constructionist theory.

The order in which the inference classes are listed in Table 1 is not altogether arbitrary. Inference classes 1, 2, and 3 are needed to establish local coherence, whereas inference classes 3 and 4 are critical for establishing explanations. Classes 4, 5, and 6 are important for establishing global coherence. Classes 7 through 11 are elaborative inferences that are not needed for establishing coherent explanatory meaning representations. Classes 12 and 13 address the pragmatic communicative exchange between reader and author. The order of listing the inference classes is weakly correlated with the amount of attention that the inference classes have received in the psychological literature. Referential inferences (class 1) have received the most attention, whereas inferences about author intent and attitude (class 13) have received the least attention. The local inferences that are elicited by one or two sentences have received more attention than the global inferences. Inferences that are elicited from rich textual cues have received more attention than inferences that are remotely derived from the text by virtue of background knowledge structures.

The researchers' preferences in the selection of inferences to investigate can be attributed both to methodology and to theory. The most familiar and defensible research methods in experimental psychology carefully manipulate stimulus texts, so there is a preference for investigating local text-bound inferences. Early theories in psycholinguistics, text linguistics, and reading focused on inferences that were derived symbolically from explicit linguistic elements (Brady & Berwick, 1983; Brown & Yule, 1983; Katz & Fodor, 1963; Kempson, 1977). These inferences were derived by rules, meaning postulates, and compositional analyses that stripped away most of world knowledge. It is very tedious and difficult to specify the numerous knowledge structures associated with text, so theorists and empirical researchers have normally avoided a systematic analysis of world knowledge. Nevertheless, a mature theory of inference generation would need to analyze world knowledge in detail. Consequently, some researchers have pursued rather ambitious projects that map out the world knowledge structures that participate in text comprehension (Alterman, 1985; Dahlgren, 1988; Graesser & Clark, 1985; Mannes & Kintsch, 1991; Schank & Abelson, 1977). Clearly, it is important not to confuse the likelihood that a class of inferences is generated on-line and the amount of attention that the class of inferences has received in the scientific literature.

There is an important distinction between *text-connecting* inferences and *extratextual* inferences (Graesser & Bower, 1990; Singer & Ferreira, 1983; Trabasso & Suh, 1993). In the case of a text-connecting inference, the current clause being comprehended is related to a previous explicit statement in the text; the previous statement is reinstated (i.e., activated or reactivated) and is inferentially linked to the current clause. The referential inferences (class 1 in Table 1) are always text-connecting inferences. In the case of extratextual inferences, the inference is copied or derived from generic and specific knowledge structures that are

The taxonomy in Table 1 does not include some classes of inferences that normally are difficult to generate and are therefore off-line. First, there are logic-based inferences, which are derived from systems of domain-independent formal reasoning, such as prepositional calculus, predicate calculus, and theorem proving (Newell & Simon, 1972; Rips, 1990). Second, there are quantitative inferences and statistical inferences that are products of complex formulae and mathematical procedures (Kahneman, Slovic, & Tversky, 1982). These inferences are usually a struggle to generate (Bruner, 1986; Graesser & Clark, 1985; Kintsch, 1993; Schank, 1986), as everyone who has attempted to solve analytical brain teasers and algebra word problems knows. Of course, this does not mean that these inferences are never generated during the comprehension of narrative text (Lea, O'Brien, Fisch, Noveck, & Braine, 1990).

For the convenience of communication, we consider whether each class of inferences is in one of two discrete states: on-line versus off-line. However, there undoubtedly is a probabilistic continuum between on-line and off-line. The continuum can be attributed to fluctuations in reader abilities, reader goals, text materials, samples of inferences, experimental tasks, and so on. The continuum can also be explained by the theoretical possibility that inferences are encoded to some degree rather than all-or-none (Gernsbacher, 1990; Kintsch, 1988; McKoon & Ratcliff, 1992; Sharkey & Sharkey, 1992). The degree to which an inference is encoded might be strengthened or attenuated as more information is received. Technically speaking, when we claim that a class of inferences is generated on-line, our intention is to convey that it has a substantially higher strength of encoding or higher likelihood of being generated than the contrast classes of inferences that are off-line. A full-blown theory would account for likelihood of generation, the strength of encoding, the time-course of generation, and the exact locus of generation (within the text) for each class of inference.

A Constructionist Theory of Inference Generation

As discussed earlier, the proposed constructionist theory emphasizes Bartlett's (1932) principle of search (or effort) after meaning. This principle embraces the reader goal assumption, the coherence assumption, and the explanation assumption. We elaborate on these distinctive characteristics of the constructionist theory in this section. In addition to these distinctive characteristics, the theory adopts some components, assumptions, and predictions that are widely accepted by psychological researchers in discourse processing (Gernsbacher, 1990; Just & Carpenter, 1992; Kintsch, 1988; Sanford & Garrod, 1981; Singer, 1990; van Dijk & Kintsch, 1983). These uncontroversial assumptions are succinctly enumerated in this section before turning to the theory's distinctive characteristics.

Uncontroversial Components and Assumptions

relevant *background knowledge structures* (both specific and generic), and the *pragmatic context* of the message (i.e., the author, reader, setting, and purpose of the exchange).

2. *Levels of cognitive representation.* Following Kintsch and his colleagues (Kintsch, 1988, 1992; van Dijk & Kintsch, 1983), three levels of code are constructed as a result of comprehension: the *surface code* (i.e., the exact wording and syntax), the *textbase* (explicit text propositions plus inferences needed for text cohesion), and the *situation model.*

3. *Memory stores.* There are three memory stores: *short-term memory* (STM; which holds the most recent clause), *working memory* (WM; which holds approximately the last two sentences, plus information that is actively recycled in WM), and *long-term memory* (LTM). It should be noted that some models do not distinguish between STM and WM.

4. *Discourse focus.* Attention may be focused on any of the three levels of cognitive representation (see assumption 2). From the standpoint of the situation model, the discourse focus is analogous to a mental camera that scans across the scenario and zooms in on particular characters, actions, events, spatial regions, and hot spots (Bower, 1989).

5. *Convergence and constraint satisfaction.* Both the explicit information and inferences receive more strength of encoding to the extent that they are activated by several information sources (i.e., there is convergence), and they satisfy the conceptual constraints imposed by the various information sources (Golden & Rumelhart, 1991; Graesser & Clark, 1985; Kintsch, 1988; Mannes & Kintsch, 1991; Sharkey & Sharkey, 1992; St. John, 1991).

6. *Repetition and automaticity.* Repetition increases the speed of accessing knowledge structures and the elements within a knowledge structure. In the case of an automatized package of knowledge (e.g., a familiar generic knowledge structure), the content is wholistically accessed and activated at little cost to the processing resources in WM.

Distinctive Components and Assumptions of the Theory

The proposed constructionist theory embraces the search-after-meaning principle (Bartlett, 1932; Berlyne, 1949; Spiro, 1980; Stein & Trabasso, 1985). At a general level, this search-after-meaning principle asserts that comprehenders attempt to construct meaning out of text, social interactions, and perceptual input. The principle has three assumptions that empower the constructionist theory with distinctive predictions: (7) satisfaction of reader goals, (8) achievement of both local and global coherence, and (9) explanation of explicit information.

It is important to emphasize that the search-after-meaning principle is an effort, not necessarily an achievement. In most reading contexts, the fruits of these efforts are realized because writers–authors construct messages to be understood. However, there are conditions that prevent the reader from constructing a meaning representation that provides coherence, that explains the explicit text, and that satisfies the reader's goals. If the reader fails to devote any effort, then these

insufficient time for comprehension. A globally coherent message is not constructed if the text is choppy, incoherent, and pointless. An explanation may not be generated when there is a random sequence of events or a puzzling sequence of propositions that satisfy a researcher's counterbalancing constraints. Inferences are not constructed without the prerequisite background knowledge structures.

7. *Satisfaction of reader goals.* When readers comprehend a text, they are motivated by one or more goals. In some contexts, the goals are ill defined and general. This is the case when an adult reads the morning newspaper to become informed about current events and when a person reads a novel to be entertained. The reader must understand the meaning of the text under these conditions. In other contexts, the reader's goals are specific. This is the case when a reader tries to determine whether it is a good time to invest some money in the stock market (while reading a newspaper) and when a reader tries to form a mental picture of what a character looks like (while reading a novel). According to the reader goal assumption, readers are persistent in their attempts to satisfy their goals and therefore will construct inferences that address these goals.

We distinguish among three levels of goal specificity: default, genre-based, and idiosyncratic. At the first, most undifferentiated, level, the reader's goal is to construct a meaningful situation model that is compatible with the text. This level is the least constrained and is regarded as the default level.

At the next level, there are goals associated with the genre of the text. Readers of fictive narrative have the goal of being entertained in some fashion (e.g., excited, enthralled, amused, or frightened), whereas readers of expository text have the goal of being informed about events and facts in the real world (Brewer, 1980; Kintsch, 1980; Pearson & Fielding, 1991; Zwaan, 1993). Brewer (1980) has contrasted four "discourse forms" that reflect different goals of reading text: to entertain, to persuade, to inform, and to have an aesthetic–literary impact. Zwaan's (1993) experiments on reading and memory have demonstrated that substantially different information is extracted from a text when it is called a newspaper article versus a literary story.

The final level of goal specificity involves idiosyncratic reader goals. These goals may lead the reader to construct virtually any type of code (i.e., surface or textbase vs. situation model) and virtually any dimension of the situation model (e.g., spatiality, causality, plans, or traits of characters). An adequate account of idiosyncratic goals would need to incorporate a general theory of human motivation, which is quite outside the boundaries of our constructionist theory. The constructionist theory offers a priori predictions about inference generation in the context of default goals and genre-specific goals, whereas its predictions are ad hoc in the context of idiosyncratic goals. The ad hoc prediction is that inferences are generated if they are directly relevant to the idiosyncratic goals.

Reader goals must be carefully analyzed in the experiments conducted by researchers in discourse processing. The task demands constrain the goals that readers adopt and therefore the inferences that they construct. Readers may not generate deep inferences, for example, if the tests, materials, and tasks only require shallow

For example, suppose that an experiment is conducted in which the reader's task is to recognize whether character A or B is activated by a pronoun *she*. Suppose further that the words are presented very quickly (250 ms per word), and the reader is asked to recognize which of two words had been presented, as quickly as possible (namely, character A vs. B after presenting *she*). Shallow processing is sufficient to complete this task because (a) the task merely involves the recognition of explicit text, (b) the material is quickly presented, (c) shallow processing is satisfactory for performance, and (d) the recognition test requires the discrimination of only two characters. The reader might adopt an artificial reading strategy that is similar to monitoring a list of unrelated items. The reader might be frustrated from having the normal comprehension goal of constructing a meaningful situation model. in contrast, a meaningful situation model would be constructed in a task that allows readers to read at their normal pace and that tests them on deep inferences relevant to the situation model.

8. *Local and global coherence.* The comprehender attempts to build a meaning representation that establishes local and global coherence among the events, actions, and states in the text. Once again, this does not mean that a coherent representation is necessarily achieved at all levels, however. If the reader believes that the text is not considerate and lacks global coherence, then the comprehender settles for local coherence. If the reader believes that the text lacks local coherence, then the reader regards the text as incoherent. Stated differently, the reader attempts to construct the most global meaning representation that can be managed on the basis of the text and the reader's background knowledge structures. A globally coherent cognitive representation is successfully achieved when the following conditions are met: (a) the textual features support global coherence, (b) the reader has the prerequisite background knowledge, and (c) the reader does not have a specific goal that prevents understanding of the material. When there is a breakdown in one or more of these conditions, the reader settles for local coherence or gives up trying to achieve any coherence at all.

Coherence is achieved to the extent that elements and constituents in a text are conceptually connected by virtue of background knowledge structures, the constructed situation model, linguistic features of the text, or all three. There is an imprecise but important distinction between local and global coherence. Local coherence is achieved when conceptual connections relate the content of adjacent text constituents (i.e., a phrase, proposition, or clause) or short sequences of constituents. For example, in the story "How Leisure Came," there is a causal connection between the "man's haste and abstraction" and the event "he stuck a pickle fork into his right eye." Global coherence is achieved to the extent that most or all of the constituents can be linked together by one or more overarching themes. For example, the theme "haste makes waste" ties together most of the content of "How Leisure Came."

Features of the explicit text have a prominent role in the construction of local coherence (de Beaugrande, 1980; Halliday & Hasan, 1976; Kintsch & van Dijk, 1978; Mann & Thompson, 1986). In fact, the term *cohesion* is sometimes reserved for local connections that are based entirely or primarily on linguistic

knowledge. Referential cohesion is established, for example, when an explicit noun in a sentence is connected referentially to a previous noun phrase or proposition in the text. Another example of cohesion is when a connective (e.g., *because, so, and, therefore*) explicitly links adjacent clauses with a particular type of conceptual relation.

Nevertheless, features of language and the explicit text do not go the distance in establishing local coherence. Sometimes readers need to infer the relations between constituents. The classes of inferences that are important for establishing local coherence are referential inferences (class 1 in Table 1), case structure role assignments (class 2), and those causal antecedent inferences (class 3) that connect adjacent constituents. There is substantial evidence that the process of inferring these relations increases comprehension time (Bloom, Fletcher, van den Broek, Reitz, & Shapiro, 1990; Haberlandt & Bingham, 1978; Keenan, Baillet, & Brown, 1984; Myers, 1990; Myers, Shinjo, & Duffy, 1987; Singer, 1990).

The establishment of global coherence involves the organization of local chunks of information into higher order chunks. For example, a moral, main point, or theme of a text (class 5 in Table 1) organizes many of the events and episodes in narrative. A higher order chunk has its tentacles attached to constituents that span large stretches of text. As a consequence, readers sometimes need to link an incoming constituent to an excerpt much earlier in the text; the earlier excerpt is in LTM but no longer in WM. In these situations, reinstatement searches are executed to fetch the earlier text and to place it in WM. These reinstatement searches take additional processing time (Bloom et al., 1990; Dopkins, Klin, & Myers, 1993; Fletcher & Bloom, 1988; Kintsch & van Dijk, 1978; Singer, 1990, 1993; Suh & Trabasso, 1993; van den Broek & Lorch, 1993).

Detailed analyses of global coherence are available in several fields: text linguistics (Grimes, 1975; Halliday & Hasan, 1976), artificial intelligence (Dyer, 1983; Hobbs, 1979; Lehnert, 1981), education (Meyer, 1985), and cognitive psychology (J. M. Mandler, 1984; van Dijk & Kintsch, 1983). Some global structures are contextually specific and detailed, such as a script for eating at a restaurant (Schank & Abelson, 1977). Others are abstract frames. In one type of REVENGE structure, for example, characters A and B have a positive bond, character C harms B for unjustifiable reasons, and subsequently character A harms character C. Readers infer these global structures and thereby construct thematic inferences (class 5 in Table 1). Unfortunately, there have been very few empirical tests of whether these inferences are generated on-line (Seifert, McKoon, Abelson, & Ratcliff, 1986).

Although it is beyond the scope of this article to provide a detailed account of the representation and processing assumptions of the constructionist theory, it is worthwhile to point out briefly how coherence could be achieved computationally. Coherent representations have traditionally been expressed in a symbolic form and have been constructed by procedures that manipulate symbols (Dyer, 1983; Fletcher, 1986; Golden & Rumelhart, 1991; Graesser & Clark, 1985; Kintsch & van Dijk, 1978; Lehnert, 1981; Trabasso, van den Broek, & Suh, 1989;

of nodes (i.e., nouns, states, events, or goals) that are connected by relational arcs of different categories. The global structures have either been tree hierarchies or nonhierarchical networks. The process of constructing the coherent representations during comprehension has normally consisted of recursive transition networks or production systems (Allen, 1987; Anderson, 1983; Just & Carpenter, 1992).

More recently, researchers have adopted connectionist architectures for computing coherence (Britton & Eisenhart, 1993; Holyoak & Thagard, 1989; Kintsch, 1988; Read & Marcus-Newhall, 1993; Rumelhart & McClelland, 1986). In Kintsch's (1988) construction–integration model, for example, all N nodes in the total node space (involving the textbase, situation model, and background knowledge) are connected with one another in an $N \times N$ connectivity matrix. Each connection between two nodes is assigned a positive excitatory weight, a negative inhibitory weight, or a zero weight. As each constituent in the text is interpreted, the activation values of the nodes in the node space are modified by a spreading activation process through the node space, as stipulated by the connectivity matrix; a parallel constraint satisfaction process settles on activation values for the nodes by converging on the best compromise of the constraints imposed by positive, negative, and zero-weight connections. After the last clause in the text is comprehended, each of the N nodes has a final activation value. Those nodes that meet some criterion of activation are included in the final coherent meaning representation, whereas the other nodes are not included.

According to the constructionist theory, a computational model would need to be designed in a manner that ensures that readers make every effort to establish both local and global coherence. In Kintsch's construction–integration model, for example, there would need to be a special set of nodes in the node space and connections in the connectivity matrix that explicitly capture the coherence assumption. Similarly, the model would need to be augmented with a special set of nodes and connections that incorporate the reader goal assumption and the explanation assumption. In other words, the three distinctive assumptions of the constructionist theory do not naturally emerge from the version of the construction–integration model reported in Kintsch (1988).

9. *Explanation.* Comprehenders attempt to explain *why* episodes in the text occur and *why* the author explicitly mentions particular information in the message. Thus, comprehension is typically guided by why-questions rather than other types of questions (e.g., what-happens-next, how, where, or when). There is extensive evidence that causal explanations of actions, events, and states play a central role in our understanding of narrative (Black & Bower, 1980; Bloom et al., 1990; Bower et al., 1979; Fletcher, 1986; Graesser, 1981; Rumelhart, 1975; Schank, 1986; Singer, 1990; Trabasso & Sperry, 1985; Trabasso et al., 1989; van den Brock, 1990). The importance of causal explanations is also bolstered by theories outside of the discourse-processing arena. For example, it is compatible with theories of causal attribution in social psychology (Hastie, 1983; Hilton, 1990; McLaughlin, 1990; Pennington & Hastie, 1986; Read, 1987; Read & Marcus-Newhall, 1993) and with theories of planning and mundane reasoning in artificial

Researchers have analyzed the information that is accessed when individuals answer why-questions (Graesser, 1981; Graesser & Clark, 1985; Graesser & Franklin, 1990; Graesser & Hemphill, 1991; Graesser, Lang, & Roberts, 1991; Graesser, Robertson, & Anderson, 1981; Lehnert, 1978; Schank & Abelson, 1977). Explanations of why involuntary events occur include their causal antecedents and enabling states (class 3 in Table 1). The reasons why characters perform intentional actions include their superordinate goals (class 4) and the causal antecedents that trigger these goals (class 3). Regarding goals, superordinate goals are appropriate answers to why-questions but not subordinate goals and subplans. For example, consider the following question in the context of the "How Leisure Came" story: "Why did the man buy spectacles?" Appropriate answers to this why-question would include the superordinate goal "in order to improve his eyesight" but not the subordinate goal "in order to pay the doctor." Regarding causal chains, causal antecedents are appropriate answers to why-questions but not causal consequences. An appropriate answer to the example question would be the causal antecedent "because his right eye was damaged" but not the causal consequence "because he was reduced to poverty." Therefore, the claim that comprehension is guided by why-questions rather than other types of questions substantially narrows down the set of inferences that readers normally construct.

Comprehenders are particularly sensitive to actions and events in the world, rather than to constancies and ongoing states. This is because changes frequently convey new and interesting information: discrepancies from normal states in the world, violations of normative standards, danger, obstacles to an agent's goals, goal conflicts between agents, methods of repairing planning failures, emotions that are triggered by goal failures, and abnormal occurrences that have adaptive significance to the organism. The comprehender's attention is captured and explanations are sought when there is an abnormal deviation from the homeostatic balance in a physical, social, or psychological system (Berlyne, 1960; Cheng & Holyoak, 1985; Hart & Honore, 1985; Hilton, 1990; Lazarus, 1991; Mackie, 1980; G. Mandler, 1976). States become important only to the extent that they enable actions and events that dynamically unfold. It should be noted that the state inferences in Table 1 (class 11) do not include those states that enable actions and events.

Explicit actions and events are easy to explain when they are motivated or caused by a previous event, action, or state mentioned in the text. Explicit events and states are also easy to explain when they are very typical of the activated scripts and other background knowledge structures. For example, drinking a glass of wine is a very typical action in a BAR script. Such an action is stored in the generic script for BARS and in thousands of specific experiences involving bars. In contrast, the same voluntary action of drinking wine would be more difficult to explain if it could not be causally linked to the previous text and if it was not typical knowledge in the background knowledge structures (such as a person drinking wine in the context of a classroom). There is a coherence break when an incoming clause cannot be readily explained by prior [illegible] ground knowledge [illegible]

in the activated information sources. It takes more time to explain these atypical actions and events (Bower et al., 1979; Hastie, 1983), but this atypical information is more distinctive and discriminable in memory than is the typical information (Bower et al., 1979; Graesser, Gordon, & Sawyer, 1979; Hastie, 1983). If the reader's attempt to explain an incoming clause fails, the reader may wait for the subsequent text to explain it (Stein & Trabasso, 1985).

A pragmatic level of explanation must also he considered when readers comprehend explicit actions, everts, and states in the text. The reader considers why the author would bother mentioning the information conveyed in each explicit clause. Readers normally follow the Gricean postulate that whatever the author expresses is relevant and important (Grice, 1975; Roberts & Kreuz, 1993; Sperber & Wilson, 1986). When static information is presented at the beginning of the novel (e.g., a description of the protagonist's house), the author is presumably supplying a rich setting to anchor the story world. An explicit state might also be intended as a clue that ends up solving a mystery (e.g., there was a red stain on the shirt of a character).

A Processing Model for the Constructionist Theory

We present a processing model at this point to clarify what cognitive mechanisms would be involved in the production of inferences. The processing model would apply to situations where readers are attempting to comprehend considerate narrative text, without any idiosyncratic comprehension goals. We do not present a complete processing model. Instead, we briefly sketch a simple model that captures those inferences that are products of the explanation assumption and global coherence. These inferences are the most distinctive in the sense that they are not predicted to be generated by a number of alternative models of inference generation. Our processing model could be expanded to accommodate idiosyncratic reader goals and the establishment of local coherence; however, the resulting inferences would be generated by most theoretical frameworks and therefore are not particularly controversial.

Our processing model is built on the computational platform of Just and Carpenter's READER model (1992). There is a set of production rules that scan and operate on the contents of WM at each comprehension cycle, as text is comprehended online. The grain size of the comprehension cycle is defined as an explicit action, event, goal, or state in the discourse focus. A production rule has an "IF(condition, cognitive processes)" composition. If the specified conditions are met, then the cognitive processes are executed; if the conditions are not met, then the processes are not executed. All of the production rules are evaluated and executed in parallel, as is assumed in the READER model. The production rules are "soft" rules rather than "hard," brittle rules. That is, a condition is satisfied when there is a configuration of WM content that meets or exceeds some activation threshold; when cognitive processes are executed, the activation values of WM content are modified.

The READER model assumes that there is a limited supply of processing

precise upper bound in the capacity limitations. However, a few points need to be made about the amount of resources that are consumed by particular cognitive processes. According to the model, the process of accessing and utilizing generic information sources places very little demand on WM because this information is overlearned and automatized (see assumption 6). Access to generic information in LTM is very quick and executed in a parallel, rather than a serial, fashion. Access to specific information sources in LTM is accomplished more slowly (in parallel); the utilization of content within a specific information source is comparatively time consuming, at times in a serial fashion, and places more demands on WM. Therefore, it takes a noticeable amount of time to reinstate information that appeared much earlier in the text being read, after the information exits WM. Comprehension processes, including inference generation, slow down to the extent that the demands on WM approach the upper bound of capacity limitations. When the demands on WM exceed the upper bound, there is a catastrophic deterioration of comprehension, and few inferences are constructed. It should be noted, once again, that these assumptions are compatible with the basic processing mechanism of Just and Carpenter's (1992) READER model.

In Table 2, we present six production rules that implement the explanation assumption and the global coherence assumption. For each rule, there is a specification of the condition element, a succinct description of the cognitive processes and an elaborated description of these processes. The condition element for rules A, B, C, and D declares the type of statement in the discourse focus (i.e., action, goal or state vs. event) that "fires" the production rule. For rules E and F, the rule is fired when particular content in WM has an activation level that reaches some threshold. When a production rule is fired, various cognitive processes are executed: (a) searching for information sources in LTM and WM, (b) searching for information within information sources, (c) increasing the activation value of content in WM, and (d) verifying whether potential inferences are compatible with constraints of the WM content that is highly active. All six production rules are evaluated and possibly fired at each comprehension cycle, as text is comprehended on-line, statement by statement.

Production rules A, B, C, and F handle the explanation-based inferences. These inferences are needed to explain *why* characters perform actions, *why* events occur, and *why* information is explicitly stated in the text. Production rule A generates superordinate goals (i.e., motives) of character actions and goals. Production rule B generates causal antecedents of actions, goals, and events. Production rule C generates inferences that explain why statements are explicitly mentioned in the text. According to production rule F, these inferences are encoded in the situation model if their activation values meet some threshold.

All six production rules are needed to establish global coherence. According to production rule E, global plot structures are activated when WM contains a particular configurat on of actions, goals, events, states, and emotions. Some of this WM content was established by explicit text and some by inferences: goal inferences through rule A, action/event/state inferences through rule B and emotional reactions of characters

le 2: Production rules of the constructionist theory that model the process of explanation and establishing global coherence

luction	Condition	Succinct description of cognitive processes	Elaborated description of cognitive processes
A	Explicit statement in the discourse focus is an intentional action (A) or goal (G) of a character.	Explain why the character performed action A or has goal G.	1. Search information sources in WM and LTM for plausible superordinate goals of A or G. 2. Increase the activation of superordinate goals in WM to the extent that (a) they are in multiple information sources and (b) they are compatible with the constraints of WM content that meet some threshold of activation.
B	Explicit statement in the discourse focus is an intentional action (A), a goal (G), or an event (E).	Explain why the character performed action A, why the character has goal G, or why event E occurred.	1. Search information sources in WM and LTM for plausible causal antecedents of A, G, or E. 2. Increase the activation of the causal antecedents in WM to the extent that (a) they are in multiple information sources and (b) they are compatible with the constraints of WM content that meet some threshold of activation.
C	Any explicit statement (S) in the discourse focus.	Explain why the writer mentions S.	1. Search text genre schemas in LTM that would accommodate S. 2. Increase the activation of the genre schema to the extent that it is compatible with the constraints of S and with WM content that meets some threshold of activation.
	Explicit statement in the discourse focus is an intentional action (A) or an event (E).	Track the emotional reactions of characters.	1. Search information sources in WM and LTM for salient emotional reactions of characters to A or E. 2. Increase the activation of the emotional reactions in WM to the extent that (a) they are in multiple information sources and (b) they are compatible with the constraints of WM content that meet some threshold of activation.
	WM contains a particular configuration (C) of goals, actions, events, emotions, and/or states that meet some threshold of activation.	Create global structures.	1. Search for information sources in LTM that match configuration C. 2. Increase the activation of the information source in WM to the extent that it is compatible with the constraints of WM content that meet some activation threshold.
	An implicit statement or structure in WM meets some activation threshold.	Construct inferences that receive high activation in WM.	The implicit statement or structure is constructed as an inference in the situation model.

M = working memory; LTM = long-term memory.

Production rule C generates genre schemata, such as a schema for a mystery story, or a schema for a joke. Once again, a genre schema ends up being encoded if its activation value in WM managers to meet some threshold.

The six production rules implement the reader's active comprehension strategies when reading narrative text. As we discuss later, other models of inference generation do not postulate this ensemble of production rules. For example, McKoon and Ratcliff's (1992) minimalist hypothesis does not highlight these classes of inferences as being important for text comprehension. Except for the causal antecedent inferences, all elaborative inferences have an equivalent status in the minimalist hypothesis, namely that they are not consistently made during comprehension. If we were to implement the minimalist hypothesis in the form of a production system model, then the only production rules would be B and F. However, even rule B would need to be modified because the minimalist hypothesis states that causal antecedent inferences are made only under two conditions: (a) when the inference establishes local text coherence or (b) when there is a break in local text coherence that prompts a strategic search for causal antecedents (in the prior text or other information sources). The condition element of the production rules would need to be tuned to these discriminations. Unlike the minimalist hypothesis, the constructionist model always searches generic and specific information sources for causal antecedents of explicit events, actions, and goals; the search occurs regardless of whether or not there is a break in local text coherence. In summary, alternative models of inference generation would not have exactly the same set of production rules and the condition elements would not be tuned in exactly the same way. In a subsequent section, we examine assumptions and predictions of some alternative models.

Predictions of the Constructionist Theory

The constructionist theory makes distinctive predictions about which classes of inferences are likely to be generated on-line during the comprehension of narrative text. As discussed earlier, there undoubtedly is a continuum between on-line and off-line, but we assume a discrete demarcation for ease of communication.

In many contexts, readers have a general goal of reading a coherent text for understanding or for entertainment (rather than an idiosyncratic goal). The default or genre-based level of goal specificity would apply, as discussed earlier, and the predictions of the constructionist theory are clear-cut. The theory predicts that the following classes of inferences are ger crated online: referential (class 1), case structure role assignment (class 2), causal antecedent (class 3), superordinate goal (class 4), thematic (class 5), and character's emotion reaction (class 6). The referential, case structure, and causal antecedent inferences (classes 1, 2, and 3) are needed to establish local coherence in the text. The inferences that assign case structure roles to explicit noun phrases and prepositional phrases establish local coherence within a clause. The referential infereness and causal antecedent inferences are prevalent when establishing local coherence between clauses. The causal antecedent and superordinate goal inferences (classes 3 and 4, respectively)

intentional actions. Thematic inferences (class 5) are generated during the establishment of global coherence. The emotional reactions of characters (class 6) and the superordinate goals (class 4) also play a prominent role in global plot configurations of stories (Dyer, 1983; Lehnert, 1981; Stein & Levine, 1991) and are therefore needed for the establishment of global coherence. Interesting story plots involve goal conflicts and salient emotional reactions of characters to episodes in the story world.

The constructionist theory predicts that several classes of "elaborative" inferences in Table 1 are not normally generated on-line: causal consequences (class 7), instantiations of noun categories (class 8), instruments (class 9), subordinate goals/actions (class 10), and states (class 11). These inferences are not needed to construct a coherent explanation of the explicit content in the narrative so they have a lower likelihood of being generated on-line.

An elaborative inference in one of the above five classes might be constructed on-line by virtue of convergence and constraint satisfaction (see assumption 5). This occurs when an inference receives a high strength of activation from multiple information sources, and it satisfies the constraints from multiple information sources. It is important to point out that there are theoretical and empirical criteria for identifying these elaborative inferences that are products of convergence and constraint satisfaction (Graesser & Clark, 1985; Kintsch, 1988; Mannes & Kintsch, 1991). Therefore, the predictions of the constructionist theory remain tractable.

As a case in point, causal consequence inferences are normally not constructed on-line according to the constructionist theory. That is, readers do not forecast a hypothetical plot that involves new plans of agents and long event chains into the future. According to the constructionist theory, the only causal consequences that are generated on-line are (a) superordinate goals of existing plans that may end up being achieved in the future plot (class 4 inferences), (b) emotional reactions of characters to events and actions (class 6 inferences), and (c) causal consequences that have a high strength of encoding by virtue of assumption 5. Researchers have frequently proposed that causal consequences are not made on-line because there are too many alternative hypothetical plots that could potentially be forecasted, because most of these alternatives would end up being erroneous when the full story is known or because it takes a large amount of cognitive resources to forecast a single hypothetical plot (Graesser & Clark, 1985; Johnson-Laird, 1983; Kintsch, 1988; Potts, Keenan, & Golding, 1988; Reiger, 1975). However, a causal consequence inference is likely to be generated on-line if it is highly constrained by context and there are few if any alternative consequences that would be likely to occur (Keefe & McDaniel, 1993; McKoon & Ratcliff, 1986; Murray, Klin, & Myers, 1991; van den Broek, 1990).

In some contexts, readers are motivated by idiosyncratic goals. They are predicted to generate those classes of inferences that are directly relevant to the idiosyncratic goals. For example, if their goal is to gain a vivid mental picture of the spatial setting and to track the location of objects, then spatial state inferences (class 11 in Table 1) would be constructed on-line even though it is time-consuming to [illegible]

normally generated on-line when readers read naturalistic stories for understanding and entertainment (Zwaan & Van Oostendorp, 1993). In some contexts, the reader's idiosyncratic goals are pitched at a shallow level of comprehension, such is proofreading a manuscript for spelling errors or performing in an experimental task that involves word recognition. In such cases, the reader would not construct a meaningful situation model, and virtually none of the inferences in Table 1 would be generated on-line. Therefore, there is not an invariant set of on-line inferences when considering all of the reader goals that potentially motivate reading. However, there are clear-cut predictions when the reader goals are pitched at a default level or a genre-based level of goal specificity.

The status of author intent or attitude (class 13) is uncharted at this point of inference research. There has been very little theoretical discussion of the psychological impact of author intent and attitude (Hunt & Vipond, 1986; Rosenblatt, 1978) and no empirical research investigating on-line processing. From one perspective, the reader is expected to generate inferences about author intent and attitude because it explains why the author expresses particular clauses in the text and why the author wrote the text. From another perspective, however, there are several reasons for being pessimistic about the likelihood of generating these inferences on-line. There rarely is a rich pragmatic context that anchors communication between the author and reader of a story, so there is very little information to support such inferences. In fact, the author of a text is normally invisible to the reader. There are cases in which there is a rich pragmatic context, for example, a letter to a friend or a politician writing a story to be read by a constituency; in these cases, readers are predicted to generate inferences and explanations about author intent and attitude on-line. A second reason to be pessimistic is that the reader may fail to achieve a globally coherent interpretation of the text per se; establishing a globally coherent message is presumably a prerequisite or corequisite of computing author intent and attitude. There is a yet a third reason to be pessimistic. People do not normally construct author intent and attitude when they observe events and actions in the everyday world, so this cognitive skill is not overlearned through everyday experience.

The status of reader emotions (class 12) is also uncharted. In one sense, reader emotions are reactions of the reader to the text rather than inferences per se. The reader experiences suspense, surprise, fear, curiosity, amusement, and other emotions while reading episodes in the narrative (Brewer & Ohtsuka, 1988; Graesser, Long, & Mio, 1990; Jose & Brewer, 1984). The reader may identify with a character and empathetically experience some semblance of the character's emotions. These reader reactions do not refer directly to the situation model depicted in the story plot so they are not really knowledge-based inferences. In another sense, however, they are inferences that refer to the pragmatic context of the author–message–reader system. Authors write texts to elicit particular reader emotions, readers have these emotions, and readers cognitively acknowledge (consciously or unconsciously) that they are experiencing these manipulated emotions. Readers may experience the appropriate emotion during an episode, with elevated physiological arousal, in a manner carefully crafted by

that they should be having a particular emotion during a particular episode, even though they are not physiologically aroused or in the mind set of experiencing the appropriate emotion. When a reader reads a story for a second or third time, the reader may cognitively infer that an episode is surprising or suspenseful even though the entire story is known and there is no uncertainty about the plot (Gerrig, 1989). Clearly, the phenomenon of reader emotion is complex. For this reason, the constructionist theory does not offer a decisive prediction about its processing status (i.e., on-line vs. off-line).

In summary, the constructionist theory predicts that six classes of inferences are normally generated on-line (1, 2, 3, 4, 5, and 6) and five classes are off-line (7, 8, 9, 10, and 11). These predictions prevail when reading narrative under the default and genre-based reading goals. All things being equal, there should be a higher strength of encoding for the first six classes than for the second five classes. A decisive prediction is not offered for inferences referring to reader emotion (class 12) and to author intent and attitude (class 13).

The significance of these predictions can be appreciated once we consider the predictions of other theories of narrative comprehension. We cover alternative theoretical positions in the next section.

Other Theories of Inference Generation during Narrative Comprehension

In this section, we discuss other theoretical positions that offer predictions about inference generation during narrative text comprehension. It is beyond the scope of this section to present all of the components and assumptions of each theoretical position. Instead, we directly focus on the salient features of each theoretical position and then declare the resulting predictions. In Table 3, we summarize the inference classes that are predicted to be drawn on-line by each theoretical position.

Explicit Textbase

This is a straw-man theoretical position that asserts that no knowledge-based inferences are constructed during comprehension. None of the production rules in Table 2 would exist according to this position. Early psychological theories of discourse processing indirectly endorsed this position to the extent that they focused exclusively on explicit text in the construction of meaning representations. This position is not a serious contender among contemporary discourse-processing theories, but it is an interesting extreme position to consider conceptually.

Minimalist Hypothesis

McKoon and Ratcliff (1989, 1992) recently

that are encoded automatically during reading are those that are based on easily available information (either from explicit statements in the text or from background world knowledge) and those that are necessary for establishing local coherence. The inferences needed to establish local text coherence are classes 1, 2, and 3 (referential, case structure role assignment, and causal antecedent). Therefore, inferences in classes 1, 2, and 3 are the only inferences that are automatically encoded. McKoon and Ratcliff (1992) did not offer predictions about which inferences are strategically generated on-line. However, they did specify that strategic inferences (a) are more time consuming to construct (greater than 500 ms), (b) are constructed when local coherence cannot be established during the interpretation of a clause, and (c) are not as consistently encoded during comprehension (i.e., there are fluctuations among readers, reader goals, and tasks). These claims permit us to extrapolate some predictions about what inferences are most likely to be constructed on-line after readers have more time to process a given clause. Given that strategic inferences are only probabilistically generated on-line, whereas automatic inferences are consistently generated, then inference classes 1, 2, and 3 should have a higher likelihood of being generated on-line than the other classes of inferences in Table 1. The minimalist position would assume the existence of production rules B and F in Table 2 but not production rules A, C, D, and E. As discussed earlier, it would be essential to tune production rule B more precisely to capture the exact conditions under which causal antecedents are generated according to the minimalist hypothesis.

Current-State Selection Strategy

This is a model of narrative comprehension that specifies various rules for making causal connections between explicit events, actions, and states in STM (Bloom et al., 1990; Fletcher, 1986; Fletcher & Bloom, 1988). The CSS strategy of Fletcher and Bloom (1988) merged a causal network model of narrative representation (Trabasso & van den Broek, 1985) with the STM assumptions of earlier models by Kintsch and his colleagues (Kintsch & van Dijk, 1978; Miller & Kintsch, 1980). This hybrid model was compared with the earlier, proposition-based, "leading edge" rule of Kintsch and van Dijk (1978). The leading edge rule relies heavily on argument repetition as the main basis for linking propositions. The CSS strategy would assume the existence of production rules A, B, and F in Table 2 but not production rules C, D, and E. Moreover, production rules A and B would be tuned somewhat differently than that of the constructionist theory.

The CSS strategy specifies that causal connections are made between the current clause and a causal antecedent (i.e., an antecedent event, an antecedent state, or a superordinate goal) if the causal antecedent resides in STM. A causal antecedent remains in STM as long as it has no causal consequent. When a connection is made, the causal antecedent is transferred out of STM to LTM. If no causal antecedent can be found for an incoming clause, a local causal coherence break occurs, and a search for a cause is made in LTM.

The CSS

systems, a strategic search for causal coherence occurs at local coherence breaks. However, the kinds of coherence assumed by the two positions are different. For example, referential coherence and argument repetition are critical in the minimalist hypothesis, whereas causal coherence is critical in the CSS strategy. Another difference addresses the generation of superordinate goal inferences. According to the CSS strategy, there must be a failure in establishing a local causal antecedent for global coherence to be achieved through the retrieval of a goal mentioned much earlier in the text. In contrast to the minimalist position, the CSS allows a goal to reside in STM for more than one clause as long as it does not find a consequent. Once the goal is connected, however, it is removed from STM and is retrieved as a cause only when there is a subsequent break in local causal coherence. Breaks in other kinds of local coherence are not relevant to the CSS assumptions.

The CSS strategy predicts that four classes of inferences are generated on-line: referential inferences (class 1), case structure role assignments (class 2), causal antecedents (class 3), and superordinate goals (class 4). Technically speaking, the superordinate goals are generated under limited conditions in the CSS strategy described above. However, Fletcher and Bloom (1988) did have a version of their model that predicted that the superordinate goal inferences are made whenever possible (i.e., the "CSS + Goal" strategy). The original CSS strategy is similar to the minimalist hypothesis in that it emphasizes the achievement of local coherence; it differs from the minimalist hypothesis in that the kind of coherence is causal rather than referential (i.e., argument repetition). The CSS + Goal strategy is similar to the constructionist theory in its emphasis on the formation of causal explanations and its predictions that causal antecedents and goals are constructed on-line. However, the constructionist theory predicts that two additional classes of inferences are constructed on-line to achieve global coherence: thematic inferences (class 5) and the emotional reactions of characters (class 6).

Prediction–Substantiation Model

This model asserts that reading is expectation-driven in addition to explanation-driven. That is, readers generate expectations about future occurrences in the plot, and these expectations guide the interpretation of clauses in a top-down fashion (Bower et al., 1979; DeJong, 1979; Dyer, 1983; Schank & Abelson, 1977). Expectations are formulated whenever higher order knowledge structures are activated, such as a script or a theme. For example, if a story activates a RESTAURANT script and the text mentions that two characters entered a restaurant together, then the reader would form expectations that the characters will eat, talk, and be served food. If a story activates a REVENGE theme and the text specifies that character A hurts character B, then the reader would form the expectation that character B will hurt character A. Expectations are normally formulated at a superordinate abstract level rather than being fleshed out in fine detail. For example, a comprehender might expect that character B will hurt character A but will not generate a fine-tuned expectation of exactly how the

The prediction–substantiation model predicts that seven classes of inferences are generated on-line: referential (class 1), case structure role assignment (class 2), causal antecedent (class 3), superordinate goal (class 4), thematic (class 5), character emotional reaction (class 6), and causal consequence (class 7). Inferences in classes 1, 2, and 3 establish local coherence. Those in classes 3 and 4 explain why actions and events occur. Those in classes 4, 5, and 6 are critical for constructing higher order knowledge structures and establishing global coherence. The inferences in class 7 are expectations about forecasted plots. There is only one discrepancy between the theoretical predictions of the constructionist theory and that of the prediction–substantiation model, namely that of the causal consequence inferences. The prediction–substantiation model would incorporate all of the production rules in Table 2 (A through F) and would add an additional production rule to account for causal consequence inferences.

Promiscuous Inference Generation

This extreme straw-man position predicts that all classes of inferences are generated on-line. Thus, all of the production rules in Table 2 would be adopted, plus many others. It is assumed that the reader builds a complete, lifelike situation model by fleshing out all of the details about the characters, props, spatial layout, setting, actions, events, and so on. The meaning representation would be a high-resolution mental videotape of the narrative, along with exhaustive information about the mental states of the characters and about the pragmatic exchange between the author and reader. No researchers have directly proposed this promiscuous inference generation position. We should point out, nevertheless, that McKoon and Ratcliff (1992) have claimed that a constructionist theory would embrace such a position.

As discussed earlier, each of the classes of inferences in Table 1 could potentially be generated on-line if the experimenter tuned the instructions, task, and materials properly. For example, if the experimenter encouraged the reader to have the goal of constructing the spatial layout of the narrative, then the reader would construct spatial inferences on-line. Of course, it might take a long time to construct these inferences and some readers might give up trying. The critical tests of the constructionist theory and the alternative theoretical positions described in this section perhaps consist of experimental conditions in which the reader is not tuned to the class of inferences under scrutiny. For example, would the reader construct spatial inferences when reading the narrative for understanding, for entertainment, or for the specific goal tracking of the traits of a character? If spatial inferences are constructed when readers have these latter goals, then that would be compelling evidence that spatial inferences are generated on-line; if not, then these spatial inferences are not generated on-line.

More generally, several conditions must be met before there is a fair test of whether an inference class is normally

be sufficient time for the reader to construct the inferences, and (e) the instructions and tasks must not be specially tuned to the inference class under investigation.

Empirical Evidence for the Constructionist Theory

There have been some lively debates over the proper measures and experimental designs that test whether or not a class of inferences is generated on-line (Graesser & Bower, 1990; Keenan, Golding, Potts, Jennings, & Aman, 1990; Magliano & Graesser, 1991; McKoon & Ratcliff, 1989, 1990; Potts et al., 1988; Singer, 1988). However, in this article, we do not dissect the methodological problems with each of the existing measures and tasks. There does not appear to be a perfect measure and task; there are merely trade-offs, with each enjoying some benefits and some shortcomings. The evidence presented in this section is based on empirical studies that have minimal methodological problems. An ideal dependent measure would tap processes that occur during the course of comprehension rather than reconstructive processes well after comprehension is completed; this eliminates recall and summarization tasks in which data are collected after a reader finishes comprehending a text. An ideal dependent measure would track the time-course of various cognitive processes by charting response times. Such measures include self-paced reading times for text segments (e.g., words, clauses, and sentences), gaze durations on words in eye-tracking studies, lexical-decision latencies on test words (i.e., whether a test string is a word or a nonword), naming latencies on test words, latencies to verify whether a test statement is true or false, latencies to decide whether a test segment had been presented earlier (i.e., recognition memory), or speeded recognition judgments under a deadline procedure. Moreover, an ideal experimental design would eliminate or control extraneous variables.

To test whether knowledge-based inferences are generated on-line, it is critical to demonstrate that subjects have a sufficient knowledge base and sufficient information sources to produce the inferences. It would be pointless to test whether readers generate an inference if they do not have the prerequisite world knowledge or if an inference test item (i.e., a word or statement) fails to match any cognitive representation that a reader could manage to construct. There is one, very critical, methodological implication of this note of caution: Experimenters should not generate their own inference test items and assume that the subjects are actually making these inferences, particularly if the experimenter ends up concluding that the inference ckiss is not generated on-line. The experimenter must validate that the inferences could be generated by the designated reader population if the readers had sufficient time to do so.

In light of the above cautionary note, researchers have sometimes collected verbal protocols from readers during comprehension to validate that the readers could potentially generate the inferences under investigation. These verbal protocols are collected while the reader comprehends the text sentence by sentence or clause by clause. In think-aloud tasks, the readers express whatever

Daly, Weber, Vangelisti, Maxwell, & Neel, 1989; Ericsson, 1988; Ericsson & Simon, 1980; Fletcher, 1986; Olson, Duffy, & Mack, 1984; Suh & Trabasso, 1993; Trabasso & Suh, 1993). In question-answering tasks, the readers answer particular questions about each clause, such as why, how, and what-happens-next (Graesser, 1981; Graesser & Clark, 1985). In question-asking tasks, the reader asks questions that come to mind about each sentence (Collins, Brown, & Larkin, 1980; Olson, Duffy, & Mack, 1985). These verbal protocols expose potential knowledge-based inferences. The researcher has some assurance that the inference could be made, that the reader population has the prerequisite world knowledge, and that the inference is expressible in language. The researcher can measure the proportion of subjects who produce the inference at particular points in the text that elicit the inference.

Of course, the fact that an inference is expressed in verbal protocols does not imply that the inferences are normally generated on-line. It is possible that readers adopt unnatural reading strategies when producing the verbal protocols (Nisbett & Wilson, 1977). Therefore, it is necessary to test the on-line status of candidate inferences by collecting appropriate measures from a separate group of readers who do not supply verbal protocols. Such measures include sentence reading times, gaze durations on words, lexical-decision latencies or naming latencies on test items in a secondary task, latencies in making recognition memory judgments on words or sentences, and so on. Researchers have satisfactorily demonstrated that particular classes of inferences exposed by verbal protocols do in fact predict these on-line temporal measures collected from a different group of readers (Graesser, Haberlandt, & Koizumi, 1987; Long, Golding, & Graesser, 1992; Long & Golding, 1993; Magliano, Baggett, Johnson, & Graesser, 1993; Millis, Morgan, & Graesser, 1990; Olson et al., 1984; Sharkey & Sharkey, 1992; Suh & Trabasso, 1993). These studies have shown that some, but not all, classes of inferences from the verbal protocols are generated on-line. Therefore, theories of inference generation can be tested by coordinating verbal protocol analyses and online temporal measures, as we illustrate later. Magliano and Graesser (1991) have advocated the implementation of a three-pronged method that coordinates (a) the collection of verbal protocols to expose potential inferences, (b) theories of discourse processing that make distinctive predictions about which classes of inferences are generated on-line, and (c) the collection of on-line temporal measures to assess whether a class of inferences is actually made on-line.

At this stage of development, most investigations of inference generation have not used the three-pronged method. It takes considerable effort to collect and analyze the verbal protocols, so most researchers have resisted the temptation to pursue the methodology. However, we believe that the most compelling evidence involves the collection of these protocols to ensure that readers have sufficient knowledge to make these inferences. Once we are satisfied that the readers can make these inferences under unlimited time constraints, we can then collect time-based behavioral measures to investigate the time-course of generating these inferences.

tap on-line processing but did not adopt the three-pronged method. The focus is on inference classes 1 through 4 and 6 through 11 because there are essentially no adequate empirical tests of classes 5, 12, and 13. In the second subsection, we report a study that adopted the three-pronged method to investigate text-connecting inferences during narrative comprehension. As mentioned earlier, these inferences specify how explicit clauses in the text are connected conceptually. In the third subsection, we report studies that used the three-pronged method to investigate extratextual inferences during narrative comprehension. As reported below, the available evidence supports the constructionist theory to a greater extent than the alternative theoretical positions presented in the previous section.

Evidence from Studies that Do not Use the Three-pronged Method

As summarized in Table 3, the constructionist theory predicts that the following five inference classes are generated on-line (under normal comprehension conditions in which the reader is not tuned to generate a particular class of inferences): referential inferences, case structure role assignments, causal antecedents, characters' emotional reactions, and superordinate goals. In fact, there is empirical support for these predictions in studies that have used the time-based behavioral measures described above. Support has accrued in the case of referential inferences (Bever & McElree, 1988; Dell, McKoon, & Ratcliff, 1983; Duffy & Rayner, 1990; Gernsbacher, 1990; McKoon & Ratcliff, 1992; O'Brien, Duffy, & Myers, 1986; Sanford & Garrod, 1981), case role assignments (Frazier & Flores d'Arcais, 1989; Just & Carpenter, 1980; Swinney & Osterhout, 1990), causal antecedents (Bloom et al., 1990; Fletcher & Bloom, 1988; McKoon & Ratcliff, 1986, 1989; Myers et al., 1987; Potts et al., 1988; Singer, Halldorson, Lear, & Andrusiak, 1992; van den Broek & Lorch, 1993), superordinate goals (Dopkins et al., 1993), and characters' emotional reactions (Gernsbacher, Goldsmith, & Robertson, 1992).

In contrast, the constructionist theory predicts that several classes of "elaborative" inferences in Table 3 are not generated on-line (unless the reader has a specific goal to generate these inferences or the inferences are highly predictable through constraints of multiple information sources): instantiations of a noun category, instruments, causal consequences, subordinate goals/actions, and states. These inferences are not needed to construct a coherent explanation of the explicit actions and events in the narrative, so they have a lower likelihood of being generated on-line. Once again, available empirical studies support the prediction that these classes of elaborative inferences are not constructed on-line. The prediction is supported in the case of instantiations of noun categories (Whitney, 1986), instruments (Corbett & Dosher, 1978; McKoon & Ratcliff, 1981; Singer, 1979, 1980), causal consequences (Bloom et al., 1990; McKoon & Ratcliff, 1986, 1989; Potts et al., 1988; Singer & Ferreira, 1983), and states (Seifert, 1990; Seifert, Robertson, & Black, 1985).

The central argument, therefore, is that the constructionist theory predicts the exact subset of inferences that are generated on-line and the conditions under

the alternative theoretical positions: the explicit textbase position, the minimalist hypothesis, the CSS strategy, the prediction–substantiation model, and the promiscuous inference generation position.

There is considerable variability in the amount of empirical evidence available for each class of inference. Therefore, at this point, we identify some of the most solid empirical findings and trace the theoretical implications.

Most of the theoretical positions predict that causal antecedent bridging inferences are generated during comprehension. Indeed, there is substantial support for the prediction (see above citations). For example, in studies by Singer (Singer et al., 1992; Singer, Revlin, & Halldorson, 1990), subjects read sentence pairs such as 1a and 1b below.

1a. Dorothy poured the bucket of water on the bonfire.
1b. The fire went out.

An understanding of this sentence pair requires the recognition that the first event caused the second event. The reader must also know something that, when coupled with the fact that water was poured on the fire, accounts for the fire going out; specifically, the reader fills in a causal antecedent enabling event *water extinguishes fire.* According to Singer's model, the reader initially constructs a mental syllogism with a missing premise (called an *enthymeme*) and then solves the syllogism with the inferred enabling causal antecedent (i.e., the inference). In this case, 1a and the inference are two premises that imply conclusion 1b in the solved constructed syllogism. In a contrast condition, subjects read the sentence pair 2a and 2b.

2a. Dorothy placed the bucket of water by the fire.
2b. The fire went out.

In this case, the inference *water extinguishes fire* is not generated in the explanation. The sentence pairs are causally related in the 1a–1b sequence (the causal condition) but only temporally contiguous in the 2a–2b sequence (the temporal condition).

After subjects read one of the sentence pairs, they were asked to verify the inference by answering the question, "Does water extinguish fire?" They pushed either a "yes" or "no" button as quickly as possible. Of course, the answer to this generic fact should be yes in both conditions. The latencies to answer this question were in the expected direction. Answer time for the test question was faster in the causal condition than in the temporal condition. This result has consistently occurred in a number of studies that Singer and his colleagues have conducted (Singer et al., 1990, 1992). The effect occurs when the sequences are isolated sentence pairs and when the sentence pairs are embedded in text. The effect even occurs when the order of presenting 1a and 1b is reversed. Moreover, the effect cannot be explained by extra priming of the question by the words in 1a of the causal condition because the effect

The consistent finding that causal antecedent inferences are generated on-line is sufficient to eliminate the explicit textbase position but not the alternative theoretical positions. The causal consequence inferences provide a more discriminating test among the theoretical positions. Potts et al. (1988) investigated whether causal antecedent inferences and causal consequence inferences are generated while comprehending short two-sentence excerpts. They collected naming latencies on test words shortly after subjects read the sentences. For example, conside the test word *broke* in the context of the following three texts:

> *Causal antecedent condition.* No longer able to control his anger, the husband threw the delicate porcelain vase against the wall. It cost him well over one hundred dollars to replace the vase.
> *Causal consequence condition.* No longer able to control his anger, the husband threw the delicate porcelain vase against the wall. He had been feeling angry for weeks, but had refused to seek help.
> *Control condition.* In one final attempt to win the delicate porcelain vase, the angry husband threw the ball at the bowling pins that stood against the wall. He had never won anything and was determined not to miss this time.

The inference *the vase broke* is a causal antecedent bridging inference while comprehending the second sentence in the causal antecedent condition; therefore, this inference should be generated on-line. The same inference is a causal consequence of the first sentence of the causal consequence condition; in this case, the status of this inference varies among the theoretical positions. The inference would not be generated in the control condition. The naming latencies in the Potts et al. (1988) study were consistent with the proposal that causal antecedent inferences are generated on-line but not causal consequence inferences. The naming latencies showed the following pattern: causal antecedent < causal consequence = control.

The finding that causal consequence inferences were not generated on-line in this study and several other studies (see earlier citations) eliminates additional theoretical positions. Specifically, the data are not compatible with the predictions of the prediction–substantiation model and the promiscuous inference generation position. We are therefore left with three viable theoretical positions: the constructionist theory, the minimalist hypothesis, and the CSS strategy.

Characters' emotional reactions are generated on-line according to the constructionist theory but not according to the minimalist hypothesis and the CSS strategy (see Table 3). Gernsbacher et al. (1992) investigated these inferences by collecting sentence reading time measures and naming latency measures. Subjects read stories that had explicit concrete actions and events and that triggered emotional inferences. An example story involved a main character stealing money from a store where his best friend worked and later learning that his best friend had been fired. In such a story, the emotion of *guilt* is predicted to be generated on-line according to the constructionist theory. Test words were pre-

The test words were either an appropriate emotion (e.g., *guilt*) or an inappropriate emotion (e.g., *pride*). Gernsbacher et al. (1992) reported that naming latencies were shorter for the appropriate emotions than for the inappropriate emotions. This outcome supports the constructionist theory rather than the minimalist hypothesis and the CSS strategy.

Another test that discriminates the above three theoretical positions involves global inferences that link an incoming explicit statement with information several episodes earlier in the story (i.e., information that is outside of WM). According to the minimalist hypothesis and the CSS strategy, these global inferences are made only when there is a failure in establishing local coherence or causal coherence. However, according to the constructionist theory, these global inferences are generated even when local coherence is intact. The evidence favors the constructionist theory (Dopkins et al., 1993; O'Brien & Albrecht, 1992; Singer. 1993; Suh & Trabasso, 1993; van den Broek & Lorch, 1993). The materials in the study by Singer (1993), for example, are illustrated below.

3a. Valerie left early for the birthday party. (global inference condition)
3a'. Valerie left the birthday party early. (control condition)
3b. She checked the contents of her purse.
3c. She backed out of the driveway.
3d. She headed north on the freeway.
3e. She exited at Antelope Drive.
3f. She spent an hour shopping at the mall.
TEST: Do birthday parties involve presents?

Sentences 3b, 3c, 3d, and 3e intervened between the motivating statement (3a), or the control statement (3a'), and the attempt to prepare for the party by shopping (3f). Statements 3a and 3a' should be deleted from WM by the time 3f is comprehended. It should be noted that both versions were referentially and causally coherent. According to the minimalist hypothesis, 3a should not be inferentially bridged to 3f because they are several sentences apart and local coherence is established; the constructionist theory predicted the two sentences should be inferentially bridged to establish global coherence. The time to subsequently answer the test question supported the constructionist position: The latencies were shorter in the global inference condition than in the control condition. Further support for the constructionist theory was provided by an explicit control condition, in which sentence 3f explicitly referred to the inference (i.e., She spent an hour shopping for a present at the mall). Answer latencies to the test question were similar in the explicit control condition and the global inference condition, indicating that the global inference has a status in the text representation similar to an explicitly stated idea. Once again, readers attempted to achieve global coherence even when mechanisms of local coherence are intact.

A Study of Text-connecting Inferences Using the Three-pronged Approach

A discourse model predicted the points in the text where particular text-connecting inferences would be constructed on-line. Specifically, they were interested in the process of reinstating superordinate goals that were explicitly mentioned earlier in the text. Think-aloud protocols were collected from a group of subjects while they comprehended the stories, sentence by sentence. The content extracted from these verbal protocols confirmed the predicted text-connecting inferences of the discourse model; that is, superordinate goals were reinstated by explicit clauses at predictable text locations. A separate group of readers provided recognition test decisions and latencies for test statements at different points in the text (instead of providing verbal protocols). The patterns of recognition decisions and latencies confirmed the model's predictions regarding the locations in the text where the superordinate goals are reinstated.

In Table 4, we present two versions of an example story that was investigated by these researchers (Suh & Trabasso, 1993; Trabasso & Suh, 1993). In the hierarchical version, Jimmy has a main (superordinate) goal of wanting to buy a bike. Jimmy tries to get his mother to buy the bike, but this strategy fails because she refuses. Later on in the story, after the main goal is presumably no longer in WM, Jimmy tries a second approach to getting the bike by asking for a job, earning money, and purchasing the bike by himself. Many of the actions in the second half of the hierarchical story should reinstate Jimmy's goal of buying a bike (G11; see Table 4). In contrast, this goal should not be reinstated by these actions in the second half of the sequential story version. Jimmy's goal of buying the bike is satisfied early in the sequential version of the story because Jimmy's mother agrees to get the bike for Jimmy.

Both the constructionist theory and the discourse model of Suh and Trabasso (1993) predict that the superordinate goal will be reinstated by particular story actions in the hierarchical version. Reinstatement of this goal supports global coherence. It should be noted that the superordinate goal should be reinstated even though there is no break in local coherence. All of the sentences in both stories are locally coherent by virtue of argument repetition (Halliday & Hasan, 1976; Kintsch & van Dijk, 1978): The subject of each sentence after sentence 1 is Jimmy. According to the minimalist hypothesis and the CSS strategy, the global goal inference should not be reinstated because there is no break in local coherence or causal coherence.

One prong of the three-pronged method addresses theory. The theoretical predictions of Suh and Trabasso (1993) were based on a discourse theory that specifies in detail how the content of the stories are organized into causal network structures and how the structures are constructed during comprehension (Trabasso & Suh, 1993; Trabasso & van den Brock, 1985; Trabasso et al., 1989). Each sentence is classified by its role in an episodic structure. That is, it is assigned to one of six main categories: settings (S), events (E), goals (G), attempts (A), outcomes (O), and reactions (R). Settings introduce characters and indicate the spatial-temporal context of the story. Events have an impact on characters and influence goals. Goals are desired and valued states, activities, objects, and resources. Attempts are actions carried out to achieve goals. Outcomes index the

Table 4: Hierarchical and sequential versions of the Jimmy story (Suh & Trabasso, 1993)

Category	Sentence
	Hierarchical version
S11	Once there was a boy named Jimmy.
E11	One day, Jimmy saw his friend Tom riding a new bike.
G11	Jimmy wanted to buy a bike.
A11	Jimmy spoke to his mother.
O11	Jimmy's mother refused to get a bike for him.
R11	Jimmy was very sad.
E21	The next day, Jimmy's mother told him that he should have his own savings.
G21	Jimmy wanted to earn some money.
A21	Jimmy asked for a job at a nearby grocery store.
A22	Jimmy made deliveries for the grocery store.
O21	Jimmy earned a lot of money.
A31	Jimmy went to the department store.
A32	Jimmy walked to the second floor.
O31	Jimmy bought a new bike.
	Sequential version
S11	Once there was a boy named Jimmy.
E11	One day, Jimmy saw his friend Tom riding a new bike.
G11	Jimmy wanted to buy a bike.
A11	Jimmy spoke to his mother.
O11	Jimmy's mother got a bike for him.
R11	Jimmy was very happy.
E21	The next day, Jimmy's mother told him that he should have his own savings.
G21	Jimmy wanted to earn some money.
A21	Jimmy asked for a job at a nearby grocery store.
A22	Jimmy made deliveries for the grocery store.
O21	Jimmy earned a lot of money.
A31	Jimmy went to the department store.
A32	Jimmy walked to the second floor.
O31	Jimmy bought a new basketball.

Note: S = setting; E = event; G = goal; A = attempt; O = outcome; R = reaction. The first number after the letter indicates the episode to which the statement belongs. The second number indicates the cumulative number of times that the statement's category has occurred in that episode. For example, A32 refers to the second attempt in the third episode.

success or failure of a goal being achieved. Reactions are emotions and cognitions that evaluate events and outcomes. The numbers in the lettered subscripts in Table 4 refer to the episode in which the sentence occurs (the first digit) and the ordinal number of a particular category within an episode (the second digit). For example, G21 is the second episode's first goal statement and A32 is the third episode's second attempt statement. Trabasso's discourse theory specifies how the sentences are connected with [illegible]

connections are built on-line during comprehension. The discourse theory predicts that G11 should be causally linked (on-line) to sentences A11, G21, A31, and A32 in the hierarchical version but only to sentence A11 in the sequential version.

Another prong of the three-pronged method states that verbal protocols should be collected to confirm that the theoretically predicted inferences are generated on-line. Suh and Trabasso (1993) collected think-aloud protocols as subjects read the stories sentence by sentence. After a subject read each sentence, the subject told the experimenter what his or her understanding of the story was in the context of the story, no matter how obvious it was to the subject. The protocols were tape recorded and analyzed. The theoretical prediction is that the superordinate goal (G11, Jimmy wanting to buy a bike) should frequently be mentioned when A11, G21, A31, and A32 are comprehended in the hierarchical version and when A11 is comprehended in the sequential version. This prediction was confirmed. The likelihoods of mentioning G11 were 1.00, .92, .58, and .92 for the respective actions in the hierarchical version, and .92, .29, .04, and .17 in the sequential version. The verbal protocols clearly confirmed the predictions of the discourse theory.

The other prong of the three-pronged method states that time-based behavioral measures should be collected to more rigorously assess whether an inference is actually made on-line. Suh and Trabasso (1993) collected recognition decisions and latencies for test items that were interspersed with the sentences during comprehension. Test statements were presented after story sentences, and subjects decided as quickly as possible whether the test statement was presented earlier in the text (by pressing a "yes" or a "no" key). A critical test item was the G11 goal sentence. The recognition latency was expected to be shorter if the reader had reinstated G11 during the comprehension of a story sentence. The results confirmed the predictions of the discourse model. Recognition latencies (in milliseconds) were 973, 986, and 1,084 for the critical test item after A11, G21, and A32, respectively, in the hierarchical version; the corresponding latencies were 980, 1, 123, and 1, 209 in the sequential version. Once again, the significant differences between the hierarchical and sequential versions at positions G21 and A32 would not be predicted by the minimalist hypothesis.

The results of Suh and Trabasso's (1993) application of the three-pronged method are compatible with the constructionist theory. The theory predicts that readers generate superordinate goals during the comprehension of narrative to explain why goals, actions, and events are explicitly mentioned. Thess inferences may either be text-connecting inferences or extratextual inferences. Superordinate goals are generated even when local coherence is intact and when the incoming sentence needs to be linked to a superordinate goal that was mentioned much earlier in the text.

Studies of Extratextual Inferences Using the Three-pronged Method

Graesser and his colleagues have used the three-pronged method to investigate extratextual inferences during the comprehension of short narrative texts (Graesser et al. 1987; Long & Golding, 1993; Long et al. 1992; Long, Golding

Graesser, & Clark, 1990; Magliano et al., 1993) and short expository texts (Millis, 1989; Millis et al., 1990). They focused on five classes of inferences because the status of these classes discriminated among alternative theoretical positions: superordinate goals (class 4), subordinate goals (class 10), causal antecedents (class 3), causal consequences (class 7), and states (class 11). Below, we present an example story and an example inference in each of these five classes:

The Czar and His Daughter

Once there was a Czar who had three lovely daughters. One day the three daughters went walking in the woods. They were enjoying themselves so much that they forgot the time and stayed too long. A dragon kidnapped the three daughters. As they were being dragged off they cried for help. Three heroes heard their cries and set off to rescue the daughters. The heroes came and fought the dragon and rescued the maidens. Then the heroes returned the daughters to their palace. When the Czar heard of the rescue, he rewarded the heroes.
Inferences when comprehending "The dragon kidnapped the daughter":

1. Superordinate goal: The dragon wanted to eat the daughters.
2. Subordinate goal: The dragon grabbed the daughters
3. Causal antecedent: The dragon saw the daughters.
4. Causal consequence: Someone rescued the daughters.
5. State: The dragon has scales.

The first prong of the method addresses theory. The theoretical predictions are summarized in Table 3 and were discussed earlier in this article.

The second prong of the three-pronged method involved the collection of question-answering protocols while readers comprehended the stories clause by clause. After reading each clause (that referred to an action, event, or state), the subjects answered questions about the clause. One group answered a why-question, a second group answered a how-question, and a third group answered a what-happened-next question. The question categories were selected to extract particular types of extratextual inferences. As discussed earlier, research on human question answering has strongly established that why, how, and what-happened-next questions are selective in extracting particular inferences (Graesser & Franklin, 1990; Graesser et al., 1981, 1991; Graesser & Murachver, 1985). Why-questions expose superordinate goals and causal antecedents; how-questions expose subordinate goals/actions and causal antecedent events; what-happened-next questions expose causal consequences. States are exposed by more than one of these question categories and can be distinguished by content.

A *constructive history chart* was prepared for each of the inferences that was elicited by the question-answering protocols. The chart identified which explicit clauses in the text elicited a particular inference, the type of question that elicited it, and the proportion of subjects who articulated the inference in the question-answering protocols. The point in the story where an inference [illegible] was [illegible]

measures tested an inference when it first emerged in the situation model, as manifested in the question-answering protocols.

Whenever Graesser and his colleagues evaluated the on-line status of classes of inferences, they always equilibrated the classes of inference test items on the proportion of subjects who produced the item in the question-answering task (Graesser & Franklin, 1990; Graesser et al., 1981, 1991; Graesser & Murachver, 1985). Inference test items were also equilibrated on a number of extraneous measures, such as word length, word frequency, and word class (i.e., nouns, verbs vs. adjectives).

The third prong of the three-pronged method involved the collection of lexical-decision latencies or naming latencies for test words during the comprehension of the stories. Long et al. (1992) reported a study that adopted the three-pronged methodology to test whether superordinate goal inferences and subordinate action inferences are generated on-line when stories are comprehended. According to the constructionist theory, superordinate goals should be generated on-line because they explain why characters perform intentional actions. In contrast, subordinate actions should not be generated because they do not explain why actions occur, subordinate actions merely elaborate the details about how actions are executed. Long et al. used question-answering protocols to extract a sample of superordinate goals and subordinate actions associated with explicit actions in the text. Why-questions uncovered the suprordinate goals, whereas how-questions uncovered the subordinate actions. The two samples of inferences were equilibrated on a number of extraneous variables, such as production likelihood in the question-answering protocols, word frequency, word length, and word class.

Long et al. (1992) collected word-naming latencies to test whether inference words are generated on-line during comprehension. A test word was presented 500 ms after each sentence in a story was read. The subjects were instructed to say the test word aloud as quickly as possible. The test word was sometimes a word that came from a superordinate goal and sometimes a word from a subordinate goal/action. These items were new inferences constructed for the first time in the story by explicit target actions. There also was a control condition in which the superordinate and subordinate inferences were named in an unrelated passage context. Therefore, an *inference activation score* could be computed for each test word by subtracting the naming latency of the word in the inference context from the naming latency of the word in an unrelated context. This computation of inference activation scores has been used by other researchers who have collected lexical-decision latencies to study inference processing (Kintsch, 1988; Sharkey & Sharkey, 1992; Till, Mross, & Kintsch, 1988). Long et al. (1992) reported significantly higher inference activation scores for superordinate goal words than for subordinate goal/action words (which in turn were essentially zero). Using the same design, Long et al. reported a similar pattern of data when lexical decisions were collected instead of naming latencies. The activation scores showed the following pattern: superordinate goal > subordinate goal/

In another study, Long and Golding (1993) reported that superordinate goals are constructed very quickly (within 750 ms) in the case of fast readers with good comprehension. In contrast, inference activation scores were essentially zero in the case of subordinate goal/actions for all readers and in the case of superordinate goals for readers who are not fast, good comprehenders. Precise control over reading time was accomplished by implementing a rapid serial visual presentation (RSVP) rate of 250 ms per word. There was precise control over the time-course of inference activation by imposing a short 200-ms stimulus onset asynchrony (SOA) between the final word of the sentence and the test word. The results of these investigations of superordinate and subordinate goals are compatible with the constructionist theory and incompatible with most of the alternative theoretical positions (i.e., explicit textbase position, minimalist hypothesis, and promiscuous inference generation position).

Magliano et al. (1993) tested whether causal antecedent and causal consequence inferences are generated on-line and also determined the time-course of their activation. They manipulated inference category (causal antecedent vs. causal consequence), RSVP rate (250 vs. 400 ms), and SOA interval (250, 400, 600, and 1,200 ms). Lexical-decision latencies were collected on test items after each sentence, following the same procedure as the studies presented above. The results indicated that there was a threshold of 400 ms after stimulus presentation (either RSVP or SOA) before causal antecedents were generated, whereas causal consequence inferences were never generated on-line.

Studies using the three-pronged method have revealed that state inferences are not generated on-line. Long et al. (1990) compared causal antecedent event inferences with state inferences in a study that collected lexical-decision latencies. Latencies were shorter for test words that referred to causal antecedent event inferences than for those referring to state inferences. Graesser et al. (1987) collected word reading times using a moving window method and focused on times for end-of-clause words. It was assumed that inferences are generated primarily at end-of-clause words, following the results of previous research (Haberlandt & Graesser, 1985; Just & Carpenter, 1980; Kintsch & Van Dijk, 1978). Graesser et al. (1987) found that end-of-clause reading times were predicted by the number of new goal inferences and causal antecedent event inferences that were constructed during the comprehension of the clause but not by the number of state inferences.

In summary, Graesser's research on extratextual inferences using the three-pronged method was compatible with the predictions of the constructionist theory and one version of the CSS strategy (i.e., the CSS + Goal strategy). Superordinate goals and causal antecedents are generated on-line, whereas subordinate goals/actions, causal consequences, and states do not tend to be generated on-line. Stated differently, the first two inference classes have substantially higher encoding strengths than do the latter three classes. These results are not consistent with the predictions of the explicit textbase position, the minimalist hypothesis, the original version of the CSS strategy, the prediction–substantiation model, and the promiscuous inference generation position.

Summary of Empirical Findings

This section has presented evidence for the constructionist theory of inference generation and against the alternative theoretical positions. Although most of the available research has been on short texts that do not use the three-pronged method, a few studies have adopted the methodology that coordinates theory, the collection of verbal protocols, and the collection of time-based behavioral measures.

When considering all of the evidence, the constructionist theory is supported by the finding that inference classes 1, 2, 3, 4, and 6 (see Tables 1 and 3) are normally generated on-line, whereas inference classes 7, 8, 9, 10, and 11 do not tend to be on-line. These predictions are not made by the explicit textbase position, the minimalist hypothesis, the CSS strategy, the prediction–substantiation model, and the promiscuous inference generation model. The constructionist theory predicts that the latter five classes (7 through 11) are generated on-line only under two conditions: (a) when the reader has a specific goal to generate these inferences, (b) the inferences are highly predictable by virtue of the constraints imposed by multiple information sources (as specified by assumption 5), or both. Unfortunately, there is no solid evidence one way or another about the status of inference classes 5, 12, and 13. One direction for further research is to examine these inferences in more detail. The constructionist theory also correctly predicts that global inferences are generated on-line even under conditions in which local coherence is intact. In contrast, the minimalist hypothesis and the CSS strategy predict that these inferences are made only when there is a breakdown in local coherence or causal coherence.

In closing, it would appear that the proposed constructionist theory provides the best foundation for predicting and explaining inference generation during the comprehension of narrative text. Readers construct rather rich situation models during the comprehension of narrative. However, it is not the case that the reader constructs a complete lifelike rendition of the story, as if a camera captured all pictorial details in fine detail and a narrator tracked the minds of all of the characters. Instead, a predictable subset of the situation is preserved and another subset never makes it into the meaning representation. The search-after-meaning principle goes a long way in distinguishing what knowledge is in the representation versus what is out.

Space: Irrealis Objects in Technology Policy and Their Role in a New Political Economy

Philip Graham

Outlines of the Problem

> Political economy proceeds from the fact of private property. It does not explain it.
>
> Marx (1844 [1975]: 323)

I am concerned here with analysing how various aspects of actual and potential spaces are being prefigured for commodification and ownership in the language of global technology policy. My motivation for doing so is the widespread talk of an emergent form of political economy, otherwise known as digital capitalism, the knowledge economy, global capitalism and so forth. The new economy is a concept that has been codified in policy throughout the world since the early 1990s, and is therefore endowed with considerable social and symbolic force. As the above quote from Marx indicates, because it is presupposed, the concept of *space* is largely ignored in classical discussions of political economy. For whatever reason, when the subject of space is broached by political economists they tend to reduce it to some aspect of time, such as labour, rent, the circulation of money and goods, the depreciation of machinery and so on. That remains largely the case today.

Even in recent efforts to define the meaning of space in 'the new economy' – for example, in Castells' 'space of flows' – space is reduced to an aspect of social *activity*, of *time*: 'Space is the expression of society'; '*space is crystallized time*'; '*space is the material support of time-sharing social practices*' and so on (1996: ch. 6). But to reduce space to an aspect of time ignores the very significant fact that the foundations of capitalist *and* precapitalist forms of politico-economic organization

are built upon the meaning of finite, *geotechnical* spaces that exist independently of what people do. To be of any economic use, these spaces must be occupied exclusively. Land is the exemplar. The legal, and therefore *linguistic*, redefinition of land in the transition from feudalism formed the basis of private property for capitalism. Any transition to a new economy, if it is truly new, will include a fundamental redefinition of geotechnical space (Marx, 1844 [1975]).

As an idea and a reality, privately owned land has become quite taken for granted. However, we can perhaps grasp the kinds of technical, legal and historical work that have gone into making the *idea* of private property a social *reality* by means of a thought experiment.

> Imagine that you live at sea on a vessel that comfortably contains about 40 or so people. You cannot see land on any horizon. You have never seen it. The currents are such that the vessel drifts at regular intervals within indistinct but recognisable boundaries. The community harvests fish at one time of the year, whales at another, and nutritious seagrasses at another. Rain falls predictably enough so that people have enough water during most years. (Graham, in press a)

Here is the problem: given such a situation, how would you go about imagining and defining the space within which the sea-bound community moves so that it could be broken up into separate subdivisions, which could then be owned by particular individuals?

There are four prerequisites. At the very minimum, you would need technical and legal definitions of the space – legally recognized methods for measuring and dividing the sea-space into ownable portions. Some sort of legal system to regulate the entire area is also necessary. There also needs to be some pre-existing set of time-bound relationships and activities being enacted within the space prior to it being legally subdivided (fishing here, harvesting there, teaching children at these times, etc). Otherwise the sea-space would probably not be perceived as being at all useful, let alone divisible. The community would also need the means to patrol and enforce the boundaries of each and every subdivision, as well as the boundaries of the community as a whole. Otherwise anybody could redefine the space in their own terms, thus dispossessing incumbents of their spaces. These were the preconditions that allowed privately owned land (private property) to become a reality throughout Western Europe over approximately 300 years (Hobsbawm, 1962).

Just as in the transition from feudalism to capitalism, the *meaning* of space is undergoing profound transformations which are being largely ignored, both in policy and in social theory (Graham, in press a). In the transition from feudalism, a change in the meaning of land made capitalism possible. Quite suddenly, land could be owned by individual people. In the current transition, the meaning of electromagnetic spectrum is changing in a very similar way. The problem is essentially one of seeing the electromagnetic spectrum (hereafter 'electromag-

Formally defined geotechnical spaces have different qualities from the more abstract 'social spaces' created by human activity (cf. Bourdieu, 1991), even though they are interdependent aspects of the same 'thing'. We make many different kinds of social spaces by doing what we do. For example, a conversation in a workplace creates many different types of social and symbolic spaces all at once: it creates and maintains *interpersonal* spaces, or meaningful relationships between people; *attitudinal* spaces, or culture-specific value systems; *organizational* spaces, within which social behaviours are regulated; and *ideational* spaces, in which special ways of knowing and representing are actively created and preserved, such as in the physics department of a university (cf. Halliday, 1994; Lemke, 1995; Graham, in press a). Our conceptions of space are tied inseparably to our sociohistorical situatedness. They are a function of the entire web of activities, environments and relationships in which we are embedded.

Geotechnical spaces – like land, sea and air – exist independently of what people do; they *contain and constrain* what we do (we cannot grow potatoes in the ocean); and they share a common aspect under in that they can only be 'occupied' exclusively – two different people, groups, factories or cities cannot occupy the same geotechnical space at the same time. It is simply impossible. The same holds for *electrospace*: a particular frequency cannot be used by different people or organizations at the same time (Smythe, 1981). For the simple reason that electrospace is (at least as far as we know) the only globally continuous space capable of facilitating light-speed exchanges of meaning, it is the space within the dominant institutions of any future global knowledge economy *must* occupy (Graham, in press a). Electrospace and socio-symbolic activity (knowledge work) are the land and labour of the new economy. They are currently being prefigured in the *discourses* of policy for privatization and commodification on a global scale.

To show the central role of language in this process, I proceed by first outlining my approach to the problem. I then show the disjunctions and links between social space and geotechnical space; the fundamental differences in the meaning of these two very different concepts of space; how they are expressed, evaluated or ignored in different types of policy; and the implications that all this has within the context of the current transition in human relations.

A Transdisciplinary Approach for Analysis

The basic theoretical assumptions I make here are that: (i) language is the ultimately coordinating element in human social systems and is thus the critical departure point for any social analysis; (ii) perceptions of value are essentially a function of language; (iii) the perceived *Desirability* of anything is identical to its perceived 'value'; and (iv) the *Desirability* of anything is a sociohistorically specific attribution that requires significant amounts of mediated inculcation in contemporary societies (cf. Lemke, 1998; Graham, 2000, in press b). My perspective synthesizes theoretical and analytical resources from CDA (Fairclough, 1992, 2000; Lemke

1995, 1998; Fairclough and Graham, forthcoming); Marx's critique of classical political economy (1852 [1972], 1844 [1975], 1973, 1976); and critical media theory, specifically the body of literature referred to as 'political economy of communication' (e.g. Innis, 1951; Smythe, 1981; Garnham, 1990; Silverstone, 1999). The synthesis is 'transdisciplinary' in the sense that 'the logic of one theory is put to work in the elaboration of another without the latter being simply reduced to the former' (Fairclough, 2000: 165).

CDA is concerned with analysing language 'as one element of the social process dialectically interconnected with others', specifically to show how 'socio-economic systems are built upon the domination, exploitation, and dehumanization of people by people, and to show how contradictions within these systems constitute a potential for transforming them in progressive and emancipatory directions' (Fairclough and Graham, forthcoming). The links between CDA and political economy are thus quite explicit. Political economy, however, is first concerned with the production of *values* (Marx, 1973).

Any analysis of our current system must comprehend the predominance of *exchange values* – a system of values based on the 'exchangeability of all products, activities and relations with a third, *objective* entity [money PG] which can be reexchanged for everything *without distinction*' (Marx, 1973: 162–3). To develop a conception of our current system 'it is necessary to begin . . . with value, and, precisely, with exchange value in an already developed movement of circulation' (1973: 259).[2] Herein lies a further imperative for – and some difficulties associated with – any sociolinguistic analysis of contemporary political economy.

In any global knowledge economy, conditions must allow meanings to be appropriated, alienated, commodified, evaluated and exchanged *en masse* (Graham, 2000). The current global network of electronic and institutional media (including policy institutions), combined with the international regime of law concerning intellectual property, is the means by which these tasks are to be achieved on a global basis. Commodified artefacts of knowledge work must also *appear* more and less valuable. That is, the comparative values of different ways of knowing must be *qualitatively* established as more and less valuable knowledge commodities; they must be *seen as* more valued modes of knowing (Bourdieu, 1991; Graham, 2000).

Consequently, meaning-making processes in institutions of power are under specific *aesthetic* pressures to conform to technocratic conventions of elegance: presentations of high-value, high-power knowledge must look the part. Such aesthetic pressures are inculcated by institutional processes of mediation, the ultimate aim of which is to promote institutional modes of distinction as legitimate, powerful and valuable. In so far as mediation processes are

> central to this process of making distinctions and judgements; in so far as they do, precisely, mediate the dialectic between the classification that shapes experience and the experience which colours classification, then we must enquire into the consequences of such mediation (Silverstone, 1999: 13–14).

Today, the function of producing the perceived value of specific modes of knowing falls to national and supranational commercial and legislative institutions and, more specifically, to their associated 'mediation processes'. The way in which meaning is moved from 'one text to another, from one discourse to another, from one event to another', and which involves 'the constant transformation of meanings, both large scale and small, significant and insignificant' (Silverstone, 1999: 13).

Media theory assumes that the *means* by which people move and transform meanings between social contexts have social effects. Political economy assumes that the way in which we produce and distribute *values* has social effects. CDA assumes that the way people *language* (meant here as a verb) has social effects. Each facet of the synthesis I propose here is nothing more than a lens through which to view social change from specific *systemic functional* perspectives: from the perspective of mediation systems; from the perspective of *value-production systems*; and from the perspective of *language systems*.

Policy Discourses and Utopian Futures: Space, Time, Language and Values

> The future ain't what it used to be
>
> Yogi Berra

Contemporary policy language poses problems of temporality for discourse analysis because it invariably functions in the future tense. The purpose of policy is hortatory, not historical (Haskins, 1904); it is designed to 'get people to do things' and is therefore always future-oriented (Muntigl, 2000: 147). For millennia, policy-makers have developed many ways to create and promote imperatives for future ways of acting: by the allocation of resources, by legal coercion, by force and by propaganda. In many ways, though, these are the blunt objects of policy. A far more ancient and perennial method of getting people to do things is to prophetically create perceptions of value for new, unexplored and unknowable spaces that exist at a time–distance from the here and now – that is, to create *value* for some imagined future place *and* time (Bernier, 1992).

Whether as 'the next world' described by Plato (de Santillana and von Dechend, 1962); the future 'kingdom of priests and . . . holy nation' of the *Old Testament* (Exodus 19:6, in Küng, 1968 [1995]: 370); the more democratic 'holy nation' promised by the *New Testament* (in Küng, 1968 [1995]: 380–3); the mythical 'El Dorado' upon which the South Sea Bubble was built (Morgan, 1929); or the gold-fields of the 19th century in Australia and California (Marx, 1976), Utopian future spaces – imagined and real – have remained as a feature of political discourses since the beginnings of history (Voltaire, 1764 [1972]). Our official Utopias have been perennial 'places' to aspire to, places where life will be better, where, by 'simply passing on through the inevitable steps proposed by whatever particular ideology is in question, we are promised that we will re-enter Eden at a higher, more sophisticated level. Paradise is the first and last

Today's official Utopia is said to be located in cyberspace, with its high-tech knowledge or information economy. Here is a typical example of how our latest paradise is portrayed in the corpus:

> The information economy opens up new ways of doing every day activities – and it offers huge opportunities to all Australians.
>
> We can all choose to participate at our own pace, in our own time, in our own homes, in a truly global economy, a global society. In the global information economy, no one, no market, no information – nothing we may need or want – is beyond reach. The information economy opens up to us unprecedented convenience, flexibility, and choice about how Australians will live, learn, work, create, buy and sell. (National Office for the Information Economy [noie1: 541])

Many historical parallels could be drawn with the claims made for the techno-Nirvana in this description. But for my analytical purposes, three aspects are of interest.

The first is the *factual* appearance of the language – there are clear truth claims made for the existence of the Utopia, for its limitless bounties and boundaries, and for the general accessibility thereof. There are no explicit exhortations for action here. They are rare in policy. That is because today's policy authors cannot easily *command* constituencies to act in such and such a way, as if by royal decree or divine authority. They are compelled by technocratic convention to rationalize their '*proposals*' for action with seemingly rational statements of fact, or '*propositions*' (cf. Halliday, 1994).[3] A command, a kind of *proposal*, cannot be tested for truth. For example, the command, 'Go to the shop!', is neither true nor false. The commands of contemporary policy are often implied in, disguised as, or buried under piles of ostensibly value-free, objective, pseudo-scientific facts (Lemke, 1995). Nonetheless, the facts of policy are unquestionably oriented towards changing the future behaviours and attitudes of whole societies. The displacement between the *propositions* of technology policy and the *proposals* thereof, between statements of fact and imperatives for action, is usually operationalized by drawing on evaluative themes which must usually be inferred intertextually from outside the texts themselves (Graham, in press b). Evaluative themes get condensed with the thematic condensations typical of the policy genre because

> what is a proposition at one point in a text readily becomes 'condensed'... as a participant at another, and participants (especially abstract nominals) are often meant to be correspondingly 'expanded' by the reader into implied propositions through reference to some known intertext, as well as through reference to the immediate co-text. (Lemke, 1998: 43)

Thus, when readers expand thematic condensations, the evaluative, or 'orientational' dimension of meaning, which is inseparable from 'presentational'

The second aspect of interest is the *tense* of the truth statements. They appear to be set in the here-and-now. However, as I will show in the following analyses, by deploying *process metaphor* and by exercising the *potentiality* embedded in certain nominals, such as *opportunities*, policy authors strenuously, though almost invisibly, exercise the tense system to portray future and imagined states as if they actually existed in the here-and-now.

The third aspect of analytical salience is that the Utopia is presented as an extremely *Desirable*, and thus *valuable*, place. These three aspects constitute the main lines of analysis along which I show how social and geotechnical spaces, both actual and potential, are being prefigured in policy discourses to form the foundations of a new political economic form. In what follows, I identify and demonstrate the salience of *process metaphor*, the difference between how *realis* (actual) and *irrealis* (potential) spaces are expressed in policy, and my method for analysing evaluative meanings. I show how these aspects of language are helpful for analysing the way new economy discourses colonize and prefigure currently existing social and geotechnical spaces in order to commodify the most intimate aspects of human activity.

Analysis

Process Metaphor as Method

Halliday (1994: 109–43) identifies six broad categories of processes (or *verbs* in latinate grammar): *material processes*, or 'processes of doing', such as *hit, kick, push; mental processes*, or 'processes of sensing', such as *think, dream, see, hear; relational processes*, or processes that taxonomize, identify or assign attributes to elements in language, such as x *has* [y attributes], x *was/is/will be* [a kind of y], x *is* y*; behavioural processes* that refer to 'typically human' behaviours, such as *cough, laugh, shiver, shit; verbal processes*, or 'processes of saying', such as *said, promise, exhort, mean*; and *existential processes*, or those that claim actual or potential existence for something. Halliday's functional typology distinguishes between processes that relate to 'antithetical' but overlapping 'worlds' of human experience: 'the abstract world of relations' (being); 'the world of consciousness' (sensing); and 'the physical world' (doing) (1994: 108).

But, *process metaphor* allows participants in language to act simultaneously throughout these antithetical realms of human experience. The term *process metaphor* should not be understood here as the term metaphor is generally understood.[4] It is, rather, a form of 'grammatical metaphor' (1994: 342–9). In process metaphor, the process retains its grammatical standing *as* a process, but functions very differently according to Halliday's experiential taxonomy. It can imply action *throughout the whole of human experience all at once.* Here is a typical example from the corpus:

[1] The transition to a knowledge economy and society over the next few decades

In text [1], the phrasal verb *opens up* appears to function as a *material* process, a singular *doing* (Halliday, 1994). In the case of a more 'concrete' construal, one that might be deployed in more 'common-sense' context, such as *George **opens up** the shop*, the singular materiality of the process is clear (Martin, 1999). However, the process relates two highly condensed, extremely abstract nominal groups that compress myriad, complex and massive processes into static things. [*The transition to a knowledge economy and society over the next few decades* and *the possibility of massive productivity gains*.] Furthermore, there are temporally 'loaded' objects in both nominal groups related by the process.

In the first, there is a circumstantial element [*over the next few decades*], which confuses the temporality of the whole clause. In the second, there is a temporally loaded object functioning as head of the nominal group: *the possibility*. . . . The frozen temporal elements shift the apparent materiality and present-ness of the process [*opens up*] to different levels of abstraction across *time and space* [the countries of the OECD are moving *to a knowledge economy and society over* a non-specific period]. The effect is to free the process up, as it were, so that it operates semantically *across all the realms of human experience*, and not necessarily in any material sense at all. In fact, the phenomena to which the process refers need not even exist – now, or in future. In the policy genre, process metaphor is a deceptively powerful tool for construing future human *activity (time)* as a pseudo-spatial, fact-like *object* (*a space*).

We can see the rather surprising metaphorical scope of *opens up* in [1] by substituting other processes that retain the semantic sense of the OECD's proposition: *The transition to a knowledge economy and society over the next few decades* [*opens up*; promises; offers; brings; creates; reveals; shows; presents; indicates; implies; signifies; suggests] *the possibility of massive productivity gains*. But in a more concrete construal involving the same phrasal verb, there appears to be only one other choice that can retain a similar semantic sense: *George* [*opens up*, opens] *the shop*. Within the choices that retain the original semantic sense of the proposition in [1], we see that they would occupy positions on the *verbal* [promises, suggests]; *abstract-material* [offers]; *relational* [indicates, shows = *symbolizes*]; and *material* [creates, brings] planes of Halliday's process typology. In other words, process metaphor lets an abstract and highly compressed nominal group actor-like thing [*The transition to a knowledge economy and society over the next few decades*] grammatically loose among practically *all* the realms of human experience – the conscious, the sensate, the physical *and* the logical – by having for its object an irrealis, highly compressed nominal group.

Realis and Irrealis Spaces

My analysis distinguishes primarily between two distinct types of space *realis* and *irrealis*. The significance of process metaphor in policy language is that it operates officially in the subjunctive in order to regulate behaviour across 'large stretches of institutional time and space. It achieves this, first, by orienting [illegible] actions to[illegible]

that helps distinguish between past, present and future states is most usually expressed in redundancies between tense, mood and modality systems (Iedema, 1998), the functional power of *process metaphor* turns on the actuality⇔potentiality circumstance being embedded in the object to which the process is directed, whether the potentiality is realized literally, as in the words *possibility* and *opportunity*, or whether it is buried in the highly compressed nominal groups are typical of the policy genre. Herein lies the *aesthetic* ruse of process metaphor: when deployed, representations of *irrealis* states look like (are presented *as if* they were) *material action* in the here and now, as actually existing matters of fact.

Brief Notes on Evaluative Meaning and Annotation

Because they are so condensed, enormous amounts of evaluative detail can be unpacked from policy texts (Graham, in press b). However, rather than paying detailed attention to 'appraisal' resources that inscribe or evoke evaluations for particular elements in the discourses (Martin, 2000), or to the relationship between the 'predication and propagation' of values in the text (Graham, in press b), I use an adaptation of the broad categories described by Lemke (1998; see Figure 1) to describe explicit, implicit and propagated (intertextually generated) evaluations wherever necessary. My reasons for choosing a less detailed evaluative analysis are twofold: (i) to concentrate on the historically significant political economic aspects of the phenomenon I describe; and (ii) to highlight the role of process metaphor, which can conflate practically the whole spectrum of evaluative semantics into a single process, and greatly assist in the displacement between propositions and proposals.

Annotations Where 'evaluative condensation' is overt or implied, that is, when a Process, Participant or Circumstance collapses a pre-evaluated proposition that can be expanded into Lemke's rank shifted probe, *it is . . . x that*, I have underlined the evaluator concerned using broken lines and marked it with the evaluative dimension(s) condensed therein ([D] = *Desirability*, and so forth (see Figure 1). Process metaphors, their associated irrealis objects, and their spatial elaborations, are marked in **bold**. Where agency is attributed to the spaces being *opened up*, the Actor is underlined. Examples from the corpus quoted here are identified by file name and concordance word numbers (see Appendix 1 for a list of corpus documents cited).

The generic tendency in policy towards Necessity As I have noted above, although the 'presentational' content of policy texts is overwhelmingly propositional, the evaluative and intertextual ('orientational' and 'organizational') dimensions do most of the work in generating imperatives for action (cf. Lemke, 1995: 42). In more common-sense contexts, the hortatory function of language, which is the *essence* of the policy genre, is not usually expressed in factual assertions. The evaluative dimension of factuality is most usually expressed in positive, high-degree evaluations for *Probability* or *Warrantability*. But, in the policy genre, there is a great deal of 'metaphorical transfer *among* the evaluative semantic dimen-

Evaluative Dimension	Positive degree	Negative degree
[D] Desirability/Inclination	It is *wonderful* that John is coming	It is *horrible* that John is coming
[W] Warrantability/Probability	It is *certain* that John is coming	It is *unlikely* that John will come
[N] Normativity/Appropriateness	It is *essential* that John comes	It is *inappropriate* that John comes
[U] Usuality/Expectability	It is *normal* that John is coming	It is *unusual* that John is coming
[I] Importance/Significance	It is *important* that John comes	It is *irrelevant* whether John comes
[C] Comprehensibility/Obviousness	It is *obvious* that John will come	It is *mysterious* that John is coming
[H] Humorousness/Seriousness	It is *hilarious* that John will be there	It is *serious* that John is coming
[A] Ability /Difficulty [proposals]	It is *easy* for John to come	It is *difficult* for John to come
[Ut] Utility /Usefulness [proposals]	It is *useful* for John to come	It is *useless* for John to come

Figure 1: Evaluative resources for proposals and propositions (adapted from Lemke, 1998: 37)

1998: 47). The general result of metaphorical evaluative transfers in the policy genre is to create evaluations for high degrees of *Necessity*, which is almost invariably transferred – quite directly – from high degrees of *Importance*, and intertextually from expressions of high degrees of *Desirability* for given outcomes (Graham, in press b). Policy authors achieve this metaphorical feat by making evaluative themes extremely abstract and condensed; by nominalizing explicit evaluators and appraisal resources and casting them as agent-like things; by removing human agency from the texts; and by confusing temporality and tense in textual devices like process metaphor. The expectations created by the function of the policy genre also add impetus to metaphorical transfers.

The effect of evaluative transfers from claims for *Warrantability*, typical of technocratic propositions, to the implied *Necessity* for certain actions can be seen in the following example:

> [2] A great deal of effort **must be put into securing** [W:N:I:C] widespread public acceptance and actual use of the new technology [D]. Preparing Europeans for the advent of the information society **is** [W] a priority [I] task. Education, training and promotion **will necessarily** [W] **play a central role.** (eu3: 1, 525)

In [2] we see a highly modality truth claim being made for an imperative for effort on someone's part which ***must be put into*** *securing widespread public acceptance and actual use of the new technology*, the *Desirability* of which is presupposed. If we were to expand [1]

processes: the statement might sensibly be expanded as *it is very Important/ Obvious/True/Necessary that effort must be put into securing...* An evaluation for *Truth* can be construed because, as is typical of the genre, the whole text is agent-less. Even where we are told that something *must* or *should be done*, we are not told by whom (cf. Lemke, 1995; McKenna and Graham, 2000).

Describing the *Necessity* for agentless, nominalized action allows the exhortation to pose as a fact. After the proposal for action by unnamed Agents, we are given an explicitly evaluative (axiological) justification for the proposition, which is also cast as a statement of fact: *Preparing Europeans for the advent of the information society is a priority task.* Here we see how evaluations for *Importance* become translated *directly* into *Necessity* in the policy genre. In more commonsense contexts, *Necessity* is usually expressed as a high-degree of *Normativity* or *Obligation* (cf. Lemke, 1998; Martin, 2000). Translated into Lamke's (1998) rankshifted probe, the proposition says: it is very Important that someone prepares *Europeans for the advent of the information age.* Seen from the generic function of regulating behaviour, however, it says: it is very *Necessary* that someone prepares *Europeans for the advent of the information age*, i.e. that someone *must* prepare Europeans. We are not told why it is *Important* that Europeans are prepared, or who *must* do the preparing.

What we do see, though, is the relationship between an *irrealis* object [*the advent of the information society*], evaluative meaning tending to transfer metaphorically from *Importance* to *Necessity*, and the smuggling in of a second exhortation by what seems like a relational proposition: *Preparing Europeans* <Tok> *is a priority task* <Val>. Thus *education, training and promotion will* necessarily *play a central role* in the new economy. The 'is-ness' of the Tok ^ Val construction gets transferred by the 'must-ness' of the previous statement, and by the *Importance* intertextually embedded in *priority task* towards an even stronger evaluation of *Necessity* for future action upon the *education, training and propaganda* systems of Europe.

Opening Up Future Spaces: Gold Fever and Bubble Blowers in the New Economy

Being concerned with the subject of irrealis spaces, the first part of my analysis is centred on the process metaphorical usage in policy of the phrasal verb, *open up* and its various forms. In the corpus, 'open/s/ed/ing up' collocates with the irrealis objects, *possibility/ies* and *opportunity/ies.*[5] The *possibilities* and *opportunities* opening up are overtly spatial in their constitution. They are presented metaphorically as the spatial aspects of *irrealis* states; as the result of future ways of being, seeing, and *enacting* new spaces (cf. Fairclough, 2000).

Something on the value differentials between *possibilities* and *opportunities* is in order. *Possibilities* may be positive or negative potentialities in terms of *Desirability*, one of the broadest (or at least most highly elaborated) 'species' of value in the English language (cf. Lemke, 1998; Graham, in press b). Possibilities may be evaluated as *Desirable* or *un-Desirable* to varying degrees. *Opportunities*, however, are already pre-evaluated potentialities. They are positively evaluated for *Desirability*: *Opportunities* are always *Desirable* potential realities for *someone* and

moved from potentiality (*irrealis*) to actuality (*realis*). These broadest of evaluative orientations are expressed implicitly and explicitly in the data. Following, for example, is an explicit recognition that possibilities may be *Desirable* or *un-Desirable:*

> [3] As with other technologies that have become intrinsic [N] parts of everyday [U] life like the automobile, different [U:N] physical, social and economic configurations may prevail in distinctive [U] societies with particular [U] traditions, values and political preferences. The Net is no different, it **opens up possibilities, from the ominous** [-D] **to the utopian** [+D], for facilitating the development of new [+D] or the consolidation of old [-D] **social orders.** (oecd6: 2, 656)

Opportunities, however, are unquestionably *Desirable* potentialities, even if those potentialities are not available, or their *Desirability* not *Obvious,* to all:

> [4] However, an element of the population is likely to remain excluded [-D] from the **opportunities opened up** by e-commerce for a range of social and economic reasons.
>
> Whilst a number of publicly-funded initiatives, at **local, regional and national level, aim to improve** [+D] the **opportunities** for this 'e-excluded' group, the Team believes that better [+D] co-ordination of these initiatives is needed [N] – with resources targeted at the most effective [+D] programmes – which **must also be** effectively **marketed** [+N:I]. (uk_eva~2: 32, 909)

In [4] we see the interrelatedness between evaluations of *Desirability* and *Importance* for realizing *opportunities.* The hortatory function of policy is again expressed in *Necessity: initiatives* are required to *improve opportunities* and these *initiatives must be effectively marketed.* There is also a subtle reference to *degrees of Desirability* where *opportunities* are concerned; for some, namely this *'e-excluded' group, opportunities* can be *improved.* That is, they must be made to appear more *Obviously Desirable* than they currently are. Thus, the express need to improve the *opportunities* by means of *marketing* specific *programmes* also implies that this *e-excluded* group lacks the *Ability* to see *opportunities.* Evaluative force is propagated for the *Necessity* of making sure everybody can at least *recognize* opportunity spaces in the new economy, at *local, regional and national levels.*

Language and the Preconditions for Space in Political Economy

As I said above, there are four preconditions for the development and formalization of new spaces of politico-economic significance. In the following sections, I show that these are indeed present in new economy policies. The first aspect is the creation of new geotechnical spaces, but this is the least elaborated aspect of space in the corpus. The second is the pre-existence of informal relations in that space and is the main focus of the corpus. The third is a legal infrastructure for formalizing human relationships. The fourth is the means to patrol, police and defend [illegible]

with 'air, land, and sea', as a 'battlespace', thus committing the world's most expensive and destructive war machine to patrolling and policing the boundaries of electrospace (Brewin, 1998). Further, this analysis is literally an analysis of texts produced within already existing, globally linked, law-producing systems. Therefore, I firstly focus on the activity spaces – the informal relationships – that are being prefigured for formalization in the new economy before moving on to identify the very different way in which electrospace is being prefigured in language for privatization.

Road Rules on the Way to Utopia: Regulating Activity Spaces

The new economy is most often construed as a space created by ways of doing things, which is merely to say that it is *technologically contrived* space, because, 'broadly speaking, technology is *how* we do things' (White, 1940: 15):

> [5] The information economy **opens up new** [D] **ways** of communicating with each other and doing every day [U] activities – and it **offers huge** [I] **opportunities** to all Australians.
>
> [. . .]
>
> And it no longer matters **how far away we are** from each other, because **it takes no time to get there.** This is the information society. (cital: 635)

In other words, the future *activity space* with its *huge opportunities* is created by commodifying *time* between people via *the production of speed*, the direct result of which is to *destroy* time between people (Armitage and Graham, 2001). In fact this statement says that the space between people is where *huge opportunities* lie, as they must in any process of mediation (Silverstone, 1999). These *new ways* of doing things (the very definition of new technologies) are paths to the promised land. Throughout the corpus, there are positive evaluations of *Desirability* for *new*-ness, 'traditional', or 'old', ways of doing things are 'barriers' to progress.

In any case, the Utopia is a space of new activities into which specific institutions are firstly *moving*:

> [6] Telecommunications companies . . . **are moving into e-commerce and application development** and finding new value [+D]. They **are moving more into** Internet Protocols and data transmission. This **is opening up** a whole lot of new **opportunities** for them . . . **in this new environment** that can mean developing software. (ausbey~I: 40, 801)

Here are direct and explicit links between what people do, the *new environment* created by doing old activities in *new ways*, and the perceptions of value that accompanies the creation of new activity spaces. People will find *new value* there.

New Views and New Ways: Discourses of Seeing, Being and Acting

construed in video-geographical terms, as new spaces that would be seen more concretely: *vistas, horizons, perspectives* and so on:

> [7] In the future, the main [I] **possibilities** for manufacturers, whose **horizons** for the moment remain primarily European [-D], will be linked to **the expected opening up of the American market** . . . . (fr3: 16, 736)

In [7], the process metaphor is nominalized and rendered part of a projected nominal group organized around a disembodied expectation. The strategic advantage of nominalizing the process metaphor here is to submerge an admission of subordinate dependency. Future *possibilities* for French *manufacturers*, whose *horizons* are currently limited (an implicitly un-Desirable state in a global economy), *will be linked to expectations* of an irrealis space *opening up.*

The manufacturers' *main possibilities* are linked to an *expected opening up,* (another set of *possibilities*) which are shifted towards higher *Probability* by being *expected* by nobody in particular. Put differently, [7] says: *manufacturers' future opportunities depend on whether the American market opens up;* that is, whether it is 'liberalized' or 'deregulated'. Here is where the admission of dependency comes to the surface. To be realized as overt process metaphor, this construal would have to read something like *the expected liberalization* (i.e. opening up; deregulation) *of the American market* ***will/would open up*** *the main possibilities for manufacturers* . . . .

New *horizons* and new *vistas* go together, but the vistas opened up by the *power of tomorrow's communication technology* are *vistas* on the most intimate aspects of social interaction, and on the bodies and minds of the people who constitute these:

> [8] . . . the power of tomorrow's information technologies **will open up new vistas** by radically improving the capacity [D] to communicate and simulate. . . . Once liberated [D] from some of **the constraints of cost, time and space** of traditional [-D:+U] education, learning systems that encourage individual creativity [+D:-U] may take over.
>
> Biotechnology **will open up new vistas.** The identification of genetic information and applications of genetic engineering are already making their mark in society and will profoundly [I] affect many facets of everyday life [U] in the future. Human health, food production (both livestock and plants) and food processing are all likely to be influenced by advances [D] **at the interface of genetics and technology.**
>
> Work is already well under way on the human genome; by 2005, at the latest, scientists should know the full DNA sequence of **a** typical [U:N] **man or woman.** (oecd7:1,164)

There is clearly a colonizing imperative in all of this. Opening up and securing new *vistas* is *Desirable, Important* and therefore *Necessary.* The spaces are of the most intimate kinds. *Cost, time and space* are *un-Desirable constraints* that will be cast off to enable new kinds of *education.* Once again, the destruction of *time and space* between people makes room for qualitatively new spaces. The map of the *human genome should be* complete shortly, and the sequencing of *a typical man*

skin, eyes, hair and teeth be? What will they look like? How would they smell? Who will decide what are *Normal* and *Usual* physical and intellectual traits? If 'typical' men and women are part of *the new vistas* that *biotechnology will open up*, one might well wonder what the authors' meaning of *individual creativity* in education might be.

Legal Spaces

The geographical metaphors of *trails* and *paths* provide the nexus between social activity and its legal regulation. In the following [9], legal expertise and legal language are the means by which *new paths can and must be put forward*, another geographical feature of the future space of political economic activities:

> [9] France has a meaningful [I] voice to be heard in this respect, which should amount to more than [N:I] just exporting its 'model' of data protection; given the country's experience [N] in these matters, France **must and can put forward** propositions that **open up new paths.** (fr2: 14, 231)

It is legal *propositions that open up new paths*. New legal *trails* are being blazed in France, ones of a very specific nature and orientation:

> [10] The current positive law covering communications would not be capable [A] of serving as a basis for the entire analysis relating to criminal liability. The first cases brought before the courts **open up certain trails** which confirm that inspiration can be drawn from foreign examples. It then becomes appropriate [N] to formulate recommendations which are based both on a clarification of the relevant [N:Ut] rules and recognition of the role [I] of a joint regulatory body. (fr2: 64, 483)

The laws are concerned with intellectual property, with the ownership of the products of people's minds, mouths and relationships. 'How does one become an owner of productive stock? How does one become owner of the product created by means of this stock? Through *positive law*' (Marx, 1844 [1975]: 295). The legal definition of existing social relations is perhaps the most significant aspect of any transition in human social relations. It is the means by which formal feudalism (vassalage and fiefdom) and capitalism came to be (Bloch, 1940 [1961]; Hobsbawm, 1962). The mere mention of a knowledge economy implies new commodity forms and property laws, which depend on the codification of new types of *property*. New *positive law* is needed to own the new kinds of formally defined products of labour, products of everyday human interaction.

(De)Regulation, Information and Infrastructure

There is a great deal of causal circularity in the corpus where *regulation* and *liberalization* are concerned. The circularity is typical of the genre (McKenna and Graham, 2000). For instance:

[11] The gradual **opening up** of the telecommunications market **is leading to** profound [I] changes in the structure of this sector of activity and considerably speeding up its growth [D:I]. (fr3: 17, 819)

In other words, in [11], *the gradual opening up* of the infrastructure *market* is causing *changes in the structure of the sector* as well as *speeding up its growth.* Liberalization is *prima causa,* not an effect of regulation. But the European Commission (EC) says that:

[12.1] Provided the necessary safeguards are in place, **opening up** infrastructure provision **will underpin** the further development of the telecommunications sector, and this development is necessarily **at the heart of the transition towards the Information Society in the European Union.**

[12.2] Liberalisation of infrastructure will reinforce the benefits [D] of the liberalisation of telecommunications services by encouraging innovation and the exploitation of the new technologies, and by **opening up** greater [I] **possibilities** to provide new services in **new ways** [D]. A clear regulatory framework and timetable is required [N] [. . .].

[12.3] In the longer term and as integrated or multimedia services and applications develop, a regulatory framework will be required [N] that addresses the issue of **convergence between telecommunications and broadcasting.** It is already possible technically to use communications infrastructure from each of these domains to provide services in either area.

[12.4] **The development of the Information Society** and of the new integrated applications will make it increasingly difficult, to distinguish [A:0] between the **two service areas. Opening up** infrastructure provision is an essential [N] step for **the future development of the telecommunications sector and the Information Society,** and this document puts forward the measures and principles that are required [N] at a Union level to provide the necessary regulatory framework. (eugpv16c: 45, 542)

In [12], we see the confusion of causal circularity fully blown in which regulation and deregulation are concerned: *provided safeguards* (regulations) *are in place, opening up* (deregulating) *infrastructure provision* will *underpin* further growth of the *telecommunications sector.* This in turn will lead to Europe's transition to an *Information Society.* A dichotomy is established between the space of communication 'pipes', or *infrastructure,* for telecommunication and the *services* that are sold 'through' the pipes.

According to the EC, *the liberalization of telecommunications services* is exceeding that of 'pipe'-space provision. So Europe needs both *liberalization of infrastructure* as well as *liberalization of services.* But *liberalization* [deregulation] requires *a clear regulatory framework* [set of regulations]. But the processes of regulation and deregulation will necessarily get further confused because the services and infrastructure of *telecommunications* are getting confused with those of broadcasting. To add to the confusion, *the development of the Information Society* will make it more *difficult* to tell the difference between telecommunications infrastructure and broadcasting. So even more regulation will be required for continuing

This is a schizophrenic worldview given the appearance of sanity by the process metaphorical deployment of the *greater possibilities* that are *opening up* in paragraph [12.2]. Evaluations for the *Necessity* of new *regulations* appear as the result of *Necessary deregulation*, or *liberalization: deregulation of infrastructure* is necessary to *open up* the *possibilities of the Information Society*. Safeguards are *necessary*; regulation is *required; opening up infrastructure provision* is *essential*. Nobody is doing the *needing* and *requiring*. All this *Necessity* for regulatory action is predicated upon the *Desirability, Inevitability* and *Importance* of the *Information Society*, which, according to text [12], does not yet exist, except as a space of *greater possibilities*.

Market Spaces

The most common irrealis spaces which are to be opened up in the corpus are market spaces:

> [13] <Heading> Internet **opens up** global **markets**
>
> **The market** must lead. The government's first job is to remove **obstacles**, and **champion** [D:I] **the way ahead**.
>
> <Heading> Setting out **a vision and a clear direction**
>
> Where government intervenes, the results must **progress us towards** becoming a knowledge-driven economy [D:I]. We must have a sense of urgency. [N]. We've won against the odds before . . . we can again [U:D].
>
> Throughout our history, New Zealanders have shown a remarkable ability [A] to respond in a positive way to world events [D]. Just as the first shipment of refrigerated meat aboard the SS Dunedin in February 1882 **opened up new overseas markets** for our primary products, so the Internet **opens up new markets** for our knowledge exports. These include such products as software, technology, education, film, television, Web design, telecommunications, financial services, call centres and others, all of which can **travel down** the information **superhighways** to **the world at the speed of light**. (nzknow~1:17, 456)

The authors claim that the *Internet opens up global markets*. While *open up* does not function overtly as process metaphor in this text [13], the metaphorical function is buried in the relations over a stretch of text much longer than any single clause. The phenomenon is worth investigating.

All the spatial objects [markets] that are being *opened up* appear to be past or present actualities. Semantic probing reveals that the authors seem to mean that the Internet *clears the way to; exposes; gives access to markets*; and so on, all of which are realizations on the abstract-material plane. Nevertheless, the authors are clearly concerned with a new territory of opportunities that is *irrealis*. The literary metaphor of the heroic, pioneering trailblazer is deployed to portray the government's role: *to remove obstacles, and champion the way ahead*. Within the first two sentences, the New Zealand propositions become either circular or redundant because of two very different meanings for *markets* and *market*. The *Internet opens*

means a space defined by the activities of producing, buying and selling commodities. The second, in which the *market must lead*, refers to *market* logic, principles and values.

The comparison between 'the new' economy and 'the old' highlights the process metaphor and raises some interesting questions about the nature of *market spaces*. If, as the report claims, a *shipment of refrigerated meat opened up new overseas markets* as early as 1882, then the authors are not concerned with the existence of new *geographical* markets, as none have been 'created' for many decades. Not even the most confused technocrat could buy literally into the assertion that *a shipment of meat opened up markets*. Here is where the process metaphorical function becomes clearer. It has been buried under piles of extremely condensed, ultimately nonsensical propositions.

The *refrigerated meat* did not depart all by itself from New Zealand in search of foreign lands to *open up new markets*; it merely *signified* the existence of new markets, or, more precisely: (i) the newly acquired *Ability* that some New Zealanders developed to keep their products fresh during long sea voyages: the medium of refrigerated ships; (ii) the pre-existence of *Normative* commercial and legal relationships between New Zealand institutions and those in other countries that made trading shiploads of meat practical and legal; (iii) the conditions that made New Zealand's refrigerated meat a *Desirable* commodity for people in other countries; and (iv) the ability of New Zealand farmers to produce enough meat to establish practical commercial and legal relationships throughout the world. Thus, the use of *opened up* here collapses all sorts of Participants, Circumstances, Relationships, Activities, Processes, Evaluations and other abstractions in the strange clause that claims *refrigerated meat opened up new markets*.

Extreme expressions of neoliberal dogma are possible when expectations of the irrealis are overlaid on present states according to neoliberal 'competitive market' dogmas:

> [14] With the advent of information and communication technologies, **the vision** of perfect [D] competition **is becoming a reality**. Consumers can now find out the prices offered by all vendors for any product [D]. **New markets have opened up**, and prices have dropped [D]. When businesses can **deliver** their products **down** a phone line **anywhere, in the world**, twenty four hours a day, the advantage goes to the firm that has the greatest value addition [D:I] the best known brand [D:I], and the lowest 'weight' [D:I]. Software provides the best example: huge added value [D:I] through computer code, light 'weight' [D:I] so that it can be delivered anywhere at any time [D:I]. (nzknow~1:3, 920)

In [14] we see at least one reason why the market space of the new economy is construed so reverently in technocratic policy statements. Contemporary economics is well known for its lack of ability to cope with the unpredictable muck of reality, partly because of an over-reliance on the assumption that all Participants in markets can have perfect information about prices and products (Saul, 1997). So by creating perfect information throughout the whole of human-

If nothing else, this is an interesting comment on the problem of space in contemporary economic thinking. Space between people causes problems because information about products and prices travels very slowly from place to place, if at all (most people in Australia will not know the price of rugs today in, say, a particular shop in Iraq). Thus, in the minds of these policy authors, when space has no meaning, which is to say, when the time–distance *between* people and their exchanges is reduced to zero, then reality will fit the ideal of *aspatial* econometric theories. But at the same time, new market spaces will be created. Once again, we see the *Desirability* of *destroying* one aspect of space through the production of speed in order to create another qualitatively different space that is *purely commercial.*

The process metaphor is again less obvious in [14], partly because of its past tense (*have opened up*), partly because it is agentless, and, partly because of the level of abstraction in the single Participant, *new markets.* Markets are activity spaces, mass activities involving many People, Processes and Things. There are many different kinds of markets: labour markets, financial markets, software markets and so on. We are left unsure as to which *new markets have opened up.* But if we take the *advent of information and communication technologies* as the 'hyper-theme' (Martin, 2000), and assume that *perfect competition and consumers* having perfect knowledge of *prices* are predicated upon the hyper-theme, then the metaphorical function becomes apparent. Put more directly, the relationship is this: *With the advent of information and communication technologies new markets have opened up* [in the first instance, *appeared; come into being; have become accessible,* and so on]. But, even with that relationship made clear, the scope of the metaphor is still not entirely exposed. To see it, we need to consider time and tense.

The temporal relations between ostensibly linked propositions in [14] is confusing because of mixed tenses: the *present-ness* of *is becoming a reality,* and of *can now find out,* conflicts with the *past-ness* of *have opened up* and the *future*-ness of *when businesses can deliver their products down a phone line* (I am assuming that a future **when^then** construction is implied here because the condition of delivering *all products* down the phone line is nowhere near being a reality). We are left unsure as to which elements are causally predicated upon which others, and of the qualitative aspects of the previously *opened up* markets. Presumably, the markets that the authors refer to must have been *opened up* prior to *consumers* having access to price knowledge. The confusion of *present*-ness, *past*-ness and *future*-ness, and the consequent lack of clear causal relationships, makes the propositional content elusive: while perfect competition is construed as a result of *information and communication technologies, new markets* are already presupposed in the availability of information about prices and products. The ability of *businesses* to *deliver their products down a phone line* appears to be set in the future, except for where software and some forms of money are concerned. But in the next paragraph, *the increasing size of the market* is again *opened up by these technologies,* resulting in more *competition,* while *products with a high knowledge component* – those that *can* be delivered over the phone – appear in the present.

When all this is unpacked in terms of causality and temporal relations, the

its producers and its prices are *already* present: new technology *makes these available; exposes them* to competition; *relates* them to all the others; *signifies* their existence to people, along with their *Significance; creates* markets as social and symbolic spaces of interaction; and *facilitates* awareness of all participants in the market process to all others, thus *creating perfect competition.* The superficial singularity and materiality of *opened up* appears to be something that has already happened. However, it collapses and confuses causal relations, uniting past and future happenings, awarenesses, possibilities, knowings and doings for all the participants in the marketspace of the knowledge economy, thus bringing into being an ideal state: *the reality of perfect competition.*

In this *vision,* space is stripped of its economic significance. It is a space constituted by pure and immediate (albeit thoroughly mediated) activities, all of which are conducted at light-speed. It is a space of *pure exchange,* in which *the only activity is exchange itself.* However, a foundational condition for any new economy is the redefinition of geotechnical space, the concrete space *within which* time-bound, commodified human activities are to take place. That space is the focus of the following section.

Policy and Electrospace: Enclosing the Foundations of the New Economy

> Nothing is property unless it can be reduced to possession and exclusively occupied and held. The newspapers of Washington D.C., called attention . . . to the purchase of space overlying a lot of ground by the owner of a tall building adjoining, in order to secure the right to the perpetual use of whatever light and air might fill that space. Air drifts in and out with every zephyr, and light passes through at the rate of 186, 000 miles per second. The purchaser can only own so much of them as he can use. What [was] bought was something more imponderable than light. In economics it is known as land, or natural resources; in everyday English it is space.
>
> (Childs, 1924: 520)

All of the future spaces that are elaborated to any extent in the corpus are symbolic, time-bound activity spaces, social spaces created by people's *labour* – things people do, or *must* do to reach Nirvana. Whether metaphorically referring to vague, irrealis states of being, to extant markets or to currently protected social activities, what is said to be *opening up* in the policy corpus are *possibilities* and *opportunities* for reconfiguring, redefining and further commodifying existing human activities: *education, biological processes, thought, art, language services, cultural production, imagination* and so on, none of which *are new in any sense whatsoever.* They are existing activities that are to be formally redefined for 'removal' to, and commodification within, a 'new' geotechnical space.

Throughout history, the *meaning* of geotechnical spaces – that is to say people's *formal* relationships with each other *in relation to* particular geotechnical spaces (such as the relationship between lord, serf and land in feudalism and capital

electrospace is the space of most significance in the current transition. Electrospace 'is to communications today as land is to crops and water to fish. It is a peculiar natural resource, one whose politico-economic and social aspects have largely been ignored by social scientists' (Smythe, 1981: 300; cf. Childs, 1924). And that remains the case in the corpus I have analysed so far.

The significance of electrospace cannot be understated in the current environment. Until quite recently, electrospace was considered to be 'world property', and 'one of the most important bases of politico-economic power' throughout the world (Smythe, 1981: 307). But today this source of *power* is being privatized on a global scale (Federal Communications Commission [FCC], 1998, 2000; International Telecommunications Union [ITU], 2000). Unlike copper wire, fibre optics or satellite infrastructure, *radio spectrum is the global, finite, non-depletable, concrete resource upon which any global knowledge economy must eventually be built* (Rosston and Steinberg, 1997).

Quibbles over the ownership of radio spectrum may seem mundane in terms of what is being proposed in the new economy corpus: namely, the commodification of practically everything that makes humans human (and inhuman). But it should be noted that the global privatization of bandwidth is an historically unique proposal, and something that the new economy cannot proceed without. Electrospace is *objective* space, the global enclosure of which is presupposed in global policy. Its *meaning* remains largely unexamined in policy. The privatization of electrospace is literally an attempt to enclose conscious human experience on a global scale (Graham, in press a). Today, there exists a developed system of international institutions that provide the legal infrastructure to define and formalize social interaction; to make property, commodity and contract laws; and to enforce them on a global scale. Set apart from this 'international community', there is a small group of highly specialized legislators charged with privatizing electro-space. In the following section, I show how their discourses differ from the globally propagated new economy discourses, with which most readers will be familiar.

Electrospatial Metaphors

The most obvious difference between the discourses that are deployed to commodify social activity and those deployed to privatize electrospace is the metaphorical construals of the space. In the new economy corpus, *bandwidth* is mentioned 198 times in 1.3 million words. Only *once* is it discussed in terms of 'available electromagnetic space', and even then it gets metaphorically confused with data transfer rates and commodity forms:

> [15] **Bandwidth refers to the range of frequencies,** expressed in Hertz (Hz), that can pass over a given transmission channel. The **bandwidth determines the rate at which information can be transmitted** through a circuit.
>
> The phenomenal growth projected in **electronic commerce will significantly affect the demand for bandwidth.** The growth in online transactions for intangibles

In Australia, **demand for bandwidth is expected to grow strongly** for the retail trade; property and business services; education; and health and community services sectors over the next five years. (au_kba: 7, 622).

The authors of [15] confound data transfer rates, commodity categories and also identify bandwidth as *a kind* of space [*the range of available frequencies*]. It is a most perfunctory and confused treatment of what is actually being proposed for the future of electrospace. None of the corpus documents identify the fact that electrospace is a naturally occurring, limited geotechnical space *which must be occupied monopolistically* to be part of any formal political or economic system. To see the discourses being deployed to prefigure electrospace, it is necessary to step outside new economy discourses into the specialized realm of telecommunications policy.

Even this small group of legislators who are charged with privatizing electrospace seem confused. Their language is shot through with all the metaphors and pioneering images that adorn the imperialist mindset. The spatial aspects of the discourses are quite clear. They are marked in bold:

[16] I truly believe that encouraging **more bandwidth**, particularly, to residential consumers in the country, is the next great frontier in communications policy.

As I was saying, **bandwidth is the great::: the next great frontier** in communications policy. And I want the hallmark of this Commission's work to be that we encourage the competitive provision of high speed networks and services using any appropriate technology for all Americans **wherever they live, at home, at work, in schools, libraries, hospitals, whether they live in cities or in rural areas, on reservations.** Wherever there's demand, **there should be bandwidth.** (Kennard, 1998 in FCC, 1998)

Commissioner Kennard's [16] panegyric about the deregulated supply of electrospace implicates the same expansive aspects of social life as those in the policy directed at commodifying human activity. But this time the talk is referring to foundational, concrete space – *newly privatizeable property* – not something that there can be suddenly *more* of by the mere fact of legislative *encouragement.* Electrospace cannot be supplied like so many pounds of bananas. Like land, electrospace can only be *allotted and occupied.* The supply of electrospace cannot be increased any more than the supply of land can. The metaphorical aspect of the language is directed towards *realis* space – the *next great frontier* is an all-encompassing, singular and *global* expanse of *real estate.*

The privatizing talk is marked by the liberatory metaphors that have accompanied such revolutions throughout history (cf. Marx, 1846 [1972]; Fairclough and Graham, forthcoming). Process metaphor plays no part. In the following text, we have another commissioner bidding a hero's farewell to national electrospace:

[17] I think **this is an extraordinary crossroad** in our intellectual thinking with regard to communication services, and we should keep that in mind. In a sense

> communication services we provide to the public, but as well in **the regulatory structure that was built up and served well**, and to a great degree, administering national policy with respect to those sorts of systems.
>
> And so, this really is **one of the many opening salvos** of an important transition, both in terms of the way we provide communication services and the way that we regulate them. (Powell, 1998 in FCC, 1998)

This US warden of electrospace, poised at a *crossroad* in *thinking*, fires off *salvos* whilst *crossing the Rubicon*, bidding fond farewells to old worlds, their *regulatory structures* and their *limitations*. He enthusiastically mixes historical and spatial metaphors to confuse medium, message, regulation systems and the products of human consciousness. The effect is to *entirely obscure* the meaning of privately owned electrospace. Past, present and future *collapse* in these metaphors. Space and time become warped, as the mythical conquests of ancient Rome collide with the prophetic promises, opportunities and possibilities of *globalized* electrospace. Just as the purveyors of new economy policy turn the time-bound activities of people (*labour* in the present context) into a spatial *object*, and faced with a perennial, non-depletable, concrete space, the technocrats of electrospace turn their spatial domain into *time*. It is as if by mythologizing electrospace, by turning it into an object of conquest, it can be made to seem as if it were a *product* of human activity rather than the natural phenomenon it is.

In this policy realm, the push for privately owned electrospace is underpinned by a single spurious assumption, because of the digital nature of our new media environment, communication between people has become *qualitatively indistinguishable:* 'I would say that if not already, in the very immediate future, it gets rather basic. Bits is bits. Voice is data. Data is voice. Video is data. They're all the same' (Chrust, 1998 cited in FCC, 1998). There is much in history to refute such assertions: 'bits is bits'; radio waves is radio waves; talk is talk; space is space – emphasizing the self-identity of any medium is to miss the whole significance of *mediation as a process* that involves people, their cultures and their historical and extant knowledge economies (Silverstone, 1999). We might as well say 'trucks is trucks', regardless of whether they are transporting nuclear weapons, wheat or anthrax. From such a perspective 'all roads lead to Rome'. The rest is so much irrelevant detail.

A Macro Synthesis of the Meaning of 'Activity' and 'Property' Policy

In all of this – in the privatization of formerly common property and in the global regulation of human activity at the most intimate levels – we see an incipient prefiguring of what policy-makers and telecommunications industry experts think should happen in the irrealis world of the knowledge economy. The symbolic activities of humans are to be commodified and traded within a privatized global realm of *electrospace*. The unifying principle underpinning both 'types' of policy is that the new economy will encompass and commodify *all* aspects of human activity *everywhere*, and that it will do so under the commodity logic of capitalism.

need that allegedly underpins the putative *Necessity* of it all is *never questioned.* Regardless, the policy concerned with spectrum ownership is determined to 'reach' people *wherever they live.* Similarly, for policy concerned with those aspects of humanity that are to be modified for, and commodified within, the newly acquired global space include how people *live, learn, work, create, buy and sell.* Put simply, the privately owned, concrete property element will ideally extend to surround and enclose all of humanity; the logic of commodification will ideally infuse every aspect of what it means to be human.

Conclusion

It is not surprising to find that policies produced in an age dominated by a perverse, falsely individualist, neoliberal economics have the most personal aspects of people as the primary focus of the commodification process. We owe such an oppressive global condition to the failure of political economy to understand its object; namely, how human life gets to be a commodity in the first place. Nevertheless, neoliberal economics has become ultimately successful in dominating administrative logic and colonizing the channels of public opinion throughout much of humanity. But political economy and its policy-makers continue to *ignore* space. This is all the more pronounced considering that we are in the historically unique situation of seeing the creation of new private property on a global scale – the global 'privatization' of *electrospace.* It is the single largest continuous expanse of 'arable' space we can possibly realize under existing technical conditions. Consequently, we are in the situation of seeing the creation of the largest division of '*property owners* and propertyless *workers*' in history (Marx, 1844 [1975]: 322).

At the same time as 'the digital divide' is being loudly and roundly touted as the issue that most needs addressing today by one group of legislators, another group of legislators is busily, though on the whole invisibly, working towards the only possible means by which such a fundamental division can be created and sustained. The entire global mass of new economy policy entirely ignores the meaning of this new form of private property, focusing instead on rationalizing the commodification of human thought, language, art, imagination, communication, creativity and emotion. These are the activities of the propertyless knowledge worker that will be commodified in the institutional edifices that control the medium through which all electronically mediated experience must eventually pass. Should full technological realization of the property element prove to be realizable (there are doubts that this can be accomplished), the implications cannot be understated: it would amount to the commodification of *every* aspect of humanity.

Moreover, because it has been the politico-economic basis of power since the advent of radio, the privatization of global electrospace is essentially the privatization of a global political power base. What is now a barely covert influence in world politics must, if the property [illegible]

structural dominance on the part of the future owners of electrospace. What follows from that – the alienation of thought, language and the most intimate aspects of biology – is the apotheosis of a pathology that is oriented to the legal definition and ownership of others' lives, of their life energies and of the products of these. The gene pools of entire populations are now being traded as if they were stamp collections. The current process is, or will be, at its most complete if and when the irrealis objects being claimed process-metaphorically in 'new economy' policies are codified at law, and when the electrospace through which such commodities are to be exchanged is no longer public property by default. The language of policy *is* the operationalized discourse of contemporary political economy. For this reason, if for no other, a sustained critique of policy language is necessary, though perhaps not sufficient, for positive change.

Acknowledgements

Notes

1. The term 'electrospace' was coined by Hinchman in 1969 (cited in Smythe, 1981: 300).
2. The term 'exchange value' stands in co-relation to 'use value' (Marx, 1976: 167). It should be understood that the two are *strictly* relational terms: every object of utility (use value) has potential exchange value, and the 'term 'use value' can . . . be applied to all manner of objects, activities and events in particular social and natural settings' (Harvey, 1973: 154).
3. According to Halliday (1994), the difference between *propositions* and *proposals* is that propositions can be tested for truth whereas proposals cannot. I adopt a modified distinction put forward by Thibault (in press) which emphasizes the *attitudinal* dimension of language, thus allowing for a 'prepositional attitude' to be expressed about a 'something' that cannot immediately be tested for truth, such as an arguable claim regarding 'a possible future state of affairs'.
4. Although Shakespearean 'conversion-metaphor' is somewhat similar in function and form (*Oxford English Dictionary*, 1986: 531).
5. I analysed the corpus using *Wordsmith Tools* software.

Medical Discourse: Sociohistorical Construction

B.L. Gunnarsson

Introduction

Scientific language and discourse emerge in a cooperative and competitive struggle among scientists to create the knowledge base of their field, to establish themselves in relation to other scientists and to other professional groups, and to gain influence and control over political and socioeconomic means. In every strand of human communication, language and discourse play a role in the formation of a social and societal reality and identity. This is also true both of the formation of the different professional and vocational cultures within working and public life and of the formation of different academic cultures.

Historically, language has played a central role in the creation of different professions and academic disciplines, and it continues to play an important role in the development and maintenance of professional and institutional cultures and identities. Societal, social, and cognitive factors all make important contributions to the construction of professional cultures. Professionals try to create a space for their field within society. They try to establish themselves in contact and competition with others within their group as well as with other groups. Their knowledge base and its linguistic forms are created in a societal and social framework.

Diachronic Studies on the Development of Scientific Genres

A constructionist perspective on the emergence of scientific discourse and text genres is found in various traditions. Within the tradition of sociology of science,

Source: Keith Brown (ed.), *Encyclopedia of Language and Linguistics* vol. 7, Article 2360.
2nd Edition, 2006, 709–717.

several studies have been devoted to analyzing the role of texts in the establishing of scientific fact. The scientific field is seen as a workplace, a laboratory, where social rules determine the establishing of facts and the rank order of the scientists. Knorr-Cetina (1981) was one of the first to describe the writing up of results as a process of tinkering with facts rather than a knowledge-guided search. Latour and Woolgar (1986) described the social construction of scientific facts as an antagonistic struggle among scientists, leading to a purposeful diminishing of the results of others and a leveling up – to a generalized level – of one's own results.

Bazerman (1988) studied the rise of modern forms of scientific communication, focusing on the historical emergence of the experimental article. A social-constructivist approach in relation to written texts is also found in Bazerman and Paradis (1991), which examined the important role played by texts in profession building. Textual forms and definitions are found to impose structure on human activity and help shape versions of reality. Texts are shown to play powerful roles in staging the daily actions of individuals, and to be important factors in the rise of action. In Gunnarsson *et al.* (1997), which examined both professional written communication and spoken interaction, the central theoretical issue is how language, written genres, and spoken discourse are constructed as successive and continuous interplay between language and social realities. A sociorhetorical perspective on the scientific genre is also developed in Bhatia (1987), Swales (1990), MacDonald (1994), and Berkenkotter and Huckin (1995). The emergence of the English scientific text genres has been analyzed in several important works, including Atkinson (1999) and Valle (1999). Extensive studies have also been made into scientific written communication in other languages, e.g., German (Standard German) (Schröder, 1991) and Swedish (Gunnarsson, 1997, 1998, 2001a; Melander, 1991, Näslund, 1991). The differences between academic genres developed within different national cultures have also been analyzed from a socioconstructivist approach, e.g., Mauranen (1993).

The Construction of Professional Discourse

In this article an exemplary picture of the emergence and development of medical written discourse will be sketched. In order to understand the historical development of professional medical language and communication in its rich and varied totality, we must study the dynamic processes behind the construction of medical language.

In this dynamic process, three main layers are distinguished: one relating to **cognitive** types of activities, one to **social**, and one to **macrosocial** or **societal**. Professional culture is built up via these layers, which means that all three must be considered in order to get a full picture. Written texts as well as spoken discourse are constructed as cognitive, social, and societal activities within the different professions and branches of working life. (The term 'profession' is here used in quite a general sense, including academic as well as nonacademic discourse.)

If we begin by considering the **cognitive layer**, we find that each profession has a certain way of viewing reality, a certain way of highlighting different aspects

of the world around it. Socialization into a profession means learning how to discern the relevant facts, how to view the relations between different factors. We are taught how to construct and use a grid or a lens to view reality in a professionally relevant way. Language, texts, and spoken discourse help us in this construction process. We use language in the construction of professional knowledge. Medical terminology, medical text patterns, and medical text and discourse content have developed as a means of dealing with reality in a way that is appropriate for medical purposes.

The way in which language is used is related to existing knowledge within the field and also with conceptions about what constitutes knowledge and the attitude that should be adopted to it. What is therefore important is what scientists consider they know about different sectors of reality at different periods, what knowledge they believe is relevant in this field, and how they consider data should be collected, observed, and analyzed. Attitudes and norms regarding what is professionally relevant and right are thus built into the cognitive structure.

The knowledge base of a field has a network of relations with other fields. The cognitive structure of a professional language thus reveals its dependence on and relationship toward other knowledge domains, and this knowledge-based network can vary over time. In metaphors, in terminology, in modes of reasoning, and in diagrams, the contribution of adjacent fields to the construction of professional knowledge is revealed. For example, many fields owe a debt to statistics, psychology, mathematics, sociology, physics, economics, politics, and religion, and this debt can be seen in the language that is used.

Second, regarding the **social layer**, every professional group, like other social groups, is also formed by the establishment of an internal role structure, group identity, group attitudes, and group norms. The need for a professional identity, for a professional sense of 'us-ness,' for separation from the out-group, has of course played an important role in the construction of professional group language and constantly motivates people to adapt and be socialized into professional group behavior. Socialization into a group also means establishing distance from people outside the group.

The use of medical scientific language during different periods is thus related to the type and level of the scientific community (the social group), its size, structure, degree of professionalization, degree of internationalization, degree and nature of mutual contacts, existence of publications, etc.

Third, as regards the **macrosocial** or **societal layer**, each professional group also stands in a particular relationship to the society in which it operates; it exerts certain functions and is given a certain place within that society. The members of a profession play a role in relation to other actors in society, and the professional group acts in relation to other groups. They play – or do not play – a role on the political scene, within the business world, the education system, in relation to the media, etc. And this cluster of societal functions is essential for language. It is through language that professional groups exert their societal function. If they are going to play a role on the political scene, they have to construct their communicative behavior in a way that is adequate for that purpose. Their relationship to written texts and spoken discourse and to different genres is also

important. Professionals adapt to established genres, but are also involved in forming new genres.

The way in which language is used within science during different periods is linked with the relationship of the scientist and the scientific community to society in general. Factors that are important are the status of the profession and its role in society, both the status of the scientific community and to what degree and in what way it is integrated into society. The societal layer is thus related to economic and political factors. It is related to power and status patterns in the particular society, i.e., the nation-state, as well as on the global scene.

The three layers are strongly related to the emergence and continuous recreation of professional language, and they constitute a part of the construction of professional language and discourse. Historically, language is constructed in relation to all these layers. The cognitive establishment of the field takes place at the same time as the professions fight for their place in society and for the strengthening of their group in relation to other groups.

Stages in the Development of Medical Science

Medical knowledge and practice took a great step forward in the 17th and in particular in the 18th century. However, it was only gradually that it developed into a science in the modern sense. Since the 18th century, all societies have undergone radical change. Changes have also taken place within the medical scientific community:

1. Medical knowledge has grown immensely.
2. Science in general and the philosophy of science have undergone changes. Statistics and empirical methods have developed. Positivism has become the only accepted view in many sciences.
3. The medical profession has gradually become increasingly established and recognized. Today, doctors are considered highly valuable professionals, and medical scientists and medical research are considered highly important to society.
4. The medical scientific community has become much larger. The number of doctors, medical scientists and students of medicine has increased, as has the number of medical journals and conferences.

Important changes have thus taken place relating to medical science, science in general, the medical profession, and the medical-scientific community. This article will explore how language and discourse are essential elements in the construction of science, in profession building and in the shaping of the scientific community, and that academic genres play important roles in this process of constructing scientific knowledge and the role of the scientist in society, and in the growth and strengthening of the social network among scientists.

Changes as to language and text patterns will be discussed in relation to three scientific stages: the pre-establishment stage, the establishing stage, and

the specialized stage. For each layer the three stages can be summarized on a developmental axis:

Cognitive layer:
- Individual findings – Accumulation of findings – Integration into theory

Social layer:
- Isolated researchers – Academic grouping – Advanced scientific community

Macrosocial/societal layer:
- Scientists function within society – Scientists function within society and academic groupings – Scientists function with the scientific community.

Scientificality in Swedish Medical Articles 1730–1985

The empirical results referred to are based on studies on Swedish medical language carried out at Uppsala University. The whole corpus analyzed comprises a total of 360 scientific and popular articles from three fields – economics, technology and medicine – and six periods (Gunnarsson, 1998). The medical subcorpus which will be focused on here consists of 60 scientific articles, 10 from each of the six periods 1730–1799, 1800–1849, 1850–1880, 1895–1905, 1935–1945, and 1975–1985. All these articles come from scientific journals and deal with pulmonary diseases (30 articles) or skin diseases (30 articles). Our analyses have focused on four text linguistic levels: the cognitive, the pragmatic, the macrothematic and the microsemantic. We have also made analyses relating to the vocabulary and terminology (Gunnarsson, 1998).

Content and Content Structuring of the Texts

The content and content structuring of medical articles will be related to the stage reached by the domain of medical science, in terms of degree and type of scientificality, and also the role of scientists in society.

The cognitive analysis examines the content of the text in relation to five 'cognitive worlds': a scientific world, a practical world, an object world, a private world, and an external world (cf. Gunnarsson, 1992). Within each of these, two or three aspects were discerned:

World	Aspect
Scientific	Theory
	Classification
	Experiment
Practical	Work
	Interaction
Object	Phenomenon-focused
	Part-focused
	Whole-focused

Private	Experience
	Conditions
External	Conditions
	Measures

Each proposition in the articles was categorized in relation to **world** and **aspect.** We could thus calculate the proportions of the total number of propositions representing each world and each aspect in texts from different periods.

The analysis showed a very clear increase in the proportion of each text devoted to the scientific world, that is, to the presentation of 'theory,' 'classifications,' and 'experiment,' over the periods. On the other hand, there was a clear decrease in the role of the external world in particular, that is in the proportions of texts dealing with 'conditions' and 'measures' of a political, economic, and social nature. There was also an increase in the proportion of 'experiment/observation' within the scientific world and a decrease in the proportion of 'measures' within the external world.

The cognitive analysis also comprised an analysis of text content in relation to four time **dimensions**, 'cause,' 'phenomenon,' 'process,' and 'result,' which showed that the proportions of each text devoted to describing 'causes' and 'phenomena' have decreased over time, while the proportions devoted to 'processes' and 'results' have increased.

Another analysis focused on the macrothematic structure. The content of the medical articles was categorized in relation to four **superthemes**, 'introduction,' 'theme development,' 'discussion,' and 'conclusions.' This analysis revealed an increase as regards how much of each text is devoted to the superthemes 'introduction' and 'theme development' (that is, to a description of materials, methods, results). The proportion devoted to 'discussion' and in particular to 'conclusions,' on the other hand, had decreased.

A third analysis, which aimed at a description of the pragmatic character of the texts, e.g., the types of **illocution** present, pointed to an increase as regards 'informative' and 'explicative' illocutions and a decrease in 'expressive,' 'argumentative,' and 'directive' illocutions.

To sum up, the changes in the content and content structuring of Swedish medical articles from 1730 to 1985 show the following tendencies: more 'scientific world,' less 'external world'; more 'experiment,' fewer social, political, and economic 'measures'; more 'process' and 'results,' less 'cause' and 'phenomenon'; larger proportion of 'theme development,' smaller proportion of 'discussion' and 'conclusions'; more 'informative' and 'explicative' illocutions, fewer 'expressive' and 'directive' illocutions.

These findings relating to changes in the medical article genre point for one thing to a development of medical science. The knowledge structure of the texts appears to have changed, to include more emphasis on experiment and on process and results. There is also a trend toward a genre of a more purely descriptive character, in which the main part of the text is devoted to developing

features which could be related to a positivist scientific ideal. All these results can be related to the cognitive layer of the construction of academic discourse.

These results also reveal the role played by scientists in society. In terms of text content, the proportion devoted to the external world and external measures has decreased, as has the proportion devoted to conclusions and directives. Such results can be discussed in light of the specialization and professionalization of society. Compared with earlier periods, scientists today act to a greater extent in a discourse community of their own. Science in general and medical science in particular is accepted and highly esteemed in modern society. Considerable funding is given to medical research. The role of large-scale experiments has increased.

The discourse changes can be related to this endeavor among medical scientists to become specialists, and a profession of their own, with their own exclusive domain to deal with. A high degree of scientificality in spoken and written discourse provides prestige.

A more purely scientific genre has emerged. Scientist-writers have turned toward their own group, and the medical article genre has become a within-science genre. The popularization of medical findings is taken care of by others – trained journalists. Scientists can write for their own group, and do not have to bother about a growing distance between the lay public and the experts. The article genre has become more exclusively internal, and less concerned with reaching out to other sectors of society.

These results can also be interpreted in light of the interplay between the cognitive and societal layers. The role played by the medical profession in society interrelates with the presentation of scientific content.

Formal Organization of the Text

The formal organization of the texts and their rhetorical patterns will be related to the stage reached in the development of the medical scientific community. A strong scientific community reveals itself in firm genre conventions, that is, in more homogeneous texts, and also in explicit markings of belonging to a group.

The number and types of headings in the modern Swedish articles vary over time. The use of section headings has increased dramatically. Also the type of heading has changed. In the early periods, headings relate to the content of the article, while in the modern article they relate to its structure: 'Material,' 'Methods,' 'Results,' 'Discussion,' 'Conclusions.' The modern headings thus structure the presentation in a general scientific way, which also reflects a more homogeneous organization of the texts.

An increasing homogeneity is also found in relation to the thematic article structure (Gunnarsson, 1993). The articles from the period around 1980 (1975–1985) were clearly more homogeneous in terms of their linear text structure than earlier articles. Also the introductions in articles from different periods revealed a gradually greater homogeneity. This homogeneity can also be seen in a contrastive perspective; that is, the Swedish pattern has come to resemble that of the English scientific article, as described in Swales (1990).

Another finding relates to the information flow of the text. An analysis of the connection between content structure and graphical disposition in articles from different periods showed that each sentence has become more independent with regard to the surrounding text. It introduces a new angle, which means that it becomes less integrated with its neighboring sentences (Melander, 1993). We thus find a change toward a fact-listing or 'catalogue' style in the modern article.

This tendency toward a catalogue style can be seen as another feature reflecting firmer genre conventions. When texts are organized in a homogeneous and predictable way, there is less need to elaborate on the details. Readers know where in the text they will find different types of content. The tendency toward a more catalogue-like article could also be seen as indicating a strengthening of the scientific community. The knowledge of this community is well established among the specialist readers, and need not be elaborated on.

Other analyses reveal that the number of references per article has increased over time, and that the way of presenting them has become more homogeneous. Another tendency relates to the changed use of personal pronouns. In the articles from the 18th century, the pronoun 'I' was quite a frequent word, while it has more or less totally disappeared in the articles from the latter part of the 20th century. The pronoun 'we,' on the other hand, which was quite unusual during the first two periods, has since the middle of the 19th century had a similar rank. The author's explicit marking of article relevance has also changed over time. Here we find a shift from a societal orientation in earlier periods to a more internal orientation in the last period (Gunnarsson, 1998).

To sum up, the changes as to the formal text organization and the rhetorical patterns show the following diachronic tendencies: more headings; more homogeneous text organization; more homogeneous article introductions; more fact listing; more references; less use of the personal pronoun 'I'; more relevance marking relating to the 'group.'

The medical article has developed toward greater homogeneity – relating to the use of headings, the superthematic text structure, the rhetorical structure of introductions, etc. – which indicates a strengthening of genre conventions. The medical article has become more established as a genre, and its genre conventions have become firmer and thus more homogeneous. This strengthening of the academic article genre, however, is also a sign of a growing and stronger medical discourse community. For the medical discourse community, as for most scientific discourse communities, writing plays an essential role as a group marker, and the establishing of firmer conventions for written text genres is part of the growth and strengthening of this community. The trend toward a more fact-listing and catalogue type of article can also be seen as a sign of a stronger discourse community, in the sense of being more homogeneous and closed. It is a well-known fact within sociolinguistics that communication within a dense group or network needs to be less explicit and elaborated than communication within one more open and less dense.

The modern habit of giving references to the works of colleagues is another sign of a strong discourse community, a discourse community with a clear group feeling. When the group is essential to its members, it becomes important to

indicate one's sense of belonging and one's relationship to other group members. Problems relating to the group also become more important than those relating to the world outside the group. The modern tendency to list references, to use 'we' instead of 'I,' and to mark relevance in relation to one's own group can be viewed from this social perspective. I would suggest that these text features are part of the construction of an increasingly close-knit (dense) medical discourse community.

There is also a connection between these features and the role of medical scientists in society; that is to say, the strengthening of the professional group is paralleled by a process of gradual specialization of the professions. These features are thus also part of the construction of a role for the medical community within society. We can thus see how the social and societal layers interact. Strengthening of the internal group structure is interrelated with the underlining of a role for the group in society.

Linguistic Expressions of Evaluations

The linguistic expressions of evaluation and its variation over time will be related to the positioning of the scientist/author on the developmental axes for the three contextual dimensions. The study referred to was based on an analysis of 30 Swedish scientific medical articles from six periods. All the articles dealt with pulmonary diseases. The study, which comprised an analysis of evaluations linked to descriptions of the subjects studied, the diseases and treatments, the introduction of the author's own initiatives, and descriptions of the research and findings of others, focused on three main aspects: (1) what is being evaluated, (2) through whom the evaluation is taking place, and (3) how the evaluation is being made (Gunnarsson, 2001a).

In articles from all the periods, the object of the study and the initiatives of other researchers were evaluated. The author also referred to his own initiatives in most articles. From a diachronic perspective however, it is more interesting to consider the second aspect; that is, through whom the evaluation is taking place (author's own voice, author through others author through facts). A comparison of the medical texts from the 18th, 19th, and 20th centuries shows that in the earliest texts the evaluation is made by the author himself, using his own voice, whereas in later articles it is allowed to emerge indirectly via facts from others, e.g., in references to the other articles.

A change over time is also found in relation to the third aspect, how the evaluation is being made. When articles from the 18th century are compared to articles from the 20th century, we find a weakening tendency; that is, the evaluations in articles from 1730 are expressed in a more severe way. A more obvious change, however, relates to the degree of certainty. Here we find a discernible increase in the use of hedges and other expressions of caution over time (cf. Salager-Meyer, 1994).

We thus find a progressive moderation of the author's own voice in the medical articles; in other words, increasingly the focus is placed on facts. There is another clear change in the author's relationship to facts, which is revealed in increases in the frequency of markers of epistemic modality.

These tendencies were also found in analysis of word frequencies. As mentioned earlier, there is a change in the use of the personal pronouns *jag* 'I' and *vi* 'we' in the articles over time. The occurrences of the pronoun *jag* are reduced by half between the first period (18th century) and the fourth period (1895–1905) and disappear completely during the sixth period (1975–1985). To some extent the pronoun 'I' is replaced by the pronoun 'we.' In this case, however, the increased use of 'we' is mainly explained neither by the use of reader-inclusive 'we' nor by co-authorship. It could rather be linked to the progressive phasing out of authorial identity in scientific prose.

A comparison of the frequencies of a number of markers of modality in the Swedish medical corpus revealed an increase over time. All nine markers – *torde* 'is probably,' *tyder* 'suggests,' *tycks* 'seems,' *tänkbar* 'conceivable,' *tveksam* 'doubtful,' *sannolik* 'likely,' *sannolikhet* 'likelihood,' *möjlig* 'possible,' *möjlighet* 'possibility' – revealed a linear increase in frequency over the six periods. This increasing tendency to be cautious can of course be seen as a sign of the progressive extension of medical knowledge; that is, it can be related to the author's placement on the knowledge axis. The greater the body of collective knowledge, the more aware authors are of its relativity. But it could also be linked to circumstances within the social group, in this case the medical community. In order to survive in a competitive society, which is what the world of medical research undeniably is, one must be careful not to lose face, and take care not to threaten the face of others. Ideas of this kind are proposed in Myers (1989). Myers claims that in order to survive in the competitive academic world, modern scientists adopt pragmatic politeness strategies, and that Brown and Levinson's concepts of 'face saving' and 'face threatening' are also relevant in the analysis of scientific texts (Brown and Levinson, 1987). Scientists tread a narrow path between the need to emphasize their own achievements on the one hand and to criticize those of their peers on the other.

It may well be that the difference in the wording results from the increased knowledge scientists now possess about illnesses and their treatment, i.e., that the difference can be linked to the cognitive dimension. Or it may result from greater awareness of the importance of politeness in a large and well-developed scientific community, i.e., the difference can be linked to the social dimension; doctors/researchers admittedly make evaluations, but they avoid expressing them subjectively and straightforwardly and choose greater objectiveness, thus showing more caution.

Lastly, the variation in linguistic expressions of evaluations will be systematically related to the three scientific stages and the three layers distinguished earlier, and articles from the 18th, 19th, and 20th centuries will be placed on developmental axes illustrates the relationship between text and context for medical scientific articles during three centuries.

In the articles from the 18th century, we encounter a number of different individuals – the author himself, his colleagues, and his patients – and their experiences and judgments are described. The typical article is full of explicit, severe, and assured evaluations which concern the object of the study – the illness and method – and also the advocates of the method, its naïve practitioners.

In the way the author writes, he places himself fairly obviously toward the left of all three contextual axes in Table 1; he treats individual findings as if they exist *per se*, he describes himself and his colleagues as isolated researchers and he seems to act within society rather than the scientific community.

Table 1: Text and context during three centuries

Dimension	1700:1	1800:2	1900:3
Cognitive	Individual findings	Accumulation of findings	Theoretical integration
Social	Isolated researchers community	Academic groupings	Developed scientific
Macrosocial	Scientists act within society	Scientists act within society and academic groupings	Scientists act within the scientific community

In the articles from the 19th century, the typical author adopts a considerably more analytical attitude to the research of others. The author himself figures as an evaluator. He also explicitly adduces the opinions of other researchers. The evaluations are of medium severity and the author marks his doubts in different ways. The author is fair and square in the middle of the contextual axes.

In the articles from the 20th century (around 1980), the typical author does not express himself in his own voice or explicitly through others. Evaluations take the form of the presentation of facts, supported by references to other works. Summaries of the research of others form an integral part of the description of the illness/method. What characterizes this and other articles in the subcorpus from this period is above all the attitude adopted to facts. The evaluations are not few in number, but they are weak to medium, severe rather than severe, and they are presented throughout as less certain – in other words these authors should be placed to the right on the contextual axes.

Conclusions

Language constructs science in relation to the cognitive layer (the scientific content), the societal layer (scientists' role in society), and the social layer (relations within the group). This construction process has been in progress since the first doctors tried to establish themselves as medical scientists and it is still continuing. In Sweden this process began in the 17th century. However, it was not until the middle of the 18th century that Sweden became a national writing community. Before 1740, the language of the learned was Latin, but in the Era of Liberty, from the middle of the 18th century, Swedish was gradually accepted as a scientific language, and the construction of medical science and the medical scientific community was related over a long period to the development of the Swedish medical article as a genre. This article has focused on this phase in the Swedish medical history, an account which ended in 1985.

What has taken place since then is an accelerating Anglicization of the academic writing community in Sweden. English is now used in medicine as the medium for Ph.D. theses, for conference abstracts and papers, and for articles presenting original research (Gunnarsson, 2001b). *Läkartidningen*, the Swedish medical journal, still exists, but is no longer the prime forum for presentations of new findings. The Swedish medical scientists of today choose to present their research in English in international medical journals. When they write in *Läkartidningen*, they do so with other purposes than to present original research findings. The Swedish medical scientific community has thus turned diglossic; that is, English is used for certain purposes and Swedish for others. In the Swedish medical journal, articles give overviews and present research relating to basic diseases, but this is no longer a journal for the first presentation of new research (Gunnarsson *et al.*, 1995).

A development of the kind here described is not country specific. The shift from Latin to the national language took place around the same time in most Western countries, and the modern spread of English as a scientific language is universal (Ammon, 2001). The Anglicization of the medical scientific community and the accelerating use of the Internet as a communicative tool has lead to an intensified globalization and also homogenization of science and scientific language. From a sociohistorical perspective this development is most interesting and in the future will certainly lead to important investigations.

Tactical Uses of Stories: Participation Frameworks within Girls' and Boys' Disputes

Marjorie Harness Goodwin

Introduction

Stories are often treated as artifacts that can be abstracted from their local circumstances and examined in terms of their internal features (Labov 1972). Here, instead, I want to look at how they are deeply embedded within larger social processes. My concern is with how children use stories as a constitutive feature of the activities they are engaged in and as powerful tools to arrange and rearrange the social organization of a group. In this paper I examine stories within a particular context, the organization of dispute.

My primary concern is with the participation frameworks that stories provide, allowing children to *construct and reconstruct their social organization on an ongoing basis.* I examine how boys and girls, in their same-sex groups, make use of features of stories to accomplish and restructure social identities within encounters. To investigate how stories constitute tools for accomplishing social tasks I look at how they structure situations within one particular domain, argumentative sequences, a fruitful site for investigating the intersection of genres. As noted by Turner (1986:39–43) a world of theater is often created while redressing grievances, as conflict provides the quintessential arena in which "the structures of group experience (*Erlebnis*) are replicated, dismembered, remembered, refashioned, and mutely or vocally made meaningful" (p. 43). When stories are used in dispute processes they permit the playing out of an event in ful dramatic regalia; through a multiplicity of voices (Goffman 1974), the teller of the story and her hearers animate principal figures in the story and offer commentary upon the unfolding action and characters.

Source: Deborah Tannen (ed.), *Gender and Conversational Interaction*, 1993, pp. 110–143.

Using the same story and dispute resources, boys and girls construct quite different types of events. Boys use stories as a way of continuing an ongoing argument while reshaping the domain in which dispute takes place; by switching from a sequence of counters to a story, a speaker may radically reformulate the participation structure of the moment. Girls, in contrast, use stories to restructure alignments of participants, not only in the current interaction, but also at some future time. Stories can generate in listeners who are offended parties statements of future plans to confront an offending party, which result in confrontations that mobilize the entire neighborhood. I examine how each gender group manages its social organization through storytelling.

Fieldwork and Theoretical Approach

The present study is based on fieldwork among a group of children in a black working-class neighborhood of West Philadelphia whom I encountered during a walk around my neighborhood. I observed them for a year and a half (1970–1971) as they played in their neighborhood, focusing on how the children used language within interaction to organize their everyday activities.[1] The children (whom I will call the Maple Street group) ranged in age from 4 through 14 and spent much of the time in four same-age and same-sex groups:

Younger Girls	Ages 4–9	5 children
Younger Boys	Ages 5–6	3 children
Older Girls	Ages 9–13	15 children
Older Boys	Ages 9–14	21 children

Here I am concerned principally with older children, ages nine to fourteen. Specific ages of the children who are included in the groups reported on in this paper are listed in Appendix A.

As the children played on the street after school, on weekends, and during the summer months, I audiotaped their conversation. In gathering data, I did not focus on particular types of events that I had previously decided were theoretically important (for example, games or rhymes) but instead tried to observe and record as much of what the children did as possible, no matter how mundane it might seem. Moreover I tried to avoid influencing what the children were doing. The methods I used to gather data about the children were thus quite different from those characteristically used in psychological and sociological studies of children's behavior; in such studies efforts are typically made to systematically collect in a carefully controlled fashion particular types of information deemed to be theoretically important. Rather than being based on a laboratory model, the methodology I used was ethnographic, designed to capture as accurately as possible the structure of events in the children's world *as they unfolded in the ordinary settings where they habitually occurred.*

The tapes I collected preserved a detailed record of the children's activities, including the way in which their talk emerged through time. In all, over

two hundred hours of transcribed talk form the corpus of this study. The approach used in this chapter, conversation analysis, constitutes an approach to the study of naturally occurring interaction developed within sociology by the late Harvey Sacks and his colleagues.

Stories within Disputes of Boys

Within the boys' group, games in which points are scored or activities in which there are winners and losers provide a way of distinguishing group members with respect to relative rank. Boys' pastimes permit a range of comparisons in terms of skill and ability, and boys proclaim and protest how they stand in a series of activities. For example, boys discuss ranking in terms of skill displayed in games and contests.

(1)

William: I could walk on my hands better than *an*ybody out here. Except him. And Freddie. ***Thom***as can't walk.

(2)

((Discussing ranking of go-cart members))

Malcolm: I'm the ***driv***er.
Tony: He's the driver. // You know he drives it.
Malcolm: I know what // that- Archie can't ***drive*** that good.
Archie: See- I'm number ***three*** driver. I'm number ***three*** driver.
Malcolm: And ***Dave*** can't drive that good,=
Tony: I'm number // ***two*** driver.
Archie: I'm number ***three*** driver.

In addition, boys compare one another in contests of verbal repartee, as in the following fragments, which occur during a slingshot-making session. Nine boys, aged nine through fourteen, are making slingshots in the backyard of Malcolm and Tony Johnson. The boys have informally divided themselves into two teams, one under the direction of Malcolm (aged thirteen), and the other led by Tony (aged fourteen).[2]

Disputes Built through Reciprocal Counters

Looking at example 3, it can be observed that argument proceeds through a sequence of **reciprocal counters:** two-turn sequences in which a first challenge or threat is answered by a counter to it. Data are transcribed according to the system developed by Jefferson and described in Sacks, Schegloff, and Jefferson (1974:731–733). A simplified version of this transcription system appears in Appendix B.[3]

(3)

1	Tony:	***Gi***mme the ***things.***
2	Chopper:	You sh:ut up you ***big*** lips. (Y'all been
3		hangin around with thieves.)
4	Tony:	(***Shut*** up.)
5	Chopper:	Don't gimme that.=I'm not ***talk***in to
6		you.
7		(1.4)
8	Tony:	I'm talkin to ***y:ou***!
9	Chopper:	Ah you better sh:ut ***up*** with your
10		little- ***di:***ngy sneaks.
11		(1.4)
12	Tony:	I'm a ***ding*** your hea:d.=How would you
13		like ***that.***

Using such couplets to build an argument shapes the interaction of the moment in distinctive ways. First, it both focuses talk and restricts participation in the debate. Each subsequent challenge selects prior speaker as next speaker. Thus, though nine people are present, only two parties speak in the sequences. Second, the protagonists in this sequence talk in relatively short turns that, typically, are not interrupted.

Within the context of the event that has been in progress, this is striking. The boys have divided themselves spatially into two separate teams, each making its own ammunition in preparation for the slingshot fight, and, during most of this work, parties within each group have been carrying on separate conversations. The effect of this has been considerable simultaneous talk.

The emergence of the dispute sequence creates a point of focus for all present. It thus provides organization not only for those who talk within it, but also for the others present, who become ratified overhearers to it. In brief, argumentative sequences built from paired counters shape in distinctive ways both the interactions of the moment and the talk occurring within it.

Looking at line 9 of example 4, we find that, at a certain point, Tony simply disattends Chopper and turns to other activities.

(4)

1	Tony:	Why don't you get out my yard.
2	Chopper:	Why don't you ***make*** me get out the yard.
3	Tony:	I ***know*** you don't want that.
4	Chopper:	You're not gonna make me get out the yard
5		cuz you can't.
6	Tony:	Don't force me.
7	Chopper:	You can't. Don't force me to hurt you.
8		***((snickering))*** Khh Khhh!
9	Tony:	***((to his team))*** Now you gotta make
10		your noodles.
11	Chopper:	[[You hear what I said boy?

Thus, despite the fact that Chopper wants to pursue the sequence – note his "You hear what I said boy?" in line 11 – he is unable to do so without Tony's continuing coparticipation. Moreover, though an extended dispute occurs here, there is no clear demonstration that one of the protagonists has gotten the upper hand over the other.

One might ask how a speaker in the midst of a sequence of this sort could design talk that would prevent a move such as the one made by Tony. For example, would it be possible to build a participation framework in which such a unilateral exit would no longer be a strong possibility?

Using a Story to Restructure a Dispute

Example 5 is a continuation of the "I'm a dingy your head" dispute seen in (3).

(5)

12	Tony:	I'm a ***din***gy your hea:d.=How would you
13		like ***that.***
14		(0.4)
15	Chopper:	No you won't you little-*h ***Guess*** what.

34	Malcolm:	[Ah~***ha***~aa~aa~***Ah~ha***//ha
35	Tokay:	You there ***Mal***colm,
36	Chopper:	*((snickering))* *hhKh He was the(hh)re.
37	Tokay:	What'd he say ***Chop***per. ***((smile***
38		***intonation))***
39	Chopper:	*((snicker))* *hKh Yeah.=
40	Tony:	=***You*** was there [To***kay***!
41	Chopper:	[*hih *hih
42	Chopper:	Lemme~tell ya, An h(h)e sai(hh)d,

In line 15 Chopper starts a counter to what Tony has just said but breaks it off before it reaches completion.

No you won't you little-

He then produces a prototypical story preface, "Lemme tell ya. Guess what" and. subsequently, in lines 19–25 tells a story about Tony. With his preface he signals that he has a multiutterance unit to complete that will extend over several turns. Although, generally, following such a preface a recipient provides a warrant for the telling by responding at that point, here the storyteller launches quickly into a story.

Participant Frameworks Invoked by the Story

Introducing a story at this point has a range of consequences. First, since the utterance containing Chopper's counter is not brought to completion, Tony is not given the opportunity to respond to it. The return and exchange sequence has. in effect, ended, and participants are no longer within that frame. Second, the story invokes a *participation framework* that is quite different from that provided by the aborted counter. The counter locates Tony as its specific addressee – for example, with the second person pronoun in line 15 ("you little-") – and makes relevant particular types of next actions, such as return counters, from him and not others. Dialogue is restricted to two persons. Though others are present, they are positioned as *onlookers* to the dispute between Chopper and Tony.

By way of contrast the story is addressed to all present and, indeed, Tony, who is now referred to in the third person, is no longer the exclusive, or even the principal, addressee. Rather than being situated as onlookers to a dispute that does not concern them, others present now become the *audience* to the story. Moreover insofar as members of the audience are active coparticipants in the production of a story (C. Goodwin 1984, 1986), they gain rights to participate in the telling in distinctive ways.

Within the story, Chopper portrays Tony as cowardly. In addition, Chopper proposes that Tony's behavior be evaluated in a particular way, specifically as **laughable:** In line 25, as Chopper speaks the words "no(h)(hh)o m(h)oney," he starts to embed laugh tokens in the talk being quoted. This laughter is not heard as part of Tony's words but rather as Chopper's current *comment on* those words Here, rather than simply reporting what Tony said, Chopper enacts Tony's behavior at the moment of climax; indeed as Vološinov (1971) has argued, one never simply reports an action but, rather, takes up a position with regard to what she or he is saying. First, with the phrase "Tony did like this," Chopper announces that an enactment is to follow. He then marks the talk that follows as an enactment through animation cues such as increased volume (indicated by capital letters and emphasis (italicized words, the italicization marking high pitch), which result in focus upon the initial part of the reported denial "*I AIN'T* GOT." Other work (M. H. Goodwin 1980b) has demonstrated that such heightened dramatization in the midst of speech function to obtain enhanced responses from recipients

Thus rather than treating people other than Tony as overhearers, Chopper is now inviting them to participate in the talk of the moment. Moreover, in animating (Goffman 1974:516–544) Tony's talk and drawing attention to it through increased loudness, Chopper proposes that it should be evaluated in a particular way – as laughable. Jefferson (1979) has demonstrated that such laugh tokens can solicit recipient coparticipation in the laugh, and, indeed, that is what happens here. In response to Chopper's talk, Pete (lines 26–27) and Malcolm (line 34) produce laughter. Before Chopper's animation has reached its conclusion, Pete is laughing with him. Shortly afterward, Malcolm (line 34) also laughs, thereby displaying an affiliation and agreement with the mode of argument Chopper is presenting.

In brief switching to a narrative *about* Tony creates a participation framework into which others now have rights to enter with their evaluations of the events heard in the story. Rather than treating people other than Tony as overhearers, Chopper is now inviting them to participate in the talk of the moment.

Audience Alignment toward Opponent/Story Character

Recipients may, of course, respond in a number of different ways, depending on their structural positions with respect to the story: (1) Recipients occupying the identity of prior participant in the recounted event can assist the teller in providing details of the event, (2) a prior participant whose actions are negatively portrayed may counter the claims made against his character, (3) participants absent from the event being discussed can provide requests that lead to expansion of the story or replaying of its key scenes.

In what follows, Tokay not only requests information concerning specifics of the story but also displays intense interest in the report and, with smile intonation, aligns himself with Chopper:

(6)

25	Chopper:		"*I AIN'T* GOT n(h)(hh) [o (°m(h)oncy)."
26	Pete:		[Ah~hih~ha,
27			*hh Hah~hih!
28	Chopper:		*((snicker))* khh
29	(ei2):		(° look [good.
30	Pete:		[*hh
31	Tokay:	→	You ***di:*** [d, *((smile intonation))*
32	Pete:		[Aw:,
33	Chopper:		*((snicker))* *hhh~Khh [°Hey Poo(h)chie.
34	Malcolm:		[Ah~***ha***~aa~aa Ah~***ha/ha.***
35	Tokay:	→	You there ***Mal***colm,
36	Chopper:		*((snickering))* *hhKh He was the(hh)re.
37	Tokay:	→	What'd he say ***Chopp***er. *((smile*
38			*intonation))*
39	Chopper:		*((snicker))* *hKh Yeah.=
40	Tony:		=***You*** was there [To***kay***!
41	Chopper:		[*hih *hih
42	Chopper:		I [illegible]

Tokay's talk is first answered by Chopper, who intercepts a request directed to Malcolm ("*You* there ***Mal***colm") and requests for elaboration ("What'd he say ***Chopp***er"). Second, it is answered by protagonist Tony, who argues that Tokay's asking questions into the story is inappropriate ("*You* was there To***kay***!") in line 40.

Tony elaborates a defense against the portrait being presented of him in lines 45–51; he argues that he didn't, in fact, raise his hands up in cowardice.

(7)

42	Chopper:		Lemme~tell ya, An h(h)e sai(hh)d,
43	Tokay:		***WH:EN***!=
44	Chopper:		="***I*** ain't got no(h) mo [(h)ney."
45	Tony:		[Member=
46	Pete:		[Whew::,
47	Tony:		[that night when we was goin [there,
48	Chopper:		[*((snicker))* **Khh**
49	Tony:		and [them boys came down the street,
50	Chopper:		[*((snicker))* Khhh!
51	Tony:	→	***I*** ain't ***rai***:sed my hands [up.
52	Chopper:		[Go
53			ahead.=You're gonna say it- ***I*** **know**:.
54			*hh ***Di***dn't he g'like this? (0.4)
55			"***I ain***'t go(hh)t
56			no(hh)n [(h)e."
57	Malcolm:		[Ah~***ha***~ha~ha~ha~ha~ha
58	Chopper:		*((snicker))* *hkh
59	Malcolm:		Aw::::
60	Chopper:		*((snicker))* *KHH
61	Malcolm:		((baby voice)) "***I ain***'t got no money."
62			Ah~ [ha~ha.
63	Chopper:		[((*snicker*)) Khhhhheh!

This move is useful to the ongoing development of Chopper's characterization of Tony. Chopper counters Tony's defense: "*You* was there To***kay***!" and then explicitly requests confirmation ("***Di***dn't he g'like this?") of his quote of Tony, which he recycles once again in lines 55–56.

Afterward Chopper's talk receives renewed laughter (line 57), as well as recycling of the refrain ("I ain't got no money") in mocking intonation (line 61) from Malcolm. Refutations are used to Chopper's benefit in the elaboration of the story that he wants to tell. Though Tony repetitively produces counters, these are defensive answers to Chopper's stories rather than first moves in counter sequences. Throughout the storytelling, when Tony attempts to defend himself, he gets himself into greater and greater trouble. Counters result in three further descriptions that instance Tony's cowardice. Recipients ratify Chopper's depiction through laughter and through recyclings of the quote "I ain't got no money" (which gets used as a refrain indexing Tony's cowardice) until Chopper finally entraps Tony.

Building a Multiparty Consensus

Though the introduction of the story constitutes a marked transformation of the dispute, it remains very relevant to it. Of crucial importance is the way in which the story allows Chopper to create a visible multiparty consensus against Tony. Chopper moves to a structure that provides parties not initially designated as ratified participants the opportunity to participate. Maintaining and shaping their participation in particular ways, Chopper is able to demonstrate publicly that his characterization of Tony is one that others share. Through their laughter Pete and Malcolm affiliate themselves with Chopper's position.

Throughout the encounter the story remains a point of focus to which others can return. More important, the rearrangement of argument mode also calls into play a different configuration for social organization. The event shifts from one designating only two parties to the dispute (others present being ratified overhearers but not full-fledged contributors) to one inviting the participation of all those present. In that others may become contributing participants in the activity, even without being officially summoned as witnesses, they may align themselves with a particular side of the dispute, and their participation may display whose version has more support.

The structure of the recounting itself allows for displays of appreciation, both laughter and repetition of lines in Chopper's story produced in a mocking tone of voice, as well as requests for elaboration of the story, which grant Chopper a warrant to develop his line.

Girls' Stories

In contrast with boys, girls do not generally utilize direct methods in evaluating one another. They seldom give one another bald commands or insults, and making explicit statements about one's achievements or possessions is avoided. Such actions are felt to indicate someone who "thinks she cute" or above another, thus violating the egalitarian ethos of the girls. These different cultural perceptions concerning evaluating oneself in the presence of others lead to different ways in which stories that are part of dispute processes are built by the teller and involve others in the process of storytelling. Rather than directly confronting one another with complaints about inappropriate behavior, girls characteristically discuss their grievances about someone in that party's absence. Through an elaborated storytelling procedure called "instigating," girls learn that absent parties have been talking about them behind their backs, and they commit themselves to future confrontations with such individuals.

The activity of reporting to a recipient what was said about her in her absence constitutes an important stage preliminary to the confrontation event. It is the point where such an event becomes socially recognizable as an actionable offense. The party talked about may then confront the party who was reportedly talking about her "behind her back," producing an utterance of the following form:

Bea to Ann:	**Kerry said you said that (0.6)** **I wasn't gonna go around *Pop*lar no more.**	
Bea→Ann	**Bea is speaking to Annette in the present**	
Ker→Bea	**about what Kerry told Bea**	
Ann→Ker	**that Annette told Kerry**	
Bea	**about Bea**	
A→B	**A is speaking to B in the present**	**3 Confrontation**
C→A	**about what C told A**	**2 Instigating**
B→C	**that B told C**	**1 Offense**
A	**about A**	

Informing leading up to the confrontation typically is accomplished through use of stories by a girl who stands as neither accuser nor defendant. This type of storytelling, as noted, is called "instigating" by the children. The instigator may initiate a sequence of events that leads to conflict as part of a process of negatively sanctioning the behavior of a girl who steps outside the bounds of appropriate behavior or as a way of demonstrating her ability to orchestrate such events.

The larger framework of the he-said-she-said dispute provides organization for the storytelling process in several ways.

1. It provides structure for the cited characters and their activities within the story.
2. It influences the types of analysis recipients must engage in to appropriately understand the story.
3. It makes relevant specific types of next moves by recipients: for example, evaluations of the offending party's actions during the story, pledges to future courses of action near the story's ending, and rehearsals of future events at story completion and upon subsequent retellings.

Structure in Telling and Listening to Instigating Stories

Bringing about a future confrontation has direct bearing upon the way a speaker structures her instigating story and recipients respond to it. Through dramatic character development, the speaker skillfully guides her recipients to interpret the events she is relating in the way she wants them to and attempts to co-implicate

hearers in forms of future activity. Recipients' responses to instigating stories are differentiated, depending upon the identity relationship of listeners to figures in the story.

Bea tells two stories dealing with Kerry. Bea's first story recounts to both Julia and Barbara what Kerry said about Julia. Julia then leaves, and Bea starts a new set of stories in which she tells Barbara what Kerry said about *her* (Barbara).

The description of the past is organized so as to demonstrate that the events being recounted constitute *offenses*. Moreover, the presentation of past events is carefully managed, so as to elicit from its recipient, now positioned by the story as an *offended party*, pejorative comments about the party who offended her, without this appearing as the direct intent of the speaker's story.

I start by examining the initiation of Bea's first story, recounting what Kerry said about Julia.[4]

(8)

11	Bea:	***How- how-*** h- um, uh h- h- how about me
12		and ***Ju***lia, *h and all them um, and
13		***Ke***rry, *h[and all them-
14	Julia:	[***Is***n't ***Ker***ry ***mad*** at
15		***me*** or ***s:om***p'm,
16		(0.4)
17	Bea:	***I'on'*** kn//ow.
18	Barb:	Kerry~***al***ways~mad~at somebody.
19		°***I*** ['on' care.
20	Julia:	[Cuz- cuz cuz I wouldn't, cu:z she
21		ain't put my ***name*** on that ***pa***per.
22	Bea:	***I*** know cuz OH yeah. ***Oh*** yeah.

This story beginning has the form of a reminiscence. Bea requests that others remember with her a particular event: "***How- how-*** h- um, uh h- h-how about me and ***Ju***lia, *h and all of them um, and ***Ke***rry." The numerous stutterings in her speech contribute to the highly charged framing of this talk. The proposed story concerns negative attributes of Kerry. The telling of pejorative stories, especially in the context of the he-said-she-said, poses particular problems for participants. That is, such stories constitute instances of talking behind someone's back, the very action at issue in a he-said-she-said.

A party who tells about another runs a particular risk: Current recipient might tell the absent party that current speaker is talking about her behind her back. The activity of righteously informing someone of an offense against her can itself be taken and cast as an offense. Are there ways in which a party telling such a story can protect herself against such risk? One way might be to implicate her recipient in a similar telling so that both are equally guilty and equally vulnerable. However, this still poses problems: Specifically, it would be most advantageous for each party if the other would implicate herself first. This can

lead to a delicate negotiation at the beginning of the story: In lines 11–13, when Bea brings up Kerry's offenses toward Julia, she requests the opinion of others, while refusing to state her own position. In response, Julia asks a question that describes her relationship to Kerry in a particular way: "***Is***n't Kerry ***mad*** at ***me*** or ***s:om***p'm" (lines 14–15). If Bea in fact provides a story at this point demonstrating how Kerry is mad at Julia, Bea will have talked pejoratively about Kerry before Julia has co-implicated herself in a similar position. Bea subsequently passes the opportunity to tell such a story by saying "***I'on'*** know" (line 17). Then Julia provides an answer to her own question: "Cuz- cuz cuz I wouldn't, cu:z she ain't put my ***n***ame on that ***pa***per" (lines 20–21). Only after Julia implicates herself does Bea begin to join in the telling (line 22).

Cited Characters and Current Participants

Instigating stories concern others within one's neighborhood group of friends who are judged to have behaved in an inappropriate fashion. Such stories have certain features in common:

1. The principal character in the story is a party who is not present.
2. The nonpresent party performed actions directed toward some other party.
3. These actions can be seen as offenses.
4. The target of the cited offenses is the present hearer.

The placement of present recipient within the story as a principal figure provides for her involvement in it and, consequently, for the story's rather enduring life span, by comparison with other recountings.

Some evidence indicates that the four features just listed are oriented to by the teller in the construction of her instigating stories. In the data being examined, Bea's initial stories (line 20 in Appendix D) involve offenses Kerry committed toward Julia. These include having said that Julia was acting "stupid" and inappropriately when girls were telling jokes and having intentionally excluded Julia's name from a "hall pass." During these stories both Julia and Barbara are present. However, Julia then departs, leaving only Barbara as audience to Bea. Bea now starts a new series of stories (line 21) in which Barbara is the target of a different set of offenses by Kerry. Thus, when one hearer (Julia) leaves (prior to the beginning of line 21), the speaker modifies her stories. In both sets of stories the absent party who commits the offenses, Kerry, remains constant. However, the recipient of her actions is changed so that the target of the offense remains the present hearer. Through such changes the speaker maintains the relevance of her story for its immediate recipient. What happens here demonstrates the importance of not restricting analysis of stories to isolated texts or performances by speakers but, rather, of including the story's recipients within the scope of analysis, since they are consequential to its organization.

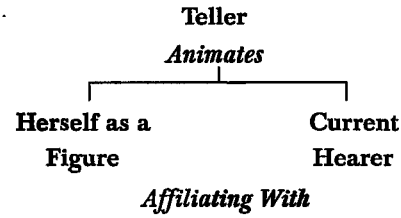
Stories may also be locally organized with respect to the person selected as the offender. The fact that Kerry is reputedly the agent of offensive talk in the story to Julia may well be why she is selected as a similar agent in the stories to Barbara several minutes later.

Larger political processes within the girls' group might also be relevant to the selection of Kerry as offender in these stories. Gluckman (1963:308) notes that gossip can be used "to control aspiring individuals." In the present data, Kerry is the same age as the other girls but has skipped a year in school, and they are annoyed at her for previewing everything that will happen to them in junior high school. The structure of the immediate reporting situation, as well as larger social processes within the girls' group, is thus relevant to how past events are organized within these stories and the way in which particular members of the girls' group become cited figures (Goffman 1974:529–532).

In replaying past events, the teller animates (Goffman 1974) the cited figures within her stories in ways that are relevant to the larger social projects within which the stories are embedded. In a variety of ways the absent party's actions toward the current hearer are portrayed as offensive. Thus, in describing what Kerry said about Julia, Bea (lines 26–31) reports that Kerry characterized Julia as having acted "stupid."

Teller
Animates
↓
Absent Party
Animating
↓
Current Hearer

(9)

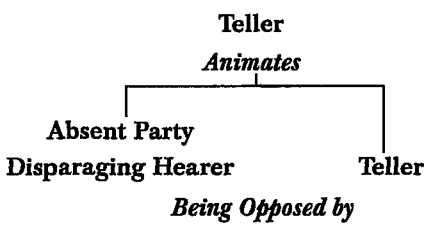


26	Bea:	***She*** said, ***She*** said that um, (0.6)
27		that (0.8) if that ***girl*** wasn't
28		there=***You*** know that girl that always
29		makes those funny jokes, *h Sh'aid if
30		that ***girl*** wasn't there ***you*** wouldn't be
31		***ac***tin, (0.4) a:ll ***stu***pid like that.

Continuing on, Bea (lines 35–36) animates Kerry's voice as she reports that Kerry said that Julia had been cursing.

(10)

35	Bea:	and she said that ***you*** sai:d, that,
36		"***Ah***: go tuh-" (0.5) somp'm like tha:t.



As Bea further elaborates her story about Kerry, she relates how Kerry attempted to exclude Julia's name from a "hall pass" (a permission slip to go to the bathroom). At the same time that she describes Kerry's actions as offensive, she portrays Julia as someone whose actions were appropriate and exemplary (lines 64–66) and herself as someone who stood up for Julia (lines 68–69).

(11)

64 Bea An m- And Julia w'just sittin
65 up there actin- actin:, ac- ac- actin
66 sensible. An she up- and she up there
67 talking bout, and she-*I* said, I s'd I
68 s'd I s'd "This is how I'm- I'm gonna
69 put Julia ***na***:me down here." Cu- m- m-
70 Cuz she had made a pa:ss you know. *h
71 She had made a ***pa***:ss.

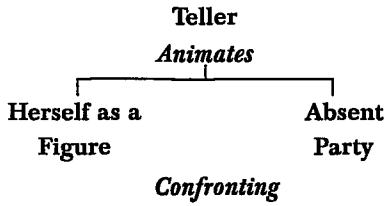
Throughout her talk, Bea's stuttering adds to the dramatic quality of her talk as she expresses excitement about what she is relating. As Bea animates Kerry's voice, she colors her talk with a whiny high-pitched defensive tone, enacting Kerry's distaste for having to include Julia's name. Immediately following, however, Bea again portrays herself as someone who *defended* the position of her present hearer against the offender.

(12)

93 Bea: But she ain't even put your ***na***me down
94 there. *I* just put it ***down*** there. Me
95 and Martha put it *down*. =An I said, and
96 she said "***Gi***mme-that-paper.=I don't
97 wanna have her ***name down*** here." I s- I
98 s-I s-I said "She woulda allowed ***you***
99 name."

Quite different forms of affect and alignment toward Julia's perspective are conveyed by Bea's animation of Kerry and of herself. Kerry was eager to remove Julia's name from the hall pass, so that she would not be included in the group of girls exiting from the classroom together. Bea, in contrast, stood up for Julia and argued that, had Julia been in a similar situation, she would have included Kerry.

Recipient Responses



In responding to talk, participants pay close attention to the differential access they have to the events being talked about. Briefly, parties who both were present when the action described occurred and are figures in the story may participate in its telling, denying and countering the absent offending party's statements about them. Recipients who were not present at the past event and are not characters in the story may provide general comments on the offender's character, referring to ongoing attributes of the offender in the present progressive tense, for example:

(13)
18 Barb: Kerry~***al***ways~mad~at somebody.
19 °***I*** 'on' care.

(14)
40 Barb: Kerry ***al***ways say somp'm.=When you
41 ***jump*** in her ***face*** she gonna de***ny*** it.

In response to listeners' evaluations of events, the speaker acts upon any indication by recipient of her alignment toward the absent party. For example, when Julia makes an evaluative comment, "OO: r'mind me a-you old b:aldheaded Kerry" (lines 109–110) at the close of the story about Kerry's actions toward Julia, Bea states, "***I*** should say it in fronta her face. (0.8) Bal: head" (lines 111–112). Bea presents a model of how she herself would confront the offending party and invites the recipient to see the action in question as she herself does, as an action deserving in return an aggravated response such as an insult.

Suggestions for how to act toward absent party may also take the form of stories in which *speaker*, rather than recipient, appears as principal character reacting to actions of offending party. Briefly the speaker makes her suggestions by telling her present recipient the kinds of actions that ***she herself*** takes against the offender, these actions being appropriate next moves to the offenses described in the informing stories.

(15)
142 Bea *h And she was leanin
143 against- I- I said, I s'd I s'd I s'd I
144 said, "***Hey*** girl don't lean against that
145 thing cuz it's ***weak enough.***" *h And

146 she said and she said *h she- she did
147 like that.=She say, "Tch!" *((rolling*
148 *eyes))* // like that. I s'd- I said "You
149 c'd ***roll*** your eyes all you ***want*** to.
150 Barb: Yeah if somebody do that to her-
151 And if [you know what?
152 Bea: [Cuz I'm ***te***llin you. (0.5)
153 ***Te***llin- I'm not ***ask***in you." (0.4) An I
154 ain't say no ***plea***:se ***ei***ther.

In this story, Bea tells how she confronted Kerry with marked insult forms, issuing a direct command to her: "Cuz I'm ***te***llin you. (0.4) ***Te***llin-I'm not ***ask***in you" (lines 152–153). The bald, on-record nature of the command is highlighted by placing it in contrast with a more mitigated form that was not said: "An I ain't say no ***plea***:se ***ei***ther" (lines 153–154).

Evaluation through descriptions of past activities is consequential for the process of eliciting from the recipient a promise to confront the offender in the future. On the one hand pejorative actions performed by the absent party can be interpreted as explicit offenses against the current recipient. On the other hand, a speaker's description of her own actions in response to such offenses, that is, confronting the offender, can provide a recipient with a guide to how she should act toward that party. Thus Julia's statement that she will confront Kerry occurs right after Bea has described how she confronted Kerry about having excluded Julia's name from the bathroom pass.

(16)
87 Julia: I'm a- I'm a ***tell*** her about herself.

Offended parties' responses that constitute plans to confront the offending party are made in the presence of witnesses; they thus provide displays of someone's intentions to seek redress for the offenses performed against her. Failure to follow through with a commitment statement such as "I'm a ***t***ell her about herself" can be remarked on as demonstrating inconsistencies in a person's talk and actions, thus reflecting negatively on her character. Indeed, when Julia later fails to confront Kerry, others use her actions in the present exchange to talk about the way in which she had promised to tell Kerry off but then did nothing.

(17)
Bea: Yeah and Julia all the time talking
bout she was gonna tell what'shername
off. And ***she*** ain't do it.

Alignments taken up in the midst of an exchange such as this can thus be interpreted as **commitments** to undertake future action for which parties may be held responsible by others. People who refuse to confront once they have reported their intentions are said to "swag," "mole," or "back down" from a future confrontation. The fact that a statement about future intentions can be treated

as a relevantly absent event at a future time provides some demonstration of how responses to instigating stories are geared into larger social projects.

Thus, through a variety of activities – passing the opportunity to align herself with a definitive position before the hearer does at story beginning, presenting herself as having defended the offended party in the past, and portraying how she boldly confronted the offending party – the speaker carefully works to co-implicate her present recipient in a next course of action. Though the report is reputedly a narrative account of past events involving teller and offending party and speaker's alignment of righteous indignation toward these acts, it may also function to suggest future courses of action for present recipient.

A Comparison of Boys' and Girls' Dispute Stories

The forms of participation made available in boys' and girls' dispute stories may now be compared. The girls' and boys' stories examined here share several features: (1) The principal topic is offenses of another, and (2) one of the characters in the story is a present participant. In the case of boys' stories, cited offenses deal with wrongdoings of a *present participant.* Among girls, however, offenses concern *reported deeds of absent parties.* Such differences have consequences for the trajectory of dispute in girls' and boys' groups; whereas boys can deal directly with an offender, girls must wait to confront the offending party at a future time.

Within boys' and girls' dispute stories *hearer who is a character in the story* is portrayed in different ways. Whereas in Chopper's story Tony has performed objectionable actions in the past as a coward, in girls' instigating stories the present hearers (Julia and Barbara) are said to have performed exemplary actions in the past that sharply contrast with the reportedly objectionable actions of an absent party (Kerry). Among the girls, storyteller skillfully works to align hearer *with teller against an absent third party.* A coalition of what the girls call "two against one" (teller and hearer against absent party) is established in the immediate interaction. From the teller's perspective, the offended party's alignment is important for bringing forth a future confrontation. From the recipient's perspective the fact that at least two parties agree on a particular version of an event provides a warrant for bringing action against a third party. By way of illustration, consider the following speech that Vettie (age eleven) makes to her adversary during a confrontation:

(18)

Vettie: Well I'm a get it straight with the people.
What ***Ke***rry, (1.4)
it's between Kerry, and you, (1.0)
See ***two*** (0.5) two against one. (0.7)
Who wins? The one is two.=Right? (0.5)
And that's Joycie and and Kerry. (0.5)
They both say that you said it.
And you say that you didn't say it.

In contrast the teller in the boys' stories constructs a situation of conflict, not at some future time, but instead between teller and recipient, who is the principal character in the immediate interaction; boys who are hearers (and can be co-tellers of the story) align themselves *with the teller against the present principal character.*

Response from parties other than those who are principal figures in the story are similar in both girls' and boys' stories; such parties aid in the teller's depiction of the offending party by providing comments on the offender's character. Responses of offended parties, however, differ in girls' and boys' groups. Although offended parties in both girls' and boys' groups oppose reported descriptions. they oppose different identities. Boys who are offended parties direct counters to *principal storyteller,* but girls direct counters to *cited figures* who offended them in the past.

The portrayal of characters and events within dispute stories has consequences for the form and timing of interaction that ensues. Thus, whereas boys' dispute stories engender disagreements that permit contesting in the *immediate setting,* girls' stories engender alignments of "two against one" against an absent third party who will be confronted *at some future time.* In that the offending party is absent from the instigating event, girls cannot resolve their disagreements in the present interaction. Girls' he-said-she-said disputes, in contrast with those of boys, may be extended over several days.

An offended party in girls' stories reacts by stating not only that she disapproves of the offending party's actions toward her in the past, but also that she is prepared to confront her offender. When the offended party confronts the plaintiff, she does so with indirect, rather than direct, speech, in that the offenses at issue have been learned about through a third party. Girls' stories constitute a preliminary stage in a larger process of negatively sanctioning inappropriate behavior. After the instigating session, girls replay reactions of offended parties to the stories and rehearse future possible scenarios for confrontation with friends (M. Goodwin 1988b). Following the confrontation, serious offenders of the girls' moral code may be ostracized; the degradation ceremony of ridicule and teasing that results can extend over several weeks. Whereas boys' stories have little motive power beyond the present situation, girls' instigating stories are embedded within a larger social process, the he-said-she-said, a speech event providing for the involvement of participants in multiple phases of activity.

The present study has relevance for theories regarding not only the relationship of speech activities to larger social processes but also gender differences in children's social organization and culture. Whereas boys' arguments display an orientation toward social differentiation and principles of hierarchy, within he-said-she-said disputes girls display a form of organization based on what has been called "exclusiveness," reportedly more characteristic of American girls' groups than of boys'(Douvan & Adelson 1966:200–202, Eder & Hallinan 1978, Feshbach & Sones 1971, Lever 1976, Savin-Williams 1980:348, Sutton-Smith 1979). Girls affirm the organization of their social group through assessing

the behavior of absent parties. The alliances they form in the process of discussing others mark who is included and excluded from the social group of the moment, rather than relative rank.

It is sometimes argued that girls avoid direct competition and are little interested in "negotiational involvements" (Gilligan 1982, Lever 1976, Sutton-Smith 1979). Girls' tendency to be more nurturant than boys' is felt to result in relatively less conflict in their same-sex peer group (Miller, Danaher, & Forbes 1986:547). Within certain domains (M. H. Goodwin 1980a, 1988a) girls do select accounts for their actions that more closely reflect what Gilligan (1982:62–63) terms an ethic of care (as contrasted with an ethic of justice) and appear more concerned with a self "delineated through connection," than with a "self defined through separation" (Gilligan 1982:35) or differentiation from others. Such forms of behavior, however, must be interpreted as situated presentations of self, sensitive to the contexts in which they occur. As the data presented here vividly show, within the he-said-she-said storytelling event, girls react with righteous indignation when they learn their character has been maligned. They display an intense interest in initiating and elaborating disputes about their rights (not to be talked about behind their backs) that differentiate offending and offended parties. Alignments taken up during such disputes clearly demarcate who stands within the bounds of an inner circle of friends, as well as who is relegated to that circle's periphery. Stories thus provide arenas for each gender group to negotiate concerns central to each group's notions of social organization.

Appendix A: The Children

Boys			Girls		
Name	Age	Grade	Name	Age	Grade
Tony	14	8th	Barbara	13	8th
Archie	13	8th	Bea	12	7th
Pete	13	8th	Martha	12	7th
Malcolm	13	8th	Julia	12	7th
Tokay	12	7th	Kerry	12	8th
Dave	12	7th	Annette	10	5th
Chopper	12	7th	Rochele	9	4th
William	10	5th			
Tommy	9	5th			

Appendix B: Transcription

The following example has been constructed to contain a variety of relevant transcription devices in a brief example. It is not an accurate record of an actual exchange. Features most relevant to the analysis in this paper are identified after it.

UNIV BONN

Example Number

(16)

1 2 3 4 5 6 7 8 9 10

Pam: °Twel- *Thir* [tee:::n.
Bruce: [*Fou::r*//teen. = *hh W~u-mean.
Pam: *((Chanting))* THIRteen (only) Thirtee(h)n.

↑ (0.4) ↑ ↑ ↑
11 12 13 14 15

1. **Low Volume:** A degree sign indicates that talk it precedes is low in volume.
2. **Cutoff:** A hyphen marks a sudden cutoff of the current sound. In the example, instead of bringing the word *twelve* to completion, Pam interrupts it in midcourse.
3. **Italics:** Italics indicate some form of emphasis, which may be signaled by changes in pitch and/or amplitude.
4. **Overlap Bracket:** A left bracket marks the point at which the current talk is overlapped by other talk. Thus, Bruce's "***Thir***teen" begins during the last syllable of Pam's "***Four***teen." Two speakers beginning to speak simultaneously are shown by two left brackets at the beginning of a line.
5. **Lengthening:** Colons indicate that the sound just before the colon has been noticeably lengthened.
6. **Overlap Slashes:** Double slashes provide an alternative method of marking overlap. When they are used, the overlapping talk is not indented to the point of overlap. In the example, Pam's last line begins just after the "***Four***" in Bruce's "***Four***teen."
7. **Intonation:** Punctuation symbols are used to mark intonation changes, rather than as grammatical symbols:

   - A period indicates a falling intonation contour.
   - A question mark indicates a rising intonation contour.
   - A comma indicates a falling–rising intonation contour.

8. **Latching:** The equal signs indicate "latching"; there is no interval between the end of a prior turn and the start of a next piece of talk.
9. **Inbreath:** A series of *h*'s preceded by an asterisk marks an inbreath. Without the dot, the *h*'s mark an outbreath.
10. **Rapid Speech:** Tildes (~) indicate that speech is slurred together because it is spoken rapidly.
11. **Comments:** Double parentheses enclose material that is not part of the talk being transcribed, for example, a comment by the transcriber if the talk was spoken in some special way.
12. **Silence:** Numbers in parentheses mark silences in seconds and tenths of seconds.
13. **Increased Volume:** Capitals indicate increased volume.
14. **Problematic Hearing:** Material in parentheses indicates a hearing that the transcriber was uncertain about.

15. **Breathiness, Laughter:** An *h* in parentheses indicates plosive aspiration, which could result from events such as breathiness, laughter, or crying.
16. **Citation:** Each example is preceded by a citation that locates the tape and transcript where the original data can be found.

Appendix D: Girls' Dispute Story

(20)

((Bea, Barbara, and Julia are sitting on Julia's steps discussing substitute teachers during a teacher's strike.))

Barb: ***Teach*** us some little ***six***th grade work.
(0.4) ***That***'s how these volun***teers*** doin
now. A little um, *h ***Ad***din 'n all
that.
Bea: ***Y***ahp. ***Y***ahp.//Yahp. An when
we was in the-
Barb: Twenny and twenny is // forty an all
that.
Bea: ***How*** bout when we was in-
Barb: Oo I ***hate*** that junk.
Bea: ***How-how***- h- um, uh h- h- how **about me**
and ***Jul***ia, 'h and all them um, **and**
Kerry, 'h [and all them-
Julia: [***Is***n't ***Ke***rry ***mad*** at
me or ***s:om***p'm,
(0.4)

17 Bea: ***I'on'*** kn//ow.
18 Barb: Kerry~***al***ways~mad~at somebody.
19 °***I***['on' care.
20 Julia: [Cuz- cuz cuz I wouldn't, cu:z she
21 ain't put my ***name*** on that ***pa***per.
22 Bea: ***I*** know cuz [OH yeah. ***Oh*** yeah.
23 Barb: [An next she,
24 (0.3)
25 Barb: [[talk~bout~***peo***ple.
26 Bea: [***She*** said, ***She*** said that um, (0.6)
27 that (0.8) if that ***girl*** wasn't
28 there=***You*** know that girl that always
29 makes those funny jokes, 'h Sh'aid if
30 that ***girl*** wasn't there ***you*** wouldn't be
31 ***ac***tin, (0.4) a:ll ***stu***pid like that.
32 [(°Sh-
33 Julia: [But ***w***as I actin stupid w[ith them?
34 Bea: [Nope, no,=And
35 she- and she said that ***you*** sai:d, that,
36 "***Ah***: go tuh-" (0.5) somp'm like [tha:t.
37 Julia: [°No I
38 didn't.
39 Bea: She's- an uh- somp'm like ***that***. She's-
40 Barb: Ke[rry ***al***ways say somp'm.=When you=
41 Bea: [She-
42 Barb: =***jump*** in her ***face*** she gonna de***ny***
43 it.
44 Bea: Yah:p Y[ahp.=An she said, 'h An- and
45 Julia: [°Right on.
46 Bea: she said, hh that ***you*** wouldn't be ***ac***tin
47 ***li***ke ***that*** aroun- around ***peo***ple.
48 Julia: So: ***she*** wouldn' be ***ac***tin like ***that***
49 wi' that ***other*** girl.=***She*** the one picked
50 ***me*** to ***sit*** wi'them.='h She said,["Julia you
51 Bea: [Y:ahp.
52 Julia: sit with her, 'h and I'll sit with her,
53 'h an Bea an- an Bea an-
54 an an [Martha sit together."
55 Barb: [SHE TELLIN Y'ALL WHERE TA ***SIT***
56 AT?
57 (0.2)
58 Bea: An so ***we*** sat together, An s- and s- and
59 so Julia was ju:st s:ittin right
60 there.=An the girl, an- an- the girl:
61 next to her? 'h and the girl kept on
62 getting back up. 'h Ask the teacher
63 can she go t'the bathroom. An Julia
64 say she don' ***wa***nna go t'the bathroom
65 w'her. An m- And Julia w'just sittin
66 up there actin- actin:, ac- ac- actin

67 sensible. An she up- and she up there
68 talking bout, and she- *I* said, I s'd I
69 s'd I s'd "This is how I'm- I'm gonna
70 put Julia ***na***:me down here." Cu- m- m-
71 Cuz she had made a pa:ss you know. 'h
72 She had made a ***pa***:ss.
73 (0.2)
74 Bea: [For all us to go down to the bathroom.
75 Barb: [Y'all go down t'the bathroom?
76 Bea: For ALLA-yeah. Yeah. For u:m,(0.4)
77 for- for alla us- t'go to the
78 bathroom.=I's'd-I's'd "***How***: ***co***:me you
79 ain't put Julia name down here." *h So
80 she said, she said *((whiny defensive tone))*
81 "That other girl called 'er so.
82 she no:t ***wi***:th ***u***:s, so,"
83 That's what she said too. (0.2) So *I*
84 said, s- so I snatched the paper
85 wi'her. I said wh- when we were playin
86 wi'that paper?
87 Julia: I'm a I'm a ***t***ell her about herself
88 to***da*** [y. Well,
89 Bea: [Huh? huh remember when we're
90 snatchin that [paper.
91 Barb: [An she gonna tell you
92 another story ***a***ny***way***. // (Are you gonna
93 talk to her today?)
94 Bea: But she ain't even put your ***na***me down
95 there. *I* just put it ***down*** there. Me
96 and Martha put it down.=An I said, and
97 she said "***Gi***mme-that-paper.=I don't
98 wanna have her ***name down*** here." I s-I
99 s- I s- I said "She woulda allowed ***you***
100 name (if you star:ed)."
101 (1.0)
102 Julia: I said Kerry "°How come you ain't put my
103 name."
104 Barb: Here go B//ea, "uh uh uh well-"
105 Julia: "You put that ***o***ther girl (name down)
106 didn't you. I thought ***you*** was gonna
107 have-owl: a hall pass with that ***o***ther
108 girl." That's °what Kerry said. I said
109 (What's-her-problem.) OO: r'mind me a-
110 you old b:aldheaded Kerry.
111 Bea: *I* should say it in fronta her ***face***.
112 (0.8) Bal: head.
113 Barb: Hey member when what we did th(h)e
114 o(h)ther ti(***h***)me.

(21)

((The following occurs 45 seconds later after Julia has gone inside.))

Bea: She shouldn't be ***writ***in things, about me. (0.5) An so- An so- so she said ***Bar***bara, Barbara need ta ***go*** somewhere.

(1.0)

Barb: Well you ***te***ll her to ***c***ome say it in front of my fa:ce. (0.6) And ***I***'ll ***p***ut ***her*** somewhere. (3.8) An Barbara ain't got nuttin t'do with ***what.***

Bea: ***Write***- um doin um, [that- that thing.

Barb: [What do y'***all*** got ta do with it.

Bea: Because because um, ***I*** don't know what we got to do with it. Bu[t she said-

Barb: [W'll ***she*** don't know what ***she talk***in bout.

Bea: But- but she- but we ***di:d*** have somp'm to do because we was ***ma:d*** at ***her.*** Because we didn't ***like*** her no more. (0.6) And ***that's*** why, (0.6) Somebody the one [that use-

Barb: [So, she got anything t'say she come say it in front of my face. (1.0) I better not ***see Ke***rry today. (2.5) I ***ain***'t gonna say- I'm~a~say "Kerry ***what you say*** about m[e. She gonna say

Bea: [*((whiny))* (Nyang)

Barb: I ain't ***say*** nuttin."

Bea: (behind her face) she meant- sh'ent You know you- you know what. She- she cha[gin it.

Barb: [If I ***wro***:te somp'm then I ***wrote*** it.=Then I got somp'm to do with it.=W'then I ***wrote*** it.

(0.5)

Bea: And ***she*** said, an- an- she u:m ah whah.(I'm sorry oh.) I'm a walk you home. ***She*** said that um,

Barb: She get on my ***n***erves.

Bea: She said that um,=

Barb: =***Nown*** I got somp'm ta write about her ***now***::.

(0.5)

Bea: Oh yeah.=She sai:d tha:t, (0.4) that

um, you wouldn't have nuttin ta do with it, and every***thing***, and ***plus***, (0.5)
Bea: [um,
Barb: [WELL IF I WROTE SOME'N *I* HAD SOMP'M- T'***DO*** with it.
Bea: An she said, *I* wanna see what I was gettin read ta say, (2.0) °And um,
Barb: She gonna de***ny*** every ***word***.=Now ***watch***. I c'n put more up there for her the:n.
(2.0)
Bea: [***What***,
Barb: [An in magic marker °so there.
(0.6)
Bea: Oh yeah, oh yeah.=***She*** was. ***she***- w's ***she*** was in Rochele: house you know, and she said that um, that- I heard her say um, (0.4) um um uh uh "***Jul***ia said y'all been talking behind my back."=I said I'm a- I'm a say "H:oney, I'm gl***a***:d. that ***you*** know I'm ***talk***in be***hind your back***. Because *I*- because *I meant* for you to know ***any***way." An she said, I- said "I don't have to talk behind your back.=I can talk in front of your ***face too***." // And she said-
Barb: That's all I write. I didn't write that. *I* wrote ***that***.
(1.2)
Bea: Over here. *I* write ***this-I*** cleared it ***off***. Because ***Lan***da ***wrote*** and I- *h, [and *I* made it *bi*gger.
Barb: [Mmm,
(0.2)
Bea: So she said, [That first-
Barb: [And the other I did with my finger on the cars [and all that.
Bea: [An-so-*I* said, an- an so we were playin ***school*** you know at Rochele's house? And ***boy we tore*** her ***all***- we said, I got uh y'know [I was doin some signs?
Barb: [I better ***not*** go around an catch Kerry.
Bea: And Ro***chele*** called her ***bald***headed right~in~fronta~her face. She said "You ***bald***headed ***thing***." Because she was messin with Rochele.=I said, and so she said, you know we were playin around with her? And she said "You ***bald***headed

thing."=She said, "Rochele YOU DON'T
LIKE IT?" I said I said [that's why-
Barb: [Yeah she gonna
base in some little kid's [face.
Bea: [Yeah. And
she said,// I said AND I SAID= I said I
said "What~are~ya doin to her."
Barb: I better not see Kerry to***day***. I'm a
say "Kerry ***I*** heard you was talkin bout
me."
Bea: I a s[ay-
Barb: [Then she gonna say "I ain't- ***What***
I say about you." I say "Ain't none
yer ***busi***ness what you said.=You come
say it in front a my ***fa***ce since what=
you been tell everybody ***else***." (0.4)
((*falsetto*)) OO:, And I can put more
and I'm a put some- some °bad words in
to***day***.
(0.5)
Bea: ***She*** said, and ***she*** was saying.
[she said-
[***Now***:
n I got somp'm to write [ab***out***.
Bea: [***I*** said,
Barb: I better not catch you t'day.=I'm a
tell her butt o:ff.
(0.4)
Barb: An if she //get ***bad*** at me:***e***: I'm a,
punch her in the eye.
Bea: ***I*** said, ***I*** s- ***I*** said, I said, Hey
Barbara I said, "Why don't you" um, I
s-I-I-I- and *"**Why** don' you stop
messing with her." And she said she
said "She called me baldheaded."
=I said,
Barb: That's right.
Bea: =[An so-
Barb: [That's her name so call her name back.
Bea: ***Guess*** what. ***Guess*** what. Uh- we- w-
an we was up finger waving?=And I said,
I said, I said I said *((does motion))*
like that.=I did.
hh An [just like that.='h and I said=
Barb: [OO::,
Bea: an I an I was doin all those ***sig***:ns in
her face and everything? (0.5) 'h And
she said that um, (1.0) And then she-
an you- and she s- °She- roll her eye

like that, 'h And she was leanin
against- I- I said, I s'd I s'd Is'd I
said, *"Hey* girl don't lean against that
thing cuz it's ***weak enough.***" *h And
she said and she said 'h she- she did
like that.=She say, "Tch!" *((rolling
eyes))* // like that. I s'd- I said "You
c'd ***roll*** your eyes all you ***want*** to.
Barb: Yeah if somebody do that to her-
And if you know what?
Bea: [Cuz I'm ***tell***in you. (0.5)
Tellin- I'm not ***ask***in you." (0.4) An I
ain't say no ***plea***:se ***ei***ther.
Barb: mm hmm.
Bea: *((chews fingers))*
Barb: ***Don***'t do that. (1.5) W'll I'm tellin ya
I better not catch ***Kerry*** to***day***. Cuz if
I catch her I'm gonna give ***her*** a wor:d
from my ***mou***th. (0.6) An if she ***j***ump in
my ***face*** I'm a punch her in her ***fa***:ce.
(1.5) And she can talk behind my ba:ck
she better say somp'm in front of my
face.
(1.5)
((Boy walks down the street))
Barb: OO: there go the ***Tack***. 'h 'hh 'hh Eh
That's your na(h)me.
(1.5)
((Barbara starts down the street))
Barb: °h See y'all.
Bea: ***See*** you.

Notes

This chapter originally appeared in *Discourse Processes* 13(1990):1.35–71.

1. For a more complete description of this fieldwork see M. H. Goodwin (1990).
2. A more extensive analysis of the formation of teams, as well as speech activities, occurring in this encounter appears in C. Goodwin and M. H. Goodwin (1990).
3. The complete cycle of stories from which these data were selected appears in Appendix C. Subsequent line numbers related to this example refer to line numbers in the expanded version of this story in Appendix C.
4. The series of stories from which these data were taken appears in Appendix D. Line numbers in this fragment correspond to line numbers in the more expanded sequence of which this story is a part, which appears in Appendix D.

The Terms of Agreement: Indexing Epistemic Authority and Subordination in Talk-in-Interaction

John Heritage and Geoffrey Raymond

Social psychologists have long noted that social actions involve persons in commitments that others should recognize and validate. Perhaps the preeminent theorist of this perspective was Erving Goffman, who observed in "On Face-Work,"

> [W]hen a person volunteers a statement or message, however trivial or commonplace, he commits himself and those he addresses, and in a sense places everyone present in jeopardy. By saying something, the speaker opens himself up to the possibility that the intended recipients will affront him by not listening or will think him forward, foolish, or offensive in what he has said (1967:37).

And in *Relations in Public,*

> [L]et a participant whom others would rather see silent make a statement, and he will have expressed the belief that he has a full right to talk and is worth listening to, thereby obliging his listeners to give a sign, however begrudging and however mean, that he is qualified to speak (1971:95).

Goffman conceptualized these obligations in the concept of "face," which he conceived as central to the organization of social interaction. This work was extended by Brown and Levinson (1987); drawing on Durkheim's (1915) distinction between negative and positive rites, they distinguished between negative

face (the desire to be unimpeded) and positive face (the desire for approval, appreciation, or ratification).[1] Brown and Levinson operationalized face-work into a set of specifically linguistic strategies that embody connections between language use, social distance, power, and related variables. In this way, connections are made between *face* processes embodied in interaction and facets of social and cultural *identity*; both Goffman's theory and Brown and Levinson's extension are at pains to distinguish these notions. Identity is specific and local to persons, groups, and cultures, whereas the desire to be unimpeded and to be regarded positively – the two central components of face – embody putatively universal elements of human conduct and are conceived as basic to its organization.

Goffman's theoretical conception of face as situated within "the flow of events in the encounter" (1967:7) invited an empirical focus on sequences of talk-in-interaction; these, as Schegloff (1992) observes, are a primordial site of human sociality. One domain of such research, generally recognized as converging with Goffman's concerns, is the management of conversational actions, such as agreement and disagreement, that are clearly consequential for social solidarity. Conversation analysts have used the term *preference organization* to refer to the set of practices through which persons manage courses of action that either promote or undermine social solidarity (Holtgraves 1992; Lerner 1996; Pomerantz 1978; 1984; Sacks 1987; Schegloff 1988, forthcoming; Schegloff, Jefferson, and Sacks 1977). The most prominent organizational consequence of these practices is to maximize the likelihood of affiliative, socially solidary actions, and to minimize the consequences of disaffiliative, socially divisive ones (Heritage 1984a:265–80).

In addition to the organization of preference, however, participants' concerns with face can be found in the management of rights and responsibilities related to knowledge and information. For example, conversationalists treat one another as possessing privileged access to their own experiences and as having specific rights to narrate them (Pomerantz 1980; Sacks 1984); journalists distinguish between firsthand and derivative access to breaking news as relevant for the rights to describe it (Raymond 2000; Roth 2002); callers to 911 emergency services report matters in quite distinctive terms if they are bystanders to an incident rather than victims (Whalen and Zimmerman 1990); and patients offer medical diagnoses to physicians only under relatively particular circumstances (Gill 1998; Gill and Maynard forthcoming; Heritage and Robinson forthcoming). In each of these cases, the distribution of rights and responsibilities regarding what participants can accountably know, how they know it, whether they have rights to describe it, and in what terms is directly implicated in organized practices of speaking.[2]

In this paper we consider sequences in which participants offer evaluative assessments of states of affairs. We focus on how relative rights to perform these evaluations are indexed within the talk. Although these sequences are occupied mainly with agreement and are fundamentally affiliative, we show that they can involve complex face considerations relating to the management of knowledge and information. We distinguish between assessments that initiate an assessment sequence as "first position assessments," and assessments that are designed to be responsive to these as "second position assessments."[3]

In sequences of interaction, first position assessments establish a representational field in which second assessments will be found to position themselves in some fashion: through agreement, disagreement, or adjustment (Heritage 2002a, Pomerantz 1984). In this sense, first position assessments offer a terrain within which agreement will be sought. We propose that these assessments also carry an implied claim that the speaker has primary rights to evaluate the matter assessed. For example, as we demonstrate, persons offering first assessments may work to defeat any implication that they are claiming primary rights to evaluate the matter at hand. Conversely, persons who find themselves producing a responsive assessment may wish to defeat the implication that their rights in the matter are secondary to those of a first speaker. Because assessments are always produced in real time and are unavoidably produced as first and second positioned actions, they bring unavoidable relevance to issues concerning relative epistemic rights to evaluate states of affairs.

Our primary objective is to explicate the management of these rights, and the means by which this management is achieved. To do so, we focus on the intersection between differential rights to make assessments, turn design, and sequential positioning. As we demonstrate here, persons in the midst of jointly evaluating states of affairs are concerned not only with agreement, but also with who is agreeing with whom (Schegloff 1996a:177) – or, as we shall have it, "the terms of agreement."

Assessments and Their Epistemics

The assessment of states of affairs generally requires some form of access to the state of affairs being assessed (Pomerantz 1984). In (1), for example, a second speaker struggles to find a basis for affiliating with a first assessment whose very construction ("you sh'd see that house E(h)mma") denies the access necessary for building agreement:

(1) [NB:IV:10:2]

1 Lot: [h h] Jeeziz Chris' you sh'd see that house E (h) mma yih'av
2 ↓no idea.h[hmhh
3 Emm: [I bet it's a drea:m.

Emma's response in line 3 ("I bet it's a drea:m.") projects an agreement with Lottie's assessment of the house, while simultaneously thematizing her lack of firsthand experience. Lacking that experience, she manages raw affiliation with Lottie's evaluation by an utterance that expresses, at best, a simulacrum of agreement.

While (1) illustrates the limits of verbalized agreement without access, most assessment sequences incorporate the presumption of concurrent or serial joint access to a referent state of affairs. Such access can be first-order and immediate, as in (2):

(2) [JS:II:28]

1 J: -> T's tsuh beautiful day out isn't it?
2 L: -> Yeh it's jus' gorgeous . . .

Alternatively, it can be second-order and mediated, as in (3). Here Jon and Lyn are a couple who have seen the film *Midnight Cowboy*, while Eve has not:

(3) [JS:II:61]

1 Jon: We saw Midnight Cowboy yesterday- or [suh- Friday.
2 Eve: [Oh?
3 Lyn: Didju s- you saw that, [it's really good.
4 Eve: [No I haven't seen it
5 -> Jo saw it 'n she said she f- depressed her
6 Eve: -> ter [ribly
7 Jon: -> [Oh it's [terribly depressing.
8 Lyn: -> [Oh it's depressing.

As these two examples indicate, access to assessable objects is ranked. First-order access entails rights to assess, which can outweigh the rights of second-order access. In (2) the initial assessment of the weather is marked by its present-tense declarative form as drawn from direct and current experience; in this context of face-to-face interaction, such experience is equally available to the recipient. The co-interactant responds with an agreement ("Yeh") and an upgraded second assessment with comparable features. In (3), by contrast, Eve's assessment of *Midnight Cowboy* at lines 5–6 is marked as based in the account of a third party. Jon and Lyn's responsive assessments, however, renew the claim to direct, first-order access to the movie (first asserted in line 1), and are marked by the "oh"-prefaces as asserting stronger rights to assess it (Heritage 2002a).

First and Second Position Assessments and Rights to Assess

Participants orient to first and second position as involved in claims about rights to make assessments. This is most apparent in cases where there is some incompatibility between the epistemic rights that a speaker wishes to claim and the position in which the assessment is offered. In (4), for example, Norma offers a downgraded first assessment of a third party:

(4) [SBL 2-1-8:5]

1 Bea: hh hhh We:ll, h I wz gla:d she c'd come too las'ni:ght=
2 Nor: -> =Sh[e seems such a n]ice little [l a dy]
3 Bea: [(since you keh)] [dAwf'l] ly nice l*i'l
4 p*ers'n. t hhhh hhh We:ll, I [: j's]
5 Nor: [I thin]k evryone enjoyed jus . . .

Just before this sequence, it emerged that Norma had met the person assessed in line 2 – a longtime acquaintance of Bea – for the first time (see Example (14)

downgraded assessment "She seems such a nice little lady" and Bea's declaratively asserted agreement "dAwf'lly nice l*i'l p*ers'n." By downgrading her claimed access with the evidential verb "seems" (Chafe and Nichols 1986),[4] Norma manages her initial assessment so as to defeat any epistemic priority that might have been inferred sheerly from its first positioning.

The reverse contingency is evident in (5) below. Here Abe and Ben are in the midst of a discussion prompted by Abe's announcement that he has acquired a Burmese cat. As emerged earlier in the conversation, Ben's knowledge of Burmese cats is second-order: it is derived from a neighbor's ownership of the breed:

(5) [TCIIA:1]

1	Abe:		It's the- only cat I ever saw that chased do:gs.
2			(0.2)
3	Ben:		[ehh hhu [hh huhh]
4	Abe:		[(Hadda) [go out'n r] escue a dog thet wz eight times bigger'n
5			he wz th's [morning.
6	Ben:		[e- .hhhhhh Hurra: :y fer the Burme:se.
7	Abe:		e-huh-huh- [heh- [heh-he:h,]
8	Ben:		[F : : : [ight'n fo]o:ls.
9			(0.2)
10	Abe:		Pard'n,
11			(0.3)
12	Ben:	->	.hhh They're fight'n fools those Burmese,
13	Abe:	->	Oh I know 'e is.

The target sequence of assessments (lines 12–13) emerges from Ben's effort (lines 6 and 8) to affiliate with Abe's illustration of his cat's fighting prowess. His clearly responsive "Hurra::y fer the Burme:se." is appreciated with laughter, while his appended characterization of Burmese cats as "F:::ight'n foo:ls." is treated as problematic with "Pard'n,".[5] As a result, Ben's original phrasal assessment, which initially was produced in second position to Abe's first positioned assessment (and therefore fitted to Ben's rights to assess Burmese cats), comes to be produced as a fully sentential declarative assessment ".hhh They're fight'n fools those Burmese," (line 12). In this context, Abe comes to treat Ben as asserting rights to assess Burmese cats that are equivalent to his own, and it is this putative claim of equivalence that Abe resists. Three features of Abe's turn embody this resistance. First, he shifts the terms of assessment from Ben's assessment of the breed in general ("those Burmese"), to the cat which he owns and has primary rights to assess. Second, the "oh"-prefaced design of this assessment indexes his claim to primary rights in this matter (Heritage 2002a). Finally his use of, and stress on, the word *know* underscores his claims in this regard.

As the talk in these sequences demonstrates, participants work to manage the relationship between rights to assess and sequential position by manipulating the design of the turns out of which their assessments are built. In the following sections we examine speakers' resources for managing this intersection of rights to assess and sequential position.

Assessments in First Position: Resources for Indexing Epistemic Rights

Speakers can design first positioned assessments to create three basic forms that modulate the extent of their claimed epistemic rights. Using these resources, producers of first positioned assessments may manage face claims by asserting the socioepistemic rights associated with particular social identities, or by deferring to the rights associated with the identities of others.

Unmarked first assessments. In unmarked assessments, speakers deploy simple declarative evaluations that claim unmediated access to the assessable. These utterances contain no language that either strengthens or weakens the declarative claim that is made. For example, in excerpts (6) and (7), speakers assess their immediate experience.

(6) |VIYMC 1:4]

1 J: Let's feel the water. Oh, it . . .
2 R: -> It's wonderful. It's just right. It's like bathtub water.

(7) |NB VII:2]

1 Emm: =We're painting like ma:d in th' kitchen=
2 -> =a:nd oh evrything's workin out so pretty here

In (8) the first speaker deploys similar resources to evaluate past experiences which were shared with the coparticipant:

(8) |SBL 2-2-3:5]

1 Chl: -> We:ll it was[fu:n Clai[re, ((smile voice))
2 Cla: [hhh [Yea: : [:h,]
3 Chl: [°M]m°

A similar pattern is evident in (9), where the assessment concerns a joint acquaintance:

(9) |NB:IV.7:-44]

1 A: -> Adeline's such a swell [gal
2 P: [Oh God, whadda gal. You know it!

Across these sequences, the first speakers' declarative utterances (arrowed) flatly assert evaluations of states of affairs, and clearly do so on the basis of direct access to them.

Downgraded first assessments. Contrasting with these are assessments designed to exhibit downgraded epistemic access to a state of affairs. Two main resources can be used to accomplish this. First are evidentials (also see (4) above), through which speakers mark mediated access to a referent, and thus downgrade the claims made by the accompanying assessment. In (10), for example, Hyla has been describing a play that she and Nancy have tickets to see:

(10) [HG II:6]

1	Nan:	->	Kinyih tell me what it's abou:t?=
2			
3			. . . . . [27 lines of description deleted]
4			
5	Hyl:		=.hh En she's fixed up, (0.4) en she meets this gu:y, .hh a:n'
6			yihknow en he's (.) rilly gorgeous'n eez rilly nice en
7			evrythi[:ng bud li]ke=
8	Nan:		[Uh h u :h,]
9	Hyl:		=.hh He's ah .hh Hollywood (0.3) s:sta:r's son yihknow who wz
10			a mista:[ke en they [put im in'n [Academy,]
11	Nan:	->	[O o this [s o u n d s [so goo: :___]_: : [d?
12	Hyl:		[school, .hh buh
13			wai:t.='n then, .hhm (0.2) .tch en the: (w)- the mother's .hh
14			sister is a real bigot.

It is clear from line 1 that Hyla is the better informed about the play. This asymmetry is preserved in Nancy's assessment ("Oo this sounds so goo:::d?" at line 11; the evidential formulation of this underscores that the basis for her evaluation is premised on the information provided in Hyla's description.

A second means to downgrade an assessment involves the use of tag questions. By introducing an invitation to agree with the assessment as a feature of its surface syntax, such questions index a putatively secondary access to a referent relative to the coparticipant.[6] In (11), for example, the assessment refers to Vera's grandchildren, whose recent visit included a stopover at Jenny's house. Jenny's declaratively formulated assessment is modulated with a tag question that defers to Vera's rights to assess her own family members:

(11) [Rah 14:2]

1	Jen:		Mm[I: bet they proud o:f the fam'ly.=
2	Ver:		[Ye:s.
3	Jen:	->	=They're [a luvly family now ar'n't [they.
4	Ver:		[°Mm:.° [They are: ye[s.
5	Jen:		[eeYe[s::,
6	Ver:		[Yes,
7	Jen:		Mm: All they need now is a little girl tih complete i:t.

The tag question is positioned so as to invite response as the *first* matter to be addressed by the coparticipant. In this way, Jenny formulates her turn as (in the first instance) a question to be answered rather than as an assertion to be agreed with; thus she cedes epistemic authority in the matter to her coparticipant. The introduction of the invitation to agreement in the surface design of the utterance indexes Jenny's position that Vera has primary rights to assess her own grandchildren.

In a similar case, Norman and Ilene are dog breeders discussing the breeding potential of one of Norman's younger dogs. At line 9, Ilene invokes a comparison with Trixie, another of Norman's dogs.

(12) [Heritage 1:11:4]

1	Ile:		No well she's still a bit young though isn't [she<ah me] an: =
2	Nor:		[S h e : :]
3	Ile:		=uh [:
4	Nor:		[She wz a year: la:st wee:k.
5	Ile:		Ah yes. Oh well any time no:w [then.]
6	Nor:		[Uh:::]: [m
7	Ile:		[Ye:s.=
8	Nor:		=But she [:'s ( )]
9	Ile:	->	[Cuz Trixie started] so early [didn't sh [e,
10	Nor:	->	[°O h : : [ye:s.°=
11	Ile:		=°Ye:h°=

Ilene's assessment asserts that the dog started breeding "early" and the following tag acknowledges Norman's primary rights to assess his own dog.[7]

Upgraded first assessments. Just as assessments can be epistemically downgraded relative to a recipient's attributedly superior rights, so can they be upgraded. The primary resource for this task is the negative interrogative, as in (13):

(13) [SBL:2–1–8:5]

1	Bea:		Wz las'night th'firs'time you met Missiz Kelly?
2			(1.0)
3	Nor:		Me:t who:m?
4	Bea:		Missiz Kelly?
5	Nor:		^Ye:s. hh [Yih kno]:w what<]
6	Bea:	->	[Isn't]she a culte little thi:ng?

Here it is established at the beginning of the sequence that Bea has a more extended acquaintance with "Missiz Kelly" than does Norma (lines 1–5). Bea asserts her corollary epistemic rights in her assessment at line 6. The form of her assessment embodies this stance through the following features working in concert.

First, by virtue of its interrogative syntax, this format mandates a second assessment through the conditional relevance of a question-answer pair more strongly than would a simple declarative. Moreover, by projecting a yes/no (or type-conforming) response, it asserts command of the terms to be used by the recipient in the assessment of the referent (Raymond 2003). Finally, the negative interrogative strongly invites agreement (Heritage 2002b). It thereby invokes an established or settled position and, through that, a more extensive acquaintance with the referent and/or stronger rights to assess it.

All three of these features cooperate to establish Bea's evaluative position as "settled" or "decided" and, as part of that position, to reinforce her primary rights to assess the acquaintance in question.

In a second case, (14) below, Emma is calling to thank Margie for a recent lunch party. She extends a compliment about the occasion into a sustained and favorable evaluation of the others present. This culminates, like (13), in a positive assessment managed through a negative interrogative. Emma's assessment "e-that Pa:t isn'she a do:ll?" emerges as an Nth compliment to her co-interactant:

(14) [NB VII:1–2]

1	Emm:		=Oh honey that was a lovely luncheon I shoulda ca:lled you
2			s:soo [:ner but I:]I:[lo:ved it. Ih wz just deli:ghtfu [: 1.]=
3	Mar:		[((f)) Oh:::] [°( ) [Well]=
4	Mar:		=I wz gla [d y o u] (came).]
5	Emm:		['nd yer f:] friends] 'r so da:rli:ng,=
6	Mar:		= Oh::: [: it wz:]
7	Emm:	->	[e-that P]a:t isn'she a do: [:11?]
8	Mar:		[iY e]h

Here, perhaps in an effort to emphasize the compliment, Emma deploys a format that asserts her own epistemic primacy in relation to "Pat," the assessed party, although she acknowledges her recipient's closer relationship with her. In contrast to the previous case, then, we find a lack of fit between this claim and the actual state of the relations between the parties. This turns out to be a source of subsequent difficulty (see the discussion of (27) below).

In sum, although first assessments index a tacit claim to epistemic primacy, that claim can be modified: practices exist for asserting both upgraded and downgraded epistemic access and/or rights to assess a referent. It is clear that these practices embody selectional choices, given that an unmarked method of assessment (i.e., the use of an unqualified declarative statement), which embodies an unmarked claim of primacy, is also an available option.

Managing Epistemic Rights in Second Position Assessments

Just as first position assessments can incorporate features that index relative access to a referent, so too do second position assessments. The task of indexing relative access is complicated for second speakers by the fact that their access must be managed in relation to the claims embodied in first position assessments, and indeed to the specific practices deployed by first speakers to index those claims.

Second position assessments can take a simple declarative form, as in (15) and (16). Here the participants are jointly assessing shared social occasions. In each case these assessments conclude an extended passage of conversation about the events that are referenced, during which joint access to the events has been thoroughly established as a feature of the talk.

(15) [SBL 2–2–3:5]

As these examples suggest, given equal access to past events, a declarative assessment in first position invites a matching response claiming similar access.

Alternatively, second speakers can modulate their response to upgrade their claimed epistemic access to, and/or rights to assess, a referent. Two main kinds of resources are deployed to this end. First, speakers can design the second assessment so as to convey that their position on the matter is already "settled" – that is, held independently of the view that the first speaker's assessment conveys. In this way they can undercut any relative inferiority in epistemic rights that sheer "secondness" might otherwise convey; indeed, they can advance a claim to primary epistemic rights in the matter under evaluation. Second, speakers can use interrogative syntax in second position to undercut, and supplant, the "firstness" of a first assessment, and to seize the epistemic rights that accrue to that position. These resources are deployed, and their deployment is understood, in relation to the claims that are indexed in first position assessments.

Upgrading with resources that assert a position as "previously held." We discuss two resources with which speakers in second position can present an evaluation as previously held or "settled." Using these resources, producers of second positioned assessments may assert the socioepistemic rights associated with particular social identities: they may "match" the claims of downgraded first position assessments or, alternatively, may compete with epistemic priorities that may be suggested by unmarked first position assessments.

Upgrading with confirmation + agreement token: The first resource to be discussed exploits features of tag questions in downgraded first position assessments. Because a tag question (like other yes/no-type questions) makes a "yes" or a "no" relevant as the first component of a response (Raymond 2003), speakers can produce different actions by designing their responses to satisfy or defeat this expectation. For example, in the following excerpt (discussed above as excerpt (2)), the first speaker uses a tag question to downgrade a declaratively produced assessment of the weather, thereby indexing the similar rights available to a copresent participant.

(2) [JS:II:28]

1 J: -> T's tsuh beautiful day out isn't it?
2 L: -> Yeh it's jus' gorgeous . . .

In response, L agrees with J's assessment while similarly declining to assert primary rights in the matter. By initiating her turn with "Yeh", L satisfies the constraints set by J's tag question and thereby accepts the terms set by J's first position assessment (Raymond 2003). In this respect, L's responsive assessment is wholly occupied with agreement.

Alternatively, speakers can upgrade their claimed access to a referent using [confirmation + agreement token] turn format. In the following excerpt, for example, Mum describes a child in "hot water" because of a "craze" for wearing

two earrings in a single ear (lines 4–9). While the turn-initial "oh" of Lesley's response (line 10) indexes recognition of the "craze" to which Mum's answer to Lesley's question refers (Heritage 1984b), its tag question downgrades her asserted rights to assess the fashion that has landed Miriam in "hot water":

(17) [Holt 1.1:8]

1	Mum:		Miriam's going next week,
2	Les:		Ye:s: yes:.
3			(0.4)
4	Mum:		She['s been in hot water with'er Mum t'day,
5	Les:		[M-
6	Les:		Why: ;?
7	Mum:		.hh We:ll. (0.2) Uh you know (.) there's a cra:ze with the
8			girls now to have (.) a secon:d. (1.1) ring ih- a secon:d
9			uh earring in on [e ear.
10	Les:		[Oh: it's very chea:p isn't.
11	Mum:	->	It's very cheap yes'n this is u- this is what Ann said. An'
12			Ann said (0.3) she- she'll haf (.) tuh have another. (0.5)
13			.hh (.) hole in'er ear . . . ((continues story))

Mum's response takes the form of a full repeat ("It's very cheap") followed by a type conforming token ("Yes"). This response complements Lesley's stance by indexing her own primary rights as storyteller, which initially were projected by Lesley's epistemically downgraded turn. Two features of Mum's assessment work to accomplish this complementarity.

First, Lesley's epistemically downgrading tag is a "yes/no" question: like other questions of this type, it invites a "type-conforming" "Yes" or "No" response as the *first* component of any response (Raymond 2003). In this context, Mum's deferral of the "Yes" is constructed as a marked action. The placement of the agreement token ("Yes") after the partial repeat *separates* the action of agreeing from the action of "confirming" in a way that the normal ordering of response to the question ("Yes it is") does not. Whereas "Yes it is" would be understood as wholly occupied with agreement, Mum's actual response ("It's very cheap yes" . with its initial declaratively formed partial repeat, *confirms* Lesley's evaluation rather than simply *agreeing* with it. By "confirming the assertion" before "responding to the question," Mum also treats agreement with Lesley's assessment as a matter of lower priority. Thus she goes out of her way to subordinate the action of agreeing with the assessment to the assertion of her epistemic rights relative to Lesley's. Finally, Mum's ordering of the [partial repeat] and [agreement token] conveys the position that Lesley's evaluation addresses a matter on which Mum already holds a "settled" opinion which is quite independent of this occasion (Raymond 2003). In this instance, that she held this position previously is also asserted overtly by reference to what "Ann" (Miriam's mother) previously said to her (lines 11–13).

Second, if the first component of Mum's turn is designed to assert the independence and priority of her position in relation to Lesley's, the second component modulates any hint of impropriety that might be glossed from that

treatment. legitimizing Lesley's evaluation and bringing the two women's positions into alignment. This is accomplished by the production of a type-conforming token; this token, in satisfying the constraints set by Lesley's tag question, ultimately accepts the terms set by Lesley's first position assessment (Raymond 2003).

In this example, to assert priority the second speaker draws on the tag question in the prior speaker's turn. In this way she matches the prior speaker's indication of downgraded access/rights to evaluate with her own upgraded claims in the matter. This complementarity is present in a large majority of first positioned [assessment + tag question] formatted utterances in our data.[8]

In (18), the same speakers are discussing Lesley's daughter's dental problems. At line 3, the grandmother (Mum) asks if the problem is related to "eye teeth," using a format that prefers an affirmative response. Lesley's response is complex: it refers to the child's dentist as the authority for a negative response, while stating her intention to send the child to her own dentist for a second opinion (line 8). Mum's renewal of her earlier diagnostic suggestion (line 9), produced in this context of skepticism, reinvokes her earlier question-formed diagnosis while upgrading its likelihood by using a [statement + tag question] format.

(18) Holt X(C)-1-2-7 (p4, 14)

1	Les:		.hh An' I'll: get her fixed up with a de:ntist too:,
2			(0.7)
3	Mum:		Oh w't a ↓nuisance isn't ↓it. Is it ↓ey.:e tee:th?
4			(0.4)
5	Les:		.hh ↑Well the den: u-her dentist says °no:t.°
6			(0.2)
7	Mum:		[↑Hm:.
8	Les:		[.hh But I:'ll send 'er to ↓my den:tist I thi[nk
9	Mum:		[Sounds
10			↓like it ↑d'z'n't [↓it.
11	Les:	->	[.hhh It does rather yes:

Here Lesley is the one with more direct access to the daughter's medical problems: as her mother, she has primary rights to evaluate them. The downgraded rights to assess indexed by Mum's [statement + tag question] are matched by Lesley's epistemically upgraded [partial repeat + agreement] response.

Upgrading via confirmation can be accomplished by means other than partial repeats. Excerpt (19) involves a further case, in which the neighbor (Jenny: also see Example (11)) assesses a member of Vera's family (her son Bill) in first position. As in the prior sequences, Jenny's subordinate rights are indexed in a [statement + tag question!] formatted assessment:

(19) [Rah 14:6]

1	Ver:	=Jillian, she c'n be a little nasty little bi [tch.
2	Jen:	[Well you w'r
3		say: ↑ing thez something in that_=It's a sha:me i [sn't i:t.]
4	Ver:	[Yeh a::n]d-

5 Ver: even Jean said she couldn't do eh uh she said she's alw'z
6 glad when they go:.
7 Jen: Yeh .h well of course you see Bill is so good wih th'm ez
8 well is [n't h [e:.
9 Ver: -> [.kl [That's ri:ght yes.

Similar to the repeats deployed in the prior excerpts, Vera's "That's right" response treats "confirmation" as the primary business of the response, before going on to agreement with "Yes." In addition, the formulation "That's right" more overtly takes an epistemically authoritative stance in relation to Jenny than do the earlier partial repeats.

In these examples, speakers achieve epistemic alignment by downgrading rights to assess in first position assessments and upgrading them in second position. The [confirmation + agreement] format is most commonly used in response to interrogatively formed assessments, particularly those deploying tag questions. This distribution can be understood as a product of the specific set of resources that tag questions make available and relevant. An assessment with a tag question appended offers the recipient an opportunity to disentangle confirmation and agreement as distinct activities in a responding turn. Speakers can simply agree (e.g., "Yes" or "Yes, they are"). Alternatively, by inverting the order of a confirmation and an agreement token, speakers can treat answering and agreement as separable activities and can exploit their separation to assert their epistemic supremacy.

Upgrading with "oh"-prefaced second assessments: A second practice for epistemically upgrading second assessments is "oh"-prefacing. In these cases, the change-of-state sense of "oh" (Heritage 1984b, 1998) is used to index epistemic independence and priority, relative to a first assessment (Heritage 2002a). In contrast to the practice of confirming in turn-initial position described above, which normally exploits an earlier tag question, "oh"-prefaced second assessments are much less constrained in the contexts of their occurrence.

In (20), as noted earlier, Norman is the owner of the dog "Trixie," whom Ilene evaluates (line 9) as having "started so early." This assessment is followed by a tag question which downgrades her epistemic access to this information relative to Norman's.

(20) [Heritage 1:11:4]

1 Ile: No well she's still a bit young though isn't [she<ah me] an:=
2 Nor: [S h e : :]
3 Ile: =uh[:
4 Nor: [She wz a year: la:st wee:k.
5 Ile: Ah yes. Oh well any time no:w [then.]
6 Nor: [Uh:::]: [m
7 Ile: [Ye:s.=
8 Nor: = But she [:'s ( )]
9 Ile: -> [Cuz Trixie started] so early [didn't sh[e,
10 Nor: -> [°O h : :[ye:s.°=
11 Ile: =°Ye:h°=

Simultaneous with the tag question, Norman's "Oh:: ye:s." asserts epistemic priority on the issue. "Oh"-prefacing here conveys a "change of state of orientation" in response to Ilene's assessment. This is a systematic way of claiming that a speaker has independent access to, and already holds a position regarding, the referent. "Oh"-prefacing is thus a resource through which a second speaker can convey that the assessment which follows is independent of the "here and now" of current experience and the prior speaker's evaluation. It achieves this outcome through a "change of state semantics," which conveys that the first assessment has occasioned a review, recollection, and renewal of the speaker's previous experience and judgment, and that this forms the basis for the second assessment (Heritage 2002a). As with [confirmation + agreement], "oh"-prefacing functions to convey superior knowledge of, and/or rights to assess, the matter under discussion.

The following case (21) vividly illustrates this usage. Gay is giving Jeremy a German telephone number. After she has recited 11 digits, thus exceeding the norm (during the 1980s) for a (British) intracountry call, Jeremy comments (line 13) on the length of the number, prefacing his comment with "Gosh." This expression indicates that, for him, this is something new, notable, or surprising. Here Gay could have responded with a simple agreement, which, as in (15) and (16) above, would have conveyed that her agreement was grounded in the "here and now" common experience of an interminable telephone number. Instead Gay begins her response with "Oh it doe:s":

(21) [Heritage:0I:7:3]

1	Gay:		So the ↑number **is (0.2) oh: one oh::.**
2	Jer:		Oh one oh:,
3			(1.0)
4	Jer:		Yeup,
5	Gay:		↑Four ni:ne,
6			(0.5)
7	Jer:		Ri:ght?
8	Gay:		Sev'n three, u-six o:ne?**hh**
9			(0.6)
10	Jer:		Sev'n three: six o:ne?
11			(0.3)
12	Gay:		Ei:ght ni:ne,
13	Jer:	->	°Gosh°it goe:s (.) goes on'n on
14	Gay:	->	Oh it doe:s Germany doe:s.

Two aspects of Gay's "Oh it doe:s" treat Jeremy's remark as reviving an earlier observation of the same type that she had made independently of this occasion. Thereby they convey that Gay, in contrast to Jeremy, finds the length of the number unsurprising. First, as noted earlier, the "oh"-preface indexes prior and independent access to this phenomenon. Second, the partial repeat ("it does"), by confirming rather than simply agreeing with Jeremy's remark, underscores this stance (Stivers forthcoming). By these means Gay also manages

to indicate that she is an "old hand" at phoning abroad. In addition, Gay continues with a turn component that appears to be designed to further suggest her expertise about foreign telephone calls. Her postpositioned "adjusting" component ("Germany doe:s.") recalibrates the referent of her response from this particular telephone number to German telephone numbers in general, and also conveys a degree of prior knowledge on the topic. Moreover, with its hint of a further contrast with telephone numbers in other foreign countries, it implies a still broader expertise in placing telephone calls, abroad. Shortly afterwards, Gay underscores her expertise, informing Jeremy that the "ringing" sound on a German phone sounds like a "busy" signal on a British phone (data not shown).

A third case points to the use of "oh"-prefacing as a means of countering a recipient's upgraded claim of access to a referent that began as the speaker's informational preserve. By inquiring into Lottie's trip (to Palm Springs), Emma casts her as having direct and immediate experiential access to its events that Emma herself lacks. Emma, however, meets Lottie's enthusiastic initial assessment of the trip ("Oh:: Go:d wonderful Emma,") with an "oh"-prefaced, negative interrogative "Oh idn'it beautiful do:wn the:re," which embodies a competitive claim to primacy in assessing the attractions of the location.

(22) [NB IV.10.R:1]

1	Emm:		.h ↑How wz yer tri:p.
2	Lot:		Oh:: Go:d wonderful Emm[a,
3	Emm:	->	[Oh idn'it beautiful do:wn the:re,
4	Lot:	->	Oh:: Jeeziz ih wz go:rgeous::.
5	Emm:		Wh't a ni:ce ↑wut time'djih git i:n. Jst a li'l whal ago?

Lottie herself then responds to this assessment with a further and equally competitive "oh"-prefaced agreement that underscores her own claims to primacy in the matter. This competitiveness is also evident in the referent shifting that is part of the sequence. The sequence begins with Lottie's evaluation of her recent trip; Emma's assessment at line 3 shifts the referent to its general locale, a knowledge domain to which Emma has some claim. In turn, Lottie's response at line 4 uses the past tense ("wz") to shift the referent of her assessment back to her own arena of expertise – the recently completed trip.

In sum, "oh"-prefacing can be deployed in a wide variety of contexts by a second or (as in (22)) subsequent assessor to assert epistemic independence and supremacy relative to a first. In addition to competing with sheer "firstness" (as in (20) and (21)), it can also be deployed (as in (22)) to meet and compete with epistemically upgraded prior assessments.

Upgrading by usurping the "firstness" of a previous assessment. Using two resources – tag questions and negative interrogatives – speakers who are responding to an assessment in second position can assert their assessment as a "first positioned" evaluation. In both cases, interrogative syntax is deployed as a means of usurping a previous speaker's first positioned assessment with a new one that now commands the terms of agreement. With these resources, speakers effectively usurp the socioepistemic claims of others.

Upgrading with tag questions: While tag-questions downgrade first position assessments, their function is reversed in second position: there they *upgrade* second position assessments.[9] In second position, the [assessment + tag] format invites agreement to the position that is taken by the second speaker, thus preempting "first position" in the sequence. In this way it upgrades the second speaker's claimed rights over the first with respect to the matter at hand. This usage is illustrated clearly in (23). In this sequence, Jenny and Vera are discussing Vera's two grandsons after a recent visit to Vera, during which the children also visited Jenny's home. After some discussion of the children, Jenny and Vera face a potential discrepancy regarding what they have just agreed on (in lines 4–6) when each names a different child to complete Jenny's observation "he's a bright little boy." Almost as soon as this discrepancy becomes apparent, (that is, when Vera, the grandmother, produces "Paul" in overlap with Jenny's "little James," lines 5 and 6), Jenny immediately accepts "Paul" by repeating his name (line 5) and then offering several agreement tokens (in lines 5/7). Perhaps to counter the potential inference that she was simply "going along" with Vera in accepting "Paul" as the "bright" boy, Jenny offers a negative assessment of James: "Yeh James's a little devil" (line 11). By initiating her turn with "Yeh", Jenny builds it as a continuation of the prior sequence, effectively offering the assessment as confirmation that she "meant" Paul in the first place because she already viewed James as "a little devil." Ironically, in solving this problem, Jenny inadvertently creates trouble of a different kind: in conveying that she meant to refer to Paul, Jenny comes to produce a declaratively formed, first position, negative assessment of Vera's other grandson, James.

(23) [Rahman:14:1–2]

1	Ver		ehr: they readjer comics:'n evrythink yihkn[o:w
2	Jen:		[Yeh: w' 1
3			I think he's a bri:ght little boy: u [h:m
4	Ver:		[I: do=
5	Jen:		=l [ittle Ja]: [:mes,] uh [Pau:l.yes.]
6	Ver:		[Pau:l,] [mm- m] mm [Pau : : 1,]
7	Jen:		Mm:. [Yes.
8	Ver:		[Yes.
9			(0.3)
10	Ver:		[Yes ( )]
11	Jen:	->	[Yeh James's a little] divil ihhh ↑heh heh
12	Ver:		[That-
13	Jen:		[.huh .hh [h He:-
14	Ver:	->	[James is a little bugger [isn'e.
15	Jen:		[Yeh-
16	Jen:		Yeah [(into) ev'rythi]ng.

Although she steps in to agree with Jenny's assessment, Vera as the grandmother resists the putatively superior access entailed in such a first position assessment.

This resistance is embodied most forcefully in Vera's use of a tag question in turn-final position. By deploying an interrogative form as part of a second position assessment, Vera marks her turn as a "new" first pair part. The "firstness" of her assessment is also manifest in her re-use of "James" (a locally initial reference form deployed in a locally subsequent position (Schegloff 1996c). Moreover, the remainder of her turn is designed as a full-form declarative that effectively disregards Jenry's immediately prior reference to him, and, by extension, her utterance. The status of Vera's utterance as a "first position" assessment is subsequently accepted by Jenny: she cuts off her initial response to Vera's comment (line 15), and then redoes her responsive agreement at line 16 with a type-conforming "Yeah" and an elaboration that gives a potential (and decidedly pallid) specification of the "little bugger" as "into everything." In this case, then, the tag question, by inviting a response, positions Vera's evaluation as a first action to be agreed or disagreed with. In this way, it attenuates its responsiveness to Jenny's initial evaluation, thus asserting Vera's rights in the matter.

Upgrading with negative interrogatives: Just as negative interrogatives upgrade the epistemic claims embodied in first assessments, they also can achieve this outcome for second assessments. Used in second position, negative interrogatives (like second positioned, tags) provide a putatively "new" first pair part for the previous speaker to respond to, and thus attenuate their status as "second position" assessments. In the following case (discussed above), Margie's second assessment downgrades the virtues of the assessed party ("Pat") while deploying a negative interrogative to assert upgraded rights to her opinion.

(24) [NB VII:1–2]

1	Emm:		=Oh honey that was a lovely luncheon I shoulda ca:lled you
2			s:soo [:ner but I:] 1: [lo:ved it.Ih wz just deli:ghtfu [: 1.] =
3	Mar:		[((f)) Oh:::] [°( ) [Well] =
4	Mar:		=I wz gla [d y o u] (came).]
5	Emm:		['nd yer f:] friends] 'r so da:rli:ng, =
6	Mar:		= Oh:::[: it wz:]
7	Emm:		[e-that P]a:t isn'she a do:[:ll?]
8	Mar:	->	[iY e]h isn't she pretty,

As we noted earlier, Emma praises Margie's friend ("Pat") using a negative interrogative (line 7) to upgrade both her rights to assess the friend and, with it, the compliment that her assessment embodies. Perhaps to manage the receipt of this compliment in an appropriately downgraded fashion (Pomerantz 1978), Margie responds (line 8) with an initial type-conforming agreement and a significantly weaker token of praise ("pretty" versus Emma's "a doll") (Pomerantz 1984). At the same time, she asserts her own primacy in assessing her friend by packaging her response as a negative interrogative.

A somewhat more perverse case can be found in a return to excerpt (22):

(22) [NB IV.10.R:1]

1	Emm:	.h ↑How wz yer tri:p.
2	Lot:	Oh:: Go:d wonderful Emm [a,

As we noted above, Lottie is the projectedly authoritative evaluator of her trip. Her initial evaluation, however, is intersected with an "oh"-prefaced negative interrogatively formed assessment. By shifting the referent to the location, this assessment brings the topical focus of the sequence towards Emma's generalized experience of Palm Springs rather than Lottie's more immediate experiences there. In these ways, an assessment initiated in response to Lottie's evaluation is designed to exert control over the onward trajectory of the sequence.

Summary

Above we described four practices with which speakers can upgrade the epistemic claims of second assessments relative to the claims embodied in first positioned assessments. These four practices are of two types. The first two – [repeat/confirmation + agreement] and ["oh"-prefacing] – assert primary rights to assess by embodying the claim that the position asserted was held already and independently by the second speaker. The second two – [statement + tag] and [negative interrogatives] – assert primary rights by manipulating the sequence to "reclaim" the first position assessment slot and thereby the epistemic rights which accrue to that position. These two latter practices reflect an important way in which "first" and "second" position, though at first appearance lodged in the temporal order, are not confined there. Rather, these positions can be negotiated through practices of speaking that reflexively claim "first position" and "second position" (see note 10) as distinct from the raw appearances of temporal ordering in the flow of conversation.

Reviewing these practices, the first – [confirmation + agreement] – is relatively specialized to environments in which first assessments are downgraded by using tag questions. For these reasons, this practice is normally used in circumstances where the speakers achieve alignment concerning their relative rights to assess, and therefore is relatively "mild." Much more combative are the "all-purpose" resources afforded by the use of "oh"-prefacing, tag questions, and negative interrogatives. Whether a first assessment is unmarked, upgraded, or downgraded, the change-of-state semantics of "oh"-prefacing asserts an independent stance, and hence epistemic authority, in relation to an assessable. It can be used in combination with other resources, and can be deployed to address first assessments regardless of their specific formulation. Tag questions in second position function by asserting interactional primacy in assessment sequences: their deployment of interrogative syntax formulates the second speaker's assessment as the axial one calling for agreement. Finally, negative interrogatives are perhaps the strongest of the four practices. Like tag questions, they deploy interrogative syntax to assert interactional primacy in an assessment sequence, but they are significantly more assertive. Thus they combine both the import of a declarative and the sequential implicativeness of an interrogative as resources to wrest the initiative from the first speaker.

Multiplex Deployments of These Resources and the Management of Face

Having developed an analysis of some of the resources through which speakers

now turn to three cases in which the terms of agreement are more complicated. In the preceding analysis we relied on examples involving a straightforward relationship between the participants' prima facie socioepistemic rights and the practices they deploy to manage them as a way of establishing a relationship between the two. There is no guarantee, however, that speakers will assert the rights to which they may be entitled, nor that recipients will align with or support the rights asserted by them. Speakers may assert rights that are (or could be) contested; in some cases they may defer to a recipient with putatively subordinate rights. Here we consider three cases in which participants assert rights which are potentially problematic, or which become a source of conflict or struggle. By explicating the resources through which such circumstances are prosecuted, we can discern the reflexive character of these practices for asserting relative rights to assess in sequences of turns, and thus the management of face and identity issues within these interactions.

The first of our cases involves one party's assertion of the primary right to assess a person that previously had been treated as her recipient's primary right to assess. In (25), Vera and Jenny are discussing Vera's grandchildren after a recent visit. As we noted above, in the course of managing a potential discrepancy regarding what Jenny and Vera have just agreed on (in lines 4–6), Jenny comes to offer a negative assessment of one grandson, James (line 11), most likely to counter the inference that she was simply deferring to Vera's naming of Paul as the "bright little boy." Although Vera produces a similarly negative assessment of James (line 14), she then complicates matters by reversing herself and evaluating James's behavior positively (line 17–18). It is this reversal, and Jenny's response to it, that we now address. This environment may be especially problematic for Jenny: if she is to agree with Vera, she must produce a positive, second position assessment of James even though she has just offered a highly negative assessment. As in the sequence regarding Paul, Jenny has a clear interest in indicating that her reversal is not "merely responsive" to Vera's, especially since she has lesser rights to evaluate the child.

(25) [Rahman:14:1–2]

16 Jen: Yeah [(into) ev'rythi]ng.
17 Ver: -> [Mindju 'eez good] Jenny, 'e wz mischeevious .
18 but w-'e wz good.
19 Jen: -> Oo 'e. wz beautiful here [wuz↑n't'ee. =
20 Ver: [↓Yes.
21 Jen: ='E wz very well beha:ved.

Despite her putatively subordinate rights in the matter, Jenny (line 19) strongly asserts rights to assess James by (1) producing an "oh"-prefaced assessment of James's behavior (2) focused on his behavior at her house. She follows this assessment with (3) a tag question. Each component of Jenny's assessment works against the potential inference that her positive assessment reflected anything other than the actual position she held independently of Vera's immediately prior positive assessment. First, the "oh"-preface indexes Jenny's previous, independent access to James. Second, Jenny supplies the basis for this claim by invoking James's behavior "here" (at her own house), in contrast with Vera's assessment of his behavior in general. Finally, her use of the tag question casts her turn as a "new" first assessment, even though its production immediately follows Vera's positive evaluation of James.

In light of Jenny's systematic deference, up to this point, to Vera's primary rights to assess her own grandchildren, it appears that Jenny's assertion of primary rights in this sequence is designed to defeat any suspicion that her current, positive assessment could be motivated simply by a desire to agree with Vera. Specifically, although her turn is produced in response to Vera's, she deploys an array of practices to establish that the position she takes in that turn is held independently of the circumstances of its production. In this case, then, Jenny uses such practices for asserting her primary rights to assess James (despite her previous deference to Vera) as a method for managing the local, interactional circumstances created by Vera's reversal.

Our second case offers a more ambiguous deployment of these resources. This excerpt is taken from a conversation between Lesley and her elderly mother, in which Lesley offers a series of reports regarding (potential) acquaintances who are currently in the hospital or who have just died. In this case, although Lesley produces an extended description of Mr. Millbeck, Mum fails to recognize him. As Lesley proceeds with the report "anyway," she notes that he was "still working" when he died at age 79. Yet despite Lesley's status as teller and her clearly intimate access to the deceased, she packages her first position assessment (in line 25) using a tag question that eschews any claim of epistemic primacy:

(26) [Holt X(c)-1-1-1]

1 Les: And um (0.4) I ↑don't know ↑ 'f you remember Missiz
2 Mil↓beck th't use to go to ↓chu:rch.

28	Mum:		↑Marvelous.
29			(0.2)
30	Les:		.tk.hhhh ↑Anyway we had a very good evening ↑o:n
31			Saturda:y

It is not clear whether Lesley's tag question indexes Mum's rights to judge a person of similar age, or simply acknowledges the self-evident character of her assessment (i.e., that a person who worked until the day he died at age 79 had a "good innings"). Mum, however, matches the position taken by Lesley by using the [confirmation] + [agreement token] format to upgrade the rights that otherwise would accrue to her second position assessment. In this case, then, Lesley manages the potentially problematic circumstance of producing a first position assessment regarding a state of affairs that both she and Mum can claim rights to assess by simply avoiding any claim of epistemic priority, despite her status as putatively the better-informed party.

Finally, in our third case, competitive positions regarding epistemic rights to evaluate Margie's friend are coopted into a deeply ambiguous process of agreement. This example, as noted previously, is an extended compliment sequence. After a generalized evaluation of Margie's friends as "so da:rli:ng" (line 5), Emma's "e-that Pa:t isn'she a do::ll?" singles out one of the guests for particular praise. As observed earlier, the primacy embodied in this first position assessment is further upgraded by Emma's deployment of a negative interrogative format to package it. On the one hand, this format (as noted earlier) invites an agreement produced as a response to a question. On the other, however, the assessment and its format create two problems for Margie. First, as a question, the assessment invites confirmation, but as a compliment Margie's agreement is constrained by conventions governing self-praise (Pomerantz 1978). Second, although Emma

characterizes the persons present as "your friends" (line 5) – thus acknowledging Margie's primary rights to evaluate them – her assessment is packaged with a format which (as we have seen) asserts epistemic primacy and virtually commands agreement.

(27) [NB VII:1-2]

1	Emm:	=Oh honey that was a lovely luncheon I shoulda ca:lled you
2		s:soo [:ner but I:] 1: [lo:ved it.Ih wz just deli:ghtfu [: 1.] =
3	Mar:	[((f)) Oh:::] [°( ) [Well] =
4	Mar:	=I wz gla [d y o u] (came).]
5	Emm:	['nd yer f:] friends] 'r so da:rli:ng,=
6	Mar:	= Oh:::[: it wz:]
7	Emm:	[e-that P]a:t isn'she a do:[:ll?]
8	Mar:	[iY e]h isn't she pretty,
9		(.)
10	Emm:	Oh: she's a beautiful girl.=
11	Mar:	=Yeh I think she's a pretty gir[l.
12	Emm:	[En that Reinam'n::

Margie's response in this context embodies two elements: (1) a minimal, pro forma, type-conforming agreement "iYeh", and (2) a negative interrogative-formed assessment, built as a new first assessment that invites agreement but which is downgraded significantly ("pretty" versus Emma's "a doll").

In the face of this divergent assessment, Emma's response at line 10 reasserts a version of her earlier assessment ("beautiful girl"). It does so within an "oh"-prefacing frame that, in this context, reasserts an overriding epistemic claim. Here it is plausible to see Emma's insistence on this compliment as an effort to overcome Margie's purely "social" resistance to it. Margie's final response again expresses a pro forma agreement; however, her repetition of her earlier evaluation ("pretty") underscores her position as overtly unmovable (as adumbrated in her turn at line 8), while the introduction of "I think" into the utterance explicitly acknowledges its status as a disputed assessment. Here, as in Example (25), one participant's efforts to build a strong positive evaluation of a part of another person's world creates a context in which agreement is contaminated by a competitive epistemic struggle.

Discussion and Conclusion

In his essay "Territories of the Self," Goffman describes an array of territorial "preserves" and ways in which their boundaries "are ordinarily patrolled and defended by the claimant" (Goffman 1971:52). Goffman did not include a discussion of knowledge and expertise in his description of an "information preserve" (1971:63–64), though control over rights to information is evidently the object of linguistic and interactional management (Kamio 1997; Maynard and Zimmerman 1984) and systematic social competition (Abbott 1988). In this paper

we have suggested that rights to evaluate states of affairs are indeed "ordinarily patrolled and defended" by individuals in routine conversational practices through which these rights are ranked by speakers relative to one another.

Our evidence comprises two sorts of observations. First, we have argued that assessing a referent state of affairs in first position implies a claim of primary epistemic and/or moral rights to assess that state. We will abbreviate these as "K+ rights," relative to those of a second speaker, who has lesser ("K–") rights. The evidence for this claim is fourfold:

To begin with, first position assessments are rarely upgraded in the several hundred ordinary conversations we have examined; however they are quite commonly downgraded. Similarly, second position assessments are rarely downgraded but they are quite commonly upgraded. These distributions suggest a recurrent social need to compensate for the primary (K+) claims of first position and the secondary (K–) claims of second position.[10]

This general distributional observation is supported by three others:

Downgraded first position assessments are generally produced by persons who, at least at first appearance, have lesser socioepistemic (K–) rights to evaluate them.

In addition, upgraded second position assessments are generally produced by persons who, at least at first appearance, have greater socioepistemic (K+) rights to evaluate them.

Finally, under conditions where both speakers have putatively equal access to a referent state of affairs, first speakers may downgrade initial assessments using a tag question format, while second speakers respond with declaratives. These two practices cooperate to cancel the epistemic implications of the first and second positioned status of their contributions (see note 7).

This conversational patrol and defense of information preserves is mandated by the fundamental association between the positioning of an assessment and the epistemic claims implied by that positioning. Because social interaction is organized sequentially and because someone must necessarily be first to assess a referent, the management of information preserves is inexorably relevant in social interaction.

Second, we have identified a variety of practices that are deployed in managing these epistemic claims. Downgraded claims in first position are implemented prominently through tag questions and evidentials.[11] Upgraded claims in second position are implemented through an array of practices that either invoke a "settled" and preexisting point of view, or deploy interrogative syntax to compete for first position by usurping a previous evaluation with a new "first positioned" evaluation to which the other should respond. The practices we have identified here are somewhat varied in their privileges of occurrence. The [confirmation + agreement] response format is enabled by and virtually specialized to address, and complement, first assessments that deploy the [statement + tag] format. Although "oh"-prefacing is not tied to a specific first position format, and thus is usable in less complementary and more competitive ways, it is deployed almost exclusively in second position. Negative interrogatives are most aggressive and can be deployed in either first or second position to assert

claims of epistemic supremacy. Some of these practices also have positional and relational variations. For example, the [statement + tag] format, which downgrades claims in first position, can be used by K+ speakers to upgrade a responsive assessment in second position.

Agreement involves more than simply arriving at aligned evaluations. As our analysis makes clear, persons evidently are concerned to establish the independence of the positions that are asserted in accomplishing agreement. This is reflected most prominently in two themes in our data. First, persons work to establish the independence of their access to evaluated states of affairs as a basis for agreement. Second, persons recurrently negotiate the relevance of "confirmation" rather than "agreement" in circumstances where primary access to a state of affairs comes to assume critical importance. In these and other ways, the matter of "who agrees with whom" turns out to be a common, if not ubiquitous, feature of the terms of agreement.

These considerations suggest a systematic dilemma at the heart of agreement sequences. Put bluntly, affiliation and agreement generally are sought from others; when provided, however, they must respect the parties' information territories and their associated epistemic rights. Although this problem may be soluble in the matter of "Burmese cats" by responding to someone who asserts the merits of his own cat in terms of the merits of the breed in general, such a solution involves an unavoidable element of detachment from the concrete specifics of the other's experience. Perhaps this is acceptable in the matter of cats, but a mother's claim to lack loving feelings for her child cannot be met effectively by remarks about "women in general" (Heritage and Lindström 1998). For this reason, Alcoholics Anonymous specifically encourages members to seek out persons with a history of recovering from alcoholism to discuss their problems (Alcoholics Anonymous 2001). In responding to assessments of distinctively personal matters, speakers must manage the independence of their access to the matters under discussion while avoiding too deep an intervention into territories of knowledge, feeling, and relational ownership that their recipients may defend as their own. In such cases, the sociological dilemma of involvement and detachment is an entirely practical matter.

Our analysis of these practices suggests a further observation regarding "face" and related subjects. As we noted in introducing this concept, Goffman and others distinguish between face and identity. As we have shown, considerations of face are clearly implicated in the kind of epistemic negotiations with which we have been concerned here. Yet as Goffman also made clear, face claims commonly invoke elements of enduring social identity. Although multiple identities may be engaged in the sequences we have discussed (and in others like them), dog and cat owners evidently expect to be treated as experts on their pets. Grandparents have ownership rights and expect to have the last word in evaluating their grandchildren. And all participants, as Sacks (1984) and Goffman (1983) observed, have primary rights to know and describe their own thoughts and experiences.

Persons deploy these practices with remarkable frequency in the context of conversational agreement. One might think that interactants' insistence on the assertion of relative epistemic rights is an ugly contaminant of courses of action

which otherwise are the essence of consensus building. One also might think that in this paper we make much ado about nothing: the negotiations and conflicts that we observe are simply made salient, as Labov and Fanshel (1977:346) noted, as a product of looking closely at activities which probably were not experienced consciously, much less recollected by the parties at this level of detail.[12] Yet one also may observe that relative epistemic rights to describe and evaluate objects within different knowledge domains are part of our basic human rights to experience and its expression. The regulation and sanctioning of such rights is no trivial matter, but is rather a part of the interactional "housekeeping" that is a condition of personhood and even sanity (Goffman 1983). That the means by which this housekeeping is managed are lost in a Leibnitzian "surf" is, in this context, all to the good.

We thank Emanuel Schegloff and the *Social Psychology Quarterly* reviewers for comments on earlier drafts. This paper was developed jointly from original materials contributed independently by each author.

Notes

1. These notions, of course, have a long lineage in Western political and social thought; see Berlin (2002:166–217).
2. Also see Drew (1991); Drew and Heritage (1992).
3. First position assessments commonly emerge in environments that have been made "ripe" for them in various ways. For example, another speaker has made observations which clearly imply a particular evaluative stance towards the entity under discussion and which may trigger the production of an assessment. First positioned assessments are distinctive in that they take an explicit, on-record evaluative stance that is available to be agreed with or disagreed with in next turn. First positioned assessments do not "agree" or "disagree" with the previous comments that lead up to them, though they may be aligned or disaligned with the tenor of those comments.
4. Evidentially qualified claims (using expressions such as "It looks, feels, appears X") are downgraded relative to unmarked declarative claims because they are compatible with the asserted state of affairs not being the case. Thus it is possible to offer the remark "She seems (looks, sounds) X, but she isn't" without self-contradiction.
5. For an account of this kind of "open class" repair initiation, see Drew (1997).
6. A number of authors, including Bernstein (1971), Kollock, Blumstein and Schwartz (1985), Lakoff (1975), and O'Barr and Atkins (1980), have linked the use of tag questions to class, gender, and power. In this section we connect their use not to general social identities but to the acknowledgment of particular, situated rights to evaluate specific states of affairs. Such rights may or may not map onto more general differences in social power.
7. In (11) and (12), the first speaker uses epistemic downgrading to address the coparticipant's clear primary rights to assess the referent. In a sub-set of cases, however, similar downgrading does not appear to address such a contingency. These

[JS:II:41)

J: -> T's- tsuh beautiful day out isn't it?
L: Yeh it's jus' gorgeous . . .

[VIYMC:1:2] ((J and R are in a rowboat on a lake))

J: -> It's really a clear lake, isn't it?
R: It's wonderful.

[Ravioli Dinner: 6 (Mark and Kim are eating dinner involving many samples of free food]

Mar: Not bad for free huh?
(0.3)
Kim: Hm mm.

In these three cases, it is evident that neither party can claim epistemic primacy concerning the referent states of affairs. Given the concurrent, direct, and therefore equal access enjoyed by both participants, the first speaker's use of a tag question can be understood to downgrade the putatively primary rights to assess the referent that might attach to having gone first. This downgrading is accomplished by inviting agreement in the surface design of the turn through the [declarative + tag question] format.

8. The data used in this paper comprise several hundred items of ordinary conversation drawn from Britain and the United States. Most, but not all, of our cases involving symmetry between [assessment + tag question] and [partial repeat + agreement] forms are drawn from British data. What Schegloff (personal communication) calls "the British tag" as a means to downgrade epistemic claims may be much more prominent among speakers of British English than among their U.S. counterparts. For another case of British/U.S. divergence in basic interactional usage, see Jefferson (2002).
9. The fact that tag questions function differently in first and second positions in a sequence is a clear example of what Schegloff (1996b) calls "positionally sensitive grammar."
10. As noted elsewhere, this analysis is based on an examination of several hundred recorded conversations. Robustly founded quantitative analysis is hampered, however, by what Schegloff (1993) calls the "denominator problem." Briefly put, without clear evidence of the parties' relative rights to knowledge *independent of* the talk, we cannot evaluate the extent to which parties assert these rights *in* the talk. Thus we are obliged to focus on those cases in which the assertion of these rights emerges as a matter that the parties are addressing by talking. These methodological issues, of course, bracket the question of whether, or how, these relative rights exist independent of their assertion in the situation itself.
11. These do not exhaust speakers' methods for downgrading the rights claimed by first position assessments. In addition to evidentials and tag questions (which focus on the authoritativeness of the assessment, or on the access claimed by it), speakers also can modulate the rights claimed by a first position assessment by downgrading its "firstness." For example, speakers can preface their turns with "so" or other expressions which indicate that the turn is being offered as an upshot or other product of prior talk, and by that action can acknowledge their recipients' primary rights. For example, in the following excerpt, Shirley offers a "so"-prefaced upshot (in line 43) to display her understanding of Gerri's telling about Dana. By virtue of the very way in which this sequence is initiated (e.g., Shirley's "Did you talk to Dana this

week" and "how is he" (line 7)), Shirley conveys her understanding that Gerri has superior knowledge about Dana. This stance is confirmed further by the telling that Gerri goes on to produce.

[Frankel TCI]

7	Shi:		.hh Uhm how is he.
8	Ger:		(Well) he's fi: ne[(yeh),
9	Shi:		[ss=
10	Ger:		Yihknow he's no:w (.) in (0.2) competition, .hhh=
			((14 lines of transcript omitted))
25	Ger:		.hh A:nd u- (0.2) yihknow I don't- he doesn't think he's
26			going to win.c'z there's a lot'v other students thet, .hh
27			are doing equally well.=
28	Shi:		=M- [hm,]
29	Ger:		[or] and or better.
30	Shi:		M-hm,
31	Ger:		Bu:t, he does feel tha:t (1.0) yihknow, (.) he's proud a'
32			the fact thet he got intuh th'finals. .hhh en he doesn't
33			ca:re if he doesn't make the finals en go o:n .hh=
34	Shi:		=Ri[:ght.]
35	Ger:		[to-] Berkeley er wherever, .h[h en then=
36	Shi:		[Ri:ght.
37			(.)
38	Ger:		become a Harvard attorney I mean 'e doesn't care
39			about*that. et[all.
40	Shi:		[Right.
41	Shi:		Ri[ght.
42	Ger:		[So
43	Shi:	->	.hh So he's doing alright.
44	Ger:		Ye:ah.

After Gerri's telling regarding Dana's participation in an academic competition. Shirley conveys her understanding of its upshot by producing an assessment: "he's doing alright" (line 43). Although Shirley produces her assessment of Dana before Gerri has offered any similar evaluation, she clearly indicates its derivative status, and Gerri's primary knowledge in the matter, by prefacing it with a "so." Thus instead of modulating the access claimed by her assessment, she downgrades its "firstness" – much as speakers have used interrogative forms in second position assessments to counter the default assumptions attached to that position (Raymond 2004).

12. Labov and Fanshel (1977:346) termed this the "paradox of microanalysis," observing, "[T]he more deeply we analyze the underlying speech actions that motivated these sequences of events, the further we remove ourselves from the conversation as it was actually experienced."

Politeness, Power and Provocation: How Humour Functions in the Workplace

Janet Holmes

Introduction

Most workplace humour is inextricably context-bound. Utterances which give rise to great hilarity among work colleagues often appear obscure and opaque to outsiders. This is a reflection of one of the most basic social functions of humour – that it serves to create and maintain solidarity, a sense of belonging to a group. Shared humour is an important in-group vs out-group boundary marker. But humour can also be a management strategy – a way of attenuating or reinforcing power relationships. Humour can be used to reduce inequalities between those of different professional status, alternatively it can be used to emphasize power imbalances, or even to license challenges to status hierarchies. This article explores some of the diverse functions of humour in the workplace, drawing on a database of interactions recorded in four New Zealand government organizations.

There is extensive pragmatic research on humour examining the contribution of conversational maxims and pragmatic inferencing to an understanding of how jokes function in interaction (e.g. Attardo, 1990, 1993; Raskin, 1985), and exploring the communicative function of humour (e.g. Mulkay, 1988; Norrick, 1993). Sacks (1978, 1989) analysed the work involved in telling jokes, and described the joke as a 'conversational achievement'. Other conversational analysts have explored the social meanings expressed by humour (e.g. Pizzini, 1991). Some sociolinguists have examined gender differences in the use of different types and functions of humour in interaction (Ervin-Tripp and Lampert, 1992; Jenkins, 1985; Kotthoff, 1995; Kramarae, 1987; Sollitt-Morris, 1996). But overall there is relatively little sociolinguistic research on humour, and even less on humour

Source: *Discourse Studies* vol. 2, no. 2, 2000, pp. 159–185.

in the workplace. Most of the extensive literature in this area appears in journals and collections in disciplines such as management, business administration, business organization, social psychology and communication.

Much of this research focuses on demonstrating the social and psychological benefits of humour to business organizations (e.g. Davis and Kleiner, 1989; Decker, 1987; Duncan, 1982; Duncan et al., 1990; Linstead, 1985; Morreall, 1991). Humour is advocated as a means of improving productivity (e.g. Caudron, 1992), and an essential tool for managers (e.g. Decker, 1987). The work of Consalvo (1989) on the distribution and function of humour in business meetings is typical. He asserts:

> The role and constructive uses of humor need to be better understood as humor has the potential to improve quality of life, job satisfaction, and performance in organizations. (1989: 285)

Researchers document the type of humour noted in workplaces (e.g. Vinton, 1989) and the functions of workplace humour (e.g. Cox et al., 1990; Duncan, 1985; Linstead, 1988; Murphy, 1986; Sabath, 1990) with special attention to the advantages of humour for encouraging creativity (e.g. Cade, 1982; Caudron, 1992), and defusing conflict among workers (e.g. Duncan et al., 1990; Fry, 1992).[1] More recently, some researchers have begun to treat humour as a source of insight into the complexity of the workings of business organizations (Hatch and Ehrlich, 1993).

From a sociolinguistic viewpoint, one remarkable feature of much of this research is the reliance on indirect, reflective, or apparently unsystematic methods of collecting data about how people actually use humour in interaction (see Williams, 1988). Participant observation and the use of field notes cannot provide a sufficiently exact account of normal conversational interaction for the purposes of discourse analysis. Similarly, self-report data, interview responses, and answers gleaned from questionnaires involving simulated situations tend to elicit people's beliefs about how they and others use humour, rather than reliable information on what they actually do (see Mott and Petrie, 1995). There is remarkably little research on humour in the workplace which uses tape-recorded material from authentic workplace interaction. Such research is, of course, subject to the familiar problem of the effect on participants' behaviour of their awareness that they are being recorded. On the other hand, it guarantees that the material analysed is an accurate rendition of what was actually produced, unfiltered through the observer's perceptual biasses, and unaffected by memory limitations. For these reasons, we decided to use recorded material for our New Zealand workplace research.

The Language in the Workplace Project

The Language in the Workplace Project was begun in 1996 with the following goals:

(1) to analyse the features of effective interpersonal communication in a variety of workplaces from a sociolinguistic perspective; and
(2) to explore the practical implications of the results of the research for a range of New Zealand workplaces.

Over the last three years we have collected interactions from a range of workplaces, including the four New Zealand government agencies whose interactions provide the data for the analysis in this article. The bulk of the data consists of small, relatively informal work-related meetings and discussions ranging in time between 20 seconds and two hours. Such meetings are regarded by the participants as the focus of their core business and they fulfil a wide variety of purposes in these workplaces, being used to plan, convey instructions, seek advice, check reports, solve a problem or do a task, provide feedback, evaluate proposals and so on. They are also the sites of many different types of humour, as I will demonstrate.

Methodology

It is only relatively recently that humour research has adopted a more ethnographic methodology, using recordings of spontaneous spoken conversations, rather than questionnaires or surveys (see Hay, 1995: 8–10). Recording in workplaces is difficult, especially if the aim is to be minimally intrusive in order to collect data which is as spontaneous and 'natural' as possible. The methodology developed for recording in New Zealand offices was designed to give participants maximum control over the data collection process. After some initial training, a group of volunteers from each workplace tape-recorded a range of their everyday work interactions over a period of about two weeks. Some kept a recorder and microphone on their desks, others carried the equipment round with them. All those involved provided information on their ethnic background, home language, age, contextual information, and permission for the data to be used for linguistic analysis. They also participated in debriefing sessions after the recording process, and, in some cases, in follow-up interviews to discuss the interpretation of the material. This methodology provided a wealth of ethnographic information which enabled the contextualization of interpretations at a different level. This was crucial for qualitative analysis of the kind undertaken in this article.

Throughout the process participants were free to edit and delete material as they wished. Even after they had completed recording and handed over the tapes, they could still ask us to edit out material which, for whatever reason, they did not wish to be analysed. By handing over control of the recording process in this way, we developed an excellent research relationship with workplace participants, based on mutual trust. Over a period of time, people increasingly ignored the recording equipment, and there are often comments at the end of interactions which indicate that people had forgotten about the tape recorder.[2] Also, over time, the amount of material participants edited, or asked us to edit, decreased dramatically. As a result, in return for guarantees of anonymity and confidentiality, our volunteers trusted us with a wide range of fascinating material.

The data base consists of more than 120 hours of material constituting 330 workplace interactions in four government departments. The participants include New Zealand Pakeha, Maori and a range of other ethnic groups, such as Samoan, Chinese and Thai.[3] In each workplace a group of key personnel, representing a range of roles and levels within the organization, recorded their everyday interactions with a variety of interlocutors across a number of work settings. From this database I selected for detailed qualitative analysis a range of interactions consisting mainly of small meetings (involving between two and four people) which a preliminary analysis had identified as including instances of humour. At least five interactions from each of the four workplaces were included, with examples of single sex and mixed sex interactions, involving both Pakeha and Maori participants. My analysis of these interactions identified 200 instances of humour, and these provide the basis for the qualitative analysis of humour in the New Zealand workplace which follows.

Definition

However difficult it may be, it is useful to start with a brief definition of what was counted as an instance of humour. The literature abounds with discussions of this issue, many linked to particular theories of humour.[4] Some theorists distinguish between humour and wit (Coser, 1962), some categorize jokes as instances of humour (Duncan, 1984) while others treat jokes as a distinct category which is different from humour (Long and Graesser, 1988). A number of analysts identify essential components of humour; so that many agree, for example, that humour must always involve some kind of cognitive dissonance, such as the establishment of an incongruent relationship or meaning (e.g. Berger, 1976; Duncan and Feisal, 1989).

Some researchers consider an instance of humour from the point of view of the speaker: something is humorous only if it was intended to amuse (e.g. Pizzini, 1991; Winick, 1976). Use of 'smile voice', and similar paralinguistic or prosodic clues can provide an empirical basis for judgements of speakers' intentions (Crystal and Davy, 1969; Sacks et al., 1974). Some analysts who take this perspective include consideration of failed humour as well as successful humour (Hay, 1996). Others consider humour from the listener's or the audience's point of view, and some identify humour by the listener's response (e.g. Coser, 1960; Norrick, 1993). For such practitioners, laughter is a crucial auditory clue and, when videotapes are used, a smile is an important visual clue. Others take the view that the speaker and the hearer must both be taken into account in identifying instances of humour: so the speaker's intention is relevant and must evoke an appropriate response (e.g. Berger, 1976; Martineau, 1972).

One factor which is rarely considered in analyses of humour is the role of the analyst. The analyst's identification of instances of humour is a crucial component in the analytical process. Instances of humour which are not identified, or which are misinterpreted by the analyst, will obviously be excluded. It seems important, therefore, to take account of the clues used by the analyst who works

with material provided by others. In cases where, as in our research, the analyst is working from audio-tapes (supplemented by discussion), the analyst's role is particularly crucial. Another problem is the status of 'failed humour', where for whatever reason the speaker's humorous intention is not appreciated by the audience (Hay, 1996). This topic has been excluded from the current analysis because it raises many complex issues which there is not space to explore in this article. The following definition, therefore, has been developed for the purposes of this analysis.

> *Definition of humour*
> Instances of humour included in this analysis are utterances which are identified by the analyst, on the basis of paralinguistic, prosodic and discoursal clues, as intended by the speaker(s) to be amusing and perceived to be amusing by at least some participants.

A wide range of contextual and linguistic clues are relevant to identifying instances of humour, including the speaker's tone of voice and the audience's auditory and discoursal response. So while laughter is an obvious (though not unambiguous) clue, it is by no means the only way in which members of an audience signal that they consider something to be humorous.[5] As Hay (1996) documents, audience members may respond to humour in a variety of ways, including an echo response, by contradicting self-deprecating humour, or by producing more humour. While irony may elicit a mere raised eye-bow or twitch of the lips, at the other extreme, a humorous remark may trigger a range of overt responses. Indeed, some of the more interesting, effective, and extended instances of humour encountered were dynamic, interactively achieved and 'jointly constructed' examples, with verbal contributions from a number of participants (Marra, 1998). Addressees often added to a humorous remark, indicating not only appreciation, but a willingness to extend the humour.

The definition adopted for this analysis is obviously not comprehensive. As mentioned previously, it excludes 'failed humour', just as it excludes unintended humour. However, it is adequate for an exploratory qualitative analysis of the functions of humour in the New Zealand workplaces included in our sample. It also has the advantage of highlighting the extent to which humour is an interactional achievement.

Theoretical Frameworks

Many analyses of humour adopt psychological or sociological theoretical frameworks, examining psychological functions of humour such as tension release, the expression of aggression, or hostility (Freud, 1905) or social functions such as the assertion of superiority (Duncan, 1985; Radcliffe-Brown, 1952), or the enforcement of social norms (Bricker, 1980; O'Quin and Arnoff, 1981). In this analysis, I explore the value of Politeness Theory (Brown and Levinson, 1987) to account for the social psychological functions of humour in the workplace,

combined with insights from Critical Discourse Analysis (Van Dijk, 1993, 1998), an approach which provides concepts such as 'repressive discourse' (Pateman, 1980) and 'coercive discourse' (Fairclough, 1995) to more adequately analyse power relationships in workplace interaction.

Politeness Theory provides an account of the ways in which humour takes account of the positive face needs of both addressee and speaker. So humour may express solidarity, indicating concern for the *listener's* positive face needs, as well as self deprecation, which attends to the *speaker's* positive face needs. Politeness Theory also includes consideration of power relations, insofar as they are assumed by, or salient to, the participants. But the main focus of Politeness Theory is an account of how participants handle face threat, and Brown and Levinson's analysis is designed to account for modifications of face threatening acts (FTAs) which are consistent with a basic cooperative intent. Differential power tends to be considered largely as a factor accounting for deferent behaviour (i.e. more mitigated FTAs) by the person with less power, or for the use of less mitigated FTAs by the more powerful participant. Hence, humour which is deliberately used to license a direct threat to the face of the addressee, or instances of humour used to legitimize unambiguously aggressive intent, are not so effectively accounted for within a model which assumes cooperative intent as its starting point (cf. Austin, 1990).[6]

Following Weber (1947), Brown and Levinson provide a useful and widely accepted definition of power, as 'the degree to which H [the hearer] can impose his (sic) own plans and his (sic) own self-evaluation (face) at the expense of S's [the speaker's] plans and self-evaluation' (1987: 77). Such power may be institutionally authorized, or it may be based on less tangible factors. In institutional contexts, such as the workplace, when individuals are acting in role in asymmetrical interactions, they can articulate their power overtly by reference to their position. This is coercive power (Thomas, 1995: 125) enacted through 'oppressive discourse' – discourse in which the intentions are quite explicit and undisguised (Pateman, 1980: 83).

However, it is also possible to 'do power' less explicitly, and this is generally more acceptable in an era when informality is valued, and there is a general trend towards democratization, and a reduction of emphasis on power differences (see Fairclough, 1989, 1992, 1995). Where the underlying intent is controlling or coercive, however, this use of language can be identified as 'repressive discourse' (see Patemen, 1980). Repressive discourse disguises the coercive intent underlying an utterance, or fudges the power relationships involved (Pateman, 1980: 84–5). So while it is fundamentally based on a power imbalance, repressive discourse tends to distract attention from issues of power. It often functions to gain willing compliance, retain goodwill, promote social cohesion and, at least superficially, to reduce asymmetry (see Sollitt-Morris, 1996, 1997). Humour is one means of realizing repressive discourse.

Humour is also a very effective way of 'doing power' less explicitly, and hence some uses of humour are most illuminatingly analysed as instances of coercive or repressive discourse. In other words, humour can be used to achieve the speaker's instrumental goal while apparently de-emphasizing the power

differential.[7] Pizzini (1991: 477) for example, describes how gynaecologists used humour to 'move interview talk along' and 'to stop patients rambling on' [sic] in order to gain the patients' compliance with their agenda. An analysis which treats such humour as simply attenuating an FTA, i.e. as purely an expression of concern for the addressee's face, risks under-analysing the interactional social significance of the exchange, and ignoring the complexity of the communicative goals involved (see Tracy and Coupland, 1990).

Conversely, humour can also be used by the subordinate in an unequal power relationship to subvert the overt power structure. Humour provides a socially acceptable means of signalling lack of agreement, registering a protest, or even a challenge to more powerful participants. Graham et al. (1992: 162) comment on this use of humour to 'veil socially unacceptable behaviour'; and Winick (1976) and Pizzini both comment on the fact that humour enables subordinates to express risky opinions:

> Because humour officially does not count, persons are induced to risk sending messages that would be unacceptable if stated seriously. (Pizzini 1991: 481)

I have labelled this function of humour *contestive.* I turn now to a more detailed consideration of these functions of humour, with exemplification from the New Zealand workplace data.

Functions of Humour in the Workplace

There is an extensive literature on the functions of humour. Martineau (1972), for example, discusses three very broad functions: consensus, conflict and control. Following Ziv (1984), Ervin-Tripp and Lampert (1992) identify four functions: *equalizing* or creating solidarity, *defending* or protecting the self, *sharing* similarities, and *coping* with weaknesses. At a more detailed level, Graham, Papa and Brookes (1992) identify 24 functions of humour on the basis of a comprehensive review of a wide range of papers dealing with the social–psychological functions of humour. Hay (1995: 98) groups the functions of humour in her data into a hierarchy with an overall general function, three broad macro-functions (relating to solidarity, power and self-defence) and twelve micro-functions.

Two familiar methodological problems arise in any such analysis. The first is the well-known fact that all utterances are multifunctional (see Holmes, 1982; Tracy and Coupland, 1990). Hence, a humorous utterance may, and typically does, serve several functions at once.

Excerpt 1 (See Appendix for transcription conventions.)
Context. A young policy adviser, Ivan, and a senior policy officer, Esther, meet for a discussion with a third adviser. The meeting begins with a complaint from Esther.

1 Esther: you were supposed to bring coffee and he was bringing croissants
2 Ivan: was he

3 Esther: yeah we had this discussion last week
4 Ivan: ah you should have got it in writing
[Laughter]

Ivan's remark is an example of good-humoured sarcasm: he is sending up bureaucratic procedures generally. At the local level, he is also parodying Esther, in particular, who is inclined to want everything well documented; hence this is also an example of contestive discourse from a subordinate to a senior. At a more global level, it can be seen as a good tempered response to a criticism, in other words a cooperative attempt to amuse, to keep the tone light and maintain good collegial relations. This analysis is typical in its complexity – almost every example of authentic discourse has several layers of meaning.

The second problem is that of infinite regress.[8] In my view, and this is reflected in the definition provided above, the most general or basic function of humour is to amuse. But then one can ask *why* does the speaker wish to amuse the audience. The answer to this question can be extremely complex, involving a never ending regression proceeding from sociological through increasingly detailed psychological explanations. Why does Ivan want to amuse his colleagues? From a social point of view, he is maintaining collegiality, but the form of his humour reflects the power relationships between those involved (the sarcasm is attenuated or gentle). From a psychological point of view, one can ask if Ivan is motivated by guilt or by a desire to avoid conflict, or both of these simultaneously.

Politeness Theory provides a basis for constraining the level of analysis to an examination of the impact of humour on the face needs of the participants. Brown and Levinson (1987: 102) include 'joke' as a positive politeness strategy, in that it 'claims common ground (point of view, opinions, attitudes, knowledge, empathy)'. Their discussion is very brief, however, focussing on ways in which jokes can emphasize shared values, or attenuate FTAs of various kinds. Exploring the issue further, in principle, there are a number of ways in which humour can be regarded as an expression of politeness:

1. Humour as positive politeness
   1.1 Humour can **address the hearer's/addressee's positive face needs** by expressing solidarity or collegiality.
   1.2 Humour can be used to **protect the speaker's positive face needs** by expressing self-deprecatory meanings or apologetic sentiments.
2. Humour as negative politeness
   2.1 Humour can be used to **attenuate the threat to the hearer's/addressee's negative face** by downtoning or hedging an FTA, such as a directive.
   2.2 Humour can be used to **attenuate the threat to hearer's/addressee's positive face** by downtoning or hedging a Face Attack Act (Austin 1990) such as a criticism or insult.

In other words, humour can function both as a positive politeness strategy expressing solidarity, or as a hedging strategy, a means of modifying illocutionary force

1. Humour as Positive Politeness

With its basic assumption of cooperative intent, and consideration of participants' 'face needs', Politeness Theory provides a convincing explanation of humour oriented to the addressee's positive face needs by indicating friendliness, and to the speaker's positive face needs by conveying self-deprecation.

1.1 Addressee's Positive Face Needs: Solidarity or Collegiality To the extent that a humorous utterance amuses others in the workplace, it contributes to the development of social cohesion at work (Blau, 1955; Holdaway, 1988; O'Quinn and Arnoff, 1981). Shared humour emphasizes common ground and shared norms. A successful attempt at humour indicates that the speaker shares with others a common view about what is amusing – thus creating or maintaining solidarity, while also enhancing the speaker's status within the group. Hay (1995) clearly demonstrates the relevance of this function of humour for the examples collected in the friendship groups she studied. It is also much in evidence in our workplace data. There were many instances of humour between equals in the workplace data which clearly served to express and strengthen solidarity, and so contributed to social cohesion.

This was particularly apparent in examples which were interactively constructed, where several participants contributed to the discourse, and each built on the contributions of others. Excerpt 2, which centres around the need for people to 'panic early', nicely illustrates the way humour can build solidarity between work colleagues.

Excerpt 2

Context: Planning meeting of a group of colleagues. They are discussing the need to coordinate the taking of annual leave to ensure minimum negative impact on the work project.

1	Hel:	people might have to take some leave by that stage as well with this
2		sort of panic before the end of November
3	Will:	oh I'm saving up all mine [laughs]
4	Sel:	well people could panic early [laughs]
5		[general laughter]
6	Hel:	never happens
7		[general laughter]
8	Sel:	well the HR coordinators might crack the whip/so that people
9		panic early yes\
10	Toni:	/I planned to panic early by taking\ the school holidays off but that
11		didn't work [laughs]

People's problems with getting prepared ahead of time elicit the suggestion from Selena that they need to 'panic early' (line 4) – something of a contradiction in terms, since the notion of panic is almost inextricably tied to last minute pressures. The group clearly share a common reaction to the notion, and this is a good example of them 'doing collegiality' through humour.[9] The humorous scenario is interactively achieved or jointly constructed: Helen's comment (line 6) and Toni's

contribution (line 10) both build on the humorous suggestion made by Selena, who elaborates on it further in line 8.

Shared criticisms of others can also serve to cement solidarity between work colleagues. A criticism endorsed by others reflects common values and attitudes. Criticisms of people not present were often a source of amusement for coworkers, as in Excerpt 3.

Excerpt 3

Context: Two young Maori men are discussing plans for a formal presentation which will involve the use of the Maori language by another Maori colleague. Maori is a second language which all three men acquired after childhood.

1 Tom: Sam's probably the fellow who's had the most experience of them
2 all but god his pronunciation it's [laughs]
3 Kit: [laughs]

Sam's pronunciation of Maori is clearly beyond description; indeed it is so embarrassing that it is a source of shared humour for Tom and Kit. The inexplicitness of this exchange is typical of much workplace humour; it reflects shared background knowledge, experience and understandings. Tom and Kit reinforce their shared in-group status with such exchanges.

Humour directed at outsiders to an organization also illustrates the function of humour in expressing solidarity and emphasizing in-group status and group membership. In Excerpt 4, in a workplace where swearing is relatively rare, humour is generated by the unexpectedly strong language directed at outsiders.

Excerpt 4

Context. Three colleagues are discussing a problem which the organization is having with an outside group.

1 Val: so shall we just
2 Sal: pay the bloody/money\
3 Val: /pay them\ pay the sods and sort it out
[Laughter]]

Once again, the extent to which the participants are 'in tune' with each other is reflected in the discourse structure, with Val and Sally jointly constructing turns, and with each producing a slightly 'shocking' word, indicating stylistic harmony as well.

However, while there were many instances of humour expressing solidarity in the New Zealand workplace data, this function did not have the same pre-eminence in the workplace as in Hay's (1995) friendship groups, where it was the over-riding and ubiquitous function of humour. The predominance of the solidarity function is not always as clear-cut in the workplace, particularly where a power differential is involved, as Excerpt 1 illustrated. This point will be discussed further below.

1.2 Speaker's positive face needs: self-deprecation To the extent that a group values humour, its effective use can add to a person's prestige or standing. Not all workplaces encourage humour, however, and sometimes the workplace 'joker'

is regarded as disruptive, and becomes the focus of censure. On the other hand, humour can serve the individual as a useful 'self-defence' or coping strategy (Ziv, 1984). Humour can also be a means of self-disclosure, especially of difficult or embarrassing information (Civikly, 1983; cited in Graham et al., 1992: 175; Kaplan and Boyd, 1965). In a variety of ways, then, humour can protect the positive face needs of the speaker by expressing self-deprecatory sentiments.

The New Zealand workplace data includes a number of examples of humour explicitly addressed to the speaker's face needs, i.e. face-saving humour where the face involved is the speaker's, rather than the hearer's. Excerpt 5 illustrates humour being used to cover an embarrassing memory lapse.

Excerpt 5

Context. Fay, the section manager, is talking to her administrative assistant, Pam, who has finally located a file which she has no recollection of creating.

1 Pam: oh well I must have done it
2 [Both laugh]
3 Pam: oh isn't that gorgeous . . .
4 Fay: when did you send it?
5 Pam: ++ it's a mystery to me [laughs]
6 [Fay laughs uproariously]
7 Pam: it really is

Pam first creates a positive context by explicitly admitting her culpability rather than denying it (line 1). She continues this by describing her lapse as *gorgeous* (rather than, say, 'terrible') and by comically exaggerating her ignorance with a dramatic pause (line 5) followed by *it's a mystery to me*, rather than diminishing it (one might have expected a response such as 'I'm not sure'.) Pam thus manages to preserve her positive face by amusing Fay and deflecting her potential irritation.

Similarly, the humour in Excerpt 6 is predominantly concerned with attention to the speaker's positive face needs as Ray confesses to losing touch with a project.

Excerpt 6

Context. Two young male colleagues discussing the next stages of a project.

1 Len: are you going to attend that meeting then?
2 Ray: yeah yeah I will /(. . .)\
3 Len: /okay\
4 Ray: I'd kind of stopped when I [laughs] got too out of it /[laughs]\
5 Len: /[laughs]\

The speakers both laugh as Ray admits to acting in ways which could be considered less than fully professional, a 'confession' which is framed as humorous self-disclosure. This is typical self-deprecatory humour, where the speaker anticipates embarrassment and responds by turning the source of the embarrassment into a subject of humour. By admitting professional fallibility, the speaker expresses trust in his addressee; by encoding the message humorously, he elicits a sympathetic response in the form of a positive reaction to the humour.

speaker-oriented positively polite device, oriented to the participants' need to be valued.

2. Humour as a Negative Politeness Strategy

A major focus of Brown and Levinson's discussion of Politeness Theory is an account of strategies which reduce the face threat of speech acts such as directives and criticisms. Again, such an analysis is predicated on the assumption that participants wish to interact harmoniously within the constraints of their institutional roles. Negative politeness strategies constitute assurances that the speaker recognizes and respects the addressee's basic wish to preserve self-determination (Brown and Levinson, 1987: 70), and they include hedges and softening devices, as well as other linguistic means of conveying deference and concern for the addressee's negative face needs. Humour is clearly one such device.

2.1 Addressee's negative face needs: hedging FTAs Humour may be used to soften the impact of speech acts such as directives or instructions which might otherwise be regarded as a threat to the autonomy of the addressee. Examples of humour used in this way between equals were common in the workplace data. Humour was often used to reduce the force of a directive between equals where there was no formal institutional basis on which one person had the right to direct the other's behaviour. In such a context, humour reflects a positive concern for the addressee, and is a signal of goodwill and a basic cooperative intent; it functions as a means of maintaining and negotiating respect between participants. In Excerpt 7, Kate attenuates her directive to Melanie with humour.

Excerpt 7
Context. Two policy analysts, Kate and Melanie, are discussing a proposal. Kate suggests that Melanie should take the proposal away and work on it further.

1 Kate: well we've just about done it to death I think
2 it's about ready for you to give give it mouth-to-mouth
3 rescuscitation do you think
4 [Both laugh]

The use of 'we' emphasizes the collegiality at the basis of Kate's relationship with Melanie, while the incongruity of the metaphor is a source of humour attenuating the directive which appears to threaten that collegiality. Between close colleagues, humour used in this way sometimes developed into good-natured banter, a jointly constructed humour sequence in which the person on the receiving end of the directive challenged its initiator, as illustrated in Excerpt 8.

Excerpt 8
Context. Vince and Aidan are working on a proposal.

1 Vin: you're not on page 4 yet?
2 Aid: yes
3 Vin: [laughs] /[laughs]\ [laughs]
4 Aid: /I've been there and come back\ [laughs]

Vince wants Aidan to speed up, but in the interests of maintaining good relations, he does not want to be overtly directive. He conveys his message by an indirect route, using a high-pitched incredulous and humorous tone for a comment which could be interpreted as a criticism of Aidan's slowness. Aidan retaliates, however, with a humorous challenge to Vincent's inference about his speed. Thus complex messages are conveyed in an acceptable way; humour enables Vince to convey a directive which recognizes Aidan's face needs, while Aidan preserves his dignity as well as responding appropriately to Vince.

Interestingly, in the workplace data analysed, humour was more often used to soften an FTA between equals than downwards. Superiors typically hedged directives using standard politeness strategies such as tags, modal particles, and indirect structures. However, as Excerpt 9 illustrates, in some instances humour was used to attenuate a directive between people with unequal power.

Excerpt 9

Context. Manager, Beth, to administrative assistant, Marion, who is chatting to a secretary.

1 Beth: OK Marion I'm afraid serious affairs of state will have to wait
2 we have some trivial issues needing our attention
3 [All laugh]

There are several indications that this utterance is motivated by politeness and oriented to the addressee's negative face needs: the use of the pronouns 'we' and 'our', for instance, function to align the manager and the administrative assistant, expressing positive politeness and solidarity; and the source of the humour itself – the ironic downgrading of their on-task work to 'trivial' compared to the social talk or work gossip in which the two women were engaged – also serves this purpose.

Excerpt 9 is also a classic case of competing discourses (Lee, 1992) – this time involving those of solidarity and power. The utterance reflects Beth's competing loyalties – to Marion as a colleague, on the one hand, and, on the other, to the management team which requires that she move Marion back on task. Hence, at one level Excerpt 9 illustrates the use of humour to maintain good relations between those with differential power, and to avoid the overt enactment of power or authority. But it is also possible to interpret such interactions as instances of repressive discourse, where humour is co-opted for less positive purposes. In power-differentiated contexts, humour can be regarded as a discourse strategy which disguises oppression – a device to sugar the pill. This issue will be discussed in more detail in Section 3 later.

2.2 Addressee's positive face needs: attenuating FAAs Humour can be used to soften the impact of a criticism or even an insult – speech acts which can be described as face attack acts (FAAs): i.e. 'communicative acts which are injurious to the hearer's positive or negative face, and are introduced in a situation which could have been avoided, but where their inclusion is perceived by the hearer to be intentional' (Austin, 1990: 279).[10] Humour which attenuates a critical com-

need to have their wants acknowledged, and their values respected and shared. Humour is thus a very useful strategy for softening criticisms in contexts where work is being regularly evaluated and assessed. In Excerpt 10, Andy implies that Victor has been too wordy, using humour to convey the critical message.

Excerpt 10
Context. Two advisers comparing their evaluations.

1 And: apart from that I've just got what you've got
2 just in a lot less words /[laughs]\
3 Vic: /[laughs] \

The humour lies in the directness of the criticism in a context where attention to face would be predicted. Once again, tone of voice is crucial in conveying Andy's intention to take account of Victor's face needs, to amuse rather than offend.

Where a superior was meeting with subordinates to evaluate their performance, humour was available as a strategy to reduce the face threat of critical comments. In the following excerpt Sara, the superior, is not happy that the team's strategy of passing a problem upwards means this particular problem will end up on her desk.

Excerpt 11
Context. Sara is assessing the procedures used by an evaluation team.

1 Val: then that sat somewhere for a little while and then Len passed it to
2 Clive who passed it to [laughs] me but you know then
3 Sara: yep it's coming back to me I can see it happening
4 [adopts a funny voice] I can see it coming ah [laughs]
5 Val: yeah [laughs] flying through the air at you um [tut]
6 Sara: [laughs]

Sara uses fantasy humour (Hay, 1995) to express her negative response to the results of the team's behaviour. The effectiveness of the humour as a softening device is reflected by the fact that it is picked up by Val (line 5) who makes a further contribution to the fantasy. Jointly constructed humour sequences in this context provide good evidence that the criticism has been conveyed without causing negative affect. With humour as the adhesive, the competing discourses of power and solidarity have been well integrated. Politeness Theory suggests that humour functions here to reflect the speaker's concern for the addressees' face needs.

The requirements of institutional roles at work often make face threatening acts unavoidable. In such contexts, humour provides an acceptable attenuation strategy. Excerpt 12 provides an example where a very direct criticism is attenuated by the humorous, laughing and friendly tone with which it is delivered.

Excerpt 12
Context: Two female policy analysts working on the draft of a letter.

1 Jo: it kind of reads like [laughs] you didn't want to put much time into

Jo's remark causes laughter partly because it is so direct. The workplace is a non-intimate context where such a 'bald on record' approach is unusual or marked. Jo's comment challenges the norms for polite interaction between peers; consideration for the addressee's positive face needs would generally lead to the use of a less direct strategy. The humour caused by the dissonance in such examples emphasizes the general underlying norm that people will tend to treat each other with a certain basic level of politeness in the workplace.

Humorous insults and jocular abuse are more extreme examples of the same phenomenon, while insults are quite naked FAAs explicitly signalling an absence of concern for the addressee's positive face needs. Humour is one available strategy to attenuate the effect of such utterances; it functions to reduce the unacceptability of the FAA (Austin, 1990; see also Hay, 1994). This aggressive type of humour occurred more frequently in workplace interactions where the participants knew each other well. Between equals, working together on an issue, humour was a means of 'managing' suggestions that could be interpreted as critical, or which were undoubtedly intended to be critical, as in Excerpt 13.

Excerpt 13
Context. Three women discussing proposals they are working on.

1 Val: and Celia's finished her proposals I'm sure [laughs]
2 Cel: on the last one
3 Val: ah you sod
4 All: [laugh]

Val insults Celia because she is performing well, and thus showing up the other two. The laughter reflects the incongruity of such a strong term of abuse in the work context between colleagues. At one level, there is doubtless an element of underlying aggression based on envy, reflected in the fact that an insult is the chosen response. However, insults between those who know each other well are also signals of solidarity and markers of in-group membership (i.e. 'we know each other well enough to insult each other without causing offence' (see Hay, 1994). Humour encodes the criticism or insult in an acceptable form; insults can be considered instances of 'doing collegiality' between those who work together closely.

Jocular abuse of this kind occurs in a variety of contexts in the workplace. Colleagues use insulting terms such as *rotter*, *sod*, and *bastard* in jest in situations such as when a colleague passes on an unwelcome job, volunteers them for a task, indicates they will be the person to respond to a tricky client, and so on. While it is possible to analyse these insults as cases where the speaker attenuates an FTA out of concern for the addressee's positive face needs, it seems that Politeness Theory is being stretched to its limits by such an interpretation. The underlying 'dark side' to some insults suggests that an alternative explanation should be sought. An instance of jocular abuse in the workplace is not adequately analysed as an attenuated FTA; nor is it simply a means of expressing solidarity (Hay, 1995). Rather, some workplace insults function as FAAs, and humour provides their 'cover'. In other words, jocular abuse often functions as a covert

strategy for face attack, a means of registering a veiled protest, i.e. what I am calling a *contestive strategy*, as described later.

So, Politeness Theory, with its focus on the speaker's concern for the participants' face needs, provides an adequate explanation for the frequent uses of humour to enact, create and maintain solidarity in the workplace. Politeness Theory also accounts for the use of humour to attenuate or hedge the impact of negatively affective speech acts, such as directives or criticisms, which threaten collegial relations and underscore power relationships. However, it must be recognized that not all participants consistently want to de-emphasize power relationships. Indeed, it is sometimes politic, especially in relation to particular broader workplace objectives, to assert authority in order to ensure that particular goals are achieved. In such cases, humour may be used 'repressively', to maintain control of a situation and emphasize who is in charge. Equally, subordinates may refuse to stay in their 'place', and humour is a powerful device for subtly signalling incipient rebellion in the ranks, or at least for encoding rebelliousness in a sufficiently indirect form to evade censure. Contestive humour challenges the status quo; it is inherently subversive. I turn now to an examination of these alternative power-based and more critical perspectives on the functions of humour in the workplace.

3. Repressive Humour

Politeness Theory provides an adequate account of humour used to express concern for the face needs of others, but it is less satisfactory in explaining humour used to license deliberately face threatening behaviour, especially in asymmetrical relationships. Where it is acceptable for power to be blatantly exhibited (e.g. between young males), humour is often used to legitimize an emphasis on power relationships; in such situations, more powerful participants tend to make fun of those who are less powerful.[11] More commonly, powerful players use humour to subtly control the behaviour of their subordinates (Graham et al., 1992; Hay, 1995; Martineau, 1972; Murphy, 1986). Because it is no longer acceptable in many communities to use explicit orders when addressing professional clients, for example, attenuation devices, such as hedges and humour, are necessary tools for those who wish to achieve particular goals, but who do not wish to appear authoritarian in doing so. The gynaecologists mentioned above who used humour to gain patients' compliance in Pizzini's (1991) study provide one example.

Where power relations are especially salient, humour used downwards by those in authority is often most accurately analysed as evidence of 'repressive discourse', a disguise for a less acceptable message. Context is crucial in identifying the nature of the power relationships, as Excerpt 14 illustrates.

Excerpt 14

Context. Barry, Callum's manager, has asked Callum to speed up his team, which Callum has done by phoning all of them to put the pressure on. When Barry walks into a meeting later in the day, Callum takes the opportunity to protest to his boss.

1 Call: everyone has been running around like crazy men since
2 our phone call this morning
3 Bar: not altogether a bad thing [laughs]

Barry's response (line 3) is unsympathetic and unpalatable to Callum, but he presents it as a humorous comment, making it difficult for Callum to challenge without losing face or appearing to be a whinger. The humorous tone masks Barry's impatience with his subordinate's earlier handling of the situation. The humour provides a 'cover' for a remark which might otherwise be considered unreasonably oppressive in the work context.

As discussed earlier, criticism is a more extreme instance of face threat, often more accurately described as face attack. If criticism is regarded as unavoidable in order to further some goal other than that of good interpersonal relations, then the speaker may choose to hedge it. Humour is one available attenuation strategy, as illustrated in Excerpts 10 and 12. But where a superior is criticizing a subordinate, to some extent the effect must always be a demonstration of power and authority, or 'oppressive' in Pateman's (1980) terms. Humour can be used then in the service of power to minimally disguise the oppressive intent, i.e. as a repressive discourse strategy. Even Excerpt 9 earlier can be analysed from this perspective, despite its positively polite components. And Excerpt 15, where the critical intent is very manifest, certainly illustrates this use of humour.

Excerpt 15

Context. Neil, the boss, has come to collect his administrative assistant, Ken, for a meeting for which Ken is late. Ken is working at his computer.

1 Neil: hate to drag you away when you're obviously having so much fun
2 but it IS after ten
3 Ken: [laughs] some fun

Neil's comment is ironic, as Ken's response recognizes. The irony provides an acceptable cover for the reprimand, which is clearly evident in the tone of voice. The fact that humour is often used to disguise the force of criticisms in asymmetrical interactions underlines the extent to which criticism is experienced in our data (and our culture) as a very heavily weighted threat to face. Though criticism is an activity one might expect to be a normal component of the feedback mechanism in an asymmetrical relationship in workplaces, the fact that it is regularly attenuated suggests it is more accurately classified as an FAA. In Pateman's terms, humour in this context is clearly acting as a repressive discourse device; it is used to disguise the fact that the speaker has the authority to explicitly require the addressee to behave as s/he orders, and to reprimand the addressee who fails to behave as directed or meet required standards.

An analysis which considers the possibility that humour may function as repressive discourse, thus involves examining the underlying power relationships, their salience in the particular context, and the explicitness with which they are being enacted. As the examples involving directives and criticisms in sections 2.1 and 2.2 make clear, humour is one way to 'do power' less explicitly – a

way that is generally more acceptable in a context where informality is valued and status differences are played down. However, the underlying intent is coercive, and so this use of verbal humour clearly qualifies as 'repressive discourse'; it functions to gain willing compliance, while, at least superficially, expressing solidarity and de-emphasizing the power differential.

4. Contestive Humour

Finally, humour may be used to challenge existing relations within the institutional power structure. In such cases, it is used not so much as a politeness device, attending to participants' positive or negative face needs, nor as a repressive discourse device, disguising an underlying power relationship, or conveying a directive or a negatively affective speech act with a sugar coating.[12] Rather, it functions as a critical discourse device, *a contestive strategy*, using one of the few acceptable means available to subordinates who wish to challenge, if only temporarily, the existing authority structures.

Humour is used contestively in the workplace when it serves as a cloak for the expression of 'socially risky' opinions (Winick, 1976), or as a shield for criticism of a superior. In Excerpt 16, Bob casts doubt on his senior's judgement.

Excerpt 16
Context. Chairperson, Henry, planning with Bob, a more junior staff member, a strategy to trounce opposition at a meeting.

1 Hen: they're bound to fall over as soon as you present this stuff
2 it can't be refuted
3 Bob: let's just hope they've been reading the same textbooks as you
4 [Both laugh]

The humour serves as an instance of contestive discourse, attenuating and thus concealing what could be considered the effrontery of a critical speech act in such a context. Bob is effectively conveying scepticism about Henry's views, and indicating that he is less confident than Henry about the predicted outcome. By embedding his different judgement and sceptical evaluation of their chances of success in a humorous utterance, Bob renders it more acceptable. Humour also renders Bob's implied critical judgement and different opinion less accessible for challenge by Henry because it is not explicitly 'on record'.

Similarly, humour may be used in this way to license a challenge to a superior's definition of the situation. Sollitt-Morris (1997) provides a very clear example of such a challenge in a school department meeting where one teacher contests another's attempt to speak for her.

Excerpt 17 (Sollitt-Morris, 1997: 17)
Context. School department meeting. Zeb is the Head of Department and Chair.

1 Zeb: okay let's have a look at this agenda + + exams right we've all got a
2 copy of the third form [laughter] what about the fourth
3 Bet: no Ann hasn't got one yet

4 Ann: no I haven't [with fake American accent] **mom**
5 [laughter]

Sollitt-Morris comments (1997: 17–18)

> In this example Bet takes it upon herself to answer for Ann, which Ann clearly does not appreciate. Rather than tell Bet overtly that she does not want Bet to speak for her, Ann agrees with Bet then calls her 'mom' in a silly voice. 'Moms' speak for children, and 'moms' have a higher status in relation to their children. By addressing Bet as 'mom', which she is patently not, Ann is able to undermine Bet's interference.

In Excerpt 18 May uses humour to direct Jenny, her superior, to take responsibility for the next presentation.

Excerpt 18
Context. Forward planning meeting involving Manager, Jenny, and her team.

1 May: I'm sure you would just love to show off your new whizz-bang
2 computer with all its special effects wouldn't you Jenny
[General laughter]

May does not have the right to tell Jenny what to do. In this case the humour in the form of an ironic assertion serves as a useful disguise for what could be regarded as an implicit challenge to the superior's authority. Support for this analysis can be found in an account of directives in a hospital setting by Maureen Mooney (1980) where, in a meeting between medical personnel, all instances of subordinates giving directives to superiors were treated as humorous. So when a senior nurse used an imperative to suggest that a doctor add a particular patient to his workload (*You do that one*), this elicited general laughter. Nevertheless, in such situations the socially 'unacceptable' or norm-breaking message is effectively put across. Indeed, one of our informants commented that humour was a useful non-threatening strategy for floating subversive or 'outrageous' ideas. And, as with jocular abuse, it is difficult for a superior to challenge contestive humour without losing face.

As analysed above, humour is a common strategy for attenuating insults in the workplace. Because it constitutes such a threat to face, jocular abuse tends to be restricted to those who know each other well, and is most common between equals, where it serves as one means of 'doing collegiality'. However, there are cases in our data where jocular abuse occurs upwards as well as between equals.[13] Subordinates sometimes complained about tasks assigned to them, for instance, or criticisms made about them, by humorously abusing their superiors (e.g. *oh shut up., what a rotten trick to play on a girl*). These jocular insults have different force between status-differentiated participants from between equals. They are always slightly risky and, however jocular, there is an underlying contestive, challenging or 'dark side' to the message which is not adequately analysed within Politeness Theory framework.

To sum up, then, in work contexts humour can be used by subordinates as a subtle (or not so subtle) license to challenge the power structure as well as

those in power to achieve the speaker's goal while apparently de-emphasizing the power differential. Humour is one very effective way of 'doing power' less explicitly, a subtle device for getting things done while also conveying important messages about power relations. An analysis which treats humour as basically a negative politeness strategy, a device for attenuating a FTA, and purely an expression of concern for the addressee's face, risks under-analysing the interactional social significance of the exchange.

Conclusion

Humour is always intended to be amusing, but it may also serve a range of more complex functions in the workplace. Humour generally creates and maintains solidarity or collegiality; and it may hedge or attenuate face threatening acts such as directives, and negatively affective speech acts such as criticisms and insults. In all these functions humour contributes to social cohesion in the workplace. Humour is sensitively oriented to participants' face needs. It is a dynamic means of expressing and constructing solidarity, and an effective strategy for reducing potential offence.

In interactions where relative power is particularly salient, however, the way humour functions in constructing and negotiating relationships is often more complex. Humour is a means of embedding a risky or unacceptable proposition in a superficially innocuous utterance; it is thus particularly useful in the management of unequal work relationships. Humour may be used by the powerful to maintain authority and control while continuing to appear collegial, and by the repressed to license a challenge which subverts that control. Humour may be used by those in authority as a repressive discourse device, concealing the authority structures or power relations involved in order to gain the addressee's compliance. In this case, humour functions strategically, encoding a directive or criticism in a more acceptable form. Alternatively, humour may be used by subordinates in an asymmetrical power relationship as a critical discourse device, functioning to facilitate a challenge to the positive or negative face needs of the addressee. In such cases, humour provides an acceptable form for a challenge to the status quo, questioning the validity or accuracy of statements from a superior, for instance, or clothing an insulting attack on the positive face of a superior with a pretence of play. Humour permits the subordinate to embed the challenge, criticism or insult in a socially acceptable form, which makes the negative communicative intent less easy to challenge.

Many other aspects of the way humour is used in the workplace merit attention. The distribution of humour is not random, for instance, and varies according to many factors, including the type of interaction. In general, humour is most likely to occur in the opening and closing sequences of meetings, and at points of change within an interaction, but some meetings are regularly punctuated with banter. There are particular types of humour which seem to be preferred in particular workplaces; and while the types of humour which occur in mixed-gender

and single gender interactions overlap, there appear to be preferred styles in some organizational contexts. The predominant functions of humour also seem to vary in different contexts. Defusing tension is an important function of humour in some meetings, while in others more frequent functions of humour may include facilitating difficult negotiations, and conveying criticism or instructions in an acceptable form.

Another area of further research only briefly touched on in this paper is the extent to which humour is jointly constructed in workplace settings (Marra, 1998), and how it often serves as a remarkably powerful solidarity building device in the business context. A related factor is the relationship between the use of humour and the relative integration of different participants into the workplace culture or networks. It seems likely that the most frequent targets or butts of banter are also the core members of the organizational networks (cf. Hay, 1994). There is also a distinctly creative aspect of humour, especially evident in some of the larger meetings in our data, where participants were required to brainstorm new projects or produce innovative ideas. This, too, merits further attention.

So, to conclude, this analysis of humour has identified a number of different functions served by humour at work. While Politeness Theory accounts satisfactorily for the positive politeness functions of humour, it is clear that an alternative model is often necessary to analyse the functions of humour in situations of asymmetrical power. I have suggested that an adequate model must integrate politeness theory with a more critical approach to the analysis of humour. In other words, we must be able to account not only for cooperative, face-oriented discourse in a range of contexts, but also for the dark side of politeness – the repressive discourse of manipulative superiors in asymmetrical contexts, as well as the impolite manifestations of the less powerful, the critical challenges to those in power from those in subordinate positions. The power of humour lies in its flexibility for all these purposes – it can function as a bouquet, a shield, and a cloak, as well as an incisive weapon in the armoury of the oppressed.

Appendix: Transcription Conventions

All names are pseudonyms.

YES	Capitals indicate emphatic stress
[laughs]	Paralinguistic features in square brackets
[drawls]	
+	Pause of up to one second
++	Two second pause
/so how\	Simultaneous speech
/yes but\	
(hello)	Transcriber's best guess at an unclear utterance
?	Rising or question intonation
publicat-	Incomplete or cutoff utterance
. . .	Some words omitted

Notes

I thank those who allowed their workplace interactions to be recorded, the Language in the Workplace Project team who assisted with collecting and transcribing the data (especially Kate Kilkenny, Maria Stubbe and Bernadette Vine), and Jen Hay, Meredith Marra and Maryann Nesbitt, who read drafts of this article and provided helpful comments. Jiansheng Guo provided valuable comments following a seminar presentation, and I also express appreciation for the comments of the anonymous reviewer. A very short summary of some of the points in this article appears as Holmes (1998). The research was supported by a grant from the New Zealand Foundation for Research Science and Technology.

1. Gibson (1994) provides an interesting critique of such approaches.
2. Mott and Petrie (1995: 329) adopted a similar methodology and make the same point.
3. Pakeha is a Maori word used in New Zealand to refer to people of European (usually British) descent.
4. See Graham, Papa and Brooks (1992) and Hay (1995) for a good discussion of this issue.
5. Obviously, this analysis is confined to auditory signals of listener response.
6. Attardo (1993) analyses jokes as involving deliberate violations of Grice's maxims.
7. For a sophisticated discussion of the complexities of participants' communicative goals, and the relevance of goal conflict, see Tracy and Coupland (1990).
8. As Sinclair (1985: 16) argues 'The problem is mainly where to stop. Language activity is but one component of our general activity'.
9. For further discussion of ways of 'doing collegiality' at work, see Holmes (in press), Holmes, Stubbe and Vine (1999).
10. Austin notes that Brown and Levinson's model of politeness assumes that 'the speaker wants or needs to maintain the hearer's face, that the hearer poses a threat to the speaker's face, and that the speaker cares what the hearer does in retaliation' (1990: 279). FAAs are not based on such assumptions. Indeed, they account for situations where mutual interest does not govern the conduct of the interaction, and what the speaker wants to communicate is not necessarily cooperative (1990: 278–9).
11. See, for example, Labov (1972), Kiesling (forthcoming), Kuiper (1991).
12. See Holmes (1984) for a discussion of positively affective and negatively affective speech acts.
13. It is interesting to note that jocular abuse downwards from superior to subordinates was rare in the workplaces which have been analysed. It is possible that insults, even if attenuated by humour, would too obviously constitute abuses of power in the workplace, and that they are thus avoided due to legislative restraints. However, this pattern was also noted by Hay in her analysis of jocular abuse in friendship groups. Newer and less well-established group members received less abuse than longer standing and well-integrated members.

Stance and Engagement: A Model of Interaction in Academic Discourse

Ken Hyland

Stance and Engagement: A Model of Interaction in Academic Discourse

Over the past decade or so, academic writing has gradually lost its traditional tag as an objective, faceless and impersonal form of discourse and come to be seen as a persuasive endeavour involving interaction between writers and readers. This view sees academics as not simply producing texts that plausibly represent an external reality, but also as using language to acknowledge, construct and negotiate social relations. Writers seek to offer a credible representation of themselves and their work by claiming solidarity with readers, evaluating their material and acknowledging alternative views, so that controlling the level of personality in a text becomes central to building a convincing argument. Put succinctly, every successful academic text displays the writer's awareness of both its readers and its consequences.

As this view gains greater currency, more researchers have turned their attention to the concept of evaluation and how it is realized in academic texts. Indeed, much of my own work over the past decade or so has been devoted to this. Consequently, a variety of linguistic resources such as hedges, reporting verbs, *that*-constructions, questions, personal pronouns, and directives have been examined for the role they play in this persuasive endeavour (e.g. Hyland, 2000; Hyland and Tse, forthcoming; Swales, 1990; Thompson, 2001). Despite this plethora of research, however, we do not yet have a model of interpersonal discourse that unites and integrates these features and that emerges from the study of academic writing itself. How *do* academic writers use language to express a stance and relate to their readers? This is the question addressed in this article,

that brings together a diverse array of features by drawing on interviews and a corpus of 240 research articles to offer a framework for understanding the linguistic resources of academic interaction. My aim, then, is to consolidate my previous work using this corpus to offer a model of stance and engagement in academic texts.

Interaction and Evaluation

Evaluation, as Bondi and Mauranen (2003) have recently observed, 'is an elusive concept'. For while we recognize interaction and evaluation in academic texts, it is not always clear how they are achieved. The ways that writers and speakers express their opinions have long been recognized as an important feature of language, however, and research has attempted to account for these meanings in a number of ways. Hunston and Thompson (2000) use the term 'evaluation' to refer to the writer's judgements, feelings, or viewpoint about something, and others have described these varied linguistic resources as *attitude* (Halliday, 1994), *epistemic modality* (Hyland, 1998), *appraisal* (Martin, 2000; White, 2003), stance (Biber and Finegan, 1989; Hyland, 1999), and *metadiscourse* (Crismore, 1989; Hyland and Tse, 2004).

Interest in the interpersonal dimension of writing has, in fact, always been central to both systemic functional and social constructionist frameworks, which share the view that all language use is related to specific social, cultural and institutional contexts. These approaches have sought to elaborate the ways linguistic features create this relationship as writers comment on their propositions and shape their texts to the expectations of their audiences. Perhaps the most systematic approach to these issues to date has been the work on appraisal which offers a typology of evaluative resources available in English (Martin, 2000). For Martin, appraisal largely concerns the speaker's attitudinal positions, distinguishing three sub-categories of affect, judgement, and appreciation, roughly glossed as construing emotion, moral assessments, and aesthetic values respectively, and the ways these are graded for intensity. While this broad characterization is interesting, however, it is unclear how far these resources are actually employed in particular registers and to what extent they can be seen as comprising core semantic features in given contexts of use.

Because the work on evaluation and stance is relatively new, much of it has tended to concentrate on mass audience texts, such as journalism, politics, and media discourses, which are likely to yield the richest crop of explicitly evaluative examples. Yet these public genres tend to offer writers far more freedom to position themselves interpersonally than academic genres. Because we do not yet have a model of evaluative discourse that emerges from the study of academic writing itself, we cannot say which features are *typical* in scholarly writing, rather than which are *possible*. It seems, for example, that 'attitude' in academic texts more often concerns writers' judgements of epistemic probability and estimations of value, with affective meanings less prominent (Hyland, 1999, 2000). The role of hedging and boosting, for instance, is well documented in academic prose as

communicative strategies for conveying reliability and strategically manipulating the strength of commitment to claims to achieve interpersonal goals.

An important consideration here is that evaluation is always carried out in relation to some standard. Personal judgements are only convincing, or even meaningful, when they contribute to and connect with a communal ideology or value system concerning what is taken to be normal, interesting, relevant, novel, useful, good, bad, and so on. Academic writers' use of evaluative resources is influenced by different epistemological assumptions and permissible criteria of justification, and this points to and reinforces specific cultural and institutional contexts. Writers' evaluative choices, in other words, are not made from all the alternatives the language makes available, but from a more restricted sub-set of options which reveal how they understand their communities through the assumptions these encode. Meanings are ultimately produced in the interaction between writers and readers in specific social circumstances, which means that a general categorization of interactional features is unable to show how academic writers, through their disciplinary practices, construct and maintain relationships with their readers and thus with their communities.

To be persuasive, writers need to connect with this value system, making rhetorical choices which evaluate both their propositions, and their audience. In sum, to understand what counts as effective persuasion in academic writing, every instance of evaluation has to be seen as an act socially situated in a disciplinary or institutional context.

Stance and Engagement

Interaction in academic writing essentially involves 'positioning', or adopting a point of view in relation to both the issues discussed in the text and to others who hold points of view on those issues. In claiming a right to be heard, and to have their work taken seriously, writers must display a competence as disciplinary insiders. This competence is, at least in part, achieved through a writer–reader dialogue which situates both their research and themselves, establishing relationships between people, and between people and ideas. Successful academic writing thus depends on the individual writer's projection of a shared professional context. That is, in pursuing their personal and disciplinary goals, writers seek to create a recognizable social world through rhetorical choices which allow them to conduct interpersonal negotiations and balance claims for the significance, originality and plausibility of their work against the convictions and expectations of their readers.

The motivation for these writer–reader interactions lies in the fact that readers can always refute claims and this gives them an active and constitutive role in how writers construct their arguments. Any successfully published research paper anticipates a reader's response and itself responds to a larger discourse already in progress. This locates the writer intertextually within a larger web of opinions (Bakhtin, 1986), and within a community whose members are likely to recognize only certain forms of argument as valid and effective. Results and interpretations

need to be presented in ways that readers are likely to find persuasive, and so writers must draw on these to express their positions, represent themselves, and engage their audiences.

Evaluation is therefore critical to academic writing as effective argument represents careful considerations of one's colleagues as writers situate themselves and their work to reflect and shape a valued disciplinary ethos. These interactions are managed by writers in two main ways.

1. *Stance.* They express a textual 'voice' or community recognized personality which, following others, I shall call *stance.* This can be seen as an attitudinal dimension and includes features which refer to the ways writers present themselves and convey their judgements, opinions, and commitments. It is the ways that writers intrude to stamp their personal authority onto their arguments or step back and disguise their involvement.
2. *Engagement.* Writers relate to their readers with respect to the positions advanced in the text, which I call *engagement* (Hyland, 2001). This is an alignment dimension where writers acknowledge and connect to others, recognizing the presence of their readers, pulling them along with their argument, focusing their attention, acknowledging their uncertainties, including them as discourse participants, and guiding them to interpretations.

The key resources by which these interactional macro-functions are realized are summarized in Figure 1 and discussed in more detail below.

Together these resources have a dialogic purpose in that they refer to, anticipate, or otherwise take up the actual or anticipated voices and positions of potential readers (Bakhtin, 1986). Stance and engagement are two sides of the same coin and, because they both contribute to the interpersonal dimension of discourse, there are overlaps between them. Discrete categories inevitably conceal the fact that forms often perform more than one function at once because, in developing their arguments, writers are simultaneously trying to set out a claim, comment on its truth, establish solidarity and represent their credibility. But it is generally possible to identify predominant meanings to compare the rhetorical patterns in different discourse communities.

It should also be borne in mind that evaluation is expressed in a wide range of ways which makes a fine-grained typology problematic. While writers can

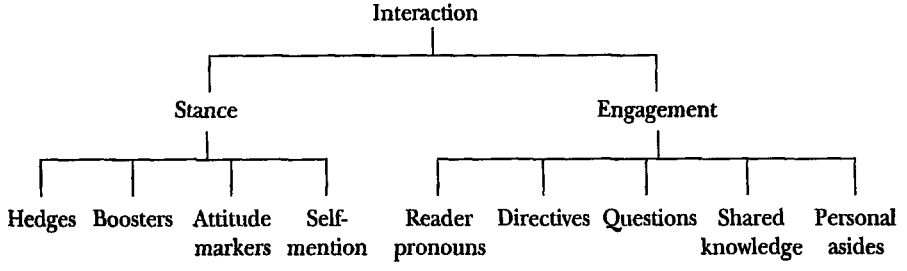

Figure 1: Key resources of academic interaction

mark their perspectives explicitly through lexical items (such as *unfortunately, possible, interesting,* etc.), they can also code them less obviously through conjunction, subordination, repetition, contrast, etc. (e.g. Hunston, 1994). Moreover, because the marking of stance and engagement is a highly contextual matter, members can employ evaluations through a shared attitude towards particular methods or theoretical orientations which may be opaque to the analyst. Nor is it always marked by words at all: a writer's decision not to draw an obvious conclusion from an argument, for example, may be read by peers as a significant absence. It may not always be possible therefore to recover the community understandings and references embedded in more implicit realizations.

Distinguishing between these two dimensions is a useful starting point from which to explore how interaction and persuasion are achieved in academic discourse and what these can tell us of the assumptions and practices of different disciplines. This is what I set out to do below. Following a description of the corpus, I sketch out some of the key resources of stance and engagement and discuss what these differences in functionality tell us about the epistemological and social beliefs of disciplinary cultures.

Corpus and Methods

My view of stance and engagement is based on a series of studies which draw on both qualitative and quantitative approaches, comprising the analysis of a corpus of published articles and interviews with academics. The text corpus consists of 240 research articles comprising three papers from each of ten leading journals in eight disciplines selected to represent a broad cross-section of academic practice and facilitate access to informants. The fields were mechanical engineering (ME), electrical engineering (EE), marketing (Mk), philosophy (Phil), sociology (Soc), applied linguistics (AL), physics (Phy) and microbiology (Bio). The value of exploring such a large corpus is that it makes available many instances of the target features in a naturally occurring discourse, replicating the language-using experience of community members.

The texts were converted to an electronic corpus of 1.4 million words and searched for specific features seen as initiating writer–reader interactions using *WordPilot 2000*, a text analysis and concordance programme. A list of 320 potentially productive search items was compiled based on previous research into interactive features (e.g. Biber and Finegan, 1989; Bondi, 1999; Hyland, 1999, 2000), from grammars (Biber et al., 1999; Halliday, 1994), and from the most frequently occurring items in the articles themselves. All cases were examined to ensure they functioned as interactional markers and a sample was double-checked by a colleague working independently.

The interviews were conducted with experienced researcher/writers from the target disciplines using a semi-structured format. These employed open-ended interview prompts which focused on subjects' own and others' writing, but allowed them to raise other relevant issues. Subjects could therefore respond to texts with insider community understandings of rhetorical effectiveness, while

Stance and Features of Writer Positioning

Stance concerns *writer-oriented features* of interaction and refers to the ways academics annotate their texts to comment on the possible accuracy or credibility of a claim, the extent they want to commit themselves to it, or the attitude they want to convey to an entity, a proposition, or the reader. I take it to have three main components: *evidentidity, affect* and *presence.* Evidentiality refers to the writer's expressed commitment to the reliability of the propositions he or she presents and their potential impact on the reader; affect involves a broad range of personal and professional attitudes towards what is said, including emotions, perspectives and beliefs; and presence simply concerns the extent to which the writer chooses to project him or herself into the text. It is comprised of four main elements:

1. Hedges.
2. Boosters.
3. Attitude markers.
4. Self-mentions.

Hedges are devices like *possible, might* and *perhaps,* that indicate the writer's decision to withhold complete commitment to a proposition, allowing information to be presented as an opinion rather than accredited fact. Because all statements are evaluated and interpreted through a prism of disciplinary assumptions, writers must calculate what weight to give to an assertion, attesting to the degree of precision or reliability that they want it to carry and perhaps claiming protection in the event of its eventual overthrow (Hyland, 1998). Hedges, therefore, imply that a statement is based on plausible reasoning rather than certain knowledge, indicating the degree of confidence it is prudent to attribute to it (Example 1):

> (1) Our results suggest that rapid freeze and thaw rates during artificial experiments in the laboratory may cause artifactual formation of embolism. Such experiments may not quantitatively represent the amount of embolism that is formed during winter freezing in nature. In the chaparral at least, low temperature episodes usually result in gradual freeze-thaw events.
>
> (Bio)

Equally importantly, hedges also allow writers to open a discursive space where readers can dispute their interpretations. Claim-making is risky because it can contradict existing literature or challenge the research of one's readers, which means that arguments must accommodate readers' expectations that they will be allowed to participate in a dialogue and that their own views will be acknowledged in the discourse. By marking statements as provisional, hedges seek to involve readers as participants in their ratification, conveying deference, modesty, or respect for colleagues views (Hyland, 1998). Two of my informants noted this:

> Of course, I make decisions about the findings I have, but it is more convincing to tie them closely to the results

> You have to relate what you say to your colleagues and we don't encourage people to go out and nail their colours to the mast as maybe they don't get it published.
> (Bio interview)

Boosters, on the other hand, are words like *clearly, obviously* and *demonstrate*, which allow writers to express their certainty in what they say and to mark involvement with the topic and solidarity with their audience. They function to stress shared information, group membership, and engagement with readers (Hyland, 1999). Like hedges, they often occur in clusters, underlining the writer's conviction in his or her argument (Example 2):

> (2) This brings us into conflict with Currie's account, for static images surely cannot trigger our capacity to recognize movement. If that were so, we would see the image as itself moving. With a few interesting exceptions we obviously do not see a static image as moving. Suppose, then, that we say that static images only depict instants. This too creates problems, for it suggests that we have a recognitional capacity for instants, and this seems highly dubious.
> (Phil)

Boosters can therefore help writers to present their work with assurance while effecting interpersonal solidarity, setting the caution and self-effacement suggested by hedges against assertion and involvement.

Both boosters and hedges represent a writer's response to the potential viewpoints of readers and an acknowledgement of disciplinary norms of appropriate argument. They balance objective information, subjective evaluation and interpersonal negotiation, and this can be a powerful factor in gaining acceptance for claims. Both strategies emphasize that statements not only communicate ideas, but also the writer's attitude to them and to readers. Writers must weigh up the commitment they want to invest in their arguments based on its epistemic status and the effect this commitment might have on readers' responses. These comments from my interview data suggest the importance of getting this balance right:

> I'm very much aware that I'm building a façade of authority when I write, I really like to get behind my work and get it out there. Strong. Committed. That's the voice I'm trying to promote, even when I'm uncertain I want to be behind what I say.
> (Soc interview)

> You have to be seen to believe what you say. That they are *your* arguments. It's what gives you credibility. It's the whole point.
> (Phil interview)

> I like tough minded verbs like 'think'. It's important to show where you stand. The people who are best known have staked out the extreme positions. The people who sit in the middle and use words like 'suggest', no one knows their work.
> (Soc interview)

Attitude markers indicate the writer's affective, rather than epistemic, attitude to propositions, conveying surprise, agreement, importance, frustration, and so on, rather than commitment. While attitude is expressed throughout a text by

the use of subordination, comparatives, progressive particles, punctuation, text location, and so on, it is most explicitly signalled by attitude verbs (e.g. *agree, prefer*), sentence adverbs (*unfortunately, hopefully*), and adjectives (*appropriate, logical, remarkable*). By signalling an assumption of shared attitudes, values and reactions to material, writers both express a position and pull readers into a conspiracy of agreement so that it can often be difficult to dispute these judgements (Example 3):

(3) these learner variables should prove to be promising areas for further research. (Bio)

.... two quantities are rather important and, for this reason, the way they were measured is re-explained here. (ME)

The first clue of this emerged when we noticed a quite extraordinary result. (Phil)

Student A2 presented another fascinating case study in that he had serious difficulties expressing himself in written English. (AL)

Self-mention refers to the use of first person pronouns and possessive adjectives to present propositional, affective and interpersonal information (Hyland, 2001). Presenting a discoursal self is central to the writing process (Ivanic, 1998), and writers cannot avoid projecting an impression of themselves and how they stand in relation to their arguments, their discipline, and their readers. The presence or absence of explicit author reference is generally a conscious choice by writers to adopt a particular stance and disciplinary-situated authorial identity. In the sciences it is common for writers to downplay their personal role to highlight the phenomena under study, the replicability of research activities, and the generality of the findings, subordinating their own voice to that of unmediated nature. Such a strategy subtly conveys an empiricist ideology that suggests research outcomes would be the same irrespective of the individual conducting it. One of my respondents expressed this view clearly:

I feel a paper is stronger if we are allowed to see what was done without 'we did this' and 'we think that'. Of course we know there are researchers there, making interpretations and so on, but this is just assumed. It's part of the background. I'm looking for something interesting in the study and it shouldn't really matter who did what in any case. (Bio interview)

In the humanities and social sciences, in contrast, the use of the first person is closely related to the desire to both strongly identify oneself with a particular argument and to gain credit for an individual perspective. Personal reference is a clear indication of the perspective from which a statement should be interpreted, enabling writers to emphasize their own contribution to the field and to seek agreement for it (Example 4):

(4) I argue that their treatment is superficial because, despite appearances, it relies solely on a sociological, as opposed to an ethical, orientation to develop a response. (Soc)

I bring to bear on the problem my own experience. This experience contains ideas derived from reading I have done which might be relevant to my puzzlement as well as my personal contacts with teaching contexts. (AL)

In these more discursive domains, then, self-mention clearly demarcates the writer's role in the research:

Using 'I' emphasizes what you have done. What is yours in any piece of research. I notice it in papers and use it a lot myself. (Soc interview)

The personal pronoun 'I' is very important in philosophy. It not only tells people that it is your own unique point of view, but that you believe what you are saying. It shows your colleagues where you stand in relation to the issues and in relation to where they stand on them. It marks out the differences. (Phil interview)

Engagement and Features of Reader Positioning

In comparison with stance, the ways writers bring readers into the discourse to anticipate their possible objections and engage them in appropriate ways have been relatively neglected in the literature. Based on their previous experiences with texts, writers make predictions about how readers are likely to react to their arguments. They know what they are likely to find persuasive, where they will need help in interpreting the argument, what objections they are likely to raise, and so on. This process of audience evaluation therefore assists writers in constructing an effective line of reasoning and, like stance options, also points to the ways language is related to specific cultural and institutional contexts (Hyland, 2001). There are two main purposes to writers' uses of engagement strategies:

1. Acknowledgement of the need to adequately meet readers' expectations of inclusion and disciplinary solidarity. Here we find readers addressed as participants in an argument with reader pronouns and interjections.
2. To rhetorically position the audience. Here the writer pulls readers into the discourse at critical points, predicting possible objections and guiding them to particular interpretations with questions, directives and references to shared knowledge.

Again, these two functions are not always clearly distinguishable, as writers invariably use language to solicit reader collusion on more than one front simultaneously. They do, however, help us to see some of the ways writers project readers into texts and how this is done in different disciplines. There are five main elements to engagement:

1. Reader pronouns.
2. Personal asides.
3. Appeals to shared knowledge.
4. Directives.
5. Questions.

Reader pronouns are perhaps the most explicit way that readers are brought into a discourse. *You* and *your* are actually the clearest way a writer can acknowledge the reader's presence, but these forms are rare outside of philosophy, probably because they imply a lack of involvement between participants. Instead, there is enormous emphasis on binding writer and reader together through inclusive *we*, which is the most frequent engagement device in academic writing. It sends a clear signal of membership by textually constructing both the writer and the reader as participants with similar understanding and goals. This was recognized by my informants:

> Part of what you are doing in writing a paper is getting your readers onside, not just getting down a list of facts, but showing that you have similar interests and concerns. That you are looking at issues in much the same way they would, not spelling everything out, but following the same procedures and asking the questions they might have.
> (Bio interview)

> I often use 'we' to include readers. I suppose it brings out something of the collective endeavour, what we all know and want to accomplish. I've never thought of it as a strategy, but I suppose I am trying to lead readers along with me.
> (ME interview)

In addition to claiming solidarity, these devices also set up a dialogue by weaving the potential point of view of readers into the discourse, thereby anticipating their objections, voicing their concerns, and expressing their views. Thus, *we* helps guide readers through an argument and towards a preferred interpretation, often shading into explicit positioning of the reader (Example 5):

> (5) Now that we have a plausible theory of depiction, we should be able to answer the question of what static images depict. But this turns out to be not at all a straightforward matter. We seem, in fact, to be faced with a dilemma. Suppose we say that static images can depict movement. This brings us into conflict with Currie's account,.....
> (Phil)

> Although we lack knowledge about a definitive biological function for the transcripts from the 93D locus, their sequences provide us with an ideal system to identify a specific transcriptionally active site in embryonic nuclei.
> (Bio)

Personal asides allow writers to address readers directly by briefly interrupting the argument to offer a comment on what has been said. While asides express something of the writer's personality and willingness to explicitly intervene to offer a view, they can also be seen as a key reader-oriented strategy. By turning to the reader in mid-flow, the writer acknowledges and responds to an active

audience, often to initiate a brief dialogue that is largely interpersonal. As we can see, such comments often add more to the writer–reader relationship than to the propositional development of the discourse (Example 6):

(6) And – as I believe many TESOL professionals will readily acknowledge – critical thinking has now begun to make its mark, particularly in the area of L2 composition. (AL)

He above all provoked the mistrust of academics, both because of his trenchant opinions (often, it is true, insufficiently thought out) and his political opinions. (Soc)

What sort of rigidity a designator is endowed with seems to be determined by convention (this, by the way, is exactly the target of Wittgensteinian critiques of Kripke's essentialism). (Phil)

This kind of engagement builds a relationship between participants which is not dependent on an assessment of what needs to be made explicit to elaborate a position or ease processing constraints. It is an intervention simply to connect: to show that both writer and readers are engaged in the same game and are in a position to draw on shared understandings. While all writing needs to solicit reader collusion, this kind of engagement is far more common in the soft fields. Because they deal with greater contextual vagaries, less predictable variables, and more diverse research outcomes, readers must be drawn in and be involved as participants in a dialogue to a greater extent than in the sciences.

Appeals to shared knowledge seek to position readers within apparently naturalized boundaries of disciplinary understandings. The notion of 'sharedness' is often invoked by writers to smuggle contested ideas into their argument, but here I am simply referring to the presence of explicit markers where readers are asked to recognize something as familiar or accepted. Obviously readers can only be brought to agree with the writer by building on some kind of implicit contract concerning what can be accepted, but often these constructions of solidarity involve explicit calls asking readers to identify with particular views. In doing so, writers are actually constructing readers by presupposing that they hold such beliefs, assigning to them a role in creating the argument, acknowledging their contribution while moving the focus of the discourse away from the writer to shape the role of the reader (Example 7):

(7) Of course, we know that the indigenous communities of today have been reorganized by the catholic church in colonial times and after,..... (Soc)

This tendency obviously reflects the preponderance of brand-image advertising in fashion merchandising. (Mk)

Chesterton was of course wrong to suppose that Islam denied 'even souls to women'. (Phil)

This measurement is distinctly different from the more familiar NMR pulsed field gradient measurement of solvent self-diffusion.

(Phy)

Over three-quarters of such explicit appeals to collective understandings in the corpus were in the soft papers. Writers of scientific papers expect their readers to have considerable domain knowledge and to be able to decode references to specialized methods, instruments, materials, and models, but these understandings are signalled less explicitly.

Directives instruct the reader to perform an action or to see things in a way determined by the writer. They are signalled mainly by the presence of an imperative (like *consider*, *note*, and *imagine*); by a modal of obligation addressed to the reader (such as *must*, *should*, and *ought*); and by a predicative adjective expressing the writer's judgement of necessity/importance (*It is important to understand . . .*). Directives can be seen as directing readers to engage in three main kinds of activity (Hyland, 2002a):

1. Textual acts.
2. Physical acts.
3. Cognitive acts.

First, *textual acts* are used to metadiscoursally guide readers through the discussion, steering them to another part of the text or to another text (Example 8):

(8) See Lambert and Jones (1997) for a full discussion of this point.

(Soc)

Look at Table 2 again for examples of behavioristic variables.

(Mk)

Consult Cormier and Gunn 1992 for a recent survey

(EE)

Second, *physical acts* instruct readers how to carry out research processes or to perform some action in the real world (Example 9):

(9) Before attempting to measure the density of the interface states, one should freeze the motion of charges in the insulator.

(EE)

Mount the specimen on the lower grip of the machine first, . . .

(Bio)

Set the sliding amplitude at 30mm traveling distance.

(ME)

Finally, *cognitive acts* guide readers through a line of reasoning, or get them to understand a point in a certain way and are therefore potentially the most threatening type of directives. They accounted for almost half of all directives in the corpus, explicitly positioning readers by leading them through an argument

to the writer's claims (Example 10) or emphasizing what they should attend to in the argument (Example 11):

(10) Consider a sequence of batches in an optimal schedule.
(EE)

Think about it. What if we eventually learn how to communicate with aliens.
(Soc)

(11) It is important to note that these results do indeed warrant the view that...
(AL)

What has to be recognised is that these issues.....
(ME)

Questions are the strategy of dialogic involvement *par excellence*, inviting engagement and bringing the interlocutor into an arena where they can be led to the writer's viewpoint (Hyland, 2002b). They arouse interest and encourage the reader to explore an unresolved issue with the writer as an equal, a conversational partner, sharing his or her curiosity and following where the argument leads. Over 80 percent of questions in the corpus, however, were rhetorical, presenting an opinion as an interrogative so the reader appears to be the judge, but actually expecting no response. This kind of rhetorical positioning of readers is perhaps most obvious when the writer poses a question only to reply immediately, simultaneously initiating and closing the dialogue (Example 12):

(12) Is it, in fact, necessary to choose between nurture and nature? My contention is that it is not.
(Soc)

What do these two have in common, one might ask? The answer is that they share the same politics.
(AL)

Why does the capacitance behave this way? To understand we first notice that at large B there are regular and nearly equal-spaced peaks in both C3,(B) and C31(- B).
(Phy)

Stance and Engagement Practices: Corpus Findings

Analysis of the research article corpus shows that the expression of stance and engagement is an important feature of academic writing, with 200 occurrences in each paper, about one every 28 words. Table 1 shows that stance markers were about five times more common than engagement features and that hedges were by far the most frequent feature of writer perspective in the corpus, reflecting the critical importance of distinguishing fact from opinion and the need for writers to present their claims with appropriate caution and regard to colleagues' views.

The significance of these frequencies can be more clearly understood in comparison to other common features of published academic writing. Biber et al. (1999), for instance, give figures of 18.5 cases per 1000 words for passive voice constructions and 20 per 1000 words for past tense verbs. These count interaction

markers can therefore be seen as an important element of academic prose. Perhaps more interesting, however, are the disciplinary distributions. Table 2 shows the density of features in each discipline normalized to a text length of 1000 words. As can be seen, the more discursive 'soft' fields of philosophy, marketing, sociology and applied linguistics, contained the highest proportion of interactional markers with some 75 percent more items than the engineering and science papers.

Stance, Engagement and Disciplinarity

It is clear that writers in different disciplines represent themselves, their work and their readers in different ways, with those in the humanities and social sciences taking far more explicitly involved and personal positions than those in the science and engineering fields. As I noted at the beginning of this article, the reason for this is that the resources of language mediate their contexts, working to construe the characteristic structures of knowledge domains and argument forms of the disciplines that create them.

In broad terms, rhetorical practices are inextricably related to the purposes of the disciplines. Natural scientists tend to see their goal as producing public knowledge able to withstand the rigours of falsifiability and developed through relatively steady cumulative growth (Becher, 1989). The fact that this research often occupies considerable investments in money, training, equipment, and expertise means it is frequently concentrated at a few sites and commits scientists to involvement in specific research areas for many years. Problems therefore emerge in an established context so that readers are often familiar with prior texts and research, and that the novelty and significance of contributions can easily be recognized. The soft knowledge domains, in contrast, are more interpretative and less abstract, producing discourses which often recast knowledge as sympathetic understanding, promoting tolerance in readers through an ethical rather than cognitive progression (Dillon, 1991; Hyland, 2000). There is, moreover, less control of variables and greater possibilities for diverse outcomes, so writers must spell out their evaluations and work harder to establish an understanding with readers.

While there are clear dangers in reifying the ideologies of practitioners, these broad ontological representations have real rhetorical effects. They allow, for

instance, the sciences to emphasize demonstrable generalizations rather than interpreting individuals, so greater burden is placed on research practices and the methods, procedures and equipment used. New knowledge is accepted on the basis of empirical demonstration, and science writing reinforces this by highlighting a gap in knowledge, presenting a hypothesis related to this gap, and then conducting experiments and presenting findings to support the hypothesis. In soft areas, however, the context often has to be elaborated anew, its more diverse components reconstructed for a less cohesive readership. Writers are far less able to rely on general understandings and on the acceptance of proven quantitative methods to establish their claims and this increases the need for more explicit evaluation and engagement. Personal credibility, and explicitly getting behind arguments, play a far greater part in creating a convincing discourse for these writers.

The suggestion that 'hard' knowledge is cumulative and tightly structured not only allows for succinct communication, but also contributes to the apparently 'strong' claims of the sciences. The degree to which the background to a problem and the appropriate methods for its investigation can be taken for granted means there are relatively clear criteria for establishing or refuting claims and this is reflected in writers' deployment of evidential markers. While writers in all disciplines used hedges in the evaluation of their statements, they were considerably more frequent in the soft disciplines, perhaps indicating less assurance about what colleagues could be safely assumed to accept. The use of a highly formalized reporting system also allows writers in the hard disciplines to minimize their presence in their texts. In the soft disciplines where what counts as adequate explanation is less assured, interpretative variation increases and writers must rely to a greater extent on a personal projection into the text, through self-mention and attitude markers to invoke an intelligent reader and a credible, collegial writer.

In addition to creating an impression of authority, integrity and credibility through choices from the stance options, writers are able to either highlight or

frequent engagement devices in the corpus were reader pronouns and over 80 percent of these occurred in the soft discipline papers where they functioned to appeal to scholarly solidarity, presupposing a set of mutual, discipline-identifying understandings linking writer and reader. They also claim authority as well as communality, however, addressing the reader from a position of confidence as several of my informants noted:

> I suppose we help to finesse a positive response – we are all in this together kind of thing. I use it to signal that I am on the same wavelength, drawing on the same assumptions and asking the same questions.
>
> (Mk interview)

> It helps to locate you in a network. It shows that you are just doing and thinking what they might do and think. Or what you would like them to, anyway.
>
> (Soc interview)

Similarly, questions were largely confined to the soft fields. The fact they reach out to readers was seen as a distraction by my science informants:

> Questions are quite rare in my field I think. You might find them in textbooks I suppose, but generally we don't use them. They seem rather intrusive, don't they? Too personal. We generally prefer not to be too intrusive.
>
> (ME interview)

> I am looking for the results in a paper, and to see if the method was sound. I am looking for relevance and that kind of dressing is irrelevant. People don't ask questions as it would be seen as irrelevant. And condescending probably.
>
> (EE interview)

In contrast, the soft knowledge writers saw them as an important way of relating to readers:

> In my field that's all there are, questions. Putting the main issues in the form of questions is a way of presenting my argument clearly and showing them I am on the same wavelength as them.
>
> (Phil interview)

> Often I structure the argument by putting the problems that they might ask.
>
> (Mk interview)

Finally, directives were the only interactive feature which occurred more frequently in the science and engineering papers. Generally, explicit engagement is a feature of the soft disciplines, where writers are less able to rely on the explanatory value of accepted procedures, but directives are a potentially risky tactic and, as a result, most directives in the soft fields were textual, directing readers to a reference rather than informing them how they should interpret an argument. Two of my respondents noted this in their interviews:

> I am very conscious of using words like 'must' and 'consider' and so on and use

> to take notice of it'. So I suppose I am trying to take control of the reader and getting them to see things my way.
>
> (Soc interview)

> I am aware of the effect that an imperative can have so I tend to use the more gentle ones. I don't want to bang them over the head with an argument I want them to reflect on what I'm saying. I use 'consider' and 'let's look at this' rather than something stronger.
>
> (AL interview)

The more linear and problem-oriented approach to knowledge construction in the hard knowledge fields, on the other hand, allows arguments to be formulated in a highly standardized code. Articles in the sciences also tend to be much shorter, probably due to editorial efforts to accommodate the rapid growth of knowledge and high submission rates in many sciences. These factors place a premium on succinctness, and directives provide an economy of expression highly valued by space-conscious editors and information-saturated scientists, as several informants noted:

> I rarely give a lot of attention to the dressing, I look for the meat – the findings – and if the argument is sound. If someone wants to save me time in getting there then that is fine. No, I'm not worried about imperatives leading me through it.
>
> (EE interview)

> I'm very conscious of how I write and I am happy to use an imperative if it puts my idea over clearly. Often we are trying to work to word limits anyway, squeezing fairly complex arguments into a tight space.
>
> (ME interview)

In sum, these different features, taken together, are important ways of situating academic arguments in the interactions of members of disciplinary communities. They represent relatively conventional ways of making meaning and so elucidate a context for interpretation, showing how writers and readers make connections, through texts, to their disciplinary cultures.

Conclusion

My claim has been that effective academic writing depends on rhetorical decisions about interpersonal intrusion and I have suggested a model which attempts to show how writers select and deploy community-sensitive linguistic resources to represent themselves, their positions and their readers. The account I have provided, however, is necessarily a partial one, representing only the broadest categories of rhetorical function. There are certainly more fine-grained distinctions to be made among these resources which are likely to offer further insights into the rhetorical options available to writers and the patterns of effective persuasion employed by different communities.

There are also obvious limitations with the kind of corpus approach I have adopted. Unlike the detailed studies of

on introductions, Brenton's (1996) study of conference abstracts, or Brett's (199 analysis of results sections, for example, a corpus study is unable to provide i formation about where these features are likely to cluster. Several studies sugge that greater writer intrusion is a characteristic of Introduction and Discussic sections, where argument is emphasized and decisions, claims and justificatio are usually found (e.g. Gosden, 1993; Hanania and Akhtar, 1985). While it seen to be an intuitively reasonable assumption that stance and engagement wo is most likely to be done here, the division of research papers into rhetorical simple and detached Methods and Results, and complex, subjective and autho centred Introductions and Discussions might be unwise. Even the mo rhetorically innocent sections reveal writers' efforts to persuade their audien of their claims, so that stance and engagement are likely to figure, in differe ways, across the research paper. Indeed, as Knorr-Cetina (1981) pointed o many years ago, the IMRD structure is itself a rhetorical artefact.

It should also be noted that this creation of an authorial persona is an act personal choice, and the influence of individual personality, confidenc experience, and ideological preference are clearly important. We are not th instruments of our disciplines and variables such as individuality and ideolecticit are important limitations on the kind of analysis presented here. It may even b the case, as John Swales (pers. comm.) has observed, that a few famous write (perhaps Heidegger, Wittgenstein, Sartre, and Halliday) do not play this inte active game with their audiences. However, writers do not act in a social vacuum and knowledge is not constructed outside particular communities of practic Such communities exist in virtue of a shared set of assumptions and routine about how to collectively deal with and represent their experiences. The way language is used on particular occasions are not wholly determined by thes assumptions, but a disciplinary voice can only be achieved through a process c participating in such communities and connecting with these socially determine and approved beliefs and value positions. In this way, independent creativity i shaped by accountability to shared practices.

I hope to have shown, then, that stance and engagement are important ele ments both of a writer's argument and of a disciplinary context as they seek t bring writer and readers into a text as participants in an unfolding dialogue. Th model presented here offers a plausible description of academic interaction an suggests how writers anticipate and understand their readers' background know ledge, interests, and interpersonal expectations to control how they respond t a text and to manage the impression they gain of the writer.

When Talk isn't Cheap: Language and Political Economy

Judith T. Irvine

Perhaps one of the most durable legacies of Saussure's *Course in General Linguistics* is its radical separation of the denotational sign (qua sign) from the material world. This conception of the sign has endured not just because of the effectiveness of Saussure's own formulation, but probably also because it was consonant with ideas already having a long history in the Western intellectual tradition – most particularly, the separation of mind from body.[1] It was also consonant with emerging views in American anthropology and linguistics at the time. The Boasian concern for the independence of linguistic form from race and culture (given the technological emphasis common in conceptions of culture in the early years of this century) similarly led many scholars to promote the autonomy of linguistics as a discipline and to turn their attention away from the political and economic conditions of speech. Although the Boasians and their descendants included major figures and schools who focused on relationships between language and culture, they did so largely by defining culture in terms of knowledge and ideas. The obverse side of this tradition is represented by those anthropologists and other scholars who, in studying a material and political economy, ignored or played down the study of language, and sometimes even saw themselves as aligned against the "idealists" or "culturalists" who drew on linguistic models and verbal data.

Recent years, however, have seen some uneasiness with this dichotomy, and some attempts at rapprochement. Within linguistics, the consideration of language use and context has reached out to the material and historical conditions of linguistic performance. Thus, for example, linguists like William Labov portray speech as varying according to speakers' socioeconomic class and other affiliations relating to economic and political interest. The implication is that the

class connotations of variants influence the direction of change in the linguistic system. From a more sociological point of view, we see in some quarters a new or renewed concern with ideology, including its linguistic articulation, in the control of material production and distribution (for example, Rossi-Landi 1983). Still, in these views, however much the world of ideas and the world of goods may influence each other, language remains firmly locked in the former – the world of ideas. Linguistic signs stand for aspects of the marketplace; they influence it but are not of it.

Language has more roles to play in a political economy than these. And, problematic though the term "political economy" may be in some respects,[2] it may offer clues as to what those roles are. To recognize that the study of economy must include institutions, practices, and values, as well as goods – and that the values and interests governing much of its operation necessarily involve political processes and relations, not just the autonomous flow of markets – is to begin to move beyond the dichotomy that excludes linguistic phenomena from the economic realm. The allocation of resources, the coordination of production, and the distribution of goods and services, seen (as they must be) in political perspective, involve linguistic forms and verbal practices in many ways – as this paper will demonstrate.

The other side of the problem, and the one more central to my discussion, lies in our conception of Language. In linguistic anthropology a fruitful approach began with the work of the anthropologically oriented sociolinguists Hymes and Gumperz, with their attention to speaking as a socially and culturally constructed activity. This school's significance for the problem of language's relationship with political economy might not be obvious from a cursory glance at some of its early texts, since the early years of the "ethnography of speaking" sometimes tended to focus on cognitive questions (for example, the concept of communicative competence) and to emphasize ideas about speaking as part of a larger, cultural system of ideas, rather more than the verbal acts themselves. But while these initial emphases were not inconsistent with the relegation of linguistics to an "idealist" camp, the shift toward a concern with speaking as a social activity opened the way to a more productive conception of relations among language, culture, and society – and, from there, the way beyond the materialist/idealist dichotomy.[3]

The present paper builds upon that base. It also draws upon recent conceptions of a semiotics inspired as much by Peirce as by Saussure (see Mertz and Parmentier 1985; Silverstein 1980, 1984), for we need to conceive of linguistic phenomena, and the functions of the linguistic sign, more broadly than in the usual structuralist readings of Saussure if we are to move beyond the materialist/idealist conundrum. As I have suggested above, we also need conceptions of economy and of value that are comprehensive enough to include linguistic resources and verbal activities. Toward that end, in this paper I consider a case where linguistic objects and performances are exchanged for cash and goods – a case where language's involvement in an economy is perhaps most direct. This is a type of economic function of linguistic phenomena that, I believe, deserves

language and economy, and to be properly understood it needs to be compared with others.

Part I of this paper, therefore, lays that groundwork: it summarizes and compares some views of the relations between linguistic phenomena and economy (best thought of as political economy). I shall lay out a range of possibilities as to what those relations can be. Part II will explore a more specific topic: a comparative economy of compliments. Ethnographic illustrations in the paper derive largely from my own fieldwork in West Africa (Senegal). As Part II emphasizes, among other things the Senegalese case presents compliments that are paid for in cash – an example of linguistic phenomena as objects of economic exchange.

A major purpose of these discussions is to show that the roles language and speech can play in a political economy are not mutually exclusive. Even though some of these "roles" correspond to views already articulated in the linguistic and sociological literature, views that are sometimes seen as competing, what they actually represent are coexisting functions of language. Rather than rival theories or separate sets of ethnographic cases, they concern different dimensions of language use. Because of language's semiotic complexity (its multiple levels of patterning, and the multifunctional nature of the linguistic sign), there are multiple possibilities for its relationship with a material world. All the types of linkage between linguistic phenomena and political economy mentioned in Part I could be found coexisting in the same community – even in the same verbal performances, as we shall see in Part II.

In outlining language's many relationships with the material world, my object is not to claim it for a "materialist" camp, or to attack the materialist/idealist dichotomy merely by inverting it. Indeed, I argue that cultural systems of ideas are crucial to an understanding of language's full range of roles in a political economy. Language is a complex social fact that can be looked at from many angles, including the economic. It is only by appreciating language's complexity that we can transcend the conundrum.

I. Types of Linkage between Linguistic Phenomena and Political Economy

The linkages compared here can be distinguished in several ways: according to what sign-function they emphasize (denotational reference, indexicality, and so on); according to what kind of linguistic and social diversity they encompass; and according to how they connect language with the social division of labor – as its instrument, as its index, or as part of its substance. That is, does linguistic diversity impede social cooperation? Does the variety of verbal behaviors merely index social groups, divisions, or roles formed on mainly nonverbal bases, or is the variety of verbal performance a precondition for (and thus a defining characteristic of) the social division of labor itself – as the practices constituting a social role, or as the objects of economic activity?

As I suggested earlier, the notion that signs may have an economic and political dimension is hardly new. Nor are most of the extant statements on the

subject inherently faulty. They are, however, incomplete. Some reduce language to only one of its functions, for example referential propositionality.[4] Some describe an indexical relationship but give little account of it. And most omit a consideration of linguistic phenomena as possible *objects of exchange* – exchanged against what we consider to be material objects, not only against other linguistic signs.

Propositionality: signs denote objects and activities in the material world The first kind of relation between language and economy is the most familiar one: linguistic signs denote objects, the natural world, and economic skills and activities. They label persons and groups; and they refer to, and make predications about, the forces of production and the coordination of efforts. Because signs refer to the external world, a society's productive efforts can be organized and a division of labor becomes possible.

In discussing this referential function of language and its communicative implications, however, many writers both in linguistics and in the social sciences have done more than merely elaborate on these statements. Instead, some have assumed that referential communication is the *only* function of language, and that language must be uniform in order for referential communication to work. They assume, therefore, that a social division of labor depends on linguistic homogeneity, or at least is facilitated by it. Bloomfield wrote, for example:

> In the ideal case, within a group of people who speak to each other, each person has at his disposal the strength and skill of every person in the group. The more these persons differ as to special skills, the wider a range of power does each one person control. Only one person needs to be a good climber, since he can get fruit for all the rest; only one needs to be a good fisherman, since he can supply the others with fish. *The division of labor, and, with it, the whole working of human society, is due to language* [1933:24, italics in the original].[5]

Notice that this discussion of the "ideal" case envisions a diversity of skills in the socioeconomic realm but not in the linguistic: "Obviously the value of language [for social cooperation] depends upon people's using it in the same way" (1933:29). Homogeneity in linguistic usage is assumed necessary to ensure referential communication. Utterances *refer* to economic skills, to their realization in acts and events, and to their coordination. Thus Bloomfield's conception of language's role in a social division of labor rests entirely on the referential function.

It would be unjust to Bloomfield to suggest that he never acknowledged the existence of diversity in linguistic skills or performances within a speech community. Indeed, he paid more attention to this than did many other scholars of his day and later (see Hymes 1967). But the rubrics under which he considered diversity – as material to eliminate from his science of language, or as relevant only to historical processes such as "intimate borrowing" – are inimical to any serious sociolinguistic view. For the most part he saw linguistic diversity as incidental to social and regional boundaries, or as contingent upon them. The

with shared reference, and thus with economic cooperation or any other aspect of community. The "literary genius" (Bloomfield 1933:46) is the only figure he mentions whose social position is actually constituted by special linguistic skills.[6]

This picture of linguistic homogeneity as basic to communication and hence to social coordination is a familiar one – as are some of the critiques of it – and I do not want to dwell on it at length.[7] Only two further remarks are worth making here. First: although some aspects of the picture have been condemned, it has not been thrown out altogether. Sociolinguists like Hymes and Gumperz have attacked Bloomfield's (and Chomsky's) portrayal of the homogeneous speech community, and they replace it with a notion of the organization of linguistic diversity; but they do not wholly abandon the view that social coordination is facilitated if the parties to it share some common code. Instead, Gumperz and Hymes shift the emphasis to *interpretation*, as what is shared, rather than performance. In this way referential accuracy can be preserved under multilingual (or multi-varietal) conditions, although denotational reference is not the only function of language sociolinguists envisage.

Second: much investigation remains to be done on just *how* language facilitates coordination of a social division of labor. For example, within the linguistic system the study of directives (requests and commands) is especially relevant, because it concerns the verbal management of the flow of goods and services in an economy. The few studies we have of directives in social and cultural context suggest that, in conspicuously task-oriented situations, speech coordinating the tasks is often reduced and simple compared to speech of other kinds, or speech in other settings.[8] (The reduction and "simplicity" of linguistic form in pidgins and trade languages originating in labor or market settings might be relevant also.) Another, more sociological aspect of linguistic involvement in coordinating a division of labor concerns how people participate in organizational discussions. For instance, a single spokesperson may represent a group and carry out the communicative tasks necessary for its coordination with other groups.[9] In short, coordinating a material division of labor does not universally *require* a very complex system of signs held in common among all coordinated parties.

However, to the extent that a code is held in common, or at least that a semantic system is, it may also facilitate cooperation – or at least co-optation – in an indirect way: by incorporating an ideology that supports a particular socioeconomic system. The lexicon labeling social groups and economic activities, and perhaps also a system of metaphoric constructions and semantically generative principles, would presumably be the main places in the referential structure to look for this.

Indexicality: signs index social groups, categories, and situations entering into the relations of production I turn now to the second type of relation between signs and political economy – to a view that has become familiar to us under the rubric of sociolinguistics: a view of the speech community as an organization of linguistic diversity, having a repertoire of ways of speaking that are indexically associated with social groups, roles, or activities.[10] In other words, there is a diversity on the linguistic plane that indexes a social diversity. Studies

of correlations of this sort, especially as social dialectology, have become commonplace. Less common is any attempt to explain the correlation – why a *particular* linguistic variety should mark a particular social group, except for reasons of external historical contingency, such as the demographic one of migration of ethnic groups speaking different languages. Indeed, most of these studies either state or imply that the social diversity is formed independently from its linguistic marking: for example, Labov's use of an already-existing sociological survey of the Lower East Side that provided a 10-point index of socioeconomic class, based mainly on occupation and income.

Among all these cases and their correlations, what kinds of distinctions might be useful? One possibility has been to distinguish dialects from registers – that is, to distinguish codes associated with persons and groups from codes associated with situations. This classification makes a convenient starting point, but it becomes complicated when – as is so frequently the case – a variety historically associated with one social group is adopted by another to mark a social situation. Similarly, Labov's studies of speech styles and socioeconomic class have shown how the type of linguistic variation that signals class also signals differences in style (thus, situation), in one and the same sociolinguistic process (Labov 1972).[11]

Another approach has been to characterize "types of linguistic communities," distinguished according to degrees of internal differentiation. In an early paper by this title ("Types of Linguistic Communities," 1962) Gumperz proposed that language distance among codes in a repertoire is correlated with degrees of social complexity – social differentiation internal to the community – in an evolutionary scheme ranging from bands through "larger tribal groups" to modern urban-industrial societies (1971[1962]:105). Gumperz (private communication) no longer subscribes to this scheme and its evolutionary implications. He had suggested it at a time when (as he noted, pp. 104–105) "reliable cross-cultural information on speech behavior [was] almost nonexistent." Counterexamples now abound: compare the studies of urban social dialectology in the United States and Britain, where "language distance" between social classes consists largely in phonetic detail, with cases such as the Vaupés region in the northwest Amazon, a small-scale egalitarian social system where mutually unintelligible languages are associated with descent-group-like units in a network of marriage alliances.

Although I too discard this particular evolutionary hypothesis, a valuable aspect of the 1962 paper was its attempt to draw some explanatory link between the form of the social division of labor and the nature of its linguistic indices – in contrast to correlational studies that assume the relationship is entirely arbitrary, or entirely external to the linguistic system. With this problem in view I think it is still useful to look at the topology of linguistic differentiation and social differentiation, and to pay attention to the kind of linguistic phenomena involved. For "language distance" let us substitute some other properties of codes: their *discreteness* and their *autonomy* from other codes in a communicative system. In other words, the question is how functionally independent of one another they are, regardless of their genetic relationship and structural comparability

This might allow us to compare several kinds of sociolinguistic systems: (1) systems where the socially indexing linguistic alternants form a set of discrete usages, versus systems where they are gradient (for example, multilingualism versus differences in vowel height). This contrast concerns the alternants' linguistic form.[12] (2) Systems where the socially indexing alternate varieties are limited to a narrow semantic range, or a set of topically specific items (as with some kinds of respect vocabularies), versus varieties that can apply over a wide referential range (such as dialects differing mainly in phonetics). This contrast concerns the extent to which the socially indexing variety is simultaneously involved with the referential function. (3) Systems where the relevant codes are autonomous (at least potentially), in the sense that they can be independently described or characterized, versus systems where some codes can only be defined relative to other codes (for example, by the addition of a surface-level rule, as with Pig Latin and many other play languages, and also the gender-linked codes of some American Indian languages).

Where these alternants index social groups and roles, I would suggest that their contrasts might have some connection with a cultural ideology of role relations – such as, whether the roles they mark are thought of as essentially autonomous, defined independently of one another, or as dependent and complementary; whether a role is thought to be part of a person's basic identity, thus applying to all situations and governing what other roles he/she may take on; and whether, in principle, the roles (or groups) are exclusive and sharply bounded, as opposed to allowing degrees of participation, or mobility and shifting among them (see Goodenough 1965; Nadel 1957).

A good example of the kind of cases we might look at in this light would be "antilanguages" (Halliday 1976): argots spoken by groups (or in roles) culturally defined as opposing, or inverting, prevailing norms – such as thieves, prisoners, and revolutionaries. As Halliday points out, the linguistic phenomena characterizing these codes cannot be accounted for simply by the need for secrecy or for group boundary markers, although those needs are present. Instead, the codes' origin in *counter-societies* is reflected in many aspects of their linguistic form, for instance in their elaboration of lexicon and metaphor relevant to their special activities and their attitudes toward the normative society, and in their frequent use of formal inversions and reversals, such as metathesis. Also significant is their conspicuous avoidance and violation of forms recognized as "standard" (consider, for example, Reisman's [1974] description of "contrapuntal" speaking in Antigua as a counter to conventions of orderly turn-taking associated with the social forms of white colonial society and its heirs; see also Kochman 1972). These anti-languages are clearly not autonomous codes, then, although the normative codes on which they depend may be. The anti-language is not, and has never been, anyone's native tongue, nor are all its formal characteristics simply arbitrary. Both functionally and formally it is derived from the normative code, just as its speakers define their social role in opposition to the normative society.

The language (and culture) of gender, in different societies, might be another suitable set of cases, some perhaps even showing the characteristics of "anti-languages" (in cases where sex roles are culturally conceived of as antagonistic).

The question is whether the forms of speaking associated with males and females reflect, in some way, cultural conceptions of their social identities, in relation to each other and in relation to other kinds of statuses an individual may hold.[13]

My point is that indexical correlations between realms of linguistic differentiation and social differentiation are not wholly arbitrary. They bear some relationship to a cultural system of ideas about social relationships, including ideas about the history of persons and groups. I do not mean that linguistic variation is simply a diagram of some aspect of social differentiation – as correlational studies often in effect suggest – but that there is a dialectic relationship mediated by a culture of language (and of society).

As a more detailed example, an ethnographic case from West Africa illustrates these suggestions about code discreteness and autonomy.[14] Among rural Wolof of Senegal, there is a series of ranked, endogamous occupational groups, called "castes" in the ethnographic literature on the region. As I have described (Irvine 1975, 1978b, 1982), caste differences are culturally associated with differences in speech style. A style connected with high rank (*waxu géér*,[15] "noble speech") contrasts with a style connected with low rank (*waxu gewel*, "griot speech," so named after the bardic caste which in some respects is said to epitomize low-ranking groups). Linguistically, the phenomena that most conspicuously distinguish the two speech styles are gradient in form and/or application: prosodic differences, such as pitch, loudness, and speed of talk; and the proportional use of emphatic particles and parallel and/or repetitive constructions. The prosodic phenomena in particular can only be defined relative to one another. There is no pitch frequency that absolutely marks a voice as high-ranking or low-ranking, only relatively low or high pitch. The two speech styles are *complementary*, mirror-images diverging from a neutral middle ground to the extent that a social situation defines differences in social rank as relevant.

Contrast this complementarity in Wolof speech styles, then, with the speech of another "caste" group, the Lawbé (Woodworkers). A semi-nomadic population said to have migrated into Wolof territory from a Pulaar-speaking region to the north, the Lawbé are bilingual: they speak Wolof during their temporary visits in Wolof villages (during which they are hired by villagers to cut down trees and carve wooden utensils from them), but they speak Pulaar in their encounters with Pulaar-speakers (the similarly semi-nomadic cattle-herding Peul and the sedentary Tukulor). Wolof villagers claim that the Lawbé also speak Pulaar among themselves, and that their command of that language shows they are "not Wolof."

Given the dearth of published studies of the Lawbé (and I have not closely observed them myself), it is not clear what they speak among themselves – whether what the Wolof claim about them is true or, if true, whether it holds for all Lawbé groups or only some of them. What does seem to be clear, however, is that Wolof villagers assign the Lawbé a different ethnic origin and a separate history, to match their control of a separate language, Pulaar. These same Wolof villagers also describe the Wolof system of caste occupations, its associated symbolism, and so on, as if it were complete without Woodworkers – that is, as if Woodworkers were simply a late, tacked-on addition to an already

self-sufficient social system. In contrast, they describe nobles and griots as complementary ranks such that neither could exist without the other. Without nobles, or without griots, there would be no Wolof caste system at all.

Now, it is probably true that the Lawbé, or at least some Lawbé, are descendants of migrants from a historically separate system to the north, and that their linguistic behavior, as compared with Wolof nobles and griots, is the result of historical facts. But this cannot be the whole story, because historical documents attest that there used also to be Wolof Woodworkers, called by a different name (*seeñ*), and taking their place on lists of Wolof caste occupations.[16] So I would suggest that Wolof villagers' ideas about the history of Woodworkers and their place in an overall set of caste roles have at least partly shifted to match their linguistic behavior and their residential marginality, in a broader cultural scene that ideologically links language differences with historical autonomy (and with regional boundaries rather than caste boundaries).

In this case, we see two kinds of code/role relationships: the speech styles of nobles and griots, nonautonomous styles that can only be defined relative to one another, like their speakers' social roles; and the separate language, Pulaar, whose speakers are culturally assumed to have an autonomous history matching their autonomous code.[17] There is an iconic link here between the *kind* of linguistic differentiation and the *kind* of social relationship it marks, at least in the cultural ideology.

Two other languages present on the Wolof sociolinguistic scene – Arabic and French – can also be considered in the same light. These languages are of interest because they are relevant to the connections between a rural Wolof village and the national and international systems that impinge upon it, and also because we can see these connections mediated, again, by the ideology of language just described. For Wolof villagers, Arabic is the language of Islam, the dominant religion among Wolof for many centuries. Although villagers are well aware that Arabic is also the language of the modern Arab nations, including neighboring Mauritania, for the majority of the community the religious connotations predominate and a form of classical Arabic is the only variety of that language they know.[18] Indeed, many villagers, of various castes and age groups, know some Arabic;[19] in contrast, far fewer people know (or admit that they know) French, the language of colonialism, despite the long-established presence of French-speaking schools, radio, and so on. The level of acquisition of French, especially before the 1970s, has been low compared with its availability in terms of exposure and opportunities for systematic instruction.

From the linguist's point of view, of course, Arabic and French are equally unrelated to any form of Wolof; the three are historically, and denotationally, autonomous. But some Wolof villagers have not always seen them that way. In 1970 I was told that Arabic "is really Wolof underneath, at heart. . . . Only the pronunciation is different." French, on the other hand, was said to be quite alien, even formed in a different part of the body. Thus the local ideology of language was tending to assimilate Arabic into the repertoire of "Wolof" linguistic varieties because of its functional integration into social life, while French

remained (in that view) a "foreign" language belonging properly only to non-Wolof, and not readily acquirable by true Wolof ethnics, except perhaps for persons of low rank.[20]

Since local ideology linked the nature of linguistic differentiation (between Arabic, Wolof, and French) with the nature of the social relationships and activities it indexed, ideas about language were likely to shift if there were some major change in the social situation. It is not surprising, then, that the advent of Senegalese independence, by altering some aspects of the 'political and economic connection with France, eventually affected villagers' ideas about French, now the official language of the Senegalese state.[21] While no one has told me that French "is really Wolof," by 1984 it was apparent that many people who used to consider French unlearnable and unspeakable had changed their minds.

Note, however, that the linguistic ideology whose modifications are described here is no simple reflex of the change of government or even of a shift in economic opportunities. The attitudes toward language in general (and French and Arabic in particular) found in this rural Wolof locality differ from those in some other areas of Senegal, where (for example) French sometimes penetrated earlier, even though instructional opportunities were fewer and economic opportunities no greater. What we see here is a particular rationalization of a particular local experience, a rationalization informed by a framework of other ideas about language and about the kinds of people who speak in certain ways.

It should be clear, therefore, why this discussion of indexical values of linguistic phenomena, and the topology of linkages between codes and social relationships, does not propose a direct analogy between linguistic and social differentiation that would claim to predict the one from the other. To attempt such prediction would be to ignore the role of linguistic ideology – the cultural (or subcultural) system of ideas about social and linguistic relationships, together with their loading of moral and political interests – which is a crucial mediating factor. And I should also emphasize that the cultural system (including the linguistic ideology) is a *mediating* factor, not necessarily a causative one. In some cases it may merely rationalize a set of sociolinguistic differences, rather than shape them. The usual assumption that some historical contingency of a non-linguistic sort, such as migration, has brought about a present-day sociolinguistic scene may often be true enough; but it is not all we need to consider. The cultural reformulation of that scene (its persons, groups, and codes) according to some rationalizing criterion is also relevant, perhaps sometimes inventing as much history as it reflects.[22]

Incorporation: linguistic phenomena are included in the economy as practices and as commodities One of the reasons correlational sociolinguistic studies fall short of revealing the full involvement of linguistic phenomena in political economy concerns the fact that forms of speaking are not always merely an index of some independently generated social differentiation but may indeed *effect* social differentiation. The division of linguistic labor is not just an analogy with the division of labor in society, or even a homology (as some have said; see Rossi-Landi 1983), but, in some ways, part and parcel of it. That is, while linguistic phenomena may denote the forces of production and the

relations of production, they may also be among those forces, and they may be objects of economic activity. I turn now to that "communicative economy," to borrow a term used by Hymes (1974:4, 26) to describe the organization of a society's system of communicative (not just linguistic) institutions, vehicles, and contexts. In this view, verbal skills and performances are among the resources and activities forming a socioeconomic system; and the relevant knowledge, talents, and use-rights are not evenly, randomly, or fortuitously distributed in a community (see Bourdieu 1977, 1982; Hymes 1971, 1973). The fact of uneven distribution is itself economically relevant.

Verbal skills as economic resources (and as practices constituting a social role) One way in which linguistic goods enter the marketplace is simply as a consequence of indexical correlations like those noted above. This process is discussed at length by Bourdieu (1977, 1982), who sees it as a process of "conversion" between a "linguistic marketplace" and a material one. In a class-based society, he points out, where social classes and class-linked activities correlate with linguistic variation, the linguistic varieties acquire differential value that translates into economic value. Access to high position and prestigious social circles may require, or seem to require, the ability to speak or write in a prestigious language, variety, or style, whose acquisition becomes the focus of economic activity.[23] People who fail to acquire the high variety, such as a national standard, at their mother's knee must pay for instruction later on, whether through tutoring, how-to books (more often how-not-to), newspaper columns about "proper speaking," or state subvention through the school system.

Bourdieu's discussion focuses on the European industrial nations, especially France, and on the acquisition of standard language among other indices of membership in the bourgeoisie. Much of the argument applies elsewhere too, however, even in pre- or less-industrialized settings. Any case of diglossia, or a case where there are linguistic forms that (for at least some of the population) can only be acquired through special education, will be somewhat parallel. In all these cases code acquisition – actually, second-code acquisition – is surrounded by economic activity because of the perceived value, and distributional scarcity, of the linguistic variety to be acquired.

Now, while Bourdieu's view of the "linguistic marketplace" is clearly useful to our inquiry, it is not without complications. For example, it tends to reduce language to presuppositional indexicality and to derive language's role in political economy entirely therefrom. Little room is left for any statement made in one of the available varieties to make a difference to the political and economic situation – to be anything other than a symptom of it.[24] As Woolard (1985) points out, moreover, Bourdieu's statements on the value of class-linked varieties in the linguistic market, and his emphasis on the institutional domination of a language, are oversimplified. Questions remain as to whether the linguistic market is ever fully integrated, and whether the population that does not control a dominant variety regards its domination as legitimate (1985:740–741).

These questions about integration and legitimacy are especially relevant to Third World situations and the link between local sociolinguistic systems and the languages of national and international relations.[25] Senegal's "linguistic market"

for example, is far from integrated. The political dominance of French was long acknowledged in Wolof communities without being considered legitimate, while, in contrast, members of other ethnic groups often favored French as the alternative to Wolof domination. Within the particular Wolof village described here, changes in the legitimacy of French have already been mentioned; but even though French is no longer resisted as much as before, differences in the legitimacy of French and Arabic show up in the economics of their acquisition. Economic activity surrounding acquisition of Arabic takes place at the grassroots level, where villagers pay for their children's (and sometimes their own) instruction, while economic activity directed toward the acquisition of French – dominant but far less legitimate, in the local view – takes place at the level of the state.[26]

Despite complications, however, it is evident that linguistic skills can be economic resources, and even if some skills are merely status markers their acquisition may be the focus of economic activity. Still, as regards how linguistic phenomena can be economic resources, grammatical competence in a high-valued code is not the only aspect of language to look at. We must also consider skills in the appropriate use of language and in the management of discourse – skills that fall outside "grammatical commence" as usually defined, and that do not depend on the differentiation of a set of codes. Many social roles and statuses are at least partly defined in terms of discourse management: teacher, lawyer, or psychiatrist, for example. Even where verbal skills are not crucial to the performance of some particular social role they may be crucial to gaining access to it; see studies of gatekeeping interviews by Gumperz and his associates (Gumperz 1982; see also Erickson and Shultz 1979).

Among rural Wolof, skills in discourse management are essential to the role of the griot (bard), whose traditional profession involves special rhetorical and conversational duties such as persuasive speechmaking on a patron's behalf, making entertaining conversation, transmitting messages to the public, and performing the various genres of praise-singing. Not everyone who might be born with the appropriate raw talent can become a professional bard – for that one must be born into the griot caste. But within that category, the most talented and skillful griots earn high rewards and are sought after by would-be patrons, such as village-level political leaders (or those who seek leadership positions). High-ranking political leaders do not engage in these griot-linked forms of discourse themselves; to do so would be incompatible with their "nobility" and qualifications for office. But their ability to recruit and pay a skillful, reputable griot to speak on their behalf is essential, both to hold high position and to gain access to it in the first place.

Note that political systems in other African societies (and societies elsewhere in the world too, for that matter) commonly include spokesperson roles, such as the Ashanti "linguist" who speaks on behalf of the king. In contemporary states public relations personnel, press secretaries, and professionals in the communications industry are statuses somewhat resembling these traditional spokesperson statuses and in Senegal, at least, have often drawn their personnel from among the bardic castes.[27]

This point – that some social roles are constituted by discourse management – has been made often by Hymes and others, and I shall not belabor it, even though it is important to our understanding of political processes and access to political positions. I shall just emphasize that its implications reach beyond the cognitive (questions of communicative competence), to include how we conceive of economy. Thus, one must consider the place of verbal skills and rights in a system of transactions that includes both material and nonmaterial goods, services, and values. It is perhaps not a question of looking at a "communicative" economy, therefore, or at some sort of linkage between a sociolinguistic system and an (independently conceived) economic system, but, instead, just at an economy, from which the verbal must not be excluded.

Indeed, linguistic elements and utterances may themselves be goods and services, exchangeable against other goods and services, including material goods and cash. The next sections shift to this focus.

Authentications: signs accompany commodities and give them value

In a 1975 paper, "The Meaning of Meaning," Hilary Putnam presents what he calls a "division of linguistic labor." The discussion turns in several ways on the reference of terms for natural kinds, such as *elm* and *gold*. Putnam writes:

> We could hardly use such words as "elm" and "aluminum" if no one possessed a way of recognizing elm trees and aluminum metal; but not everyone to whom the [linguistic] distinction is important has to be able to make the distinction [between the things or substances]. . . . Gold is important for many reasons: it is a precious metal, it is a monetary metal, it has symbolic value (it is important to most people that the "gold" wedding ring they wear *really* consist of gold and not just *look* gold), etc. . . . Everyone to whom gold is important for any reason has to *acquire* the word "gold;" but he does not have to acquire the *method of recognizing* if something is or is not gold. He can rely on a special subclass of speakers. [These are people who have the job of] *telling whether or not something is really gold* [1975:227–228: italics in the original].

In other words, these people are experts whose knowledge (for example, knowledge of some test for telling whether a metal is really gold), while not itself linguistic, nevertheless renders their usage of the term *gold* authoritative. The economic and symbolic value of gold for the wider community depends on this. Any gold object circulating in the community must be accompanied by some convincing testimonial to its being authentically gold, if it is to command its full value. The testimonial may be oral or written (for example, when the state stamps its insignia on a gold coin).

Most often, we are probably relying not just on a single testimonial statement, but on a *chain of authentication*, a historical sequence by which the expert's attestation – and the label (expression) that conventionally goes along with it – is relayed to other people.[28] For example, I claim that the necklace I wear is made of gold because I acquired it from a trustworthy person who said it was, and who in turn acquired it from a "reliable" dealer, who in turn acquired it

from a reliable source, and so on back to a point at which some expert actually did make the tests that enabled him or her to declare this metal to be gold. Thus my valued commodity (the necklace) is accompanied, not just by one special kind of statement (the authoritative testimonial), but by two: the authoritative and the derivatively authoritative (reportive – all the statements after the expert's, in the chain of authentication).

This kind of process applies not just to gold, but to any exchangeable item invested with social value, where only an "expert" can tell if it "really" is what it purports to be. Such items include not only material objects, but also verbal items like magic spells or other texts. Just *what* is invested with what sort of value, and which persons get into the position to speak authoritatively about the value, must vary from one society to another. What this process suggests, however, is that perhaps *any* system of prestations and counter-prestations – that is, an economy (in a broad sense) – will necessarily include authoritative statements as part of the exchange system. When I pay for the gold necklace, I am paying not only for the necklace itself but also for the chain of authoritative statements that accompanies it. And if I take it to be appraised, I am paying for the statement alone.

Utterances as commodities exchangeable for material goods The above discussion of testimonials focused on statements accompanying an object of exchange, statements necessary if the object is to have its full exchange-value. I turn now to cases where a verbal statement is the object of exchange. Although the appraisal of a piece of jewelry meets this criterion in a way, it only does so because it is part of a longer series of transactions whose object is the jewelry, not the statement. What we consider now are verbal "goods" and practices having value in their own right. Thus, a view of economy that can incorporate verbal practices and products will be useful for understanding systems where linguistic texts can become alienable property, and systems where some forms of speaking are institutionalized and receive financial reward.

What the verbal goods and services are, and where they enter an overall economy, will vary from one sociocultural system to another. Presumably, *any* aspect of a speech act might, separately or in combination with other aspects, be the source of its economic value in a particular system. In any given case we might ask: What aspects of the verbal performance bear the value? Who holds rights in them? Who benefits? Who pays – and in what coin?

For example, magic spells may be as much the property of a community (as with some Trobriand magic [Malinowski 1978 (1935)]) or lineage (as with some Wolof spells) as gardening land is. According to Malinowski (1978 [1935]:64), however, although the community "owns" the major form of gardening magic and has the right to benefit from its application, only one person, the *towosi*, has the right and the ability to perform community gardening spells, though he may delegate the office to a junior relative. All members of the community who expect to benefit from the performance must contribute payments for it – just as they pay for other kinds of specialist services, material or otherwise.[29]

In its capacity as community property, Trobriand gardening magic is apparently inalienable: but verbal properties may be alienable too. Silverstein

(n.d.a) describes proper names in North-west Coast societies as "investment property" and "heirloom antiques," alienable during the lifetime of a bearer. People used to try to accumulate as many names as possible and to control their bestowal (on themselves or on others). Sometimes the bearer of a name would vacate it, bestowing it on some junior relative. Acquiring a new name involved a ceremony in which an audience assembled and called the new bearer by it – receiving, in exchange, large quantities of material valuables. As Silverstein writes: "The wealth thus constitutes a back-prestation in response to the audience's having come and called the new bearer by that name, this act effectively validating the claim to it as being at a certain ranked ordinality with respect to their names" (n.d.a).

Consider, too, the case of "the sick who do not speak" (Sansom 1982). Among Aboriginal Australians of Darwin fringe camps, a person who has undergone a major episode of illness may not verbally recount the story of the illness.[30] The right to tell the "sickness story" is given over, instead, to the persons who "helped him through" – in partial recompense for the debt arising from their care. The story, Sansom argues, is a bit of property exchanged against caregiving, in a community that places little store in material investments.

Although Darwin camp members treat the telling of "sickness stories" as a privilege, in other societies some kinds of talk may be treated as a burden one pays someone else to undertake. The high-ranking Wolof noble pays a griot to make a public announcement for him, because loud public speaking is something he would be "ashamed" and "unskillful" at doing.[31] On many public occasions the noble whispers briefly in the griot's ear, and it is then the griot who volubly and elaborately performs the speech for the audience. In this case, then, the act of public utterance is a service for which the griot is paid in cash.

These examples could be multiplied. It seems preferable, however, to explore one case in greater depth. Accordingly, the following section offers a more extended example of this kind of relation between language and economy. It concerns a particular type of verbal goods – statements of praise and compliment – and the verbal services of the flatterer, among village Wolof as compared with contemporary middle-class Americans. But while one of my purposes is to examine some verbal objects of exchange, the material I present also reflects other linkages between language and political economy, especially the indexical relation discussed earlier. Thus the example illustrates the fact that language is always multifunctional – and its relation to economy is, therefore, manifold.

II. The Multifunctionality of Linguistic Signs: A Wolof Example

Recently there appeared a cartoon in the *New Yorker* magazine, entitled "Flattery getting someone somewhere" (M. Stevens, 28 July 1986). "You're looking great, Frank!" says a man in business suit and necktie to another, perhaps older, man with glasses and bow tie. "Thanks, Chuck! Here's five dollars!" Bow Tie replies, handing over the cash. The joke depends, of course, on the notion that the exchange of compliments for cash should not be done so directly and overtly

We all know that Chuck may indeed flatter Frank with a view to getting a raise, or some other eventual reward; but it is quite improper in American society to recognize the exchange formally, with an immediate payment. A compliment should be acknowledged only with a return compliment, or a minimization, or some other verbal "goods." If it is to be taken as "sincere," it is specifically excluded from the realm of material payments.

Some cultural systems do not segregate the economy of compliments from the economy of material transactions and profits, however. It is doubtful, for example, that the cartoon would seem funny to many Senegalese.[32] With a few suitable adjustments for local scene, the transfer it depicts is quite ordinary. There is, in fact, a category of persons – the griots – specializing in flattery of certain kinds, among other verbal arts. The income they gain from these activities is immediate and considerable, often amounting to full-time employment for those whose skills include the fancier genres of eulogy.

Let us return to a consideration of the social system in which these transfer, and institutionalized acts of eulogy, occur. As I mentioned earlier, the Wolof (and, indeed, most other Senegalese peoples from the Gambia River north) traditionally had a complex system of social stratification usually called a "caste" system. Though undermined by government policies and other factors the caste system retains considerable importance on the rural scene, and even on the urban scene too, according to some observers (see, for example, Silla 1966). Thus Wolof society is a hierarchical one in which hierarchy is an explicitly acknowledged value. It is also personalistic, a patronage system where person and position are closely identified. Compliments to the person are directly relevant, therefore, to the construction of high position, political and otherwise.

The lower ranks of rural Wolof society engage in various kinds of activities – agricultural labor, smithing, weaving, and so on – whose product, delivered to their patron, enhances his or her position and role as redistributor.[33] The higher ranks, as patrons, compete among themselves for political position and influence. Access to such positions is supposed to be based on genealogical rank and moral qualifications as well as on one's ability to attract and maintain a large clientship; but ideologically these criteria are almost indistinguishable from one another, for one's moral character, personality, reputation, and ancestry are all considered to be linked.

Verbal activities fit into this local system of production in several ways, most notably as one of the kinds of productive activities low-ranking persons provide for the higher-ranking. Thus verbal praise enhances the reputation and attractiveness of a would-be patron. It is comparable to physical enhancement, such as hairdressing, and requires a similar reward. (Actually, eulogizing and hairdressing are often done by the same people, or at least by members of the same social category, the griots.) Moreover, the griots' performances supposedly – that is, in the ideology of the system – contribute more directly to the system of production and distribution as well, because their liveliness and excitement arouse the addressees to carry out their own allotted role more energetically and enthusiastically. That is, praise directed to a patron stimulates him/her to (re-)distribute largesse more generously, while other kinds of performances, such

as the drumming and singing directed to a work party laboring on a patron's behalf, rouse laborers to work more vigorously. Physical aspects of the performance are relevant to how this works, or so informants suggest: the forceful gush of humanly shaped, vibrating air (breath) stimulates the energy of the recipient, just as the air blown from a bellows arouses a fire.

The propositional contents of compliments and praise are of course dependent on a cultural system and the kinds of attributes locally invested with social value. Among rural Wolof, personal beauty is in some respects subordinated to "beauty of birth" (*rafet-juddu*), the subject matter of much of Wolof praise, especially of its most institutionalized form, praise-singing (as the Wolof term *woy* is often translated; praise-oratory might be a better term). I shall examine this oratorical form in more detail in what follows. But note that in doing so I am not departing so far from Chuck and Frank's conversational compliment as it might appear. Wolof conversational compliments are often formulaic praise-utterances derived from, or alluding to, the extended forms of praise-oratory. Thanks for a gift, for example, always includes praise and very frequently draws upon these formulaic expressions, or other allusions to praise-oratory. A difference between full-fledged praise-oratory and its conversational vestiges is that the former are performed only by griots, while the latter may be produced by anyone. But the griots' praise-singing is, for Wolof, a cultural model or prototype for praise-utterance in general.

Indeed, except for compliments between lovers, only this type of compliment is proper.[34] Otherwise, anything departing too far from the model is suspect, suggesting an indecent envy or exposing the addressee to the attentions of witches. "Departing too far" means a compliment focusing only on physical appearance or possessions, *and* uttered by someone of same or higher rank than the addressee. (Neither condition alone would be problematic. Lower-ranking people, like a griot speaking to a noble, may freely comment on appearance and possessions; while a high-ranking person may comment on ancestors and generous deeds.)

Returning, then, to the contents of praise: the content of a griot's praise-song normally focuses on the praiseworthy ancestry of the addressee – the ancestry that qualifies him or her for high rank and has contributed to the character and the physical being he or she is. Although the performance includes comments explicitly eulogizing particular ancestors (their generosity, strength, rectitude, beauty, great deeds) and the addressee, much of it consists in naming the ancestors and connecting them to kings or village founders or other heroic figures. Merely setting forth the names would be eulogy in itself, a display of the addressee's verbal family heirlooms, as it were. That the most elaborate displays of genealogical eulogy are performed at life-crisis events and family celebrations is only appropriate, therefore, as are outbursts of eulogistic performance at local-level political gatherings. Praise is not limited to those occasions, however, and in fact the shorter forms of eulogy and compliment need no special scheduling to occur.

Since I have described some aspects of praise-singing elsewhere (Irvine 1978a), I shall focus here on just a few relevant matters: some characteristics

icon, index, and symbol is useful, because it allows us to see praise-singing as a complex semiotic gesture uniting all three types. As icon, praise-singing formally illustrates the roles of laborer and redistributor: the singer is both verbally and physically active, declaiming the praise long and loud, and with energetic, dramatic gestures. Meanwhile the recipient (the high-ranking patron) is silent and motionless, perhaps even hidden from view behind a curtain (depending on the occasion). His/her sole appropriate movement is to hand over the cash that pays for the performance.

These iconic, formal considerations shape several aspects of the linguistic register in which praise-oratory is performed – "griot speech" (*waxu gewel*), as opposed to "noble speech" (*waxu géér*). As I described earlier (and see Irvine 1975), "griot speech" is loud, high-pitched, rapid, verbose, florid, and emphatic, with assorted phonological, morphological, and syntactic devices linked to those characteristics. It is the appropriate style for all expressions of praise and/or thanks, by anyone (griot or not), and for other verbal expressions of rank lower than one's addressee;[35] but, as its name implies, it is conventionally associated with griots, as the professional eulogizers who carry the style to an extreme. Thus the speech style of praise is an index of the speaker's (relatively low) rank and social identity. In a larger sense it also indexes the traditional system of ranks and sources of authority, as compared with other sources such as the French-speaking colonial regime and the national state.

Another indexical function, too, links the praise-song's eulogistic and genealogical content to its addressee, at whom the griot dramatically points. That is, the praise-song indexes the praisee (addressee) because it is pointedly directed at him/her. This addressee is also the praise-song's principal referent, however. The praisee is named, and this name, together with the genealogical statements expanding upon and providing background to it, are part of the performance's symbolic dimension. Here it is important that the griot display the patron's genealogy coherently and convincingly, mentioning only persons of good reputation, and linking the patron to famous heroes and to the ancestors of other notables, perhaps even higher-ranking. Should the griot fail to do this – that is, should he state the relationships incoherently, or reveal skeletons (family relationships) the patron would prefer to keep in the closet, or spend so much time on other lineages that he fails to display the patron's own genealogy adequately – the performance will no longer qualify as truly complimentary. Of course, griots may fail in these ways conspicuously and on purpose, if they are unsatisfied with the payment they have been offered.

This mention of payment brings me to the economic value of praise-singing, an aspect of it for which Peirce's trichotomy is no longer particularly illuminating. It is not illuminating because Peirce focuses on the relations between the sign and what it stands for – not on what it may be exchanged for.[36] But the praise-song costs, and this aspect of it is crucial. It is one of the unavoidable, large expenses a Wolof notable must incur on his way to attaining political position and maintaining any claim to rank; and, moreover, it is a sign of his ability to pay.

all may see and admire the person being praised as a potential patron for their own services. In an important sense, then, the exchange-value of the sign is an understood part of it.

Let us consider what that value rests upon. Wolof praise-songs are a form of property, in that exclusive rights are asserted over them. The rights are of two kinds: rights over the genealogical and historical *content* of the praise-song (it is the patron's genealogy, and in principle at least the griot must obtain permission before performing it for any other addressee); and rights over the *performance* of it. (Rights to perform the long, formal versions of praise-singing accrue only to griots of particular families, although griots may transfer these rights to other griots. In no circumstances may the patron perform "his" [or "her"] own song.)

The value of the performance depends in part on the gloriousness of the content – how praiseworthy the family history really has been, and how important the family has been in political and religious hierarchies – but it depends much more on the skill and reputation of the performing griot. Though even the clumsiest griot receives something for praising a patron, knowledgeable and skillful griots are much in demand and their performances highly paid. This is especially the case when, for example, two nobles from the same lineage are competing for a lineage title and, in the process, for the services of the most famous griots who know their lineage history. And those famous performers, in turn, are careful to keep the supply of trained performers down, in order to keep the price up (as one young griot complained to me).

Thus the complexities of the overall market in which praise-song performances are situated affect their exchange-value (in cash or goods), and are the reason one may indeed, I think, speak of exchange-value here rather than just use-value. Linguistic phenomena are not all limitlessly and publicly available, like fruits on the trees of some linguistic Eden. Some of them are products of a social and sociolinguistic division of labor, and as such they may be exchanged against other products in the economy.

Under what circumstances do utterances or linguistic forms become products exchangeable against other kinds of goods? Perhaps, as material in this paper suggests, when the sign (or some aspect of it) is a scarce good, invested with value – either because knowledge of the relevant linguistic form is unequally distributed, or because performance of it cannot be universally undertaken. That is, performance might be an exclusive right, or it might require time and effort or other costs to the producer – including, for example, as in the Wolof case, an implication of lower rank (a cost explicitly recognized as requiring remuneration and carrying the right to receive largesse).

In these pages I have only scratched the surface of a comparative economy of compliments and praise, and how they do or do not link up with other forms of transaction in a given society. Moreover, these are certainly not the only kinds of utterances worth looking at as objects of exchange. My purpose, however, was to suggest that the project is worth undertaking – that utterances, and indeed various aspects of linguistic form and its production, *can* be viewed as prestations, and thus as part of a political economy, not just a vehicle for thinking about one.

Conclusion

I began by mentioning Saussure and suggesting – as, indeed, it has become fashionable to do – that I would take some post-Saussurean, post-structuralist position, in regard to his segregation of the sign from the material world. Actually part of this position is not so very novel. Anthropology has a long tradition of looking at the material objects exchanged in a cultural system partly in terms of their sign value. A good example would be Evans-Pritchard's discussion of cattle among the Nuer (Evans-Pritchard 1940, 1956). In some circumstances the sign-value of the Nuer ox can be so predominant, and its material substance so irrelevant, that you can substitute a cucumber for it. What I argue for here is, in a way, a parallel treatment of the verbal sign. Ultimately, the goal – which I do not pretend to have reached, though I hope to have moved in its direction – must be a more comprehensive conception of "value," so that the various kinds of sign-values and material values can be seen in their complex integration.

Thus, linguistic forms have relevance for the social scientist not only as part of a world of ideas, but also as part of a world of objects, economic transactions, and political interests. The verbal sign, I have argued, relates to a political economy in many ways: by denoting it; by indexing parts of it; by depicting it (in Peircean terms, the iconic function, illustrated here for Wolof praise-singing); and by taking part in it as an object of exchange. These multiple functions may all co-occur, because they merely reflect the multifunctionality of language in general.

Saussure's segregation of sign-value from the world of material values is linked to his focus on only one of language's functions – its role as vehicle for referential communication. To acknowledge that language has many functions, and therefore that signs relate to the material world in many ways, including as objects of exchange, is important to understanding language's role in a political economy. An opposition between "idealists" and "materialists" that assigns the study of language only to the former is – as social theorists increasingly recognize, on other grounds – a false dichotomy.

Acknowledgments

Earlier versions of portions of this paper were presented at the annual meetings of the American Anthropological Association in 1984 and 1986, as no. 7 in the *Working Papers of the Center for Psychosocial Studies* (Chicago, IL), at the University of Massachusetts/Boston, and at Brandeis University. For helpful comments I am grateful to the audiences at these meetings; to the anonymous reviewers for *American Ethnologist*; and to Annette Weiner, Michael Silverstein, Bill Hanks, and Paul Friedrich. Financial support for fieldwork in Senegal was provided by the National Institutes of Health, the National Science Foundation, and Brandeis University; I am also grateful for institutional support from the Institut Fondamental d'Afrique Noire and the Centre de Linguistique Appliqué de Dakar, and for the help and cooperation of Senegalese officials, consultants, and hosts.

Notes

1. See discussions in, for example, Coward and Ellis 1977 and Derrida 1972.
2. Unlike political scientists, apparently, many anthropologists make a close connection between the term "political economy" and debates over a Wallerstein-derived world-system approach, on which this paper takes no particular stand. One of the issues in the debate, however, is the degree of importance to be assigned to local social relations and their "culture" (I put the word in quotation marks since some writers contest its applicability). To the extent that anthropological views of culture have been bound up with language, then, this paper contributes to the debate by considering the way we think about relations between linguistic phenomena and the forces of production.
3. See Hymes 1961 and 1973.
4. Those that reduce language to presuppositional indexicality are equally problematic. This criticism, differently worded, has been leveled at the writings of Bourdieu (see Thompson 1984).
5. Underlying this conception of language's role in social cooperation was Bloomfield's enthusiasm for behaviorist psychology. See his 1931 obituary of the psychologist A. P. Weiss, which draws a more explicit connection between language, its speakers' nervous systems, and cooperation among members of a speech community (1970: 237–238).
6. But see his discussion, in the last chapter of *Language*, of the roles of traditional grammarians, school-teachers, and administrators as supported by the conventions of linguistic standardization.
7. For a useful historical summary, see Weinreich, Labov, and Herzog 1968.
8. As regards the form of directives, this difference in settings is sometimes confused with matters of politeness or rank, I believe. For studies of directives in social and cultural context, see, for example, Ervin-Tripp 1976 and Irvine 1980.
9. See, for example, Barth 1972 on the political integration of Pathan-speaking social segments into a Baluchi system. Despite the language difference, Barth argues, Pathan segments are easily attached to the Baluchi political hierarchy because a single bilingual spokesman suffices for the communicative needs of the political relationship and its economic arrangements. There is no need for the ordinary Pathan-speaker to convey personal opinions or discuss individual contributions, as (Barth suggests) might be required in a more egalitarian political system, such as is found among other Pathans.
10. "Index" is used here in the Peircean sense of that sign-function in which the sign represents its object by contiguity (as smoke is a sign of fire), rather than by resemblance (as with a picture of a fire) or by rules and conventions (as with the word "fire").
11. Although Labov's conception of "style" differs from that of other scholars, the general point – that variation marking groups and variation marking situations appear to be closely linked wherever we have the information to investigate the relationship – still holds, I believe. See Irvine 1985.
12. A similar contrast, however, might concern categorical versus variable application of a rule.
13. For a recent discussion of the language and culture of gender see Silverstein 1985. For an extended ethnographic example see Abu-Lughod 1986.
14. Fieldwork was carried out in Senegal in 1970–71, 1975, and (briefly) in 1977 and 1984.
15. The transcription of Wolof expressions is based on the phonemic system developed by the Centre de Linguistique Appliqué de Dakar and officially adopted by the

Republic of Senegal in 1971. The system is phonetically fairly transparent: /waxu géér/ [waxu geer]; /gewel/ = [gɛwɛl]; and so on.

16. The relation between *seeñ* and *lawbé* is complex. Yoro Dyao (Rousseau 1929, from a turn-of-the-century manuscript) briefly describes both groups; see also Kobès 1875. Abdoulaye Diop (1981) considers them to have been subcastes, but argues that the *seeñ* were eventually absorbed into a different low-caste category, not into the *lawbé*.
17. That is to say, Pulaar is a language distinct from any form of Wolof, whose existence and form owe nothing to Wolof as far as we know (though the two languages are genetically related), and which has both formal and functional completeness within the main communities of its speakers, the Tukulor and Fula. For Lawbé, it is historically and denotationally autonomous, but has an indexical value within the Wolof system.
18. Note that the village from which my description is mainly drawn is far from the Mauritanian border. In Wolof villages further north, or among Wolof-speakers in Mauritania itself, native speakers of Arabic would be much more conspicuous, and the relationship with them would, no doubt, alter the ways their language is thought of by the local Wolof population.
19. Villagers' competence in Arabic is almost entirely passive. They may recite formulaic prayers, and those who know Arabic best read texts and listen to religious speeches on the radio; but they compose nothing.
20. The views of Wolof city-dwellers might well have been quite different from this even at the time. Wolof villagers acknowledged that French was more widely used in town, but they also claimed that city-dwellers were likely to be people of dubious ethnic, caste and moral background.
21. Senegal gained its independence from France in 1960. Ties with France remained close, however, and a sizable French population stayed on – including, locally a community of French ethnical Personnel. For some time after independence, therefore, many villagers apparently still thought of French in colonial frameworks – whence the statements I heard in 1970. In subsequent years the French Population in Senegal dropped sharply, especially in rural areas outside the tourist zone.
22. See also Silverstein's (n.d.b) discussion of comments on British regional dialects by the Queen's English Society.
23. Silverstein (n.d.b) calls this "commoditization."
24. Again, see Thompson's (1984) critique.
25. For a Mexican example involving the autonomy of Mexicano-speaking peasant communities, see Hill 1985.
26. The acquisition of varieties of Wolof itself should not be left out of the economic picture, although this part of the linguistic "market" operates in a different way (further evidence, presumably, of the lack of integration of the Senegalese "linguistic market").
27. See Silla 1966.
28. See Putnam (1975:246) on the transmission of reference, and Kripke 1972 on the transmission of proper names, from performative nomination or "baptism" through subsequent, warranted referential usage.
29. See also Weiner 1984.
30. The former patient does, however, bear a nonverbal sign of the illness, such as a tic, a scar, or a recurrent cough (Sansom 1982:183).
31. See Irvine 1975, and Part II below. These attitudes are part of a larger sociolinguistic ideology connecting griots (and the lower ranks in general) with noisy activity and the high ranks with quiet, sometimes inert, solidity.

32. Except insofar as it might seem funny to see Americans or Europeans behaving like griots and their patrons.
33. Though I refer principally to "traditional" activities, and have not space to consider the complexities introduced by contract labor and "modern" trades, patronage and values generated through personalistic networks are important there also.
34. Actually, another proper type of compliment focuses on the addressee's religious goodness and piety. In practice, however, these compliments seem usually to merge with the praise-singing type, "goodness" being evidenced by birth and generosity.
35. This is something of an oversimplification. In some circumstances a speaker draws on only some features of the register, not others.
36. Some scholars consider that what the sign may be exchanged for, and what it stands for, are the same: hence Saussure's analogy between money and language, and the connection drawn between *valeur* and *signification*. I believe the equation is problematic, however, particularly as regards the analogy with money. Because money is a system that is maximally structured by exchange-value and minimally by use-value, it makes a tempting analogy for language if one conceives of linguistic signs as those that are maximally structured by denotational sign-value in a system and minimally by any other kind of function. But these forms of "value" may still be distinguished. Moreover, the analogy between money and language may make it difficult to conceive of any other relation between them.

Political Discourse: The Language of Right and Left in Germany

Siegfried Jäger

1 Introduction

In this chapter I shall analyse the political discourse of the right and of the left in Germany. Elements of these forms of political language may also be found in 'independent' newspapers and in the rhetorics of members or sympathizers of several political parties of the centre. However, I shall deal in particular with contemporary texts and talk of the right and, with some reservations, of the left. I say 'with reservations' because there is no (strong) movement of the left in Germany today. Public discourse in contemporary Germany is predominantly coloured by conservative and right-wing ideologies and ideas, especially as regards everyday thinking and debate. Leftist ideas and ideologies survive only in the niches of little groups and circles, and relics of them can be found in a small number of journals and pamphlets.

Thus it is a reflection of the political landscape of contemporary Germany if the analysis of right-wing political discourse dominates the following discussion. However, there is also some justification for this in the fact that right-wing thinking and debate in the new larger Germany can be seen as a danger for the democratic development of society in this country, and I think that it is also necessary for linguists such as myself to see their own political responsibility, especially in a country in which large sections of the population and many politicians today tend to deny its past political history and to suppress its responsibility for the Holocaust and the 'Third Reich' and other crimes. Furthermore, after the 'fall of the Wall', feelings of nationalism and chauvinism are growing again, and new right-wing political groups are emerging, while the whole political map is drifting towards

Source: Patrick Stevenson (ed.), *The German Language and the Real World: Sociolinguistic, Cultural, and Pragmatic Perspectives on Contemporary German* [illegible]

the right. It is important to realize, for example, that political slogans of a right-wing party like the 'Republicans' (such as 'the boat is full', meaning that no more refugees should be accepted) and concepts like placing refugees seeking asylum in so-called *Sammellager* (that is, concentration camps (!)) have been adopted by most conservatives and even by growing numbers of representatives of the Social Democratic Party (SPD).

But first of all I would like to address the question of what we mean when we talk of political discourse. Political statements occur in all sorts of contexts. You find them in everyday conversation at home, in restaurants, or at work, as well as reading or hearing more or less elaborate fragments of political discourse in the printed press or other media, in school-books and lectures, at universities, in parliaments, and on many other political platforms. But what is the political element of political discourse? What turns discourse into political discourse?

In this chapter I shall call a text or discourse a political one, first and rather trivially, if it deals with matters of public interest such as general public affairs, for example housing or health services, activities of politicians, political parties or trade unions, foreign or home affairs, political aims and concepts, philosophies, ideologies, etc. Secondly, I shall call a discourse political if it deals with political issues but is not classifiable as an instance of the specialized discourse of political science.

Indeed, political discourse is not characterized by any special structural, rhetorical, or stylistic features such as special metaphors, special sentence structures, special text types, etc. It draws on the full repertoire of a given language, although it may do so in special ways, depending on the context, aims, and topics of the specific text. In other words, the political nature of discourse does not so much depend on the competence of individual speakers, it is more a question of their use of language, of their particular aims and intentions, and so on.

So political discourse, as understood in this chapter, is not just the discourse of professional politicians or of political science, even though elements of these special discourses always do penetrate into political discourse, as is the case with any special discourse: political discourse can be described as that part of general or everyday 'inter-discourse' that deals with political topics and themes.

Before proceeding any further, therefore, we should now define exactly what we mean when we use the term 'discourse', and how a linguistic analysis of discourse should be conducted. The approach I shall follow here draws on the ideas of the French social philosopher Michel Foucault, which have been adopted and to some extent modified by German scholars like Utz Maas, Jürgen Link, and myself (see Maas 1984, Link 1982, and Jäger 1991, which combine theoretical (sociolinguistic) and practical political interests). In the framework of this new approach, discourse is not simply equivalent to the notion of 'text'. Discourse analysis does deal with texts (in the old sense) but if we look at how texts are produced in everyday life by everyday people, we see that the older concepts of text linguistics are no longer adequate.

In accordance with the traditional definitions of 'text', I consider 'texts' to mean all forms of written or spoken language. But if you look at the process of

producing texts, you find that they are products of human labour just like other products (for instance knives, roads, cars, etc.). In producing texts, individuals use a set of 'tools', which admittedly are different from the tools they use when building a house or manufacturing a car. But in both cases people think, remember, anticipate, and so on; in addition, they are learning when they are producing 'things', be they texts or other products of labour. In producing texts individuals use words and sentence structures as opposed to a hammer or an axe. Producing texts or other 'things' means using knowledge and facilities acquired in learning processes from other people, which they in turn have learned and/or picked up from others, from their parents and friends, in their peer groups, from their teachers or their neighbours. So the production of texts (and other things) is an intrinsically social and historical fact. Since texts are determined socially and historically, they both 'contain' socio-historical material and have an effect on the social processes in a given society.

But there is another possible aspect of the notion of text we must consider. In many texts there is a utopian component, too. Through 'texts' or in 'texts' you may anticipate possible (or even impossible) future events. Here again, however, there is no difference between texts and other products. If you build a house, you are doing so in order to live in the house or for other people to live in it now or in the future. On the other hand you may produce things that will never be used, or that will turn out to be 'utopian', like Leonardo's aeroplane, which was planned and built and then forgotten for hundreds of years until new 'utopian' products came to be designed, manufactured, and used or, like atom bombs (I would hope), once used, damned and forgotten again.

The concept of text adopted here can be summarized in the following way: it is a product of human labour in a given society and is therefore determined by the efforts of our ancestors and past processes of learning and planning, which are handed down from generation to generation and which to some extent anticipate possible future events. This differs from the traditional concepts of text linguistics, where the text is considered as an isolated object, and the linguist's aim is to look for internal regularities and structures within texts (see e.g. Brinker 1985). I would argue that we ought to take a text as a socio-historical product, which is intrinsically both individual and social. The individual aspect, if you see things this way, is reduced to the individual being interwoven or caught up in the process of 'discourse'. One piece of text is therefore an element or a fragment of all those events which occur in a society and which can occur only because they continue the process or flow of society in history. This is why I propose that we no longer use the term 'text', and why I prefer to speak of 'discourse' as the 'flow' of text and talk (and other products of labour). This means combining Michel Foucault's understanding of discourse with A. N. Leontiev's theory of activity (*Tätigkeitstheorie*; see Foucault 1977*a* and 1977*b*, Leontiev 1982). Looked at in this way, a single piece of text is nothing but an element of discourse, a fragment of social discourse. In other words, if you analyse a piece of text, you have to locate it in its social and in its (past and future) historical contexts. In doing this, you go beyond merely analysing texts and you leave the realm of text linguistics in favour of a new concept of discourse analysis.[1]

2 Language and Ideology of the Far Right in Germany

2.1 The Social, Historical, and Ideological Context of Extreme Right-Wing Propaganda

In accordance with my concept of discourse analysis, I shall first of all sketch in the political landscape of contemporary Germany and its development in recent years.

In 1981–2 the coalition of Social Democrats (SPD) and Liberals (FDP) had come to an end, and the Conservatives (CDU/CSU), in coalition with the Liberals, took over government. At the same time this so-called *Wende* (political change) initiated a political development that made room for extreme right-wing movements, and that culminated in their electoral successes between 1987 and 1989 on various levels, from the European Parliament down to local elections. Although the change from Helmut Schmidt to Helmut Kohl as Chancellor was accompanied by some social problems, one cannot say that these problems were the basis for the renaissance of the far right. The ground for this political change had been prepared by a strong ideological campaign, which was intended to demolish the welfare state and weaken the 'social security net'. At least some sections of the Social Democrats and their Liberal partners supported this development, and in doing so they were assisting the political change.

One cannot describe this in terms of political *hara-kiri*, or simply of treachery. To understand this process we have to look at global economic developments and the growing competition between several parts of the world and national or continental situations of capital, especially that of the USA, Japan, and in Europe the countries of the European Union. Along with this development there emerged radical technological change, which in turn was accompanied by changes to the social and psychological condition of large sections of the population (for a detailed analysis of this interrelation see Hirsch 1990.) At the same time certain concepts of social darwinist and biologistic ideologies were disseminated, in order to legitimize the decline of social security, at least for certain parts of the population, and the growing support of industry by the State.

It was the right-wing parties, and populists like Franz Schönhuber, leader of the 'Republicans', and Dr Gerhard Frey, head of the Deutsche Volksunion (DVU; German People's Union) as well as other small right-wing groups, who profited from this development. Their ideological concepts became socially acceptable again and were supported, since conservatives (of all parties) had prepared the ideological ground for them. Indeed, many voters preferred to elect the original instead of the copy, as the leaders of the renewed right-wing movement proudly proclaimed after their first electoral successes.

This development came to a head in 1989, and it was interrupted very suddenly when the second German state (GDR) ceased to exist (and the Soviet Union began to decline). Chancellor Helmut Kohl was allowed to present himself as a great historical victor, and as the architect of Germany's (re)unification. The events of October 1989 seemed to prove that most of the national aims of the far right had become reality, especially the aim of reunification. Large sections

of the German public fell into a state of national intoxication. As a result, the room for manœuvre that right-wing parties had gained dramatically disappeared. Today, however, several years after these events, it is becoming evident that the new 'golden age' has brought serious social problems and a loss of social security for many people on both sides of the former Wall. Indeed, the elections in some federal states and at local level show that extreme right-wing parties are becoming popular again.[2]

But it was not the larger right-wing parties alone which profited from this development. It was (and is again) the circles of the New Right who were strengthened by it. They propagate their concept of a right-wing 'cultural revolution', as had been envisaged in recent decades by French intellectuals like Alain de Benoist, the leading figure of the New Right in Europe. In Germany's popular right-wing parties the influence of New Right ideas is also becoming apparent although not yet to the extent that official co-operation exists, such as can be seen between Le Pen of the Front National and leading figures of the intellectual right in France like Bruno Megret. In Germany the influence of the New Right can be seen in the form of ideological modifications, new themes like ecology, intellectual support in the formulating of party programmes, legal help in avoiding unconstitutional passages in manifestos, and so on.

The influence of New Right ideas that can be seen quite clearly in most of the right-wing groups and parties in the states of the 'old' Federal Republic has not yet reached the so-called *neue Länder* of the former GDR. Right-wing groups and leaders of far right parties in the East mostly refer to ideological tenets of the National Socialists of the Third Reich. That is why they seem to be much more militant than their counterparts in the West. One manifestation of this is the sudden and rapid spread in the East of racist skinhead groups, who are still very marginal in the West, even though attacks on the homes of refugees and other criminal acts of aggression towards foreigners are widespread in both parts of the country. The number and form of these assaults is comparable in western and eastern German states. I shall come back to these events later on, because they can only be explained if we understand the ideological motives and discourse conditions that are the basis for these attacks.

2.2 The Discourse of the Right in Germany

Having outlined some of the general conditions and contents of right-wing discourse in Germany as elements of this discourse as a whole, I shall now examine the general discourse of the right-wing press, its weight and importance, and some of its linguistic characteristics.

The influence and the importance of the discourse of the far right and right-wing propaganda in Germany, its contents and its goals, the weight and importance of its ideology, its rhetoric, and its effects can best be judged by looking at its newspapers and pamphlets, which reach at least 5 million readers. In addition we should consider the public performances of members of the far right on television, in more widely read publications such as daily newspapers and, not least, the penetration of (large parts of) this special political discourse into the steady flow of the 'inter-discourse' (see Section 1 above).

First of all I shall describe the scope of the right-wing press and some of its major exponents, identifying the key ideological concepts of the far right in the process.[3] Then I shall analyse specific text material like headlines and passages from a typical article from the monthly *Nation Europa*.

Publications of the Right

In the western part of the Federal Republic (the so-called *alte Länder*) there are about 130 right-wing papers. Some of them are weekly newspapers, the rest are journals, magazines, reviews, and other periodicals, some of them quarterlies, but most appearing on a monthly basis. Most of these journals are published by political parties, as is the case with *Der Republikaner*, edited by Franz Schönhuber, or the *Deutsche Nationalzeitung*, central organ of the Deutsche Volksunion. Others are published by relatively small groups, or even by individual political mavericks and right-wing or fundamentalist Christian sects. Between them, these journals cover the broad spectrum of right-wing ideologies.

Some of the bigger and more influential journals include the following:

Nation Europa appears monthly with a circulation of about 10,000 copies and may be considered the central organ of all party functionaries of the far right. The main focus is on 'race' and racism.[4] For the makers of *Nation Europa* there are such things as human 'races', and racism itself is inborn and a simple matter of fact: you cannot fight it; at best you can only mitigate its effects. The core of their ideology is ethnopluralism and apartheid; all other ideological tenets of this militant racist organ, like nationalism and national identity or its bio-ecological concept of society, are derived from its fundamental racist formula. The paper's main slogans are 'Ausländer raus!' (Foreigners out!), 'Deutschland den Deutschen!' (Germany for the Germans!), 'Das Boot ist voll!' (The boat is full!), and so on.

Another monthly publication, reminiscent to some extent of *Reader's Digest*, is *Mut*, which has been appearing for more than twenty years. It has a circulation of about 40,000 copies. Its target audience are members of right-wing conservative middle-class families, who seek confirmation of their 'values' and who want to forget the crimes of the Third Reich. This paper is very clearly an extreme right-wing one, although it tries to package its extreme ideology in a 'refined' writing style and high-quality appearance. It also tries to acquire a 'serious' reputation by commissioning contributions from recognized conservative writers. This enables articles by extreme right-wing writers to gain a spurious respectability by being placed alongside the work of eminent but more 'moderate' writers. The main authors of this periodical are Gerd Klaus Kaltenbrunner and Bernhard C. Wintzek, a former member of the National Democratic Party (NPD).

One other interesting journal that is worth mentioning here is *Criticon*, which was founded by Caspar Schrenck-Notzing in 1970 and acts as a kind of bridge between the conservative right and the far right.

All these publications, and most of their authors, co-operate very closely. However, there is some competition between them, so that the interests of readers from different social and political backgrounds are catered for.

In the 'new' German states there are no high-circulation right-wing journals. The existing extreme right-wing groups produce small pamphlets with fewer

than a thousand copies each. However, magazines from the West are beginning to penetrate into the eastern parts of Germany.

Racism in Extreme Right-Wing Texts

Headlines such as the following appear regularly in all right-wing papers:

Ausländer kosten Milliarden (*Code*, Jan. 1992)
(Foreigners cost billions)
Multikulturalismus ist Völkermord (*Nation Europa*, Dec. 1991)
(Multiculturalism is genocide)

Asylanten-Invasion: Wer betreibt den Völkermord am deutschen Volk? (*Remer Depesche*, Nov. 1991)
(Invasion of asylum seekers. Who is perpetrating the genocide of the German nation?)

Bonn schläft. 1991 erstmals über 240,000 Ausländer – aber nichts geschieht (*Deutsche Rundschau*, Jan. 1992)
(Bonn is asleep. In 1991 for the first time more than 240,000 foreigners – but nothing is done)

'Deutschland den Ausländern!' Überfremdung: Die Union läßt die Maske fallen (*Deutsche Rundschau*, Jan. 1992)
('Germany for the foreigners!' Foreign infiltration: The Union [CDU] drops its mask)

Asylanten immer krimineller (*Deutsche Rundschau*, Jan. 1992)
(Asylum-seekers increasingly criminal)

Asylantenskandal: Sind unsere Politiker unfähig, das Problem zu lösen? (*Deutsche Stimme*, Sept. 1991)
(The scandal of the asylum-seekers: are our politicians incapable of solving the problem?)

Zustrom der Auslander wird immer größer (*Deutsche Stimme*, Sept. 1991)
(The influx of foreigners is growing and growing)

Nachrichten von der Überfremdungsfront (*Nation Europa*, column in each edition)
(Foreign infiltration: news from the front)

Migrationsfolgen und deren Einfluß auf die innere Sicherheit (*Nation Europa*, June 1986)
(Consequences of migration and their influence on internal security)

Rasse und 'Rassismus' (*Nation Europa*, Sept. 1986) (Race and 'racism')

In the texts themselves there are many suggestive formulations like 'full boats', 'invasions of ants', 'bursting houses', 'exploding' or 'colliding cars', or 'aeroplanes flying out of control', and they are full of dubious theories and all the theoretical rubbish of social darwinists like Konrad Lorenz, H. J. Eysenck, Irenäus Eibl-Eibesfeldt, and Arthur Jensen. A detailed analysis of some hundreds of these articles shows that there is a limited stock of about thirty prejudices which are brought up again and again to support the central aim of these right-wing authors, which is to push foreigners out of Germany, or 'better still', out of Europe (see Jäger 1988).

In the following passage, I shall consider an article by Christian Mattausch, which appeared in *Nation Europa* in 1986 and which is quite typical of the more

intellectual branch of right-wing racism.[5] Under the headline 'Consequences of migration and their influence on internal security' Mattausch begins:

> The presence of non-Caucasian ethnic groups in western Europe creates problems of historical significance for all states which are affected by it. It is not just the economic pressures that are giving cause for concern; it is first and foremost the efforts of these groups to take root here, and to set up cultural and/or political branches of their homelands.

The expression 'non-Caucasian ethnic groups' points the finger at a central problem of the far right as a whole, namely that they were faced with the planned opening of the internal market within the context of a new 'Europe without frontiers'. They expect a new 'flood' of African and Asian immigrants to penetrate the neighbouring countries, and from there 'flow' into Germany without hindrance. That incidentally is the main reason why they are demanding the erection of a 'fortress Europe', a sort of closed shop with high walls at all European frontiers. Furthermore, the word 'Caucasian' might just as well be replaced by 'Aryan'. But the writer criticizes the reduction of the consequences of this unification to economic issues. There is a warning about 'economic pressures', which is the standard argument against immigrants, but it is not the only argument. Mattausch is concerned with 'culture' as a whole, and this points to one of the central ideological tenets of the far right: the priority of (their understanding of) politics over economics.

Mattausch goes on:

> If this fact is put in the context of its psychological correlate, there is no mistaking the significance of one attribute that determines every aspect of human behaviour: the different nature of non-Caucasian populations, the number and variants of which are constantly increasing with the flood of Afro-Asian economic refugees.

We see that Mattausch does not only focus on the 'non-Caucasian populations' (incidentally the word *Population* is normally used only in connection with animals) but there is another danger: the expected 'flood of Afro-Asian economic refugees'. Mattausch here uses two of the keywords of far right propaganda, which unfortunately have since become part of the whole public discourse in Germany: 'flood' and 'economic refugees'. Flood is a so-called collective symbol, calculated to evoke fears of being drowned or getting killed in a wild outburst of the elements. Today this collective symbol appears in 'mainstream' newspapers, and deep in the centre left of our political landscape. It is used in connection with storms, invasions, and other dangerous occurrences, and it is often used in combinations with other metaphorical fields, such as medicine or disease. For example, formulations like the following are quite common: 'The flood of economic asylum seekers will destroy the body of our Germany like a tumour'. These mixed metaphors ('catachreses') paradoxically serve to hold the argumentation together, by linking different and often contradictory parts of the text.

Mattausch here adopts a central component of the official policy on foreigners in Germany: to distinguish between foreigners who come from (what is now) the European Union and those from the rest of the world. He supports this distinction with racist arguments: he applies the label 'non-Caucasian' to the large numbers of Turks and Kurds living in Germany, while 'Afro-Asian economic refugees' is used to describe asylum-seekers from Sri Lanka and from other countries in the Far East and from Africa.

The author takes advantage of the fact that there is a public discourse of differentiation between different sorts of foreigners, and he tries to establish a connection between his racist construction and this discourse, which itself is used as a means of distinguishing between 'good' and 'bad' foreigners: the good ones are the so-called *Gastarbeiter* (guest workers), who work hard and pay taxes, and can therefore be integrated more easily into German society; and the bad ones are those who create social costs, who are not able or willing to work or to adopt German customs and values. Here we can see in a detailed way how a special political discourse tries to infiltrate everyday inter-discourse, and that this inter-discourse is closely bound up with the ruling and therefore dominant hegemonic interests.

If we compare extreme right-wing texts which appeared some years ago (such as the Mattausch text), with texts from the 'mainstream' press today, we can see that the attempts of the right to exert an influence on the general inter-discourse have become more and more successful. Formulas like 'floods of asylum-seekers', 'our boat is full', expressions like 'economic refugees' and other discriminatory phrases, which until a few years ago belonged exclusively to the domain of right-wing extremists like Franz Schönhuber, can be found in almost any section of the contemporary press. If we compare articles by right-wing propagandists with those of mainstream journalists today, and at the same time look back at the way in which the latter used to write, we can see that the whole political landscape in Germany has been drifting to the right. I think that by making statements such as this possible, the concept of socio-historical discourse analysis shows its intrinsic analytical value.

But let us return to Mattausch's article from *Nation Europa*. Another interesting feature of his writing is his use of scientific-sounding vocabulary to make his text appear serious and credible: consider, for example, words like *Population* (instead of *Bevölkerung*), *europid*, *verhaltensbestimmend* (determining human behaviour). He continues:

> The indigenous populations perceived these new conditions as a menace to their collective identities, which had grown over hundreds or even thousands of years. In those European countries which have been affected by these problems, a deeply rooted feeling of anxiety and in some cases a sense of serious crisis has been growing. There can be no doubt that the process of alienation of the native environment was increased by the influx of groups that cannot be Europeanized and this was responsible for the loss of a sense of security in the [illegible]

In this passage Mattausch discloses his real message: these foreigners are not just different, they cannot be integrated, they cannot be 'Europeanized'. The influx (*Zuzug*) of these people will result in riots and general crisis.

The biologistic and racist position expressed in this passage dominates the thinking of the whole group of extreme right-wing intellectuals like Mattausch, who base their thinking on the work of 'major' scholars like Konrad Lorenz, Irenäus Eibl-Eibesfeldt, and others. In the rest of his article Mattausch draws attention to the 'fact' that 'racial' mixture will lead to civil war and riots. Conservative politicians are depicted as idiots, and passages from all kinds of newspapers are quoted to show that Germany is becoming more and more *überfremdet* (overrun by foreigners). Immigrants with a black skin are pictured as especially dangerous because they have a different *Naturell* (mentality), inborn aggression, and deeply rooted criminal inclinations.

Articles like this contain the essential propagandist keywords and collective symbols for the everyday agitation of right-wing extremists. For example, Mattausch uses terms like *afroasiatische Völkerwanderung* (that is, Afro-Asian migration on the scale of entire nations) or like *Suche der Einwanderer nach dem Sicherheitsstaat* (the immigrants' search for a security state). But he also adopts some items of conservative vocabulary in order to build bridges in that direction. The *soziale Hängematte* (literally, 'social hammock'), for instance, is a phrase which was coined by conservative politicians in order to discriminate against the unemployed (cf. the English expression 'feather-bedding'). Another common expression is the *Belange des deutschen Volkes* (the interests of the German people), which can be found in the law on foreigners. The semantics of the word *Belange* is highly vague; it means 'concerns' in a very broad sense, and therefore if you say that foreigners are not allowed to disturb the *Belange des deutschen Volkes*, this can be applied to almost any behaviour of foreigners that is different from German customs and values.

Mattausch tries to relate his formulations to anxieties and fears which affect many people (of all social classes) in Germany. There is, for instance, a widespread fear in Germany of losing a sense of national identity or the homogeneity of the German people. In doing this Mattausch pours oil on the fire which is smouldering under the cover of normal everyday life. He confirms his readers in their prejudices, and thereby helps to strengthen feelings of racism in the inter-discourse. Furthermore, he constructs a 'natural' relationship between a fear of foreigners and the urge or compulsion to drive them out, which enables people to define and consolidate 'their' cultural territory. In this way, he claims that xenophobia and racism are innate human characteristics.

The article ends with the sharp warning that 'the stage is set for a future civil war'. His final words are: 'The shadows of a dark future can no longer be ignored.'

The Reproduction of Racism and Extreme Right-Wing Ideological Tenets in Conservative Texts and in the Daily Press

Following this brief review of the extreme right-wing press and my attempt to analyse an article by a well-known far-right author, I should add at least a few

remarks about some other newspapers, such as the mass-circulation tabloid newspaper *Bild*, with more than 15 million readers (for a sociologist's analysis of *Bild*, see Albrecht 1982).

Racism as a concept which opens the door to extreme right-wing thinking is one of the most important focal points in *Bild*. There have been, and still are, many elaborate campaigns against foreigners in this racist paper, especially in the run-up to elections; but even at 'normal' times *Bild* never tires of attacking and discriminating against immigrants, using suggestive symbols and images like that of the threatening 'flood of asylum-seekers', who will make 'our boat' sink. On the front page on 5 September 1991, for example, the following set of banner headlines appears:

Blutschande / Endlich / Die Töchter wehren sich
Asylanten / Endlich / Bonn wacht auf
Miethaie / Endlich / Die ersten bestraft
(Incest / At last / The daughters put up resistance
Asylum-seekers / At last / Bonn is waking up
Rent profiteers / At last / The first are punished)

This racist and suggestive combination of headlines is by no means harmless. The word *Asylant* (asylum-seeker) is a neologism with deeply discriminatory overtones, and in the context of this set of headlines it is associated with a cluster of negative images. This operates not only on the surface level, but also by implicitly suggesting parallels with the past through the use of keywords like *Blutschande* and *Miethaie: Bild* conjures in the minds of its readers the threat that asylum-seekers will seduce 'our' daughters and wives (like the Jews in the propaganda of the Nazis) and that they will buy up our homes and property and charge extortionate rents (*Miethaie* was an abusive term for Jewish landlords used in the Third Reich). To this extent we can say that *Bild* is working with a kind of 'subcutaneous' anti-Semitism too, although the paper's founder, the late Axel Springer, and his followers always laid great emphasis on being a big friend of Israel.

In an edition of *Bild* which appeared some days before the elections in Schleswig-Holstein and Baden-Württemberg in April 1992 the following headline appeared:

Die Flut steigt – wann sinkt das Boot?
Fast jede Minute ein neuer Asylant (*Bild*, 2 Apr. 1992)

(The tide is rising – when will the boat sink?
A new asylum-seeker almost every minute)

This headline is a very typical example of *Bild*'s use of collective symbols: they simply take suggestive metaphors, put them together, and couple them with nonsense-facts. Logical connections are clearly considered unimportant: why, I ask myself, should a boat sink if the tide is rising?! Nevertheless, *Bild* succeeds in producing its dramatic message of danger, loss of space, and overpopulation

But *Bild* is just one exponent of this sort of journalism. Racism 'occurs' and is produced in almost every other paper in Germany, even in some of the more serious papers like *Der Spiegel*, *Die Zeit*, or the *Süddeutsche Zeitung*. The racist articles or racist opinions published in these papers, however, sound less blatant and overt than in *Bild*, which goes on to incite its readers against immigrants and refugees (for a detailed discussion see Quinkert and Jäger 1991 and Gerhard 1992).

Racism in Everyday Discourse and its Mediation by the Press

In a detailed study of everyday discourse (see Jäger 1992*a*), I came to the conclusion that most people in Germany are more or less imbued with racist thinking, even though not all of them can be called blatant racists. That is to say, they produce and reproduce racist opinions and prejudices. These prejudices appear in our 'normal' newspapers as well. That is why I assume that the influence of the press in producing and reproducing racism is so great. Furthermore, in everyday life people share their experiences socially through talk. This also includes racist interpretations of these experiences as well as value judgements, attitudes, and norms.

I shall illustrate this contention with some examples from statements made by our informants, but first I should say a few words about the project itself. Together with some of my students I carried out twenty-two non-standardized open interviews each lasting 45 minutes on average. We conducted these interviews in five large towns in western Germany. The interviewees were men and women of all ages and from various occupational backgrounds. Rather than putting set questions we tried get our informants to speak on various subjects such as their neighbourhood, shopping, travelling by bus or train, the reunification of Germany, and the Gulf War. Normally our interviewees began of their own accord to talk about foreigners. If they did not, we gave them a 'prompt'. This sample, which is reasonably representative of German populations in larger towns, was analysed on the basis of the discourse-theory approach outlined in Section 1 above.

In one interview a 52-year-old woman is asked right at the beginning: 'How do you like the town you live in?' She answers without hesitation: 'I don't like my neighbourhood very much, because there are a lot of foreigners living here, especially Turks.'[6] Asked why she feels disturbed by foreigners in general, she answers:

> It bothers me because the mentality of the foreigners is totally different from that of the Germans, especially as regards cleanliness, as regards . . . I also don't like the discrimination against women, at least that's the way it seems to me; if you see, er, these people in couples, er, the woman has to carry the heavy bags, the men walk some metres behind the women; and I have the impression that women have very little freedom in these countries.

Asked why she feels disturbed by foreigners living in her neighbourhood, she says:

> I don't like it very much. First of all, er, as far as school is concerned; admittedly my own children are a little bit older and they don't go to the local school any more, but I think it is bad, because the education of the children is very, very bad and the children fall behind, and when they go on to further education or training their basic education will be worse than in schools where there are mostly German children.

At this point, the interviewer intervenes, saying: 'But that's not an answer to my question', and the women continues:

> Yes, I have nothing directly against foreigners [*laughing*], but somehow, er, it's not so nice, er, to be surrounded by foreigners; there's really very little contact; the foreigners shut themselves off, the Germans too of course; most of them don't want to have anything to do with the foreigners, and the other way round I think, it is the same way with the foreigners, who don't like to have anything to do with Germans. They have their own religion, they have customs of their own, and, er, somehow I don't like that. I'd prefer to live in a place where there are only Germans.

When the interviewer asks if she would like to improve her acqaintance with Turks, she answers rather brusquely: 'I don't want to have any contact with Turks at all.'

In this passage we find some of the typical attitudes towards foreigners, especially Turks, who are in a sense considered as prototypes of the foreigner: 'We just don't like them, our children suffer from them, they are different as regards their customs and especially their religion, they are not clean', etc. The presence of Turks is a general cause of anger and feelings of frustration. Attitudes like these are very often accompanied by a clear desire to drive foreigners out.

The following argument can also be heard very often: 'We can't take in all the distressed and burdened people of the whole world, can we? I think if they all come, the boat will be exhausted, er, as regards the density of the population, won't it?'

Here we find some of the collective symbols which were mentioned earlier, and which are drawn from the discourse of the media. A great many of these collective symbols, which have been shown to be the 'cement' of media discourse (Link 1991), can be found in everyday discourse as well. In addition, this discourse is interspersed with journalistic keywords (like agglomeration, assimilation, identity, discrimination, interaction, level, rationality, veto) that stand out from the more colloquial nature of the rest of such texts. This and some other features of these texts, such as in some cases verbatim quotations from passages from the newspapers the interviewees habitually read, confirm my supposition that the influence of the media on everday thinking and speaking is enormous.

But how does it work in detail? Do the newspapers just reflect what people think, as is often claimed when the press is accused of instigating racist or other prejudices? Having analysed media discourse and everyday discourse in parallel for some years, I would [illegible]

seen in its ability to promote or play down racist discourses at will. For instance, racist discourses typically increase in prominence in the press and in everyday discourse in the run up to any election. It is true, however, that politicians, who have easy access to the media, play their part in this game, too; but it is the press itself that is capable of managing and influencing the inter-discourse as it pleases (for this notion, see Van Dijk 1991). In short, it can at least be argued that racism is socially reproduced by discourse.

Finally, one further point should be mentioned here: racist (and other) discourse may by no means be harmless, or just a cluster of bad attitudes and worse opinions. As recent events in Germany have shown, there is a high correlation between the rise of racist discourse in the press (see above) and thousands of attacks against immigrants, including arson and even murders. Discourse theory, then, argues that there is a continuum between verbal and non-verbal action. In certain circumstances, verbal action may well be transformed into physical actions like attacks and riots (see Link 1982, Jäger 1992*a*, where this problem is dealt with in detail). In the interviews we conducted we found that some of the interviewees showed considerable willingness to attack foreigners if they did not behave in accordance with German customs and norms.

It goes without saying that racism is one of the central ideological tenets of right-wing parties (and of right-wing conservative politicians, too). Therefore it seems reasonable to conclude that an increase of racist discourse in the German population may signal an increase in the prospects of right-wing extremism too.

3 The Language and Ideology of the Left in Germany

3.1 The Press of the Left in Contemporary Germany

During the last two decades the German left, and together with it the left-wing press, has declined dramatically. Many journals disappeared, or became commercialized, or lost large numbers of their readers. It is not possible to analyse the causes of this decline in detail here, and I shall confine myself to just a few points. First of all we must differentiate between the two mainstreams of the German left since 1968: the orthodox left, which adhered closely to the canonical ideology of Stalin's and (parts of) Lenin's works, and the New Left. The orthodox left disappeared from the political stage after the fall of the Berlin Wall and the end of the Soviet Union. Some marginal groups still exist, however, such as the DKP (German Communist Party), which has about a thousand members and publishes the newspaper *Unsere Zeit*.[7] The PDS (Party of Democratic Socialism), successor to the GDR's official SED (Socialist Unity Party), still has some 200,000 members in eastern Germany, but it has not been able to establish a foothold in the West, where it has gained only about 700 members. The attempt to get rid of the old orthodox thinking, undertaken by leading members of the PDS, for instance by Gregor Gysi, was not very successful, and there are many members of this party who still adhere to the old ideologies and politics

Neues Deutschland, the former central organ of the SED, was saved by the PDS, and its former bureaucratic style and ideological contents have been changed to a great extent. It now reflects the debates of the progressive wing of the PDS (and some other socialists) on socialist reforms and anti-capitalist perspectives. These changes can be illustrated by comparing two editions of *Neues Deutschland*, one before and one after the *Wende*. In the edition of 27/8 June 1987, the following headlines appeared:

> 4. Tagung der Volkskammer bestätigte Haushaltsrechnung für 1986: Eine Bilanz der erfolgreichen Wirtschafts- und Sozialpolitik
> (4th session of the Volkskammer [Parliament] confirms budget for 1986: a record of successful economic and social policy)
>
> DDR-Planwirtschaft funktioniert gut
> (GDR's planned economy is working well)
>
> Wir haben keine Schuldenwirtschaft
> (We do not have a budget-deficit economy)
>
> Steigende Leistung – Sinkende Kosten
> (Rising output – falling costs)
>
> Dem Ministerrat Entlastung erteilt
> (Report of Council of Ministers approved)
>
> Dank für großen Beitrag zum Wohle des Volkes
> (Thanks for major contribution to the good of the people)
>
> Grußadresse des ZK zum 'Tag des Bauarbeiters'
> (Message of greeting from Central Committee on 'Construction Worker's Day')
>
> Festumzug ein Höhepunkt des Jubiläums von Berlin
> (Procession a highlight of Berlin's jubilee celebrations)
>
> Schwarzer Donnerstag für Westberliner Mieter
> (Black Thursday for West Berlin tenants)

This anthology shows that readers were confronted with long and tedious official statements in the style of official bulletins. The consequence of this sort of state journalism was that, with the exception of some functionaries who were compelled to do so, nobody actually read *Neues Deutschland*. Passages like the following were typical:

> Abgeordnete R. W., Vorsitzende des Ausschusses für Haushalt und Finanzen, bezeichnete in der Stellungnahme des Ausschusses die Ergebnisse bei der Senkung der Kosten als unbestechlichen Maßstab für die Fortschritte auf dem Weg der umfassenden Intensivierung.
>
> (In the report of the Budget and Finance Committee, the Chair, delegate R. W., described the results of the cost-cutting exercise as an unerring measure of progress on the road to comprehensive intensification.)

The bureaucratic and clumsy style reflects a complete lack of content, which

By contrast, in an edition of 24/5 March 1990, there are lively debates about the future of the GDR, in which passages are quoted from the work of Theodor W. Adorno, the great scholar from the 'Frankfurt School', who until recently had been accused of being an *Abweichler* (deviator) from the true ideology of socialism. However, whilst in this edition journalists and scholars are still fighting for a new socialist democratic state of the GDR, this has given way more recently to running battles and attempts to criticize the capitalist way of life and the annexation of the former GDR by the West.

I shall now turn my attention from the orthodox left to other left-wing groups. In doing this I shall ignore the many small sects, some of which continue to produce their small papers (for instance the VSP (Unified Socialist Party), a Trotskyist group). Around the beginning of the 1990s many members of Trotskyist or Maoist and other 'Marxist' groups (like MG (Marxistische Gruppe) or even of the DKP moved in the direction of the Greens and changed or modified their political ideologies to a large extent, in some respects adopting blatant political pragmatism (the so-called *Realos*). The political debate of the members and sympathizers of this political group can be found in journals like *Kommune* or in the *tageszeitung*. This means that there have been some changes in the style and form of debate, and there cannot be any doubt that this new 'movement' has contributed a great deal to the emergence of new themes like ecology, which have since been adopted (and often diluted) by other parties. To some extent it could be said that they have developed a new language, nearer to everyday communication, and that their discourse has gained some influence on the general inter-discourse.

At this point I should mention some journals of the moderate New Left on the one hand and the more radical New Left on the other. There are papers like *Links*, *kultuRRevolution*, *Wechselwirkung*, or *Sozialismus*, which have no particular association with any political parties. Like journals such as *Frankfurter Hefte*, an independent journal which is politically aligned with the left wing of the Social Democrats, these publications try to maintain an intellectual debate, based on the ideas of Adorno, Bloch, Althusser, Benjamin, Foucault, and others. They all argue on a relatively high intellectual level, and so far they have had no influence on inter-discourse whatsoever. But some of their authors have access to the major papers too, for instance Elmar Altvater, a well-known Marxist professor of economics, Jürgen Link, professor of literature and discourse theory at Dortmund University, and Joachim Hirsch, who teaches politics at Frankfurt University. So it is fair to say that a German New Left still exists, but it is not organized and has no meaningful influence on the process of politics and the general inter-discourse as a whole.

Finally, I should at least draw attention to two papers of the radical left in Germany: *Arbeiterkampf* and *Konkret*. *Arbeiterkampf* was founded many years ago as the organ of the Kommunistischer Bund (Communist Union), a former Maoist group that is now defunct. The paper itself, a strictly anti-capitalist monthly, still exists, with a circulation of about 3,000 copies. It regularly reports on affairs of the so-called underdeveloped countries, and it deals with all subjects in which

Marxists and Anarchists may possibly be interested. Their analyses are founded strictly on Marxist theory, especially the 'original Marx', but this is not done in the sophisticated and academic manner of most of the other papers of the New Left. *Konkret*, a monthly magazine with a circulation of about 20,000 copies, is also a radical socialist paper with a long tradition. It has always been independent and it specializes in criticizing the left from an even more left position. Its style is readable and its themes are many and various.

The total number of readers of the press of the left in Germany may be estimated at about 1 million.

3.2 The Gulf War in the Discourse of the Left

The way at least large sections of the left debated the Gulf War may serve as a typical example of debates within the left in contemporary Germany. Since it is not possible to go into detail on this topic here, a few remarks must suffice (for a detailed discussion see Kellershohn 1992). The German left is, put simply, a left-wing movement in Germany. This means that it is also caught up in the last sixty years of German history and its discourse. During the Gulf War the problem of anti-Semitism became central. The German left was divided between pacifists on the one hand, who defended peace at any price, and on the other hand those who defended Israel at any price and who accused the 'pacifists' of anti-Semitism. The debate has continued to divide whole groups and journalists on political newspapers and periodicals. The charge of anti-Semitism is probably the most serious accusation left-thinking people in Germany could be confronted with, and so it is not surprising that this debate was conducted very vehemently and in some cases even violently.

This is just one of many delicate topics that the German left seldom likes (or dares) to discuss. One of the main reasons for this is the fact of Germany's past, which has also not been dealt with adequately by the left. Further subjects of this kind include abortion, eugenics, and (at least for some parts of the left) Stalinism. The left normally leaves it to the right to discuss these topics, but there is no getting away from them. Since the left appears to be unable to deal with these topics on a serious theoretical level, it is not prepared to discuss them at all in an adequate way. This is one of the reasons why the left in Germany has remained marginal and politically weak. Some years ago there was a popular slogan: 'Der Geist steht links!' (literally: 'the mind is on the left!', that is, the intellectual climate is dominated by the left). This may have been true then, but not any more: since then the initiative has shifted firmly to the right!

4 Conclusions

The bulk of this chapter has been devoted to the language of the right in Germany, and this is because at least since the early 1980s the focal point of German political discourse has been drifting to the right. This trend represents a significant

new development in Germany's post-war history. Furthermore, the signs are that in the new 'unified' Germany the right will continue to dominate political discourse and the left will continue to decline.

Nevertheless, it is both legitimate and important to consider in conclusion whether there is any possibility of developing counter-discourses, in order to confront at least the most powerful discourses of the right, such as racism and anti-Semitism. In this respect, I think there may be some grounds for optimism. As discourses are linked with power and as they are not directly determined by purely economic circumstances, there is at least a chance that enlightened concepts will eventually prevail; and as far as the topic of this chapter is concerned, it may just be that discourse analysis and improvements in discourse theory will make a positive contribution to this process.

Appendix

Migrationsfolgen und deren Einfluß auf die innere Sicherheit
Christian Mattausch

Die Anwesenheit nichteuropider Volksgruppen in Westeuropa stellt alle betroffenen Staaten vor Schwierigkeiten von historischer Bedeutung. Es sind nicht allein wirtschaftliche Engpässe, die Kopfzerbrechen bereiten – es sind vor allem die Bestrebungen dieser Gruppen, hier Wurzeln zu schlagen und zu kulturellen bzw. Politischen Ablegern ihrer Herkunftsländer zu werden. Setzt man diesem Sachverhalt sein psychologisches Spiegelbild gegenüber, fällt unweigerlich der Stellenwert eines in jeder Beziehung verhaltensbestimmenden Merkmals auf: Andersartigkeit nicht-europider Populationen, deren Zahl und Varianten sich noch durch die Flut afro-asiatischer Wirtschafts-flüchtlinge ständig vergrößert.

Diese Bedingungen, von den einheimischen Bevölkerungen überall als eine Infragestellung alter, über Jahrhunderte bis Jahrtausende gewachsener Kollektividentitäten empfunden, haben in den betroffenen Ländern Europas zu tiefer Beunruhigung, stellenweise sogar zu akutem Krisenbewußtsein geführt. Es unterliegt keinem Zweifel, daß die Entpersönlichung der heimatlichen Umgebung durch den Zuzug nicht-europäisierbarer Gruppen geradezu beschleunigt wurde und bei vielen Bodenständigen zu einem Verlust an Geborgenheitsgefühl geführt hat....

Die Schatten einer düsteren Zukunft sind nicht mehr zu übersehen.

German Text of Interviews (pp. 245–6)

F = Frage A = Antwort x = pause

F. Wie gefällt Ihnen denn die Stadt, in der Sie hier wohnen?

A. Die Wohnlage gefällt mir ja nicht so besonders, weil um mich herum sehr viele Ausländer wohnen; vor allen Dingen Türken.

F. Warum stört Sie das?

A. Mich stört das insofern, weil die Mentalität der Ausländer eine total andere ist als die der Deutschen, vor allen Dingen geht's da um Sauberkeit, um, was mich daran auch stört, die Diskriminierung der Frau, habe ich zumindest das Gefühl; wenn man die

muß, die Männer einige Meter hinter den Frauen laufen und ich hab eben das Gefühl, daß die Frau sehr wenig Freiheit genießt in diesen Ländern.

F. Warum stört Sie das, wenn hier Ausländer in der Umgebung wohnen?

A. Ich find das nicht besonders gut; einmal, eh, auf dem Gebiet der Schule; meine Kinder sind allerdings schon älter und gehen halt nicht mehr in diese hiesige Schule, aber, eh, ich finde es schlecht, weil die Ausbildung der Kinder sehr, sehr schlecht ist und die Kinder dann halt ins Hintertreffen geraten, wenn sie zu einer fortbildenden Schule gehen oder auch später in der Berufsbildung ist die Grundlage eine schlechtere als in einer Schule, wo überwiegend deutsche, eh, Kinder zur Schule gehen.

F. Aber das ist ja keine Antwort auf die Frage; ich mein, dann brauchte Sie das ja nicht zu stören, wenn hier Ausländer in der Umgebung wohnen.

A. Ja, ich hab nichts direkt gegen Ausländer [*Lachen*], aber irgendwie, eh, ist es nicht so sehr schön, eh, von Ausländern umgeben, eh, zu wohnen; der Kontakt ist, eh, ganz minimal nur; die Ausländer grenzen sich irgendwie ab, natürlich auch die Deutschen; die meisten wollen halt mit den Ausländern nichts zu tun haben und umgedreht glaube ich, ist es auch so, daß die Ausländer mit Deutschen recht wenig zu tun haben wollen. Die haben ihre eigene Religion, die haben ihre eigene Lebensweise, und, eh, irgendwie stört mich das. Ich würde also lieber in einer Gegend wohnen, wo nur Deutsche wohnen.

F. Möchten Sie eigentlich auch keinen Kontakt zu den Türken?

A. Ich möchte keinen Kontakt zu den Türken haben.

A. Wir können nicht alle mühselig und beladenen der ganzen Welt hier aufzunehmen, ne. Irgendwo is ja auch, wenn die alle kommen, denk ich ma, dat Schiff hinterher, eh, vonner Besiedlungsdichte her, eh, erschöpft, ne, denk ich mir.

Notes

1. It is often the case that the term discourse is simply used instead of 'text'. Therefore I consider it necessary to give a somewhat complex definition of my understanding of discourse. This is even more necessary because there are some other new approaches

such as anthropology, semiotics, literary studies, linguistics, sociology, psychology, and the various branches of communication. Each of these approaches has to recognize the fact that an interdisciplinary approach is unavoidable. This is one of the reasons why the term discourse sometimes sounds rather mysterious. If you take into account the fact that there are a variety of approaches and 'schools' in each single discipline, you may understand why it is not possible to speak about discourse theory or discourse analysis in terms of a firmly established field of research.

In Germany there are a number of different concepts of discourse and discourse analysis, some adopting ideas of the philosopher Jürgen Habermas or other scholars like Karl Otto Apel, others following US-American traditions (e.g. Dell Hymes 1979). Teun A. Van Dijk of Amsterdam University and editor of the new journal *Discourse & Society* describes the growth of discourse analysis during the last two decades and calls it 'a new discipline of sociolinguistics' (Van Dijk 1990: 5). Van Dijk's own concept of discourse analysis is based on cognitive psychology and artificial intelligence research. My concept is developed in Jäger (1991 and 1993); it has been used in empirical analyses of right-wing texts in Jäger (1988) and in the field of everyday racist discourse in Jäger (1992*a*) and in various other publications.

2. This became clear in the elections to the senate in Bremen and the municipal elections in Schleswig-Holstein in Oct. 1991, and the elections to the parliaments of Baden-Württemberg and Schleswig-Holstein in Apr. 1992 showed dramatically that the temporary decline of right-wing parties was over. The 'Republicans', who seemed to have reached a dead end after the fall of the Wall, gained 10.9 per cent of the votes; in Schleswig-Holstein the DVU gained 6.6 per cent.
3. For a broader analysis of the scope of the press of the far right and its ideologies see Jäger (1988) and Jäger and Jäger (1992).
4. My notion of racism cannot be outlined in detail here. I basically concur with the views associated e.g. with the names of Stuart Hall (1989), Étienne Balibar (1989), Georg Auernheimer (1990), and Kalpaka and Räthzel (1990). A fully fledged racist disposition is given if the following three elements co-occur: (1) biologically or culturally founded differences are manifested; (2) these differences are seen negatively (or sometimes positively, e.g. if somebody says that black people make especially gifted jazz musicians); and (3) if these positions are based on real power, so that the person concerned or his/her group is able to act against foreigners. This power is normally given, if the person concerned is a member of the majority or dominant group.
5. The original German can be found in the Appendix to this chapter.
6. The translations inevitably neglect the fact that the speakers use dialects or some other forms of the non-standard speech of the Ruhr area. For the original text see Appendix.
7. *Unsere Zeit* is still being published in a style and format comparable to *Neues Deutschland* before the *Wende* (see below), but it has become absolutely insignificant.

The Uses and Representations of Local Languages in Tourist Destinations: A View from British TV Holiday Programmes

Adam Jaworski, Crispin Thurlow, Sarah Lawson and Virpi Ylänne-McEwen

Introduction

Travel programmes are very popular in the UK. According to their own publicity, for example, both the BBC's *Holiday* <www.bbc.co.uk/holiday> and ITV's *Wish You Were Here?* <www.wishyouwerehere.com> have been running for over 30 years and boast weekly ratings of up to eight million viewers. While for some package tourists, these programmes have been found to form an important part of their pre-holiday preparations, providing information and tips about holiday destinations, they also aim to provide entertainment on prime time TV (Hanefors & Mossberg, 2000). The basic format of these programmes follows an introduction by a lead presenter and then three or four 'episodes' where other presenters or guest celebrities try out different holidays in a variety of locations. Although most locals/hosts[1] featured in the holiday programmes use English to communicate with the travelling journalists regardless of the official status of English in their territories, it is not uncommon for the presenters to initiate interaction with the hosts in their native language, or to quote 'foreign' language phrases in their commentaries/narratives. Occasionally, the presenters also elicit words or phrases in the host language from the hosts.

The data we have used in this study come from 18 programmes of the BBC's *Holiday* and 10 programmes of ITV's *Wish You Were Here?* broadcast between November 2000 and April 2001. The programmes comprise 106 episodes

featuring 33 destinations (countries or regions), broadly reflecting the most popular destinations of UK holidaymakers (National Statistics, 2002).[2] Perhaps not surprisingly, the most popular destination on the programmes is the UK, where the question of a language barrier in communicating with hosts is also far less likely to arise. Notably, in episodes featuring the UK, most interviews are with other tourists, rather than hosts, although British tourists, tour operators and expatriates are also occasionally interviewed in 'foreign' episodes. We have nonetheless chosen not to include any of these interactions in our data analysis. Many other popular destinations, such as Ireland, the USA, parts of the Caribbean or of Canada, are, of course, largely 'English-speaking' and whatever interactions are undertaken with hosts in these locations, they are invariably conducted in English. In other locations, however, English is spoken by the majority of the local population as a second or foreign language. It is predominantly these settings that our examples come from.

Across all the 106 episodes of the programmes analysed here, we identified 246 instances of interaction between tourists/programme presenters and hosts. For our purposes, we define 'interaction' as any form of mutual engagement between a tourist and a host. This may be verbal (often non-reciprocal, with only one participant assuming a speaking role), or non-verbal, for example, when the tourist and host make eye-contact, or when a tourist/presenter gets a message from a host. We exclude from the category 'interaction' the ubiquitous, one-sided act of tourist gazing – in a more literal sense than the way it has come to be used in tourism studies, following Urry (2002). Our sample includes 63 instances of the use and/or representation of languages other than English, which constitute approximately 26% of all interactions with locals in the total sample.

The data that we deal with in this paper operate at a metalinguistic level in the sense that local languages in the programmes are represented and performed for the benefit of the viewers (see below). This implied reflexivity of language use invites an analysis following the traditions of Critical Language Awareness (CLA) studies (e.g. Clark & Ivanič, 1999; Fairclough, 1992a) as a development of Language Awareness (LA) (e.g. Hawkins, 1987) and folk linguistics (Preston 1996, 2004), and building upon those of Critical Linguistics (e.g. Fowler & Kress, 1979) and Critical Discourse Analysis (CDA) (e.g. Fairclough & Wodak 1997). With a central concern for metalinguistic and metapragmatic norms and competencies, CLA has dealt mostly with educational and workplace domains in which desirable or required versions of communication are spelled out for pupils, trainees and employees. However, the framework offered by CLA also encourages an examination of how everyday communication norms and conventions of 'appropriacy' (Fairclough, 1992b) act as manifestations of underlying power differentials, competing ideologies and 'gatekeeping' strategies. This approach is consistent with our general view of metalanguage as a broad socio-linguistic category and a site of much ideological 'work' that social actors do through their representations of and manifested attitudes to language (see Jaworski *et al.*, 2004).

Following Cameron (1990/1999: 62), one of the central tasks of critical a

featuring 33 destinations (countries or regions), broadly reflecting the most popu lar destinations of UK holidaymakers (National Statistics, 2002).[2] Perhaps n surprisingly, the most popular destination on the programmes is the UK, whe the question of a language barrier in communicating with hosts is also far le likely to arise. Notably, in episodes featuring the UK, most interviews are wit other tourists, rather than hosts, although British tourists, tour operators an expatriates are also occasionally interviewed in 'foreign' episodes. We have non theless chosen not to include any of these interactions in our data analysis. Man other popular destinations, such as Ireland, the USA, parts of the Caribbean c of Canada, are, of course, largely 'English-speaking' and whatever interactions a undertaken with hosts in these locations, they are invariably conducted in Englis In other locations, however, English is spoken by the majority of the local popu lation as a second or foreign language. It is predominantly these settings tha our examples come from.

Across all the 106 episodes of the programmes analysed here, we identifie 246 instances of interaction between tourists/programme presenters and host For our purposes, we define 'interaction' as any form of mutual engagement be tween a tourist and a host. This may be verbal (often non-reciprocal, with onl one participant assuming a speaking role), or non-verbal, for example, whe the tourist and host make eye-contact, or when a tourist/presenter gets a messag from a host. We exclude from the category 'interaction' the ubiquitous, one-side act of tourist gazing – in a more literal sense than the way it has come to be use in tourism studies, following Urry (2002). Our sample includes 63 instances o the use and/or representation of languages other than English, which constitut approximately 26% of all interactions with locals in the total sample.

The data that we deal with in this paper operate at a metalinguistic level i the sense that local languages in the programmes are represented and performe for the benefit of the viewers (see below). This implied reflexivity of languag use invites an analysis following the traditions of Critical Language Awarenes (CLA) studies (e.g. Clark & Ivanič, 1999; Fairclough, 1992a) as a developmen of Language Awareness (LA) (e.g. Hawkins, 1987) and folk linguistics (Preston 1996, 2004), and building upon those of Critical Linguistics (e.g. Fowler & Kress, 1979) and Critical Discourse Analysis (CDA) (e.g. Fairclough & Wodak 1997). With a central concern for metalinguistic and metapragmatic norms and competencies, CLA has dealt mostly with educational and workplace domains, in which desirable or required versions of communication are spelled out fo pupils, trainees and employees. However, the framework offered by CLA also encourages an examination of how everyday communication norms and conventions of 'appropriacy' (Fairclough, 1992b) act as manifestations of underlying power differentials, competing ideologies and 'gatekeeping' strategies. This approach is consistent with our general view of metalanguage as a broad sociolinguistic category and a site of much ideological 'work' that social actors do through their representations of and manifested attitudes to language (see Jaworski *et al.*, 2004).

Following Cameron (1990/1999: 62), one of the central tasks of critical analyses of language practice is to reveal how institutions like the broadcast media

produce and reproduce linguistic norms, and, in turn, to consider 'how these norms are apprehended, accepted, resisted and subverted by individual actors and what their relation is to the construction of identity'. On this basis, we view our data as 'common sense understandings' or representations by the TV producers of how communication between hosts and presenters shapes up in face-to-face encounters. Specifically, it is our aim in this paper to examine the uses of host languages (other than English) in the TV holiday programmes, and to establish how these language choices position hosts, presenters and TV audiences *vis-à-vis* one another. We address the latter aim in our discussion by defining the uses of languages other than English in our data as instances of *crossing*, which 'is concerned with switching into languages that are not generally thought to belong to you' (Rampton, 1995: 280). These heavily mediated encounters are thus ideologically situated practices which help to better understand the subject-positionings and relations of power which underpin tourism as both an international industry and an intercultural playing field.

It is precisely this kind of strictly linguistic or sociolinguistic approach which, we believe, can make a useful contribution to the already interdisciplinary tourism literature. Indeed, part of the impetus for this move comes from within Tourism Studies, where writers like Franklin and Crang (2001) advocate the need for a more 'multi-sense' understanding of tourism, and a concomitant re-appraisal of its undue emphasis on the visual – typified by the sway of Urry's (2002) otherwise trenchant notion of the 'tourist gaze'. To some extent, any lack of scholarly attention to language is explained by nature of the tourist experience itself; in Cronin's (2000: 82) words, 'sightseeing is the world with the sound turned off'. As Dunn (2002: 3) further explains, tourists usually end up gazing simply because they cannot understand the languages spoken by the objects of their gaze. Either way, analyses of language and social interaction in tourism have been noticeable by their absence. With this said, our concern here is less about making a contribution to the tourism literature, as it is about demonstrating the application and relevance of CLA to a very significant domain of everyday, interethnic interaction – in fact, one of the most substantial cultural industries today. This is done also in the sense of *Language Awareness*'s long-standing attention to the evaluation and prioritisation of different languages and their speakers, especially within the context of 'foreign language' learning (see, for example, Hawkins, 1999). It is all of these concerns which stimulate our particular interest here in the ideological and discursive functions of languages other than English as they are represented in holiday travel programmes.

Before we discuss their functions, however, we want also to comment on these languages as a form of performance, and consider their particular functioning in terms of what Goffman calls the 'theatrical frame' (1974: Chap. 5), i.e. strips of behaviour which are produced and interpreted as, or by analogy to, a rather narrowly conceived stage performance.[3] In this sense, performance involves one or more performers engaged in a make-believe interaction (or monologue in the case of just one performer), and an audience, where performers and an audience are likely to be separated spatially (the former, traditionally, performing on a stage viewed by the audience from an auditorium). Of particular importance to

our data here, however, Goffman recognises how an audience operates in a dual role. On the one hand, every member of the audience engages in the act of buying a ticket, taking a seat in the auditorium, spending real time in the theatre, taking part in the non-performance activities such as having a drink during intermission, and so on, i.e. every member of the audience is a 'theatregoer'. On the other hand, every member of the audience also collaborates as an onlooker in the 'unreality onstage' (Goffman, 1974: 130) – or what, in dramaturgical terms, is known as the suspension of disbelief. In other words, the audience is an essential constituent or co-creator of the performance since it is only through the audience that the performance is itself ratified.

Goffman (1974) also notes how participants' activities may fall out of the ongoing frame. This may take place in moments of disattention to specific actions or participants and usually results in changing patterns of alignment, or footing, among participants (Goffman, 1981). In 'real-life' conversation (i.e. that which is perhaps less overtly, self-consciously staged), this may be achieved linguistically, for example, by adopting a vocative form of address to turn one's attention to a new participant, although this is usually achieved through non-verbal means such as facial expressions, body orientation, gaze (cf. Levinson, 1988). In performance (at least in its most canonical form discussed with all the caveats above), or the theatrical frame, the audience, despite its status as accepted onlookers, is such a disattended participant by the actor-in-character, although it is also true that the specific status of the audience as ratified eavesdroppers is 'maximally facilitated' and, to continue, 'theatrical audiences have only restricted rights to reply to the show they watch and are allowed only a restricted role, but unlike the onlookers at excavation sites, they do have *some* expectations in this regard' (Goffman, 1974: 226).

Examples of new positions that may be taken up by audiences are those brought about by

> the special role of chorus, 'orator,' or other mediating, editorialising functions that can easily be built into the performance. The mediator – a specialised viewer who also participates as a staged character – can comment on whole aspects of the production, treating as an object of direct attention what the projected characters have to treat as something in which they are immersed. He is a footnote that talks. (Goffman, 1974: 226–227)

Other examples of such mediations between the performance and the audience mentioned by Goffman are prologues and epilogues, subtitles in silent films, and other slightly out-of-frame stage voices such as soliloquy in which the actor allows the audience to 'hear' his or her thoughts, and different forms of direct address, which is used to comment on or explain a twist in the plot, elaborate on a moral issue or summarise what has happened so far. In unstaged interaction, an out-of-frame activity may involve asides and collusion, as 'individuals can turn from their companions and give fleeting vent to their "real" feelings, through gesture and *sotto voce* comment' (Goffman, 1974: 233). Goffman's example of such 'electronic collusion' in the case of TV shows is the case of an

voiceover in a quiz show 'telling the folks in TV land what the answer was while the contestant manfully strained at pretending to strain at recalling it' (1974: 233).

Following Goffman's work on the theatrical frame and out-of-frame activities, we treat the TV holiday programmes as instances of scripted performances, with the TV audiences being the accepted onlookers, whose right to participate in and respond to the staged activities is necessarily minimal, but whose role in ratifying the programmes is hugely important. In simple economic terms known as the 'ratings game', without the viewers' mass participation, the programmes would be scrapped by the TV stations producing them. And as we hope to demonstrate in this paper, the use and representation of host languages serves as an important aspect of the programme makers' realignment with the viewers.

Functions of Languages Other Than English in TV Holiday Programmes

An initial analysis of the primary functions of languages other than English in TV holiday programmes identified four main categories of function:

- expert talk (e.g. guided tours, explanations, instructions);
- service encounters (e.g. purchasing foodstuffs in shops or markets);
- phatic communion (e.g. exchanging greetings, thanking – often as part of a service encounter);
- naming and translating (e.g. providing labels for local concepts, artefacts or dishes, translating local place names).

These functions are performed by the presenters and/or hosts either when the two parties are shown interacting with one another, or by either party when no face-to-face interaction is present, for example, in numerous voiceovers by the presenters or when racing commentary is heard during a visit to a race course. Of course, most communicative utterances perform multiple functions, and we found such overlaps in our data. As such, it was not always possible to isolate communicative intent. In looking to code our data, therefore, interactions were categorised in terms of their *primary* functional orientation, while allowing coding in terms of more than one function to retain something of the multifunctionality of exchanges where relevant.

Expert Talk

We define talk as 'expert' when a host is portrayed in the role of an authority or guide and shown explaining a process, system or local custom to the presenter, who is portrayed in the role of learner, listening and perhaps asking questions. Expert talk appears to be the most common function of language used by hosts in the programmes. The majority of these instances take place in English (in our sample, almost as much as 90% of all instances of expert talk). After all, this is

British television, English is its unmarked linguistic code, and it is important for the viewers to understand what is going on. In fact, what is surprising is that, in these highly scripted and edited programmes, there is any room left for languages other than English, which is precisely what makes us wonder what viewers are expected to make of the snippets of 'foreign' languages they do get to hear. Consider Extract 1, for example, featuring Vera, a hotel owner in Tuscany. In this example, the presenter, Mary Nightingale, introduces Vera to the audience in an English voiceover and the latter continues in Italian a highly edited demonstration of the preparation of home-made pasta:

Extract 1 Wish You Were Here?, 26 February 2001 Mary Nightingale in Tuscany, Italy[4]

MN:	(voiceover) I found all the hotels very comfortable and what's nice is	1
	they're all so individual and they feel so (.) Italian (1.0) this farmhouse	2
	has been in the family for generations (.) Vera is the boss (.) and the	3
	chief pasta maker	4
Vera:	(cut to Vera's kitchen where she is making pasta) quest'e' la pasta queste	5
	this is the pasta these	
	sono (.) l'impasto (.) mangiala cruda mangiala cruda	6
	are (.) *the mixture* (.) *eat it raw eat it raw*	
MN:	(picks up a single strand of raw pasta, moves away from Vera, raises the	7
	piece of pasta to the camera) there's a piece of Vera's tagliatelle (.) isn't	8
	that absolutely beautiful (.) it's perfect	9
Vera:	(looks baffled at MN's interest in the piece of pasta)	10

In the voiceover, Vera is clearly cast in the role of a cooking expert (lines 3–4), followed by a kitchen scene where she shares her knowledge and experience of pasta making. In her very short turn, she is shown commenting on what she is doing in a way which is reminiscent of typical TV cooking programmes. Likewise, in this extract, Vera comments on the high quality of her cooking and recommends it with confidence accorded to her by her expert status and fluency in her native language.

However, very quickly, at the end of her turn, *she* becomes an onlooker. The presenter's (MN) evaluation of Vera's pasta in lines 8–10 is directed at the viewer, as is evidenced by both her verbal and non-verbal behaviour: she looks at the camera, away from Vera and speaks in English. As our comment in line 11 indicates, Vera loses her 'expert' status being left just watching the presenter and her crew (unseen by the audience) filming the rest of the scene. Vera becomes sidelined and forms a mere backdrop to the presenter's continued demonstration of the charms of Italian living.

Already in this extract, then, we see both the performance frame of the TV holiday programmes, in which the presenter tells the story of his/her holiday and enacts some 'live' interactions with hosts, but also the disattention to this performance frame and the enactment of a second stream of 'out-of-frame activity' (Goffman, 1974: 210). In the extract above, this is achieved by MN's disattending verbally and non-verbally to Vera, depriving her of the full *participation status* (Goffman, 1974: 224). Vera's role in lines 9–11 gains what Goffman calls the 'toy status, namely, the

as if in frame, an object to address, act to or comment on, but which is in fact out of frame (disattendable) in regard to its capacity to hear and talk' (1974: 224).

From an analytic point of view, we face a dilemma here. Why do the programme makers bother to introduce Vera as an 'expert' only to sideline her immediately. Given the constraints of the programme, they are unlikely to treat her as some kind of superfluous decoration or a participant to be simply ignored. What we would suggest, then, is that Vera acts as a 'vehicle' for injecting some local (linguistic) flavour authenticating the touristic experience of the presenter/viewer (see also below).

As we demonstrate throughout our analysis, this out-of-frame activity of orienting to the audience becomes more consequential to the achievement of the main goal of the holiday programmes, i.e. creating involvement with the audience. Even more importantly, it is also crucial to understanding the metalinguistic function of the 'foreign' languages in these encounters. In Extract 1, MN's overt orientation to the viewers starts in lines 1–4 with her voice overlaying images of Tuscan countryside and the hotel in which she is staying. The extract then shifts back to the performance frame (lines 5–6), in which Vera is centrally positioned as the expert in pasta-making explaining the process to the presenter (and by extension to the viewers). Finally, MN steps out of the performance frame (lines 8–10) by literally turning her back on Vera and orienting herself towards the camera/audience. (What cannot be conveyed by the transcript alone are the proxemics of this re-orientation to the TV viewers which, in lay or 'social' terms, are plain rude.) Clearly misjudging or misunderstanding her televisual role as human scenery, not unlike many other hosts in the extracts we have analysed, Vera is thereby doubly disempowered: first by being cast involuntarily in and out of frame by the presenter, but also by being seen to afford the presenter undue benefit of the doubt in terms of conversational relevance (Grice, 1975) having taken MN's interest in her work at face value.

Service Encounters

Service encounters (e.g. Aston, 1988; Ventola, 1987) are the next most common category of function identified in the data. Presenters are shown interacting with people such as local shopkeepers, market stall-holders, waiters and hotel staff. In the following extract, Jilly Goolden and her teenage daughter, Verity, go shopping for food at a market in France.

Extract 2 Holiday 2000, 28 November 2000 Jilly Goolden and daughter Verity in France

JG:	now what do you fancy?	1
VG:	(to vendor) je voudrais un kilo de tomates	2
	I'd like a kilo of tomatoes	
Vendor 1:	un kilo merci	3
	a kilo thank you	
	[ ]	
JG:	let's go and get cheese	4
Vendor 1:	merci	5
	thank you	

JG:	merci	6
	thank you	
JG:	loads of lovely French cheeses now (.)	7
	[	
VG:	smells gorgeous	8
JG:	what sort of cheese do you fancy?	9
	(vendor hands over cheese)	10
JG:	merci	11
	thank you	
Vendor 2:	voilà	12
	here you are	

In this extract, the presenter and her daughter are shown to interact as clients with the local vendors in service encounters, using brief, formulaic phrases in French. Interaction is minimal and the vendors appear as anonymous and fleetingly encountered servers/helpers on the tourists' journey across the country. The edited nature of the extract, which involves two service encounters in which goods are selected, accepted and paid for, lasts only 13 seconds. This makes the exchanges look even more brief but also more efficient and successful; use of the host language is made to look effortless and no real obstacle to buying food. Additionally, French adds local flavour and authenticity to this episode, even though it does not go beyond the most stereotypical foreign language textbook/tourist phrasebook repertoire.

A similar encounter, in which the desirability of the 'authentic' experience of buying local produce using a local language, and succeeding, is demonstrated in Extract 3, where Mary Nightingale tries out her Italian in a Tuscan delicatessen.

Extract 3 Wish You Were Here?, 26 February 2001 Mary Nightingale in Italy

MN:	(voiceover) the hotels provide packed lunches for around seven pounds	1
	but I think it's <u>much</u> more fun to go to a local shop (walks into a shop)	2
MN:	(to shop assistant) er prosciutto	3
	ham	
Assistant:	prosciutto (.) prosciutto della casa	4
	ham (.) *our speciality ham*	
	[ ]	
MN:	(hesitantly) si (nods) ((si)) ah (.) (voiceover) isn't that gorgeous	5
	yes *yes*	

Again, the use of the host language and interaction with the local shopkeeper are minimal. The presenter's use of Italian invites the shop assistant to use Italian in return, albeit in a simple repetition of the order (line 4). However, in a hesitant attempt at Italian (line 5), the presenter tries hard to maintain the travel frame in a combination of the most rudimentary linguistic skill articulating a singular *si* 'yes', followed by 'safe' or communicatively less entropic strategy of expressing sociability through non-verbal nodding. This is followed by a sudden switch to English voiceover, in which, not unlike the last two lines of Extract 1, the presenter (MN) acknowledges the superior quality of local produce for the benefit of the viewing public and not of the shopkeeper.

Phatic Communion

The third most common function of talk in these programmes is phatic communion – exchanges of 'mere sociabilities' and apparently 'purposeless expressions' (Malinowski, 1923: 150). This again is a type of interaction that tourists might typically be expected to engage in with hosts. Naturally, and as we have already indicated, many of the interactions in our corpus are multifunctional: our next example is no exception, where playful banter is seen woven into a service encounter.

Extract 4 Holiday 2001, 30 January 2001 Craig Doyle in Italy

CD:	(voiceover) the Italians are passionate about food and no one more so	1
	than Massimo one of Siena's larger than life grocers	2
M:	grande grande =	3
	large large	
CD:	= grande	4
	large	
M:	questo è pesto pesto genovese (.) guarda (picks up a packet of pasta)	5
	this is pesto pesto from Genoa (.) look	
	[	
CD:	si si pesto fresh tomatoes si	6
	yes yes pesto	7
	so I need these as well yeah (picks up a tray of blackberries)	8
M:	avanti	9
	let's go on	
CD:	oh yeah	10
M:	tomatoes dried si chiamano ciliegini (shows CD some dried tomatoes)	11
	they're called cherry tomatoes	
CD:	(points over M's shoulder) look at that out there (pops a tomato in his	12
	mouth with a look of mock guilt-cum-innocence)	13
	[	
M:	(looks away briefly)	14
CD:	grazie grazie (.) (CD pays)	15
	thank you thank you	
M:	a posto cosi	16
	anything else?	
CD:	ciche ciche cento	17
M:	no (.) ciche ciche ciu (.) ciao a presto (shakes hands with CD)	18
	bye see you soon	
	[	
CD:	ciao grazie	19
	bye thank you	
CD:	(walks out of shop; voiceover) thank you Massimo	20

Although CD's primary goal in this scene is to buy food for the meal he is going to cook later in the programme, the playful use of Italian and non-verbal behaviour by the presenter and the shopkeeper make it a fairly sociable occasion. They are not just buying and selling, respectively, but apparently having fun. Massimo is cast as an affable caricature of an Italian who is stereotypically

'passionate about food' (line 1). The playful and therefore phatic nature of this encounter is emphasised by CD's Italian–English code-mixing (line 6), mocking repetition of Massimo's utterances (lines 4, 6), and his uninhibited phonetic approximation of Italian regardless of whether it is 'correct' or not (line 17).

Massimo's role in this extract could be also construed as that of an 'expert' explaining/recommending his goods (e.g. lines 5, 11), but the jocular tenor of the interaction makes the propositional content of his talk secondary. For this reason, the Italian in this extract, as the host languages in Extracts 1–3, remains untranslated by the programme makers. What Massimo and CD say in Italian is not greatly relevant, and in CD's case not always 'correct' (line 18). In this moment, CD appears to be attempting to repeat a price given to him by Massimo but which has been edited out. The first part of Massimo's response (line 18) may be a teasing comment on CD's inability to articulate the Italian figure. From the pragmatic point of view, the main aim of this scene is to demonstrate to the viewers the 'ludic' potential of the local language – a sense of pleasurable, but somewhat derisory, play. Admittedly, many of the Italian expressions used in Extract 4 (as is the case with the French expressions in Extract 2) may be fairly easily recognisable to British viewers (e.g. *grande*, lines 3, 4; *avanti*, line 9; *grazie*, lines 15 and 19, and *ciao*, lines 18 and 19) but, again, these are largely politeness formulae which do not carry much semantic weight.

In the next extract, Ingrid Tarrant's exchange with the waiter, who brings her a drink to the poolside, is even more revealing in demonstrating the presenter-tourist's skeletal proficiency in the phatic use of the host language (Swahili):

Extract 5 Wish You Were Here?, 26 March 2001 Ingrid Tarrant in Kenya

(IT on poolside, waiter brings her an exotic looking drink)

Waiter:	jambo *hello*	1
IT:	jambo *hello*	2
Waiter:	our special (.) welcome [	3
IT:	oh asante sana (voiceover) cheers Chris *thank you very much*	4

Here, phatic communion, which is again embedded in a service encounter, is made manifest by the presenter's use of the most basic greeting and thanking formulae in Swahili. In this way, the viewing audience is reassured that a close encounter with a host, even in a most unfamiliar location, requires little more than a couple of routine, courtesy phrases to cope with a simple service transaction. As such, the ludic quality again emerges in the knowledge that, in such status-unequal interactions, no talk is strictly necessary – let alone in the potentially more effortful 'foreign' language.

The use of host languages for phatic communion in the holiday programmes does, of course, transcend the mutual displays of civility between tourists and hosts. When we consider the occurrence of such exchanges with the primary orientation to the audience, they become

characteristic unique to the travel destinations – 'local language'. For example, the interplay of host and audience orientation in Extract 6 makes it clear that the exchange of the Fijian greeting *bula* between the presenter, John Savident, and a local shopkeeper, is used only to invoke the sound of host language as part of the presenter's elaboration of his point about how 'friendly' Fijian people are.

Extract 6 Wish You Were Here?, 22 January 2001 John Savident in Fiji

(JS apparently wandering through a market place)

JS: away from the hotel the town of Nandi [sic] is just ten minutes away (.) 1
Fiji is such a friendly place and you're always greeted with a big smile 2
(cut to a woman smiling) and a call of ((BULA)) the local greeting 3
(to a street vendor) bula 4

Vendor: bula bula John (JS continues walking past her stall, laughs to her) how 5
are you bula bula la la la 6

In this example, both the presenter's and the local's use of Fijian is limited to a single greeting formula, mixed by the vendor with the English greeting 'how are you' (lines 5–6). Note that it is the host again, as in Extract 5, who switches to English, which subverts her role as a 'local' limited to speaking the local language. Interestingly, in an almost imperceptible televisual faux-pas, the vendor greets the presenter by his first name, which clearly indicates the rehearsed nature of this scripted encounter and suggests that the interaction is 'set up' for the sole purpose of 'staging' friendliness with the addition of the authentic feature: the Fijian greeting.

Naming and Translating

The Fijian location provides an example of the fourth main category of local language use – naming and translating. In this function, the local language is used to denote such things as local artefacts, dishes or place names. Extract 7 shows John Savident in the same piece providing names or labels for traditional housing and dress.

Extract 7 Wish You Were Here?, 22 January 2001 John Savident in Fiji

JS: (looks at camera) and just a shell's throw from the beach (.) your very own 1
((bure)) (points to a bungalow; 'ethnic' music plays in the background'; cut to a 2
camera pan of the inside) (1.0) (voiceover) a traditional thatched Fijian 3
bungalow (3.0) (shot of room in a bungalow) (walks on the beach) do you like 4
my sarong by the way? (.) here they're called (.) ((sulu)) 5

The above extract operates wholly as a direct address to the audience. The visual imagery of the bungalow and JS walking on the beach is accompanied by the sound of 'ethnic' music. Together with the mention of the two Fijian words (lines 2, 5), unlikely to be remembered by viewers, this scene creates an authentic and exoticised vision of the destination. But there is a paradox here. Apart from using 'strange' words, the same local concepts are also labelled with two, more easily recognisable terms: 'thatched bungalow' and 'sarong', and these acts of

naming also render the exotic more familiar, adding to the programme's construction of a holiday destination as simultaneously adventuresome and safe.

Extract 8 shows the presenter learning some useful phrases in Korean – translation equivalents of toasting formulae – with the help of a local couple. Here, the act of translating and invoking a local phrase is jointly performed by the presenter (CD) and one of his hosts (KK)

Extract 8 Holiday 2001, 20 February 2001 Craig Doyle in South Korea

CD:	so I met BBC correspondent Kevin ((Kin)) and his girlfriend ((Mirren))	1
	in one of the street bars where he introduced me to the local tipple soju	2
	which will be my reply next time I'm offered a glass	3
KK:	in the UK you say cheers in Korea you say ((gum-bae))	4
CD:	((gum-bae))	5
KK:	((gum-bae gum-bae::))	6

Sharing toasting formulae is an easily recognisable, phatic accompaniment to drinking in a linguistically mixed group and viewers are likely to find such behaviour unremarkable and possibly, even, familiar from their own experience. The use of a host language here, again, has the dual function of exoticising the destination while depicting a customary social situation.

At this point, and before we move on, we would like to note our intention *not* to promote an unduly sinister or one-sided agenda for the presenters. First, of course, they are themselves one of many agents in the production of these programmes, along with directors, editors, script-writers and so on. What is more, as we discuss in some detail elsewhere, there is undoubtedly a complex, complicitous relationship between tourists and hosts (Thurlow *et al.*, forthcoming). As such, to some extent at least, it is possible to view presenters and local people in the holiday programmes as being engaged in a kind of 'commercial' relationship. As Harvey (1992) notes from her own research, local people are rightly capable of exploiting the power of the media and it is not always possible to second-guess their 'political consciousness'. Nevertheless, as long as programme-makers and presenters hold ultimate editorial control, they continue to control the mechanisms of representation. As such, and in accordance with the fundamental principles of CLA, the resulting text is no accident, and the overall impression created an ideologically forceful one.

Metalinguistic and Metapragmatic Comments about Host Languages

One aspect of the direct address of the audience that merits separate discussion is that of metalinguistic and metapragmatic comments (henceforth 'metacomments') on the use and mention of host languages. So far our discussion of overt orientation to the audience has focused on the presenters' use of voiceover (e.g. Extracts 1, 3, 4, 5), body posture and looking at the camera (e.g. Extracts 1, 7), as well as editing of video footage to produce a quick succession of unconnected exchanges (e.g. Extracts 2, 4).

A close examination of some data extracts containing metacomments on host languages confirms that there is often an ulterior motive in their use in these programmes, and that it goes beyond the functions we have discussed so far. In fact, expert talk, service encounters, phatic communion and naming/translating in host languages, should be primarily considered in terms of their viewer-orientation. We have alluded to some of these functions above. In this section, we specify them in more detail according to the following overlapping themes: *having 'fun', out-grouping of hosts*, and *creating a linguascape of the travel destination.*

As we have already begun to show, the unquestionable and unsurprising message coming from all the holiday programmes is that holidays are 'fun'. Even if the educational aspect of travel is included in the programme (usually in very small doses), it is subordinate to the consumerist and hedonistic goals realised through attention to the tourist's comfort, efficiency of service, the pleasures of eating and drinking, shopping and generally engaging in all sorts of *fun* activities. In most of our examples (with the notable exception of Extract 12 below), the presenters are also shown having fun with host languages. It may not be everyone's idea of fun, but the message to the viewers is that managing simple interactions in host languages is not only possible but also rather pleasurable. Consider the following example, in which the presenter tries out a phrase she has presumably learnt from her phrase book (or her producer).

Extract 9 Wish You Were Here?, 22 January 2001 Lisa Riley in Spain

LR:	(voiceover) it's well worth taking a wander up the side streets off the square (camera on LR and friend) where you can find traditional tapas bars just like this one (points to bar) ((shall we take a look)) (LR walks to bar; to barman) hola me puedes dar la carta por favor? *hello can you give me the menu please?*	1 2 3 4
Barman:	(hands over menu) ((unclear))	5
LR:	gracias (to camera, cheerfully) been learning that all day (giggles) *thank you*	6

Although the presenter's comment in line 6 gives the impression of the host language as being 'difficult', her cheerful tone and the giggling suggest a degree of pleasure in using Spanish, and succeeding in achieving the transactional goal of the utterance (requesting and receiving the menu). Arguably, LR uses an otherwise inappropriate, familiar address-form (i.e. second-person *tu* rather than third person *Usted*), which may again betray the prior, off-screen interaction needed to stage the scene as a spontaneous encounter. Nevertheless, picking up a formula in a foreign language is construed as an enjoyable accomplishment, which despite its rote learning and limited scope, gives the speaker a sense of fluency in L2 (Coulmas, 1981; Wray, 2002).

As we noted at the beginning of the paper, an important function of metalanguage includes making judgements or expressing attitudes towards the speakers of different accents, dialects or languages, which serves the purpose of drawing social boundaries between 'self' and 'other', reinforcing similarities and differences, respectively. In our analyses thus far, we have also pointed to the inclusion

and exclusion by presenters of local people from the performance frame. Indeed, the idea of 'othering' of local people in tourist destinations is not new (for overviews see, e.g. Morgan & Pritchard, 1998; Thurlow *et al.*, forthcoming). In this paper we prefer to use the term out-grouping, since, in the context of the holiday programmes, hosts are usually portrayed superficially and tokenistically (Jaworski *et al.*, 2003) but usually without the baggage of pejoration, marginalisation, homogenisation and de-authentication typically associated with 'othering' (Coupland, 1999). After all, the primary message of the holiday programmes is that the holiday destinations are 'safe', and so are their hosts.

Linguistically, the out-grouping of hosts in the holiday programmes is achieved through metacomments drawing the viewers' attention to the fact that host languages are incomprehensible and that they require translation.

Extract 10 Holiday 2000, 21 November 2000 Kate Silverton in Spain

	(KS sitting at a beach bar)	
KS:	(receives a drink from the barman) oh gracias what do **you** *thank you*	1
	recommend I have for lunch now?	2
Barman:	sardinas ((al espeto)) *barbecued sardines*	3
KS:	(cut to grilled sardines on a skewer; soft voiceover) that's barbecued	4
	sardines to you and I (to barman) is that what everybody does on the	5
	beach?	6
Barman:	mainly yeah (.) there's about a hundred of these beach bars and	7
	they all do that	8
KS:	and they're called?	9
Barman:	chiringuitos there's friendly atmosphere on the beach nice	10
	restaurant fresh air from the sea	11
KS:	I think I'll have the (.) sardines	12
Barman:	(to chef off camera) ((UN ESPETO)) POR FAVOR *one barbecued sardines, please*	13
Chef:	(still off camera) HASTA *coming right up*	14

Following the barman's naming of a local dish, the presenter uses voiceover to translate the name of the dish for the viewers (lines 4–5), which, as noted before, explicitly shifts the orientation of the presenter to the viewers. Additionally, the soft voice creates an aura of confidential, secretive communication as if to exclude the host from this communication (which obviously is the case). Besides, the presenter's comment 'to you and I' (line 5), overtly separates the barman, and by implication all other hosts, from the community of actual and implied (British) tourists.

This example is certainly not unique. The following extract includes a similar use of translation and an in-grouping/out-grouping comment.

Extract 11 Wish You Were Here?, 22 January 2001 Lisa Riley in Spain

LR:	(voiceover) there's more to Marbella than sun glitz and glamour (.)	1
	take a short stroll up from the main street and you'll find the old town	2

–	(2.0) this beautiful quarter is centred around the Plaza de Naranjos	3
. . . .	(camera on sign) orange square to you and me	4

Although the last two examples suggest some difficulty in understanding local place names or reading local menus, they are resolved positively by the presenters/tourists finding out their meanings (even though if it is only the approximate meaning as evidenced in Extract 11, line 4 – *naranjos* translating as 'orange trees', not 'oranges' or the colour orange). Again, there is a ludic promise of coping with, but also playing with, host languages and, by implication, local people and culture more generally.

In the next extract, however, the incomprehensibility of the host language is posed as a more serious problem.

Extract 12 Holiday 2001, 23 January 2001 Kevin Duala in Italy

KD:	(voiceover) but Turin hasn't needed to chase the tourist lira (.) it was a	1
	wealthy city especially in 1861 when Turin became the first capital of	2
	the new united Italy (.) Palazzo Real was the official residence of their	3
	first king (shot of Palazzo Real's decorative ceiling, cut to a group of	4
	tourists with a guide speaking Italian, cut to KD speaking to camera with	5
	mock horror intonation and facial expression) the entire tour is in Italian	6
	but you've got to book on the tour to get in (1.0) (glances at guide) I	7
	can't understand a word (to camera) no capito (gesticulates 'no')	8
	I don't understand	

In Extract 12, the guide's talk (untranscribed here, see line 5) is portrayed as truly 'incomprehensible', as the presenter's metapragmatic comments (lines 7–8) reveal that his competence in Italian does not go beyond the level of phrasebook expressions such as *no capito*. The presenter's paralinguistic and non-verbal behaviour also communicates an aura of disbelief at how tourists can be made to do something as useless as joining a guided tour in a language they do not understand. The relational aspect of this example, such as seeking sympathy with the viewers, emphasises the sense of solidarity and in-groupness among the tourists (the presenter and the implied tourists at home) in the face of irrational and unaccommodating hosts.

What is also really apparent from Extract 12, is how the use of Italian by the expert host is presented as meaningless babble; it is in this way that the 'foreign' language is thereby rendered an untranslated linguascape. In fact, one of the most successful ways in which out-grouping is achieved in these holiday travel programmes is through the general disattention to the languages of hosts and their relegation to mere backdrop. Even in Extract 10 above, for example, both the presenter's and the local person's use of Spanish politeness formulae (lines 1, 14) and the naming of a local dish (lines 3, 10) again also serve to create a linguascape.

Although British holiday programmes position English as the international medium of communication (see Jaworski *et al.*, 2003), host languages are used frequently to authenticate holiday destinations in the same way as, for example, the shots of local people and scenery; sampling, descriptions and evaluations of local food and drink; and references to the places' history and customs. In this

sense, host languages create 'linguascapes', together with other uses of the soundtrack, for example, when 'ethnic' music is played (cf. Extract 7), or when in an episode from Egypt, a wall covered with the hieroglyphics in an ancient tomb is accompanied by music from the film *Raiders of the Lost Ark*. In the following extract, French is used phatically between the presenter and a group of local people (lines 6–8), but the subsequent voiceover by the presenter (lines 8–9) again reframes it as linguascape.

Extract 13 Holiday 2000, 14 November 2000 Craig Doyle in Mauritius

CD:	(to camera; walks along the buffet table with chefs preparing and	1
	serving dinner) so what we have tonight is Indian food with a little	2
	twist of Mauritian we've got tuna kebabs there and a bit of roast	3
	deer leg with spices being sliced we've got some pancakes being	4
	made (.) an:d lots of spices and coconut being sprinkled on	5
	(to the chefs behind the serving table) bonsoir	6
	good evening	
Various voices:	(softly) bonsoir	7
CD:	bonsoir (cut to Mauritian landscape; voiceover) yes don't let the	8
	fried rice and fish curry let you forget that this is a French	9
	speaking island	10

The greeting exchange in French is clearly initiated by CD for the benefit of the viewers to 'warn' them that the apparent familiarity of the cuisine associated with the Indian subcontinent, and its widespread use of English, does not bring the promise of English being a 'safe' medium of communication in Mauritius.

Importantly, this use of sound-bursts (as opposed to snapshots) to create an aural backdrop or 'linguascape', begins to reveal a far more multi-sensory tourist landscape – something which, as we noted earlier, has traditionally been overlooked in theoretical discussions of tourism (see Franklin & Crang, 2001). In the remaining part of the paper, we develop this analysis further, dividing discussion into two parts: first, we review and elaborate on the significance of the use of host languages in the holiday programmes and in the domain of tourism in general; second, we offer an interpretation of the data in the light of a broader sociolinguistic framework of language 'crossing' (Rampton, 1995).

Host Languages: Linguascaping the Exotic in Tourism

In all of the above examples, whether presenters' explicit metacomments are present or not, the performance frame, in which the presenters narrate their experiences and engage with the hosts, appears to be subservient to their orientation to the TV audience. Performing phrasebook dialogues, offering translations, providing local terminology, and so on, not only make host languages accessible but also help the viewers to familiarise themselves with the destination as a whole. At the same time, the use of host languages serves to create a more authentic atmosphere in the holiday programmes and thus contributes to the entertainment aspect of the programmes. I

another form of 'fun' activity on a par with trying different local culinary specialities or learning new skills such as sailing, horse-riding, skiing and so on. Although host languages are sometimes portrayed as being difficult to learn or impossible to understand, trying them out in different situations is seen to be enjoyable.

Overall, in the TV travel programmes examined in this study, the use of local languages is quite limited. Certainly, this could partly be explained by the short duration of the coverage of any one destination, which is commonly in the order of three to six minutes (Rice, 2001); it may also be due to the linguistic profile of viewers. The functions for which local languages are used in these programmes are also limited, centring around expert talk, service encounter talk, phatic communion and naming/translating – all types of interaction that a tourist might expect to have on holiday.

As we have discussed them, holiday programmes as a genre are inherently instances of performance. It is also important to remember that TV holiday programmes, although providing viewers with information about particular travel destinations, are broadcast at peak family viewing times and hence also have the function of entertainment. It is this underlying viewer orientation in production values which persists in the use and representation of local languages. Doug Hammond, Executive Producer of *Wish You Were Here?*, has been quoted as saying, 'If the audience is not entertained, there will be no audience' (Rice, 2001: 7). Arguably, in this sense, TV travel programmes constitute a cultural product which is designed to be consumed regardless of whether viewers actually intend to travel to the destinations covered. However, as Rice (2001: 6) reminds us, it is also true to say that the programmes 'play a crucial role in both influencing us about our holiday choices and showing us aspects of life in other countries'. Representations of local people and their language(s) are therefore important considerations in revealing their ideological bases in terms of intercultural/international communication.

In addition, the frame of the TV screen is also indicative of the ideological frame surrounding tourism more generally. Urry suggests that the 'frame' through which tourists experience their holidays, 'the hotel window, the car windscreen or the window of the coach ... can now be experienced in one's own living room' (Urry, 2002: 90–91). According to Urry, Feifer's (1995) so called 'post-tourist' 'does not have to leave his or her house to see many of the typical objects of the tourist gaze' (2002: 90). Moreover, in the TV travel programmes, the tourist destinations are mediated through a consistently anglophone lens, made safe and accessible by being translated – thus Cronin's (2000: 95) observation once again that, for speakers of powerful languages, 'the other is always already translated'. Generally, hosts in the tourist destinations are shown to speak English and, when the presenters do use other languages, it tends to be to enhance the entertainment level for the television viewer rather than to serve any other communicative need. As such, the ethos of the programmes positions English as a global language and British (native) speakers of English as global, or at least globe-trotting, citizens. Local languages, meanwhile, are reduced to the status of rubber-stamp phrases from guidebook glossaries, co-opted for the staging and authenticating of unproblematised, exoticised linguascapes. This is the aural equivalent of precisely

the kinds of 'mediatized motifs' and 'key exoticisms' which Edensor (2001: 67) highlights in his discussion of visual performance in tourism; as he suggests, 'through the use of such 'scenography' the tourist gaze is directed away from extraneous chaotic elements, reducing visual and functional forms to a few images'.

Host Languages: Crossing and a Community of British-International Tourists

We have already suggested that by using a variety of languages in holiday programmes, presenters can demystify holiday destinations and reassure the implied tourists that language is not necessarily an obstacle to successful travel. Host languages add exotic flavour to the destination and can be used with relative ease to get things done (e.g. facilitating service encounters, as in Extracts 2, 3), or to have fun with, or to poke fun at, local people (e.g. while socialising, in Extract 8). And, in the worst possible scenario, if a host language *is* a problem, it, and its speakers, can simply be ignored (Extract 12). There is, however, also a relational aspect involved here as well. The presenters in the programmes are cast in a kind of two-fold tourist role: both as tourists in their own right (thus 'presenter-tourist') and as role-models or proxies for 'viewer-tourists' – a kind of Every Tourist or 'tourist-tourist'. Through participating in various holiday activities, the presenters' main allegiance is to the viewers, not hosts, and all that we see them do in the programmes, including 'conversing' in host languages, is geared towards creating a sense of involvement with and for the viewers – what in media psychology would be referred to as a parasocial relationship (Rubin *et al.*, 1985).

In her study of the use of 'mock Spanish' by Anglo-Americans in the United States, for example, Hill (1998/2001) demonstrates how apparently jocular incorporations and ungrammatical approximations of languages other than English are employed by non-native speakers. Following Ochs' (1990) earlier notion of 'direct indexicality' (i.e. the production of non-referential meanings), Hill argues that playful, flippant snatches of, in her case, Spanish-language materials, serve to elevate the identities (or 'Whiteness') of Anglo-Americans. To our mind, therefore, and extending our earlier discussion about out-grouping/in-grouping, much the same argument may be made for the use of phrasebook expressions by presenter-tourists and the general linguascaping of the tourist landscape; in this case, however, it is the elevation and constitution of a *Britishness* which is at stake.

In fact, we would like to argue that TV holiday programmes' main aim is to create for the viewers a sense of belonging to a *community of (international-British) tourists*, and that this is achieved largely through the presenters' specific exploitation of the sociolinguistic resource known as 'crossing' (see Rampton, 1995, 1998, 1999), which is the use of a language (or variety) of a group which the speaker cannot legitimately claim membership of.

As far as our data are concerned, all uses of host languages by the holiday programme presenters fit many of Rampton's defining characteristics of, and explanations for, crossing. In these terms, therefore, our data may be recontextualised in the following ways.

- Crossing occurs or results in liminal or liminoid (Turner, 1977) moments and activities, i.e. when routine expectations about the flow of events is suspended – holidays (represented in our data as 'holiday programmes') are a liminal/liminoid activity *par excellence* in taking tourists to a world beyond the ordinary world (Selwyn, 1996; Urry, 2002); they usually involve the suspension of everyday norms of behaviour (dress, cf. Extract 7, eating and drinking habits, cf. Extract 8; daily routine, sexual behaviour, communicative patterns, etc.).
- Crossing occurs in the context of ritual and performance art – holiday programmes are media performances staged for mass audiences; they involve scripted, fairly routine accounts of the experiences of travel.
- Crossing occurs at peripheral stages of interaction requiring negotiation of participants' status – most interactional code-crossing in the holiday programmes involves greeting, parting and other politeness formulae in service encounters or in phatic communion; even though status roles in these encounters are seldom ambiguous, crossing may be used as a means for the presenter to assert or reclaim status.
- Crossing occurs in games, which suspend everyday rules and constraints of interaction – playful interactions with hosts in a host language require the adoption of new rules and lengthy preparation (cf. 'been learning that all day', Extract 12, line 6).
- In contrast to in-group code-switching, which is largely unexceptional and unremarkable to the social actors in everyday situations, out-group code-crossing 'is much more likely to be 'flagged' (for example, 'marked by pauses, hesitation phenomena, repetition and metalinguistic commentary', Romaine, 1988: 141)' (Rampton, 1995: 282) – instances of host language use in the holiday programmes are frequently brought to such prominence, especially through metacomments (cf. Extracts 9–12);
- Due to its de-routinisation and the effect of incongruity that crossing may have on some participants, it requires extra inferential work – the uses of host languages transcend their propositional meaning, their main inferential value lying in invoking the images of authenticity and exoticisation on the one hand, and familiarity and trust in a holiday destination on the other;
- Crossers' proficiency (spoken or listening) in the semantico-referential dimension of the out-group language may be quite minimal – in the holiday programmes presenters often display minimal knowledge of host languages (cf. 'no capito', Extract 12, line 8).
- Minimal significance of the propositional content in code-crossing finds compensation in the greater significance of the expressive meaning, which may be augmented, for example, by music – holiday programmes use host languages alongside with music and other incidental noises to create the kind of linguascapes described above (see line 2, Extract 7).

If our characterisation of host language use by the holiday programme presenters as crossing is right, this has certain consequences for how we characterise

the orientation of the presenters to their hosts (into whose languages they cross), and the TV audience (for whom they do the crossing). In this sense, our examples of crossing also evoke Bell's (1999) notion of 'referee design', by which he means style-shifting in the direction of linguistic forms associated with a group different from that of the speaker *and* addressee. What is more, this group is often also absent from the communicative situation. One especially pertinent example discussed by Bell is the use of a Mâori song *Pôkarekare Ana* in two Air New Zealand TV commercials. In one of the commercials, the song provides most of the sound and verbal track as background to the rich and varied visual imagery including Mâori people as the exponents of the New Zealand nation, middle-class Pakeha (i.e. of European descent) New Zealanders in the context of international travel (e.g. at airports), New Zealand scenery and birdlife. With a voiceover in English, the song is performed in Mâori, which is a non-native and an out-group language to both the performers (including the opera singer Kiri te Kanawa) and the target audience for the TV commercial (middle-class Pakeha New Zealanders). Mâori therefore functions in the TV commercial as a symbol of New Zealand national uniqueness and identity, but paradoxically, the cultural imagery and linguistic association is that with a marginalised, othered ethnic minority with whom the performers of the song (and implicitly the makers of the ad) and the target audience, do not identify.

We find a number of analogies between the use of Mâori in the Air New Zealand adverts analysed by Bell, and the use of host languages in our holiday programmes. As we have already emphasised, the interactions with hosts (in English or host languages) are presenters' performances for the target audience of largely monolingual TV audience in Britain. This renders hosts the absent reference group in Bell's sense. They become a snapshot, part of the tourist's narrative about their travels, places seen, people met, and activities performed. This is where tourist gaze becomes tourist haze: the remembering and the telling of tourist narratives. Just as tourist stories are predominately aimed at 'the folks back home', when British TV presenters report from a 'foreign' country, they report back to the British viewers – both as audience and as 'fellow nationals'.

The use of host languages, together with the imagery of hosts and the scenery of the destination produces short, condensed representations of a destination's 'essence', and gives an impression of its accessibility, but the presenters embrace the identities of the hosts only playfully, in short, 'as if' moments, never claiming a new national identity. This point is also consistent with Rampton's view of the way crossing among British, 'multi-ethnic' adolescents affects locally construed identities in talk:

> First, the intimate association with liminality meant that crossing never actually claimed that the speaker was 'really' black or Asian – it didn't ... imply that the crosser could move unproblematically in and out of the friends' heritage language in any new kind of open bicultural code-switching. Second, crossing's location in the liminoid margins of interactional and institutional space implied that in the social structures which were dominant and which adolescents finally treated as *normal*, the boundaries round ethnicity were relatively fixed. (Rampton, 1998: 300)

By appropriating host languages, the presenters in the holiday programmes never claim to be 'really' French, Italian, Kenyan, or Fijian. On the contrary, more often than not, they emphasise their difference from their hosts. For example, by often sending themselves up as incompetent host language speakers they position themselves firmly as *British* tourists. Different from the hosts and similar to the (implied) tourists in front of the TV screens, their ultimate aim is to create a sense of community of (British- international) tourists with their viewers. Through these programmes, and venturing into host languages, they reassure their compatriots about the safety of foreign travel in these destinations: they can remain British even outside of Britain, finding 'home away from home'. Using host languages may be useful and fun, but only the low-level proficiency required on holiday does not threaten anyone to having to become 'someone else'. Just as Rampton talks about crossing creating new cross-ethnic patterns of identification, we regard crossing in the holiday programmes as creating new cross-national or inter-national allegiances, which allow one to maintain a preferred national identity while momentarily venturing outside of one's own national boundary. Even if one ends up in Italy, France, Kenya or Fiji, becoming Italian, French, Kenyan or Fijian is no more than an optional pretend play.

Conclusion

> When tourists enter particular stages, they are usually informed by pre-existing discursive, practical, embodied norms which help guide their performative orientations and achieve a working consensus about what to do. (Edensor, 2001: 71)

In this paper, and returning to Goffman, we have been concerned with the theatrical scripting of tourism both in terms of the everyday performances of host-tourist interaction and the more stylised, deliberate stagings of the tourism industry. In the holiday travel programmes, presenters are clearly both performer and casting director; where they inevitably cast themselves in the lead role, local people are invariably cast as either chorus/extras or understudies. Together with the programme makers (e.g. directors, editors, script-writers), it is the presenters who get to change and choose participant alignments and status. Local people have little control over their own subject-positioning or footing, and the ground is constantly changed for them as they are shifted from participant to object and back again. Again in Goffman's (1981) terms, theirs is truly 'subordinated communication' – in an interactional sense and also in a sociopolitical sense. In fact, within the framework of CLA, what is even more noteworthy is the underlying promotion of the presenter-tourist as a kind of tourist role-model, effectively saying, 'Here's how we celebrity Brits do tourism; these are the places to go, these are the things to do, these are the ways to be a tourist'. As viewer-tourists, we are thereby encouraged to subscribe to the kind of scripted performances shown us by presenter-tourists, and we are also invited to improvise and play at the expense of local people.

While the staging of encounters in tourism is by no means new to academic perspectives, what we are looking to do here is to approach this issue from the specialised perspective of language and communication. In particular, what our analysis shows is how language comes to be ritualised and commodified in tourism performances – what Jack and Phipps (2002) refer to as the 'languaging and translating' of the tourist landscape. By referring to linguascapes and linguascaping, however, we mean also to reveal the very particular deployment and devaluing of local languages as both backdrop and ludic resource.[5] It is in this way, that, as powerful ideological mediators, TV holiday programmes and their style-setting presenters promote a regime of touristic and intercultural truth about local languages which construct subjectivities for hosts and identities for viewers (cf. Foucault, 1980; Mellinger, 1994). Specifically, host languages are appropriated as a primary identity resource by which visitors may construct themselves as tourists. Furthermore, it is through their playful, transient crossings into local languages that they further position themselves as 'cosmopolitan internationals' – not in the sense of their being culturally engaged with, or embracing of, local people (cf. Hannerz, 1996), but rather with repect to their appeals to the elite caché of global citizenship.[6] These are people freely traversing national boundaries but staying firmly rooted in their mutual identification as (British) nationals.

Acknowledgement

The research for this paper was supported by funding from the Leverhulme Trust (Grant No. F/00 407/D) to the Centre for Language and Communication Research, Cardiff University, for a larger project on Language and Global Communication <www.cardiff.ac.uk/encap/global/>. We thank Peter Garrett and two anonymous reviewers for their useful comments on an earlier draft of this paper. All remaining interpretations are our own.

Notes

1. We recognise that a term like 'host' is inherently problematic and makes assumptions about (a) the relative power status of local people and their motivation to entertain, and (b) the homogeneity of inhabitants who may or may not be native/local and whose role-identities will inevitably vary. We are also not completely happy with the disparaging connotation of 'locals' – itself susceptible to the same homogenising assumption. However, with its apt dual-meaning of a parasitic or symbiotic life-source, we have chosen to retain the label 'host' and to use 'local' only as a premodifier and not in its nominalised form.
2. Holiday destinations featured in the programmes used: UK (16), Spain (14), Caribbean (11), Italy (9), France (8), USA (6), Greece (5), Eire (3), Portugal (3), Austria (2), Canada (2), Egypt (2), Germany (2), Hong Kong (2), Maldives (2), South Africa (2), Australia (1), Cyprus (1), Dubai (1), Ecuador (1), Fiji (1), Finland (1), India (1), Kenya (1), Malta (1), Mauritius (1), Mexico (1), Netherlands (1), South Korea (1), Sweden (1), Switzerland (1), Thailand (1), Turkey (1).
3. Performance as metaphor has become a central point of discussion in critical tourism writing, taking its cue from the early work of MacCannell (1973) (see also Crang, 1997; Edensor, 2001).

4. The extracts were transcribed using a simplified version of Jefferson's (1984/1999) transcription conventions for spoken data. The following conventions were used:
   [(square bracket) – overlapping speech;
   = (equal sign) – contiguous speech;
   underline – emphatic speech;
   CAPS – louder than normal voice/shouting;
   : (colon or double colon) – lengthening;
   (.) – short pause;
   (smiles) – nonverbal and other contextual information;
   ((unclear)) – unclear speech, uncertain transcription.
5. The underlying message this sends to viewers about the value of learning foreign languages is, at best, ambiguous and, at worst, deleterious.
6. Our argument about appeals to global/globe-trotting citizenship is developed further in Thurlow and Jaworski (2004, in press), together with the notion of 'new internationalities' discussed in Jaworski and Thurlow (submitted).

Notes on 'Latency' in Overlap Onset

Gail Jefferson

Introduction

This will be in part a recapitulation and in part an extension of some of the work I did during my two years at the Katholieke Hogeschool Tilburg, exploring the orderliness of overlapping talk. I had been interested in overlap for a long time, and had been noticing evidence of its orderliness. But I had been looking at a few striking, indicative cases. At Tilburg I worked with a mass of materials in which overlap, in one form or another, occurred.

One immediate payoff was this: In the past I had noticed that not *all* overlap was a matter of 'people just not listening to each other', a messy chaotic business, but to the contrary, that it *could*, at least now and then, here and there, be a matter of fine-grained attention. But I'd had no idea just how massively overlap is associated with such attention. In the apparent chaos of overlapping talk, I began to locate a series of systematicities which collected and ordered an enormous amount of material.

I'll be talking about one of those: Transition-space onset.

1. Transition-Space Onset

Looking at talk which might well be characterized as someone starting up 'interruptively', i.e., in the midst of another's utterance, I found again and again that the places at which such talk started were perfectly reasonable 'completion' points.

The overlap could then be seen as a byproduct of two activities: (1) A recipient reasonably, warrentedly treats some current utterance as complete, 'transition ready', and starts to talk, while (2) the current speaker, perfectly within his rights, keeps going.

Source: *Human Studies* vol. 9, 1986, pp. 153–183.

I located a series of 'positions' across the transition space, and I'll just show a few cases of each; an instance of clean transition, and then a couple of instances of overlap.

Possible Completion Onset

1.1 [NB:II:3:R:1]
Emma : G'morning Letitia =
Lottie : = u-hHow'r YOU:. =
Emma : = FI:NE

The equal signs are marking a particular sort of relationship of one utterance to another: an absolute adjacency; immediately as one ends, the other begins.

And it turns out that a great deal of overlap can be seen to be a byproduct of a recipient starting just upon possible completion, with the current speaker going on. I've picked out a few cases in which it seems to me the recipient has particularly good warrant to treat an utterance as completed or transition-ready.

And the overlap can be minimal and unproblematic, as in the following two cases.

1.2 [GTS:I:1:43:R]
Roger : Y'probly ev nutt'na do wih those people.
Louise : Hm:?
→ Roger : Probly ev nothing tuh do with those p*eop*le.
: [huh.]
→ Louise : [I d] o:n't.

The 'particularly good warrant' in this case is that the utterance in question is a repeat of a prior. It turns out to be repeat plus a bit more.

1.3 [MDE:60-1:6:1]
Sheila : Hello:?
Harriet : Hello is Lila home?
Sheila : nNo she's no:t. She:'s et school.
Harriet : Yeh d'you know what time she'd be back in t'day?
(0.2)
Sheila : Zis Harriet?
Harriet : Yeah.
→ Sheila : Hi Harriet. [Uh about fi:ve.
→ Harriet : [Hi:.

And of course the warrant in this case has to do with a 'greeting' as a prototypical adjacency-pair first pair-part, where it's not only that such an object has powerful relevance for a next action, but that having done one, its producer has a certain obligation to permit that next action to occur.

Let me just note that the minimal, unproblematic character of the overlap in this case may not be accidental. Given the relevant identities of these people; that they are connected by the absent Lila, Sheila being Lila's mother, Harriet Lila's

girlfriend, Sheila may be able to project a 'no-name' greeting from Harriet, where 'Hi Sheila' would be too informal for these persons on this occasion, but 'Hi Missiz Lorenzo' would be too formal; the solution, then, a 'Hi' and no more.

So these overlaps occurring at possible completion can be minimal, perhaps achievedly so. But they can become more florid. Again, here are a couple of cases where I take it that the recipient has particularly good warrant to treat an utterance as completed or transition-ready.

1.4 [SBL:3:3:R:5]
→ Milly : O:kay that's all ah wan'duh know
[I thought it w]z mu] c h]
→ Keith : [Y a h w' l
w e w e don' know how much is
↑in:↓come h*ere though,

Somehow 'Okay that's all I wanted to know' has a strong sense of finality about it. But, no, one can perfectly well go on with more.

The last fragment in this little set is another one of those prototypical adjacency-pair first pair-parts, 'How are you?' In this case the one asking the question goes on to produce a candidate answer.

1.5 [Her:0II:2:7:5:R]
Doreen : Yes well pop in on th'way back'n pick it up
Katie : °Thhank you ve 'y much° eh ha-how are you ↓all.
→ [Yer a l]ittle ti:red °nah°
→ Doreen : [Oh wir] all fi:ne, Yes I'm jus: sohrta clearing up

We can note the reasonableness of such further talk for such an item as 'How are you?' That is, it is in the first place merely a pro-forma question which recurrently gets just the sort of pro-forma answer it gets here, 'Fine.' The additional material here provides that there was a bit more to the question than that.

I'll just quickly go through two more positions in the transition space, again showing a case of clean transition, and then a few in which there is overlap, both minimal and more florid. These next two positions entail a slight incursion into the utterance in progress.

Terminal Onset

1.6 [Fr:USI:99:R:2]
((Vic has just accused Mike of having made a statement that 'came from an attitude.' This idiom rather defies translation; suffice it to say it's not a good thing.))
Mike : ↑Din' come f'm'n ↓atti↑too:d? (.) °↑Don'tell me it came↑ f'm 'n ↑atti↓tood.°
(.)
→ Vic : °I ↓came fum↓ en a:ttit[0)°
→ Mike : [Ah ha:h.
↳ Carol : [°Ehka:v.°

I show this particular case because it has two people starting up 'there'. And somehow I find it useful for, in the first place proposing that it *is* a 'there', to have such consensus.

1.7 [Her:I:11:10]
Norma : Oh: yes cz Mi:n:x now is (.) three:: (0.3) three pou:nds
→ eleve [n. ou:nc [es,
→ Doreen : [Ye:s, [Ye:s,

1.8 [NB:IV:1:R:1]
Emma : W't time yih haftih go e:eleven?
(1.2)
→ Lottie : ↓No:: abah a quarduh twe:l [ve twenny] minnis t'twelve.
→ Emma : [O h : :]

1.9 [Rah:B:2:(14):10:R]
((re. why Vera's visiting grandchildren didn't want any lunch.))
Vera : ·h they muucked intuh biscuits. They had (.) quite a lotta
→ biscuit [s'n che] e e ↓ : : : s e,
→ Jenny : [Oh : :] well thaht's it th] en

1.10 [JG:I:8:3]
Marge : Well so anyway I certainly hope thatchu would go with
→ hi [m:beec– hh·hh
→ Colin : [Yeah well tuh tell tell'm [ah'm–
Marge : [BECAUSE HE ha:s already
arranged uhr a h-room up there so I know thetchu'd have a place tih sta:y.

'Last-Item' Onset

1.11 [Her:01:2:2]
→ Jean : So well they won't be here Boxing [Day?
→ Doreen : [Oh ↓ well that
doesn'mattuh

1.12 [SCC:DCD:23]
Sokol : Ah'll tell you'ow she does i:t? ·hhh That's oll sewn
→ tihgethuh by [hay:nd.
→ Bryant : [I thought this wz a very expensive (business)
I, I see [this.
Sokol : [°Yeh.°

1.13 [GTS:I:1:68:R:4]
→ Roger : u-But heck I do the same damn [t h i n g] buh–
→ Louise : [↑Oh ev'ry] b'ddy does
s'sa°↓:me th [ing.°
Roger : [Bud yers wz pretty obvhhi(h)ou:s heh

Note that the overlap in this case is resolved by the current speaker dropping out; i.e., it is not in the first place 'minimal' in the sense that some of the others are.

I've been trying to show very simple cases. I'll just show one – another case of overlapped 'last-item' onset – in which the phenomenon is not so obvious. As it happens, a recipient is 'interrupting' an 'if-then' formatted statement which eventually, after several rounds, turns out to be '. . . if it quiets one thing maybe it quiets . . . your whole . . . gastric . . . kind of business.' What may be happening here is that the recipient is utilizing a simpler version, 'If it quiets one thing it quiets everything,' for which, then, she is starting up at the projected 'last-item'.

1.14 [SBL:2:1:8:R:5]
Bea: VERY often u-*u:: anything thet's given to yuh to:: qhuiet things do:wn quiets mo:re then you wah:nt.
· ((ca. 8 lines omitted))
·
Nora : Well I spoze it does if it quiets one thing maybe it
→ quiet[s yer
→ Bea : [uSURE]ly. [E V RY t h u] EVRY thi:ng.
Nora : [yer w h o :l] e
(0.4)
Nora : who::le gas-s-tric
(0.6)
Bea : E[v– eh–
Nora : [kind'v]business.
Bea : Ev↑rythi:ng. Uh ha:h

So there is this phenomenon: Transition-space onset, speaker continuation, resulting in overlap, it is massively present; obviously so in many cases, more obscurely in others.

This is not to say that *all* cases of overlap are accountable in that way. People do, for various reasons, start up before a current utterance is anywhere near completed or transition-ready. I'll just show a few cases of these. I tried to find a neutral term for them and came up with 'interjacent' onset.

2. Interjacent Onset

2.1 [GTS:I:1:44:R:2-3]
Louise : That's FI:VE TE:N? en tha:t's six foot two:?
(0.2)
→ Louise : 'N how t[all u h r] you ↓A:]l,
→ Roger : [How tall'r] ↓you Al.]
(0.7)
Louise : ih[↑hhuh]↑hu]
Al : [I'm fi]:ve]seven,

2.2 [MDE:60-1:3:1-2]
Sheila : What time did'e get on the plane

Tom : Uh::: (0.2) I: don't know exactly I think ih wz arou:nd
three uh'clo:ck er something a'that sort.
(0.2)
→ Sheila : Oh: maybe he g[o t s'm
→ Tom : [He took it] et fou:r. **Gerda says.**

2.3 [SBL:2:2:3:R:38]
Zoe : an' he sorta ↓scares me,h
Amy : Have you seen im?
Zoe : ·hhh We:ll I(m) I've °↓met eem,°
→ Amy : ·hhhhh W'l *uh actually:
→ Zoe : [when s h e's
[En the way th] e:y ↓pla:y. Oh–:
(.)
Amy : Serious huh?
Zoe : ·h ↑Y-ah,

2.4 [NB:II:4:R:16]
Nancy : He's jist a ri:l sweet GU↓*:y. ·h ·t[·hhhhh
Emma : [↑WONder↓f*ul.
→ Nancy : ↑So: we w'r[s*itting in
→ Emma : [Y E R LIFE] is CHANG[ing
Nancy : [↑↑EEYE::A:H

Among the cases I had stuck together as 'interjacent onset', I had a subset that I was calling 'post continuation onset'. In these, a recipient would start up just after the current speaker had produced a clear indication of going on, following a possible completion. Here are a few of these.

2.5 [SBL:3:1:R:6]
Amy : all thetu stuff Maryou:? requires a lo:↑tta spa↓*:ce.
→ Ah me[a:n][i h]·hhh
→ Marylou : [Spe] [cially] if yer gonna have it open fuh the
public,

2.6 [Fr:GS:4]
Mary : hn (h)he shiz we:ll, (0.5) u-ghesshu get ha:lf
→ en[I sid I GET M O]RE THEN H(h)ALF
→ Sue : [Wuh year wuzit?]

2.7 [SCC:DCD:26]
Bryant : that brai:ding that wouldn't of bean touched with'n
→ i:yn. The m[o:st we'd of done]
→ Sokol : [O h : n o a : w] right, steam

2.8 [NB:IV:4:R:4]
Emma : cz you see she wz: depending on: hhim takin'er in tuh
→ the L.A. deeple s:– depot Sundee so['e siz]
→ Lottie : [Ah:'ll] take'er in:

And that's a reasonable enough place to 'interrupt'. For example, if what has been – adequately and syntactically possibly completely – said so far is something to which a recipient wants to respond, and now it looks like the speaker is at least continuing and perhaps moving on to other matters, then one might want to get in now, while the initial matter is still relevant, even if it means interrupting.

Or, for example, as in the following fragment, the utterance in question might itself be treated as interruptive of something prior. This is taken from an interview of a group of young girls. One of them, Cindy, produces an utterance which could be just a remark, but could also be a story preface. Another, Kathy, then produces a similar sort of utterance. After a first possible sentence completion, Kathy starts a next clause, and simultaneously both the interviewer and the initial speaker, Cindy, make a move; the interviewer asking a question which will provide for a story being told, the initial speaker simply continuing her story.

2.9 [Labov:Quadro:I:1720:5:Simplified]
Cindy : Th:ey got mad on Friday though I dint get home t'leven thirty,
Debbi : ·hhhh [ ] Oh:::::::
→ Kathy : Yeh my mo [ther wz kinda mad I [din get
→ Louella : [Where were you.
→ Cindy : [En I had the ca:r, I don'know we were just– we went t'the basketball game . . .

So it looks like this is certainly some kind of 'there', a place for another or others to start up. Now, there was one really puzzling bunch of these things: someone would start at this 'post-continuation' place, and then immediately drop out. For example:

2.10 [Fr:USI:43:R:2:Simplified]
Mike : Least'e c'd'v] done wz c'm dah::n en letchu know w't
→ happ'n hey [look yi] h gla:ss broke,
→ James : [Tha:t–

2.11 [Her:III:1:4:2-3]
Desk : Just one moment I'll uh he's in uh–actually in suhr:gery
→ et the moment ah'll [see'f I c'n get hold of [him,
→ Heath : [ee– [eeYe:s,

2.12 [SCC:DCD:9]
Phipps : Didju hev it ma:de (0.3) ju– soon ahftih you bowt th'
→ m'terial? ohr ohr ↓lay::tuh. Was i [t in] Febru'ry:
→ Sokol : [W'l I]

2.13 [NB:II:1:R:12-13]
Emma : °God ih° jist like a night ma: [re,
Lottie : [Ihd e-seems like a

→ fairy storeh I [: couldn'believe it.
→ Emma: [I–

2.14 [GTS:I:1:50:R:1-2]
Dan : it is part a'the function a'°th'↓group to begin d'sha:re°
→ in° ↓some a'these things
so [: the others c'n understand . . . °
→ Roger : [W'l

The question was, what on earth is this? They start up after it's obvious that someone is continuing, and then do this 'oops sorry' and drop out. I kept collecting the things, with this sort of question in mind, and after awhile it occurred to me that I'd got it wrong. Maybe they're not starting up 'post continuation'. Maybe the way to characterize where they're starting up – and this would handle, account for, these immediate dropouts – is that they're starting up by reference to the possible completion which precedes the continuation.

Further, there is a massively recurrent, systematic position for next speaker startings, which these things might be treated as instances of. It's another transition-space position. Where, then, just as the other 'transition space' onsets can end up in overlap as the current speaker continues talking, so can this one. I'm calling this position 'unmarked next' position.

3. 'Unmarked Next' Position

I call it 'unmarked' simply because in my transcripts I don't use a symbol to show this particular relationship. A recipient/next speaker produces his talk in such a way that it occurs with neither haste nor delay. It is not pushed up into or latched immediately onto the prior utterance, but permits just a bit of space between the end of the prior and the start of the next. It is 'simply next'. And I have the impression that this is the most common, the usual, the standard relationship of one utterance to another. Here is an instance.

3.1 [NB:I:1:R:1:R]
Curly : Hello:?
Bud : Curly?
Curly : Ye:h.
Bud : Bud Hoffmeier.
Curly : Hi Bud how you doin.
Bud : Fine.

To get a sense of 'unmarked next position' as a locus of overlap I'll sneak up on it gradually, starting with innocuous cases.

For example, there are cases where the overlapped material, while it might well indicate that a current speaker is 'going ahead', does not constitute 'talk' as such. Rather, the speaker is taking a breath, perhaps in preparation for further

talk which does not seem to be of the sort which would motivate 'interruption'; such things as brief 'receipts', 'acknowledgement tokens', etc. The resulting data is innocuous to the point of vacuousness.

3.2 [SBL:2:1:6:R:3]
Tess : becuz I wz going dih haftih get out (.) early in the
morning I have (.) a p– (0.3) transaction et the
→ ba::nk.,·h (__) [hh
→ Bea : [↓Ya:h.
Tess : A:nd uh ·p but it wouldn't a'made any diffrence **cuz ah**
→ wz gunnuh dress t'guh down'n do it
anyWA:Y.,·h (__) [hh
→ Bea : [↓Ya:h.

3.3 [Her:I:11:12]
→ Doreen : en Jonathan's gone tuh Kingston fer a meeting,
·hh h
→ Norma : (__) [Oh:.

3.4 [MDE:60-1:5:1]
→ Sheila : they were already off someplace so Tony
called.,·hh hh
→ Erma : (__) [Oh:.

But these little receipts and acknowledgements also occur 'in the midst' of another's talk; specifically, after it is clear that a speaker is going ahead after a possible completion.

3.5 [Rah:B:1:(13):3]
Jenny : I think she's got a– uh–m: one a'those: uh **permanent**
→ caravahns. (up) [in: Gro] ze↓da: [le.
→ Ann : (__) [M m:] [A:oh.

3.6 [NB:IV:3:R:5]
→ Lottie : becuz they would really be the Spri:ng.
(Let)' [s see tha] t's twunny fi:'dollars . . .
→ Emma : (__)' [Y e a h.]

3.7 [SBL:3:5:R:4]
→ Milly : Well that's it (an)' [it's diffrent then I've e:ver ↑lived
→ Ginny : (__)' [°Yah°

3.8 [Owen:8B15(A):36]
Bette : It really keeps you going actually hol– ah mean both
→ looking forward an'looking ba:ck. (on th)' [holiday . . .
→ Andrea : (____)' [Ye:h

3.9 [Friedell:30]
Hank : Well we better not spend three hundred fifty a month
→ (we) [better be able tuh hold it, (0.6) three hundred,

While in fragments 3.2–3.4 a current speaker may be not only pausing for breath but making a space for various orientation signals from a recipient, in fragments 3.5–3.9 no such opportunity is provided. That is, the recipient is producing such a display just after a speaker has shown that no such thing is called for.

This phenomenon could be accounted for if the recipient/next speaker was designing his talk by reference, not to what occurred immediately prior to the start of his own talk, but by reference to what occurred a bit earlier; i.e., the possible completion of the other's utterance.

The design of the recipient/next speaker's talk could be characterized as providing a bit of space between the two utterances. The bit of silence, then, being part of the recipient/next-speaker's work in the first place.

It would not then be a matter of an utterance reaching possible completion, a silence occurring, and the recipient/next speaker understanding thereby that the prior turn is completed, whereupon he starts to talk, as is sometimes argued. Rather, as is nicely evidenced by 'last item' onset and 'terminal' onset, upcoming completion is projected as the talk in progress is unfolding. In the cases at hand, it may be that the recipient/next speaker undertakes to produce a particular, standard sequential configuration, with a small inter-turn space as a projected part thereof.

What the recipient/next speaker is doing, then, might best be described as producing an action which consists of: permitting a bit of space and then starting to talk.

Now, such an action might not have the recipient/next speaker in such an orientation as would have him listening for or attending to the occurrence of that small particle of sound inhabiting the little silence he is now, as part of his activity, providing for. He is, as it were, in a 'blind spot'. He is no longer in recipient orientation, but in a state of speakership, although he is not yet producing sounds.

Such an account handles these 'post-continuation' acknowledgements and receipts, and also the set of 'post-continuation' onsets followed by immediate dropouts (see fragment 2.10–2.14). They are not being produced 'post-continuation', but 'post possible completion plus a bit of silence'. That is, they are being produced to occur in 'unmarked next position'. As with other transition-space onsets, they happen to collide with a current speaker's producing further talk.

The possibility of a systematic, designed 'latency' in a recipient/next speaker's talk provides for an orderliness to some other sorts of overlap.

I'll mention two. One of them I haven't done any work on, and the data are often very messy. But they might at least partially be accounted for if this 'latency' is produced not only by recipients, but by speakers as well. That is, in a sort of correlate to the way in which a recipient might shift into speakership orientation and not listen for or hear a particle of further talk, a speaker having reached a point of possible completion might not shift into recipient orientation but maintain speakership orientation, and thus not listen for or hear that a recipient has started to talk. The speaker, then, could be characterized as providing a bit of space between two adjacent activities, and/or two adjacent syntactic components.

I haven't systematically collected these, but here are a few cases that will do for the time being

3.10 [SBL:2:2:3:R:38]
Zoe : well with Bud? en the way he says I'm not bid uhhh·w(h)'l
(h)if you s(h)ay two(h)o sump'n then I'm not gunna bi:d,
→ ·(hh) [hh [I] ↑don't] think Elva si – Elva would =
→ Amy : = (Oh th ey) don't ·hh
Zoe : = take that kindly

3.11 [SBL:2:1:8:R:12]
Nora : En the] little edge ed curled up'n wz showing re:d.h
→ · hhh [h [En ah thought gee wh] iz what's thi:s.
→ Bea : (Oh f e r g'dness °say°)

3.12 [NB:IV:10:R:50]
Lottie : we bought s'm hats et Wah uh Wal:d-u-er Cla:rk's they
had uh: those uh (0.2) fisheen ha: [ts yih] know
Emma : [Mm:] hm:,]=
→ Emma : =(doze lid) [dle] (badges)] Yeh]
→ Lottie : *a- do:llar] so I] : bought one fer he↓:r,

One that I have collected systematically occurs after a completion followed by a silence. One participant starts up a bit after another. Again, the possibility is that each now being in speaker orientation is not listening for or hearing that the other has started. In such cases the 'latency' can be on the part of prior speaker or recipient, or as in fragment 3.20 below, can occur as between two recipients of a prior utterance. I'm showing cases across a range of lengths of silence, from a 'micropause' of just over 1/10th second, to a substantial silence of one and four-tenths second.

3.13 [Her:I:6:11]

3.19 [JG:I:24:8-9]
Laura : But I know thet Joe did say he had a letter from im.
→ (1.2)
Marge : (Eh di) [d he tell you- ·hh
Laura : (___) [That's all he said.
Marge : Well did he tell you that when you phoned im . . .

3.20 [G:84:AD:52]
Cal : You know why niggers are always goin like dis?
→ (1.4)
Bart : (Ban) [d e o d orant?
Len : (___) [They don'know]what they wanna do:.

So there is a great deal of data in which, in varying degrees, someone starts up 'in the course of' another's talk, which can be characterized in terms of 'transition-space' onset or, as in fragments 3.13–3.20 in terms of for all practical purposes 'simultaneous' starts. The account for the 'interjacent' starting has to do with a systematic 'blind spot', each participant being in speakership orientation and not listening for or hearing a bit of talk by another. That is, someone can be systematically described as not having heard.

Now, this is not to say that participants *cannot* be hearing and dealing with

possible completion, or with what is being said, in particular, in that bit of talk. People can and do react to small particles.

4. Consensus or Reaction?

In the following two fragments, someone does a checkout on a prior utterance, and the prior speaker produces a confirmation. In each case, after just a bit of the confirmation object has been produced, we get an acknowledgement of that confirmation.

4.1 [JG:II(a):3:2]
Sorrell : she's a'ready gone cz Claire's there.
(0.3)
Maggie Oh: (.) Claire came in?
→ Sorrell : (Ye) [ah. en she siz] no prob'm she'd work tihda:y
→ Maggie : (__) [°O h: okay,j]

4.2 [JG:I:16:6]
Pete : No ah'll call again,
Grace : You will.
→ Pete : (Ye) [ah.
→ Grace : (__) [Ah-hah ·hh Ah'll tell'im then.

And across a range of circumstances and activities we can see recipients attending to small particles. The cases I'm showing might be seen as a systematic subset of 'interjacent' onset; i.e., 'recognitional' onset.

4.3 [Her:I:6:9]
Doreen : If by any chance, (0.8) theh isn't anybody heuh I've got tih go out jus fer awhi:le, [·hh] What is your– new–
Helen : [Ye:] s
→ Doreen : What is your (telee) [phone] nummuh?]
→ Helen : (____) [Well] we're n] ot on the phone
y [et.
Doreen : [Ah I see:.

4.4 [Rah:II:11:R]
Jenny : But– ee–ee °two pihleece cahrs'd° stopped outsi:de. =
Ida : = eeYe:: [s?
Jenny : [·h An'that whether he tho:wt thet I ed'n
→ (ac) [cidn't [[ohr someth ing I don't kno:w. =
→ Ida : (__) [I : : [: [k n e o: w]
Jenny : = [B't ·h
Ida : [n↓No:::

4.5 [Fr:TC:I:1:2–3]
Shirl : Who w'yih ↑ta:lking to.

Geri : Jis no:w?
→ Shirl : ·hhhh No I called be– like between
(ele) [ven en
I: wasn't talkeen tuh a:nybuddy. (b) Bo-oth
Marla 'n I slept'ntil about noo:n,

4.6 [MDE:60-1:5:2-3]
Erma : did you hear w't'e: she– tol:d Lisa? ·hhh thet they w'r
c'nsidered the cutest couple in [the cla:ss? [( )
Sheila : [·hhhhhh [Yeh– Wul
this: this was official, apparently this goes into the

→ Erma : (___) [Oh: yer kidding. How adorable.

4.7 [NB:IV:13:R:12]
Emma : What city is] it i↓:n.
(0.8)
→ Lottie : Wul 't 's in (Cos) [ta Me] :sa
→ Emma : (___) [Costa] Mes]a

Some of these 'recognitionals' can get quite delicate. In the following fragment it appears that an initial consonant is adequate for acknowledgement to occur. Here, a repair is being made from 'fifty cents' to 'fifty dollars'.

4.8 [Friedell:32]
Sandy : I wz figuring– six twunny five is what I get f'm Merit so
rother [t h e n] be [ing f] ifty cents.
Hank : [A'right] [Okay,
(.)
→ Sandy : u-mean fifty (d) [ollars.] (.) ou:t, we'd be . . .
→ Hank : (_) [Ye:h,]

And in the following fragment a possible alternation between 'shoot' and 'shit' is reacted to upon the occurrence of the crucial vowel. I'll just note that we have a great deal of talk between these two women, and their friends, neighbors, relatives, and this is the only occurrence of the word 'shit'. They routinely use 'shoot', 'doggone' and others of a mild grade, 'damn' and 'hell' being the boundarying expletives.

4.9 [NB:II:5:R:3]
Emma : 'e wantih pull a tooth'n make me a new go:ld uh: ·hhhh
(0.2) bridge fer (.) EI:GHT HUNDER'DOLLARS.
→ Lottie : °Oh:: sh:: (i) [:t.°
→ Emma : (_) [Shi] :t. (0.2) is ↓ri:ght.

In fragments 4.1–4.10 it seems quite clear that a recipient is exhibiting that his response is directed to the particle which directly precedes that response.

I've found a few cases where such monitoring and reaction might be occurring, at those points I've proposed to be 'blind spots'. But at least as far as

I can see, they're ambiguously independent actions or reactions. That is, I can't decide or argue that someone is hearing and responding to some particle, or starting an independent bit of talk with that 'latency' I've been proposing.

I'll start with an innocuous case. In the following fragment, an object which is alternatively used to solicit response or link into a next part of an utterance in progress, 'See,' (cf. 'You know,' 'Right?', etc.), occurs after a possible completion. It is immediately followed by an acknowledgement token by the recipient.

4.10 [SBL:3:5:R:6]
→ Milly : W'l this is what I ↑mea:n. (See) [↓ it's goyn be so =
→ Ginny : (___) [↓ M m h m]
Milly : =↓whu– ↑o:↓n:derf:ul↓

I just don't have the analytic resources to argue one way or the other; the acknowledgement token could be responding to 'See,' as a response-solicit, or could be occurring independently of it, in unmarked next position to the prior part of the utterance.

There are others, rather more interesting and delicate, in which that sort of ambiguity is present. The following fragment is taken from a telephone conversation between two men on duty at different locations during the 1964 Anchorage Alaska earthquake. They refer to each other by their locations: 'City' is the Anchorage fire department and 'Elmondorf' is an outlying army base. They've been connected by a short circuit in the telephone wires, and have taken the opportunity for a chat. The fragment starts after they've been talking for awhile.

4.11 [FD:Finger:2-3]
E'dorf : D'you know w't–w't kinda news'ere broadcastin'down'th' States et (.) pres'nt?
City : I: heard [d'fir:st
Squawk : [(xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx [xx)
City : [The firs' one thet dey uh, (0.7) broadcas'wz sixty
[tuh thr–
E'dorf : [Yer loud'n clear Muldoon Tower,
(2.0)
E'dorf : Pard'n?
City : I heard d'[firs'broadcas'Stateside,
Squawk : [xxxxxxxxxxxxxxxxxxxxx] x[xxxxx)
E'dorf : [Justa minnit.
(1.4)
E'dorf : Go'head.
(1.9)
E'dorf : Go'head,
(0.2)
→ E'dorf : (Ci) [ty,
→ City : (__) [Ye–u– ah heard d'firs'broadcas'state det deh wz bout sixty t'three hunner'dea:d'n (0.4) city of Anc'rage is on dih grou:n'

Just as City starts to answer Elmondorf's question, a squawkbox on the Elmondorf side starts up, with a report in from Muldoon air field. And we can watch City's work by reference to the Squawk. He initially drops out, and then, perhaps because he gets no indication from his coparticipant that he should maintain his silence, may take it that someone else on duty is handling it, so he starts up again. But it turns out that his coparticipant is handling the call, and interrupts him to respond to it.

Thereafter, City remains silent until he's invited back by Elmondorf, with 'Pardon?' And perhaps he hears it as directed to him and not to the fellow on the Squawk because 'Pardon?' is a 'conversational' object, in strong contrast to the 'instrumental' 'You're loud and clear'. But again, just as he gets going, the Squawk goes again, he produces a first clause, and Elmondorf, again with a 'conversational' object, 'Just a minute', gives the Squawk priority.

Now comes the problematic stuff. Elmondorf uses 'Go ahead', which is ambiguously conversational or instrumental. This may cause a problem for City; who is being asked to 'Go ahead', himself or Muldoon Tower? And it is possible that Elmondorf comes to see what the problem is; after two such invitations, he shifts to a non-ambiguous item, 'City'.

It's possible that City hears, in that small particle, 'Ci . . .' that it is he who is being invited to talk, whereupon he starts. It is also possible that it's a matter of consensus; that whatever it is that brings Elmondorf to see that his recipient, City, is having a problem, brings City to see that he is indeed Elmondorf's recipient. That one of them starts minutely later than the other is just another instance of post-silence latency, as in fragments 3.13–3.20. Again, I don't have the resources to choose between these possibilities.

The following fragment *might* be quite exquisite. I'm using the real names of two of the participants, Jeff and Joann, to show just how delicate it might be. This is from a group therapy session for teenagers. At this session, there are observers in a room behind a one-way mirror.

4.12 [GTS:I:2:19:R:5]
((Jeff is reporting a success with his parents, who have stopped interrogating him about his comings and goings.))

Jeff : Nob'ddy se]z inning yih jis keep °whha:lkin.° hh
°yihknow
(0.2)
Jeff : It's j↑bghuggin'↓mhhe(h)now [hm hm
Joann : [↑Don'ta] lk tih ↓them talk
t'u:*:s:.
(1.3)
Jeff : No (.) th– (0.4) drapes er closed now I c'n see through that liddle crack et th'window over there
(2.0)
→ Dan : Yer very ↑°conscious'v th'm being in the:re. (Je) [ff.
→ Joann : [He
keeps:: [↑talk [in'↓there.]
Jeff : [°ih° [It doesn']rilly ↓bother me,

The overlap in question could be occurring at a very touchy moment. Joann having raised the issue of the observers in the first place, it's possible that Dan's remark is addressed to her. Indeed, the appending of the boy's name may be directed to clearing such a possible ambiguity, similar to Elmondorf's work in the prior fragment, with his shift from 'Go ahead' to 'City.'

And similarly to City's problem in the prior fragment, Joann could be monitoring for which of the two who have shown themselves to be 'conscious of them being in there' is being addressed. If that is so, then the 'recognitional' work in this case is a bit finer than in the prior, the alternative names in this case starting with the same consonant. What would be involved here, then, would be another instance of that very fine sort of monitoring and response seen in fragment 4.9 vis-à-vis the 'shoot'/'shit' alternatives; i.e., recognition upon the occurrence of the crucial vowel.

One problem with this fragment is that it is face-to-face interaction and we don't have the video. Dan might be looking straight at Jeff, in which case we have a trivial instance of 'unmarked next position' onset happening to overlap with an appended and unnecessary particle. On the other hand, it turns out that frequently just such actions as Dan is producing; e.g., challenges, confrontations, etc., are done 'blind' – a term introduced by a graduate student of Harvey Sacks, Blaine Roberts. That is, they are done specifically *not* looking at the recipient. And there is at least one other reasonable target for Dan's eyes – the controversial observation window.

So, we have a possible case of a very delicate monitoring for and reaction to an otherwise 'blind spot' particle. Or just another case of overlap in the transition space.

I'll show one more case of possible intermediate reaction to a small particle, or possible independent actions which exhibit consensus. It's taken from a conversation between the two ladies of fragment 4.9. In this case, in a range of ways, we can see Lottie working to have the conversation end, without herself having been the one to end it.

4.13 [NB:III:4:R:3]

	Emma	:	·hhhh Well ah won't KEEP yih honey,
	Lottie	:	Oh ↑that's oka:y, (uh) [(I'm just)
	Emma	:	[Have ↑fun fishin↑ ah hope yih catch a big one,
	Lottie	:	Yeah.
			(0.2)
→	Emma	:	(Al) [right,
→	Lottie	:	(—) [Okay] **honey,**
			(.)
	Emma	:	[ ] Bye bye,
	Lottie	:	Bye bye

For example, 'Oh that's okay' does not disagree with the proposal that she's being 'kept' on the phone. In other such cases we see strong disagreement items, and/or devices for showing that one is happy to keep talking, e.g., introducing a new topic, referring back to a prior one, asking about something in recipient's

Then, the 'Yeah'. It occurs at a point where she could initiate Closings with, e.g., 'Okay.' So she's clearly not doing Closings. But in terms of being in conversation, she's put the talk into a state which John Lee and I call 'attrition/hold'. Roughly, it hasn't been closed off, and thus is still alive, but such an object as 'Yeah' provides no materials for the coparticipant to take off from or work with. If the talk is to keep going, it's up to the coparticipant to find something to say. Thus, the sense of 'attrition'.

Focal for us is her 'Okay' which is alternatively 'latent' or 'recognitional'. It *might* be occurring just and only when Emma has recognizably initiated Closings. That is, withholding an overt entry into Closings until Emma does the initiating, and then pouncing on it the moment she has, reifying it with what might stand as a 'simultaneous second', similar to the terminal pair (the 'goodbyes') (see work on closings of G. Button, forthcoming).

For the terminal pair there is indeed perfect independent consensus; they occur utterly simultaneously. But for the prior pair there is, ambiguously, consensus or fast reaction, one party waiting until the other has recognizably made a move, and then responding to it.

To get a sense of the issues involved here, we can look at another case of Closings; one which is in some ways very similar, but in crucial ways quite contrastive. In this case there is no possibility of seeing 'consensus'. This is a man talking to his elderly mother.

4.14 [Her:I:5:6:R]

	Heath	:	Well yyou leave **that w'n with me.**
			(0.3)
→	Janet	:	Yes (alri) [:ght,]
→	Heath	:	(__) [A l] **right,**
			(0.5)
	Heath	:	Bye:,
	Janet	:	Bye darling,

In the first place, Janet's 'alright' is not necessarily a Close-initiation, but an agreement to an arrangement. By coming in on it in terminal overlap, with another 'Alright', Heath retroactively provides that it is the first of a Close-initiating pair.

And in contrast to fragment 4.13, there is no subsequent consensus. Janet remains silent at a point where she might herself volunteer the first of the terminal pair.

In this case we can see Heath placing his 'Alright' in such a way that, that Janet has done a first is unequivocal; i.e., enough of it has been produced before he starts up. In fragment 4.13, Lottie places her 'Okay' in such a way that it is not clear whether she is responding to Emma's, or whether they have both independently and for all practical purposes simultaneously, moved to close the call. In fragment 4.14 we have a clear case of 'you started it'; in 4.13 a possible case of 'we agree'. (And see fragment 2.1 as another ambiguous case involving a possible 'saying the same thing at the same time' consensus).

Now, the fact that people do have the capacity to react to a very small particle – when they are in various ways primed for its occurrence – may provide them with the capacity to achieve a display of consensus in contrast to response, specifically by responding quickly enough to make it at best ambiguous as to whether they're acting independently or responsively. And in fragments 4.11–4.13 we may be seeing such achieved independent consensus occurring in what is otherwise a 'blind spot' in conversation. That is, the consensus is achieved in part by producing what is systematically characterizable as transition-space overlap; a mere coincidence of two independent activities.

In a sense, I've gone to a lot of trouble and ended up within a membrane's thickness of where I started. That is, I started out with a batch of cases which I initially took to be someone starting up after hearing that another was still talking after a point of possible completion. I argued that they might not be that at all, but yet another sort of transition-space onset, providing for a 'blind spot' in which just those particles which make the new talk 'interruptive', are not heard. And now I'm trying to argue that perhaps *some* of those cases are indeed perfectly well heard.

But I think that membrane-thin difference matters. It can matter in terms of managing to exhibit independent-minded consensus when one has, in fact, responded to what another is doing. It may also matter in terms of something like 'rights to a turnspace'. Roughly, if one can manage one's talk in such a way as to achieve a lawful placement of it, i.e., in the transition space, then one may have every bit as much right to be talking as did the prior speaker in his turnspace. And I would argue that the vast majority of apparent transition-space onsets – Last-item, Terminal, Possible Completion, and Unmarked Next-Positioned – are lawful. That is, that they are produced by reference to seeing that an utterance is just ending or just ended.

But there is this very recurrent business of a recipient starting up in the transition space for an utterance, finding that what he took to be 'an utterance' was not yet an utterance, and that the current speaker is still talking.

5. What is 'Completion'

Perhaps the materials and considerations I've gone through could be the basis for a complaint against the way a lot of recipients do a lot of their talk. That is, if they would only wait a bit longer, they'd see that the speaker isn't finished just because he's arrived at a possible completion point. That is, we could propose that something like Utterance + Pause *should* be the way talk proceeds. Perhaps, indeed, the way it is designed to proceed, where, then, we're seeing a 'breakdown' of conversational rules.

But that doesn't take into account the fact that even a very tiny silence can be treated by a *speaker* as problematic; where, then, they will engage in activities to deal with that problem. Anita Pomerantz (1984) considers this issue: she works with rather substantial silences, of approximately one second. I'll just show a few fragments in which even a tiny delay can cause problems.

Here are two fragments from a same corpus; calls between a family and some of their friends and neighbors. There are two women who call routinely to talk to the mother. When the phone is answered by the youngest boy, he tells his mother that it's 'Auntie Lorna' or 'Auntie Myra'. When the older boys answer, they just tell her 'It's for you.' And that sets up the problem. In one such call we get the following.

5.1 [Rah:B:1:(12):1]
Jessie : °Hello?°
(0.5)
→ Myra : Jessie?
→ (0.3)
→ Myra : It's me:,
Jessie : Oh hello My:ra.

I don't know what the first silence of half a second is about, but I doubt whether it involves Myra waiting to see if Jessie is finished talking or not. What I want to note here is the shorter (0.3) silence, in the course of which I take it that Myra decides that Jessie hasn't recognized her voice, whereupon she provides more voice (with 'It's me'), whereupon Jessie, in unmarked next position, displays recognition – and with the 'Oh' shows that there was indeed a problem (see John Heritage, 1984, on 'Oh' as a 'change of state' token).

In a subsequent call we get a tighter version of this phenomenon, with a silence of under two-tenths of a second; i.e., a 'micropause'.

5.2. [Rah:C:1:(16):1]
Jessie : Hello:?°
→ Myra : Hello Jessie.
→ (.)
→ Ida : [It's m e:.
Jessie : [Oh hello the] ah.

And in this case it so happens that just as Myra sees that there is a problem and moves to resolve it, her recipient has herself resolved it.

This very short 'tolerance' by a speaker for inter-turn silence can be seen across a range of activities. I'll just show a few cases, in which, as in fragment 5.2, a speaker's problem-resolutional activity collides with a recipient's (slightly delayed) response.

5.3 [Rah:A:2:(9):1-2:R]
Jessie : I've only jus goht in en ah thowt w'l p'hahps ih wz a
bit late tih come round [d f'coff] ee:. [ ] If you've ti:me,
→ Alice : N o ↑:
→ (.)
→ Alice : [Have yih?
Jessie : [It's jist] thet evrybuddy seems t'be in to:wn tihday.

5.4 [GTS:I:1:44:4]
→ Roger : I guess I jis didn'wanna be like evrybuddy ↑e:lse.
→ (.)
→ Roger : [[Y'know] w?]
Louise : [[You:] a___rn't.

5.5 [G:93:AD:7:7]
→ Bart : Well you r'member when **McKuen did tha:t?**
→ (0.3)
→ Bart : [[L o:ng] time ago . . .
Cal : [[↓(No:,)]

5.6 [SBL:2:2:3:R:27]
→ Zoe : Ellen had fiftee:n.
→ (0.3)
→ Zoe : [[hundred.
Claire : [[Oh:,

Here's another, that I think is particularly lovely. It occurs in the course of a conversation which is part of a series taking place during a hurricane and flood in New Orleans. Josh is the commander of the New Orleans Civil Defense. Opal is a woman who has been trying to reach her brother by telephone. She finally has reached him, and has told Josh some of the eyewitness materials she got from him.

The point at which the fragment starts involves a nice sort of problem. Josh is attempting to elicit further information, with a device Anita Pomerantz (1980) has described. Roughly, one does not ask, but provides for its relevance by delivering the partial knowledge one has oneself. In this case, however, that Josh is Commander of Civil Defense may be relevant to Opal's hearing of his utterance. She (eventually) produces no more than an acknowledgement token, and a token of the sort I have elsewhere proposed to display particularly 'passive' recipiency.

Parenthetically, the fact that she doesn't do even that for half a second may constitute a real case of silence telling a recipient that some sort of speaker transition should occur.

5.7 [CDHQ:II:252:R:3-4]
Josh : Ah heard uh: first thet there wz rilly s'm water in:
Mohg'n City up uh: waiz deep uhr something.
(0.5)
→ Opal : Mm hm,
→ (0.2)
→ Opal : [[Well] now he]
Josh : [[U h] how fo]:r inlin:d uh did he ↑say 'nything
about s'im: uh↓::*: s'm othuh (0.6) ·k *uh: cities like
Lahfeeyet . . .

What I want to be focussing on is that in the (0.2) silence following the acknowledgement token whereby Opal shows herself to be still aligned as a recipient, both parties come to see that there is a problem, and what the problem is. Simultaneously they produce the same class of remedial activity. Opal starts to report something that a 'he' told her, and Josh asks what a 'he' said, 'he' being the temporarily lost brother with his eyewitness materials.

It seems to me that fragments 5.2–5.7 are particularly nice data for the issue of completion not being a matter of an utterance + pause. Even such tiny silences can be problematic and generate remedial activities. And, as in these cases, result in overlap. But it might be argued that I've got it wrong again; that what I'm treating as completion + problematic silence + remedial activity is in fact a speaker making the briefest of intra-utterance hesitations; that what they say next was in the first place designed to be part of a single utterance. That is, that neither the recipients nor I have waited long enough, and once again what we're seeing is some form of interjacent onset, or 'interruption'. Well, how long shall we wait? Over half a second?

5.8 [NB:IV:13:R:25]
Emma : yih d<u>o</u>n't go tuh work til thre<u>e</u>:,h
(0.4)
→ Lottie : F<u>ou</u>:r.
→ (0.6)
→ Lottie : [[T'<u>da:y</u>] <u>'s Sa:</u>] turday.
Emma : [[<u>O h</u>: f] ou<u>r</u>:.
(.)
Emma : ↑<u>A</u>oh that's ↓°r*ight.°

How about one second?

5.9 [Fr:USI:8-9:R]
Vic : <u>Wu</u>t's <u>l</u>eft <u>a</u>ftih you take th'chez <u>up</u>.
(.)
↱ Mike : <u>No</u>thi[ng. [°( )°
↳ Fred : [There's [ba:re fl<u>oo</u>:r.
→ (1.0)
→ Mike : [[Just f l] <u>oo</u>:r.]
Vic : [[Thez no] ho: <u>le</u>?
Mike : <u>NO</u>::↓::.

I'll stop at one second because some work I've done recently indicates that one second is some sort of 'standard maximum' silence (Jefferson, forthcoming), so whatever one might mean by 'waiting long enough', waiting beyond one second is waiting too long.

Every now and then we can find materials in which a best characterization might in fact be that a speaker takes it he's finished and a recipient isn't sure, so he waits a bit. There was that possibility in fragment 5.7. And here is the one other case I have that feeling about.

5.10 [SBL:3:5:R:10]

	Milly	:	En I said I'd never heard Hunter so that w'd be most interesting. =
↔	Ginny	:	= It certainly could (the) [et le] ast tha:t [one] thet =
	Milly	:	[Y a h] [she tol'] [me]
	Ginny	:	= I heard was
→			(0.7)
→	Milly	:	She tol'me he wz wonder [ful,
	Ginny	:	[Yah

Roughly, there may be a particularly problematic combination of structure and intonation which makes it unclear whether 'At least that one that I heard was' is a completed pro-formed re-use of the prior 'that would be most interesting', or is as yet incomplete, its speaker in a wordsearch for a description, e.g., 'At least that one that I heard was ((pause)) fascinating.'

But as far as I can see, for the vast majority of cases 'utterance + pause' does not capture the routine ways that recipients monitor talk in progress. What it does recurrently catch is a particular sort of problem posed for speakers.

When I talk about how recipients monitor an utterance in progress, I talk in terms of possibly complete actions, and/or syntactic possible completion. Now and again people ask if I've considered intonation, and if so, does it matter? I say I have, and it doesn't seem to.

At the start of this project on overlapping talk I did a mass of transcribing, and was careful to catch a range of intonational features, assuming that would have a lot to do with the phenomenon. But while I was working with the materials, it didn't seem to matter. Speakers would, for example, produce what I heard as 'full stop' intonation and then keep going (see, e.g., fragments 1.2, 1.3, 1.5, 1.7, 1.9, 2.5, 2.7, 2.12, 3.5, 3.6, 3.8, 3.11, 3.18, 4.1, 4.5, 4.10 and 4.12). Or, for example, speakers would produce 'continuing' or indeterminate intonation, a recipient would start up, and there would be clean transition (see, e.g., fragments 1.1, 1.5 and 2.3). What held across cases of clean transition and recipient onset resulting in overlap alike was observable completed actions or syntactic possible completion.

But recently, John Local and John Kelly at the University of York have been doing some interesting work with intonation in actual sequences of talk, and getting some possible results in terms of turn transition, etc. (see the following paper in this issue: Eds.); and their work brought me to wonder if I had been looking at the phenomenon properly. Perhaps intonation does matter, and somehow I'd missed it. I undertook a data run, to see how often 'clean transition' and 'overlap' were associated with 'completion' intonation and 'non-completion' intonation.

I immediately ran into two problems. One was that I have only the grossest idea of what 'completion intonation' is, or could be defended to be. But there were some contours I supposed anybody would agree to be completion or non-completion intonation, so I focussed on those. The second problem has begun to be familiar. Roughly, if something 'works' it's there and if it doesn't 'work' it isn't there. So there would be an intonation contour that I'd identify as 'completion intonation'. If it occurred in a case of clean transition, it was unproblematically-

'completion intonation'. But if it occurred in a case of overlap, I found myself doubting that it was really a case of 'completion intonation'.

Nevertheless I counted, and came up with some strong results. I suppose this could mean that the base phenomenon is very strong indeed, if the cockeyed way I was going at it could get results. I used some 800 cases of transition-space overlap involving 'possible completion' and 'unmarked next position' onset. And I matched those with some 800 cases of clean transition, with recipients starting up in those two positions. The results:

Clean Transition:	ca. 70% after completion intonation;
	ca. 30% after non-completion intonation.
Overlap:	ca. 75% after non-completion intonation;
	ca. 25% after completion intonation.

For one, in the vast majority of these cases, intonational features that can be described as signalling intent to stop or continue are matched by what speakers actually do thereafter (in 70% of clean transitions and 75% of overlap; about three quarters of the total corpus).

And in a great number of these cases, recipients can be described as starting up not only by reference to a possibly complete action and/or syntactic possible completion, but to a speaker's signal of intention to stop (again in that 70% of clean transitions, and in 25% of overlap; about half of the total corpus).

And if there is something like an intonational rule that says if a speaker signals completion then he should stop, and if he signals non-completion then a recipient should not start, then *all* of these cases of overlap could be described as the result of one or another party violating the rule. Three quarters involve a recipient starting up where there has been possible syntactic/activity completion but not completion intonation. One quarter involve a speaker producing completion intonation and then not stopping.

How could I have missed this? I suppose it has to do with the fact that the whole of my original corpus consisted in these 'violations'. To use a Man From Mars analogy: plunk this creature down on a city street near some traffic lights. Now every car going through the intersection crashes into a car coming across the other street. Asked what sort of orderliness he noticed, he might propose, 'Crashes occur at intersections!' Pressed about whether the traffic signals matter, he might well say, 'Not so you'd notice.'

But even when an equal number of clean transitions are added to the corpus of transition-space onsets, with all 1600 cases taken in the aggregate, a problematic pattern can be seen: just under two thirds of the entire corpus involves what could be described as some sort of 'violation' of this candidate rule. About 27% are done by speakers (15% stopping without signalling completion and 12% continuing after signalling completion) and about 35% are done by recipients (starting with no completion signal from a speaker).

So, although in three quarters of the cases, speaker's subsequent activities can be seen to match the intonation contour they've used on a possibly complete utterance, and in half the cases recipient's activities can be seen to match the

intonation a speaker has used, it is only in just over a third of the cases (the seventy percent of clean transitions) that the two sets of activities coincide; i.e., a speaker produces completion intonation and stops, and a recipient starts.

Conceivably, then, the intonation contours in question constitute some sort of 'accompaniment' rather than a transition-relevant 'signal', such that in these clean transitions we are seeing an incidental convergence rather than something like cause and effect. Perhaps it's not 'because' a speaker produces completion intonation that a recipient starts up, but it just so happens that a speaker has produced this contour while a recipient has – by reference to such features as action and syntax – found an utterance to be possibly complete.

There is of course another set of materials that would have to be considered: those cases in which a speaker produces a multi-sentence utterance and a recipient remains silent over its course. For example, as in fragment 1.3, 'nNo she's no:t She:'s et school.' 2.2., 'I: don't know exactly I think ih wz arou:nd three uh'clo:ck . . .' 3.2, 'becuz I wz going dih haftih get out (.) early in the morning I have (.) a p– (0.3) transaction et the ba::nk.' 3.14, 'But'e said a lotta times it happens 'e said I could've even been allergic . . .' 4.5, 'I: wasn't talkeen tuh a:nybuddy. (b) Bo–oth Marla'n I slept'ntil about noo:n,' and 4.13, 'Have ↑fun fishin↑ ah hope yih catch a big one,'.

In this very small sample we see both intonation contours used; non-completion in fragments 2.2, 3.2, 3.14, and 4.13, and completion in fragments 1.3 and 4.5. Again then, the relationship of these contours to a speaker's intention to stop or go on, is obscure.

And here's another sort of data which bears on this issue. Some number of recipients starting up in the transition space, finding that the speaker has continued talking, immediately drop out. It was that phenomenon that raised the possibility that what initially looked like 'interjacent', 'post-continuation' onsets were produced to be 'adjacent', 'unmarked next positioned' onsets. Looking back at the small set of samples, fragments 2.10–2.14, we can notice that this phenomenon is associated with both types of speaker intonation. In fragment 2.12, a recipient starts up after completion intonation. But in fragments 2.10, 2.11, 2.13, and 2.14 they start up where there has been possible utterance completion but not completion intonation – and immediately drop out as the speaker keeps going.

That is, it appears that recipients are monitoring not only for a possibly complete utterance, but for a speaker's projected silence thereafter. These could be two distinct and separable aspects of the issue of 'completion'. And recipients could be oriented to the former and not, or not necessarily, to the latter. That is, recipients could be starting to talk by reference to something like 'entitlement', exclusive of a sensitivity to whether a speaker intended to stop or keep going, and had signalled that by one or another intonation contour.

But materials such as fragments 2.10, 2.11, 2.13 and 2.14 suggest that recipients do indeed produce their talk not only by reference to 'entitlement', but by reference to speaker's intentions. However, it appears that they don't use these intonation contours to decide that a speaker is or is not intending to stop or go on. That an utterance is possibly complete, in terms of action and/or syntax, appears to be used to handle both aspects of [illegible]

I take it that the issue is far from settled. And I don't have the analytic resources to handle it. Fortunately, there are sequentially-oriented phonologists like Local and Kelly who are beginning to make some inroads on these sorts of problems.

Author's Note

Some of the results are reported in *Tilburg Papers in Language and Literature*, No. 28, 'Two Explorations of the Organisation of Overlapping Talk in Conversation: Notes on Some Orderliness of Overlap Onset', and 'On a Failed Hypothesis: 'Conjuntionals' as Overlap Vulnerable'. For a version of the former see Jefferson (1983).

Sociolinguistic Resources, Individual Identities, and Public Speech Styles of Texas Women

Barbara Johnstone

Together with two colleagues, I am studying the speech and writing of women from Texas to see how they draw on linguistic resources provided by history, culture, and society in constructing public voices that display personal and regional identity. (See Johnstone et al. 1993 for an overview of the project. See McLeod-Porter 1992; Bean 1993; and Johnstone 1993 for preliminary reports of some findings.)

Our study explores the relationship between individual identity and shared sociolinguistic resources in the description of linguistic variation. It takes a perspective on sociolinguistic variation that supplements the results of studies of language use in relatively tight, focused, homogeneous communities. Using the particularistic techniques of ethnography and discourse analysis, it asks and answers questions about how speakers draw on regional and social models of phonology, morphology, syntax, and pragmatics as they construct and express individual identities in a mobile, multiethnic, linguistically heterogeneous context. Our approach to sociolinguistic variation expands on work by LePage and Tabouret-Keller (1985) and others on linguistic "acts of identity." LePage and Tabouret-Keller point out that people in a given area can be expected to speak alike only if they interact regularly and exclusively with the same people and are trying to express an identity similar to the identities projected by the people they interact with. Their examples of the linguistic heterogeneity possible in a relatively nonfocused speech community come from the Caribbean, where societies are racially and ethnically diverse and where various forms of English, French, and Spanish are available as resources. The heterogeneity that they

Source: *Journal of Linguistic Anthropology* vol. 5, no. 2, 1995, pp. 183–202.

find leads them to suggest that each individual creates his or her own ways of talking, ways that overlap more or less with the ways others talk; they call into question the idea that languages and varieties are widely shared and that people necessarily form speech communities with joint orientation toward group norms.

Sociolinguistic research in the United States and Great Britain has until recently typically taken place in relatively tightly knit communities in which everyone is more or less focused on the same models for talk and makes use of the same sets of linguistic variants. Beginning with the Linguistic Atlas projects, research on language in the American South has likewise sought to describe the speech of relatively closed, stable populations such as small rural towns and urban ghettos, with the assumption that sociolinguistic models that accounted for the relatively stable patterns of variation found there would also account for patterns of variation in other settings. Southern states may indeed at one time have consisted of homogeneous speech communities. For most of the region's history, people could be said to talk the way they did because of where they came from, since people stayed where they were born and interacted with the same people in their community, and few from outside it, all their lives. But does it still make sense, in view of current demographic and economic facts about the South, to suppose that Southerners, or even lower Southerners, or inhabitants of the Appalachians, or Texans, form speech communities analogous to those of Harlem or Detroit or inner-city Belfast? Outsiders and Texans alike tend to think that there is a single linguistic model toward which all Texans either aim or decide not to aim. But clearly all Texans do not speak alike or share the same norms for speech.

It is our view that contemporary Texas is more like the Caribbean than like a neighborhood in Belfast. There are many very different resources available here for the creation and display of idiosyncratic ways of being and sounding, and the many Texans who interact with people outside their immediate communities, either privately or in more public media, have access to varying sets of these resources. Texas is a particularly suitable locale for a study of the linguistic effects of multiple cultural models. It is the quintessentially southwestern state, culturally (and geographically) both southern and western, and it is ethnically diverse, with large Hispanic, Anglo, and African American populations that influence one another. To varying degrees, people in Texas speak English like Southerners, like Californians, like Midwesterners; they speak Spanish, Tex-Mex, Vietnamese, German, Czech; they use features of Black English Vernacular and traditions of African American oratory; they project colorful, direct western personalities or genteel, indirect southern ones (both are stereotypes that they can describe); they try to sound like the people on *Dallas*, the people on *The Cosby Show*, or the people on *Beverly Hills 90210*. Texans shape languages to use as they shape individual identities in the "multidimensional social space" (LePage and Tabouret-Keller 1985:180–186 et passim) suggested by these and other possibilities.

Not all linguistic possibilities are open to all Texans: not all speak Spanish equally well, for example, and some are only able to make small symbolic stabs at sounding southern. Some Texans do continue to live in tightly focused communities

in which linguistic resources are limited and homogeneity is accordingly high. We are not trying to undo the results of dialectology based in such communities, but rather to extend the study of linguistic variation so that it provides a model of the language of people in other, more public contexts as well.

Our research population consists of women who live in Texas. The methodology combines two techniques. (1) Interviews are conducted with women of a variety of demographic backgrounds to elicit attitudes about place, personal identity, and language use. An understanding of generally shared sociolinguistic models on which Texas women draw is thus allowed to emerge from their own senses of who they are and how they show it. (2) Detailed case studies of the language of ten women who have occasion to speak or write in public settings have also been conducted. Our case-study subjects are women who use language in public in a variety of ways: they are teachers, politicians, journalists, storytellers, singers, and orators. These case studies are based on two things. First, we conduct with each woman an interview that is designed to elicit speech in a variety of styles, as well as information about the subjects' histories as speakers and writers and their attitudes about language and speech. As part of the interview, we ask each woman to tell us about what she sees as the main influences on the ways she talks, how she learned to use language as she does, and who and what her models are. Second, we examine other examples of the subjects' writing and speaking in a variety of genres. Subjects of case studies include politician and professor Barbara Jordan, writer and entertainer Sunny Nash, editorialist Molly Ivins, and county spokeswoman Eliza Bishop, as well as other writers and politicians, teachers, an attorney, a labor leader, and a country-western singer and lyricist. Each case study shows how one particular woman draws on shared models for Texas speech, as well as on particular models of speech from family and acquaintance as she creates and expresses a personal identity. The overall project is both sociolinguistic and ethnographic in nature, as we are interested both in how Texans talk and why they talk as they do and in Texans' own understandings of their ways of speaking.[1]

In this article I explore how some of these successful professional women conceive of themselves as language users and why; I also illustrate some ways in which their choices of how to say things serve as a metalinguistic display of the things that they say about who they are. Some of the cultural and linguistic resources that our subjects draw on are easy for them to talk about: they are glad, for example, to discuss how they feel about being Texans and how features associated with Texan speech fit into their linguistic repertoires, and they readily acknowledge the influence of speech styles associated with ethnicity and with vocation. But when we ask about being and sounding like *women*, they hesitate. These accomplished, visible women – many from the generation that grew up struggling for equal rights and influenced by feminism – do not attribute very much about the way they act and speak to female role models or models of women's speech. This article examines why this should be and looks at how these women define themselves as language-users. What will emerge is that the sources of identity expressed in talk and other action are idiosyncratic and particular. Although all of the women whom we have studied draw on [illegible]

expectations and stereotypes as they construct public voices, each does so differently, all draw equally or more on other linguistic and cultural resources, and all attribute the largest part of their identity to very particular facts about their own lives and families. Ideologies about region, gender, and ethnicity do not appear to serve, for these influential women, primarily as constraints on what they can do; rather, models of speech and action that express linguistic ideologies are sources of creativity, selected from and combined in the expression of unique selves.

I look in this article at what four women had to say to us about the sources of their linguistic abilities and styles. All four are middle-aged, between 40 and 60; all are natives of Texas, and all are successful and visible in professions that require them to speak in public, to audiences of people whom they do not and probably never will know and who do not know them, as representatives of their vocations. Linda Chavez-Thompson is Executive Director of the San Antonio Local of the American Federation of State, County, and Municipal Employees. She has been involved in union organizing and administration for most of her adult life. She grew up in a Spanish-speaking family in various small towns near Lubbock, Texas. Barbara Jordan, from Houston, is a former U.S. Representative, the first African American woman from the South to be elected to the House. She is especially well known for speeches to the House Judiciary Committee concerning the Nixon impeachment and for two keynote addresses to Democratic conventions. She is now a professor at the University of Texas. Sunny Nash, also African American, is a freelance writer of newspaper columns, screenplays, short stories, and novels, as well as a musician, photographer, and art teacher. She is from Bryan, a medium-sized city in central Texas. Bettye Springer is an attorney in Fort Worth who presents workshops about issues in labor law such as sexual harrassment. She is a West Texan (from Lamesa) of European origin. I examine how these four women talked, in interviews with us, about linguistic models and resources associated with gender, region, ethnicity, and vocation.

My methodology for this aspect of the study is simply to listen carefully and critically to what our research subjects told us about who they are and how they talk. My analysis is of course informed by my understanding that people are not accurate reporters of the finer details about their speech and of the fact that texts, be they literary works or the conversations that I am working with here, do not completely speak for themselves. These women may well be unaware of some of the real sources of their styles, or they may have reason to conceal them. What I am interested in here is how they understand what motivates their choices and how their own understandings of their linguistic images are reflected in their speech.

Resisting Gender Identification

There are vivid traditional models for female speech behavior in Texas. (See Carrington 1975, Crawford and Ragsdale 1992, Exley 1985, Fernea and

Duncan 1977, Furman 1980, and Marshall 1983, for example.)[2] As is Texas in general, Texas women tend to be treated in the state's popular media with a fair amount of positive hyperbole, as tougher and stronger, more glamorous, more neighborly, and "friendlier" than other people are. For white Texans, many of whom are of southern U.S. ancestry, one powerful image is that of the courtly but indirectly powerful "southern belle," with her "iron fist in a velvet glove," as it is often put. There are also popular images (propagated in magazines like the *Texas Monthly*, on TV shows like *The Eyes of Texas*, and in local and national advertising campaigns) of rugged pioneer women working ranches in the southern and western parts of the state. Rural African Americans preserve memories of fiercely independent former slaves farming and raising families by themselves while their menfolk went to the cities to find work. (Some of Sunny Nash's work has in fact involved documenting this history in central Texas.) Contemporary church life provides African American women with other models that involve public speech and action. Traditional models for Hispanic women, perhaps the most restrictive with respect to public action and speech, allow for considerable power within the family. Texas women can also draw on models of womanly speech and behavior from elsewhere. Thus a woman wishing or needing to express a particularly female identity has many resources to draw on, and except perhaps for Hispanic women, such an identity need not imply powerlessness or the lack of a public voice.

But all four research subjects resisted or rejected explanations of their linguistic behavior based on gender. They insisted that they do not, and have never, made or oriented to gender distinctions, and all except labor leader Chavez-Thompson denied that gender discrimination had figured much in their lives. When we asked them whether they had been aware as children of different linguistic or social expectations for girls and boys, they said that such distinctions had not applied to them. Here, for example, Chavez-Thompson talks about noticing different expectations for interaction among men and women when she was a child:[3]

> *Chavez-Thompson:* When [my parents] moved to town, the biggest shock for my mother is that three or four couples could sit and visit in the living room together. The standard for them was that they would visit, eat; the men would go to one place and the women would go to the kitchen and, and, and do the gossip in the kitchen. We approached it differently. In fact, when I was very young, I wondered, "Why did they do that?" you know, because I wanted in and listening in to what the men were saying, because I found that very interesting. And, and they said, "Get away from here," you know, you're sort of like, you're bothering us." Well, I, I was little, so maybe I was bothering them. [*Laughs.*]
> *Johnstone:* [They were] attributing it to being a child, yeah.
> *Chavez-Thompson:* Yeah, because I was a child at the time. ***But I never, I, I really never separated that which women are supposed to do and that which men are supposed to do.*** My first marriage didn't set any barriers; uh, certainly my second marriage did not. And, and so, ***I've really perhaps not, been there for, obstacles many many other women have had placed before them.*** Although some obstacles are, you know, have always been there.

Chavez-Thompson describes how females in her family were expected not to participate in the men's conversation, but when the men would ask *her* to leave, she attributes it to her having been a nuisance, not to her having been a girl. The same reluctance to identify herself with other women characterizes her descriptions of interactions as an adult. She brings up the topic of "obstacles many other women have had placed before them" but denies having faced such obstacles in her marriages.

Chavez-Thompson did describe how being a woman made her job difficult at times. Here she tells about first coming to work for the government employees' union:

> I came to work for the organization in June of 1971. But it was basically just, you know, having to battle the fact that I am a woman . . . and that I am at the same level as business agents of plumbers and pipe fitters and, and whatever organization; it was difficult. Even, even my own – even here within this organization; it was difficult, because a HISPANIC woman, in the union business, is a bigger, a, a, a more rare thing. . . . I signed up the first 13 people in this union. And I had bottles thrown at me, when, when I was out there. . . . It was a long time before, uh, people of that mentality treated me differently than, than a secretary.

When she was asked, however, whether being in this position required her to learn to talk or act in more traditionally male ways, Chavez-Thompson hesitated, first appearing to say yes and then firmly saying no:

> *Johnstone*: Do you think that, when women, including yourself, get into, get into positions like yours, they have to learn to talk like men or to act more like men or would you just, would you describe it some other way, how you managed to do that?
> *Chavez-Thompson: There are times when you have to, to be just like a man, I guess,* if that's, that's, talking is, is –
> *Johnstone:* – Yeah, that's part of it. –
> *Chavez-Thompson:* – is part of that. But I've, I've had a few of, quite a few of those moments, but *I've never acted like anything but what you'd describe as a lady. Or a woman, you know, I just, I do things, as I think they are. The biggest respect that I get from someone is that they look at me as their union representative, not as a woman. Not as a woman acting like a man,* but just because of the talent that I may have, to resolve their problems.

Chavez-Thompson does not want others to identify her with her gender; she wants the people whom she works with to "look at me as their union representative, not as a woman." Nor does she want to attribute to gender any influence her own speech or behavior ("not as a woman acting like a man"). Yet she described situations in which it is clear that others do identify her with her gender and in which it would be easy to describe Chavez-Thompson's behavior as "acting like a man." The following excerpt illustrates both (she was describing a recent conversation with a group of sheriff's deputies):

> *Chavez-Thompson:* But, but, in fact, in fact, in fact, they st-*they call me "Mom."*
> *Johnstone:* Oh yeah?

Chavez-Thompson: Yeah. Now they call me "Mom," but every once in a se- in a, in a while, *I ask them, "What kind of mother are you calling me?"* Uh, because [*laughing*] honest! They're bad sometimes! But the question here for them – and, and for me – is that occasionally a city manager or occasionally a department head, ah, that because I'm a woman they're going to be able to walk all over me, or because I'm a woman I don't know how to take them on. And every once in a while, ah, I have to show them, that they're getting to deal with me at the same level as they would a man. *And, uh, I don't often have to use the strong language that I, I, I am sometimes prone to do. Ah, I know some words, but I, and, and, and I am prone to do that.*

Both in turning "Mom" into a joke about a familiar profanity ("What kind of mother are you calling me?") and in describing her "proneness" to use "strong language," Chavez-Thompson is, by standards that she herself is aware of, "acting like a man"; and in calling her "Mom," others are, at least superficially, treating her like a woman (though the playfully aggressive tenor of the whole interaction could be described as more typically male than female; Tannen 1993a). Yet Chavez-Thompson continues throughout to be very reluctant to acknowledge either. She does not want to describe herself in these ways and does so only when pressed, interestingly often becoming less articulate – hesitating and stuttering – when she does.

Barbara Jordan also denied having noticed gender distinctions in expected linguistic behavior as a child:

Johnstone: Were there other contexts in which you noticed, uh, that girls were **supposed** to speak differently than boys, or less, or more, or
[more carefully?
Jordan: [*I really can't, I really have no recollection of that being a distinction.*

Jordan rejected an explicit question about gender differences in public oratory and denied speaking differently to women than to men:

Porter: I have a couple of questions for you about, about what I'd call women's style of, of speech making. Do you, have any sense of whether or not your style is different from say some of the men counterparts that you've uh encountered in your career?
Jordan: I, uh, I just, I s- I have, *I have no sense of that* because I don't know how a man does his speeches or gets them and, and, um, presentation. I, *I have no idea.*
Porter: Well, whenever you're preparing a speech and you know that you're speaking to an audience predominantly of men as opposed to an audience predominantly of women, do you make adjustments to meet the needs of that particular, those particular groups?
Jordan: [*Laugh.*] *I don't. I really don't.* I, uh, and I have, I will of course think of the group, and, uh, for instance it was late December when I went to Dallas to speak to a group of, uh, the women's foundation or whatever, and when in preparing that speech I thought, "This is a, a women – this is a woman's group and they will want something specifically about women and so after I do the rest of the stuff that I want to say here I better throw in something like that," and I'll try to find a good quote that may be appropriate for the occasion, that sort of thing.

Under Porter's repeated questioning, Jordan did eventually acknowledge that an audience of women might "want something specifically about women" and that as a result she "throws in" something like "a good quote" "after I do the rest of the stuff that I want to say." This acknowledgment of an effect of audience gender on Jordan's speech is about as minimal as possible, and its phrasing reflects its intent, as Jordan departs from her normally very formal style to use expressions like "stuff" and "throw in." When we pressed her about what a women's group might want to hear about, Jordan appeared very deliberately to frustrate our expectations:

> *Porter:* Now would you move towards something that was more story-oriented, anecdotal for women, as opposed to –
> *Jordan:* No, *more theoretical, philosophical in general.*
> *Porter:* For, for?
> *Jordan:* For women, right.

Porter was finally forced to back off the issue, and Jordan had the last word:

> *Porter:* Interesting. Um, so then you're not conscious of any kinds of adaptations that speakers make when they're addressing different [audiences.]
> *Jordan: [I'm not.] I am not.*

Attorney Bettye Springer also resisted suggestions that her linguistic style might be related to her gender or that of her audiences. Here, asked whether her "participatory" style in the workshop that we observed could be a style typical of women, she began to agree, but immediately backtracked, ending by suggesting that a person's style is a matter of "who you go around with."

> *Johnstone:* Some, uh, some people would want to claim that that kind of more participatory style was more more likely to be a woman's style, and the more kind of lecture style was more of a man's style. How do you, how do you feel about that? Big generalization, of course, but –
> *Springer:* Let me think. That very well could be; now the fellow that's in there for my law firm right now that's participating in the mock trial, uh, M___F___, I, I've worked with him a lot on programs and I've seen him take questions and do participatory, but maybe not quite to the extent I do. But I have seen him do that some, uh, but – and I will say that the woman who works with me, uh, who but you didn't meet, but her name is S___G___ – she's a fifth-year lawyer. I guess you'd say I've trained her, and I, we still work together in doing training, and I see that she's adopted the style that I have, because she's seen me the most. *So maybe it's who you go around with.*

Springer brought up the topic of role models (she called them "protegés") in the interview, partly in order, it seemed, to make the point that hers had been men:

> *Springer:* You didn't – One thing that you didn't ask me about, that I thought you might, was did I have a protegé.
> *Bean:* Do tell.
> *Springer:* And, and I really did have a protegé that, that might be of interest to you.

Chavez-Thompson agreed that she had not had many female role models:

> *Bean:* So you've had role models, Hispanic role models, but not too many women.
> *Chavez-Thompson:* No, not too many women. Just very few and far between.

Writer Sunny Nash also repeatedly denied having had role models of either gender:

> *Johnstone:* When you, when you do your writing now, are you influenced by some authors more than others, or?
> *Nash:* No .... Generally, generally, the things just kind of pour out of my own experience.

More specifically, she said that she had not learned how to be a public speaker from either of the women in her family:

> *Johnstone:* How did you learn to be a public speaker, for example?=
> *Nash:*=Oh.
> *Johnstone:* From your parents, from your grandmother?
> *Nash:* No, no, my mother is probably the shiest person in the world [*laughing*]: she doesn't even talk to me. [*Laughs.*] She's very, very shy. . . . And my grandmother talked to herself a lot and, uh, and prayed out loud s- but I think, see I had all kinds of uh projects of my own when I was a kid.

Although a closer linguistic analysis would indubitably show that the linguistic interaction of the interviews, and the speech of our subjects, was in some ways clearly affected by our and their gender, the subjects appeared to be making little *strategic* use of "sex-class-linked" linguistic features (Tannen, in press) in their talk. Like that of Chavez-Thompson, Springer, and Jordan, Nash's speech in the interview reflects her rejection of traditionally female models for Texas speech and of stereotypical models of women's speech in general. None, for example, displays the indirectness or the positive politeness associated with southern female speech style; none makes a display of linguistic hesitancy; all speak with fairly low-pitched voices.[4]

Manipulating Regional Identity

The women's reluctance to talk about their speech styles in terms of gender contrasts strikingly with their willingness to talk about themselves in terms of region. All but Nash claim to orient their style to models of Texanhood, and all including Nash talk about using their Texanness strategically, especially with outsiders. Models for speech and other action identified as particularly Texan are ubiquitous: Texans have for several generations been encouraged to think of their state as unique and superior, and Texas's size and population now makes it a target for specialized advertising that plays on traditional images such as the state flag and the shape of the state, as well as on ways of dressing, acting, and talking which are seen as especially Texan. (See Duffer and Sewell n.d.)

People can "talk Texan" in varying degrees. Some use speech and discourse

only occasionally, mainly with non-Texans, for strategic purposes such as getting attention or seeming exotic. Many Texas speakers symbolize their regional identification on a more regular basis, making more consistent use of a few features that have become linguistic badges of Texas identity. These include the use of *y'all*, at least in the nominative and oblique cases and often also in the possessive (*y'all's*), the monophthongization of /ay/ preceding voiceless obstruents (in words like *night* and *like*),[5] and discourse-level displays of extreme "positive politeness" (Brown and Levinson 1987) such as extended, elaborate greetings. There are, of course, still many small-town or rural Texans, many older, who "talk Texan" because, living in small, homogeneous communities and interacting mainly in a dense, multiplex social network, they have limited linguistic resources from which to choose. These are the speakers favored as informants in traditional dialectology and modeled best by much current sociolinguistic theory, but none of our research subjects are in this category.

Since the traditional stereotypical Texan – the relaxed, neighborly, south-midland-accented cowboy in roper boots and hat – is a white man, state imagery is more easily available to white women than to others. Bettye Springer talked at length about the role of Texanness in her presentation of self to outsiders:

> *Bean:* We do seem to have some sort of attitude about the state. Do you have any particular feeling about the state?
> *Springer:* [*Emphatically.*] Oh I, I do, um and I can tell you, I can – with an anecdote. When I lived in Chicago, particularly in Chicago and everyone was from somewhere, and they were either Irish or they were Polish or they were this or they were that and my best friend in law school was Hungarian, but everybody was something.
> *Johnstone:* That's real important in Chicago.
> *Springer:* And, and people would always ask me, "Well, what are you?" and I'd always tell them, "I'm a Texan." [*Bean laughing.*] Because I can remember growing up, I never was a German, which is what my Daddy was, or anything else; you were a Texan. . . . So I always had that identity and I'm still – there's things that that we have in the state that I'm not particularly proud of, like guns and stuff, but uh . . . but I'm proud of where I'm from.

Springer talked at length about what she felt characterizes the interactive style of Texans – a combination of independence and friendliness – which she illustrated with the example of Texas drivers who sometimes make their own rules on the road but still wave at one another.

When we asked Barbara Jordan if she felt that Southernness was part of what shaped her style, she hesitated, saying that she hadn't always been proud of the region. But her identification with Texas was clearer.

> Well, I, uh, uh, I'm proud of the South too. I wasn't always but, uh, I grew to become, uhh, fond of the South and of course it's the race question that, uh, made the South a negative for me for so long, but when I was a member of Congress, uh, the Southerners would y- sort of get together: there was an affinity among the Southern contingent in the United States House of Representatives which you could not count on in any other region of the country. . . . When when I was there, uh, *Texas was was sort of a a*

thing apart, and we at least we considered ourselves a thing apart [laughing] and just a little bit superior, eh, to tell the truth of the matter. And that's a function of Texas braggadocio, that's what that is.

Linda Chavez-Thompson told us an anecdote of a genre that one hears repeatedly in Texas: a story about surprising outsiders with what is called Texas "friendliness." ("Friendliness," in this context, usually means active courtesy to strangers. For example, "driving friendly," as motorists are encouraged to do with road signs, means pulling onto the shoulder to let others pass. The most commonly adduced contrast with this mode of behavior is the behavior, experienced or imagined, of people from "the East" or "the North.")

Johnstone: You think of yourself as a Texan, then, in addition to–
Chavez-Thompson: – Yeah. Yeah. Very much a Texan. . . . We had a convention here in 1988. The people from California came. I do not know what they expected. And I got more compliments from, "Ohh, ya'll are just WONDERFUL; the people HERE they're so friendly!" I wondered what they had ever heard about Texas for them to think that we wouldn't be. And, I think that this image of Texans, you know, as, uh, guns, you know, the the saloon, the the twang. I, I have no idea what other people think of us –
Johnstone: The kind of Wild West,
[do you think? That's what they were expecting?
Chavez-Thompson: [I think so, sort of like the Wild West, yeah. And, and so they were absolutely floored by how friendly – "We even asked somebody on the street for directions, and they were so nice! They gave us directions." [*Laughter.*] Well, aren't you supposed to?

Springer told a similar story, about surprising an airport bus full of dentists attending a convention by being a "friendly Texan." Both Chavez-Thompson and Nash talked about using their Texanness strategically. Chavez-Thompson spoke of "the showmanship issue":

I'm very guilty, ever since [former governor] Ann Richards came into the picture in Texas, of using her phrases, her Texas twang. I find myself doing that when I am somewhere else. I twang it, you know, I actually do! . . . I can talk like Ann Richards, and I do it deliberately. Again, the showmanship issue.

Nash also employs her Texanness for professional reasons ("I capitalize on the Texas aspect"), although she denied feeling the need for a real regional identity. For example, she used being a Texan (an exotic identity in the context, especially for an African American) to get bookings in the East Coast jazz-club scene that she tried to break into for a time.

All four women, then, claimed that the ways they speak are sometimes influenced by their being from Texas. Some illustrated this in their speech to us during the interviews, too. Both Springer and Chavez-Thompson use monophthongal /ay/, Chavez-Thompson variably and Springer fairly invariably, before voiceless obstruents, and both used *y'all* occasionally, even in the fairly formal context of an interview with two or three professors

Orientations to Ethnicity

Except in occasional, often commercial displays such as German Oktoberfests and Czech kolache-baking contests, the Anglo Texans whom we have studied make reference to their national origins less often than do many other European Americans. (This is attested, for example, in Springer's comments quoted above about how much more important being "from somewhere" was in Chicago than at home.)[6] White ethnicity in Texas is to a considerable extent conflated with regional identity. But if regional identity can be most easily drawn on and exploited by white Texans, ethnic identity is most easily available as a model for action and talk to Hispanic and African American Texans. Jordan, Nash, and Chavez-Thompson all talked about ethnic identity. Each orients to ethnicity in two ways: she draws on ethnic models in some respects, and she actively resists and rejects ethnic models in others. Nash, for example, talked about rejecting her community's ways of talking, at the price of being seen as different:

> *Nash:* My mother didn't speak that often, but when she did, she read to me, and she always used correct language. She always did; she never told me I had to, but she always did, so that's what I heard.
> *Bean:* This is the way it's done, kind of -
> *Nash:* -Un-hnn. And, and now down the street, at the Candy Hill Market, now that's not the way people talked. And they would look at me real funny.

In her writing, Nash orients herself to her perception that whites expect blacks to write in an emotional way and attempts not to write that way, choosing instead a reportorial style. Some of Nash's work is also partly aimed at undercutting what she sees as ethnic expectations: she has, for example, collected and restored antique photographs of and written newspaper columns about local rural African Americans who, contrary to stereotype, were sometimes quite wealthy.

For Barbara Jordan, African American speech style is an inalienable element of her own. Although she does not think of herself as a "preacher," she describes the influence of black preaching style on that of any black orator:

> The, uh, what black or-, oratory is an important ingredient of the black experience because preachers have been so paramount in leadership roles in the black community throughout the country. You are going to find that there are any number of people who are public speakers who try to reflect what they have heard from their minister, and the black minister has a definable and totally, uh, in my opinion different style of oratory than anybody else in the country. And it is because of that role of the black minister, a role which I don't believe is paramount in any other race or group of people but it is that, it is there, it is there for us, and it is because of that preaching that, uh, influences, I think, the way that a person who is black would deliver an, an address or a speech.

When asked if she was "part of that tradition," Jordan exclaimed, "Of course I am! How can I not be a part of that tradition?"

Linda Chavez-Thompson speaks of rejecting ethnic stereotyping as a child by refusing to notice it:

> *Chavez-Thompson:* In school, uh, I know that I was less than ten years old and I remember feeling different because, uh, a little boy and a little girl called me a Mexican. And, Is-you know, I said, "Well, I know THAT" you know, it was like,
> *Johnstone:* [So what?
> *Chavez-Thompson:* [so what's wrong with that? And then, my own, my own, when I say my own, my, my friends, who were Hispanics, Mexican Americans treating me differently, because I used to hang out with some of the Anglo girls in school, because they did, they, they, and I got, *I never really saw and never treated myself as any different.*

But she also described insisting to the manager on proper service in a restaurant where her family was treated sloppily, attributing the sloppiness to their being "the only Hispanic family in the place." Being Hispanic is connected with Chavez-Thompson's vocational identity in a very direct way: most of the members of the union local that she manages are Hispanic, and her job involves using Spanish fairly often.[7] Her speech (in English) to us was not markedly Hispanic-sounding. (Features of Hispanic English include, for example, the pronunciation of *-ing* as [in], the devoicing of /z/, the deletion of the regular past-tense marker when the root ends in an alveolar consonant, and the use of intonation patterns that sound hesitant to non-Hispanics; see LeVine and Franco 1982 and Peñalosa 1981.) She did, however, display her ethnic identity during the interview in nonlinguistic ways, describing at length how her grandfather taught her to make formal speeches (in correct Mexican Spanish) as a child and how moved she felt when she and her daughter visited Mexico City for the first time.

Jordan displayed her willingness to identify herself with her ethnic group in several ways. Her speech style in general is characterized by displays of verbal virtuosity: elevated diction, self-conscious word choice (and commentary about word choice), extremely careful articulation, grammatical complexity, and a lack of editing. These are features that have been identified with African American style (see Balester 1993) and traced historically to the valuation in black culture of the "man of words" (Abrahams 1976). Jordan also switched into markedly African American phonology and intonation at one point in the interview, during a narrative about talking to an elementary-school class. Nash's linguistic style was not noticeably (to us) influenced in the interview by African American models, though perhaps the main theme of the interview was her assertiveness and uniqueness, characteristics that Hecht et al. (1993) have described as "core symbols" for African Americans.

Expressing Individuality

To summarize, the women whose talk I have examined here are uncomfortable defining themselves, or having others define them, in terms of gender. Even when they can cite cases in which they are treated differently because they are women or in which their

them well, they deny talking or acting like women and claim to have been uninfluenced by gender discrimination. On the other hand, they readily acknowledge acting and talking like Texans, either all the time or for strategic purposes; and they are not unwilling to cite ways in which their ethnic identities influence their behavior and speech. Why should this be?

One explanation is psychological. Whitehead and Smith (1986:166) cite a number of studies showing that Americans attribute their own success to their ability, effort, and other internal factors, while they attribute failure to external factors such as the difficulty of the task or bad luck. The women whom I have described here are all highly successful, some despite considerable odds. It may not be surprising, then, that they explain their achievements in terms of psychological predispositions: they have no need to present themselves as victims of the process of identity ascription and no real reason to present themselves as its beneficiaries. But this does not explain why they *are*, in fact, willing to talk about empowerment via region and ethnicity.

Another part of the explanation may have to do with the nature of the handicap imposed by female gender. It could be that, by these people, talking or acting "like a woman" is still seen as a liability in a way talking like a Texan or like an African American or like a Hispanic is not. It could be, in other words, that for these women ascribed gender identity is still a greater social and linguistic burden than is regional identity or ethnic identity. This is despite the fact that a Texas "twang" is a decidedly mixed blessing in terms of linguistic prestige for people in public life (and Texans are well aware of the stigma attached to Southern-sounding speech) and despite the continuing stigmatization of African Americans and Hispanics.

To understand completely why Chavez-Thompson, Jordan, Nash, and Springer talk about talk they way they do, we need to examine their own most common and most spontaneous explanations for the provenance of their acting and speaking styles. For these women, ethnicity, gender, and region are not determinants of how people talk. Instead, they are resources that are selectively and sometimes consciously used in the presentation of self. They reject the notion that they talk and act as they do because they are women or because they are African Americans, or Hispanics, or Anglos, or Texans. What they present to the world when they write, orate, negotiate, or lecture are, they insist, their unique selves, shaped by particular circumstances of birth, family, inclination, and luck. Each claimed repeatedly that she talked and acted the way she did because she always had, because she was born that way, because of influences of particular friends and relatives early in life. Nash, for example, "always knew" that she was talented with words. She refers to her style as something that "started happening" when she was in elementary school. Most explicitly, Nash points out that the linguistic choices she makes are in service of the expression of her individual uniqueness, "who I am":

> *Nash:* Well, it's, it's actually in in the handling of the language. I want to make sure that I am not digressing from who I am when I speak. When I, when I speak, uh,

verbally or when I speak, uh, in the written [mode], "This is me." I don't want to be somebody else when I'm writing a story about [my father-in-law], I want to be the same person who wrote the story about [a farmer]. . . . "That's the same person," you can read the story and say "I bet that's the same person [who wrote that]," even though the material is completely different.

Springer attributes her success in court to "being *herself*," in response to a question that was meant to get her to talk about being *a woman:*

Johnstone: Do people ever talk about differences in style between male and female attorneys in the in the courtroom?
Springer: Yes, they do, a lot. Uh, in the courtroom, uh, difference in style and people have told me that they think that I'm successful in the courtroom because I can identify with the jury, that the juries like me. *And I haven't ever figured out why, except that I try to smile, and I try to just be myself,* and I don't put on any airs.

When Springer does attribute aspects of her style to the influence of a woman (her mother), she does so, interestingly, by means of a biological metaphor that immediately particularizes the source of influence: she claims to have inherited her mother's "teacher genes."

Linda Chavez-Thompson also speaks of a relative, the grandfather who taught her to make speeches in Spanish, as an important source of influence. But she attributes her success as a negotiator and administrator mainly to her own inborn talent, a "sixth sense" that she has always had, as recognized by a man for whom she worked as a secretary:

When I met this gentleman, he, maybe recognized the potential. Uh, whether he recognized *a talent that I might have had. I have almost this, this sixth sense* of people sitting down and beginning to tell me their problem, and *I automatically* can figure out what the solution might be and how do we get there. And *I've always had this*; I, I, I'm sort of like a middle child in the family. There's two older, and there's, there's, uh, five younger, but I'm the one that, that everybody looks to to make a decision.

For these women, the primary reasons for linguistic choice are particular reasons. They talk as they do because they are the particular individuals they are, shaped by the particular circumstances of their birth, family, and community. If there are speakers who are victims of their gender, ethnicity, or place of origin, speakers who "are spoken by" language rather than creating language as they speak, the successful public speakers whom we are studying do not feel that they are in that group. These women are resourceful in two ways: as members of a mobile, heterogenous society, they have many resources from which to choose as they construct ways of expressing their uniqueness, and they are good at doing so. As Linda Chavez-Thompson puts it:

And I think that the advantage – and I use it, believe me, I use it – the advantage is, uh, I AM female. I AM Hispanic. I am, uh, labor. Of course, some people would take that as three strikes against me, but, but that's besides the point.

Not all speakers are as resourceful. For some, limited education or limited contacts outside a small, tight community mean that fewer choices are available; for others, the aptitide or motivation to choose effectively is lacking. I do not mean to suggest that ideologies about gender and other social attributes do not exert enormous influence over how people talk. I do want to point out, though, that the process is an indirect one, always mediated by the individual.

Discussion

In a 1993 article, Donna Eder reports on a study of working-class adolescent girls' teasing about romance and sex. Eder found that the girls referred to traditional concepts of how females were supposed to act in teasing each other, but that the teasing functioned more to strengthen bonds among the girls than to socialize them as females. Stereotypical romantic and sexual behavior was a resource to be played with rather than a source of inescapable influence. This finding leads Eder to call for more study of "the spontaneous and innovative side of an individual's behavior" (1993:29) and to wonder whether adults as well as children might not selectively use dominant social ideologies as resources.

Our study of Texas women suggests that the answer is yes. To see ideologies about gender, ethnicity, and region primarily as constraints on what a person can do is to miss the fact that individuals use ideologies creatively. As speakers decide, consciously or unconsciously, how to sound, they pick and choose from among the available ways of sounding. Our interviews with Texas women show that this is in fact the way they themselves understand their language. People, at least people like these, those who shape public discourse, are motivated at least as much by the need for self-expression – the expression of a unique, differentiated self – as they are by the necessity to replicate social ideologies.

The women whom we are studying take various approaches to being Texans and to being women, as well as different approaches to their ethnic backgrounds and to their vocations. They are members of a common speech community in that they all participate, to one extent or another, in a large public network of influence, but they cannot be said to orient to the same set of norms for speech or other behavior. Instead, their sociolinguistic identities are constructed in discourse. These Texans shape languages to use as they shape individual identities in the social space defined by the axes of region, gender, vocation, ethnicity, and ideologies about talk, as well as by more particular axes of family, community, psychology, and the need for individuation.

Acknowledgements

An earlier version of this article was presented at the American Anthropological Association Annual Meeting in November 1993, in a session on gender ideology in discourse organized by Deborah Tannen and Susan U. Phillips. I am grateful to them and to the session's discussants and audiences for comments and suggestions. I am also grateful to Judith Mattson Bean, one of my coworkers on the Texas women's speech project, for ideas arising

from many discussions of the interview transcripts that I draw on here, and to Bean and Delma McLeod-Porter for their help with interviewing and transcribing. Anonymous reviewers for the *Journal of Linguistic Anthropology* also provided useful suggestions.

Notes

1. Both in its concern with speech and writing for public audiences and in its use of sociolinguistic data collected in relatively formal interviews, the project thus focuses on relatively non-"vernacular" speech, in contrast to many other sociolinguistic studies. This is because we are interested in the public sources of influence that increasingly supplement private neighborhood and family networks as agents of linguistic change.
2. The material in this paragraph is greatly condensed, in the interest of space. It is drawn from the language-attitude interviews described above and from the enormous literature in history, political science, literary studies, and anthropology on Texas women.
3. Transcription conventions: I have indicated overlapping talk with brackets and latched talk with equal signs; the transcriptions otherwise employ normal English orthography and punctuation. I am more interested in this article in what the subjects said than in how they said it, and this system makes the transcripts easiest to read. Capitalization indicates unusual emphasis. Material that I have left out is indicated with ellipses.
4. There is not much scholarship to date on discourse-level features of southern speech; see Johnstone 1992 for an overview of what has been done. There is, of course, an enormous body of scholarship on language and gender in general, but this is not the place to review it. See Tannen 1993b, for example, for work on gender and interactional style; Eckert 1989 on sociolinguistic effects of gender; Graddol and Swann 1989:12–40 and Sachs et al. 1973 on biological versus learned aspects of vocal pitch.
5. Monophthongized or glide-reduced /ay/ before *voiced* sounds is common throughout the South; it is specifically monophthongization before *voiceless* obstruents that appears to be associated with Texas identity. Bailey 1991 shows that opinion-poll respondents who rate Texas as a "good" or "excellent" place to live are more likely than others to use monophthongal /ay/ before voiceless obstruents.
6. The issue of religious identity and ethnicity connected with it is more complicated. I have not dealt with it here.
7. The variety spoken in this sort of context is not actually called, by its speakers, "Spanish." It is a variety that involves frequent, extremely fluent switches from English vocabulary and syntax to Spanish and back, with the conversation as a whole sometimes seeming more Spanish and sometimes more English. The case can be and has been made that this is a distinct "language" or "dialect" (linguists do not have an appropriate term) rather than the result of switching between two separate languages. Linda Chavez-Thompson, like many Texas Hispanics, calls the variety "Tex-Mex" (another of the case-study subjects uses the expression "speaking mixed") and emphatically denies that people are speaking Spanish when they speak this way; further west, it is sometimes referred to as Pocho Spanish. See Anzaldua 1987, Ornstein-Galicia 1981, and Peñalosa 1981.

The Role of Knowledge in Discourse Comprehension: A Construction–Integration Model

Walter Kintsch

Discourse comprehension, from the viewpoint of a computational theory, involves constructing a representation of a discourse upon which various computations can be performed, the outcomes of which are commonly taken as evidence for comprehension. Thus, after comprehending a text, one might reasonably expect to be able to answer questions about it, recall or summarize it, verify statements about it, paraphrase it, and so on.

To achieve these goals, current theories use representations with several mutually constraining layers. Thus, there is typically a linguistic level of representation, conceptual levels to represent both the local and global meaning and structure of a text (e.g., the micro- and macrostructure, constituting the *text base* in van Dijk & Kintsch, 1983), and a level at which the text itself has lost its individuality and its information content has become integrated into some larger structure (e.g., van Dijk & Kintsch's situation model).

Many different processes are involved in constructing these representations. To mention just a few, there is word identification, where, say, a written word like *bank* must somehow provide access to what we know about banks, money, and overdrafts. There is a parser that turns phrases like *the old men and women* into propositions such as AND[OLD[MEN],OLD[WOMEN]]. There is an inference mechanism that concludes from the phrase *The hikers saw the bear* that they were scared. There are macro-operators that extract the gist of a passage. There are processes that generate spatial imagery from a verbal description of a place.

It is one thing for a theorist to provide some formal description (e.g., a simulation model) for how such processes can occur and for what the computational

Source: *Psychological Review* vol. 95, no. 2, 1988, pp. 163–182.

steps were that led to a particular word identification, inference, or situation model. It is quite another to control construction processes in such a way that at each point in the process exactly the right step is taken. Part of the problem has to do with the characteristic ambiguity of language: How do we make sure that we access the financial meaning of *bank*, and not the meaning of *riverbank*? Why did we parse *the old men and women* as we did – maybe the women were not old at all. Why did we infer that the hikers were scared rather than that they had their eyes open, or a myriad of other irrelevancies? Of all the many ways macro-operators could be applied, how did we get just the right sequence to reach a plausible gist without making the wrong generalizations? The number of possible alternative steps is distressingly large in constructing discourse representations, and without firm guidance, a computational model could not function properly for long. That is where knowledge comes in.

General knowledge about words, syntax, the world, spatial relations – in short, general knowledge about anything – constrains the construction of discourse representations at all levels. Indeed, this is what makes it possible to construct these representations. There is a striking unanimity among current theories about how this is done.

Our conceptions about knowledge use in discourse comprehension are dominated by the notions of top–down effects and expectation-driven processing. Knowledge provides part of the context within which a discourse is interpreted. The context is thought of as a kind of filter through which people perceive the world. At the level of word recognition and parsing, it lets through only the appropriate meaning of an ambiguous word or phrase and suppresses the inappropriate one. Through semantic priming, the feature counter of the logogen for *bank as a financial institution* will be incremented and will reach its threshold before that of *riverbank* in the right context (Morton, 1969). Parsing a sentence is often thought of as predicting each successive constituent from those already analyzed on the basis of syntactic rules (Winograd, 1983). Scripts, frames, and schemata constrain the inferences an understander makes (as in Schank & Abelson, 1977), thereby preventing the process from being swamped in a flood of irrelevancies and redundancies. Arithmetic strategies generate just the right hypothesis in solving a word problem and preclude the wrong ones (Kintsch & Greeno, 1985). In a word, knowledge makes understanding processes smart: It keeps them on the right track and avoids exploring blind alleys. People understand correctly because they sort of know what is going to come. This program of research is well expressed by the following quotation from Schank (1978, p. 94), which served as a motto for Sharkey's (1986) model of text comprehension:

> We would claim that in natural language understanding, a simple rule is followed. Analysis proceeds in a top-down predictive manner. Understanding is expectation based. It is only when the expectations are useless or wrong that bottom–up processing begins.

Empirically, this position is questionable: Even fluent readers densely sample the words of a text, as indicated by their eye fixations (Just & Carpenter, 1980).

making the bottom–up mode appear the rule rather than the exception. Computationally, it is not an easy idea to make work. It is difficult to make a system smart enough so that it will make the right decisions, yet keep it flexible enough so that it will perform well in a broad range of situations. On the one hand, one needs to make sure that exactly the right thing (word meaning, proposition, inference) will be constructed; for that purpose one needs powerful, smart rules that react sensitively to subtle cues. On the other hand, humans comprehend well in ever-changing contexts and adapt easily to new and unforeseen situations; for that purpose one needs robust and general construction rules. Scripts and frames, as they were first conceived, are simply not workable: If they are powerful enough, they are too inflexible, and if they are general enough, they fail in their constraining function. This dilemma has long been recognized (e.g., Schank, 1982; van Dijk & Kintsch, 1983), and efforts have been undertaken to make expectation-driven processes sufficiently flexible (e.g., Schank's memory organization packets, or MOPs). In this article, an alternative solution to this problem will be explored.

Construction of Discourse Representations

The traditional approach to modeling knowledge use in comprehension has been to design powerful rules to ensure that the right elements are generated in the right context. The problem is that it is very difficult to design a production system powerful enough to yield the right results but flexible enough to work in an environment characterized by almost infinite variability. The approach taken here is to design a much weaker production system that generates a whole set of elements. These rules need to be just powerful enough so that the right element is likely to be among those generated, even though others will also be generated that are irrelevant or outright inappropriate. An integration process will then be used to strengthen the contextually appropriate elements and inhibit unrelated and inappropriate ones. Weak productions can operate in many different contexts because they do not have to yield precise outputs; on the other hand, a context-sensitive integration process is then required to select among the outputs generated. The integration phase is the price the model pays for the necessary flexibility in the construction process.

The model proposed here has been termed a *construction–integration* model to emphasize its most salient feature. It combines a construction process in which a text base is constructed from the linguistic input as well as from the comprehender's knowledge base, with an integration phase, in which this text base is integrated into a coherent whole. The knowledge base is conceptualized as an associative network. The construction process is modeled as a production system. Indeed, it is a generalization of the production system used in earlier work, such as the simulation-of-comprehension processes developed by Fletcher (1985) and Dellarosa (1986) after the model of Kintsch and Greeno (1985). The main difference is that instead of precise inference rules, sloppy ones are used, resulting in an incoherent, potentially contradictory output. However, this output structure

is itself in the form of an associative net, which can be shaped into a coherent text base via relaxation procedures in the connectionist manner (e.g., Rumelhart & McClelland, 1986). Thus, the model represents a symbiosis of production systems and connectionist approaches.[1]

Certain limitations of the present article are worth noting at this point, for it does not offer a solution to all the problems in discourse understanding. Thus, it is not primarily concerned with the specific strategies (or rules) for the construction of text propositions or inferencing. Instead, it relies in this respect on what is available in the literature as well as on whatever future researchers will be able to come up with. The only point it makes is that whatever these strategies or rules are, they will be easier to formulate within the present framework, which allows them to be both weaker and more general. Thus, one need not worry about constructing just the right inference, but can be content with a much sloppier rule. Sometimes, of course, even the latter type of rule may be hard to come by, whereas in other cases (e.g., in the word problems discussed later) promiscuous hypothesis generation is straightforward (while selecting just the right one can be tricky).

Knowledge Representation

The process of constructing a discourse representation relies heavily on knowledge. To understand how it operates, one must first have an idea of how the to-be-used knowledge is organized. Typically, theorists have tried to create knowledge structures to support smart processes: semantic nets, frames, scripts, and schemata. As has been argued elsewhere (Kintsch, in press), such fixed structures are too inflexible and cannot adapt readily enough to the demands imposed by the ever-changing context of the environment. Instead, a minimally organized knowledge system is assumed here in which structure is not prestored, but generated in the context of the task for which it is needed. An associative net with positive as well as negative interconnections serves this purpose.

Knowledge is represented as an associative net, the nodes of which are concepts or propositions.[2] The nodes in this net are interconnected. Connections among nodes have a strength value, which may be positive, zero, or negative, ranging from 1 to −1. Nodes consist of a head plus a number of slots for arguments. Thus, the nodes of the knowledge net are formally equivalent to the propositions used to represent texts (e.g., Kintsch, 1974).[3] The slot specifies the nature of the relation between the head and the argument. Slots may represent attributes, parts, cases of verbs, or arguments of functions. They need not be named, but may be named if the relation is a common one (such as the cases of verb frames). The arguments of a proposition are concepts or other propositions. The number of arguments in a proposition may vary from one to some small number. Examples of common types of nodes in the knowledge net are (a) MARY, (b) CAKE, (c) SWEET[CAKE], (d) BAKE[agent:MARY,object:CAKE], (e) CONSEQUENCE [condition:NOT[WATCH[agent:MARY,object:CAKE],effect:BURN[object:CAKE]]. Examples A and B are lexical nodes that have associated with them perceptual procedures that identify certain patterns in the environment – either the objects

themselves or the written or spoken words, such as MARY and CAKE, respectively. In the following I shall not deal with these perceptual procedures explicitly. The semantic and associative relations into which MARY and CAKE enter, which constitute a part of the general knowledge net, are the focus of interest here. MARY and CAKE appear as arguments in Examples C through E in various roles (the agent and object slots, etc.).

There are two ways of looking at the list of propositions in Examples A through E. On the one hand, it could be considered simply as a portion of a general knowledge network, whereas on the other hand, it could be considered the propositional base of a (brief) discourse, in which a particular Mary bakes and burns a particular cake.[4] Thus, the elements of which knowledge nets and text bases are constructed are the same. Indeed, as will be detailed later, text bases are formed by selecting, modifying, and rearranging propositional elements from the knowledge net. However, text bases are not part of the knowledge net, but separate structures with their own properties.

Concepts are not defined in a knowledge net, but their meaning can be constructed from their position in the net. The immediate associates and semantic neighbors of a node constitute its core meaning. Its complete and full meaning, however, can be obtained only by exploring its relations to all the other nodes in the net. Meaning must be created. As a first step one could add all propositions in the net directly related to a node to obtain what Mudersbach (1982) termed the first level of meaning; then all propositions directly related to the propositions at the first level can be added to form a second level, and so on, until the whole knowledge net is involved. Note, however, that such a construction is a theoretical exercise without direct psychological correspondence. It is not possible to deal with the whole, huge knowledge net at once. Instead, at any moment only a tiny fraction of the net can be activated, and only those propositions of the net that are actually activated can affect the meaning of a given concept. Thus, the meaning of a concept is always situation specific and context dependent. It is necessarily incomplete and unstable: Additional nodes could always be added to the activated subnet constituting the momentary meaning of a concept, but at the cost of losing some of the already activated nodes.[5]

The notion of an associative net is not unfamiliar, but it is usually thought of as relating concepts only, not propositional nodes. Two extremely simple examples will illustrate the nature of such an associative net. First, consider the representation of the homonym BANK in an associative net. Positive connections are indicated by arrows, negative ones by circles. Asterisks indicate further, unspecified nodes. Of course, each of the concepts and propositions shown in Figure 1 participate in the general knowledge net beyond the single connection shown here. As a second example, consider the proposition BAKE[agent: PERSON, object:CAKE] (see Figure 2). Once again, only a fragment of the complete network is shown, just to illustrate certain types of connections.

Representing knowledge in a propositional network has several advantages. Primarily, it provides a common format for the knowledge base and for the mental representation of discourse. Furthermore, we have by now considerable

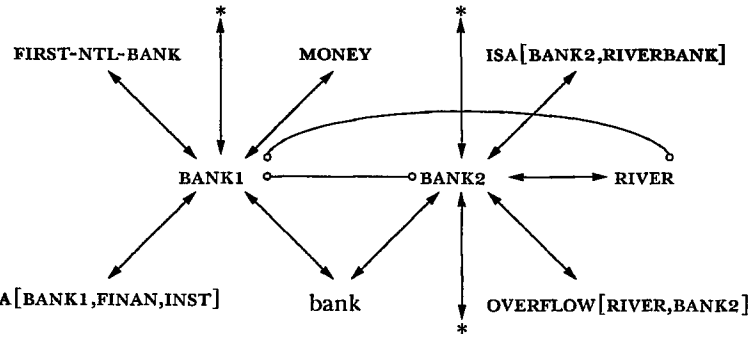

Figure 1: A fragment of the associative net for BANK (Positive connections are indicated by arrows, negative ones by circles; asterisks indicate further, unnamed nodes.)

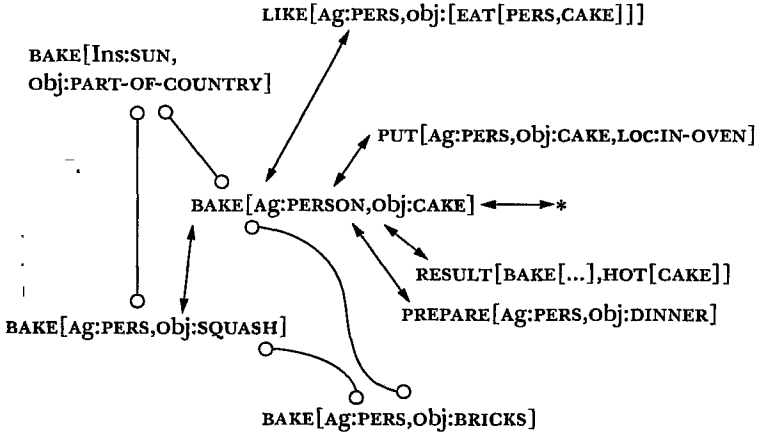

Figure 2: A fragment of the associative net for BAKE

experience working with propositional structures, whereas other forms of representation are less well understood (e.g., the spatial-imagery and linear structures of Anderson, 1983; the mental models of Johnson-Laird, 1983; or whatever the appropriate representation in the affective system might be, as in Zajonc, 1980). However, the decision to use a propositional representation does not imply that all other forms of knowledge are to be considered unimportant or nonexistent. It would be desirable to expand the model to include nonpropositional representations, but one would first have to learn how to operate with such forms of representation.

Construction Processes

The steps in constructing a text base according to the construction–integration model involve: (a) forming the concepts and propositions directly corresponding to the linguistic input; (b) elaborating each of these elements by selecting a small number of its most closely associated neighbors from the general knowledge

net; (c) inferring certain additional propositions; and (d) assigning connection strengths to all pairs of elements that have been created.

The result is an initial, enriched, but incoherent and possibly contradictory text base, which is then subjected to an integration process to form a coherent structure.

In Step A of this process, a propositional representation of the text is constructed from a parsed linguistic input, such as the words of a text with suitable syntactic annotations, and from a knowledge system as envisioned earlier. Note that the parser itself is not a part of the present model. The basic process of proposition building has been described in van Dijk and Kintsch (1983, chapter 4) and Kintsch (1985). I will illustrate it here with some simple examples. Consider the sentence *Mary bakes a cake.* The parser output needed is *Mary* (agent of BAKE) *bakes* (predicate) *a cake* (object of BAKE). *Mary*, *bake*, and *cake* activate their corresponding lexical nodes, and MARY and CAKE are assigned the roles of agent and object in the BAKE proposition. As was suggested in Figure 2, BAKE requires a PERSON as agent, hence a test is made whether MARY is a person. This may either involve a search through the knowledge net for the proposition ISA[MARY,PERSON] or, should that search prove unsuccessful, an attempt to infer this proposition (e.g., the net may contain only propositions to the effect that MARY is a name and that persons have names; exactly how such problem-solving activity occurs within an associative net will not be considered here).

The present model, however, differs in a significant way from my earlier conceptions: It does not require that the right, and only the right, proposition always be formed. Instead, the construction rules for building propositions can be weakened, allowing for the formation of incomplete or "wrong" propositions. Proposition building is on-line, and frequently, all the relevant information for building just the right one is not available on-line, leading to false starts or incompleted attempts. In the aforementioned example, this has no interesting consequences; for example, if in response to the phrase *Mary bakes . . .* the proposition BAKE[MARY,$] – the dollar sign indicates an unfilled slot – is formed, it will simply be replaced by the complete proposition when the rest of the sentence is processed. However, consider an example discussed by Frazier and Rayner (1982): *The linguists knew the solution of the problem would not be easy.* Here, the on-line construction of propositions is not so simple. First, the proposition KNOW[LINGUISTS,$] is formed. Then, by the strategy of minimal attachment, the subsequent noun phrase is interpreted as the object of KNOW, yielding KNOW[LINGUISTS,SOLUTION]. The final verb phrase, however, requires a subject, so [NOT[EASY[SOLUTION]]] is constructed. As Frazier and Rayner pointed out, this does not involve a reinterpretation of the sentence. Subjects do not go back, noting in some way that *solution of the problem* had been attached to the wrong proposition, and repair this error. Instead, the incorrectly formed KNOW proposition somehow just disappears; the description of the integration process that follows shows how.

A third example of proposition building, involving pronoun identification, will be discussed here. There exists good psychological evidence that pronouns may activate more than one possible referent (e.g., Frederiksen, 1981). Thus, in

The lawyer discussed the case with the judge. He said "I shall send the defendant to prison." the following propositions would be formed: DISCUSS[LAWYER,JUDGE, CASE]; SAY[LAWYER,[SEND[LAWYER,DEFENDANT,PRISON]]]; and SAY[JUDGE, [SEND[JUDGE,DEFENDANT,PRISON]]]. Eventually, of course, the right interpretation comes to dominate the wrong one, as will be shown shortly.

In Step B of the construction process, each concept or proposition that has been formed in Step A serves as a cue for the retrieval of associated nodes in the knowledge net. The retrieval process itself is modeled after well-known theories that have been developed and tested in the memory literature (Raaijmakers & Shiffrin, 1981). Suppose that node i in the knowledge net is positively associated with n other nodes in the net. Let $s(i,j)$ be the associative strength between nodes i and j. Then the probability that the retrieval cue j will retrieve node j is

$$P(j \mid i) = \frac{S(i, j)}{\sum_{h=1}^{n} s(i, h)} \tag{1}$$

Note that each concept or proposition in the text base serves as an independent retrieval cue, hence the particularly simple form of the retrieval process. (An intersection search would be required if the items in the text base acted as a compound cue.) On each retrieval attempt, an item among the associates of i is selected according to Equation 1. A sampling-with-replacement process is assumed so that dominant associates may be retrieved more than once. The number of retrieval attempts with item i as the cue is assumed to be fixed and is a parameter of the model, k. In the examples that follow, k was chosen to be 2 or 3, mostly to reduce the complexity of these examples. However, one may speculate that the most realistic value of k would not be much higher, perhaps between 5 and 7.

Consider some simple examples.

1. Suppose the word *bank* is presented as part of a text. It will activate the lexical nodes BANK1 (financial institution) as well as BANK2 (riverbank), plus some of their associates; for example, the construction process might pick from Figure 1: BANK1, MONEY, FIRST-NATIONAL-BANK, BANK2, RIVER, OVERFLOW [RIVER,BANK2].

2. Suppose the sentence *Lucy persuaded Mary to bake a cake* is presented as part of a text. The parser should provide a phrase structure tree as output, from which the proposition PERSUADE[LUCY,MARY,BAKE[MARY,CAKE]] is constructed. Each text proposition activates propositions closely related to it in the general knowledge net, regardless of the discourse context. For instance, in the case of BAKE[MARY,CAKE] we might thus obtain LIKE[MARY,EAT[MARY,CAKE]], PUT[MARY, CAKE,IN-OVEN], RESULT[BAKE[MARY,CAKE], HOT[CAKE]], PREPARE[MARY,DINNER]. These propositions are all closely associated with baking a cake (Figure 2). Note, however, that elaborating the text base in this way is not just a question of retrieving associated propositions from the knowledge net. The arguments of these retrieved propositions must be treated as variables that are to be bound to the values specified by the retrieval cue. Thus, because MARY is the agent of the text proposition, MARY is made the agent in the knowledge propositions it brings

into the text representation, instead of PERSON in Figure 2. Similarly, although the informality of the present notation hides this, CAKE now is the particular one MARY bakes, not the generic one in Figure 2. These knowledge propositions function as potential inferences. Out of context there is no way of determining which of them are relevant: Maybe Mary really likes to eat cake, but perhaps she is in the process of cooking dinner, in which case PREPARE[MARY,DINNER] might become a macroproposition (what van Dijk, 1980, calls a *construction*). But it is also possible that next she will burn her fingers when she takes the cake out of the oven, making HOT, which plays no role at all in the other contexts, the relevant inference. At this point, the construction process lacks guidance and intelligence; it simply produces potential inferences, in the hope that some of them might turn out to be useful.

3. In the third example, if the proposition SEND[LAWYER,DEFENDANT,PRISON] has been formed, the knowledge net contributes nothing, because one presumably does not know anything about lawyers sending defendants to prison. (Of course, LAWYER, DEFENDANT, and PRISON would each be associatively elaborated separately.) If, however, JUDGE rather than LAWYER were the agent of SEND, the elaboration process would contribute the information that this implies that the judge is sentencing the defendant and so forth.

Step C in the construction process, the generation of additional inferences, is necessary because not all inferences that are required for comprehension will, in general, be obtained by the random elaboration mechanism described earlier. In some cases more focused problem-solving activity is necessary to generate the desired inferences. Exactly how this is to be done is, however, beyond the scope of this article. I merely wish to point out here that in addition to the undirected elaboration which results from Step B of the construction process, there is still a need for controlled, specific inferences. Two types of such inferences are of particular importance in comprehension. Bridging inferences (Haviland & Clark, 1974; Kintsch, 1974) are necessary whenever the text base being constructed is incoherent (i.e., whenever either the original text base itself or the elaborated text base remains incoherent by the criteria discussed in van Dijk and Kintsch, 1983, chapter 5). Second, macropropositions have to be inferred (as discussed in general terms in chapter 6 of van Dijk & Kintsch, 1983, and operationalized as a production system by Turner, McCutchen, & Kintsch, 1986). Macropropositions are also elaborated associatively, as described in Step B for micropropositions.

What has been constructed so far is a set of propositions containing the (micro)propositions directly derived from the text, a randomly selected set of associates for each of these, the macropropositions generated from the text, and their associates. The final Step D of the construction process involves the specification of the interconnections between all of these elements. There are two ways in which elements are interconnected. (a) The propositions directly derived from the text (hence referred to as "text propositions") are positively interconnected with strength values proportional to their proximity in the text base. Specific realizations of this principle are described in the discussion of Figure 4. (b) If propositions i and j are connected in the general knowledge net with the

strength value $s(i,j)$, $-1 < s(i,j) < 1$, and if i and j become members of a text base, the strength of their connection in the text base is $s(i,j)$. In other words, propositions in the text base inherit their interconnections from the general knowledge net. Strength values are additive, up to a maximum of 1, in those cases in which an inherited strength value combines with a text-base-determined connection.

Consider, for instance, the portion of a network that is generated when the word *bank* activates both BANK1 and BANK2, as well as the associations MONEY and RIVER. A possible pattern of connections is shown in Figure 3, where for simplicity, connection strengths have been limited to ±.5 or 1. Alternatively, the graph shown in Figure 3 can be expressed in matrix form as shown in Table 1. BANK1 is associated with MONEY, BANK2 with RIVER, but inhibitory connections exist between MONEY and BANK2 and between RIVER and BANK1.

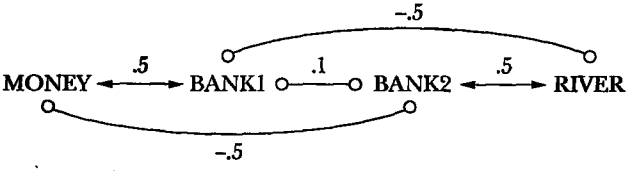

Figure 3: Connections between BANK1 and BANK2 and their associates

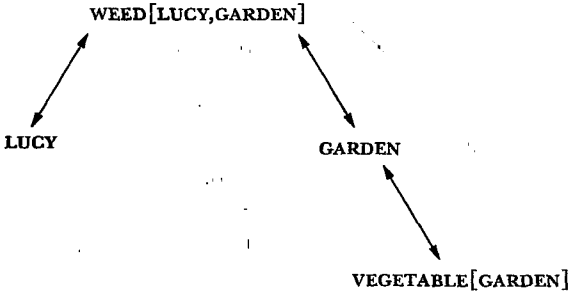

Figure 4: The text base for *Lucy weeded the vegetable garden*

An example of text propositions that are interconnected via their positions in the text base is shown in Figure 4. LUCY is connected most strongly to WEED[LUCY, GARDEN], and least strongly to VEGETABLE[GARDEN]. Although there are many possible ways to assign numerical connection strengths to express this pattern of connectivity, the one chosen here results in the matrix shown in Table 2.

Table 1: Connectivity matrix for the graph shown in Figure 3

Proposition	1	2	3	4
1. MONEY	–	0.5	−0.5	0.0
2. BANK1	0.5	–	−1.0	−0.5
3. BANK2	−0.5	−1.0	–	0.5
4. RIVER	0.0	−0.5	0.5	–

Table 2: Connectivity matrix for the graph shown in Figure 4

Proposition	1	2	3	4
1. LUCY	–	0.9	0.7	0.4
2. WEED	0.9	–	0.9	0.7
3. GARDEN	0.7	0.9	–	0.9
4. VEGETABLE	0.4	0.7	0.9	–

Inferences inherit positive and negative interconnections from the general knowledge net, as seen in Figure 5. The result of the construction process is, therefore, a network expressable as a connectivity matrix, consisting of all the lexical nodes accessed, all the propositions that have been formed, plus all the inferences and elaborations that were made at both the local and global level and their interconnections.

Integration

The network that has been constructed so far is not yet a suitable text representation. It was carelessly constructed and is therefore incoherent and inconsistent. At all levels of the representation, components associated with the text elements were included without regard to the discourse context, and many of them are inappropriate. An integration process in the connectionist manner can be used to exclude these unwanted elements from the text representation (e.g., see Rumelhart & McClelland, 1986, and Waltz & Pollack, 1985, for discourse).

Text comprehension is assumed to be organized in cycles, roughly corresponding to short sentences or phrases (for further detail, see Kintsch & van Dijk, 1978; Miller & Kintsch, 1980). In each cycle a new net is constructed, including whatever is carried over in the short-term buffer from the previous cycle.[6] Once the net is constructed, the integration process takes over: Activation is spread around until the system stabilizes. More specific, an activation vector representing the initial activation values of all nodes in the net is postmultiplied repeatedly with the connectivity matrix. After each multiplication the activation values are renormalized: Negative values are set to zero, and each of the positive activation values is divided by the sum of all activation values, so that the total activation on each cycles remains at a value of one (e.g., Rumelhart & McClelland, 1986).

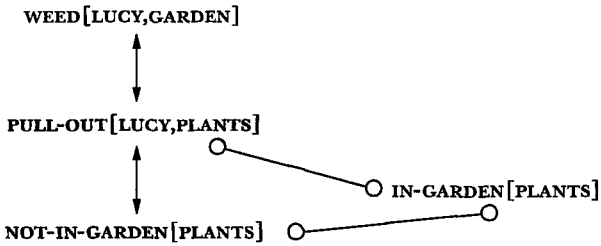

Figure 5: Inferences generated from WEED[LUCY,GARDEN] and their interconnections

Usually, the system finds a stable state fairly rapidly; if the integration process fails, however; new constructions are added to the net, and integration is attempted again. Thus, there is a basic, automatic construction-plus-integration process that normally is sufficient for comprehension. This process is more like perception than problem solving, but when it fails, rather extensive problem-solving activity might be required to bring it back on track. These processes will not be considered further here.

The result of the integration process is a new activation vector, indicating high activation values for some of the nodes in the net and low or zero values for many others. The highly activated nodes constitute the discourse representation formed on each processing cycle. In principle, it includes information at many levels: lexical nodes, text propositions, knowledge-based elaborations (i.e., various types of inferences), as well as macropropositions.

A few simple examples will illustrate what is at issue here. Consider *Lucy persuaded Mary to bake a cake*, which was discussed earlier. The PERSUADE proposition will pull in related knowledge items, just as was shown for BAKE. However, out of context the integration process will not yield any striking results. In the context of *Lucy made tomato soup and sauteed some porkchops with herbs. She set the table and persuaded Mary to bake a cake*, the integration process has very different results: PREPARE[LUCY,DINNER] emerges as the dominant proposition (macroproposition) because most of the other propositions in the text base contribute to its activation value. That the cake was hot, or that she put it into the oven, disappears from the representation with activation values around zero.

Next, consider the example just discussed, where a perfectly good propositional strategy led to a wrong result. For *The linguists knew the solution of the problem would not be easy*, the text base that was constructed is shown in Figure 6. It corresponds to the connectivity matrix exhibited in Table 3 if connection strengths are assigned as in Table 2. (KNOW[SOLUTION] and NOT[EASY] are connected positively via KNOW[$] but negatively via EASY, which adds up to 0.) The activation vector (.25, .25, .25, .25) corresponding to the assumption that all text propositions are equally activated initially is repeatedly multiplied with this matrix, renormalizing the obtained activation values after each multiplication as described earlier. To decide when the activation vector has stabilized, the following criterion was established: A stable state is reached when the average

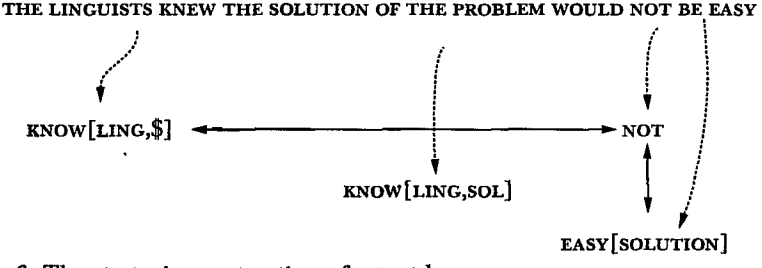

Figure 6: The strategic construction of a text base: SOLUTION-OF-THE-PROBLEM is first assigned to KNOW, then to EASY (The Dollar sign is a placeholder.)

Table 3: Connectivity matrix for the graph shown in Figure 6

Proposition	1	2	3	4
1. KNOW[$]	–	0.9	0.7	0.9
2. KNOW[SOL]	0.9	–	−1.0	0.0
3. EASY	0.7	−1.0	–	0.9
4. NOT	0.9	0.0	0.91	–

change in the activation values after a multiplication is less than .001. Although this is an arbitrary criterion, even large changes (by one order of magnitude in either direction) make only minor differences in the final activation values obtained in this and many other cases. In the present case, this criterion is reached after 10 operations, yielding the final activation vector (.325, .000, .325, .350) – that is, the wrong KNOW[LINGUISTS,SOLUTION], which does not fit into the text base, has been deactivated. The integration process similarly resolves the problem of multiple pronoun referents. For *The lawyer discussed the case with the judge. He said "I shall send the defendant to prison,"* propositions were constructed for both lawyer and judge as referents of *he.* However, the process of associative elaboration generated some additional information for SEND[JUDGE,DEFENDANT,PRISON], but not for SEND[LAWYER,DEFENDANT,PRISON]. The resulting text base is shown in Figure 7. To obtain the corresponding connectivity matrix (see Table 4), connection strengths among text base propositions were assigned as in Table 2.

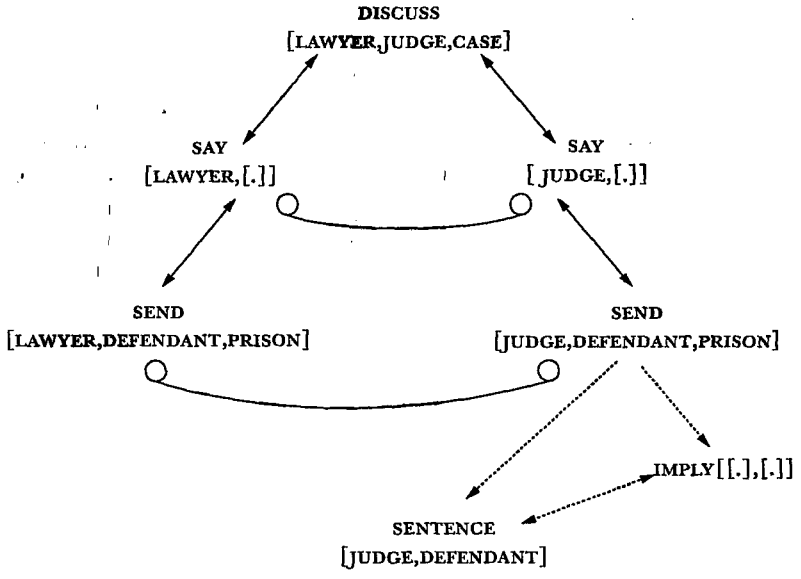

Figure 7: The strategic construction of a text base: The pronoun *he* is identified with two potential, mutually exclusive referents (Instead of writing out whole propositions. the abbreviation [.] is used for the arguments of a proposition when they can be readily inferred.)

Table 4: Connectivity matrix for the graph shown in Figure 7

Proposition	1	2	3	4	5	6	7
1. DISC	–	0.9	0.9	0.7	0.7	0.0	0.0
2. SAY[LAWYER]	0.9	–	−1.0	0.9	0.0	0.0	0.0
3. SAY[JUDGE]	0.9	−1.0	–	0.0	0.9	0.0	0.0
4. SEND[LAWYER]	0.7	0.9	0.0	–	−1.0	0.0	0.0
5. SEND[JUDGE]	0.7	0.0	0.9	−1.0	–	0.5	0.5
6. IMPLY	0.0	0.0	0.0	0.0	0.5	–	0.5
7. SENT	0.0	0.0	0.0	0.0	0.5	0.5	–

and among associates as in Table 3 (other assignments result in different numerical values for the final activation vector, but its pattern remains the same as long as the essential features of the matrix are preserved – for example, which connections are positive, negative, and zero). Assume an initial activation vector of (.25, .25, .25, .25, .25, 0, 0), reflecting the fact that only the text propositions themselves are activated initially. After 19 multiplications with the connectivity matrix, the two propositions in which *he* had been identified as the *lawyer* have activation values of 0, whereas the corresponding *judge* propositions have activation values of .261 and .283, respectively. Just a little knowledge was enough to choose the correct referent.

After this general description of the construction-plus-activation model, two specific applications will be discussed in more detail: how words are identified in a discourse context, and how a propositional text base and situation model are constructed when comprehension depends heavily on activating a rich knowledge set. For that purpose, arithmetic word problems were chosen as the example, because the knowledge that needs to be activated is particularly well defined in that domain, and unambiguous criteria of understanding exist – a solution is either right or wrong. The purpose of these examples is twofold: to show how the general framework proposed can be elaborated into specific models in these experimental situations, and to compare the performance of these models with empirical observations and experimental results as a first test of the psychological adequacy of these models.

Word Identification in Discourse

The first problem to be considered in detail is how knowledge is used in understanding the meaning of words in a discourse. The previously sketched model implies that word meanings have to be created anew in each context, that this is initially strictly a bottom–up process with context having its effects in the integration phase, and that this construction-plus-integration process takes time, with different factors influencing successive phases of the process.

Context effects in word recognition are ubiquitous in the experimental literature, and the explanation of these context effects has been a primary goal

of theories of word recognition. Typically, it is taken for granted in these theories that because context influences word recognition, contextual factors interact with the perceptual processes. Context effects are said to be top–down and expectation driven and are said to facilitate (or sometimes interfere with) the perceptual analysis. Similar ideas were once current in related fields, such as the "New Look" in perception (Bruner & Postman, 1949) and the filter theory of attention (Broadbent, 1958). People perceive what they expect or want, attention filters out the irrelevant. Some words are recognized because the context favors them; others are not because the context inhibits them. How these top–down effects of context are realized differs in detail among theories, but all the most influential current theories postulate interactive processes in which contextually expected words are favored. In the logogen model (Morton, 1969, 1979), context primes semantic features that enter into the feature counter of a logogen and therefore strengthen that logogen. In Forster's search model (Forster, 1976), perceptual analysis defines a candidate set that is then searched by semantic relations or by word frequency. In Becker's verification model (Becker, 1976), both a set of sensory candidates and a set of semantic candidates are created, with the latter being verified first. In the cohort model of Marslen-Wilson and Welsh (1978), context is used to exclude members of the cohort from the very beginning. Norris (1986) has recently reviewed these models and pointed out that they all involve some sort of priming mechanism through which context effects are mediated.

The model of how knowledge is used in discourse suggests a fundamentally different approach. Following earlier work by Kintsch and Mross (1985) and Norris (1986), the present model is neither interactive, nor does it involve priming. As these authors have argued, word identification is not simply a matter of lexical access. Rather, it is a complex process that responds to different influences at different stages. These stages, however, are merely convenient verbal labels. In fact, processing is continuous, and there is significant temporal overlap between the different subprocesses defining these stages. In the first stage (which was termed *sense activation* by Kintsch & Mross, 1985), the number of word candidates consistent with the perceptual input is progressively reduced through perceptual feature analysis. As in Forster or Becker, a set of sensory candidates is created through perceptual analysis, but its size decreases as the analysis progresses. This process rapidly reduces the number of word candidates to some manageable number, but not necessarily to one. At this point (probably at about 50 ms, see Fischler & Goodman, 1978), the semantic context comes into play. Some small number of lexical nodes has now been selected, each one activating a few of its strongest semantic or associative neighbors in the knowledge network. If there is a node whose associates fit into whatever context is present, it will be taken as the meaning of the to-be-identified word. What fits is determined by the integration process sketched earlier. This is the *sense-selection* stage of Kintsch and Mross.

Note that if the perceptual analysis had been allowed to continue for a sufficient period of time, for most words it would have yielded a result eventually by itself, and probably the same one. It is just that the association check helped

to shortcut this process. With homonyms, however, the association check plays a crucial role: Perceptual analysis alone cannot decide which meaning of *bank* to select in any given context.

Sense selection by means of an association check is the very first of a possibly very long series of contextual plausibility checks (Norris's term). It comes first because the associative/semantic context of a lexical node can be computed rapidly. As more information about the context becomes available, the sentence and discourse meaning begin to emerge, and more and deeper plausibility checks can be performed as long as there still is time. This is the *sense-elaboration* phase, in which the meaning of a word is contextually explored and elaborated. However, once a response has been made in a recognition experiment, or once the process moves on in a discourse, elaboration is terminated. Thus, word meanings are usually identified long before complex inferences are made in comprehending a discourse.

At this point, a "meaning" has been constructed for the word in this particular context. It consists of the lexical node that has been activated (the contextually inappropriate nodes that had been activated have by now been deactivated through the various context checks), the associative and semantic neighbors of that node, the sentence and discourse context in which the word participated, and some inferences and elaborations that were produced in the course of the various plausibility checks that explored the role of that word in the given context.

What do we need to make such a model of word identification work? We shall disregard the perceptual analysis and take for granted that a certain number of appropriate lexical nodes has been activated (e.g., multiple semantic nodes for a homonym). We then need to compute the sentences and phrases in which the word in question participates, or more accurately, the propositions in which the corresponding concept token (for which the lexical node serves as the type) plays a role. Finally, we need to construct inferences and elaborations when necessary.

A model of word recognition that thus far is identical with the one favored here has recently been developed by Norris (1986). Norris called it the "checking model" and compares and contrasts it with the other extant models of word recognition in the literature. In Norris's model, the plausibility of word candidates in any given context is evaluated. The recognition criterion for contextually plausible words is lowered and that for implausible words is increased. By manipulating criterion bias in this way, Norris accounted for a wide range of observations from threshold and other types of recognition experiments.

Instead of equating plausibility with criterion bias, a different mechanism – integration – is used here. This mechanism has the great advantage of being applicable not only at the word-recognition level (which is what Norris was concerned with), but it is equally suited to modeling knowledge integration at higher levels.

When a word is perceived, one or more lexical nodes are accessed, and some of their neighboring nodes that are closely related associatively or semantically are also activated. Similarly, when a proposition is constructed, a number of associatively and semantically related propositions are also constructed. Both related concepts and related propositions serve to determine the plausibility of

the core words and propositions. A richly interconnected structure is thus formed, through which activation can spread, so that positively interconnected items strengthen each other, while unrelated items drop out and inconsistent items become inhibited. Or, said differently, implausible items will be suppressed, whereas plausible ones support each other – at the level of word recognition as well as of textual integration.

Time Course of Activation of Words in a Discourse Context

The model of word recognition just outlined is consistent with a great deal of experimental data. Norris (1986) has reviewed the word recognition literature in great detail and shown that his checking model accounts for the rich empirical findings in that area better than any of its competitors. The construction–integration model is closely related to Norris's model. On the one hand, it is more specific in that it proposes computational procedures by means of which Norris's "plausibility check" could actually be achieved, whereas on the other hand it replaces Norris's shift in criterion bias with the computationally more feasible integration mechanism. It appears likely that the present model can handle all the data the checking model accounts for, in just the same way and for just the same reasons as the checking model. There is, however, another part of the literature on word recognition that is not discussed in Norris (1986): the work on word identification in discourse. The empirical findings in this area are also in good agreement with the construction–integration model.

In a lexical decision task, the subject sees a string of letters and must decide as quickly as possible whether it forms an English word. If a target word is preceded by a closely related word, the response to the target word is speeded up (on the order of 20 to 40 ms) in comparison with unrelated control words. This priming effect has been well documented for some time and is obtained in list contexts (e.g., Meyer & Schvaneveldt, 1971) as well as in discourse contexts (e.g., Swinney, 1979). However, the discourse context is actually irrelevant to the priming effect. What matters is merely the associative relation between the prime word and the target word. As has been shown repeatedly (Kintsch & Mross, 1985; Swinney, 1979; Till, Mross, & Kintsch, in press; also equivalent results obtained with a naming task by Seidenberg, Tanenhaus, Leiman, & Bienkowsky, 1982), homonyms will prime strong associates of both their meanings, irrespective of the discourse context and in spite of the fact that the context-inappropriate meaning of the homonym never enters consciousness. Furthermore, context-appropriate inferences that are not associatively related to a priming word are not responded to any faster than unrelated control words. However, all of this depends on the amount of time allowed for the processing of the priming word. If the target word closely follows the priming word, so that the processing of the prime is still in its initial stages, the results are as already described. However, if there is enough time for more complete processing of the priming word in its discourse context, quite different results are observed. In this case, context-appropriate associates are still primed, but inappropriate associates no longer

are, whereas context-appropriate inferences now become strongly primed. This time course of knowledge activation can be described in more detail by some illustrative experimental results.

In the study by Till et al. (in press), subjects read sentences like *The townspeople were amazed to find that all the buildings had collapsed except the mint.* After the priming word *mint* they were given a lexical decision task, with the target word being either *money, candy,* or *earthquake.* That is, the target was a context-appropriate associate of the prime (*money*), a context-inappropriate associate (*candy*), or a topical inference word (*earthquake*), respectively. In addition, the interval between the presentation of the prime and the target word (stimulus-onset asynchrony, or SOA) was varied from 200 ms to 1500 ms. In the first case, the prime could only be incompletely processed; with an SOA of 500 ms, a somewhat deeper processing of the prime was possible before a response had to be given to the target word; and with 1,000 ms, extensive processing of both the prime word and its discourse context was possible. The data are shown in Figure 8. To keep this presentation simple, Figure 8 shows the average priming effects observed in the three experiments of Till et al. for SOAs of 200, 300, 400, 500, 1,000, and 1,500 ms. The value shown for associates at 200 ms, for instance, is the difference between the mean reaction time for context-inappropriate and context-appropriate associates at that prime–target asynchrony. It is the average of two such values obtained in two different experiments – showing the data separately for each experiment merely complicates the picture without changing its essential features. The value for inferences, similarly, is based on the difference between topic words and unrelated control words. The purpose of Figure 8 is, therefore,

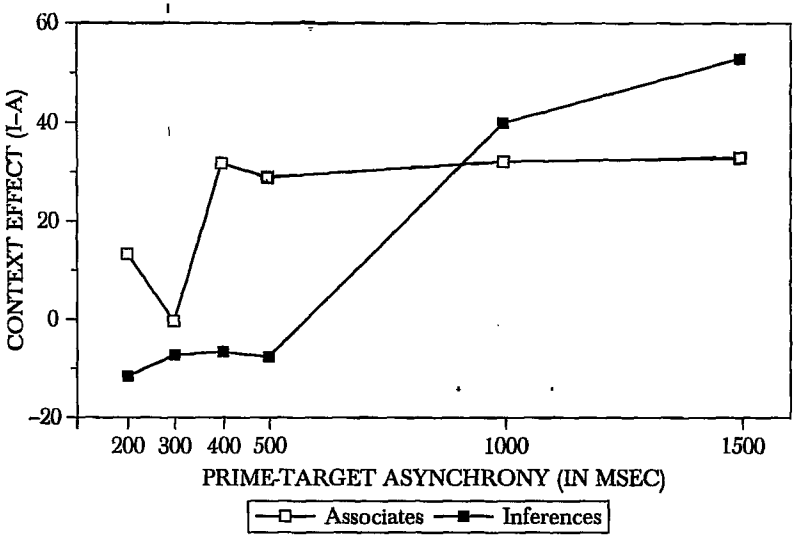

Figure 8: Context effects as indexed by the reaction time difference to context inappropriate and appropriate associates or inferences as a function of processing time, after Till, Mross, and Kintsch (1988)

merely to give an impression of the over-all shape of the results of this study (for more detailed analyses, the original article must be consulted).

Targets that are contextually appropriate associates of the priming word are primed at all four SOAs. Contextually inappropriate targets, however, are primed only when the priming word is still in its initial processing stages; by 400 ms inappropriate associates are no longer activated. Topical inferences are primed only if there is ample time, more than 500 ms, for the processing of the prime and its discourse context. This observation implies that the topic was not inferred immediately as soon as the relevant information became available, but was left for the sentence wrap-up period. Till et al.'s sentences were written in such a way that the topic could have been inferred before the last word in the sentence. This, however, is not what happened: Topics were inferred only after the whole sentence was read, requiring more than 500 ms of processing time. Thus, the full contextual meaning of the prime required about 1 s to emerge.

Data like these suggest that the initial activation of lexical knowledge is independent of the discourse context. What matters is only the (relatively fixed and stable) associative/semantic context of each word by itself. This stage of sense activation, however, is quickly followed by a process of sense selection in which the discourse context becomes effective: By 500 ms, context-inappropriate associates are deactivated (see also Seidenberg et al., 1982, and Swinney, 1979). If given more time, context effects grow even stronger: By 1,000 ms, contextually appropriate inference words are strongly and reliably primed even in the absence of associative connections (similarly for recognition, see McKoon & Ratcliff, 1986).

Clearly, this pattern of results is in excellent agreement qualitatively with the model of knowledge use in discourse presented earlier. Right after a word is perceived, it activates its whole associative neighborhood in a context-independent way, with the consequence that strong associates of a word are likely to be represented in working memory and hence will be primed in a lexical decision task, whether they are context appropriate or not. The knowledge-integration process then results in the deactivation of material that does not fit into the overall discourse context (such as context-inappropriate associates). Note that in order to disambiguate words on-line, the integration phase cannot be delayed until the end of a processing cycle; word senses are disambiguated before that. In the model, therefore, as soon as a text proposition is constructed and its associates have been generated, they will be integrated into whatever context exists at that time in working memory. Thus, each processing cycle involves many integrations, and the single integration operation performed at the end of each cycle in many of the examples discussed here is merely a simplification, adopted whenever one is not concerned with the on-line generation of word meanings. Finally, contextual inferences should require the most time to become activated on the average because although they sometimes result from the initial knowledge sampling, in other cases repeated sampling or, further, strategic elaboration might be required.

Earlier, an example was given of one of the texts used in the Till et al. (in press) study. The predictions of the model will be illustrated by means of this

example. The aforementioned text (*The townspeople were amazed to find that all the buildings had collapsed except the mint*) has the following propositional representation:

1. TOWNSPEOPLE
2. AMAZED[TOWNSPEOPLE,P3]
3. COLLAPSE[P4]
4. ALL-BUT[BUILDING,MINT]
5. BUILDING
6. MINT

Connection strengths of .9, .7, .4, and 0 were assigned to text propositions one, two, three, or more steps apart in the text base (e.g., P1 is two steps away from P3, connected via P2). Next, each text proposition was allowed to access at random two of its neighbors in the long-term associative net. This process was simulated by having an informant provide free associations to phrases based on each of these six propositions. For instance, the phrase *all buildlings but the mint* elicited the associations *many buildings* and *mint is a building.* Of course, MONEY and CANDY were chosen as the associates of MINT. Each text proposition was connected by a value of .5 to its associates, yielding an 18 × 18 connectivity matrix. Activation was then allowed to spread from the text propositions to the knowledge elaborations. Specifically, an initial activation vector with 1/6's corresponding to the text propositions and zeros otherwise was multiplied with the connectivity matrix until the pattern of activation stabilized. As a result, text propositions achieved activation values between .0987 and .1612, depending on how closely they were tied into the text base, and the knowledge elaborations had much lower activation values, between .0142 and .0239, with both MONEY and CANDY having a value of .0186. Thus, at this stage of processing, MONEY and CANDY are equally activated.

Activation continues to spread, however, and differences begin to emerge among the activation values for the various knowledge elaborations that have been added to the text base. The reason for this is that the knowledge elaborations are connected not only to the text propositions that had pulled them into the net but also to other text propositions as well as to each other. To approximate these interrelations, a connection value of .5 was assigned to any two propositions sharing a common argument. Because the homophone *mint* contributed associations to the subnet that refers to both of its senses, an inhibiting connection of −.5 was assigned to MINT/CANDY and BUILDING, whereas CANDY and MONEY themselves were connected by a −1. Continued multiplication of the activation vector with this connectivity matrix yielded a stable pattern (average change <.001) after 11 operations. At this point text propositions had activation values ranging between .1091 and .0584. Several of the knowledge elaborations reached values in this range, for example, .0742 for both ISA[MINT,BUILDING] and MONEY and .0708 for KILL[BUILDING,TOWNSPEOPLE], whereas others had faded away by this time; for example, MAN, which entered the subnet as an associate of TOWNSPEOPLE, had an activation value of .0070 and, most significantly, .0000 for CANDY. This stage of processing corresponds to the 400- and 500-ms points in Figure 8: MINT

is now clearly embedded in its context as a kind of building, and the inappropriate association CANDY is no longer activated.

The next processing stage involves the construction of a topical inference – what is the sentence about? While the exact operations involved in the construction of such inferences are beyond the scope of this article, van Dijk and Kintsch (1983, chapter 6) have discussed some of the mechanisms involved, such as a strategy of looking for causal explanations, which is what actual subjects appear to use predominantly in the following case. If given enough time, the modal response of human readers is that the sentence is about an earthquake that destroyed a town. Thus, the (empirically determined) propositions EARTHQUAKE and CAUSE[EARTHQUAKE,P3] were added to the text base and connected with the text-base propositions from which they were derived by a value of .5. The two new propositions were given initial activation values of zero, and the integration process was resumed; that is, activation now spread from the previously stabilized subnet into the newly constructed part of the net. Nine more integration cycles were required before the expanded net stabilized. As one would expect, the two new inferences did not alter the pattern of activation much, but both of them became fairly strongly activated (thereby diminishing activation values in the already existing portion of the net). The topical inferences EARTHQUAKE and CAUSE[EARTHQUAKE,P3] ended up with activation values of .0463 and .0546, respectively, among the most strongly activated inferences in the net. At this point, the process appears to coincide with the time interval between 1,000 and 1,500 ms shown in Figure 8.

The construction–integration model thus accounts for the data in Figure 8 by means of an intricate interplay between construction and integration phases: the construction of the text base and the context-free, associative knowledge elaboration during the first 350 ms of processing; the establishment of a coherent text base, which appears to be complete by 400 ms; and finally, an inference phase, involving new construction and new integration and requiring more than 500 ms of processing under the conditions of the Till et al. study. The model does not account for the time values cited here, but it describes a processing sequence in accordance with the empirically determined time sequence.

In many models of word identification, the problem is thought to be "How do we get from a certain (acoustic or visual) stimulus pattern to the place in the mental lexicon where the meaning of this word is stored?" In the present model, word identification is much more deeply embedded into the process of discourse understanding. The lexical node itself provides just one entry point into the comprehender's long-term memory store of knowledge and experiences, and what eventually becomes activated from that store depends on the discourse context. In conceptions of the lexicon like that of Mudersbach's (1982), the meaning of a word is given by its "neighborhood" in the associative network into which it is embedded. Neighborhoods may be defined narrowly or broadly (nodes one link away vs. nodes several links away). In the present model, the meaning of a word is also given by its neighborhood – narrowly or broadly defined – not in the long-term memory net as a whole, but in the subnet that has been constructed as the mental representation of the discourse of which the word is a

part. Because that representation changes as processing proceeds, word meanings change with it.

Figure 9 depicts the changing meaning of MINT in our example. MINT is directly linked to nine propositions in the network; indirectly it is linked to the whole net, of course. If one takes as its contextual meaning only its immediate neighbors, one finds at the beginning of processing mostly closely related propositions from the text base plus three weakly activated knowledge elaborations that in part do not fit into the context at all (CANDY). At the end of the process, however, the context-inappropriate association has dropped out, other inferences have been added, and the activation is more evenly distributed among text propositions and knowledge elaborations. Thus, textual information becomes part of the contextual meaning of a word, in contrast to most traditional conceptions of "meaning."

This example is, of course, no more than an illustration. Parameters in our calculations could be changed. For example, more than just two associates could be sampled initially in the process of knowledge elaboration. In this case the neighborhood of MINT would contain many more knowledge elaborations than are shown in Figure 9, where there is a strong predominance of text propositions. Not enough is known at present to set some of these parameters with confidence. But Figure 9 does reflect certain aspects of the data correctly: the equal initial activation of MONEY and CANDY, the later emergence of the topical inference

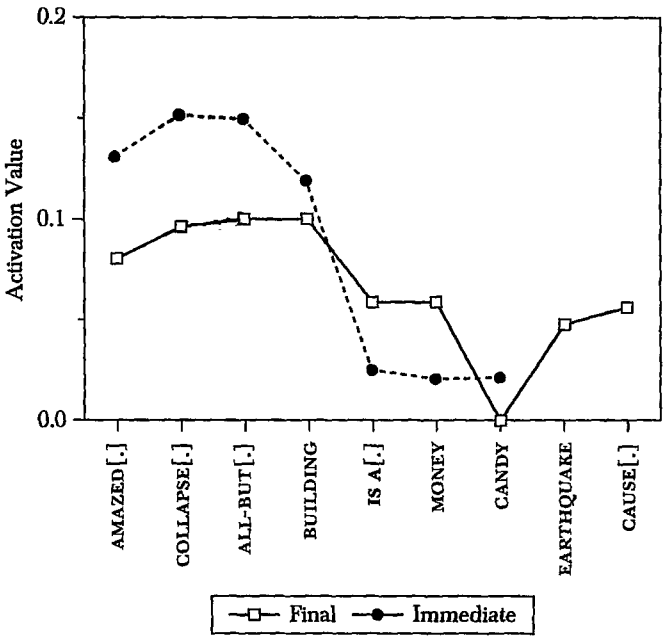

Figure 9: The changing meaning of MINT (The activation values of all propositions directly connected to MINT at the beginning and at the end of the process. The [.] notation is used as an abbreviation for the arguments of a proposition.)

EARTHQUAKE. Although much more research is needed to produce a more adequate picture of how the contextual meaning of words is constructed during discourse comprehension, here is a technique that at least may help us to do so.

Arithmetic Word Problems

How children understand and solve simple word arithmetic problems provides an excellent domain to try out the construction-plus-integration model. Unlike with many other types of discourse, there are clear-cut criteria for when a problem is solved correctly, and the formal knowledge of arithmetic that is necessary for its solution is easily defined. However, word problems, like all other texts, share the ambiguity and fuzziness of all natural language. Not only formal, arithmetic knowledge is involved in understanding these problems, but all kinds of linguistic and situational knowledge. What makes word problems hard – and interesting – are often not their formal properties, but the way a problem is expressed linguistically and the way formal arithmetic relations map into the situations being described. Thus, word problems are ideal from the standpoint of knowledge integration because it is precisely the integration of formal arithmetic knowledge and linguistic and situational understanding that is at issue here.

Another reason for choosing the domain of word problems is that there already exist alternative formal models of how children solve simple word arithmetic problems (Briars & Larkin, 1984; Kintsch & Greeno, 1985). Specifically, the work of Kintsch and Greeno will be taken as a starting point here. Their model represents a union of the work on problem solving in arithmetic by Riley, Greeno, and Heller (1983) on the one hand, and that on discourse understanding by van Dijk and Kintsch (1983) on the other. Kintsch and Greeno (1985) added to the discourse-comprehension strategies of the van Dijk and Kintsch model some special purpose strategies for solving word arithmetic problems, which they named the *arithmetic strategies.* For instance, if the model encounters a quantity proposition, such as "six marbles," it forms a set and tries to fill in the various slots of the set schema: what the objects are, the cardinality of the set, a specification of the objects (e.g., that the marbles are owned by Fred), and the relation between the present set and other sets in the problem (the six marbles were given to Fred by Tom, which might identify them as a "transfer set"). Thus, the Kintsch and Greeno model for word problems builds a text base in quite the same way as in the van Dijk and Kintsch general theory of text comprehension, but it then forms a very specialized situation or problem model in terms of sets of objects and their interrelations. It solves a problem by recognizing a particular pattern of relations among sets (such as transfer-in or superset) and then using a stored-solution procedure appropriate to that case.[7] Thus, in terms of the foregoing discussion about knowledge use in discourse, the Kintsch and Greeno model is a "smart" model: Production rules are formulated in such a way that in each situation exactly the right arithmetic strategy is fired.

The Kintsch and Greeno model of solving arithmetic word problems is useful in several ways. The model identifies different classes of errors, such as errors

caused by a lack of arithmetic knowledge, errors caused by linguistic misunderstandings, and errors that do not reflect a lack of knowledge at all but result from resource limitations. Certain formulations of word problems overload the resources of the comprehender, especially short-term memory, leading to a breakdown in processing. As Kintsch and Greeno have shown, within each arithmetic problem type there exists a strong correlation between the frequency of errors made in solving the problem and the memory load imposed by it, even though there are no differences within problem types in either the arithmetic or linguistic knowledge required for solution.

The model distinguishes between linguistic and arithmetic errors and helps us to investigate to what extent errors made by second- and third-grade pupils are caused by a failure to understand properly the text of the word problem, rather than by a faulty knowledge of arithmetic (e.g., Dellarosa, 1986; Dellarosa, Kintsch, Reusser, & Weimer, in press; Kintsch, 1987). If certain linguistic misunderstandings about the meanings of such key words as *have more than, have altogether,* or *some* are built into the knowledge base of the model, the model produces a pattern of wrong answers and misrecall of the problem statements that strikingly parallels some of the main types of errors that experimental subjects make. This is a good example of how much can be achieved even with the use of knowledge-poor representations in studies of discourse processing. The Kintsch and Greeno model knows about arithmetic (its arithmetic strategies), and it knows about the meaning of words (its lexicon; a *semantic net* in Dellarosa, 1986). However, it has no general world knowledge that would allow it to understand the situation described in a word problem. It merely picks out the crucial arithmetic information from the discourse and builds a propositional text base for it. This is good enough for some purposes (e.g., the investigation of resource limitations or linguistic factors in understanding as mentioned earlier, or to predict recall, summarization, or readability as in Kintsch & van Dijk, 1978, and related work), but it is not good enough for other purposes.

The limits of this approach are illustrated by a well-known observation: If a word problem is embedded into a concrete, familiar situation or action context, it is much easier to solve than when the same problem is expressed abstractly (e.g., Dellarosa et al., in press; Hudson, 1983). Thus, *Five birds saw three worms on the ground, and each bird tried to get a worm. How many birds didn't get a worm*? is easy for first graders, but *There are five red marbles and three green marbles. How many more red marbles are there than green marbles*? is very hard, even though the two problems are equivalent in form.

The Kintsch and Greeno model does not account for this difference. What is needed is a model in which all knowledge relevant to the understanding of a word problem becomes integrated into a representation that is sensitive to arithmetic as well as to situational information. In the model to be described shortly, this is achieved by forming many different hypotheses about the arithmetic relations in the problem, instead of only a single one, and then by looking for information in the text in support of each hypothesis. Thus, situational and arithmetic information can combine in forming the problem int[illegible]

Arithmetic Strategies

Arithmetic knowledge forms a special subset of a person's general knowledge network. Sets of objects can be represented by a propositional schema with the slots object, specification, quantity, and role (i.e., their relation to other sets) – equivalent to the set schema of Kintsch and Greeno (1985). Superordinate schemata can be similarly defined. Thus, a TRANSFER-IN schema can be set up with slots for a START, TRANSFER-IN, and RESULT SET. With each such superordinate schema, various arithmetic procedures (such as the counting strategies of Kintsch & Greeno, 1985) can be associated.

Arithmetic knowledge is used in the same way as general world knowledge. That is, propositions that represent various hypotheses about the arithmetic structure of a word problem are constructed as the text of the word problem is read and become part of the subnet. Several possible arithmetic hypotheses are constructed at each point, and whatever evidence in the text favors one or the other of these hypotheses is connected positively to it.

The strategies required for solving arithmetic word problems have been described in Kintsch and Greeno (1985) and Kintsch (1984) and have been incorporated into the computer simulation of Dellarosa (1986). However, they are used here in a different way. In the aforementioned works, the intent was to circumscribe the conditions under which each strategy is applied so accurately that only the correct one is fired in each word problem. Here, strategies fire promiscuously whenever they are supported, however weakly, by the text, and it is left for the integration process to weed out what is not wanted, just as all sorts of general knowledge propositions are activated that later turn out to be useless. A problem is solved when the right superordinate schema is more strongly activated than its alternatives, which then triggers the desired arithmetic procedures.

Three forms of arithmetic strategies need to be considered. There are strategies that form arithmetic hypotheses about sets, strategies that determine the nature of the connections between various text propositions and these hypotheses, and strategies that form superordinate arithmetic schemata on the basis of which arithmetic calculations can be performed.

1. Hypotheses about sets are propositions of the form SET-[object:X, specification:Y,quantity:Z,role:W], where X refers to an object, such as TULIP; Y is one or more other text propositions, specifying X further – for example, PAST[LOCATION[TULIP,IN-GARDEN]]; Z is a quantity proposition with X as argument – for example, FOURTEEN[TULIP]; and W indicates the role of the set in some superschema, such as WHOLE or PART.

2. Whenever a quantity proposition is encountered in the text base, possible arithmetic hypotheses derivable from it are constructed (e.g., two otherwise identical propositions with the roles WHOLE and PART). Propositions in the text base that provide evidence for any of these alternatives are then connected positively to it. Key words can be used for this purpose, as in Kintsch and Greeno (1985): Collection terms such as *altogether* indicate WHOLE sets; *give/take, of these,* and *have more/less than* indicate PART sets. In addition, general world knowledge about situations and actions is used to determine what is a WHOLE and what are

its PARTS. The strategies involved have been described in Kintsch (1984): restricted subsets, conjunction, and time-ordered possession/location.

Restricted subsets. If the specification of one set is more general than that of another, the former is assigned the role of WHOLE and the latter that of PART. Examples are LARGE-WINDOW, SMALL-WINDOW versus WINDOW, or ON-UPPER-SHELF, ON-LOWER-SHELF versus ON-SHELF.

Conjunction. If the object or specification of one set consists of the conjunction of the objects or specification of two other sets, the former is the WHOLE and the others the PARTS. This conjunction may be explicit as in YESTERDAY, TODAY, and YESTERDAY&TODAY, or implicit, as in TEDDYBEAR, DOLL, and TOY.

Time-ordered possession/location. If the specification slots of three sets contain either HAVE[agent,object] or LOCATION[object,place], or the negations of these propositions, as well as information to establish a temporal order, WHOLE and PART roles can be assigned to the three sets according to the resulting patterns. For instance, if the specifications of three sets are TIME1 [HAVE, JOE, P [MARBLES]]; TIME2 [GIVE, JOE, TOM, Q [MARBLES]], which implies TIME2[NOT[HAVE, JOE,Q[MARBLES]]; and TIME3[HAVE[JOE,Z[MARBLES]], SET1 is indicated as the Whole set.

3. The PART–WHOLE schema is the only arithmetic super-schema to be considered in the examples that follow, though various TRANSFER and COMPARISON schemata could have been treated in the same way, as in Kintsch and Greeno (1985). Three hypotheses can be formed about the PART–WHOLE schema, depending on whether the first, second, or third of the sets formed is to be considered the WHOLE set. (Note that the order in which the sets were formed in the word problem, not their true temporal order, is at issue here.) Thus, a proposition with the head PPW, which is simply a mnemonic for PART–PART–WHOLE, expresses the hypothesis that the problem is a PART–WHOLE problem with the third set as the WHOLE:PPW[role[SET1,PART],role[SET2,PART],role[SET3,WHOLE]]. Associated with this schema is the equation $Q1 + Q2 = Q3$, where Qi is the quantity of the i-th set, as well as procedures to solve this equation, depending on which of the quantities happens to be unknown.

Examples and Issues

Three examples will be analyzed here to show how the model understands, or fails to understand, as the case may be, arithmetic word problems. To see how these examples work, it is necessary to present at least the first one in sufficient detail. This problem is intended simply as an illustration of the basic mechanisms of the model – nothing much of interest happens with respect to the arithmetic, and textually, the only thing of significance is that a simple inference is formed, which, however, is crucial for the understanding of the problem. Two more examples, which will not be presented in as much detail, will serve as illustrations of how the model can account for some well-known facts about word-problem solving that alternative models (Briars & Larkin, 1984; Kintsch & Greeno, 1985) do not handle readily.

Inferences

> Manolita tried to weed her father's garden. "You sure weeded it," said Mr. Mundoza. "There were fourteen tulips in the garden and now there are only six." How many tulips did she pull out by mistake?

This problem, modified from the "Thinking Stories" of Willoughby, Bereiter, Hilton, and Rubinstein (1981), requires for its solution the application of one of the LOCATION strategies: There were so many tulips in the garden, then some were pulled out, and now so many are left. A simple, knowledge-based inference becomes necessary: that the tulips that were pulled out are no longer in the garden. The knowledge-activation mechanism of the present model readily supplies this inference, and the problem will be solved successfully.

The model processes this problem in three cycles, which includes the first sentence, the statement by Mr. Mundoza, and the question sentence. The first sentence simply sets up a context and is not directly relevant to the arithmetic. In Figure 10, the way the model understands this sentence is indicated, albeit in abbreviated form. The propositions constructed from the sentence itself are (P1) MANOLITA, (P2) GARDEN, (P3) TRY[MANOLITA,P4], (P4) WEED[MANOLITA,GARDEN], (P5) FATHER'S[GARDEN]. Only the first terms of these propositions are shown in Figure 10. Also shown in Figure 10 are the propositions that were added to the text base through the process of associative-knowledge elaboration (they are marked with an asterisk and, once again, abbreviated: *NAME stands for ISA[MANOLITA,NAME], etc.). Because no simulation of a general knowledge network is available, or even conceivable, the process of knowledge elaboration must be approximated empirically. An informal procedure was adopted for this purpose: Three persons were asked to provide free associations to phrases corresponding to P1 through P5 (as well as to corresponding phrases from the remaining two sentences of this word problem), and the responses generated by at least two

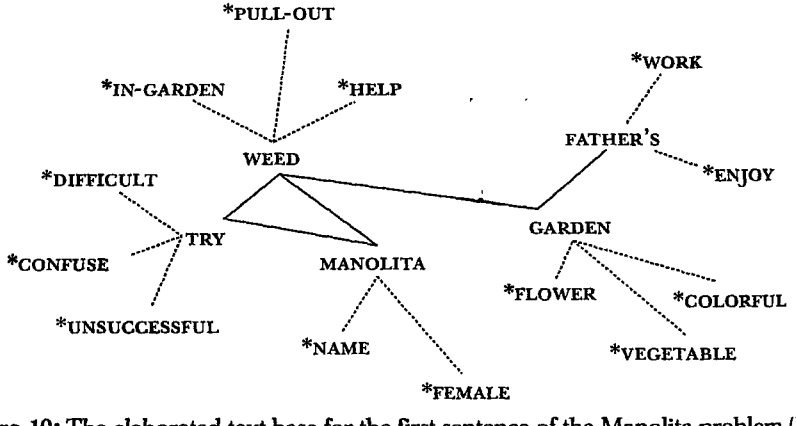

Figure 10: The elaborated text base for the first sentence of the Manolita problem (Each proposition is indicated by a single word. Text propositions are connected by solid lines, their associates by broken lines. Associates are marked with an asterisk.)

persons were considered as the top associates of each proposition in the general knowledge net (up to a maximum of three associations per proposition).

The text base shown in Figure 10 serves as a basis for deriving a connectivity matrix, using the principles illustrated earlier in Tables 1 and 2: Text propositions are connected depending on their proximity in the text base, each text proposition is connected to its associates by a value of .5, and knowledge derived propositions are interconnected by the same value if they share an argument, or by −.5 if different word senses are involved (this does not occur in the present example).

An initial activation vector consisting of .2 s for the five propositions directly derived from the text, followed by 13 zeros for the propositions generated from the knowledge net, was then repeatedly updated by multiplying it with the connectivity matrix until the activation values stabilized, as in the examples discussed previously. In the present case, activation levels stabilize after 10 iterations. The resulting pattern of activation is shown in the first panel of Figure 11. WEED [MANOLITA,GARDEN], whose centrality in the text base is apparent in the graphical representation, has the highest activation value, and the other text-derived propositions also have fairly high activation values. Knowledge-derived propositions are considerably less activated. The four most strongly activated propositions (P1 through P4) are retained in the short-term buffer and enter the second processing cycle.

The second processing cycle is shown in Figure 12. The four propositions held over in the short-term memory buffer from Cycle 1 are joined by 9 new text propositions and 11 associated propositions from the knowledge base. (Because of lack of space, the latter are indicated only by asterisks.) The quantity propositions FOURTEEN[TULIP] and SIX[TULIP] generate four arithmetic hypotheses: that the 14 tulips that were in the garden in the past are, respectively, a PART or WHOLE set, and that the 6 tulips now in the garden are a PART or WHOLE set. What the reader knows about weeding gardens provides the crucial information that discriminates among these hypotheses: The tulips before the garden was weeded are the WHOLE set, and only a PART is left after the weeding. This knowledge is expressed in the connectivity matrix by connecting PAST with WHOLE[14], and PRESENT with PART[6].

The last three propositions that enter the subnet are the superordinate arithmetic hypotheses PPW, PWP, and WPP. They receive support from their corresponding first-order arithmetic hypotheses. Thus, whatever strength each arithmetic hypothesis gathers from the text is fed into the superordinate arithmetic schemata consistent with it. These schemata are mutually exclusive and inhibit each other with connection values of −1. Note that only at this final level is inhibition among arithmetic hypotheses used: The hypotheses that a particular set of objects plays the role of WHOLE or PART set are also mutually exclusive, but they are not allowed to inhibit each other; they merely collect more or less positive evidence, which they then transmit to the superordinate stage where a selection among alternatives is made.

The resulting connectivity matrix then becomes the multiplier of the activation-state vector for the 28 propositions participating in this second processing cycle. Initially, these activation values are positive for the text-derived propositions

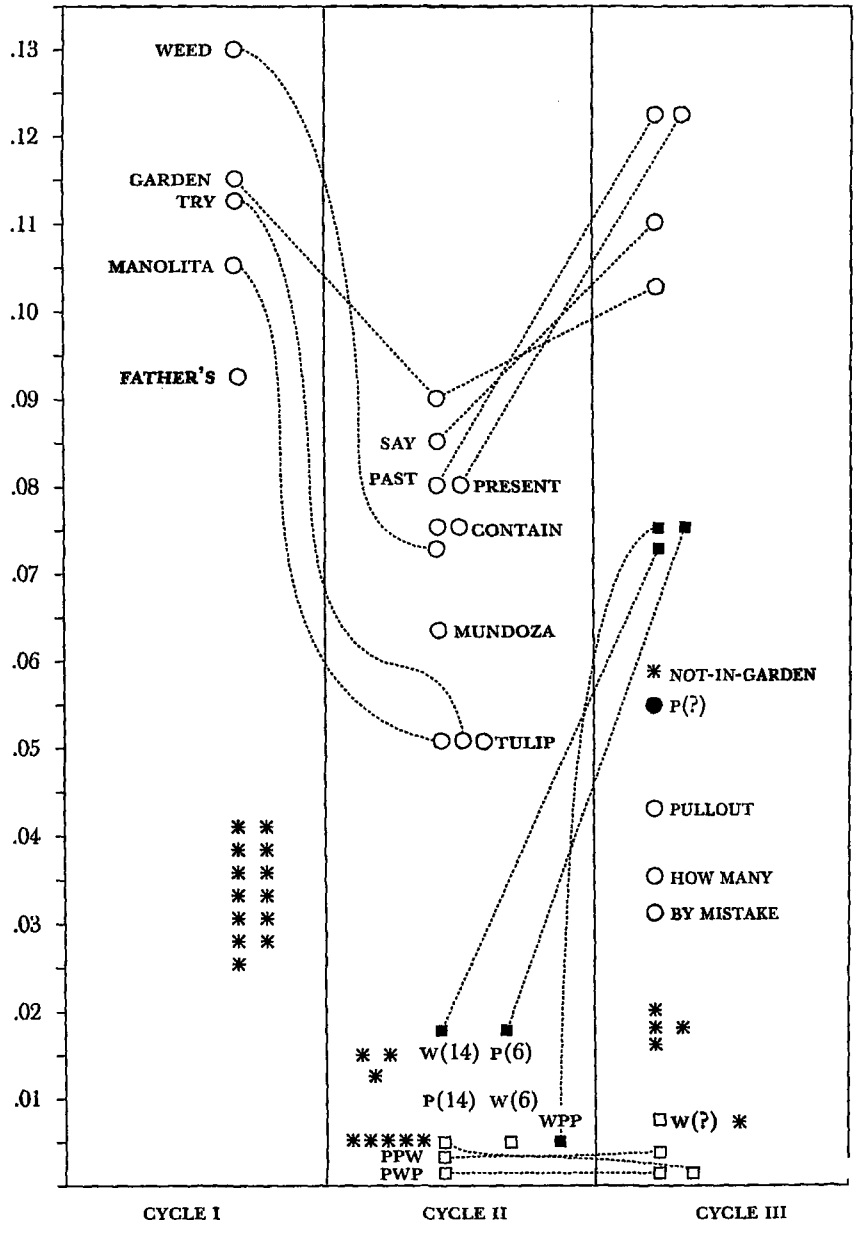

Figure 11: The result of the integration process for the three sentences in the Manolita problem (Propositions are indicated by single words; inferences are marked by an asterisk; their arrangement in the figure is approximate. The ordinate shows the activation values of each proposition after the process has stabilized. Propositions carried over from one processing cycle to the next are connected by arrows.)

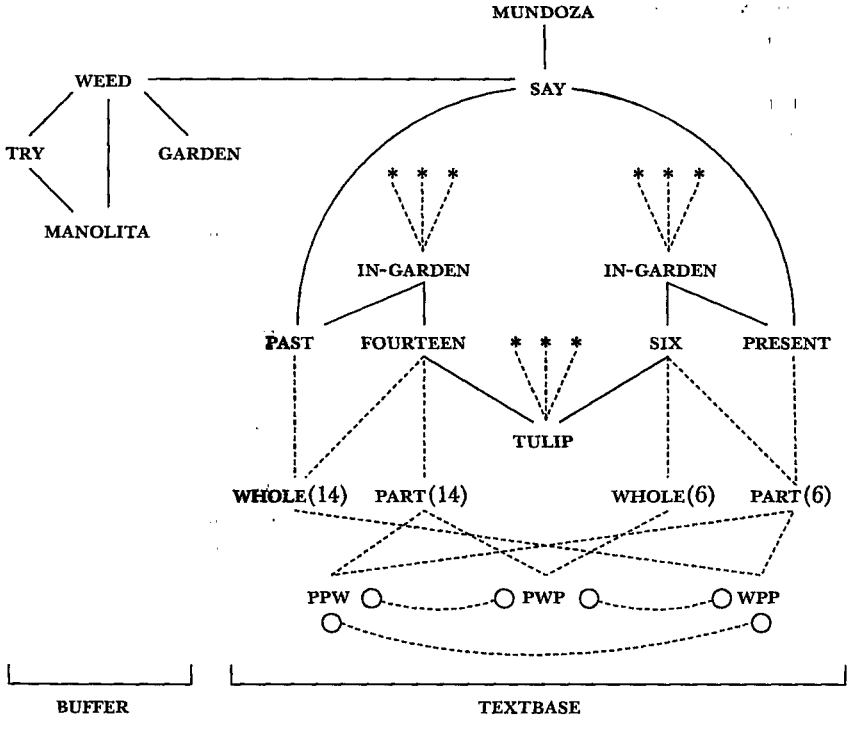

Figure 12: The elaborated text base for the second sentence of the Manolita problem. Four propositions were carried over from the previous cycle in the short-term memory buffer. Solid lines connect text propositions, broken lines inferences; nonarithmetic inferences are indicated by asterisks only.)

and zero otherwise, except for the propositions carried over in the buffer, which retain the activation values they reached in the last cycle. In this case, the activation vector stabilizes already after seven operations. The results are shown in the second panel of Figure 11. (If the activation process is extended to twice the number of cycles, the activation values for the arithmetic hypotheses, measured to four decimal places, do not change at all.) All text-derived propositions remain strongly activated, while none of the textual inferences (e.g., MUNDOZA is a NAME of a MALE, TULIPS are FLOWERS, RED, and GROW-IN-HOLLAND) reach a high level of activation. This is intuitively quite plausible. As far as the arithmetic is concerned, the problem is at this point understood correctly and practically solved: WHOLE[14] is more strongly activated than its alternative, PART[14]. Similarly, PART[6] is stronger than WHOLE[6]. The correct hypothesis, WPP, is the most strongly activated of the three alternative superschemata.

Note that the text propositions and inferences are, in general, much more strongly activated than the arithmetic hypotheses. Therefore, the activation values of the latter must be considered separately, relative to each other, rather than in relation to the text propositions when it comes to selecting propositions to be

maintained in the short-term memory buffer. This imbalance is required for the model to work. If the arithmetic hypotheses are weighted more heavily, they draw the activation away from the text itself, and the system cannot stabilize: It will flip-flop between alternative, mutually contradictory arithmetic schemata. The arithmetic hypotheses have to be anchored in a stable text representation.

For the third and final sentence, the short-term memory buffer needs to carry over both text propositions to establish textual coherence and arithmetic hypotheses to take advantage of the understanding of the problem that has been achieved so far. It has been assumed here that the four strongest text propositions as well as the four strongest arithmetic hypotheses are carried over in the buffer, as shown in Figure 13. (There are, of course, other plausible alternatives.) The three text propositions generated on the basis of this sentence bring with them into the net six knowledge propositions, one of which is NOT [CONTAIN[GARDEN, TULIP]], which turns out to be crucial for the solution of the problem. In addition, new hypotheses about the question set are formed, and the schemata PPW and PWP, which were lost after the second cycle, are reconstructed. Because the child knows about weeding gardens, the tulips that were pulled out are identified as a part of those that were in the garden in the

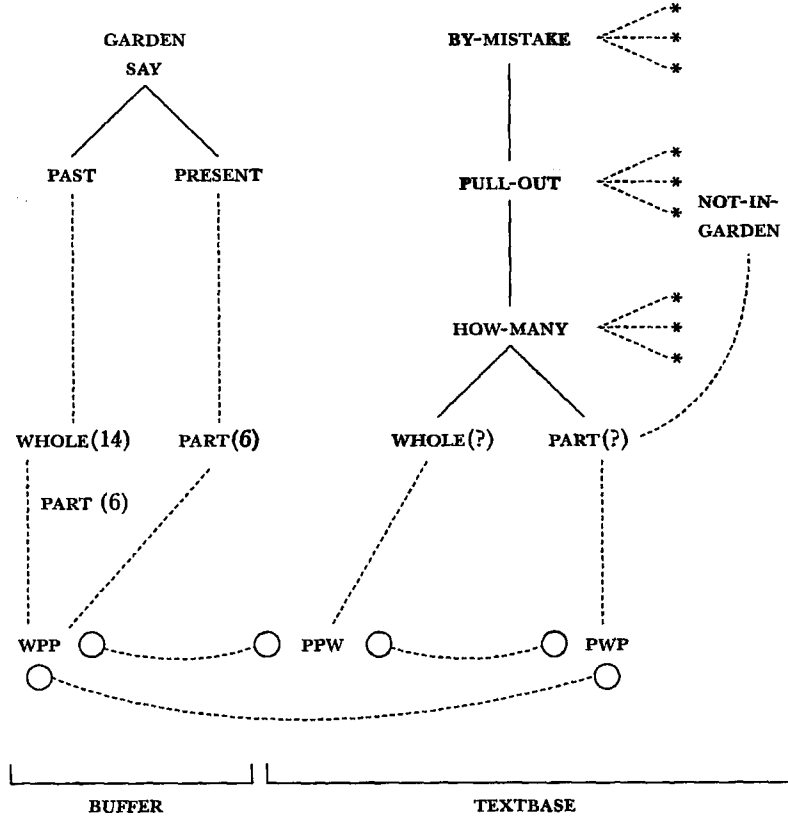

Figure 13: The elaborated textbase for the third sentence of the Manolita problem

beginning. Hence, a connection that favors the PART hypothesis over the WHOLE hypothesis is formed between the inference NOT[CONTAIN[GARDEN,TULIP]] and PART[?]. It completes the pattern that is the condition for the use of a LOCATION strategy: some tulips at one place in the past, then some not there, now some are left.

The new net requires 43 operations to stabilize. The knowledge-based inference NOT[CONTAIN[GARDEN,TULIP]] achieves an activation level above the range of the text propositions (Figure 11, third panel). The picture is completely clear as far as the arithmetic is concerned: All the correct hypotheses are strongly activated, and all incorrect alternatives have low or zero activation values.

The final steps in the solution of the problem are procedural. From information associated with the WPP pattern the equation $14 = 6 + ?$ is generated, which is then used to obtain the correct answer. A lot of mountains had to be moved to achieve a very simple result!

The Manolita problem was solved without problem solving. The basic comprehension operations were sufficient; that is, it produced the inference that the pulled-out tulips are not in the garden, which was required for the application of the LOCATION strategy. However, this is not always the case. In many, not necessarily difficult, problems, more focused problem-solving operations are required because the random-inference generation process described earlier fails to generate the required inference. Consider the following "thinking problem":

> Mrs. Nosho was telling Mark about the two huge aquariums she kept when she was a little girl. "There were 30 fish in one and 40 fish in the other, so you can tell how many fish I had." How many fish did Mrs. Nosho have?

In a simulation run of this problem the model failed because it did not come up with the transitive inference HAVE[X,Y]&CONTAIN[Y,Z] implies HAVE[X,Z]. At this point, the process needs to go into a problem-solving mode in which the information in the text is elaborated in a more focused manner than is possible with the automatic-comprehension mechanisms discussed here.

Context Effects

Problems embedded into a familiar situational context are much easier to solve than problems that must be solved without this situational support (e.g., Hudson, 1983). Thus, birds catching worms present a concrete, understandable situation that makes it clear what is the whole and what are the parts, whereas abstract, ill-constrained problems do not. All depends on whether the right arithmetic strategy is used; the situation is of no help.

In the worm-and-bird problem, the text provides a situational constraint for the interpretation of the problem that has very little to do with arithmetic per se. It is the knowledge about birds eating worms that matters. The birds trying to catch the worm are understood as the WHOLE set, with the birds catching worms as one PART, and the birds unable to get a worm as the other PART. This understanding was achieved not because a certain key phrase, like *how many more*,

was parsed correctly but on the basis of general world knowledge. If there are birds, some of whom catch and some of whom do not catch a worm, what is the WHOLE set and what are the PARTS is given by general world knowledge that is not specific to arithmetic. The arithmetic can hardly go wrong here because the well-known situation guarantees the right interpretation of the problem. It is this aspect that the present model deals with most effectively.

Context, however, does not always facilitate problem solution, it may also interfere with it. Consider this typical school problem, with its highly impoverished context:

> Fred has four Chevies and three Fords, (a) How many cars does he have altogether? (b) How many more Chevies does he have than Fords?

Context is no help with this problem; it must be solved on the basis of specialized arithmetic strategies, on the basis of the key words *have altogether* for Question A and *have more than* for Question B. Of course, children are much more familiar with the former (e.g., Riley et al., 1983), but if the right strategies are available, both problems will be solved. In the model, too, the *altogether* in Question A will be connected with the HOW-MANY/WHOLE hypothesis, and the *have more than* will be connected with the HOW-MANY/PART hypothesis in Question B, and both questions will be answered equally well. After the first sentence, PART and WHOLE hypotheses are established for both the Chevies and the Fords, but there is not much to distinguish them; the superordinate schemata PPW, PWP, and WPP are only weakly activated and hardly differentiated. Question A, on the other hand, correctly activates the PPW hypothesis, and Question B yields the WPP result. Thus, if the arithmetic knowledge is available, it makes very little difference which question follows the problem statement.

In contrast, if the problem is only slightly contextualized, the model can be biased in favor of one of the questions, and actually fails when it gets the wrong one. Suppose, the foregoing problem is changed to read

> Fred has a nice collection of antique cars. Four of his cars are Chevies, and three are Fords.

Collection, like some, is constructed as a quantity proposition, and hence PART and WHOLE hypotheses for a set of cars with unspecified quantity are established in the first processing cycle. They are both activated equally, however, at this point. This changes dramatically with the second sentence: The *four Chevies* and *three Fords* are both identified as PART sets because of the phrase *of his*. In consequence, the model begins to favor the WPP hypotheses. When it receives Question A, the WPP hypothesis is decisively strengthened, and the problem is solved correctly. On the other hand, if it is given Question B, the model becomes confused between the WPP and PWP hypotheses, which are both equally activated, and fails to solve the problem.

Thus, we have here an example where the problem context interferes with the solution of a problem. It biases the problem in favor of one particular inter-

fails. It is important, however, to analyze exactly why the model failed to answer Question B correctly: After processing the second sentence, it was so strongly convinced that the *four Chevies* and *three Fords* were both PART sets that it did not carry over the corresponding WHOLE set hypotheses and therefore had no way of using the information in the *have-more-than* question in support of the CHEVIES/WHOLE hypothesis. Thus, rather special circumstances prevented the model from answering Question B. In slightly different circumstances, it could have done so: (a) if the buffer were large enough, the CHEVY/WHOLE hypothesis would not have been lost, or (b) if the model had been allowed to reread the problem statement.

Question Specificity

The final example illustrates some different aspects of word-problem solving; namely the complex role that redundant specifications of sets may have. On the one hand, overspecifying a set can be helpful because it provides more than one way to refer to it. On the other hand, redundant specifications increase the length of the text and thus the likelihood that some important piece of information is no longer in active memory when it is required. In the following problem, three versions of the question are possible:

> Joe had a collection of nine marbles. He started his collection with some beautiful red marbles. Then Lucy added six pink marbles to his collection as a present. (a) How many beautiful red marbles did he start his collection with? (b) How many marbles did he start his collection with? (c) How many beautiful red marbles did he have?

The first processing cycle results in undifferentiated hypotheses about the nine marbles. The set constructed in the second cycle, on the other hand, is clearly a PART set, as is the one constructed in the third cycle. Indeed, at the end of the third cycle, the model understands the problem essentially correctly, with the WPP schema greatly exceeding alternative hypotheses in activation value. To understand what happens next, it is necessary to know which text propositions were maintained in the buffer at the end of the third cycle: Only propositions from the third sentence are carried over, while the propositions from the second sentence are no longer held in active memory at this point. This has non-trivial consequences when the question is asked. In Versions A and B everything is all right, because the question itself identifies the question set as a PART set – *starting a collection* serves this function, just as it did in Sentence 2. Version C of the question, on the other hand, does not yield a correct solution. The question itself does not indicate the role of the question set, and there is no information from the second sentence still available in active memory that would help to identify its role either: because there are already several strong PART hypotheses around, the model tends toward the hypothesis that the question set has the role of a WHOLE; the PWP schema thus becomes more activated than the correct WPP schema.

However, this is far from an unequivocal prediction of failure for Version C of the question. With a slightly [illegible]

intervening (*pink marbles, as a present*), the critical information from the second sentence could have been maintained in the buffer and used to solve the problem. Or even more obviously, the problem solver could reread the problem or perform a reinstatement search (Kintsch & van Dijk, 1978; Miller & Kintsch, 1980) to activate the required information from long-term memory. Rather the prediction is that children, like the model, would have more trouble with Question C, and fail more frequently, than with either A or B.

Thus, the more specific the question the better. But how irrelevant or redundant material will affect the difficulty of a word problem is a more complex story. It may be quite harmless, or may even facilitate problem solving, if the question exploits a redundancy in the specification of a set. But it may be a source of difficulty and even a cause of failure when the question is asked in an unhelpful way. The present model has the flexibility to handle these complex effects of context: Many small effects are allowed to add up and pull the model one way or another. The "smart" models of Kintsch and Greeno (1985) and Briars and Larkin (1984) have no ready way to cope with these subtle contextual demands: Either the right strategy is used or not.

Discussion

How people recall relevant knowledge when they read a text is reminiscent of another experimental paradigm that has been studied extensively in psychological laboratories: how people recall lists of words. A widely used explanation for the recall of word lists is based on the generation–recognition principle. Some words are recalled directly, perhaps from a short-term memory buffer, and these words are then used to generate other semantically or contextually related, plausible recall candidates. Words that have actually appeared in the to-be-learned list will be recognized among these candidates and recalled, whereas intrusions will tend to be rejected. Generation–recognition theories have had their detractors, and in their most primitive form they are certainly inadequate to account for the more complex phenomena of list recall. However, sophisticated versions of this theory are widely accepted now. Almost every current model of list recall includes a generation/retrieval as well as a recognition/editing stage.

The model of knowledge use in discourse comprehension proposed here has two analogous stages: First, a propositional network must be constructed, and then it must be edited or integrated. The way the construction process is thought of here is a straight extension of previous work on discourse processing. The words and phrases that make up a discourse are the raw material from which a mental representation of the meaning of that discourse is constructed. This mental representation takes the form of a propositional text base. Text bases combine two sources of information: the text itself and knowledge – knowledge about language as well as knowledge about the world. To construct even a single proposition, an appropriate frame must be retrieved from one's store of knowledge, and its slots must be filled in the way indicated by the text. The novel aspect of the present model is that the role of knowledge is greatly expanded in this process. Previously, one could think of the text base – to put it

crudely – as a translation into "propositionaleese" of the sentences in the text. Now, the text base becomes a much richer structure than before. Not only does it contain the propositions directly derivable from the text, but also each of these propositions brings with it a number of other propositions that are closely connected to it in the general knowledge net. Thus, propositions are constructed just as before (e.g., van Dijk & Kintsch, 1983); yet where previously a single proposition was formed, a whole cluster is generated now.

Crucial in the present model is how this cluster of propositions is obtained: by a context-free process of activation of the closest neighbors of the original text-derived proposition in the general knowledge net. Of course, such a process will inevitably activate a lot of material that is irrelevant for any given context and, indeed, inconsistent with it. However, the price that has to be paid for promiscuity is not very high: The resulting text base is a connectionist net in which further spreading activation processes rapidly take care of inconsistencies and irrelevancies. What is gained by this dumb and seemingly wasteful process of random knowledge activation is flexibility and context sensitivity. The research on knowledge activation in psychology, as well as the experience with artificial intelligence systems, suggests that it is very difficult to activate knowledge intelligently. Prediction or expectation-based systems that use frames or scripts do not adapt easily to new contexts; prestructured knowledge hardly ever is exactly in the form that is needed. The construction–integration scheme proposed here may turn out to be more successful in this respect.

The general framework sketched earlier could be extended and elaborated in various ways as more experience with it is obtained. It might prove necessary, for instance, to resort to greater formalization in the propositional notation used here. However, until it becomes quite clear what the gains of greater formalization would be, a robust, easy-to-use system is to be preferred, even at the cost of some imprecision.

Perhaps more important might be elaborations of the knowledge-sampling mechanism. As presented here, each text-derived proposition activates its own strongest associates. It might be worthwhile to explore schemes whereby pairs or clusters of propositions activate their strongest joint associates.

Similarly, other criteria for stabilizing a network might be explored. For instance, networks might be made to maximize some statistic like harmony, as in Smolensky (1986). This might have considerable advantages. For instance, it is not always possible now to compare different networks in terms of how fast they reach equilibrium, because the number of cycles required depends strongly on the number of nodes in the network. In addition, at present there is no really satisfactory way to tell how good an equilibrium a process achieves. In the word arithmetic problems, all one can tell is whether the right hypothesis is more strongly activated than its competitors, but comparisons of the size of that difference across problems are problematic.

Constructive processes other than the ones explored here will need to be considered. For word arithmetic problems, the most important constructions involved the arithmetic hypotheses. The construction of macropropositions could be neglected, mostly because the word problems were short ones and their

macrostructure played no role in the problem-solving process.[8] For many other types of text, construction rules to form successive layers of abstractions and generalizations, as described by Turner et al. (1986), would be of primary interest. The macro-structure of a text could thus be made an integral part of a text base rather than a separate component, as it is presently treated.

Thus, there are a great many rules necessary to make the construction–integration model work for proposition building, assigning references and coreferences, bridging inferences, forming macrostructures, elaborating knowledge, and so on. Some of these construction rules are reasonably well worked out at this point, others are available within restricted domains, but many problems remain as yet unsolved. Thus, some of the same problems are encountered here as in conventional expectation-driven, top–down models of comprehension – but with one difference: Weaker, more general rules can be used here because these rules need not be fine-tuned to an ever-changing context. Whatever rules are still needed ought to be easier to work out within the construction–integration framework.

In van Dijk and Kintsch (1983), an imporant distinction was made between text bases and situation models. The former correspond to the propositional representation of a text, both at the level of the micro- and macrostructure. The latter correspond to a representation of the text that is integrated with other knowledge. Thus, in terms of the present model, the integrated text base – after irrelevant and inconsistent information has been deactivated and important knowledge elements have been absorbed – is a kind of situation model. The qualifying phrase "a kind of" is needed because text bases, integrated or not, are always propositional, whereas van Dijk and Kintsch specifically left open the possibility that situation models may be nonpropositional (e.g., Perrig & Kintsch, 1985). Situation models, under certain circumstances, may thus be like Johnson-Laird's (1983) mental models.[9]

The theory of knowledge use in discourse comprehension has been presented here at two levels: first, it is presented in terms of a general computational mechanism, at the level of what Pylyshyn (1985) called the "cognitive virtual machine"; and second, as a particular model that specifies how this mechanism is used in word identification in discourse and in understanding and solving word problems. The function of the model is primarily explanatory. Certain phenomena can now be interpreted within the framework of the model; for example, why a particular formulation of a word problem is especially hard or easy. Unlike less complex theories, however, there is no direct link between explanation and prediction in the present case. Unqualified experimental predictions are hard to come by in a model as complex as the present one. At best, one might predict that a particular problem should be a difficult one, but that might mean several different things at the empirical level: that the solution fails, that a particular error occurs, that extra memory resources are required, that a reinstatement search will occur, that the problem must be read twice, and so forth. Even if we knew precisely what the "knowledge-use virtual machine" was like, our ability to make precise experimental predictions that are testable in conventional ways would still be severely limited. That, however, is not to say that such theories

are without empirical consequences. Although we cannot predict particular events, predictions concerning classes of events are quite feasible (e.g., the different ways people might have trouble with word problems). Furthermore, our newfound understanding of why and how certain things happen can have important consequences for how certain texts are created in the first place or for instructional practices designed to help people with particular comprehension tasks.

Notes

1. Conceivably, a purer connectionist model might be constructed. In the present model, an associative knowledge net is used to build a text-base net, which is then integrated. McClelland (1985) has put forth the idea of a connection information distributor, which is a subnetwork in which the units are not dedicated and connections are not hardwired. Instead, this subnetwork is programmable by inputs from the central network where the knowledge that controls processing in the subnetwork is stored. One could say that the production rules in the present model have the function of programming such a subnetwork.
2. Formally, concepts and propositions can be treated alike (e.g., Anderson, 1980).
3. This use of the term *proposition* differs from the standard one in logic. Furthermore, not all authors who use comparable semantic units in their analyses use the same term. For instance, Dik (1980) talked about *predicates* and *terms* combining to form *predications*. Wilensky (1986) used *relation* and *aspectuals*. In spite of this terminological disarray and the possibility of confusion with the meaning of proposition in logic, *proposition* appears to be the most widely accepted term and will be retained here.
4. The extreme informality of this notation is chosen for ease of exposition. Frequently, of course, a more precise formalism is needed. It is fairly straightforward to elaborate the present informal notation whenever that is the case. For example, in the computer simulation of word problem solving by Dellarosa (1986), the LOOPS language provides a ready-made type-token distinction. There seems to be no reason, however, to burden a general discussion like the present one with a cumbersome, formal notation when it is not needed.
5. As with *proposition*, this is a nonstandard use of the term's meaning. Meaning is used here as shorthand for the momentary, subject- and situation-specific activated semantic and experiential context of a concept. Clearly, this is not what many people have in mind when they speak about the meaning of a word – though it is a conception of meaning quite appropriate for a psychological processing model.
6. That integration occurs at the end of each processing cycle is proposed here merely as a simplifying assumption. Although there is clearly something going on at the end of sentences (e.g., Aaronson & Scarborough, 1977), integration does not need to wait for a sentence boundary (see the evidence for the "immediacy assumption"; Just & Carpenter, 1980; Sanford & Garrod, 1981). It would be quite possible to apply the

relaxation procedure outlined here repeatedly in each cycle, as propositions are being constructed. This would allow for the disambiguation of word senses before the end of a cycle. Because inferences and macro-propositions are usually not available before the end of a processing cycle, end-of-cycle integration plays an especially important role.

7. Computer simulations of this model have been developed by Fletcher (1985) and Dellarosa (1986) and are available from the author.
8. Longer problems in which the macrostructure does play a role have been investigated by Dellarosa et al. (1988). Depending on whether a word problem establishes a theme of competition or cooperation between two protagonists, *compare or combine* problems will be solved most easily.
9. Unlike the representation of the text itself – the text base, which is always propositional – situation models may have a different representation format, although this possibility was not considered in the present article. Both text bases and situation models are mental models of one kind or another in the sense of Gentner and Stevens (1983), though not necessarily in the more restrictive sense of Johnson-Laird (1983).

Heteronormativity in Action: Reproducing the Heterosexual Nuclear Family in After-hours Medical Calls

Celia Kitzinger

One of the major achievements of the lesbian, gay, bisexual and transgender (LGBT) movements of the last 30 years has been to transform – at least in many quarters – "the problem of homosexuality" into "the problem of heterosexism." So, for example, the focus of social scientific research has shifted from a focus on LGBT people *per se* (e.g., assessing their mental health of their parenting capacities) to the multiple oppressions to which they are subjected – ranging from state-sanctioned execution, torture, and enforced psychiatric treatment (Amnesty International 2001), to institutional discrimination and hate crimes (Herek and Berrill 1991), to the mundane oppressions of everyday life, such as anti-gay jokes and the social gaffes made by well-meaning heterosexuals in talking to, or about, LGBT people (Conley et al. 2002).

Just as "homosexuality" is a social construction invented to diagnose, circumscribe, and control certain kinds of behavior (same-sex sexual relationships) treated as social problems (Kitzinger 1987), so too is "heterosexism" such a social construction. The term represents a second attempt by the LGBT movement (the first was "homophobia"; see Kitzinger 1987) to label certain kinds of behavior (e.g., discrimination, prejudice, and violence against LGBT people) as social problems. Insofar as the social construction of "heterosexism" is successful, it is the behavior of heterosexual people in discriminating against LGBT people that is the legitimate target of social reform. As a social constructionist, one approach I might take to "heterosexism" as a topic (not the one pursued here) would be to investigate how (i.e., through what claims-making actions, with what degree of success, and against what contestations) the LGBT movements have struggled

Source: *Social Problems* vol. 52, no. 4, 2005, pp. 477–498.

to promote heterosexism as a social problem. An alternative approach – the one exemplified here – is to explore how everyday heterosexist reality is constructed: that is, how does it come about that people in ordinary interactions (not motivated by heterosexist prejudice or discriminatory intent) commonly invoke and produce a normative heterosexual world as a taken-for-granted reality?

As a lesbian-feminist activist and scholar, I am concerned about the full spectrum of heterosexist oppression – from the deportation of homosexual asylum seekers to countries in which they are tortured and imprisoned, to the denial of equal marriage rights to same-sex couples, to the minor indignities and exclusions of everyday life. The analysis presented here aims to gain purchase on the latter phenomenon. It is motivated by my strong sense that while LGBT activists are campaigning against blatant oppression and overt discrimination, at the same time all around us a heteronormative social fabric is unobtrusively rewoven, thread by thread, persistently, without fuss or fanfare, without oppressive intent or conscious design. My current research program uses conversation analysis to explore how that is done and aims to understand what strong threads constitute and bind together a normative heterosexist culture that make it so impervious to challenge and so slow to change. In this study, my aim is to make visible (and thereby to enable us all to challenge) some of the mundane quotidian actions that result in the routine achievement of a taken-for-granted world that socially excludes or marginalizes non-heterosexuals.

The term "heteronormativity" is widely used in contemporary political, social, and critical theory to describe socio-legal (e.g., Phelan 2001), cultural (e.g., Lancaster 2003), organizational (e.g., Grace 1999), and interpersonal (e.g., Blasius 2000) practices that derive from and reinforce a set of taken-for-granted presumptions relating to sex and gender. These include the presumptions that there are only two sexes; that it is "normal" or "natural" for people of different sexes to be attracted to one another; that these attractions may be publicly displayed and celebrated; that social institutions such as marriage and the family are appropriately organized around different-sex pairings; that same-sex couples are (if not "deviant") a "variation on" or an "alternative to" the heterosexual couple. Heteronormativity refers, in sum, to the myriad ways in which heterosexuality is produced as a natural, unproblematic, taken-for-granted, ordinary phenomenon.

In contrast with what John Heritage (1984) calls the "normative determinism" (p. 16) of theorists such as Durkheim, Freud, and Parsons, the conversation analytic approach pursued here (like ethnomethodology more generally; Garfinkel 1967) does not depend upon an understanding of actors as the bearers of internalized, culturally transmitted norms that guide or determine their conduct. Heteronormativity is embodied in what people do rather than in their beliefs, values, ideologies, or faiths. Complicity with heteronormativity does not necessarily imply prejudiced attitudes or beliefs (e.g., as these are usually conceptualized by homophobia scales; see Kitzinger 1987) or any deliberate intent to discriminate against LGBT people (Kitzinger forthcoming). Rather, heteronormativity – like other social norms – is embodied and displayed endogenously, in the details of conduct, and may be studied empirically as such.

My empirical investigation of heteronormativity builds on Harvey Sacks's (1995a) analysis of norms,[1] most especially in relation to membership categorization as outlined in his classic lecture "The Baby Cried. The Mommy Picked It Up." Norms, according to Sacks (1995a), provide rules of relevance for selecting categories ("viewers use norms to provide the relevant membership categories in terms of which they formulate identifications of the doers of those activities for which the norms are appropriate"; p. 260), and people "use norms to provide some orderliness, and proper orderliness of the activities they observe" (p. 260). According to Sacks, norms are used to "see a family" when observers see a man beating up a woman and do nothing because "we thought you were married and it wasn't any of our business" (p. 91). Also according to Sacks, people can "pass" as members of categories to which they do not in fact belong simply by virtue of the norm that leads them to be seen that way, as when "a woman walks away from a supermarket with the baby carriage filled with a baby that's not hers" (p. 254). Norms might also occlude families as when older parents observed caring for their child are taken to be the child's grandparents (p. 226), or as in the following account from the mother of two-year old Nathaniel, describing what happened when they were referred to a new doctor: "After I had introduced her to Nathaniel and explained his symptoms she responded by looking at me and asking, 'And who are you?' Since parents do not need to legitimate their right to discuss their own children's illnesses with a doctor, I inferred from this that she did not think I could be his mother" (Liladhar 1999:240). Janine Liladhar (1999) understands the doctor's displayed inference that she is not the mother of her child with reference to race: she is white and her son is black. Observers apparently did not see a family when a white mother playing race-you-to-the-car with her 20-year-old black son was taken to be pursuing a thief (Rosenblum and Travis 2000:169) or when two lesbian parents were asked, "which one of you is the mother" (Dalton and Bielby 2000). In such instances, other cultural norms (about "age," "race," and the proper gender constitution of family members) overturn inferences that could or should be made normatively on the basis of category-bound activities. Through the displayed assumptions of the interactants in such situations, analysts can begin to understand the constitution of the normative concept of the family as, for example, "private," mono-racial, and bi-gendered.

The research reported here develops the Sacksian notion of norms with specific reference to the heterosexual nuclear family. It puts conduct in interaction at the center of theorizing about the social world, and shows how norms and normativity can be grounded and elaborated in detailed empirical analysis of their deployment in action. As such, it is part of the ethnomethodological tradition that aims to "treat the obvious as a phenomenon" (Zimmerman and Pollner 1970:80) and to explicate the seen-but-unnoticed tacit presuppositions (or "norms") of everyday life and contributes thereby to the "sociology of the unmarked" (Brekhus 1998) an understanding of the practices that produce ordinary mundane heterosexism.

Insofar as conversation analysis has focused on social problems – and certainly in relation to the social problems highlighted in the 1988 special issue of *Social Problems* on "Language, Interaction, and Social Problems" – these have been

treated in the form of "trouble" as oriented to by participants in interaction (Maynard 1988:325). However, from the point of view of many social activists, and others concerned with social problems – indeed, including Sacks, the founder of conversation analysis himself, in his early lectures (Sacks 1995b:175–87) – social problems can also be produced, and reproduced, by social actors who are not oriented to any trouble in their interactions. A social problem exists only for us, as analysts eavesdropping on their talk, who see in it the untroubled reproduction of a heterosexist (or racist or classist or otherwise oppressive) world. One important theoretical goal of this article, then, is to highlight the value of conversation analysis in analyzing interactions in which, by and large (and with orderly exceptions), the taken-for-granted, ordinary world is reproduced and reconstituted with no trouble at all – because it is precisely the assumptions with which this taken-for-granted world is imbued that cause "trouble" or "problems" (at best), and oppression and discrimination (at worst), for those who do not conform to its cultural norms.

Family as a Categorization Device

This article focuses on person reference terms drawn from the category of the "family" as these are deployed by interactants in after-hours calls to a doctor. Previous analyses have shown that social participants readily produce family terminology that displays their heterosexuality without being heard thereby as doing anything out of the ordinary (Kitzinger 2005), whereas when people make it apparent in the course of ordinary activities (such as making a dentist appointment or taking out car insurance) that they have same-sex partners there are recurrent interactional problems (Land and Kitzinger 2005). The analysis presented here is particularly germane, then, to the sociological tradition of work on the family – long-considered a social problem, especially in its "deviant" forms: for example, black families (e.g., Stack 1974), or working-class families (e.g., Rubin 1976; compare to Smith 1993). LGBT families, in particular, are at the forefront of contemporary debates about marriage and the family (e.g., Bernstein and Reimann 2001; Weston 1998).

Family researchers have been preoccupied by issues of definition. As James A. Holstein and Jaber F. Gubrium (1999) argue, however, "family is not objectively meaningful . . . it is constantly under construction, obtaining its defining characteristics somewhere, somehow, in real time and place, through interpretive practice" (p. 4). This, they suggest, mandates an empirical focus on "the myriad social processes through which persons in the course of everyday life produce and organize 'family' as a meaningful designation for social relations" (p. 4). In common with their innovative empirical research program analyzing discourse about the family across a range of organizational contexts (e.g., Gubrium and Holstein 1990; Holstein 1993), the work to be reported here explores how "family" is constructed in interaction. The production of the heteronormative family is understood as an ongoing, locally managed accomplishment, and the analysis focuses on one of the key practices through which family is constituted in these calls: the use of person references and the inferences that attach to these.

Person references drawn from the category of "family" – such as "wife," "husband," "daughter," "brother-in-law," and so on – are common non-recognitional person references (Sacks 1963, 1972a; Sacks and Schegloff 1979; Schegloff 1996). That is, they are terms routinely deployed as references to third parties in talk-in-interaction where the speaker is treating their co-conversationalist as someone who does not know the person being referred to and/or would not recognize them by name. (Other examples of typical non-recognitional person references include categorical or role references such as "a doctor," "an African-American," "a diabetic," "a woman.") Family reference terms are among the categories whose deployment Sacks began to explore – most famously in "the baby cried, the mommy picked it up" discussion (Sacks 1972b, 1995a), but also at various points scattered throughout his work, including an interrogation of the use of inferences attached to "wife," "sister," and "child" in a counseling call (Sacks 1995a:116) and the (hypothetical) deployment of "heterosexual couple" inferences to disguise otherwise stigmatized identities (Sacks 1995a:593). The present research, then, builds on the early work by Sacks both on norms and on membership categories, and contributes to conversation analysis a more systematic and data-driven approach to the selection and deployment of non-recognitional person reference forms. It explores – in a single corpus of calls – the difference the selected person reference term makes to the sequence that subsequently unfolds, due to the inferences that, thereby, can be seen to attach to the term selected. I begin with a description of the data-set and then consider the way in which the talk produces a heteronormative version of family.

Data

The data corpus comprises recordings of 59 after-hours calls made to a medical practice in a large town in the English Midlands.[2] In 50 of the 59 calls, the caller is someone other than the patient; these calls are the focus of analysis here. According to the terms of reference of the British National Health Service, general practitioners – physicians with no particular clinical specialization – have 24-hour responsibility for the medical care of their patients. This includes the condition that they should visit patients in their own homes if necessary, either because the patient cannot travel to the surgery or because the surgery is closed. The normative purpose of these after-hours calls is to request such a home visit (Drew forthcoming).

This data corpus cannot be treated as representative (as Drew forthcoming points out), either in terms of the kinds of after-hours calls made generally or in terms of the manner in which doctors manage such calls. Moreover, it is likely that definitions of "the family" vary – for the participants in these calls and for people generally – across their occasions of use. Analysis of these calls begins to chart the deployment of family reference terms in one such specific context.

In all of these calls, the doctor is a "locum" (a stand-in for the doctor with whom the patient is registered), such that he knows neither the caller nor the

patient, nor does he know anything about their family circumstances. Interactions between the patients and their usual physicians would be conducted very differently because most references to nuclear family members could be done by using recognitional forms of reference (i.e., their names). However, the range of recurrent occasions in modern societies in which recognitionals cannot be used is vast, and the use of family reference terms is a potent resource in all such contexts.

The data were transcribed according to the system devised by Gail Jefferson (see Atkinson and Heritage 1984) and subsequently developed by other conversation analysts, designed to preserve those small but significant features of talk (cut-offs, silences, etc.) that interactants use in systematic and orderly ways, many of which turn out to be essential to the analyses presented here. Non-recognitional person reference forms – in particular, person reference forms drawn from the category set of the family – were very common across these calls, and I collected and analyzed them in their sequential context. I examined, in particular, *initial* person references – and the inferences associated with them – for what they show about normative understandings of the family and the interactional uses these understandings are put to.

Reproducing the Heteronormative Family

Of the 50 calls in the corpus where the patient is not the person calling, 33 are calls on behalf of people referred to as family members (e.g., spouses, children and grandchildren, siblings, and in-laws), and 17 are on behalf of non-family members (e.g., friends, neighbors, and people for whom the callers have an institutional responsibility. Extracts 1 and 2 are examples of openings of calls on behalf of family members:

(1) [DEC 1-2-12 BREATHLESS]
01 Doc: Hel:lo,
02 Clr: Hel:lo, is tha' du- doctor?
03 Doc: <Yes, Doctor ((deleted)) speaki:ng,
04 Clr: i: i: (Yeah) Couldja's call an' see my wife
05 please,

(2) [DEC 1-1-10 ASTHMA]
01 Doc: Hello:,
02 Clr: Hello, I'm sorry tuh trouble yuh, <my daughter has
03 Ventolin:e::hm one spoonful at night, <.hh I gave
04 her some about an hour ago< I kept (it late) with it
05 being so hot but sh[e st]ill can't brea:the very=
06 Doc: [Yes,]
07 Clr: =easily,

Extracts 3 and 4 are examples of the openings of calls on behalf of people who are not family members.

(3) [DEC 1-2-6 DISCLOCATION]
01 Doc: Hello:,
02 Clr: Hello:, eh. .hhh I've got a friend here (.) an' 'e
03 dislocated 'is shoulder

(4) [DEC 1-2-13 SICK I]
01 Doc: .hh Hello:,
01 Clr: .h Ah good evenin', um: .hh this is a relief warden
02 from:((deleted))
03 Doc: Oh yes:,
04 Clr: Ehm- I'm ringing you up regarding one of our
05 tenants here. <A Misses ((deleted))
// ((some talk from tape deleted here))
06 Clr: That's right dear.
07 Doc: mt Ri:ght,
08 Clr: .hh U:m:- the lady is a diabetic.

In each Extract 1 to 4, the caller makes an initial reference to the patient using a term which displays a relationship between the patient and the caller – either a family relationship (as in 1 and 2) or not (as in 3 and 4). The analysis presented here focuses on the inferences mobilized by these initial person references and on the difference they make to the sequential unfolding of the call. It pays particular attention to the understandings of family thereby displayed and to how these understandings are deployed.

The fact that family reference terms are used at all in these calls is a contingent finding – they need not have been used. It is not sufficient to say of the speakers in Extracts 1 and 2 that they refer to the patient as their "wife" or "daughter" because that is who the patient is. There are alternative, equally "accurate" ways of referring to these persons: "a seventy five year old woman" (Extract 1), "an asthmatic" (Extract 2), and so on. The availability of person reference forms from a number of different category sets (e.g., age, diagnosis) means that person reference in terms of the category set of family can be understood as the consequence of a speaker making a selection from amongst a range of possible alternatives: so in Extract 4 the same person is variously referred to as "one of our tenants" (lines 4–5), "A Misses ((deleted))" (line 5), and "the lady" (line 8). In Extract 5 – which I will later analyze in its broader conversational context – there are also two different person references to the same patient. This extract is notable in that it is the only instance in the dataset in which a family reference term is used after some other form of person reference not indexing family. The patient is referred to initially as "a patient of Doctor ((deleted))" (line 5) and only then – albeit immediately afterwards – as "my husband" (line 6):

(5) [DEC 2-1-15 FOOD POISONING]
01 Doc: .hhh Hello:,
02 Clr: .hh Hello:, um: I'm: ph- (.) phoning up fer
03 Doctor ((deleted))
04 Doc: Yes.

05 Clr: I have a:b- a: patient of:h:: Doctor ((deleted))
06 my husband here,

This initial person reference locates the patient in relation to the doctor rather than, as in all other instances, in relation to the caller. Note that this form of person reference, in principle, could have been used in any and all of the other calls in the corpus – in many of which the doctor subsequently asks for just this information (e.g., see Extracts 20 and 21).

Across these calls, then, family reference terms displaying the relationship between caller and patient are systematically selected as initial person references, where there are equally accurate alternatives drawn from non-relational category sets (diagnostic category, age, sex, occupation, etc.), as well as an alternative type of person reference designed to display the relationship between the doctor and the patient.

In the following sections I explore how the deployment of these initial person references relies on and constructs a normative understanding of family: as related by law and by blood; as co-resident; and as an intimate, caring (gendered) social unit. In an intersection between the family and the institution of medicine as it is organized in England, members of a family are also understood to share the same family doctor.

Code of Law and Bond of Blood

The definition of family employed here is indigenous to the interaction in the sense that person references like "daughter" and "son" are used by the participants and are treated by the interactants themselves – and not just by the analyst – as indexing family relationships. This is most blatantly the case when the term "family" is used as a collective term for the caller, the patient, and any other actual or potential members. So, for example, in Extract 6 the caller refers to her "daughter" (line 1), on the basis of which – and without any intervening talk to warrant it – the doctor later generates a "family" (line 63):

(6) [DEC 1-1-1 DIARRHEA]
01 Clr: My daughter's: uh Melanie she's age four:,
// ((61 lines of diagnostic questioning omitted))
63 Doc: Anyone else:: in the family with: (.) tummy bug
64 or anything?

Likewise, in Extract 7 the caller refers to her "son" (line 5), on the basis of which the doctor later asks about "family" composition (line 75):

(7) [DEC 1-1-11 MEASLES]
01 Doc: Hello:,
02 Clr: Hello, can I speak to the doctor on call please,
03 Doc: Yes, Doctor ((deleted)) speaking,
04 Clr: Hello, ehm (0.5) I was wonderin', I think my
05 son's got measles, an':

// ((69 lines of diagnostic questioning omitted))
75 Doc: [.hh Fine, <Any other children in your family?

By contrast, there are other kinds of relationships which are *not* treated as familial. In Extract 8 the caller refers to the patient as her "boyfriend" – a term that, in contrast with "husband" does not imply a marital relationship. In the course of this call the doctor begins to ask (at line 3) whether "anybody else in the fa-[mily]" has the same symptoms as the patient, but cuts off the word "family" after the first syllable and replaces it with "house". (The warrant for hearing "fa-" as the first syllable of "family" comes from empirical conversation analytic research on the technology of repair: this is an instance of [pre-framed] replacement repair; Schegloff, Jefferson, and Sacks 1977:370).

(8) [DEC 2-1-16 STOMACH]
01 Clr: Um my boyfriend's uhm: really ill at the moment.
02 <'E's got really bad stomach pains. An' fever.
03 Em::symptoms.
04 Doc: R:ight.
05 Clr: Can anyone: come out tuhnight to look at im?=
06 Doc: =((sniff)) Welb- uh:m: u->sorry< who's 'is doctor?
07 (0.4)
08 Clr: 'is doctor's ((deleted))
09 Doc: R:ight. .hh Wull what's actually been happening
10 with'im
// ((32 lines of diagnostic questioning omitted))
43 Doc: Anybody else in the fa- the house got a fu- o:-
44 [got] hmm
45 Clr: [No,]

In abandoning "family" as the reference term for this unmarried couple, the doctor displays that marriage is integral to his definition of "family." In selecting "house" as an alternative, he displays that his intention in initially selecting "family" was to ask about the health status of other people with whom the patient is co-resident, thereby also displaying an understanding of "family" members as co-resident (see next section). In this call, as in virtually all others in this corpus, it seems from the caller's description of the patient's symptoms that caller and patient are co-present; this is reinforced by the caller's selection of "come" (in her request on line 5), rather than, for example, "go." In virtually all the calls in which the names of female callers have not been deleted from the audiotape, the title "Mrs." is used: callers thereby display themselves as married and this may contribute to their relationship with the patient being treated as "familial," in ways that the caller's in Extract 8 is not.

Marriage – code of law – is one key way in which, according to David M. Schneider (1968), Euro-Americans define kin; biological relatedness – bond of blood – is the other. In Extract 9 below (an extension of Extract 7), the doctor displays an implicit understanding (at lines 79 and 81–82) that children in a "family" are all the biological offspring of the same mother.

(9) [DEC 1-1-11 MEASLES]

01	Doc:	Hello:,
02	Clr:	Hello, can I speak to the doctor on call please,
03	Doc:	Yes, Doctor ((deleted)) speaking,
04	Clr:	Hello, ehm (0.5) I was wonderin', I think my
05		son's got measles, an': (what I should give it to
06		'im) or anythin',
07	Doc:	Sor[ry
08	Clr:	[(and that) whether I should give 'im anything
09		for measles,
10	Doc:	.hhh Oh right, ew: how old is your son?
11	Clr:	Ah he was one last week, .hh[h
12	Doc:	[B:right, an' an'
13		what's actually been happening to 'im=
//		((61 lines of diagnostic questioning omitted))
75	Doc:	[.hh Fine, <Any other children in your family?
76	Clr:	Yeah, I've got another boy,
77	Doc:	Ha- older or younger?
78	Clr:	Ah- [older,
79	Doc:	[Well, must be older, mustn't he?
80	Clr:	Olde [r, yeah]
81	Doc:	[.hhhh] ehhehm! Well, unless you're very
82		quick, sorry .hh
83		ah:m yeah has he had measles?

The inference that the caller's sons are both biologically hers – that she bore and gave birth to them – is displayed through the doctor's assertion (made without waiting for the caller to answer his question) that the other boy "must be" older (line 79). It makes sense only as indexing his recollection that the patient is 12 months old and his knowledge that pregnancy lasts 9 months. This analysis of "must be" is reinforced by the doctor's subsequent acknowledgement, at lines 81–82, that a younger child would be *possible* if the caller had been "quick." The laughter (at line 81) and the apology (at line 82) are oriented to the sexual implications of a "quick" second conception.

Circumstances other than a "quick" second conception under which a woman could have two sons in her family with less than a year's difference in age include (in addition to twins): the adoption of one or both children; the caller and her partner both bringing infants from prior relationships into their "blended" family; and the caller being in a lesbian relationship in which both partners had conceived and given birth within a few months of each other. These alternatives do not involve a biogenetic link between mother and son, and are not oriented to as possibilities by the doctor. His assertion that the second son "must be" older is based on, and thereby reproduces (without any orientation to so doing), the concept of the mother/son relationship as normatively biological.

People who are not biologically related to their child (adoptive parents, step-parents, lesbian/gay co-parents) construct (sometimes precarious) claims to parenthood in the context of this assumption (e.g., the lesbian mother quoted in Hayden 1995 who describes feeling like a fraud "if I act like he's my baby.

I'm afraid someone will ask me about labor [. . .] I have to keep telling myself he *is* my baby" [p. 49]). The dependence of kinship on biology is also manifested when the families of origin of non-biological parents refuse kinship roles with a child (e.g., the mother of a lesbian who referred to the child she was asked to treat as her "granddaughter" as "my daughter's friend's daughter"; Epstein 1994:83).

The Nuclear Family as Co-residential Unit

When the doctor offers a home visit, he routinely asks the caller for a home address, and sometimes also for a home telephone number. In designing his request, he displays certain inferences about the residential arrangements between caller and patient. With only two exceptions in the dataset (a working mother calling about a child at home with his father [DEC 2-1-2] and an adult sister calling about a suicidal brother [DEC 2-1-13]), callers and the patients about whom they are calling generally seem to be co-present, as displayed through:

(a) the formulation of the description of current symptoms (e.g., a knock to a pregnant sister's stomach that happened "bout five minutes ago" [DEC 2-1-3], a wife who has "just fainted" [DEC 1-1-13]);
(b) audible patients off-line (e.g., a crying child [DEC 1-2-14], an adult sister who answers a question about symptoms relayed to her from the doctor by the caller [DEC 1-1-14]);
(c) explicit statements of co-presence; these are made only by distant relatives and non-relatives and function as accounts for the presence of the patient in their homes (e.g., "I have my brother in law staying with me" [DEC 2-1-18], "I've got an old friend stayin' with me down on- from Scotland on holiday" [DEC 1-1-4]). As the analysis below displays, parents of young children, and husbands and wives, treat their co-presence as a taken-for-granted, tacit assumption and instead treat not being co-present as accountable (see [DEC 2-1-2]);
(d) the formulation of the request to the doctor to visit the patient using the term "come" (e.g., "Can anyone come out tonight to look at him?" [DEC 2-1-16] in Extract 8, which invites the inference that caller and patient are co-present [whereas "Can anyone go out tonight to look at him?" would invite the inference that they were not]).

The inference that the patient and the caller are co-present applies across the dataset to both "family" and "non-family" callers. However, when callers are identified as spouses or parents, the doctor makes an assumption of co-residence, whereas when they are otherwise identified, he does not. So, for example, in Extract 10 the caller asks the doctor to "call an' see my wife please" (line 4) and the doctor asks "where do you live" (line 10) – as opposed to "where does she live" – thus displaying an inference that the caller lives with his wife, such that to call and see one is to call and see the other, with the pro-term "you" being understood as plural.

(10) [DEC 1-2-12 BREATHLESS]

01	Doc:	Hel:lo:,
02	Clr:	Hel:lo, is tha' do- doctor̲
03	Doc:	<Yes, Doctor ((deleted)) speaki:ng,
04	Clr:	i:i:Couldja's call an' see my wife please, .h [h
05	Doc:	[Yes:.
06	Clr:	She's breathless. <She can't .hh get 'er
07		breath.hh! .h [hhh]
08	Doc:	[What]'s: her name?
09	Clr:	((deleted))
10	Doc:	Ru-an' where do you live.

In Extract 11, the caller announces that his "wife" has fainted and, after some diagnostic questioning, the doctor asks "What's your address" (line 40) in order that he might "pop round and see her" (lines 40–41), thereby again displaying the inference that the caller's address is also the wife's address.[3]

(11) [DEC 1-1-13 FAINTED]

01	Clr:	=Eh: my wife has uh: just fai:nted, .hh She:'s
02		(0.7) been to:: the doctor's a:nd eh: our doctor

07	Clr:	Eh: she's been in be:d, and she had a sort've
08		fainting spell
//		((18 lines omitted – describing lead up to fainting))
26	Clr:	. . . she just slumped and banged her head on the bed
27		and fell on the floo:r,
28	Doc:	Mm hm,
29	Clr:	So she's lyin' there now till she recovers,
//		((11 lines of diagnostic questioning omitted))
40	Doc:	What's your address, and I'll pop 'rou
41		an' se[e'er
42	Clr:	[(It's) ((deleted))
43	Doc:	.hh Oh-kay; I'll be about twenty minutes.

The assumption of co-residence displays that it is normative, in these conversationalists' culture, for husbands and wives to live together. As Kath Weston (1998:74) points out, the normative power of co-residence as part of the definition of a family is also evident in the fact that lesbian/gay organizations in the United States have helped to frame domestic partnership legislation that stipulates co-residence for a specified period – anything from three months to a year – before an unmarried couple can register to achieve the legal standing entitling them to benefits available to married couples (see also Kitzinger and Wilkinson 2004a).

The assumption of co-residence is also routinely displayed when parents phone on behalf of children. Following the reference to a patient as "my daug:hter, Jean" (and subsequent talk during which the daughter is said to be two years old), the doctor asks simply "where d'you live" [DEC 1-2-9]; when the

patient is "my daughter who's uh:: .hh just coming fuh nineteen months old" [DEC 2-1-7 SICK], the caller later says, "my address is." An assumption is thereby displayed that the doctor will understand that she and her daughter share the same home address, such that the caller's address is what is needed for the doctor to visit the patient.

By contrast, family members who are not children or spouses are not unproblematically treated as co-resident. In the calls from which Extracts 12 and 13 are taken, the callers show, through their description of the patient's current symptoms and their own attempts to relieve them, that they currently must be at the same location. However, the doctor displays problems with treating these callers and patients as co-resident. In Extract 12, after a caller's account of his adult daughter's medical problems (adult, as the problems are related to the termination of a pregnancy), the doctor does not (as in Extracts 10 and 11) ask some variant of "where do you live?" or "what's your address?" Instead, he designs his question in such a way as to display his inference that caller and patient are only temporarily ("at the moment") in the same home, and that the address he needs is the patient's current location, whether at the home of caller or patient. The inference that the patient might be at either of two possible locations is premised on an inference that patient and caller are not – or may not be – normally co-resident.[4]

(12) [DEC 1-2-11 DAUGHTER]

01	Clr:	I'm ringing about my daughter. She's doubled up
02		in pain ( ) t! stomach
//		((64 lines of problem description and diagnostic questioning omitted))
67	Doc:	An:'whe-whe:re are you at the moment. mhh What's
68		her address.

In Extract 13, the doctor launches his question in such a way as to display an inference that the caller and her daughter do not live together, and then repairs this to display an awareness that, whatever their living arrangements more generally, mother and daughter are currently at the same location.

(13) [DEC 1-2-7 CONTRACTIONS]

01	Clr:	I'm phonin' for my daughter, e:hm (0.7) she's due
02		'er baby the twenty fourth u' this month
//		((56 lines of diagnostic questioning omitted))
59	Doc:	Where does she li-where are you, What's your
60		address

Likewise, callers display what they take to be normative living arrangements in first referring to the patient. No caller in the data corpus ever says that a spouse or child lives with them – that is something which, they take it, goes without saying (despite the number of divorced and separated couples now parenting from separate households; Jacobson et al. 2001). Instead, they use a family reference term and then immediately describe the patient's symptoms (as in Extracts 10 and 11), and it is on the basis of this family reference term that the doctor then displays an inference of co-residence.

Through the normative treatment of some person reference terms as implicative of co-residence, and others as not, the traditional nuclear family of co-resident parents and children is reproduced. The non-normativity of all alternative arrangements is constituted in part by precisely the normative assumptions displayed here. In these calls, the interactants draw on what they take to be normative about kinship and living arrangements in their culture, and use it as a resource in negotiating medical care. Without being oriented to doing any such thing, they are reflecting and reproducing their normative culture.

Intimate Caring, Gender, and Family Designations

The doctor in these calls routinely displays an assumption that any adult calling for a child, thereby demonstrably engaged in an act of caring on her or his behalf, is that child's parent. So, for example, the "little girl" of Extract 14 is subsequently referred to by the doctor as the caller's "daughter" and "the baby" of Extract 15 as "your first," although in neither case do these callers specify that the children about whom they are calling are their own.

(14) [DEC 1-2-3 ULCERS]
01 Clr: I've got a little gi:rl of nineteen months.
02 Doc: R:ight,
03 Clr: An' I've just noticed in 'er mouth. that she's
04 got .hhhh at least three: quite bad ulcers on 'er
05 tongue.
// ((13 lines describing symptoms omitted))
19 Doc: Ri:ght, sorry. .hh So- so how old didju' say-
20 you say your daughter was,

(15) [DEC 1-1-5 COLIC]
01 Clr: It's thee: (0.4) the baby, she's: (0.4) just
02 comin' up on four weeks old,
03 Doc: Right,
// ((107 lines of diagnostic questioning omitted))
111 Doc: [h Is she] the second baby? or (.) your first, yeah

Thus, when callers say they "have" children or babies, this is treated as claiming a kinship relationship. By contrast, the caller who says "I have a gentleman that's in a very bad way" [DEC 1-2-17] is not treated as claiming a kinship relationship. The assumption that an adult calling on behalf of a child is (unless otherwise specified) the parent of that child reflects, and reproduces, cultural understandings that parents (especially mothers) are responsible for the care of their children.

The analysis of Extracts 14 and 15 goes some way towards offering empirical support for Sacks's (1972b; 1995a) famous claim that when we hear "The baby cried. The mommy picked it up," what we hear is that the "mommy" who picks the "baby" up is the mommy of that baby. Apparently the doctor hears, and is intended to hear, "I've got a little gi:rl" and "it's the baby" as indexing familial relations between speaker and child. However, whereas Sacks simply claims

that "baby" is a family reference term, the data presented here show that the terms "baby" and "girl" are, in the context of these calls, treated and understood by these social participants themselves as family reference terms, even though (unlike "daughter") they are not specific to familial relationships and can be used in other contexts to refer to non-kin.

The social norm that parents care for their sick children is apparent in this dataset in that, in fact, it is indeed overwhelmingly a parent, and more specifically a mother, who performs the action of calling the doctor on behalf of a sick child. More importantly from the conversation analytic perspective on normativity advanced here, the activity of calling the doctor is understood by social participants with reference to the social norm that makes caring for children a category-bound activity, such that those who make such calls on behalf of their children overwhelmingly select person reference terms that display the parent/child relationship (e.g., "son," "daughter," etc., as in Extracts 2, 6, 7, and 9). Moreover, as we have seen, those who do not select such person references nonetheless have their more ambiguous – and not, strictly speaking, familial – terminology ("baby," "girl," "boy") treated with reference to this social norm, and are identified as mothers on the basis of the category-bound activity they are performing (caring for children, as in Extracts 14 and 15). These data also, thereby, provide evidence for Sacks's (1995a) claim that "for an observer of a category bound activity, the category to which the activity is bound has a special relevance for formulating an identification of its doer" (p. 259). In sum, the family is produced as a locus of caring not simply because it is, in fact, overwhelmingly parents who do call the doctor on behalf of their children, but also because those who care for children produce themselves, through their selection of familial terminology, as the parents of their children, and not as members of whatever other category sets they can also claim to be members of.

The inference that people calling on behalf of children are their parents can be so strong as to override even clear statements to the contrary, as in Extract 16 in which the caller identifies the patient as a baby who is not her own (lines 1–2). This statement is ostensibly not heard, or not understood, by the doctor. He subsequently queries her identity (line 21), such that she finds herself explaining (in lines 24–25) why it is she, and not the mother, who is calling.

(16) [DEC 1-2-16 BABY I]

01	Clr:	I've got u:m .h my next door neighbor's baby's
02		not very well. <She keeps losin' 'er breath an' .hh
03		um (.) bringin' up sick and everything an' she
04		keeps cryin'. <She's been cryin' for about four
05		hours, .hhh They don't know what's wrong with 'er.
//		((15 lines of diagnostic questioning omitted))
21	Doc:	Are you the mother.
22	Clr:	No, I'm the next door neighbor.h .h
23	Doc:	Right.
24	Clr:	The mother's lookin' after the baby at the
25		moment. hh .hh
26	Doc:	An' she's- I see. Okay doke.

In this dataset, no parent provides an account for why he or she, as opposed to another, is making the call.

Evidence that, as feminists claim, women's caring role is not just statistically more common, but also socially normative is also displayed in these calls. First, more women call on behalf of others than do men (only 11 of the 50 such calls are from men). Second, the trend in the data is that if a male calls on behalf of a patient (of either sex), he is more likely to be offered a home visit than is a female caller.[5] One reason for this may be the doctor's expectation – displayed to female callers, and never to males – that women will be free to bring the patient to see him the following day: as in Extracts 17 (a mother calling about her child) and 18 (a wife calling about her husband):

(17) [DEC 1-1-9 CONJUNCTIVITIS]
01 Doc: An' if you're worried in the morning, bring 'im
02 along to the morning surgery,

(18) [DEC 2-1-15 FOOD POISONING]
01 Doc: If you wanted to bring 'im along in the morning
02 I'll have a loo[k at 'im.]

Family carers are often (though, according to Gubrium and Holstein 1990: 97–112, not always) expected to have intimate personal knowledge about the patient's personal circumstances, previous medical history, and current medical needs. In history-taking from callers identified as "mothers" and "wives," the doctor displays through question design his expectation that callers will be able to provide him with personal medical information. Of wives he asks: "what treatment did he put your husband on?" [DEC 2-1-4]; "Has he had any problems in the past, with 'is stomach," [DEC 2-2-2]; and "Has he ever had anything like this befo:re?" [DEC 2-2-4]; and of a mother: "has she had any illnesses in the past of any note?" [DEC 1-1-1]. Husbands are asked: "She ever had those [codeine phosphate tablets] befo:re," [DEC 1-1-13]; and "Does she have a problem with 'er chest normally," [DEC 1-2-12]. The doctor displays on only one occasion an orientation to the possibility of a spouse not having the information requested: he asks a husband, "When was her last period. D' you know?" [DEC 1-2-15].

By contrast, non-familial callers are not expected to have intimate knowledge of the patient. When a caller identifies herself as an institutional representative (Warden Services), the doctor asks, "does she have any past history *that you know about*" [DEC 2-1-5, my emphasis], thereby displaying an expectation that she may not know.

Non-familial callers are unapologetic about their lack of knowledge of the patient's medical needs:

(19) [DEC 1-2-17 BREATHING]
01 Doc: All he needs is a bit of a Nebulizer, .hh [Diyih]
02 Clr: [( )]
03 Doc: Diyiknow how to use that?

04 (0.4)
05 Clr: No but he knows how to use it, doesn't he!
// ((18 lines omitted, in which doctor advises on drugs))
24 Doc: Is 'e also: got some steroids with "im.
25 Clr: Oh I don't know a damn! I don'know what 'e's got,
26 Doctor

No such blithe confessions of ignorance are ever produced by husbands and wives, or by parents of children. Instead, close family members treat themselves (and are treated by the doctor) as accountable for not having this kind of information: "I don't know what it was earlier on - I wasn't here you know," says Melanie's mother [DEC 1-1-1], who has already explained that she was at work when her daughter's illness started; "It's hard trying to remember everything" says a wife [DEC 2-1-4]. Callers treat themselves as accountable for having intimate knowledge about their children, husbands, and wives (as the caller in Extract 19 does not), thereby re-inscribing the taken-for-granted inference that "close" kin – which they are thereby displayed to be – normatively have this kind of knowledge about each other.

In sum, unless otherwise accounted for (e.g., by the institutional relationship played in the caller's self-identification as a "relief warden" in Extract 6 above), making a call to a doctor on behalf of another implies that the caller is in an intimate caring relationship with the patient. The deployment of family reference terms to refer to the patient, and the inferences which demonstrably attach to these, both display and reconstitute the family as the culturally privileged site of intimate caring it is already understood to be.

The Family Doctor

The analysis in this section shows how co-interactants display the inference that the culture of which they are co-members all family members (parents and children alike) share the same family doctor. This arrangement is, of course, culturally specific and may differentiate U.K. from U.S. (and other) medical cultures. However, the general argument advanced here is generalizable to every culture - that cultural norms (including those associated with heteronormativity) are displayed in talk, and that analysts can read from participants' talk-in-interaction whatever practices are normative in their particular culture.[6]

As noted, the doctor in these calls is a "locum" taking sole temporary responsibility for a multi-doctor practice, and he routinely asks for the name of the doctor with whom the patient is registered. In designing this question, he displays an inference that those calling on behalf of family members are registered with the same doctor as the patient, whereas other callers are not. For example, in Extract 20 a woman calling about her husband's swollen testicles is asked, "have you seen your own doctor at all" – a question which makes sense only if the pronoun is understood as plural, such that the woman's doctor is also her husband's:

(20) [DEC 2-2-4 SWOLLEN TESTICLES]

01	Doc:	.hh How can I help. .hh
02	Cld:	.hhh U::m well my husband's- he's been quite
03		poorly for about the last two or three da:ys,
04		a:nd u:m (.) he's passing water a lot an' 'is
05		testicles are swollen an' 'e's rea- lotta pain in
06		the bottom of 'is body like. (.hhhhh)
07	Doc:	R::igh[t,]
08	Cld:	[(Um)] hmm hmm! ((throat clear))
09	Doc:	(.hh) An:d: >sorry< how long's that-
10	Cld:	.hh[h]
11	Doc:	[b]een going on for.
12	Cld:	Aw, two days. But it's just gettin' wo:rse.
13	Doc:	Has- Have you: seen: (.) your own doctor at all?[7]

Similarly, in Extract 21 a mother calling about a child's sickness is asked, "who's your doctor," thereby displaying the assumption that mother and child share the same doctor:

(21) [DEC 2-1-7 SICK III]

01	Clr:	... my daughter who's uh:: just coming fuh nineteen
02		months old, um: .thh yesterday she was feelin' very
03		sick.
//		((74 lines omitted, of problem presentation, diagnostic questioning, and diagnosis))
78	Doc:	Who's your doctor,

By contrast, non-family members are assumed not to share a doctor, with the question formulated as "Who'[s his doctor?" [DEC 2-1-16] or "Who is his doctor actually" [DEC 1-2-17]. A caller on behalf of an adult son is asked, "Who- who's her doc- your: t! his doctor?" [DEC 1-2-19]. Likewise, the caller who identified herself as "only 'is grandma" (i.e., kin, but not close kin) is asked, "O:kay, an' who's your doctor normally, or his doctor." [DEC 2-1-9]: in the original formulation the doctor displays an orientation to the caller as family; in his repair, he treats her as distant kin, unlikely to share with a grandson a family doctor.

Callers – especially spouses – also make available in their talk the inference that nuclear family members have the same doctor and that others do not. A husband of a wife who has just fainted explains that "She's been to the doctor's and our doctor at ((deleted)) gave her some painkillers" [DEC 1-1-13]; a husband of a couple not registered with the practice asks, "Did you want to know where our doctor was?" [DEC 1-1-6]; and a wife of a husband with possible food poisoning reports unproblematically the advice of a previous doctor to "contact our own doctor" [DEC 2-1-15]. What is interesting about this latter case is that it turns out that husband and wife do not, in fact, have the same doctor. The exchange in which this statement is made is reproduced in Extract 22 (an extension of Extract 5), described earlier as unique in the corpus for the deployment of a non-familial person reference (line 5) – typical of institutional calls – followed

(22) [DEC 2-1-15 FOOD POISONING]

114 ((deleted)) 'e ne- 'e decided not tuh change it.
115 eh-hh!
116 Doc: Right. >Yeah.<=

Over the course of this call, a hypothetical family doctor is first conjured into being and then dissolved. This person is first invoked by the caller in seeking to justify the need for a home visit: she reports having been advised by a holiday doctor to contact "our" own doctor (line 37). Later, in response to the caller's account of the difficulties of visiting a surgery some distance from home, the

doctor invokes this same person: "Well, so have you changed your: doctor" (line 109, with "you" and "your" here treated as plural). The hypothetical family doctor finally dissolves in lines 110–14 where "his doctor" makes an appearance instead – and it becomes apparent that husband and wife have different doctors, with this accounted for in terms of "his" previous residence, "his" preferences, and "his" decisions. The way in which a normative inference (here, that spouses share a doctor) acts to shape the interaction is powerfully apparent in this call.

In sum, I have shown that the heteronormative definition of the family reflected and constructed by these social participants in the course of their everyday lives comprises wife and husband, co-resident with their biologically related, dependent children, with the wife/mother taking primary responsibility for caring for sick family members and for contacting the (shared) family doctor. The normative construction of the family is invoked, deployed, negotiated – and occasionally resisted – by social participants for whom the business at hand is caring for a sick person and trying to secure a home visit from a doctor. However, in conducting the business of their everyday lives, without conscious design or oppressive intent, they reproduce their society's heteronormative social order.

Conclusion

In this analysis, I have sought to excavate what Euro-American readers – as cultural members – already "know" and take for granted: that families normatively live together and care for one another. I have analyzed the mundane understandings of family embedded in these calls to show what these understandings are, and how they are displayed by people who are not simply describing, but are actively deploying family reference terms for interactional purposes. In conclusion, I will: (a) examine some of the interactional uses to which these family reference terms are put; and (b) extrapolate from these findings the implications of this quotidian reproduction of heteronormativity for the problem of heterosexism more broadly.

Interactional Uses of Family Reference Terms

The use of heteronormative terms and inferences in these calls is not designed to display anti-gay prejudice or to discriminate against non-heterosexual people. Rather, speakers are deploying person reference terms that they treat as ordinary and natural in pursuit of the interactional goals related to their medical concerns. A key interactional use of reference terms relating to the traditional nuclear family is to render ordinary and natural the action being performed by callers in contacting the doctor on behalf of these particular patients. Calling the doctor is – along with other actions described in the calls (such as sponging down a feverish child, helping a spouse to the toilet, preparing special foods or drinks) – demonstrably an act of caring. Caring activities are, as has been shown in the preceding analysis, category-bound to the particular categories of people who constitute the nuclear family, especially the wife/mother. This means that callers

who contact the doctor and report, "My husband isn't very well," or, "I think my son's got measles," constitute themselves as ordinary people doing an ordinary and natural thing in calling on behalf of these patients in particular – because these patients, referred to by terms which display them as members of the caller's nuclear family, are precisely the people for whom "caring" is an ordinary and natural activity. As demonstrated above, a wife/mother is culturally understood to be bound to her "husband" by marriage and to her "son" by blood, to live with them, to care for them, to have intimate knowledge of their medical needs, and to share with them a family doctor. Calling on their behalf is rendered thereby a wholly non-accountable activity: nothing special is happening in terms of the relationships displayed. Whatever other interactional hurdles the caller has to negotiate (conveying the nature of the medical problem, describing the symptoms as sufficiently severe to merit a home visit, and so on; Drew forthcoming) she does not have to deal with the issue of why she rather than some other person is calling on behalf of the patient. The fact that she is the one calling is rendered ordinary and natural.

Here, nuclear family reference terms are being used, as Donna J. Haraway (1997:53) has theorized, as a technology for producing the effect of "natural" relationships. The use of these reference terms mobilizes the inferences which attach to such relationships, obviating the need for the caller to account for her caring activities and facilitating a smooth and unproblematic doctor/caller interaction. The sheer ordinariness of a parent calling on behalf of a child, or one spouse on behalf of another, makes the use of these terms a powerful resource for "doing being ordinary" (Sacks 1984), with all the interactional benefits (of not having to provide accounts, explanations, justifications, etc.) that attach to being an "ordinary" person doing a "natural" activity.

Nuclear family terms also are used to co-implicate a third party in the decision to call the doctor. Callers frequently display an orientation to their call as constituting a demand on the doctor's time and energy (e.g., via expressions of regret for the necessity of making the call or requesting a home visit: "I'm afraid I'm- I'm sorry, but I've gon' t'av to call ya out" [DEC 1-2-15]). They reduce their own culpability in this respect by allocating some of the responsibility for the call to other family members – in this dataset, always spouses – who have either allegedly requested that the call be made, or whose purported anxieties for the patient have prompted the call. For example, when one caller's suggestion that her daughter may have mumps meets with some skepticism from the doctor, she says, "My husband just said ta phone ya" [DEC 1-2-8]. Another caller, having described how his pregnant daughter is vomiting and has a slight discharge, co-implicates his "wife" in the anxieties this is causing: "It won't stop at the moment, e- which is obviously: (.) worrying me, an:d my wife" [DEC 1-1-7]. Patients who call on their own behalves also occasionally claim that they are doing so in response to the promptings of a spouse, thereby displaying what John Heritage and Jeffrey Robinson (forthcoming), drawing on Jefferson (1984:351), call "troubles resistance" – that is, that they are not calling the doctor lightly and have tried to deal with the problem themselves. The marital unit

terminology of "husband" and "wife" offers a resource for co-implicating other people whose involvement with caller and patient is treated as self-evident.

Implications for the Problem of Heterosexism

The mundane, everyday use of family reference terms in these calls constitutes a major resource for ordinary folk who are not oriented in any way to LGBT concerns but who are simply getting on with the business of their lives. In so doing, the social order they reproduce is profoundly heteronormative: in these calls the nuclear family is always a heterosexual one, individuals are (apparently) universally heterosexual; sexual orientation – of any kind – is simply not an issue. It is precisely this untroubled reproduction of a heteronormative world that – from an analyst's point of view – contributes to the problem of heterosexism.

These casual displays of heterosexuality in the service of local interactional goals constitute a mundane instance of heterosexual privilege by those who take for granted, as others cannot, their access to their culture's family reference terms. Such terms are not available – in any unproblematic way – to lesbian or gay couples in England, where (as in most other countries) same-sex marriage is not permitted under law (see Kitzinger and Wilkinson 2004a). A study in which gay men were asked about their lexical choices in referring to their "lover"/"partner"/"friend"/"boyfriend" points to a plethora of self-consciously articulated difficulties and concerns (Harvey 1997; see also Land and Kitzinger 2005 for an analysis of lesbians attempting to deploy the terminology of "wife" and referring to a female "partner" in the course of everyday activities). The normative understanding is that a family unit properly comprises one (and only one) mother and father – what Sacks (1972b) refers to as the "proper number of incumbents for certain categories of any unit . . . a nation-state may have but one president, a family but one father, a baseball team but one shortstop on the field, etc." (p. 221).

Family researchers have emphasized the range and diversity of "emergent and reconfigured forms of family life" (Lempert and DeVault 2000) in contemporary modern societies. According to the 1991 Census, only 14.6 percent of UK households contained one adult male and one adult female, with between 1 and 3 dependent children, where only one of the adults was in employment (Bernardes 1999). The acknowledged existence of family diversity does not, however, necessarily map onto social members' displayed understandings of the family as a normative concept. It is not necessarily the case that the families of which these callers are members are as rigidly traditional as their displayed understanding of "the family" implies: they include several mothers who work outside the home, fathers/husbands who call on behalf of sick family members, an unmarried couple, a family dealing with a daughter's abortion, the couple who do not share a normative "family doctor" – and presumably other kinds of non-conformity which were not revealed in these calls. If these callers had been interviewed on the topic, they may well have produced more nuanced and complicated accounts of family life; however, what I have shown in their daily interactions, when family terminology is a resource not a topic, is their deployment

of the traditional normative construction of "the family" as a distinct, co-residential, heterosexual marital unit. This commonsense understanding is produced by callers and doctor in interaction and is oriented to as normative even when it is breached, as when accounts are offered for the presence of others (such as friends) in the home (Extract 3) or when non-normative medical arrangements are glossed as normative (Extract 23).

The interactional trouble that arises in these calls when normative understandings are breached enables us to extrapolate the problems that might confront a lesbian or a gay man contacting a doctor on behalf of partner or child (especially any child of whom she or he is neither a biological nor a legally appointed adoptive parent). Such a caller lacks as a resource the culture's family reference terms, and the inferences associated with such a resource, used so smoothly by most of these (apparently) heterosexual callers. Research (based on self-reported data) on lesbians' and gay men's experience of the physician-patient relationship has found that 17 percent report having avoided or delayed seeking health care for reasons to do with their sexual orientation (Stein and Bonuck 2001) while 27 percent report negative or problematic experiences with their children's health care related to sexual orientation or family constellation (Mikhailovich, Martin, and Lawton 2001; see also Riordan 2004, for the experience of lesbian and gay physicians). Although some of these negative interactions are the product of explicitly homophobic behavior including intimidation and humiliation from health care professionals (e.g., Stevens 1992), many must derive from the underlying assumptions of universal heterosexuality incorporated into the culture's family reference terms and the mundane heterosexism (Peel 2001) to which that gives rise. Research on lesbian and gay families more generally (e.g., Stacey 1998; Weston 1991), like the medical research cited above, has used self-report data to highlight the heteronormative context for same-sex couples and their children. The analysis presented here contributes to that literature a detailed analysis of how heteronormativity is grounded in the empirical details of talk-in-interaction (see also Kitzinger 2000, 2005; Land and Kitzinger 2005).

In conclusion, analysis of these family reference terms, the inferences normatively associated with them, and the interactional uses to which they may be put in the context of after-hours medical calls have shown that (and how) tacit, taken-for-granted concepts of "the family" are reflected in, and reproduced by, the talk of social participants. Through their deployment of family reference terms in conducting the business of their ordinary lives, the speakers in this dataset both reflect and (re)construct their society's normative definition of family as composed of a co-residential married heterosexual couple and their biological children. This analysis has also demonstrated that heterosexism can be produced and reproduced, even – and perhaps especially – where there is no sign of trouble in social interactions. It may be particularly important to target for analysis precisely those everyday interactions which seem unremarkable, where nothing special appears to be happening, because what is always happening on such occasions is the reproduction of the normal, taken-for-granted world, invisible because it is too familiar. Here, in the specific context of requesting a home visit from a doctor, we see heteronormativity in action. In unravelling the social

fabric of ordinary, everyday life, LGBT activists and researchers can make visible and challenge the mundane ways in which people – without deliberate intent – reproduce a world that socially excludes or marginalizes non-heterosexuals.

Acknowledgements

The author wishes to thank John Heritage for encouraging her to pursue the ideas on which this article is based and the audiences at the University of California at Santa Barbara and the University of Madison–Wisconsin for very useful discussions following presentations of earlier versions of this article. Helpful feedback on earlier drafts was provided by Paul Drew, Gene Lerner, Douglas Maynard, Geoffrey Raymond, Emanuel Schegloff, Jack Sidnell, and Sue Wilkinson. James Holstein was a thoughtful, thorough editor.

Notes

1. As Sacks (1995a) points out, his is "a different sense of 'norms regulating activities' than one might usually use in doing sociology or anthropology, where it would be said by and large that the norms are followed by those persons who do the things – or ought to be" (p. 253). Although norms and normativity (as here defined) are central to conversation analysis as a field, few conversation analysts since Sacks have used this terminology in their work; but see Schegloff's analysis of *sotte voce* improprieties as episodes in which "formal notice is . . . taken of the cultural norms applicable here, in the very course of showing a lack of commitment to abide by them" (Schegloff 2003:63). Rather than abandoning important sociological notions such as norms and normativity, I am here respecifying them in terms used by ethnomethodologists and conversation analysts.
2. The calls were recorded by the doctor, and many of the names (of people and places) and other identifying information were deleted by him, at his discretion and before the tapes were released. This appears to have involved recording silence over identifying information. Deletions have been indicated as such; those names that were not deleted (presumably in error) have been pseudonymized.
3. Although the use of "call" in Extract 10 (line 4) may invite the inference that the parties are co-present, at least in British English a request to "call" on someone does not necessarily imply either the co-presence of the speaker and the person to be called upon, or their cohabitation – as is instantiated by this example from a telephone conversation in which Lesley (who, as is clear from other calls in the corpus, does not live with her mother-in-law) asks a plumber's wife: "Could you:r husband call on my mother in law please" [Holt 1–6].
4. Here, as elsewhere in this article, space constraints preclude inclusion of the conversations in their entirety; however, in neither of these extracts could anything in the omitted material reasonably underwrite the doctor's reluctance to ascribe co-residence to these callers and patients. In fact, the situation is rather the reverse in Extract 12 where between lines 2 and 67 the caller reports on a range of different remedies attempted with a daughter who "had a operation to terminate a pregnancy on Tuesday" – three or four days before the call – none of which has been successful in alleviating her pain. This invites an understanding that caller and patient have

been co-present at least sometimes over the course of the last three or four days, and hence might make possible the inference of co-residence, here withheld.

5. The sample of male callers is small, and this finding does not quite reach significance at the $p < 0.05$ level ($x^2 = 3.57$, $df = 1$, $p < 0.10$, critical value 3.84).
6. The norms identified in earlier sections of this article are also culturally specific: the norm of cohabitation is not displayed in those cultures in which husband and wife live separately, either in their natal homes or in men's or women's houses (Barnard and Good 1984:78–83) or in cultures in which children do not normatively live with their parents (Ingoldsby 1995:119); the norm of "caring" between spouses is not displayed in cultures in which husband and wife are neither intimate with nor care for one another, and indeed never meet after their ritual ceremony (Gough 1968).
7. As is evident from the repair, this turn was initially designed to be "Has he seen his own doctor" and was specifically altered to display an inference that the woman would share the same doctor as her husband, and would have accompanied him to the surgery.

Oral Genres of Humor: On the Dialectic of Genre Knowledge and Creative Authoring

Helga Kotthoff

Introduction

Humor poses a challenge to genre theories whose concept of genre imposes an excessively high standard of rigor and is too narrowly based on an interest in classifying ideals of pre-patterned discourse. The high degree of creativity, emergent construction and artistry typical of humor call for a concept of genre which makes sense of modifications and transgressions in communicative processes, as shown by Luckmann (1986, 2002), Günthner/ Knoblauch (1995) and Muntigl/Gruber (2005). Some forms of conversational humor are generic, for example, standardized jokes. Other forms exploit our knowledge of serious genres and activity types (thereby relying on it). Despite, or better because of this, generic boundaries are often transgressed and disregarded in joking; new sub-types arise, such as absurd meta-jokes which violate the well-known expectation of a punch line or other features of the genre. There are genres such as teasing which much more than jokes reflect their emergent construction. We can define prototypes of teasing (and other humor genres), but the genre is nevertheless realized in a great variety of ways. Linguists have also identified some basic generic features of stories, but there are as well many sub-types of humorous stories demanding a certain style of performance, a special framing and significant deviation from their serious counterparts. There are also genres for which we lack a folk taxonomy but which are nevertheless quite generic in their dialogical structure and emergent performance (i.e. joint fantasizing). I will take a close look at the above-mentioned genres and discuss how genre, contextualization and keying relate to each other. Conversational humor often works with contextualization procedures such as code switching, social stylistics,

Source: *Pragmatics* (forthcoming, 2007).

features of oral art, repetition, marked wording, prosody, interjections, laughter, mimicry, etc. that create a humorous keying. These cues index the continually changing contextual presuppositions necessary for situated interpretations in oral discourse. Much of spontaneous humorous discourse involves conversational inferencing in the sense of Gumperz (1982).

Finally, I will discuss what it means for a genre such as gossip to be performed as a play with gossip. Is "playing gossip" still gossip? Intertextuality is another important concept that I draw upon.

1. Genre in the Sociology of Knowledge

Communicative processes following more or less fixed patterns are called "genres." Luckmann (2002: 163) describes typification and routinization processes as going on naturally in human action. It comes as no surprise that in the course of history interlocutors consolidate certain structural expectations about how an activity might begin, develop and come to an end, what role relations it allows, where it typically takes place, what its reputation is, and what functions it is able to realize. Like poetics, theology and literary criticism, classical rhetoric works with a genre concept. Because of the excessive demands for rigor and clarity expected in scientific definitions of genre, "thus far in the illustrious history of the discipline, not so much as one genre has been completely defined" (Dundes, cited following Swales 1990, 34). Genre theorists have mainly been preoccupied with written texts, whereas the work of Bakhtin (1986/1994) and Voloshinov (1929/1975) prompted a 'communicative turn' in genre theory, as discussed by Günthner/Knoblauch (1995). The two authors opposed a static concept of genre such as the ones common in folklore studies and literary criticism. In linguistic anthropology (Hanks 1995, Foley 1997), and likewise in the ethnography of communication, there is a tendency to no longer consider genres as static, monological products, but rather to adopt a performance-centered approach and to study genres in the process of their interactive production within a conversational and socio-cultural context. This includes showing how and why speakers violate conventions and index originality. Conversation Analysis has also had an important influence on genre research. Sacks (1974, 1978), for example, analyzed joke-telling in natural settings. He showed how joke-telling suspends the normal turn-taking procedure. For the length of the joke, the teller reserves the right to speak. This is why jokes are usually introduced before they are told. The announced intention to tell a joke must first be ratified by the prospective listeners.

Joke-telling is temporally and sequentially organized. The story unfolds in a simple series of events located in time (Sacks 1974, 1978). The sequential structure of the joke relies on a series of implausibilities. In order for a joke to be received as such, it is necessary from the very beginning to secure an appropriate reception by the listeners. The conflation of temporal and sequential order allows the sequence of events to appear coherent.

Earlier studies have suggested that disbelief is suspended for the length of the joke. Sacks, however, emphasizes that the implausabilities of jokes must be handled systematically. Jokes are not invalidated by implausibility, but rather implausibilities help to secure the appropriate reception through the canonical order of time (1978). He writes that in receiving a story, listeners should believe the events being told; if necessary, they are expected to suspend 'disbelief'. In telling a joke, the teller concentrates on constructing the punch line so that listeners can figure it out (get it) as easily and quickly as possible. Recipients should understand a joke directly, without receiving hints or additional information, and laughter is the preferred and desired reaction. But Sacks also showed that joke-telling can be used for context-specific purposes. Speakers can, as is the case in Sacks' (1978) example, use jokes to show their knowledge of sexual behavior. An interlocking of functions and goals arises. Of course, one function of jokes is to amuse people. Individual and context-specific functions can also be added. Genres may be reframed strategically in various ways. As Günthner/Knoblauch (1995: 7) explain, reframing can only succeed if there are pre-fixed communicative patterns.

Günthner/Knoblauch hold that pre-patterning is located on three different structural levels: the level of internal structure, the situative level and the level of external structure. Many features of the internal structure of jokes can be identified. At the situative level, it remains clear that joke-telling is typical of informal settings. It may be used to deformalize a context. The external structure is quite loose because we seldom find situations that make joking obligatory. One such occasion is the German "Büttenrede," a speech delivered during the Carnival season. And there are situations when joking is forbidden, for example at funerals. There is an ideology underlying standardized joking as there is for every genre. In Germany, and perhaps throughout Western Europe, men were in the past more likely to tell jokes than women. There was a critical meta-discourse about jokes. Many jokes were, for example, regarded by the women's movement as carrying sexist messages. Most jokes took place in a male world; women were often the butt of jokes (Legman 1970, Kotthoff 2006a). Then the women's movement began to produce numerous jokes aimed at men. In this way, the genre gained a new status in society's communicative household. Briggs/Bauman (1992: 147), applying Bakhtin's concept of intertextuality, describe an "intertextual relationship" as a linkage of texts that are "ordered, unified, and bounded, on the one hand, and fragmented, heterogeneous, and open-ended, on the other." Günthner/Knoblauch (1995: 21) sum up approaches that underline the interrelationship between generic speech practices and social structures, values and ideologies. With Luckmann they see genres as part of a cultural system, as an important link between language and culture. Speakers are always open to modifying typified forms of communicative behavior. I see this flexibility as the advantage of discussing genres within the context of the sociology of knowledge. Knowledge of typified genre realization frees speakers to inscribe new social meanings into a genre. Identical realignments hold true for everyday communication, as has been discussed in connection with the evolution of the creative arts:

> How a competent reader approaches a work of literature, his attitude and expectations, depend importantly upon the genre he sees it as exemplifying. A work that rebels against genre-conventions equally relies on the reader's recognition of the conventions being rejected. Aesthetically relevant features of a work may stand out only if its reader has a background awareness of the historical development of the genre, or of the style, that the work is transforming in its distinctive way and perhaps without direct allusions within the text itself. The work demands to be seen against the foil of the whole tradition from which it stems, and which it modifies by its very existence. (Hepburn, 1983: 496, cited following Swales 1990: 37).

It is also the case that humor is produced and perceived in relation to the norm constituted by codification. The fact that communicative activities violate the norms of their genres does not mean that those genres necessarily disappear.

I will look at jokes, teasing activities, humorous stories, joint fantasizing, humorous gossip and humorous counseling in order to discover the creative potentials that depend on genre knowledge.

2. Beyond the Standards of Standardized Jokes

The genre of the "joke" is familiar to everyone in our culture, and this can be relied on. I have already summarized Sacks' joke analysis. He writes that the joke, constructed as a test of comprehension, always makes special interpretative demands on reception. The demands for plausibility and coherence are different from those in serious discourse. Freud referred to the high 'density' of jokes already in 1905. Sacks (1978) stresses that there are no divergences from the central focus. 'Embellishment' is typical of stories, but not of jokes. Everything that does not direct attention to the punch line should be eliminated in jokes.

But there are indeed aesthetic strategies that improve a joke.

The next joke was told in the US state of Minnesota during a dinner shared by several friends. David, Wendy and Vivian are Americans, Roland is German.

Datum 1[1]

(David (D), Vivian (V), Wendy (W), Roland (R))

1 D: ...which remInds me of a JOke i wanna tell **you.**

and the REAson he came Over of course is to make
his fOrtune in this new LAND.
he heard, the further wEst you WENT, the bEtter
chance you had at making a FORtune.
remEmber there was a GUY [that said,
W: [go WEST young mAn.
go WEST young mAn. go WEST.
W: yeah.
D: (? ?) i think his nAme was.
Anyway he comes over and he he lAnds in new YORK.
well All the money that he had OBviously was spent for passage. sEE'
W: yeah. ((glass is tipped over))
D: so, Anyway he uh he goes and he hears that there=s a WAggon train
that's being set Up (-) in new YORK,
and he wants to gEt on this WAggon train.
but (-) he has no MOney. so he goes to the WAggon master
and he says, uh sOmething about,
(-) uh i would like to go as far WEST as you people are gOing.
and he said, wEll, we're going ALL the way over to the Oregon territory.
wEll he says, i'd like to go WITH,
but i don't have any MOney. he says,
but i'd be glAd to do ANY kind of wOrk
that yOU would like me to DO'
wEll, he said uh, how are you with a RIfle.
(-) and he says i'm uh really vEry GOOD with a with a gun. see.
so they said wEll, we're gonna set you on the last
WAggon of the waggon train.
you're gonna sit on the BACK and watch out for Indians.
okay? so they take Off from new YORK.
well they go through you know ohIo,
(-) and pennsylvAnia, and Illinois, and the whole wOrks,
and they go to minnesOta and they get into
the dakOtas before they ever see an INdian.
W: hehehehe
D: so and they're in the dakOtas and they are trAveling,
(-) you know, this guy has got his rIfle, he hollers to the drIver,
and he says, HEY DRIVER, he says, (-)
I SEE AN INDIAN. (-) and the drIver says,
HOW BIG IS HE: he says, well, HE'S ABOUT THAT BIG.
((indicates a very small distance with his fingers))
well, he says, he's TOO far away to shOOt. he says.
jUst WATCH=m. so they go for mIles and that
and he says uh DRIVER,
THAT INDIAN'S STILL FOLLOWING US:
HOW BIG IS HE NOW. OH HE'S THAT BIG.
((indicates a greater distance))
he says, – TOO small to shOOt. they're TOO far awAy.
so: Anyway they GO and that and he says uh
HEY that Indian's still – following us
and he's getting a little CLOser.

59 how big's he NOW? wEll about THAT big.
((indicates a greater distance))
60 ah, he says, he's still TOO far awAy.
61 W: hehe
62 D: so they keep on gOing and that and fInally, he says
63 HEY that Indian's getting closer.
64 and the driver says, HOW CLOSE IS HE NOW?
65 WELL, he says, HE'S ABOUT THAT BIG. ((indicates a greater distance))
66 he says, SHOO::T=m.
67 (-) he sis, i CAN't shOOt=m. so why nOt.
68 he sis he's a frIEnd of mine.
69 (- -) hehe, he says, a frIEnd of yours?
70 how the heck do you figure he's a frIEnd of yours.
71 he sis, hey, I've known him since he was THAT big.
((indicates a small distance))
72 a: hahahahahahahahahahahaha
73 W: thAt's good, hehehehehehehehehehe
74 V: hehehehehe okay
75 D: HARD to find a good, clean jOke.
76 m: hehehehehehe
((Baby cries))

Generic features go beyond those described by Sacks. The joke prefers implicit person characterization for which direct quotations are very important. An essential question for joke performance always remains whether the typification process is staged in such a way that it could be shared by listeners.

2.1. Comical Effects of Social Typifications and Stylizations

With Tannen (1989), Couper-Kuhlen (1999) and Günthner (1999), I regard reported dialogue as a play with double voicing in the sense of Michail Bakhtin. The persons whose speech is delivered are stylized and evoked (Günthner 1999, Kotthoff 1998). These implicit typifications of the dramatis personae are easily identifiable by the listeners because they are based on shared knowledge about typical speech styles, which is confirmed in this manner.

In a well presented joke, scenic narration occurs. Onomatopoetic callings-out, expressive evaluations, gesticulations, mimicry, interjections, typical oral and structural discourse markers and so on are employed as stylistic procedures, just as with funny stories.

63 HEY that Indian's getting closer.
64 and the driver says, HOW CLOSE IS HE NOW?
65 WELL, he says, HE'S ABOUT THAT BIG. ((indicates a greater distance))
66 he says, SHOO::T=m.

Direct quotes are imperative. Elements of spoken discourse, interjections such as "hey" and "well," call prosody and shortenings (SHOO::T=m) can be reproduced most effectively in a quote. There are good and bad realizations of

a genre. In a bad realization (which would not contain the mentioned strategies) the genre remains valid.

A good joke performer not only stylizes direct quotes, but also integrates other special effects, for example, s/he manipulates the tempo of the joke, such as here the iconization of great distance with long lists of the territories traversed.

40 well they go through you know ohIo,
41 (-) and pennsylvAnia, and Illinois, and the whole wOrks,
42 and they go to minnesOta and they get into
43 the dakOtas before they ever see an INdian.

Even the reproduction of a standardized joke is much more than simple reproduction. The specific speaker-listener constellation influences the performance of the joke. Beyond the goal to amuse the public, jokes can have more specific goals, such as to introduce American folklore to a German guest as is the case in the example.

2.2. Meta-Jokes

For a theory of genre, it is important that interlocutors play with the features of the genre. There are question-and-answer jokes, such as elephant jokes:

- How do you fit four elephants into a VW?
- Two in the front, two in the back.

The punch line is based on a demonstration of normality. Most cars seat two persons in the front and two in the back. That elephants are too large to fit into a VW is suppressed, and thus the question is not really answered but it does not present an odd solution either.

What Attardo (1994: 285) discusses as an example of a joke, which fails to deliver the expected punch line and becomes funny precisely because of the failure to do so, is in fact a meta-joke based on the failure to fulfill the normal genre expectation:

"Have you heard the latest?"
"No? Well, neither have I."

There are typical summons which open up a joke telling sequence, such as "have you heard the latest?" or "Do you know the one about X?" one can play with.

3. Stability and Variability in Teasing

Teasing is a genre with even greater variation in situative performance. We start from the common denominator that teasing is a personally addressed jocular remark with a bite, often performed in front of a public. The humorous quality is marked, for example, by the inadequate wording of attributions.

In the next episode, a playful framing is initiated in the first line by the inappropriate combination of *opulent* and *social life*. This steers the reception towards irony since the utterance is stylistically marked.

Datum 2[2]

(David (D), Ernst (E), Inge (I), Johannes (J), Katharina (K), Maria (M), Rudolph (R), several persons at once (m))

14 s: heheheheheheheheh

The dinner takes place at Katharina and David's home. Maria focuses on David's *social life*. She employs an elevated and inappropriate formulation (*opulent social life*), thereby creating a playful-ironic modality. Everybody knows that David prefers a quiet lifestyle. Recently, however, he has taken part in two social events: dinners at their home at Christmas and on New Year's Eve.

David likewise responds ironically to Maria's remark. Above all the formulation *taken the initiative* is quoted from Maria and his wife Katharina, who immediately reacts affirmatively to this and laughs. Many people present know that the view that David normally *does not take the initiative* is not his own. David's self-irony thus draws its potential from Maria and Katharina, who sometimes use such psychological jargon. The others also understand the conflict-laden point of David's reclusive social life and how it is discussed. In lines 6, 7, and 8 several persons laugh.

David not only processes Maria's irony, but he immediately counters it. We must assume that shared knowledge of personal habits and speaking styles and a high degree of familiarity make it possible to respond very quickly and creatively to irony. In lines 9 and 10, Ernst alludes to next Christmas and New Years Eve, which further amplifies the topic and the teasing of David. The background is that Katharina had invited numerous guests this year not only for Christmas, but also for New Year's Eve, among others those present, and that this was definitely too much for David. He has resigned himself good-naturedly to his fate. Everyone laughs at the teasing jest that he is looking forward to the next Christmas and New Year's Eve, which also implies that there will again be numerous invitations to social events.

Ernst expands on the irony by himself starting to tease David. A contrasting perspectivation is still at stake. He speaks about David in the third person, which is typical of teasing (Straehle 1993, Günthner 1996). Maria's ironic implication that David considers his present social life to be "opulent" is now teasingly intensified. David is portrayed as wanting nothing more than to have more parties. In line 12 Ernst refers to a *rumor* he pretends to have heard, thereby suggesting the fictitious quality of his remarks.

In line 13 David seriously reports what his stated preference is (he would like to have a party on either Christmas or New Year's Eve in the coming year). Everyone laughs again. Drew (1987) has shown that teased persons initially react seriously to a teasing attack. David seriously explains how he made it clear to his wife Katharina that in the future he would prefer not to hold big parties at their home on Christmas and New Year's Eve. This reveals his real mood.

But the teasing continues. Starting at line 13, Katharina links David's distaste for an *opulent social life* with his disinclination to travel. David really does not enjoy trips abroad and seldom takes them, and the threat to take one would be the last thing we would expect from him. Everyone present shares this knowledge. David starts to take part in the teasing himself (15). He confirms the views attributed to him. This again is a reaction to the literal meaning. Ernst augments this once more by referring to *the Caribbean*. David himself had recently teased him because of his flight to the Caribbean. For environmental reasons, David was critical of traveling long distances on vacation trips. Again, the participants

laugh. David's "leg is pulled", but he shows the ability to laugh at himself. Teasing can work with irony, as is the case here, and it always works additionally with exaggeration. "Tangential address" (Günthner 1996) is typical; it underlines the performance character of the teasing.

Ironic activities are being carried out here teasingly, which everyone present seemingly finds amusing. People communicate knowledge of one another in this way and thereby affirm their identity as part of the in-group. Friendly irony allows the in-group to deal playfully with social differences, which thereby receive acceptance. The participants leave the domain of official face politics and playfully create a high level of intimacy (Kotthoff 1996). Teasing in this case indirectly communicates a social difference to David. His friends playfully convey to him a construction of how he might see himself in regard to the topic – and also make it clear that they know his real perspective. Friendly irony combines social dissonance und consonance (in the sense of Radcliffe-Brown 1940/1965), individuation and solidarity. David's self-irony shows that he does not feel insulted by the teasing. In datum 2 the social function of the teasing episode can be described as negotiating social norms and accepting differences in regard to them.

There are other forms of teasing, and the knowledge of teasing can be exploited. The listener can define a simple critique as teasing and thereby invite the emergent construction of a teasing episode.

Datum 3 (from Drew 1987)

(Gerald has a new Mustang Sport wagon)

Gerald: Hi, how are you.
Martha: Well, you're late as usual.
Gerald: eheh eheh eheh eheh
Lee: What's the matter, couldn't you get your car started?
Gerald: hehe That's right. I had to get it pushed, eheh eheh

Gerald's laughter in line 3 defines the criticism as teasing. We get an impression here of the recipient's power to negotiate the meaning of a speech activity. Lee ratifies Gerald's definition of the situation through teasing. Drew does not discuss that this is emergent teasing invited by the activities of the recipient.

I see datum 3 as an example of a recipient's reframing of a critique. Martha's remark is quite serious. But Gerald refuses to offer a serious reception of her complaint (late as usual). The occasion of the teasing is a critical incident here. As Drew claims, there is an evident contrast here between the new car and Lee's comment that he could not get it started. The critical component of datum 3 is more evident than in datum 2.

Some teasing episodes are totally fictional. Schmitt (1992) describes a group that meets everyday at a newsstand to chat and have a drink. This group likes to tease an older customer (Müller) for coming just to see Iris, a 22-year old student. This teasing is a provocation without any underlying real event or critical attitude. The group likes to see Müller's reactions. In a playful way, the group invents special situative identities for the steady customers. The owner of the newsstand, Gerhard, for example, pretends to unmask Müller as a secret

admirer of Iris. Müller is spoken about in the third person, which is typical of teasing activities. Müller often gets into the act, and Iris likewise reacts with laughter (1992: 92ff.).

The teasing episodes take place in front of a public. Often they thematize aspects of social relations. Customer Müller counters the newsstand's owner's teasing by pointing out that Gerhard's shoes could use polishing. Although the teasing is carried out in a playful mode, relevant cultural values are at stake, such as age differences in love affairs or standards of cleanliness.

Already, we have seen three moments of variation in teasing:

- Playful provocation based on behavioral differences within a social group
- Teasing as a redefinition of criticism
- Fictional teasing

Some anthropological linguists have analyzed the teasing of children, which shows further variants of that genre.

Eisenberg (1986) discusses how two Mexican families in California manipulate their children by teasing them. It is important that the children learn not to believe what is being said. Very often an adult says something that is highly threatening to the child, like: "We are going to throw Marissa into the garbage can!" This is said with a lot of laughter and a marked sing song intonation. Smiling also contextualizes a humorous keying. Very often emotive threats form the kernel of the provocation. For example, a mother might say that everyone is going to visit grandfather, but Nancy will have to stay home. After Nancy gets excited, it is made clear that Nancy will of course accompany the others. In teasing, children are first threatened, but then the threat is taken back completely, and the adults thus create a possibility to communicate closeness, security and love. The teasing in this setting is used as the first part of a ritual with two parts. The second is the celebration of love, togetherness, and solidarity within the family.

Again, it becomes evident that the genre is used in various contexts for various purposes. Sexual and romantic teasing among youngsters would reveal additional aspects (Eder 1993, Lampert/Ervin-Tripp 2006). Among themselves, adults do not close a teasing sequence by demonstrating their principal social conjunction. They often develop a new teasing topic from a previous one (as we saw in datum 3). A teasing topic can be transformed into a running gag as is the case with Müller and Iris at the newsstand.

4. Humorous Stories about Problems

The dialectic of genre knowledge and creative authoring can also be seen in narratives, for example, when comparing talk about problems with humorous talk about problems. Humorous stories about problems deviate significantly in production and reception from serious stories about problems.

Jefferson (1984) has dealt with trouble telling in conversations and shown that in this context laughter produced by the speaker does not necessarily demand

that listeners also laugh. She discusses episodes in which speakers laugh while talking about difficult problems, e.g.:

Datum 4 (from Jefferson 1984)

(1)[Frankel:TC:1:4:SO]

G: You don't want to go through all the hassle?
S: 'hhh I don't know Geri,
(.)
S: I've stopped crying uhheh-heh-heh-heh-heh.
G: Why were you crying?

Person S laughs after saying that she has stopped crying. Person G (Geri) does not join in. While laughter on the side of recipients is the normal response to the speaker's initial laughter and the normal case in daily discourse, the listeners here display "trouble-receptiveness" (1984: 348). Precisely by not laughing they indicate that they take the problem seriously.

Jefferson writes that initial laughter in the context of problem presentations shows that the narrator displays resistance to the problem; she wants to take the problem lightly. But the hearer may not necessarily share this attitude. The hearer indicates "trouble sensitivity" if s/he tends to react to the problem content by posing questions about it or making serious comments on it. In connection with problem presentations, there is a need for especially strong contextualizations of humor intended to evoke laughter from the hearers.

Jefferson's examples suggest that the trouble teller herself laughs relatively late in the problem presentation; in her data the first laughter particles usually occur in the closing phase of the topic. The positioning of laugh particles thus contributes significantly to the social meaning of the utterances. It makes a difference in what phase of presenting a problem the tellers laugh. If the problematic aspects are already introduced with laughter, the humorous potential of the topic takes the upper hand. Recipients expect something funny to follow.

In the following we focus on strategies of contextualizing harmlessness and humor in regard to the presented problem.

In the next datum, Anni jokes about losing her student status at the university. From the very start, the contextualization of humor prevents a possible "trouble sensitive" reception.

17 A: to my knowledge that came from art history.
18 K: professor sauer got this regrettable campaign rolling.
19 hypocritically he wanted to find out
20 what's wrong with these characters, he?

The group discusses the topic of who has studied what and when. and Anni says that she has to withdraw from the university in her thirty-ninth semester. Anni presents this information as incredible (*imagine*). Possible embarrassment is thereby avoided from the start. Maria's reception in line 4 indicates simultaneous astonishment and amusement. Ulf has also read that in Berlin measures are being taken against students whose progress is too slow (*Bummelanten slowpokes*), a category in which Anni is now indirectly placed. Ulf does not show any problem sensitivity, like the hearers in Jefferson's analyses, but rather reinforces the problem with negative attributions. The laugh particles (bummeln (h) Anten/ slow (h) pokes) function in his comment like quotation marks. Anni does not resist the attribution of being an overly slow student, but rather confirms Ulf's claims. The students forced to leave the university, Anni further states, are ones studying art history. Ulf can also report that one student was discovered to be in his fifty-ninth semester. Anni immediately competes with him: *he has more than i* (12). Ulf laughs. In line 14 she laughs as she announces her own ambitions

study goals. Ulf laughs with her. Katharina asks seriously, and Anni explains that a professor had hypocritically tried to find out what was wrong with these *characters*. Anni adopts proforma the professor's perspective. But since he had already been presented as hypocritical, it is made clear that the professor was not interested in finding out the reasons, but only in ridding the university of dawdlers. Anni ironically plays with thought patterns that are indirectly attributed to the professor (Kotthoff 1998).

Her announcement that she has been forced to end her university studies in her thirty-ninth semester seems anything but contrite. Nor does she present having been enrolled for so long as a personal inadequacy, but rather as a sort of game: the longer the better. Katharina's question is not understood as a question of how the overly long enrollment could have happened, but rather of how the termination could have happened. In her presentation, Anni turns the tables on the usual societal evaluations. The professor is a negative sort of person: he has spoilt her fun. She is in one sense a loser – but in a game whose norms she rejects anyway. She invites her hearers to laugh with her over the incongruity of the norms. Here a representative of the institution has indeed won, but at least she has had her fun.

In order to accept the casualness of Anni's representation of her withdrawal (Exmatrikulation), however, background knowledge is helpful. Anni has been professionally active as a sinologist for some time and was enrolled as a student only secondarily, in order to supplement her knowledge of Chinese art history. If she were actually unable to cope with her studies, the presentation and reception would probably have been different.

The listeners' reception here again shows that they share Anni's distanced and amused perspective on losing one's student status. Ulf names a negative attribution (*Bummelanten/slowpokes*) as a quotation, which Anni emphatically confirms (9). If Anni had presented her termination as awkward, it would have been tasteless to stress the awkwardness by negative attribution. But Ulf can feel sure that Anni will recognize the quotation character, and thus he indicates that he shares her amused perspective on what has happened. Narratives at the teller's own expense can encourage a sharing of perspectives.

It is important to bear in mind that some stories might be told from different perspectives, tailoring them as much as necessary to fit the current context (Norrick 2000). In a different setting, Anni might very well describe the same event as really creating a problem for her.

5. Joint Fantasizing

Characteristic of this genre is the emergent production of a shared fantasy, often with several conversational participants making short contributions which create coherent scenes through the incremental structuring and augmentation of unreality. The genre shows how interlocutors put each other on inferential tracks and how these tracks can be processed, drawing on the relevant contextual knowledge, so that the humor can be immediately "topped" (to ...

ethnographical term). It shows how several persons closely oriented to each other select formulations which produce a coherent fiction, until the created scene is conversationally phased out again. In this case a scene is an imagined situation, in the sense of Karl Bühler's phantasm, which lies outside the ongoing conversational situation (Bange 1986, Ehmer 2004).

The conversation takes place among thirty-year-old Viennese in a bar in Vienna. Most have academic degrees.

Before the transcript starts, the group has already been discussing a certain Hermes Phettberg. At the time when the recordings were made (1995), Phettberg was a very popular television moderator in Austria and Germany. He wrote a column in a well-known cultural magazine in Vienna (*Falter*), in which he aired his views on life as such, and he had a late-night TV talk show called "Nette Leit Show", on which he interviewed celebrities. The title includes a pun – Leit could suggest either Leute (people) or Lite (light). Thus it could either mean "nice people show" or "nice light show." His professional name is also a pun: it literally means "mountain of fat" (German: "Fettberg").

His popularity was partly based on his unusually corpulent figure, especially for a media personality; he is also a confessing homosexual masochist. With his open way of talking about intimate subjects and his critical attitude toward the Catholic Church, which is quite powerful in Austria, he appealed to an intellectual public.

The group jointly imagines how Phettberg, the anti-type, could be presented as a typical celebrity by the yellow press. The group not only cooperates in creating the content of the fantasy but also in the style of speaking.

32 L: hahaha yucky.
33 C: that's a lifetime task.

Before the transcript begins, someone had commented that Hermes Phettberg would not reach the age of seventy, since he was much too fat. Conrad agrees in

line 1/2 and notes twice that no one knows how much Phettberg weighs. Renate offers a concrete guess with a slight question intonation. Peter in line 4 offers an even higher estimate. So far the talk is serious. In line 6 Conrad makes a statement about himself, which demands extra processing effort to fit it into the topical context. The last word contains a laughter particle. Lilo and some others respond with laughter (lines 7, 8), which suggests that they understood Conrad's statement to be funny. Coherence seems to be formed. Conrad refers to a youth magazine, *Bravo*, which publishes so-called *Steckbriefe* (celebrity trading cards) containing all sorts of information about film, pop and rock stars. Here we have an unusual combination of elements from the life world.[3] Phettberg does not at all fit into the trendy youth magazine *Bravo*, which does not cover intellectual and unconventional personalities. Peter has not understood something (maybe he could not see the comical dimension). Hugo's question in line 10 is directed at Peter, who in line 4 made a claim about Phettberg's weight. Peter in the following softens his assertion a bit. In line 13, Conrad agrees with him.

In the lexeme *Steckbriefsammlung* (celebrity trading cards), we find the first laugh particles of this episode, which elicit responsive laughter; thereby ratifying a humorous perspective on the conversational topic *Phettberg* in connection with *Bravo*. The utterance in line 6 does not immediately make sense and violates the maxims of quality and quantity, because nothing is ever written about Phettberg in *Bravo*. According to Sperber and Wilson (1985), the listeners have to seek a context for the information which requires as little processing effort as possible, thus preferably the one already opened, to which the new information can relate. The widely differing topics of Phettberg and *Bravo* can relevantly be connected if one takes *Bravo* as a context in which celebrity trading cards about Hermes Phettberg could be created. This presupposes that Phettberg could be presented as a teenage idol. In reality, this is so far from the truth that it is amusing. It works as an invitation to enter the realm of fiction. The normative world of stars and starlets is connected with the anti-normative world of Hermes Phettberg. Line 6 bi-sociates two contrastive frames, as Arthur Koestler described in his book on "acts of creation" (1964). The inferencing does not explode maximally in many directions, but in a coordinated manner elaborates the context that was opened up by Conrad.

In line 14, Peter continues to fantasize about the topical area of *Bravo*. The phrase *that would be something* introduces something that is marked as unusual. The line is syntactically and prosodically subdivided into three phrase units, which all have the same rhythm and intonation. The accent is on the first syllable in each phrase; the intonation falls at the end of each. Rhythm and intonation can contextualize comicality, if semantics support this. In this way a humorous keying is reinforced. The youth magazine is known for its celebrity cutouts; one can gradually fit together small pieces to create life-sized celebrity portraits. The pieces can be clipped out of *Bravo* one after the other like puzzle pieces. This sort of world knowledge has to be activated. Drawn out laughter in line 16 indicates that something funny is being processed.

Bravo is introduced in headline style. Formulation (lines 14ff.) certainly is among the procedures which key humor. Metonymically, elements of *Bravo*

(a journal has headlines) are used in order to not only denote this magazine, but simultaneously to stylistically evoke it. The syntactic and prosodic forms recreate the semantic content iconically. This "likeness on several levels" (Jakobson 1960: 369) characterizes aestheticized speech. Conversational humor here enters into the realm of verbal art (Knoblauch/Kotthoff 2002).

Furthermore, the continuation of a very elliptical speech style is striking. Ellipses usually contain the *rheme*, the new information. In line 18, for example, the proposal to present Phettberg in *Playgirl*, as well as the evaluation *no viel besser/ much better* are like small spotlights on an already set stage; lines 19 and 21 also cohere in form and content to lines 14f.

The presented fictionalization is absurd, since Phettberg absolutely does not come into question as a teenage idol, suitable to be presented in *Bravo*. In line 16 the women present laugh. Lilo comments on the fantasy that in the case of Phettberg it would take an especially long time to collect all the pieces (a Jahr/one year); she thereby alludes to his enormous girth. Allusions further aestheticize the discourse. In conversational humor the recipients often actively top the ongoing humor (Norrick 1993). The humorous fantasy is displayed as an ongoing achievement. Hugo in line 18 intensifies the fiction about Phettberg in *Bravo*; he suggests *Playgirl*, a magazine known for erotic photos of nude or scantly clad males. Previously created images are then detailed. Peter would like to see him presented a year long in this magazine as well. Several persons laugh (20). In line 21 Lilo stretches the life-sized figure to one twenty-five meters high and likewise laughs.

Starting in line 22, Peter takes up another aspect of Phettberg's girth and erotic self-display. His belly hangs down, serving as though it were a sort of fig leaf. Conrad and Hugo affirm this impression. Phettberg and youth age limit form a new combination, which is also developed by other interlocutors. Conrad in line 30 alludes to a game for children. The game is called *Malen nach Zahlen/ painting by numbers*. Peter then continues with a further fictionalization from children's games (*the Phettberg Puzzle*). Lines 30 and 31 again use a headline style. The games are presented like an ad. Lilo laughs and inserts an interjection of dismay. Conrad, by pointing out that one thereby has a *Lebensaufgabe/lifetime task*, again alludes to Phettberg's enormous girth.

All the fictionalizations draw on cultural knowledge of entertainment media and thereby make coherence easy. The topic development goes from Phettberg in *Bravo*, Phettberg in *Playgirl*, to Phettberg in children's puzzle games. The coordinated imaginings have a meta-message: Hermes Phettberg, who markets himself as nonconformist, is mercilessly marketed in the fantasies of the young Viennese in a conforming way. They take his body as a starting point for various humorous quips. The interlocutors do something that Phettberg himself very often does but they do it so-to-speak in a diametrically opposite manner. In numerous interviews, Phettberg himself has referred repeatedly to his unusual body, body feeling and sexuality. He acquired his popularity to a considerable degree due to the fact that he staged himself as an appealing anti-type. He contradicts several norms of the boulevard press. He notoriously presented himself in interviews as fat, unkempt, homosexual and masochistic – thereby trying to shock and simultaneously win over the public, which amused at least part of the

intellectual public in Austria. Consequently, it is amusing to see him being integrated into the yellow press world as though he were a quite typical TV celebrity. Thereby the young Viennese also implicitly communicate that they find Phettberg's self-presentation contradictory. Thus, distance can be simultaneously displayed toward both Phettberg and the yellow press. The participants show their knowledge of media contents, and as well their critical attitude to them, without explicitly evaluating them. The evaluation is not made explicit, but is jointly performed. In their imaginings, the norms of the magazine world are violated, and at the same time the social norms of self-presentation are negotiated, using Phettberg as an example.

With a high level of personal participation, thirteen different turns come about which sketch out a fiction and amplify the absurdity of its elements (lines 6, 14, 15, 17, 18, 19, 21, 23, 25, 27, 30, 31, 33). In this genre the most important thing appears to consist in somehow continuing to spin out the topic within theater frame. This means that a performative special frame was created. A different example of this type is discussed in Kotthoff (2005).

In joint fantasizing, condensed information is quickly added on to produce the most absurd fictive scene; the short turns iconize the tempo of building up the structure. The particular artistry of participation in the formation of such fantasies consists in doing this rapidly (Ehmer 2004). The taking over of constructions is functional in the sense of "on-line" syntactic phenomena (Auer 2005).

6. Playing with Genre Norms

6. 1. Humorous Nutritional Counseling

Below, I present another transcript from a dinner shared by friends (30 to 45 years old) in a German academic milieu. Vegetables are being passed around. Anni responds to them in an unusual way; she claims that she needs to eat a few carrots just for the sake of vitamins, and this time with butter. Then she advises the others with exaggerated emphasis that raw fruits and vegetables ought to be eaten with butter. Her explanations become still more amusing when she reveals the source of her nutritional expertise: from the *Bäckerblume* ('Baker's Flower', a free magazine available in many German bakeries, offering among other things nutritional advice). An amusing episode follows. I will explain the sequence conversation analytically and pragmatically.

Datum 6

(Everyone (a), Anni (A), Bernada (B), David (D), Johannes (J), Katharina (K), Maria (M), several (m), Ulf (U))

1 B: noch jemand ↑rÜebli::? ((bietet diese an))
2 A: ICH muss noch welche Essen.
3 ich hab zu wenig vitamin A: und bE:.
4 weil, du musst se ja mit BUTter essen.
5 sonst is das vitamin A hehe ni (h) cht w (h) Irksa (h) m.
6 B: ja also

7 ((Zwischensequenz, A nimmt sich Butter))
8 A: jetzt tu maln bisschen BUTter drAU (h) f. hehe
9 U: des heißt, man muss eigentlich e:h [die dann auch
10 A: [na ja, ohne **BUTTER**
11 D: UNbedingt. rohkost wIrkt nich ohne. (? ?)
12 B: wUsst ich gar nich.
13 A: ja::::hehe
14 M: ich AUch net. Ich hab [rOhkost IMmer SO gegessen.
15 A: [genau des NÜTZT nIx.
16 brauchst ↑BUTter mit dabEI.
17 ↑BUTTER.
18 D: [hehehe
18 [deshalb war das schOn ernährungs [poli (h) tisch WICHtig.
19 hehe was wi (h) r vorhIn gesagt ham.
20 D: [hehehehehehe [hehehehe
21 a: [hehehehehehe
22 hehehehehehehe
23 M: °wohEr WEISCHT du des?°
24 A: sowas WEIß ich. weil Ich die ↑BÄCKerblume lese.
25 m: hahahahahahahahahahahaha [hahahahaha
26 K: [ICH wEIß es auch **daher.**
27 B: aber bei Unserm bäcker ↑GIBTS jetzt
<
28 [keine bäckerblume me:::hr.
((kindlich)) >
29 A: [ja genAU. des wird jetzt Alles EINgespart.
30 das musst Ich jetzt AUCH schon mal feststellen.
31 B: sonst würd ich sie mir AUCH noch hOlen. [(? ?)
32 K: [ich hab
33 [die früher AUCH immer gelEsen.
34 A: [die BÄCKerblume und die METZgerzeitung.
35 ich war ganz verzwEI (h) felt als
36 [ich merkte, hehe die BÄCKerblume kOmmt nich mehr.
37 B: [kann sein dass es die bei Uns schon LANge
38 nich mehr gab.
39 U: da hab ich ja noch gAr keinen konTAKT aufgenommen.
40 [in meiner journalistischen lAUfbahn.
41 ?: [hehehehehehehehe
42 U: wo ich eigentlich [versUch JEdes blatt irgendwie EInzubeziehen
43 M: [zur bÄckerblume?

Translation:

1 B: anyone else rÜebli:::? (Swiss German for carrot)
2 A: I must eat some more.
3 I have too little vitamin A: and bE:.
4 because, you must eat them with butter.
5 otherwise the vitamin A will no (h) t be (h) effe (h) ct (h) ive.
6 B: well
7 ((incomprehensible side sequence, A helps herself to the butter))
8 A: now put a little butter on t (h) em. hehe
9 U: that means, one should practically e.h [then also
10 A: [well, with ... BUTTER

11 D: Absolutely. raw fruits and vegetables have no effect without.
12 B: I really didn't know that.
13 A: we::::ll hehe
14 M: I didn't either. I have always eaten [raw fruits and vegetables plAIn.
15 A: [that's exactly what doesn't hElp.
16 you need ↑bUtter with them.
17 BUTTER. therefore it was already
18 D: hehe
19 nutritional [poli (h) tically important. hehe what w (h) e said before.
20 D: [hehehehehehehehehehehehe [hehehehehehehehehe
21 a: [hehehehehehehehehe
22 hehehehehehehehehehehe
23 M: °where did you find that out?°
24 A: I knOw that sort of thing. because I read the ↑Baker's Flower.
25 m: hahahahahahahahahaha [hahahahahaha
26 K: [I also found out about it there.
27 B: but at our bakery there ↑ is now
> ((childish))
28 [no more Baker's Flower.
((childish)) <
29 A: [yes *exactly*. everything is being sAved on now.
30 I Also could not help but notice that.
31 B: otherwise I would still pick it up. [(? ?)
32 K: [I
33 [also always used to read it.
34 A: [the ↑BAker's Flower and the BUtcher's Journal.
35 I was really desp (he) erate when
36 [I noticed that BAker's Flower doesn't come anymore.
37 B: [could be that it hasn't been available here anymore for a lOng
38 time already.
39 U: I haven't contacted them at all.
40 [in my journalistic career.
41 m: [hehehehehehehehehehe
42 U: whereas I normally try [to include every publication somehow
43 M: [even Baker's Flower?

What is going on here? Bernada, who is from Berlin, asks the group whether anyone else would like *Rüebli* (*carrots*). This term, spoken in Swiss German dialect (Standard German would be 'Karotten' or 'Möhren') in a diminutive form, represents a code switch and thereby draws attention to the expression as such. The group is meeting in a Swiss town on the German border. Talking like the Swiss (German dialects are a popular source of German humor) affects the creation of a play layer of action in Clark's sense (1996: 357f.): The Berliner even prolongs the *i* of the Swiss diminutive *li* exaggeratedly, thereby reinforcing the playful effect.[4] Marked registers and "borrowed" varieties are effective performative strategies (Coupland 2001). Marked formulations draw attention to themselves and highlight performance.

Anni pretends in line 2ff. that for the sake of vitamins she still *has to eat some more*. Laughter particles in line 5 indicate that these reasons are not to be taken

overly seriously. The scene switches back and forth between joking and seriousness. But no punch line humor moves the text from the realm of bona-fide into that of non-bona-fide (as it is sometimes discussed in humor theory, see Attardo 1994). Anni actually does eat some carrots (*Rüebli*) with butter and offers a nutritional theory that the others respond to seriously (9, 12, 14, 23). Her acceptance of the carrots is not the usual way of accepting offered food, but is easy to understand. Transcripts from conversations often show that utterances contain laughter particles in places where nothing really funny is being said. Above all Jefferson (1984, 1985) corrected the dominant view in humor research that laughter follows from a humorous stimulus. Laughter itself often functions as a stimulus, as a contextualization cue, as an extra element that lends an utterance additional meaning in the sense of: "Take it easy," or "What I am saying is a bit funny." In line 5 the laughter contextualizes comicality (see also Glenn 2003).

In line 8 Anni tells the others laughingly that they should also put butter on their carrots. What inferences could be made from her laughing speech and nutritional counseling? Maybe she can thereby avoid the danger of being considered a glutton. Anni stylizes herself in a transparent way as someone who always acts sensibly. This perspective remains totally implicit and vague. As we all know, this is not unusual in everyday talk. We often invite listeners to make a little extra effort to construct additional meaning. All contextualization cues create, as Gumperz (1982) and Auer (1986) have pointed out, information on how to interpret what is said. Since these cues are analogous, they make sense only in combination with what is said.

David seriously confirms Anni's theory in line 11. He must have stayed in the realm of what Attardo (1994) calls the bona-fide. We see that it is not problematic to react bona-fide to a non-bona-fide utterance. This does not mean that the discourse is shifted back to the bona-fide. It shows instead that two levels are activated simultaneously.

Bernada admits that she does not know how one ought to eat raw fruits and vegetables. This sequence is also spoken seriously. Anni then reacts with a drawn-out *ja* (well), in which laughter particles are integrated (line 13): This *well*, spoken with a gradually falling contour, has a playful sense. We could translate it as, 'There, now you see how much/know'. Anni presents herself as an expert on nutrition and simultaneously comicalizes this role with the laugh particle and other strategies. Maria reacts seriously to the information (14). Though they switch back and forth between both keys, this does not seem to present a problem. The playful keying does not necessarily suspend any of serious meanings that are created. What Anni tells her friends is true, and her suggestions are meant in this sense. But there is an additional layer of meaning. She could of course have pointed out seriously that vitamins in raw fruits and vegetables are more easily digested if they are eaten with some sort of fat, but serious nutritional counseling is not very entertaining. Anni communicates her advice in a double framing: she shows her knowledge and at the same time invites comical perspectives.

In lines 16 and 17, Anni again gives advice in a very exaggerated manner. Above all the word *Butter*, repeated twice with a high onset and spoken loudly, has a comic effect. David responds with laughter.

But only with the term "nutritional politically" (*ernährungspolitisch*) do most of the hearers begin to laugh. This academic-sounding term is too elevated for her modest suggestions. Anni alludes to something they *have said before* (*vorhin gesagt ham*). Prior to the episode recounted in the transcript, there was another in which the participants developed the absurd theory that if something tastes good then it must also be good in a nutritional sense. The extended laughter in lines 19 and 20 also has to do with remembering this absurd theory. The participants are also invited to infer that Anni is supporting her current culinary tastes with theories whose value depends arbitrarily on whether they fit her current tastes or not. This would be one possible way to construct relevance for her talk. But why do people present arbitrary theories and simultaneously pull the rug out from under them? Sudden shifts into a quasi-scientific register, which are contextually inappropriate, come up repeatedly with these intellectuals. They play with academic terminology, theatricalize it as though quoting scientific texts, and thereby frame it as something unusual.

Our everyday conversations are full of citation-like speech that is not introduced as such (Kotthoff 1998, 2002). We can use this mode of speech in order to blend in other persons' ways of speaking. Chiefly shared knowledge is what guarantees that such utterances are not understood on a direct level, but rather as playing with typical utterances in typical genres in a sort of theater frame – be it academic or parental or whatever – that people can laugh about. Phenomena like prosody, gestures and mimicry, seen by Bateson (1953, 1954) as meta-messages indicating, "this is play," perform a basic function in the creation of humor. Goffman (1981) calls these "footing," and Clark (1996, 2004) calls them "pretense" and "layering." The speaker downplays her responsibility for the utterance. This is not to be confused with non-bona-fide speech. Anni really motivates the group to take more butter, but does this in an entertaining manner, contextualized by integrated laugh particles, the manipulation of volume and an exaggerated authoritative intonation, whereby the utterance is made recognizable as a citation. We seem to have no problems with vague communication, as many pragmaticists since Grice have recognized. Nevertheless, Anni's humorous way of speaking can only vaguely be assigned an intention. Humorous intentions can seldom be pinned down exactly. Apparently, such vagueness can be handled without problems in communication.

Now, up to line 18 Anni is the only one who laughs. Bernada, David, Maria and Ulf react seriously, which is not a problem. There is no punch line that must be ratified by laughter. One can very well respond to the serious level of the advice. Anni's comments require no specific sort of response.

Maria asks quietly how Anni "knows that" (23). Anni constructs her answer in a suspense-creating way. The first part of the answer can be understood as in itself bragging (24); it is syntactically independent. A long, immediate laugh follows the information contained in the second statement, *Baker's Flower* (spoken with high onset). But what is funny about *Baker's Flower*?

Baker's Flower (*Bäckerblume* – no pun between 'flower' and 'flour' is intended, since the corresponding German words are 'Mehl' and 'Blume') is a free customer magazine available in many German bakeries. Anni focuses on this magazine

as though it were something special. Cultural knowledge of the mundane, everyday kind comes into play here, since *Baker's Flower* is well known to be a very modest publication, both topically and intellectually. Anni's almost proud reference to *Baker's Flower* as the chief source of her nutritional expertise is humorous to the extent that the magazine clearly does not meet our expectations about what a university graduate normally reads. This is one of the tacit assumptions that Anni rejects when she violates such milieu-specific cultural expectations of normal behavior. Cultural knowledge has to be shared if we are to grasp this sort of humor.

Katharina announces that she has also acquired similar knowledge from *Baker's Flower* (26). Bernada's comment that her baker no longer carries this magazine is given a complaining and childishly whining undertone through the extended *o* in *more* (*German: e in mehr*). She thereby joins in the humorous play of exaggerating the prestige of this lowbrow magazine. Anni confirms the negative trend (28) in bakeries. Bernada also confesses to reading *Baker's Flower* (32), and Anni extends the report of her reading interests to the *Butcher's Journal* (34). A confessional discourse arises, keyed as humorous, and several participants join in. They perform their extreme disappointment at the disappearance of this valued source of information. The staging of humor focused on *Baker's Flower* is jointly produced. In the emergent discourse, the scope of the humor gradually broadens.

The introduction in line 35 of the sense of feeling 'desperate' as a reaction to the disappearance of the magazine points again to exaggeration as a keying procedure. *Baker's Flower* is humorously transformed into an intellectually significant journal. One can take part in this humor by pretending to be quite serious on the explicit level, as Ulf does in the following (39). Ulf is a journalist with high standards and now pretends that he might want to publish in *Baker's Flower* and that that this would help to make up for a personal journalistic deficiency. Several of the friends laugh. Through his participation in exaggerating the status of a trivial popular magazine, Ulf also shows that he is ratifying the humor of the preceding discourse. His remark is integrated into the already constituted humorous discourse and expands on it. Ulf speaks in a serious tone, although the group knows that he normally publishes in much more prestigious journals.

In the emergent discourse, the humor is developed step by step. A level of bona-fide is nevertheless preserved. Again and again we find exaggeration used as a humor strategy.

The humorous counseling as well as the humorous play with the upgrading of modest journals allow the group, consisting of academics, to distance themselves from the norms of the academic world. Speakers index informality by maximizing an intertextual gap from serious counterparts of genres such as counseling or talk about journals.

6. 2. Humorous Gossip

Bergmann (1987/1993) analyzed gossip as a reconstructive, collaborative genre of moral communication. In gossip, "discreet indiscretion" is

gossip has a bad reputation, it is widely indulged in and even fulfills important functions for group formation. The producer of the gossip and the addressees talk about an absent object. The information is delivered as delicate.

In the next datum, the interlocutors play with the genre of gossip.

Datum 7 (Conversation 14 Episode 10)

(David (D), Ernst (E), Inge (I), Johannes (J), Katharina (K), Maria (M), Rudolph (R))

1	K:	Irgendwie hast du=s AUCH nicht mEhr so mit frau donner. ne?
2	R:	[m:::::::::
3	K:	[frÜher war das mal, da gab=s doch mal mEhr kontakt.
4	R:	sie hat en FREUND jetzt wieder,
5	D:	m:::: wie lang gOht des schon?
6	R:	he?
7	D:	wie lang gOht des schon.
8	R:	ja seit SECHS wOchen ungefähr.
9		und sEIther ist sie wieder UMgänglicher.
10	M:	ach sO?
11	I:	was ISCH des für EIner?
12	R:	oh jE. jetzt eh eh RED ich natürlich wieder ausm
13		nÄhkästchen.
14	E:	dEs erfahr ich sowieSO.
15	R:	he?
16	D:	[(? ?)
17	K:	[bei UNS ist das gUt [aufgehoben.
18	M:	[hehe [hehehehehe
19	I:	[hehehehehe
20	R:	es ist der VAter ihres sOhnes.
21	a:	NA::::I:::N
22	I:	po:::
22	K:	erzÄ::h::1.
23	D:	WER das is wolln wa ja gar nicht wIssen, rudolph.
24		das dArf doch KEIner wissen.
25	M:	[(? ?)
26	R:	[also wenn ihr jetzt nÄchstens ins TREppenhaus geht,
27		und die lllo kommt, sagst du, wir wissen NICHT,
28		dass dun verhÄltnis mit dem vAter [deines SOHnes hast.
29	I:	[heheheheh

7 D: how long has that been going on already?
8 R: well for about six weeks.
9 and since then she is more approachable again.
10 M: oh really?
11 I: what sort of person is he?
12 R: oh well.
13 now uh uh i am naturally giving away secrets.
14 E: i will find that out anyway.
15 R: he?
16 D: [(? ?)
17 K: [it is safe with us.
18 M: [hehe [hehehehehe
19 I: [hehehehehehe
20 R: it is her son's father.
21 a: NO::::::::
22 I: po:::
22 K: te:::ll us
23 D: who that is we definitely do not want to know, rudolph
24 no one is supposed to know.
25 M: [(? ?)
26 R: [so if you step into the stairwell sometime soon,
27 and lilo comes, you will say, we do not know,
28 that you are having a relationship with
the father [of your son.
29 I: [hehehehehehehehehehehehehehe
30 D: nor do we know it from rudolph.
31 a: hahahahahahahahahahahaha
32 R: we definitely did not learn about it last monday.
33 a: hahahahahahahahaha [haha
34 K: [rudolph, do you like the sparkling wine...

Katharina asks Rudolph about his current relationship with *Frau Donner*, who works as a psychologist in the neighborhood and is usually addressed informally by everyone as Lilo. The formal reference to *Frau Donner* instead of *Lilo* indexes distance from the lady in question. This is the first step to establishing a possible object of gossip. Rudolph's drawn-out interjection in line 2 is hard to interpret, but somehow signals the delicacy of the subject. He answers in line 4 that *Frau Donner* apparently has a boyfriend again. A wonderful topic of gossip is thus established. David reacts with the same drawn out interjection *m*::: (thereby underlining the delicacy) and with a question in Alemannic (a south-German dialect), which he otherwise never speaks (*wie lang goht des schon*? How long has that been going on already?), and which thereby becomes an indicator of comicalization, a stage separator in Haiman's sense (1990). Now a gossipy conversation is imitated. In line 7 David repeats the question in Alemannic in response to Rudolph's questioning signal. The stylization of the question in Alemannic dialect gives his words a quotation-like character.[5] Rudolph replies normally and comments on *Frau Donner's* relationship. Maria and Inge would like to know more (10, 11). Rudolph verbalizes the difficulties he is having in his role as a gossip informant (*jetzt eh eh red ich natürlich*

uh I am naturally giving away secrets.) The group seems to be fully aware that gossip has a bad reputation. Ernst allays his misgivings. He also has other sources. Katharina pretends to be acting therapeutically (17), as though the informant would be relieved if she could share the secret. There is a humorous incongruity in this, because the opposite is obviously the case. Maria and Inge laugh. Rudolph presents the key piece of information in formal syntax (*es ist... it is...*). In line 21 a sort of exclamation goes through the round which is so exaggerated that it reinforces the theater frame of the gossip. Inge inserts an interjection which playfully underlines the outrageousness of the news (*po:::*). Katharina insists that Rudolph tell them about it. Everyone knows about Frau Donner's child and has already on various occasions wondered about the father's identity. Now David turns the tables: He evinces explicit disinterest in exactly what everyone is so anxious to know (23, 24). Starting at line 26, Rudolph stages scenes of meetings with *Lilo Donner.* They imagine saying to her that they don't know any of the things they have just been talking about. Inge laughs (29). David expands on Rudolph's fantasy of the dialogue (30). Everyone laughs. Rudolph speaks even more concretely in line 32. Everyone laughs again. The imagined dialogue with *Frau Donner* is absurd. The joking episode reaches a climax and ends, among other things, with the drinks being refreshed.

In playing with gossip, some gossiping really is going on. In a humorous frame, people can distance themselves from a speech genre with a bad reputation (Bergmann 1987/1994) and simultaneously still carry on the activity. The main piece of information, that *Frau Donner* is having a relationship with the father of her child, whose identity they have kept secret, is in any case passed on.

The emergent play is so successful because everybody knows not only the genre, but also the ideology underlying it. Key information about Frau Donner is being transmitted in a play frame.

7. Final Remarks: Transcending Genre by Relying on Genre Knowledge

In this paper I have considered humorous genres (jokes, teasing, joint fantasizing) and determined that we can find a basic pattern for them. Nevertheless, the realizations of these genres are related only by a sort of family resemblance in Wittgenstein's sense. Genre knowledge is, however, employed precisely when the speaker goes outside the genre and when the pattern is violated in such a way that further information is located precisely in the violation.

Then I considered humorous realizations of genres that modify a serious genre (humorous stories about problems, humorous counseling, humorous gossiping). Here the framing is done from the start in such a way that a serious mode of understanding is undermined. The humorous realization is co-constructed. The co-construction is of course emergent, but nevertheless (or precisely for this reason) it relies on genre knowledge.

Along with Clark (1996), we can say that in humorous realizations of genres a second meta-communicative layer is made relevant. A level of commentary on the said arises by means of which speakers distance themselves from their messages. In playing with gossip, the gossip is kept as an intertext. The participants also communicate knowledge of the bad reputation of the genre. They take the offensive toward the ambivalence attached to the genre in everyday life (on the one side a bad reputation – on the other pleasure in the exchange of discrete indiscretions). Other intertexts are also included in the game, e.g. therapeutic discourse. People act as though it is more in the interest of the teller to tell something, than in the interest of satisfying their own curiosity.

We viewed genres from a performance perspective and witnessed how an actual co-construction of ongoing discourse indexes social relationships, moral stances and a certain context. With Briggs and Bauman (1992) we can see datum 5, 6 and 7 as maximizing an intertextual gap. Creative improvisation blurs any sharp distinctions among genres. Although the intertextual gap is smaller in realizing jokes, teasings or joint fantasies also these genres of humor demand high performance standards – rather monological in the case of jokes and rather dialogical in the case of teasing and joint fantasies.

Transcription conventions (based on GAT, Selting et al. 1998)

(-)	one hyphen indicates a short pause
(- -)	two hyphens indicate a longer pause (less than half a second)
(0.5)	pause of half a second; long pauses are counted in half seconds
(? what?)	indicates uncertain transcription
(? ?)	indicates an incomprehensible utterance
..[..	
..[.... .	indicates overlap or interruption
=	latching of an utterance of one person; no interruption
hahaha	laughter
hehehe	slight laughter
goo(h)d	integrated laughter
(h)	audible exhalation
(')h)	audible inhalation
,	slightly rising intonation
?	rising intonation
.	falling intonation
.	ongoing intonation
:	indicates elongated sound
°blabla°	lower amplitude and pitch
COME ON	emphatic stress (pitch and volume shift)
(O)me ON	primary and secondary accent syllable within a sentence (only in the original language of the transcript)
'	high onset of pitch
'	pitch goes down
<↓blabla>	low pitch register within the brackets
<smiling)>	comments
((sits down))	nonverbal actions or comments

Author's Note

This article will also appear in the journal *Pragmatics* in 2007. I wish to say thanks to *Pragmatics*.

Notes

1. The data stem from various circles of friends who were at the time of the recordings between 30 and 40 years old; most have an academic training background. The data are characterized in Kotthoff 1998.
2. The irony in this scene is also discussed in Kotthoff 2002.
3. Literature theorists such as Iser 1992 see that as a typical procedure to create art. They discuss only written texts such as novels or poetry. Humor shows all features which Iser calls artistic staging.
4. This diminutive is well-known in the German speaking world and is identified by most speakers as typical for Swiss German. See for German dialects Barbour and Stevensen 1999.
5. I discuss the potentials of shifting and crossing dialects as a humor strategy in Kotthoff 2006b.

Against Arbitrariness: The Social Production of the Sign as a Foundational Issue in Critical Discourse Analysis

Gunther Kress

1. Critical Reading

One aspect of critical linguistics (CL) which has attracted the particular attention of some commentators is the status of critical readings. 'What is it', so the challenge is formulated 'that privileges the readings of the critical linguist over those of the ordinary reader?' This is a challenge of a fundamental kind. Why should the readings of one reader have greater legitimacy or privilege than those produced by other readers? Of course, this question has particular topicality in the current, postmodern, period, and in poststructuralist theories, in which the plurality of readings is taken as a given, and the authority of certain readings is challenged, along with a far-reaching challenge to power and its effects. And indeed, as critical discourse analysis (CDA) in its very aims seeks to reveal the structures, locations and effects of power – whether in the operation of discourses of race, or of gender, or of ethnicity; or in the operation of power at micro-levels as in relations across the institutional/individual divide (doctor–patient interactions, for instance); or in the interactions of socially positioned individuals in everyday relations – this challenge is a fundamental one to CDA. There is always the possibility that practitioners of CDA will replicate the operations of power in the readings which they produce.

My suggestion, in response to this challenge, and in its refutation, is that CDA needs to produce a clearly articulated theory of the *reading* of texts as much as a theory of the production of texts, and that such a theory needs, crucially, to be founded on a theory of the social production and reading of signs. As such,

Source: *Discourse & Society* vol. 4, no. 2, 1993, pp. 169–191.

CDA will become, and this too is an essential step, part of that larger enterprise which deals with the production of meaning in any semiotic medium, namely that of social semiotics. That enterprise is one which attempts to account for the making and remaking of meaning in all those semiotic modes which cultures employ, differentially, but as a matter of course. As just one consequence of such an approach language will need to be seen as just one such semiotic mode, and therefore the longstanding theoretical and political buttressing of language as the primary, most significant, medium ('logocentrism') will be challenged. That has far-reaching effects on structurings of power, not least in what present themselves at the moment as unmentioned givens about language and its role in social, cultural and cognitive structurings.

In this paper I (1) outline a theory of the sign as a motivated and conventionalized semiotic entity; (2) focus on an account of the reception/reading of signs in cultural histories, which introduces and deals with the notions of opacity, mystification and ideology; (3) deal with the question of the boundaries of signs, and the interplay of power and the question of boundaries as punctuations of ongoing semiosis; and (4) provide two analyses which demonstrate both the need for and the critical effect and potential of this theorization. That is, my argument will be that this account acts not merely to remind CDA analysts of other modes through which meaning is made, but demands a significant rethinking of practices within CDA.

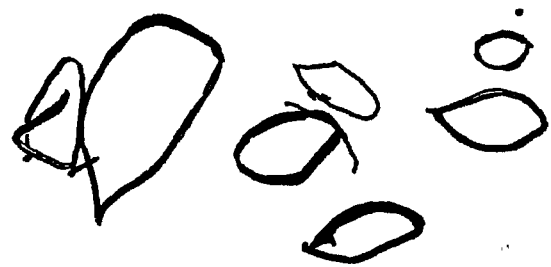
Some of the most crucial assumptions which underpin critiques of critical reading (CR), conducted in CL, or in CDA, are:

(a) unproblematized notions of text, and of the text which is to be read: that is, text is seen as unproblematically established, fixed, bounded;
(b) that reading is treated as a mirror-image of text production, that is, the conditions of the production of the text are regarded as identical with those of the reading of the text, in all essential factors;
(c) that as a corollary of (b) producers of texts and their purposes are treated as identical to those of readers of texts;
(d) that language is an autonomous, self-contained system, discrete in all respects from other semiotic and social systems of practices, whether of representation (as kinds of social action) or of action, so that the meanings of the verbal semiotic seem in no sense to depend on the contributory meaning of any other semiotic; and lastly, and most significantly,
(e) the common sense, including the theoretician's common sense, surrounding the question of the sign, particularly (i) the assumption of the arbitrariness of the relation of the signifier and the signified in the sign – the relation of 'form' and 'content' in common-sense parlance; and (ii) the assumption of the stable nature of the sign.

In my view some or all of these underlie criticisms of the enterprises of CL, CDA, CR; and inevitably underlie and buttress the theoretical edifices of most mainstream versions of linguistics, semantics and, surprisingly, even pragmatics. Any activity which goes beyond assumptions of the naturalness and transparency

of language brings these to the surface. In this sense, then, mainstream linguistic theories and descriptions are founded on these assumptions. For instance, (b) and (c) above together imply either a theory in which power is treated as so significant that readings are enforceable and enforced, or else an asocial theory which treats a communicating group as composed of atomistic individuals of exactly the same (biological, cognitive, cultural, social, etc.) make-up. Such implications are naturalized in most mainstream linguistic theories, and in much semantic and pragmatic work also.

However, even in critical theories of text production and reception these questions are not usually brought into focus or discussed: though it is the case that most practitioners in CDA would regard most of these as relevant points, or questions. The exception to this in CDA is the question of the sign; that theoretical category, either in the traditional Saussurian sense, or in any sense of critique, is absent from discussion. At the same time there is an increasing amount of work which is beginning to engage with the question of the sign, particularly in terms of a critique of the traditional conception of the Saussurian sign (Halliday, 1978, 1985; Hodge and Kress, 1988, 1993; Kress, 1978; Lentriccia, 1980). Nevertheless it is the case that even where the discussion has been broadened, its implications have not been taken up. This means, in any case, that through all of this century linguistics, with some exceptions, has remained as the science of the signifier (to borrow a phrase from Tobin [1990], who himself, however, perpetuates the idea of the sign as an arbitrary construct). To the extent that CDA relies on existing linguistic theories, it is always in danger of importing that discipline's unexamined baggage of common sense.



A social theory of the production of the sign is the essential underpinning not only of critical theories of text production and reception, but also of any plausible theory of language and text. In this paper I articulate aspects of a social theory of the sign in relation to four points: the characteristics of signs; the production/reception of signs; rules determining the boundaries of signs; and the multimodality of all texts as signs. As a part of this argument I attempt to provide refutations of the assumptions outlined earlier.

2. Characteristics of Signs

This drawing was produced by a 3½-year-old child.

The child first drew the four circles in the centre, then added two circles on the left, and finally the one circle in the top right corner. Having drawn it, he said 'This is a car'. What is crucial here is the relation of the signified – a 3½-year-old child's idea of 'car' at this point in time – to the signifier – the seven circles. It illustrates a number of fundamental characteristics of all signs.

This relation, and the resultant sign, encodes, on the one hand, characteristics of the producer of the sign, and, on the other, characteristics of the object to be represented. For the producer of the sign, wheels seems to be the most prominent, the criterial aspect of the car, they become, for him, at that age, the signified. Given this producer's physical size it is plausible to assume that when he looked

'This is a car'

at his parents' car the wheels were the most obvious features, especially as at that time 'his' car used to be parked on a driveway which sloped upward from the front door of the house where he and his family were staying, making the wheels seem even more prominent. At the same time, the sign is also motivated by features of the object to be represented, the object which is the stimulus of the signified for this child sign-producer. That is, the car does have wheels.

Similarly, circles, and the arrangements of the circles, are both an apt signifier for the signified 'wheel'. This sign therefore is not the product of an arbitrary association of a signifier and a signified, either from the point of view of the producer, or from a consideration of characteristics of the object. From the point of view of the producer it represents his particular 'interest' in the object, an interest which is itself a reflection of his place in the world, physically, cognitively, socially, culturally, conceptually. This 'interest' is not fixed but is the expression of a temporary configuration of socially and culturally produced internal representations – a drawing done the next day might have produced a different sign, fixing on, selecting different aspects of the car as criterial. Certainly, drawings of cars done by him now, around the age of five years, reflect different interests, and, above all, reflect the increasing awareness of culturally existent conventions, itself an aspect of 'being in the world' – the way cars are represented in books for children, for instance. It is important to insist that the sign is always motivated from the point of view of the object; that is, that the sign always has referential dimensions, in that it is particular aspects of the object which are affected. These then affect the characteristics both of what may be used by the producer to construct signifieds, and of what can function as apt signifiers.

To give another example, from the verbal semiotic, one which complicates the picture somewhat. The same child, at this age, while climbing a very steep hill, said: 'This is a heavy hill.' As before, aspects of his 'interest' – great expenditure of effort for a small child – and aspects of features of the object to be signified produce a particular signified – perhaps something like: 'This activity takes considerable physical effort' – and this expresses aspects of the referent that produced, in part, this signified – the difficulty of climbing the steep hill.

There are two differences compared to the previous example. The object/referent is not a relatively integral object, such as the car, but a highly complex behavioural event and a resultant conceptual structure. And whereas in the case of the car the signifier could be produced newly by the child, here he is operating

in a semiotic system (spoken language) in which signs already exist. He therefore selects an existing sign which in his view most nearly expresses aspects of the signified, namely 'heavy'. That is, an existing sign in one semiotic system becomes the signifier for a newly produced signified. This view of the production of signs has close affinities, formally, with the theoretical work of Hjelmslev (1943/1969) and, deriving from it, that used in the writings of Barthes (1982) and Eco (1976). The significant and crucial difference lies in my attempt to locate this process firmly in the social and cultural histories of the producer of the sign.

In other words, the production of signs, in semiotic systems with already available sign/signifiers, is subject to constraints which the child (or adult producer of a sign) is not subject to in a semiotic medium which does not already provide ready-made signs. Even here, however, the sign is a motivated construct, even though some limitation or circumscription is placed on the production of the sign by the presence of already existent signs. In other words, as a sign-producer moves into greater facility with existing semiotic systems, the production of signs takes place in a situation of ever increasing tension between the meanings of existing signs, which provide the signifiers (Hjelmslev's 'expression substance'), and the producer's need or wish to produce new signs.

Generalizing, I wish to say that signs are always motivated in this manner by the producer's 'interest', and by characteristics of the object. It is 'interest' which determines the characteristics that are to be selected and to be represented. The relation of signifier to signified, in all human semiotic systems, is always motivated, and is never arbitrary. This may seem a tenable hypothesis in relation to some signs only – certain visual icons, onomatopoeia in verbal language perhaps; it will seem entirely untenable in relation to the vast majority of signs in all kinds of semiotic systems, and in particular in relation to signs in verbal language – words, for instance, or sounds. It is as well to recall here Volosinov's statement: 'The form of the sign is conditioned above all by the social organization of the participants involved and also by the immediate conditions of their interaction' (1930/1973: 21).

I will give some more examples and then extend the hypothesis even further, to include all those instances of signs which appear to be quite outside this hypothesis, namely all those instances which appear to be simply re-uses of 'existing' signs.

If the notion of 'interest' is extended to the making of signs by the fully acculturated, fully socialized individual, we will have to take into consideration the individual's social and cultural histories, and her or his present social positioning in the whole complex of social structures which make up an individual's social life. 'Interest' is the articulation and realization of an individual's relationship to an object or event, acting out of that social complex at a particular moment, in the context of an interaction with other constitutive factors of the situation which are considered as relevant by the individual. These might, for instance, include other individuals and their social positionings, present purposes and intentions, structures of power which obtain in the situation, etc. Signs, then, reflect, in their construction, that relation of signified to signifier which expresses this interest. That is, in relation to a particular object or event, 'interest' leads the

producer of the sign to focus on a particular characteristic of an object or event (whether an object or an event in the physical or in the social/cultural, semiotic world) to make that the criterial characteristic of the object or event, that is, make it the basis of the production of a signified.

It may be worth drawing attention to the fact that the process which I am describing here is the process underlying the construction of a metaphor. An aspect of the object or event to be represented by being drawn into the metaphoric relation is selected by the speaker or writer as having, at that point and in relation to the speaker/writer's purposes, criterial characteristics in respect to the object to be represented; that is, it becomes the signified. This criterial aspect simultaneously specifies the characteristics which will make an apt signifier. So in relation to the earlier example of the car, the child decides that wheels are criterial in representing the signified 'car'. That decision then determines what may be an apt signifier, in this case circles. Wheels are selected as the criterial aspect of the object to be represented (the signified), and circles are apt signifiers in the sense that they adequately signify, represent or express the characteristics of the signified. All signs are formed in this metaphoric process. All signs are metaphors.

Two consequences follow for CDA. On the one hand all signs are metaphors, hence code ideological positions in that they realize the social, cultural and therefore political position of their producer. On the other hand all signs are thus equally subject to critical reading. This last point has the important theoretical and methodological consequence that no sign is innocent. There are therefore no texts which can escape critical reading. All texts equally code the ideological positions of their producers. The everyday, innocent and innocuous, the mundane text is as ideologically saturated as a text which wears its ideological constitution overtly.

Consider, for instance, the signified 'social distance'. Any sign which already expresses distance – temporal, spatial or other kinds of distance – can become an appropriate signifier of the signified 'social distance'. Hence, as an example, the so-called past tense can serve as a marker of social distance – the sign of distance in time serving as an appropriate signifier for social distance: the so-called polite formulations, in English: 'I want*ed* to ask you, *could* you . . .' (compared to 'I want to ask you, can you . . .'). With this conception of the sign the first question which arises is about the interest of the user of this sign. What is it that he or she is taking as criterial, and in what process or situation? Other signifiers of distance are available, of course: spatial distance (proximal versus distal) – *this* rather than *that*; conceptual distance (hypothesis versus factuality) – *If it were* . . . rather than *It is* . . .; ontological distance (possibility versus certainty) – *possibly* rather than *certainly*; etc.

Take as a real example the following contrasting pair of textual extracts. Each is the abstract preceding an article in a scientific journal, in one case the prestigious disciplinary journal *Science*, in the other case the popularizing journal *Scientific American*. The articles both report the same set of findings (from Myers, 1990).

(1) Experiments show that Heliconius butterflies are less likely to oviposit on host plants that possess eggs or egg-like structures. The egg mimics are

an unambiguous example of a plant trait evolved in response to a host-restricted group of insect herbivores. (From *Science*)

(2) Heliconius butterflies lay their eggs only on Passiflora vines. In defense the vines seem to have evolved fake eggs that make it look to the butterflies as if eggs have already been laid on them. (From *Scientific American*)

Given the hypothesis that signs are constructed out of the interest of a specific individual we are forced to ask about that interest in each case. What is it that changes the interest of the writer in the two instances, so that in one case we have one characteristic set of verbs, and of tense/modality forms (show, are, are, has) and in the other case another (lay, seem to have evolved, make it look, as if . . . laid). In a traditional account the difference would be noted, and assigned, either in a correlational fashion, or simply as a matter of description, to a (formal and less formal) 'scientific style'. In CL and CDA the modal effect would be noted, though the present account is needed to provide the link between social location of the producer of the form, and the form itself.

Signs can be of any size: a word; a syntactic unit; a clause; a text consisting of many sentences. So, for instance, the choice of one specific textual genre rather than another – an informal note rather than an official memorandum; an informal chat versus an official on-the-record exchange – constitutes the production of a sign, just as does the example above. In this instance too, the producer's interest, as a reflection of a present socal positioning, leads him or her to focus on particular aspects of the object to be represented (the need for formality), which becomes the signified, and to select a specific textual form as an appropriate signifier.

3. The Production and Reception of Signs

The choice of a generic form of text may be thought to be not an instance of the production of a sign, but rather an instance merely of the reproduction of a sign, because (in most instances) the use of a generic text type seems to be simply that: the use of a pre-existing text type, involving no new production. This is certainly the common-sense, naturalized view. However, until I as speaker or as writer have actually made the decision to use this text type, no specific sign exists. There is nothing that fully predicts my production of a sign. Nor is the textual instantiation of any one generic type ever like that of any previous instantiation, even in conditions of great external constraint. Even in a situation of great constraint and awareness of convention, I can act unpredictably, assessing in a particular instance the consequences of my action differently to what would normally be predicted. I can speak formally to my partner over the dinner table when there seems no clear, contextually plausible reason for doing so; and I can speak informally to my superior in a formal situation, prepared to accept the consequences in both cases. But even my decision to act in conformity with an understood convention is the result of an act of choice, and as such is my new production of the meaning of conformity. That, after all, is the source of the immense social, ideological and psychic power of that act. Consequently the notion

of the re-using of the sign, which is the essential underpinning of the idea of the stable sign, is not tenable even in those instances which seem most exemplary. However, the more significant point is to realize that in all instances the characteristics of the signified are never entirely knowable or predictable, given the producer's interest – as a product both of momentary and of much more persistent factors.

Let me give another example. Crawling along in a traffic jam on the motorway, I notice next to us a car towing a speedboat on a trailer. The boat is called 'Weekend Warrior'. The two signifiers *Weekend* and *Warrior* are not new, of course; and quite probably, the conjoined signifier *Weekend Warrior* has been used before, even in British contexts (ignoring its colloquial US usage), so that it may well be an existing sign. I could therefore treat the use of this name for the speedboat as the re-use of a sign, a cliché; and from that I could make my predictable judgements about our temporary neighbour on the motorway. However, I cannot know the signified that he had constructed – what mixtures of age and gender values, what notions of self, perhaps even degrees of irony. In other words, it is much more plausible to see this as the production of a new sign, a newly made conjunction of an existing sign/signifier ('Weekend Warrior') with a new signified – our motorway neighbour's conception of himself. And I would certainly have to abandon any notion of this merely as cliché if I discovered that his wife, who on this occasion was a passenger in the car, was driving the speedboat for all of the weekend. Nor does this begin to touch on *my* remaking of this sign in my *reading* of it; that is, a treatment of signs in a communicative framework.

This view contrasts sharply, on the one hand, with a view that sees an individual's meaning pushed, squeezed, forced into the 'straightjacket' or the 'mould' of existing word-signs; or, on the other hand, with a view which sees the individual's meaning as already accommodated to existing signs, either in the traditional and persistent view of the speaker's re-use merely of existing signs, or in an alternative view, language structuring thought, in effect the Whorfian view of language.

The notion of sign which I am putting forward makes it possible to connect the specificities of semiotic forms, in any medium, with the specificities of social organizations and social histories, via the actions of social individuals in the production of signs. It permits the move from the actions of individuals as social agents, with their interests, to the actions of the group of which individuals are members, with that group's interest, in the fullest sense. This accounts at the same time for the paradox of group interest and values, and divergences and differences within group interests and values. The history of any semiotic system, for instance the history of a language, is thus accounted for by the histories of social groups through the actions of their members in constantly making and remaking the semiotic system.

It also explains the paradox of the appearance of the systematicity of the semiotic system, a characteristic which always recedes and dissolves when it is subjected to analytic probing. A 'language' can be seen to be the working fiction constructed by, and in the interest of, a larger social group, itself consisting of multiplicities of groups: a fiction insofar as its imputed systematicity dissolves wherever searching analysis is applied; yet a working fiction, in the sense that

large 'language communities' do work with such fictions, and have to do so for the achievement of particular social ends, and in the sense that such fictions do work to a certain extent, in very many practical domains.

This view of signs also permits the move from the micro-histories of semiotic events to the macro-history of semiotic systems. The history of a language, for instance, must be accounted for, can only be accounted for, through the myriad of small-scale histories which are the records of linguistic events. It is through the two related notions of interest in the production of the sign and the motivated relation of signifier and signified that (critical) readings are made possible. The former both allows and obliges (critical) readers to seek to hypothesize about the producer's actions, situation, intentions; the latter makes it formally possible to do so. Without either notion critical reading would be impossible, and reading itself would be seen as an activity of the same kind as the looking up of the code handbook to decipher the message in front of the reader.

Nevertheless there is an element absent from my account of the production and particularly the reproduction/reading of the sign. If signs are motivated conjuncts of signifiers and signifieds, how do they come to be opaque? For after all, if the relation is motivated, why is it not transparent? My answer is founded on the notion of interest, as before. In the case of the child's drawing it was the accident of the parent's presence at the naming of the drawing which enabled the reconstruction of the child's interest and so made the sign relatively transparent: the reader, at least hypothetically, was provided with sufficient information necessary for that. Without that accidental presence, neither interest nor motivation would be easily recoverable: any reading, critical or ordinary, would be more difficult, or impossible in those circumstances. A 3½-year-old child's position in the world is, simply, very different from that of an adult.

In quite that way do the interests of fully social individuals differ from each other. At times, of course, that difference may not be very marked. And on very many more occasions, our possibilities of attending to potential discrepancies in interest are severely curtailed, by the multitudinous pressures which surround every act of communication and which curtail attempts at a critical reading. Attention to the interest of the producer of a sign demands the hypothetical reconstruction by the reader of the conditions of production of the sign; given the complexity of any message, that task is impossible other than in extremely unusual circumstances. This factor alone, that is, the complete usuality of difference of interest, and the impossibility of attempting to recover the conditions of production of the sign in each instance, is a factor that pushes 'ordinary readers' into common-sense readings – where the category of 'ordinary reader' is not defined by an individual's qualification as a reader – though that is a significant factor – but by the fact that the reading is done in ordinary circumstances.

Not only are the interests of social individuals different, but also those of social groups, a difference ranging from the merely other to the directly oppositional, antagonistic and conflictual. A sign produced by an individual member of one group within the interest of that group is thus most likely to be opaque in its constitution to a member of another group. Differences in interest are likely to be lesser among members of a particular social group than across different groups, especially in relation to those matters which are constitutive of that group.

In these conditions too the motivations for the production of the sign are likely to be difficult or impossible to recover easily, so that the most likely reading is one which simultaneously treats the sign as stable and known, and, the conditions of its production being unknown, as an arbitrary construct. Of course, where interests are oppositional and conflictual, there is more likely to be a contestation about the characteristics of the sign.

It is at this point that it becomes essential to make overt what I have so far kept implicit, namely that any understanding of the production and reception of signs, that is, a theory of semiosis, has to be set in the context of a social theory of communication in which power is an inevitable component. (It may seem tautologous to use the term 'social' with 'theory of communication', and I do so as a rhetorical means to draw attention to the fact that so many theories of communication are cognitive/psychological in their constitution, treating the communicating individuals as asocial atoms.) While it is quite likely that the child producer of the car/sign produced that sign without any notion of an audience in mind, either specific or general, more mature makers of signs do have an idea of an audience, not, of course, necessarily consciously. And most events of communication take place in relatively well-established social structures, which bring together not only individuals in events of communication, but also social groups in structures of interaction which have relative stability and persistence. In other words, in any society most communication takes place in pre-existing networks which bring together both the individual participants and the groups of which they are members in relatively stable configurations. This ensures a relatively well-developed understanding of who the audience is, and it also ensures a relatively well-developed awareness of interests at issue in that relation.

The presence of power introduces a factor into the production of signs not unlike, in its effects, that of the childish producer. While the child/producer does not attend to his or her audience because there appears no possible area of difficulty in that the child simply and naïvely expresses his or her interest, the powerful producer of the sign can act in a similar fashion motivated not by childish naïvety, but by the wilfulness of power. This can lead to its own naïvety because ease of communication is not his or her primary consideration, or even a consideration at all. In other words, with an increase in the power of one participant in relation to that of his or her interlocutor's comes the possibility of forcing them to accept more and more esoterically constructed signs. Whereas the demands of 'good', efficient communication suggest that the producer of the sign makes the interest which is coded in the sign relation as transparent as possible for the addressee, the presence of power allows her or him to override that consideration. This is not a question of bias – there is no means of producing an unbiased sign, there are only means of producing signs in which the characteristics of the object to be represented are coded as transparently as possible for the envisaged audience. It is nevertheless a question of power producing 'distortion', in the sense of an increase in the opacity of the sign, with a consequent increase in the degree of power brought to bear, and expressed. The actual inherent power of the individuals involved in the event of communication is

not a telling issue – powerful individuals do not need to use or display their power – rather it is the degree of power actually brought to bear on a particular occasion which produces opacity.

Where *group* interests are at issue, the same factors obtain; where one group is actively seeking to control the other, this becomes a strong part of the potentially controlling group's interest. The signs constructed by the powerful group may take at least two forms: as transparent as possible, on the grounds of a wish to maintain the appearance of relations of solidarity with another group within an established structure of interaction; or opaque, on the grounds that the degree of power possessed by the makers of signs allows them to ignore requirements for ease of understanding and to enable them to force the interlocutor into attempts either to recover the motivation that produced the sign, or to accept it at its proposed value.

Of course, the manner in which I am setting out these possibilities is an oversimplification. First, the situation is one of a scale, along which there is a vast range of possibilities. Secondly, interlocutors are perfectly capable of resistant, oppositional and subversive reading, tugging a forelock while ridiculing the boss.

Hence the question is not 'is this sign opaque, or transparent?' or 'To what degree is it either opaque or transparent?' All signs are always transparent to the makers of the sign; and all signs are always opaque to some degree for the readers of signs. The question is: 'How opaque is this sign for this specific reader, and why?' All signs are motivated in their relation of signifier to signified, and all signs are always transparent to their makers, and all signs are more or less opaque to readers. Motivatedness of signs, and opacity and transparency, are distinct considerations. The former relates to the conditions of production of the sign; the latter relates to the uses of signs in structures of communication affected by differential distributions of power: to the conditions of reception.

Ideology can now be seen to have at least two polar forms, in terms of the production of the sign out of a producer's interest. At the one extreme, a producer's position in the world will make him or her produce signs which arise out of that position and reflect his or her interest in relation to particular events and objects. This will produce a set of signs reflecting one kind of interest. Of course, a producer's position in the social and cultural world is always a position which includes multiple locations, many of which will be at odds with others, either simply different, or different in the sense of contrast or opposition. One part of becoming a social subject is to produce meta-signs for the self which provide reconciliations, temporarily or more permanently, of such differences, which provide integration for the individual. These sets of signs, including the meta-signs, produce a particular account of the world, an individual's ideology.

At the other extreme, a sign-maker's position in the world vis-à-vis specific others, individuals or groups, may lead her or him to produce sets of signs which are reflections of their interest in the relation to the other individual or group. That is, the sign is produced to provide a particular sense of the relationship of individuals or groups – for instance, a set of signs which provides an account of relations of domination. If the individual or group producing the sign or set of

signs is successful in having that sense accepted by the other individual or group, then an ideological position in the traditional Marxist sense has been produced.

In most instances of sign production both kinds of interest are at issue, so that signs or sets of signs are nearly always ideological in both senses, with particular degrees of each. That is, signs are fundamentally contradictory, in the sense that they code the producer's interest per se, and their interest vis-à-vis an interlocutor in a specific situation of communication.

In *Social Semiotics* (Hodge and Kress, 1988) we dealt with this issue by producing the term 'ideological complex'. The ideological complex is a structure which contains, at the same time, the representation of a state of affairs as it appears from the point of view of the producer's interest, and another representation of a state of affairs as it appears from the point of view of the interest of the producer vis-a-vis another individual or group.

Text 1

School banishes boy too poor to pay for uniform
by Ian MacGregor (Education Correspondent)

1. A SCHOOLBOY was taught in a class on his own because his parents could not afford a uniform, it was revealed yesterday.
2. The 13-year-old was separated from classmates for several weeks, a community advice organisation said.
3. His misery only ended when friends found enough jumble in an Oxfam shop for a make-shift uniform.
4. 'It was the worst case of this kind we have seen', said Nichola Simpson, head of policy at the National Association of Citizens' Advice Bureaux.
5. 'It was very distressing for a boy so young. 6. And he missed out educationally. 7. Children should not suffer like that, especially because they cannot afford a uniform. 8. It was a very hard-hearted thing to do'.
9. The incident happened in the East Midlands earlier this year when the boy's family moved into the area.
10. His parents were on income support, but education chiefs told them they did not qualify for a grant because their son moved schools mid-term.
11. The case was revealed by the association in a report on uniforms.
12. It said many poor children were suffering at school because local bureaucrats are not helping them pay for uniforms.
13. Many parents on benefits or low incomes were not receiving grants, which are discretionary.

Discipline

14. The news comes as many schools return to uniforms in a bid to make pupils more presentable and disciplined.
15. But the NACAB found local authority provision for uniform and clothing grants was tending to 'wither away'.
16. Assistant director Peter Hildrew added that grants were now a low priority for many education authorities.

17. 'Parents are penalised according to where they live', he said. 18. The system is often arbitrary and seems close to collapse.
(*Daily Express*, Friday, 3 May 1991)

Bearing in mind several of the points made just above, I shall briefly analyse this text. My interest here lies initially in the construction of the concept of poverty in the popular media (see Meinhoff and Richardson, forthcoming); and my specific focus is the clause 'his parents could not afford a uniform' in sentence 1. Given the theory of text briefly sketched earlier, my view is that the text itself is a large, complex sign, in which the interests of a particular producer are realized. This means that these interests will be realized in other parts of this text. Particular points to focus on are the headline, sentences 3, 7, 8, 10, 12, 13, 15, 16, 17 and 18.

The cited clause in sentence 1 presents a syntactic ambiguity. What syntactic analysis/description do we give to *afford*? Overtly it looks to be a transitive verb, with *a uniform* as direct object, and *his parents* as subject. A syntactically analogous form to that reading of this clause is 'His parents (could not) buy a uniform', which is clearly transitive. However, 'affording a uniform' is not clearly transitive; its subject noun is not clearly agentive: *His parents* is not an unambivalently agentive subject. *Afford* is a state of being, not a process under the control of an agent. And clauses which are not clearly transitive do not passivize easily: 'a uniform was (not) afforded by his parents' (and similarly with further tests, such as prenominalizing of the adjective, 'The afforded uniform . . .'). Yet many readers of the *Daily Express* may read across this clause in reading the text, and read it as fully semantically transitive, which I shall call, following Hodge and Kress (1993), a 'transactive'. In support of that reading, these readers might say: 'We scrimped and saved, and we afforded a uniform for our children, so why can't they?!'

There are thus at least two syntactic readings for this clause, very likely corresponding to the readings of different audiences – a hypothesis which could be tested. Other forms which line up with the non-transitive, non-transactive reading are 'too poor to pay . . .', (3) 'friends found . . . jumble', (7) 'Children should not suffer . . .'; and by a further extension, all those clauses which are not transactive, for instance (3) 'His misery . . . ended when . . .'; (6) 'he missed out educationally'; (9) 'The incident happened in the East Midlands . . . when the boy's family moved into the area'; etc.

Forms which align with the transitive, transactive reading are 'too poor to pay (money) for . . .', (3) 'friends found . . . jumble', (2) 'the 13-year-old was separated (by someone) from classmates', (10) 'their son moved schools', etc.

In other words, many of the forms which can be read transactively can also have a non-transactive reading. This serves, or can serve the producer's interest. A sign which can be read in both ways – a syntactic form which can be read as assigning agency to subjects, or which can be read as simply 'involving' subjects – may be what best reflects the producer's interest: on the one hand, it buttresses a politically reactionary view which wishes to hold the poor responsible for their own poverty; on the other hand it serves an interest not to alienate those readers who may be poor, or who have a divergent account of the causes of poverty.

It is important to see that there is a whole pattern of these ambiguous forms (and of clauses with a relational syntax, which tend towards a stative reading of the linguistic-social world). The pattern sets up, facilitates modes of reading. Most of the clauses in this net-like pattern involve the social participants who are implied and implicated – entailed – in my 'focal' clause – 'his parents could not afford a uniform': the boy, the parents, the uniform, the school, the school authorities, the local education authorities, bureaucrats. All of these have a complex place in the then and still current educational and social politics of the British Conservative government. This has, broadly, entailed – apart from far more widely ramified politics – a move to destroy the place of local education authorities (which are seen as obstacles to the imposition of centralizing control) in order to gain control of schools directly, and centrally. Part of the strategy of both government and the right-wing press has been an attempt to undermine the credibility not only of local governmental structures, but also of all forms of social organization which may provide resistance to the 'modernizing' drive of the Conservative state; such as, for instance, 'bureaucracy', seen itself as a leftover from a 'socialist' version of a centralized state (the 'Nanny State'), and an obstacle to Conservative moves aimed at the renovation of the state.

Linguistically, semiotically, this leads to the presence of the clearly, unambiguously transactive clauses 'School banishes boy' (headline), (1) 'A schoolboy was taught . . .', (2) 'The 13-year-old was separated . . .' (both having the impersonal, 'faceless' agent of the passive deleted), (8) 'It was a very hard-hearted thing to do' (where the embedded clause has a deleted agent 'Someone did a hard-hearted thing') (12) '. . . local bureaucrats are not helping them . . .' (when the real culprits are identified), etc.

In this analysis the agents of the transactive clauses are the members of the demonology of the Conservative right: local education authorities, local councils. schools, teachers, bureaucrats. It is they who act oppressively towards the hapless. helpless, powerless individual, both parents and child. The syntax thus clearly represents one facet of Conservative discourse. There are, of course, other facets. and these are by no means complementary. So the transactive reading of 'his parents could not afford' is a politically Conservative reading, which assigns responsibility for 'their' poverty to the poor. And in other texts, schools are represented as sites of resistance to (socialist) local council tyranny, through the agency of parent-power. Of course, this kind of 'common sense' in the Gramscian sense is exactly what we should expect.

At the same time this text provides, as I have mentioned, another reading the non-transactive, which allows a space for those readers who have an oppositional view of poverty. The text is thus the site of at least two discourses on poverty: the Conservative, which assigns responsibility to the poor and to a malign set of social agents; and the oppositional (in this context), which represents poverty as an event in which participants are caught up.

My account provides a description and explanation of this seemingly confused or contradictory syntactic pattern in terms of the production both of the sign of the clause, the sign of the sentence, but more, of the complex sign of the overall text, in terms of the interests of the producer of the text, including his interest in

the perceptions of the text in terms of the receiver's interest. The complexities of that possible reception, which includes divergent audiences with divergent interests, are coded in the complex sign of the text, and in the smaller level signs of clause and sentence.

The micro-history of the production of this text/sign is set in the context of the macro-history of British society at this time, and the latter provides an account of the former. However, the text as sign also encodes and produces as an object a sign which embodies that social state, and in doing so both naturalizes and deproblematizes that state of affairs, *and* produces a sign which in itself projects and produces new signs which reproduce its meanings.

This text also illustrates the operation of power in producing opacity of signs, at all levels. To make that point succinctly, imagine the instructions one might give to a student writing this report, encouraging her or him to be clearer, or to write more clearly.

More can be said about this, in particular in relation to my subsequent discussion of the boundaries of the sign. This text/sign occurs on the right half of a page, which on its left has a largely pictorial 'story', under the rubric 'photonews' of a member of the royal family cuddling, caring for, a child from a foster-family which has dealt with child victims of child abuse. It is hard to think how the reading of the one text can not affect the other.

In relation also to a discussion on the stability of signs, it is relevant to consider the effect of this text on the semiotic system of language, and, in particular, the system of transitivity or valency of verbs. The production of signs which are constructed to enable differentiated readings by two distinct groups on the one hand introduces a systematic instability into the system and to terms in the system – in as far as we wish to maintain that theoretical construct – and, on the other hand, facilitates and entrenches particular readings of verb valencies for particular readers; that is, it shifts the system for particular readers in specific directions.

From the producer's own interest, the 'poverty text' is to be read with the adjacent visual text on the care for abused children. From within the producers' interest vis-a-vis a group of potentially sceptical or oppositional readers of the 'poverty' text the visual 'caring' text is to be taken as merely co-present, and the features of the layout, which bring them together in this manner, are to be read as an accidental factor. In my experience these are the readings given to the text by the readers whose readings I have tested.

In any interaction involving power, signs will therefore be ideological or produce ideology, in the two senses, either as 'world view', or as 'mystification', encapsulated in Marx's metaphor of the camera obscura. Common to both is the effect produced by the wilfulness of the powerful, whose power can be realized, among other things, in their indifference to the need for the best obtainable conditions of communication in any particular situation. This is a factor which makes their communication as opaque as that of children, for reasons which are in part the same – in the case of the child, 'indifference' is an accidental component of the child's interest – and in part entirely different, namely the causes of the indifference in the case of the powerful, that is, the wilful obliteration of the needs of addressees.

4. The Boundaries of Signs

Text 2

Consider the text from the *Sunday Telegraph* (16 June 1991). What determines the boundaries of texts? Do we have here two texts, or one. On the face of it, the answer seems clear: there are two texts, one which I shall call the 'Bullying' text, and another which I call the 'Correctness' text. The relation between them is, it seems, determined by the (accidental) contingencies and exigencies of layout: it just happened that the sub-editor responsible for laying out that page needed a small bit of text to fill a gap, and so stuck the 'Correctness' text where it fitted, into the 'Bullying' text.

Bullying is beyond a joke for victims

by Sarah Johnson

SARAH, a pretty and intelligent 14-year-old, was twice forcibly stripped to the waist by a gang of 10 boys and girls at her school. After a failed suicide attempt, she is now thriving at a new school.

Sarah (not her real name) was photographed and punched and had her hair pulled during the attack in which she was forced to beg on her hands and knees for her clothes back. The head at the Edinburgh school where her ordeal took place dismissed it as "horseplay".

Her story is told in a book on bullying and disruptive behaviour in schools, which sets out a 10-point plan that teachers can use to eliminate a menace which has long been a feature of school life.

The book attacks the British education system for failing to train teachers to cope with disruptive behaviour. It says they are "hopelessly ill-equipped" to deal with the growing problem of bullying.

Its author, Michelle Elliott, is director of the children's safety campaign Kidscape. *In Bullying — a practical guide to coping for schools* — published tomorrow by Longman at £10·95 — Elliott and other experts offer what is probably the first comprehensive compendium of advice.

They also tell some horrific tales of recent cases including those of:

□ "Mark", 9, whose arm was broken by a gang who set on him as he walked home from school in Essex.

□ "Tony", 7, who was set on fire by a child of the same age.

□ "Sandra", 14, who was driven to truancy and eventually contacted Esther Rantzen's *ChildLine* for help.

The girl had suffered weeks of physical attacks and cruel jokes, such as a pack of ketchup-soaked tampons left on her desk or a sanitary towel stuck to her blazer.

In the school dinner queue girls screamed obscene rhymes and names at her — such as "rat-faced lesbian" — and Sandra, whose father has a history of violence against her mother, recalls: "I think the teachers on dinner duty thought it was just a joke."

The book advises teachers to set up "courts" in which bullies should be arraigned by the whole class. But Mrs Elliott warns: "Bully courts may not be the right answer for every school. One head-teacher saw the courts as just another form of bullying."

She also encourages teachers to take a tougher line with the classic excuse: "It was only a joke, Miss" — so why wasn't everyone laughing?

She is concerned about the inability of British teachers to cope with bullies. "When I was trained 25 years ago in the US," she says, "we had a course in dealing with the disruptive child.

"Teachers in this country learn virtually nothing. They get out of training and are suddenly confronted with a group of 10-year-old thugs and don't know what to do."

She criticises the Government for spending £175,000 on a three-year study of bullying "which will simply tell us there is a problem and delay doing anything for another three years".

● ALMOST all the members of a group set up by the Government to advise on the teaching of English oppose the idea of "correctness" in the language.

Twenty-one of the group's 25 members belong to a pressure group representing a highly ideological minority of teachers.

One expert outside the group said: "A lot of them believe teaching children grammar and Standard English is oppression of the working class. They aim to reshape English on multicultural, anti-racist, anti-sexist lines."

The Language in the National Curriculum project, set up in 1989, came to prominence last week when Tim Eggar, the Schools Minister, blocked the publication of teaching materials it had prepared at a cost of £21 million.

Sunday Telegraph (16 June 1991)

Even on this totally innocent account – an account implausible to anyone who is vaguely familiar with practices of sub-editing and layout – a number of observations are nevertheless indisputable. (1) The heading serves, visually, as a heading for all of the text in the columns underneath it. It is difficult not to read all of that text outside the heading of 'Bullying'. (2) The large black dot in front of the 'Correctness' text seems to function as a bullet-point in the larger text, in a way akin to the function of the square markers, drawing attention to a significant subsection of that larger text. (3) The 'Correctness' text is literally framed by the 'Bullying' text, and the former is embedded in the latter in much the same way that a subordinate clause is embedded in a higher clause in a sentence. (4) Anyone reading both texts will be struck by the echoes, the intertextual relations set up between the two texts: teachers don't care about bullying (because) teachers are bullies themselves ('a highly ideological minority of teachers' – in Conservative Britain 'highly ideological minority' is a lexemic variant for [political] 'bullies').

As with the *Daily Express* extract, an attack is made in both of these texts on a particular target, namely, to use the Tory term, 'the educational establishment'. That establishment is held responsible not only for the present state of the British education system, but also for the present moral state of British society. This attack is made in the 'Bullying' text in several places, via an attack on the shortcomings of teacher-training institutions (paras 3, 4, 11, 12); in the 'Correctness' text the attack is made on a group of educational experts who had been established by the government to produce materials to support the training of English teachers. The equation which reaches across and unifies the two texts is that an attack on correctness is an attack on proper manners, which itself is to undermine the social fabric.

So what determines the boundaries of the text/sign? We must choose a particular boundary, which becomes the frame of the sign, its boundary. These choices may be left relatively open and unconstrained, or may be subject to the severest constraint.

Some readers wish to enlarge the scope of the sign, by making the frame larger; for instance, in this example treating the whole page as the relevant sign, and the white borders of the page as the frame. Furthermore, any one reader, even in ordinary reading, may operate with variable boundaries, at times focusing more narrowly, at times much more broadly, depending on a whole range of factors acting together. In my own reading practice I frequently treat the whole paper as constituting the relevant boundary, and indeed the long chains of intertextual relations which are set up by one paper from day to day; which give me quite another but essential frame for reading any item which appears in the paper.

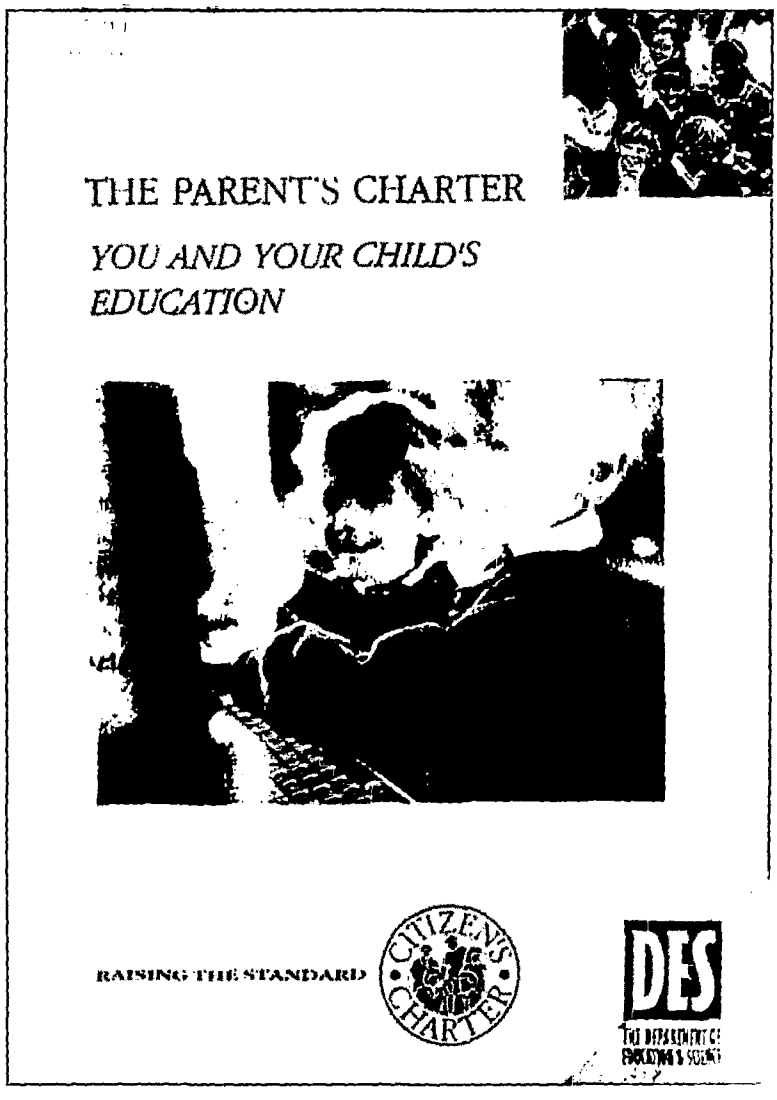
The question of the boundaries of the sign is thus one of the most important questions of all. There seem to me at the moment no formal criteria for settling this issue: there are, however, social–political criteria. Let us take the seemingly relatively uncontentious ground of academic analysis, that is, how a 'relevant' discipline deals with this question. Within many contemporary versions of linguistics the sentence continues to be the proper domain of linguistic speculation, theorization and analysis. Pragmatics allows extra and cross-sentence relations, relations of implicature for instance. In text linguistics or discourse analysis of

many kinds the example above would be seen to consist of two texts; although some versions would also admit the category of intertextuality. Critical discourse analysis sees texts in the widest social contexts, and focuses on the conditions of production and reception of texts, for instance. A social semiotic approach would go beyond a concern with the medium of language alone, and insist that other, visual, semiotic modes are in play here, layout for instance, so that this text is a multi-modal text. Further, a social semiotic approach would attempt to dissolve the category of context itself, preferring to speak of series of interrelating semiotic systems.

In a specific theory many or perhaps all of these criteria will be presented in formalistic terms; yet their motivations are political – ranging from the politics of disciplines and their concerns with boundaries and 'proper domains' – for example, 'the autonomy of linguistics' – to the politics of social and political critique. These are mirrored in the domain of 'ordinary readings', with debates around 'reading too much into' or 'reading things into' a text, a device to enable close control on the boundaries of the sign. In general, there is a close relation between power and the size of the unit treated as the relevant or proper unit of analysis. The smaller the unit the greater the degree of control; and vice versa, the greater the degree of control exercised the smaller the size of the unit. Lesser control therefore enables an expansion of the scope of what is treated as the sign. Of course, size is an historically variable factor, and so it might be better to say that, in general, the greater the degree of control possible, the more closely enforced will be the maintenance of the boundaries of the unit at the currently prevailing size, within a given domain – whether a disciplinary domain or a non-disciplinary domain. Power acts to keep the size of units as small as it is sustainable to do at a particular time.

5. The Multi-Modality of Signs

I wish to make one last point about an essential characteristic of signs. All signs are multi-modal, that is, in effect, all signs are complex signs, existing in a number of different semiotic modes. This is a largely unrecognized fact, and the naturalizings of linguistics have done much to obscure it. Texts such as advertisements, films, televisual texts, etc., obviously *are* multi-modal: a filmic text must be read as a single text, at one level, consisting of multiplicities of semiotic modes – visual, verbal, musical, sound, costume, setting, lighting, proxemics, etc. But even the seemingly uni-modal written text of the *Sunday Telegraph* example consists, as I mentioned, of the visual semiotic of layout, of the semiotic of written language, and of the semiotic of typography. In this connection consider the simple fact that a written text is always *written*: it has to appear in the visual medium. A particular style of handwriting, or of typeface, inevitably accompanies written language: language is imprinted with the visible visual marks of a writing style, or is carried by a particular voice. There is no language other than through the co-presence of another semiotic medium. To that extent the Hjelmslevian notion of expression substance is both a help and a hindrance: a hindrance, in that the



materiality of that substance, and its already existent semiotic organization, makes it anything but a transparent, neutral medium; and a help, in that we are constantly reminded of the relative intractability of the medium of the expression plane.

In fact, a much more radical proposal would be to challenge the unifying category of grammar, and to suggest that the diversity and multiplicity of features and forms subsumed by this category in fact constitute a collection of different semiotic modes. In the case of spoken language this may be easier to demonstrate, and more plausible, as it connects with statements made within linguistic theories themselves, where intonation, rhythm and other prosodic and 'paralinguistic' features have been treated as 'outside' syntax. In that treatment of speech there is the semiotic mode of grammar and syntax on the one hand, and the semiotic modes subsumed under the label 'paralinguistic' on the other. But even in the semiotic of written language it is possible to treat various aspects of syntax as in fact realizations of different semiotic modes. For instance, cohesion and cohesive devices seem of a qualitatively different kind to, for instance, noun-verb concord; and the prosodic element of modality seems qualitatively different to that aspect of clause syntax concerned with propositional relations. Indeed, I would push this principle very far indeed, so that, for instance, 'sylistic' variants such as different kinds of sentence connection (hypotactic or paratactic) would be evidence of yet another semiotic mode.

However, the most pressing issue is the recognition of the increasing role of the visual semiotic in all forms of communication. It is no longer possible to avoid this issue in critical analyses, on the assumption, explicitly or implicitly held, that all (relevant) meaning in a text is, as it were, fully glossed in the verbal component of the text.

Text 3

As my last example, I am taking the front page of *The Parent's Charter*, a publication by the Conservative government in Britain. Nearly all the meaning is here carried in the visual semiotic. Apart from iconographic elements (the use of children, the 'seal', the motto, the logo), it is elements of the visual grammar, both of the page as a whole – its layout/composition – and of its constituent parts, which is most telling, semiotically and ideologically. The page layout uses a centring structure, that is, the dominant visual element is in the centre of the composition. Of the two images, the top right image also uses this structure, with the black child in the centre of the composition. Centring structures are relatively rarer in the western visual semiotic than left–right, top–bottom structures (Kress and Van Leeuwen, 1990, 1992). Further, the more common left–right orientation of the western visual semiotic (with a reading of 'progression', moving from the established to the new) is here replaced by a right–left orientation. This is most noticeable in the central image, but is also the case in the top–right image. Centring composition and right–left orientation together dominate in the 30 images in this 22-page publication (16 images are clearly centring compositions; 16 images have right–left orientation). The ideological effect of the visual is here not merely a supporting one, underlining, illustrating or emphasizing; it has a significance

quite of its own. A reliance on the verbal semiotic alone is becoming too problematic, and only in part due to changing practices and valuations in representational practices.

6. Conclusion

The major point of my argument is that CDA needs the theory of the motivated relation of signifier and signified as an essential foundation and legitimation of the enterprise of critical reading. This does not produce legitimate readings, but it does produce a theory which not only legitimates but also demands critic

reading as the condition of all reading. To restate briefly, such a theory rests on a recognition of:

(a) the interest of producers of signs as individuals and as members of social groups;
(b) the social histories of these individuals and groups;
(c) the micro-histories of the production of the sign, including the social structures which constituted the relevant contextual features;
(d) the structurings of power at work in the production of signs;
(e) the reading/reception regimes in operation at particular points in the reading of signs;
(f) the interests of readers of signs as individuals and as members of social groups;
(g) the boundaries of signs in particular, and the degrees of rigidity or fluidity with which these are enforced; and
(h) the invariable multi-modality of signs.

Beyond this, it seems to me that CDA needs to be clear about the texts which it selects as objects of critical analysis. If the hypothesis of the motivated sign is plausible, then the question becomes which text is ideologically the most effective: the text which overtly declares its ideological constitution and intention, or the text which does not? Which is the most in need of critical analysis? My hunch is that ideological work is done as potently through the bland text as it is through the more overtly ideological text. If that is so, this needs to be taken into account in CDA.

This point connects with my personal position in this enterprise, which I ought to declare. Reading practices – whether in institutions such as school, university, place of work – in relation to culturally salient texts will increasingly become sites of a struggle over discursive freedoms. My own personal and political project is about the maintenance of possibilities of communication in the widest sense, both as a condition of a liberal society, and for the possibility of productive cultural futures. A strong theory of text and of the production and reception of text is an absolute prerequisite of that project.

Acknowledgement

I wish to express my thanks to Ann Doyle for her help in preparing this paper. The issue of the status of critical reading is discussed in Richardson (1987).

Narrative Analysis: Oral Versions of Personal Experience

William Labov and Joshua Waletzky

Most attempts to analyze narrative have taken as their subject matter the more complex products of long-standing literary or oral traditions. Myths, folk tales, legends, histories, epics, toasts, and sagas seem to be the results of the combination and evolution of simpler elements; they contain many cycles and recycles of basic narrative structures; in many cases, the evolution of a particular narrative has removed it so far from its originating function that it is difficult to say what its present function is.

In our opinion, it will not be possible to make very much progress in the analysis and understanding of these complex narratives until the simplest and most fundamental narrative structures are analyzed in direct connection with their originating functions. We suggest that such fundamental structures are to be found in oral versions of personal experiences: not the products of expert storytellers that have been retold many times, but the original production of a representative sample of the population. By examining the actual narratives of large numbers of unsophisticated speakers, it will be possible to relate the formal properties of narrative to their functions. By studying the development of narrative technique from children to adults, and the range of narrative techniques from lower-class to middle-class speakers, it will be possible to isolate the elements of narrative.

In this article, we will present an analytical framework for the analysis of oral versions of personal experience in English. We will first introduce definitions of the basic units of narrative and then outline the normal structure of the narrative as a whole. Finally, we present some general propositions about the relation of formal properties to narrative functions, based on our examination of a moderate body of data.

Source: *Journal of Narrative and Life History* vol. 7, no. 1–4, 1997, pp. 3–38.

The analysis will be *formal*, based upon recurrent patterns characteristic of narrative from the clause level to the complete simple narrative. We will rely upon the basic techniques of linguistic analysis, isolating the invariant structural units, which are represented by a variety of superficial forms. From this analysis it is possible to derive a considerable amount of information on the syntax and semantics of English below the sentence level, but this direction of research will not be exploited here. We will be concerned primarily with the characteristics of narrative itself.

The analysis is *functional:* Narrative will be considered as one verbal technique for recapitulating experience – in particular, a technique of constructing narrative units that match the *temporal sequence* of that experience. Furthermore, we find that narrative that serves this function alone is abnormal: it may be considered empty or pointless narrative. Normally, narrative serves an additional function of personal interest, determined by a stimulus in the social context in which the narrative occurs. We therefore distinguish two functions of narrative: (a) *referential* and (b) *evaluative.*

In most previous studies of folk narrative, the basic unit for analysis has been a substantial piece of thematic material, defined at various levels of abstraction by the type of action referred to. Thus the work of Propp (1958) was devoted to the formal structure of such large semantic units. The present study assumes as a basic task the analysis of narratives that might appear as fundamental, unanalyzable units in Propp's scheme. We will be concerned with the smallest unit of linguistic expression that defines the functions of narrative – primarily the clause, although we will refer to cases where phrases and words are relevant to evaluative function. Colby's work (1966) took as data the frequencies of individual words according to a semantic subcategorization; a linguistic approach is quite opposite in direction, focusing upon the syntagmatic structure of words and phrases operating in clauses and higher levels of organization. Schatzman and Strauss (1955) studied class differences in narrative technique by informal means; it is hoped that the methods developed in the present discussion will permit a more reliable and objective approach to studies of this type.

We will be dealing with tape-recorded narratives taken from two distinct social contexts. One is a face-to-face interview where the narrator is speaking only to the interviewer, a person not a member of a narrator's primary group. In the second situation, the narrator is recorded in interaction with his primary group; he is speaking in part to the members of his group, and in part to an outsider on the margins of the group, who provides only a part of the stimulus for the narrative.

The following pages provide 14 examples of the data on hand, drawn from about 600 interviews gathered in the course of four linguistic studies.[1] The narrators include speakers from Black and White communities, rural and urban areas, and they range in age from 10 to 72 years old. In one respect the range is limited: There are no highly educated speakers represented here; in fact, none of the narrators finished high school.

The ultimate aims of our work, require close correlations of the narrator's social characteristics with the structure of their narratives, since we are concerned with problems of effective communication and class and ethnic differences in

verbal behavior.[2] In this article, however, we are concerned with the narratives themselves, and so these fourteen examples appear as anonymous narrations, arranged in descending order of the speakers' ages.

Narrative 1

(Were you ever in a situation where you thought you were in serious danger of getting killed?) I talked a man out of – Old Doc Simon I talked him out of pulling the trigger. (What happened?)

Well, in the business I was associated at that time, the Doc was an old man . . . He had killed one man, or – had done time. But he had a – young wife, and those days I dressed well. And seemingly she was trying to make me.

I never noticed it. Fact is, I didn't like her very well, because she had – she was a nice looking girl until you saw her feet. She had big feet. Jesus, God, she had big feet!

Then she left a note one day she was going to commit suicide because he was always raising hell about me. He came to my hotel. Nice big blue 44, too.

I talked him out of it; and says, "Well, we'll go look for her, and if we can't find her, well you can – go ahead, pull the trigger if you want to." I was maneuvering.

So he took me up on it. And we went to where they found her handkerchief – the edge of a creek – and we followed down a little more, and we couldn't find anything. And got back – it was a tent show – she was laying on a cot with an ice bag on her head. She hadn't committed suicide.

But – however – that settled it for the day. But that night the manager, Floyd Adams, said, "You better pack up and get out because that son of a bitch never forgives anything once he gets it in his head."

And I did. I packed up and got out. That was two.

That was two.

After I came out from New York . . .

Narrative 2

I had dogs that could do everything but talk. And by gorry, sir, I never licked 'em.

(When you have small kids, they're always asking for one more thing, like a drink of water, to keep from going to bed at night. I wonder if you had that problem, and what you did about it?) Yeah, but – a lot of the children I've seen, that their excuse they've got to go to the bathroom, and they don't have to go at all. (How do you cope with it. You can't – you never know . . .) No. I don't remember how we coped with it. I never believed a whole lot in licking. I was never – with my children, and I never – when it was with my animals, dogs; I never licked a dog, I never had to. A dog knew what I meant; when I hollered at a dog, he knew the – what I meant. I could – I had dogs that could do everything but talk. And by gorry, sir, I never licked 'em.

I never come nearer bootin' a dog in my life. I had a dog – he was a wonderful retriever, but as I say he could do everything but talk. I could waif him that way, I could waif him on, I could waif him anywhere. If I shot a crippled duck he went out after it; he didn't see it in the water, he'd always turn around look at me, and I'd waif him over there, if the duck was there, or if it was on the other side of where we're on, I could waif him straight ahead, and he'd turn and he'd go. If he didn't see me, he'd turn around, he'd look at me, and I'd keep a-waifin' him on. And he'd finally catch sight of him, and the minute he did, you know, he would bee-line and get that duck.

I was gunnin' one night with that dog – we had to use live decoys in those days – a fellow named Jack Bumpus was with me; I was over at a place called Deep Bottom,

darker than pitch. And – uh – heard a quackin' off shore. And, I said to Jack, "Keep quiet. There's one comin' in." And – uh – finally Jack said to me, "I think I see 'im." I said, "Give 'im a gun. Give 'im a gun. Try it."

So he shot, and this duck went for the shore with his wings a-goin' like that for the shore. Went up on the shore. Well this dog never lost a crippled duck on shore, he'd take a track just the same as a hound would take a rabbit track. And I sent him over. I said, "Go ahead."

So he went over there. And – gone a while and come back and he didn't have the duck. And that was unusual – I said, "You git back there and get that duck!" And he went back there; and he stayed a little while longer, longer than he did the first time, and he come back and he didn't have that duck.

And I never come nearer shootin' a dog. By gorry, I come pretty near. "*You git back there and get that duck!*" And that dog went back there, and he didn't come back. And he didn't come back. By gorry, we went over there – I walked over there, and here he was; one of my tame ducks that I had tethered out there had got the strap off her leg, and had gone out there, and when this fellow shot, he hadn't hit the duck. The duck came to the shore, he hadn't hit the duck; but the duck was scared and come for the shore. My dog was over there, and he had his paw right on top of that duck, holdin' him down just as tight as could be, and – by gorry, boy, I patted that dog, I'll tell you if I ever walloped that dog I'd have felt some bad. He knew more 'n I did; the dog knew more than I did. He knew that was that tame duck; he wasn't gonna pick him up in his mouth and bring him, you know. He was just holdin' him right down on the ground.

Narrative 3

(Were you ever in a situation where you were in serious danger of being killed?) My brother put a knife in my head. (How'd that happen?) Like kids, you get into a fight and I twisted his arm up behind him.

This was just a few days after my father had died, and we were sitting shive. And the reason the fight started . . . He sort of ran out of the yard – this was out on Coney Island – and he started talk about it. And my mother had just sat down to have a cup of coffee. And I told him to cut it out.

Course kids, you know – he don't hafta listen to me. So that's when I grabbed him by the arm, and twisted it up behind him. When I let go his arm, there was a knife on the table, he just picked it up and he let me have it. And I started bleed like a pig.

And, naturally, first thing was – run to the doctor. And the doctor just says, "Just about this much more," he says, "and you'd a been dead."

Narrative 4

. . . They didn't believe in calling the law or anything like that. They just took things in their own hands. (Did you ever see any shooting of that sort?) Oh, yes. I can remember real well. I w's just a girl. 'Fact, stayed with me quite a while.

Well, there's a fellow, his name was Martin Cassidy 'n' Bill Hatfield. Mr. Cassidy's mother gave him some money an' tell him to go get a bushel of peaches. An' he went down to Martin's house. An' Martin had some moonshine there.

Back down there, they make their own liquor, you know. So – we call it moonshine. Today, they call it white lightnin'; but at that time we call it moonshine.

An' I remember real well what happened. Bunch of us kids was out there playin'; an' no one meanin' any harm about it. But anyway, Mrs. Hatfield come down an' took away her money from Mr. Hatfield, you know, for the peaches, cause she know what he was gonna buy drinks with it. 'Nd Mr. Cassidy was laying out there in the yard.

And Mr. Cassidy just looked up, and he said to Bill, just – just jokin', just in a kiddin' way, he said "Uh huh," he says, "that's – another dollar bill you won't get to spend for drinks, hunh?"

'Nd Bill said, "I'll fix you, ya so-and-so."

So he walked in Martin Cassidy's *house*, his own house, came out with a double-bitted axe, hit him down 'crost the head once, turned over and hit him again, then throwed the axe down and run through the woods.

Just over two dollars that he was sent for peaches with.

Narrative 5

(Were you ever in a situation where you were in serious danger of being killed?) Yes. (What happened?) I don't really like to talk about it. (Well, tell me as much about it as you can?)

Well, this person had a little too much to drink, and he attacked me, and a friend came in, and she stopped it.

Narrative 6

(Were you ever in a situation where you were in serious danger of being killed?)

Yeah, I was in the Boy Scouts at the time. And we was doing the 50-yard dash, racing, but we was at the pier, marked off, and so we was doing the 50-yard dash. There was about eight or nine of us, you know, going down, coming back.

And going down the *third* time, I caught cramps and I started yelling "Help!", but the fellows didn't believe me, you know. They thought I was just trying to catch up, because I was going on or slowing down. So all of them kept going. They leave me.

And so I started going down. Scoutmaster was up there. He was watching me. But he didn't pay me no attention either. And for no reason at all there was another guy, who had just walked up that minute . . . He just jumped over and grabbed me.

Narrative 7

(And what about the street fight?) Then – ah – well, street fight, the most important, lemme see. (You know, the one that you remember the most.) Well, I had quite a lot. Well, one, I think, was with a girl [laughter]. Like, I was a kid, you know.

And she was the baddest girl – *the baddest girl in the neighborhood.* If you didn't bring her candy – to school, she'd punch you in the mouth. And you had to kiss her when she ['d] tell you. This girl was only about twelve years old, man, but she was a killer. She didn't take no junk. She whupped all her brothers.

And I came to school one day, and I didn't have no money; my ma wouldn't give me no money. And I played hookies one day. First time I played hookies, man, put sump'n on me, so I said, you know, I'm not gonna play hookies no more, 'cause I don't want to get a whuppin'.

So I go to school, and this girl says, "Where's the candy?" I said, "I don't have it." She says, powwww!! So I says to myself, "Well, there's gonna be times my mother won't give me money because a poor family, and I can't take this all – and and, you know – every time she don't give me any money. So I say, well, I just gotta fight the girl. She gonna hafta whup me. I hope she [don't] whup me."

And I hit the girl: powwww!!

Narrative 8

(Were you ever in a situation where you were in serious danger of being killed?) I'm gonna die? When I was drownin', I didn't know – like, I was turnin' tumblesaults. But that was th[illegible]

I – I was in a fight downtown once. Like – I went down to a party, and – this – this guy was a soldier – and this guy was a soldier, and he comes on, "gimme a cigarette."

I said, "I don't have any cigarette"

"Well, lemme search you."

I said, "You're not gonna search me."

"Well – I'm a soldier, and I know judo."

I said, "Well, I don't – I don't care if you're a *cop* and you know karate, you're not gonna search me."

And he hit me, man, like I hit him. And like, I – I got next to the guy. He didn't get a chance to use nothing, and I put sump'm on him.

I had – had a couple of guys with me. So we walked around the corner, – after, you know, I knocked him down a couple of times. I said "Well, you know, we'll soon get it."

I walk around the corner about twenty guys come after us, down by the projects. And we're runnin' – and, like – I couldn't run as fast as the other guys. And they was catchin' up to me. And I crossed the street, and I tripped, man. And, like, when I tripped, they kicked me and they was on me and I said, "Like this is it, man"; I pulled a knife.

But – a guy I know from the projects came over and gave me a hand.

And that – that was it, you know. That was it.

Narrative 9

(Did you ever have a feeling, or a premonition, that something was gonna happen, and it did?) Yes, I did. (Tell me about it.)

I was goin' with a girl, one time; we were layin' on a bed – we weren't doin anything, we were talkin' – and, I don't know, I looked into her face, and I saw, like, horns coming out of her head. You know. You know – like – I said, "You look like the devil!"

She said, "What do you mean, I look like the devil?"

"Don't kid around." I said, "I'm not kiddin'. I saw horns comin' out of your head."

And the girl got very angry and walked out. But, we got together, and we went together for about four months.

And, like, this girl tried to put me in a couple of tricks. Like she tried to get some boys to hurt me. You know. And she was a devil.

So, now, anything I see I believe it's going to happen.

Narrative 10

(Did you ever see anybody get beat up real bad?)

I know a boy name Harry. Another boy threw a bottle at him right in the head, and he had to get seven stitches.

Narrative 11

(What was the last cartoon you saw on television?) I don't know, I was watching the Sandy Becker show. (What was the story about?) About this pig. (What happened?)

See he – they threw him out, you know. So he wanted to get back in, 'cause, you know, it was sn- raining hard. So he got on this boat and tried to – go somewhere else. And the boat went over. And he tried to swim.

So this other man was fishing in the rain. So he seen the pig, and went over there and, and picked the pig up and put it in the boat and brought it back to shore, so he would land there.

Narrative 12

(What was the most important fight you remember?)

When I was in fourth grade – no – it was third grade – there was this boy, he stole my glove.

He took my glove, and say that his father found it downtown on the ground. I told him that he – it's impossible for him to find downtown, 'cause all those people were walking by, and just his father is the only one that find it? So he get all upset.

Then I fought him. I knocked him all in the street. So he say he give. And I kept on hitting him. Then he start crying and run home to his father.

And his father told him, he ain't find no glove.

Narrative 13

. . . See, Napoleon he took the ring and put it on the maiden. It was a statue of the maiden. Then he put it on her finger where the ring's supposed to be, and then he put it on the 45° angle. And then he looked in, and then he saw the place where the project was made at. And everything wh – the doctor who made it was dead.

So he came. He took him and the boy – the boy asked could he see it, and when the boy started to see it, he had this thing on – this patch or something – on his back. The Japanese leader could trace him by that patch because, you know, by radar.

And then – he started – so he took the patch off the boy and put it on the dog. And he took a stick and threw it in the water and the dog ran after it. And the radar – it went in the water with the dog.

And then – Napoleon and the dog started running – I mean, Napoleon and the boy started running, and they started running to the place where the project was made. And they started running to the place. And then, when they got there, they found that all of it was dried up and everything.

So when they started to leave out, he had a Japanese man first tell him to surrender. And before he told him to surrender, the dog – the dog came in there. The dog had found them. And the Japanese man came and told 'em to surrender.

See, they was inside the cave and the Japanese man was outside. And he told them to surrender. And he didn't surrender. He first – he told them that he made a trap. Then he said, "You can come in and make sure the project is all washed up," 'cause it was no more there. And they came.

When he sent one of his men to India . . .

Narrative 14

(Did Calvin do something that was really wild?) Yeah. We made Calvin hit – I say, "Calv – "

See, we – it was on a Sunday, and we didn't have nothin' to do after I – after we came from church. Then we ain't had nothin' to do.

So I say, "Calvin, let's go get out – put our dirty clothes on so we can play in the dirt."

And so Calvin say, "Let's have a rock – a rock war." And I say, "All right."

So Calvin had a rock and we, you know – here go a wall and a faraway go a wall. Calvin threw a rock. I was lookin' and – uh – and Calvin threw a rock. It oh – it almost hit me.

So I looked down to get another rock.

Say "Sssh!" an' it pass me.

I say, "Calvin, I'm bust your head for that."

Calvin stuck his head out. I th'ew the rock, and the rock went up, I mean it went

These fourteen examples cover a wide variety of types, from extremely short to relatively long, from highly organized structures to simple serial types. In addition to the narrative themselves, enough preliminary quotation is given so that one can obtain some idea of the stimulus to which the narratives respond – a matter quite relevant to the functional analysis of narrative.

Some difficult questions arise as we examine these narratives:

1. Though each is presented as a single narrative, how in fact do we know whether one or more narratives are contained in a given example? Is narrative structure well enough defined that we can answer this question? For instance, is Narrative 5 a narrative or a fragment of a narrative? Is Narrative 13 a fragment of a narrative or three separate narratives?
2. The structural framework of the narrative cannot be studied profitably without saying something about the sequence of events to which it refers. The fundamental question of narrative analysis appears to be this: How can we relate the sequence of clauses in the narrative to the sequence of events inferred from the narrative?

We will attempt to answer these questions in the following discussion.

The Basic Framework of Narrative

Temporal Sequence

We have defined narrative informally as one method of recapitulating past experience by matching a verbal sequence of clauses to the sequence of events that actually occurred. For example, in Narrative 5 we have four independent clauses that refer to four successive events or situations:

(5)
a Well, this person had **a little too much to drink**
b and he attacked me
c and the friend came in
d and she stopped it.

The temporal sequence of narrative is an important defining property that proceeds from its referential function. Narrative is not the only method for referring to a sequence of events; all recapitulation of experience is not narrative. For example, the events of Narrative 5 might have been presented in the following way:

(5')
c A friend of mine came in
d just in time to stop
a this person who had a little **too much to drink**
b from attacking me.

This form of presenting events depends on syntactic embedding. However, not all alternatives to narrative require this type of subordination. The following series of four independent clauses presents the same material in reverse order:

(5")
d A friend of mine stopped the attack.
c She had just come in.
b This person was attacking me.
a He had had a little too much to drink.

Despite the fact that these two formulations are perfectly logical, orderly, and acceptable ways of representing a sequence of events, they are not narratives as we are about to define the concept. The basic narrative units that we wish to isolate are defined by the fact that they recapitulate experience in the same order as the original events.

However, inspection of the other examples shows that the relationships between clauses and events are not simple. For instance, in Narrative 3:

(3)
d and we were sitting shive.
e And the reason the fight started . . .
f He sort of ran out in the yard –
g this was out on Coney Island –
h and he started talk about it;
i and my mother had just sat down to have a cup of coffee
j and I told him to cut it out.

The sequence of clauses d through j does not match the sequence of events and situations inferred from the narrative. The situation described in g ("This was out on Coney Island") certainly did not follow f ("He sort of ran out of the yard"); the event of i ("and my mother had just sat down to have a cup of coffee") did not follow h ("and he started talk about it") – rather, it preceded it; the referent of clause e is not temporally ordered with relation to any of the events ("and the reason the fight started"). The clauses that do refer to events clearly in the sequence are:

(3')
f He sort of ran out in the yard
h and he started talk about it
j and I told him to cut it out.

So far, we have discussed clauses in general as narrative units. But it can quickly be seen that only independent clauses are relevant to temporal sequence. Subordinate clauses (like the embedded clauses seen in formulation 5') may be placed anywhere in the narrative sequence without disturbing the temporal order of the semantic interpretation, as in the next example taken from Narrative 1:

(1)
k Then she left a note one day
l she was going to commit suicide
m because he was always raising hell about me.

Here clause 1 ("she was going to commit suicide") is the familiar construction of indirect discourse in which we refer to the fact that a person in the past referred to an event that would occur sometime in the future. Clause m, on the other hand, refers to events prior to clause k. One can quote any number of examples to show that any subordinate clause is removed from the temporal sequence of narrative, even if it retains its own temporal reference.

These considerations illustrate the motivation for the definitions of the narrative clause to be developed later in this article. These elements will be characterized by *temporal sequence:* Their order cannot be changed without changing the inferred sequence of events in the original semantic interpretation.

Displacement Sets

The following operations provide a formal basis for establishing temporal sequence among the independent clauses of a narrative. Each clause is assigned a sequential symbol (using lowercase letters), as in the next example from Narrative 8:

(8)
w and they was catchin' up to me
x and I crossed the street
y and I tripped, man.

Each clause is then tested for the potential range of displacement by examining the semantic interpretation that results when the clause in question is moved to all possible positions in the remaining sequence. For example, we find that x can be placed before w without changing the original semantic interpretation, since we can infer that the process of catching up extended throughout the sequence:

(8')
x and I crossed the street
w and they was catchin' up to me
y and I tripped, man.

But x cannot be placed after y without changing the original interpretation, as in:

(8")
w and they was catchin' up to me
y and I tripped, man
x and I crossed the street.

The result of these operations is indicated in the following system of subscripts

of the preceding a clauses and after any of the following p clauses without changing the temporal sequence of the original semantic interpretation.

The set consisting of the clauses before which c can be placed, c itself, and the clauses after which c can be placed, is the *displacement set* of c, symbolized DS(c).

Thus, for the partial sequence of w, x, and y discussed previously, we have

(8''')

${}_0w_2$	and they was catchin' up to me	DS(w) = {w, x, y}
${}_1x_0$	and I crossed the street	DS(x) = {w, x}
${}_0y_0$	and I tripped, man.	DS(y) = {y}

Narrative Clauses and Free Clauses

Two extreme types of displacement ranges that result from this operation are

$${}_0c_0 \text{ and } {}_{x-1}c_{n-x}$$

in which n is the total number of clauses in a sequence. The ${}_0c_0$ clause, with a displacement set of {c}, is locked in position in the sequence; it evidently functions as a *narrative clause* of the simplest kind, maintaining the strict temporal sequence that is the defining characteristic of narrative. The ${}_{x-1}c_{n-x}$ clause, on the other hand, has a displacement set equal to the entire narrative and can range freely through the narrative sequence. This type may be termed a *free clause.*

Coordinate Clauses

Although the free clause has no fixed relation to the temporal sequence, and the simple ${}_0c_0$ narrative clause is strictly ordered by temporal sequence, there are other types of clauses that have more complex relations to narrative sequence. We frequently find sequences of the type ${}_0c_1\ {}_1d_0$, as in this extract from Narrative 14:

(14)

${}_0s_0$	[and the rock] came down
${}_0t_1$	and smacked him in the head
${}_1u_0$	and say (slap!)

Clauses t and u might just as well been reversed:

(14')

${}_0s_0$	[and the rock] came down
${}_0t_1$	and say (slap!)
${}_1t_0$	and smacked him on the head

Both t and u have identical displacement sets, DS(t) = {t, u}, DS(u) = {t, u}, and they may be freely interchanged without any change in temporal sequence. Clauses with identical displacement sets may be termed *coordinate clauses.* (All free clauses

are coordinate in this sense, since they all have the same displacement sets, but it is the coordinate nature of certain narrative clauses that is our primary concern.)

One can, of course, have three or more coordinate clauses in a single sequence, as in the following extract from Narrative 1:

(1)

$_0l_0$ He came to my hotel. Nice big blue 44 too.
$_0m_3$ I talked him out of it,
$_1n_2$ and says, "Well, we'll go look for her,
$_2o_1$ and if we can't find her, well you can – go ahead, pull the trigger if you want to."
$_3p_0$ I was maneuvering.
$_0q_0$ So he took me up on it.

Here clauses m, n, o, and p are coordinate, with identical displacement sets (m, n, o, p), because they could occur in any of the six possible permutations without altering the temporal sequence of the original semantic interpretation. But none of these could be placed before 1 ("He came to my hotel") or after q ("So he took he up on it").

Restricted Clauses

The narrative clauses that we have considered are of two general forms, $_0c_0$ and $_0c_1\ _1d_0$, and appear to have one feature in common. Their displacement sets range from a left zero subscript to a right zero subscript, with no zeros in between. We also find in narratives a third type of clause that does not range freely over the entire narrative, yet has a wider range than the narrative clause. This type of clause has a displacement set that may range across several left or right zero subscripts. Such clauses, which are neither free nor temporally ordered in the strict sense, may be termed *restricted clauses*.

It may be now helpful to consider a narrative as a whole to illustrate the nature of free clauses, coordinate clauses, and restricted clauses and to show how the displacement sets of such clauses are determined. Narrative 6 may be analyzed as follows:

(6)

$_0a_{18}$	yeh I was in the boy scouts at the time	DS {a–s}
$_1b_{17}$	and we was doing the 50-yard dash	"
$_2c_{16}$	racing	"
$_3d_{15}$	but we was at the pier, marked off	"
$_4e_{14}$	and so we was doing the 50-yard dash	"
$_5f_{13}$	there was about eight or ten of us, you know, going down, coming back	"
$_6g_0$	and, going down the *third* time, I caught cramps	{a–g}
$_0h_0$	and I started yelling "Help!"	{h}
$_0i_1$	but the fellows didn't believe me, you know,	{i–j}

$_1j_0$	they thought I was just trying to catch up because I was going on or slowing down	{i–j}
$_0k_1$	so all of them kept going	{k–l}
$_1l_0$	they leave me	{k–l}
$_0m_3$	and so I started going down	{m–p}
$_{13}n_5$	Scoutmaster was up there	{a–s}
$_6o_3$	he was watching me	{i–r}
$_7p_2$	but he didn't pay me no attention either	{i–r}
$_0q_0$	and for no reason at all there was another guy, who had just walked up that minute . . .	{q}
$_0r_0$	he just jumped over	{r}
$_0s_0$	and grabbed me	{s}

Narrative 6 begins with six free clauses, all of which can range over the entire narrative; for each of these, the sum of the subscripts is 18. The third clause, *racing,* is in apposition with *doing* in the second clause, and is treated as derived from *we was racing.* It must be analyzed separately, because it is possible that such an appositive could be temporally ordered in respect to other clauses.[3] The situation and action described in these six clauses prevails throughout the entire narrative: that is, the *8 or 9 of us* continue racing even when the narrator himself is in trouble.

The first narrative clause is g, with a displacement set of {a, b, c, d, e, f, g}, ranging from the left zero of a to its own right zero. Clauses i and j are coordinate clauses of the type just discussed, and so are k and l.

Clause m is a narrative clause with a displacement set ranging over the three following clauses. These following clauses are not in strict narrative sequence; the first one, n, is a free clause ("Scoutmaster was up there"). It should be understood that the test for displacement range must include a procedure for adjusting anaphoric reference. "Scoutmaster was up there" would be a strange utterance in initial position, but if we supply the referent of "there – at the pier," we have "Scoutmaster was up at the pier," which could stand in initial position without changing the temporal sequence of the original semantic interpretation. The reverse situation would apply if a specific free clause in initial position, with several proper names, was displaced to a point later in the narrative: pronoun substitution would be made.

The second clause, o, ("He was watching me") is a restricted clause, with DS(o) = {i–r} extending before n. It could have been placed at any point after h ("I started yelling 'Help!'"), that is, after the action that called the scoutmaster's attention to the narrator and logically motivated his action. It is worth following the logic of this argument in detail, because it is typical of the method for establishing the displacement sets of restricted clauses.

While it is true that the scoutmaster's job was to watch everyone, we interpret the statement o ("He was watching me") to mean that there was a significant change at one point, from watching everyone to watching the narrator in particular. This interpretation hinges on the word "either" – this word coordinates

the negation of "He didn't pay me no attention" with some previous negative statement; the first preceding negative clause is i ("the fellows didn't believe me."). Therefore, we can conclude that both of these statements refer to events that responded to clause h ("and I started yelling 'Help!'"). Therefore, the displacement sets of o and p cannot include h without a change in the temporal sequence of the original semantic interpretation.

On the other hand, clause o could range towards the end, at any point up to clause s. If clause o appeared after s, then the same temporal inference that we now draw – that the scoutmaster began watching after the cry for help – would be altered. It would be the grabbing of the narrator by the "other guy" that would mark the beginning of the scoutmaster's watching.

The same argument holds for clause p, which is a restricted clause with the same range as o.

The rest of the narrative consists of simple $_0c_0$ narrative units. Clause q ("for no reason at all there was another guy") has the temporal status of a punctual act, appearance: the viewpoint is clearly that of the narrator.

Figure 1 is a graphic display of these statements about the displacement sets of the clauses concerned. Each clause is represented by a mark opposite the alphabetic symbol, and the vertical line running through this mark represents the displacement set. We will return to this diagram later in discussing the normal structure of narrative as a whole.

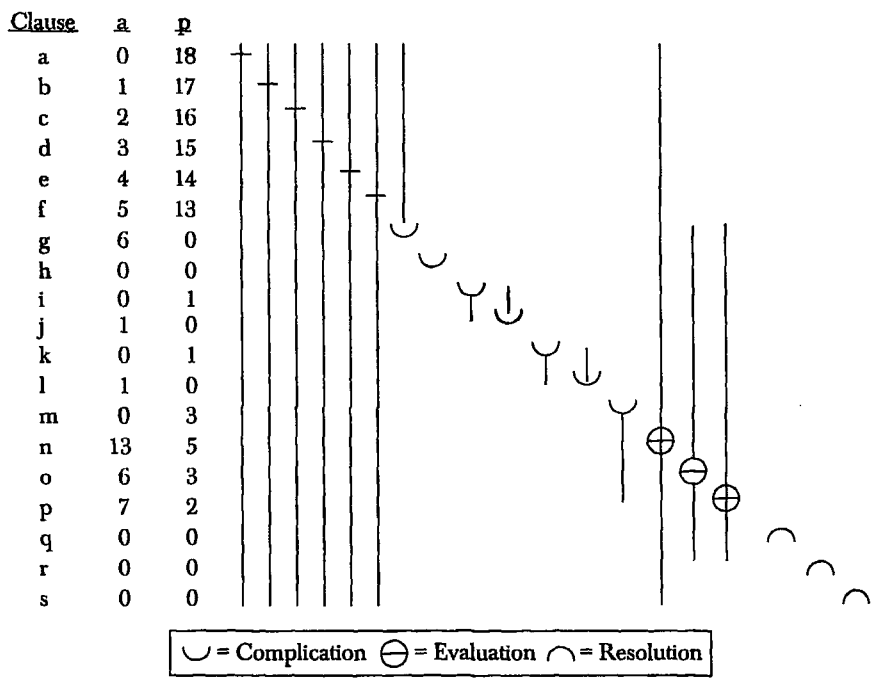

Figure 1: Displacement ranges of the clauses of Narrative 6

Temporal Juncture

If narrative clauses succeed each other in uninterrupted sequence, the zero subscripts alone would show the temporal segmentation of the narrative. But because any number of free or restricted units can intervene between two narrative clauses, we must define temporal relations between any two clauses in the narrative, not necessarily contiguous. We wish to define formally the condition under which any two clauses are ordered with respect to each other and cannot be interchanged without change in the temporal sequence of the original semantic interpretation. Such a condition is met when the displacement range of a given clause does not extend past the actual location of some following clause, and conversely, the displacement range of this following clause does not extend past the actual location of the given preceding clause. More concisely, their displacement sets do not include each other. Two such clauses are temporally ordered with respect to each other. Their displacement sets may in fact overlap, but the displacement set of c will not include d, and that of d will not include c if c and d are temporally ordered.

Two clauses that are temporally ordered with respect to each other are said to be separated by *temporal juncture.* This juncture has no relation to any free or restricted clauses that may fall in between the temporally ordered clauses. In Narrative 6, given in full previously, we find temporal junctures between g and h, h and i, j and k, l and m, m and q, q and r, r and s. Since i and j, k and l are coordinate, we can best represent these junctures by the following diagram:

g I caught cramps
h and I started yelling
ij the fellows didn't believe; they thought I was
kl all of them kept going; they leave me
m I started going down
q there was another guy
r he just jumped over
s and grabbed me.

Definition of the Narrative Clause

We can now proceed to define the basic unit of narrative, the narrative clause, in terms of temporal juncture and displacement sets. It is characteristic of a narrative clause that it cannot be displaced across a temporal juncture without a change in the temporal sequence of the original semantic interpretation. Therefore if the displacement set of a given clause does not contain two clauses that are temporally ordered with respect to each other, then that clause is a *narrative clause.* More simply, we can say that a narrative clause has an *unordered displacement set.* If the displacement set is ordered – that is, if some members are temporally ordered with respect to each other – then the given clause is a restricted clause or a free clause. If such an ordered set is equal to the narrative as a whole, the clause is a *free clause;* if not, a *restricted clause.*

We can restate these definitions formally in the following manner. A narrative N may be represented as a set of n clauses

$$c^1, c^2 \ldots c^i \ldots c^n$$

in which $0 \leq I \leq n$. Then

1. $c^i \in DS(c^j)$ if $c^i \ldots c^j$ and $c^j \ldots c^i$ yield the same temporal sequence in semantic interpretation [or if $c^i = c^j$]
2. If $c^i \in DS(c^k)$ and $c^j \in DS(c^k)$
   and $c^i \notin DS(c^j)$ and $c^j \notin DS(c^i)$
   a. and $DS(c^k) = N$, then c^k is a free clause.
   b. and $DS(c^k) < N$, then c^k is a restricted clause.
3. If condition 2 does not hold, c^k is a narrative clause.

Definition of a Narrative

We can now define quite simply those sequences of clauses that we will consider as narratives. Any sequence of clauses that contains at least one temporal juncture is a narrative. Thus

(10)
${}_0a_2$ I know a boy name Harry.
${}_1b_0$ Another boy threw a bottle at him right in the head,
${}_0c_0$ and he had to get seven stitches.

is a narrative, because a temporal juncture is found between b and c. A statement such as "I shot and killed him" would be a narrative, because it contains a temporal juncture, but not "I laughed and laughed at him." There are many ambiguous cases that allow two distinct interpretations: "I punched him in the head, the mouth and the chest" is normally a list, which does not imply that he was punched first in the head, then in the mouth, and then in the chest. But the temporal interpretation is possible, and it is more likely in "I beat him up and stomped on him."

The upper bound of narrative is not set by this approach, and the question of deciding between one narrative or two must be left to the section that deals with the overall structure of narrative.

Narrative Heads

The finite verb of a narrative clause, which carries the tense marker of the clause, is the *narrative head* of that clause. Heads of coordinate clauses are coordinate heads.

(2)
${}_0u_0$ And – gone a while

$_{0}w_{1}$ and he didn't have the duck.
$_{0}x_{31}$ And that was unusual –
$_{1}y_{0}$ I said, "You git back there
$_{0}z_{0}$ and get that duck."[4]
aa. And he went back there;

Here the narrative heads are *gone, come, did-, was, said, said,* and *went.* The types of grammatical forms and categories that can function as grammatical heads are extremely limited. The principle forms are simple past and simple present. As a rule, no modals appear; abstractly considered, it is possible that *could* could function as a narrative head, though no examples have been found in our materials to date. The progressive (past and possibly present) does appear occasionally as a narrative unit:

(1)
$_{0}u_{1}$ and got back
$_{1}v_{0}$ it was a tent show
.w, she was laying on a cot with an ice bag on her head.
.x; She hadn't committed suicide.
.y. But – however – that settled it for the day.

In this example, "was laying" is in temporal order; it can be displayed before the free unit v and after the restricted unit x, but not before u or after y without changing the temporal sequence of the semantic interpretation. There is considerable semantic and syntactic interest in the questions raised by this use of the past progressive,[5] and many other such issues are raised by the data of narrative analysis; however, this article is confined to the description of the basic units and framework of narrative, and such questions are not pursued here.

In general, the present perfect does not appear in narrative.[6] The past perfect, as noted before, does not function as a narrative head. However, if the clause with the past perfect refers to an event developed in the narrative, rather than to some event preceding the entire narrative, as is the case in Clause x in Narrative 1. Although x would have been true in initial position, it would not have referred to the particular suicide threatened in Clause k. In its present position, x asserts that the threat of k was not consummated at some time prior to the moment in which x is stated – necessarily before the next preceding narrative unit. Therefore, x can be placed before the disclosure of w, at any point after k. It can also occur at any point after the disclosure w with no change in temporal sequence.

A series of past perfect narrative heads can be used to describe a set of events in temporal sequence, placing the entire set at some point prior to the preceding narrative unit.

(2)
$_{0}nn_{1}$ I walked over there
$_{0}oo_{18}$ And here he was;
$_{0}pp_{17}$ one of my tame ducks that I had tethered out there had got the strap off her leg,

$_{43}$qq$_{16}$ and had gone out there,
$_{30}$rr$_{15}$ and when this fellow shot he hadn't hit the duck.

It is true that the three clauses pp, qq, and rr are here in temporal sequence. But no permutation of their order will produce a different temporal sequence in semantic interpretation:

$_{0}$oo$_{18}$ and here he was
$_{28}$rr$_{17}$ and when this fellow shot he hadn't hit the duck
$_{43}$qq$_{16}$ one of my tame ducks that I had tethered out there had gone out there
$_{44}$pp$_{15}$ She had got the strap off her leg.[7]

As indicated by the subscripts, pp and qq are free clauses, and rr is restricted – it cannot precede the shot itself, but can follow at any later point.

Related Narrative Sequences

The definitions we have given for narrative units are deliberately applied to the linear sequence presented by the narrator. This linear sequence may be considered the *surface structure* of the narrative; there are often many narratives with rather different surface structures, but with equivalent semantic interpretations. In the same way, there are many sentences with different surface structures that correspond to the same underlying string of formatives in the original phrase structure of a grammar:

a The rock say "shhh!"
b "shhh!" is what the rock say
c What the rock say is "shhh!"
d It's a fact that the rock say "shhh!"
e The rock's saying "shhh!"

In previous discussions, we showed that for each series of events described in a narrative, there are other equivalent means of verbal statement besides narrative. There are also equivalent narratives with the same semantic (temporal) interpretation. It is useful to relate all of these to a single underlying form. just as sentences b through e are related to the simplest form, a. To do this, we must consider the fundamental semantic relation in narrative.

The semantic interpretation of a narrative, as we have defined it, depends on the expectation that the events described did, in fact, occur in the same order as they were told in. Thus the sequence

$_{0}$a$_{0}$ he attacked me
$_{0}$b$_{0}$ the friend came in

with temporal juncture between a and b, is equivalent in its semantic interpretation to

$_0a_0$ he attacked me
then
$_0b_0$ the friend came in

That is, the temporal juncture is semantically equivalent to the temporal conjunction *then.*

Of course, the a-then-b relation is not the only one at work in narrative. If it were, we would have only a succession of narrative clauses. One also finds implied relations between clauses such as a-and at the same time-b, or a-and now that I think back on it-b. But among these temporal relations, the a-then-b is in some sense the most essential characteristic of narrative. Some narratives (see Narrative 5) may use it exclusively, and every narrative must, by definition, use it at least once.

Though some of these relations are marked explicitly, the majority of them are implied by certain lexical and grammatical features. Moreover, these implicit markers are, in a given situation, often ambiguous: They may stand for more than one relation. Consider the following sequence from Narrative 4:

$_1b_?$ Martin Cassidy's mother give him some money
$_?c_0$ an' tell him to go get a bushel of peaches
$_0d_0$ an' he went down to Martin's house

Though both c and d are connected to the preceding clause by *and*, and though d is clearly ordered with respect to b, b and c are not clearly ordered. The lexical meanings of *give* and *tell* imply a possible simultaneity between b and c. If we substitute for *tell* a verb whose lexical meaning (virtually) denies the possibility or simultaneity with *give*, then b and c are unambiguously ordered:

$_0b_0$ Martin Cassidy's mother give him some money
$_0c'_0$ an' bring up a bushel of peaches from the cellar

One more important point can be drawn from this example. The two possible relations between b and c as they stand are b-then-c and b-and at the same time-c. not c-then-b. This again suggests that the x-then-y relation is the fundamental one in narrative, which is then added to or modified by marked lexical or grammatical forms.

Isolating Primary Sequences

If we give primacy in narrative to the a-then-b relation, we may wish to select the narrative sequence with the most explicit statement of this relation as the basic underlying form and derive other equivalent narratives from it. Such a basic form we term the *primary sequence.* As we will see, the derivation of other forms from the primary sequence has an important interpretation in the functional organization of the narrative structure as a whole. The procedure for isolating primary sequence can be set out as four steps, and illustrated by the following operations on Narrative 6, previously analyzed in Figure 1.

1. A displacement range is assigned to each clause of the narrative.
   $_0a_{18}\ _1b_{17}\ _2c_{16}\ _3d_{15}\ _4e_{14}\ _5f_{13}\ _6g_0\ _0h_0\ _0i_1\ _1j_0\ _0k_1\ _1l_0\ _0m_3\ _{13}n_5\ _6o_3\ _7p_2\ _0q_0\ _0r_0\ _0s_0$
2. Free clauses are moved to the beginning of the narrative.
   $_0a_{18}\ _1b_{17}\ _2c_{16}\ _3d_{15}\ _4e_{14}\ _5f_{13}\ _6n_{12}\ _7g_0\ _0h_0\ _0i_1\ _1j_0\ _0k_1\ _1l_0\ _0m_2\ _5o_3\ _6p_2\ _0q_0\ _0r_0\ _0s_0$
3. Restricted clauses are moved to a point as early as possible in the narrative without changing the temporal sequence of the original semantic interpretation.
   $_0a_{18}\ _1b_{17}\ _2c_{16}\ _3d_{15}\ _4e_{14}\ _5f_{13}\ _6n_{12}\ _7g_0\ _0h_0\ _0o_8\ _1p_7\ _2i_1\ _3j_0\ _0k_1\ _1l_0\ _0m_0\ _0q_0\ _0r_0\ _0s_0$
4. Coordinate clauses are coalesced to single units.
   $_0a\text{–}n_{91}g_{00}h_{00}o\text{–}p_{51}i\text{–}j_{00}k\text{–}l_{00}m_{00}q_{00}r_{00}s_0$

The string of 10 symbols given here represents the primary sequence of the narrative, in which the a-then-b relation is developed most explicitly. The operation of moving free clauses and restricted clauses as far to the left as possible is a method of minimizing the total amount of delay in the statement of any given event or condition. We can, in fact, define both of these as a specific operation: the minimizing of left subscripts.

Formally, we consider a narrative $c^1, c^2 \ldots c^i \ldots c^n$ with left displacement ranges $a^1, a^2 \ldots a^i \ldots a^n$, in which $0 \leq i \leq n$. A *left displacement function* $y(Ni)$ is defined for each permutation $N_1, N_2 \ldots N_m$ of the clauses $c^2, c^2 \ldots c^n$ that preserves the temporal sequence of the original semantic interpretation:

$$y(Ni) = \sum_{i=1}^{n} a^i$$

When $y(N_i)$ is minimal, any sequence c^i, c^j in which $DS(c^i) = DS(c^j)$ is rewritten as c^k and displacement ranges reassigned. The resulting string is the *primary sequence* of the series $N_1, N_2 \ldots N_m$.

We now proceed to show why in most narratives the linear ordering of clauses departs significantly from the order of the primary sequence. For this purpose, we will have to outline the overall structure of narratives as governed by narrative functions.

Overall Structure of Narratives

Orientation

Figure 1 shows a group of six free clauses occurring together at the beginning of Narrative 6. This is characteristic of most narratives to a greater or lesser degree. Of the 14 examples given in the beginning of this article, 11 have such groups of free clauses. When we examine these groups of free clauses in relation to referential function, we find that they serve to orient the listener in respect to person, place, time, and behavioral situation. We will therefore refer to this structure feature as an *orientation section:* formally, the group of free clauses that precede the first narrative clause. Not all narratives have orientation sections, and not all

orientation sections perform these four functions. Furthermore, some free clauses with these functions our in other positions. Finally, we find that the orientation function is often performed by phrases or lexical items contained in narrative clauses. Despite these limitations, the overall view of narrative shows that the orientation section is a structural feature of a narrative structure. When orientation sections are displaced, we frequently find that this displacement performs another function, evaluation, to be discussed later. Furthermore, we find that orientation sections are typically lacking in narratives of children and less verbal adults whose narratives fail in other ways to carry out referential functions, for example, to preserve temporal sequence. This is the case with Narrative 13, the narrative of vicarious experience from a television show, *The Man From UNCLE.* An interesting example is Narrative 5, where the suppression of full narrative structure is plainly motivated by the explicit reluctance of the narrator to identify persons and places. Here, as in many of the critical issues discussed below, it is essential to preserve the context of the narrative. Because such originating context is often missing and cannot be reconstructed in traditional folk tales, it is more difficult to relate analysis to the originating functions.

Complication

The main body of narrative clauses usually comprises a series of events that may be termed the complication or complicating action. In Figure 1, complicating action section of Narrative 6 runs from clause g to m.

In many cases, a long string of events may actually consist of several cycles of simple narrative, with many complication sections. This is the case with Narrative 2, the product of a practiced storyteller who is widely known in his community (Martha's Vineyard) as an expert in this traditional art.[8] The subdivisions of Narrative 2 are plainly marked by structural features to be discussed later, but in Narrative 13, this task is much more difficult and must depend upon informal semantic criteria.

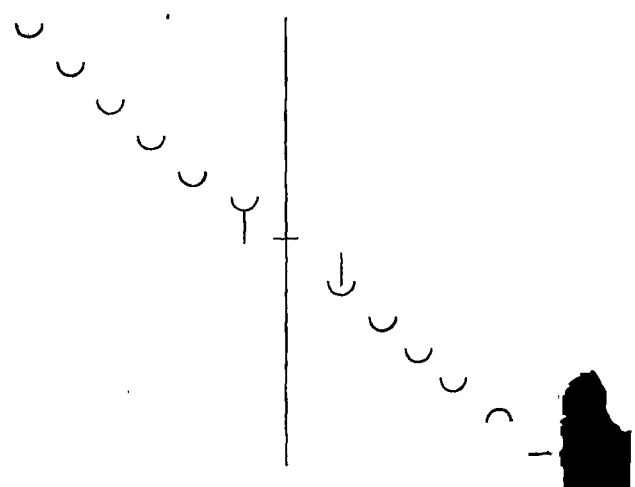
The complication is regularly terminated by a result, as in the simple Narrative 5: clause d – or perhaps c and d – is the result that ends the complicating action of a and b, as shown in Figure 2.

Figure 2: Overall structure of Narrative 5

To isolate the result in Narrative 5, we are forced to use semantic criteria that are often difficult to apply and seldom consistent. Without further functional analysis, it will usually be hard to tell when a narrative is actually over – when the result begins and when it has been given in full

Evaluation

Before proceeding to discuss the result of narratives, we would like to suggest that a narrative that contains only an orientation, complicating action, and result is not a complete narrative. It may carry out the referential function perfectly, and yet seem difficult to understand. Such a narrative lacks significance: it has no point. This is the case with Narratives 11 and 13. Narrative 11 is difficult to follow, although the complicating action and the result seem to be clearly stated.



(11)

$_0a_0$ See he- they threw him out, you know.
$_0b_0$ So he wanted to get back in, 'cause, you know, it was sn-raining hard.
$_0c_0$ So he got on this boat
$_0d_0$ and he tried to – go somewhere else.
$_0e_0$ And the boat went over.
$_0f_1$ And he tried to swim.
$_6g_6$ And this other man was fishing in the rain.
$_1h_0$ So he seen the pig
$_0i_0$ and he went over there
$_0j_0$ and picked the pig up
$_0k_0$ and put it in the boat
$_0l_0$ and brought it back to the shore, so he would land there.
$_0m_0$ And that was that.

There are 13 independent clauses, and 12 of them are narrative clauses. A diagram of displacement ranges for this narrative offers little justification for any internal segmentation (see Figure 3).

Narrative 13 is actually a very detailed statement of a sequence of events and their results – a series of at least three narrative cycles. Yet, the overall effect of

Clause	a	p
a	0	0
b	0	0
d	0	0
d	0	0
e	0	0
f	0	1
g	6	6
h	1	0
i	0	0
j	0	0
k	0	0
l	0	0
m	0	0

Narrative 13 is confusion and pointlessness. This is true for the whole narrative, which is actually 10 times as long as the extract.

Both Narratives 11 and 13 are examples of narratives of vicarious experience, not, as in the other cases, of personal experience. They are lacking the evaluation section that is typical of narratives of personal experience. When we compare Narrative 13 with Narrative 14, a narrative of personal experience, we can appreciate the great difference between unevaluated and evaluated narration.

Narratives are usually told in answer to some stimulus from outside and to establish some point of personal interest. For example, among the narratives given here we find many examples of narratives dealing with the danger of death. When the subject is asked if he were ever in serious danger of being killed, and he says "Yes," then he is asked: "What happened?". He finds himself in a position in which he must demonstrate to the listener that he really was in danger. The more vivid and real the danger appears, the more effective the narrative. If the narrative is weak and uninteresting, he will have made a false claim. (See Narratives 1, 3, 6, and 8.)

Beyond such immediate stimulus, we find that such narratives are so designed as to emphasize the strange and unusual character of the situation – there is an appeal to the element of mystery in most of the narratives. (See Narratives 2, 5, and especially 9.). Then, too, many narratives are designed to place the narrator in the most favorable possible light: a function which we may call self-aggrandizement. (See Narratives 7, 8, and especially 12.)

The functions of narrative have an effect on the narrative structure. A simple sequence of complication and result does not indicate to the listener the relative importance of these events or help him distinguish complication from *resolution.* We also find that in narratives without a point it is difficult to distinguish the complicating action from the result.

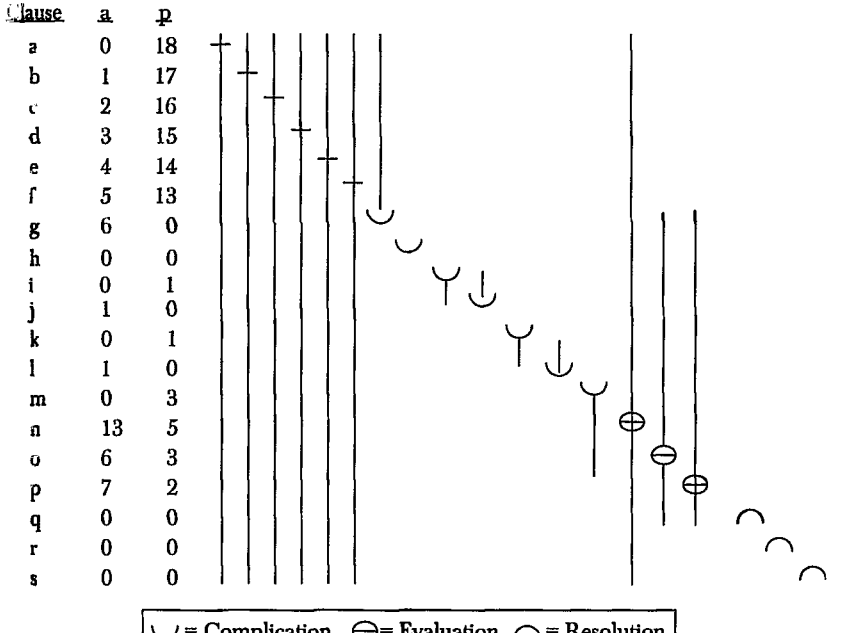
Therefore, it is necessary for the narrator to delineate the structure of the narrative by emphasizing the point where the complication has reached a maximum: the break between the complication and the result. Most narratives contain an evaluation section that carries out this function.

Many evaluation sections are defined formally. Multicoordinate clauses or groups of free or restricted clauses are frequently located at the break between the complicating action and the resolution of these complications. This is the case in Figure 1, for the clauses n, o, and p. As the narrator is going down, in the water, the moment of crisis is suspended by three clauses that do not occur in this position by any necessity of temporal sequence. They are restricted clauses that could have occurred much earlier in the narrative – in fact, before the first temporal juncture. After these three clauses, the narrative moves swiftly to a conclusion.

In many narratives, the evaluation section is fused with the result: that is, a single narrative clause both emphasizes the importance of the result and states it. This is the case with Narratives 3 and 12. In Narrative 3, the doctor's statement: "you'd a been dead" tells us simultaneously that the narrator was close to death and that he survived. The evaluation is here shown as related directly to the originating function – to demonstrate that the narrator was indeed close to death

In the case of Narrative 1, we find more than one evaluation section. Narrative 1 begins with a long orientation section of 10 clauses.

(1)



$_0a_{30}$ Well, in the business I was associated at that time, the Doc was an old man . . .
$_1b_{29}$ He had killed one man,
$_2c_{28}$ or – had done time.
$_3d_{27}$ But he had a young wife
$_4e_{26}$ and those days I dressed well.
$_5f_{25}$ And seemingly, she was trying to make me.
$_6g_{24}$ I never noticed it.
$_7h_{23}$ Fact is, I didn't like her very well, because she had – she was a nice looking girl until you saw her feet.
$_8i_{22}$ She had big feet.
$_9j_{21}$ Jesus, God, she had big feet!
$_{10}k_0$ Then she left a note one day she was going to commit suicide because he was always raising hell about me.
$_0l_0$ He came to my hotel. Nice big blue 44 too.[9]
$_0m_3$ I talked him out of it,
$_1n_2$ and says, "Well, we'll go look for her,
$_2o_1$ and if we can't find her, well, you can – go ahead, pull the trigger if you want to."
$_3P_0$ I was maneuvering.
$_0q_0$ So he took me up on it.
$_0r_0$ And we went to where they found her handkerchief – the edge of a creek –
$_0s_0$ And we followed down a little more,
$_0t_0$ And we couldn't find anything.
$_0u_1$ And got back –
$_{21}v_9$ it was a tent show –
$_1w_1$ she was laying on a cot with an ice bag on her head.
$_{12}x_7$ She hadn't committed suicide.
$_1y_0$ But – however – that settled it for the day.
$_0z_0$ But that night the manager, Floyd Adams, said, "You better pack up
$_0aa_0$ and get out, because that son of a bitch never forgives anything once he gets it in his head."
$_0bb_1$ And I did.
$_1cc_0$ I packed up
$_0dd_0$ and got out.
$_0ee_0$ That was two.

The first narrative unit is k ("Then she left a note one day . . ."), followed by l ("He came to my hotel") and m ("I talked him out of it"). We then have two clauses coordinated with m – clauses n ("And says") and o ("I was maneuvering."). These multicoordinate clauses suspend the action at a critical moment – when the danger of death is greatest, and they contain an explicit statement of the attitude of the narrator. His coolness in a moment of crisis emphasizes the danger and reflects well on himself.

Five narrative clauses follow this suspension, resolving the crisis introduced by l and m. A second evaluation section occurs at a subsidiary point when the situation is further resolved – the fate of the lady in question is determined, and simultaneously the immediate threat to the narrator. The action is suspended at this point by the use of a free clause that might have occurred in the orientation section, v ("it was a tent show"), and a direct comment, x, that might have been inferred from w. The resolution is stated with some finality in y ("that settled it"). Finally, there is an added explicit evaluation of a third party that confirms the implications of the previous evaluation section, followed by a conclusion. The overall diagram shows how evaluation sections outline the structure of the narrative.

It should be apparent here that the evaluation sections are responsible for those deviations from the order of the primary sequence of the narrative that complicate the a-then-b relation of narrative. The functions of the evaluation section must be added to the primary narrative function in order to understand how the primary sequence is transformed into the more complex structure that we see here. All of the evaluation sections shown here are related to the originating function of the narrative. From a structural point of view, the first section is the major break in the complicating action.[10]

Not all evaluation sections have the structural feature of suspending the complicating action, as shown in the Figure 4. In many cases, the evaluation may be present as lexical or phrasal modification of a narrative clause, or it may be itself a narrative clause or coincide with the last narrative clause. For this reason, the fundamental definition of evaluation must be semantic, although its implications are structural.

The *evaluation* of a narrative is defined by us as that part of the narrative that reveals the attitude of the narrator towards the narrative by emphasizing the relative importance of some narrative units as compared to others. This may be done by a variety of means:

Semantically defined evaluation:
1. direct statement: "I said to myself: this is it."
2. lexical intensifiers: "He was beat up real, real bad."
   "I whupped that dude half to death."

Formally defined:
3. suspension of the action:
   a. through coordinate clauses and restricted clauses: See Figure 1
   b. repetition (subtype of the above): See Narrative 2, at the moment of crisis when the dog is gone for the 3rd time: "And he didn't come back. And he didn't come back."

Culturally defined:
4. symbolic action: "They put an egg on his door."
   "I crossed myself."
   "You could hear the rosaries clicking."
5. judgment of a third person: here the entire narrative is reported to a person not present at the narrative.

Narrative 12 is a heavily evaluated narrative that shows three of these characteristic forms of evaluation. It is typical of many fight narratives in its two-part Structure. The first subcycle deals with the events leading up to the fight, and its conclusion is the beginning of the second subcycle, the fight itself. In this case, the evaluation of the first section is a statement of the narrator:

$_0d_0$ I told him that – it's impossible for him to find downtown.
'cause all those people were walking by, and just his father
is the only one that find it?

Although the very length of this closely reasoned argument serves to suspend the action, the structural criteria we have been using show it as a single narrative clause. We identify this clause as an evaluation on semantic grounds: It is an explicit statement by the narrator of his attitude towards the situation.

The conclusion of Narrative 12 is also an evaluative statement that coincides with the last narrative unit: The statement of a third person after the entire sequence of events is reported to him.

$_0j_0$ Then he start crying
$_0k_0$ and run home to his father.
$_0l_0$ And his father told him, he ain't find no glove

In addition, we have the evaluation of the act of clause i

$_0h_0$ So he say he give
$_0i_0$ And I kept on hitting him.

It is normal not to hit someone after he says "I give." This incident evaluates the narrative by indicating that the anger of the narrator was so great – due to excessive and unreasonable provocation – that he was carried away to the extent of violating this norm. The other boy had placed himself outside of normal sanctions by his behavior.

All of these forms of evaluation serve the function of self-aggrandizement, showing the narrator in a favorable position as compared to the other boy. It is evident that there are a great variety of evaluation types, more or less deeply embedded in the narrative. But this variety should not obscure the fact that unevaluated narratives are exceptional as representations of personal experience, and unevaluated narratives lack structural definition.

An important characteristic of narratives is the degree of embedding of the evaluation in the narrative framework. There is a wide range, from the most highly internalized type – a symbolic action or the evaluation of a third person – to the most external – a direct statement of the narrator to the listener about his feelings at the time. In the examples given previously, we find internalized evaluation in Narrative 1, in the dramatic statements of narrator and manager; and in Narrative 3, in the statement of the doctor, ("just about this much more," he says, "and you'd a been dead."). The last narrative, Narrative 14, has a dramatic statement of the narrator ("I say, 'Calvin, I'm bust your head for dat.'").

Sometimes the evaluation occurs in a statement of the narrator to himself, less well integrated into the narrative, as in Narrative 7: "So I says to myself, 'Well, there's gonna be times . . .'".

The other end of the scale is shown by a comment at the end of the narrative directed towards the listener, as in Narrative 13: "Just over two dollars that he was sent for peaches with." Still more direct is Narrative 2: "I'll tell you if I had ever walloped that dog I'd have felt some bad."

We might construct a scale of degrees of embedding of evaluation, following examples of the following sort:

Internal ↑
1. And when we got down there, her brother turned to me and whispered, "I think she's dead, John!"
2. And when we got down there, I said to myself, "My God, she's **dead!**"
3. And when we got down there, I thought, "She's dead."
4. And when we got down there, I thought she was dead.
5. Later, the doctors told us she was close to death.
6. I think she must have been close to death.

↓ External
7. You know, in cases like this, it's clear that she was likely as not dead.

Resolution

With this definition of evaluation, we can now return to the problem of defining the result of a narrative. The problem is now quite simple. We can establish the break between the complicating and resolving action by locating the place

of the evaluation. Thus, the *resolution* of the narrative is that portion of the narrative sequence that follows the evaluation. If the evaluation is the last element, then the resolution section coincides with the evaluation. In the examples given previously, the complicating clauses are symbolized ∪ and the resolving clauses ∩.

Coda

Many narratives end with a resolution section, but others have an additional element that we may call the *coda*.

The actual sequence of events described in the narrative does not, as a rule, extend up to the present. The coda is a functional device for returning the verbal perspective to the present moment. This is accomplished by a variety of means, so that the codas cannot be identified by such simple tag lines as "And they lived happily ever after."

a. One device used in a coda is *deixis*. This is the linguistic category that points to a referent instead of naming it explicitly: In this case, it has the effect of standing at the present moment of time and pointing to the end of the narrative, identifying it as a remote point in the past.

(1)
$_0aa_0$ I packed up
$_0bb_0$ and got out.
$_0cc_0$ That was two.

(7)
$_0bb_0$ That was one of the most important.

(8)
$_0gg_1$ And that – that was it, you know.
$_1hh_0$ That was it.

(11)
$_0m_0$ And that was that.

This use of the obviate deictic category – *that, there, those* – contrasts sharply with the use of the proximate in the body of the narrative – *this, here, these*. For example, we have the following proximate evaluation in Narrative 8:

(8)
$_0bb_0$ and they was on me and
$_0cc_0$ and I said "Like this is it, man."
$_0dd_0$ I pulled a knife

b. Another device used in codas is an incident in which one of the actors can be followed up to the present moment in actions that may not be totally relevant to the narrative sequence:

And you know that man who picked me out of the water?
he's a detective in Union City,

c. The effect of the narrative on the narrator may be extended to the present moment:

I was given the rest of the day off,
and ever since then I haven't seen the guy, 'cause I quit.
I quit, you know.
No more problems.

It is interesting to note that all codas are separated from the resolution by temporal juncture. At the same time, it seems that some semantic criterion is necessary to identify codas: The fact that they are frequently not descriptions of events, or of events necessary to answer the question: "What happened?"

The overall structure of the narratives that we have examined is not uniform; there are considerable differences in the degree of complexity, in the number of structural elements present, and how various functions are carried out. However, a composite view of narrative performance leads us to posit a *normal form* for oral versions of personal experience; the degree to which any one narrative approximates this normal form is a significant fact about that narrative – perhaps more significant than any other in terms of fulfilling the originating function of the narrative.

The normal form is quite distinct from the primary sequence of the narrative. As noted above, the need for an evaluation section motivates the transformation of the primary sequence into the more characteristic normal form that appears in the linear sequence presented by the narrator.

One can represent the normal form of narrative using the diagram in Figure 5. Here the originating function of the narrative is applied at the base of the diamond; we proceed up and to the left with the orientation section, then up to the apex with the complication. Frequently, but not always, the evaluation suspends the action at this apex, as represented by the circle. The resolution proceeds downward and to the right, and the coda is represented by the line that returns to the situation (point in time) at which the narrative was first elicited. The simplest possible narrative would consist of the single line of the complication,

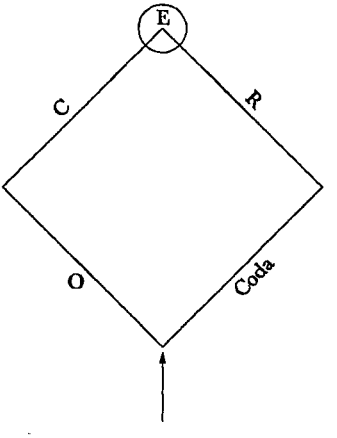


Figure 5. The

without a clear resolution; frequently we find minimal narratives that have both complication and resolution ("He hit me hard and I hit him back"). As we proceed to more complex narratives, told by speakers with greater overall verbal ability. we find a higher percentage of narratives that duplicate the exact form of this diagram. Perhaps the most frequent variant is the case in which the evaluation ends the resolution: jokes, ghost stories, and surprise endings take this form. as the story is reshaped by many retellings.

Conclusion

This view of narrative structure helps us to answer the two questions raised at the beginning of this discussion. First, we have related the sequence of narrative elements to the inferred sequence of events in the experience that is being recapitulated, through the definitions of narrative units, restricted clause, free clause. and narrative clause. Secondly, we have outlined the principle elements of simple narratives that perform both referential and evaluative functions. We have shown that the evaluative function requires the transformation of the primary sequence. based on the a-then-b relation, into the more complex normal form of the narrative as presented by the narrator.

With this framework, we are beginning to analyze relative effectiveness and completeness of narrative structure among various subgroups of our population. and, furthermore, to analyze the more complex types of narration developed by skilled storytellers and preserved by oral tradition. It is clear that these conclusions are restricted to the speech communities that we have examined. This view of narrative structure will achieve greater significance when materials from radically different cultures are studied in the same way.

Acknowledgment

The work described in this article was supported in part by the U.S. Office of Education in connection with Cooperative Research Branch Project No. 3288, "A Study of Non-Standard English of Negro and Puerto Rican Speakers in New York City," under the overall program of Project Literacy.

Notes

This article was originally published in *Essays on the Verbal and Visual Arts: Proceedings of the 1996 Annual Spring Meeting of the American Ethnological Society* (pp. 12–44), edited by June Helm, Seattle: University of Washington Press. Copyright 1967 by University of Washington Press. Reprinted with permission.

1. The materials include: 70 interviews with speakers from various occupations. ethnic membership, and ages on Martha's Vineyard, Massachusetts; 230 interviews with speakers representing a stratified random sample of the Lower East Side of New York City; 250 interviews of children and adults from our current research in Central Harlem and 50 interviews from exploratory work in Cleveland, Boston, Philadelphia,

Chicago, Phoenix, and Beaufort County, South Carolina. The basic interview techniques are described in Labov (1964, 1966) and Labov, Cohen, and Robins (n.d.).

2. In our current research in Central Harlem, we are concerned with the functional conflicts between standard English and the nonstandard English of Black and Puerto Rican children. Many of these children show great verbal ability in many areas, including the construction of narratives, but cannot read at all. One purpose of this work on narrative analysis is to show how children use language to carry out the functions that are important in their system of values.
3. As in, "We were running, walking, and then creeping down the road." We might better say that an apparent appositive turns out to be a coordinated clause. Coordinate verbs are always analyzed separately if they are independent, and in most cases in which they are subordinated to verbs of saying and telling. See Narrative 2, which follows: "I said, 'You git back there/and get that duck.'" If the narrator had cited himself as saying, "You get that duck and get back there," he would have been reversing the inferred sequence of events – in this case, two utterances. The same argument holds for the example in Narrative 1 (cited previously), clauses n and o. On the other hand, if someone says: "You try and get it," we cannot understand these as two independent verbs, but rather the use of "and" is equivalent to an infinitive embedding, the same as "You try to get it."
4. As noted previously, the subordination of "get back there" and "get that duck" to "I said" is not the type of subordination that removes clauses from temporal sequence. We can consider this coordination: "I said, 'You git back there,' and I said, 'You get that duck.'"
5. If "was laying" is accepted as a narrative clause, it cannot have the basic grammatical meaning of "simultaneous" as stated by Diver (1963). It would rather differ from the simple past *lay* by the feature "extended." The meaning of "simultaneous" can be supported by arguing that these clauses are equivalent to "When we got back, she was laying . . ." In other cases, Diver pointed out, the use of the past progressive may force a metaphorical interpretation "the action was so swift that it was as if it was simultaneous with the preceding," as in "I was on the masthead; the ship gave a lurch; I was falling through the air; I hit the water." These and other interpretations can be subjected to an increasing number of empirical tests through the analysis of narratives such as the ones given here.
6. Diver (1963) showed this form in his narrative axis with the meaning of "present, before," and gives a constructed example: "All day the sun has warmed the Spanish steps . . . ." One can find such examples in literary works that use historical present sequences freely, perhaps, but they have not occurred in the material we have examined to date.
7. Here the usual adjustments in anaphoric reference have been made. It may be noted that this series of past perfect clauses is one answer to a difficult problem produced by a narrative of this type. The result would lose its surprising effect if these clauses were placed in narrative sequence with regular preterit verbs. By placing the three clauses well out of temporal sequence, it is more difficult for the listener to follow the explanation and surprise is achieved at the risk of a certain awkwardness and confusion. Again, we find that even partial success signals the fact that the narrator of Narrative 2 is a practiced storyteller and has probably told this story many times. We do not take narratives of this type as primary data.
8. As noted previously, Narrative 2 has many formal features that set it aside from the others and identify it as the product of a practiced storyteller. One can point to the embedding of an essentially anonymous "other" in the complicating action, frequent if traditional metaphor, the triple subcycle typical of [illegible]

repetition, and also the determination shown by the narrator in introducing the story. The preliminary material illustrates how a narrator of this sort will get the topic of his favorite stories into the conversation despite the fact that the original stimulus was only marginally relevant. The transition of the interview theme was accomplished solely by the subject, and the actual stimulus for the narrative was his own.

Despite the fact that features appear in this narrative that are distinct from the simpler examples, a formal analysis of Narrative 2 is possible only after consideration of the simpler narratives or, at least, a formal analysis based on such functional considerations as we have introduced.

9. The phrase "Nice big blue 44 too" might as well be considered a narrative clause, derived from "He had a nice big blue 44 too." However, the status of *had* as the head of a narrative clause is still at issue, and it would be tendentious to use a deleted form as evidence. We have therefore been treating this phrase as subordinated to "He came to my hotel," equivalent to "with a nice big blue 44 too."
10. The three evaluation sections of Narrative 1 raise the possibility that we can analyze this narrative as consisting of three distinct subcycles: that it is a complex narrative consisting of three structural units. This article is limited to the consideration of simple narratives, and this possibility must be postponed to a later study of subcycles and complex narratives.

Gender, Discourse and Semiotics: The Politics of Parenthood Representations

Michelle M. Lazar

Introduction

The aim of this article[1] is to examine the politics at work in representations of parenthood in a national, government advertising campaign in Singapore. Although it is not uncommon these days to find egalitarian or **symmetrical** models of parenting in the media, this is not to say that the more traditional, **asymmetrical** division of labour between women and men in this domain has disappeared. The asymmetry may not be as blatant as it was decades ago, but as this study will show, it continues to thrive in sometimes less obvious and seemingly innocuous forms. The particular concern of this article is to examine the **coexistence** of both symmetrical and asymmetrical forms of representation of parenthood in the same ad or set of ads. The dynamics of the two will be analysed in terms of what I call the Discourse of Egalitarian Gender Relations and the Discourse of Conservative Gender Relations, respectively.

Representational practices are deeply political in at least three key ways. The first involves the question of **relative** representation and non-representation who is represented (or not) in what ways **in relation** to the other? Secondly, there is the issue of **modes** of representation – how is representation achieved textually? What linguistic and non-linguistic resources are deployed, and in what ways? The two points intersect with the third, which is an interrogation of the **power dynamics** at work – what does the representation/non-representation tell us about the (changing or unchanging) contemporary balance of power between, in this case, women and men in the domain of parenthood? Whose interests are served by it, and whose suppressed? Part of the interrogation of interests, in this study, inevitably includes the stake the state has in these representational practices, and the support (or otherwise) for particular orderings of gender relations.

Source: *Discourse & Society* vol. 11, no. 3, 2000, pp. 373–400

In what follows, I will begin by locating the present study in terms of the socio-political context of Singapore, and also in relation to previous work that I have undertaken in this area. This is followed by a discussion on the view of 'discourse' adopted in the study, and a case for the inclusion of multisemiotic analysis in the study of discourse. In the succeeding section, I will present the analysis of the two apparently contending discourses of gender relations (the Egalitarian Discourse and the Conservative Discourse) in the advertising campaign in question, which I refer to as the 'Family Life' ads.[2] In the campaign, approximately 14 of the ads deal with representations of parenthood;[3] a brief description of these is outlined in the Appendix. I will conclude by summarizing the findings of the analysis, and suggesting that far from being straightforward, the Conservative/Egalitarian distinction itself is in need of problematization.

The Study in Context

The present study is part of a larger project on a critical discourse analysis of gender (and sexuality) in Singapore's Family Life advertising campaign that I have undertaken over several years. This campaign arose from the changed, pronatalist fertility policy actively pursued by the government of Singapore since the 1980s. At that time the government had become concerned with the rapid decline in the country's birth rate, both in terms of the 'quantity' of births (i.e. nationally), as well as with the 'quality' of births (i.e. the better-educated segment of the population, in particular, were reported as markedly under-reproducing). Amongst the various measures undertaken in order to rectify the situation was the inception of the national, multi-media 'Family Life' advertising campaign. It needs to be said that the launching of such a campaign in itself is quite unremarkable in the Singapore context, which may be dubbed a 'campaign country'. Historically, since the present leadership came to power 41 years ago, an assortment of national campaigns have been utilized as regulative instruments in the service of social engineering. The present campaign under study is no exception.

The 'Family Life' campaign is a two-pronged endeavour: one half of the programme is targeted at single women and men, encouraging them to get married. and another, concurrent, half is addressed to those already married, urging them to have babies soon. In an earlier paper to *Discourse & Society* (1993), I had dealt in part, with the 'first' half of the campaign. In the present paper, my focus is on the 'second' part, in which I am specifically interested to ask what it means in these ads for women and for men to become parents, and what are the power dynamics at work in and through these representations.

In order to appreciate the workings of the Egalitarian and Conservative Discourses of Gender Relations that are co-present in the 'Family Life' ads (and, as we shall see, the complexity of their inter-relationship), it is necessary first to consider why it is that childbearing had become generally unpopular in Singapore, thus precipitating the inception of this national campaign. Apart from the effectiveness of the previous (now defunct) Family Planning or Limitation campaign, which had extolled the benefits of a small family, the practice of having

fewer children had become symptomatic of a coping strategy employed by many Singaporean women who were in the paid labour force. This is perhaps best understood in terms of what Bernard (1972) has described as the transition from the 'One Role Ideology' to the 'Two Role Ideology' (cited in Quah, 1994: 189). According to the 'One Role Ideology', women's roles were exclusively those of childbearing, childrearing and housekeeping. In the case of the 'Two Role Ideology', women's roles were extended to include paid work outside the home in addition to their original domestic responsibilities. In the 1960s and 1970s, when the government had urged large numbers of women to enter and stay in the paid workforce, many Singaporean women found themselves at grips with the 'Two Role Ideology'. The change occurring for women in regard to the public sphere, however, was not matched by concomitant changes in gender roles and expectations in the (distinctly separated) private sphere where housework and childcare were concerned. Optionally, some men have helped out in the home, but it has been just that – 'helping out' or 'lending a hand', which in itself is deemed praiseworthy. There is nothing remarkable, however, when women perform daily domestic chores and care for children – in addition to working outside the home – for that is considered 'women's work' anyway. With little restructuring of the gender order, this means that women in paid employment have come to hold two equally demanding jobs. Commenting to *The Straits Times* (Singapore's main daily), one (female) academic summed up the impact this has had on women:

> Anyone who has attempted to hold two jobs will understand why the key terms recurring again and again in women's letters to the press are 'exhaustion', 'guilt', 'conflict', 'burden', and 'tired[ness]'. They will also see why so many women try to curtail one job or the other – by dropping out of the work force or having only one child. (Heng, 1983)

In fact, some women have opted for childless marriages. Figures have shown that since 1980, the proportion of all ever-married women with no children had risen by a third, to 12 percent, in 1990 (Liak, 1994: 56). The majority, who would like to have children, have tended to postpone childbearing, or space out the birth of their children over a wider period (Fawcett and Khoo, 1980, reported in Hill and Lian, 1995: 150), and they generally have small-sized families. The number of births per woman, moreover, correlated directly with her educational attainment, which caused much consternation to Singapore's eugenic-minded leaders: they were worried that the better-educated class of women, whom they saw as having superior or more intelligent genes, were not reproducing sufficiently. There has also been a noted discrepancy between the numbers of children this class of women are generally willing to have compared to men of a similar educational background. In a relatively recent government survey, it was found that whilst most female tertiary graduates only wanted two children, most male graduates wanted three. The difference was explained by the fact that 'women were aware of the heavy responsibilities in the dual roles of being mothers and career women' (*The Straits Times*, 21 April 1997).

The double bind that has confronted women is not only asymmetrically apportioned at the level of private interaction between women and men, but is

underscored by various public policies and practices of the state (see Lazar, in press). Women are granted (almost) the same access to educational and employment opportunities as men, and are much needed for their economic productivity. However, at the same time, a range of state policies hold sacrosanct traditional, Confucian–Asian values that support men's position as heads of households,[4] and unequivocally emphasize women's reproductive and nurturing roles as mothers. Whilst women are urged to remain economically active, their maternal roles are prioritized for them, as the following rhetorical question by the former Prime Minister, Mr Lee Kuan Yew, makes amply clear: 'Do our women need to value their careers more than, and at the expense of, their families?' (*The Straits Times*, 19 February 1984).

Discourse and Semiotics

Discourse(s)

'Discourse' is here understood in Foucauldian terms to mean a set of related statements that produce and structure a particular order of reality, and which within that reality makes available specific subject positions. In this vein, I find it useful to think of discourse as a socio-historically contingent 'meaning potential' – to borrow a Hallidayan terminology – that both enables and constrains possible ways of knowing about the world, a sense of who we may (and may not be) within that world order, and how we may (and may not) relate to one another. In the domain of parenthood, this means that there is nothing inherently fixed about the identities of 'mother' and 'father', or in the way gender relations between them have tended to be structured. Rather, these are socially formed and fixed in and through discourse. We perceive these relations and identities in certain ways (say, motherhood as 'natural' and fatherhood as 'social') as a result of conventional ways in which the societies we live in have come to express and think about them. What is fixed, therefore, can be analytically un-fixed or dismantled. That is to say, discourses (and the realities and subjectivities that they make available) can be taken apart in such a way as to reveal that they are not immanent truths, but rather are constructed that way from particular positions that serve particular interests, whilst subordinating others.

In this study, I analyse the interplay of two discourses of gender relations that operate in the domain of parenthood: a **dominant** Discourse of Conservative Gender Relations, and a **counter** Discourse of Egalitarian Gender Relations. Both underscore the **relational** aspect of gender construction, that is, ways of being a 'woman' and a 'man' (or, as is the case in this study, 'mother' and 'father') are always explicitly or implicitly co-constructed one in relation to the other. The two discourses, however, structure this relationship in different, indeed (potentially) contradictory, ways. The difference is one of parity; specifically, whether possibilities for ways of being and becoming are equally available and interchangeable between women and men. The Conservative Discourse deriving

from a Confucian–Asian ethic favours a traditional, asymmetrical arrangement between the genders, whereby women and men each have gender-specific roles, responsibilities and expectations to fulfil. The Egalitarian Discourse, in contrast, which is motivated in part by feminism, strives for gender parity in all aspects of personal and public life. At stake in the two discourses is the balance of power between women and men as they enact their respective parental (and other, careerist) identities.

Bridging Discourse and Semiotics

A valuable insight worth importing into CDA from Foucault is that discourse is not equivalent to language use alone. In his view, discursive **statements** are not reduced to sentences and propositions, as is the usual understanding of the term 'statements' in linguistics. Indeed, discursive statements are not units or structures (in the way, say, that sentences are), but a **function** (or meaning) that operates as much through language as through other semiotic modalities. In other words, graphs, maps, classificatory tables, statistical calculations and algebraic formulae (Foucault, 1972) are as much forms of discursive statement as is language.

Extending from this conception of discourse, 'text' can be viewed as the multi-semiotic manifestation of discoursal meaning(s). Typically, however, many studies have tended to conflate 'discourse' with 'language' and therefore, by analysing only linguistic structures and meanings in texts, have had a restricted scope. And if images (for example) are also discussed, they have been considered separate from 'text' – a term which, like 'discourse', is reserved only for linguistic phenomena. What I propose, therefore, is the uncoupling of the two categories 'discourse' and 'language' in favour of discourse encompassing semiosis of various kinds (including language). A critical analysis of discourse, in other words, involves a commitment to the analysis of various strands of semiosis that configure in the realization of particular discoursal meanings in texts. The present study will demonstrate, for instance, how the interplay of language and visual images (including layout, gestures and actions) contributes to the manifestation of the two contending discourses of gender relations in the 'Family Life' texts. Not to attend concurrently to both modes of semiosis, in this case, would be to offer a less than complete analysis of discourse (Lazar, 1999).

Analysing Discourse

Discourse is analysable in terms of a set of representations that express a particular discoursal meaning (e.g. Conservatism or Egalitarianism). To give an example, part of the Discourse of Egalitarian Gender Relations in the 'Family Life' ads can be analysed in terms of particular representations of gender identities: the 'New Man' and the 'New Woman'. The aim of the analysis is to show up these various representations, singly and in constellation with others, which evidence the operation of a particular discourse in the text(s). This being the aim, the starting point of the analysis will be to identify types of representation articulated in

the ads, supported by an amalgam of textual structures and processes that cue these representations. The explication of textual resources involves the **interplay** of several categories of textual structure (be that linguistic, non-linguistic, or linguistic **and** non-linguistic) that work in tandem to manifest a particular type of representation.

In order to analyse the linguistic and visual structures in the texts I use the grammars of Halliday (1994), and Kress and van Leeuwen (1996), respectively. The various aspects of the grammars will be drawn upon in different degrees in the study. As many will know, Halliday's functional grammar is based on a view of language as simultaneously involved in three kinds of meaning-making:

- Ideational (representing the world 'out there' and our inner states – analysable in terms of participant types, processes, and circumstances).
- Interpersonal (enacting social relationships between participants – analytic categories include types of mood and modality choices).
- Textual (making connections within the text, and the text and its social context – analytic categories include thematic and information structures, and cohesion).

The grammar is analysable at the ranks of word, group and phrase, and clause and clause complex (sentence).

The analysis of the images in the texts is based largely on the grammar of visual design developed by Kress and van Leeuwen, following Halliday's theory of triple meaning-making:

- Ideational meaning is of two types: (a) narrative, which includes dual participant ('transactional') or single participant ('non-transactional') action and reaction (or perceptual) structures, realized by vectors of various sorts; and (b) conceptual, which includes classificational ('type of') and analytical ('part-whole') structures.
- Interpersonal meaning includes, amongst others, contact (or mood) – realized by eye contact; and distance or social affinity – realized by frame size and types of shots.
- Textual meaning (or composition) includes such categories as salience – realized by relative size and sharpness of focus; and information value – realized by relative position (centre or margin) within a frame.

My use of the visual grammar is supplemented by insights selectively drawn from Goffman's work on gender in advertisements (1979).

Analysis of Parenthood in Discourses of Egalitarianism and Conservatism

In this section I begin by presenting the analysis of the Egalitarian Discourse of

Gender Relations in terms of the interplay of linguistic and visual resources deployed in the ads. The two discourses are co-present within single ads, as well as across the intertextual spread of the 14 ads in the campaign. The basic distinction between the two discourses, as previously indicated, is one of gender parity, i.e. whether there is an equitable access to possibilities for being. In modern industrial societies, the issue of gender parity largely rests on the possibilities, and the extent of negotiation, that are available to women and to men between the private and the public spheres of life (i.e. between the home/the family and paid work/career).

The Discourse of Egalitarian Gender Relations

The Discourse of Egalitarianism in the ads is identifiable in terms of three types of representation: (1) the representation of parenthood as symmetrical for women and men; (2) the depiction of men in the domestic sphere as devoted, nurturing fathers; and (3) the portrayal of women as mothers as well as successful careerists outside the home.

Women and men One way that egalitarianism between the genders is construed in the ads is through an invitation to view parenthood as being identical for women and men. In many instances, women and men are collectively referred to as joint participants. For example, in terms of lexical choice the gender-neutral noun *parents* or *parenthood* is overwhelmingly favoured (over the gender-specific terms 'mother'/'motherhood' and 'father'/'fatherhood'). And in terms of the choice of pronouns, we repeatedly find either the collective *our/we* or the indefinite pronoun *you* (depending on whether the ad is presented from the first or second person point of view). In either case, gender is again elided, and it appears to represent women and men alike, as constituting a single undifferentiated unit. For example:

(1) *It's the most precious gift **parents** can give* (Lonely Child).
(2) *Becoming **parents** changes **our** lives completely*... (Something Wonderful Happened).
(3) *As **you** gaze at **your** child, **you** will feel so proud to be **parents*** (Experience The Joy).
(4) *Understandably, **parenthood** is a big decision* (Experience The Joy).

As a corollary of being referred to as joint participants, we also find in the above clauses that women and men are represented as sharing a common experience. They are affected by parenthood in the same way, and appear to respond to it identically. The representation of egalitarianism expressed in the language structures, moreover, finds visual support in one of the (print) ads. In *Something Wonderful Happened*, the symmetry is striking on two counts. The couple are shown in a joint action process of pushing a baby stroller together, thereby showing that what they are doing is a joint endeavour. In addition, the couple are portrayed as distributed symmetrically across the picture space (i.e. they are at equal distance from each other, and are roughly equal in size and orientation), which according to Kress and van Leeuwen (1996: 88) expresses a 'covert taxonomic

the ads, supported by an amalgam of textual structures and processes that cue these representations. The explication of textual resources involves the **interplay** of several categories of textual structure (be that linguistic, non-linguistic, or linguistic **and** non-linguistic) that work in tandem to manifest a particular type of representation.

In order to analyse the linguistic and visual structures in the texts I use the grammars of Halliday (1994), and Kress and van Leeuwen (1996), respectively. The various aspects of the grammars will be drawn upon in different degrees in the study. As many will know, Halliday's functional grammar is based on a view of language as simultaneously involved in three kinds of meaning-making:

- Ideational (representing the world 'out there' and our inner states – analysable in terms of participant types, processes, and circumstances).
- Interpersonal (enacting social relationships between participants – analytic categories include types of mood and modality choices).
- Textual (making connections within the text, and the text and its social context – analytic categories include thematic and information structures, and cohesion).

The grammar is analysable at the ranks of word, group and phrase, and clause and clause complex (sentence).

The analysis of the images in the texts is based largely on the grammar of visual design developed by Kress and van Leeuwen, following Halliday's theory of triple meaning-making:

My use of the visual grammar is supplemented by insights selectively drawn from Goffman's work on gender in advertisements (1979).

Analysis of Parenthood in Discourses of Egalitarianism and Conservatism

In this section, I begin by presenting the analysis of the Egalitarian Discourse of Gender Relations, followed by the analysis of the Conservative Discourse of

Gender Relations in terms of the interplay of linguistic and visual resources deployed in the ads. The two discourses are co-present within single ads, as well as across the intertextual spread of the 14 ads in the campaign. The basic distinction between the two discourses, as previously indicated, is one of gender parity, i.e. whether there is an equitable access to possibilities for being. In modern industrial societies, the issue of gender parity largely rests on the possibilities, and the extent of negotiation, that are available to women and to men between the private and the public spheres of life (i.e. between the home/the family and paid work/career).

The Discourse of Egalitarian Gender Relations

The Discourse of Egalitarianism in the ads is identifiable in terms of three types of representation: (1) the representation of parenthood as symmetrical for women and men; (2) the depiction of men in the domestic sphere as devoted, nurturing fathers; and (3) the portrayal of women as mothers as well as successful careerists outside the home.

Women and men One way that egalitarianism between the genders is construed in the ads is through an invitation to view parenthood as being identical for women and men. In many instances, women and men are collectively referred to as joint participants. For example, in terms of lexical choice the gender-neutral noun *parents* or *parenthood* is overwhelmingly favoured (over the gender-specific terms 'mother'/'motherhood' and 'father'/'fatherhood'). And in terms of the choice of pronouns, we repeatedly find either the collective *our/we* or the indefinite pronoun *you* (depending on whether the ad is presented from the first or second person point of view). In either case, gender is again elided, and it appears to represent women and men alike, as constituting a single undifferentiated unit. For example:

(1) *It's the most precious gift* ***parents*** *can give* (Lonely Child).
(2) *Becoming* ***parents*** *changes* ***our*** *lives completely*... (Something Wonderful Happened).
(3) *As* ***you*** *gaze at* ***your*** *child,* ***you*** *will feel so proud to be* ***parents*** (Experience The Joy).
(4) *Understandably,* ***parenthood*** *is a big decision* (Experience The Joy).

As a corollary of being referred to as joint participants, we also find in the above clauses that women and men are represented as sharing a common experience. They are affected by parenthood in the same way, and appear to respond to it identically. The representation of egalitarianism expressed in the language structures, moreover, finds visual support in one of the (print) ads. In *Something Wonderful Happened*, the symmetry is striking on two counts. The couple are shown in a joint action process of pushing a baby stroller together, thereby showing that what they are doing is a joint endeavour. In addition, the couple are portrayed as distributed symmetrically across the picture space (i.e. they are at equal distance from each other, and are roughly equal in size and orientation), which according to Kress and van Leeuwen (1996: 88) expresses a 'social [illegible] classification'.

belong to the **same** category of 'parents', rather than being classified according to the differential and value-laden roles of 'father' and 'mother'.

Commenting on the now widespread use of such gender-neutral terms as 'parenting' and 'parenthood', some scholars (e.g. Busfield, 1987) have noted that two different but related assumptions underlie their usage. Both of these support the egalitarian thesis put forward in this paper. The first assumption is that gender relations are becoming more symmetrical (as analysed above), and the second assumption is that men are becoming more involved in the day-to-day care of their children – which is the focus of the next sub-section.

Men The Discourse of Egalitarianism in relation to parenthood is also articulated in terms of a construction that is widely known in gender and cultural studies as the 'New Man'. This is a type of masculinity that has gained popularity in the (mainly Western) media since the 1980s, in response to feminism's critique of traditional forms of masculinity. A significant dimension of the modern New Man is a caring, sensitive and nurturing depiction of fatherhood – an involvement that is a far cry from 'authoritarian' or 'distant breadwinner' (Pleck, 1987, cited in Chapman, 1988) images of fatherhood in the past. According to this new portrayal, men are very comfortable with infants and very young children, and are expressive of care and emotion, which traditionally were seen to be the prerogative of women and motherhood. Indeed, what makes the New Father a part of the egalitarian discourse of parenthood is its breaking down of gender stereotypes. As Rutherford (1988: 34) describes, the New Father 'looks soft and gentle and, what's more, he's not afraid to show it'. Somewhat ironically, therefore, the egalitarianism appears to be based on the feminization of men.

In the 'Family Life' ads, the New Father is especially strongly represented in interactions between men and their newborn babies. The portrayal is jointly realized by visual representational structures as well as in compositional structures. In terms of the visual representational structures, three characteristic features of tenderness and emotional bonding are evident: cradling, intently gazing, and sweetly smiling at the baby. Quite obviously, cradling is a transactional action structure whereby the man (Actor) carries the infant (the Goal) gently in his arms. At the same time, however, the cradling is also indicative of an analytical structure that represents a compound relationship between the man as Carrier and the baby as an Attribute, which is visually seen to be extension of him. Coupled with cradling, are the reactional structures of smiling and gazing upon the infant in his arms.

Compositional structures, further, frame these depictions in ways that heighten their emotional value. Close-up shots are especially deployed for this purpose. So, for example, a close-up in *Your Family is Your Future* focuses on the facial expression of a young father, who gazes lovingly and smiles almost tearfully at his infant. Also, in *Something Wonderful Happened*, there is a close-up shot of a large male hand holding the very small hand of a baby to the accompaniment of the following reiterated adjective in the lyrics *'tiny fingers, tiny toes'*. Emphasizing the contrast in the size of the two hands, and the gentleness of the touch, evokes a heart-tugging quality of the father's sensitivity vis-à-vis the baby's vulnerability.

The tender, nurturing role of the New Father in these representations approximates so much to stereotypical constructions of motherhood that in a family shot in *Your Family is Your Future*, there is a reversal in the positions occupied by the father and the mother in relation to their baby. In contrast to traditional representations of the mother carrying the baby and the father protectively wrapping his arm around her shoulders (Goffman (1979) calls these 'shoulder-holds'), in this particular ad, it is the father who is shown cradling the baby, with the mother's arm around him.

The Sensitive New Man is constructed not only visually, but also linguistically:

(1) And *it was only then, as I took her [the baby] into my arms for the very first time and looked down into her tiny, perfect face that I realised my whole life had changed.* (Your Family is Your Future, TV)
(2) They're *[My children are] my life and my future.*
They are my hope, my strength.
The reason I can carry on. (Collage Ad, TV)

In these extracts we find an emotional response to the experience of fatherhood. (The first example from *Your Family is Your Future* is the verbal equivalent of the visual structures earlier analysed). They are both expressed from the first person point of view (*I, my*) and stress (via repetition of *my life*) that the lives of these men are profoundly affected by children (note die material processes: *had changed* and *(can) carry on*). Whereas the impact is succinctly encapsulated in the first of these ads via premodification (*my **whole** life*), this is elaborated over a series of identifying relational processes in the second ad, in which the father identifies himself wholly with his children.

More generally, too, many of the ads show men to be highly visible and actively involved in family life. Apart from representations of men as Actors in the visual structures of these ads, the men are also depicted in analytical terms. To take just one example, in the (TV) ad *Why Build Your Career Alone?* we are presented with various snapshots of a father playing a board game with his family, sitting alongside and watching his son do school work, and sitting with his family gathered around him. In all of these scenes, the man together with the other characters are represented as parts that make up 'the (whole) family'. Such a representation invites an interpretation of egalitarian gender relations, for here is a man who is portrayed as very much involved, and part of the everyday family scene.

Women Whilst men in the Discourse of Egalitarian Gender Relations are represented as involved participants in the domestic sphere, women in this discourse are shown as participants not only in the private but also in the public work space as well. This is a depiction of the modern 'New Woman', as opposed to traditional images of women as full-time caregivers at home. In two of the ads, *Make Room For Love* (TV) and *Babies and Careers* (Print), it is suggested that women can have a career and be successful at it, whilst also fulfilling familial roles. In *Make Room for Love*, this is conveyed in the depiction of 'Mrs Tan', a senior, newly retired career woman. Two pertinent aspects of her identity are revealed in the following congratulatory utterance by a younger (former) colleague: *You had a wonderful career, Mrs Tan.* The clause neatly brings together the woman's dual participation

in the public and private spheres: she is represented as Carrier both in terms of a career (and note the epithet *wonderful* to describe it) and in terms of marital status, indicated by the title *Mrs*. Later in the ad, Mrs Tan is also called *mom* and *granny* by another woman (her daughter) and two youngsters (her grandchildren), respectively, who enter the scene. 'Wife', 'mother', and 'grandmother' all belong within a common semantic field of familial identities attributed to this career woman. In other words, she is offered in the ad as an example of a woman who has had it all – a marriage, a family, and a successful career.

If the portrayal of Mrs Tan – someone of an earlier generation – appears optimistic, then the following declaration in *Babies and Careers* by a 29-year-old woman (the age group of the target audience) is even more heartening: *It's now easier to be successful in both [a career and motherhood]*. The choice of declarative mood together with categorical modality renders the proposition a simple undisputed statement of fact. These, plus the time indicators – *now* and *easier* (a comparative reference presumably being made to an earlier generation) – construe a 'reality' that purportedly reflects current, more enlightened times.

The Discourse of Conservative Gender Relations

Although thus far we have seen a discourse at work that promotes a symmetrical and egalitarian gender order, there is a concurrent overwhelming presence of the Discourse of Conservatism that maintains gender asymmetry in the ads. In what follows, I analyse the gender asymmetry in the construction of parenthood on two levels: (1) the systematically divergent roles performed by women and men within the domestic sphere itself, and (2) the different ways in which women and men may negotiate their respective parental identities **between** the private and public spheres of life. I shall first present the two-level 'asymmetry analysis' in regard to fathers, followed by the analysis concerning mothers. A discussion on the dynamics between the conservative and egalitarian discourses of gender relations will be undertaken in the concluding section of the paper.

Men

(A) Within the Private Sphere: In terms of the construal of the conservative discourse, let us now consider the (asymmetrical) representation of men's involvement in the private sphere. First of all, there appears to be a clear representation of gender role differentiation in the home front. Fathers are mainly depicted in executive (functional) roles, realized in transactional action structures. The role of the executor as Goffman (1979: 32) has noted, is typically performed by men and not women in representations where the two are co-present. To take an example, it is the fathers in the 'Family Life' ads who are consistently represented as the Actors operating such equipment as cameras and camcorders in family situations.[5] In *Something Wonderful Happened*, a young father uses a camcorder to 'record' images of his sleeping infant; in *Because That's Your Family*, the father sets up the camera and runs back to join his family in a self-timer shot; and in *Precious Moments*, the mother passes the camera over to the father to take a

photograph of their children playing together, instead of taking the photograph herself.

Fathers-as-executors extend to men's interactions with children. Fathers are commonly represented with sons, and in these interactions, men are shown in various ways directing their young sons in gendered play and behaviour. For instance, in *Because That's Your Family* (TV), the father is represented showing his son the mechanics behind the running of a toy train, and in *Kids Make You See* (TV), the father teaches his son to ride a bicycle. Even where the man is not in an active instructor or executor role (i.e. as Actor), we have a powerful representation in *Fam, Fam, Fam* (TV) of a boy learning gendered behaviour, nonetheless, from his father through observation and imitation. The father, shown leisurely reading the newspapers with his legs widely crossed, becomes the Phenomenon (or object) of his son's avid gaze, and his body posture and activity are directly replicated in the boy's subsequent actions. The boy's emulation (Phenomenon), in turn, does not go unnoticed by the father (Senser), who smiles approvingly to himself. In this way, the father is still shown very much in the executive role, only this time directing indirectly. Following Pleck (1987) (reported in Lupton and Barclay, 1997), who undertook a historical study of fatherhood in America, all these portrayals seem to support the more traditional, 'sex role model' type of fatherhood, which pre-dates the New Father.

Apart from the executor representation above, fatherhood (compared to motherhood) is largely construed in terms of fun and physical play. While the representation of men's involvement with children in this way is undeniable, it is asymmetrical in so far as gender roles and relations are concerned. Fun, play and popularity appear to be the prerogative of fatherhood and take centre-stage, whereas, as we shall see in the section on 'Women', support and routine care are largely left to motherhood, which is relegated to the periphery. Taking centrestage means that there is greater frequency in the portrayal of fathers' activities with children, and these appear saliently in relatively large shots (e.g. *Fam, Fam, Fam* (Print), and *Kids Make Your World Brand New* (Print)). Moreover, father–children interactions typically centre on leisure activities rather than on intensive day-to-day care-giving activities. This is indicative of differential understandings of care that apply to fathers as opposed to mothers: 'care', where fathers are concerned, is understood purely in terms of fun and relaxation. ('Care' and motherhood will be dealt with in the following section.)

The popular 'fun dad' representation is realized mainly through transactional action structures, In many instances, fathers are the Actors and their children are the Goal or Beneficiary[6] at or for whom the men's physically affectionate behaviour is directed. For example, a father is shown ruffling his son's hair, tickling and playing with him, nuzzling and kissing his children, and making funny faces at them (in *Kids Make Your World Brand New* (TV), *Kids Make You See* (TV), and *Fam, Fam, Fam* (TV)). In some instances, the roles are reversed, that is, fathers are the recipients and the children are the Actors. One such case is found in *Fam, Fam, Fam* (Print), where three young children (Actors) sitting on their parents' bed pillow-fight their dad (Goal), who good-naturedly receives the 'blows'

The playfulness of dads is also significant in portraying them as 'one of the kids', which accentuates their popular appeal. For example, in the same ad (*Fam, Fam, Fam*, TV), the father and children are united in their role as Actors, who conspire to 'steal' and eat cookies from the kitchen counter – cookies freshly baked by the children's mother. The representation of being 'one of the kids' is especially well expressed via a classificational (covert taxonomic) process. Preceding the cookie stealing shot, the father and children are identically represented as they place their heads one on top of the other, in a totem-pole fashion, forming a symmetrical vertical composition. As Kress and van Leeuwen (1996: 81) have observed, 'For participants to be put together in a syntagm which establishes a classification **means** that they [are] judged to be members of the same class and are to be read as such.'

It is important to bear in mind that representations of gender role differentiation – whether in terms of men's executive role or their 'fun daddy' role – are not simply about functional difference but, rather, are implicated in asymmetrical power relations. This is perhaps most striking in representations of fathers as heads-of-households. In *Why Build Your Career Alone?* (Print and TV) this is indicated by the central position occupied by the father in relation to members of his family. Such a shot demonstrates an exhaustive analytical structure, whereby the two adults and three children in this ad are parts (or 'Attributes') that altogether comprise 'the family' (the 'Carrier'). However, although the father is **one** member of the family (and one of **two** adults), he is represented as the most salient – literally the central – figure, flanked by his wife, who stands partially hidden behind him, and his children who encircle him in the front. Furthermore, other portrayals of him in relation to his family represent him as a Carrier himself, with members of his family represented as his Attributes. This interpretation of the analytical structures evokes a proprietal relationship, expressed by the man placing an arm around the shoulders of his family members. In one scene, he has an arm around the woman in the ad, which defines her in relation to him as **his** wife. and in another scene, the man has an arm around a little boy, which defines the child in relation to him as **his** son. Shoulder-holds[7] are a common enough gesture also found in other ads where men are represented with their family (for example. *Experience the Joy, Because That's Your Family*, and *Kids Make You See*).

What I have analysed so far in terms of the Discourse of Conservative Gender Relations are asymmetrical representations of men's roles in the family (i.e. in the private sphere) as (1) executors, (2) popular and fun dads, and (3) heads of households. In the next sub-section, I shall focus on how men are represented as being able to negotiate between their identity as fathers and their public work identity. *(B) The Public versus the Private:* In contrast to ads that address women, those directed at men construct a world in which men basically can have it all without significant tension. Three broad types of representation are found in the ads. which I will examine in turn: (1) the harmonious co-existence of a man's career with family life; (2) absenteeism of fathers on account of their careers as excusable: and (3) a family as beneficial to men's own self-interests.

First, in some ads family life and paid-work life are represented as co-existing harmoniously for men, that is, the identities of father and careerist are reconcilable without one compromising the other. The compatibility between the identities is enacted by bridging representations of men in the public and private worlds. The portrayal of men in the public world of work is signalled by the clothes they wear (long-sleeved shirts and ties),[8] i.e. men here are seen as Carriers whose professional identities are inscribed upon their bodies, and (optionally) also in terms of the representation of an office setting. Although the men, in these instances, are seen primarily in their professional capacity, their identity as fathers is quite easily co-enacted. This is explicitly the case in *Why Build Your Career Alone*? and *Fam, Fam, Fam*: the words *for dad* handwritten on a gift box and *dad* written in icing on a birthday cake, respectively, are displayed in the foreground. The men are shown in turn, via transactional actional or reactional structures, as claiming this identity. In *Why Build Your Career Alone*? (TV) the man is represented lifting the gift up from his office desk with a smile. In *Fam, Fam, Fam* the man, still in his office attire, is represented peering through the kitchen doorway of his home and being pleasantly surprised by a birthday cake being prepared for him by his family. The direction of his gaze forms a vector linking him (in his professional identity) to the cake with the words *Happy Birthday Dad* written on it.

Even where there are admissions that a man's career commitments may compete with his family role, this is rendered as expected and understandable. The following are two verbal examples from the *Collage Ad* (TV):

(1) even *though my work takes me away, when it comes to joy and dreams, my children are the key.*
(2) even *though my work takes me away, my children are my hope and joy supreme.*

The concessive (conjunctive) adjunct at the beginning of the clause complexes sets up a presupposition that men would be away on account of their career, and that this in itself is hardly surprising. Further, the choice of the material process attributes *my career* with an agency of its own, positioning the man himself as the unwitting Goal, haplessly 'taken away' from his family. The remainder of the clause complexes, moreover, appears to compensate the absenteeism by representations of effusive declarations of the importance of his children to him. Through the rhetorical strategy adopted in these clauses, absenteeism of fathers is accepted and forgiven, and not seen as a censure on men to better balance their twin roles. Further, the representations in the examples are one-sided: we are told of the effect children have on the father, but not the effect of his absence upon them. The latter is borne out by Phoenix and Woollett's (1991) observation that the existing literature on fatherhood rarely deals with the impact that fathers' frequent absences on account of their careers have on the development of their children.

Further to the representation of the unproblematic co-existence of family and career for men, men's careers are represented as positively enriched by family life. It is not only the case that, as we saw, fathers are showered with gifts and birthday

surprises from their family members, but that having a family is construed as positively benefiting their personal and career development. In two of the ads – *Why Build Your Career Alone*? and *Your Family* is *Your Future* – the family is portrayed in instrumental terms, as bringing about certain personal qualities deemed necessary for men's professional success. In the following clauses, the selection of material processes (in examples 1–4) and causative constructions (in examples 5–7) systematically represents family life as a helping, enabling agent, and men, on their part, as the recipients – the ones who stand to gain.

(1) *Family Life helps* (*Why Build Your Career Alone*? Print)
(2) *It also provides stability, encouragement and support* (*Why Build Your Career Alone*? Print)
(3) *It's broadened my horizon* (*Why Build Your Career Alone*? TV)
(4) *It gives you a direction, a purpose. And most of all, it gives you a future.* (*Your Family is Your Future* Print)
(5) *[. . .] a happy, well-rounded Family Life makes people wider in their outlook* (*Why Build Your Career Alone*? Print)
(6) *Family Life has made my life really good* (*Why Build Your Career Alone*? TV)
(7) *[It has] made me more stable, understanding and less selfish* (*Why Build Your Career Alone*? TV)

Men are also represented as active participants, but in clauses with mental processes. These convey men's response to the benefits they have received from having a family. The self-revelatory construals by means of the mental processes indicate the positive transformation family life has had on these men.

(1) *I've* ***learnt*** *a lot* (*Why Build Your Career Alone*? TV)
(2) *And it was only then, as I took her [the baby] into my arms for the very first time and looked down into her tiny perfect face that I* ***realised*** *my whole life had changed.* (*Your Family is Your Future* TV)

All these personal benefits accrued on account of having a family translates directly into men's professional success. Herein lies the instrumentality in men's involvement in family life; it enables the preservation and development of their own career interests. Nowhere is this raised so pointedly as in the ad *Why Build Your Career Alone*? (Print), where upon outlining the usefulness of family life (see examples of clauses above), the ad closes with the rhetorical question: *Isn't that what you need for a successful career*? The question presupposes that the answer is in the affirmative.

Another way that family life is construed as having an instrumental effect upon men's careers is that it is shown to imbue the pursuit of a career itself with greater, tangible meaning. Consider the following excerpt from *Your Family is Your Future* (TV):

Now for the first time, I seem to have a direction and a ***purpose*** (cl.7)
And *I know what I'd been working for all my life* (cl.8)
Not for money or status (cl.9)
I've been working for the future (cl.10)
And I know in my arms was the future (cl.11)

Here, by means of the conjunction 'and' (used twice), the instrumental link between family life and work life is established. On the first occasion (clauses 7 and 8), fruits of family life (*direction* and *purpose*) are causally linked (by *and*) to the realization of the significance behind the pursuit of a career. On the second occasion (clauses 10 and 11), the new realization concerning his career is tangibly reinforced in terms of the baby in his arms. The depiction of meaningfulness of one's career in this way, in fact, may be viewed in relation to what scholars such as Burgoyne (1987) have suggested about conventional styles of fatherhood, namely, that men tend to translate their new responsibilities as fathers in terms of an increased commitment to (paid) work.

Women

(A) Within the Private Sphere: In the preceding section, we noted that there were particular executive tasks in the family that almost certainly fell to men. Similarly, in this section, we shall see that most routine, practical care-giving tasks are reserved for women. What is most striking in the conservative discourse of gender relations is the way that motherhood is constructed as entailing total devotedness to others, whereas as we saw in the previous section, representations of fatherhood, to a large extent, looked to the preservation of the self-interest of men. In the final part of this section, we shall see how other-centeredness is also the operative principle behind the negotiation of the public and private spaces for women.

Firstly, let us consider the representation of women within the private sphere as mothers. By 'other-centeredness', I mean women's acute consciousness (or consideration) of their husbands and their children in the enactment of their motherhood identity. The implication to be drawn from this is that women derive self-fulfilment indirectly through the happiness and fulfilment of others.

Already, in the first instance of expecting a baby, women's experience of pregnancy and would-be-motherhood is defined almost entirely in relation to their husbands. Consider the following two scenes from the ad *Something Wonderful Happened*, where the would-be-mother is represented as responding directly to her husband's evident interest in having the baby. In the two scenes, the pregnant belly of the woman is the prime object of her husband's gaze and actions towards her. In the first scene, the husband's gaze is eye-level with his wife's abdomen as she emerges from a gynaecologist's office. The shot cuts to a close-up of the woman's face as she slowly meets her husband's gaze. Whereas his gaze is full of eager expectancy, her look is less certain, pensive, and searching. In other words, her own feelings and thoughts about having a child are unclear to us, but the fact that she locks eyes with him suggests a willingness to engage with him in terms of his evident interest.

The reactive (as opposed to the active or initiative) position of the woman in relation to her husband is also manifest in a later scene in the same ad. Triggered by her husband's action of leaning to keenly listen at her pregnant belly, the woman responds through a configuration of reciprocal transactional processes, whereby she looks and smiles at him (reactional processes) and kisses his forehead actional process). Whilst all those

about having the child is left unrepresented. What *is* represented, however, is her joy as a mother-to-be that is experienced on account of **his** paternal interest.

The only time a woman is represented as claiming motherhood as a self-determined choice occurs linguistically in *Babies and Careers: I want to be a mother. My life would be incomplete without kids of my own.* Notwithstanding the reason she gives for wanting children, she is represented here on her own terms, without reference to her husband. Clearly identified in the first person singular (possessive) pronoun, the woman is represented as the Senser, who desires motherhood, and explains the consequence that not having children would otherwise have on **her** life. However, one clause later, **her** wish gets subsumed within ***our*** wish, i.e. making sure that this is also what her husband wants:

> *We want someone else to make **our** lives complete. To finally make **us** a family and bring new meaning to **our** lives.*

The shift in pronoun from singular to plural, in other words, signals the similar sort of other-centeredness found in the representation of would-be-motherhood, as discussed earlier.

My point in earlier discussion is not that I find problematic representations of men being keen on fatherhood, or that women would want to consult their partners in parenthood. Such portrayals in themselves are fine; indeed, sharing and (men's) keen involvement, as we have seen earlier, make for an egalitarian model of parenting. My point, rather, is that whereas in these examples the experience of motherhood is directly defined vis-à-vis their husbands, the representation of fatherhood is relatively independent of their wives, since it only focuses on their own interaction with the children. Further, as I have shown in *Something Wonderful Happened*, the other-centeredness of women entails a submergence of their own dispositions on becoming mothers within their husbands' expressed desire for fatherhood. What may appear as a joint decision by couples to have children, therefore, may belie divergent and potentially conflicting views held by each party, and one party may be 'pressured' into having the baby. Burgoyne (1987) has found, for example, that men in partnerships with women who are highly career-oriented, or who wish to use commitment to parenthood as a means of cementing an insecure relationship, are more anxious to become parents than their partners, a situation which is borne out in the story-line of *Something Wonderful Happened*.[9] In the light of putting to work the principle of other-centeredness, I would argue that the 'pressure' placed on women may also be self-generated, thus obliging them to respond 'appropriately'.

Other-centeredness applies not only to wives' relationships with their husbands, but also to mothers' relationships with their children. In the 'Family Life' ads, one of the most powerful other-centred gestures mothers can express is to consider the interest of an only child by producing siblings for that child to grow up with. Consider the following extract from *Lonely Child* (TV):

> *You may give your child the best things money can buy* (cl. 1)
> *But the most precious gift of all is a brother or a sister* (cl. 2)
> *The most precious gift you can give your child is a brother or sister* (cl. 3)

What we find in the above is the construction of a 'giving' mother. A giving mother, by implication, is a Good Mother, someone who has the child's best interest at heart. The adversative conjunction in clause 2 suggests to mothers that they may be somewhat misguided, and directs them to choose what is set up as the ultimate thing that mothers can give to their only child. The full impact of the verbal text is best understood in the light of the visual portrayal of the child in the ad. In the visual image, in spite of being surrounded by toys of various kinds (cf. clause 1 above), the child is portrayed as aimless and miserable. The dissatisfaction of the child is conveyed in two concurrent grammatical structures: although the boy is in Actor position, holding a toy motor car in one hand, he is at the same time a Reactor in a non-transactional reactional process, who looks away from the immediate scene into the mid-distance. Similar to Goffman's 'licensed withdrawal', the child is physically present in the scene, yet mentally 'absent' from it. His sullen facial expression and listless body posture, moreover, suggest that he is not looking at anything in particular outside the picture frame, but is merely bored and unhappy. If the child is unhappy, the implication is that the mother has not been other-centred enough, not giving enough. In short, she has been a Bad Mother.

Clauses 2 and 3 in the extract (p. 389) are grounded, in this visual context, in which the onus is placed on mothers to ensure the happiness of the child by having another baby. From the point of view of the construction of other-centeredness in this discourse, this is a rather interesting expectation: women are encouraged to have more children – regardless of how they themselves might feel (cf. the discussion earlier in relation to men) – out of a sense of maternal duty towards their children. The onus on women is particularly emphatic in the print version of this ad: *But there's one precious gift, which only you can give – a brother or sister.* 'Only' accentuates the obligation women have as Good Mothers to keep their child happy by **giving** him or her a sibling. The final segment of the TV version of the ad concretely plays this out through the deployment of a transactional action process, whereby the mother, the Actor, gives a new-born baby, the Goal, over to the delighted boy, the Beneficiary.

Less dramatically, women are also represented in a range of gender-differentiated tasks that emphasize their other-directedness. Visually, this is manifested in transactional actional structures in which the mother is the Actor, and her family, the Goal or Beneficiary. For example, mothers are depicted towel-drying children's wet hair, baking cookies for the family, cheering and applauding children's efforts at tasks, getting children dressed and preparing them for public events, and taking care of children's safety at outings (*Fam, Fam, Fam* and *Because That's Your Family*). The gendered nature of the mundane care-giving tasks the mother performs is emphasized in contrast to what the father is shown doing at the same time, if co-present. To take one example from *Fam, Fam, Fam*, whilst the mother is represented as watching over the safety of her youngest son at the beach by holding on to his float, the father, although also represented as an Actor, is engaged in an activity entirely different in nature from the basic care-giving function performed by the mother. The father is shown enacting his 'popular dad' role by entertaining the child (and the child's siblings) by making funny faces at them.

The care function performed by mothers is not only different from the roles performed by fathers in the same settings, since mothers are also sidelined by the fathers' enactment of their 'fun daddy' role. Unlike the father, the mother is rarely the focus of the children's attention. Instead, she stands at the margin looking in at the bonding that goes on between the father and the children. The spectator role of the mother is realized by transactional reactional structures, where she is the Senser watching her husband, her children, and the interaction that transpires between those two, without being included in their activities. The implication is that women derive happiness indirectly through witnessing the happiness of others. Further, her own care-giving function (e.g. holding on to the boy's safety float) is **subsumed** within the father's interaction with the children. The implication is that the type of care performed by women taken for granted as something mothers do 'naturally', and is therefore quite unremarkable. Feminist scholars (e.g. Ann Oakley, 1974) have long criticized assumptions about the naturalness of motherhood, and the construal of motherhood as being the greatest achievement of women's lives, since these contribute to the perpetuation of women's disadvantaged status in relation to men (Lupton and Barclay, 1997).

(B) Between Private and Public Spheres: Let us now look at the representation of women in terms of their negotiation between the public and private spheres of life. One of the heartening aspects of the egalitarian discourse, which we saw earlier in the article, was that in encouraging motherhood, the pursuit of a woman's career was not overlooked. However, further analysis shows that the negotiation of the public in relation to the private spheres is remarkably dissimilar for women and for men. Whereas for men, the representation was that the two spheres are entirely compatible, for women, the relationship is fraught with tension. In the following examples from *Babies and Careers*, the two spheres of life are set up as co-existing contentiously, through a set of presuppositions.

(1) *I'm really excited about parenthood, but I also love my job.*
(2) *Babies and Careers. Who says you can't have both?*
(3) *How will you divide your time between the kids, housework, and the office?*

In Example 1, the use of the adversative conjunction sets up a presupposition that the two interests are conflictual. In Example 2, such a question can only be asked based on the presupposition that according to some discoursal point of view, it is inconceivable or problematic for women to have babies as well as a career outside the home. A further presupposition that arises from this is that (as in Example 1) babies and careers are incompatibly matched. The asking of the question in Example 3 also conveys presuppositions, namely that it is an extremely difficult juggling act, and that the need for time management between her public and private roles is a concern that is unique to her alone as a woman (since no indication is given of sharing the tasks with a partner). Note also the order of the list presented: *the kids* come first and *the office* comes last, suggesting an implied order of priority prescribed for women.

The fact that these utterances are even made suggests that women's experience of having a family and a career is markedly different to men's. The assumptions that underlie each of these examples are absent in the representation of men in relation to their career and family life. Nowhere is it questioned, though, why the tension should exist for women and not for men. Since men, as we have seen, can have it both ways without any problems, the issue clearly is not that one's public and private identities are inherently irreconcilable. Rather, what is at issue in these representations is the asymmetrical assumptions and expectations in regard to gender.

In constructing a world in which, for women, the twin pursuits of a career and a family are deemed problematic, the solution offered to women (and only women) is to self-regulate the two carefully; to strike a balance. Note the reiteration of this concern:

(1) *Oh, I'm sure you'll do very well, Lin. But do* ***balance*** *your career with a family.* (*Make Room For Love,* TV)
(2) *One of my major concerns right now is* ***balancing*** *family and career. But I have friends who have shown me that it can be done. A lot of Singaporean women are making that choice, too.* (*Babies and Careers*)
(3) *And along the way,* ***balancing*** *what's best by making the right choices and practical decisions.* (*Babies and Careers*)

The need for balance, furthermore, is represented in terms of choices and decisions that women are obliged to make. This is found in Examples 2 and 3 above. Also, it is found in *Make Room For Love* (TV): *There are choices we make today that we'll be living with for the rest of our lives.* In these three examples, note the reiteration of the word *choice* as well as the transitivity structures, in which women are represented as the Actors who (need to) make those choices. Further, note that *choice* in this conservative discourse does not connote freedom or the availability of a range of options. On the contrary, it suggests that women are **not** at liberty to pursue a career and a family anyway they like, but are constrained to select very particular options – which, according to Example 3 above, are deemed to be ***the right choices.***

Why is striking a balance and making the right choice so important when it comes to women? What is this 'right' choice? As we shall see, to balance a career and family does not mean giving the two equal weightage. Rather, it is tipped in favour of fulfilling the family role. Indeed as the analysis of the ad *Too Old* will show, the juggling act is construed as necessary in order to ensure that a woman's maternal role is accomplished. In other words, women's identity as mothers is prioritized for them as their primary identity. The cornerstone of motherhood is other-centeredness, and in the Discourse of Conservative Gender Relations, this is something that needs safeguarding. Thus, a career associated with self-fulfilment and self-directedness is regulated in relation to women's prioritized, other centered maternal identity. The regulation is achieved via two threats or sanctions on women: (1) the inability to bear (more) children as they get older, and; (2) the implication this has for women as deficient or Bad Mothers. These sanctions both

draw upon and reinforce the social disapproval of 'late motherhood'. Let us take each of the sanctions in turn.

The threat of inability to bear children is explicitly presented in the ad *Too Old*. The following is an excerpt from the print version of the ad:

> *Because while you're busy building your career* (cl.9), *or saving for your dream home* (cl. 10), *Mother Nature just won't wait* (cl.11).
> *The older you get* (cl. 12), *the more difficult it can be to conceive* (cl. 13).
> *You may find pregnancy a whole lot tougher* (cl. 14).
> *And the risk of something going wrong increases* (cl. 15).

Note that there is an implied causal relation here that is established linking a woman's career building (thematic clause 9) to her getting older (thematic clause 12). The ramifications of this are built up through a combination of lexical choices in clauses 13–15. The words *more difficult, tougher* and *risk* – accentuated by the comparatives (in the first two instances) and by the verb *increases* (that follows *risk*) – portray a consistently bleak, problematic scenario. Such an outcome, moreover, is constructed as inevitable, based on (the personified) representation of *Mother Nature* as an Actor following her own natural course. The threat of a reduced childbearing capability foregrounds the reproductive function of women, and uses that as a 'natural' justification for getting women (and, therefore, not men) to keep their careerist motivation in check. Further, the scare tactic employed here through an appeal to a (pseudo-)medical perspective on later motherhood ignores a host of other contending, liberatory views on the subject. These include advances made in obstetric knowledge; the fact that in previous generations women continued to have children until later in life; that in many respects women (in industrialized countries) are now healthier than ever; and the positive view taken by 'older' women themselves of becoming mothers after 40 (Woollett and Phoenix, 1991: 40, 220–1).

It is also the case that the threat of a diminishing childbearing capability is not represented in terms of how this would impact on women themselves, but on how it impacts on others in the family. Unlike representations of men and the family, therefore, the focus is once again fixed on other-centeredness. In *Too Old*, the inability to have children is not about the woman being childless, but about her not producing more than one child. And in this respect it is construed as a failure – **her** failure – to give her only son a sibling. Consequently, as we see in the following extract from the TV version of the ad, she is ascribed blame and guilt for depriving him of a brother or a sister. (The extract involves a boy of about six years old chatting with his friend, a girl.)

> Boy: [. . .] *And as for starting a family (14), mom and dad put that off for some more years. (15)*
> *And then they couldn't. (16)*
> Girl: *They had you, silly. (17)*
> Boy: *Eventually. (18) After a lot of trying. (19)*
> *But by that time, mom was getting so old. (20) The doctor said (21) it wasn't advisable to have any more children. (22)*

Girl: *That's awful! (25)*
Boy: *She was too old, you see. (26)*
[. . .]

The boy attributes blame for being an only child squarely on his mother: the demonstrative in clause 23 – ***That's why*** – refers to his mother being *too old* to have a safe pregnancy. Interestingly enough, although in clauses 14 and 15 he says that both his mother and father had delayed parenthood, when it comes to allocating blame, she alone is singled out. Note the shift from the co-ordinate structure *mom and dad* in clause 15 (and the third person plural in clauses 16 and 17) to the singular noun *mom* in clause 20. Subsequently all reference pronouns are in the third person singular feminine, whilst all traces of the father disappear. In this way, blame is asymmetrically apportioned. What is more, according to conservative discourses of mothering prevalent in developmental psychology, mother-blaming appears to be justified. Woollett and Phoenix (1991: 216) explain that studies in the field make an expressed link between mothers and children, such that mothers are held directly 'responsible' for the ways in which their children develop and behave. According to this reasoning, then, the loud complaining of the boy in *Too Old* is not seen as a reflection on him but as symptomatic of his mother's deficiency as a 'Good Mother'. Therefore, when she is blamed, this happens because she has 'asked for it'.

Conclusions

In this article I have suggested a view of discourse-as-meaning-potential that is jointly realised by (though not limited to) linguistic and visual structures and strategies. By arguing for the co-presence of two discourses of gender relations in the domain of parenthood in the ads, therefore, we have two sets of socio-historically contingent meaning potentials at work at the same time. This is indicative of the contemporary social order that Singapore finds itself in as it negotiates between competing forces of traditionalism (hence, the Discourse of Conservative Gender Relations) and modernism (hence, the Discourse of Egalitarian Gender Relations). The question I now want to address in this section is how the negotiation between the two discourses is accomplished in the text(s). Before I do this, however, let me recapitulate the analyses undertaken of the two discourses.

The Two Discourses in a Nutshell

In the Egalitarian Discourse, we saw the representation of identical parenting expressed gender-neutrally in such terms as 'parent' and 'parenthood'); the construction of the sensitive New Man, and the portrayal of the New Woman as someone who has career commitments outside the home. By contrast, we found that in the Conservative Discourse the relationships between the public and private spheres, and the involvement within the private sphere itself, were structured in markedly dissimilar ways for men and for women. In the home front, men

depicted as all fun and play. Moreover, there was no significant tension between their identity as fathers and their professional identity at work. The two were represented as coexisting well, absenteeism on account of their careers was excused, and family life was shown to enhance their self-interest.

A different picture emerged in the representation of women as mothers. Women were constantly encouraged to be other-centred, to the extent of their own self-effacement. In the private sphere, their experience of motherhood was defined in relation to the concerns of their husbands and children, and they performed gender-differentiated tasks that put the others in the centre, occupying a marginal and vicarious role themselves. We also saw that where a career was concerned, this was represented as causing tension, and that women were advised to strike a balance between a career and their families. The 'balance', too, was construed unequally, in favour of prioritizing women's family role, with the underlying threat that they might otherwise face personal and social censure.

The principle that underpinned the analysis of the two discourses was **relationality**, namely, how women and men were represented in relation to each other.[10] In so far as the Egalitarian Discourse was concerned, there was an evening out in terms of representations of gender responsibilities and expectations. The New Man and the New Woman representations, for example, worked in tandem to redress gender stereotypes; fathers had a strong presence in the home front, which has been traditionally the preserve of women, whilst women were portrayed as 'working mothers', disrupting the association of motherhood solely with the private sphere. In so far as the Conservative Discourse was concerned, the asymmetries in representation came into stark relief only when we looked through the lens of gender relationality. If the representations of motherhood and fatherhood are considered in isolation, these in and of themselves may not be faulted. However, where relationality becomes the interpretive principle in the analysis, this changes the complexion on matters. The question that gains prominence is how men are systematically represented in ways that women are not, and how women are systematically represented in ways that men are not. In other words, the politics of representation is one of relative presences as well as of relative absences that are organized along gendered lines. This is fundamentally an issue of power, since possibilities for ways of being (or not being) are unequally available to men and to women, and the inequity benefits one party at the expense of the other.

The Dynamics between the Two Discourses

What is the dynamic **between** the two discourses of gender relations in the Family Life ads? How are the two apparently dissonant discourses co-articulated in the same campaign without jeopardizing an overall sense of coherence? After all this is a strategic ad campaign launched by the Singapore government with very specific social and demographic goals and intended outcomes.

The two discourses, I would argue, are 'managed' in the ads via an implicit strategy of **disproportionate coexistence**. By this I mean that although certain egalitarian values may be present in the ads they are overwhelmed by a prevailing

conservative discourse that is simultaneously at work in the same ads, and which, as a result, renders the egalitarian virtues non-threatening. Further, I would argue that the 'brand' of egalitarianism supported in the ads is itself far from subversive. That is, it does not seriously undermine or challenge the conservative project, which is why the co-existence is even possible. It is an egalitarianism which can be accommodated and/or displaced by conservatism.

In the light of this, it is worth revisiting the three representations of egalitarianism discussed originally. Firstly, the neutering or de-gendering in the use of such terms as 'parent' and 'parenthood' requires scrutiny. At first sight, it suggests symmetry and the mutual sharing of roles and responsibilities. However, as we have seen, in the light of the predominant conservative discourse of gender relations, the apparent neutrality actually glosses over the unequal, gendered work that continues much as before. Further, the notion of sharedness is a tricky one. It encourages a view of gender role complementarity, whereby the functions performed by fathers and mothers are deemed 'different but equal'. Such a view, however, is deeply problematic in that it overlooks the structural arrangements in society that support not just dissimilarity, but a rigidly dichotomous and hierarchical gender order. In other words, we may critically ask what exactly is meant by 'sharing', what and how much is shared, and what this sharing entails for women and for men.

Secondly, it has to be stated that the New Man is not a subversive construction. Scholars in gender and cultural studies have pointed to the disjuncture between the media rhetoric of the New Man and men's actual contributions to childcare in reality. This is no different in the present study. Whilst images of fathers' interest and enjoyment of their children in the ads are heart-warming, there is little evidence to show that there is a significant redistribution of practical childcare responsibilities between fathers and mothers. Moreover, in the light of what I have shown in terms of men's negotiations between the private and public spheres, the New Man or New Father can easily be assimilated within the Conservative Discourse of Gender Relations. The New Man is not an antithesis of conservative masculinity, but may be viewed as a hybridized form of masculinity[11] that gets the best of both worlds with little significant cost to men. I would call this a **politically correct (PC) masculinity**, which is geared to appeal to modern women without sacrificing the benefits that accrue to conservative masculinity. As we have seen from the analysis, fathers stand to gain personally and professionally even though their type of involvement in family life is rather limited. An added dimension of PC masculinity is that it is a class indicator. Griswold (1993) (cited in Lupton and Barclay, 1997), for example, argues that the New Man is a middle-class phenomenon, whereby this class of men are shown up as modern and 'enlightened', setting them apart from the crude and overtly sexist working class men. In the Singapore case, the class argument is construed more broadly to include educational class.

Finally, like the New Man, the New Woman represented in the ads is insufficiently threatening to the status quo. An important characteristic of the New Woman is that she wants a modern career. However, she is not a careerist alone; as we have seen, she is typically represented as someone who combines a career with a family. In other words, already in the first [illegible]

the New Woman is grounded obligatorily, in part, in motherhood. (It is in the light of the conservative discourse that it becomes clearer that this part of her identity is unequivocally prioritized for her as her core identity.) Further, the depiction of the New Woman itself as a careerist-cum-mother is inherently problematic, in that it is based on rather dubious assumptions. Recall the following example from the egalitarian discourse that read: *It's now easier to be successful in both [a paid career and motherhood]* (Babies and Careers). *'Easier'* presupposes that at some point in time it had been 'easy' for women to balance the two, and that it has now become even easier.[12] However, one may challenge that premise by asking: has it ever been easy for women to manage the two jobs successfully? In leaving this unquestioned, however, I suggest that the New Woman construction blurs with that of a Superwoman. Far from being a liberating influence, this Superwoman assumption loads a further burden on to women. It presents them with an unrealistic ideal of 'having it all' unproblematically, and it denies the actual struggles experienced by countless women who are forced to cope with increasingly onerous private and public responsibilities. A very recent study by a sociologist in Singapore, in fact, reports that mothers who also worked outside the home struggled as a result of the high expectations placed upon them, as few duties in the home were shared between couples in dual-career families. (*The Sunday Times*, 18 September 1999). (Cf. Heng's quote on page 375; also recall the reasons earlier cited for Singaporean women's reluctance to become mothers. or to have fewer children.)

In sum, parenthood evidently means different things for fathers and for mothers. The analysis has shown that men have a lot to gain from becoming fathers. They have the option of being more, or less, involved in childcare; but either way, they are not tied definitively to this identity. An other-centered mothrehood, however, is a compulsory identity for women. It is an identity that has strategic importance for others: for children, for men/husbands, and for the state. It is little wonder that motherhood thus construed has long been considered by feminists as oppressive to women, for the needs of others are met at the expense of women's own desires, aspirations and empowerment (Koh and Wee. 1987; Lazar, 1993; Soin, 1996). A critical discourse analysis of media representations of parenthood, fatherhood and motherhood has shown how the disempowerment of women is discoursally maintained by the state in its efforts to boost national fertility rates. As we have seen, the discoursal mechanics are less than straightforward: although at first glance there appeared to be two contending threads of discourse running through the campaign, upon closer scrutiny. the two appear to be braided together. In other words, instead of providing a subversive (emancipatory) current, the discourse of egalitarianism is itself subverted (and deflected) by the discourse of conservatism.

Notes

1. An earlier version of this paper entitled 'Gender, Discourse and Semiotics: Asymmetrical Constructions of Parenthood' was first presented at a meeting on CDA at the University of Birmingham (UK), 6–7 April 1999.

2. I have named these the 'Family life' ads, based on the fact that the majority were produced by the Family Life Co-ordinating Unit specially set up under the Ministry of Finance.
3. Most of the 14 ads were produced in print and televisual media, which means that the total number of actual texts analysed is around 28.
4. Indeed, the original Women's Charter (1961) description of 'head of household', which had been gender-neutrally worded, was recently amended to ensure that only men could acquire the legal status of being the 'head of the household' and 'principal breadwinner' (Soin, 1996).
5. The depictions support an American study cited in Goffman (1979), which reported that 'the male head of household used the camera most of the time' (Chalton, 1975: 94).
6. Kress and van Leeuwen's (1996) grammar does not have 'Beneficiary'. This is a category that I have imported from Halliday's analysis of transitivity structures.
7. The shoulder-hold, although appearing to be an affectionate gesture, is clearly asymmetrical (Goffman, 1979). It is also evident between men, where someone senior can put an arm around his junior, but not vice versa. An example of this can be found in the interaction between 'Peter' (the protagonist) and his younger male colleague in *Why Build Your Career Alone?* (TV).
8. In Hallidayan linguistic terms, this is an attributive relational process that is intensive, i.e., the attributes describe what the Carrier 'is'.
9. In the 'story' of *Something Wonderful Happened*, it is the husband who wants the couple to try for a baby, in order to salvage their ailing marriage. They had drifted apart on account of their respective busy careers.
10. The importance of relationality is reflected in the names given to the two discourses: Egalitarian Discourse of Gender **Relations**, and Conservative Discourse of Gender **Relations**.
11. See also Chapman (1988), who uses the term 'hybrid masculinity' to refer to an adapted form of masculinity that is better able to retain control in contemporary society.
12. Another reading of the clause may be that it used to be hard for women to balance their twin roles in the past, but that it has now become less difficult to do so. The point, however, remains that the ad glosses over answering another pertinent question, namely how this change has become possible. In keeping silent, the ad leaves unaddressed important social issues regarding the general stasis in gender relations in Singapore society.

Appendix

The following is a list of print and televisual ads referred to in this paper, with a brief description on each ad.

1. *Make Room for Love.* Mrs Tan, a senior colleague, advises her younger female colleague on the importance of combining a career with a family.
2. *Why Build Your Career Alone?* Family life is represented as contributing to a man's career by providing him with invaluable support and stability.
3. *Precious Moments.* Snapshots are shown of three children (siblings) playing together, while their parents warmly look on.
4. *Lonely Child.* A miserable only child cheers up when his mother brings home a newborn baby – a sibling – for him.
5. *Experience The Joy.* Married couples are advised on the benefits of starting a family while they are still young.

6. *Fam, Fam, Fam.* A family is engaged in a number of leisure activities, with the father prominently portrayed in his 'fun daddy' role.
7. *Because That's Your Family.* On the pride and appreciation of two parents as their children surprise them in little ways.
8. *Your Family is Your Future.* As a young father holds his infant in his arms for the first time, he realizes that from then on his whole life will take on a new meaning.
9. *Kids Make Your World Brand New.* This presents a collection of photos of many different children, some on their own, others with a parent.
10. *Too Old.* A young boy complains to a friend that he has no siblings because his mother had given priority to developing her career.
11. *Kids Make You See.* A family represented as enjoying active leisure activities together.
12. *Babies and Careers.* The personal account of a young career woman, who describes her decision to become a mother.
13. *Something Wonderful Happened.* The birth of a baby helps to reunite an estranged young married couple.
14. *Collage Ad.* A special compilation of shots on fatherhood, selected from the full series of ads.

Reconstructing Topical Sensitivity: Aspects of Face-Work in Talks between Midwives and Expectant Mothers

Per Linell and Margareta Bredmar

Sensitivity in Conversation

When people meet and talk about various topics, whether in institutional encounters or in the private spheres of everyday life, their communication is not a matter simply and only of efficient and rational information transfer about anything that might be present in their minds. Rather, speakers follow a rationality informed by moral choices: "all verbal behavior is governed by social norms specifying participant roles, rights and duties vis-à-vis each other, permissible topics, appropriate ways of speaking and ways of introducing information" (Gumperz, 1982, p. 165).

A *sensitive*, or interactionally *delicate*, topic may be defined as one that cannot be addressed directly or explicitly by the speaker without endangering the interactional harmony of the encounter by threatening the listener's face (and therefore also the speaker's own face). Sensitive topics are primarily those with "moral" implications, that is, they often touch upon interlocutors' responsibilities for leading their lives in good or bad, acceptable or blameworthy ways. The interactional treatment of morality and delicate topics have a strong affinity with issues of mutual face preservation discussed by Erving Goffman (e.g., 1955, 1959, 1983, p. 28). One can talk about both a positive face-need (to present oneself and to cast others as, e.g., competent and socially likeable) and a negative face-need (to want to be unimpeded). For example, if an expectant mother is invited to have an HIV test, there is an implied threat to her negative face both by the mere fact of the tests and by the impositions that would follow a positive test result.

Source: *Research on Language and Social Interaction* vol. 29, no. 4, 1996, pp. 347–379.

Brown and Levinson (1987), arguing largely along Goffmanian lines, pointed to the tension in interaction between the two opposed poles of *positive politeness* (being authentic, genuine, involved, immediate, sincere) and *negative politeness* (being considerate, tactful, respectful, discreet). Sensitive, potentially face-threatening topics generally cluster toward the latter, and have been found to be expressed in more indirect and implicit ways, with more deference and negative politeness, than topics that are more neutral with respect to moral implications. We use *indirectness* (of expression) as a cover term for various kinds of "expressive caution" (cf. Silverman, 1994a), defined as any type of deviation from a straightforward ("bald-on-record"), immediate (e.g., nondeferred), explicit, and unambiguous expression of the things and issues meant (including their implications).

In health care there are two major kinds of sensitive topics.[1] Both occur in maternal (prenatal) health care (MHC) talk and are well represented in our data. One category is lifestyle-implicating topics, that is, those that concern modes of living for which the addressee (normally the patient or client) can be held responsible. In our case, these are the topics of smoking and drinking habits, and sexually transmitted diseases. The other recurrent category of sensitive topics in health care contexts is those that relate to serious diseases and disabilities with strongly intimidating aspects, potentially affecting life and death. In our data, these are primarily issues concerning malformations of the fetus/baby, which, in turn, entail issues of serious moral choice, that is, abortion.

Topics such as sex, illness, and dying are difficult to address in ordinary conversation, and they were found to be sensitive also for participants in the institutional contexts of AIDS counseling sessions, as studied by Peräkylä and Silverman (Silverman & Peräkylä 1990; Peräkylä & Silverman, 1991; Peräkylä 1993; Silverman, 1994a, 1994b). We will see how such topics are dealt with in a seemingly much less threatening context, namely, that of routine visits by newly pregnant women to midwives working in primary (preventive) health care units.[2] We argue that the clinical frame may be seen as involving efforts to remove some of the moral concerns from the delicate topics, and yet the participants' actual handling of the topics as "sensitive" reinvokes the moral dimension all over again.

Data

Our data are drawn from a project on authentic encounters between midwives, who are qualified nurses working within preventive MHC units, and expectant mothers, who pay regular visits to these units. Preventive MHC is a service provided to pregnant women in Sweden. The purpose of this societal service is primarily to give personal and professional advice and assistance to women, but it naturally also affords health authorities with some opportunities to check and control progression and conduct during pregnancy. It is optional to take advantage of these communal MHC services, but a large majority of women (95% according to national statistics) do it.

At the time when our data were collected (in the years 1990–1993), a woman could see her midwife as many as 15 times during her pregnancy. (Recent cuts in Swedish maternal services have now brought the number down to about 10.) In our data, the first visit usually takes place in the 10th or 11th week of pregnancy, and involves a good deal of history-taking and information transfer by the midwife. This talk is commonly called the booking interview (Swedish: *inskrivningssamtal*). It is followed by a series of visits, the last one taking place a few weeks or a month after delivery. A couple of these appointments also include an examination by (and talk with) a doctor (either a specialized gynecologist or a general practitioner, the ordinary doctor of the primary health care clinic).

In our project, ethnographic fieldwork was conducted at nine MHC centers, and a large number of interviews with women clients and with midwives and other personnel were conducted. The core data, however, are the tape-recorded (and observed) midwife–pregnant woman encounters. There are two corpora of such data, one of which is used in this article. It consists of 30 booking interviews,[3] that is, the first encounters between the individual women and their midwives.

The booking interview serves to acquaint the expectant mother with the midwife and with the routines and norms of the MHC. The midwife takes in a considerable amount of information about each woman, and this information is entered on a form with preprinted slots. The midwife also communicates information about what is going to happen at different stages of a "normal" pregnancy, particularly with regard to what the different visits to the MHC center will involve. The client receives some printed brochures, and times are fixed for some of the future visits. The overall *phase structure* of the booking interview is as follows:

(a) Greetings
(b) M(idwife) asking W(oman) "how she is," and the ensuing (usually chit-chat type) conversation
(c) Information collection: M filling in W's case-book, posing specific questions, and then entering W's answers on the preprinted form
(d) Instructing W to call the hospital to fix a date for the upcoming ultrasound examination (to be done in Week 12)
(e) Taking W's blood pressure
(f) Informing about the AFP test[4]
(g) Informing about the routines (opening hours, working schedules) of the MHC center
(h) Talking about blood tests to be taken after the interview
(i) Agreeing on times for later visits to the MHC center
(j) Various issues (optionally brought up by W)
(k) Closing the session

The order of these subactivities may vary slightly. In particular, the talk on the blood tests (h) may sometimes occur earlier, after (d), (e), or (f).

The topics of the booking interview are largely agenda-bound, that is, they are predetermined, and many points correspond to items on the printed form. The

the predefined agenda will therefore provide a frame in which topics, which are sensitive by mundane standards, could be broached in a rather "mechanical" or "bureaucratic" way, along with other nonsensitive topics. We see that, nonetheless, they are treated differently from these other topics.

In our data, there are three different topics that are almost always brought up in the interviews and that may be candidates for sensitivity.[5] These are (1) a lifestyle issue, the woman's smoking and drinking habits; (2) tests for sexually transmitted diseases (syphilis, HIV); and (3) a "dreaded" issue implicated by the AFP test. The AFP test is used as an indicator of serious anomaly or malformation in the fetus, and this topic will then bring up the morally loaded issue of abortion. These three topics belong to rather different domains, and in the booking interviews they belong to different frames and contexts; in terms of the aforementioned phases, they occur in (c), (f), and (h), respectively. Accordingly, they exhibit both features that are common to all of them and other features that distinguish between them.

The Expression of Sensitivity

Analyses of conversational episodes pertaining to the three topics just mentioned yield an array of eight features of indirectness and mitigation, which we can interpret as signs of sensitivity. These features range from phonetic and prosodic features of delivery over various grammatical, lexical, and sequential properties of discourse to aspects of contextual embeddings. We now proceed to a systematic account of these observed features of indirectness, and illustrate them through the use of selected excerpts from the three domains. These features are pausing and other perturbations of delivery, reduction of topic prominence, deferral of topic introduction, limited depth of topic penetration, use of special (mitigating) vocabulary, restrained interactional style, use of neutralizing activity contexts, and use of neutralizing cognitive contexts (frames).

Pausing and Other Perturbations of Delivery

Pauses, especially if nondeliberate, may be characterized as a perturbation of a smooth delivery of information and argument. As is shown in the literature (Schegloff, 1980; Peräkylä, 1993; Weijts, Houtkoop, & Mullen, 1993), predelicate sequences often involve such features as hesitations (filled and unfilled pauses), abandoned utterance attempts and renewed turn beginnings, self-repairs, topicless introductory turns (*let's see then*), and so on. Such disfluency features also serve to delay the introduction of the delicate issues. In our data they are characteristic particularly of the syphilis and HIV episodes:

Example I[6] (Tema K:BU4: Episode on rubella[7]/syphilis/HIV; M = midwife, W = pregnant woman, in this case expecting her first child)
((*M returns to the printed form*))
1 M: ehrm (.) then let's see, (.) German measles. do you

3 W: no:, I haven't, but on the other hand [I am (.)
4 M: [mm vacc-]
5 W: of course vaccinated °right°
6 M: we must see to it that the vaccination has taken on
7 too
8 W: mm mm
9 M: (.) chrm you could stay away from hugging spotty
10 children °before°
11 W: *yeah. hh*=
12 M: =°we know° (.) this answer. (2.0) then we'll take (.)
13 a test, also a blood test (1.0) where one can see (.)
14 that (.) so that you haven't got syphilis
15 (.)
16 W: I see ((Swedish: *jaha*))
17 M: this, you see, is something we take **on everybody,**
18 (.) an' I haven't yet found anybody
19 W: *no:*=
20 M: =in all these years
21 (1.0)
22 M: HIV, (0.3) we will test.
23 W: mm
24 M: it's optional, d'you want to do that?
25 W: yes, it-- °it ca-°=
26 M: =(that) I take, you know, in the same **pricking when**
27 I now (.) when I do it on you, right?
28 W: mm
29 M: so it won't be anything (.) extra
30 W: ° no°
31 ((*M turns the page*, 3.0))
32 M: then I talked about ultrasound

In Example 1 the midwife informs the woman about three blood samples. We note that she uses the topic of the rubella test as an introduction to the whole block of tests for which she seeks W's consent.[8] When, in lines 12–14, she moves on to the syphilis test, she does not say, for example, straightforwardly "syphilis we will also test" (let alone, in analogy with lines 1–2, "syphilis, do you know if you have [had] that?"); instead, her approach is slow and stepwise, replete with pauses and with some repetitions. Such perturbations and signs of guardedness are quite typical, and distinguish the syphilis and HIV topics from the adjacent rubella topic. In this case, the word "HIV" is produced in the beginning of a turn (line 22), but it is surrounded by pauses and followed by some verbal material ("we will test").

In the following excerpt, the beginning of a fairly long episode on the AFP test, we see the midwife producing quite a lot of pauses:

Example 2 (TemaK: BUI: Episode on AFP: W expecting her first child)
((*previous topic: appointment dates*))
1 M: mm. (0.7) yes, then I thought I should inform you
2 [illegible] (0.5) in week sixteen, ( ) then you'll

4 (.)
5 W: yes.
6 M: and this blood test that will show then if one has
7 heightened values of (.) °alpha-fetoproteins, that
8 is a protein which is found° (.)
9 W: mm
10 M: °in the blood°. an' that can then, if one has too
11 much of it it CAN mean that there is something
12 (0.5) which is not well with the baby, °right°
13 W: °mm-hm°
14 M: an'(.) what above all you see then, that is those s-
15 (.) open spinal hernias
16 W: mm. (.) °mm°
17 M: one can then also, often in combination with this it
18 can be that they don't have (.) that much brain either
19 W: °°I see°°
20 M: plus hernias in (2.5) ehrm the abdominal wall, that
21 ehrm (1.5) the abdominal wall is not closed so to
22 speak, right
23 W: °mm°
24 M: but the bowels °so to speak°
25 W: °mm°
26 M: °come out like this°. and-ah (.) that is not that (.)
27 bad actually, you know, but it's only that it's good
28 to know about it.
29 W: °^yeah^°

Pauses, if consciously planned, may express cautiousness and guardedness in approaching the sensitive topic. Nondeliberate pausing, too, may indicate some resistance toward introducing face-threatening topical aspects directly. Both of course lead to deferring the direct expression of sensitive aspects.

In addition to pauses in introductory sequences, pauses typically occur just before and/or just after the keyterm, that is, the expression most unambiguously naming the sensitive topic (see Table 1). Although it is certainly commonplace that there is a hitch in speech delivery before keywords (speakers often seem to hesitate a little before finding or deciding on which word to use), pauses and hitches are particularly frequent and salient in our data, especially considering the fact that midwives are involved in carrying out routine activities. The prekeyterm pauses are perhaps more convincing evidence of the speaker's addressing the keyword as delicate than are postkeyterm pauses, which could be interactionally driven (solicitation of acknowledgment, reestablishing eye contact, etc.). Yet, a pause after the keyword(s) may also be heard as an attempt to let the intimidating information sink in. On this point, however, there seems to be a competing, partly opposed, strategy available, namely, to move on quickly without dwelling on the sensitive point (this is addressed further later). Virtually all the midwife's turns in Example 2 are replete with pauses. There are micropauses in the introduction (e.g., Example 2, lines 6–9) and some longer pauses in the "dreadful" description (Example 2, lines 20–22, 24, 26). Another significant feature is M's (apparently)

Table 1: Some properties of midwives' strategies for presenting some topics (incidence in percentages)

	Topics			
	AFP (n = 30)	Rubella (n = 21)	HIV (n = 30)	Syphilis (n = 19)
Pauses in introductory sequence[a]	27	24	27[b]	21
Pauses before or after keyterm[c]	23	10	63	58
Prekeyterm utterance segment[d]	70	52	87	63
Postkeyterm utterance segment[e]	50	57	60	74
Proxy topic[f]	100	76[g]	100	100
Quick retreat from topic[h]	47	24	90	95

[a]A sequence was positively coded if it contained at least two pauses (micropauses or longer).
[b]Note, however, that HIV and syphilis topics often do not have an introductory sequence of their own: they are introduced through the "safe" topic of the rubella test (see text).
[c]A sequence was positively coded if it contained at least one pause before or after the key expression.
[d]Any verbal material except hesitation markers like (Swedish equivalents of) *uh*, *ehrm*, and so forth.
[e]Compare Footnote d.
[f]This notion is explained in the text under "use of neutralizing cognitive contexts" (p. 369).
[g]In the remaining cases (24%). M asks directly about rubella or immunity against rubella.
[h]A quick retreat must not contain any additional remark on the topic.

Reduction of Prominence

One strategy for diminishing the face-threat of some topics seems to consist of reducing the perceptual or cognitive salience of their corresponding expressions. For example, lowering the volume to sotto voce, thereby perhaps also switching to another voice quality, may be a way of indicating the delicacy of a particular issue. We find it particularly in the AFP test episodes, when (some) midwives start to lead up to mentioning particular malformations (as in Example 2, lines 7–8, 10).

Another feature quite frequent in our data is that of syntactic embedding; the use of some verbal material before and/or after the particular delicate or threatening keyterm. To see this point, let us first introduce an example of an episode that is quite different in that it involves morally relatively neutral topics. Consider the following sequence from the dialogue accompanying the filling in of the form:

Example 3 (Tema K: BÄ5:6. Sequence from information collection by M; W expecting her first child)

1 M: >then I'll go through different diseases an'such.<
2 diabetes, you haven't got that, have you?
3 W: no.
4 M: urinary tract or kidney disease?

5	W:	no.
6	M:	epilepsy?
7	W:	°no°.
8	M:	°high blood pressure?°
9	W:	°no°
10		(.)
11	M:	heart disease?
12	W:	^no^
13	M:	lung disease?
14	W:	°no°
15	M:	any (.) gynecological disease or operation, that
16		you had, hadn't you?
17	W:	yes, there I had an operation ((*etc.*))

In contrast to the HIV episodes, the keyterm (usually a noun, explicitly identifying the topic) is here routinely introduced by M straight on (and it is, of course, taken as such from the printed form). In most cases, like in Example 3, the woman will give short negative answers, which receive no overt verbal responses from the midwife, who, instead, moves on quickly through the list of items, without much ado. The rubella, HIV, and syphilis tests are also three items that make up a small list (corresponding to a specific subsection on the printed form), and yet there is ample evidence that they are not treated in the same way. Typically, the keyterms HIV and syphilis do not come first in a turn (or even turn-constructional unit); they tend to be preceded, and/or followed by, other, often rather empty, verbal material. We saw this in Example 1. Example 4 shows something of the same:

Example 4 (Tema K: BU8: Episode on rubella/syphilis/HIV; W has children from before)
((*Previous topic: tallness and weight. W chats with her little child, M leafs through papers, clears her throat. No talk for about 15 seconds*))

1	M:	°°let's see her-°° °then we'll fill in these blood
2		tests we're gonna take.° then I guess they checked
3		up HIV last time you were pregnant?
4	W:	mm.
5	M:	but that's something one repeats.
6	W:	°yeah exactly°.
7	M:	you have nothing against that?
8	W:	no.
9	M:	in the same way we check up °syphilis too°.
10	W:	yes=
11	M:	=German measles on the other hand, that you were
12		immune against, so that's OK, you know
13	W:	mm
14	M:	so that we-- °we need not° (.) that you can't change
15		anything on that, right?
16	W:	°^no^°
		((*W talks to her child, pause for 7 seconds, then a new topic*))

This episode is a rather exceptional case in terms of its absence of pauses (but note M's local use of lowered volume; Example 4: lines 1–2, 9). Yet, rubella is again treated differently from HIV and syphilis. In this case, however, we have a woman whose immunity to rubella is known from her previous pregnancy, but HIV and syphilis are different and must be checked again. Note, though, how the rubella test is used as an exit, a means to retreat rather rapidly from the topic of testing for the sexually transmitted diseases.

There seem to be embeddings of sensitive material at several structural levels. At the level of turn-constructional units, we find the use of prekeyterm or postkeyterm utterance segments, which allow the speaker to avoid having the (threatening) keyword (usually a noun) stand out as the perceptually salient first or last word of the utterance. At a somewhat higher level, we find the use of a "safe" topic, the rubella test, used as an entrance (as in Example 1) and/or an exit (as in Example 4) to the topic of venereal diseases.[9] In the following we encounter other ways of embedding delicate topics in suitably neutral contexts.

Deferral of Introduction

Some of the aforementioned methods serve to defer the introduction of the sensitive topic. Another method to achieve deferral is the use of presequences (Schegloff, 1980; Heritage, 1984, pp. 265ff.):

Example 5		(TemaK: BÄ8: Episode on AFP test; W has children from before)
		(5.0)
1	M:	AFP, did you take that last time?
2	W:	no.
3	M:	what are you going to do this time?
4	W:	no, I think I'll stick to this.
5	M:	yes, but then I write abstains here.
6	W:	yeah.
7		(11.0)

In our data, presequences are characteristic primarily of the AFP topics; for instance, Example 2, line 1: "I thought I should inform you," and Example 5, line 1: "AFP, did you take that last time," and Example 6, line 1, following. The syphilis and HIV episodes may exhibit similar features (Example 4, line 1: "we'll fill in these blood tests we're gonna take"). The use of pre-acts, which we can see as a kind of sequential embedding (cf. the uses of syntactic embedding, discussed in the prior section), may serve the purpose of indicating the delicate character of that which is going to be introduced later on (Schegloff, 1980, pp. 131 ff.). Peräkylä (Silverman & Peräkylä, 1990, p. 308; Peräkylä, 1993, p. 303) observed this feature in counseling sessions.

Limited Depth of Penetration

If the sensitive topic is sometimes approached slowly, indirectly, or gradually,

midwife, soon start retreating. This is especially salient in the malformation/abortion issue. As we noted before, the AFP test is a major method in screening pregnant women for fetal anomalies, and it implicates serious moral considerations. However, if the midwife finds out that the woman knows about the test and knows what stance she will take, the midwife will invariably, as in Example 5, move on without any penetration of the topic at all, thus avoiding the implicated moral issue completely. Example 6 is just a little more explicit:

Example 6 (TemaK: BU10: Episode on AFP: W has children from before)

(4.0)

1 M: AFP, did you take that last time?
2 W: well, that I don't (know)
3 M: that was this thing with the chi[ld having] an open
4 W: [well that]
5 M: spinal [hernia]
6 W: [well] that I took (2.0) I probably took
7 all the tests, ((*laughter*))
8 M: (xx) yes, you did.
9 W: mm
10 M: that was good.
11 W: ^yeah^
12 M: the offer stands of course.
13 W: mm
14 M: and one doesn't take it until preg- the sixteenth
15 pregnancy week so there will be--
16 W: that I want to take (°anyway°)
17 M: mm
18 W: ^yeah^
19 M: (.) then you'll get a new appointment when you've
20 been to the doctor's check up
21 W: yes
22 M: so we'll take it in week so it's fairly important that
23 one takes it in week sixteen you know
24 W: mm
25 M: so that there won't--
26 W: ^yeah^
27 M: be any change on that.
((*new topic*))

In some cases, the AFP gives rise to a long episode. In Example 2 we saw the start of such an episode; Example 7 is almost a direct continuation of the sequence in Example 2:

Example 7 (TemaK: BU1; see Example 2)

32 M: hh. ehrm yeah, so that one has then an opportunity to
33 take such a test.
34 W: mm.
35 M: now I should of course also tell you that this is
36 of course terrible

37 W: it is, isn't it.
38 M: yes, it is, so that it is so to speak *nothing* which (.)
39 W: no
40 M: happens often, but it is terribly unusual
41 W: °yes exactly°
42 M: ^yes^. and it is completely optional if you want to take it.
43 (0.3)
44 W: whereabouts
45 M: hh
46 W: d'you take °it°?
47 M: it's a common blood sample that I (.) take here
48 ((*M shows where on her arm the sample is to be taken*))
49 W: take it here then.
50 M: mm=
51 W: =mm.
52 M: but one takes it in week sixteen.
53 W: m-hm
54 M: mm. (0.5) so you can then (.) read through this brochu-
55 or ehrm (.) slip at home then, and- ah (0.3) then you
56 can (.) tell me (.)
57 W: mm
58 M: when you come to the doctor then, if you want to take
59 the test °or not°.
60 W: °yes exactly°
61 M: mm. what I think perhaps is important that is I think
62 that one (.) goes one step further what do I do if I get a--
63 (.)
64 W: yes.
65 M: that one has so to say (.) thought it over a little bit, so
66 that one won't take a test that one actually doesn't hh
67 *want*
68 W: °mm°
69 (0.3)
70 M: to know, right
71 W: mm
72 (1.0)
73 M: so th- (.) but talk about it at home an'--
74 W: mm
75 (2.0)
76 M: then you'll see.
77 W: °°yes°°
78 M: ^mm^. that (brochure) you'll have (.) also then.
79 W: mm.
((*M goes on to leaf through papers, then a new topic*))

Whereas morally indifferent topics can be approached head-on, the topical episodes of morally sensitive topics are quite different. The co-text for the AFP test and its implied issues is tests and examinations that the MHC "offers." The footing is clearly that of information delivery, but such information could of

course be heard as a (delicate) way of providing advice. The strategy used by the midwife usually involves a preparatory action, "have you heard about AFP?" Only if this is met with a negative answer, or an answer indicating uncertainty, does the midwife go further into the issues. This naturally happens more often with women who have had babies before.

If we generalize across the AFP episodes of the whole corpus, we can discern an approach phase, a central phase, and a retreat phase. The approach phase is characterized by indirectness (in the sense of deferral). For example, preparatory sequences are common; metacommunicative pre-acts (Example 2, line 1: "I thought I should inform you about"; also, "I am going to ask you about"; "do you know anything about") are used to signal in advance that a certain topic will be broached, a certain type of sensitive question will be posed or sensitive information given, and so on. This gives the woman an opportunity to prepare herself, and it gives M (and W) a chance to withdraw promptly, if possible. In fact, midwives regularly take the chance not to go into the matter if the women say that they are familiar with the test and that they know what they want to do. Even if the woman is very laconic on the matter, the midwife accepts this without probing the issue (Example 5).

In most cases, the episode develops into a central phase, defined as the sequence in which parties get maximally close to the (sensitive) topic. In many cases the central phase is characterized by limited degrees of concreteness, precision, and depth of penetration. Often there are abstract and vague references and anonymizing strategies; the talk is temporarily at a general level, rather than addressed to the individual woman; compare the use of "one" (Swedish: *man*) rather than "you" (Swedish: *du*): "if one has heightened values" (Example 2, lines 6–7), "one can then also" (Example 2, line 17), "one has an opportunity" (Example 7, line 32). Ways of retreating from the sensitive parts are often hinted at, and, if possible, also exploited. In some cases, the dreadful aspects and moral implications are avoided altogether.

Accordingly, we can say that parties, led by the midwife, prefer to leave the central phase rather quickly and move into a retreat phase. The retreat can sometimes be very rapid, with M posing questions in forms that allow for short replies on the part of W. In other cases, however, when the intimidating topic has been penetrated, there is a need to neutralize negative and threatening aspects, if these have been brought up. This calls for a longer retreat. In Example 7, M takes some pains to assure W that the malformations are "terribly unusual" (Example 7, lines 36, 40).

The morally loaded issue dormant in the AFP episodes is of course that of a possible abortion (medical reasons for abortion becoming relevant if the test indicates increased levels of AFP). Although this issue is explicitly brought up in those cases in which the midwife goes into describing the possible malformations involved, it never happens that the midwife asks for a particular stance from the woman (at the stage of the booking interview), nor do the women ever overtly speak their minds on this point.

Compared to the AFP episodes, those on smoking and drinking exhibit a rather different form. Let us look at three cases of varying extension, Examples 8–10:

Example 8 (Tema K:BU5: Episode on smoking and drinking: W expecting her first child)
((*straight from previous topic, housing, no pause*))

1 M: d'you smoke?
2 W: °no°
3 (3.0)
4 M: ehrm (.) drink alcohol?
5 W: °no°
6 (.)
7 M: never?=
8 W: =°no°
9 (3.0)
((*new topic*))

Example 9 (Tema K: BM3: Episode on smoking and drinking: W has children from before)
(1.0)

1 M: well, an'then (.) d'you smoke by the way?
2 W: no
3 (0.5)
4 M: °your alcohol habits?°
5 W: well, they are *awfully moderate* ((*laughs*))
6 M: they are, yes.
7 W: *yes*
8 M: once in a while or--?
9 W: well, now that I am pregnant, then I am naturally
10 completely abstinent, of course
11 M: you are, right?
12 W: yes
13 M: mm. then I put down never then. an'you-- >we have
14 talked, haven't we, about your-- we talked about it
15 last time<
16 W: yes
17 M: >this thing about temporary abstinence and that
18 this< [that is so well worked into]
19 W: [yes it would nev-] it would never occur
20 to me
21 M: no, if you don't take (.) headache tablets ((*i.e., aspirins*))
22 W: no
23 M: then you shouldn't drink anything either
24 W: no
25 M: ((*M laughs*)) no (.) then that is fine.

Example 10 (Tema K: BM6: Episode on smoking: W expecting **her first child**)
((*previous topic: W's overweight*))

```
(2.0)
M:  °yes, that's it° °an'then°, d'you smoke?
W:  yes, unfortunately.
M:  about how much then?
    (.)
W:  °one package per day°
M:  °one package per day° (0.5) that was pretty much.
W:  °mm°=
M:  =mm
    (0.3)
W:  I've tried to reduce since I did my test at home then, but I
    I can't manage you see, I can't do it.
M:  mm. do you feel stressed from (.) feeling that now I must
    quit, or?
W:  yes, I do that too. (0.5) yes, it's it's hard, it feels hard
    'cause you know one (.) one knows, one has heard so much
M:  mm mm
W:  [if it isn't--
M:  [an'clearly,] =twenty cigarettes is (.) a whole lot, you know
W:  mm
    (0.3)
M:  so that (.) if you (.) tried--
    (0.3)
W:  yes, most (.) of all (.) I would of course want to be able
    to quit once [for all
M:               [completely straight] over, [yes
W:                                          [so I] mean
W:  I can't keep it (.) somewhere in between for
    [that I can't ma  ]nage
M:  [that you can feel]
W:  no, no, no, I know that it is like that, °actually°
    ((discussion goes on for about 30 more turns))
```

In Example 8, M introduces smoking bald-on-record whereas the midwives in Example 9 and Example 10 display a few features of indirectness. The question in Example 9, line 1, is embedded between "an' then" and "by the way." The use of "and (then)" prefacing in Example 9, line 1, and Example 10, line 1, indicates that the questions have a routine or agenda-based character (Heritage & Sorjonen, 1994), and this marking may somewhat contribute to diminishing moral implicativeness. We also note the lowered volume used in Example 9, line 4, and Example 10, line 1; it seems as if the midwife in Example 10 anticipates that the woman is a smoker (her voice quality may be a reliable symptom). The typical pattern of the smoking and drinking episodes, however, is that the midwife poses the basic questions rather straightforwardly, without any previous pauses

or other perturbations and without prekeyterm utterance segments; the keywords are taken directly from the form; "do you smoke?", "your alcohol habits?" (the latter typically in this elliptical form). If these questions receive clear "nos" from the woman, the topics are typically left without further comments; Example 8 is a case in point. If the woman hesitates just a little before answering "no," a few reminders by the midwife are usually forthcoming. In Example 9, the woman does not hesitate, but prefaces her response with a weak Swedish *ja* (here translated as "well" in Example 9, line 5) and then concedes that she drinks alcohol moderately, before she, after a follow-up question by the midwife, assures the midwife that she does not drink at all during her pregnancy (Example 9, lines 9–10). In such cases, the midwife would still mention the desirability of "temporary abstinence" (Example 9, line 17; using an abstract coinage that means, in literal translation, "point abstinence"; Swedish: *punktnykterhet*) and then leave the issue. In cases like Example 10, when the woman admits that she does smoke a number of cigarettes per day, or that she may drink a glass of wine now and then, a discussion usually evolves in which the midwife issues the "recommendations" by the MHC ("we issue a recommendation of temporary abstinence"; Swedish: *vi går ut och rekommenderar . . .*) and expresses some cautious moralizations. The general pattern of the episodes is this: *first* ask for information about W's habits, *then either* leave the topic (if W provides unambiguous, negative answers), *or* explain what the MHC wants.

Midwives are clearly aware that their recommendations imply an intrusion into private lifestyle. (On this point, one may compare recommendations on other non-lifestyle-related issues, such as the prescription of iron tonics, which, in our data, never involves any face-preserving measures on the part of midwives.) In some talks, the midwives explicitly mention that they are "aware that they cannot set limits" and that they do not want to evoke feelings of guilt with regard to (especially) smoking habits. So, if midwives try to educate and control, they do it in a mitigated manner.[10] The desiderata of the MHC with regard to women's conduct are often expressed in terms of mitigated recommendations, rather than straightforward requests. Thus, the force of prescriptions is downgraded; a recommendation of "temporary abstinence" is a fairly limited intrusion into the woman's lifestyle (midwives do not say "we think you should not drink at all").

Use of Special (Mitigating) Vocabulary

Other strategies for warding off face-threats and avoiding embarrassment include the use of vague or abstract expressions, circumscriptions and euphemisms, mitigators, attenuations, and various qualified "weak" expressions (cf. Drew, 1992, p. 503). Speakers often prefer such expressions to naming the things talked about bald-on-record. Rather than being indiscreet, speakers leave it to their addressees to draw conclusions about things meant and implied. For example, Macintyre (1982) mentioned gynecologists' use of initiations like "Let's have a look *down there*," and Weijts et al. (1993, pp. 304ff) found the same, as well as an excessive use of pronominal expressions in referring to sexual organs and activ-

particularly salient in the episode types considered in this article. Note however, abstract, and somewhat clumsy, coinages like "temporary (*point*) abstinence."[11] In asking about drinking habits, midwives regularly use the abstract noun "your alcohol habits?" rather than "do you drink anything?" which would have focused on the personal agent and her conduct more directly. In one case (not quoted here), in which the midwife first addresses the woman more personally on the matter, she immediately corrects herself, thus taking immediate measures to re-establish the anonymization.

Restrained Interactional Style

The two last paragraphs point to the role of vagueness and incompleteness of discourse on sensitive topics.[12] Another characteristic of the interactional style is the asymmetrical pattern, with the midwife providing information, without too much penetration, and the expectant mother responding, often rather minimally. This is actually quite noteworthy, because there are other episodes in the booking interviews where the two women interact in rather different ways.[13] Consider a spate of talk like Example 11, where the two women indulge in a more symmetrical exchange:

Example 11 (Tema K:BÄ5:4–5. Sequence preceding the information collection phase: W expecting her first child):

		(3.0)
1	M:	>(d'you think it's been) tough, this thing?<
2		(0.5)
3	W:	mm, very tough.
4	M:	yes, it's natural. ^yeah^
5	W:	mm
6	M:	yeah
7	W:	it was the third time, you know.
8	M:	yeah exactly.
9	W:	yeah=
10	M:	=^yeah^
11		(.)
12	W:	yes it was-- it was perhaps not so (.) tough the thing
13		itself uh (0.5) well, it was one got tired from the
14		treatment then
15	M:	mm
16	W:	but- uh (0.5) that waiting, then was I going to have
17		my period or--
18	M:	yeah exactly
19	W:	mm
20	M:	°I see°
21	W:	^yes^. (.) so, mentally it has been tough
22	M:	yes, it must be almost even tougher when one (.)
23		keeps trying anyway so to speak
24	W:	yes (0.3) ^yeah^. that's uh (2.5) no, it's been terrible,
25		I think ((*light laughter*))

27 W: so that was the last try, then I thought never anymore.
28 so that this third time I relaxed in some way, I was--
29 M: yes then [it--
30 W: [it must be as it may this time, that is (0.5)
31 I go just 'cause I (.) sh- [should do it]
32 M: [should do] it ((*laughs*))
33 yes yes, but it is kind of nice to have that attitude
34 for [it's a little–
35 W: [yeah, perhaps that's] why it--
36 M: it works, right?
37 W: yeah
38 M: ^yeah^
39 W: ^yeah^ °so that it--°
40 (0.5)
41 M: 'cause it's a terrible-- I think terribly much lies (0.3)
42 perh- terribly much but it can surely be terribly much
43 on the mental plane if
44 W: mm
45 M: how one succeeds
46 W: mm
47 M: and so on
48 W: mm. I think so too.
49 M: so that uh (.) yeah: (0.5) but it's nice
50 W: yeah
51 M: mm.
((*M starts asking about housing conditions*))

Note here features like the upgrading in second assessments (Example 11, lines 1, 3: "tough," "very tough"; lines 21, 22, 24: "tough," "even tougher," "terrible"), collaborative completion of turns (e.g., lines 35–36), overlapping turns (lines 29–35), shadowing (e.g., lines 31–32), and sequences of mere confirmations (lines 8–10, 37–39, 49–51). By contrast, in the case of morally delicate topics, the two interlocutors do not engage in lightheartedness and they seldom go into details.

Yet, along with paralinguistic strategies for mitigating face-threatening messages such as pausing, sotto voce, and perturbations of delivery, one might expect the use of laughter, which has often been shown to alleviate face-threats (cf. Jefferson, 1985; Adelswärd, 1989). Beck and Ragan (1992) found that patients and nurses often key their talk with laughter and jokes during actual gynecological examinations, and Aronsson and Rundström (1989) found doctors bracketing sensitive talk by using a joking mode when they issued lifestyle recommendations to child patients and their parents. Neither of these latter phenomena is common in our data, however.[14]

Use of Neutralizing Activity Contexts

Discourse cannot be understood without analyzing its contexts. Turning now to contextual resources, we note the following aspects of indirectness.[15] Under this

First of all, the *institutional encounter* itself is of course a particular type of context, partly clinical and medical in character, which makes it different from an everyday-life context. In part, the institutional context may be regarded as an environment created partially to make it possible to talk professionally about issues which are not naturally talked about in everyday life. On the other hand, midwives (and other [para]medical personnel) seem to try to create an informal atmosphere, so as to partially reconstruct a more everyday-life type of conversational frame. One may think of the communicative genre as one in which the midwife, together with her interlocutor, seek a compromise between a professional neutrality and a more conversation-like affiliative stance. In Fairclough's (1992, p. 205) terms, we can talk about the "conversationalization" of a type of institutional discourse.

Secondly, one may exploit *particular activity types* or *phases* in the encounters. For example, among conversational activities one may mention types of information collection being administered by the professional in going through a form. This generates a kind of highly constrained, routine-like interaction, in which specific questions are often posed in sequences of elliptical formulations that allow for short answers (cf. Example 3). With this specific kind of interactional footing, delicate issues might be smuggled into a "neutral" context (cf. Silverman & Peräkylä, 1990, p. 309). In our case, this is true of smoking and drinking, but not of HIV and syphilis.

Another strategy may be to exploit the specific footings of situations in which the medical professional pursues a *physical examination of* the patient. In this kind of situation, the patient has already been stripped of some of her personal integrity, and she is in fact often partly undressed, and the doctor or nurse may then insert a few pertinent questions and comments, as if it were in the background of the physical manipulations.[16] Our data for this article do not include any physical examinations, though, except for taking a patient's blood pressure (for other findings from the more comprehensive corpus, see Bredmar, in press).

A third, and somewhat related, strategy is simply to sneak in sensitive topics in phases that may be regarded as marginalized in the encounter as a whole. There is a tendency for the HIV and syphilis test topics to be relegated to inconspicuous phases, that is, rather late in the encounter, when, one may perhaps assume, all important things have already been dealt with. This squares well with the results of Weijts et al. (1993) on the topic of sex in gynecological consultations.

Use of Neutralizing Cognitive Contexts (Frames)

Under this rubric, we also find a number of different phenomena. Most of them concern the discursive *reframing of issues*, that is, one tends to bring up the delicate topics within frames that are not in themselves morally loaded. Thus, we observed how HIV and syphilis, in our data, are never talked about as diseases, let alone as morally implicative phenomena (cf. note 11). Instead, they are always topically framed as targets of blood tests. We could say that the topic of the tests stands proxy for the more delicate topic (accordingly, the term *proxy topic*). The issue of anomalies and potential abortion is obligatorily introduced through the practical

Another strategy in the discourse is the deployment of anonymization ("we," "the MHC"); compare what Drew and Heritage (1992, p. 30) termed "the self-referring *we* [used] to invoke an institutional over a personal identity." A related strategy in our data is the invocation of routines, that is, practices applied to everybody (although the individual woman may decline to take the tests involved). In our data, a sensitive issue is sometimes framed as if it were of no concern for the individual woman, and instead something forced upon the individuals by the need to check the state of health in the Swedish population. A characteristic feature of Example 1 is the midwife's immediate comment (line 17) that the test "is something we take on everybody." Thus, the testing has nothing to do with any suspicion in the specific case (cf. also Example 1, lines 13–14, cast with the negative presumption: "a blood test where one can see that you haven't got syphilis").

Three Sensitive Domains: Similarities and Differences

The three types of sensitive topics are different in fundamental respects. The smoking and drinking topic is concerned with a lifestyle, which the woman, and indirectly the MHC, can influence, and hence it becomes rational to discuss appropriate conduct during pregnancy. The syphilis and HIV topics are also potentially lifestyle-related, but little can be changed here, at least not within the scope of the current pregnancy. The topical complex of fetal anomalies and possible abortion implied by the talk on the AFP test does not involve lifestyle issues; we are faced with something for which the individual cannot be held responsible. On the other hand, these topics involve a rather frightening future perspective and lead to the morally loaded question of what decision the woman would take on the issue of abortion.

There are also other premises and conditions that distinguish the discursive treatment of the three topics. The context for the smoking and drinking issue is a rather early phase in the conversation, in which the midwife goes through the case-book, that is, there is a printed form to be filled in. The syphilis and HIV episode, on the other hand, sometimes occurs in a late phase of the encounter, as if it was some insignificant matter that the midwife had forgotten to deal with before. It is related to the form (the consent by the woman to take the tests is entered there) and is always introduced in the frame of obligatory tests to be taken.

These differences lead to distinct ways of managing the topics in the dialogues. The major patterns can be summarized as in Table 2. Briefly, we can say that the topics of smoking and drinking are characterized by an immediate approach, a mitigating vocabulary, and a limited depth of penetration. The latter aspects are what indicates sensitivity. The bald-on-record approach may have to do with the fact that the issues involved are routinely raised in many types of health care talk these days. By contrast, HIV and syphilis are not talked about in most doctor consultations, and here they are introduced through a reframing and

Table 2: Typical patterns of indirectness and mitigation and their incidence in three kinds of sensitive topics in midwife–pregnant woman talks

	Smoke/Drink	HIV/Syph	AFP (Malf/Abortion)
Reduced volume	no	yes/no	yes
Pausing	no	yes	yes/no
Perturbations of delivery	no	yes	yes/no
Syntactic embedding	no	yes	yes/no
Presequences	no	yes/no	yes
Limited depth of penetration	yes	yes	yes[a]
Mitigating vocabulary	yes	no	yes/no
Elliptic Q–A sequence	yes	no	no
Inconspicuous phase	no	yes	no
Practical reframing (proxy topic)	no	yes	yes
Anonymization	yes	yes	yes/no

[a]Limited depth of penetration occurs whenever possible, that is, when the woman says she knows about the test.

delayed approach. The same is true of the issue of malformation and possible abortion. There, the presence of presequences is particularly noteworthy.

There are additional common features. With respect to morally loaded aspects, there is a general preference for avoidance, a reluctance to detail accounts or to penetrate issues. The issues are anonymized; they are talked about as handled by the MHC in general, rather than by the midwife herself. Downgrading also applies to some descriptions ("it is very unusual" about anomalies, thus reducing the range of applicability of the description). Peräkylä (1993) likewise found counselors generalizing and anonymizing descriptions and prescriptions, and mitigating the applicability of dreadful descriptions (upgrading their conditionality: "if it were to happen . . ."). At the same time, such similarities may conceal differences. For example, mitigations have a rather different meaning in prescribing lifestyle as compared to estimating the likelihood of a birth defect.

Moral aspects are also typically recontextualized by the institution. Rather than being couched as moral in nature, they are framed as issues of what is medically appropriate. Sometimes, the medical aspects too are backgrounded, in favor of practical aspects. This pattern is perhaps most clearly shown in the case of the AFP test and its background and implications. The course of progression is nearly always this:

1. First *practical* aspects: information about how and when blood tests are taken.
2. Then *medical* aspects: describing the anomalies that may be indicated by heightened levels of AFP.
3. Last *moral* aspects: the dilemma of deciding on abortion is explained. This order may be a natural and logical one, but it is still a significant fact that the moral issues are backgrounded, deferred, and never brought to a climax.

Conclusion

Sensitivity in conversation has been treated in terms of tact (Leech, 1983), face-threats and politeness strategies (Brown & Levinson, 1987), sequential properties of structurally dispreferred responses (especially within Conversation Analysis), and so on. Here we relate it to moral implicativeness, and we take indirectness to be its overt expression. Sensitivity is therefore related both to accountability (what the speaker can be held accountable, or responsible, for; Buttny, 1993) and reportability (what topics can be freely reported on, or not).

Indirectness has been shown to have many different shapes. Many of them can be understood in terms of the speaker's *distancing* himself/herself and his/her interlocutor from the delicate or "dangerous" issues involved. For example, sensitive topics are often gradually approached, only partially penetrated, and quickly retreated from in many episodes. Given that speakers may be said to have several voices or identities available (Bakhtin, 1986; Wertsch, 1991), anonymization may be understood as the speaker's attempt to not speak in his/her personal identity (rather, the midwife is the representative of the MHC system), and to speak as if the topic did not directly concern the individual other (anonymization, Peräkylä's "universalistic approach," 1993, p. 305). Other means to distance oneself from one's own and the other's person include the collective construction of depersonalizing situations with less conversation-like footings, for example, those involving the use of technology or the manipulation of the body.

Another possibility of distancing oneself from sensitive topics lies in the exploitation of the participation framework of a multiparty encounter. For obvious reasons this is not available in a dyadic situation like ours. However, Aronsson (Aronsson & Rundström, 1989; Aronsson, 1991) has shown, in studies of pediatric consultations featuring a doctor, an allergic child, and his/her parent, how physicians may address sensitive topics to the child when they are actually targeted at the parent.[17] Peräkylä's studies of participation framework in his AIDS counseling session data showed that a counseling team could avoid addressing delicate questions to the client directly in basically two different ways. Either the co-counselor could request the main counselor to ask the client a sensitive question, thereby relieving the main counselor of the burden to act as principal and author (in Goffman's, 1981, terminology) of the sensitive question. Another possibility sometimes used was for the counselor to ask the co-client, a close relation accompanying the client (a spouse or a girl/boy friend) first to tell her/his views on topics dealing with the (HIV-positive) client's experience; only then was the latter himself addressed on the same issue (Peräkylä & Silverman, 1991).

One way of neutralizing sensitivity is to reconstruct it within new frames or contexts (cf. Peräkylä, 1993, p. 306). As we have argued, the establishment of institutional contexts may be taken to function as a means to provide opportunities for talking about sensitive issues in neutral contexts, with neutral professionals having no personal interests involved. One aspect of the treatment of moral issues in such contexts is their recontextualization (and reinterpretation) in the direction of a framing of practical, administrative, or technical considerations. For example, Adelswärd (in press) described this "de-moralization" in interviews with conscientious objectors, and modern judicial procedures exhibit

the same phenomena (Linell & Jönsson, 1991). A similar tendency can be seen in the present data, for example, in reconstructing sensitive issues in terms of medical appropriateness ("temporary abstinence"), practical business (taking blood samples), and so forth.

The institutional context in our recorded talks involves several features that seem to warrant a more neutral treatment of sensitive issues. Yet, the actual performance shows that the issues are still sensitive, with (it seems) their moral implications lurking below the surface. Indeed, the exploitation of some of the specific contextual features just referred to contribute to making the issues stand out as special, that is, as delicate or sensitive. Parties try partly to avoid the morally loaded aspects, and in doing just that, that is, exhibiting partial avoidance, they reconstruct the moral loadedness. Bergmann (1992), in his study of "veiled morality" in psychiatric interviews, made a similar point with respect to vagueness; if the psychiatrist describes an event in an indirect and vague way, he/she makes the event "embarrassing, delicate, morally dubious" (1992, p. 154) precisely by speaking about it in this indirect way. In a similar vein, Schegloff (1980, p. 143) noted in the discursive treatment of delicate issues that it is "not so much a matter of 'masking the delicateness' as of 'doing masking of the delicateness', which is not masking at all." In our case, the institutional contexts seem to be arranged in order to recontextualize issues as nonsensitive, and yet parties reconstruct topics as sensitive in and through their conversational conduct.[18] Sensitivity becomes both a precondition for and a product of indirectness in discourse.

Acknowledgements

This article is based on research carried out with Grant Number B91:0058 from The Swedish Research Council for Social Research. The article was read at the Annual Meeting of the American Association for Applied Linguistics in Baltimore, MD, USA, on March 8, 1994. For valuable comments, we thank Viveka Adelswärd, Karin Aronsson, John Heritage, Doug Maynard. Deborah Tannen, and Ruth Wodak.

Notes

1. Not all sensitive aspects in discourse are exclusively topical in nature. Some are more endogenous to the discursive interaction as such, in the sense that certain moves or illocutionary actions may be face-threatening in themselves. For example, orders, inquisitive questions, or threats and other imposing moves are often interpersonally delicate, apart from the fact that their topics are often sensitive too. At a general level, Linell and Rommetveit (in press) talked about "discourse-internal ethics" as an intrinsic moral dimension of human discursive interaction.
2. Politeness strategies in health care encounters were treated by Aronsson and Larsson (1987), and Larsson (e.g., Larsson, Johanson, Säljö, & Svärdsudd, in press) described in later studies how lifestyle issues, relating particularly to smoking and drinking, tend to be talked about in indirect, vague, or incomplete ways. Aronsson and Rundström (1989) pointed to the use of pauses, hedges, diminutions, and other

indirectness types in doctors' presequencing of lifestyle critiques and potentially face-threatening advice. Weijts et al. (1993) described the exercise of "expressive caution" (Silverman, 1994a), represented by delays, avoidances, and depersonalizations, in talk on sexuality during gynecological consultations. Conversational strategies to approach morally implicative issues in health care were also treated in Heritage's studies of health visitors (Heritage & Sefi, 1992; Heritage & Lindström, in press).

3. We disregard here the fact that a prior telephone contact occurred in some cases. Also, some of the women had met their midwives during one or several previous pregnancies. The 30 booking interviews are divided among 10 "young" women (ages 17–24), 10 "middle-range" women (ages 25–32), and 10 "older" women (over age 32). Eight of these were first-time mothers, the other 22 had delivered at least one child before (and had also gone to a MHC center before). The other data corpus is longitudinal; 13 women were followed through pregnancy, and in each case six encounters were observed and tape-recorded. These 13 women were all expecting their first child, so the total number of primigravidae in the entire corpus was 21. Six different midwives appeared in the 43 booking interviews.

   The whole project deals with how the participants construct, or reconstruct, views of the pregnancy, the projected childbirth and the circumstances connected with these events, and how these topics and understandings are differently talked into being in the course of the progressing pregnancy. Issues like solidarity talk between women (in spite of the institutional environment), the role of medical technology as a resource for promoting understanding, and the prevalence of the notion of normality in these talks are treated in other studies. For a full documentation of the entire corpus, see Bredmar (in press).
4. Alpha-fetoprotein (AFP) is produced by the fetal liver and is passed via the amniotic fluid through the placenta into the mother's blood circulation, where it can be measured. The maternal serum AFP screening is not in itself a diagnostic test. Other tests (ultrasound, amniocentesis) are used to diagnose suspected fetal anomalies (see Katz Rothman, 1993, p. 236).
5. Other sensitive topics may occur in individual talks, for example, cases of prior abortions, previous problematic deliveries and their circumstances, and issues of malformation and abortion may sometimes surface in other contexts than the AFP test. Likewise, information about problematic marital life or social networks may occasionally make topics like residence and housing conditions (an obligatory topic) morally delicate. However, these types only occur in a few isolated cases.
6. Excerpts are close English translations of Swedish originals. We use standard transcription conventions (such as brackets for overlapping speech, ° ° for *sotto voce* speech, and (.) for a micropause), but note also the following points:

   underscore = marks (the stressed syllabic nucleus of) a focally stressed word
   * * = laughter in the speaker's voice while pronouncing the words enclosed
   >< = accelerated tempo (relative to surrounding talk)
   ^ ^ = words pronounced on in-breath
   -- = utterance fades out, usually with a prosody indicating that the speaker leaves it unfinished
7. The Swedish lay term for "rubella" is *röda hund*, which is consistently used in the talks. A literal translation of the term would be "red dog." It is translated here by "German measles."
8. These tests formed part of the screening procedures undertaken on pregnant women when our investigation was carried out. In the last phase of our data collection, syphilis

9. The rubella test as an entrance is, not surprisingly, more common with first-time mothers (nth-time mothers are usually known to be immune), but the correlations between discursive strategies and first-/nth-time pregnancy seem otherwise less pronounced in our data than could be expected a priori.
10. In general, our results on this point corroborate those of other researchers, for example, Larsson et al. (1994, in press), who have found that topics like smoking and drinking (and sex-related issues) are usually touched upon only superficially, in spite of their potential importance in primary health care.
11. The discursive treatment of HIV and syphilis (in our data) do not seem to involve euphemisms or mitigated substitutions, but note that both words (HIV, syphilis) are rather clinical in nature. Sex is never mentioned in the episodes involved. Note also that midwives almost invariably talk about "HIV" or "HIV positiveness"; only exceptionally do they mention "AIDS," that is, the (dreadful) illness.
12. Vagueness and incompleteness as face-preserving techniques (Brown & Levinson, 1987) have been described for many communicative genres. For example, Marková (1989) analyzed semantic indeterminacy, as well as unfinished sentences and other kinds of incompleteness, in dialogues between patients and therapists as strategies for handling emotionally difficult topics, and Bergmann (1992) showed how euphemistic descriptors are used by psychiatrists to describe events with discretion.
13. It is undoubtedly a significant factor that our data involve only women. Features of indirectness have sometimes been considered as a gender-based indicator of female conversation. Moreover, the two persons of each dyad in our data are, in general, more equal in status than are, for example, a doctor and his/her patient. Because we lack a commensurable corpus of conversations with male doctors (or midwives!) we must, however, abstain from exploring the gender dimension here.
14. The longitudinal corpus includes some instances, as when the topic of sex is raised by the midwife in the postdelivery checkup encounter, for example:

TemaK: B8:6:7

1	M:	it feels good dow- down there?= did you try intercourse?
2		((*The translation "down there" in line 1 is a free one;*
3		*the Swedish original was i underlivet "in the womb"*))
4	W:	=no, we haven't done that.
5	M:	=you haven't done that, no.
6	W:	I forgot how to do it, I say ((*laughs*))
7	M:	((*laughs loudly*)) *you have to take a course* ((*laughs*, 2.0))
8	W:	>he said that, *when we talked about it earlier*, an'then he
9		said,< (0.3) °you can tell her this° we thought of quitting,
10		now that we have got a child. *and* see what she says,
11		((*laughs*))
12	M:	*yes* ((*laughs*))
13	W:	yes, right, we (xx)
14	M:	there's no point any longer, you ⌜say ((*laughs*))
15	W:	⌞*no* ((*laughs*))
		((*shift of topic*))

15. Actually, textual and contextual features are heavily intertwined in discourse, and hence the taxonomy used here is a considerable simplification. We have chosen to be a bit inconsistent in dealing with anonymization, largely a matter of wording, addressing it under the heading of "Use of Neutralizing Cognitive Contexts." For a

16. Larsson et al. (1994) mentioned that the issue of self-examination of the breasts, a sensitive issue bordering on other topics with sexual overtones, tends to be broached during the physical examination phase. Interestingly, the related issue of mammography is not as sensitive, judging from Larsson's (admittedly limited) data. Mammography, on the other hand, is associated with technology (see later discussion under "Use of Neutralizing Cognitive Contexts").
17. Our ethnographic data, however, have documented a case where the midwife addresses, in a joking mode, a 6-year-old boy accompanying his (pregnant) mother with the question: "Well, Charlie, how's mother doing on smoking?"
18. Whether this is due to strategic choice or to psychological-emotional factors, or both, is something that can hardly be determined on the basis of our data.

The Body Literate: Discourse and Inscription in Early Literacy Training

Allan Luke

The body is the inscribed surface of events (traced by language and dissolved by ideas), the locus of a dissociated Self (adopting the illusion of substantial unity) and a volume in disintegration. – Michel Foucault (1977, p. 148)

Introduction

The 'linguistic turn' in the social sciences has had a significant influence on educational research and practice. Since *Functions of Language in the Classroom* (Cazden, Johns, & Hymes, 1972), the development of studies of classroom interaction has provided educators with alternative criteria and models for examining practice. One key consequence has been an ongoing reappraisal of signposts for the achievement of classroom reading and writing. In much research literature, pedagogical theory and teacher education, if perhaps less in many classrooms, there has been a visible move away from criteria for literacy narrowly defined as discrete psychological "skills" internal to the subject, and towards more contextual explanations of literacy as social practice.

Yet models of applied educational linguistics, the ethnography of communication, and ethnomethodology themselves have significant limitations in their capacity to connect patterns of everyday events with larger configurations of discourse and power, identity and authority (Bourdieu, 1977a; McHoul & Luke, 1989). Since the 1960s, the articulation of a sociology of language in educational settings largely has drawn upon symbolic interactionist, ethnomethodological and, at times, structural-functionalist concerns with "roles," "group norms," "intents,"

Source: *Linguistics and Education* vol. 4, no. 1, 1992, pp. 107–129

and so forth. In much American and British research, analyses of classroom literacy events have remained within the confines of liberal social theory which presupposes and models consensus, and thereby takes a generally benign, acritical view of social and discourse relations between human subjects. The 'sociologies' underlying sociolinguistic and interactionist classroom research are indeed increasingly attendant to situation and context (cf. Deleuze, 1988, p. 11). But what is missing is an explication of how local events and sites connect with what have emerged as larger concerns of a social theory of pedagogy: the cross-generational production and reproduction of knowledge and power, and, more recently, the complex fabric of texts and discourses through which social representation and reproduction is effected.

For Bourdieu (1977b, 1990, 1991), the interactionist tradition omits due consideration of the sources and strategies of capital which precede and underlie educational sites and events. For Foucault (1979), it would be seen to inadequately explain how such events figure in the moral regulation of human subjects, in this case, of school children. My point here is that even where educational analyses have begun to stress the "social construction" of student literate competence, practice and text, without due consideration of how texts, discourses and indeed literacies have differing power, consequences and capital – such models are unable to provide critical social analyses.

This study is part of a critical sociological investigation into what counts as literacy in Australian elementary and secondary schools (Baker & Luke, 1991; Freebody, Luke, & Gilbert, 1991; Luke, in press-c). My aim is to "change the subject" (Henriques, Hollway, Urwin, Venn, & Walkerdine, 1984) of early literacy instruction by offering an alternative vocabulary for talking and writing about classroom literacy events. The argument here proceeds in two complementary moves. It begins with a theoretical reframing of discourses and practices of early literacy instruction by reference both to poststructuralist and feminist work on discourse and inscription, and to critical sociological explanations of the role of discourse in cultural and economic reproduction. My approach is to critique neomarxian analyses of pedagogy as ideological reproduction – and to use this critique as a springboard for applying Foucault's conceptualizations of "technologies of the self" and Bourdieu's notion of the "habitus" to classroom and community literacy events. I then apply this theoretical frame to a discourse analysis of selected classroom events transcribed as part of a survey of recent progressive reforms of literacy teaching.[1] I conclude with comments on the implications of this work for literacy pedagogy and research, specifically for reexamining contending approaches to instruction as modes of training, surveillance, and regulation.

The Politics of Pedagogy and the Body

The theoretical and strategic differences between neomarxian social theory, Bourdieu's sociology of the "habitus", and poststructuralist discourse theory have been the subject of widespread debate and discussion (e.g., Fraser, 1989;

deCerteau, 1984; Macdonnell, 1986). While recognising the various debates between these positions, here I want to draw these templates together to construct a model for literacy instruction as a *material social practice* in the *institutional site* of the classroom. I begin by describing pedagogy as a form of *inscription*, of body writing and mapping. My focus is on techniques by which pedagogic discourses position and constitute the child as subject (Walkerdine, 1986). This done, I reframe ideology as a knowledge effect of these techniques, arguing that the bodily/linguistic *habitus* produced by pedagogical discourse is shaped and reshaped by discourse in a range of other cultural sites. This framework, I argue, enables a reconsideration of whether and how these multiple inscriptions figure in the representation and reproduction of class and gender in contemporary cultures.

Neomarxian approaches to pedagogy generally have assumed that curriculum, instruction and assessment are part and parcel of a process of ideological transmission. These range from more monolithic "iron cage" explanations which stress the inescapability of this transmission (e.g., the works of Althusser, Bowles, and Gintis), to those Gramscian and "emancipatory" models which emphasise human agency as a necessary precondition to resistance and contestation (e.g., the "radical pedagogies" of Freire, Giroux, and colleagues). As Archer (1986) has noted, since the advent of the "new sociology" of education in the early 1970s the theoretical elaboration of such models has centred on attempts to reconcile the relative power of social structure and human agency.[2] This is also a central concern of structuralist attempts to identify and define the variables of "pedagogic discourse" (Bernstein, 1990).

Models of pedagogy as ideological transmission are based on several fundamental epistemological and methodological assumptions. Ideology critique presupposes that something akin to Marx and Engels' *camera obscura* can be identified and, correlatively, that an undistorted version of social/economic reality can be accessed via a science of the social that in fact stands outside of 'ideology' (Luke, in press-a; Thompson, 1984). A related supposition is that within technological and multinational economies and cultures a distinctive logic of capital, a set of identifiable economic interests can be traced to the patterns and systems of ideological presentation and representation, production and reproduction, both in schools and in other public 'education' institutions like the media. By this account, a central feature of capitalist (and noncapitalist) educational systems is seen to lay in the transmission of false consciousness, or of structures of what Habermas (1979) has called "systematically distorted communication". In both phenomenological and neomarxian explanations, even those quite sensitive to intersubjectivity and the possibility of Habermasian "universal pragmatics", the mind/consciousness of the sovereign human subject remains the primary focus or object of pedagogy.

Neomarxian and Frankfurtian sociological analyses of education are thus articulated from several first principles: mind/consciousness, the logic and interests of capital translated into particular semiotic (and pedagogically deployed) systems of false consciousness, and an emancipatory science of the social capable of seeing through those systems. In its positive historical moment,

this science is seen as capable of specifying and advocating pedagogical strategies for redressing false consciousness and distorted communication, presumably with the force of remaking the mind/consciousness of the subject and, to bring the model full circle, altering repressive political and inequitable socioeconomic conditions. If we turn this model to literacy training, we are able to argue that the texts, interactional norms, literate competences embodied in pedagogy are encodings of forms of consciousness readily traceable to particular class interests. These ideologies and forms of consciousness are selectively and differentially distributed to children in a manner which credentials and reproduces position in relation to the means of production (cf. Bourdieu, 1976; Bourdieu & Passeron, 1977). Various terms have been used to describe the relationship of literacy to class reproduction. These range from the more economicist explanations of "literacy as cultural capital" (Cook-Gumperz, 1986), to more culturally-focussed conceptions of "ideologies of literacy" (Soltow & Stevens, 1981), to those grounded in Gramscian social theory like Graff's (1979) description of the 19th century pedagogical enforcement of a "moral economy".

In contrast, Michel Foucault's (1979, 1980, 1988) explanation of institutional regulation is an attempt to describe the construction rather than presuppose the essence of the human subject. His work begins from a deliberate scepticism towards an autonomous, a priori essence of the sovereign subject and towards its accompanying humanist metaphor: mind/consciousness. *Discipline and Punish* (1979) describes the emergence of modernist disciplinary knowledge. These knowledges consist of techniques of power, regimes of "normalisation" contingent not always on the exercise of overt, coercive force, but rather on the diffuse power of discourses for the recategorisation and surveillance of the populace. By this account, *disciplinary power* lacks a centre because it is enacted in a multiplicity of texts: those of the various human sciences which provide taxonomies and categories for the human subject, and those of attendant institutional practices which have material effects on human subjects in everyday sites.

The "regimes of truth" of science and theory in turn give rise to and are used to legitimate particular "regimes of practice" which enforce a panoptic *gaze* on the human subject. Here Foucault turns to Jeremy Bentham's 19th century theory and architectural design for the "panopticon" as a model for the modern prison. Foucault views Bentham's work as an exemplar of the extension of state power upon "docile bodies". Central to the efficiency of institutional regulation, then, are systems of surveillance and regulation:

> A relation of surveillance, defined and regulated, is inscribed at the heart of the practice of teaching, not as an additional or adjacent part, but as a mechanism that is inherent to it and which increases its efficiency. (Foucault, 1979, p. 176)

This gaze is most visible in the incarcerating processes of criminology and psychiatry, but equally manifest in such institutional practices as psychometrics, psychoanalysis, schooling, and modern human sciences like social behaviourism and structural-functionalist sociology.

The poststructuralist reappraisal of modern science, then, begins from scepticism towards disciplinary discourses as unmediated statements or revelations of the 'real' or the 'true'. The "truth games" (Foucault, 1988) or "grand recits" (Lyotard, 1982) of science are seen to constitute and create 'truths' about human subjects, thereby constructing, positioning and regulating "the insane", "the criminal", or, to take more pertinent examples, "the learning disabled", "the skill deficit child", "the beginning reader" or "the natural learner" (Luke, 1991). Such categories are constructed and 'done' in everyday institutional discourse, in face to face interaction (e.g., clinical or classroom conversation) as readily as in written texts (e.g., official documents, report cards, professional magazines).

But the effects and consequences of discourse are much more than just a naming of the social and natural worlds. Such disciplinary discourses do not yield social control in the coercive and monolithic sense implied in Marxian analysis or even in some versions of classical sociology. It is not a simple matter of the "top–down" imposition of power. Discourses make up practical "grids of specification" (Foucault, 1981) for diagramming, classifying, and categorising the subject in the social. These grids are put to work in institutions in ways which generate self-surveillance, wherein the subject internalises the disciplinary and cultural gaze as her or his own. The effect is one of self-colonisation, where the subject takes on 'responsibility' for monitoring her or his morality, discourse, and body.

In his later work, Foucault (1988) sketches differing social and discursive "technologies". Each of these, he argues, comprises a "matrix of practical reason":

1. technologies of production, which permit us to produce, transform or manipulate things;
2. technologies of sign systems, which permit us to use signs, meanings, symbols, or signification;
3. technologies of power, which determine the conduct of individuals and submit them to certain ends or domination, as objectivizing of the subject;
4. technologies of the self, which permit individuals to effect by their own means or with the help of others a certain number of operations on their own bodies and souls, thoughts, conduct, and way of being . . . (1988, p. 18)

Foucault goes on to argue that the aforementioned disciplinary "truth games" of science, law, morality, ethics and so forth authorise and sanction these specific technologies of sign systems, technologies of power – which "determine the conduct of individuals" and submit them to technologies of the self.

In contemporary schooling, educational discourses coordinate and interleave all four technologies. Such discourses in local sites target the body as a locus of power, as an "inscribed surface of events . . . traced by language" (Foucault, 1977, p. 148). Discourse operates on the subject not as an abstract set of ideas to be transposed into, inside of, or within mind/consciousness, but instead "as a *material* series of processes, power actively marks or brands bodies as social, inscribing them with the attributes of subjectivity" (Grosz, 1990, p. 63). Furthermore, Grosz argues, this focus on inscription "is intended to challenge a prevailing model of

power conceived as a system of ideas, concepts, values and beliefs, *ideology*, that primarily effect consciousness". Hence, rather than eliminating them from any analytic template, we can posit consciousness and ideology as net "knowledge effects" or consequences of discourse, discipline, and inscription.

Foucault's work thus moves away from the presupposition that ideology is a coherent and goal-seeking entity, coded in text and semiosis, and passed from consciousness to consciousness. Instead, it offers a central emphasis on discourse as a form of power which both literally and metaphorically inscribes the collective and individual social body. In contrast with neomarxian theories of the state, Foucault's conceives of social power as having no (organic or mechanical) heart. Because discourse is at once deployed in particular local sites in differing continuities and contiguities, it would be erroneous to take for granted a singular source or continuity for power, or to presuppose that inscription (and pedagogy) operates with total, seamless effectiveness (Eco, 1987, pp. 239–255). In this way, poststructuralist theory allows for the relative unevenness and flexibility of discourse, its diffraction and apparent arbitrariness in local sites.

Foucault thus provides a model for rethinking pedagogy as discourse and inscription. But what are the procedures and consequences of the 'uptake' of discourse by the human subject in classroom events? The body also figures centrally prominently in Pierre Bourdieu's depiction of "socially distinct and distinctive *modes of acquisition*" (1977b, p. 659) of social class-based patterns of language and literacy. "Inevitably inscribed" within the embodied "dispositions" of the habitus, is "the whole structure of the system of conditions, as it presents itself in the experience of a life-condition" (Bourdieu, 1986, p. 172). For Bourdieu, the habitus is posited as a "structuring structure" of generative and constraining disposition, properties, schemas, habits, tastes and so forth – all of which can be traced to "differences objectively inscribed in conditions of existence" (p. 172). Like Foucault, Bourdieu (1977a, p. 115) argues that particular categories and dominant "taxonomies" come into play in the shaping of subjectivity. He also argues that such differences are visible and observable, "objectively inscribed" in the patterns and practices of everyday life. This inscription occurs through "symbolic violence" (Bourdieu, 1991), the representational, semiotic power at work in the texts of such institutions as schools and mass media. As distinct from Foucault, Bourdieu's notion of the habitus grants a centrality to structuring economic and social conditions, and to the ideological character of such conditions prior to training, acquisition, and inculcation.

Bourdieu's stress is on the educational shaping of the habitus as a central aspect of the state's formation and distribution of linguistic and "cultural capital" (Bourdieu & Passeron, 1977). His model also fashions the body as the locus of control, as the object of a sum of dispositional "products" and "general properties":

> The body is an instrument which records its own previous uses and which, although continuously modified by them, gives greater weight to the earliest of them; it contains . . . the trace and the memory of the social events. . . . The effects of any new experience on the formation of the

> experiences already integrated into the habitus in the form of classifying and generative themes. (Bourdieu, 1977b, p. 660)

The habitus, then, as "the generative, unifying principle at the basis of all linguistic practices," becomes both a marker and proscription of one's class position and "relation to the language market" (Bourdieu, p. 667; cf. Mey, 1985). Describing how "linguistic capital [as] . . . embodied capital" is acquired, Bourdieu (1977b, p. 660) maintains that "language learning is one dimension of the learning of a total body schema which is itself adjusted to a system of objective chances of acceptability." In language socialisation, children actually model a "'preferred' shape of the buccal aperture, i.e., the most frequent articulatory position . . . [as] as component of the *global use of the mouth* (and therefore a component of the body hexis)" (661).

Bourdieu thus offers a more structuralist explanation of pedagogy than Foucault's description of moral regulation (for a complementary example, see Bernstein, 1990). It shares with neomarxian analyses a recognition of the significance of pedagogy in the 'logic' and distribution of capital. "Language is a bodily technique" which is tied to "objective chances" in the subject's life trajectory (Bourdieu, 1977b, p. 660; cf. Bourdieu, 1986). In this way, Bourdieu's analysis of language as cultural capital is tied to a sociology which accounts for the cross-generational reproduction of social class. Like Giddens, Bourdieu attempts to establish an explanation of the cross-generational interaction of social structure and human agency which is nondeterminist. At the same time, he seeks to develop a model which has explanatory power in explaining the material trappings, "tastes," choices and linguistic practices of social classes.

Speech also figures prominently in Foucault's articulation of the "panoptic gaze": "The association of prohibition and strong incitations to speak is a constant feature of our culture. The theme of the renunciation of the flesh was linked to the confession of the monk to the abbot, to telling the abbot *everything he had in mind*" (emphasis added; Foucault, 1988, pp. 16–17). An emphasis, then, in Foucault's explanation of the internalisation of the morally regulatory text is on the technology of the self as a means of taking on the discourse and gaze of the Other. In Burdieu's description of language acquisition, the emphasis remains on the external ideological and social class-based shaping of the "body schema" or habitus (e.g., Bourdieu, 1973). What is key here is that in both models the body is the target of pedagogy and its primary mnemonic device: the morally regulated body remembers.

Yet Foucault does not preclude the possibility of ideology or, for that matter, economic interests figuring in such institutional sites and instances as those of pedagogy. Rather he attempts to displace them from their status in the marxian system as 'given' engines which drive practice, and instead, reframes them as possible "knowledge effects" (Fraser, 1989). Contrary to many conventional characterisations of poststructuralism, ideology and economics do not disappear, but instead resurface depending on the site and discourse in question. Foucault (1980, p. 109) recognises that

> it is quite possible that the major mechanisms of power have been accompanied by ideological productions. There has, for example probably been an ideology of education, an ideology of the monarchy . . . etc.; but basically . . . it is much more and much less than ideology. It is the production of effective instruments for the formation and accumulation of knowledge – methods of observation, techniques of registration, procedures for investigation and research, apparatuses of control.

The "cohesion of the social body," then, is achieved via forms of moral regulation. Technologies of regulation, and the institutions where they are put to work, may indeed have ideological, political and economic concomitants and consequences.

A further central issue in Bourdieu's (1986) sociology is a concern with longitudinally and biographically traced outcomes and effects. This focus on the games of early learning imprinting a "memory trace" that later is influential in bodily disposition and discipline is shared by, among others, Wittgenstein (1967, pp. 1–2):

> One thing we always do when discussing a word is to ask how we were taught it. . . . Although this language is not what you talk when you are twenty, you get a rough approximation of what kind of language game is going to be played . . .

Wittgenstein also emphasises the role of bodily "gestures and facial expressions." Further, and important to the matter of literacy training, Wittgenstein similarly sees aesthetic judgement, what Bourdieu (1986) would describe as "taste," as shaped by one's participation in developmental language games.

I here have assembled poststructuralist and sociological definitions and positions with an eye to a theoretical reframing of early language and literacy training. On this basis, I propose the following model: (1) that the discourses of pedagogy are built around claims about 'truth' and the 'real' which in turn are transformed and rearticulated in the multiplicity of material practices deployed in the site of the classroom. There (2) a disciplinary inscription of the subjectivity of the student occurs, contributing to the construction of a bodily habitus. This habitus, a developing marker of the literate's cultural capital, (3) concurrently and subsequently undergoes multiple transformations at other sites of linguistic/literate practice through the texts of family and community, popular culture, further schooling and so forth, such that (4) one's inscribed habitus is evident in terms of classed and gendered identifiable life styles, differential textual and material practices.

This model of literacy teaching as discourse and inscription can be exemplified by reference to particular institutional discourses, texts and sites. My focus here is on (1) and (2) in the proposed model. What follows is an elaboration of the model: first, through a general description of how the truth claims of educational discourses on literacy construct the subject; and second, through discourse analyses of local classroom literacy events.

Educational Discourse and Subject Production

Educational discourse consists of textual and spoken statements which are circulated across and within a range of sites: from academic research papers and policy documents, to professional books which commonly set out to translate and explain 'theory' and research to practitioners, to teachers' formal and informal professional exchanges, to documents like teachers' guides and official syllabi. Across these texts are varied constructions of the child subject (e.g., the "pre-operational" child, the child "author"), of particular skills or competences (e.g., "reading readiness," "decoding," "critical thinking"), as well as of the visible signs to be taken as evidence that such skills or competences have been achieved or not (e.g., "frustration levels with text," "miscues").

Many educational sites (e.g., policy bodies, school boards, state departments, particular staff rooms, in-service programs) give the appearance of homogeneity and univocality. For instance, a range of programs and theories might intertextually construct and refer to the "natural language learner." But in contemporary secular schooling, the construction and articulation of educational discourse is heteroglossic. For example, if we turn to the construction of literacy in a given jurisdiction, school or classroom, an array of contending truth claims, attempts at falsification, conflicting versions of received wisdom and commonsense all arise. The dominance of a particular set of 'truths' seems to be contingent on a local political field of play which is tied to a broader, complex political economy of educational ideas, commodities, and material practices.

Across late capitalist countries, we would encounter at multiple sites opposing theories of what literacy is, how best to teach it. Such debates feature contending constructions of the literate subject: from classicist versions of the "culturally literate" citizen, to behaviourist characterisations of the child literate as skilled and reinforceable subject, to the romantic constitution of the child literate as the natural, spontaneous language user. It is worth noting here that such constructions historically have been gendered – from the medieval monastic copyist, to the Flaubertian 19th century reader of romantic fiction, to the educated "gentleman" of Commonwealth private school education, to the (male) functional (il)literate of the industrial 1960s. Differing kinds of competence with the technology typically have been constructed in tandem not just with classed but as well with gendered textual labour (Luke, in press-b). We could explore further the various political and economic effects of particular "naturalisations" of the competent child: Since the founding of mass schooling of literacy, the institutions of schooling have worked closely with secular and nonsecular authorities to construct literacy and the literate in the service of particular interests (Luke, 1989). At present, suffice it to say that there are multiple constructions of the literate in play in Western countries. Accordingly, the public debate over literacy could be seen to turn not on which method is most effective at teaching literacy, but rather on the particular claims of economic and moral efficacy of particular kinds or types of literacy and literates.

To see school literacy as a simple instance of ideological reproduction in action thus is somewhat problematic, or at the least historic and site specific

This is not to say that the historical exclusion from socially and politically useful and powerful knowledges and competences of minorities and working class children does not continue to occur in quite systematic ways across Western nations (Cook-Gumperz, 1986). But it is to query the existence of a monolithic dominant ideology of literacy, and of the unmediated or univocal connection between the kinds of literacy produced in schools and those operational in domains of work, life-style, and leisure. However well the body may remember, many literate practices inscribed at the site of the school have little apparent connection to out-of-school sites (Heath, 1980). Many of the practices of school literacy are little more than *simulations* – self-referential practices which appear to serve little other than the maintenance of age, authority, and power relations within the school (Luke & Luke, 1990). Following Foucault and Bourdieu, what seems to be at stake in much contemporary schooling is not the production of literacy for stratified kinds and levels of work, but rather literacy training as a form of moral and political discipline.

This said, it is worth noting that educational discourses on literacy in particular localities do indeed cluster around key or dominant metaphors. In surveys and interviews, 64 urban Australian teachers were asked to rank order (on a 1–7 scale) "the most important goals of literacy teaching": "personal expression and creativity" (1.44) was ranked highest by a significant margin, followed by "development of skills" (1.94), "enhancement of natural growth" (2.94), "academic preparation" (5.53) and "social and occupational mobility" (5.70).[3] These general constructions were corroborated in interviews with teachers and administrators, where many commented on the importance of "literacy and individual growth." Both survey and interview comments were marked (intertextually) by statements that "naturalistic and holistic" approaches to literacy would address the needs of the full range of clientele: migrant second language learners, working class, girls as well as boys, rural and Aboriginal children.

Such interview data is particularly revealing, not of any truths about literacy or the teachers in question, but rather of an educational discourse at work in the textual practice of the government-sponsored survey. All subjects were informed that the survey was co-sponsored by the Federal government and the regional educational authority, their employer (and, indirectly, mine). Hence, the survey text constituted a bureaucratic technology of power and a technology of the (professional) self, a gaze on the practitioner and clinician. The tension is noticeable on interview tapes, marked by wariness, queries about who we would be reporting back to, stated mistrust of the political agenda of the survey, reiteration of a 'party line', and so forth. Yet in light of the foregoing explanation of the traverse of educational discourse, the widely documented problems with viewing interview and survey discourse as a transparent window on the 'real' and 'truth' can be turned to advantage (Game, 1989). Such surveys and evaluations are authorised, authoritative confessionals. What this 'data' reveals is the surface of public and government-observed discourse on literacy. In this case, the cited educational discourse of 'truth' about literacy, the literate subject and the optimal technologies for constituting that subject turns on what Baker (1991, p. 182) calls individualist, "mentalist notions" of what 'reading' is, or could be.

Such discourses of 'truth' about literacy, are in turn reflected, albeit in a diffused and diffracted manner, in the multiplicity of material practices deployed in the classroom. The practical discourses of pedagogy are manifest in research texts and models, in textbooks, classroom talk, writing assignments and marking, test and examination scripts and so forth (e.g., Freebody, 1992; Freebody, Luke & Gilbert, 1991; Gilbert, 1989). Each of these levels of pedagogic discourse also can be described in terms of Foucault's four discursive technologies. Educational knowledge itself stands as an actual "technology of production" insofar as schooling constitutes an economic service-sector activity, one which entails the actual use and consumption of iconic, material commodities and the production of credentialled (student) subjectivities. The commoditisation of educational knowledge into concrete objects of veneration, authorised textual/material goods to be venerated, professed and consumed is well documented (Luke, 1988). Such goods – textbooks, the teachers' guidebooks, reading comprehension tests, instructional software, students' worksheets – comprise "technologies of sign systems," encodings of particular disciplinary narratives, whether scientific or humanist. Furthermore, the school and classroom are sites of instructional "technologies of power" which govern individuals' conduct, submitting them as objects of surveillance.

But of central interest for the analysis of classroom events are those "technologies of the self": those means "which permit individuals by their own means or with the help of others . . . operations on their own bodies" (Foucault, 1988, p. 18). Sociologies of school knowledge have stressed the domination and subjugation of individuals by the institutional organisation of educational work and its relation to larger patterns of production, by the ideological/semiotic codings of textbooks, and by the actual control and direction of students in the twin sites of school and classroom. I here attend to how those disciplinary technologies of the self work with overt technologies of power in classroom talk. My aim is to move from those (staffroom, survey, and textbook) metanarratives of truth about the child and literacy to those practical discourses inscribed in classroom literacy events.

Classroom Inscriptions

In contemporary psychologically-based pedagogy, teachers inscribe and read the student "body as the surface of the mind" (Baker & Luke, 1991). Early literacy training as the site of body mapping and writing, as comprising material practices for the constitution of the literate, is exemplified in various cross-cultural and historical settings. As Heath (1986), Wagner, Messick, and Spratt (1986, pp. 254–255) and other ethnographic researchers have demonstrated, the technologies, icons and products of literacy constitute a "material culture." Here I make the case that ceremonial inscription of the body is a key, and frequently overlooked and undertheorised, element of literacy training.

For many children in Western cultures, the dispositional training of the habitus first comes into play in the routines of family literacy events, however natural

such sites and practices may appear (Heath, 1982; Miller, Nemoianu & DeJong, 1986). One reader recalls his first encounters with text:

> Ann-Marie made me sit down in front of her, on my little chair; she leant over, lowered her eyelids and went to sleep. From this mask-like face issued a plaster voice. . . . After a moment, I realized, it was the book that was talking. Sentences emerged that frightened me; they were like real centipedes; they swarmed with syllables and letters, spat out their dipthongs and made their double consonants hum; fluting, nasal, broken up with sighs and pausings . . . words left their mark on objects, transforming actions into rituals and events into ceremonies. Someone began to ask questions: . . . it was as if a child were being quizzed: what would he have done in the woodcutter's place? Which of the two sisters did he prefer? Why? Did he agree with Babette's punishment. But this child was not entirely me and I was afraid to reply. I did reply, though; my feeble voice grew faint and I felt I was turning into something else. . . . When she stopped reading, I quickly took back the books and carried them off under my arm without a word of thanks. . . . In the long run, I came to enjoy this release which tore me out of myself. (Sartre, 1967, p. 44)

The scientific and literary pedigree of this environment notwithstanding, this reconstruction might fit well into Heath's (1982) "Maintown" community, where the heuristic exchanges of childhood story reading prepare the child for what counts as school literacy. Here, the child is practicing an academic language game. An integral part of such games is differing trainings in bodily position and paralinguistics. For example, in Heath's (1982) study, for white, working-class families, sitting properly and not squirming was part of the ritual of bedtime reading; for black working class children, verbal storying entailed learning and inventing bodily patterns of mime, dance and movement to frame the tale. What is occurring in early literacy (and oral storying) events is the construction of the habitus, the articulation and instantiation of a system of bodily discipline.

What is curious in the above instance is Sartre's reconstruction of early reading as a *disembodied* construction of the Other: as a calling upon of the "child who wasn't entirely me," with the effect of tearing "one out of oneself." The ritual effect here is the bodily and linguistic (and, for Sartre, ontological) constitution of the literate by turning the child/student "into someone else." This would appear an instance of literacy training as a technology of the self, one geared for what Foucault called the inscription of the "dissociated Self" par excellence.

Such inscriptions of the habitus also occur in contemporary classroom literacy events. As part of our survey of Australian classrooms in two urban sites, 18 boundaried literacy-related 'lessons' were audiotaped in two sites, one urban and one rural; transcription was aided by the use of field notes. All lessons observed and taped can be described as discrete classroom events, which according to the self-report data on the large scale survey tend to occur as regular, routinised practices in progressive early childhood literacy training: for example,

"morning news," "modeled writing" sessions, "writing conferences," "story-time," and "shared book experience" (cf. Michaels, 1981). Here I focus on two examples of the latter, which use an enlarged print book for a group collaborative reading as developed by Holdaway (1976). This practice reportedly is common in the two jurisdictions studied, and I construe many of the patterns which emerge in these transcripts as attempts at 'model' practice under the scrutiny of the researcher.

Transcript 1: Billy Goats

[15 5- and 6-year-old children are arrayed around the teacher on the floor in a rugged area; they are working with an enlarged print book about "Billy Goats". The teacher sits before them on a chair, turning pages of the book which is mounted on an easel.]

1 S1: I've gotta pair of socks like that.
2 T: David, will you just sit up straight. Michael, just sit up straight and face the front. When we first look at this, I was looking at this book and there's something different about the goats. But around here [points to picture] . . . what were all the goats wearing? [turns page]
3 S2: Go . . gooo
4 S3: Ah beard, . . a little beard, and they all gotta little beard.
5 T: [loudly] A beard. What do they all got on the first page? What do they all got around their necks?
6 S1: Ah bells, a one has . . .
7 S3: //Bells
8 T: [loudly] Bells. Well actually I was wrong. I thought that no one has bells, but I got it straight anyway. So . . . has the little billy goat got a bell? Michael, if you can't sit down you can practice sitting up straight at recess. OK? Sit down. But . . . ssshhh . . . What's the big billy goat got?

This site is bounded both temporally (i.e., shared book 'time') and spatially (i.e., this 'time' occurs within the confines of the rug reading area; children who move out of this instructional locus are physically and verbally rearranged both before and during the events).

The onset of the event is taken with the rearrangement of student bodies into the 'correct' reading habitus, and with the discursive construction of a collectivity such that this rearrangement can be targeted and retargeted as the lesson proceeds. In turn 2, the teacher's pronominalisation of "we" shifts fluidly to "I" within a single clause. Here, the subjectivities of teacher and student reader(s) are collapsed, effecting an equivalence, a fluid conflation of teacher–student reader. It is this conjoint subjectivity which is interrogated (turns 2, 5, 8), and from this interactively constructed subjectivity that student responses are sourced. Against this, we find 'difference' marked in turn 8. Those who have not internalised the teachers' gaze, those who are not willing participants in the technology, are singled out, not as "I" or "we" but "you." Where the technology of the self fails, the technology of power steps in. Where the gaze apparently has not been internalised by the children, it is externally asserted by the teacher.

This construction is achieved in part through a set of injunctions: in turn 2, a composite set of bodily inscriptions is undertaken. "Sit up straight," "face the front," are preludes to gestural and linguistic imperatives on 'how *we* look' and 'where *we* look'. Posture, movement and visual gaze thus are monitored and directed. So what is occurring here can be described beyond its archetypal IRE exchange structure. In effect who is to take the R turn (which subjectivity? which reader? which body?) is constructed by and within the classroom discourse.

This classroom literacy event constitutes what will count as reading for its participants (Baker & Freebody, 1989). Within the IRE pattern, the language game entails guessing the single word response prompted by teacher gesture and talk (Mehan, 1979). I have here stressed the bodily constraints of such literacy events. This event, like many following the "shared book" pattern, leads on to a choral reading led by the teacher:

Transcript 2: Billy Goat Narrative

"Now I'm coming to gobble you up," roared the Troll. "Well come along I've got two spears and I'll poke your eyeballs out at your ears. I've got besides two great flat stones and I'll crush you to bits, body and bones."

That is what the Big Billy Goat said, and that is what the Big Billy Goat did, and after that he went up the hillside.

The billy goats got so fat they could hardly walk home again. And if the fat hasn't fallen off them, why they're still fat . . .

As Bourdieu notes, part of the training of the bodily habitus entails training of the mouth. In this particular event, "*We* read" (McHoul, 1991), and this reading entails the aforementioned collectivisation not only of the body, but of eyes, mouth and body; "we" see, we move and we mouthe. The 'reading' is boisterous, and led by the (louder) teacher's voice and gestures which set cadence, stress, intonation and pitch. Notably, even those boys who had trouble sitting (and dissociating) participate here. They strain their bodies upward and open their mouths widely. The teacher's volume and pitch stresses the alliterative passage, "bits, bodies, and bones", shouted by all, and punctuated by many of the boys with bodies stretching upwards towards the teacher and text. The girls, by contrast, tend to sit more shrunkenly, their hands at their sides and in their laps.

Multiple levels of inscription are occurring here, not the least of which is bodily. Certainly the ideational content of the text constitutes one form of 'writing' of the subject, a selective introduction to particular ways of speaking, acting, and being. On its lexicogrammatical surface, the culture represented is indeed masculinist and violent, constructing ideological "subject positions" (Kress, 1985) and "classification schemes" (Fairclough, 1989). But perhaps what is significant is not the "content" of the technology per se, but rather how it shapes and constructs its subjects. In the following event, group and individual reading are interleaved in a way which foregrounds those very workings of this technology of the self:

Transcript 3: Mr. Singh's Garden

[10 children, ages 5–6 sit on the rug area around the teacher. Again, she is poised next to an enlarged print book mounted on an easel. She sits on a chair above the children and has a pointer in her hand.]:

1	T:	On your bottoms please, so that we can all see. [gestures to the text, begins tracking lines in text with her hand]
2	Students and Teacher:	In Mr. Singh's garden, there was a red rose. "Ah," said the caterpiller, "I see a red rose."
3	S1:	Nah, Kylie [shouts]
4	T:	Shhss, Kylie, we don't need help. Be quiet. Evelyn, you read the next page [turns page].
5	S2:	"Ah," said the bird, "I see the caterpiller."
6	T:	Brendan, you read the next page [turns page].
7	S3:	"Ah," said a cat, "I see a bird."
8	T:	All together now, I'll pick some nice children out for individual reading [turns page].
9	Students and Teacher:	"Ah," said the dog, "I see a cat." "I see a dog," said Mr. Singh, "and it's in my garden."
10	T:	Good girl Emma, for reading "Mr. Singh." I read "Mrs. Singh" by mistake.
11	S4:	Mister.

Prohibitions on the body are central here. One not only must sound like a reader to an authoritative ear, but one is enjoined to adopt the correct bodily habitus for participation in reading: "on your bottoms please, so that we can all see" (Turn 1).

Collective reading (Turns 2 & 9) is alternated with individual reading (Turns 5 & 7). In this manner, the very exchange structure of the lesson fuses together for its participants, individual and group subjectivities, transposing the "I" into a collective "we". Those "nice children" who are picked out for solo performance are those who are seen to have internalised the discipline of collective readership. These children are mapped differently than those who are disciplined on behalf of the collectivity (Turn 4: "*we* don't need help").

In Turn 10, Emma is singled out from the collective reading and praised for showing signs of having assumed the gaze. She apparently has internalised the procedure sufficiently to correct the teacher's misreading. Here the relationship is reversed, and the teacher confesses to having misread. What is interesting is that Emma has taken on the authorised 'voice' of the teacher; the technology of the self is in place. Her performance stands in direct contrast to the male speaker in Turn 3, who, like the boys in Transcript 1, shows no (bodily or linguistic) sign of internal discipline: he yells out. But here he succeeds in calling attention to the undiscipline of the girl next to him, who becomes the object of a technology of power, the reprimand, albeit on behalf of the collective "we" (Turn 4).

The patterns of inscription described here are gendered. In the above lessons, as throughout the lesson corpus, the technologies of power are predominantly asserted on boy participants (Walkerdine, 1981). In the events examined above,

the girls tended to be more willing participants, and, like Emma in the latter transcript, their compliant bodily schemas signalled that their willing participation and the technology of the self are at work.

If the foregoing analyses of classroom events were done using the templates of psychology – whether Skinnerian, Chomskian, Vygotskian, or Piagetian – if they were operating from normative definitions of literacy and the optimal means for its instruction, the events and sites described would take on a very different appearance. Depending on which psychology was called into play, they would appear appropriate or inappropriate, efficient or inefficient at achieving 'learning' and 'reading'. Yet the suspension of a priori acceptance of the legitimacy of 'true' educational discourses, whether those revealed in the surveys of these and other teachers, or in educational texts, enables what Foucault (1977) termed a "genealogical" reading of what is accomplished in the regimes of practice.

A very different diagram emerges, one which foregrounds the training and building of a literate habitus. Particular postures, silences, gestures, and visible signs of 'being in' the lesson and the collective body are on display. Proximics, the organisation and delimitation of space and time in the classroom are encompassing aspects of the gaze: from "sitting on one's bottom" to "sitting up straight," awaiting one's turn to speak. These are monitored for by the teacher who, with her or his discourse templates and metaphors for 'reading' and the 'child', scans and maps bodies on (psychological/humanist) grids of specification, accordingly issuing prohibitions "to 'watch one's tongue', to 'mind one's p's and q's', to pursue correctness through constant self-corrections" (Bourdieu, 1977, p. 656). His or her age, size, position, and official status as leader of the event – his or her displays of superior knowledge and power with both 'reading' and 'teaching' – grants his or her eyes, ears and mouth moral authority. They come to stand as embodied sources of power (Kroker & Cook, 1986, pp. 79–87), at times mirroring, at times filtering, at times marking and punctuating. But beyond this authoritative reading by the teacher of the physical and semiotic, a material 'seeing' and 'hearing' is marked on the canvas of student body. Throughout, students take on directional gaze towards the text, the pronunciation, cadences and intonation patterns of the teacher's voice (e.g., "bits, bodies and bones"), and the hearing of the text, alternating group and individual performance. Subjectivity is reestablished in terms of a collective identity, and possession of this identity is marked on and by the body – moving and still, seeing and hearing, speaking and silent.

(Re)Membering the Body

I have here offered a poststructuralist discourse analysis of early literacy training. It does not target for criticism a particular approach to literacy instruction or its participants. Rather it tables a different map for reading classroom literacy events, one which views the truth claims of pedagogy and research themselves as discourse constructions with tangible, political consequences. It also sets out to [illegible] in the material culture of classroom events as bodily

transcription and to show how that culture constitutes the morally regulated, literate subject. In this way, the theory-driven analysis undertaken here moves towards Foucault's project of "genealogical" analysis of the body inscribed by history and "traced" by language. I conclude with comments on the implications of this model for theorizing and studying literacy events, and for reframing the sociocultural consequences of literacy instruction.

The model of literacy training presented here can be used to reread data from social histories of literacy and cross cultural ethnographies of communication. Reconsider, for instance, the rote acquisition of Quranic literacy among the Vai:

> children . . . bend over their individual boards with passages from the Quran written on them. For 2 hours or more the singsong of their chanting can be heard, accompanied occasionally by the admonishment from the teacher, or the snap of a small whip landing on the backside of an errant student (Scribner & Cole, 1981, p. 30).

Here the body and voice are subject to the instructional technology, a technology tied directly to the discipline, in Foucault's sense, of the Quran. These nonsecular ceremonies, moreover, have their parallels in Western settings: for instance, in the choral repetition, rote memorisation and veneration of the Book taught to fundamentalist children in southern-US Sunday schools (Zinsser, 1986). We find parallel examples in 19th century British and Canadian pedagogy, where standardised bodily stances were to be assumed for oral recitation, slatewriting, pensmanship, and other literate practices (deCastell & Luke, 1986). There too, pedagogy entailed the construction and discipline of a bodily and linguistic habitus. Furthermore, this bodily aspect of literacy training has clear precedents in some oral cultures' initiations into archetypal texts. Describing the recitation of the Bagre among the LoDagaa, Goody (1988, p. 171) notes the focal role of the shea nut, "needed (verbally at least) to make the 'oil' (in fact, whitewash) that is used to mark the bodies of the new members."

Setting the tenor for the last decade of research in the ethnography of literacy, Heath (1981, p. 27) maintained that reading and writing, "like other systems of communication" are "organised . . . in culture-specific ways and according to certain norms of interpretation" and that the events of literacy training assemble, enact and rehearse "methods of learning these norms and having them reinforced." But despite the proliferation of ethnographic and interactional analysis of literacy events in schools, the body has not been viewed as a constitutive or focal object of study. While we see the body in descriptions of tribal culture like Goody's, and occasionally in descriptions of community life like Heath's, it disappears when we turn to the modernist school, the very site of the cross-generational representation and reproduction of the Cartesian mind/body dualism. As several theorists of popular culture have noted, the discourses, "styles" and practices of schooling exclude and rationalise bodily pleasure and desire (e.g., Hebdige, 1979). By stressing the heard (voice), the seen (text), and the unseen (mind), by readily explaining ethnographic and linguistic evidence

via psychological metanarrative, much interactionist classroom research has participated, however tacitly, in that exclusion. The reconceptualisation of literacy training proposed here is an attempt to reinstate the body as a political object of literacy and linguistic research.

The inscription of children in literacy training has taken on differing configurations in various cultural and historical settings. The "Great Debate" over literacy education in English-speaking countries continues apace, and most recently has featured reforms which stress more child-centred, holistic approaches. The "shared book" instructional events described here have come to be associated with reform movements in New Zealand and Australia. Advocates argue for the replacement of individuated "skill and drill" activities with what teachers in this study described as "natural learning" approaches, some of which reframe classroom events as "social contexts." But as part of an interactionist tradition, they typically stop short of an analysis of classroom events which reconnects with a broader political theorisation of the consequences of the distribution of discourse and literacy. The analyses I offer here may lead us to query whether such 'child-centred' instructional events are indeed (more or less) "natural," or whether they signal a shift in emphasised discursive technology, a reshaping of moral regulation and with it, patterns of social reproduction.

Such progressive approaches and their apparent opposite numbers, traditional skills and classicist approaches, may act as equivalent and oscillating "armatures of [governmental] power" (Hunter, 1989; McHoul, 1991). But they also signal differences in pedagogical technologies, supplanting what I have called here technologies of power with more subtle technologies of the self. Certainly, in the events discussed here 'reading' is remade into collective activity, harkening back to the forms of choral and oral reading predominant before the early 20th century prescription of silent reading (Luke, 1988). In this regard, they suggest a discipline similar to that noted by Davis (1987, p. 221) in her description of literacy learning in 16th century France: "the protestant method for guaranteeing orthodoxy was in the last instance censorship and punishment; but in the first instance it was *the combination of reading with listening to a trained teacher.*" In the protestant literacy training described by Davis and the progressive training analysed here, the premium placed on membership in a collective engaged in 'learning by doing', on noncoercive participation – however 'kinder and gentler' – still marks out a form of political and moral construction of the literate habitus, what Foucault (1979) calls a "means of correct training."

Of course, in local sites such approaches never occur in the 'pure' forms prescribed in the 'truths' of educational discourse. Disciplinary power is neither unitary nor total, but rather diffuse and site specific. The 'progressive' teaching examined here exemplifies how a single boundaried lesson may be the site for multiple pedagogical technologies aimed at single bodies, alternating strategies designed to collapse them into a unitary, collective entity of the literate subjectivity, whether the "natural learner" or the "decoder." Implements of technologies of signs (e.g., the enlarged print book, the blackboard, the pointer), move in concert with those of technologies of power (e.g., the reprimand, the injunction), and those of technologies of the self (the internalised gaze). In this light, perhaps

what differentiates contending models in the great debate over literacy teaching (e.g., "skills," "cultural literacy," "great books," "whole language") is more fundamental than overt difference in ideology and content. Drawing from a full historical arsenal, each centres on differing technologies for shaping and regulating bodies.

To return to the literacy/reproduction nexus posited by Bourdieu et al.: Such technologies no doubt have concrete sociocultural parts to play in the representation and reproduction of classed and gendered textual labour. The ritualised oral reading procedures here could be seen to mirror particular home practices (e.g., the bedtime story) and various secular and nonsecular practices in the community and polity (e.g., church responsive reading; singing of a national anthem). Curiously, though, however well the body may remember, the language games mapped here do not appear to have direct correlates to reading-at-work or reading-at-home. I would argue that the forms of "cultural capital" garnered here (e.g., oral reading, intonation patterns, correct posture) are not taken out directly for credit on the "linguistic market." Rather, their capitalisation would seem to be in acquiring the bodily habitus for student reading and thereby ensuing discipline and promotion within the institution. If this is the case, the mode of inscription described here is a closed text, one sourced in, characteristic of, and servicing the disciplinary regime of the school.

The imprint is in part a matter of, as Graff (1981) so eloquently puts it, training in being trained. Of course, the effect may indeed be the inscription of particular values, beliefs, and attitudes. Particularly focal in children's texts and interaction are the interlocking possible worlds of class, gender and ethnicity presented: the Billy Goat narrative is but one exemplar of textual ideology at work. But I have tried here to draw attention to the normalisation of the body as pedagogic strategy and practice. The key is in what Foucault (1988, pp. 16–17) calls "the prohibition and strong incitation to speak" as a means of turning the gaze on oneself, of "telling the abbot everything he had in mind," and thereby monitoring oneself in the confessional. And what more effective way of extending the body politic to its members.

Acknowledgements

The author thanks Carmen Luke, Terry Threadgold, Judith Green, and David Bloome for editorial advice and encouragement; Kate Rowe for assistance with data collection.

Notes

1. This data was collected in 1989 by the author as part of an evaluation of the effectiveness of in-service programs in generating classroom change. That research was sponsored by a grant from the Australian Commonwealth Department of Employment, Education and Training. An earlier version of this paper was presented at the XII World Congress of Sociology, Madrid, 1990.

2. We could read these reformulations – like debates among deconstructionists (Fraser, 1989, pp. 69–92) – as quite deliberate attempts at a post-1968 politics for academic critique and strategic intervention in response to neo-conservatism, the celebration of narcissism, political reconfiguration in Eastern Europe, and late capitalist political economy (cf. Laclau & Mouffe, 1985).
3. Also collected in 1989 by the author as part of the survey noted herein.

You Know, It Depends

Ronald Macaulay

She was a modern, you know.
He, you know, dealt in land.
They maintained, you know, several gardens.
You know, when the wind blows, their flowers **are famous.**

William Stafford "The Big House"

1. Introduction

Quantitative studies of variation in the use of discourse features are still quite rare (Macaulay, to appear), for obvious reasons. It does not usually make sense to count tokens in samples of speech that have been collected under very different circumstances, unless the aim is to explore the effect of different situations. Where samples have been collected by systematic procedures, as in sociolinguistic interviews, usually only a few variables, mainly phonological but occasionally morphological (and even more rarely syntactic) have been extracted for analysis. The quantitative analysis of discourse features requires that the total sample of speech be transcribed because raw numbers are misleading unless the total amount of speech is reported. The only way in which quantitative measures of discourse markers can provide evidence of differential use is when the relative frequency of occurrence is reported. This can be done only when the complete (or an extended) sample of speech is transcribed and a total word count provided.

This paper deals with the feature *you know*, which has received considerable attention (e.g., Bernstein, 1962; Erman, 1992; Holmes, 1986; Huspek, 1989; Östman, 1981; Schiffrin, 1987; Schourup, 1985). The aim of most of these studies

Source: *Journal of Pragmatics* vol. 34, 2002, pp. 749–767.

has been to counter the negative view of *you know*, to show that it has a function, and that it is not simply 'verbal garbage' (Schourup, 1985: 94) or a weak feature of 'women's language' (Holmes, 1986). In general, these scholars start from the premise that the use of *you know* as a discourse marker is consistent with the basic meaning of the words and there is often a reference to 'shared knowledge.' One of the conclusions of the present paper is that this does not account for the use of the expression as a discourse marker. The recordings on which this claim will be based were not collected for the specific purpose of exploring the use of *you know*, so there was no preliminary hypothesis, but enough examples occurred in the transcripts to make an investigation of their distribution worth conducting.

2. The Sample

The paper is based on two corpora of speech recorded in Scotland under very different conditions. The first is a set of 12 interviews with adult speakers carried out by a single interviewer in the town of Ayr 1978–1979 (Macaulay, 1991), providing a corpus of just over 120,000 words. The sample was balanced in terms of social class, with 6 speakers each identified as middle-class or lower-class, but was unbalanced as regards gender, with only three women. The second corpus consists of 17 sessions of same-sex dyads recorded in Glasgow in 1997 (Stuart-Smith, 1999), providing a corpus of over 125,000 words.[1] The speakers were drawn from two areas of the city, representing broadly urban working-class and suburban middle-class areas. The sample consists of two age-groups: adolescents (13–14) and adults (40 +), with equal numbers of males and females.[2] For each session one speaker was selected and asked to choose someone they would feel comfortable talking to in the presence of a tape-recorder for about half an hour. The participants were free to talk about anything they wished. The figures for the two corpora are given in Table 1.

Table 1: Combined word totals recorded in Ayr and Glasgow by social class

	Ayr	Glasgow
Adults		
Middle-class	50,898	34,309
Working-class	69,771	50,307
All	120,669	84,616
Adolescents		
Middle-class		21,953
Working-class		21,093
All		43,046
All speakers	120,669	127,662

Table 2 gives the distribution by gender.

The proportion of narratives in the two corpora is roughly similar, about 25% in the Ayr interviews and 33% in the Glasgow conversations, but in both

Table 2: Combined word totals by gender

	Ayr	Glasgow
Males	97,997	51,724 (incl. 18,947 by boys)
Females	22,672	75,938 (incl. 24,099 by girls)

cases there is great individual variation among the speakers. The gender imbalance in the Ayr sample is unfortunate but there is enough speech recorded from the three women to provide some provisional information. All the speakers in the two corpora would be recognisable as Scots from their speech but there are clear differences between the social class groups (Macaulay, 1991; Stuart-Smith, 1999).

3. The Variable

Although there have been several studies of *you know* as a discourse marker (e.g., Holmes, 1986; Östman, 1981; Schiffrin, 1987; Schourup, 1985), most provide limited information on the frequency of use. The present paper examines gender, social class, and age differences, both quantitative and qualitative, in the use of *you know*.

It is first necessary to identify the variable. The examples in (1) all contain the words *you* and *know* in that order but they are not examples of the discourse marker *you know*.

(1) (Examples from the Ayr interviews)
   a. well *you know* how we're di– we're different
   b. if *you know* somebody who's there *you know* if you're going to stay
   c. whether *you know* it or not
   d. *you know* Jim Sellars the M.P.
   e. not what *you know* who you knew

In all these cases, the construction *you know* forms part of the syntax of the clause and could not be omitted. In the examples in (2) this constraint does not hold.

(2) (Examples from the Ayr interviews)
   a. you didnae offer her money *you know*
   b. I could see *you know* the hunted look on his face
   c. than I would be if I was actually *you know* out
   d. than if I was *you know* working nine till three
   e. I maybe always *you know* didnae back the winner

The examples (2b–e) are the clearest illustrations of *you know* as a discourse marker since, far from being part of the syntax of the clause, they actually separate constituents that are usually contiguous. There are, however, examples that

are potentially ambiguous in that it would be possible to claim that there is a syntactic role for the construction, as in the examples in (3).

(3) (Examples from the Glasgow adult sessions)
   a. *you know* I didn't have to think about it
   b. *you know* it just so happened
   c. but *you know* we had – we had a very good gym teacher
   d. but I know that the time will come *you know* that they're going to get to that point
   e. "Oh *you know* I'm really sorry honey"

If the examples in (3) were examples of informal written language, taken out of context, it might seem plausible (though highly unlikely) that they were instances of *that*-deletion following the verb; but on the tapes, it is clear from prosodic features that *you know* is not a verb with a following complement but a discourse marker with a very different function. *You know* in examples such as these is generally uttered as a single unit with a falling intonation and often at a slightly lower pitch and volume than the surrounding speech. For the purposes of the present comparison, occurrences of *you know* are treated as examples of discourse markers if they are not crucially part of the syntax of the clause and/or they are marked prosodically as separate units. In practice, it is usually not difficult to identify *you know* in its role as a discourse marker.

4. The Results

There is a total of 846 tokens of *you know* as a discourse marker in the combined corpora, with a frequency of 3.41 per thousand words. The total would appear to be sufficient to allow a plausible investigation of the use of this discourse marker. The first factor that appears to be influential is the context of recording. In the interviews conducted in Ayr the number of instances is 261 with a frequency of 2.16. In the Glasgow sessions the number of instances is 585 with a frequency of 4.58. These figures suggest that *you know* is more likely to occur in conversations between peers who know each other than in interviews with a stranger.

The second difference in the use of *you know* is shown by a comparison of the figures for the adolescents and the adults in Glasgow. The adults have a total of 548 instances with a frequency of 6.84 per thousand words; the adolescents have 37 instances, with a frequency of 0.86.[3] Whatever it is that leads to the use of *you know* in peer conversations of this kind it does not seem to be well established at the age of fourteen. Consequently, if only the adult conversations in Glasgow are compared with the Ayr interviews, it can be seen that *you know* is more than three times as frequent (6.48 *vs.* 2.16) in the conversational data. However, there may be an additional factor. Holmes (1986: 14) and Erman (1992: 228) found a greater use of *you know* in same-sex interactions than in

There are also gender differences. Of the total 846 instances 57% (485) are produced by females and 43% (361) by males. Since in the total sample there are more males, the difference is better expressed in frequencies. The females use *you know* with a frequency of 4.92 per thousand words and the males with a frequency of 2.41. This is consistent with results reported by Fishman (1978, 1980) and Östman (1981), but not with Holmes (1986), who found no gender differences in her sample, or with Erman (1992), who found that men used *you know* more frequently than women.[4]

The final extralinguistic variable is social class. In the total sample the working-class speakers produced 493 tokens for a frequency of 3.49 per thousand words and the middle-class speakers 353 tokens for a frequency of 3.29.[5] This small difference is consistent in both the Ayr and Glasgow samples, but much less than Bernstein (1962) suggests.[6] Social class is much less of a determinant than age, gender, or recording situation. The gender distinction is consistent across class, as can be seen in Table 3.

Table 3: Social class and gender differences

	Ayr freq.(#)		Glasgow freq. (#)	
Middle-class women	4.11	(21)	8.34	(156)
Middle-class men	1.88	(86)	4.36	(68)
Working-class women	2.33	(41)	8.33	(276)
Working-class men	2.16	(113)	4.59	(79)
Middle-class girls			1.73	(18)
Middle-class boys			0.35	(4)
Working-class girls			0.66	(9)
Working-class boys			0.81	(6)

The only category in which males used *you know* with greater frequency than females is among the working-class adolescents, and the difference is small and there are few tokens.

There are, however, social class differences in the function of *you know*. In Macaulay (1991), I pointed out the positions where *you know* occurs in the clause:

> "*You know* can occur in initial position in the clause..., in medial position..., or in final position in the clause. By *initial position* is meant either the first position in the clause or immediately following a coordinating conjunction or a discourse marker such as *well;* by *medial position* is meant any position preceded and followed by any constituent other than a coordinating conjunction or a discourse marker; and by *final position* is meant a position followed by no constituent other than a terminal tag such as *and that.*" (Macaulay, 1991: 156)

In the Ayr interviews there was a preference for final position in both groups, but it is stronger in the lower-class group.[7] The middle-class speakers are more

Table 4: Distribution of *you know* in Ayr

	Initial	Medial	Final
Lower-class	16%	19%	64%
Middle-class	25%	34%	41%

[From Table 10.11 in Macaulay, 1991: 156]

The figures from the Glasgow sessions show even more marked differences, as shown in Table 5.

Table 5: Distribution of *you know* in Glasgow

	Initial	Medial	Final
Working-class	25%	10%	65%
Middle-class	18%	50%	32%

Most accounts of *you know* attempt to explain its use in terms of shared knowledge, given the basic meaning of the sequence in its normal syntactic function (as illustrated in (1) above). My own view, based on the Ayr and Glasgow examples, is that *you know* has become grammaticalized much in the same way as *lets*, for example, (Hopper and Traugott, 1993) or certain uses of *like* (Romaine and Lange, 1991), in which most of the basic meaning has been bleached out.[8] There are examples where *you know* occurs in close proximity to the verb *know* (shown in bold) in its basic function, as in (4). (The examples in (4–14) are all taken from the Glasgow conversations.)

(4) a. but I **know** that the time will come *you know* that they're going to get to that point
b. sort of *you know* not **knowing** what an A.G.M. would be like at a golf-course
c. but *you know* I think that's the sort of thing that maybe you do when you're eighteen *you know* er I don't **know**
d. *you know* you **knew** at some point
e. Do you **know** *you know* that's what I would have had with me

Such examples do not prove that the basic meaning has been bleached out of *you know*, but they suggest that the speakers are not anxious about the conflict of homonyms.

It is also the case that a speaker will use *you know* when the addressee does not know what the speaker is about to say or has already said (Östman, 1981: 17). This was illustrated in Macaulay (1991: 157–8) showing one speaker who used *as you know* to refer to mutual knowledge and *you know* in connection with something that the interviewer could not have known. In initial and final position, *you know* is frequently used before or after statements that clearly do not represent shared knowledge, as illustrated in (5) and (6):

(5) a. *you know* I had mentioned the fact that I had taught for a few years (*reporting on a conversation that the addressee had not heard and could not have known that the speaker had mentioned this*)
b. and *you know* if they got the ball out to her (*referring to a women's rugby match that the addressee had not seen*)
c. *you know* we were playing is it a Stapleford? (*referring to a golf competition that the addressee had not participated in*)
d. I remember seeing a– a John Cleese video a few years ago on golfing etiquette *you know* he rolls into the car-park (*since the addressee had not seen the video he could not have known this*)
e. *you know* I think they probably will a few times (*the addressee presumably does not already know what the speaker thinks*)
f. *you know* there was a violent thunderstorm (*the addressee has already said that she did not know about the time when the system crashed because of lightning*)

(6) a. and I'd said I'd go up and meet them *you know*
b. we just all went down the road thegither *you know*
c. and I was just saying to her "Don't leave it until it's too late" *you know*
d. saying "No I think that's better on the top and that and that that that" *you know*
e. and he said "You didn't tell me you were going out" and I said "Yes I did" "No you didn't" *you know* so the next morning he was going out to work and he said "Well will I see you for tea tonight?" *you know* "Will you be at home?" *you know*
f. and Hilary walloped her one *you know* (*All examples of new information being provided as part of a narrative*)

There are, of course, occasions when *you know* is used in initial or final position in relation to a statement that could be shared knowledge, but the examples in (5) and (6) show that the use of *you know* cannot be predicated on the assumption of shared knowledge.[9] To start from that assumption often requires interpreting the new information either as part of general knowledge or as taking the speakers to be saying, in effect, 'You can imagine what the situation was.' Such an approach risks overinterpreting the data. If an explanation can be found without any assumption of shared knowledge, there is no need to make such subjective interpretations.

Nor is initial *you know* used in the Ayr interviews or Glasgow conversations to claim the floor by introducing a new topic (Fishman, 1978, 1980). The dynamics of turn-taking are different in the interviews and same-sex dyads from those in multiparty conversations. Initial *you know* is sometimes used to introduce backgrounded information contained in a subordinate clause or prepositional phrase, as in the examples in (7).

(7) a. But *you know* when you're working away
b. *you know* if you come out of the St Enoch's car park
c. *you know* if you're going to stay with somebody
d. and *you know* if they got the ball out to her
e. so *you know* instead of digging and digging rock you were just–

In final position *you know* can be interpreted as what Sacks et al. (1974) call a 'transition relevance place' since it usually marks the end of a syntactic unit, but generally in the Ayr interviews and Glasgow conversations the listener does not take advantage of this opportunity to take over the floor, except to contribute feedback in the form of a minimal response such as *uhuh* or *mhm*. This is not surprising since *you know* usually does not signal a desire or intention to yield the floor.

(8) a. 13L: and the kids were aw drapped off at my mother's *you know*
13R: uhuh
13L: and went fae school to my mammy's
b. 13L: then I had tae get a job roond Kirstie being at nursery and then get it roond Kirstie being at school *you know* cause I'd nae baby-sitters near
c. 10R: I mean they've got one of these old stone terraced houses in Prestwick which have got really
10L: mmhm
10R: high ceilings *you know* and I was saying you could really do a deep se– colour on the ceiling
d. 10R: cause he's the one that sits up late and watches j– garbage on
e. 10R: I'd got caught on a phone by somebody who was asking for help *you know* and I came out
10L: mmhm
10R: thinking "This is ridiculous" *you know* "she's wanting help and yet my child's the one who's being left at home" *you know* the television *you know* and you have to hassle and say "G–please go to bed"

Example (8e) illustrates a common use of final *you know* to mark the end of a section of quoted dialogue (see also 6e above). Other examples can be seen in (9).

(9) a. and Alison said to her "Well the holiday I'm meant to be having" *you know*
b. and I'm saying "Oh I– I'm so sorry Philip" and "Mummy just got caught up" *you know* and everything
c. and I thought "I'm no telling them" *you know*
d. and I says "Cause I want to gie something to it" *you know* cause I was one of the ones that done all the running aboot
e. he says "Nanny" and it's "Nanny nanny nanny" *you know*

Since *you know* can occur within the quoted speech, it is sometimes difficult to decide whether *you know* belongs inside the quoted speech or not.

(10) a. and I was just saying to her "Don't leave it until it's too late *you know* don't hassle and don't worry about it overly"
b. and you say "Well *you know* just tell him or don't argue about it"
c. I had to stop at Maryhill Shopping Centre at ten past three and phone the school and say "I'm sorry *you know* ha I'm here. Could you please take my child?" *you know*
d. I says "I'm trying to work them oot because wi the wean *you know*" I mean I says "but if the other granny watches her *you know* I'll just– I can go any time in August"

e. And I just says "Frank I'm– I'll be a bit later but I'll just come alang the road and get–and get you just stay in there *you know* I'll come alang and get you"

Examples such as those in (10) are problematic for those who wish to emphasize the interpersonal function of *you know*, since it is not clear whose face is being addressed.

The most interesting uses of *you know*, however, are those that occur medially, that is, potentially within a constituent. It is necessary to include the notion of potential constituents because one of the common uses of *you know*, particularly in the middle-class interviews and conversations, is before self-repairs, as in (11).

(11) a. and yet it's a shame because they – *you know* they do need they need a holiday but
b. I mean I'm– *you know* a– I– I having gone through it earlier em with Mum and Dad
c. certainly one for the formal situation and one f– *you know* for the more sort of relaxed situation
d. er but em you know Christine was a– *you know* was a good player really
e. and even then you wouldn't se– *you know* you wouldn't er compare him with the- the current back-row forwards.

This use of *you know* is what would be described by Brown (1977: 107) as a "verbal filler" and Edmondson (1981: 153) as a "fumble" in that it allows the speaker time to find the desired expression. Schourup points out that these repairs are often "clause internal 'restarts'" (1985: 137).[10] Similarly, *you know* is often used with hedges such as *sort of* and *kind of* as in (12).

(12) a. I think that's the sort of feeling that the feeling of guilt that you have *you know* when you're– *you know* you– you kind of chuck your children round
b. and she's a very *you know* neat em kind of gentle person
c. so there'll be a kind of *you know* they 'll avoid em Hilary em
d. it took me a while to *you know* sort of master it *you know*
e. and– and you– you just– *you know* you sort of semi-scramble down to the bay

However, not all medial uses of *you know* are in connection with repairs or hedges. *You know* is often used when the speaker apparently wishes to emphasize a constituent or to use a less expected expression. Obviously, identifying such a use requires a projection on the part of the analyst. Some examples are given in (13).

(13) a. I'm sometimes actually ending up doing more out and about than I would be if I was actually *you know* out
b. and they demand things and they *you know* stomp out
c. so I mean it's not as though they're *you know* completely on their own
d. whether they're *you know* into boys or into make-up or into pop or into what or whatever

In examples such as those in (13) it is as if the speaker wished to draw attention to the constituent that follows *you know*. In other cases, such as those in (14), the speaker is elaborating a preceding item.

(14) a. It's just horrendous *you know* absolute madness
b. there's a lot of pressure *you know* power stuff in the pack
c. I wondered actually if what we're seeing over the last couple of weeks is end of term *you know* celebrating end of term
d. because you– you met everybody *you know* all varieties of people
e. I mean it was all the old-fashioned stuff *you know* the– *you know* the Brown system

5. Discussion

It has been common in analyzing the use of *you know* to place the emphasis on shared knowledge (e.g., Schiffrin, 1987; Quirk et al. 1985; Crystal and Davy, 1975; Holmes, 1986) or on the effect on the addressee (e.g., Östman, 1981; Crystal and Davy, 1975; Schourup, 1985). This may be appropriate in multi-person conversations or among speakers in the US or New Zealand, but it does not seem to be the right way to categorize the pattern of use in the Ayr interviews or the Glasgow conversations. There does not appear to be any strong evidence that either *you* or *know* retains its basic meaning and function. Eble (2000), following Wales (1996: 78–82), comments on the increase in the use of 'indefinite *you*' as a general agent, distinct from its use as a second-person addressee form. She cites examples such as those in (15) (my italics):

(15) 1. "It's scary how Hollywood treats *you* like this completely different person when *you*'re thin." (Jennifer Anniston, *McCall's*, June 2000)
2. "*You* dream about it. *You* fantasize about it," [Matt] Doherty said of coaching the Tar Heels. ([Raleigh] *News and Observer*, 12 July 2000)
3. "*You*'ve got three million Palestinian refugees." (Martha Raddatz, *Washington Week in Review*, 21 July 2000)

It is likely that *you* in *you know* is an indefinite pronoun, like in the examples in (15), more often than it is a reference to the addressee as an individual. The examples in (4) showed that there was little sense of awkward repetition in the use of *you know* in close proximity to the use of *know* as a verb in its basic sense, suggesting that its meaning had been at least partly bleached out. Vincent and Sankoff (1992) examine a set of discourse markers that they call 'punctors' in 12 interviews sampled from the Sankoff–Cedergren corpus (Sankoff and Sankoff, 1973) of French speakers in Montréal. Among the ten punctors are the forms *tu sais* and *vous savez*, which correspond to *you know*. Vincent and Sankoff (1992: 206) comment that "Punctors have lost all or most of their original meaning or

function; we can say that they are to a large extent desemanticized." The same seems to be the case with *you know* in the Ayr and Glasgow materials.

If this view is correct it may be premature to make claims of the following kind based on a study in New Zealand:

> "Pragmatic devices, such as... *you know*, which are primarily addressee-oriented, tend to emphasize solidarity and implicit shared understanding, and it is therefore not surprising to find such discourse features in the present sample to be more closely associated with working-class speakers and less formal speech contexts." (Stubbe and Holmes, 1995: 85)

If *you know* is NOT "primarily addressee-oriented," then it may not "emphasize solidarity" and it is perhaps not surprising that it is found as frequently in the middle-class conversations in Glasgow as it is in the working-class ones. To say this is not to dispute the New Zealand findings but to warn against enthusiastic extrapolation. If we are to make serious claims about the use of discourse features, we need more and better data. Perhaps because discourse analysis is such a new technique there may be a temptation to over-interpret the data in order to justify the approach. Some of the work in gender differences suggests this as a real danger (Macaulay, to appear). As regards social class differences, the work of Basil Bernstein serves as a cautionary example of the dangers of extrapolating from meagre data, despite the acuteness of many of his insights. Until we have adequate data on which to make generalizations about social groups, it may be prudent to follow Johnstone's (1996) advice and also pay attention to how individuals use certain discourse features.

In the Scottish materials, *you know* sometimes appears to be an idiosyncratic feature of the speaker's speech style. This can be seen most clearly in the use of *you know* in final position, as in the examples in (8) and (9). As was shown in Tables 4 and 5, two-thirds of the working-class examples of *you know* in both Ayr and Glasgow are in final position. This usage is often stigmatized as indicating incoherent speech (e.g., Francis, 1983). However, one function is to provide a form of rhythmic pattern in a fluent narrative, or act as a kind of oral punctuation marker, what Jefferson has called "an utterance lengthener" (1973: 69). Far from indicating hesitancy it can be used quite effectively by fluent speakers.

This can be illustrated by an example of a discourse marker functioning to segment a narrative. In Ayr (though not in Glasgow) *ken* (presumably a shortened version of *you ken*) is often used in this role, as in this story by Willie Rae, a coal miner, interviewed as part of the Ayr investigation:

(16)

623 oh but this I dae remember
624 the pits were privately owned
625 and aw the miners stood at the **corner *ken***
626 they backed their wee lines

627 the bookie was staunding there and aw
628 sixpenny doubles and one thing and another *ken*
629 here this day I wondered
630 what was wrang
631 aw the auld yins took their caps off *ken*
632 because it was the pit owner
633 that was going by *ken*
634 for respect *ken*
635 an auld auld man he was *ken*
636 come by in a chauffeur-driven motor *ken*
637 the old yins daffing the cap
638 in oor days they'd be chucking stanes at that motor[11]

Rae's use of *ken* in the above example is not because he was searching for words or in any way hesitant, but because it is part of his narrative style. There are 157 examples of (*you*) *ken* in WR's interview, 93% are the reduced form *ken*, and 90% occur in final position. It can be seen that in this narrative, he uses *ken* as a way of separating out sections of his story:

(17) (A) oh but this I dae remember the pits were privately owned and aw the miners stood at the corner *ken*
(B) they backed their wee lines the bookie was staunding there and aw sixpenny doubles and one thing and another *ken*
(C) here this day I wondered what was wrang aw the auld yins took their caps off *ken*
(D) because it was the pit owner that was going by *ken*
(E) for respect *ken*
(F) an auld auld man he was *ken*
(G) come by in a chauffeur-driven motor *ken*
(H) the old yins daffing the cap in oor days they'd be chucking stanes at that motor

"(A) introduces the critical factor of the private ownership of the mines and sets the scene with the miners standing on the corner of the street. (B) explains why they were standing there. (C), introduced by the deictic discourse marker *here* (Macaulay, 1991: 169), which often indicates surprise, presents the central event of the miners taking off their caps. (D) gives the first explanation, that it was the pit owner going past. (E) explains the significance of the action. (F) and (G) add further background information. (H) both indicates the conclusion of the story and draws a contrast between the present and the past. Although the discourse marker *ken* makes no semantic contribution to the story, it helps to give it structure." (Macaulay, 1997: 155–156)

There are no such extended examples of *you know* used like this in the Glasgow conversations, perhaps because the narratives there are not of this anecdotal

kind, and none as marked as this even in the Ayr interviews, but there are sequences of *you know*, as in (18).

(18) (Glasgow session #18, working-class men)
L: and all the women would go "Oh we got a murder" *you know*
R: aye aye
L: and they– they eh em they'd buy the paper *you know*
R: aye aye aye
L: oh it was amazing nowadays it's eh *you know*
R: it's commonplace
L: murder it's commonplace *you know*
R: aye aye
L: you get a snippet of it on the back page of the Evening Times or something like that *you know*

You know in this usage is somewhat similar to the use of terminal tags by some of the working-class speakers in Ayr (Macaulay, 1985, 1991).[12]

If the use of *you know* is not to get "the addressee to cooperate and/or to accept the propositional content of his utterance as mutual background knowledge" (Östman, 1981: 17), "to allude specifically to the relevant knowledge of the addressee in the context of utterance" (Holmes, 1986: 16), to check "Are we together on this?" (Bernstein, 1962: 235/1971: 111), or to show a presumption about "some shared ground between the private world and other worlds with respect to what is in the shared world" (Schourup, 1985: 109), what is it that motivates the speaker to use it? If the answer is not to lie in the meaning of *you know*, the answer must lie in the nature of the signal itself.

Like *I mean*, *you see*, and *of course*, *you know* has an iambic structure, so it is perhaps not surprising that all four should occur frequently as discourse markers, since the iambic foot is such common part of English rhythm.[13] In the Ayr interviews, 66.85% of the medial and final occurrences of *you know* come after stressed syllables, suggesting that rhythm plays a role in its occurrence. *You know* also has a simple CVCV structure with two sonorant consonants and two vowels that are high in sonority. In this, it contrasts with its obvious competitor *you see* with its fricative/s/ and high front vowel.[14] Erman, (1992: 228) found *you see* to be less frequent than *you know* and in Ayr the middle-class speakers (with one exception) show a preference for *you know* (Macaulay, 1991: 144). (There are very few examples of *you see* in the Glasgow conversations.)

There is also considerable individual variation in the frequency with which discourse markers of this kind are used. In Ayr, the frequency with which individual speakers use *I mean* ranges from zero to 8.74 per thousand words; in the Glasgow adult conversations from zero to 6.91 per thousand words. In Ayr, the frequency of *you see* ranges from zero to 7.63 per thousand words. There is great individual variation as can be seen in the figures for the adult speakers' use of *you know* in both corpora. The range is shown in Tables 6 and 7.

Table 6: Range of frequency of *you know* by social class and gender Ayr

Working-class				Middle-class			
		#	Frequency			#	Frequency
WR	(m)	2	0.39	DN	(m)	12	0.79
HG	(m)	4	0.41	WG	(m)	7	0.82
EL	(f)	11	0.83	JM	(m)	7	0.91
AS	(m)	48	2.27	AM	(m)	27	2.77
WL	(m)	59	3.63	NM	(f)	21	4.11
MR	(f)	30	6.86	IM	(m)	33	7.22
All		154	2.21	All		107	2.1

Table 7: Range of frequency of *you know* by social class and gender Glasgow

Working-class				Middle-class			
		#	Frequency			#	Frequency
17R	(m)	1	0.16	16R	(m)	0	0.0
17L	(m)	1	0.53	10L	(b)	8	1.75
14L	(b)	5	1.16	11L	(m)	13	2.5
13L	(b)	14	3.41	16L	(m)	18	3.84
18R	(m)	21	4.77	12L	(b)	18	4.1
14R	(b)	53	6.74	10R	(b)	93	12.8
13R	(b)	47	9.1	12R	(b)	32	12.84
15R	(f)	45	10.45	11R	(m)	42	15.67
15L	(f)	81	10.99				
18L	(m)	56	12.09				
All		324	6.44	All		224	6.53

There are a number of observations to be made about the figures in Tables 6 and 7. The first is that there is a wide range in the frequency with which speakers use *you know*, from zero to over 15 instances per thousand words.[15] The second point is that this variation is not constrained by either social class or gender. The third point is that with the exception of two conversations (17 and 15), the use of *you know* is not equally frequent by the two speakers. Usually, one speaker uses this form much more frequently than the other. Note also that while generally the women use *you know* more frequently, for three of the groups the speaker with the highest frequency is a man. This is a warning not to generalize too quickly from group scores to predictions about individuals, particularly where gender is involved. Finally, one speaker was recorded in two sessions. The speakers identified as 13R and 14R are the same woman. The similarity in the frequency with which she uses *you know* (9.1 *vs.* 6.74) with different interlocutors (her two scores are ranked consecutively in the order of frequency in Table 7) suggests that this may be a consistent feature of her speech in such situations.

6. Conclusion

Quantitative studies of discourse features are still at a very preliminary stage. No doubt, improved methods of creating machine-readable corpora of speech recorded under a variety of circumstances (Sinclair, 1995) will provide more accurate information on many aspects of discourse. In the meantime, small-scale projects such as the Ayr interviews and the Glasgow conversations, while they cannot provide evidence on which to make unchallengeable claims, can perhaps provide pointers for future research. From the figures presented above, some tentative conclusions can be drawn, though their significance may not extend beyond the boundaries of Scotland.

(1) The use of *you know* varies among individuals from similar backgrounds. Some rarely use it, if at all, while others use it quite frequently.
(2) Speakers are more likely to use *you know* in conversations with an acquaintance than in interviews with a stranger.
(3) Women are more likely to use *you know* than men.
(4) Adolescents have not yet developed the use of *you know* as a characteristic of their discourse style.
(5) The use of *you know* is not more common in one social class than the other. However, middle-class speakers are more likely to use *you know* medially in an utterance for purposes of self-repair or elaboration, while working-class speakers mainly use *you know* at the end of an utterance.
(6) The use of *you know* does not appear to be primarily based on assumptions of shared knowledge, but rather to form part of the speaker's discourse style and the rhythmic organization of utterances, particularly when it is used at the end of an utterance.
(7) Some insight into the function of *you know* may be gained by looking in detail at how individuals use it, rather than depending solely upon group scores.

Notes in Press

This paper was written before I had seen Erman's recent functional analysis of *you know*, which explains the lack of any reference to that work in my paper. It may be helpful to point out that my paper deals only with the category that Erman calls 'textual monitors' (2001:1342–1345). Her other two categories include examples where *you know* is in syntactic construction with other elements in the utterance. As illustrated in by the examples I gave in (1) at the beginning of the paper, these constructions were excluded from my analysis. Apart from that, Erman's observations that 'discourse markers functioning at the textual level are not primarily concerned with the addressee's decoding of the message, but rather with the organization of the discourse' (2001: 1343) is consistent with the view I have tried to present above.

Acknowledgements

I am grateful to Don Brenneis, Janet Holmes, Lee Munroe, Claudia Strauss, and two anonymous journal reviewers for comments on an earlier draft, The usual caveats apply.

Notes

1. My thanks obviously in the first place to Jane Stuart-Smith who organized the whole project, and then to her assiduous assistants who transcribed the tapes: Cerwyss Ower, Claire Timmins, Kathryn Allen, Lesley Eadie, and Susan Bannatyne, especially the first two.
2. For technical reasons three sessions were recorded with working-class women; one speaker was recorded twice with different interlocutors. As a result the number of participants in each social class/age/gender category is not totally consistent, but since the results are presented in terms of frequencies, the difference in absolute numbers need not materially affect any conclusions. The raw figures for working-class women, however, cannot be used in direct comparison with those of the other groups.
3. The frequency for the Glasgow adults is almost identical to that found by Holmes (1986: 13) for informal contexts, namely 6.9 per thousand words. Although Holmes' corpus is much smaller (30,000), the similarity of frequency is interesting.
4. This is what Erman (1992: 228) claims and she gives figures to show that more examples of *you know* were produced by males (198) than by females (148), but she does not give figures on the actual amount of speech produced by males and females. If, in fact, as is quite possible, the males spoke more than the females, then these figures could be misleading.
5. The Ayr lower-class speakers also use a form *(you) ken* in this function with a frequency of 2.9, but this figure is distorted by the fact that one speaker (WR) is responsible for 78% of the examples in a relatively short interview. WR uses *(you) ken* with a frequency of 31.4. One other speaker (WL) is responsible for 17% of the examples, with a frequency of 2.15. The other four lower-class speakers have only 9 examples among them. If all the tokens of *(you) ken* are added to those of *you know*, the frequency of the combined forms for the working-class men in Ayr is 6.01 per thousand words, but without WL's exceptional use of *(you) ken* the combined frequency for the other working-class speakers is only 3.31, so the use of *(you) ken* does not greatly affect the overall picture. The form *(you) ken* does not occur in the Glasgow conversations. WL's use of *ken* will be illustrated later in the paper.
6. Bernstein does not give figures for *you know* alone but groups it in its terminal use with other items under the category 'sympathetic circularity' (SC) sequences. The other items include *isn't it, ain't it,* and *wouldn't he.* Bernstein was reporting on a very small corpus of about 8,000 words and gives the the figures of 8 SC sequences for the middle-class boys and 67 for the working-class boys. These convert to frequencies of 2.53 for the middle-class boys and 14.14 for the working-class boys. Bernstein interpreted these results as symptomatic of the 'restricted code' used by the working-class boys: "The meanings signalled in this code tend to be implicit and so condensed, with the result that there is less redundancy. A greater strain is placed upon the listener which is relieved by the range of identification which the speakers share. The S.C. sequences may be transmitted as a response of the speaker to the condensation of his own meanings. The speaker requires assurance that the message has

been received and the listener requires an opportunity to indicate the contrary. It is as if the speaker is saying 'Check– are we together on this?'. On the whole the speaker expects affirmation. At the same time, by inviting agreement, the S.C. sequences test the range of identifications which the speakers have in common." (1962: 235/1971: 111) This is a very clear statement of the notion of 'shared knowledge' that underlies many of the interpretations of the use of *you know.*

7. These figures are similar to those Huspek (1989: 666) found in a sample of 10 working-class speakers. He found 43.3% of *you know* in final position and 23.9% in initial position. His figures are not strictly comparable since he gives his results in terms of sentences, a measure that reduces the proportions in comparison with clauses.
8. Jefferson (1973: 95) argues that overlapped tag-positioned address terms in closing sequences "are not motivated by 'personal' considerations, although they can become resources for interactants to do 'being personal'". In a similar line of argument, I suggest that the use of *you know* is not necessarily motivated by interpersonal intentions though it may be so used.
9. Marcia Macaulay (1990), in her comparison of oral and written speech across genres, analyzes a section from a lecture *The Politics of Love* given by Leo Buscaglia, comparing it with a section from his book *Loving Each Other.* She points out that Buscaglia uses *you know* in 'speaking to an audience of thousands" (p. 92). He uses it in instances where there is no possibility that his audience could share the knowledge, e.g., a story in which he says "... and there was this man pushing everybody aside with his poor wife on his arm *you know* he's pulling her through..." (p. 196, italics added). The reference to *this man* makes it clear that this is new information to the audience. In the extract from his speech printed in the appendix to the volume there are 19 examples of *you know,* giving a frequency of 13.25 instances per thousand words. This is a higher frequency than in any of the Glasgow conversations, yet Buscaglia can have no direct knowledge of what such a large audience knows or does not know.
10. Schourup, however, points out that *you know* "cannot very appropriately be used in cases where the repair involves radical changes" (1985: 122). He gives the example:

    ?*I got a dog– you know cat for my birthday*
    which seems very unlikely, whereas the same utterance with
    I mean sounds quite normal: *I got a dog– I mean cat for my birthday.*

11. *dae* 'do,' *aw* 'all,' *wee lines* 'bets on horses,' *bookie* 'bookmaker,' *staunding* 'standing,' *sixpenny doubles* 'bets,' *wrang* 'wrong,' *auld yins* 'old ones,' *daffing* 'doffing,' *oor* 'our,' *chucking stanes* 'throwing stones.'
12. In the lower-class Ayr interviews terminal tags such as *and that* and *and one thing and another* occur with a frequency of 4.93 per thousand words, but this is mainly due to one speaker (AS) who produced 85% of these examples (a frequency of 13.84). The speakers often use these tags at the end of clauses:

    a. if I had her cleaned up *and that*
    b. aye but it– it was a cheap holiday *and that*
    c. I didn't feel it tight *and that*
    d. when he died *and that*

    As the last example clearly shows, these tags need not have a set-marking function (Dines, 1980). As the last example clearly shows, these tags need not have a set-marking function (Dines, 1980).
13. It is interesting that of these four discourse markers only *of course* is common in written language.

14. It also contrasts very strongly with the focuser *like*, so popular among younger speakers in the US (Dailey O'Cain, 2000; Schourup 1985; Romaine and Lange, 1991; Underhill, 1988). *Like*, with its final voiceless stop consonant imparts a staccato effect to the user's speech. My guess is that *like* and *you know* are probably in complementary distribution for the contexts in which they could both occur.
15. Vincent and Sankoff (1992: 207) show a similar range in the use of punctors in their sample. Huspek (1989: 665) also shows a range of use of *you know* among his working-class speakers, with one speaker using *you know* almost five times as frequently as the least frequent user. Since Huspek gives his frequencies in terms of sentences, it is not possible to compare them with the Scottish results.

Analysing Self-Constituting Discourses

Dominique Maingueneau

In this article I specify my conception of discourse analysis, before dealing with a research field that I would like to promote: that of 'self-constituting discourses'.

1. Discourse Linguistics and Discourse Analysis

Most discourse analysts are satisfied with a 'minimalist' definition of discourse analysis, which they only consider as the study of texts in context, of communicative events. Actually, the notion of 'discourse' is more problematized than that of 'discourse analysis'. This oversimplification can be explained easily: in the beginning the scholars who worked on discourse had to legitimate their research, to establish a new conceptual and methodological area at once against a narrow conception of linguistics or semantics and against traditional approaches to texts. Their attention was naturally drawn more to the boundaries of what they were opposed to than to those of their own discipline. Now that the legitimacy of discourse studies is established, to the extent that throughout the world people work in this area, I think that we must reflect more on the boundaries of 'discourse analysis'.

Some people consider that demarcating the territory of discourse analysis is a quite uninteresting question and that the scholars who specialize in this area must work without any restraint; for them 'discourse analysis' is a mere label given to a wide range of studies on texts; it does not need to receive a definite content. I am nevertheless convinced that working without any reference point is very difficult. Even those who say that they do not worry about the boundaries of their research and who refuse to register in a given discipline submit in fact to paradigms they are not conscious of.

Source: *Discourse Studies* vol. 1, no. 2, 1999, pp. 175–199.

Instead of asking whether limits *can* be set to discourse analysis, some sceptical analysts could ask whether one *must* do it: if we clear up the vagueness, don't we run the risk of destroying what we intended to clarify – the risk of discovering that there is nothing firm in the area of the so-called 'discourse analysis'? It is a fact that many people consider discourse analysis a trifling activity, which fluctuates between useless sophistication and confusion, mixing in an uncontrolled way linguistic analysis with second-hand psychological or sociological views.

The instability of discourse analysis is steadily increasing, for more and more researchers throughout the world are exchanging ideas about discourse study, and, thanks to modern information technologies, more and more quickly. An aggravating circumstance is that discourse analysis is practised by two types of people, whose preoccupations are very different: on the one hand those who are mainly interested in discourse properties, and on the other hand those who use discourse analysis for dealing with historical, sociological, psychological or other problems. The former worry much more about concepts and methods than the latter, who wish to get immediate results, and who consider discourse analysis as a mere instrument for interpreting social or psychological data. Nevertheless discourse analysis cannnot be a mere auxiliary discipline, like statistics for sociology: the disciplines that may use discourse analysis as an instrument must not forget that they are also discourse, and may therefore turn into an object for discourse analysis. Likewise discourse analysis may turn into an object for sociology, psychology, etc.

It cannot be denied that nowadays any study of texts may be called 'discourse analysis'. Maybe such a situation results from the inertia of academic institutions: as contemporary research in social sciences cannot be easily channeled within the limits of traditional disciplines, many people say that they practise discourse analysis in order to legitimize studies that could be seen, from a traditional viewpoint, as 'marginal'. But if we take a long-term view, discourse analysis may be devalued by that ambiguity.

As a consequence, many definitions of 'discourse analysis' are very tolerant, or, on the contrary, extremely restrictive.

According to tolerant definitions all studies that claim to belong to discourse analysis have to be considered as discourse analysis. Such tolerance may be connected with a sceptical conception of scientific activity, according to which disciplines could only be defined by sociological criteria, not by their content.

Restrictive definitions are mostly given by scholars who do not take into account the diversity of the actual works in this area. Such an attitude may be adopted for two different reasons:

- Some call 'discourse analysis' their own research and expel other trends from that discipline. This is a rather common occurrence in social sciences, where people must give a definition of their discipline that is compatible with the way they work.
- Others draw up a definition of discourse analysis that is too narrow because they want to use clear-cut denominations. They decide therefore to name 'discourse analysis' a very small part of the studies that claim to be

discourse analysis. They do not do so because they are sectarian, but because they want to give precise definitions. In the *Nouveau dictionnaire des sciences du langage*, for example, 'discourse analysis' is restricted to the distributionalist method of Z. S. Harris in the 1950s (Ducrot and Schaeffer, 1995: 404); such a definition ignores the diversity of research in the field. We could mention too the interesting distinction made by S. Levinson in his handbook *Pragmatics* (1983): according to him, discourse analysis is one of the two main trends in the study of oral interactions. To that trend, focused on speech acts theory and hierarchical analysis of conversation, belong J. Sinclair and M. Coulthard (1975) or E. Roulet's school in Geneva (1985). Yet another trend proceeds from ethnomethodology. Such a distinction is very pertinent from a theoretical viewpoint, but it is only a matter of terminology. This distinction does not correspond to actual research: it can hardly be denied that for most of specialists discourse analysis is a much wider field.

If we want to take into consideration the full diversity of discourse analysis we are obliged to give very vague definitions. K. Ehlich, for example, in his presentation of the trends of discourse analysis in Europe (Ehlich, 1994: 9–10) uses expressions such as study of 'the reality of verbal action in its multiplicity and its complexity', or study 'based on facts of real communication'.

I think we would do better not to conceive of the relationship between 'discourse' and 'discourse analysis' as analogous to the relationship between any empirical object and the discipline which studies that object. Assuming that an empirical area commonly named 'discourse', interpreted as verbal activity in context, exists, it is postulated that discourse analysis is *the* discipline that takes charge of that area. But it can be challenged that discourse must be analysed by *one* discipline. Why not consider that discourse allows the construction of various objects, corresponding to various viewpoints, various approaches? Only God could apprehend discourse from one viewpoint. So, it seems necessary to introduce a distinction between *discourse linguistics* and *discourse analysis*. Various disciplines (rhetoric, sociolinguistics, discourse analysis, conversational analysis, etc.) assume the study of discourse; as a whole they constitute 'discourse linguistics'.[1] According to that viewpoint, discourse analysis is only one of the disciplines belonging to discourse linguistics. Each of those disciplines is ruled by a specific *interest* in discourse.

The specific interest of discourse analysis is apprehending discourse as articulating text and social places. Consequently, its object is not textual organization nor communicative situation, but what knots them through a certain genre of utterance. The notion of 'social place' must not be considered from a literal viewpoint: this 'place' may be a position in a symbolic field (political, religious, etc.).

Discourse analysis, logically, gives a key role, to discourse genres. These 'genres' are not to be considered as text classes, in a taxonomical way, but as

communication devices, at once social and linguistic, in a word: discursive. From this viewpoint, a dissertation, a TV programme, a conversation or a lecture are genres, but not categories such as description, polemic, etc., which cross manifold genres. Since the focus of discourse analysis is communication devices – genres – which are at once textual and social, it borders on text linguistics and social representations study. Considered as 'discursive institution' (Maingueneau, 1991), a genre implies roles and tacit contracts for the partners, specific medium, pertinent localization in time and space, prototypical text organizations, etc.

2. Discourse Analysis

Such a conception of discourse analysis is not very far from that of Brown and Yule's *Discourse Analysis*, where it is presented as 'committed to an investigation of what language is used for' (1983: 1). Another book, written from a similar functionalist viewpoint, is more explicit: 'All linguists – from the phonetician, through the grammarian, to the discourse analyst – are concerned with identifying regularities and patterns in language. However, in the case of the discourse analyst, the ultimate aim of this analytical work is both to show and to interpret the relationship between these regularities and the meanings and purposes expressed through discourse' (Nunan, 1993: 7). It seems to me that both formulations focus on the same idea, although it is not clear whether discourse analysis is the only discipline assuming discourse study.

As a result, discourse analysis has no data of its own: it can analyse the same data as other discourse disciplines, but by its own approach. Besides, in the same investigation the analyst can change disciplines, adopting various viewpoints on the data. In analysing a TV debate, for example, the analyst can take the viewpoint of conversational analysis, of rhetoric, of sociolinguistics or of discourse analysis and focus his or her attention on corresponding aspects of the data. If the analyst adopts the viewpoint of conversational analysis, he or she will privilege the study of interpersonal relations, turn-taking, cooperation and negotiation, physical attitudes, etc. The specialist of rhetoric will privilege other dimensions of discourse, in particular the connection and the nature of the arguments. The analyst of discourse will reflect on the communication device, on the articulation of public space and the way the text is organized. Naturally, each discipline may, and must, take into account the results of the others, but subordinating them to its own interest. It often happens that investigations with a descriptive approach to data cannot be referred precisely to a discipline. That does not entail that those disciplines do not exist.

Though data are not the property of a given discipline (oral interaction is not reserved solely for conversational analysis, nor is advertising for rhetoric, etc.), there is no denying that each discipline studies preferential data. It can be easily understood that discourse analysts are a priori less interested in everyday conversations than in newspapers, specialists of conversation less interested in advertising discourse than specialists of rhetoric.

Even if the viewpoint about discourse analysis outlined earlier is assumed, it is clear that this discipline does not appear at all homogeneous. Various interdependent factors contribute to its diversification:

- *Heterogeneity of scientific and intellectual traditions*: in England, for example, empiricism dominates the conception of scientific activity, the notion of 'discourse' is tightly tied to oral communication and to anthropolinguistic studies. In France discourse analysis is deeply influenced by the 'French school' of the 1960s and by Michel Foucault's work.
- *Diversity of reference disciplines:* as discourse analysis is always in contact with all social sciences, it varies according to the nature of the disciplines that exert influence upon it. The role of sociology and anthropology is much bigger in American discourse analysis than in Europe, where linguistics is more influential.[2]
- *Diversity of schools, trends.* Generally, these are associated with a charismatic leader who gives to the group the key concepts and the methodological paradigms of research.
- *Diversity of the data.* Two cases can be distinguished:
  - Some analysts may be particularly interested in certain types of discourse, which are well adapted to their conception of discourse analysis; and
  - Some groups may decide to work on certain types of texts (political, scientific, administrative); a large variety of theoretical options can be tolerated since their members are only united by the data that they study.
- *Aspect of discursive activity taken into account.* Some analysts study especially discourse production, others discourse circulation, others reception modes, etc.
- *Applied or not applied finality of the analysis.* By nature, discourse analysis is in close contact with social demand in many sectors (therapeutic, educational, political, economical). It is actually impossible to draw a clear-cut line between applied and theoretical research, but there is no denying that opting for an applied perspective has deep consequences on the way one works.
- *The academic identity of analysts.* By 'academic identity' I mean the field to which one claims to belong. If you are an historian, a sociologist, a psychoanalyst, etc. you will be more tempted to consider discourse analysis as a mere instrument for interpreting. I am not saying that discourse can really be studied for its own sake: we always look at discourse through philosophical, sociological, or political preoccupations. But having a philosophical preoccupation for discourse differs from studying discourse as a philosopher.

Although discourse analysis, by its very nature, is at a crossroads of social sciences, although discourse analysts concern themselves with discourse for philosophical, or sociological reasons, I think that discourse analysis must keep in

privileged contact with linguistics. If it does not do so, it can hardly be distinguished from the traditional 'content analysis' (Berelson, 1952) of empirical sociology. This is an important point. When we study discourse for militant motives, we are sometimes inclined to neglect linguistic phenomena, in order to have quicker access to representations, inclined to 'go across' language to arrive at interpretations that are independent of the way language is used in a given genre. We may also be inclined to study some details independently of the text as a whole and of the communication device. For this reason, it is worth maintaining discourse analysis in the field of language sciences. Let us remember that texts can be studied out of language sciences: many specialists of literature, politics, philosophy or advertising analyse texts in their own way, which is quite impressionistic but, according to them, well adapted to their aim. Discourse analysis demands more: its methods depend on scientific knowledge about language.

As a recent discipline, discourse analysis is exposed to various risks. In particular:

- Speculating about subjectivity, ideology, language, etc. without being connected with empirical phenomena.
- Describing data without any organizing viewpoint. Virtually, the territory of discourse analysis is unlimited: any linguistic utterance may be taken into account, split into elements, or commented: but what for? For syntax or morphology, descriptive works are very useful, indeed indispensable, as a basis for building linguistic models, but in discourse analysis, descriptions may easily prove to be useless, although they look quite exact and serious. A way to protect oneself against this risk is to address methodological problems, dealing more accurately with the relationship between the specificity of the data and the aim of the investigation.
- Uncontrolled hermeneutics, by which any discursive phenomenon would be analysed according a pre-established interpretation. That is a reproach often addressed to psychoanalysis, but it is valid for any hermeneutic practice.

Discourse analysis is doomed to take part in social and ideological conflicts, to intervene in political debates, directly or indirectly. Not all analysts concern themselves with social problems, but it is a permanent dimension of discourse analysis. The 'French school' of the 1960s planned, with marxist assumptions, to work out a theory of ideology. Two decades later, 'critical discourse analysis', as socio-political analysis of discourse, purports to study the various forms of power in relations between sexes, races, social classes (Van Dijk, 1990, 1993). Such a project is based on a conception of ideology as a set of socio-cognitive systems of representation that control attitudes and prejudices. That trend develops in a theoretical frame quite different from that of French school, but they both illustrate the same attitude towards the role that discourse analysis is called to play in political and social conflicts.

This critical attitude is a dimension of discourse analysis, but, of course, according to its promoters, it cannot be the whole of discourse analysis, which also studies places and modes of speaking independently of militant projects. Even when it is not openly interested in criticizing ideology, discourse analysis, radically, is a critical activity: it affects some basic illusions of speakers – the illusion of saying what they mean, the illusion that the places from which they speak are not constitutive of signification.

3. French Tendencies

I would now like to introduce the analysis of 'self-constituting discourses'. This type of analysis is in keeping with a trend of discourse analysis that I have proposed to call 'French tendencies' (Maingueneau, 1991: 24), although the word 'French' is not quite suitable: many discourse analysts outside of France share basic assumptions of this trend, and within France many analysts work with quite different assumptions. But I have not found a more appropriate name. These 'French tendencies' have their roots in the philology of the last century, in various practices (particularly the stylistic analysis of literary texts) and 'continental' philosophical traditions. By speaking of 'French tendencies' I only point to a certain style of discourse analysis, generally characterized by the reference to 'enunciation' theories, the preference given to 'constrained' discourses apprehended from a macrosociological perspective, an interest in discursive subjectivity and heterogeneity (polyphony, dialogism), the emphasis put on linguistic 'materiality', the assertion of the primacy of interdiscourse. I do not mean to imply that all the scholars who participate in this sort of analysis share all the same assumptions.

Let us emphasize some points:

- *The study of 'constrained' discourses* contrasts with (by no means 'is opposed to') the analysis of conversations. 'Constrained' discourses refers to oral or written discourses that imply a strong control, from a social and a textual point of view, and that may be stocked, commented. Such discourses are not more or less interesting than everyday oral interactions: discourse is always circulating from one pole to the other, from 'fleeting' utterances to 'authoritative' utterances.

Roughly speaking, three modalities of discourse genres in a society can be distinguished:

- *Author genres:* when they assign genres such as 'tragedy', 'meditation' or 'elegy' to their works (of philosophy, literature, etc.), authors enrol them in a 'genealogical class' (Schaeffer, 1989), i.e. in a class of texts associated to a prototypical text or set of texts; for example, Greek tragedies for tragedy, Plato's work for philosophical dialogues, Montaigne's *Essays* for essay, etc.
- *Routine genres* are the most common. They have no author, they stabiliz-

purpose: buying something, lecturing, campaigning for a candidate . . . To such genres are assigned specific roles, speech contracts, text macro-structures, etc.

- *Conversation genres* are much less constrained. Interpersonal relations override roles, their finality is not always clear and stable, their text organization may be very fuzzy.

What I call 'constrained' discourses refers especially to author and routine genres.

- *Putting emphasis on language 'materiality'* means turning one's attention to linguistic forms. Taking directly into account the psychological or social effects of a linguistic element, or of a linguistic structure is not enough. Language is not a mere instrument for speakers: they have to negotiate with what language materiality imposes to them. Discourse tries to resolve conflicts but across a language that limits movements and triggers uncontrolled effects.
- *Linguistic theories of 'enunciation'*,[3] developed by linguists such as C. Bally (1932), E. Benveniste (1966; 1974), R. Jakobson (1963) and A. Culioli (1990) play a very important part in many of those discourse studies. They deal with phenomena such as nominal determination, deictic elements, tense, polyphony, thematization. Enunciation theories may be considered as a component of pragmatics trends, but they are above all an analysis of *language* structure, not a theory of communication. Furthermore, they are very concerned with intersubjectivity: the enunciation subject, who articulates text and communication setting, cannot be reduced to a social subject nor to linguistic forms ('I', 'we'), which are only traces of it. Enunciation theories are therefore precious to discourse analysis, which is very anxious to avoid opposing social and linguistic dimensions of subjectivity.
- *Primacy of interdiscourse* is hard to define, for it may be interpreted in various ways. Such a principle decentres discourse analysis. It does not mean that analysis ought to compare texts with each other, instead of studying isolated texts: it means more: the identity of a discourse is constituted and maintained through other discourses, speaking is always speaking with, against or across other discourses, other voices. So, the relation of a text to itself and its relation to others, that is 'intradiscourse' and 'interdiscourse', cannot be dissociated.

Many phenomena in texts can be referred to this primacy of interdiscourse: presupposition, negation, quotations, mood and tense, irony, parody, etc.

4. Self-Constituting Discourses

The analysis of 'self-constituting discourses' is not a well-stabilized territory, but it gives the possibility of asking exciting questions about some important types of discourse. For quite some time I have been studying a wide range of texts,

that if we disregard superficial differences, many descriptive concepts could be transferred easily from one to the others. So I came naturally to the assumption that in the discursive production of a society a specific area could be delimited: that of 'self-constituting discourses'. Of course, religious discourse or literature, for example, have been steadily studied for centuries by hundreds of thousands of people, but bringing those discourses together in a new discursive unit may open an interesting research programme.

To clarify the notion of 'self-constituting discourses', one can start from a commonplace observation. Philosophers or scientists are not supposed to appeal to the authority of journalists when they deal with philosophy or science; on the contrary, when a debate is organized in the mass media about important problems, particularly ethical problems, journalists request the intervention of priests, scientists, philosophers or writers. These people are perceived as delivering not just any message, but one authorized by their privileged acquaintance with 'ultimate' discourses: discourses upon which others are based – that have a particular relationship with the foundations of society and with the signification of human destiny. This asymmetry proceeds from the particular status of 'self-constituting discourses': discourse like others, they are also discourses which claim to be above any other type of discourse. Discourses bordering on unspeakable meanings, they must negotiate the paradoxes that such a status implies. To found other discourses without being founded by them, they must set themselves up as intimately bound with a legitimizing Source and show that they are in accordance with it, owing to the operations by which they structure their texts and legitimate their own context, the way they emerge and develop. Analysts have no access to the world beyond limits of speech, but they can analyse the textual operations by which self-constituting discourses manage their self-foundation. Self-constituting discourses take charge of what could be called the *archeion* of discursive production in a given society. This Greek word, the origin of Latin *archivum*, has, from our viewpoint, an interesting polysemy: derived from *arch* ('source', 'principle', 'order', 'power'), the *archeion* is the centre where authorities sits, a group of magistrates, and public archives too. So, this notion of *archeion* binds tightly *founding* operations in and by discourse, the determination of a *place* for legitimate speakers and addressees, and the management of *memory*.

'Self-constituting discourse' does not define a category whose typological status is familiar. Usually discourse analysts handle typologies based on various criteria:

- *Linguistic* typologies, independent of the content and of the purpose of discourse, bring together texts that share significative properties. Those who work with concepts of 'enunciation' theories often use the basic distinction of Emile Benveniste between 'discours' and 'histoire' (Benveniste, 1966: 237): texts in relation to their enunciation situation, that is to say texts with deictic elements, are opposed to texts devoid of any relation to their enunciation situation, therefore devoid of deictic elements.
- *Functional* typologies class discourses according to their purpose. Such classifications handle very abstract functions, generally communicational

functions, for instance those of Roman Jakobson's famous typology (Jakobson, 1963), or functions based on sociological criteria (play function, mythical function, etc.).

- *Situational* typologies classify discourses according to diversified criteria: the places where they are produced (discourse in hospital, in the army, in classrooms), the identity of their speakers (the young, women), their genres (sermons, handbooks, papers), their ideological position (communist discourse, racist discourse, etc.).

What about self-constituting discourses? From a typological viewpoint, they can be considered a functional category as well as a situational category, for they imply criteria at the same time functional and situational: they play a specific part in ideological production (founding and not being founded) and they also correspond to specific places in communication areas of society.

Referring particularly to Foucault (1969), I think that actually we must focus on an approach to self-constituting discourses that connects their textual properties with their status in interdiscourse, with the institutions that legitimate their speakers, with the way they circulate or they handle other discourses, the way they are transformed, stocked, and so forth.

For centuries those discourses, at least certain genres belonging to these discourses, have been intensively analysed and commented on, because they were prestigious. Everyday genres, in contrast, were ignored, because they were considered unstructured or devoid of interesting content. Nowadays the situation is quite different: in the whole world 'ordinary' uses of language are privileged data for scientific investigation: for the first time in history *any* discursive production may be worth being integrated in a scientific research. But that revaluation of ordinary interactions must not institute them as privileged forms of discourse, to which all forms of discourse ought to be referred. Of course, discourse is by nature interactive, but interactivity cannot be reduced to immediate, face-to-face interaction: the basic interactivity of language is distributed in a large variety of types of communication. We are always tempted to consider that a certain type of discourse is more important than others because it is supposed to give access to the ideological kernel of a society. This privilege has been attributed variously, to literature, to everyday conversation, to political discourse, or to mass media discourse. I think that we had better renounce the belief that there is such a privileged discourse area, a centre that could give access to the hard core of ideological processes: what matters actually is the multitude of connections between all discursive areas, the diversity of discourse.

The analysis of self-constituting discourses has to avoid two dangers. First, it must not be submitted directly to applied perspective. Scientific discourse, particularly, is mainly analysed for practical purposes, such as documentation or technical writing. When approached as self-constituting, a discourse has to be considered from a wider viewpoint: not only as a type of text that has specific properties, but also as a type of discourse that has a specific status in interdiscourse. Second, it is better not to apprehend each self-constituting discourse

separately, as traditional specialists do. On the contrary, those discourses must be decompartmentalized: systematic connections must be established between them, as well as between self-constituting discourses and other discourse areas.

By nature, self-constituting discourses claim to found others and not to be founded. This property permits a definition of their status in interdiscourse, but it does not correspond necessarily to the personal convictions of their speakers. Such discourses are at once *self-* and *heteroconstituents*, two inseparable aspects: only a discourse that constitutes itself can found others. Therefore the name 'self-constituting discourses' must not be misconstrued: ideally, we should write '(self) constituting discourses', with 'self' in parentheses. That does not mean that other forms of discourse do not act on them; on the contrary, self-constituting discourses and other areas are always interacting, but in the case of self-constituting discourses, that interaction is ruled by specific principles, which are different for each type of discourse.

It is not easy to establish a list of self-constituting discourses, even if we only consider our type of society, for such discourses are defined by their status in interdiscourse, not by clear-cut frontiers in social activities. Each type of society has its own self-constituting discourses or its specific way of connecting them. Speaking 'anachronistically', one could say that mythical discourse in traditional societies is both 'philosophical', 'scientifical and 'religious'. Experimental psychology is self-constituting in that it belongs to scientific discourse, but the status of psychoanalytic discourse is more fuzzy: at least in continental Europe, it behaves like a specific self-constituting discourse, similar to philosophy or religion. Unlike psychoanalytic discourse, political discourse does not seem to be a self-constituting discourse; there is no denying that it is a very powerful ideological frame, but it leans on scientific, religious, literary and other discourses; it is not really autonomous. Technocratic discourse, for example, leans mainly on economics, fundamentalist discourse on religion, and other discourses. I would rather say that political discourse is a privileged contact zone between self-constituting discourses and other areas.

In modern societies, as in classical Greece, *various* self-constituting discourses exist at the same time, thus competing with each other. This variety is irreductible: self-constituting discourses' life is made of it. During many centuries philosophical discourse claimed to be prevalent: it attributed to itself the privilege of assigning boundaries to the others. Theological discourse also did so, and so did scientific discourse later . . . The common-sense belief is that each self-constituting discourse is autonomous and has contingent relations with others; actually their relation to others is a part of their core identity; they must manage that impossible coexistence and the way they manage it *is* their very identity.

The Three Dimensions of 'Constitution'

We have still not justified the use of the expression 'self-constituting discourses'. The reason is that 'constituting' connects two interesting values:

- 'Constituting' as action of establishing legally, of giving legal form to some juridical entity: self-constituting discourses emerge by instituting themselves as legitimated to utter as they utter.
- 'Constituting' as forming a whole, an organization: self-constituting discourses are sets of texts whose structuration modes must be legitimized by discourse itself.

Those two values converge to the derivative name 'constitution' as a body of fundamental principles according to which a State is governed, and people receive rights and duties: self-constituting discourses produce texts dedicated to embodying norms, to guaranteeing behaviours of a collectivity, to drawing the frontiers of good and evil, false and true, etc.

As the analysis of self-constituting discourses is discourse analysis, it aims at showing the connectedness of textuality and action, of 'intradiscursive' and 'extradiscursive' dimensions. Discourse as text and discourse as activity are tightly knotted in discursive institutions, where groups of men and text genres are articulated. Text production delimits a space inside social space but configurates that space too. Therefore, the analysis of self-constituting discourses implies keeping a 'rhetorical' conception at a distance: in fact, content and textual organization are not independent of the discursive scene which takes charge of them and through which they appear.

Position and Discursive Community

Self-constituting discourses interact with each other and demarcate each other. Thus they are not compact blocks, but form *discursive fields* (Maingueneau, 1984) in which various *positions* compete: in modern societies ideological frames are steadily discussed and 'discursive fields' are the space where the diversity of those 'positions' is structured.

Positions are the product of an act of 'positioning', in the commercial meaning of the word. The content of this notion of 'position' (doctrine, school, party) is very poor: it only implies that no position can occupy the whole space of a given self-constituting discourse, that the identity of each position emerges and is kept up through the interaction, often conflicting, with the others. That is a motto of many discourse analysis works: the pertinent object is not discourse in itself, but the system of relations with other discourses. Of course, most of the producers of such discourses claim that their message proceeds directly from a true apprehension of God, Man, Science, Beauty, Reality, Reason, etc. but in order to understand how such discourses really work, we must refer positions to the place they hold in their field.

A position is not only a more or less systematic set of ideas, it associates a certain textual configuration and a certain way of life for a group of people. The various philosophical schools in ancient Greece, or the various groups in contemporary social sciences, are not only theoretical positions, they imply the existence of groups, of *discursive communities* (Maingueneau, 1987) which may be organized

in many ways. Inventing a new way of having dealings with other people and producing new discourses are two dimensions of the same phenomenon. Those communities are structured by the discourses they produce and put into circulation. So, discursive communities are paradoxically united by the texts they produce: the texts are both their product and the condition of their existence.

The key role given to such communities converges with many studies, particularly about scientific discourse (Hagstrom, 1965; Swales, 1990). The way people make science, practise philosophy or religion, or lead an artistic life, is inseparable from the way they produce discourse (De Certeau, 1975; Debray, 1983, 1991; Maingueneau, 1984, 1993). But that principle must be diversified according to the type of discourse taken into consideration: communities do not behave in the same way when they belong to scientific field or to theological field; moreover, theology does not imply the same type of community as devotion, though both produce religious texts.

It may happen that some positions refuse any form of group. For instance, many writers claim to live in the desert; Pyrrhonian sceptics in ancient Greece refused to belong to a school, as to do so was incompatible with the principles of their scepticism. But they cannot escape from philosophical or literary fields for all that if they produce discourse: their loneliness is integrated in their work as a condition of its textual identity.

The questions of discursive communities of self-constituting discourses is tightly bound with that of mediation. When we work on texts belonging to self-constituting discourses, we deal with highly structured discourses that speak of man, society, rationality, beauty, good and evil, that have a large scope, *global* aims. But those discourses are produced *locally*, by few people set in a small sector of society. Psychoanalytic discourse, for instance, is diffused in the mass media, or in many therapeutic practices, but it is shaped in very limited circles belonging to a specific field.

The Hierarchy of Genres

Self-constituting discourses are not a genre; they form a network of genres, which are situated in a hierarchy. It is a basic property of self-constituting discourses that some texts or genres are considered to be more prestigious because they are supposed to be nearer to their Source.

More exactly, two hierarchies must be distinguished. The first one opposes 'archetexts' and 'ordinary texts'; the other hierarchizes genres. These two hierarchies do not coincide with each other, but are tightly associated.

Archetexts are singular texts that are reputed to have a privileged relation to the 'archeion'. Plato's *Dialogues* or Descartes's *Meditations* for philosophical discourse, Newton's *Principia* for physics, The Gospel for Christians, Homer's *Odyssey* for literature, etc. embody, in a sense, the basic values of the discourse they partake of. But the notion of 'archetext' varies according to self-constituting discourses. Religious discourse is organized around prior archetexts, whereas scientific discourse only considers archetexts as exemplary; in literature archetexts are 'chefs-d'œuvre'. In religious discourse archetexts embody the Source

of truth; in scientific discourses such as physics or chemistry archetexts exemplify the norms of scientific activity; but in psychoanalysis, archetexts in some respects look a little like religious archetexts.

Although it seems contrary to common sense, it must be admitted that these archetexts that must be commented, and the texts that comment on them presuppose each other. Archetexts, when taking place in what could be called an 'hermeneutic frame', receive a pragmatic status that turns them into texts worthy of interpretation and attributes to them a certain way of circulating in interdiscourse. Sometimes the very form of the archetext depends on this status: the Gospel was not written and later commented, it was shaped through the commentaries that turned to it.

The meaning of a text that happens to be in an hermeneutic frame is supposed to exceed the abilities of its interpreters. If interpreters fail to understand it, it is not because the text is deficient, but because interpreters are deficient. This failure is the consequence of their 'hyperprotected' pragmatic status (Pratt, 1977). An hyperprotected text may transgress conversational maxims without losing authority. It is a 'monument' (from Latin *monere*, to remind), whose memory lives and whose interpreters die. Rather than obscure or ambiguous, it is enigmatic. If a text is no longer interpreted, it stops being enigmatic, therefore worthy of interpretation: the more interpretations it gives rise to, the more enigmatic it appears.

Interpretation cannot be considered independently of the legitimization of interpreters. Who is authorized to interpret? That depends at once on the discourses and on the positions in the discursive field. On discourses, because the interpretation of scientific texts, for instance, is reserved to specialists, whereas the interpretation of literary texts is claimed by scholars and by lovers of literature. That depends on positions too, because each position defines, explicitly or implicitly, who is authorized to read and interpret: some philosophers claim to write only for philosophers, others claim to write for ordinary people.

Two sorts of archetexts can be distinguished. Those that are *general*, which are acknowledged as archetexts by all people, and those that are only *local* archetexts, acknowledged by a part of the people of a given discursive field. In fact, this distinction is not clear-cut; for instance, 'general' archetexts may be given variable values: from the viewpoint of Moslems, the Bible is indirectly an archetext, as announcing the Koran; for all philosophers Hume, Kant or Husserl's greatest works are general archetexts, but all philosophical positions do not attribute the same value to each of them. The definition of archetexts is always controversial: each position has its own archetexts, its proper textual pantheon, setting its own identity by modifying prevailing hierarchies. Saussure's *Cours de linguistique générale*, for instance, was an archetext for most of structuralist linguists, but not for generativist linguists, who consider Chomsky's *Syntactic Structures* as an archetext, the foundation of a new age of linguistics. Surrealist writers in the 1920s showed that they were practising a new literature by changing archetexts: classical works were despised and others, which had been rejected, for example Lautreamont's or Sade's works, became archetexts.

There may exist hierarchies of archetexts, guaranteed by institutions: handbooks of literature oppose 'great' writers to others, the Catholic Church has drawn up a sophisticated scale of textual authorities.

As a rule, archetexts are considered as founders. However, that notion is ambiguous: some texts claim to found a new way of speaking of God, for instance, or practising psychoanalysis or literature; others do not. It often happens that posterity considers texts that did not claim to be founders as actually founders, and, on the contrary, that texts that claimed to be founders as not having introduced anything new. These two viewpoints are distinct and complementary.

The second hierarchy is more traditional: it opposes *top* and *secondary genres*. This distinction founds the possibility of popularization: on the one hand are texts that are supposed to be dominated by no other text; on the other hand one finds texts that clarify, simplify or diffuse doctrines already established. Thus the top genres of theology or basic science, for instance, are disseminated through secondary genres, such as predication in churches or TV programmes about medicine, diets, beauty. Between these boundaries (top genres and mass TV programmes) various genres may take place, such as handbooks for teachers or students and magazines dedicated to popularize science.

Those two hierarchies (archetexts vs ordinary texts, top vs secondary texts) have complex relations. Archetexts are singular texts, but they may belong to manifold genres such as autobiography, prophecy, or commentary. A theological commentary of the Gospel addressed to theologians is a *top* text, because the genre it belongs to is at the top of genres hierarchy, but it is an *ordinary* text in the hierarchy that distinguishes archetexts and ordinary texts. The analysis of self-constituting discourses analysis must not focus only on archetexts and top genres of texts, it must take as its object *the interaction of genres*, from the top to the base: self-constituting discourses are basically heterogeneous and that heterogeneity must be the centre of analysis. Genres and texts of high theology or great literature are always accompanied by other genres, less prestigious, which are also necessary to the 'archeion' of a society.

Generally, top genres texts are *closed*. By 'closed' genres, as opposed to *open* genres, I mean genres whose addressees are or may be producers of discourses of the same genre. On the contrary, in 'open' genres the addressees, who are regularly more numerous than the producers, belong to another sphere. The first case can be exemplified by texts of hard-core science: only potential or actual writers of articles of neurobiology are expected to read neurobiology journals. The second case can be exemplified by mass-distribution newspapers, whose diffusion is very large and whose audience is not made up of journalists.

The opposition closed – open deals with genres rules, not with reality: if millions of people happen to read a scientific article, that occurrence is independent of genre.

However, this distinction cannot be used too strictly:

- Some discourses, such as physics or mathematics, by their own nature are destined to be closed. Others are in a much more unstable situation:

history and sociology, for instance, even if they are directed to small communities of scholars, are regularly read by many other people.

- In philosophy, for example, some authors choose to write open texts, addressed to a large audience (Hume's *Enquiry Concerning Human Understanding* [1748], Descartes's *Discourse on Method* [1637]). The way they expose their doctrine and publish their book shows clearly their intention, which is an aspect of their philosophy. Others claim to write closed texts but actually are read by a large audience. These two circumstances must not be confounded. In the case of Descartes's work, he himself makes a distinction between his intellectual autobiography, the *Discourse on Method*, written in French for ordinary people, and his much more abstract *Meditations*, written in Latin for specialists.

Inscription and Medium

By nature, self-constituting discourses have to do with 'authority': their authors claim to deal with important matters, they speak according to strict and transcendent principles. In a word, they do not speak for themselves, they are on the track of some Other. Writing a scientific article, giving a sermon or writing a poem is more than expressing personal ideas, it is taking part in a rite, speaking under the control of something transcendent, such as Tradition, Reason, Truth. Many of those texts belong to a prestigious corpus, a textual heritage, which must be preserved from corruption, stored, copied, updated. So, rather than simple texts they are *inscriptions*. An 'inscription' may be oral, written or recorded, depending on the society. In traditional societies oral 'literature' or proverbs are inscriptions; nowadays many inscriptions are recorded.

Inscriptions are situated in a series: resting on words already said, they are, in their turn, virtual supports for other inscriptions. The genres of self-constituting discourses determine precisely the ways texts may take their place in interdiscourse: scientific references are not religious quotations.

This notion of 'inscription' implies further consideration of the 'mediological' dimension of utterances (Debray, 1991), i.e. the modalities of their material existence, which governs the way they circulate. Self-constituting discourses, which are ideologically dense, are highly bound with communication facilities, which is one more reason for giving a key role to genres, considered as socio-discursive devices. On that count, discourse analysis must not work with these traditional oppositions (action/representation, text/context, production/reception) which pragmatic trends have for a long time criticized. Meaning is not locked up in a text like in a box, it implies a set of communicational conditions. The 'content' of a text cannot be apprehended independently of these conditions: mediological conditions of a discourse are a dimension of its identity. It is well known that philosophical discourse could not appear in a society devoid of literacy, or that the textual organization of epic depends on the material conditions of oral performances. Modifications in the way scientific texts circulate transform scientific activity. Discursive activity ties a manner of saying and a manner of transporting texts, both associated with the way specific communities live.

5. Scenography, Linguistic Code, Ethos

Scenography

The meaning of an utterance cannot be separated from its pragmatic frame: even a doctrine must stage its own discourse. But a distinction must be made between *generic scene* and *scenography* (Maingueneau, 1998). To each genre of discourse is associated a 'generic scene', which attributes parts to actors, prescribes the place and the moment, the medium, textual macrostructures – all conditions necessary to felicity (Austin) of a given macrospeech act. But for many genres of self-constituting discourses another type of scene is implied: 'scenography', which proceeds from the choice of discourse producers.

Roughly speaking, generic scene is part of the context, it is the very scene that the genre prescribes, whereas scenography is produced by the text. So, two texts belonging to the same generic scene may stage different scenographies. A preaching in a church, for instance, can be staged through a prophetic scenography, a conversational scenography, and so forth. In the former case the speaker will speak in the way prophets do in the Bible and will give the corresponding role to the addressees; in the latter case he or she will speak in a friendly way to the audience. As a result, addressees interpret discourses through the association of two scenes, two contexts: one (generic scene) is imposed by the genre, the other (scenography) depends on particular discourses. Not all texts turn to scenography. As a rule, administrative genres, for instance, merely obey to the norms of their generic scenes. In contrast, adverts have to choose scenographies according to marketing strategies: adverts for cars can use a very wide range of scenographies: a woman in her bedroom phoning a girlfriend, an engineer explaining the technical advantages of a motor, a man describing his new car to a colleague, etc.

Here 'scenography' is not used in its usual way:

- It adds to the theatrical dimension of 'scene' the dimension of 'graphy', of legitimizing inscription, for scenography gives authority to discourse, it has persuasive effects on addressees.
- Scenography is not a frame, a scenery, as if discourse occurred inside of a place that is already fixed, independently of discourse. On the contrary, discourse puts progressively into place its own communicational device. So, *-graphy* must be apprehended simultaneously as frame and process.

Scenographies are determined according to the content of discourse: speaking through a prophetic scenography implies that only prophetic speech is convenient for the very world that the particular discourse is referring to. Discourse implies a given scenography (a speaker and an addressee, a place and a moment, a given use of language) through which a certain world is shaped, and the world must validate the scenography through which it is shaped. This paradoxical movement is the very movement of discourse. Scenography is both what discourse comes from and what discourse generates; it legitimizes a text that, in

return, must show that *this* scenography from which speech is proceeding is the pertinent scene for speaking of what it is speaking of.

In a scenography are associated a certain representation of the speaker responsible for that discourse, a certain representation of the addressee, of the place (*topography*) and of the moment (*chronography*) of discourse. Those elements are tightly bound. For instance, in a contemporary religious sect a preacher may show through his speech that he is a prophet in a desert addressing the ancient Hebrews; the biblical period and the desert, as a place far from urban corruption, a place for fast and repentance, are essential elements of that scenography, which, by mixing two discursive scenes (the empirical one and the mythical one) give authority to discourse.

Scenographies are selected according to ideological options of positions: Protestants give more authority to biblical scenes than do Catholics. Scenographies may be singular communicative events (for example, the Sermon on the Mount) or prototypical discourse genres (friendly conversation, sermon, lecturing, etc.).

So, in self-constituting discourses scenographies must not be considered as mere rhetorical strategies, as is the case in advertising campaigns: they are cosubstantial with ideological positions. When preachers, through their discourse, show themselves as prophetical figures, people who speak directly, roughly, who denounce sinners and demand intense repentance, they define implicitly what legitimate religious discourse has to be and, correlatively, the nature of illegitimate religious discourse: they are reaffirming their own act of positioning their identity inside the field.

In Descartes' *Discourse on Method* (1637) too, philosophical contents and scenography are two aspects of meaning: the scenography is not a contingent strategy, it modifies the very status of philosophy. The figure of a subject presented as simply capable of reasoning, outside of any institution, and telling his life to ordinary people shows in a performative way the superiority of the Cartesian 'method'. The *Discourse* legitimizes itself by giving to common sense ('bon sens'), independently of tradition, the part of ultimate referee, by going beyond the boundaries usually attributed to philosophical speech:

> *ceux qui ne se servent que de leur raison naturelle toute pure jugeront mieux de mes opinions que ceux qui ne croient qu'aux livres anciens* (Descartes, 1988: t. 649)
> [those who make use of their unprejudiced natural reason will be better judges of my opinions than those who give heed to the writings of the ancients]

Scenographies can be set up only in monological discourses; if there is direct interaction or debate, the speaker cannot really develop discursive scenes of his or her own but must only assume the rules of the genre in which he or she is involved. If Plato were discussing with another philosopher he could not express his thought through his own scenography as he does in his *Dialogues*.

Linguistic Code

Self-constituting discourses, mainly in top texts and archetexts, cannot have a simple relationship with linguistic diversity. When you deal with the absolute, when you are close to the frontier of the unspeakable, you cannot consider that all languages (English, Chinese, Latin, pidgin) are equivalent. Discourses that have such a particular status are always raising questions about the identity of the language(s) in which they invest their energy.

Therefore, for a given position language is not a mere instrument that carries information, it also has the status of a specific *linguistic code*, which is determined from *interlanguage*. By 'interlanguage' we mean the space of linguistic varieties to which one can have access from a certain place. Those varieties may be internal (registers, dialects) or external (foreign languages). But the distinction internal/external is superficial: it cannot be said out of context whether a language is 'foreign' or not. For instance, for cultured people in Europe during the last century, Latin was not really a 'foreign' language.

We do not use 'linguistic code' like structuralist linguists, who used that term as an equivalent to 'linguistic system'. 'Linguistic code' in our meaning is at once a communicational notion (it permits transmission of sense by conventional associations between sounds and interpretations) and in a sense a juridical notion (discourse uses the resources of interlanguage that it *must* use, in consideration of the ideological world that its own position attempts to validate).

The Gospel was written in Greek, which was not Jesus's mother tongue nor his teaching language. Using a common language such as Greek instead of Hebrew or Aramaic is not independent of the Gospel's doctrine. It indicates a breaking with the Jewish religion, implies a different diffusion area, a different practice of texts. A mass in Latin and a mass in vernacular language are not the same mass. In the case of the *Discourse on Method*, choosing French instead of Latin has to do with Cartesian doctrine: writing in French, challenging traditional teaching and appealing to the common sense of readers who do not belong to academic institutions are closely connected. It is clearly said in Descartes's quotation, whose complete form is:

> *Et si j'écris en français, qui est la langue de mon pays, plutôt qu'en latin qui est celle de mes précepteurs, c'est à cause que j'espère que ceux qui ne se servent que de leur raison naturelle toute pure jugeront mieux de mes opinions que ceux qui ne croient qu'aux livres anciens.* (1988: 1, 649)
> [And if I write in French, which is the language of my country, in preference to Latin, which is that of my preceptors, it is because I expect that those who make use of their unprejudiced natural reason will be better judges of my opinions than those who give heed to the writings of the ancients]

Besides, French in the 17th century was involved in the same ideological process as Descartes's thought. It was the moment when the French Academy [illegible] (1635), according to its ideology of clarity, French language, which

fits to the supposed natural order of reason, had to be 'purified'. Therefore Descartes's theory of 'clear and distinct ideas' invests a French language that in fact is already invested by a convergent linguistic policy. Those two movements support each other.

Now let us consider scientific discourse, for instance this very review *Discourse Studies*, or others of the same type. Writing in English (in fact, articles are not really published in 'English', but in that particular 'dialect', academic English, most of whose speakers have not English as their mother tongue) is not merely convenient, a means to facilitate the diffusion of ideas. Such a linguistic code implies various norms, not only about the way of quoting, of choosing references, of organizing texts, but also of considering scientific activity in that field, of dealing with language (a worldwide audience excludes connivance, play on words). The very fact of publishing papers coming from any country and destined to any country in the world implies the possibility of bringing together texts in the same space. We could speak of a pragmatic presupposition that a worldwide field exists: scientific productions are supposed to belong to the same universe, scientists supposed to belong to the same community, independently of their ethnic or cultural origin.

Ethos

Texts are not made to be contemplated, they are traces of discourses which try to convince subjects, to make them adhere to their universe. That adhesion is not only intellectual, in a sense it is 'physical' too. One cannot study prophetic, medical or popular speech and disregard the 'tone', the style of voice, the gestures associated with such characters. Discourse influence proceeds partly from that 'incarnation' of speakers. Here we meet the notion of *ethos*, which comes from Aristotle's *Rhetoric* (Aristotle, 1967: 1377b). By 'ethos' Aristotle means the representation of the speaker that the addressee constructs across the production of discourse: therefore it is a representation produced by discourse, it is not what the speaker says explicitly about himself, nor the representation of the speaker that the addressee may have independently of discourse. Using pragmatic terms, it could be said that ethos is 'implied' in discourse.

In traditional rhetoric ethos is reserved to oral discourse. I proposed (Maingueneau, 1984, 1993) to use it for written texts too: even written discourse is referred to a source, it implies a 'voice' that has a specific *tone*. Through that determination of voice the addressee can construct a moving representation of the body of the speaker (not, of course, a representation of the real producer of discourse). Through reading process (from heterogeneous indices given by the text) readers shape a more or less definite figure of the speaker's body that corresponds to such a text. Let us name *guarantor* such a figure. By a constitutive paradox, it is through the very text that the guarantor must legitimate his or her way of speaking.

Actually, as discourses that give sense to all social practices, self-constituting discourses, even if they deny that dimension, appeal to exemplary schematizations of body. One of the reasons why discourse can persuade is that it gets

addressees to identify themselves with the behaviour of a body that is invested by historically specified values. People who adhere to the position staged by a discourse adhere also to the imaginary investment of body that such a discourse implies. 'Ideas' appear through a manner of *speaking* that is also a manner of *behaving*, which depends on norms and representations of body in a given collectivity. Self-constituting discourses, like advertising, unite the people who adhere to them by showing a specific *ethos*, a manner of inhabiting one's body. Ethos emphasizes the 'analogical' dimension of utterance (Watzlavick et al., 1967). Owing to ethos, the speaker sets himself or herself up as the *guarantor* of what he or she is saying. The figure of this guarantor depends naturally on the discourse scene he or she is involved in. For ethos is a dimension of scenography.

I think that such an extension of the scope of ethos is fairly consistent with the Aristotelian notion, which (like its Latin equivalent, *mores*) covers not only vocal dimension of discourse, but also the psychological and physical characteristics of the orator. In a written text, the entity that I have called the 'guarantor' is not immediately perceptible, like an actor on stage, it must be constructed by readers, who assign to it a *temper* and what could be called a *corporality*. 'Temper' is a set of more or less precise psychological features; as for 'corporality', it is not only a corporal complexion but also a way of dressing and behaving. Of course, temper and corporality are two aspects of the same personality; they are not real properties of real persons but positive social stereotypes on which discourse rests and that, in its turn, it contributes to reinforce. Such stereotypes circulate in diversified registers of semiotic production; nowadays they are mainly carried by cinema and advertising, but in other periods theatre, painting and novels played a much more important part in this respect.

In one of the most famous piety books in the 17th century, *Introduction à la vie dévote* (*Introduction to Devout Life*) by François de Sales (1609), the tight relationship between doctrine, scenography and ethos can be clearly observed. The scenography of this book is quite simple: a priest, a spiritual adviser, speaks in a friendly way to a woman named 'Philothée', who belongs to the gentry, explaining to her how she can lead a devout life without renouncing the common way of life of her social class. This doctrine, which refuses rigorous devoutness and particularly Calvinist discipline, is in a sense embodied in the ethos of François de Sales' discourse: the soft, sweet tone of the speaker makes actual the sweetness of the religious attitude that the addressee is incited to adopt. In the beginning of the book, the author stages a representation of good devoutness's body, which is opposed to that of bad devoutness, represented by the stereotype of a melancholic character:

> *Le monde, ma chère Philothée, diffame tant qu'il peut la sainte dévotion, dépeignant les personnes dévotes avec un visage fâcheux, triste et chagrin, et publiant que la dévotion donne des humeurs mélancoliques et insupportables.* (1969: 34)
> [The people, dear Philothée, defame as much as possible holy devoutness. depicting devout persons with an unpleasant, sad and peevish face, and publishing that devoutness gives melancholic and insufferable humours]

This fragment evokes a sort of 'anti-guarantor', who indirectly legitimates the guarantor of the discourse: the person who speaks so softly and in such a friendly manner is the very person who lacks a 'peevish face' and 'insufferable humours'. According to the traditional medical categorization of the 17th century, this melancholic temper is opposed to the sanguine temper of the speaker.

Through ethos, by a circular process, the addressee adheres progressively to the ideological universe presented by the discourse he is reading: the way the text describes good devoutness demands the very ethos of that description. Besides, the representation of nature, society, man and God given by the texts belonging to that religious trend is consistent with that ethos. In a sense, the reader, by reading, is already in the world whose values the text is promoting.

As ethos rests on historically determined stereotypes, an important change in culture implies important changes in the valuation of ethic representations. For instance, when occidental literature passed from the classical to the romantic regime, other types of temper and corporality were valorized: being pale and lean, looking sick, speaking in a faint voice were no longer considered negative characteristics. *Poetic Meditations* (1820) by the French romantic poet Alphonse de Lamartine imply a murmuring voice, as if the speaker were only addressing to himself. The addressee perceives the voice of a speaker at death's door and the text evokes a pale and tired man, who is wandering about the countryside or sitting, weighed down, under a tree. Such a voice is opposed to the classical ideal of 'honest' conversation. One of the reasons why such poems were so successfull throughout Europe is the harmony between a way of speaking and a way of behaving. Here the poet's morbidity (actually that of the figure of the poet that those poems imply) is not an individual fact, it depends on a global transformation of culture and, particularly, of the modes of legitimization of literary discourse.

That question of ethos, the relationship between a manner of saying and a manner of being, crosses some preoccupations of Pierre Bourdieu's sociology. Bourdieu states that the use of speech is also 'a body technique' and that 'linguistic competence, and especially phonetic competence, is a dimension of corporal hexis in which the whole relation with social world is expressed'. According to him, 'the articulatory style of popular classes', for example, is 'inseparable from a whole relation with body dominated by the refuse of affected or overpolite people and the valorization of manhood' (Bourdieu, 1977: 31). The body makes possible a participation in social meanings: 'The body believes in what he is playing . . . it does not represent what he is playing, it does not memorize past, he acts past . . . What is learned by body is not something that one owns (. . .) but something that one is' (Bourdieu, 1980: 123).

These tightly articulated concepts of scenography, linguistic code and ethos must contribute to a better understanding of the efficiency of discourse and of the part it plays in ideological processes. Discourse does not only persuade by the ideas it delivers: it sets the addressee in a speech scene that partakes of the semantic characteristics of the ideological universe that discourse aims to

promote. But such concepts are not reserved for self-constituting discourses; they are actually pertinent far beyond self-constituting discourses, for many sorts of texts.

6. Conclusion

This article could not deal with all the exciting problems raised by self-constituting discourses. We only wanted to evoke a research field that is still very unsteady, but complementary of much more active fields such as mass media or conversation analysis. Until now, discourse analysis was mainly concerned with applied research or with data that traditional academic institutions had ignored. It is highly important for discourse analysis to show it can approach with specific means texts that for long have been studied separately and with traditional viewpoints.

The essential property of self-constituting discourses is their status inside interdiscourse: whereas 'ordinary' discourses lean against them, they must lean directly against transcendent principles, against what was named 'archeion'. Those discourses belong to conflicting discursive fields; they are basically hierarchical, according to their closeness to their Source; they are produced in small communities, although they deal with basic problems of society as a whole; they are defined by a specific way of circulating in interdiscourse (conservation, commentary, quotation, etc.); what they say ('ideas', 'doctrine') cannot be separated from the discourse scene through which they are produced and that gives them authority.

For it is only by their way of organizing their own discourse that they can show and attest their legitimacy – their conformity with the criteria of Truth. In commonplace uses of discourse, we mainly follow routines, in the hard core of self-constituting discourses speakers cannot ignore basic questions about who is authorized to be a speaker or an addressee, where and when it may be spoken, how texts must be organized, etc. Of course, such questions are implicit in any utterance, as was demonstrated by pragmatic trends, but in the case of self-constituting discourses, people are deeply committed: the answer to such questions has root consequences for their identity, their destiny and those of other people.

Unfortunately the notion of self-constituting discourse is hard to handle. Actually we are accustomed to work with texts that are brought together because they have the same function and share obviously some linguistic properties. Studies of discourse for specific purposes deal with such phenomena, which are very important for applied linguistics. But what self-constituting discourses share is not obvious, it does not appear superficially. To see what a novel, a scientific article, or a sermon have in common, you need to handle very abstract operations.

Studying self-constitution discourses raises a question that cannot be dodged: the relationship between analysis and its object. For self-constituting discourses analysis is a slave to a paradox: as a scientific analysis, it belongs to

self-constituting discourses, but at the same time it claims to overhang any self-constituting discourse. That paradox cannot be resolved. If discourse analysis claims to dominate self-constituting discourses, it actually assumes the old dogmatic claim of philosophy or religion, attributing to themselves the power of ruling all human discourses. Discourse analysis, on the contrary, must accept participation in a generalized interaction with other scientific disciplines and with self-constituting discourses. Discourse analysis, for instance, may question philosophical discourse, which, from its own viewpoint, may also question discourse analysis. And so on.

Notes

1. We could name them 'discourse studies' too, but it can be argued that 'discourse studies' does not mention the privileged relationship of discourse studies with linguistics.
2. Of course, there are significant exceptions, such as T. Givon's or S. Thompson's works, but from my viewpoint they belong more to text linguistics than to discourse analysis.
3. It's difficult to translate into English or German this concept of 'enunciation'. French, like other romance languages, oppose two forms derived from the verb 'énoncer': 'énoncé' 'énonciation'; the 'énoncé' is the product, the trace of the act of 'enunciation'. Unfortunately, the notion of 'utterance' is ambiguous. T. van Dijk suggests to me opposing 'discourse production' (enonciation) and 'utterance' (énoncé).

Grace: The Logogenesis of Freedom

J.R. Martin

1. The Text

By way of concluding his autobiography, *Long Walk to Freedom*, Nelson Mandela (1995, 1996) retells the story of his life and how it has reshaped his understanding of freedom. For many readers it is a moving and inspirational text, confirming the grace and wisdom of a man who changed his world and looks back over his achievements with great humility. For discourse analysts, the challenge lies in showing how this is achieved – both with respect to theory and analysis, and with respect to what we want our theory to do for us, especially where we want to use it to intervene in social processes (as advocated by critical discourse analysts; see Caldas-Coulthard and Coulthard, 1996; Janks and Ivanic, 1992; Kress, 1996). I take up a little of this challenge here, drawing on systemic functional linguistics to explore the text in relation to the generalized system of meanings it instantiates. In addition I consider the roles of text and image in a multimodal version of the text (as framed by two photographs and margin notes in Mandela, 1996).

The text in question comprises the final six paragraphs of Mandela (1995), which follow a section break. Here I interpret the text generically as a recount, and divide it into major phases, Orientation ^ Record of Events ^ Reorientation (for discussion of the recount genre see Martin 1985, 1992, 1997; Martin and Plum, 1997). In addition I have highlighted in small caps the meanings that move the recount forward from one stage to another in Mandela's life (see Appendix for guide to other style features).[1]

Example 1
[Orientation]
I was not born with a hunger to be free. I WAS BORN free – free in every way that I could know. Free to run in the fields near my mother's hut, free to swim in the clear stream

that ran through my village, free to roast mealies under the stars and ride the bared backs of slow-moving bulls. As long as I obeyed my father and abided by the customs of my tribe, I was not troubled by the laws of man or God.

[Record of Events]

It was only when I began to learn that my boyhood freedom was an illusion, when I discovered as a young man that my freedom had already been taken from me, that I began to hunger for it. AT FIRST, AS A STUDENT, I wanted freedom only for myself, the transitory freedoms of being able to stay out at night, read what I pleased and live where I chose. LATER, AS A YOUNG MAN in Johannesburg, I yearned for the basic and honourable freedoms of achieving my potential, of earning my keep, of marrying and having a family – the freedom not to be obstructed in a lawful life.

BUT THEN I slowly saw that not only was I not free, but my brothers and sisters were not free. I saw that it was not just my freedom that was curtailed, but the freedom of everyone who looked like I did. That is WHEN I JOINED THE AFRICAN NATIONAL CONGRESS, and that is when the hunger for my own freedom became the greater hunger for the freedom of my people. It was this desire for the freedom of my people to live their lives with dignity and self-respect that animated my life, that transformed a frightened young man into a bold one, that drove a law-abiding attorney to become a criminal, that turned a family-loving husband into a man without a home, that forced a life-loving man to live like a monk. I am no more virtuous or self-sacrificing than the next man, but I found that I could not even enjoy the poor and limited freedoms I was allowed when I knew my people were not free. Freedom is indivisible; the chains on any one of my people were the chains on all of them, the chains on all of my people were the chains on me.

It was DURING THOSE LONG AND LONELY YEARS that my hunger for the freedom of my own people became a hunger for the freedom of all people, white and black. I knew as well as I knew anything that the oppressor must be liberated just as surely as the oppressed. A man who takes away another man's freedom is a prisoner of hatred, he is locked behind the bars of prejudice and narrow-mindedness. I am not truly free if I am taking away someone else's freedom, just as surely as I am not free when my freedom is taken from me. The oppressed and the oppressor alike are robbed of their humanity.

WHEN I WALKED OUT OF PRISON, that was my mission, to liberate the oppressed and the oppressor both. Some say that has now been achieved. But I know that this is not the case. The truth is that we are not yet free; we have merely achieved the freedom to be free, the right not to be oppressed. We have not taken the final step of our journey, but the first step on a longer and even more difficult road. For to be free is not merely to cast off one's chains, but to live in a way that respects and enhances the freedom of others. The true test of our devotion to freedom is just beginning.

[Reorientation]

I HAVE WALKED THAT LONG ROAD TO FREEDOM. I have tried not to falter; I have made missteps along the way. But I have discovered the secret that after climbing a great hill, one only finds that there are many more hills to climb. I have taken a moment here to rest, to steal a view of the glorious vista that surrounds me, to look back on the distance I have come. But I can only rest for a moment, for with freedom come responsibilities, and I dare not linger, FOR MY LONG WALK IS NOT YET ENDED. (Mandela 1995: 750–1)

Informally speaking, the Orientation phase sets the story in time and place, introducing its main character and the habitual behaviours of his early days.

Then the time line begins to unfold as we transition through the Record of Events chronicling Mandela's life. Finally, as the events culminate, we move to a retrospective Reorientation which both summarizes the chronicle and bridges from 'present' to 'future' concerns.

In calling this text a recount, we are placing it among the genres available for the reconstruction and evaluation of experience. By way of exploring its social function, Mandela's recount can be usefully compared to other story genres, such as the following personal recount recorded by Guenter Plum (1988):

Example 2
[Orientation]
Well I've always wanted one [old English sheepdog; GP].

[Record of Events]
And I made enquiries for about 12 months, prior. And I was able to get a young bitch, nine weeks old, from a friend. No, it wasn't a friend then; I didn't know her then but it turned out to be a good friend, Harriet U. up at Winston Hills. She had this young bitch that she was going to keep herself and she decided that she'd let it go. So we got her. That was our Sophie. And so we started to show her of course. I think her first show was the day she turned 3 months old. She was eligible for it and I think she won her class. And, yes, she did win her class that day; it happened to be our championship show, the old English sheepdog championship show.

[Reorientation]
And we just took it from there. Every weekend we brushed her . . . off to dog shows, you know, joined the rat race. No, I thoroughly enjoy it.

Compared with Example 2, Mandela's text reads more like history than narrative, since it deals with a much longer time line and is especially concerned with its interpretation (the meaning of freedom).

Another useful point of comparison would be historical recounts of institutional experience, in the following example:

Example 3
. . . By the mid twenties, big changes took place to meet the needs of the fishing industry and government fisheries managers. The Board began to employ full-time scientific staff, and Technological Stations were established in Halifax, Nova Scotia, and Prince Rupert, British Columbia. The staff quickly became multi-disciplinary. At the Biological Stations physics and chemistry were added to zoology in recognition of the importance of understanding fish habitat. At the Technological Stations zoologists did some initial work on refrigeration of fish, but chemists, bacteriologists, and engineers soon took over responsibility for industrial research and development.

During the depression years the fisheries research and development program was maintained despite constrained budgets. Facilities for volunteer investigators could only be provided to those with independent financing, and the small permanent staff endured a ten-percent reduction of salaries. During the World-War-II years that followed, there was the additional setback of loss of some staff to war service . . . (W.R. Martin, 1991)

Compared with Example 3, Mandela's text is more personal, focussing on the individual life of the writer; note that there are no individuals named in Example 3, whose main protagonist is the Fisheries Research Board of Canada.

We might also compare Mandela's recount with a text from secondary school geography dealing with the destruction of habitats:

Example 4

Man has been making animals rare and even extinct for thousands of years, and one of the main ways man has achieved this is BY THE DESTRUCTION of their habitat. The destruction of a habitat MEANS THAT the vital balance between an animal and its environment is disturbed. In ancient times the destruction of habitat and the extinction of animals was quite small. Since then it has rapidly increased. People began to make more use of machines and industrialisation occurred bringing with it changes which would destroy the face of the earth's environment forever. As the demands grew wood and later coal, supplied the resources needed, this in turn RESULTED IN THE DESTRUCTION of forests and habitats. At the same time that industrialisation was taking place humans were settling in new parts of the world. Whenever they settled, nests were cut down and farms established. This destroyed the habitat of many animals.

THE EFFECTS OF INDUSTRIALISATION and the need of more land DUE TO THE GROWTH OF POPULATION seriously AFFECTED WILDLIFE and still is today already half the world's tropical rainforests have already been destroyed or irreversibly damaged. This reckless ravaging of some of the most amazing habitats on earth MEANS THAT by the year 2000 the destruction will be complete and the world will be without these areas.

Compared with Example 4, Mandela's text is more story than explanation, since it unfolds largely through setting in time rather than explicit causal connections between one event and another (note the explicit causality highlighted small caps in the preceding Example).

We could continue positioning Mandela's recount in this way for some time (see Martin, 1997; Martin and Plum, 1997; Rothery and Stenglin, 1997 story genres; and Coffin, 1997; Veel and Coffin, 1996, on the genres of history). Cutting short the discussion, we can place Example 1 generically as autobiographical recount, as opposed to personal recount (Example 2), historical recount (Example 3), historical account (Example 4) and a range of affine but not closely related narrative and expository genres (see Martin, 1985, 1993, 1997 in press, for discussion). Unlike the rest of Mandela's autobiography, however, the text reconstrues and interprets a great deal of time in just seven paragraphs and in this respect it is more like the chronicles of history than the narratives of everyday life. How does Mandela manage so much time and value in so little time?

2. Abstracting Freedom

Mandela begins his story using relatively concrete language. Participants (people, places and things) are realized as nouns; qualities (descriptive and attitudinal) are realized as adjectives; processes (doings and happenings) are realized as verbs; assessments of epistemic and deontic modality are realized as modal

verbs; and logical connections are realized as conjunctions. Some examples follow, illustrating the choices Mandela uses to construct his childhood, and symbolizing[1] perhaps in their directness the untroubled nature of his life (labelling from Halliday, 1994; see also Halliday, 1989 [1985], on spoken and written language).

participant as Thing (noun)
I, fields, hut, stream, village, mealies, stars, bulls, father. . .

quality as Epithet (adjective)
free, clear, broad

process as Process (verb)
was born, to run, to swim, to roast, rise, obeyed . . .

assessment as Finite (modal verb)
could

logical relation as Textual Theme (conjunction)
as long as

As the recount continues, however, the relation of meaning to wording becomes much more indirect (Martin, 1993). Alongside participants realized as nouns, we find processes, qualities and modal assessments realized as nouns as well (contrast the direct realizations in small caps alongside each example):

process as a Thing (noun)	
this desire	I DESIRED freedom
hatred	They HATED the prisoner
quality as a Thing (noun)	
a hunger to be free	I was HUNGRY to be free
dignity	They were DIGNIFIED
narrow-mindedness	They were NARROW-MINDED
inhumanity	They were INHUMANE
assessment as a Thing (noun)	
achieving my potential	I achieved what I COULD
truth	It wasn't TRUE
responsibilities	I MUST act

And as part of this pattern of abstraction, causal relations that might otherwise have been realized as connections between clauses are realized inside the clause as nominalized Agents which act on other nominalizations and initiate events. Note here the agentive role of *this desire for the freedom of my people* . . . in relation to *my life* and four pivotal transformations:

logical relation as Agency (inside the clause)
It was this desire for the freedom of my people to live their lives with dignity and self-respect that animated my life, that transformed a frightened young man into a bold one, that drove a law-abiding attorney to become a criminal, that turned a family-loving husband into a man without a home, that forced a life-loving man to live like a monk

Language of this kind is a long way from language in which people act and do things to other people and things. We've entered a world of abstraction which typifies the writing of uncommon sense discourse across institutions and disciplines and which a trained lawyer and politician like Mandela has learned to control (Halliday, 1989 [1985], 1994, 1998, refers to language of this kind as involving grammatical metaphor). The advantage of this language for Mandela is the range of meanings it makes available to him to interpret his life, meanings not available in the relatively straightforward language of his Orientation.

This range of meaning can be explored in three steps, with reference to Halliday's experiential,[2] interpersonal and textual metafunctions – focussing on the notion of freedom. Experientially, as we have noted, the text opens by construing freedom as a quality, technically an Attribute realized by an adjective - the kind of realization we associate with spoken language in informal registers and with child language in our culture:

'free' as descriptive Attribute
I was not born with a hunger to be *free.*
I was born *free* – *free* in every way. . .
free to run . . .
free to swim . . .
free to roast mealies . . .

Subsequently, freedom is generally realized as an entity, and once nominalized it can take on a wide range of participant roles. We have already taken note of freedom as an Agent of change (*It was this desire for freedom . . . that transformed . . .*). In addition, in action processes it becomes a commodity that can be exchanged:

freedom as abstract commodity (Goal)
when I discovered . . . that my *freedom* had already been taken from me,
. . . it was not just my *freedom* that was curtailed, but the freedom of . . .
A man who takes away another man's *freedom* is a prisoner of hatred . . .
if I am taking away someone else's *freedom*
when my *freedom* is taken from me.

In mental processes it functions as an object of desire:

'freedom' as abstract Phenomenon
that I began to hunger for it (*freedom*).
At first, as a student, I wanted *freedom* . . .
Later, . . ., I yearned for the basic and honourable *freedoms* of . . .
. . . that I could not even enjoy the poor and limited *freedoms* I was allowed

As an entity in relational processes it is subject to classification and transformation.

'freedom' as abstract Carrier or classifying Attribute
It was only when I began to learn that my boyhood *freedom* was an illusion,
Freedom is indivisible . . .

. . . that my hunger for the *freedom* of my own people became a hunger for the *freedom* of all people, white and black.

'freedom' as abstract Token or Value
. . . that is when the hunger for my own *freedom* became the greater hunger for the *freedom* of my people.

Once nominalized it can also function circumstantially, as an abstract destination, and even as an abstract companion along the way.

'freedom' as abstract circumstance of Location
I have walked that long road to *freedom*.

'freedom' as abstract circumstance of Accompaniment
But I can only rest for a moment, for with *freedom* come responsibilities . . .

Nominalization, in other words, puts virtually the entire transitivity system of English at Mandela's disposal as far as talking about freedom is concerned. We'll return to the question of just how he marshals this potential later in this article. Note at this point that it is the circumstantial realization (*long road to freedom*) that establishes the extended lexical metaphor that consolidates Mandela's interpretation of his life:

EXTENDED LEXICAL METAPHOR
When I walked out of prison . . . We have not taken the final step of our journey, but the first step on a longer and even more difficult road . . . I have walked *that long road to freedom*. I have tried not to falter; I have made missteps along the way. But I have discovered the secret that after climbing a great hill, one only finds that there are many more hills to climb. I have taken a moment here to rest, to steal a view of the glorious vista that surrounds me, to look back on the distance I have come. But I can only rest for a moment, for with freedom come responsibilities, and I dare not linger, for my long walk is not yet ended.

This lexical metaphor is of course a familiar one in our culture; and Mandela elaborates it in his own terms towards and during his Reorientation phase. The relevant lexical strings, based on hyponymy and co-hyponymy, are *journey, road, road, way, walked, taken the final step/the first step, tried not to falter, made missteps, climbing, climb, my long walk*; and *to rest, rest, dare not linger* – working up the phrasing that provides the title of his book.

Interpersonally, it is the freedom as commodity motif that is of most interest since it is as a commodity that freedom is objectified as something that can be taken away – and this gives rise to the question of who to blame. The key passages follow:

when i discovered as a young man that ***my freedom*** *had already been taken from me*

I saw that it was not just ***my freedom that*** *was curtailed*, but **the freedom of everyone who looked like I did . . .**

. . . *A man who takes away* ***another man's freedom*** is a prisoner of hatred, he is locked behind the bars of prejudice and narrow-mindedness. I am not truly free if *I am*

taking away ***someone else's freedom***, just as surely as I am not free *when* ***my freedom*** *taken from me.*

Mandela selects the passive three times, taking up the experiential option of leaving out the Agent implicated. The result interpersonally is a clause in which 'freedom' functions as Subject, as part of what Halliday calls the Mood element. For Halliday it is the Mood function which governs the nature of a proposition's arguability – as reflected in tags and elliptical responses such as those suggested here (Martin, 1992, 1995a).

Mood	**ResidueMood tag**	
my freedom had already – Had it?	been taken from me,	hadn't it?
(my freedom) that was – Was it?	curtailed,	wasn't it?
my freedom is – Is it?	taken from me,	isn't it?

So alongside not specifying who is taking freedom away (an experiential option), Mandela structures the argument interpersonally as having to do with freedom, not oppressors. Oppressors are also backgrounded in the two active clauses, where they do function as Subject. In one, Mandela talks generally about what happens when a non-specific man (*a man*) takes away another's freedom; in the other, it is Mandela himself, in a hypothetical clause, who is modally responsible (Table 1). The effect of these selections is to eschew blame and once again it is the grammatically metaphorical language that enables semantic drift (contrast the congruent *they put me in jail* with the metaphorical *my freedom was taken away*).

Table 1: Modal responsibility and freedom

Mood (Subject ^ Finite)	Residue
my freedom had already[3]	been taken from me
(my freedom . . .) that was	curtailed
(A man) who takes . . .[4]	. . . takes away another man's freedom
(if) I am	taking away someone else's freedom
(when) my freedom is	taken from me

Textually the dominant pattern involving freedom has Mandela as Theme and freedom as New. This happens 17 times in the text, overwhelming other patterns of information flow. If following Fries (1981; and see Martin 1992, 1995a) we take the pattern of Themes as constructing a text's method of development and the pattern of News constructing its point, then what we have here is a favoured pattern in which Mandela is point of departure for the message and changing conceptions of freedom are what he's on about. We can sum up this

drift in texture as Mandela's angle on freedom. Some of the examples are shown in Table 2.

Table 2: Theme is to new as Mandela is to freedom (exemplified)

Theme	Transition	New[5]
I	was born	free
I	yearned for	the basic and honourable freedoms . . .
that I	could not even enjoy	the poor and limited freedoms . . .
my people	were not	free
I	am not	truly free
If I	am taking away	someone else's freedom
just as surely as I	am not	free
we	have merely achieved	the freedom to be free
I	have walked	that long road to freedom

Much less often, freedom plays a complementary role as Theme, often where the New is what Mandela learns freedom to be.

> **my boyhood freedom** was an illusion.
> **the hunger for my own freedom** became the greater hunger for the freedom of my people.
> **Freedom** is indivisible; (the chains on any one of my people were the chains on all of them, the chains on all of my people were the chains on me.)

Strikingly, at three pivotal moments in Mandela's career, theme predication is used to foreground freedom as both Theme and New.

> [having left home]
> It was only when I began to learn that **my boyhood freedom** was an illusion, when I discovered as a young man that **my freedom** had already been taken from me, that I began to hunger for it.
>
> [on joining the ANC]
> . . . I saw that it was not just **my freedom** that was curtailed, but **the freedom of everyone who looked like I did.** [That is when I joined the African National Congress . . .[
>
> [living outside the rule of law]
> It was **this desire for the freedom of my people to live their lives with dignity and self-respect** that animated my life, that transformed a frightened young man into a bold one, that drove a law-abiding attorney to become a criminal, that turned a family-loving husband into a man without a home, that forced a life-loving man to live like a monk.

Again, it is the grammatically metaphorical language that facilitates the texture; in simple terms, the noun *freedom* is a lot more grammatically mobile than the adjective *free*.

3. Enlightenment

In the previous section we surveyed the range of meanings which an abstract construal of freedom made available to Mandela. Equally important is the way in which these meanings interact with each other as the text unfolds (their logogenesis; Halliday, 1993a). The impact of the text lies very much in the contingency of meanings, and in general terms what shapes this texture is the way in which two stories are mapped onto each other: the story of Mandela's day-to-day experience as he moves through space and time, alongside the story of his political development as his understanding of freedom transforms. His journey, in other words, is more than a physical one; it is a metaphysical journey as well – a spiritual quest, towards enlightenment. How exactly does this unfold?

The text is a recount; it moves through time. Temporal linearity is managed grammatically through linkers (*at first, later, then, when, when, during, when* – as highlighted in Example 1) and tense (generally past – Orientation *I was born* . . . then past in present, as the recount joins the present – Reorientation: *I have walked* . . .). This is reinforced through the lexis that names stages in a cycle of life: e.g. *born, boyhood, young man, husband, family* and the lexis that phases us through the steps along the way, both verbal *when I began to learn, I began to hunger for it, achieving my potential, has now been achieved, achieved the freedom to be free, is just beginning, is not yet ended* and nominal *the final step of our journey, the first step on a longer* and *even more difficult road.*

This movement through time is reconstrued by Mandela as movement through space – the extended journey metaphor I have outlined. And through the grammatical metaphor, the journey is not just a journey through physical space, but a walk towards an abstraction – to freedom. Through these steps movement in space/time acquires the possibility of depth; the text develops from two-dimensional to three-dimensional progression.

To construe depth Mandela constructs his walk to freedom as a mental quest. Life is about learning:

- free in every way that I could know
- when I began to learn that my boyhood freedom was an illusion
- when I discovered as a young man that my freedom had already been taken from me
- But then I slowly saw that not only was I not free
- I saw that it was not just my freedom that was curtailed
- but I found that I could not even enjoy the poor and limited freedoms I was allowed
- when I knew my people were not free
- I knew as well as I knew anything that the oppressor must be liberated
- But I know that this is not the case
- But I have discovered the secret that after climbing a great hill
- one only finds that there are many more hills to climb

And life is about change:

- the hunger for my own freedom became the greater hunger for the freedom of my people
- It was this desire for the freedom of my people to live their lives with dignity and self-respect that animated my life, that transformed a frightened young man into a bold one, that drove a law-abiding attorney to become a criminal, that turned a family-loving husband into a man without a home, that forced a life-loving man to live like a monk.
- It was during those long and lonely years that my hunger for the freedom of my own people became a hunger for the freedom of all people, white and black.

What the learning and transformation achieve is a steadily unfolding conception of freedom, throughout the text from beginning to end. Ideationally speaking we can recognize seven phases of understanding, corresponding to seven stages of Mandela's life.

(i) 'boyhood freedom'
- Free to run . . . free to swim . . . free to roast mealies under the stars and ride the broad backs of slow-moving bulls

(ii) 'as a student'
- the transitory freedoms of being able to stay out at night, read what I pleased and go where I chose

(iii) 'as a young man'
- the basic and honourable freedoms of achieving my potential, of earning my keep, of marrying and having a family – the freedom not to be obstructed in a lawful life

(iv) 'joined the African National Congress'
- the hunger for my own freedom became the greater hunger for the freedom of my people . . . to live their lives with dignity and self-respect

(v) 'during those long and lonely years' [in prison]
- my hunger for the freedom of my own people became a hunger for the freedom of all people, white and black

(vi) 'when I walked out of prison'
- to be free is not merely to cast off one's chains, but to live in a way that respects and enhances the freedom of others

(vii) [as President]
- . . . But I can only rest for a moment, for with freedom come responsibilities, and I dare not linger, for my long walk is not yet ended.

In the first three phases Mandela is oriented to himself, as he moves through stages of life.

[stages of life . . . freedom to]	
• childhood freedom	'to play'
• adolescent freedom	'to be independent'
• mature freedom	'to support a family'

In the next two phases Mandela re-orients himself to the needs of his own people, and then of his entire community (including his oppressors). Individual freedom ***to*** do things transforms into communal freedom ***from*** oppression.

• factional freedom	'for my people'
• communal freedom	'for all people'

Finally Mandela develops his more abstract appreciation of freedom as freedom to respect and enhance the freedom of others and to get on with things freedom positions him as responsible ***to*** do.

• democratic freedom	'to respect/enhance freedom of others'
• institutional freedom	'with freedom come responsibilities'

Overall, enlightenment is organized as three waves of recontextualization - first, three stages of Mandela's life, which taken together constitute the first stage of his reorientation to the needs of his people and then his country as a whole, which taken together constitute the first stage of his move from personal liberty to the freedom to respect freedom and finally freedom with responsibilities.

(1)	personal freedom		
	[I]	individual freedom	
		(i) childhood freedom	'to play'
		(ii) adolescent freedom	'to be independent'
		(iii) mature freedom	'to support a family'
	[II]	factional freedom	'for my people'
	[III]	communal freedom	'for all people'
(2)	democratic freedom		'to respect/enhance freedom of others'
(3)	institutional freedom		'with freedom come responsibilities'

The texture of these phases, in terms of global information flow is also significant. In the paragraphs, we find a consistent pattern with an introductory hyper-Theme (or 'topic sentence'; Martin, 1992, 1993) followed by its elaboration.

The first hyper-Theme introduces boyhood freedom, the second introduces adolescent and mature freedom, the third freedom for black Africans and the fourth communal freedom for both oppressor and oppressed:

I was not born with a hunger to be free. I was born free – free in every way that I could know.
=...

It was only when I began to learn that my boyhood freedom was an illusion, when I discovered as a young man that my freedom had already been taken from me, that I began to hunger for it.
=...

But then I slowly saw that not only was I not free, but my brothers and sisters were not free.
=...

It was during those long and lonely years that my hunger for the freedom of my own people became a hunger for the freedom of all people, white and black.
=...

With the move to abstract freedom the hyper-Theme introduces the following paragraph, but does not specify the new phase of understanding:

When I walked out of prison, that was my mission, to liberate the oppressed and the oppressor both. Some say that has now been achieved. But I know that this is not the case:
=...

That is saved for a later, penultimate sentence in the paragraph (a more newsworthy position):

For to be free is not merely to cast off one's chains, but to live in a way that respects and enhances the freedom of others.

Similarly in the final paragraph of the recount, the hyper-Theme introduces its elaborating clauses:

I have walked that long road to freedom.
=...

But the final phase of freedom, institutional freedom, is reserved for the concluding sentence of the book.

for with freedom come responsibilities . . .

Globally then, Mandela's understanding of personal freedom as liberty (freedom to act and freedom from oppression) is treated as a kind of retrospective – his angle on his life, as given by the volume as a whole. However, once we move to the present[7] (*has now been achieved, have walked*), Mandela's ultimate conception of freedom (freedom to respect freedom, freedom with responsibilities) is positioned late in the paragraphs as news, prefaced in each case with the conclusive conjunction *for*, consummating our journey.

The newsworthiness of Mandela's ultimate conception of freedom is further enhanced by the summative nature of the recount's final paragraph in relation to the first five paragraphs, and of the recount itself as a synopsis of the autobiography as a whole. Thus final position in the clause, the paragraph, the genre (our text) and the macro-genre (the book) harmonizes to foreground the responsibility of respecting freedom as the point of this story of Mandela's life (Fries, 1981; Martin, 1995b).

4. Engagement

Henderson (1996: 293), in his review of Mandela's autobiography, comments that 'it is as much a spiritual as a political work'. We have dealt in some measure with the spiritual dimension of the text, as far as enlightenment is concerned. What about its politics? Because the journey to freedom is not simply one that Mandela has invited us to observe; it is a trip he takes us on – an engaging quest. How does Mandela involve us as he moves along his way?

One striking pattern throughout the text is in Mandela's sense of audience – the resources he uses to take account of readers' beliefs and expectations and realign them with his own. For example, the text contains no fewer than 21 negative clauses, each concerned with explicitly denying something someone might have thought. These are listed here by paragraph:

I was not born with a hunger to be free.
I was not troubled by the laws of man or God.

I began to learn that my boyhood freedom was an illusion
the freedom not to be obstructed in a lawful life.

But then I slowly saw that not only was I not free
but my brothers and sisters were not free
I saw that it was not just my freedom that was curtailed
I am no more virtuous or self-sacrificing than the next man
I found that I could not even enjoy the poor and limited freedoms I was allowed
when I knew my people were not free.

I am not truly free if I am taking away someone else's freedom
just as surely as I am not free when my freedom is taken from me

But I know that this is not the case
The truth is that we are not yet free
the right not to be oppressed
We have not taken the final step of our journey
For to be free is not merely to cast off one's chains

I have tried not to falter
I have made missteps along the way
and I dare not linger,
for my long walk is not yet ended.

On five occasions Mandela replaces mistaken beliefs:

> I was not born with a hunger to be free.
> I was born free . . .
>
> Some say that has now been achieved.
> But I know that this is not the case.
>
> The truth is that we are not yet free;
> we have merely achieved the freedom to be free, the right not to be oppressed.
>
> We have not taken the final step of our journey,
> but the first step on a longer and even more difficult road.
>
> For to be free is not merely to cast off one's chains,
> but to live in a way that respects and enhances the freedom of others.

Alongside countering mistaken ideas, Mandela deals throughout the text with mistaken expectations. This 'in spite of something, something else' motif is outlined here:

> At first, as a student, I wanted freedom ONLY for myself, the transitory freedoms of being able to stay out at night, read what I pleased and go where I chose. Later, as a young man in Johannesburg, I yearned for the basic and honourable freedoms of achieving my potential, of earning my keep, of marrying and having a family – the freedom not to be obstructed in a lawful life. But then I slowly saw that not only was I not free.
>
> But then I slowly saw that NOT ONLY was I not free, but my brothers and sisters were not free.
>
> I saw that it was NOT JUST my freedom that was curtailed, but the freedom of everyone who looked like I did.
>
> I am no more virtuous or self-sacrificing than the next man, but I found that I could not even enjoy the poor and limited freedoms I was allowed when I knew my people were not free.
>
> I have tried not to falter; I have made missteps along the way. But I have discovered the secret that after climbing a great hill, one only finds that there are many more hills to climb.
>
> I have taken a moment here to rest, to steal a view of the glorious vista that surrounds me, to look back on the distance I have come. But I can only rest for a moment, for with freedom come responsibilities, and I dare not linger, for my long walk is not yet ended.

In the first three of the preceding examples, concession is reinforced by continuity markers (*only, just*; Martin, 1992) which enhance the counterexpectation. In all, Mandela uses 14 of these markers to adjust his remarks to readers who might have expected more or less than he means.

[adjusting]

- It was only when I began to learn that my boyhood freedom was an illusion
- I wanted freedom only for myself
- not only was I not free, but
- it was not just my freedom that was curtailed, but
- I could not even enjoy the poor and limited freedoms I was allowed
- we have merely achieved the freedom to be free
- the first step on a longer and even more difficult road
- For to be free is not merely to cast off one's
- The true test of our devotion to freedom is just beginning
- one only finds that there are many more hills to climb
- I can only rest for a moment

[aspectual]

- when I discovered as a young man that my freedom had already been taken from
- we are not yet free
- my long walk is not yet ended.

Some of these mistaken beliefs and expectations Mandela explicitly acknowledges as his own:

- but I found that I could not even enjoy the poor and limited freedoms I was allowed
- when I discovered as a young man that my freedom had already been taken from me

Others, such as *I was not born with a hunger to be free*, seem to be aimed at readers. In any case, our naiveté is not the issue; Mandela does not explicitly source mistaken beliefs and expectations to anyone other than himself. Rather, the unfolding text involves us in a journey during which errant suppositions are both acknowledged and refined. We are not just watching. We are taken along on the ride.

Alongside this pattern of alignment, we find a constellation of features which continually clarify and reinforce Mandela's position, lest there be any doubt about what is being asserted. One aspect of this involves what Halliday (1994) refers to as 'elaboration' (rewording meaning from one group/phrase, clause or sentence to the next; cf. the discussion of paragraph hyper-themes involving elaboration above):

GROUP/PHRASE ELABORATIONS

I was born free
= free in every way that I could know.

At first, as a student, I wanted freedom only for myself,
= the transitory freedoms of being able to stay out at night, read what I pleased and go where I chose.

Later, as a young man in Johannesburg, I yearned for the basic and honourable freedoms of achieving my potential, of earning my keep, of marrying and having a family –
= the freedom not to be obstructed in a lawful life.

that was my mission.
= to liberate the oppressed and the oppressor both

= we have merely achieved the freedom to be free,
= the right not to be oppressed.

CLAUSE ELABORATIONS
It was only when I began to learn that my boyhood freedom was an illusion,
= when I discovered as a young man that my freedom had already been taken from

Freedom is indivisible;
= the chains on any one of my people were the chains on all of them, the chains on all of my people were the chains on me.

A man who takes away another man's freedom is a prisoner of hatred,
= he is locked behind the bars of prejudice and narrow-mindedness.

The truth is that we are not yet free;
= we have merely achieved the freedom to be free,

SENTENCE ELABORATIONS
I was born free – free in every way that I could know.
= Free to run in the fields near my mother's hut, free to swim in the clear stream that ran through my village, free to roast mealies under the stars and ride the broad backs of slow-moving bulls.
= As long as I obeyed my father and abided by the customs of my tribe, I was not troubled by the laws of man or God.

A man who takes away another man's freedom is a prisoner of hatred, he is locked behind the bars of prejudice and narrow-mindedness.
= I am not truly free if I am taking away someone else's freedom, just as surely as I am not free when my freedom is taken from me.
= The oppressed and the oppressor alike are robbed of their humanity.

The truth is that we are not yet free; we have merely achieved the freedom to be free, the right not to be oppressed.
= We have not taken the final step of our journey, but the first step on a longer and even more difficult road.

For to be free is not merely to cast off one's chains, but to live in a way that respects and enhances the freedom of others.
= The true test of our devotion to freedom is just beginning.

In addition Mandela makes frequent use of extension (Halliday, 1994) to accumulate meaning, in series of two, three and even five coordinated clauses:

That is when I joined the African National Congress,
+ and that is when the hunger for my own freedom became the greater hunger for the freedom of my people.

the chains on any one of my people were the chains on all of them,
+ the chains on all of my people were the chains on me.

Free to run in the fields near my mother's hut,
+ free to swim in the clear stream that ran through my village,
+ free to roast mealies under the stars and ride the broad backs of slow-moving bulls.

the transitory freedoms of being able to stay out at night,
+ read what I pleased
+ and go where I chose.

the basic and honourable freedoms of achieving my potential,
+ of earning my keep,
+ of marrying and having a family

It was this desire for the freedom of my people to live their lives with dignity and self-respect that animated my life,
+ that transformed a frightened young man into a bold one,
+ that drove a law-abiding attorney to become a criminal,
+ that turned a family-loving husband into a man without a home,
+ that forced a life-loving man to live like a monk.

I would argue that both patterns, realignment and reinforcement, reflect a rhetoric more strongly associated with speaking than writing (Gee, 1990; Olson, 1994; Ong, 1982). This is hardly surprising since Mandela was groomed, like his father before him, to counsel the rulers of his Thembu people. These skills he learned by observing tribal meetings in which all men were free to voice their opinions, but at which the opinions of councillors carried great weight.

> I noticed how some speakers rambled and never seemed to get to the point. I grasped how others came to the matter at hand directly, and who made a set of arguments succinctly and cogently. I observed how some speakers used emotion and dramatic language, and tried to move the audience with such techniques, while others were sober and even and shunned emotion. (Mandela, 1995: 25)

Of course we have no extant record of precisely what Mandela heard. But the influence of the publicly spoken discourse he studied is more than a parent, if we draw parallels to related orality around the world (Hymes, 19 Whitaker and Sienaert, 1986). Consider, for example, the following speech from Australia, given by Vincent Lingiari on the occasion of the handover of a lease of 1250 square miles, formerly part of Wave Hill Station, by the (the Prime Minister, Gough Whitlam, and Minister of Aboriginal Affairs, Les Johnson to the Mura Mulla Gurindji Company on 16 August 1975 (Lingiari, 1986) – translated by Patrick McConvell.

> The important White men are giving us this land ceremonially, ceremonially they are giving it to us.

It belonged to the Whites, but today it is in the hands of us Aboriginals all around here.

Let us live happily together as mates, let us not make it hard for each other.

–

The important White men have come here, and they are giving our country back to us now.

They will give us cattle, they will give us horses, then we will be happy.

They came from different places away, we do not know them, but they are glad for us.

We want to live in a better way together, Aboriginals and White men, let us not fight over anything, let us be mates.

–

He [the Prime Minister] will give us cattle and horses ceremonially; we have not seen them yet: they will give us bores, axes, wire, all that sort of thing.

These important White men have come here to our ceremonial ground and they are welcome, because they have not come for any other reasons, just for this [handover].

We will be mates. White and Black, you [Gurindji] must keep this land safe for yourselves, it does not belong to any different 'welfare' man.

–

They took our country away from us, now they have brought it back ceremonially.

Space precludes a detailed analysis here; but the audience-oriented patterns of realignment and reinforcement are readily apparent, even in translation from the original Gurindji. The text unfolds in cycles (as presented here), returning four times to the point the White men took away Gurindji land, but are now giving it back – including a gracious[9] message of reconciliation as far as living together as mates is concerned. Local realignment and reinforcement thus harmonizes with global text structure here, much as it does in Mandela's recount. The major difference between the texts is that Mandela also draws on the resources of written language (i.e. grammatical metaphor), to map orality (cycles) onto linearity (temporal unfolding) – a mapping which gives rise to a spiral texture through which our understanding of freedom deepens as we are carried along. Reasoning along these lines, we might suggest that Mandela has reworked the autobiographical recount genre, blending features of western literacy with aspects of Thembu orality – in order to fashion the new meanings that interpreting his life demands.

Before closing this section, it is perhaps worth noting that Mandela's rhetoric of engagement makes us feel included rather than instructed. He doesn't tell us what to think: rather, taking our misconceptions into account, he lets us in on what he has learned. In this respect his rhetoric reflects his understanding of leadership, which he learned as a child, in the court of the Thembu regent:

As a leader, I have always followed the principles I first saw demonstrated by the regent at the Great Palace. I have always endeavoured to listen to

what each and every person in a discussion had to say before venturing my own opinion. Oftentimes, my own opinion will simply represent a consensus of what I heard in the discussion. I always remember the regent's axiom: a leader, he said, is like a shepherd. He stays behind the flock, letting the most nimble go on ahead, whereupon the others follow, not realising that all along they are being directed from behind. (Mandela, 1995: 25–6)

5. Recontextualization

So far I have explored Mandela's recount with respect to system – especially transitivity, mood, theme, grammatical metaphor, lexical relations, conjunction, tense, phase, process type, hierarchy of periodicity, polarity, continuity and elaboration. In this regard I have dealt with intertextuality implicitly, with reference to the climate of meaning immanent in our culture (as outlined in Halliday, 1994; Martin, 1992; Matthiessen, 1995). I have also explored some local weather, where it seemed important to deal concretely with intertextuality – Examples 2–4 to situate the genre; the two quotes from elsewhere in the autobiography and Vincent Lingiari's speech to highlight the orality of Mandela's recount. Along both time scales of analysis, my approach has been selective, reflecting my reading of the text. As analyses accumulate and results converge, my reading, I expect, aligns with the reading position naturalized by the recount. How might this be confirmed?

One tack is to consider closely related texts, and for the recount under consideration here we have the recontextualization published in *The Illustrated Long Walk to Freedom* (Mandela, 1996). The last two pages of this edition of the autobiography position an elided[10] version of the recount in relation to two images and margin notes, as outlined in Figure 1. Following Kress and Van Leeuwen (1996), this multimodal presentation consists in broad outline of two multimodal triptychs. Down the left-hand margin of page 202 (Mandela, 1996) we have the triptych formed by an image of a young boy and the following notes:

[above photo of young boy] On the day of the inauguration I was overwhelmed with a sense of history. In the first decade of the twentieth century, a few years after the bitter Anglo-Boer war and before my own birth, the white-skinned peoples of South Africa patched up their differences and erected a system of racial domination against the dark-skinned peoples of their own land, [below photo of young boy] The structure they created formed the basis of one of the harshest, most inhuman, societies the world has ever known. Now, in the last decade of the twentieth century, and my own eighth decade as a man, that system had been overturned forever and replaced by one that recognised the rights and freedoms of all peoples regardless of the colour of their skin. (Mandela, 1996: 202)[11]

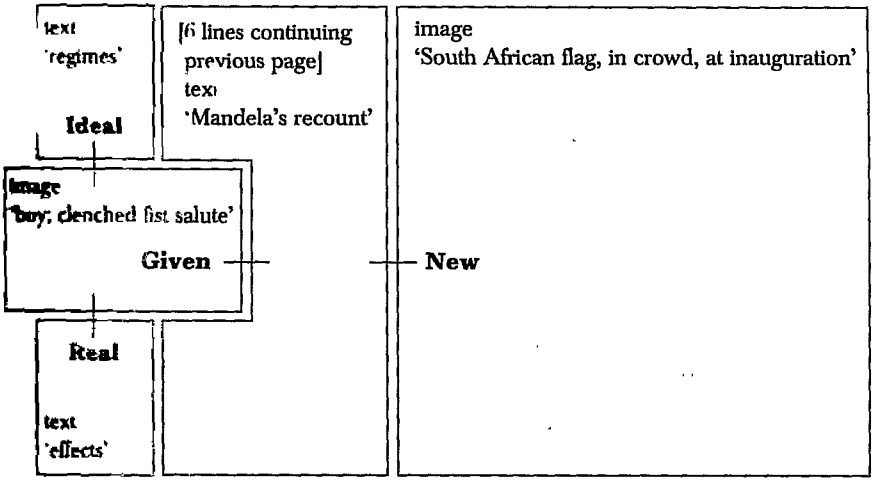

Figure 1: Outline of the illustrated recount (Mandela, 1996)

Across the pages we have the image/verbiage triptych formed by the abridged recount, with the photo of the young boy to the left, and a bigger photo (which takes up all of page 203 and spreads over a fifth of page 202) taken from the back of the crowd at Mandela's presidential inauguration, featuring the South African flag. Space precludes a detailed analysis of the two images here. In brief, the smaller photo, in naturalistic colour, features the head and upper torso of a primary school-aged African boy (medium shot). He is in the foreground, facing us, at eye-level, but focussing on something out of frame to our left. His right arm is raised in a clenched fist salute which forms a vector at a 45° angle to the triptych, reinforced by a parallel stripe on his sleeve and the fact that he is leaning to our right. The boy is wearing an orange shirt with white horizontal stripes on its body, four of which form a vector at 90° to his salute. Behind him is a crowd of what appear to be other school children, out of focus, some of whom are also saluting.

The larger photo, in naturalistic colour, is dominated by a large South African flag (medium shot). It is being held, at a 45° angle, by someone in a large crowd; the vectors formed by the flag's design are at 90° to the flagstaff, towards the lower right-hand corner of the image. The flag is at eye-level (since we are standing higher up, a few rows back). The crowd is overwhelmingly African; we see only the backs of their heads, out of focus in the immediate foreground, in focus around the flag, and increasingly out of focus towards the stage. Their gaze forms an unresolved vector towards the centre of the stage, which is outside the frame of the photo in the distance to our left.

Read in relation to one another, the images involve both similarity and contrast. As for similarities, the crowds are African; and the gatherings are constructed as political by the two symbols (the clenched fist salute and the flag). In both images the vectors formed by gaze are to our left and unresolved. The vectors formed by the boy's salute and striped shirt point in the same directions

as those formed by the flagstaff and the flag's design. Beyond this, the bold black typeface above and below the boy's image, along with his orange shirt and white stripes corresponds strikingly with the colour and design vectors of the South African flag. The relationship between the images is further enhanced by contrasts – the young boy vs the mature crowd; the boy facing us vs the spectators' backs; the boy gesturing with his arm vs the flag waving in a crowd. I take these parallels and differences as evidence that we are meant to read one image in relation to the other, mediated by the recounted text, as the triptych presentation implies.

Kress and Van Leeuwen (1996) suggest a reading of polarized images in which the left is glossed as Given and the right as New and this seems to fit the left–right triptych under discussion here. To the left, as Given, we have a young individual, gesturing with his arm; to the right, as New, we have a symbol of nationhood, aloft in a crowd of mature spectators. Mediating this relation in the triptych we have Mandela's recount, in which a boy becomes the president of the republic, and through which the freedom to play evolves into the freedom to govern (with responsibilities). Such is the nature of the photographic modality that the two images tend to linearize as Given and New the spiral texture of the recount; but, as noted, the colours and vectors of the left-hand triptych resonate so strongly with the flag that a spiral movement from youthful solidarity[12] to mature nationhood is implied. Note as well that we observe the boy, and his peers, and are in this sense excluded from the politics constructed by his salute (which might even be read as protesting against us, though we are not addressed by his gaze); with the image of the flag, however, we are included in the crowd, and aligned with their celebration of Mandela's inauguration. Thus the triptych reinforces both the enlightenment and engagement motifs of the original monomodal recount, with the recount mediating the transition from personal to institutional values.

The top–down triptych is also polarized; Kress and Van Leeuwen (1996) suggest the terms Ideal and Real for the top-to-bottom opposition, characterizing the Ideal as the generalized essence of the information, the Real as more specific, down-to-earth or practical information. In this triptych the semantic contrast seems to be between systems of government and their consequences. Above the photo Mandela deals with both the inauguration of a new republic and erection of the former apartheid regime; below, Mandela notes the effect on people of first the old regime (harsh and inhumane) and then the new (respect for the rights and freedoms of all peoples regardless of the colour of their skin). Linking these messages is the hybrid image of the boy, who can be read either as a protesting victim of old, or a celebrating champion of the new; the ambiguity of the clenched first salute (protest or celebration) thus mediates both facets of the triptych's Ideal and Real, with youthful zeal translating system into practice (see Figure 2).

Alongside enhancing the meaning of Mandela's recount, the interlocking multimodal triptychs also extend it. The key meaning here is the boy's salute, which seems at first blush to contradict Mandela's Orientation: 'I was not born with a hunger to be free'. Recall, however, that it was this salute which mediated

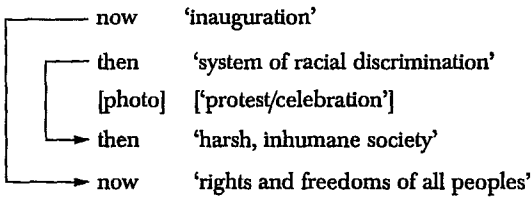

Figure 2: Mediating ideal and real in the left-hand triptych

Ideal with Real, through its ambiguity in the left-hand triptych, and which resonated strongly with the flag in the right-to-left one. The very meaning which is hard to reconcile with Mandela's recount is in fact foregrounded as the apex of the semiotic vortex constructed by the multimodal text.

I suspect that the new meaning here has to do with regeneration. The margin notes recontextualize Mandela's recount with respect to the wider context of South African history (*in the first decade of the twentieth century . . . now, in the last decade of the twentieth century*). Another aspect of this recontextualization is the absence of Mandela himself from the images here, though his presence is implied by the unresolved gaze of the inauguration crowd, by his 'rebirth' in the photo of the boy, and perhaps even by the unresolved gaze of the boy, since to his right we have the previous page and the rest of the book, throughout which Mandela's image figures prominently.[13] In each case, the virtual Mandela is realized to the left, as Given, in relation to a range of News (i.e. the flag, the president, the politicized youth, respectively). Arnheim's reading of the meaning of diagonal vectors reinforces these points. For Arnheim (1982: 107) diagonal vectors such as those formed by the salute and flagstaff are characterized as 'releasing', while those formed by the shirt stripes and flag are 'holding'. In these terms, the salute and flagstaff point forward to future accomplishments, supported by the shirt stripes and flag of the youth and nation that will get the work done.

As Mandela comments in his margin notes, the apartheid system had been 'overturned forever'; in this sense Mandela's journey has ended. The interlocking triptychs construct his legacy – one nation, united, underpinned by a generation of empowered youth for whom the freedom to respect and enhance the freedom of others is point of departure. By the time Mandela published the 1996 edition, the long walk has almost ended; the triptychs make way for others to carry on.

6. Grace

In this article I have tried, from my own specific reading position, to analyse this instance of discourse in relation to the meanings I have been trained to decode. If allowed a reaction, the term that comes to mind is *grace*, in every meaning of the word. The gracefulness with which the recount unfolds, the charm of its rhetoric, the goodwill to all peoples . . . I cannot help admiring the texture, and the Mandela it construes for me. In this kind of reaction I am not alone. Consider

for example the evaluative terms used promotionally on the covers of the 1995 edition: *anger, sorrow, love, joy, grace, elegance, riveting, brilliantly, emotive, compelling, uplifting, exhilarating, epic, hardship, resilience, triumph, clarity, eloquence, burns with the luminosity of faith, invincible, hope, dignity, enthralling, great, indispensable, unique, truly stunning, extraordinary, vivid, unusual, courage, persistence, tolerance, forgiveness, extraordinary, well worth, greatness, epic, struggle, idealism, inspired, cynicism, compulsory.* What is the appeal?

I suspect we are examining here Mandela's ability to naturalize radical values in terms that disarm rather than confront. Both the recount and its multimodal recontextualization promote a politics of freedom that involves respecting and enhancing the freedom of others. Put into practice, this involves more than an end to apartheid and reconciliation with its perpetrators. Ultimately it involves the reconfiguration of a global economic order which distributes resources so unevenly that it has to be propped up by all manner of unbearable regimes. In a sense then, Mandela is promoting socialism in the name of freedom; he naturalizes a comfortable reading position for those who might oppose his aims, and at the same time gives his sympathizers an inspirational shot in the arm. If discourse analysts are serious about wanting to use their work to enact social change, then they will have to broaden their coverage to include discourse of this kind – discourse that inspires, encourages, heartens; discourse we like, that cheers us along. We need, in other words, more positive discourse analysis (PDA?) alongside our critique; and this means dealing with texts we admire, alongside those we dislike and try to expose (Wodak, 1996).

Let me close with two more comments. The first is that discourse analysis inevitably involves multimodal analysis, even if we begin with language. Traditionally, the extra-linguistic has been glossed as context and (i) ignored; (ii) discussed in common-sense terms; or (iii) analysed on an interdisciplinary basis with apparatus borrowed from another discipline (psychology, sociology, philosophy, cultural studies and the like). The alternative explored here is to construe context as a social semiotic, model it as a system of meanings and treat it as additional texture. Kress and Van Leeuwen's (1996) pioneering work in this transdisciplinary project[14] was drawn on earlier in order to unpack the multi-modal discourse in Mandela (1996). Whether we adopt an interdisciplinary or transdisciplinary perspective on discourse analysis is an important variable. I expect that modelling context as meaning is the more promising tack for sign-oriented linguists, since it encourages them to explore new ground and renovate their discipline in ways that are perhaps long overdue.

The final point I would make is that specific instances of meaning do matter, alongside our studies of generalized instances, of corpora, and of systems as a whole. In part, this issue is simply a matter of perspective: the more variables we are interested in, the fewer texts we can analyse. So the challenge lies in developing frameworks in which system can be brought into focus without losing contact with text, and text can be explored in detail without losing contact with system.[15] In this article I have leaned towards the instance, in order to focus on

the contingency of meanings as they unfold from one step to another in a single text (Halliday, 1987, 1993c; Martin, 1995a). This local contingency is critical to understanding the social impact a text may have, on political developments in South Africa, for example, or on linguistic changes to the recount genre. In both connections it is important not to lose sight of grace in discourse, as outlined here.

We have taken a short stroll through meaning – in order to value an instance of semiotic weather in relation to a climate of political change. As socially engaged discourse analysts, however, our journeys have just begun. No doubt this new journal will guide us on our way.

Author's Note

Other style features in this article: bold type is used for highlighting; italics for citations in running text; small caps for realization of counterexpectation through continuity; underlining for through conjunction; equals sign for elaboration (Halliday, 1994).

Notes

My thanks to Malcolm Coulthard and his colleagues at the University of Birmingham for the opportunity to present an early version of this article in September 1997, and for their insights during and following the presentation; and to Anne Cranny-Francis, Rick Iedema, Teun van Dijk and Theo van Leeuwen for their guidance on revisions.

1. Cf. Halliday (1971) who explores the role of grammar symbolizing consciousness in Golding's *The Inheritors*.
2. Halliday's ideational metafunction has two subcomponents, the experiential and the logical; we are focussing on the experiential here.
3. The Mood adjunct *already* is part of Mood; it has not been separately labelled here.
4. For Halliday Finite and Predicator conflate in the simple present; so *takes* appears as both Mood and Residue.
5. I am adopting a minimalist position here, simply taking the last group or phrase of the clause as New, based on an unmarked reading of the clause with the tonic falling on its last salient syllable; parts of what I have called transition could arguably be taken as New in a carefully reasoned clause by clause analysis.
6. Or, undoing the nominalization, *I was deluded*.
7. Following Halliday (1994), the tense choice is [past in present], the 'what happened still matters now' option.
8. Semantically, if not grammatically negative: *an illusion* = 'not real'.
9. Paul Kelly (1991) comments on his song celebrating Vincent Lingiari's achievements as follows: "'From Little Things Big Things Grow" is dedicated to Vincent Lingiarri, the Gurindji stockmen and their families who walked off Lord Vestey's cattle station in 1966 thus initiating a land claim that lasted 8 years. The Whitlam government handed back much of the Gurindji country in 1974, Gough Whitlam himself pouring dirt into Vincent Lingiarri's cupped hands in a ceremony symbolizing the legal restoration of their lands. From this simple action of walking off in 1966 many consequences flowed'.

10. The elisions are presented in the Appendix; the larger cuts are to paragraphs 3 and 4. Paragraphs 4 and 5 from 1995 (communal and democratic freedom) are collapsed in the 1996 version.
11. This text is taken from pages 747–8 of the 1995 autobiography, a couple of pages before the end of the book.
12. Neither triptych resolves the question of whether the boy's salute is to be read as is a sign of protest or of celebration.
13. The previous pages feature images with a photo of Mandela and his daughter on stage during the inauguration, on top of smaller photos of visiting dignitaries – Fidel Castro, Benazir Bhutto, Yasar Arafat, the Duke of Edinburgh and four unnamed Arabs (in royal Saudi Arabian dress).
14. See also Kress (1997), O'Toole (1994).
15. For discussion see Halliday (1991, 1992a, 1992b, 1992c, 1993a, 1993b), Halliday and Matthiessen (forthcoming), Nesbitt and Plum (1988).

Appendix

Wordings from Mandela (1995: 750–1) which are elided from Mandela (1996: 202), by paragraph:

[free in every way that I could know.] . . . [near my mother's hut] . . . [and ride the broad backs of slow-moving bulls]

. . . [as a student] . . . [freedom only for myself.] . . . [as a young man in Johannesburg,] . . . [and honourable] . . . [– the freedom not to be obstructed in a lawful life].

. . . [not only was I not free, but my brothers and sisters were not free. I saw that] . . . [I am no more virtuous or self-sacrificing than the next man, but I found that I could not even enjoy the poor and limited freedoms I was allowed when I knew my people were not free. Freedom is indivisible; the chains on any one of my people were the chains on all of them, the chains on all of my people were the chains on me.]

. . . [as well as I knew anything] . . . [A man who takes away another man's freedom is a prisoner of hatred, he is locked behind the bars of prejudice and narrow-mindedness.

I am not truly free if I am taking away someone else's freedom, just as surely as I am not free when my freedom is taken from me. The oppressed and the oppressor alike are robbed of their humanity.] . . .

[Some say that has now been achieved. But I know that this is not the case.]

. . . [I have tried not to falter; I have made missteps along the way.]

Division and Rejection: From the Personification of the Gulf Conflict to the Demonization of Saddam Hussein

Luisa Martín Rojo

> Le discours, en apparence, a beau être bien peu de chose, les interdits qui le frappent révèlent très tôt, très vite, son lien avec le désir et avec le pouvoir. (Foucault, 1971: 12)

The analysis I present in this paper is basically of a 'critical' nature, in Foucault's terms. It aims to discover and delimit the means of exclusion and appropriation which work within discourse, and then reveal the motivation behind them by means of analysis. Discourses emerge from society and have effects on it as well: they contribute to building up social networks and conceptual frameworks. It is these social and political effects that I want to analyse.

This critical view is closely linked with Foucault's conception of discourse. Discourses are practices which follow rules.[1] Discourse production is controlled and structured by a cluster of procedures that function as a means to avoid external threats and power.[2] These procedures make discourse opaque. Foucault invites us to 'read' the effects of a variety of discourse forms and verify how they come to be a 'representation'. This 'representation' exists because, from the very beginning, every piece of discourse is an interpretation, and not a reflection of a state of affairs.[3]

Foucault and 'critical linguistics' (Fowler, 1991: 231; Hodge and Kress, 1992: 161; for a critical approach in discourse analysis, see also van Dijk, 1988 and 1993) are interested in the same type of discourse: anonymous discourse, a discourse of a kind which is produced in those situations where power relations

Source: *Discourse & Society* vol. 6, no. 1, 1995, pp. 49–80.

are most evident – rules within mental hospitals or prisons, for instance, or, in the case of critical linguistics, the analysis of language in the news. This paper deals with the latter, in particular with the type of discourse that the press produced on the Gulf War, an event that has been considered as one of the most outstanding examples of appropriation of discourse. However, I focus on what might be called the process of 'demonization of Saddam Hussein', especially the period just before the war, when this demonization was necessary in order to turn a western ally (against Iran) – or, at least, an 'unknown quantity' – into an enemy, and in this way justify the attacks. The change in the perception and presentation of Saddam Hussein was especially relevant in Spain, where the war was, from the very beginning, unpopular. The controversy which surrounded it reminds one of the polemic over Spain joining NATO. On both occasions, the Spanish position was presented as a chance to join the developed countries and overcome the country's traditional isolation.[4] This process implies, first of all, an inclusion procedure, which ensures that the Spanish position does not simply respond to US demands, but is an ideological option in which all Europe is involved and, of course, some Arab countries. Nevertheless, what makes the inclusion process possible is an exclusion procedure which establishes an ideological *us*, opposed to Saddam Hussein.

In this paper I study both processes – inclusion and exclusion – and try to delimit the role played by the latter in the achievement of the former. Both are realized through discourse and they are carried out by means of different linguistic and argumentative resources and strategies. The exclusion is articulated on two axes: DIVIDING, that is, establishing the categories which will be opposed in the conflict – *us*, with several different referents, vs *them*, or, nearly always, *him*; and REJECTING, that is, segregating, marginalizing, creating a negative image. The creation of an enemy, *them* or *him*, makes it possible to establish, as the opponent, an inclusive subject, *we*, which is defined simply by opposition. In the same way, the construction of a negative image of the enemy, using the fact that he flouts a series of established values and is given negative features like irrationality or madness, provides the inclusive *we*, by opposition, with a positive image. The result is a *we* which is indefinite but which evokes a set of shared values that remain implicit. Both the subject and the values are thus underdefined, but despite this the reader absorbs them and becomes part of them. By contrast, in the enemy camp there appears a concrete rival who embodies all the anti-values, all the crimes. Discourse brings about a process of categorization, of ordering and normalizing, which generates knowledge about ourselves, and about the events we are living. In this case, a vision of the war is created, transmitted and consolidated. All this fits into what Lakoff (1992) has referred to as 'the fairy tale of the just war'. This plot brings together all the metaphors Lakoff has examined, and illuminates the mechanisms and strategies I have found in the analysis. In this paper I refer to these three processes: the establishing of subjects, the clarifying of values and the transmission of a specific vision of the events.

I have taken as my corpus the so-called 'objective' press and, in particular, chosen from it one of the most prestigious Spanish newspapers: *El País*. The style of 'objectivity', by means of moderate, emotionally controlled language,

close to the standard register, seems to be a neutral style and to represent 'the ideology of consensus' (see Fowler, 1991; Norton, 1983; Sandell, 1977; Sherer and Giles, 1979 for different insights on formal style). I have chosen to examine the 'objective' press because my aim is to expose the more sophisticated and less explicit mechanisms used to control and bias the information given. To this effect, this analysis goes hand in hand with van Dijk's (1991) work on 'elite' or inhibited racism. I will try to show that, apart from some unique linguistic strategies and resources, exclusion procedures that appear in what we might call the 'elite press' do not essentially differ from those uncovered in the British tabloid newspaper the *Sun* or elsewhere by other researchers (see Imbert and Vidal Beneyto, 1986, for similar conclusions).

Foucault and Exclusion Procedures

Through discourse, according to Michel Foucault, the new rituals of power are exercised. These include the definition of what is usual, habitual and expected, as opposed to what constitutes a deviation, an exception. This type of power creates subjects and self-knowledge. Self-regulation, normalization, is produced when 'external' forces bring 'interior' self-discipline. In this case, it is seen both in the construction of a homogeneous *us* and in the exclusion of Saddam Hussein by means of this construction of what it means to be human.

The exclusion procedures permit, as we shall see, the cognitive categorization of individuals into groups, which is a way of ordering perception and judgement, a way of making sense of social processes. The means of these categories, their function and their social and psychological significance is established inside the discourse context, and changes when the context changes. This means that the categories are not constructed in the mind from a process of perception, and only later receive a linguistic label, but, rather, they are built in and by discourse 'as part of a collective domain of negotiation, debate, argumentative and ideological struggle' (Wetherell and Potter, 1992: 77).

Michel Foucault analyses three different external exclusion procedures in his book *L'Ordre du discours* (1971), and these can also be seen in the way information on the Gulf War was presented.

Prohibition. All through the Gulf War there was a prohibition, given that there was press censorship. The fact that it was the military who controlled and filtered the information on the war explains partially how pieces of news were selected and events were omitted.

Division and rejection. The example of these combined activities of dividing and rejecting that Foucault studied most is the opposition between reason and madness. This opposition appears in discourses dealing with the Gulf War, and is accompanied by others like 'ours vs theirs', 'order vs brutality' and, ultimately, 'good vs evil'. 'Division' means establishing an inclusive *us* and an exclusive *them*; in this case, them was just *him*, because the conflict was embodied in Saddam Hussein. Beneath this dual vision lies a model of society based on the idea of consensus (Fowler, 1991: 16–24, 49–54). In the foreground there are two

opposing groups: those who share the accepted values and behaviour, and those who flout them. This dual vision entails a personalization of the conflict.

Personalization is one of the essential factors formulated by Johann Galtung and Mari Ruge in their analysis of socially constructed values in news (1973: 62–72). Its functions, as Fowler proposes and as our analysis shows, are 'to promote straightforward feelings of identification, empathy or disapproval and to effect a metonymic simplification of complex historical and institutional processes' (1991: 15).

Once the two camps are established, the field of conflict (*them*) and that of consensus (*us*), 'the ideology of consensus' and ethnic prejudices are used to reinforce exclusion or 'rejection'. When they are invoked, an image of Saddam Hussein is constructed in which he plays the stranger, the irrational being, the madman, the beast, and in this way he, ultimately, personifies evil. These are the villain's attributes within the fairy tale Lakoff (1992) discusses. Rejection allows us not only to identify the enemy, but to give him an answer as well.[5]

As a result of an implicit or explicit contrast, somebody else's madness makes us rational, civilized human beings. It is by opposition that each one's characteristics can be delimited and typological differences can be established. Identity is, then, relative, since it is constructed by means of contrasts with an external otherness. It is a matter not only of fixing limits – which seems to be a constant in bourgeois mentality (Subirats, 1977) – but also of the projection of our fear, of our own irrationality. In the case in question, the exclusion of the 'other' gives direction to the reaction, and, more importantly, justifies the war: the madman is dangerous, he must be eliminated – if not, he may impose his irrationality on the world. This paper focuses on this particular procedure.

The opposition 'true vs false'. El País knows that the assumption that objectivity is possible is deeply rooted. Discourse tends to be considered as a reflection and not as an interpretation of the state of affairs. It also knows that it is highly valued. Consequently, *El País* gives the impression of being an objective newspaper, a journal which seeks for 'truth'. This pretence produces a style in which mitigation, implicitness and inferencing play a major role. My analysis highlights this; the process by which Saddam Hussein is demonized is specially efficient when a discourse is not considered to be an interpretation, made by a particular ideology, but is taken to be true. As van Dijk points out, the perlocutionary or persuasive dimension in news lies 'in the formulation of meanings in such a way that they are not merely understood but also accepted as the truth or at least as a possible truth' (1988: 83). Rhetorical structure accompanying assertive speech acts enhances beliefs assigned to the asserted propositions in the text. If we do not believe what the other says, we can hardly be expected to change our opinions. Any acceptance is a complex process which presupposes a minimal degree of coherence of the new propositions with the knowledge and beliefs we already have. Otherwise we do not discard fundamental beliefs built up during years of understanding, experience and action (van Dijk, 1988: 83). In this sense, the demonization of Saddam Hussein becomes convenient and necessary to overcome the ideological opposition to the war: establishing an individual agent of aggressive actions, the collective representations of abnormality, irrationality

and madness are evoked. These representations act as principles of organization, structuring the social experience, in this case the perception of the conflict (see REJECTION).

From now on, I develop my analysis of the linguistic and argumentative procedures of division and rejection.

Division: The Personalization of the Conflict

Among the procedures used to divide which I illustrate in this paper are: (1) the discourse strategy of *intertextuality*, which makes it possible to reproduce the ideology of consensus, personalize and affirm the existence of two conflicting groups, avoiding any responsibility for the newspaper in the discourse; (2) *cognitive models*, which underlie the discourse quoted and that of the paper itself, and which permit the construction of the two camps: among them are categorization, metaphor and metonymy; (3) finally, *the contrast* between actions and agents, which organizes the opposition *us* vs *them* on the lexical, syntactic and discourse levels, and gives coherence to the discourse. This discourse strategy delimits with clarity both subjects (*us* and *him*), and strengthens the process of division and demarcation.

Intertextuality and the Establishment of the Rival Groups

The persuasive content of news requires organizing, as van Dijk shows, 'in order to be understood, represented, memorized, and finally believed and integrated' (1988: 84; see also 96–100 and 114–19). Van Dijk points out that one means of increasing the appearance of truth in news is to resort to evidence from other reliable sources (authorities, respectable people, professionals).

In this way, *El País* systematically quoted authorities in the period just before the war. These quotations were often presented as the topic of the news, appearing in headlines and leads (categories which summarize the content of the text and express the semantic macrostructure). Nevertheless, as van Dijk claims, and as we will see below, the social hierarchy is reproduced in the rhetorical hierarchy of reliability assumed by the newspaper.

I call this argumentative resource *intertexuality*. Its study is based on the theories of Bakhtine (1981), Kristeva (1986a, 1986b) and Ducrot (1984) (see also Fairclough 1992, for an appraisal of works by Bakhtine and Kristeva). For Bakhtine, any utterance is made up of multiple voices, it is built up of fragments of other utterances which are more or less explicit and complete. The speaker may give the floor momentarily to one of the characters; in the case in question, *El País* shows its preference for George Bush and James Baker. In this way, the discourse becomes part of history and of society – from the moment that the text updates, responds to or reworks previous texts. Consequently, it contributes to making history and bringing about more transcendental changes. At the same time, the discourse lets history and society into it – since the text absorbs and is made up of previous or contemporaneous texts (see Kristeva, 1986a, and

Fairclough, 1992: Ch. 4). All the examples found respond to the field Foucault (1969) calls 'presence' – that is, they evoke fragments of discourse outside the text, either to show agreement with them, because they are considered transcendental, or to criticize them or to discredit them.

This resource entails a personification of the conflict, which produces two different results: (1) the construction of the other; (2) the construction of *us*.

The construction of the other: SADDAM HUSSEIN IS IRAQ. From the very beginning, *El País* put the blame on Saddam Hussein for the invasion and subsequent crisis. In the days before the war started, this accusation was made most frequently by means of quoting George Bush's statements or discourses. This technique cannot be understood by means of the alleged 'register of truth' the newspaper claims to have, because it allows readers to involve and share a particular conception, without apparently stating it explicitly. As a result, by including multiple voices, by means of an explicit polyphony, the most radical views can be articulated while maintaining the style of objectivity (moral ambivalence):

(1) 'Si *Sadam no abandona Kuwait* incondicionalmente *se arriesga* a sufrir unas consecuencias devastadoras para el país.' (5.1.1991: 3)
(1) [Quoting James Baker 'If *Saddam does not leave Kuwait* unconditionally, *he will expose* his country to devastating consequences.' (5.1.1991: 3)

Saddam Hussein appears in the semantic roles of agent of the invasion and the beneficiary of the retaliations. In this way the first term in the opposition is established. George Bush and James Baker are the main agents here.

In all these examples of intertextuality (see also (7), (10), (11)), *the paper does not paraphrase the discourse – the speakers are all quoted directly.* They are not mentioned with the purpose of criticizing them, but, rather, the words of these two politicians seem to constitute in themselves the information, and there are no linguistic signals to show that the author of the article ('locuteur', in Ducrot's terms [1984: Ch. 8]) does not share the vision of the events transmitted by these discourses (that is, with the point of view of the 'enunciateur', in Ducrot's terms).

By using preformulated information, the journalist presents a coded version of a situation model, which may include, as in this case, 'opinions, attitudes, perspective, and other information about the model of the speaker, as well as specific meanings, hierarchies (topics, schemata), and stylistic and rhetorical forms' (van Dijk 1988: 115). In this sense, the fact that several headlines focus on George Bush's declarations (for example: 'Bush recommends Saddam to opt for peace', 'Bush declares ...', 'Bush claims ...', 6.1.1991) shows a preference for this source and for a particular model of the event. Through George Bush's and James Baker's words, the personification of the war is achieved and a hierarchy of participants is established. Quotations reproduce the different lexical procedures (see, for instance, taxemes, in example (7)), syntactic procedures (contrast expressed through agents and actions, as in examples (10) and (11)), and pragmatic devices (see, for instance, the maintenance of the illocutionary force in (12)), used by American diplomacy. All these resources seek to emphasize the

differences in power, status and possibilities of control, and reproduce a particular model of the situation. By contrast, and as a consequence of the hierarchy of sources and the different degrees of reliability assumed by the newspaper, *El País* reproduces neither Saddam Hussein's conceptualization of the conflict nor his rhetorical procedures.

The presentation of Saddam Hussein's vision of the conflict could have made clear how much simplification was done in order to make him the only person responsible for the conflict, and the only agent in it. Nevertheless, in accordance with the exclusion process, Saddam Hussein's words are very rarely quoted and, if they are, they are often paraphrased, framed and so discredited – either by extension (2) or explicitly (3).

(2) Las fuerzas armadas están preparadas para una larga batalla', *según el presidente iraquí.* (7.1.1991: 3; titular pequeño)
(3) *Estas soflamas propagandísticas* se subrayaron con las. . . . (5.1.1991: 2)
(2) 'The armed forces are prepared for a long battle', *according to the Iraqi president.* (7.1.1991: 3; small headline)
(3) *These inflammatory speeches* were emphasized by. . . . (5.1.1991: 2)

In (2), although the words of the President are quoted, the presence of the discourse marker 'according to' points to the distance the paper ('locuteur', in Ducrot's terms) wants to establish, and the fact that it does not identify with the opinion quoted – that is, with the point of view of Saddam Hussein ('enunciateur'). The use of 'according to' relativizes his vision, so that it does not appear as the words of authority (as in (1), (7), (10), (11)), but as an utterance which is questioned by the journalist, and only Saddam himself is responsible for it. In (3) we see how Saddam Hussein's words are discredited by lexical means: the distinction between 'objective discourse' and 'inflammatory speeches' is called up and Saddam Hussein's words are classified as 'propaganda'. This distinction is based on an objectivist conception of knowledge and language, which has deep roots in our culture. Only on one occasion, on 7 January, was a sentence quoted from Saddam Hussein's speech that made it possible to guess his vision of the conflict:

(4) . . . la lucha contra 'la *corrupción*, la *hegemonía* [extranjera] y *la injusticia económica* a escala del mundo y regional.' (7.1.1991: 3)
(4) . . . the struggle against '*corruption*, [foreign] *hegemony* and *economic injustice* at a regional and global scale.' (7.1.1991: 3)

In opposition to the personalization of the conflict (everyone against Saddam) which we find in the declarations of George Bush and James Baker and in the discourse of the newspaper itself, Saddam Hussein in (4) uses abstract nouns referring to processes, to actions which take on the category of states. Thus, he presents the war as an act of rebellion against the established order, an order which prevails thanks to a participant which is not mentioned. Examples (4) and (5) do not give us enough data to know the sort of discourse used by Saddam Hussein on the conflict, though they do share a preference for the presentation [illegible] and ideological motivation, rather than personalization.

The road which takes us from personalization to other more complex motives based on economics, politics and ideology is, as we shall see, longer. Personalization is a simplification and makes it possible to leave the 'real' causes for the conflict unmentioned.

In (2), (3), (4) and (5), the words of Saddam Hussein appeared among a list of details that reduced their credibility: for example, the fact that his speech lasted 30 minutes whereas George Bush's – delivered the same day – was only 6 minutes long, or the fact that in his speech Saddam Hussein repeatedly used words such as 'battle', 'fight', etc. All these details reinforce the categorization of Saddam Hussein's discourse as propaganda. Such a presentation prevents the contrast between the opposing points of view and makes Saddam Hussein's rationale appear irrational.

(5) '. . . la batalla es entre Dios y Satán.' (31.1.1991: 6)
(5) [Quoting Saddam Hussein] '. . . this is a battle between God and Satan.' (31.1.1991: 6)

By quoting the speeches of George Bush and Saddam Hussein, delivered the same day (7.1.1991), *El País* not only increases the appearance of truth but also produces an effect of factuality and dramatization: a dialogue between the two leaders. Nevertheless, by treating both discourses in a different way, the paper confers superiority to one interlocutor over another, which results in an asymmetrical dialogue.

In editorials, where quotations are not used, and in some columns as well, it is the newspaper itself that contributes to the process of personalizing and establishing the two camps *them/him* vs *us*, assigning Saddam Hussein the agent role in the case of negatively valued actions and the beneficiary role in the case of retaliations. The mechanism becomes more pervasive as the conflict intensifies. This increases exclusion and produces a background of 'absolute otherness', by which Saddam Hussein is presented as the negative image of *us*:

(6) Los incendios de pozos de petróleo en Kuwait y, posteriormente, los vertidos al golfo Pérsico refuerzan desgraciadamente los argumentos de quienes consideraron que *Sadam recurriría a una política de tierra quemada* antes de soltar *su* presa . . . (1.2.1991: 16; editorial)
(6) Oil wells being burnt and oil being poured in the Gulf afterwards unfortunately are new arguments for those who thought that *Saddam would follow a scorched earth policy* before letting *his* prey go . . . . (2.1.1991: 16; editorial)

Identity: the construction of us. Facing Saddam Hussein there was an inclusive *us* which was often called up by means of quoting the words of James Baker, that is, using the same discourse strategy: intertexuality.

(7) '*Sadam sigue reforzando sus posiciones defensivas* en Kuwait, y cuanto más esperamos más alto será el riego que corremos, más alto será el riego que correrán *nuestros* soldados.' (6.1.1991: 3)
(7) *Saddam continues building up his defensive works* in Kuwait and the longer *we* wait, the more *we* expose ourselves, the more *our* soldiers expose themselves.' (6.6.1991: 3)

The first-person plural creates groups of people, but it may refer, in fact, to different groups (see, for example, Guespin, 1985). Among the values of *us* which have been pointed out is the national *us*, found in the quotations of Bush and Baker (as in (7)). However, what is most characteristic of this strategy is the fact that its value lies in designating a collective which has one name but varies as to content and functions (see Geffroy, 1985). The paper's reproduction of the *us* of political discourses and the progressive use of other co-referential terms – like the UN, the West, the civilized world, the whole world – shows that it widened its reference, as the war went on, to a transnational group. This group is presented as sharing ideological values which are never made explicit – we must not forget who made up the 'anti-Saddam coalition', in which it would be difficult to find common values. Thus the referent is no longer national but ideological.

In this way, by dividing – segregating through its discourse – the paper not only allows a set of categories to be established, but it also strengthens the illusion of a consensus. As Fowler says, 'the *we* of consensus narrows and hardens into a population which sees its interest as culturally and economically valid, but as threatened by a *them* comprising a motley of antagonistic sectional groups' (1990: 53). The construction of *us* implies, then, a simplification, differences are smoothed over, and in this case it made it possible for *El País* and the Government to announce that Spain belonged to the West as one of the most developed countries, and shared the structure of values attributed to this group.

However, this process of identification and construction of *us* took place slowly in *El País*, and was made up of two stages.

Stage One. At the beginning of the war, *El País* did not use the generalizing *us* in its own discourse. Above all, it was George Bush and the US who faced Saddam Hussein. The newspaper was against the war and supported diplomacy. The encompassing *us* was then made up of those who condemned the invasion and wanted a peaceful agreement. George Bush, in the other group, wanted war. Examples (8) and (9) illustrate this stage. In (9) what is at stake is a questioning of US leadership.

(8) *El presidente George Bush* – no sin fuerte oposición interior . . . – ha dejado claro que *está dispuesto a emplear la fuerza* . . ., Sin embargo, existe un *anhelo casi unánime en la opinión pública mundial* . . ., de que se evite le guerra . . . . (12.1.1991: 10; editorial)

(9) *This is not an issue between the United States and Iraq* . . ., but one that puts the UN, almost every country in the world, against the government which has seized Kuwait, so violating international law. (12.1.1991: 10; editorial)

(8) *President George Bush* – not without strong domestic opposition . . . – has unambiguously said that *he is prepared to use force* . . . . However, there is an *almost unanimous outcry within world public opinion* . . . asking for war to be avoided . . . .

(9) *This is not an issue between the United States and Iraq* . . ., but one that puts the UN, almost every country in the world, against with the government which has seized Kuwait, so violating international law. (12.1.1991: 10; editorial)

Examples (8) and (9) show that divergences and opposed attitudes are related to the search for the most appropriate solution (diplomacy vs war), but do not affect the conceptualization of the conflict. *El País* assigned to Saddam Hussein

the agent role in it and employed the identical argumentative and linguistic resources for creating a negative image of him. The only difference is that during this first stage *El País* did not resort to an inclusive *us*, which was, however, always implied by the use of intertexuality.

Stage Two: As soon as the allies attacked Iraq, *El País* changed its attitude and started to support the dominant discourse: Saddam Hussein's madness has blocked an agreement and has inevitably led to war. From that moment on, this idea pervaded editorials and news reports, and was argued both by reinforcing exclusion, stressing the rejection and the negative image of Saddam Hussein – that is, by showing that he was an irrational beast – and by inclusion – by presenting a united *us* that encompassed the whole world. Geffroy (1985: 87) has shown how war forces society to form a single group, with a unique principle, *us*, whose definition and delimitation comes from what Poliakov (1980) calls 'devil-dialectic' (see Howlett, 1982: 15). In this way, the reader feels appealed to, and absorbed into a unique and all-embracing *we*, in which references are superimposed and change throughout the discourse, or even in a single sentence.

What the existence of two different stages shows is how the divergences over the potential solution of the conflict disappear, how the newspaper's identification with the dominant discourse – represented by declarations of George Bush and James Baker – becomes complete. This identification entails the decrease of the use of intertextuality, and, as a consequence, the use of the first-person plural pronoun, *we*, becomes less frequent. Despite the similarities in the two discourses, *El País* prefers the use of collective subjects, such as 'the international community', 'the UN', 'Europe', or 'the civilized world', in which the existence of a united *us* remains implicit. This tendency is more evident in reports about aggressive actions at the beginning of the war (especially in headlines from 17.1.1991: 'US bombs Baghdad'; 'Bush is certain of victory').

At the same time as the subjects which made up *us* were left inexplicit, an acceptable picture of the conflict which faced them was drawn. Both personalization and setting the conflict within a global background (the 'civilized world against Saddam') were priorities for American diplomacy. This was a result of strategic aims and was linked with face management, but there was an even more important motive behind it all, to suppress the economic and geopolitical dimension of the conflict and to situate it in a new context: on the boundary between reason and madness, an opposition which brings together all the discourses made by the West on the Gulf War. These boundaries, as well as the conflict itself, only allowed for two options: either you enter the game or you are out.

Cognitive Models

In the previous section, I have shown how *El País*, by means of explicit intertextuality, contributed to sorting people into categories; later (see the discussion of the contrast between agents and actions below), we will see how different values are put on each of them. However, the personalization of the conflict, with the establishment of two opposing camps, that of the 'ideological *we*' and that of the enemy, embodied in Saddam, would have been impossible even

without having recourse to cognitive models built as metaphors and metonymies (Lakoff, 1987). Despite the existence of some divergences related to the solution of the crisis, *El País* conceptualized the conflict by using the same examples of metaphors and metonymies present in dominant discourse, and in particular in George Bush's discourse.

George Lakoff argues that there exists a series of relatively fixed and extended conceptual metaphors and metonymies which organize our thoughts. If a concept is created by a metaphor or a metonym, some aspects of it are emphasized and others which are inconsistent with them concealed. In the cases I examine, using these procedures makes any other interpretation of the facts impossible and works as a means to justify the war (Lakoff, 1992).

I review, first of all, procedures which highlight Saddam Hussein and contribute considerably to the division process:

THE STATE AS A PERSON METAPHOR

> A state is conceptualized as a person engaging in social relations within a world community. Its landmass is its home. It lives in a neighborhood, and has neighbors, friends and enemies. States are seen as having inherent dispositions: they can be peaceful or aggressive, responsible or irresponsible, industrious or lazy. (Lakoff, 1992: 465)

This metaphor helps sustain unanimous judgements on the state as a whole because it conceals differences between social classes or groups, nationalities, religions or concerns. In news and editorials on the Gulf War the same metaphor is used for the two contenders (9). I have noticed, however, that it is not used in the same way for both. Given this metaphor, the US, and even the mixed 'anti-Saddam coalition' or the West or the so-called 'international community', are pictured as a united block in which concerns, attributes, values, norms and ideology are shared. In the case of Iraq, this metaphor combines what is really a conglomerate of ethnic groups and religions and unifies their behaviour, so that, since they are represented in the figure of a single man, they can be made responsible and easily condemned. Iraq is seen as a person who, from the start, is also an enemy who may attack us, hurt us, maybe destroy us; so we have got to face him, set up targets, ask for support against him. The metaphor discovers the enemy, creates him and points to the expected response: confrontation on the field – that is, war.

THE RULER STANDS FOR THE STATE METONYM. This metonym is systematically used by *El País* when Saddam Hussein is involved ((1), (6) and (7)), but much less frequently if George Bush is mentioned (8). It has different readings depending on the case. In the case of Iraq, editorials and columns do not talk about any abstract entity, but explicitly isolate Saddam Hussein as the agent responsible for the whole conflict as well (see (1): 'If *Saddam does not leave Kuwait* unconditionally, . . .'). Among the consequences of this procedure there is the selection and justification of the actions undertaken against him (against Iraq), which are viewed as an unavoidable response because of some particular features of his personality. These have been carefully chosen and highlighted, or even invented, through the use

of the underlying metaphor and metonym and become attributes of this state. Under these circumstances, the process of demonization becomes much easier. Responses are explicitly portrayed as collective responses against an individual. Saddam Hussein seems to be the *beneficiary*, when there is in fact an embargo and an attack going on ((1) and (12)). The metonym comes then to: SADDAM HUSSEIN IS IRAQ.

By means of this metonym a particular sort of violence is evoked: the one which is exercised by individuals and not by groups or states. This kind of violence is linked to the social imagery of irrationality and madness (Pintos de Cea-Naharro, 1994). This metonym acts as an argumentative resource, as a persuasive device, which makes acceptable the rationalizations by which the dominant discourse tends to be legitimized (under REJECTION, we will see the role played by the imaginary dimension in the conceptualization of the war as a fairy tale, with a hero, a villain and a victim – that is, its role as a principle of organization of perception and social experience).

Within the acts of dividing and rejecting, the concept of *us* is not constructed in the same way as *them* or *him* is. In the first case, we have a process of encompassing, whereas in the second we single somebody out. This stresses Saddam Hussein's isolation, his irrational and impossible stand. The move emphasizes the contrast between the two sides and efficiently triggers patriotism. The RULER STANDS FOR THE STATE METONYM is in the case of George Bush far less pervasive. Instead of it, we find collective subjects. They are 'the international community', the UN, or 'the civilized world' and are also personified. They are given values, attributes and made responsible for actions, all of which contrast with, and often are even the direct opposite of, those assigned to Saddam Hussein (see below the discussion of contrast expressed through agents and actions). The pronoun *we* refers to a set of values and the content of the consensual assumption could be spelt out as a long series of propositions about social, political, economic and cultural world order. The apparent homogeneity strengthens the use of *we* and supports what is merely a vision of the events which harmonizes with the interests of some governments and powerful groups. This vision grows from the 'ideology of consensus' and, in its turn, articulates this ideology (see Fowler, 1991: 49–53; Hall, 1973; Hartley, 1982: 1–3).

'Our' ideology implies the assumption that the whole population – in this case, the international community – shares the same interests and beliefs. The use of *we* and collective subjects produces, then, an over-simplification rather like that of THE STATE AS PERSON METAPHOR. This process combines a conglomerate of ethnic groups, interests, cultures and religions and unifies their behaviours.[6] Thus it presents the interests and values of the dominant groups as universal. Fowler uses the expression 'homocentrism' for this overgeneralization: 'a preoccupation with countries, societies and individuals perceived to be like oneself; with boundaries; with defining groups felt to be unlike oneself, alien, threatening' 1991: 16).

I now present some examples showing this metaphor (THE STATE AS PERSON METAPHOR) and metonym (THE RULER STANDS FOR THE STATE METONYM) at work and how the contrast strengthens the dichotomy and, as a consequence, division.

The Rivals: Contrast Expressed through Agents and Actions

The act of dividing leads to contrast. Exclusion is the establishment of a borderline between two camps: 'our camp' (inside), where 'our' allies and friends are included; and 'their camp' (outside), where 'others', 'our enemies' are excluded. This establishment implies the definition of 'our' and 'their' land. Thus, contrast will give sense to words like *us* or *him*. Contrast has an effect not only on the agents, but also on their behaviour and attributes. Saddam Hussein acts as 'our enemy' – that is, as the agent of aggressive actions, and as the subject/agent in transitive or intransitive sentences endowed with negative values (see examples (6), (7), (10), (11), (20) and (26)): *'to offend'*, *'to threaten'*, *'to invade'*, *'to attack'*, *'to build up defensive works'*, *'to bomb'*, etc. The US and the international community are presented, however, as agents of actions such as *'to present a peace proposal'*, *'to defend Kuwait'*, *'to defend international order'*, *'to order a ceasefire'*, etc. [see, for instance, 'peace offering' and 'pray for peace', in (10) and (11)].

Different methods are used to build up this contrast (see (10) and (11)):

Lexical procedures. Lexical categorization. As regards the *agents*, the contrast I have referred to is made between: (a) all-encompassing agents (like 'the world' and 'the international community' – in (10) and (11) – or 'civilized world' (26)) vs very concrete agents ('Saddam Hussein', or 'him' – in (10) and 'Iraq' – in (26)); (b) a united and ideological *we* (7) vs a concrete agent, him (and (11) or 'Saddam' (7); (c) two concrete agents, 'Bush' (several headlines focus on George Bush's declarations, for example 'Bush recommends Saddam to opt for peace', 'Bush declares . . .'. 'Bush claims . . .', 6.1.1991) vs 'Saddam' ('Saddam intends to keep Kuwait and liberate Palestine', 7.1.1991). The second term of the contrast is always *him*, which implies the presentation of Saddam Hussein as the unequivocal agent of the following actions.

Vocabulary establishes a division between peaceful *actions* and aggressive actions ((10) and (11)). In this sense, euphemisms are used to present aggressive actions as legitimate, peaceful and moderate ('defend Kuwait' vs 'attack', 'peace offering' and 'pray for peace' in (10) and (11), at a moment when Americans were preparing for war – in fact already sending troops over). The contrast is more evident once war was declared, and, as different analyses have shown (see Fowler, 1991; Hodge and Kress, 1992) is a very common strategy in western newspapers. During the period studied in this paper (that is, just before the war), this procedure presented Saddam Hussein as an antagonist and his actions as refusals, to 'peace offerings'.

The main results of this procedure are first to link Saddam Hussein with the use of violence. This evocation – by using THE RULER STANDS FOR THE STATE METONYM – of a particular kind of violence, exercised by an individual, plays, as we will see, an essential role in the rejection move. The second main result is to show that there could not be a common 'rhetorical ground' and hence there could not be a diplomatic solution to the conflict. The use of force is justified.

Syntactic procedures. By these procedures, the role played by participants in different actions is emphasized or hidden.

Syntactic transformations of the clause. This is achieved by blurring the focus on agents, or suppressing them by means of impersonal structures, passive verbs, nominalizations, etc. In examples like: 'Waves of bombs fell on selected objectives in the Iraqi capital' or 'Black clouds go up from Baghdad' (both 17.1.1991), the deletion of the agent is complete. The use of this procedure, studied by 'critical linguistics' (see Fowler, 1991; Hodge and Kress, 1992), increases remarkably from 17 January on – that is, once war was declared and attacks began to be reported. When the agents of 'our' actions are mentioned, *El País* shows its preference for other forms of detachment: the use of some concrete agents like the US and the 'allies', from which Spain seems to be excluded: 'Los aliados dicen haber destruido . . .' ('Their allies claim . . .').

In this way, a friendly image is created through *parallel structures* and antonyms, especially those related with their respective behaviours and attributes (Hodge and Kress, 1992), which are used to reinforce the contrast as in the following examples:

(10) '*Mientras el mundo* esperaba', dijo, '*Sadam Husein respondió* a cada *gesto de paz* por parte de la comunidad internacional, con un *desafío*.'
(11) '*Mientras el mundo rezaba por la paz, él se preparaba para la guerra*.' (16.1.1991: 1)
(10) Quoting George Bush '*While the world waited, Saddam Hussein responded* to any *peace offering* made by the international community with a *challenge*.'
(11) '*While the world was praying for peace, he was preparing war*.' (16.1.1991: 1)

El País reproduces in examples (10) and (11) the rhetorical devices employed by George Bush: *parallel structures* (While + all-encompassing agents + peaceful action/concrete agent (he) + aggressive actions) articulate and reinforce the contrast between agents and actions.

This contrast articulates the text and makes it coherent in news reports, and even more so in editorials. Moreover it is efficient in creating a positive face for *us* and a negative one for *them* or *him*. I now focus on this point – the second move of the exclusion process: REJECTION. In this case, the main strategy is the evocation of the imaginary dimension, as a means to structure the social experience and the perception of the conflict. The 'script' of the event activated by the newspaper seems to be what Lakoff (1992) calls 'the fairy tale of the just war'. The aim of most of the linguistic and argumentative resources used by *El País* could be seen as an attempt to force the main characters and their actions to respond to this script.

Rejection: The Demonization of Saddam Hussein

In this section, I focus on the role of the imaginary dimension in the organization of perception and social experience. The concept of the imaginary dimension, developed by sociologists like Duvignaud, Balandier and Rochberg-Halton, is based on Durkheim's concept of 'shared representations' (see, for instance, Leduit, 1987: 45; Rochberg-Halton, 1986: 299). This dimension cannot be

identified with ideologies. It is considered as a principle of organization, whose main function is to make ideologies reliable and acceptable. As this analysis shows, *El País*, resorting to social imagery, looks for a particular interpretation of the events. The reader is asked to understand the Gulf War, recalling and updating an old model, which, as Lakoff claims, is like a fairy tale. (See van Dijk, 1993: 92–134; and van Dijk and Kintsch, 1983 for a theoretical framework which features the 'sociocognitive interface' of both personal mental models and socially shared mental representations.)

George Lakoff gives an account of the process by which Saddam Hussein becomes a demon through the conceptualization of the war in terms of a fairy tale. The main characters of the story are the villain, the victim and the hero. This plot is reduced to an offence committed by the villain on an innocent victim. The crime is rooted in an imbalance of power and leads to a moral imbalance. The hero must have a hard time and fight the villain in order to rescue the victim. His victory restores morality, and he himself, because of his unselfish actions, is glorified. Contrast and asymmetry between hero and villain are essential components in the tale: the hero's morality is perfect whereas the villain is immoral; the hero is valiant and rational; the villain is an irrational being, though he might be very cunning and calculating; under these circumstances, there is no way a deal can be made with him: he has to be challenged (Lakoff, 1992).

I will now make clear how the different linguistic and argumentative resources contribute both to the conceptualization of the war following this script and to the presentation of the political authorities and their actions in terms of the main characters of the story and their stereotypical behaviour. My analysis focuses on Saddam Hussein and on the social imagery of irrationality and madness – that is, on the creation of the villain.

A metaphor emerges from the tale – THE ENEMY AS A DEMON METAPHOR – which lies behind whatever descriptions, qualities and behaviours are attributed to Saddam Hussein. Amongst the villain's alleged attributes, Lakoff points to irrationality. We may wonder why this is the most outstanding and distinctive feature assigned to the villain when an event is conceptualized in terms of 'the fairy tale of the just war'.

The opposition between sanity and madness is linked, so Foucault thinks, with power:

> The realm of light is opposed to that of darkness in a way that reminds us of the way the world of the powerful is opposed to that of the weak. Light is only owned by official powers, whereas darkness belongs to the demonized classes. (Alvárez-Uría, 1983: 21–4).[7]

The image of a dissident is, Foucault says, the result of a series of conceptualizations made up by the law and ruling classes upon practices that violate the social norm (see Foucault, 1964; and Alvárez-Uría, 1983, for analyses of this process in Spain). That is to say, if you want to establish a norm, a power domain either in a particular country or at an international level – and maintain it, you [illegible] force against those who do not obey it. If such forms

domination are not accepted by both sides – the dominant and the dominated – as a 'natural order', aggression becomes the most common way to keep and reinforce the established order. (See Pintos de Cea-Naharro, 1995: 41, for the mental operations which are at the base of violent events: exclusion, discrimination, domination and aggression.) The evocation of a kind of violence, which is exercised by one individual (instead of groups or states), presents the rebellion of the dominated as an isolated gesture of greed and as the effect of irrationality and madness. As a consequence, punishment is justified.

The Gulf War takes place at the very moment when the old world order and traditional values are changing. These changes are often received with anguish. Within this context, Saddam Hussein does not react according to his status; his logic is insurrectionary. Due to the shrinking of the planet, the product of this logic becomes threats on our very doorstep. The features of the presentation of the Gulf War were a paradigmatic example of how the media can take us instantly into the farthest corner of the world. Images, information, goods, now have freedom of movement far beyond all national frontiers, which produces a feeling of there being too much space, so that we have the impression that everything that happens affects us directly and immediately (Augé, 1993: 25). The reports of the Gulf War constitute a perfect example of how the mass media 'project us in seconds into the farthest corners of the earth' and how the 'far other' who incarnates all our fears (aggressiveness, cruelty, inhumanity, madness) appears as an immediate menace (Augé, 1993: 25ff.).[8]

El País – and some other newspapers in the West as well – does not describe the conflict as a result of a new world order which is harmful to some of its members. This picture is in fact drawn by the Iraqi press and by that of other Arab countries, like Jordan. *El País* describes it, however, as a gesture of greed, as a threat to 'our interests'. The global solution to the conflicts in the Middle East desired by Iraq is never contextualized, is never linked with the non-acceptance of those borders imposed by Western Empires which split the 'Arab nations' between rich and poor. Following this logic, any proposal made by Iraq is turned into nonsense and the Gulf Crisis is understood not as a conflict of interests, but as a challenge to a new world order, ruled through reason, peace and justice; however the extent to which this order benefits us is never made explicit. Globalization must be accomplished in our own image and likeness, and in agreement with our interests. All dissidents must be expelled from the realm of humankind. What the West sets up as 'normal' must be 'universal', and this vision draws its legitimacy from concepts such as 'world order', 'reason', 'justice', 'balance' and 'peace' (Gillaume, 1993: 45ff.).

The fact that the news is focused on Saddam Hussein, George Bush, Iraq, the US, the West or the international community is irrelevant. Given that madness implies a separation between rationality and irrationality, what matters is that this contrast, either implicitly or explicitly, is always there: you have to choose one side or the other, you have 'to be within the group or remain out of it' (Foucault, 1964: 260). In this sense, emphasizing some features and not others, attributing some particular actions or behaviours to the 'other', implies the absence of these features and forms of behaviour in one's own group. We have

then ended up with a kind of mirror image: now the qualities and actions attributed to Saddam Hussein do not make up an illogical or chaotic list, but reproduce the idea we have of madness, and, ultimately, draw the image of evil.

In this section, we will look at two sorts of processes: (1) discrediting by means of differences in power; (2) the construction of the 'absolute other'. The personalization of the conflict and the division move makes both methods possible.

While the concept *us* is based upon the solidarity axis, that of *him* relies on the power axis. Only from the point of view of a homogeneous group which is identified as the voice of reason can the stranger be excluded; for that purpose, the group will have to ensure its hegemony, will have to construct and underline asymmetries.

In editorials and in the news, different linguistic items are used that may be interpreted as taxemes (Kerbrat-Orechioni, 1987); they outline the differences in power that exist between the two rivals:

(12) *El presidente de EEUU* advierte a *Sadam* sobre 'terribles consecuencias' si continúa en Kuwait. (6.1.1991: 3; titular)

(12) *The President* of the US draws *Saddam's attention* to the 'terrible consequences' if he does not leave Kuwait. (6.1.1991: 3; headline)

The pervasive imbalance we find in the way that forms of address are used for both contenders legitimizes the threats made by the 'President' of the United States. Euphemisms are used to refer to those threats ('initiatives', 'talk offers'), but syntax and taxemes show what they really are: directive acts (for example, 'Bush recommends Saddam to opt for peace'). Thus, *El País*, in its own discourse and in the discourse quoted, assumes that what is at stake is a process of domination, in which Saddam Hussein plays the deserved role of the dominated. However – and more importantly – this imbalance delegitimizes Saddam Hussein, within the background of the ideology of consensus. This ideology says a president represents his country; he has, we suppose, been elected and should respect the public's will. On the other hand, an individual who is being addressed by his first name only (Saddam) represents himself alone. In the picture drawn of the two leaders on 17 January the contrast becomes self-evident. The column on Saddam Hussein (see (17)) starts by saying: 'Saddam Hussein is 53 years old. He is a well-built man, almost 1.90 metres tall', etc. (i.e. a list of his physical characteristics). On the other hand, the portrait of George Bush goes like this: 'George Herbert Walker Bush, 41st President of the United States and Commander in Chief of its armed forces', etc. And so we end up with the 'in-group' being glorified and the 'other' being isolated, degraded and delegitimized. His rebellion is not legitimate whereas the use of force against him is justified.

Participants are categorized through the use of language in the discourse. As we shall see in the following examples, and as Fowler points out, besides different styles of naming, conventionally associated with different social values, 'those who are disfavoured and discriminated against are likely to be associated with pejorative or at least low-status verbs and adjectives' (see Fowler, 1991: Ch. 6).

By analysing the discourse, it is possible to identify what is considered negative, both socially and by certain groups in power. This is why the appearance of ethnic prejudice as a way of discrediting Saddam Hussein is important.

Implicit Judgements: The Selection and Omission Principle

Rejecting is reinforced in *El País* basically through the insertion of details which are associated with strong feelings and individual and cultural imagery that bear, above all, on the break of the ideology of consensus and on ethnic prejudices. Thus, we obtain a *symbolic descriptive illustration* which conveys an implicit meaning and leads the reader towards particular judgements, even though the newspaper is not expressing them explicitly. Implicitness and inferencing are two important characteristics in the text and in the reader. Meanings are frequently conveyed without being explicitly stated. The strategy is to supply a sequence of details which evoke the imagery of violence. These shared representations are supported by the ideology of consensus and ethnic prejudices, but at the same time make both reliable and acceptable. Details usually appear in embedded clauses or sequences of prepositional phrases and their function is the specification of the information in the main clause. Because of the particular local organization of news, 'the reader must unscramble bits and pieces throughout the text and fit them into the appropriate topics and schematical categories' (van Dijk, 1988: 65). In this sense, the role played by all these, apparently irrelevant, details in the disqualification of Saddam Hussein is crucial. As we will see, they serve to evoke the imaginary dimension and to activate the ideology of consensus as well as ethnic prejudices, by means of which Saddam Hussein will be judged.

The prejudiced use of the imaginary dimension is always present in the reports, but increases remarkably from 17 January on – that is, once war was declared. This was a crucial day also for editorials in which explicit judgements started appearing and becoming more and more negative as time went by. In both cases, the purpose was to portray Saddam Hussein as a ruler whose madness made it impossible to agree with him. In the columns, the reader was pointed in the direction of that conclusion, whereas, in the editorials, it was expressed explicitly. This produced a cumulative effect by which the reader started extracting data from various news reports and making judgements that were later confirmed by the background voice of editorials. Rhetoric and persuasion worked together in harmony – that is, the rhetoric of editorials appealed to prejudice and to social imagination, as did the connotations, metaphors and small details featured in news reports. By contrast, this harmony was absent from the *Sun*, where the accumulation of figures of speech that insisted on the brutalization of Saddam Hussein and other devices that appealed to prejudice was so obvious that there seemed to be no place left for rhetoric, only for repulsion.

The axes on which the process of Saddam Hussein's demonization is founded are basically dual: the alleged break in the ideology of consensus and the invocation of ethnic prejudices. The projection of both axes presented the reader with an unequivocal example of what Marc Augé (1993) calls 'absolute otherness':

'*If necessity arises*, all those defects one denies having oneself can be attributed to the foreigner. Towards that foreigner outside our borders are projected, from time to time, the ghosts of ferocity, cannibalism, and inhumanity' (Augé, 1993: 18). Not only did the beginning of the war reinforce the exclusion and inclusion processes, but it also involved a change of attitude and behaviour towards the other. No longer would Saddam Hussein be appealed to to give up his policy and his behaviour and to adapt to 'normality'. On the contrary, the emphasis would fall on the irreducible character of the differences separating him from the rest of the world and the subsequent need to make him disappear. The discourse became emotional, impassioned, even in the editorials of a so-called 'impartial' newspaper such as *El País* (in particular, on 17.1.1991).

The break in the ideology of consensus. For Fowler, 'articulating the ideology of consensus is a crucial practice in the Press's management of its relations with government and capital, on the one hand, and with readers on the other' (1991: 49). The ideology of consensus appears as a set of shared beliefs (everyone thinks that . . .). There is no suggestion that they might be useful to certain interests, since society is not considered to be a place of conflict. The press contributes, transmitting this idea persuasively. However, this is, in fact, a linguistic practice, which has not been studied much yet. Of course, this does not mean that the journalist is clearly conscious of the values and beliefs he or she is using, or that the readers are helpless, and necessarily persuaded by the vision they are given of the events.

The first-person plural pronoun *we*, with its multiple reference, is used in political discourse and in the press to create the illusion of the existence of a community which is ideologically one. Thus, the existence of differing interests and opposing ideology among the population is hidden. However, in the case of the Gulf War, what exactly this consensus consists of is never made explicit. This happens not only because it might turn out to be controversial, but also because of cultural, religious and ideological differences – as well as those of power and status, which clearly existed in the allied group, the group referred to as *us*.

In spite of this, the ideology of consensus is the cognitive base on which the categorization of subjects and actions takes place (styles of naming: Saddam vs the President; the words of Bush vs the propaganda of Saddam Hussein; the invasion of Kuwait vs its liberation, etc.). It explains the choices of details and the foundations for certain value judgements in the process of discrediting the President of Iraq. By slipping into the reports different details not really relevant to a particular piece of news (the clothes Saddam Hussein was wearing, for example), journalists were able to evoke the ideology of consensus, and force readers to use it to interpret the text. There were two aims hidden under this use: on the one hand, to make it clear that Saddam Hussein does not share this ideology, which leaves him outside the group; on the other, to consolidate the unity of *we*, and project a positive image of the group. Readers infer, using the framework of contrast which has been built up, that the values which are shown as negative are not accepted by the allied group.

As regards the break in the ideology of consensus, Saddam Hussein's conceptualization runs along the following lines. He is presented as: (1) a soldier and a dictator; (2) the man who is manipulating information; (3) the man who is manipulating religious fanaticism; and (4) an instigator of terrorism. All these characteristics are attributed to him through the selection of details, the insertion of convenient comments and through omissions, such as forgetting, for instance, that all these transgressions were also taking place within the so called 'anti-Saddam coalition'. Examples of this phenomenon are extracts (13), (14), (15) and (16) below. These examples show ways of attributing to Saddam Hussein values which from the point of view of the ideology of consensus are considered negative and are rejected. They are nearly all on the list published by Chibnall in 1977. Among the linguistic strategies are: the insertion into the text of details which call up the transgression of the ideology of consensus; the inclusion of negative judgments; and significant choices from the lexicon, especially of adjectives and verbs.

The soldier and the dictator. El País insists on the fact that Saddam Hussein is a soldier by continuously mentioning the titles which link him with the army, through the use of possessives that make it clear that the Iraqi army is Saddam's this linguistic resource is linked with the underlying metonym: THE RULER STANDS FOR THE STATE, and also through the selection of apparently pointless details, such as his clothing):

(13) Sadam *con una gorra verde y traje de faena*, se dirigió al país para rendir tributo a *su ejército* de *un millón de hombres*. (7.1.1991: 3)

(13) Saddam, *in a green cap and battledress, addressed the country honouring his one million army*. (7.1.1991: 3)

In (13) and (14) we find examples of ways in which journalists include items of information attached to the main proposition, with the apparent aim of describing or presenting Hussein and his actions. These are expressed by means of sequences of prepositional phrases and subordinate clauses (for this procedure, see van Dijk, 1988: 66ff.). In this sense, what is relevant in (13) and (14) – as in most of the following examples – is how explicit descriptions ((13): '*in a green cap and battledress*'; 'honouring *his one million army*'; (14): 'who *hardly ever delegates*') are, in fact, implicit qualifications. By choosing to mention all these apparently irrelevant details, the writer is evoking the imagery of violence and, as a consequence, activating a set of tacit assumptions and beliefs – in this case the ideology of consensus, which serves to condemn Saddam Hussein. As in other examples, the moral ambivalence of the newspaper is revealed.

The imagery of violence, linked to the villain of the tale, is evoked here by pointing out his clothing and the proportions of the army. Furthermore, it is precisely this imaginary dimension that explains the selections of details and refers to the ideology which gives coherence to the text. The emphasis on the orientation towards all things military presented Saddam Hussein implicitly as

a dictator, helped by ghosts of World War II and of Latin American dictatorships. However, explicit judgements could also be found in the newspaper:

(14) La última palabra está en manos del *líder supremo*, Sadam Husein, que *rara vez delega*; todo lo más consulta con su círculo de íntimos. (10.1.1991: 4)
(14) The last word always comes from the *supreme leader*, Saddam Hussein, who *hardly ever delegates*; if anything he asks his closed circle of intimates. (10.1.1991: 4)

Monopolizing power, illegality and violence are here the negative values. It is easy to infer, given the constant contrast by means of which the reports and leading articles are structured, that the opposites, freedom of choice, legality and desires of peace, are present in the anti-Saddam coalition, and that the purpose of the conflict is defence of these values.

The manipulator of information. Dogmatism, intolerance, biased reporting, monopolizing of information are crimes of Saddam Hussein. The opposites here would be compromise, tolerance, impartiality and freedom of choice.

(15) *Le prensa de Sadam* es triunfalista, porque así lo *exige la omnipresente propaganda.* (16.6.1991: 4).
(15) *Saddam Hussein's press* is triumphalist because *that is what is required by the omnipresent propaganda system.* (16.6.1991: 4)

In (15), linguistic procedures used are: possessives (see example (14)) and lexical categorization (see example (3)). Here, the subordinated clause, presented as an explanation (though it is not clear why anything needs to be explained), is in fact a way of establishing the equivalence between the Iraqi press and a propaganda machine.

The manipulator of religious fanaticism: Allusion to God and religion, as well as to the spirit of evil, were frequent in Saddam Hussein's speeches as in George Bush's. However, they were treated very differently in both cases. In Saddam Hussein's case, they were disqualified by invoking ethnic prejudices and by resorting to linguistic devices that deprived them of credibility. In (16), since Saddam Hussein was presented as agent of *to raise to the rank of*, the implication for the reader is that the war lacked that *position.* There were numerous details in news reports that contributed to creating this impression. For example, Saddam Hussein's religious faith was described as 'sudden' (10.1.1991: 4) and implicitly presented as bogus and essentially manipulative.

(16) *Como ya viene siendo habitual* desde el comienzo de la crisis, *Sadam elevó al rango de yihad* (*guerra Santa*) el combate que podría librarse en la región. (7.1.1991: 3)
(16) *As had become customary* from the beginning of the crisis, *Saddam has raised* the war that may take place in the region *to the rank of holy war* (*jihad*). (7.1.1991: 3)

An instigator of terrorism. Besides warning against Iraq's military strength, *El País* asserted, in the days before the war, that the true front line would be in Europe. in a deliberate overestimating of Saddam Hussein's power to spread terror in the West. However, the direct participation of Saddam Hussein is always kep

implicit. The negative values attributed indirectly to him are: extremism, chaos, violence, as opposed to moderation, order and the desire for peace. In this sense, news about apparently peripheral events (like Europeans beginning to store food [16.1.1991] or police action against 'false pacifists' [16.1.1991]) plays a role in the evocation of the imagery of violence.

Ethnic prejudices. While the fact of breaking the ideology of consensus presents Saddam Hussein as an antagonist, it is the use of ethnic prejudice which plays the strongest role in transforming him into the 'absolute other'. Such prejudices work in the same way as the ideology of consensus – that is, as a sort of backdrop, as a cognitive base, which is not made explicit, but which explains the choice of details included in the news. Readers must have recourse to these prejudices in order to interpret the text. They are needed to give it its coherence (see (10)).

Ethnic prejudices are invoked by means of selecting minor details which are inserted here and there in different reports. The basic lines for this invocation are the following oppositions: civilization vs barbarism; rationality vs irrationality, including the image of the beast; and, ultimately, good vs evil. The portrait of Saddam Hussein in *El País* on 17 January (in examples (17) and (18)) contains all these ingredients. The detailed description of his appearance clearly shows ethnic features and cultural differences: colour, his penetrating gaze and so on. Nothing is mentioned about the positive or negative aspects of having olive skin, or a penetrating gaze. However, for readers to find any reason for their inclusion in the text, they have to activate knowledge, which the writers present as shared, and which links these sorts of physical characteristics with certain sets of values.

On the other hand, George Bush's picture on the same page begins by enumerating his titles and merits. The implicit contrast turns them into a body versus mind opposition: ours against *theirs*.

(17) Sadam Husein tiene 53 años. Es de complexión atlética, de casi 1, 90 mētros de estatura, *cabello muy negro y piel aceitunada. Sus ojos son verde claros y su mirada intensa.*

(18) ... casado con ST, *prima suya*, su primogénito, Udai, mató a golpes y en público, a uno de los guardaespaldas de su padre. Juzgado y condenado, masas enfervorecidas recorrieron las calles de Bagdad pidiendo la clemencia paterna. La tuvo. Sadam, *licenciado en Derecho por la Universidad de Bagdad*, no mostró nunca, *en cambio* clemencia con sus rivales y adversarios. *Centenares de ellos* desfilaron ante la horca o los pelotones de fusilamiento.

(19) Licenciado en Económicas por la Universidad de Yale, que ha llegado a la presidencia con una experiencia política nacional e internacional poco habitual. Diputado por Tejas en dos legislaturas, Presidente del Comité Nacional de Partido Republicano, embajador ante la ONU, primer jefe de misión en Pekín, director de la Agencia Central de Inteligencia (CIA) y vicepresidente durante ocho años. (17.1.1991: 6)

(17) Saddam Hussein is 53 years old. He is a well-built man, almost 1.90 metres tall. *He's got very black hair and is olive-skinned. His eyes are green and he has a penetrating gaze.*

(18) ... he married Sadija Talfá, *a cousin of his*, and his elder son, Udai, beat, in a *public place*, one of his father's bodyguards to death. He was tried and found

guilty, but, arousing the masses, walked the streets of Baghdad asking for paternal benevolence. He got it. Saddam, who has a degree *in Law from the University of Baghdad*, was never merciful, however, with his rivals and opponents. *Hundreds of them* were hanged or shot dead.

(19) He graduated in Economics in Yale University and has become president after acquiring unusual political expertise, both national and international. He has been a Congressman for Texas for two terms, President of the National Committee of the Republican Party, ambassador to the UN, first ambassador in Peking, director of the CIA and vice-president for eight years. (17.1.1991: 6)

What is obvious in these examples is the way the selection and omission principle works. In the case of George Bush (19), titles come first; Hussein's are just mentioned to discredit him (18). The reference to Saddam Hussein's physical characteristics (17) and his family relationships (18) is relevant. It is interesting that this sort of detail is hardly ever included in reports about men. Instead, it is usual to include information about profession and qualifications. In (18), such details call up the imagery of incest, and point to negative characteristics of the regime, like arbitrary decisions, illegality and corruption. With regard to text coherence, what allows specific sentences to be connected into a coherent sequence – such as 'He married Sadija Talfá, a cousin of his, *and* his elder son. Udai, beat, in a public place, one of his father's bodyguards to death' in (18) – is the resort to some shared knowledge about different ethnic groups, and in particular some ethnic prejudices, which underlie the opposition 'civilization vs barbarism'. The function of the propositions included in 'He married Sadija Talfá, a cousin of his', in (18), is to provide an explanation or at least to support the final judgement, 'was never merciful, however, with his rivals and opponents. Hundreds of them were hanged or shot dead', by which the paradigm of individual violence and the image of the beast are again evoked.

The *Sun* newspaper published a portrait of the two leaders on 17 January 1991. In this case, the description/evaluation was carried out by a psychologist who selected features that coincided with those highlighted by *El País*. However, besides giving these details, the psychologist diagnosed Saddam Hussein as: a megalomaniac, due to his monopolizing of power; a 'charmer', since he could persuade his people to die for him; a psychotic and paranoid schizophrenic. The *Sun* concluded that his extreme mental disorders, together with his power as a dictator, made him a lethal figure.

The image of *the beast* was based upon two features which were always stressed: his fondness of weapons and violence, and his errors of judgement. With respect to the former, I have found numerous examples; but outstanding among them are those featured in the portrait in (20) because they lead readers to infer that this aspect of his personality was responsible for the position Saddam Hussein occupies today.

(20) Ha sido siempre un hombre de acción. *Amante de las armas y buen tirador de revólver, atentó* contra el General Abdel Karim Kasem, en 1959. Fue herido, pero huyó. . . . Desde 1963, *su carrera hacia la cúspide ha sido meteórica.* (17.1.1991: 6)

(20) He has always been a man of action. *He loves guns and is a good shot. He attempted to assassinate* General Abdel Karim Kasem in 1959. He was wounded but managed to escape. . . . Since 1963 *his career has been a meteoric climb to the top.* (17.1.1991: 6)

The function of the accumulation of details ('*He loves guns and is a good shot. He attempted to assassinate*') seems to be the explanation for what is affirmed in the last sentence: '*his career has been a meteoric climb to the top*'. Implicitly, a relationship of causality is established between facts denoted by propositions. This argumentative flow produced the required effect, as can be seen by the accumulation of negative information and animalizing metaphors. The following are examples of this latter strategy: there was speculation that Saddam Hussein would follow a scorched earth policy before 'letting his prey go' (see (2): the biography published on 31.1.1991 was entitled 'A wolf among gazelles'. However, *El País* was more cautious than the *Sun* when it came to using images that evoke violence. This may have been due to the fact that, despite their persuasive effect – for they reinforce Saddam Hussein's negative image with strong convincing strokes – they went too far into the realm of emotion and therefore did not suit the rhetoric of *El País*.

With respect to *irrationality and errors of judgement*, Saddam Hussein does not fit into metaphors like WAR AS POLITICS, POLITICS AS BUSINESS (Lakoff, 1992), and the analysis of war as a cost and benefits balance: 'defining beneficial "objectives", tallying the "costs", and deciding whether achieving the objectives is "worth" the costs' (Lakoff, 1992: 464). This is the reason why at the beginning there was talk about Saddam Hussein's bluff, whereas later on it was referred to as madness, for he was defying a power he would be unable to defeat.[9]

(21) 'Sadam cree que Bush está bromeando . . . pero está equivocado.' (5.1.1991: 3)
(22) 'Nuestro temor es que, *en su habitual estilo*, [Sadam] *calcule mal* dónde se halla el límite.' (12.1.1991: 5).
(23) *Sadam* triunfalista y *convencido* de ganar la guerra. (12.1.1991: 2; titular)
(24) *Sadam volvió a insistir* en la capacidad de *sus* fuerzas armadas para una 'larga batalla'. (7.1.1991: 3)
(21) [Quoting James Baker] 'Saddam believes that Bush is joking . . . but he is wrong.' (5.1.1991: 3)
(22) [Quoting James Baker] 'We fear that, *as he normally does*, [Saddam] *will miscalculate* where his limits are.' (12.1.1991: 5)
(23) *Saddam* smug and *convinced* he can win the war. (12.1.1991: 2; headline)
(24) *Saddam insisted again* that *his* armed forces are able to fight a long battle'. (7.1.1991: 3)

The use of 'convinced', 'insisted again' and, in other examples, the use of verbs of speech, such as 'said' and 'asserted' underline the subjective character of Saddam Hussein's opinions. These are modality markers, used to present the writer's position as regards the proposition. The readers, who knew about the capacity of the American war machine, inferred that Saddam Hussein was falling into an error of perception. After all, he was just Saddam, a man with no titles and no authority. As the conflict

opinions that described Saddam Hussein as a madman, but in its editorials, in particular in those that argued that war was unavoidable, presented him as such. The process of *symbolic descriptive illustration* became *explicit judgements* or *meta-discursive illustration*:

(25) Respecto a la responsabilidad última de este conflicto, la historia pedirá cuentas al *dictador* iraquí, cuya *locura e intransigencia* han lanzado al mundo a una aventura de consecuencias imprevisibles. (17.1.1991: 18; editorial)
(25) As for the ultimate responsibility for this conflict, History will ask the Iraqi *dictator* whose *madness and intransigence* have sent the world on a course of unpredictable consequences. (17.1.1991: 18; editorial)

Both devices contributed to construct a portrait of Saddam Hussein as an unjust man, cruel, impious and wild. As his portrait became more and more despicable, his adversary's became more and more magnificent. George Bush was described as just, humanitarian, pious and civilized. George Bush himself often formulated explicitly the content of this contrast:

(26) 'En los últimos cinco años, Sadam Husein ha demostrado su desprecio por las normas de comportamiento civilizado. En los próximos días, Irak llega a la fech a límite que *colma la paciencia del mundo civilizado.*' (9.1.1991: 3)
(26) 'In the last five years Saddam Hussein has showed his contempt towards civilized norms of behaviour. In the next few days Iraq will reach the deadline when the *civilized world's patience will run out.*' (9.1.1991: 3)

From the moment *El País* stopped asking Saddam Hussein to change his mind and adopted the strategy of emphasizing the contrast – that is, adopting George Bush's position – communication and mutual understanding were no longer possible, there could not be a common 'rhetorical ground', and hence there could not be a diplomatic solution to the conflict. Both the editorials, which labelled Saddam Hussein as a madman, and the news reports, by appealing to emotion through invocation, implicitness and inference, presented an 'absolute otherness' to which the only possible response was its exclusion, rejection and destruction.

However, underneath the metaphor of the stranger, the irrational madman, lies the image of evil and its incarnation. This is the key point that shows how, in westerners' views, evil encompasses all the features mentioned above: Saddam Hussein 'has become the angel of war who prefers desolation to life' (1.1.1991: 16).

Conclusions

A system of rhetoric that aims to create and maintain the enemy is not only based on exclusion, it also *produces knowledge*: the menacing presence of the enemy creates the conditions for a permanent discourse that provides coherence for the system itself. Thus, Saddam Hussein becomes convenient and necessary

The image constructed by the press of Saddam Hussein, incarnating the enemy and incorporating features such as injustice, pitilessness, irrationality and wildness, gave the illusion that this world, which is becoming more homogeneous, is ruled by the principles of reason, justice and respect for nations. This means that the UN were able to play their role in accordance with these same principles. This illusion palliated the 'crisis of space' (Augé, 1993) which appears associated with the continual extending of geographical space: increased facilities for the movement of goods, information and people seem to work against the understanding and control of space, and this, in turn, against the understanding and organization of social groups. Mixing of cultures and individualizing of conscience are for Augé the signs of an age in which the image of the other is more diffuse and unstable than ever before, since the other can no longer be associated with a particular place (emigration has broken the links between the other and a place of origin).

The Gulf War produced an absolute other, which the mass media made seem close, but which continued to incarnate all our nightmarish fears (bestiality, madness, evil). Saddam Hussein, therefore, contributed to reducing the blurring of signs of identity brought about by globalization, at the same time as his image reinforced our collective references.

This study has aimed to reveal new rituals of power, including the concept of normalization, and to see how normalization creates subjects and self-knowledge. I have been especially interested in personification and its effect. It is the personification of the conflict which allows the conceptualization of the protagonists as the main characters of the tale: the villain and the hero. But it is also personification which permits the appearance and consolidation of a sole but all-embracing *we*, which is used to cover the way its referents change as a piece of discourse unfolds. As readers, we are spoken to, included in and absorbed by a unique concept of *us*, which turns into an 'ideological *us*'. The aim of all this is to strengthen the ideology of consensus and make it possible to recreate the illusion that it is these positive principles which unite the world against Saddam Hussein, and that it is in the defence of the ideology of consensus that the war is being waged. Thanks to the role played by Saddam Hussein, and which he was forced to play, for a time the world was freed from irrationality, contradictions, divisions, conflict, economic and political injustice, and, of course, from the difference which was embodied in him.

Now the dream is over, what remains is the discourse built on ethnic and cultural difference. *El País* took two positions: that of calling Saddam Hussein to 'become like us', and, later on, that of exclusion, showing the unyielding character of the differences separating both positions and advocating the destruction of the other. His otherness was radical, almost unthinkable in a world which considers itself more and more homogeneous, and that is why it could only be incarnated by an individual. Once the war began, *El País* changed its discourse, since, then, its opposition could be understood as treason. As Luis Martín Santos said. 'defencelessness incapable of resisting the seduction of power is much more serious at times of crisis, when we let fear overcome us and we are afraid

to reveal our true selves' (Martín Santos, 1988: 21). The *Sun* and other representatives of the British press opted from the very beginning for a discourse of exclusion.

These two type of discourses are to be found, more and more often, in the treatment of immigration (Landowski, 1993). The first one is partly due to universalism and the second one is a consequence of a tendentious interpretation of relativism. Other potential discourses seem to have disappeared: that of respect towards differences, the idea of the cultural melting-pot or that proposed by Balandier: 'considering differences to the point when they stop being separating factors and become multiple manifestations of the "unity of man"; a unity *gradually discovered*, not postulated, which is what the philosophies of the Universal do' (1993: 36).

Exclusion is a response to the desire for particularization, a force opposed to globalization, at least when we are not certain that this is going to be according to our model. It is not coincidental that it became activated at this time, since anti-Arab racism is the least inhibited of all racisms. Maybe it is here where the dream turns into a nightmare.

Our journey has taken us from the human body to human territory: from the metaphors and metonym which make it possible for states to be conceived as people with human attributes, defects and virtues, to the anthropological space 'in which we try to find points of reference for our identity, our relations, our history' (Augé, 1993: 21). It is this real space, geographically far, but made close by the work of the mass media, which is defended by means of the appropriation of discourses. The same thing happens with the imaginary space, in which the image of the beast, of 'absolute otherness', so useful to some, incarnates all those qualities and by its mere existence frees us from them.

By allowing us a tamed taste for fear, the Gulf War made possible a generalized discourse. But the fate of words and images can be changed. If we really want to, we can recover them and continue their work. 'The word which has been marked by power can be dealienated by our opposition, and this will go further ... find new forms, new words, new images, that is, new meanings which renew those words which have been alienated' (Martín Santos, 1988: 220). This is, in essence, what I have tried to do in this paper. What I really wanted to do was go beyond the statement that discourse is not transparent, that it is possible to take it over and make it opaque. We need not leave matters here – in 'their' hands. As readers, we should react, questioning the existence and relevance of that 'united us'. We should oppose the expulsion of irrationality and the illusion which not only transformed *us* into heroes but made the world we live in into the incarnation of good (see Naïr, 1994, for a very similar proposal).

Notes

I would like to thank Luis Eguren, Angel Gabilondo, Concepción Gómez Esteban, Carmen Valle, Teun van Dijk and Rachel Whittaker, who were all able to read between the lines and suggest ways to improve the analysis. A first outline of this research was

presented by Luis Eguren and the author at the 4th International Pragmatics Conference (Kobe). Thanks also to Juan Manuel Delgado for his assistance in gathering data.

The English translations in all the extracts are translations from Spanish rather than the original wording.

1. '[Discourse] surfaces as an asset – a finite, limited, desirable, useful one – that has its own rules of appearance, but also its conditions on appropriation and use; an asset that, consequently, brings out, from its very existence (and not only in its "practical applications") the issue of power; an asset which is, by nature, an object of struggle, of political struggle' (Foucault, 1969: 58; see also Gabilondo, 1990; 89–106).
2. In French in the original: 'dans toute societé, la production du discours et à la fois contrôlée, sélectionée, organisée et redistribuée par un certain nombre de procédures qui ont pour rôle d'en conjurer les pouvoirs et les dangers, d'en maîtriser l'évenement aléatoire, d'en esquiver la lourde, la redoutable matérialtié' (Foucault, 1971: 11).
3. This simply means that there is nothing to be interpreted. There is nothing primary to interpret, because, essentially, everything is already an interpretation. Each sign is in itself not the object offered to be interpreted but the interpretation of other signs' (Foucault, 1967: 35–6).
4. As *El País* (17.1.1991; editorial) said: 'In the midst of that confusion, the Spanish government's response from the beginning of the invasion has tried to be coherent with the country's new responsibilities as a member of the European Community and of the West European Union, as well as with the resolutions of the UN.' ('En medio de ese desconcierto, la respuesta dada por el gobierno español desde el comienzo de la invasión ha pretendido ser coherente con las nuevas responsabilidades de nuestro país como miembro de la Comunidad Europea y de la Unión Europea Occidental, así como con los mandatos de las Naciones Unidas'.)
5. 'In order to act, we need at least to identify' (Canguilhem, 1966: 63).
6. See Blommaert and Verschueren (1994) for a similar process of overgeneralization in the conceptualization of the relationships with migrants and in the justification of discriminatory politics and behaviours.
7. 'I, Lucifer, mighty and independent emperor, free and absolute lord of the whole of the "Sulano" kingdom, despotic lord in all my formidable jurisdiction, forbidding and very noble, under whose orders everything moves, arbiter of all fortunes and all certainties' (Barreiro, 1973: 283–4).
8. 'With respect to these researchers sometimes bring up the idea of a crisis of identity. But, if such a crisis exists, in my opinion, it is nothing more than the natural consequence of two previous crises: that of space (how can I imagine, at one and the same time, the planet as if it were a canton, and my canton as if it were a complete world?) and that of otherness. The stability of the other was what made it possible to conceive of and identify her/him with ease. When it was a question of a faraway other, there was no problem: one only saw her/him if one travelled or, at least, if one went to visit the Colonial Exhibition' (Augé, 1993: 33).
9. It is worth observing the features in common with the definition of madness in the *Encyclopédie*: 'To get away from reason without knowing it, because one lacks ideas, is to be an imbecile. To get away from reason knowingly because one is enslaved by a violent passion is to be weak. However, to get away from it confidently and being convinced that one is following it, that is my view what is called madness' (*Encyclopédie*, entry 'Madness', quoted by Foucault, 1964).

Multimodal Resources for Turn-Taking: Pointing and the Emergence of Possible Next Speakers

Lorenza Mondada

Introduction

In this paper[1], I study a specific gestural practice through which a recipient gradually establishes her or himself as next speaker in talk-in-interaction: by using a pointing gesture, while current speaker's turn is still going on and has not yet reached its completion. Thus, pointing gestures will be studied here not as a resource primarily devoted to the accomplishment of referential or deictic actions but as a resource locally mobilized for self-selecting and for organizing the emergent character of a « transition space » (Schegloff, 1996, 96). This practice and resource will be explored in its orderly and systematic character in a specific setting, an informal work session where participants – a multidisciplinary team of agronomists and computer scientists – are involved in a discussion around a table, whilst writing notes and looking at maps.

Over the last years, the « turn-taking machinery » introduced by Sacks, Schegloff and Jefferson (1974) has been extensively studied, both in its turn-constructional component, allowing the identification of relevant spaces for turn transition, and in its turn-allocational component, constituted by selection techniques by which either current speaker selects next or next speaker self-selects.

Explorations of the *turn-allocational component* have highlighted various practices for selection (such as turn-sharing and other choral performances, Lerner 2002; various methods for addressing the next speakear, Lerner, 2003) and their eventual specialization and diversification in conversation, institutional and professional contexts (namely in talk at work, Drew & Heritage, 1992).

Source: (Translated in English) *Cahiers de Linguistique Francaise* vol. 26, 2004, pp. 269-292.

The consideration of various settings has implied a diversification of the resources studied (verbal and vocal resources for telephone conversations, multimodal resources for face-to-face interactions, artefacts and technologies for mediated interactions, etc.).

Explorations of the *turn-constructional components* have been carried out with the collaboration of linguists over the last years (within interactional linguistics: see Ochs, Schegloff, Thompson, 1996, Selting & Couper-Kuhlen, 2001, Ford, Fox & Thompson, 2002, Hakulinen & Selting, 2005): they made possible the identification of Turn-Constructional Units (TCUs) as interactive organizational units formatted by exploiting linguistic resources in ways that are both shaped by the contingencies of the step-by-step incremental organization of interaction and by the constraints and possibilities of grammar, one being reflexively structured by the other. TCUs are a specific kind of unit, praxeologically defined by the local achievements of the participants, interactively negotiated, emerging within the temporal moment-by-moment unfolding of talk as it is joinly, situatedly, contingently produced by the participants. Opportunities to co-participate to and interactively produce emerging TCUs are centrally provided by their projective potential, responsible for the predictible features of a turn's emergent construction. Projectability (Sacks, 1992, II, 40; Sacks, Schegloff, Jefferson, 1974: 702; Schegloff, 1984: 267) is a central feature that provides for next speakers the possibility not only to identify turn completion but also to predict it before it occurs, to anticipate transition-relevance points and to locate the upcoming place where to begin to speak (see Ford, Fox & Thompson, 1996; Selting 2000; Tanaka 2001, Auer, 2005 for a description of linguistic resources for projectability):

> The sentence is a great packaging technique for a series of reasons [...]. It has a structure which can at all points be seen as to whether it is possibly complete or not possibly complete, and people are able to deal with it in such a way as to see, on its occurence that it's possibly complete. And also, from its beginning it can be looked at to see what it will take to complete it. (Sacks, 1992, II, 40)
>
> Sentential constructions are capable of being analysed in the course of their production by a party/hearer able to use such analyses to project their possible directions or completion loci. (Sacks, Schegloff, Jefferson, 1974, 709)

These features are responsible for the flexible, moment-by-moment, dynamic, revisable and expandable definition of turns by the participants; in this sense, turns and TCUs are « interactively determined » units (cf. Ford, 2005 emphasizing this praxeological and interactive aspect):

> The turn-unit is f a sort which a) employs a specification of minimal sizes, but b) provides for expansion within a unit, c) is stoppable (though not a any point), and d) has transition places discretely recurring with it, e) which can themselves be expanded or contracted; all of these features except the first are locii of interactional determination. By virtue of this character, it is misconceived to treat turns as units characterized by a division of labor in which the speaker determines the unit and its boundaries, with other parties having as their task the recognition of them. Rather, the turn is a unit whose constitution and boundaries involve such a distribution of

> tasks as we have noted: that a speaker can talk in such a way as to permit projection of possible completion to be made from his talk, from its start, allowing others to use its transition places to start talk, to pass up talk, to affect directions of talk, etc.; and that their starting to talk, if properly placed, can determine where he ought to stop talk. That is, the turn as a unit is interactively determined. (Sacks, Schegloff, Jefferson, 1974: 726–727)

Therefore, a central task for conversation analysis has been to describe methods and resources by which recognizable units in action are interactively and reflexively produced and monitored. For example, previous research has shown how turns are interactively constructed (Goodwin, 1979, 1981), how TCUs can be extended beyond the initially projected completion allowing for the timely production of assessements by the other party within the unit's boundaries (Goodwin & Goodwin, 1987); how they can have a « semi-permeable » character and their second part can be predicted for the production of collaborative sentences (Lerner, 1991, 1996). The dates of these studies show that the importance of multimodal resources for these collaborative and reflexive practices has long been recognised (see also Hayashi, 2005, Schmitt, 2005).

Analyses of the methods involved in projection and in the online incremental construction of TCUs were first focussed on linguistic resources, but were soon expanded in order to take into consideration gestures, gazes and bodily postures.

Linguistic resources considered have been primarily syntactic (Sacks, Schegloff, Jefferson, 1974; Sacks, 1992, I, 642 referred to « sentences », « clauses », etc. although pointing to the practical and emic character of these units, not corresponding to their definition in classical linguistics) and syntax is still considered as one important resource for the « packaging » of turns (see Schegloff, 1996 about syntactic materials characterizing initial, middle and terminal TCU positions; Auer, 2005 on the projective potentials of syntax). But its interplay with prosodic resources has been largely explored since (see already Sacks, 1992, I, 651; Auer, 1996, Couper-Kuhlen, 1996, 2001, 2004). Moreover, by the nineteen eighties, French & Local (1983), Local, Kelly, Wells (1986), Local & Kelly (1986) were showing the import of phonetic resources for turn projection. Instead of claiming the relevance of one unique dimension, studies focus more on the contributions of syntactic, prosodic, and pragmatic resources for achieving completion (Ford & Thompson 1996; Ford, Fox, Thompson, 1996 take into consideration gaze and body movements too). More recently, multimodal resources have been strongly taken into account, including gestures (Schegloff, 1984, Streeck & Hartge 1992; Ford, Fox, Thompson, 1996; Hayashi, Mori, Takagi 2002), gazes (Goodwin, 1981; Lerner, 2003, Rossano, 2005) and more generally the entire body (Goodwin, 2000).

Establishing Speakership as a Practical Accomplishment

Through the analysis of multimodal practices for establishing speakership in a corpus of video recordings of professional meetings, this paper aims at contributing to the growing literature on turn-taking on the following aspects:

- the orderly and systematic way in which *multimodal resources* are exploited for the organization of turn-taking and more particularly within practices for self-selecting contingently defining-and-exploiting transition spaces;
- the *reflexive* organization of turns-at-talk, relying both on the production of recognizable emergent structures by current speaker and on the local interpretation, monitoring and online analysis done by and implemented in recipients/next possible speakers actions. Multimodal practices contribute crucially to the visibility for participants – and for analysts alike – of public displays and recognitions of « in-course parsing of a turn in progress » (Jefferson, 1984: 14).
- the interactive organization, identification and exploitation of « pre beginnings », i.e. of actions taking place *before* the turn properly starts, in pre-initial turn positions, and projecting the beginning of a possible next turn: this position can be occupied by head movements, gaze redirections, onset of gestures, incipient facial expressions, in-breaths, « uh(m) » tokens (Schegloff, 1996, 92–93), i.e. actions that are not yet realized as a turn but which strongly project it. We will show that multimodal actions play a crucial role in this position, allowing for their simultaneous production with ongoing current-speaker's talk. Analysis of these actions expands our focus of study beyond the limited « transition-relevance point » to the more conceptually extensive « transition space », characterized by its shape, duration, import and limits (Schegloff, 1996: 96–97).
- the very notion of speakership, and other *talk-related categories* (« next speaker », « incipient speaker », « current speaker », etc.), as well as their rights and obligations, as products of emergent joint accomplishments: the dynamic, locally organized, contingent emergence of a « speaker » provides for the occasion to respecify this category as it is recognized and accomplished by participants themselves in the course of their interaction.
- the articulation between the *context-free* and the *context-sensitive* dimensions of turn-taking: although they recognized the situated order of turn-taking, Sacks, Schegloff & Jefferson were more concerned with the abstraction of the machinery rather than the particularities of content, context or identity (1974: 699) and abstained from precisely defining « the scope of reference of 'context' that is relevant » (1974: 699 n 8). This paper will show how situated features of the material and spatial environment are methodically mobilized for achieving self-selection and in turn shed some light on more general practices for turn-taking.

Discovery of the Phenomenon

In what follows, we will analyze turn-taking practices observable in a particular corpus, dealt with as a « perspicuous setting » (Garfinkel & Wieder, 1992, 184), i.e. a setting that in its specificity and uniqueness allows us to highlight methodic and systematic features. This setting provides for specific multimodal resources, related to the spatial arrangement of the participants, to the artefacts, the

manipulate and to their peculiar activity. These resources are contingent, associated with the specificity of the activity; nevertheless, they are mobilized within systematic practices which can shed some light on other turn-taking and turn-transition practices.

The professional activity concerned is a series of work meetings (the corpus is composed of 6 sessions, for about 15h of video data) in which agronomists and computer scientists collaborate to develop a common cartographic language for modelling agricultural land. The agronomists collected a series of geographical and land-survey maps of several farms and created a new, more abstract, topological representation of these territories; the computer scientists were engaged in producing a further formalization, in the form of graphs. These activities involve several reformulations and re-descriptions of the initial map representation, as well as a number of controversial discussions about the descriptive categories each discipline is using (for detailed analysis of this « multimodal semantics in action » see Mondada, 2005a, 2005b). The maps and other visualizations lay on the work table, around which three or four participants are seated; their attention is focused on the documents that are discussed, described, pointed at, and even modified in the course of the talk. Thus, the activity considered is characterized by a specific ecology, where a limited work space full of artefacts mobilized by talk and gesture is at the centre of the collective attention. In contrast to other work settings where multi-activity occasions a constant dispersion of attention in fragmented spaces and where mutual attention has to be constantly re-achieved through intense interactional work (see Goodwin & Goodwin, 1992, Goodwin, 2003, Heath & Luff, 1992, Heath et alii, 2002 for examples), the activity studied here is characterized by a sustained focus of collective attention on the documents at the centre of the table. This peculiar ecology of action provides for specific resources for the organization of interaction, both in a indexical and systematic way.

Figure 1: Perspective view

Figure 2: Vertical view

The way in which this activity has been videotaped is reflexively sensitive to the features of action: a perspective view, allowing to see the upper part of the participants' bodies as well as their mutual orientations, is completed by a vertical view, allowing the detailed description of the material and spatial environment

involved, as well as participants' gestures (for a detailed analysis of recording choices as reflexively shaping analytical possibilities, see Mondada, 2006a).

Looking at the video recording of this activity, a recurrent action is noticeable: pointing gestures done by participants toward the maps and other documents on the table are highly frequent – either in the form of one person pointing or even in the form of various participants pointing at the same time to the same item.

Pointing gestures within talk have been mainly investigated in the literature in relationship with deictical reference (Hanks, 1992; Kendon, 2004; Kita, 2003): they are a pervasive resource for identifying and making recognizable an object (even if it is not visible for the participants, Haviland, 1996), within a referential practice which may or may not co-occur with other spoken resources, e.g. deixis. Studies of pointing-in-interaction (Goodwin, 2003; Hindmarsh & Heath, 2000, Mondada, 2005c) have shown that the articulation between deicticals and pointing gesture is not so simple as it might appear in previous accounts: pointing gestures are precisely timed, being synchronised with the moment-by-moment organization of talk-in-interaction, with recipient-oriented talk and bodily conducts, with appropriate arrangments of bodies and objects in space, with the progressive (re)disposition of the domain of scrutinity, with contingent demands of the activity, and with timely organized coordination.

Moreover, pointing gestures are not always and exclusively devoted to deictical reference. In our corpus, at the first sight, these gestures seem to be related to the descriptive practices characterizing this work activity, as well as to the common attention towards shared referents. However, detailed examination show that these gestures are not systematically associated with deictical forms and are much more frequent than referential expressions. Pointing gestures do not seem to have just a referential use. That prompts a closer analysis of the circumstances of their finely-timed unfolding in interaction.

This noticing has opened another perspective on the corpus, raising another kind of issue: speakers do point to the maps not only in order to refer to them but also to make visible their engagement and participation in interaction. The occurrence and temporality of pointing gestures is a key resource for the organization of turn-taking. Pointing practices and turn-taking practices are here deeply embedded, in a way that exploits the specificities of the situated action – such as the fact that it takes place around a table covered with artefacts, the fact that participants' attention is focused more on these objects rather than on co-participants, and the fact that topical activities are centred on visible materials. The specificity of the situation is thus locally exploited by the interactional practices, although their exploitation remains related to more general principles governing action and interaction.

Our analysis will be organized around two basic questions: the first concerns the sequential environment at which pointing *begins*, characterizing the context in which the recipient/possible next speaker is emerging and establishing as a speaker. The second concerns the sequential environment where pointing *ends*, showing that interestingly this does not always occour at the established speaker's turn completion. Thus, analysis will show a range of ordered sequential positions

at which pointing as a technique for self-selecting is used by participants, and will reflect upon the way in which this technique reflexively shapes sequentiality as it is practically managed by co-participants.

When does Pointing Begin?: Practices for Self-Selecting

In what follows, we will focus on the way in which pointing is exploited by participants as a practice for self-selecting and for projecting current speaker upcoming turn completion. This descriptive aim makes some strict demands of the data used (Mondada, 2006b): on the one hand, it requires videorecords that make relevant details accessible for the analyst: this is the reason why we will use multiple video sources. On the other hand, it requires transcripts that represent the finely tuned aspects of multimodal details as they sequentially unfold in interaction – making them available for analysis. A rough notation of gesture would erase the orderly organization of the very phenomena we try to study. In order to preserve them, we will adopt a specific notation system for gestures, complementing Jefferson's conventions used for talk. The system, inspired by Goodwin's gaze notation (1981) and by Schegloff's gesture notation (1984), aims at capturing the main phases of a gesture's trajectory and to synchronize them with talk: we will describe the preparation phase (represented by dots ....), the culmination or stroke, which can be held for a while (represented by dashes ----), and the retraction (represented by commas,,,,) (see the end of this paper for a full account of conventions used).

Turn-initial Pointings: Displaying Incipient Speakership

In the following excerpt, Pierre-Alain (PAL) is engaged in a long multi-unit turn about the way in which farmers use their land over the year. When it is brought to completion, Viviane (VIV) self-selects and relates Pierre-Alain's explanation to its cartographical representation. She is overlapped by a third speaker, Laura (LAU), asking for a confirmation about the object represented on the map.

Figure 1 .hh #

Figure 2 oui.#

Figure 3 parce#

Figure 4 que : i#

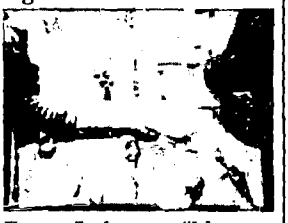

Figure 5 'm sem-#ble:

Figure 6 eh i- ici#

When Pierre-Alain has reached a recognizable turn completion (syntactically, prosodically, pragmatically), Viviane, line 6, self-selects: she begins her turn with two turn-entry-devices: with an in-breath (« .hh ») and with her arm beginning to stretch over the table (« .... »). A pointing gesture emerges from this stretching of her arm and her bending over the table, showing a direction with her pen extending the hand movement.

Excerpt (1) shows the occurrence of a second instance of turn-initial pointing: Laura self-selects overlapping Viviane (line 9) and begins to point at the beginning of the turn too. This occurrence of turn-initial pointing is done with the finger and not with a pen (the pen is being used by Laura writing notes).

Some remarks can be made at this stage:

- for the description of the gesture, the sequential placement of the beginning of its preparatory phase is crucial, and allows the identification of a relevant sequential environment for the phenomenon.
- the pointing gesture is not limited to the hand: it engages the whole body (the upper body bending over the table, the arm crossing the table). Moreover, the embeddedness of pointing in other activities and in the ecology of the ongoing action shapes the form and the resources of pointing: pointing with a pencil or pointing with a finger allow different kinds of movements, of ways of being precise, of parallel simultaneous activities.
- Viviane's pointing trajectory is not a mere individual isolated gesture but a finely coordinated one, synchronized with the format of the turn in progress and adjusted to other's actions·

(2) = (1) *line 6*

6 VIV **+.hh oui. parce que: im' *sem+ble: eh i*- ici**
+.....+ppp w pen----->>
lau *opens folder*

Viviane's turn is formatted in a way that delays (with the insertion of « i m'semble » and the self-repair of « i- ici » – which are thus not just hitches in her talk but resources for the production of a timed action) the position of the deictical « ici » until the point where the pointing gesture has reached its maximal extension (when she says « i m'semble »). This in turn is reflexively adjusted to Laura's action: Laura is holding a closed folder where the referent of Viviane's utterance is hidden and which therefore constitutes an obstacle for her referential action. Laura opens it as the pointing gesture reaches it. So, Viviane's gesture and turn on the one hand, and Laura's manipulation of the referred artefact on the other hand are finely adjusted and reflexively organized.

Pre-initial Turn Pointings: Projecting Self-selection, Claiming Speakership

The first case examined here, although it exhibits two occurrences of the same phenomenon – turn-initial pointing -, is relatively less frequent than another phenomenon: pre-initial turn pointing. In most of the cases observed in the corpus, pointing projects self-selection well before the completion of current speaker's turn and well before the beginning of next speaker's turn.

Here is an occurrence:

(3) (e3/agro1-16.48)

1 PAL **et donc on voit la logique, avec cet cet aménagement du: de**
and so one sees the logic, with this this settlement of: of
2 **l'espace, .hh qui revient à obtenir, (.) euh: des des de- des**
space, .hh which would make (.) ehm
3 **pâturages, (.) RElativement plus productives, qu'elles ne**
pasturelands, (.) RElatively more productive, than what they
4 **l'étaient avant, grâce notamment à la: (.) <la**
were before, thanks among other things to the (.) <the
5 **re*distribution des biens communs. ((decrescendo))>***
redistribution of common goods. ((decrescendo))>
la *.....*
6 LAU ***et donc le: ce qui est en (.) orange ici là, terre assolée***
and so the: what is coloured in (.) orange there, farmland
*ppp------>>
7 PAL **hum**
8 LAU **c'est, (.) des prairies,**
that's, (.) grassland,

In this case, Laura begins to point well before her turn beginning: the preparation of her gesture takes place before, but reaches its maximal extension exactly

in turn-initial position. If we consider the sequential position in which the preparation begins, we notice that it is reflexively adjusted to Pierre-Alain's ongoing turn production: his last utterance is syntactically quite complex, but could be syntactically complete with the end of the comparison (« qu'elles ne l'étaient avant » 3–4). Pierre-Alain adds another constituent (beginning with « grâce à » 4). This last add-on is characterized by some hitches (« à la: (.) la redistribution » 4–5) and by a decrescendo low voice until the end of the turn. Laura initiates the preparation of her pointing gesture just after the beginning of the descrescendo, projecting an imminent turn completion. Therefore, her movement anticipates the upcoming transition-relevance place and projects her as possible next speaker. Pointing begins properly at the same time as her establishment as self-selected current speaker.

This occurrence shows some more general points:

- pointing orients to transition-relevance points, even if it can occur much earlier (see below).
- pointing appears as a *method* for projecting self-selection, being part of an emergent movement for establishing upcoming speakership;[2]
- pointing makes visible for all participants a pre-beginning, taking the visual floor but not yet the vocal-spoken turn;
- this pre-beginning phase anticipates the possible completion of the current speaker's unit in progress: a) it exhibits the monitoring of the structure in progress by the possible next speaker, and more precisely his finely tuned online analysis for all practical purposes, b) it projects the next action i.e. the turn to be taken by the recipient/incipient speaker who is pointing.
- thus, pointing has more to do with the temporality of the interactive construction of TCUs in progress than with referential practices *per se* – since pointing begins well before deictics occur and even in absence of deictics, that is, well before the relevance to deictically indicate something. Nevertheless, if we observe where deictics are positioned in these utterances we can say that deictical reference in turn-initial position can be a resource for enhancing the legitimacy and accountability of pointing as a method for establishing speakership. Deployment of gesture at transition-place has been described by Streeck & Hartge (1992), who analyze two gestural techniques being used in this position as gestural turn-entry devices in Ilokano conversations: the [a]-face, preparing the articulation of [a], even when no sound is produced, making visible for all participants the speaker's gearing up to utter the vowel; and the « palm up » gesture employed not only for claiming the floor but also for providing co-participants with a preview of the type of projected talk, prefiguring a list. These cases confirm that gestures have a potential of anticipation: not only iconic gestures precede their speech-affiliates; more generally, gestures are oriented to the organization of interaction and project relevant sequential positions, such as transition-points. In our corpus, pointing gestures do not just precede their deictical affiliates, but are more generally exploited for

projecting self-selection (in another paper, Streeck, 1995 speaks of « action projectors »); they occur at transition places too, but more generally they tend to start even before. The aim of this paper is precisely to explore the kind of « projection space » (Schegloff, 1984) they open up.[3]

If we turn back to the first example, and reconsider it, as well as its transcript, we notice that although the preparation of the pointing gesture takes place at the beginning of the turn – that is, relatively late if compared to except (2) – VIV accomplishes other actions before she self-selects. They are represented in a second version of the transcript:
