+ .....+ppp w pen-->>

Viviane's movements exhibit a very sharp and timely understanding of Pierre-Alain's ongoing turn. The latter is characterizing one form and use of pasture: his TCU could be syntactically complete line 3 but prosodically, continuing intonation projects more to come, that is a prepositional syntagm (« sur l'assemblage sans parcours. » 4). Towards the end of this added-on constituent, Viviane begins to move, anticipating an upcoming transition-relevance place. But shortly after Viviane moved the paper on which they are working, what comes next is not her self-selection but a new TCU initiated by Pierre-Alain, continuing with an in-breath and a stance marker (« .h je pense que » 4). At that point, Viviane withdraws. The « Gestalt » of the new TCU has an argumentative binary form, stressed by a contrastive prosody, projecting clearly its upcoming completion. At its beginning, Viviane's hand comes closer again to the centre of the table, in a position that enables and facilitates the pointing gesture which follows. Thus, the initial-turn position of her pointing gesture has been prepared and projected by other actions before, showing her anticipatory ongoing understanding.

Recipients' predictions can have various scopes, and can exhibit a very early orientation to the next possible transition-relevance place:

Pierre-Alain is engaged in a long multi-unit turn about sheep reproduction. Laura begins to point at line 3, i.e. in a position where Pierre-Alain is reformulating the age at which sheep can be reproduced. Pierre-Alain's syntactical construction projects the age from line 1 on (with the preposition « à ») but before telling this information he inserts a reformulation of the process (introduced by « c'est-à-dire » 1); another reformulation, concerning the age, is inserted immediately after its mention (2). In this way, although various insertions and expansions are provided by Pierre-Alain, the syntactical construction of his turn is projected very early. Laura orients to this feature: she ends the preparation phase and begins to point properly during Pierre-Alain's reformulation of the sheep age (3). But at the end of this TCU, i.e. at a possible transition-relevance place, the current speaker initiates a new TCU (« .h et donc, » 4) and begins to point on the map. He projects a longer chunk to come, both by his pointing and his syntactical construction, which initiates a dependent clause (« pour arriver à cette production » 4) projecting a main clause, then delaying it by the insertion of a reformulation of the former (« c'est-à-dire être aptes » 5).

Laura exhibits her responsiveness to these delayed projections by suspending her pointing (1. 5); she also exhibits her anticipation of the completion at the end of the main clause by pointing again (1. 7) when Pierre-Alain adds a second paratactic clause. Thus, Laura's pointing gesture exhibits her syntactic online analysis of Pierre-Alain's turn, done for the practical purpose of looking for possible transition-relevance places. The suspension of her gesture shows her recognition not just of projection spaces but also of their spans: when the projected point is delayed, the gesture is relaxed and suspended; when the projected point comes nearer, the gesture is reactivated. This demonstrably shows that Laura is orienting to the relevance and legitimacy, in certain sequential positions, of her claims of speakership, as well as to the fact that, at other moments, these claims cannot be accountably sustained and have to be withdrawn or abandoned. The very fact that she suspends her gesture but leaves her hands ready for service at short distance, shows her readiness to pursue again the same gesture, projecting a future moment where this will be relevant again.

In this context, gesture, incremental syntax and rights and obligations related to speakership are deeply interwoven and made mutually visible, enacted through the unfolding of gestures in time.

Pre-initial Turn Pointings, Overlaps and Concurrent Claims of Speakership

Pre-initial pointings can be found in the very same sequential environments where next speakers/turn claimants produce serial starts of an incipient turn in overlap with current speaker/turn occupant (Jefferson, 2004: 46):

	fig	#fig.4

Figure 1

Figure 2

Figure 3

Figure 4

At the end of line 2, Pierre-Alain has reached a completion point and has ended up his turn. The gap that follows (3) is interpreted by Pierre-Alain as an opportunity to talk not taken by his co-participants: he continues to speak (4), but at the same moment Laura begins her serial attempts to begin her turn. Laura sees the gap as an opportunity for self-selecting: this is exhibited by her hand approaching the map before to point (3). This projection of an imminent self-selection is materialized verbally a few moment later, within the serial start (« et » « et » « ç- » 5) overlapping Pierre-Alain. At the third try, Laura points with her pen, strengthening her position as incipient speaker.

Gestures – as fragments of incipient turns or as in-breaths – are multimodal resources which make pre-beginnings visible-and-audible. These resources are particularly interesting in a multi-party participation framework, where there is a pressure for current non-speakers who might self-select, to do it as soon as possible and at least at the first possible transition point (Sacks, Schegloff, Jefferson, 1974, 712–713). Pre-beginnings are a technique for securing precise coordination of prior turn ending with next turn beginning, as well as for securing self-selection for would-be next speakers. Whereas verbal and other acoustic resources are vulnerable to overlaps in these early starts, pointing gestures are not and can be produced simultaneously with the terminal segment of the ongoing turn. This allows at the same time the opportunity to achieve an early self-selection and to display an orientation to the minimization of gap and overlap, i.e. to the

preservation of the « one party at a time » normative principle (see Schegloff, 1987 for a similar analysis of turn-beginning recycles). Nevertheless, it can be noticed that some of these gestural pre-beginnings are dealt with as having an « interruptive » potential or effect. So, even if gestures can be produced simultaneously with talk without overlapping it, pointing gestures as practices for claiming speakership and for imposing self-selection are oriented to as exhibiting concurrent practices of turn taking (cf. Jefferson who notes about overlapping laughter that « recipient/prior speaker appear to be attending to the 'premature' and turn-incursive character of their talk » 1984: 30). This may be consequential for the ongoing turn production by current speaker, as we will see below.

This situation is particularly clear in environments where concurrent pointings by several persons occur.

Figure 1

Figure 2

Figure 3

Figure 4

In this excerpt, we notice that two recipients attempt to self-select while Viviane is still speaking.

If we were to restrict our analysis to verbal conduct only, we would only see that Pierre-Alain's self-selection does not overlap with Viviane (4), and is presented as a collaborative completion of Viviane's turn, ratified by her. But, if we consider co-participants' gestures, we get another picture: we can notice that Laura comes in with her hand as early as line 3 (fig. 1), pointing before « euh » which concludes Viviane's turn (3). This projects a possible self-selection by Laura. However, after Viviane, it is Pierre-Alain who speaks first, beginning to point in turn-initial position (fig. 2). Pierre-Alain has bent his head over the table much earlier (line 1), at the end of Viviane's first TCU and before she continues with her first « donc ». Laura withdraws her pointing during Pierre-Alain's completion (fig. 3) – recognizing it as concurrent with, and a challenge to, her own claim of speakership – but prepares to point again as soon as Viviane repeats Pierre-Alain's collaborative item. Laura then fully points when she self-selects in overlap with Viviane (7).

Thus, here, three participants are pointing at the same moment (fig. 4): Viviane points during her turn, as current speaker; Pierre-Alain points when he engages in his turn, whereas Laura begins to point earlier, projecting and making visible her claim of incipient speakership. We can observe that pointing as a visible and public action projection can be initiated by various co-participants modifying their participation status as turns-at-talk unfold; they can manifest concurrent and mutually exclusive projections and claims of speakership.

As such, they are monitored by others as persisting or withdrawing claims, as related to yet-relevant or no-more-relevant contributions to the ongoing conversation. In this sense, publicly displayed pointings as practices for projecting imminent speakership are not only seen but oriented to and exploited by others, who can consequently adjust and modify their conducts. Thus, pointings reflexively shape the ongoing incremental productions by other participants, who mutually respond and adjust to them.

In the following excerpts, we will see that mutual and visible availability and recognition of participants' online interpretation of turns at talk is consequential for the emergent organization of their embodied conduct.

At the end of line 1, Pierre-Alain produces a first possible turn completion, followed by a silence (2). During this gap, Laura comes in pointing with her pen and produces an agreement (3) overlapping with Pierre-Alain who expands his turn (4) (cf. excerpt (6), lines 1–5). This TCU (4) begins with « donc » and can be interpreted as the conclusion of the previous one: this seems to be Laura's version, who holds her pointing. But Pierre-Alain does not just add some short conclusion: he projects a continuation (« et et » 5). Consequently, Laura, at the very beginning of this new TCU, suspends her gesture, although not returning to her home position but leaving her hand in place. Later, Laura points again in a peculiar sequential position within Pierre-Alain's turn: line 8, she anticipates the end of the relative clause as a possible turn completion. Line 9, Pierre-Alain deals with it as completed (namely by lowering his voice) but again adds a new TCU, initiated with an in-breath and louder voice. This initiation projects a longer argument (« alors c'est important, parce que... » 9–10), and is responded to by Laura suspending again her pointing and beginning to chew her pen – an action which not only visibly withdraws her gesture but also immobilizes her hand and occupies her mouth. Pierre-Alain completes his long argument after a long pause (11), which is not dealt with by Laura as a transition-relevance point. On this completion, he successively looks at Laura and then at Viviane: this technique for other-selection is vulnerable to the absence of gazes of the selected co-participants (Lerner, 2003). As a matter of fact, Viviane does not look at him and Laura comes back gesturally only on the terminal particle « quoi », beginning to speak as Pierre-Alain, after a gap where nobody speaks, tries to continue.

Thus, in this excerpt we see various attempts by Laura, implemented in an embodied way, to initiate turns. These attempts make visible for the analyst, on the basis of Laura's online analysis, the identification of turn-relevance points within Pierre-Alain's turn and her projection of possible self-selections. Gesture make visible and recognizable Laura's projections for other participants as well – namely for Pierre-Alain. Their public character has a reflexive effect on turn formatting: for instance, Pierre-Alain organises his turn in a way that minimizes transition-relevance points in order to continue to speak. This is namely the case of the transition-relevance point of line 9: Pierre-Alain accelerates his speech tempo at the very beginning of the TCU; moreover, at that moment, he does not glance at other participants but looks at the maps in front of him. This minimization is even clearer after several Laura's serial pointings. By contrast, he looks at Laura at the beginning of the excerpt, and at the end of his long multi-unit turn (line 11–12), in pre-completion positions, opening up the opportunity

Thus, pointing gestures as practices for projecting incipient speakership reflexively configure the other's conduct, who progressively integrates within his turn-format the emergent relevancies publicly manifested by gestures. This reflexive adjustment is responsible for the flexible, incremental, collective achievement of turn's units (cf. Goodwin, 1979, 1981). The public display of projections is particularly effective in cases of concurrent self-selections.

Pierre-Alain is explaning the territorial organization of a farm (1–7). During this explanation, Bruno and Laura project their imminent self-selection. This is visible as far as Laura is concerned: she points from the moment where Pierre-Alain has initiated the definition of the « quarter » (4), by coming in with her pen, then by fully pointing. Laura withdraws her gesture when Pierre-Alain goes on with his argument (7). Nevertheless, as Pierre-Alain is in the middle of his TCU (with some hitches on the definite determiner) Bruno comes in and takes the turn (8).

Laura and Bruno use different methods and resources for self-selecting, implying different kind of public visibility. Line 4, at the beginning of Pierre-Alain's relative clause, Bruno pulls the central document in his direction; at the same

moment, Laura moves in, preparing to point. Thus, at the same sequential position, they both accomplish a gesture on the table, displaying their common orientation to the same relevances within the ongoing action. Immediately after, Bruno does not point to the central map, but points with his pen on his own document. When he begins to speak, he intrudes and suspends Pierre-Alain's turn with a specific discourse marker, « attends attends » (8), making explicit the interruption of his action. At the same time, he attracts collective attention towards his own document. Therefore, Bruno does not use the shared work space at the centre of shared attention, as do other participants, but uses his own documents, placed in front of him, driving the collective attention onto his personal work space. In a concurrent environment for grasping the turn, Florence's pointing gesture display very visibly her projections, make them recognizable and available for others – here Bruno – who adjust their own conduct and practices, e.g. for self-selecting before her. Bruno uses a verbal – rather than a gestural – turn-entry device, « attends attends » which achieves and topicalizes his stopping Pierre-Alain's turn.

Participants can mobilize various practices and resources for solving the practical problem of self-selecting and for organizing their possibly earlier start in competitive turn-taking environments: different embodied methods favours different resources, which have specific timings and trajectories, and which are differently identifiable, recognizable, and publicly visible. This visibility makes transparent the understanding of action by participants, not only for the analyst, but first of all for their co-participants. This in turn, allows the prediction and mutual adjustment of their actions, which are reflexively shaped by taking into account responsive actions produced online by others, either for aligning with or for preempting them. As excerpts 1–9 show, these practices for self-selecting are also a priviledged place to look at participant's emic, practical and situated definitions of the emerging status of « speakership ». They show that speakership is a status that has to be established through adequate interactional work. Gesture at pre-initial turn positions and at transition-relevance places make visible, witnessable and documentable the emergent trajectory of the progressive change of category of a « non current speaker » becoming a « would-be speaker », a « (possible) next speaker », and then an « incipient speaker ». These categories are established moment-by-moment in the unfolding of action and are oriented to by participants, who affiliate or not with them.[4]

When does Pointing End? Boundaries of Speakership

Speakership as an emergent phenomenon is observable within gestures in pre-initial turn position; symmetrically, once current speaker is established, it can be interesting to study where it ends, and how a participant ceases to be a speaker. In the remaining analyses, we will focus on the end of pointing gestures in order to question the limits of speakership. Since gestures are characteristic of speakers, we can expect that towards the end of the turn current speakers stop to gesticulate or to point, and that indeed pointing stops before the turn ends, projecting its completion.

Pointing Gestures Projecting or Ending at Turn Completion

In a certain number of cases, we can observe that pointing stops just before the turn is completed:

(10) (el/ag2-3.43)

		-----><%.....%ppp--->>

As the excerpt begins, Viviane is producing an explanation and points to Bru paper. Bruno displays he is listening to her, looking at her, his hand on mouth. After Bruno's continuer, line 6, Viviane continues to speak but pro sively withdraws her pen, pointing again only in a limited way, when she repaired a problem of expression (7). So, she stops to point in a continuous from line 7 on, in a position where « qui en plus est » (7) initiates a last expan closing her turn. Interestingly, this projection of turn's closure is not unilat but comes just after Bruno has pulled his hand - which was held on his mouth until then – down on the table, thus making free his mouth for speaking and his hand for pointing. Actually Bruno puts his hand on his document and then points at the beginning of his turn. The end of Viviane's turn is thus an intera achievement, produced through the alignment of her projecting the co completion of her turn and her co-participant projecting his upcoming cat of « possible next speaker ».

Pointing Gestures Persisting after Turn Completion

Nevertheless, not all pointing gestures end with the turn they are affiliated in a precompletion position. Some gestures are held after turn completion:

post-completion *persistence seems to contradict the idea that gestures are a speaker's characteristic and thus delimit the rights and obligations of speakership.*

Detailed analysis shows that this is not the case, but that speakership is probably a phenomenon that is not strictly limited within turn (verbal) boundaries, but that is interactively shaped by complementary participants' relevancies and orientations. Here is a first occurrence of persisting pointing:

(11) (e9/ag 1-47.00) (= at the end of exc. 1)

		onl- one only unit, this was enough for their food

In this excerpt, Viviane is trying to explain what she sees on the map (1–2). Laura asks a confirmation question in overlap (3), Viviane answers (4) and then continues her previous explanation.

If we look at the pointing gestures in this excerpt, we can first notice that Laura begins to point at the beginning of her question (3) and keeps pointing until the end of the answer (4), stopping just before her acknowledgment « ouais » 5. As far as Viviane is concerned, we can notice that she keeps pointing when the question is asked, when she gives a response and then continues her explanation. The continuity between fragments of her explanation (« ce que ça voulait représenter, c'était » 2), suspended by the question/answer adjacency pair, is secured through the recycling of « c'était » after the second pair part (4). Similarly, the fact that she maintains her gesture during the adjacency pair produces an online practical categorization of this sequence as being a « punctual insertion » or a « momentary suspension ».

By holding their pointing gestures, both participants are producing the intelligibility and accountability not only of the current turn organization but more generally of the current sequence organization. They are displaying their orientation to the way in which sequence is structured, to the sequential implicativeness of their turn and to the span of the ongoing sequential actions. Pointings show that Laura is orienting to the adjacency pair as the sequential unit relevant

for her action; whereas Viviane is orienting to the continuity of her explanatory action beyond the insertion of the pair.

The sequential scope considered by participants can be variable, as shown by the following excerpt:

(12) (e5/ag1-21.04)

Pierre-Alain is describing the temporal organization of the sheep farmer's work: Laura asks a first question (5), with a first start in overlap and then a second star in the clear (5), beginning to point just after the former. She is writing note with her right hand, and this constrains her movements (she comes back wit the hand holding her piece of paper, line 5, and continues to point at distanc holding the paper from line 6 to line 11). Thus, her pointing gesture ends n just after the first adjacency pair is closed, but at the end of the second one, in tiated by her with a second question. Both questions pick up a referential eleme in Pierre-Alain's previous turn and operate a « tying » with his turn by means a pronominal anaphora (« elles » 5, « il » 10 within a right dislocation, possib orienting to the fact that another pronominal reference has been used by Pier Alain after his mention of « le parc » 7).

By holding her pointing gesture, the speaker designs the span of her acti

pairs initiated by her.

These data suggest that participants, and more particularly speakers, organize the public accountability and visibility of the scope of their turns, covering not only the length of their turns at talk, but the sequence they initiate – typically, an adjacency pair – or more subsequent sequences. In this way, speakers' gestures suggest that rights and obligations characterizing speakership do not stop at turn boundaries but continue within the normative expectancies related to the sequence initiated by that turn. In this sense, the speaker remains « responsible » of the sequence she has initiated and she continues to control, namely by displaying if it has been completed or answered in an adequate way.

Pointing Gestures Persisting over Extended Sequences

This practical delimitation of the scope of the speaker's rights and obligations across the sequence can extend beyond adjacency pairs. This shows that participants do orient to the complex sequential organization of talk-and-embodied-conduct-in-interaction, taking into detailed consideration both the finest and the most complex aspects of this organization.[5]

Line 3, Laura asks a question about the caption of the map, overlapping Pierre-Alain who is expanding a previous long multi-unit turn (see exc. 8).

Laura mentions Viviane as being the relevant speaker for that topic, but she uses the third person, referring to her more than addressing her. Laura does not glance at Viviane, although she pushes a relevant document towards her, while creating a long gap (5), giving her an opportunity to respond. On her side. Viviane is not glancing at her co-participants, and the only movement she does is slightly to pull back her hand during the long gap, displaying her unavailability for talk. In this case, we notice that pointing, pushing a document towards somebody, retracting a hand even minimally are movements that can radically reshape participation frameworks and mutual engagement displays.

In this context, Pierre-Alain answers to the question formulated by Laura (6–7). During the production of this second pair part, Pierre-Alain points. displaying his speakerhip. But Laura holds her pointing too. This continues to be the case through the except, even line 14, when Laura reorients Pierre-Alain's explanation with a complementary question.

Interestingly, when Pierre-Alain produces a word-search, line 15 (« qui a été euh: »), Viviane promptly proposes a candidate (« amélioré » 16) which is repeated by the him (18). During this short collaborative completion of Pierre-Alain's turn, Viviane makes no movement or gesture: she displays that she is speaking *for* her co-participant – *animating* him – but she is not assuming properly a speakership position – of *author.*

When ratifying the item closing the word search, Pierre-Alain withdraws his pointing (17), projecting his turn completion. He holds this position, even if Laura asks a last confirmatory question (18), which gets a short answer (19).

Laura withdraws only after she closes the whole stretch of interaction (« ah oui d'accord « 20). Closure with an agreement and a change-of-state-token (« ah » in French, corresponding to the « oh » studied by Heritage, 1984) – displaying the completion of the sequence from both an interactional and an informational perspective –, together with the withdrawal of a gesture held for a long period, exhibits the boundaries of an extended segment of talk as practically and incrementally defined by the pointing participant who initiated the sequence and projected a space for its completion.

Conclusions

The cases we studied in this paper outline a systematic use of pointing as a method for projecting self-selection, designing a transition space, and more generally defining speakership within a range of sequential positions.

Pointing as a practice for turn taking can be initiated either before the actual completion of current speaker's turn, (thereby projecting its end), or at the beginning of the incipient speaker's turn. In both cases, pointing displays a participation shift, the pointer initiating, often before even saying a word, her transition from the category of « non current speaker » to the category of « incipient speaker », through the category of « possible next speaker »: in this sense, pointing gestures manifest the temporal, situated, embodied emergent process of the establishment of speakership. Moreover, this process shows publicly and visibly the way in which a « recipient » scrutinizes, for all practical purposes, an ongoing turn and produces an online parsing of this turn in TCUs. In this way, not only a local understanding of the ongoing TCUs is exhibited, but also its embodied use oriented to the turn-taking machinery. In turn, this public manifestation of an online analysis is visible for other participants, who reflexively adjust their own turn design and conduct to what is made recognizable by the pointer – e.g. in concurrential turn at talk.

Pointing can end either in a pre-completion position or at the end of the turn. But it can also end much later in the sequence: at the end of one or more adjacency pairs initiated by the pointing speaker, as well as at the end of an extended sequence controlled by her. The latter case shows an extension of the local display of speakership: speakers hold their posture across turns, manifesting an extension of their rights and obligations beyond the turn and beyond their talk. In this way, pointing across sequences shows the situated online sequential interpretation and production by participants, displaying the span of their actions and of their sequential implicativeness.

Thus, pointing as it has been analyzed in this particular corpus highlights very general features of turn-taking and sequential organization. At the same time, it is interesting to notice that this methodical and systematic practice exploits the context sensitive specificities of the ecology of action. Pointing as a practice for projecting turns and organizing sequences is not available in every setting: in the case studied, pointing gesture is a resource made available by the peculiar spatial and material environment of the interaction, constituted by a table covered

with documents, maps and other visualizations, massively used within an activity focused on reading, writing and correcting cartographic representations. In this particular setting, interaction is not primarily organized as a face-to-face exchange of talks and glances but rather as a side-by-side common focalization of attention on objects. In this sense, pointing gesture have a prominence and a salience that is locally achieved through the very activity participants are involved in.

Moreover, pointing gestures as resources for interactional practices are made available by the high focus on referential and deictic activities going on in this praxeological setting. The referential dimension of pointing works here as a resource at the service of the interactional organization: deicticals at turn-beginnings are a resource which can enhance the accountability and legitimacy of pointing gestures for taking the turn. In this sense, both represent not exclusive but rather complementary uses of the same resource.

The efficiency of singular pointing gestures is reflexively shaped by their embededdness in this peculiar activity: pointing with a pen or pointing with a finger not only have different accuracies, but offer different opportunities for their integration within activities. For example, pointing with a pen excludes other uses of the pen, such as taking notes; pointing with the left hand allows one to write with the right hand. Chewing the pen *versus* placing the hand holding the pen close to the centre of the table constitute two *home positions* which enable different preparation phases and rely on different kinds of reactivity and temporality for pointing. In this sense, pointing involves an arrangement of the material environment as well as a disposition of bodies, all eventually preparing and projecting an upcoming-speaker position.

Therefore pointing is here the indexical resource at hand, made available by a specific ecology of action. In similar ecologies, the same resource can be mobilized. In other settings, pointing may be used in the same way, but it is also possible that other multimodal resources, best suited to the specificities of the local context and material environment, may be used instead, although nevertheless respecting the same sequential and interactional constraints. In summary, then, this paper aims to be a contribution to the description of both systematic and indexical features of multimodal turn and sequence organization.

Transcript Conventions

Data have been transcribed according to conventions developed by Gail Jefferson.

A indicative translation is provided line per line.

Multimodal details have been transcribed according to the following conventions:

* *	delimitate Laura's gestures and actions descriptions.
+ +	delimitate Viviane's gestures and actions descriptions.
⊥ ⊥	delimitate Pierre-Alain's gestures and actions descriptions.

Glances are described by the same conventions, but in a light-coloured character.

Notes

1. This paper has been presented and discussed at The Nijmegen Gesture Centre Lecture Series on April 8, 2005, and at the 9e Colloque de Pragmatique de Genève on May 26-28, 2004 and has benefited from comments of the participants. I am most grateful to Charles Antaki for revising my English text.
2. Thus, this gesture done by a current non-speaker seems only apparently contradicting the idea that « hand gesturing is largely, if not entirely, a speaker's phenomenon » (Schegloff, 1984, 271): Schegloff notes that an exception, which is itself in keeping with this general principle, is provided by the fact that « current non-speakers who initiate a hand gesture may show themselves thereby to be intending, and incipient, speakers, and the gestures may thus be used as a way of making a move for a turn at talk next » (1984, 271). It is precisely this exception that is explored in this paper.
3. « The notion of a 'projection space' is concerned with both the span in which some element of talk is 'in play' before being produced, and with the evidence of that which a speaker's turn may make available to its recipient. For example, it appears central to the organization of tightly coordinated turn-transfer from one speaker to a next that aspects of some current turn are projected, and are available to analysis by a recipient/potential-next-speaker before their actual occurrence » (Schegloff, 1984, 267).
4. The continuous transformation and negotiation of the participant's categories have been pointed out by Goodwin & Goodwin (2004) revisiting and criticizing the goffmanian notion of « participation ». Narratives in interaction have been studied from the perspective of the progressive establishment of « teller » as well as « co-tellers » (Goodwin, 1984, 1987; Hayashi, Mori & Takagi 2002). But more generally this movement is observable within every next turn. It is interesting to look at the categories used for dealing with « not yet speakers » within the current literature: in her analysis of systematic positionings of overlaps, Jefferson (1984) speaks of « recipient/next speaker », as well as, in concurrent overlaps, of Turn Occupant vs Turn Claimant, showing that these two categories are not always easy to differentiate (2004, 49). When analyzing pre-beginnings, Schegloff (1996, 97) uses the category

« current-recipient-of some talk/potential-next-speaker » showing through this complex label the transitional dynamic character of the category.

5. This is consistent with the analyses provided by Fox (1987) on long distance anaphoras, manifesting the way in which speakers deal for all practical purposes with long stretches of talk as being homogeneous and continuous from a praxeological and a topical point of view.

The Political Function of Narrative in Organizations

Dennis K. Mumby

Under the rubric of interpretive theory, a great deal of current research in organizational communication has focused on the sense-making practices of organization members, as manifested in their use of organizational symbolism. Such research is motivated by the belief that organization members, as social *actors*, actively participate in the construction of organizational reality through organizational discourse (Frost et al., 1985; Pondy et al., 1983; Putnam & Pacanowsky, 1983; Smircich, 1983). This "organizational culture" approach recognizes the emergent, ongoing, and sometimes precarious nature of organizational reality, and thus represents a significant shift away from the static, more functionalist approaches of traditional organizational theory.

My purpose in this paper is to extend these recent developments by demonstrating that cultural theory, despite its significant contributions to organizational research, articulates a rather limited and theoretically naive view of the relationship between organizational symbolism and organizational reality. While such research adequately describes organizational sense-making at a surface level, it does little to explicate the *deep structure* process through which certain organizational realities come to hold sway over competing world-views.

This article redresses this imbalance by focusing on narrative (as one form of organizational symbolism) and addressing its role as a legitimating device in formal organizations. Narratives provide members with accounts of the process of organizing. Such accounts potentially legitimate dominant forms of organizational reality, and lead to discursive closure in the sense of restricting the interpretations and meanings that can be attached to organizational activity. Closure frames discourse in a distortive fashion, and often misrepresents the interests of particular groups within organizations (Deetz & Mumby, 1985).

Source: *Communication Monographs* vol. 54, 1987, pp. 113–127.

The notion of narrative closure within organizations is unpacked by laying out the complex and interdependent relationship that exists between narrative, power, and ideology in organizations. From this perspective, narratives not only evolve as a product of certain power structures, but also function ideologically to produce, maintain, and reproduce those power structures. Because of their embeddedness in the everyday practices of organizations, narratives are not easily perceived as legitimating devices – they often articulate an organizational reality that is accepted as "the natural order of things." By adopting a political reading of narrative, however, it is possible to demonstrate that story-telling is not a simple representing of a pre-existing reality, but is rather a politically motivated production of a certain way of perceiving the world which privileges certain interests over others.

The fundamental premise for this article is based on Jameson's edict that argues for

> . . . the priority of the political interpretation of literary texts. It conceives of the political perspective not as some supplementary method, not as an optional auxiliary to other interpretive methods current today – the psychoanalytic or the myth-critical, the stylistic, the ethical, the structural – but rather as the absolute horizon of all reading and all interpretation. (1981, p. 17)

Such a position confronts narrative politically, as an ideological force that articulates a system of meaning which privileges certain interests over others. A political reading of narrative draws attention to the relationship between narrative structure and the process of interpretation and, as such, focuses on the process by which dominant meaning systems arise. Narratives "address" readers/listeners by creating a "fit" between the narrative and the individual's world-as-experienced. Such a fit is by no means perfect, however; otherwise, the individual would be completely subjugated to the narrative's ideologically constructed "reality." As Nakagawa (1983, p. 16) points out, this margin of difference between narrative and reader/listener translates into a tension between what is highlighted (present) and what is hidden (absent). It is this difference that a political reading of narrative exploits, seeking to create a disjuncture between the privileged (dominant, ideological) reading and that constructed by the reader/listener.

In a very real sense it is this disjuncture that this paper exploits, for it is clear that the issue of legitimation is a double-edged sword. Although it is argued that narratives in organizations can function as an ideological device to legitimate the meaning systems of dominant groups, narratives can also potentially *delegitimate* dominant meaning systems. In this context, power becomes more than a phenomenon that is imposed on subordinate groups; it involves a "dialectic of control" (Giddens, 1979, p. 72) in which even the ostensibly powerless can utilize organizational structure to their advantage. This dialectic will become clearer in the analysis of narrative in the final section of the paper.

The balance of this paper will therefore address the following issues: power and its relationship to organizing; ideology and organizational structuring; and the relationship between narrative and the social construction of organizational reality.

Power in Organizations

The issue of power maintains a somewhat tenuous status in organizational research. On the one hand, organizations themselves have a vested interest in presenting an image which emphasizes efficiency, productivity, and a concern for the well-being of personnel. Power does not fit very comfortably into this image. In addition, managerial lore relies heavily on the "myth of rationality" (Conrad, 1985; Weick, 1979), i.e., the belief that organizations operate on the basis of decisions made through the objective assessment of available information and the setting of appropriate, carefully selected goals. To suggest – at least publicly – that decisions in organizations are made on any other bases (power and political expediency, for example) is heretical to many organization managers.

On the other hand, organizational researchers have clearly established "power" as an important phenomenon in organizations, although it is hard to find a consistent articulation of its nature (Pfeffer, 1981). Much of the early research on organizational power is strongly influenced by Weber's (1947) seminal work. In particular, his distinction between power (*Macht*) and authority (*Herrschaft*) has been largely co-opted by more traditional theorists in a way that legitimates organizational hierarchy and domination. Dahrendorf (1959, p. 166) clearly articulates this distinction: "The important difference between power and authority consists in the fact that whereas power is essentially tied to the personality of individuals, authority is always associated with social positions or roles." Within organizations, the exercising of authority is viewed as the rational extension of a social actor's legitimate role, i.e., as legitimate power.

More recently, however, traditional conceptions of organizational power have been challenged in order to debunk the management bias that has characterized much organizational research. In particular Clegg's (1975; 1981; Clegg & Dunkerley, 1980) work has shown how Weber's concept of power and bureaucracy can be utilized to provide a more radical interpretation of organizational power. Clegg (1975, p. 59) reinterprets *Herrschaft* as "rule" to demonstrate the interpretative work that people engage in, when they make sense of the world. All authority, he suggests, is dependent upon this conception of rule-governed behavior because rules orient people toward structuring their behavior in a certain way. Different rule systems therefore provide different structures for orienting behavior. Domination involves getting people to organize their behavior around a particular rule system.

In this context, "power is about the outcomes of issues enabled by the rule of a substantive rationality which is temporally and institutionally located" (1981, p. 77). Power, then, is achieved by establishing an organization's mode of rationality through controlling the deep structure rules of organizations. It is not simply a possession of individuals within organizations. By adopting this concept

framework, Clegg is able to show how structures of domination can become "naturally" and "rationally" integrated into organizations. Power, in this sense, is legitimate only because a particular "mode of rationality" deems it to be so; the group that maintains this mode of rationality (the organizational rule system) therefore controls the organization's system of power.

Several authors have sought to question the legitimacy of organizational models based on the notion that organizations are intrinsically rational in their modus operandi. These authors often characterize organizations as complex, ambiguity-ridden structures whose members engage in a constant struggle to reduce the equivocal nature of the communication environment that they inhabit. Most notably, Cohen, March and Olsen's (1972; March & Olsen, 1976) "garbage can" model of organizing has done much to undermine traditional perspectives based on rational decision-making.

> An organization is a collection of choices looking for problems, issues and feelings looking for decision situations in which they might be aired, solutions looking for issues to which they might be the answer, and decision makers looking for work. (1972, p. 2)

Building on this theme, Weick (1979) points out that organizational activity is often made sense of, i.e., made to *seem* rational, only in retrospect; there is frequently only a limited and incomplete antecedently existing rationale which governs and directs organizational behavior. Thus "organizations are often reluctant to admit that a good deal of their activity consists of reconstructing plausible histories after-the-fact to explain where they are now, even though no such history got them to precisely this place" (Weick, 1979, p. 5).

If we tie together the notions of power and ambiguity, then, we can say that power is exercised when ambiguous or equivocal information is interpreted in a way that favors the interests of a particular organizational group; or, alternatively, when organizational ambiguity is utilized and amplified to disguise the exercise of power. Such a conception means that power can be exercised both intentionally and unintentionally, but most importantly by virtue of its integration into organizational structure. Power is therefore conceived not as a possession of individuals, nor as a relation among individuals (Bachrach & Baratz, 1962; Dahl, 1957, 1961), but rather as both a medium and product of organizational structuring and thus – following Clegg – as a potential means of control.

Such a conception of power is implicit in Lukes' statement that power is sustained by "the *socially structured* and culturally patterned behavior of groups, and practices of institutions" (1974, p. 22, emphasis added). Lukes focuses on the issue of interests, suggesting that power is often exercised not in an overtly behavioral manner, but rather by shaping the interests of individuals. Thus the existence of consensually derived values and beliefs in an organization, for example, does not necessarily mean that power is absent.

Lukes' conception of power is radical because he recognizes that power does not operate merely in the relation between individuals; rather, it is also a structural aspect of institutions which mediates in the socialization of actors in organizational settings. The behavioral aspect of the exercise of power can only

function within this deeper, more fundamental structuring. It is fundamentally misleading, however, to separate organizational structure and interaction. Social relations do not simply exist *within* organizational structure, but are actually inseparable from (and constitutive of) that structure. From this perspective, the exercise of power is interdependent with the structure within which it occurs.

In an important article, Ranson, Hinings and Greenwood (1980) provide an excellent analysis of the way in which organizational structuration (Giddens, 1976, 1979, 1981) is an integral part of the dispersion of power in organizations. From this perspective, "structure [is] a complex medium of control which is continually produced and recreated in interaction and yet shapes that interaction: structures are constituted and constituting" (1980, p. 3). This quality of organizing is crucial to the vested interests of different groups within organizations. If we view organizations as being made up of different and competing values and belief systems that embody the interests of different groups, then the groups with the most power will be those that are best able to integrate their sectional claims into the very structuring of the organization.

Thus a group's interests will be best served if those interests become a part of the taken-for-granted meaning formations that structure organizational life. Once these interests become part of the organizational structure, then that structure reflexively mediates in, and reproduces, those interests. Organizational structure is therefore both the *medium* and the *outcome* of members' social practices (Giddens, 1979, 1981; Poole & McPhee, 1983; Riley, 1983), and is therefore an integral part of organizational power. Thus "the structural framework is not an abstract chart but one of the crucial instruments by which groups perpetuate their power and control in organizations: groups struggle to constitute structures in order that they may become constituting" (Ranson et al., 1980, p. 8). At the same time it is important that power should not be conceived as a monolithic entity which is *imposed* on organization members; rather, a dialectical relationship exists between the two. In other words, social actors are constrained by organizational power structures, but at the same time these constraints provide the medium through which social actors can act strategically in organizations (Conrad, 1985).

This relationship between agency (the social actor as *actor*) and power becomes clear in Giddens' aforementioned theory of structuration, embodied in his concept of the duality of structure: "the structural properties of social systems are both the medium and outcome of the practices that constitute those systems" (1979, p. 69). In this context power becomes double-edged in the sense that it serves not only as a means *for* domination, but also as the vehicle through which social actors can potentially liberate themselves from domination. Giddens (1979, p. 51) articulates the duality of power thus: "at the heart of both domination and power lies the *transformative capacity* of human action, the origin of all that is liberating and productive in social life as well as all that is repressive and destructive." Simply to be a human agent means to have power. Even those in the most subordinate positions can "carve out 'spaces of control' in respect of their day-to-day lives and in respect of the activities of the most powerful" (1981, pp. 197–98). This "dialectic of control" recognizes that a reciprocal relationship

exists between agency and power, and that power relations are chronically reproduced in the structures of social systems.

The question that remains, however, involves the means by which groups are able to secure their vested interests within the organizational structure. It seems apparent that structuring is a privilege of only *some* organizational members: not everyone can have equal access to the resources necessary to produce and reproduce certain relations of power. Indeed, the control of such resources is part and parcel of these power relations. In the next section this question is addressed by developing the concept of ideology as the vehicle through which an organization's "mode of rationality" becomes structured.

Ideology and Organizational Structuring

While there is considerable variation in the treatment of the concept of ideology, the issue of the production and domination of consciousness, or subjectivity, is a central element in most contemporary theories. Neo-Marxist theorists are concerned with explicating the ways in which ideology functions to construct consciousness in such a way as to articulate and legitimate certain forms of social reality. In many theories, ideology is conceived as an intrinsic part of the process by which social actors are integrated into extant power structures (Althusser, 1970, 1971; Coward & Ellis, 1977; Giddens, 1979; Gramsci, 1971; Hall, 1985; Larrain, 1979, 1983).

Therborn (1980), for example, suggests that ideology performs the double function of subjection and qualification. That is, ideology simultaneously subjects social actors to a particular social order, *and* qualifies them for the roles that the reproduction of this social order demands. In this sense, "ideology operates as discourse, addressing . . . human beings as subjects" (1980, p. 15). This process of addressing, or interpellation, is accomplished through the tripartite articulation of social reality: Human actors are made to recognize (1) what exists, i.e., what is "real"; (2) what is good, i.e., what is "normal," "beautiful," etc.; and (3) what is possible, i.e., our sense of what is changeable (Therborn, 1980, p. 18). Ideology addresses and qualifies subjects by giving them an overall sense of the limits and possibilities of the social world – ideology provides a sense of what it *means* to be a social actor.

The notion of ideology addressing social-actors-as-subjects is central to this paper in that it provides a direct link between narrative and ideology. In this context, narrative can be conceived as more than simply a vehicle for diffusing information in an organization; it becomes a material social practice by means of which ideological meaning formations are produced, maintained, and reproduced. Thus in examining the structure of narrative from an ideological perspective, the principal concern is one of assessing "how structures of signification are mobilized to legitimate the sectional interests of hegemonic groups" (Giddens, 1979, p. 191). That is, narrative in its capacity as a signifying system can function to articulate a form of social reality that is accepted by all organizational groups, regardless of their position in the organizational hierarchy.

Narrative – as one mode of symbolic structuring – is a material instantiation of ideology. It is an everyday organizational practice that structures "lived experience" in a particular way for organization members. Narrative functions ideologically to structure the very notion of "organizational practice" for social actors, privileging certain practices over others.

The relationship between narrative and the ideological structuring of meaning systems can be explicated in terms of the functions of ideology. These functions are outlined below, and in the final section of this paper organizational narrative is analyzed according to these functions.

According to Giddens (1979, pp. 193–96) there are three principal ideological functions: (1) the representation of sectional interests as universal; (2) the denial or transmutation of contradictions; (3) the naturalization of the present through reification. The first is a key function in the sense that an interest must be seen as more than sectional, i.e., specific to a particular group, if it is to be accepted as anything more than one interest among many competing interests. In organizational cultures, for example, the dominant group is that which can structure meaning formations for the organizational totality from their own paradigmatic framework (Brown, 1978).

The second function of ideology refers to the way in which fundamental system contradictions are reformulated more superficially as simple social conflict. The primary contradiction in capitalist society, that between private appropriation and socialized production, is legitimated by the ideological bifurcation of the political and economic spheres. Political strategies are thus not seen as acceptable in the workplace, while the legitimate political sphere is conceived in terms of the relationship between the individual and the state, embodied in the power to vote (Mason, 1982; Pateman, 1970). This strict separation of the political and economic spheres allows the technical interest to predominate in the workplace (Habermas, 1971). As such, organization managers can argue that power does not play a significant role in the structuring of organizations because decisions are made "rationally." The fact that one group is seen as more influential than another is explicable in terms of their importance for the overall effectiveness and efficiency of the organization.

The third ideological function, reification (Lukács, 1971), deals with the degree to which humanly constructed social relations and meaning formations come to be perceived as "objective" and independent from those who created them. In this way what is "real" becomes fixed and immutable, i.e., "the way things are." In organizational cultures the reification of day-to-day experience limits the possibility of conceiving of alternative social realities or, if the alternatives are articulated, they might be considered strange or lacking in sense. For example, the issue of decision-making is normally understood to be contingent on organizational hierarchy (the more important a decision the higher the level at which it will be made). The concept of hierarchy, however, is an inherently political construct which gives power to a small percentage of organization members. Organizational culture can reify hierarchy, making it appear as a tangible, physically existing structure characterized by the formal organization plan, office size, number of secretaries, thickness of carpet, and so on.

Finally, in addition to Giddens' three functions of ideology, a fourth can be added, namely, the function of ideology as a means of control. This seems implicit in the notion of the representation of sectional interests as universal, but it requires a little unpacking. The concept of ideology as control is best expressed through Gramsci's (1971) notion of hegemony. As Mouffe (1981) points out, hegemony is frequently misconceived as the ideological domination of one class or group by another. This position views ideological struggle as a confrontation between two already elaborated, closed world-views. More accurately, hegemony involves "the ability of one class to articulate the interests of other social groups to its own" (Mouffe, 1981, p. 183). In this sense, a "collective will" is produced through "intellectual and moral reform" (Gramsci, 1971, pp. 12, 60–61). Ideological hegemony therefore involves "effective *self identification* with the hegemonic forms" (Williams, 1977, p. 18). Thus ideology functions as control through active consent rather than through passive acceptance of pre-given social formations.

To summarize this section, it is argued that ideology is materially grounded in the organized practices of social actors. Ideology constitutes subjectivity (consciousness) through its ordering of these practices into a coherent lived-world for the individual. Ideology and power are inextricably tied together insofar as ideology articulates social reality in terms of the interests of the dominant social group(s). In the context of organizations, power is most successfully exercised by those who can structure their interests into the organizational framework itself. Ideology therefore acts to support these interests by continually reproducing the structure of social practices that best serves them. In this sense, power and ideology are not purely structural phenomena, separate from the interaction of social actors: they are both the medium and outcome of that interaction, embodied in the "systems of signification" of the organization.

In the final section of this paper the above theoretical framework is applied to a specific organizational narrative, examining it in terms of its ideological functioning. The analysis will throw light on the implicit connection between organizational discourse and organizational control. Narrative will be shown to function as one of the principal means by which an organization's mode of rationality is maintained and reproduced.

Narrative and the Process of Legitimation

The current interest in the symbolic aspects of organizing demonstrates the intrinsic connection between communication and organizational cultures. Research in this area demonstrates that organizational reality is fundamentally symbolic in nature (Daft & Wiginton, 1979; Frost et al., 1985; Martin et al., 1983; Pondy et al., 1983). Organization members inhabit a symbolic environment in which they create the rules, norms and values that frame the process of organizing.

While many studies have focused on the role that organizational symbolism plays in expressing communal values, articulating shared rule systems, and so forth, few have focused on the symbolic aspects of organizational power, or on

the role of symbolism in the process of legitimation of organizational interests. In this section I want to build on the work of authors like Riley (1983), Conrad (1983), Frost (in press) and Rosen (1985), each of whom attempts to make explicit the connection between organizational symbolism and the creation and distribution of organizational power. The focus of the analysis is organizational narrative, both because stories are a pervasive form of organizational communication, and because the very structure of narrative is interesting in itself.

The story analyzed below is taken from Martin, Feldman, Hatch, and Sitkin's (1983) study of organizational storytelling. As such, the analysis is by no means an exhaustive examination of the relationship between a specific set of narratives and power; rather, it is intended to function as an exemplar of the way in which the connection between the two concepts might be fruitfully explored.

Organizational Narrative: An Exemplar

Martin et al. (1983) explore the role that stories play in demonstrating the unique qualities of organizations. Organization members tell stories to other members or outsiders to show how their organization is different from any other. Such stories can illustrate both positive and negative qualities of organizations. Martin et al. discovered, however, that "an [organizational] culture's claim to uniqueness is expressed through cultural manifestations that are not in fact unique" (1983, p. 439). In other words, stories that lay claim to organizational uniqueness occur in virtually identical forms across many organizations. Martin et al. use script theory to show that such stories generally contain common themes that address concerns that are pervasive in most organizations. Such concerns/themes include "What do I do when a higher status person breaks a rule?"; "Is the big boss human?"; "Can the little person rise to the top?"; "How will the boss react to mistakes?"; and so forth.

Martin et al. suggest that these thematic stories become an integral part of the organizational culture because they help to resolve the dualities that arise from the conflict between individual values and goals, and organizational exigencies. A duality is defined as "an issue that cannot easily be resolved because contradictory aspects of the issue are inevitably present and are simultaneously desirable and undesirable" (1983, p. 447). Thus, for example, a story about an employee chastising a higher status rule-breaker expresses the duality of equality versus inequality. Here, the contradiction between the basic societal value of equality and the inequality of organizational hierarchy is at least partially resolved by showing that such equality is possible within the organization.

The story analyzed below extends Martin et al.'s analysis by examining the ways in which narrative functions to reproduce the deep structure aspects of organizational power and rationality. Martin et al. (1983, pp. 439–40) document a story in which Thomas Watson, Jr., the chairman of the board of IBM, is challenged by a supervisor,

> a twenty-two-year-old bride weighing ninety pounds whose husband had been sent overseas and who, in consequence, had been given a job until

his return . . . . The young woman, Lucille Burger, was obliged to make certain that people entering security areas wore the correct clear identification.

Surrounded by his usual entourage of white-shirted men, Watson approached the doorway to an area where she was on guard, wearing an orange badge acceptable elsewhere in the plant, but not a green badge, which alone permitted entrance at her door. "I was trembling in my uniform, which was far too big," she recalled. "It hid my shakes, but not my voice. 'I'm sorry,' I said to him. I knew who he was alright. 'You cannot enter. Your admittance is not recognized.' That's what we were supposed to say."

The men accompanying Watson were stricken; the moment held unpredictable possibilities. "Don't you know who he is?" someone hissed. Watson raised his hand for silence, while one of the party strode off and returned with the appropriate badge.

Martin et al. suggest that the moral of this story for higher status organization members is "even Watson observes the rules, so you certainly should," while for lower status employees the moral is "uphold the rules no matter who is disobeying" (1983, p. 440). The implication is that while other corporate heads may flaunt regulations, Watson is unique in the example that he sets to all his employees.

While this interpretation provides insight into the story, it can be developed more significantly in terms of the way that the story functions to produce, maintain, and reproduce a particular meaning formation. The story can be more fruitfully analyzed from an explicitly political perspective, using the functions of ideology laid out in the previous section. While Martin et al.'s analysis of the story is largely descriptive – presenting it as a simple reflection of the organization's value system – the analysis below makes explicit the link between organizational symbolism on the one hand, and legitimation and ideological domination on the other.

The first function of ideology – the representation of sectional interests as universal – is clearly present in the story. Recall that this function enables social practices that further the interests of a particular group to be perceived as the interests of *all* groups. In the context of this story, the issue of sectional versus universal interests manifests itself in the question of adherence to rules. In terms of universal interests, the story tacitly suggests that the corporation's rules are laid down for the benefit of all employees. The fact that Watson is required to take orders from a low-status employee has the effect of temporarily suspending the corporate hierarchy, in which sectional interests are grounded. Rules, as such, appear to transcend sectional interests; all employees, of whatever rank, are required to follow the rules.

What the story obscures, however, is the fact that the formal system of rules is created *by* the corporate elite (of which Watson is the head) to protect their own interests. IBM is a profit-making organization, one goal of which is to maintain as large a share of its market as possible. Part of this involves employment of strict security to protect corporate secrets. Staying ahead of its competition in

the area of technology ensures the competitiveness of IBM products. The corporate rules that the story deals with, then, are in place for the benefit of people like Watson, and not for people like Lucille Burger.

The issue of rule-breaking becomes clearer in looking at the role of the story in denying or transmuting contradictions. In a sense, the story as a whole is a contradiction. The moral it conveys demonstrates that no one at IBM is "above the law." However, the mere fact that the story has become part of organization lore indicates that it is exceptional in some way. If Watson *was* subject to corporate rules in the same way as other employees, then this story would have little significance. The story is further contradictory in the sense that it depicts Watson simultaneously as an "ordinary human being" who can be spoken to by an employee, and as a larger-than-life figure about whom fables are told. Thus the story comments on itself: On one level it is a straightforward narrative that tells the listener/reader something about the way IBM operates; on a second, meta level, the story operates reflexively, building a particular image of Watson by saying "this is a story about the (in)famous chairman of IBM." The contradiction between Watson the individual and Watson the powerful corporate executive is obscured by the story's focusing on his interaction with an employee, to whom he ultimately defers.

The material reality of Watson's corporate position is effectively obscured by placing the narrative in an interpersonal context, and yet it only has impact because of the huge divide that separates the protagonists on the corporate hierarchy. In this sense, the effectiveness of the story depends on a tension between disparate elements: the story tells us that position on the corporate ladder means little when it comes to following rules (rules are for the good of everyone), but at the same time the listener/reader must appreciate Watson as a highly charismatic figure who commands the respect of everyone.

The story perhaps best serves an ideological function through the process reification. Simply by virtue of its narrative structure, the story form lends itself to an infinite number of recountings. As Martin and Powers (1983) point out, an organizational story is easier to recall than a set of statistics containing the same information. Stories, of course, occur in all cultural settings, and one of their aims is to present the listener with a "slice of life" that exemplifies and animates some aspect of the culture in which the story is set. Through the ongoing process of retelling, events in a story become taken-for-granted by members of the culture. Even in the case of apocryphal tales, the division between fiction and reality is blurred to the point where a narrative event becomes "real" if it is retold enough times.

Of course, the effectiveness of a story depends at least partially on the quality of its telling. In the case of the example used here, there is no way of knowing how this story might be related in the organizational context. No doubt the basic structure remains fairly constant, while the embellishments will differ with each recounting. However, there is enough detail in the example given to demonstrate the process of reification in operation. First, there is a sharp contrast in the way that the two principal characters are described in the story. In fact, little

or nothing is said about Watson himself, except that he was "surrounded by his usual entourage of white-shirted men." The description of Burger, on the other hand, is detailed by comparison. She is "a twenty-two-year-old bride weighing ninety pounds whose husband has been sent overseas." We are told that she is wearing a uniform that is "far too big" for her, and that she is very nervous at the prospect of her confrontation with Watson.

This relatively detailed description of Burger serves to accentuate the status difference between her and Watson. In this context, the story draws heavily on traditional sex-role stereotypes. For example, Burger is not simply a woman, but a "bride," suggesting both the traditional role of homemaker, and a strong sense of naivete: she has suddenly found herself, through circumstances beyond her control, in a position to which she is ill-suited. This is confirmed and accentuated by the ill-fitting uniform, which suggests an incongruence between her and the role she is required to perform. The term "bride" thus suggests an innocence and dependence which contrasts sharply with the cynicism of the "real" corporate world. Furthermore, her weight implies lack of physical stature which, in most Western cultures at least, is associated with lack of authority. Again, this serves to throw into sharp relief the status difference between the two protagonists.

The lack of detail provided for Watson serves to enhance his status as an almost mythical character. The term "entourage," used to describe the men accompanying him, is a word normally applied to those who attend royal figures. In addition, Watson at no time speaks during the course of the story. At one point someone even speaks for him ("Don't you know who he is?"). Even at a moment where he might have spoken, he simply raises his hand to gain the attention of those around him. All of these details, although not central to the ostensible theme of the story, serve to juxtapose Watson sharply with Burger. What the listener/reader gets is not a picture of an ordinary organization member, but a figure of heroic proportions. The story thus serves to reify Watson-as-hero by demonstrating his effect on the day-to-day life of the organization.

In addition, and perhaps most importantly, the story serves to reify ideologically the organizational rule system itself. Organizational rules are humanly constructed systems of norms which provide members with an organizational grammar through which action is framed and contextualized. Rules provide direction for organizational structuration, both enabling and constraining the behavior of organization members. In contrast, the IBM story negates the human element inherent in organizational rules by stripping them of their enabling/constraining grammatical function. Lucille Burger's single-minded adherence to the rules reflects not so much a heightened sense of corporate loyalty, but rather an enforcing of rules *because they exist.*

In a sense, the story demonstrates rules as having an importance all their own, independent of the function that they perform within the organization. Placed in this context, the rule system and the process of organizing are bifurcated, existing in an almost antithetical relationship. Such an antithesis is often experienced by people who work in large, bureaucratic institutions. Frequently the overwhelming feeling is that the bureaucratic structure quite happily perpetuates itself via an elaborate and impenetrable system of rules (exemplified

by the ubiquitous triplicate forms), and continuously works against the accomplishment of the organization's ostensible goals. As a result of this reification process organizational activity "takes on the character of a thing and thus acquires a 'phantom objectivity,' an autonomy that seems so strictly rational and all-embracing as to conceal every trace of its fundamental nature: the relation between people" (Lukács, 1971, p. 83).

Finally, the narrative performs the ideological function of control by providing an example of "intellectual and moral leadership" for organization members. As Gramsci (1971) has indicated, the process of hegemony works most effectively when the world-view articulated by the ruling elite is actively taken up and pursued by subordinate groups. In the case of the IBM story, we have a striking example of a situation in which organization rules are rigorously reinforced by subordinate members. The story has all the more impact insofar as those rules are enforced from the bottom up, rather than from the top down. In this context, the story conveys the legitimacy and appropriateness of IBM's organizational structure. It suggests that employees are prepared to go to extreme lengths to protect that structure, even to the point of incurring the wrath of superiors. Commitment to the system is therefore identified and equated with its legitimacy.

The above analysis thus provides a reading of the ideological function of the IBM story, demonstrating ways in which it is possible for narrative, as a social practice, to reproduce the dominant meaning formations of a particular social structure. Does this mean, therefore, that *all* narratives produced in this context will be subject to and reproduce the dominant ideology? Hall appears to answer this question in the affirmative: "Every social practice is constituted within the interplay of meaning and representation and can itself be represented. In other words, there is no social practice outside of ideology." However, "it does not follow that because all practices are *in* ideology, or inscribed by ideology, all practices are *nothing but* ideology" (1985, p. 103).

If ideologies are conceived as "systems of representation" (Althusser, 1971; Hall, 1985), that is, as systems of meaning by which we are able to identify our relationships to the world and others, then ideology becomes an essentially discursive phenomenon. However, there is no *necessary* correspondence between discourse and ideology. All discourse does not simply reproduce the dominant ideological meaning system in which it is located. As indicated earlier, all discourse, as ideology, is potentially transformative in the sense that it can create a disjuncture between its interpretation and the world-as-experienced. All discourse, while often functioning as a "strategy of containment" (Jameson, 1981, p. 53 et passim), i.e., as a constraint on thought and action, can also function simultaneously as a means of enablement, as a vehicle through which social actors can radically transform the way they conceive of a particular social structure.

Placed in this context, concern about ideological versus nonideological discursive practices is misplaced. As Hall states above, all discourse may take place within ideology, but this does not make discourse identical *with* ideology. The key issue is not, therefore, what a nonideological narrative might be like, but

rather how a particular narrative, or cluster of narratives, might function to enable or constrain behavior within the context of certain ideological meaning formations. The degree to which a story demonstrates a transformative or emancipatory capacity suggests its relationship to dominant ideologies. Thus the analysis of the IBM story is potentially transformative in the sense that it calls into question the "received" interpretation of the story; in other words, a disjuncture is created between the organization-as-experienced and the reading of the ideological themes in the story. This alternative interpretation provides "discursive penetration" into the meaning formations that constitute the social practices of IBM, allowing the possibility for new ways of understanding those practices.

A final point relates to the choice of story. It is obvious that the analysis of a single narrative in no way constitutes an in-depth examination of the ideological meaning formations in operation at IBM. The purpose here was simply to use this story to demonstrate how such an analysis might be accomplished. Indeed, to even talk about *a* story representing *an* ideology does little justice to the complexity of social structures in general. Hall (1985, p. 104) presents the complex relationship between ideology and discourse thus:

> Ideologies do not operate through single ideas; they operate, in discursive chains, in clusters, in semantic fields, in discursive formations. As you enter an ideological field and pick out any one nodal representation or idea, you immediately trigger off a whole chain of connotative associations. Ideological representations connote – summon – one another. So a variety of ideological systems or logics are available in any social formation. The notion of *the* dominant ideology and *the* subordinated ideology is an inadequate way of representing the complex interplay of different ideological discourses and formations in any developed society.

Further research into organizational narrative must carefully explore the "clusters" of narrative that constitute the complex and interdependent meaning systems of organizational structuration. There is no simple correspondence between power, ideology, and narrative. It is too simplistic, for example, to assume that a particular narrative cluster asserts a consistent, monolithic organizational reality; such an analysis must regard the cluster in the context of other clusters, relevant organizational practices, conflicting sub-cultures, economic conditions, and so forth. The power structure in an organization is by no means unitary, and its ongoing structuring is dependent on this complex system of discursive formations that continually creates and recreates the interdependent and interlocked ideological meaning formations in an organization.

Conclusion

The everyday use of narrative in organizations is one of the means by which the power structure of an organization is produced and reproduced. In the context

of this article, power has been conceived in terms of the underlying, deep structure rule system (the "mode of rationality") which frames organizational behavior and determines appropriate and inappropriate social practices. The ideology of an organization refers to the ways in which members, as social subjects, become qualified to participate in and create the organizational reality (mode of rationality) that is represented to them. This process of representation occurs through the discursive practices of the organization.

Pateman (1980, p. 16) states that "every act reproduces or subverts a social institution . . . . If every social institution is an organization of power . . . then every act is political for it either sustains or subverts a given organization of power." Organizational narrative can therefore be viewed as political in that it can potentially both sustain and subvert the underlying logic of an organization's power structure. Narratives can reaffirm or call into question the rationality of organizational practices.

Organizational narratives thus exist as an instantiation of the deep structure power relations in an organization to the extent that they help to determine the way that organizational practices are interpreted. The narrative form is a particularly powerful means of accomplishing this in the sense that it provides organization members with an easily identifiable exemplar of organizational "reality." Contrary to most research on organizational symbolism, narratives do not simply *inform* organization members about the values, practices, and traditions to which their organization is committed. Rather, they help to *constitute* the organizational consciousness of social actors by articulating and embodying a particular reality, and subordinating or devaluing other modes of "organization rationality."

The analysis of the IBM story negates the pervasive tendency to treat all narrative forms as non-political unless they take up an overtly political topic. On the contrary, stories are narrative devices which do not exist independently of the ideological meaning formations and power relations within which they are structured. They are produced by and reproduce these relations, helping to position subjects within the historical and institutional context of the material conditions of existence. A politically informed interpretation of institutional narrative must therefore explicitly take up this duality of structure, and uncover its "strategies of containment."

Narratives are not generated in a socio-economic vacuum but are an expression of the material conditions that a particular mode of production generates. The process of narrative helps to reproduce these material conditions by articulating an internally coherent sense of itself and the world that it describes. In other words, narratives punctuate and sequence events in such a way as to privilege a certain reading of the world. They impose an order on "reality" that belies the fact that such a reading is a largely ideological construction that privileges certain interests over others. Further research must therefore take up the possibilities that a political reading of narrative provides for the analysis of organizational cultures. I have merely provided some pointers in that direction. The theoretical framework laid out here constitutes a foundation upon which narratives gathered in actual organizational settings can be analyzed.

Talking to Children in Western Samoa

Elinor Ochs

Child Language: Where Culture Fits In

Child language has been and continues to be primarily the province of cognitive psychologists. If one is looking for a paraphrastic term for "child language," one often selects "developmental psycholinguistics." Child language has largely been seen as the assessment of how cognitive and linguistic processes influence one another. Psychologists and linguists alike have been particularly keen to examine the developmental sequencing of language to discover perceptual and conceptual preferences that may underlie and partially account for linguistic structures dominating the world's language (cf. research related to word order preferences in child and adult language: Bates 1976; Bever 1970; Bloom 1970; Bowerman 1973; Braine 1963; Radulovic 1975; Slobin 1973; for example).

Recently, language development has become a major focus of interest among sociologists and anthropologists (cf., for example, the contributions in Ervin-Tripp & Mitchell-Kernan 1977). This interest stems from several directions. There has long existed an interest in childhood and socialization, particularly among anthropologists (e.g., Hogbin 1943; Kluckhohn 1947; Mead 1928, 1930; Opler 1946; Raum 1940). But the attention on child *language* as a major focus has been, in part, a consequence of John Gumperz's and Dell Hymes's encouragement of ethnographies of communication (Gumperz & Hymes 1964, 1972; Hymes 1961, 1973, 1974). Guides motivated by this framework have stressed the importance of studying how a child is socialized through language, as a way which adult norms of language use can be uncovered (Sherzer & Darnell 1972; Slobin 1967). Another major influence on sociological and anthropological researches into child language has been from studies of ethnically

Source: *Language in Society* vol. 11, 1982, pp. 77–104.

socioeconomically diverse children in formal classroom settings (cf. Bernstein 1971; Cazden 1972; Gallimore et al. 1974; Philips 1970). The failure of our educational institutions to communicate effectively with these children has led several leading funding sources to support research into sociolinguistic dimensions of child language. (These researches have tended to focus on the older child, i.e., school age.)

The goals of what may be called "developmental sociolinguistic" studies have been twofold: On the one hand, there is the desire to integrate patterns of child language behavior with local patterns of social organization, and with members' values and beliefs (both collective and diverse). On the other hand, there is the desire to present the cognitive psychologist with these data, to point out that what has been assumed to be "normal" development is culturally restricted. There are many ways to develop language "normally," and any theory of child language or child development must consider variation in means and modes of communicating across developmental time.

My own research on Western Samoan child language is an attempt to meet both of these goals. I propose that how a Samoan child speaks – both form and content – is strongly influenced by social norms for using language in Samoan households and by certain attitudes and beliefs concerning individuality, knowledge, and human competence. My intention is to use this material to engage in a dialogue with developmental psycholinguistics; in particular, to indicate those aspects of child language development that society influences and those it does not.

For example, social norms within traditional Samoan communities influence the acquisition of *case marking* by Samoan children. Samoan children productively acquire ergative case marking late in their language development (after 4 years of age). This finding contrasts with that of Schieffelin (1979), who found that Kaluli children (Papua New Guinea) acquire ergative case marking quite early. The most important source for this difference in acquisition is sociological. For Kaluli speakers, this case marking is always used (given certain grammatical constraints). For Samoan speakers, this is not the case. Ergative case marking is sociologically *variable* within Western Samoan village communities. It rarely appears in speech of family members within households. It is more common in "speaking out" settings (i.e., between nonfamily members). This type of case marking is also more characteristic of mens' than womens' speech. This sociological distribution affects the acquisition of ergative case marking. Samoan children do not acquire this marking early largely because they are not exposed to it in their social environment, the household setting, where women and other family members are primary socializing agents.

This analysis has consequences for the study of how a child acquires morphemes. Previously, all attention has been turned to perceptual and conceptual sources for when children acquired particular morphemes (cf. Brown 1973; Slobin 1973). Researchers have not examined the spontaneous use of these morphemes in the speech of adults in the community to see if sociolinguistic variation could be an influence on the acquisition of particular morphemes.

Social Status, Cultural Beliefs, and Child-Caregiver Verbal Interaction

The present discussion will not focus on the relation between social norms and morphological aspects of child language, but rather on *the relation between social norms and the organization of verbal interactions between very young Samoan children and their caregivers.* Caregiver responses to the talk of young children will be related to Samoan norms of caregiving, in particular to behaviors associated with particular statuses of caregiver. In this discussion, I will compare Samoan norms and caregiver responses with those described in the psychological literature for Western middle-class caregivers.

In addition to discussing the effect of caregiver social status on verbal interaction, I will examine the *influence of Samoan concepts of human nature on verbal interactions between caregivers and young children.* Again, here I will compare traditional Samoan caregiver attitudes with those described by psychologists for Western middle-class caregivers.

What I do not want to do is to simply compare behaviors of these two sets of caregivers, to say that Western middle-class Anglo mothers respond in one way but Samoan mothers respond in another way. My intent is not to provide a catalogue of comparisons. Rather, it is to indicate one or two strikingly different responses to young children and to use those differences as the basis of understanding the *cultural sources* of these behaviors. We will see that in using language a particular way, caregivers are acting on certain assumptions concerning the capacities of human infants and young children, and concerning the nature of the caregiver role, the behaviors expected of those providing care. It is in the understanding of these assumptions that we can, in turn, understand the process of socialization through language. A caregiver, in using language a particular way, not only acts on assumptions, but conveys those assumptions to the child as well. The caregiver provides the child not only with linguistic input, but with cultural input as well; for example, a set of procedures for interpreting situations, for indicating the appropriate behavior expected of the child and others within and across situations.

The Data Base: Data Collection Methodology

While this study draws on ethnographies of American and Western Samoan societies (Mead 1928; Shore 1977) and on the earlier work of Samoan child language by Keith Kernan (1969), it is primarily grounded on a year's observation (1978–1979) of young children and adults within a traditional Western Samoan village. The study was carried out by Alessandro Duranti and Martha Platt, in addition to myself. The village is located on the island of Upolu, approximately 18 miles east of the capital, Apia. Our study focused on young children at the early stages of language development. We recorded through audio and video taping 6 children from 6 different households, who were between 19 and 35 months

at the onset of the study. As will be discussed below, these children participated in extended households, and 17 other children under the age of 6 were recorded as well. Recordings were made every 5 weeks, lasting 3 to 5 hours each period. Three households were recorded over 10 months, two over 9 months, and one over 7 months. A total of 128 hours of household interaction was audiotaped and 20 hours were videotaped, producing approximately 18,000 pages of transcript. Transcriptions were made by members of the households or by neighbors who were acquainted with the families in the study. Each transcriber was trained by a member of the research project. Each tape was transcribed initially by the native speaker and then checked by a researcher. In many cases, tapes and transcripts were checked a second time with those caregivers who participated in the specific interactions recorded. In addition to these materials, 6 hours of audio and 1 hour of video recording in formal classroom settings were transcribed. The present discussion will rely, however, primarily on the household interactions observed and recorded.

Social Status and Child-Caregiver Verbal Interaction

Social Distribution of Caregiving

As has been described by Mead (1928) and Kernan (1969), caregiving in traditional Samoan communities is distributed over several family members and over several generations. While mothers are the primary caregivers during the early months of life, assistance is provided by siblings of the mother, by male and female members of both the mother's and father's family (their generation and generations above), and older siblings of a young child. As several related families often reside together in a single compound, there is typically a large pool of caregivers available. Fathers are typically not available for caregiving, with the exception of occasional fondling of very young infants. They tend to spend the daylight hours outside of the house, either working in the plantation or in the capital, or, if they are titled men, meeting formally or informally with other household heads (chiefs or orator status) elsewhere in the village.

The role of the mother as caregiver changes over developmental time. During early infancy, the mother spends long periods of time with her child, but usually she is not alone; she is accompanied by some school-age child who will carry out some caregiving responsibilities. As the infant matures, the mother spends less time with the child, and a sibling caregiver is given greater caregiving responsibilities. It is often the case that several siblings cooperatively provide care for one or even several young child(ren).

As Kernan noted, as the young child becomes more competent, approaching the age of three, he/she will tend to spend less time with caregivers and more time with peers of approximately the same age. These peers form little groups, called *aukegi*. These aukegi remain strong throughout one's life cycle, and provide support for members on numerous occasions.

Caregiver Status and Comportment

High/low status comportment. In traditional Samoan communities, status is based on such attributes as relative age, generation, whether or not one is titled (a chief or orator), rank of title (chief over orator, high over low chiefs), rank in church organization (e.g., pastor), whether one has a government position, and its rank. Although there are specific behaviors expected of particular positions in the village, there are nonetheless certain characteristic manners that all those of relatively high status display. Two of these high status characteristics are of interest in this discussion: (1) low activity, and (2) minimal awareness of and involvement in activities of others in the immediate environment.

Low activity. Relative status is highly contextbound (Shore 1977). One assesses one's rank with respect to others who are co-present. Thus, for example, an orator will have higher rank than untitled men who may be present, but will have lower rank than a co-present chief. A chief who is of a higher generation or rank will have higher status than a younger or lower ranking chief. A host chief will take on the demeanor of a lower ranking person in the presence of his guest. Titled persons of all ranks will assume a lower status with respect to the leader of the church to which they belong (e.g., pastor, priest).

Once rank has been calculated, certain behaviors follow. One of the most salient is that the person of higher rank is expected to exert very little physical energy, to be relatively inactive (Shore 1977). For example, within a house, higher status persons tend to remain stationary. They sit on a mat and items are brought to them by lower status persons. In formal meetings, orators and chiefs do not move. If items (e.g., food in payment of a fine) are to be distributed, an untitled person or persons will carry out this task, while the titled members remain seated. In a family household, either an untitled woman or a child will serve food and fetch other items such as cigarettes for the titled household head. If a relatively high status person must go outside his/her house, he or she tends to move in the least unencumbered manner possible. For example, one usually observes high status persons walking with their hands free from objects, with the exception of an umbrella for protection from sun or rain. Younger, untitled persons will be asked to carry needed items to the destination of the higher status person. Actual movement itself is at a slow pace in the case of high status persons.

Minimal awareness and involvement. Additionally, high status persons tend not to evidence an awareness of or interest in the activities of lower status persons immediately around them. In Samoan houses there are traditionally no outside walls and no interior walls. Many different activities take place in the same vicinity and certainly within eyesight of many residents. Nonetheless, those of relatively high status will often behave as if they are unaware of these activities as if they were not in fact "present" while these activities are being performed. Thus, for example, if two women start arguing or a fight begins between two young men or a young child begins to fret, the high status party will act in such a way as to not acknowledge these situations, particularly in their initiation. The high status person will at first ignore what is happening, carrying on whatever [illegible] engaged in doing. If there is a situation to be resolved, I

higher status party lets others attempt to pursue this process. If no one else is present or if others cannot resolve the situation, the higher status person will then involve him- or herself in the event. Typically, in the latter case, a lower status villager or family member will report (*faitala*) to the superior the nature of the situation. Following this, the higher status party may direct the other to carry out some decision or in more serious cases will convey the decision directly to those involved. In the most serious cases, the high status person may find it necessary to move to the location of the activity in order to resolve the problem at hand. The persons involved would then likely be negatively sanctioned on an official level.

Status in caregiving. These two behavioral parameters distinguish statuses among caregivers within a household. We have mentioned that there is a wide pool of caregivers typically available within an extended family. These caregivers are ranked primarily in terms of age and generation. Where there is more than one caregiver present, the older caregiver occupies the higher or highest status. Thus, for example, if a mother and an older sibling of the young child are providing care, it is the mother who is given this status. If a 12-year-old and a 6-year-old sibling are providing care, it is the 12-year-old who assumes this status, and so on. Once again, status is determined in terms of who else is present who can take on caregiving responsibilities.

Just as with other persons of higher rank, "higher" level caregivers tend not (or try not) to move. If there is a lower status caregiver present, the higher status caregiver will try to remain seated on a mat, while the other fulfills various tasks requiring physical movement. This results in a distribution of caregiving labor in which the more active care is in the hands of the lower ranking personnel and the less active care is provided by the higher ranking person. The crucial distinction concerns the bounds of the seating mat. If at all possible, the higher ranking caregiver tries not to remove herself/himself from the mat. Captured on one of the videotapes is a scene in which a mother wishes to have a piece of wet clothing taken away from the immediate area but no assistance is available. She resolves this situation by taking a whisk broom lying beside her and using the broom to push the item a distance away. This involved some movement, in particular the raising of her bottom off of the mat, but at all times the woman kept her knees touching the mat, thus retaining a sitting-like position. Young caregivers, if present, are relied upon to be mobile. They are primarily the ones to change soiled clothes, wash, and provide food for the child. They also carry young infants to their mothers for breastfeeding and/or cuddling until the infant has learned to ambulate itself and is able to crawl directly to the mother. If a younger caregiver is present, higher status caregivers (e.g., mothers) will also strive not to involve themselves directly with the ongoing interactions among younger persons in the immediate surroundings or with spontaneous actions of a younger child. If, for example, an argument takes place, the higher status caregiver (e.g., mother) will at first leave it to the peers themselves to resolve it, and if it escalates, to an older sibling caregiver to handle. If it is unresolvable through these means, one or the other of the children will turn to the higher status caregiver and appeal to her to take some action. Another case of this reluctance to involve oneself

concerns attending to the actions of small children, actions which have not been motivated by some directive from the higher status caregiver. Ideally, if lower status caregivers are present, they will be the ones to watch that a young infant will not fall over the edge of the house or eat stones or touch a burning pot.

Verbal Interaction between Child and Caregiver

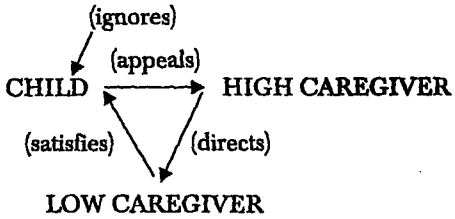
The social distribution of care is not only fascinating in its own right; it is directly relevant to understanding the organization of conversation in which young children are participants. Expectations that the young child comes to have concerning the nonverbal behaviors of different caregivers will be matched by expectations concerning the verbal behaviors of these household members.

To see what these expectations are, let us focus on one particular type of recurrent verbal sequence. In this sequence, the child expresses verbally that she/he is distressed and appeals to a high status caregiver to satisfy her/his needs. Very often these interactions proceed as follows: Child complains to mother, mother either ignores complaint or turns to a younger caregiver present to satisfy the child, and the younger caregiver proceeds to act on that directive. For example, in the following interaction, a young girl, Pesio, aged 2; 4 months, whines for a piece of sugarcane:

(1)

Pesio	*Others*
[whining to mother, Akoa]	
U ga la	
tns/ asp that	
ma ma ma ma ga/	
(*?*) *that/*	
	?: E, (?) [to P?]
	Hey! (?)
	Akoa: Lea ia ia [to sibling]
	Now here here
	amai,
	bring,
	ia amai
	here bring [*sugarcane*]
	ke au laga
	to me because
	kagi kama
	cries child
	lea//(?).
	this//(?).
	(*Now bring here, bring it to me because this child cries.*)

In this interaction, Pesio is in effect begging for sugarcane. Her mother does not respond to Pesio directly but rather turns to a sibling of Pesio, approximately 6 years old, and directs the sibling to bring the food item to the mother h



A more elaborate sequence in which the mother initially ignores the child is evident in the next example. Here Pesio, in the same recording session, has urinated in her pants. She turns to her mother, Akoa, sitting next to her to ask her for assistance:

(2)

Pesio	*Others*
Koa/	
Akoa/	
di*/ (*=si'i)	
carry (me)/	
pe*/ (*=se)	
now/	
mo pa pi igo/	
(?) burst pee(?)/	
maua// pi /	Akoa: // E lē [to Elenoa]
got //pee/	*tns/asp not*
	maua ni
	have any
papa pī/	vao faapea//nei
burst pee/	*grass like here*
	i ō
	over there
	a Elenoa?
	right Elinor?
	(America doesn't have grass like here, right Elinor?)
	Elenoa: Ummm? [to Akoa]
ua pa// pī/	Akoa// E leai se [to Elenoa]
tns/asp burst pee/	*tns/asp not any*
	vao faapea
	grass like here
	i ō
	over there.
	(There isn't any grass like here over there.)
	[Akoa & Elenoa talk for 25 more turns.]
[whining to Akoa]	
pe* pa pi (*se)	
now burst pee/	
[whining to Akoa]	
a pi li /	
(?) pee here/	Akoa: kago avaese* [to sibling]
	touch takeaway
	le pī! (*ave ese)
	the pee
	(Get and remove the pee!)

In this example, the mother chooses to ignore Pesio's predicament initially. Rather, she turns to me and strikes up a new topic. It is only after repeated appeals by Pesio and a total of twenty-eight turns exchanged between Akoa and myself that Akoa eventually acknowledges the situation at hand. Notice that this behavior is entirely in keeping with that described of high status persons generally in traditional Samoan social life. Also, as in example (1), the mother does not directly respond to the child, but turns rather irritatedly to a 16-year-old sibling who is present, directing her to alleviate the distress of Pesio.

The child-caregiver verbal interaction in such sequences can be represented as follows:

If the child secures the attention of the high status caregiver, the sequence moves from child to high caregiver to low caregiver to child (ABCA sequence).

Samoan and Anglo Child-Caregiver Verbal Interactions

The young Samoan child learns to participate in verbal interactions with adults and older siblings in ways that are strikingly different from those described of middle-class Anglo children. The developmental literature has provided numerous generalizations concerning the role of the caregiver in the development of communicative abilities of the child. All of this literature dwells on one child interacting with one other party, typically the mother. All of this literature treats two-party interaction as the mechanism through which verbal and nonverbal conventions are transmitted. The dialogue is the endpoint of communicative competence and it is given a detailed developmental history. Initially, there is the two-party exchange of "turns" between mother and child, for example mother talks-child breastfeeds (Jaffe & Feldstein 1970), child smiles-mother smiles (Stern 1974, 1977), child gestures-mother gives verbal response (Trevarthen 1977). The development of communication is seen as the gradual employment of conventional symbols (e.g., language) and conventional procedures for engaging in dialogic interaction.

There is a question as to whether or not this literature represents most middle-class Anglo family interaction. Putting this aside, we can see that *the assumptions about "normal" caregiver-child interaction (verbal and nonverbal) simply do not represent the Samoan child's social life.* The literature describes situations over developmental time in which child exhibits some behavior or expresses some state or idea and the caregiver responds directly back to the child (approving, disapproving

querying, making topic-relevant remark, shifting topic, etc.). This interaction produces dyadic exchanges of the ABABAB . . . type. While we do not want to say that young Samoan children and their caregivers do not engage in this type of verbal/nonverbal interaction, it is simply not the case that this type of interaction is the *primary* one in which the Samoan child is expected to participate. Whereas middle-class European households very often contain one child interacting with one caregiver, traditional Samoan households rarely have so few family members co-present. The spatial organization of family households together in a single compound, the high number of children per family (average number: six), the absence of interior walls that allow members to interact in isolation or small groups – all these factors create a more populated social environment for the Samoan child. Samoan children learn to interact with several family members, not just one, very early in their lives. They learn specific norms concerning verbal overtures to caregivers and appropriate caregiver responses. Unlike the middle-class Anglo child described so often in the literature, the Samoan child does not come to expect a direct response to most of his/her overtures, rather; usually the overture will be socially redirected and the response assigned to the appropriate family member.

Samoan Epistemology and Caregiver Language: Why Samoan Caregivers do not "Expand" Children's Utterances

What is an "Expansion"?

One of the most striking characteristics of Samoan caregiver language (both that of sibling and adult caregivers, high- and low-status caregivers) is the *absence of expansions*. It is striking in that this feature has been taken as a key marker of language addressed to young children (cf. Brown et al. 1973; Cazden 1965; Cross 1977; Newport 1976; Snow 1972). An expansion is an utterance of a caregiver that follows an utterance (or a series of utterances) of a child in which the child's utterance (or utterance series) is recouched in more appropriate, that is, adult, grammatical form. Examples of expansions are:

(3)

Child (Brenda)	*Mother*
lei	
fae	Hm?
(Brenda is looking at electric fan.)	
fae	bathroom?
fani	
fae	Fan! Yeah.
khu	
	Cool, yeah. Fan makes you cool.

(Scollon 1976:108)

(4)

Mother (+ context)	*Child (Allison)*
(A tries to turn top on jar in M's hand.)	
	Mama/Mama/ə wídèt/
Open it up?	
	up/
Open it? O.K.	
(M opens it; tries to get stick.)	
	(Bloom 1973:170)

In (3), the mother produces several expansions: She repeats Brenda's utterances in their correct phonological form, "fan" and "cool." She then takes the series of utterances produced by Brenda and rephrases them in the single utterance "Fan makes you cool." In (4), Allison's mother rephrases Allison's utterances with a questioning intonation.

This description of an expansion is *formal.* To understand what an expansion is, however, we must consider its *functions* in verbal interactions between young children and caregivers. In considering its function, most child language research has concentrated on its communicative and linguistic functions. The literature entertains a discussion as to the "pedagogical" use and effect of such expansions on the learning of language. Cazden (1965) as well as Newport et al. (1977) argue that such responses, compared with other topic-relevant responses, are not more language-facilitating. Brown (1977) and Cross (1977) argue that such expansions serve as communication checks and facilitate the exchange of information between caregiver and child. Caregivers use expansions as a means of assessing whether or not they have correctly understood what a child is expressing.

This explanation, however, does not shed light on why one society would make use of expansions and another not. It does not shed light, because it is not a full explanation of an expansion. In using expansions, caregivers within a society are doing more than verifying the communication. They are, through language, responding to situations in a culturally appropriate manner. They respond in this way because of their own enculturation, and, again through language, they are transmitting this cultural knowledge to the child or children with whom they are interacting.

Cultural Assumptions and Procedures Underlying Expansions

When a middle-class Anglo caregiver expands the utterance or utterances of a child, she or he is:

1. assuming or acting as if the child has performed an *intentional* social act, i.e., as if the child directs his action towards a social goal;
2. providing an interpretation of an *unclear* intention (i.e., making a hypothesis); and
3. adopting, in part, the perspective of the child (*decentering*), so that the child's intent may be assessed; in so doing, the caregiver adjusts to the child's *egocentrism.* (cf. Braunwald 1977).

These dimensions reflect a particular set of cultural values and beliefs. Western Samoan caregivers living in traditional villages do not share these values and beliefs; thus, they do not respond to infants and young children in the same way as middle-class Western caregivers do. Let us consider each of these dimensions separately and provide more detailed differences in the two cultural systems.

Assumptions concerning a child's capacity to act intentionally and socially. One of the most distinctive characteristics of middle-class Anglo caregivers is their willingness to engage in communicative exchanges with the smallest of infants. Even in the first few days of life, these caregivers have been observed holding the infant in a face-to-face position (vis-à-vis the caregiver) and verbally and nonverbally responding to the infant. In these days and in the coming months, the caregiver acts as if the young child has the capacity to act intentionally, in a directed, goal-oriented manner (Shorter 1978). Nonverbal behaviors and vocalizations are treated as if they were motivated, purposeful. A smile, a vocalization is treated as a greeting (Stern 1977), arm gestures are treated as reaches, rejections, attention-getting devices (Bates et al. 1979; Stern 1977; Trevarthen 1979). Long before the child has actually produced its first word, it is treated as if it in fact does have something to "say." This perspective is brilliantly captured in the observations of Trevarthen and his colleagues of British mothers with their infants:

> As a rule, prespeech with gesture is watched and replied to by exclamations of pleasure or surprise like "Oh, my my!", "Good heavens!", "Oh, what a big smile!", "Ha! That's a big one!" (meaning a story), questioning replies like, "Are you telling me a story?", "Oh really?", or even agreement by nodding "Yes" or saying "I'm sure you're right".... A mother evidently perceives her baby to be a person like herself. Mothers interpret baby behavior as not only intended to be communicative, but as verbal and meaningful. (Trevarthen 1979: 340)

When young children actually begin producing words, this set of assumptions by the caregiver continues. The caregiver, typically the mother, considers the young child to be expressing somewhat imperfectly a communicative intention. When the caregiver rephrases the child's utterance as an expansion, the caregiver is indicating to the child just what she (or he) takes that intention to be.

This assumption about the capacity of infants and young children to control and direct their behaviors to social ends is not shared by traditional Western Samoan adult and sibling caregivers. While infants and caregivers have considerable physical and social contact with one another, they do not engage in the communicative-like interactions to the extent described by Trevarthen and others. Infants are sung to and cooed over to distract them from their hunger or to put them asleep or simply to amuse them; they are not "greeted" (Stern 1974, 1977) nor are their vocalizations or gestures typically treated as social acts.

To understand these differences in Anglo and traditional Samoan caregiving, it is useful to turn to Samoan concepts of human nature in general and the nature of children in particular. Here I will be drawing on the ethnographic

observations of Mead (1928) and Shore (1977), as well as on primary observations of the members of our research group.

From a Samoan perspective, people have little control over their actions. Persons are not conceptualized as integrated beings; they do not have a central control mechanism that organizes and directs human actions and states. Bodily actions and functions are associated with particular body parts and not with a focal governing source. Thus, Samoans tend to say "Legs walk" (*ua savali vae*. "The hand writes" (*ua kusi le lima*), "The head (is) dizzy" (*ua niniva le ulu*, rather than "I/you/he, etc., walks, writes, (is) dizzy." Rather than persons generating states of being, these states are often seen as situationally or externally caused. The term for "sad" is *fa' anoanoa*, which literally means "makes sad." Members are seen as being in or falling into certain states. The term *musu* could be translated as "to refuse" but the usual Samoan interpretation is that of "being in an obdurate or unwilling state." Similarly, the terms *fia 'ai* and *fia inu* could be translated as "want eat" and "want drink," but are typically interpreted as the states of being "hungry" and "thirsty." There is no vocabulary item for "individual," for "personality," for "self." Syntactically, the de-emphasis on individual, centralized control is manifest in the fact that there is no true reflexive construction in the language (although a forced paraphrasing is possible). Thus, Samoans do not naturally produce a construction such as "He cut himself"; rather, one would tend to associate the cutting or the state of being cut or wounded with the specific body part affected, as in *ua lavea le lima* ("The hand is cut/wounded.").

All of these linguistic facts suggest a concept of person that is fragmented and not strongly in control of actions and states. This concept is further supported by two basic notions in traditional life – the notion of *amio* (natural behavior) and *aga* (socially appropriate conduct). These two concepts have been discussed in depth in a brilliant analysis by Shore (1977). While amio can sometimes refer to "good" ways of behaving, it is most often used to refer to natural drives that lead persons to act in socially destructive ways. One's amio is a strong force and can dominate a person in particular situations. For example, one's amio is likely to emerge when one drinks too much beer. In a state of drunkenness, what little control one has diminishes and natural impulses lead one to cause trouble (*misi*), for example, to fight or say angry words.

When amio leads to socially offensive behaviors, the actor is held responsible in the sense that some form of negative sanction will be imposed. However, the action itself will not be seen as an outcome of the actor's own control or direction (a product of his *intention*). Intention is not an issue. *Only the social consequences of the action are at issue.* It is one's amio rather than one's own directed thinking that is the source of the violation.

When the social group imposes a negative sanction, the sanction is seen as a means of controlling the emergence of such behaviors. Members would not be able to control their amio, it is felt, without the vigilance of the group. Indeed, the group not only assists in containing amio, it assists in the maintenance of socially appropriate conduct, what is known as *aga* (cf. Shore 1977). Publicly acceptable behavior is enforced in casual and noncasual contexts through public

pressure, expectation, and demands. The process of socialization is seen as the transmission of aga from caregiver to child.

How do these concepts of human capacity relate to Samoan childhood and the nature of caregiver–child interaction in traditional settings? While adults are considered to have little control in suppressing amio and maintaining aga, children are considered to have even less control. Infants and toddlers are initially seen as incapable of responding to social instruction and sanctions. Mead (1928) describes the attitude of helplessness that sibling caregivers express in curtailing the behaviors of their charges. Very young children are felt to resist control and be highly independent. From a Western point of view, these young children appear to be indulged by other members of their social environment, allowed to carry out behaviors that otherwise (in the case of the older member) would be severely sanctioned.

From the Samoan point of view, the small child is heavily under the influence of amio. Infants and small children carry out such outrageous behaviors as running and shouting during a church service or formal chiefly council meeting, throwing stones at caregivers, hitting siblings and the like, because they are incapable of displaying aga and of suppressing amio. As discussed by Shore (1977), the term for "bad." *leaga*, literally means "without aga." And this term, leaga, is used frequently to characterize the actions of young children.

Nowhere is this association of young children and amio-generated behavior more explicit than in the Samoan child's first word. Every mother interviewed within our study told us with some embarrassment that the first word of each of their children was the same – *tae*, meaning "shit." Its first use is not considered strictly referential, but rather as a curse or malediction. It is understood as implying *'Ai tae*, "Eat Shit!" This term and social act is overtly antisocial and would be negatively sanctioned if used by socially responsible members in public settings. When we asked why young children produced tae as their very first Samoan word, we were told that very young children *palauvale* ("use bad or indecent language") or *ulavale* ("make a nuisance of oneself, make trouble") (Milner 1966). In other words, this is the nature of children.

The circularity of this argument is evident. Children are at the mercy of amio because they have no aga. They have no aga, because they are not capable of responding positively to social instruction by others and to negative sanctions imposed by others. They are incapable, because, well, they are without aga and guided by strong, antisocial impulses.

What is the relevance of this epistemology to the use of expansions? Expansions are interpretations of children's intentions and reflect middle-class Anglo caregivers' assumptions that children can and do control and guide their actions towards some goal. Further, they manifest middle-class caregivers' perceptions of very small children as *social* persons. This group of caregivers acts as if a young child's utterance is socially directed and requires some response or acknowledgement (i.e., that the child is eliciting acknowledgement). In many cases, the young child may not actually be directing his/her utterance towards another person; the caregiver simply transforms it into a social act (Keenan & Schieffelin 1976).

As described above, traditional Samoan caregivers do not share all of these assumptions. Infants and very young children are generally not treated (1) as socially responsive beings (cooperative); and (2) as being in control of their actions. The actions and vocalizations of infants are treated more as natural reflexes of physiological states (e.g., hunger, discomfort, pleasure) than as intentional, spontaneous acts. The actions and utterances of toddler-age children are often treated as unalterable through social response (resistant). These assumptions would not lead adult and sibling caregivers to repeat what a young child has spontaneously expressed in the form of an expansion.

Expansions as hypotheses. Let us consider now another dimension of the use of expansions in verbal interactions between caregivers and young children. This dimension concerns the expansion as an *act of interpretation* itself. One of the things we want to distinguish is the difference between an expansion and other responses to children's verbal and nonverbal behaviors. First, we want to distinguish between expansions, and caregiver responses that otherwise address the child's utterance in a topic-relevant manner – agreements, disagreements, extensions of topic, and so on. The major difference between these two types of response is that the latter presupposes the communicative intent of the child's utterance, whereas the expansion usually does not. When a caregiver agrees, disagrees, and the like, she or he takes for granted what the child has communicated. When a caregiver provides an expansion, this is usually not the case. The expansion as a resaying is a separate assertion. The content is not presupposed; rather its content may be evaluated as accurate or inaccurate. The caregiver, in producing an expansion, takes the child's utterance(s) as a separate focus in itself.

But expansions can be more than "re-assertions." They can be *hypotheses* concerning the nature of the child's communicative intent and the utterance that expresses that intent. Expansions are typically produced by caregivers when the child's verbal act is *unclear* (cf. Cross 1977). They express the caregiver's interpretation or hypothesis concerning what the child is doing and/or saying. For example, in example (3), the caregiver takes into consideration the series of prior utterances produced by Brenda and interprets them as "Fan makes you cool." In example (4), the caregiver makes a guess that Allison is trying to say "Open it up." The extent to which a caregiver is certain of an interpretation is often reflected prosodically. Uncertainty may be expressed through the use of rising intonation in producing the expansion, as in example (4). In such cases the caregiver leaves the interpretation open for the child to verify. Allison, in example (4) appears to carry out this task in her partial repetition of the expansion.

It is this use of the expansion as a guess or an hypothesis that is culturally grounded and culturally variable. Caregivers offer tentative, partially certain accounts, because these acts are part and parcel of what is expected of members of their community. Competence within their cultural system involves first, acknowledging certain situations as ambiguous or not immediately clear and second, responding to these situations with conjectures about what is taking place. This knowledge certainly underlies cultural concepts of scientific enterprise. It also underlies literary criticism (i.e., "What is the author telling us?"). And as well, all sorts of mundane situations are acknowledged as problems

and provoke guesses: a troubled look on the face of a friend, the contents of a sauce tasted in a restaurant, the nature of a particular odor, the organization of a miniature golf course, the meaning of certain elevator buttons, and so on. It is only by placing expansions in a network of other cultural procedures can we begin to understand what caregivers are doing and why. Expansions are not universally natural; they are natural relative to particular cultural expectations. In middleclass American society, it is "natural" to acknowledge unclarity and make conjectures. After all, it is a fundamental aspect of gossip in this society.

But gossip is not the same in all societies. Not all societies build on conjecture as a basis of this genre of activity. In traditional Western Samoan communities, gossip (*fa:tala*) is based primarily on witnessed reports. Gossipers usually speak of what they or others have actually seen. Participants may argue about the report where there are conflicting claims. This does not mean, however, that the claims are understood as conjectures. Rather, the arguments mainly centered around whether or not the "witness" was telling the truth or lying, that is, whether the witness is reporting what he/she actually knows to be the case. In other words, it is assumed that the witness has certain knowledge, but there is an issue as to whether his/her accounting is valid.

Members of traditional Samoan communities tend to assume they know what is happening in a particular situation, or they assume they do not know at all what is happening. When they assume they do know, they will respond in some relevant manner. When they assume they do not know, typically they themselves will not conjecture. Caregivers in traditional Western Samoan communities do not typically conjecture what a child's unclear utterance could be expressing. If they find the child's utterance intelligible, they will respond to it in one of the ways described earlier in this paper (cf. *Verbal interaction between child and caregiver* section). If the child's utterance is not intelligible, the caregiver will not usually attempt a possible interpretation.

Caregivers in the two communities under consideration here actually "see" unclear utterances differently. The middle-class Anglo caregiver sees such an utterance as an imperfect version of adult speech; the expansion is a more perfect rendition of the utterance. The Samoan caregiver, on the other hand, sees the unclear utterance as nothing like adult language. The child speaking unclearly will sometimes be compared to an animal, a nonhuman. Or, more frequently, such utterances will be regarded as *not Samoan language.* A typical response to "unintelligibility" is to refer to the child as having *guku Saiga* ("Chinese mouth"). In other words, the child is not speaking Samoan as an adult native would speak but is speaking like a Chinese speaker. [It is unclear to me whether this means "like a Chinese speaks Samoan" or "like a Chinese speaks Chinese." In both cases, the language is a subject of ridicule and both are considered unintelligible.] The association of an unclear language with speaking a foreign language is explicit in Samoan. There is a single Samoan word, *nanu* which means both to "mispronounce" and to "speak a foreign language (usually English)" (Milner 1966).

Expansions and perspective-taking. The reluctance to make guesses on the part of traditional Samoan caregivers and the apparent acceptance to do so on the part of middle-class Anglo caregivers is a basic cultural difference. This difference

in caregiver response leads young Samoan children to have different expectations from middle-class Anglo children concerning how communication is achieved. Middle-class Anglo children will come to expect the caregiver to assist them in their communicative attempts; Samoan children in traditional setting do not share this expectation. If they are to communicate, they will have to depend more on their own skills.

This leads us to another basic distinction between Samoan caregivers and those so often described in the developmental literature. Part of the process of interpreting the child's utterance (i.e., producing expansions) involves the caregiver adopting the perspective of the child. The caregiver tries to assess what the child is expressing by entering the child's world. The caregiver assesses what the child is presently doing, what the child has been doing, how the child used this word or utterance in previous situations and so on. In other words, the interpretation of an unclear child's utterance can require a *decentering* on the part of the caregiver (Braunwald 1977).

The many observations of caregiver–child interaction indicate that caregiver decentering is highly frequent in middle-class Anglo households. The adoption of the child's perspective is one of several adaptations to a perceived incapacity of the child – his inability to perceive and produce what is needed to interact successfully with another individual. In other words, the caregiver's decentrism is an adaptation to (what the caregiver perceives as) the child's egocentrism. Braunwald and Brislin (in press) point out that certain caregivers use finely tuned interpretative procedures to determine the intention of the child. Over time they come to "learn" the child's world and code and this becomes part of the caregiver's communicative repertoire:

> It is in this sense that the listener's knowledge can be described as analogous to bilingualism and biculturalism. In fact, the listener responds as if utterances such as these were prompts or signals that activate a search through a store of child-specific information that might be relevant to the context. For instance, Cheryl's mother knows from previous experience that her daughter prefers soda pop to water and that "wawa" can refer to water, soda pop, and many other liquids. She exchanges the liquids in the cups, and Cheryl is satisfied . . . . (The child's) language may be neither explicit nor conventional, and yet succeed as communication so long as it is directed to listeners who can compensate for these inadequacies (10).

In traditional Samoan life, on the other hand, high status persons, including caregivers, are not expected to adjust their perspective to that of a lower status (e.g., younger) person. Indeed, if any decentering is to be done, it is the lower status participant in a situation who is to carry out this task. For example, it is the responsibility of lower ranking titled persons in a council meeting to lay out the topic(s) of discussion for the higher ranking titled persons. Untitled persons, including children, are normally messengers and expected to relay crucial information from one household to another. The form of decentering expected of them involves not

only meeting informational needs of their audiences but the social/appropriateness needs as well. They are expected to use particular registers of Samoan appropriate to topic and addressee, for example, use of respect vocabulary appropriate to titled persons and/or formal situations. In contrast, egocentrism is a privilege; it is permitted of those of high status rather than of those with low status. For example, orators are allowed to say things that are not well understood by others; they may even be praised for this behavior (Shore 1977). If we extend egocentrism to include talk about oneself, we can align this attribute with status as well. Higher ranking persons are more likely to express their personal opinions and reactions than are lower ranking persons. This is witnessed in formal village council meetings (Duranti 1979), where the highest ranking titled persons can articulate their own perspectives, whereas lower ranking persons are expected to express traditional (collective) positions and values.

The relative absence of expansions in the speech of Samoan adult and sibling caregivers is related to these cultural attitudes concerning decentering. In traditional Samoan households, a caregiver is not expected to take the perspective of a young child, particularly when the child has spontaneously produced an utterance. The caregiver is not expected to fill in the gaps and assist the communication by relying on the idiosyncratic background of the child. As noted earlier, caregivers tend to ignore egocentric articulation, considering it as not part of the language. This attitude holds less in early infancy, where caregivers take the perspective of the infant to the extent that the infant's physiological needs are acknowledged. Once the infant passes into toddlerhood and single word utterances are expressed, however, this orientation diminishes. At this point, the process of conscious social instruction begins in earnest. This instruction consists largely of making the young child aware of those around him/her. As the child begins to produce single words and sometimes even before, the child is instructed to notice others passing on the road or sitting in the house. One of the earliest topics of instruction concerns the names of family members. Children are asked to imitate the caregiver, who pronounces each name separately, or to independently supply the name, as in example (5) below:

(5) Kalavini, 1;10 months
(A few weeks beforehand, K's mother, Sauiluma, gave birth to a baby girl, Rossana. K, his mother, his father (Fa'atauoloa), and his new sister are clustered around the steps to their house. S and F ask K to say the name of his sister):

Kalavini	*Others*
	F: O ai le igoa. *prt who art name* (*What is the name?*)
Sana/ Losana/	
	?: (*Kalavini*).
( ) Sana?

S: Ua lava.
tns/asp enough
(Enough.)

Often the names are embedded in a speech act other than reference itself. For example, the child is asked to *vala'au* ("call out") for a particular person. This act may be directed when a person is passing by. An example of elicited imitation of such a summons is illustrated in (6) below:

(6) Pesio, 2;3 months
Pesio, her peer group including Maselino 3;4, and Maselino's mother, Iuliana, are in the house. They see Alesana [researcher-member of research project] in front of the trade store across the street. Iuliana directs the children to notice Alesana.)

(Elenoa [is] here.)

Caregivers will also instruct the child to imitate questions about others: Where is so-and-so? What is he doing? How is he feeling? and so on. These questions are addressed to others in the course of ongoing social interaction. The caregiver prompts the child in the production of socially appropriate conversational contributions. The major socialization message is that the child is not to draw attention to himself/herself (not to talk about ego) but rather to focus on properties and actions of others.

We should emphasize here that the process of learning to decenter is accomplished not only through topic biases (talk about others) on the part of Samoan caregivers. *It is accomplished through the process of elicited imitation itself.* In demanding a repetition, the caregiver is directing the child's attention to what the caregiver is expressing. To accomplish the imitation, the child must engage in a rudimentary form of decentering. *Elicited imitation in at least one way is the reverse process of caregiver expansion.* In expanding, the caregiver attempts to repeat what the child has expressed. In elicited imitation, the child attempts to repeat what the caregiver has expressed. In expansions, the caregiver engages in some degree of decentering. In imitations, the child engages in limited decentering. We find in traditional Samoan society, a heavy reliance on the latter and minimization of the former.

Expansion as a cultural procedure: Summary. In the preceding pages, several points have been considered. The most important thesis put forward is that the expansion is best understood as a cultural procedure rather than strictly as a linguistic procedure. Each time that a caregiver uses an expansion, he or she is demonstrating to the child how a particular situation is to be handled. The child comes to learn that certain situations are unclear, not fully understandable. He learns that certain situations may have several possible interpretations or meanings. An expansion expresses *one* such possible interpretation. Further, the child comes to learn that interpretation may be a trial and error process, involving one's conversational partner. When a caregiver expresses an expansion with a rising intonation, he or she is involving the child in just this process. The caregiver socializes the child into *negotiating* meanings of utterances.

Another point discussed in some detail is that in using expansions, the caregiver focuses the interaction on speakers' or actors' *intentions.* The process of interpretation involves assessment of the intention behind the verbal or nonverbal behavior. In terms of transmission of culture, the caregiver is demonstrating that intentions are important. They are important not only in interpreting meanings but in judging behavior as well. For Anglo-American culture, it is important to know if a behavior was intentional or unintentional, and if intentional, the extent to which the intention was formulated before the behavior was carried out. The importance of intentionality in this culture is reflected in how sanctions are applied. If a socially disapproved

behavior is assessed as unintentional, minimal (if any) sanctions are imposed. If a behavior is consciously carried out, more severe sanctions are brought to bear. Thus, if a child breaks a valued object accidentally, a caregiver is likely to admonish him/her lightly or not at all. If the child breaks the object "on purpose," then the caregiver will likely increase the severity of the negative sanction. This set of responses by the caregiver is part of a larger set of responses that can be found across different situations in American society, for example, legal litigation.

The concern with intentionality is not matched in traditional Samoan society. In assessing a behavior, it is far less likely that a Samoan caregiver (or other member of the society) will consider the intention behind the behavior. If a child breaks a valued object, it is irrelevant whether he/she did so inadvertently or consciously. What counts is the *consequences* of the behavior. In the case of the valued object, the consequence is loss of this object, and the child will be admonished on this basis. In formal court proceedings within the village, socially disapproved acts are discussed and assessed, but the talk does not attend to the actor's motives or awareness of what took place. Fines will be imposed on the basis of injury caused to other members of the community.

A third point of importance concerns ways in which *expansions reflect and express the social status of child and caregiver.* Throughout this discussion, we have emphasized that major differences exist in Samoan and middle-class Anglo-American concepts of the child. The latter treat the young child as if he were capable of participating in conversation and willing to cooperate in sustaining the social interaction. The Samoan traditional view of the young child sees him as socially uncooperative, resistant to appropriate social norms for engaging in interaction. Social status can be assessed as well in terms of control of intentionality. We have seen that middle-class Anglo-American caregivers let their children assume quite a bit of this control. Relative to other responses, the expansion provides greater opportunities for the child to shape the way in which his utterance is understood. If the child's utterance is ignored, or if it is presupposed in the caregiver's subsequent utterance, the child has much less of an opportunity to alter the caregiver's knowledge.

Constraints on Caregiver Speech

In the past fifteen years, there has been a considerable amount of research that focuses on language addressed to young children. Indeed, in the past few years it would seem that more attention has been given to the language of the caregiver than to the productive language of the child. This focus is a product of several sources, the most salient being the concern with the role of social environment in the process of acquiring language. The literature is heavily oriented towards determining if and to what extent caregiver speech facilitates language development of young children. To this end, features of caregiver speech that serve this function have been isolated, for example, features that simplify and clarify (Brown et al. 1973; Cazden 1972; Cross 1975, 1976, 1977; Ferguson 1964 1977; Sachs 1977; Snow 1972, 1977). Several studies have examined verbal interactions

between caregivers and young children and have noted interactional strategies of caregivers that promote communication. Several studies (for example, Atkinson 1979; Bruner 1977; Greenfield & Smith 1976; Keenan & Schieffelin 1976; Scollon 1976) have isolated ways in which caregivers contribute to the child's expression of a proposition. Caregiver and child cooperatively articulate utterances. These cooperative efforts have been analyzed as precursors to grammatical constructions that emerge subsequently in the child's language.

When I looked at the transcripts of Samoan household interaction, I was initially stunned by the relative absence of many features that have been described as caregiver register. While a more thorough investigation remains to be conducted, it is nonetheless evident at this point in our observations that Samoan caregivers do not use baby talk lexicon, special morphological modifications (diminutives, etc.), simpler syntactic constructions or constructions of reduced length, in talking with young children. Similarly, they do not expand children's utterances and there is a minimum of cooperative utterance-building between caregiver and charge. Features such as self-repetition and paraphrase do appear in caregiver speech, but they are not exclusive to caregiver–charge interaction. Self-repetition and paraphrase abound in talk, both informal and formal, between adults in traditional Samoan society. Similarly, the topics entertained between caregiver and child tend to focus on the immediate past (e.g., accusations and reports of misdeeds), immediate present, and immediate future (e.g., directives to carry out acts); but these topics characterize household talk in general and are part of a register used by familiars and intimates (Ochs 1980).

These observations raise certain questions with respect to the nature of input and caregiver register. On the one hand, it is apparent that caregiver speech may vary in important ways across societies. This variation takes the form of differential appearance of certain features and a wider social application of other features. *This difference brings out the importance of culture – the system of beliefs and values underlying social life – as a constraint on caregiver language use.* Many of the features that do or do not appear in Samoan caregiver speech, for example, can be accounted for by beliefs and expectations concerning the high and low status role behavior: The association of decentering with low status can account, in part, for the rarity of expansions and simplification processes in Samoan caregiver speech. The turn-taking pattern characteristic of many Samoan caregiver–child interactions in which child speaks to mother, mother speaks to child's older sibling, older sibling attends to child (ABCA), is a product of cultural expectations concerning the kind of activity appropriate to high and low status persons.

The point is that many of the features observed of caregiver speech are likely not *primarily* responses to linguistic/cognitive limitations of the infant or young child. In societies where caregivers do not see themselves as language teachers (cf. Schieffelin [1979] for an account of a society in which caregivers do not see themselves as taking on this role), the orientation of caregivers will be primarily towards transmission of culturally significant knowledge. More and more, this is being realized. Scollon and Scollon, for example, now see that the interactional cooperation of an Anglo caregiver and child in utterance construction expresses and transmits socially valued skills that are demanded in literate

for example, decontextualization of utterances (Scollon & Scollon 1979). Similarly, I have tried to demonstrate here that caregivers who use expansions are displaying and transmitting to their charges a valued framework for handling problematic situations (to consider motives and intentions, to hypothesize, to inquire, to negotiate) and a set of behaviors that are appropriate to the status of child and caregiver.

Ferguson (1977), Snow (1979), and Brown (1977) have noted that caregivers modify their speech largely because they wish to communicate with their children. Processes such as simplification and clarification are responses to this goal. What is needed at this point in child language research is to break down this global goal (communication) into finer, more specific ends, such as those discussed above. By specifying more precisely the concepts, skills, and strategies caregivers are displaying, we can see how and why particular features but not others emerge in the talk of caregivers with young children. A more fine-grained analysis of what caregivers are doing with their charges will provide a clearer account of variation and constancy across societies. Further, it will indicate the conditions under which certain registral features are likely to be selected by the same caregivers and the conditions under which other features will be selected. Most accounts of caregiver register tell us the statistical occurrence of particular features. A finer analysis of the contexts of caregiver speech will reveal how and when these features are employed and bring our research closer to a means–ends model, relating social environment to language acquisition.

Nominal and Temporal Anaphora

Barbara H. Partee

I. Introduction

A number of parallels between temporal and nominal anaphora were noted in Partee (1973); there I tried to account for them by invoking explicit variables over times and treating the tense morphemes *Present* and *Past* as directly analogous to pronouns. I now believe that a much better explanation of the parallels is available as the result of recent work on the formal semantics and pragmatics of temporal discourse and of pronominal anaphora. One key ingredient is the incorporation of a version of Reichenbach's notion of 'reference time' into a formal semantic framework, as developed by Bäuerle (1977) and further extended by Hinrichs (1981). In these accounts reference time is at the heart of temporal anaphora, as has been argued in less formal accounts (e.g. Smith (1978)), and the similarity between tense morphemes and pronouns can be seen as a derivative phenomenon. A second crucial ingredient is the unified treatment of pronouns provided by the theory of discourse representations of Kamp (1981a) or the 'file-card' semantics of Heim (1982). The task of unifying these advances is carried out to a large extent in Hinrichs (1981); in this study I draw heavily on the work of Hinrichs and show how it can be extended to cases of temporal quantification and temporal analogs of 'donkey-pronouns'.[1]

Among the data to be accounted for, described more fully in Section II, are temporal analogs of deictic pronouns, anaphoric pronouns with definite and indefinite antecedents, 'bound-variable' pronouns, and 'donkey-sentence' pronouns. The unified treatment of all these uses of pronouns provided by the frameworks of Kamp and Heim is reviewed in Section III. In Section IV I describe and slightly modify Hinrichs' treatment of tenses, adverbs, and temporal anaphora in simple linear discourse and in sentences with *when*-, *before*-, and *after*-clauses. In Hinrichs' treatment, events, processes, and states are taken as

Source: *Linguistics and Philosophy* vol. 7, 1984, pp. 243–286.

primitives rather than instants or intervals of time, following Kamp (1979), (1980) (cf. also Bach (1980), (1981)); 'reference events' are added to take over the function of earlier authors' 'reference times'. Hinrichs' overall framework fits into Kamp's theory of discourse representation structures, allowing 'discourse events' to be treated similarly to 'discourse entities'. Section V summarizes the explanation provided by these accounts for the parallels between temporal and nominal anaphora in the deictic case and the case of definite and indefinite antecedents. In Section VI I offer an extension of Hinrichs' treatment to cover temporal quantification as represented by *whenever*-clauses and the combination of a *when*-clause with an *always* in the main clause. This extension offers an immediate account of the temporal analogs of donkey-sentences as well, completing the account of the parallels described in Section II. The final section offers conclusions and some open problems for further research.

Insofar as the resulting explanation of the parallels between temporal and nominal anaphora is an improvement over previous accounts, it supports an important shift in perspective within the tradition of formal semantics as developed from Montague's work towards a point of view which has been independently argued for from outside that tradition, e.g. by W. S. Cooper (1978), Seuren (in press), and Bosch (1983), among others. This perspective, emphasized in Heim (1982), regards semantic interpretation as a dynamic process mapping partial models plus contexts onto new partial models plus contexts, as opposed to the classical logical view of semantic interpretation as a (static) specification of truth conditions relative to a given model and a given context.[2] This shift in perspective and accompanying enrichment of formal 'semantics-*cum*-pragmatics' should make it easier for linguists and other students of language from different traditions to draw profitably on each other's insights.

II. Parallels between Temporal and Nominal Anaphora

In this section we review the data from Partee (1973) that suggest that there is a parallel between temporal and nominal anaphora to be accounted for. (Some of the examples have been replaced, but all the types are still represented.)

A. Non-Linguistic 'Antecedents'

Partee (1973) noted that a past tense may be used to refer to an understood particular time not introduced by previous linguistic context, as in (1a) uttered while driving down the freeway; a similar use of a pronoun can be seen in (1b) uttered as the first sentence of a conversation.

(1) (a) I didn't turn off the stove.
(b) She left me.

Pronouns can be used without linguistic antecedents when their referent is understood to be salient to the hearer; there is no analog to salient physical presence

with past tenses, but a particular past time can well be presently salient while one is looking at vacation snapshots or watching family movies. (Comparable 'derivative' demonstrative uses of pronouns are also common with pictures.) The past tense in these uses is like a third person pronoun; a genuinely temporal present tense in a simple sentence is like a first person pronoun in that both are 'indexical' or 'token-reflexive', normally referring to the time of utterance and the utterer respectively (but see Kratzer (1978)).

B. Definite Anaphors with Definite Antecedents

In traditional treatments of anaphora, the paradigm case is that in which there is an antecedent noun phrase that refers to a particular individual, and a subsequent pronoun which refers to the same individual, as in (2a) below.

(2)(a) Sam is married. He has three children.

There are several potential analogs for such cases in the temporal domain, listed in (2b–d).

(2)(b) Sheila had a party last Friday and Sam got drunk.
(c) When John saw Mary, she crossed the street.
(d) At 3 p.m. June 21st, 1960, Mary had a brilliant idea.

In (2b) a time is specified in the first clause and the second clause is most naturally understood as referring to the same time. In (2c), we might view the *when*-clause as providing an antecedent for the past tense of the main clause. In (2d), a simple temporal adverb may be similarly viewed as the antecedent of the past tense. Postponing particulars of the analysis, it seems safe to say that in all of the temporal examples considered so far, the past tense can be viewed as an anaphoric element inasmuch as it is not understood as meaning 'at some time in the past', but as referring to some relatively definite past time, the specification of which is provided by a non-linguistic or linguistic antecedent.

C. Indefinite Antecedents

Considerable attention has been paid in recent studies of anaphora to cases in which the antecedent of a pronoun is indefinite as in (3a), from Kamp (1981a).

(3)(a) Pedro owns a donkey. He beats it.

We will say more about such cases in Section III, but for now note that the antecedent of a past tense may be similarly indefinite in the sense of not specifying a particular time, as in (3b).

(3)(b) Mary woke up sometime during the night. She turned on the light.

primitives rather than instants or intervals of time, following Kamp (1979), (1980) (cf. also Bach (1980), (1981)); 'reference events' are added to take over the function of earlier authors' 'reference times'. Hinrichs' overall framework fits into Kamp's theory of discourse representation structures, allowing 'discourse events' to be treated similarly to 'discourse entities'. Section V summarizes the explanation provided by these accounts for the parallels between temporal and nominal anaphora in the deictic case and the case of definite and indefinite antecedents. In Section VI I offer an extension of Hinrichs' treatment to cover temporal quantification as represented by *whenever*-clauses and the combination of a *when*-clause with an *always* in the main clause. This extension offers an immediate account of the temporal analogs of donkey-sentences as well, completing the account of the parallels described in Section II. The final section offers conclusions and some open problems for further research.

Insofar as the resulting explanation of the parallels between temporal and nominal anaphora is an improvement over previous accounts, it supports an important shift in perspective within the tradition of formal semantics as developed from Montague's work towards a point of view which has been independently argued for from outside that tradition, e.g. by W. S. Cooper (1978), Seuren (in press), and Bosch (1983), among others. This perspective, emphasized in Heim (1982), regards semantic interpretation as a dynamic process mapping partial models plus contexts onto new partial models plus contexts, as opposed to the classical logical view of semantic interpretation as a (static) specification of truth conditions relative to a given model and a given context.[2] This shift in perspective and accompanying enrichment of formal 'semantics-*cum*-pragmatics' should make it easier for linguists and other students of language from different traditions to draw profitably on each other's insights.

II. Parallels between Temporal and Nominal Anaphora

In this section we review the data from Partee (1973) that suggest that there is a parallel between temporal and nominal anaphora to be accounted for. (Some of the examples have been replaced, but all the types are still represented.)

A. Non-Linguistic 'Antecedents'

Partee (1973) noted that a past tense may be used to refer to an understood particular time not introduced by previous linguistic context, as in (1a) uttered while driving down the freeway; a similar use of a pronoun can be seen in (1b) uttered as the first sentence of a conversation.

(1) (a) I didn't turn off the stove.
(b) She left me.

Pronouns can be used without linguistic antecedents when their referent is understood to be salient to the hearer; there is no analog to salient physical presence

with past tenses, but a particular past time can well be presently salient while one is looking at vacation snapshots or watching family movies. (Comparable 'derivative' demonstrative uses of pronouns are also common with pictures.) The past tense in these uses is like a third person pronoun; a genuinely temporal present tense in a simple sentence is like a first person pronoun in that both are 'indexical' or 'token-reflexive', normally referring to the time of utterance and the utterer respectively (but see Kratzer (1978)).

B. Definite Anaphors with Definite Antecedents

In traditional treatments of anaphora, the paradigm case is that in which there is an antecedent noun phrase that refers to a particular individual, and a subsequent pronoun which refers to the same individual, as in (2a) below.

(2)(a) Sam is married. He has three children.

There are several potential analogs for such cases in the temporal domain, listed in (2b–d).

(2)(b) Sheila had a party last Friday and Sam got drunk.
(c) When John saw Mary, she crossed the street.
(d) At 3 p.m. June 21st, 1960, Mary had a brilliant idea.

In (2b) a time is specified in the first clause and the second clause is most naturally understood as referring to the same time. In (2c), we might view the *when*-clause as providing an antecedent for the past tense of the main clause. In (2d), a simple temporal adverb may be similarly viewed as the antecedent of the past tense. Postponing particulars of the analysis, it seems safe to say that in all of the temporal examples considered so far, the past tense can be viewed as an anaphoric element inasmuch as it is not understood as meaning 'at some time in the past', but as referring to some relatively definite past time, the specification of which is provided by a non-linguistic or linguistic antecedent.

C. Indefinite Antecedents

Considerable attention has been paid in recent studies of anaphora to cases in which the antecedent of a pronoun is indefinite as in (3a), from Kamp (1981a).

(3)(a) Pedro owns a donkey. He beats it.

We will say more about such cases in Section III, but for now note that the antecedent of a past tense may be similarly indefinite in the sense of not specifying a particular time, as in (3b).

(3)(b) Mary woke up sometime during the night. She turned on the light.

The first sentence of (3a) is presumably true if Pedro owns at least one donkey, and the first sentence of (3b) similarly true if Mary woke up at least once during the night. The problem is then to say how the 'it' of (3a) or the past tense of the second sentence of (3b) gets its reference when the antecedent is apparently not referential but existentially quantified. (Case (2b) of the previous section might be argued to belong here insofar as the antecedent does not specify *when* on Friday the party was.)

D. Bound Variables

Typical uses of pronouns as bound variables are illustrated in (4a–b); apparently comparable cases of temporal bound variable cases are given in (5a–d).

(4)(a) Every woman believes that she is happy.
(b) No woman fully appreciates her mother.

(5)(a) Whenever Mary telephoned, Sam was asleep.
(b) When Mary telephoned, Sam was always asleep.
(c) Whenever Mary wrote a letter, Sam answered it two days later.
(d) Whenever John got a letter, he answered it immediately.

E. 'Donkey-Sentences'

The famous "donkey-sentences" introduced by Geach (1962) are given (in the versions of Kamp (1981a) in (6a–b), along with possible temporal analogs in (6c–d); discussion of the problem raised and possible solutions to them is deferred to subsequent sections.

(6)(a) If Pedro owns a donkey, he beats it.
(b) Every farmer who owns a donkey beats it.
(c) If Mary telephoned on a Friday, it was (always) Peter that answered.
(d) Whenever Mary telephoned on a Friday, Sam was asleep.

There is also an apparent parallel in negative data that we will account for:

(7)(a) *If every man owns a donkey, he beats it.
(b) *If Sheila always walks into the room, Peter wakes up.
(cf. (b') If Sheila walks into the room, Peter always wakes up.)

All of the data above are at this point only suggestive; we have not yet offered any arguments for giving similar analyses of nominal and temporal anaphora and there are clearly many differences between them. In the remaining sections of the paper, we show how Kamp's 'discourse representation' approach, which offers a unified treatment of nominal anaphora, if taken together with an approach to tense, aspect, and time adverbials which takes 'eventualities' rather than (or possibly in addition to) times as basic and incorporates the notion of reference time, provides a framework in which the parallels observed above receive a natural explanation.

III. Discourse Representations

In this section we sketch the key features of Kamp's theory of discourse representations (Kamp. 1981a) as it applies to nominal anaphora. (A theory of anaphora which shares many properties with Kamp's approach is developed in Heim 1982 and 1983); we are presenting Kamp's version in part because it is more widely accessible and in part because Kamp and Hinrichs have made substantial progress in extending that framework to deal with temporal anaphora, but we believe that the same kind of account is in principle equally compatible with Heim's framework.) The reader familiar with Kamp (1981a) can skip this section.

Kamp's approach makes crucial use of an intermediate level of representation, 'discourse representation structures', mediating between syntax and model-theoretic interpretation. In rough terms, a discourse representation can be thought of in the simplest cases as a description of a partial model. A simple discourse representation counts as true with respect to a complete model if it is *embeddable* into the model; embeddability is a technical notion in Kamp's system which plays a role somewhat analogous to satisfaction conditions in standard semantics for predicate logic. (I will not give the definition – see Kamp (1981a) – but I will illustrate it with examples shortly.) In more complex cases, the discourse representation structure consists of a structured set of discourse representations, and the embeddability conditions for the entire structure are recursively defined in terms of the embeddability of the substructures.

The fragment of English treated in Kamp (1981a), which is sufficient for our purposes in this section, includes simple sentences with transitive and intransitive verbs, proper nouns, third-person singular pronouns, and noun phrases introduced by *a* and *every*, with and without relative clauses; it also includes *if-then* sentences.[1] A *discourse* is simply a finite sequence of sentences. The simplest cases are those discourses in which none of the sentences contains an *if-then* or an *every*, as an example we give the discourse representation (DR) of the two-sentence discourse (3a), repeated here as (8):

(8) Pedro owns a donkey. He beats it.

The first sentence of (8) induces the following DR (Kamp, 1981a, p. 287):

DR$_1$(8)

u v
. .
Pedro owns a donkey
u = Pedro
u owns a donkey
donkey (v)
u owns v

The representation is constructed by processing the first sentence top-down in accordance with the syntax-driven construction rules. When the noun phrase *Pedro* is processed, three things happen: the 'discourse entity' u is added to the DR, and the conditions u = *Pedro* and *u owns a donkey* are introduced.[2] The

is further processable: the discourse entity v is introduced, and the conditions *donkey* (v) and u *owns* v are added to the DR. In general, each occurrence of a proper name or an indefinite noun phrase will lead to the introduction of a new discourse entity in the DR; by contrast, pronouns must be interpreted as referring to discourse entities already contained in a DR. (The assimilation of deictic uses of pronouns to this treatment will be discussed at the end of this section.) The complete DR for (8) is then the following (Kamp, p. 287):

DR(8)

u v
. .
Pedro owns a donkey
u = Pedro
u owns a donkey
donkey (v)
u owns v
He beats it
u beats it
u beats v

(In fact, we could just as well omit from the final DR all those intermediate steps which are further processed within the same DR, but we will retain them to show the order of steps of DR-construction.)

The discourse (8) will be true in a model M with respect to DR(8) just in case there is a way of embedding DR(8) into M, i.e. a mapping of u and v onto individuals in M such that all of the conditions in DR(8) are satisfied. (This assumes that we already have a mapping of the proper names, common nouns, etc. into corresponding individuals, sets (or perhaps properties) and relations in M.)

Note that the existential quantifier in the embeddability condition ('there is a way of embedding . . .') has the effect of giving the discourse entity v corresponding to *a donkey* an existentially quantified interpretation, but with scope extending over the whole discourse. Thus the truth conditions assigned to (8) in Kamp's system are the same as those for the first-order sentence (8′), or equivalently (8″):

(8′) $(\exists u)(\exists v)(u = p \;\&\; \text{donkey}(v) \wedge \text{own}(u, v) \wedge \text{beat}(u, v))$.
(8″) $(\exists v)(\text{donkey}(v) \wedge \text{own}(p, v) \wedge \text{beat}(p, v))$.

The idea that indefinite noun phrases introduce what amount to free variables, which only get 'bound' in the passage from discourse representation structure to truth-conditions via embeddability, is part of what allows Kamp (and likewise Heim) to provide a unified treatment of pronouns with definite and indefinite antecedents. All pronouns are treated identically at the discourse representation level: any pronoun may be replaced at the appropriate construction step by any discourse entity accessible to it in the discourse representation.[6] The relation of the 'discourse entities', such as u and v in DR(8), to actual entities in the model is not in general a simple correspondence, because of the implicit existential quantifier in the embeddability condition.[7]

Any discourse which consists of just such simple sentences, without conditional sentences or universal quantifiers, gives rise to a single discourse representation

like that for 8), with each subsequent sentence leading to expansion of the information in the representation; new discourse entities are added with each new proper name or indefinite noun phrase, and a pronoun can be assigned to any suitable entity that has been introduced into the representation by the time that pronoun is processed.[8]

Universal quantifiers and conditional sentences give rise to more complex discourse representation structures with special embedding conditions which are relevant to (so-called) bound variable anaphora[9] and the treatment of donkey-sentences. We illustrate this first with the conditional sentence (6a), repeated here as (9).

(9) If Pedro owns a donkey, he beats it.

The first step in constructing a discourse representation structure (DRS) for (9) is, as usual, to build a DR containing just the whole sentence:

$DR_0(9)$ | If Pedro owns a donkey, he beats it |

Since the *if-then* rule was the last rule applied in the construction of the sentence, the corresponding DRS construction rule is the first to be applied. That rule creates two additional DR's, $DR_1(9)$ and $DR_2(9)$, with $DR_1(9)$ containing the antecedent clause and $DR_2(9)$ the consequent, and with the stipulation[10] that DR_1 is subordinate to DR_0 and DR_2 is subordinate to DR_1. (The subordination relation that holds among DR's does not correspond directly to the syntactic notion of subordination; it does play a crucial role in determining the accessibility of discourse entities for pronoun assignment.) Each of the two DR's is then processed in the usual way, antecedent first, with the following proviso: when a discourse entity is introduced for a proper noun, it and its identity condition are placed in the top DR of the whole current DRS (making it available for assignment to any subsequently processed pronoun), but when an indefinite noun phrase is processed, the newly introduced entity is placed in the DR being processed (and therefore accessible to pronouns only in the same or subordinate DR's). The complete DRS for (9) is then as follows (from Kamp (1981a, p. 315); I have added arrows marking the subordination relation); numbers in parentheses indicate steps in the processing sequence.

DRS(9):

$DR_0(9)$

(2) u

(0) If Pedro owns a donkey, he beats it
(2) u = Pedro

$DR_1(9)$

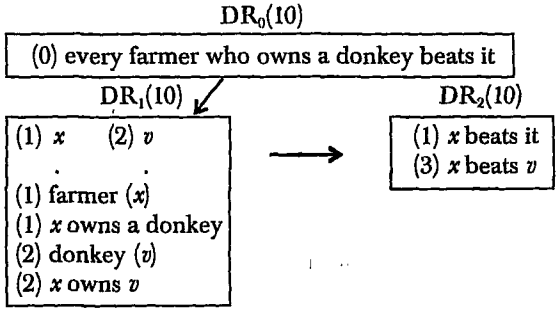
(3) v

(1) Pedro owns a donkey
(2) u owns a donkey
(3) donkey (u)
(4) u owns ...

$\longrightarrow$

$DR_2(9)$

(1) he beats it
(4) u beats it
(5) u beats v



In steps (4) and (5) we are able to assign the entities *u* and *v* to the pronouns because DR_2 is subordinate to both DR_1 and DR_0.

The embeddability condition for DRS's resulting from the *if-then* construction rule is roughly as follows (see Kamp (1981a) for full details of this and other rules): DRS(9) is embeddable in M if there is a mapping which satisfies the atomic conditions in DR_0 (i.e. which assigns *u* to Pedro) such that every extension of it which satisfies DR_1 also satisfies (or can be extended to satisfy) DR_2.

Before discussing the example further, let us introduce the final new rule of discourse representation construction, the rule for noun phrases introduced by *every*. When such a noun phrase is processed, two new DR's are introduced, with subordination structure exactly like that of conditional structures. To the 'antecedent' are added a new discourse entity and conditions on it corresponding to the content of the common noun (and relative clause, if any). To the 'consequent' part is added a condition corresponding to the remainder of the sentence, with the new discourse entity in place of the original noun phrase. This is illustrated in the DRS for (6b), repeated here as (10), with parenthesized numbers again showing the order of construction.

(10) Every farmer who owns a donkey beats it.

DRS(10):

The embeddability condition for *every*-constructions is the same as that for *if-then* sentences: every embedding that satisfies DR_1 must be extendable to an embedding that satisfies DR_2. I will refer to such DRS configurations henceforth as universal/conditional structures.

Note that while the construction of DRS's is determined (up to the choice of antecedents for pronouns) by the syntactic rules, syntactically similar sentences or discourses may receive quite different DRS's, particularly because of the difference between the rule for *every* and the rule for *a*. (Sentence conjunction with *and* could be treated much like concatenation of sentences, while *or* should probably lead to the introduction of multiple DR's.) Thus while donkey-sentences like (9) and (10) receive a natural interpretation in this system,[12] syntactically similar sentences with *every* in place of *a* fail, correctly, to get a reading in which the pronoun is linked to the *every*-phrase.

(11) If Pedro owns every donkey, he beats it.

Every donkey beats it.

In both (11) and (12), the pronoun *it* is in a DR which is not subordinate to the DR which contains the discourse entity introduced by the *every*-rule, and thus that entity is not available for assignment to the pronoun.

An instance of what has usually been viewed as an ordinary bound variable pronoun is that in (13), which is also handled naturally in Kamp's system (see Kamp (1981a., p. 299).

(13) Every farmer courts a widow who admires him.

Thus we see that all of the types of uses of pronouns mentioned at the outset except the deictic use are treated uniformly in this system; deictic uses can be treated by the same pronoun rule as well if we add the hypothesis that the mechanisms that make entities in the non-linguistic context available for pronominal reference have the effect of adding corresponding discourse entities to DR's. We will assume there is such a mechanism.[13]

This unification of what otherwise appear to be very different pronoun uses is an important achievement in its own right. In the next sections we show that the system has the added advantage of being directly applicable to the treatment of tenses and adverbs in such a way that the parallels observed in the previous section fall out as direct consequences.

IV. The Temporal System

For our treatment of tenses and adverbs, we draw on the work of Bach (1980, 1981) and Kamp (1979), who have argued for taking what Bach calls 'eventualities' (events and processes, and perhaps states) and relations of precedence and overlap between them as primitive, rather than starting from moments or intervals of time as primitive. (Kamp (1979) shows how moments and intervals can then be reconstructed by a technique that traces back to Russell and to Wiener.) Hinrichs (1981) has worked out a detailed treatment of a substantial fragment of English in the framework of Kamp's discourse representation structures, focussing on the temporal structure of the past tense narrative discourse. Since Hinrichs' fragment contains much of what we need, we will use it as a starting point, describing its essentials in this section and then in Section VI showing how it could be extended to include bound variable cases and temporal analogs of donkey-sentences. As a simplifying assumption which we will follow, Hinrichs takes whole tenseless clauses as atomic, classified as activities, states, achievements, and accomplishments.[14] (These are respectively processes, states, instantaneous events, and extended events in the terminology of Bach (1981), which we will follow here. Our examples will just involve states and events.) He treats progressive as a sentence operator which applies to a process-sentence or an extended-event sentence and gives a new category of progressive sentence (which patterns with process-sentences and state-sentences in his rules). Past and past perfect are sentence operators which apply to any of the other five kinds, giving 'past-sentences' and 'past perfect sentences' as a result. (A more complete treatment

would require paying more attention to the internal structure of verb phrases and probably treating tense and aspect as verb phrase operators (Bach, 1980). Hinrichs' fragment also includes 'frame adverbials' (Bennett and Partee (1978) like 'on Tuesday' and 'last week' and *when*-, *before*-, and *after*-clauses.

To illustrate the general approach with an example, consider the following stretch of narrative.

(14) John got up, went to the window, and raised the blind.
e_1 e_2 e_3
It was light out. He pulled the blind down and went back to bed.
s_1 e_4 e_5
He wasn't ready to face the day. He was too depressed.
s_2 s_3

The clauses labelled e_1–e_5 describe events, while s_1–s_3 describe states. In narratives with a simple linear structure and all clauses in the simple past tense, it has been observed that the event sentences move the action forward in time, while the state sentences do not, but rather describe how things are at the time of the last-mentioned event.[15]

We can represent this in a DR for (14) as follows, using '<' for the relation of complete precedence between events, '0' for overlaps and r_s for the speech time. 'John get up (e_1)' is to be understood as what signals the condition that in a proper embedding of DR(14) into a model, e_1 must be an event of John's getting up.[16]

DR(14)

e_1 e_2 e_3 e_4 e_5 s_1 s_2 s_3 r_s
. . . .
$e_1 < e_2 < e_3 < e_4 < e_5 < r_s$
John get up (e_1)
⋮
John go back to bed (e_5)
s_1 0 e_3
s_2 0 e_5
s_3 0 e_5
It be light out (s_1)
⋮
John be too depressed (s_3)

The main oversimplification we have made in this example is in ignoring Hinrichs' use of 'reference time' (Reichenbach (1947)). For one thing, the first sentence of the discourse is not interpretable without some understood past reference time (Partee (1973), Bäuerle (1979), Hinrichs (1981)), so we need to assume that there is a past reference time r_p specified at the start of the discourse, and that the introduction of new event sentences moves the reference time forward.[17] Furthermore, Hinrichs has noted that the states and processes introduced need not always be understood as overlapping the last-mentioned event, as illustrated in (15) below (Hinrichs' example (108), p. 66).

(15) Jameson entered the room, shut the door carefully,
e_1 e_2
and switched off the light. It was pitch dark around him,
e_3 s_1
because the Venetian blinds were closed.
s_2

Hinrichs proposes that each new past-tense event sentence is specified to occur within the then-current reference time, and it subsequently causes the reference time to be shifted to a new reference time which *follows* the just-introduced event. States and processes are required to include the current reference time but need not overlap the event that led to the introduction of that reference time. Intuitively, the reference time introduced by an event-sentence is located 'just after' that event; we will discuss this requirement further and make it more explicit in connection with later examples. Below we give an approximate representation of DR(15) as a first illustration of the introduction of reference times; in subsequent examples we will be more explicit about the order of construction steps, particularly about the dynamics of the shifting 'current reference time'. The notation in DR(15) combines elements from Kamp and Hinrichs; '$\subseteq$' stands for the relation of temporal inclusion, which is definable in terms of $<$ and O(verlap), and the specification of the events and states by means of DR-boxes follows Kamp (1981b) and can be read as 'e_1 is an event-token of the event-type given in the box following.' (In subsequent examples we will carry out the internal processing of such boxes.) We assume that we start with a given past reference time r_0 and present reference time r_s; the other reference times r_1, r_2, and r_3 are introduced during the construction.

DR(15)

r_0 e_1 r_1 e_2 r_2 e_3 r_3 s_1 s_2 r_s
. . . .
$e_1 \subseteq r_0$
$e_1 < r_1 < r_s$
$e_2 \subseteq r_1$
$e_2 < r_2 < r_s$
$e_3 \subseteq r_2$
$e_3 < r_3 < r_s$
$r_1 \subseteq s_1$
$r_3 \subseteq s_2$
e_1 Jameson enter the room
...
e_2: ....
....

From the fact that there are conditions requiring reference times to include events ($e_1 \subseteq r_1$, etc.) and to be included within states, i.e. within some period for which a given state holds ($r_3 \subseteq s_1$, etc.) it follows that reference times must be construed as protracted events or bounded intervals. Hinrichs construes them as events with no descriptive content stipulated, but as far as I can see we could

just as well think of them as intervals for present purposes, given Kamp's way of reconstructing instant and interval structures from event structures. In any case, the embedding conditions for DR(15) will simply require that there be *some* events (or intervals) r_1, r_2, r_3 which satisfy the specified ordering relations. The net effect of the ordering specifications in DR(15) is that $e_1 < e_2 < e_3 < r_3$, and s_1 and s_2 must both overlap some time 'just after' e_3; they may but need not overlap e_3 itself. The content of (15) would tend to make it likely that s_1 does not overlap e_3, and that s_2 overlaps all of e_1, e_2, and e_3, but none of this is required by DR(15).* The conditions represented formally at this level include only those constraints deemed to follow from the structure (including the event/state distinction) independently of particular content. Whether the particular conditions given are the correct ones is of course open to debate.[19]

Reference times thus play a crucial role in temporal anaphora. A simple sentence with a past tense is interpreted with respect to a reference time; if it is a state or process sentence, the corresponding state or process must hold or go on at the current reference time, while if it is an event sentence, the event must occur within that reference time, and a new reference time following the event is introduced. (As Hinrichs notes, not all past tense discourses follow such a neat linear sequence. If two successive event sentences have different subjects, the events may well be understood as simultaneous or overlapping. And a sentence describing a 'big' event may well be followed by sentences describing some of its subevents as in our earlier example (2b).) The proposal of Partee (1973) that past tenses be taken as directly analogous to pronouns, referring to the time specified by a preceding clause or adverb, is incompatible with the moving forward of time in successive event sentences (it would be as if pronouns referred to the *father* of the last mentioned individual!)[20] I still believe it is reasonable to characterize tenses as anaphoric, or more broadly as context-dependent, but I would no longer suggest that this requires them to be viewed as 'referring' to times as pronouns 'refer' to entities, or to treat times as arguments of pred

To complete the relevant background, we need to consider the int of temporal adverbials and tense. This is an issue which raises a host known problems for any attempt to relate semantic interpretation systematically and explicitly to syntactic form (see Dowty (1979) and Bäuerle (1979) for good discussions of some of the principal problems). We will not address all of those problems here; but I believe that the use of reference times is helpful in this respect as well, as argued by Bäuerle (1977, 1979), Kratzer (1978), and Hinrichs (1981). I will use Hinrichs' treatment as a basis for the generalizations to quantificational temporal adverbs to be made in Section VI. In the remainder of this section I will describe his treatment of sentences containing *when-*, *before-*, and *after*-clauses. As before, we are limiting our attention to sentences in narratives in which only simple past tenses occur, with clauses describing either events or states (thereby bypassing a number of issues that would be important for a more comprehensive treatment).

One of the main problems in accounting for the interaction of tenses and adverbs is the fact that a past tense seems redundant if there is an explicit adverb but not redundant when there isn't;[22] how can this be accounted for with a

uniform interpretation for the past tense? If we try to let the past tense be a sentence operator meaning 'at some time in the past' and say that an adverb like 'yesterday' or 'two days later' is simply a more specific operator, we run into problems with either possible scope of applying such operators (Dowty (1979)), It is possible by judicious use of lambda's to achieve the effect of putting both operators on in parallel rather than in series, so to speak (Parsons (1980), Bach (1980)). But given the arguments in Partee (1973) and Bäuerle (1979) for treating a simple past tense sentence without adverbs as anchored to a reference time rather than as existentially quantifying over past times, we will not pursue the 'conjoined operator' approach here.

Hinrichs' approach can be characterized as follows. A simple past tense clause must be interpreted relative to a current 'past reference time', which may have been provided by non-linguistic context or by preceding discourse. If a sentence begins with a past adverb[23] (or just a possibly past adverb if we are in the context of a past tense narrative), that adverb is processed before the main clause and serves to update the current reference time. Thus it's optional that there be an adverb, but if there is one it overrides the prior context. The main clause is interpreted by the same rules in either case, in terms of current reference time. The adverb itself, whether phrasal or clausal, provides a descriptive characterization of the new reference time; it may identify it completely ('at 3 o'clock on June 12') or simply put bounds on it, as with 'frame adverbials' like 'in June'. (Cf. the treatment of the context-dependence of modals in Kratzer (1978) and the role of *if*-clauses in augmenting the relevant context.)

Besides providing for a uniform treatment of main clauses with and without adverbs, Hinrichs' treatment accounts neatly for the asymmetry of function of main and subordinate clauses. Traditional treatments of sentences with *when*-, *before*-, and *after*-clauses have tended to simply yield truth-conditions that treat the two clauses on a par (much as the standard semantics of relative clauses makes no distinction between 'A man who loves Mary hates Susan' and 'A man who hates Susan loves Mary'). Hinrichs' treatment is compatible with the traditional truth conditions, but distinguishes the role of main and subordinate clauses with respect to the dynamics of reference time. The main clause, as we have noted, is interpreted with respect to a reference time descriptively characterized by the subordinate clause; and by the usual rules, if the main clause is an event-clause, the last step in its processing is the resetting of the reference time to a time 'just after' the main clause event. Thus the reference time in effect after the complete sentence is processed depends on which clause was the main clause; this corresponds with the informal observation that it is main clauses that carry the main story line along in a narrative. We will show this asymmetry with examples involving *before* and *after* further below, and first consider Hinrichs' basic treatment of *when*-clauses.

Suppose we are interpreting a simple past tense narrative, our most recently established past reference time is r_1, and the next sentence begins with a *when*-clause. The *when*-clause triggers the updating of the reference time to a new value, let's say r_2, and the content of the *when*-clause puts conditions on r_2. (It is also required that r_2 follows r_1, a stipulation that we will try to justify and generalize

later.) The main clause is then interpreted with respect to r_2 just as it would have been if it were a simple sentence with the reference time r_2 provided by previous context. For illustration consider the little narrative (16), which includes example (2c) from Section II as a subpart.

(16) Mary turned the corner. When John saw her, she crossed the street.

The following discourse representation, DRS(16), incorporates Hinrichs' treatment into a Kamp-style diagram, with parenthesized numbers showing the order of construction steps. Because Hinrichs' rules refer to 'the current reference time r_p', which changes in the course of the construction, I have used square brackets to enclose the conditions which update the reference time ('$r_p := r_0$', '$r_p := r_1$', etc.); only the most recent of them is in effect at any given point in the construction of the representation.[24] The DRS construction rules which depend on reference time make reference only to 'r_p', i.e. to whatever is the current reference time. In showing the effects of applying the construction rules I have filled in the values, r_0, r_1, etc., according to what the current reference time was at the corresponding point in the construction. The (past) reference time at the beginning of the processing is r_0; the reference times r_1, r_2, and r_3 are introduced in the course of processing. The resulting DRS is in a sense then a dynamic representation rather than a static one; in the long run we clearly need a more systematic representation of how the relevant context-parameters, of which reference time is just one, change in the process of interpretation.

In this and subsequent DRS's, I have used 'now' rather than 'r_t' for the present reference time, simply for mnemonic convenience.

DRS(16)

(0) r_0 (0) now (2) e_1 (2) r_1 (5) u (8) e_2 (8) r_2 (11) v (13) e_3 (13) r_3

[(0)$r_p := r_0$]

(1) Mary turned the corner

(2) $e_1 <$ now

(2) $e_1 \subseteq r_0$

(2) $e_1 < r_1$

(2) $r_1 <$ now

[(3)$r_p := r_1$]

(4) e_1:

- (6) w
- .
- (4) Mary turn the corner
- (5) u turn the corner
- (6) w = the corner
- (6) u turn w

(5) u = Mary

(7) When John saw her, she crossed the street

(8) $e_2 <$ now

(8) $r_2 <$ now

(8) $r_1 < r_2$
[(9) $r_3 = r_2$]
(10) $e_2 \subseteq r_2$
(10) e_2: [(10) John see her
(11) v see her
(12) v see u]
(11) u = John
(13) $e_3 <$ now
(13) $r_3 <$ now
(13) $e_3 \subseteq r_3$
(13) $e_2 < r_3$
[(14) $r_3 = r_3$]
(15) e_3: [(17) z
.
(15) she cross the street
(16) u cross the street
(17) z = the street
(17) u cross z]

We can extract the relevant temporal conditions from DRS (16) and summarize them as follows, omitting the condition "before now", which applies to all the introduced events and reference times.

(17) r_0
$e_1 < r_1 < r_2$
$e_2, e_3 < r_3$

According to (17), both e_2 and e_3 follow e_1, but no constraints are imposed on the relation between e_2 and e_3; all that is required is that both occur within the reference time r_2. The final reference time r_3 follows e_3, but e_2 could in principle follow both e_1 and r_1, since r_3 is not required to follow r_2.

I think we can improve this picture somewhat if we add some auxiliary premises relating to the idea of 'linear narrative'. First of all, we can suppose that in construing a piece of narrative as linear, we assume that the successively introduced reference time strictly follow one another. (Hinrichs' conditions permit r_3 to overlap or include r_1, r_2, and r_3, and r_2 to overlap or include r_3.) This would give the conditions pictured in (17′), where circles now represent inclusion.

(17′) r_0 r_2
$e_1 < r_1 < (e_2, e_3) < r_3 <$ now

Secondly, we can question Hinrichs' decision not to impose any relative ordering between e_2 and e_3, the events of the *when*-clause and main clause of the second sentence. Hinrichs gives examples (as have others) that show that the event in the main

clause does not always have to follow the event in the *when*-clause when both are in the simple past.

The *when*-event can include the main-clause event, as in (18a), or even follow it, as is possible in (18b) (Hinrichs' examples, adjusted to keep the surface order of the two clauses constant).

(18)(a) When John wrecked the Pinto, he broke his arm.
(b) When the Smiths threw a party, they invited all their friends.

But we already know that such conditions can obtain between successive simple sentences as well; simple linear progression is just one mode of discourse organization. Let us assume then that 'simple linear progression' is one possible value, probably the unmarked one, of a higher-order parameter of discourse structure (a parameter which can have different values for different subparts of a discourse), and that when it is in effect, it applies to *when*-clause constructions as well as to concatenations of sentences.[26] We can then generalize the idea that in the simple linear case an event-clause moves the narrative forward by bringing in a new reference time that is 'just after' the given event, and characterize the reference time introduced by a *when*-clause in that way as well:[27] a (preposed) *when*-clause in a linear narrative triggers the introduction of a new reference time located 'just after' the event described in the *when*-clause.

We then obtain the following picture (17''), where $\preccurlyeq$ now represents 'just after' and $<$ represents precedence with no assumption of proximity.

(17'') r_0 r_2
$e_1 \preccurlyeq r_1 < e_2 \preccurlyeq e_3 \preccurlyeq r_3 <$ now

The overt marking of 'just after' as distinct from simple precedence is a departure from Hinrichs' treatment, but one which I believe is consistent with the spirit of his analysis. The analyses differ on just *how* a *when*-clause characterizes the new reference time it introduces. Hinrichs lets the *when*-clause be either stative or eventive and puts the reference time within or surrounding it respectively. I require the *when*-clause to be eventive (if superficially stative, then interpreted as inchoative), and put the reference time just after it. Without 'just after', the reference time would not be sufficiently constrained by the *when*-clause and I would be treating *when* as if it meant *after*.[28]

The two proposals now cover slightly different ranges of data: Hinrichs' analysis covers more of the data, my suggested modification of it gives a more unified account of the introduction of reference times in the linear case. Further comparison and evaluation would require trying to embed both variants in more comprehensive theories.

The modifications I have suggested would entail some slight revisions to DRS(16) with respect to the conditions surrounding the introduction of r_i by the *when*-clause; rather than redraw the whole diagram, I will mention the revisions in a note[29] and follow the modified system in subsequent examples. The resulting picture (17'') is consistent with the idea that the primary function of a

when-clause in simple linear narrative is to provide a new reference time for the associated main clause. Even in a simple linear narrative under the assumptions made above, an event described in a *when*-clause differs from one in a simple sentence in that it is not constrained to occur within the then-current reference time, but rather serves to provide a descriptive anchor for the next-introduced reference time. Compare the anomalous discourse (19) with the normal (20).

(19) People began to leave. The room was empty. The janitors came in.
(20) People began to leave. When the room was empty, the janitors came in.

Discourse (19) is anomalous, presumably because we don't expect the state of the room being empty to hold 'just after' people begin to leave, but state-expressing sentences cannot by themselves move the action forward. The *when*-clause of (20), on the other hand, signals the introduction of a new, later, reference time; we interpret 'the janitors came in' with respect to a time which is after people began to leave and just after the room became empty.[30] The asymmetry between main and subordinate clause is even clearer in the case of *before* and *after*. Sentences with *before*- or *after*-clauses also make it particularly clear that the account of temporal anaphora cannot be directly in terms of the tense morphemes in the main and subordinate clauses, as proposed in Partee (1973). Truth-conditionally, 'after *A*, *B*' and 'before *B*, *A*' are equivalent (except possibly for the non-factivity of *before*-clauses, which we will return to below), but in simple linear narratives they can be seen to have different effects on the establishment of reference time and hence on the temporal interpretation of the discourse as a whole. To appreciate the difference, we need a three-sentence discourse. We begin by extending (16) to (21) as a basis for comparison with (22) and (23).

(21) Mary turned the corner. When John saw her, she crossed the street. She hurried into a store.
(22) Mary turned the corner. Before John saw her, she crossed the street. She hurried into a store.
(23) Mary turned the corner. After she crossed the street, John saw her. She hurried into a store.

We will not construct complete DRS's for these examples, but consider just the sketches of the resulting temporal conditions in the manner of (17′). Here again I am departing from Hinrichs in not putting the subordinate-clause event *within* any reference time of its own; to dispense with the additional reference time that he uses for *before*- and *after*-clauses, I have to claim that what is within the *before* or *after* clause cannot be a state or process. I believe that is correct, and that apparent state or process descriptions in such clauses have to be interpreted as events – again usually inchoatively, sometimes, especially with *after*, 'terminatively'.[31] See also Bach (1981). In all other respects I believe the sketches below, (21′)–(23′), conform to Hinrichs' analysis. The events have been given mnemonic names instead of numbers. In the actual processing rules the subordinate clause is always processed before the main clause and introduces the reference time with respect to which the main clause is interpreted. In each case, presumably as a result of the simple linear progression mode, the reference time r introduced

by the subordinate clause comes after the previous reference time r_1, regardless of which subordinating conjunction introduces the clause. If we break the subordinating clause into its conjunction (*before, after, or when*, which I'll abbreviate collectively as BAW) and its clause, we can say that the clause characterizes an event type and BAW tells where the new reference time r_2 is located relative to some event of that type.

(21') $r_0 \quad r_2 \quad r_3$
$e_{turn} < r_1 < e_{see} < e_{cross} < e_{hurry} < r_4$

(22') $r_0 \quad r_2 \quad r_3$
$e_{turn} < r_1 < e_{cross} < e_{hurry} < r_4$
$< e_{see}$

(23') $r_0 \quad r_2 \quad r_3$
$e_{turn} < r_1 < e_{cross} < e_{see} < e_{hurry} < r_4$

The striking difference between the *before*-clause case and the others is that the event in the *before*-clause does not end up in the linear order at all; it helps to describe the temporal location of r_2 and hence of the crossing event, but is not otherwise connected, even in the context of a simple linear narrative. This seems to be a natural reflection of two factors, iconicity of order in simple linear narratives and the dynamics of successive introduction of reference times in the interpretation process.[32]

Why does the *before*-clause event not end up linearly ordered with the other events of the discourse, while the events of the *when*-clause and the *after*-clause do? If we process just the first two sentences of each discourse and leave out the reference time r_3 introduced in the final steps of that part, we have the following structures, all linear.

(21') $r_0 \quad r_2$
$e_{turn} < r_1 < e_{see} < e_{cross}$

(22') $r_0 \quad r_2$
$e_{turn} < r_1 < e_{cross} < e_{see}$

(23') $r_0 \quad r_2$
$e_{turn} < r_1 < e_{cross} < e_{see}$

The difference arises because the next reference time, r_3, is introduced in the processing of the *main clause* of the second sentence; in each case r_3 is required to be after r_2. For (21) and (23), this continues the linear order, since the main clause event was the last event so far. But for (22), this leaves us with r_3 and e_{see} both following r_2 and no specified relation between them. Subsequent reference times follow r_3, since it is the reference times that move the narrative linearly forward, and e_{see} is left 'dangling'.

While Hinrichs does not claim to have an account of non-factive *before* (cf. Heinemaki (1974)), the isolation of the *before*-clause event from the linear structure in even this simple case accords well with the ease with which we construe such events as not part of the 'real' event structure at all.

One could question the simple linearity of the *after*-structure, (23'), as well. It is a matter of stipulation in Hinrichs' original work and even more so in the

modification I have suggested that the event in the *after*-clause must strictly follow the last current reference time (r_1). (If I try to make it follow by strengthening my claim about the general effect of the linear progression mode to require that not only all reference times but all *events* in such a discourse be linearly ordered, I would have to retract the previous remark about the *before*-case.) Mats Rooth (personal communication) has provided examples like (24) that suggest that the event in the *after*-clause can overlap the previous event; what's hard to decide is whether such cases fall within the linear order mode or amount to a shift to a different mode (e.g. 'adding details').

(24) Mary crossed the street. After she reached the middle of the street, John saw her.

I would like to think that in the simple linear mode, such cases 'really' want a past perfect in the *after*-clause, and can occur in simple past only because past perfect is hardly ever obligatory in ordinary English. Otherwise they would present a problem, since at the point at which the *after*-clause is processed, the current reference time (see (23′)) is r_1, not r_0, so there is no nice way to state a condition which would let the event in the *after*-clause overlap the previous event without letting it reach arbitrarily far into the past, which I don't think it can.

Leaving further details and open questions aside, the most important point about the parts of Hinrichs' analysis that we have reviewed here is that the phenomena of temporal anaphora which I tried in Partee (1973) to account for by treating the tense morpheme itself as a pronoun-like variable over times appear to be much more elegantly handled through the intermediary reference times, as argued by Bäuerle (1979). Reference times are not directly *denoted* by any part of the sentence; they are more like a part of the necessary context for interpreting tensed sentences (Kratzer, 1978), akin to the kind of locative frame of reference needed to interpret *left* and *right* and other locative expressions. And like the locative case, they are not bound to the actual context of the utterance but can be 'constructed' and shifted in the course of interpretation. Although Kamp's and Hinrichs' proposals and those they build on are certainly just first steps toward the construction of a formal framework integrating such contextual frame features with a model-theoretic semantics, their work can be neatly combined and extended to account for temporal analogs of bound variable and 'donkey' pronouns as well.

Before turning to these extensions in section VI, we should pause to take stock of how much of the explanation of the parallels noted in Section II is already available.

V. The First Three Parallels Explained

The first three of the five parallels discussed in Section II were pronominal and temporal anaphors with (A) non-linguistic antecedents, (B) definite antecedents,

and (C) indefinite antecedents. Both in Kamp's and Heim's treatment of pronouns and in Hinrichs' treatment of temporal anaphora there is no special distinction between cases (B) and (C) – that distinction mainly reflects the fact that in earlier treatments (B) seemed straightforward and (C) was a problem. In this section we review the account of the parallels that can be provided from the proposals discussed so far.

A. Non-Linguistic 'Antecedents'

The pronominal 'deictic' case was discussed briefly at the end of Section II. Kamp speaks in unpublished work of 'anchored' discourse referents; the notion of 'anchoring' is also found in the work of Barwise and Perry. Whatever the exact mechanism, it is apparent that personal pronouns can get their values from the non-linguistic context. As Heim (1982) puts it, it is a precondition on the interpretation of a sentence containing a non-anaphoric pronoun that the context provides an appropriate value for the pronoun. Hinrichs similarly requires that the context already provide a past reference time in order to interpret a simple past sentence (without temporal adverbs; with an adverb like 'in May', the context must already provide a year, but need not specify a more particular reference time). The discourse representation level (or Heim's 'file card' semantics) helps to unify this case with the anaphoric cases by providing a level in which contributions from context can be represented overtly (whether introduced spontaneously or via a process of accomodation in Lewis's sense) without having to arise as translations of actual constituents of the sentences of the discourse. Treating pronouns as variables has some plausibility and a considerable tradition but 'reference time', which appears to lie at the heart of temporal anaphora, does not correspond uniformly to any single constituent of the sentence, so there does not seem to be any reasonable way to introduce it systematically into a direct model-theoretic interpretation of the syntax.

B. Definite Anaphors with Definite Antecedents

The pronominal case was illustrated with proper name antecedents in Section I. In the temporal cases discussed in Section IV, the 'definite antecedent' was a reference time introduced in the processing of the previous sentence or clause. This is more like the case of a definite description antecedent (see Heim (198- than a proper noun antecedent; a closer analog to the latter would be a sentence like (25).

(25) At 3 p.m. June 21st, 1960, Mary had a brilliant idea.

Hinrichs treats the adverb in such cases as serving to fix the reference time (replacing any previously current reference time) with respect to which the rest of the sentence is interpreted; the adverb thus functions much like a proper noun antecedent for a pronoun, although in the temporal case we do not have a common syntactic category of expressions denoting the antecedent and

C. *Indefinite Antecedents*

The treatment of pronouns with indefinite antecedents was one of the main innovations in Kamp's and Heim's proposals. In the temporal case the contrast between definite and indefinite is not always clearly marked; a newly introduced reference time might be thought of as definite in those cases where its introduction is accompanied by a condition that it be 'just after' some uniquely specified event, and indefinite in those cases where it is introduced with conditions that merely constrain it to be before, after, or within some given event or interval, or 'just after' an event whose description is not uniquely specifying. But the distinction is not marked by any obligatory grammatical signals (at least in English); our temporal system is in that respect more like the nominal system of languages that lack the definite and indefinite article, and Kamp's and Heim's unified treatment of these cases (see especially Heim's work on this point) therefore makes it much easier to account for the parallels between nominal and temporal anaphora in English as well as for the existence of article-less languages.

The examples with *before* and *after* in Section IV were in effect cases of indefinite antecedents, since the conditions on the reference times introduced by such clauses amounted to 'at some time (after the previous reference time and) before/after such-and-such.' An indefinite antecedent can also be introduced via an indefinite adverb, as in (3b), repeated here as (26).

(26) Mary woke up sometime during the night. She turned on the light.

We show below a DRS for (26) which conforms to Hinrichs' construction. Hinrichs does not treat the specific locution 'sometime during the night' but does give explicit rules for other 'frame adverbs' like 'on Friday', 'in 1976', and the permissible complex adverbs that can be built up by combining appropriately nestable simple ones. We assume that 'sometime during the night' would work similarly, yielding the condition $r_1 \subseteq i_1$ in DRS(26), and we also leave definite NP's like 'the night' and 'the light' unanalyzed. We have parenthesized the initial past reference time r_0 and the conditions that pertain to it; following the observations of Smith (1978), Hinrichs provides both for frame adverbs like *two days later* which can only be interpreted in a context which includes a current r_p and ones like *in June 1970* which do not require such a context. The present example requires contextual support for the expression *the night*, but that could in principle come either from having the night available as an entity already introduced or from a reference time which specified a given period only containing one night. A similar example with 'the night of June 21st 1960' would not require any r_0 present in the context, so there would be otherwise parallel DRS's with and without the parts parenthesized in DRS(26). I introduce an interval-variable i_1 for 'the night', but perhaps it could just as well be viewed as a protracted event (cf. 'during the fight'). In DRS(26) it is the reference time r_1 that plays the role of 'indefinite antecedent'. The parallels to Kamp's treatment of pronouns with indefinite antecedents should be clear: the role of r_1 in the subsequent processing of the two clauses is exactly the same as it would have been if it had been specified 'definitely'

as the role of a discourse entity is the same for the interpretation of subsequent pronouns regardless of whether that entity is characterized by a definite condition like 'u = Pedro' or an indefinite one like 'farmer (u)'.

To complete the account of the parallels between temporal and nominal anaphora, we need to extend Hinrichs' treatment to cover temporal quantification, to which we now turn. The treatment of 'donkey-tenses' will fall out as a direct consequence of the treatments of quantified cases and indefinite antecedent cases, just as it did in the pronominal case for Kamp and Heim.

DRS(26)

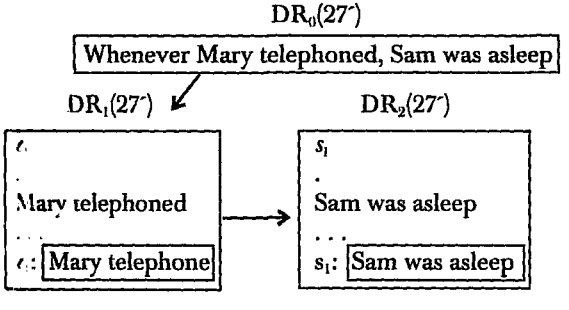
(0) now ((0)r_0) (2) i_1 (2) r_1 (4) e_1 (4) r_2 (6) u (9) e_2 (9) r_3

([(0)r_p: = r_0])
(1) Mary woke up sometime during the night.
(2) i_1 = the night
((2) $i_1 \subseteq r_0$)
(2) $r_1 \subseteq i_1$
[(3) r_p: = r_1]
(4) $e_1 <$ now
(4) $e_1 \subseteq r_1$
(4) $e_1 \prec r_2$
(4) $r_2 <$ now
(5) e_1: (5) Mary wake up; (6) u wake up
(6) u = Mary
[(7) r_p: = r_2]
(8) She turned on the light
(9) $e_2 <$ now
(9) $e_2 \subseteq r_2$
(9) $r_3 <$ NOW
(9) $e_2 \prec r_3$
(10) e_2: (12) $\overset{v}{\cdot}$; (10) she turn on the light; (11) u turn on the light; (12) v = the light; (12) u turn on v
[(13) r_p: = r_3]

VI. Generalizing to Quantification over Events

David Lewis, in his paper 'Adverbs of Quantification' (Lewis, 1975), noted that frequency adverbs like *always, sometimes, usually,* etc. are used not only for temporal quantification but more generally for quantifying over cases (as in 'The sum of two odd numbers is always even'). Kamp's treatment of ordinary quantifiers like *every* yields structures which are naturally construed as quantification over

cases, so it is not surprising that his approach is readily generalizable to temporal (and other) kinds of quantification. We will limit our treatment here to simple event and state clauses in constructions with (temporal) *whenever*, *always*, etc.



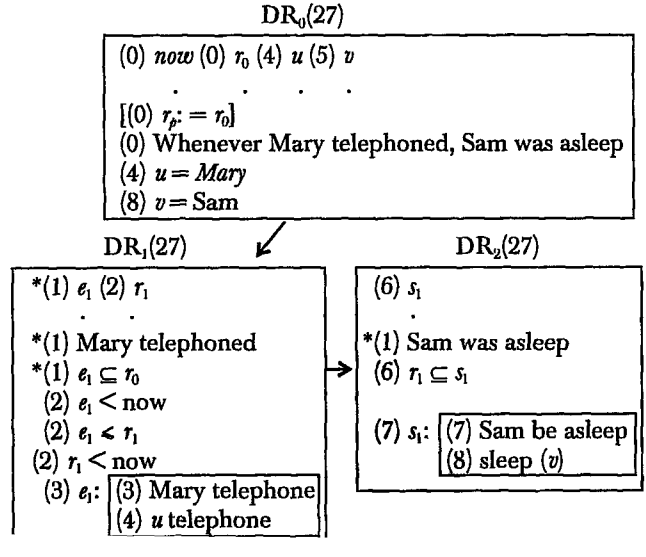
There are at least two ways to express universal quantification over eventualities, either by using *whenever* to introduce the subordinate clause or by using a plain *when* (or *before*, *after*, etc.) and putting *always* in the main clause. Even with a simple *when*-clause and no adverb in the main clause a sentence may be interpreted universally (or more likely generically); this is probably to be attributed to implicit modalization in the main clause rather than to an ambiguity in *when*, since (a) a main clause alone can have a similarly generic or habitual reading, and (b) the same phenomenon occurs with *before*, *after*, etc., which have no counterparts with *-ever* and for which there is no independent reason to posit ambiguity. Heim (1982) includes extensive discussion of the 'unselective quantifier' force of various main adverbs, modals, and other sentence operators, and shows the parallels between her treatment of quantification and Kratzer's explanation of the interaction of *if*-clauses with main clause modals (the parallels extend in relevant respects to Kamp's treatment). Kamp and Heim both treat *every* and *if*-clauses in a unified manner, as we illustrated for Kamp in Section III, and very differently from *a* or *the*. Following their lead, and without providing rules for an explicit fragment, we will assume that both a *whenever*-clause. and a main-clause *always* trigger the same sort of DRS-splitting as an *if*-clause or an *every*. In both cases, the content of the 'antecedent' box in the DRS (using Kamp's version) has the same internal form as in a simple indefinite case; the universal quantification arises in the statement of the embeddability conditions for the whole DRS conditional/universal substructure.

To see how we can put the ideas of Sections III and IV together, let's consider an example. Example (5a) from Section II is repeated below as (27).

(27) Whenever Mary telephoned, Sam was asleep.

The basic idea of the construction is to end up with a DRS roughly of the form (27') analogous to DRS(9) for the conditional example in Section III.

(27')



(Here s_1 is a discourse state.) One new factor we have to deal with is that although we are still considering an example with simple past tenses in both clauses, we are not dealing with a simple linear narrative anymore. The antecedent clause cannot be anchored to a single specific reference time as it was [illegible]

when-clause cases, yet the whole sentence does presumably have to be interpreted relative to some (sufficiently large) reference period. (The whole sentence should be characterized as describing a state, and the DRS should perhaps have a big box around it labelling the whole thing as a state (Gennaro Chierchia, personal communication), but I will ignore that factor here.) We can handle that by assuming that there is a reference time r_0 already current in the top box and that the discourse event e_1 in the antecedent box is introduced with a condition that it fall *within* the current reference time. (That has to be part of what happens in the initial box-splitting step triggered by *whenever*, since the clause that follows *whenever* is internally just like any other subordinate clause, and should therefore be processed within its box by the normal rules.)

The embedding conditions for the whole configuration will be just like those for the *if*-clause and the *every* construction: the whole sentence is true just in case every proper embedding of the antecedent part can be extended to a proper embedding of the combination of the antecedent part and the consequent part. The main thing missing from the rough sketch in (27′) is the indication of temporal connectedness between the antecedent and the consequent. When I discussed such sentences in Partee (1973), I didn't see any way to capture such 'bound variable' temporal cases without an explicit variable over times in the representation. But the abstract notion of reference time (or reference event or situation) together with the general embeddability conditions just described can do the job just as well, as we will now show.[33]

Here is a more complete picture of the DRS for (27), with parenthesized numbers showing the order of construction. Asterisks signal the application of the one new rule needed for this construction: the new rule is a straightforward adaptation of Kamp's rule for universal/conditional sentences. The remaining steps follow the rules of Kamp and/or Hinrichs (continuing with the modification of Hinrichs' treatment introduced with (17″) in Section IV).[34]

DRS(27)

It is important to recall at this point that the representation of the consequent box $DR_2(27)$ is an abbreviation for a fuller representation which incorporates all of the contents of the antecedent box, $DR_1(27)$ and adds the new material to that. This is particularly crucial for step (6), which follows the same rule that applies to all simple past state-describing clauses, namely that the state described overlaps the current reference time r_p. In step (5) r_p was set to r_1, and it is therefore that reference time that is current at step (6). The embeddability conditions for the whole conditional structure thus require, as desired, that for every choice of an event e_1 of Mary's telephoning and reference time r_1 'just after' it, there is a state of Sam's being asleep that surrounds r_1 (and hence may overlap or surround e_1).[15] The treatment of this case thus comes out exactly parallel to the treatment of *if*-clauses in Kamp's system.

Extending the parallel, we can design a rule that is sensitive to the conjoint presence of *always* and a *when*-clause (just as Kamp's *every*-rule takes a relative clause into account at the same time) to produce exactly the same DRS for sentence (5b), repeated here as (28).

(28) When Mary telephoned, Sam was always asleep.

ugh this may look suspicious because the *when*-clause and the *always* do rm a surface constituent, I believe that there are sufficient arguments in (1981) and Kratzer (1981) for viewing similar cases of clausal sentential junctions as modifying main clause sentence operators; neither of their treatments akes the same form as Kamp's and the different approaches deserve careful mparison, but the similarities seem sufficient to justify treating the *when*-clause nd the adverb *always* as in construction with each other (perhaps indirectly hrough the use of lambdas, if one wants to maintain a surface-syntax compositional treatment).

The construction as described also extends straightforwardly to the rest of the 'bound variable' cases described in Section II, including cases where the main clause describes an event rather than a state and/or contains anaphoric adverbial like 'two days later' or 'immediately'. Again we don't need to introduce invisible time-variables into such expressions, but can simply treat them as interpretable only relative to a given reference time; the interpretation proceeds just the same whether such a clause is used in isolation with a contextually supplied reference time or whether it follows a *whenever*-clause. with the reference time introduced as in DRS(27). That takes care of sentences like (29) and (30).

(29) Whenever Mary wrote a letter, Sam answered it two days later.
(30) Whenever John got a letter, he answered it immediately.

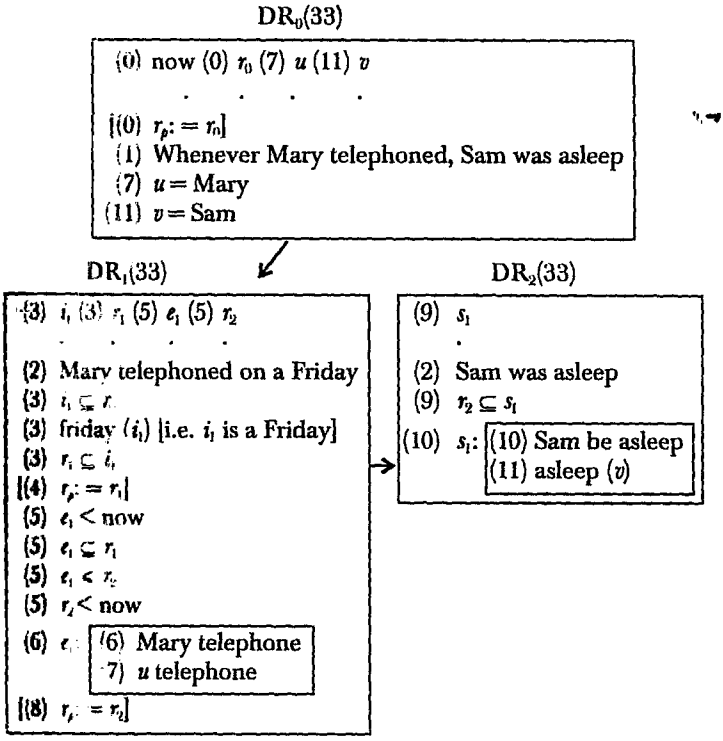
The construction does *not* extend straightforwardly, however, to cases like (3
If we adapted Hinrichs' rules for *before-* (and *after-*) sentences to the

(31) Before John makes a phone call, he always lights up a cigarette.

quantified case in the same way we have done for *when*-sentences, we would end up with the erroneous interpretation that John is lighting a cigarette at *all* times preceding each phone call, rather than that he lights a cigarette *sometime* before each phone call.[36] The meaning of the sentence is approximately the same as that of (32); we seem to need to insure somehow that the condition setting the reference time to a time

(32) When John makes a phone call, he always lights up a cigarette beforehand

before the (each) phone call ends up in the consequent box, not the antecedent box.



Sentence (32) itself does not fit into the pattern of linear sequencing we have been dealing with, suggesting that the problem of accomodating cases like (31) would be better dealt with in the context of discourse segments in which one clause introduces an event (or more generally a topic) and subsequent clauses fill in details. (And these examples further illustrate the need for a clearer articulation of what it is to quantify over 'cases'.)

The treatment of donkey-sentences on Kamp's approach is a direct consequence of his treatment of indefinite antecedent cases together with his treatment of *every* and *if*. Similarly, the treatment of the temporal analogs of donkey sentences follows directly from Hinrichs' treatment of the indefinite antecedent cases together with our extension of his analysis to sentences *with whenever* or *always*. We illustrate by constructing a DRS for sentence (6d), repeated here as (33), which differs from sentence (27) only by the addition of the indefinite temporal adverb 'on a Friday' in

(33) Whenever Mary telephoned on a Friday, Sam was asleep.

the antecedent. As in the nominal case, the net effect of the embedding rules operating on DRS (33) explains the apparent 'wide scope universal' reading of the indefinite adverb as well as the apparent 'binding' of the time in the consequent clause to the times on Fridays when Mary called.

DRS(33)

In comparing DRS (27) and DRS (33), note that the apparently different conditions on the state s_1 in DR_2, namely that it contain r_1 in the former case and r_1 in the latter, result from applying the same rule, namely that the state contains the current reference time r_p; the current reference time in both cases is whatever is in force at the end of processing the antecedent box DR_1.

I also promised in Section II an account of the negative data (7a, b), repeated here.

(7)(a) #If every man owns a donkey, he beats it.
(b) #If Sheila always walks into the room, Peter wakes up.

In Kamp's account of (7a) the occurrence of *every* in the antecedent will trigger (as always) the introduction of a pair of DRS's, subordinate in this case to the DR for the *if*-clause. Because of the subordination structure, the discourse entity corresponding to 'every man' will not be an accessible value for the *he* in the main clause. (See also the discussion of examples (11) and (12) in Section III.) A similar account for (7b) can be given, since the *always* in the antecedent will trigger a similar DR-split, with the new DR's subordinate to the *if*-clause DR,

and the *always* absorbed into their embeddability conditions, so to speak. On a reference time introduced at the level of the *if*-clause as a whole will be accessible for the main clause interpretation; the 'variable' reference time corresponding to *always* will not be.

We thus see that the proposals of Kamp (and Heim) and Hinrichs generalize straighforwardly to an account of quantified temporal anaphora. It should be reemphasized that the distinction between 'bound variable' cases and 'donkey sentence' cases, like that between cases of definite and indefinite antecedents, has no theoretical status in this approach but merely reflects the earlier descriptive classification of Partee (1973). This unification is particularly welcome in the temporal case, where the distinctions in question are quite artificial.

VII. Conclusions and Open Problems

This completes our account of the parallels between temporal and nominal anaphora. I consider this a much more satisfying account than the one offered in Partee (1973), which in retrospect can be seen to have suffered from two inadequacies: (i) the lack of a unified treatment of pronominal anaphora, which did not become available until the work of Kamp and Heim; and (ii) the claim that tenses themselves acted like pronouns and the consequent belief that they therefore had to correspond to explicit time variables in a logical representation. Intuitively, noun phrases 'refer' and tenses don't; nominal anaphora can be viewed as involving a generalization and explication of the notion inaccurately but intuitively labelled 'coreference'. Temporal anaphora is more subtle because of the categorial variety of the expressions involved – tenses, adverbs, adverbial clauses, and main clauses (including the aspectual classification of the clauses themselves into event-like and state-like). It is still fair to say that tenses like pronouns, are anaphoric, and like pronouns can be construed with either linguistic or non-linguistic antecedents; but it doesn't follow that they 'refer' to times to the degree that pronouns 'refer' to individuals.

Two general points deserve mention here.[37] Kamp motivated the level of DRS's with two separate sets of phenomena: the behavior of pronouns (in the non-temporal domain) and the interpretation of aspectual matters in the temporal domain (Kamp 1979, Kamp and Rohrer 1983). The fact that these two uses of DRS's can be so neatly combined to explain the parallels between temporal and nominal anaphora without having to treat 'tenses as pronouns' provides further support for such an approach.

The other general point relates to the integration of Reichenbach's and Prior's treatments of the past tense operator. On Prior's treatment, which has become standard tense logic, *Past* ϕ is true at time t iff ϕ is true at some $t' < t$: the past operator thus amounts to 'at *some* time in the past'. On Reichenbach's treatment a sentence *Past* ϕ is only interpretable with respect to a given past reference time R, and is true iff ϕ is true at R ('event time = reference time'); the past operator thus amounts to 'at *that* time (in the past)'. In effect, Hinrichs' analysis and those

of Kratzer and Bäuerle before him incorporate aspects of both analyses. In a simple past tense event sentence, the event is not required to coincide with the past reference time, as in Reichenbach, but to occur within it (a distinction that only became available with the advent of interval semantics). Thus the existential quantifier over past times is still explicitly there, but restricted to times within the past reference period. In narrative discourse of the sort considered by Hinrichs, reference intervals are typically quite small, since the focus is on the succession of individual events. In other sorts of discourse, reference intervals may be small and specific ('I didn't turn off the stove'), or large, vague, and possibly even irrelevant ('Who killed Julius Caesar?' – I don't have to know when it happened to know who did it, given that it could only have happened once if it happened at all). In the latter kind of case, the reference time could potentially be the whole of the past, leaving only 'at some time before now' as the consequence of the condition '$e \subseteq r_p$'. The Reichenbachian and Priorian past tenses can then both be seen as special cases of the Kratzer-Bäuerle-Hinrichs account: The Reichenbachian one results if both reference time and event time are instants, the Priorian if the reference time is all of the past.

The account given here suffices to explain the parallels with which we began, but is still very crude. Part of this is just the result of my over-simplified presentation of Hinrichs' system,[38] but it is also clear that there are many major open questions in this area that need to be explored. I will close by mentioning several that seem particularly pressing.

i) In the DRS's for temporal anaphora cases, we put 'discourse events' for events described by tensed clauses into the representation on a par with discourse entities for individuals; but then what's the difference between an event-describing clause like 'Mary telephoned John' and a nominalization like 'Mary's telephoning John', which has more claim to referring to an event. Would the strategy followed here require us to posit a discourse referent for the whole proposition expressed by a sentence to account for the 'sentence-pronoun' *it* if the next sentence is 'But John doesn't know it'? Where would that discourse referent go? Presumably not within the DRS for the sentence (proposition) it refers to on pain of circularity. Clearly a general treatment of anaphora has to involve both things (including events, situations, propositions, etc.) directly expressed or referred to in a discourse and things that become salient as a result of the occurrence and interpretation of the discourse; but it is not so clear that everything potentially relevant should be entered into a DRS in the same way, especially given the fact that there are 'pure anaphors' which can only have linguistically expressed antecedents and 'pure deictics' which can only have contextually supplied values, as well as cases like the pronouns and tenses which can have either. (Both Kamp and Heim are aware of these problems, but as far as I know neither they nor anyone else has a general solution to offer.) The questions that need to be answered here concern both ontology and levels of representation.

ii) Another pressing need is for a better articulated theory of context and its interaction with semantic interpretation. 'Reference times' probably belong to

context rather than to semantic content, but if Hinrichs' treatment of tempora anaphora and my extension of it are on the right track, we can only move refer ence time to a separate context dimension if we have a framework in whic context both affects and is affected by the process of semantic interpretatio which in turn seems to have to be viewed in some sense dynamically rathe than statically (cf. the crucial role of the 'updating' of the past reference tim r_p in the account of temporal anaphora).[39] Just as we can now see that we don need variables over times in the object language to account for temporal anaphor and temporal quantification, it is to be hoped that with a better theory of conte we will not have to put reference times into DRS's on a par with other discour referents to capture their involvement in the parallels between nominal an temporal anaphora.

(iii) Another major issue, already mentioned, is how to generalize furth to quantification and anaphora involving 'cases' in the sense of Lewis (197 *Whenever*-clauses are not always literally temporal, nor are *wherever*-clauses alwa locative; how do we tell what we are quantifying over? The problem not earlier in this section about constructions with a *before* or *after* clause accompani by an *always* is the main clause is one example of a much broader problem determining what belongs in the 'antecedent box' in a conditional/univers DRS. Closely connected with this is a problem of interpreting the embeddi condition for conditional DRS's, namely how to individuate proper embeddin of the antecedent part. This problem is perhaps best illustrated by the problem that arises in trying to extend Kamp's treatment to *most* or *almost every*, noted b Heim (1982). Whereas (34) and (35) have the same truth-conditions (at least i the respects relevant here), (36) and (37) seem not to: (37), but not (36), seems t be falsified by a situation in which just one donkey-owner fails to beat any of hi donkeys but he owns most of the donkeys.

(34) Every man who owns a donkey beats it.

(35) { Always, / In all cases }, if a man owns a donkey, he beats it.

(36) Almost every man who owns a donkey beats it.

(37) { Almost always / In almost every case }, if a man owns a donkey, he beats it.

Intuitions seem to be sharper with event-clauses (perhaps since it's not so clea what a 'case' of a state holding is). The difference in truth-conditions between (38) and (39) seems more certain than that between (36) and (37) (although still c ceivably disputable).

(38) Almost every man who swam the channel took more than 12 hours.

(39) In almost every case, if a man swam the channel, he took more than 12 h

The difference evidently arises because in the case where the quantifier is c bined with *man* we have to count men, and in the other case we have to c cases of channel swimmings and the same man may be involved in many swim mings. As Scha (1983) argues, when we have to deal with quantification w

complicated and possibly uncertain underlying ontology, we need to specify a 'sort' (for the quantifier to 'live on' in the sense of Barwise and Cooper (1981)) separately from whatever further restrictions we want to add (perhaps in terms of 'cases') about which instances of the sort we are quantifying over. In terms of Kamp's framework this means that we have to worry not only about what belongs in the antecedent box but also how to distinguish a substructure within it that plays the role of sortal (the head noun in the NP case).

This in turn relates to the syncategorematicity of *every* in Kamp's treatment and the corresponding treatment of *always* in this paper. How, for instance, can *almost* modify *always* or *every* if they are not part of the semantic representation? I suspect that many of the ingredients for a better articulation of how the meanings of the various parts combine in these cases could be gotten out of a combination of the proposals in Stump (1981) for the treatment of free adjuncts in combination with frequency adverbs, Kratzer (1978) for the treatment of *if*-clauses and modals, Heim (1982) for a more Kratzer-like treatment of the quantifier cases, and the ideas of Kamp and Hinrichs presented here. But it is important to recognize that the source of these problems for the Kamp and Heim frameworks is their abandonment of Montague's unified treatment of noun phrases as generalized quantifiers, in which determiners can be assigned a uniform semantic type and modifiers of determiners could be added straightforwardly.

I don't see how to incorporate Montague's elegant treatment of compositionality into the framework followed in this paper, nor do I see how to reporduce within Montague's theory the unified and explanatory account of nominal and temporal anaphora provided by these extensions of Kamp's, Heim's, and Hinrichs' work. So the next task is to try to construct a theoretical framework which incorporates the insights of both approaches.[40]

Acknowledgements

I am grateful for discussion and valuable suggestions to Emmon Bach, David Dowty, Irene Heim, Hans Kamp, and Johan van Benthem; my additional indebtedness to the work of Erhard Hinrichs is evident throughout. Both Ewan Klein and an anonymous referee provided very helpful suggestions for improvements to the penultimate draft. I am also grateful for helpful suggestions received on occasions when I have resented various stages of this work, first at a workshop at Ohio State University in April 1981 and in a graduate seminar at the University of Massachusetts in the same spring, then in May 1983 at a workshop at the University of Groningen and in a lecture at the Max-Planck-Institute for Psycholinguistics in Nijmegen. At one stage Emmon Bach and I were going to co-author this paper and another one; although we later decided to divide up the papers into one apiece, his ideas have had a steady influence on my thinking in the realm of tense and aspect. I accept responsibility for remaining inadequacies.

I gratefully acknowledge the following support for the period in which the paper actually got written: a fellowship from the National Endowment for the Humanities, the hospitality of the Max-Planck-Institute for Psycholinguistics in Nijmegen, and a sabbatical leave from the University of Massachusetts.

Notes

1. All references to Hinrichs' work in this paper are based on Hinrichs (1981); Hinrichs has now written a paper in English on this topic, Hinrichs (1982), which I have not seen.
2. Among other approaches which have emphasized a dynamic view of semantic interpretation are Hintikka's game-theoretical semantics and procedural semantics (Isard 1975); attention to dynamic aspects of context has been standard in studies of the semantics of programming languages.
3. There are acceptable sentences of the form (7b), such as (i) below, from Emmon Bach,

   (i) If Sheila always worked late, Peter got angry.

   But the *always* in the antecedent is then interpreted with 'narrow scope' and does not 'bind' the time of the main clause; we could paraphrase (i) as (ii):

   (ii) If Sheila always worked late over a period of time, Peter got angry during that period.

   This corresponds to the fact that *if*-clauses containing *every* are perfectly all right as long as the scope of the *every* remains within the *if*-clause.
4. Kamp does not treat *the*; Heim (1982) treats it extensively. Van Eijck (1982) offers an extension of Kamp's work treating *the*.
5. Kamp (1981a) uses the term 'discourse referent' which traces back to Karttunen (1976); in some later unpublished work he uses 'reference marker'. I use 'discourse entity' for parallelism with 'discourse event' and 'discourse state' (also Kamp's terms).

   One might ask why *Pedro* is entered via a 'variable' discourse entity rather than directly as a 'named' element. I don't know Kamp's answer, but one answer might be that it leaves the way open to abstract over that 'variable' in extending the fragment to handle VP-deletion, focus phenomena, etc.
6. For simple cases, 'accessible' just means 'already in the DR'; more complex cases will be discussed below and the notion of accessibility correspondingly sharpened. See also Note 8.
7. See Webber (1978) for an earlier statement of a similar appraoch in a computational framework, and Karttunen (1976) for a still earlier introduction of the idea of 'discourse referents'.
8. We ignore here issues of 'suitableness' (e.g. gender agreement), as well as the issues of disjoint reference and of reflexive pronouns. These are, of course, important issues for a complete treatment, but I believe they are independent of the concerns of this paper.
9. I have a terminology problem in the rest of this paper because of the 'paradigm shift' that comes from Kamp's and Heim's work. Henceforth, when I use expressions like 'bound variable anaphora', even without scare quotes or caveats, I mean 'cases of anaphora which were classified as bound variable cases in earlier treatments'.
10. Eventually one will want to find general principles governing both the introduction of additional DR's and the subordination relations among them. Since the function of both is clearly semantic, it will be interesting to see how far one can get with the assumption that the rules which introduce them are sensitive only to syntactic structure and the presence of particular (closed-class) lexical items like *if* and *if*

11. It has long been observed that there is an intimate connection between *every* and *if* and between *a* and *and*. In transformational grammar it was sometimes proposed that relative clauses be derived from conjunctions or *if*-clauses depending on the determiner of the head noun (although that very dependence weakened the attractiveness of the proposals from a syntactic perspective). In PTQ Montague built an *if* into the meaning of *every* and an *and* into that of *a*, so to speak. But Kamp and Heim seem to have been the first to have the idea that *if* brings with it an implicit *every* just as much as *every* contains an implicit *if*. (Kratzer's work on conditionals and modals (Kratzer (1978, 1981) can be viewed as an important forerunner of such an idea; her work also suggests that the quantifier implicitly associated with an *if*-clause may not always be universal. See discussion of the problem of *most* in the last section of this paper.)
12. The truth conditions assigned to (9) and (10) amount to giving the embedded *a* a wide scope universal reading. This is not uncontroversial; an apparent counterexample is (i):

    (i) If you have a credit card, you should use it here instead of cash.

    But (i) might be construable as having a wide-scope universal reading for 'a credit card' if we paraphrase it with *any* rather than *every*.

    In an earlier proposal for a unified treatment of pronouns, Cooper (1979a) treated them all as context-dependent definite descriptions. Cooper's treatment has the advantage of extending naturally to 'paycheck' sentences, but would predict anomalousness for Heim's 'sage plant' example (ii), for which Kamp and Heim correctly predict a wide-scope universal reading.

    (ii) Every customer who bought a sage plant bought eight others with it.

    See Heim (1982) for a good discussion of these and related issues.
13. Kamp (in unpublished work) and Heim (1982), both make proposals along these lines. Not all problematic cases of pronouns are covered by the mechanisms discussed here; but this covers all of the kinds of nominal anaphora that were compared to temporal anaphora in Partee (1973), and all the types discussed in Kamp (1981a), so we will not try to speculate on further extensions to cover e.g. Karttunen's 'paycheck' pronouns (Karttunen (1969)). Crit Cremers (personal communication) suggested to me that these may have temporal analogs as well. Possible examples might be (i) and (ii).

    (i) When John got married, he had a good job and money in the bank. Bill had no job and a pile of debts.
    (ii) Some people, when they got a divorce, remarry within a few months. Other people don't remarry until years later.

    I thank the anonymous referee for the following:

    (iii) The man who left town when he was fired was wiser than the man who sued the management.
14. I received a copy of Dowty (1982) just as I was putting the finishing touches on this paper. Dowty challenges Kamp's discourse representation approach and Hinrichs' application of it on just this point: the classification of sentences into aspectual types

plays a crucial role in discourse representation construction rules but would itself be determined by the compositional semantic interpretation of the parts of the sentence in a fuller treatment, since much more than the aspectual type of the main verb plays a role. Unless all the relevant factors are encoded in the syntax, as in Verkuyl (1972), there is then a conflict, Dowty argues, between the use of DRS's as intermediate constructs between syntax and model-theoretic interpretation and the role of the model-theoretic interpretation in determining properties of the sentence on which DRS construction rules depend. I believe this is indeed a serious problem, possibly a representative of a large family of such problems. I shall, however, proceed without either solving the problem or revising the paper in the belief that the proposals about anaphora that are central here are robust enough to survive whatever theoretical changes may be needed. See also Note 19.

15. This is an oversimplification which will be rectified shortly.
16. We will say more about both the construction and the interpretation of such DR's as we proceed. See also Kamp (1981b), Kamp and Rohrer (1983).
17. As with other kinds of contextual preconditions or presuppositions, it is not literally required that a past reference time is *already* available to the hearer – one will be added or assumed via the general process of accommodation if doing so does not create any conflicts with the prior context.
18. The reader may wonder (as one referee did) why I haven't added a helpful graphic display of the resulting structure with little circles along a time line, as in some examples in Kamp and Rohrer (1983). The reason is that Kamp's and Hinrichs' rules in general provide only partial information about precedence and inclusion among the introduced events and states, and it is in many cases difficult or impossible to draw a graphic display that contains *only* the information provided in the DRS. In the case of DR(15) it is the information about s_1 and s_2 that is hard to draw.

    The relation between DRS's and graphic representations of ordered event structures has not been addressed explicitly in any work that I know of: the question is potentially important for theories of language comprehension. Discussion of related issues in other domains, e.g. discourse about spatial relations, can be found in Johnson-Laird (1983). Johnson-Laird has conducted experiments to study differences in comprehension strategy for discourses like (i), which can be mapped into a determinate partial model and those like (ii) which cannot.

    (i) *A* is to the right of *B*. *C* is to the right of *A*.
    (ii) *A* is to the right of *B*. *C* is to the right of *B*.

19. In particular, Dowty's arguments described in Note 14 challenge the inclusion at this level of any conditions that depend on aspectual distinctions (here simplified to the event/state dichotomy). I believe that a potential resolution may lie in a clearer articulation of the dynamic aspects of DRS-construction and the corresponding dynamic aspects of context change as it both affects and is affected by interpretation. To make this more concrete, note that there are just two points in Hinrichs' DRS construction rules where the event/state dichotomy makes a difference: (i) in the choice between the conditions "$e_i \subseteq r_p$" and "$r_p \subseteq s_i$" relating a given event/state description to the current reference time, and (ii) in whether a new reference time is introduced or not at the end of processing a simple clause. For the first, we could let the syntax-driven DRS construction rules introduce a free context-dependent variable over temporal relations, whose value will be determined as '$\subseteq$' or '$\supseteq$' from the context

after the clause has been interpreted; for the second, the syntax-driven rules could in effect just say 'reset r_p' at the end of each simple clause, deferring until further interpretation of the clause in context the decision as to whether the reference time has moved forward or not. I am not at all sure of the best way to articulate the implement such suggestions, however.

20. See the chapters on 'egocentric logic' in Prior and Fine (1977) for discussion of a totally different logically possible (but linguistically implausible) way of assimilating pronouns to tenses, treating both as operators.
21. Another principal shortcoming of the proposal of Partee (1973), not to mention its inexplicitness about the mapping from syntax to semantics, was its failure to extend from *when*-clauses to *before*- and *after*-clauses, a direct consequence of the attempt, in effect, to make direct anaphoric connection to 'event times' without the intermediary of 'reference times'. It also failed to account for a number of uses of past perfect; Hinrichs includes extensive treatment of past perfect, which I am ignoring here for simplicity.
22. See Cooper (1979b) for discussion of both this problem and a similar problem concerning subject-agreement markers in languages where the subject is only optionally present, so that the agreement marker may be redundant or not. Cooper notes that such phenomena may be particularly numerous in polysynthetic languages; his suggested solution for such cases invokes the notion of 'rule clusters' and requires in the temporal case that the past tense operator and the time adverb be added by a single syntactic rule when both are present, and thus differs from the approach of Bach and Parsons discussed below and that of Hinrichs.
23. Hinrichs treats postposed and proposed temporal adverbs alike; I would rather restrict this account to preposed adverbs and leave internal and final adverbs out of consideration in this paper. See Note 32.
24. I am following a suggestion of Ewan Klein in making the form of the 'update' statements purposely resemble variable assignment statements used in programming languages.
25. A referee suggested that a clearer example of main-clause events preceding the *when*-clause event might be (i):

    (i) When Smith spoke, Jones introduced him.

    Actually, it seems to me that in both (18b) and (i), there is a strong tendency to interpret the *when*-clause event description broadly so that the main-clause event occurs within it, throwing a party can include planning and sending invitations, and the introduction of the speaker can be counted as part of a speaking event. The fact that we automatically construe *spoke* in (i) as 'making a speech' supports this idea.
26. I recognize that this is a controversial assumption, one that will probably have to be replaced by a more elaborate theory of the interaction among content, context, inference, and implicatures. Perhaps all that the grammar determines in the initial stages of DRS construction is a free relation variable connecting the eventuality-referent with the newly introduced reference time, and the setting of specific values like 'just after' is the result of subsequent processes involved in integrating the information in the DRS with background knowledge and contextual information. In any case, I believe that the 'just after' condition will turn out to be parallel in the *when*-clause constructions and strings of simple sentences.

27. To make this change, we must claim that sentence-initial *when*-clauses within discourses in the linear progression mode must be event-clauses and not state-clauses, since we could not otherwise characterize the introduced reference time as 'just after' the *when*-clause event. We will argue for this claim below in connection with examples (19) and (20).
28. Ewan Klein has suggested the following formal characterization of my notion of 'just after', which I accept: e' is *just after* e iff e' is after e and there is no contextually relevant e'' between e' and e. See also Note 35.
29. The only changes in DRS (16) to yield the ordering shown in (17″) are the replacement of the three conditions numbered (8) by the condition(s) '$r_1 < e_1 \leq r_2 <$ now' and the deletion of the condition '$e_2 \subseteq r_2$' in step (10).
30. Both Hinrichs' original treatment and my modification of it account for the difference between (19) and (20). Closer inspection of (20) shows one of my reasons for the modification: on Hinrichs' account, since 'the room was empty' describes a state, that state should surround the event of the janitors coming in, which it cannot. I believe we have to reinterpret states as inchoatives to fit them into *when*-clauses (at least preposed ones in linear narrative); then on my account the reference time is characterized as a time just after the room emptied, which seems correct.
31. The ontological status of states remains unclear, but I can try to elucidate what I have in mind. States can be temporally unbounded, but with those which are bounded on at least one end one could associate a corresponding event of beginning-to-hold (inchoative) or ending (terminative). With those which are bounded on both ends one can in principle associate a corresponding event temporally coinciding with the state ('holistic'). 'After Mary was in the hospital', for instance, is ambiguous: it can mean after she began to be in the hospital (inchoative), or after her whole hospital stay (which could be analyzed as either terminative or holistic). *When*-clauses in general can contain state and process descriptions, but not (I am claiming) in linear narrative. There, as in (20), it seems that an inchoative reading is always imposed. I leave as open problems the best way to characterize these effects and the existence of 'terminative' and/or 'holistic' readings; the existence of inchoative readings is already widely accepted.
32. As noted earlier, Hinrichs always processes the subordinate clause first, even when it follows the main clause. I have limited my examples to cases where the subordinate clause comes first, because I don't believe the order of the clauses is irrelevant. There is more relevant literature than I care to try to cite – but one would have to consider issues of real-time processing, within-sentence temporal iconicity, topic-focus structure, backwards anaphora, S- versus VP-attachment of temporal adverbial clauses, and restrictive versus non-restrictive adverbial clauses. I believe that sentence-internal adverbs can help characterize event types; see Bach (1980). Some preposed temporal adverbs are probably topicalized VP-adverbs; I leave them out of consideration here.
33. And in fact if we didn't have independent reasons to invoke the notion of reference time we could also achieve an appropriate linking with a condition '$e_1 \subseteq s_1$' in the consequent box, since e_1 and s_1, like discourse entities, can also end up having either particular or 'variable' referents depending on the embedding condition of the DRS's in which they occur.
34. The requirement that e_1 precede 'now' is in this case redundant, given the condition '$e_1 \subseteq r_0$' and the specification of r_0 as a past reference time, but is included since it is automatically generated by the rules processing the first clause.

35. Since r_1 is in the antecedent, it is important to require that it be 'just after' e_1 or else the resulting truth conditions will be too weak, requiring only that Sam be asleep sometime after Mary telephoned, and that could be true if he only slept after the last of her phone calls. The notion of 'just after' needs to be explicated; it must clearly be a vague notion with its values constrained by context. If we tried to dispense with the reference times and require that s_1 surround or overlap e_1 directly, we would meet the argument from discourse (15) again in the shape of sentences like (i) and (ii)

(i) Whenever John turned off the light, it was pitch dark in the room.
(ii) Whenever John took all he wanted, there was nothing (left) for the rest of us.

Remko Scha (personal communication) suggests that the introduced reference time is typically understood as including the *end of* the given event (and the beginning of the associated 'resultant state' if there is one). This suggestion would appear to generalize nicely to a treatment of shifting 'reference location' for locative anaphora, where the resultant reference location at the end of processing a motion sentence is typically the end location ('goal') of the mover ('theme').

36. The only difference between the *when*-rule and the rules of *before*- and *after*-clauses is the relation between the introduced reference time and the event described by the clause; where DR_1 (27) has $e_1 \prec r_1$, an analogous DR_1 for (31) would have $r_1 < e_1$, and the one for *after* would have $e_1 < r_1$. The embedding conditions for universal/conditional DRS's universally quantify over the discourse events and reference times in the antecedent box. In the *when* case, each instantiation of e_1 effectively determines a corresponding time r_1 (just after it), but in the *before* and *after* cases, there would be many possible values of r_1 for each instantiation of e_1, and the embedding conditions would quantify over all of them. 'Just before' or 'ten minutes before' would work fine, since then there would be a determinate r_1 for each instantiation of e_1; but 'sometime before' wouldn't work, and I don't see any basis for arguing that 'before' means 'just before' rather than 'sometime before' in sentences like (31).
I am indebted to Johan van Benthem for the first of these points and for raising the question which is discussed in the second.

38. In particular I have completely omitted the parts of Hinrichs' system designed to account for discourses and multi-clause sentences containing mixtures of past and past perfect, and I have not seriously investigated the question of whether my suggested modifications of his system are compatible with those parts of it.

39. Hinrichs himself does keep reference time apart as part of a 'conversational scoreboard' in the sense of Lewis (1979). But I could not see how to extend his treatment of the quantificational and 'donkey-sentence' case without including the reference times explicitly within the DRS representation.

40. During the final stages of revision, I received a copy of Chierchia and Rooth (to appear), which addresses the issue of whether the configurational stipulation of subordination on which anaphoric accessibility in DRS's depends is really essential. The paper argues convincingly that it is not, and that the same results can be derived from the recursive definition of proper embeddability. Chierchia and Rooth show how the language of DRS's can be reformulated to more closely resemble the language of first-order predicate logic, bringing out parallels between discourse entities and variables and showing how 'accessibility' for pronouns follows from the semantics just as it follows from the semantics of first-order logic which variables are bound by which quantifiers. They discuss the present paper as well and show that their results can be carried over to this treatment of discourse events and reference times.

The Organization of Ideological Diversity in Discourse: Modern and Neotraditional Visions of the Tongan State

Susan U. Philips

Today, various intellectual developments converge and intertwine in directing anthropologists' attention to intrasocietal diversity in interpretive perspectives. Most recently, postmodernism has affected a range of disciplines, including our own, by heightening awareness of the way people around the world are bombarded by multiple social realities (Harvey 1990; Lyotard 1984). In many parts of the island Pacific, multiple, recognizably distinct representations of nation-states are produced by those involved in political processes. In this article I examine the organization of "neotraditional" and "modern" nation-constituting discourses in Tonga and other Pacific island nations, and I ask how we can draw on contemporary anthropological ideas about ideological diversity to make sense of the configuration of these political ideas.

Attention first focuses on the organization of ideological diversity in the Tonga Magistrate's Courts. I argue that in the courts crimes are framed in both modern legal terms and distinctly Tongan moral, neo-traditional terms. Here I conceptualize the legal domain as an important locus of nation-state-authorized representations of the nation. Discussion then turns to other domains of Tongan political life, in which one does not find the same accommodative configuration of traditional and modern nationalisms. Instead, very local and different ways of representing the nation coexist within the one country of Tonga. Finally, I compare the nature and organization of diversity in traditional and modern nationalist discourses in Tonga with those of other Pacific nations, to identify factors that contribute to similarities and differences in the nature and order of such discourses. I argue that some anthropological treatments of culture that have been influenced by postmodernism and Marxism make impor-

Source: *American Ethnologist* vol. 31, no. 2, 2004, pp. 231–250.

contributions to furthering understanding of both movement and structure in the play of ideological diversity. But it is also useful to think of ideas as being organized through discourse structure into ecological relationships, or to envision an ecology of ideas.

Anthropological Approaches to Ideological Diversity

The postmodern condition has been characterized as lacking a master narrative, a coherent interpretive framework from within which the world is lived (Harvey 1990; Lyotard 1984). Instead, people are confronted with fragments from a variety of master narratives so that we experience multiple realities.

The cause of this multiplication of interpretive perspectives is globalization, more specifically global capitalism, technological change, and rapid information transmission. Twentieth-century scholars have attributed the alienation of the modern period to this same fragmenting of reality (e.g., Burger and Luckmann 1967). But associated with postmodernism is the idea that the process of being bombarded with large numbers of interpretive perspectives has been intensified and sped up by recent capitalist global economic processes. Rapid movement of culture, then, is considered characteristic of the present period.

Arjun Appadurai (1996) envisions culture as moving across national boundaries. This is an idea that destabilizes the naturalness of nation-states and that questions their present and future relevance in the world. The culture that moves across national boundaries takes many forms. Appadurai's work is associated with the movement of commodities as well as of people. For many anthropologists, his work brings to mind immigrants who are drawn from economic peripheries to economic centers, where they provide cheap labor and from which they send money home. Michael Fischer (1999) sees the movement of culture in mediated communication: newspapers, radio, television, and the Internet. But always, I suggest, ideas are in these forms of movement of culture.

Ulf Hannerz (1992, 1996) views the predominant direction of the flow of culture across national boundaries as going from economic centers to economic peripheries. Nations considered to be on the economic periphery in global capitalism buy commodities and receive television programs from the centers. The assumption that movement of culture is from centers to peripheries is strong in anthropology, despite the attention that has been given to the movement of people from peripheries to centers.

Images drawn from the behavior of water or liquid to characterize cultural movement have been attractive to many anthropologists. Appadurai (1996) and Hannerz (1996) use the term "*flow*." Joseph Errington (1998) speaks of "saturation" in describing the movement of Indonesian state culture from centers to peripheries. These images suggest that culture moves over landscape in rivers and waves and that it is formless.

At any given point in time, however, there is also structure in the flow of culture. Marx-influenced anthropological accounts of cultural diversity have made important contributions to scholarly thinking about how multiple

ideological positions within a given society are related, both in and through time. These accounts, like the key ideas associated with postmodernism, have also laid some of the groundwork for the interest in multiple cultural perspectives in analysis of globalization processes. In Marxist traditions, ideological perspectives have been given a boundedness and a discreteness that is not favored in the recent anthropological thinking that emphasizes the movement of culture. Central to the Marxist accounts of ideological diversity is the recognition that any two ideologies or ideological stances are structured vis-à-vis one another in a relationship of domination and subordination. This relationship is characterized by resistance of the subordinate against the dominant and by opposition and struggle between competing ideologies.

Studies of intrasocietal diversity in gender ideology (e.g., Abu-Lughod 1986; Kennedy and Davis 1993; Sanday and Goodenough 1990) were among the first to apply Marxist visions of class struggle, like that of Paul Willis (1977), to other sectional interests, specifically to male domination and female resistance (Philips 2001, 2003). In analyses of colonial contacts, authors such as Ann Stoler (1989), John Kelly (1991), and Lata Mani (1998) not only distinguish between the perspectives of the colonizer and the colonized, but they also distinguish within or among groups of colonizers and colonized. These works, as well as some less focused on colonialism per se (e.g., Dominguez 1986) also pursue the historically contingent nature of ideological positions.

Most relevant to this article are studies of the culture of nationalism that identify different kinds and sources of representation of the nation, both within individual nations and from country to country. Multiple representations of the nation that come from different sources are often described as being structured in relations of competition, contestation, and struggle for dominance (Dominguez and Wu 1998; Foster 1995a; Moore 1993). Some of these representations are produced by the state and some are not. Legal representations are among those conceived of as produced by contemporary states (Gramsci 1971). Legal representations of nations have been held necessary to the creation and legitimization of states since at least the 18th century, when a modern concept of law as the basis for the authority of states became widely established (Fitzpatrick 1992). Within law itself, visions of the nation are multiple (Tigar and Levy 1977), and it is with such multiple legal visions that this article is substantively concerned.

Several major sources of social differentiation have been identified as key bases for oppositional representations of the nation. Because of a long-standing European preoccupation with the idea that, to be maximally stable politically, a nation should ideally be culturally homogeneous and therefore made up of one ethnic group, researchers are well aware that different ethnic groups within a nation's boundaries may have different visions of the nation. And where one ethnic group is politically dominant, the ethnicized nationalism of the state will reflect that dominance (e.g., Blommaert and Verschueren 1998). State and civil society (Gramsci 1971) or the state and the people over which it rules (Herzfeld 1997) are sometimes represented as having different visions of the nation. And colonial and indigenous visions of the nation are also contrasted, especially as independence is achieved (Foster 1995b; Otto and Thomas 1997b). As I describe

below, in the Pacific, neotraditional visions of the nation-state are opposed not only to those of the colonial era but also to democracy and modernism. Slippage and overlap in meaning also occur between the Western alternatives to traditionalism – of colonialism, democracy, and modernism – so that in some situations these terms for Western forms are used interchangeably and influence one another's meanings.

One problem with Marxist representations of relations between different ideological positions is that usually they posit only one ideological opposition for any given society and assume homogeneity and coherence within each perspective. Here I describe how the configuration of multiple ideologies varies in Tonga, depending on the political domain being examined. The Marxist tradition is also problematic in that it invariably conceptualizes ideological multiplicity as involving relations of domination and subordination and struggle. As I show, in Tonga, multiple ideologies can be configured in other ways.

The strength of transnational visions of cultural diversity lies in their emphasis on cultural movement, whereas the strength of Marxist visions of cultural diversity lies in their attention to structure. Both perspectives would benefit from a greater commitment to the examination of ideologies as manifest in on-the-ground social practices. A discourse-analytic perspective can be useful to this end.

The ethnography of communication is a foundational source for linguistic anthropological visions of the organization of ideological diversity in discourse.[1] Central here is the idea that speech events, speech genres, and specific oral texts have internal sequential structures. Thus, a church service as a speech event can be conceptualized as involving a sequential ordering of speech genres that constitute the largest units of discourse in that event – speech genres including hymn, prayer, sermon, and offering. Or a trial can be seen as consisting of a fixed sequence beginning with opening statements, followed by testimony, and ending with closing statements. Each of these trial units also has an internal sequential structure that orders the opposition between prosecution and defense.

An event like a church service or a trial can be said to be ideologically coherent in some respects. A church service may, for example, reflect a religious denominational perspective, say a Catholic or a Methodist perspective, through and through. Similarly, a court trial is constrained throughout by a single body of evidence law. At the same time, a sequence of discourse units may also entail shifts in interpretive perspective of one kind or another as the activity moves from one unit of discourse to the next. The oppositional perspectives of prosecution and defense, which are repeatedly alternated in trials, provide a well-known example of such shifts in perspective.

I am concerned here with routine and predictable shifts in cultural interpretive frames that are built into the global structures of forms of discourse. But this work builds on several approaches within linguistic anthropology that have been concerned with the analysis of linguistic devices used to signal more locally managed emergent shifts in interpretive perspective. These approaches include John Gumperz's (1982) work on contextualization cues, Erving Goffman's (1974, 1981)

analysis of framing (see also Tannen 1993), and Mikhail Bakhtin's (1981) concept of voices (see also Hill 1995).

The internal sequential structure of discourse, then, organizes ideological diversity at the level of face-to-face interaction, or practice. I argue in this article that it is useful to think of the structure of ideological diversity in discourse as entailing an ecology of ideas. In this context metaphorical images involving plants may prove more apt than those involving water for capturing both the movement and the structuring of ideas. For I suggest here that just as plants enter into ecological relationships with other plants as they colonize new environments, so, too, do ideas enter into particular configurations as they colonize discourse. And some environments are more hospitable to certain ideas than others are.

In the discussion to follow I show how, in Tongan criminal proceedings, magistrates who represent the Tongan state regularly and predictably alternate between more British-influenced legal framings of crimes and more Tongan-based moral framings of crimes in the sequential structure of courtroom discourse. They reproduce a Tongan nation that is both modern and traditional as they do so. The particular ideological configuration I document I then consider as one of many microstructurings of multiple ideologies in Tonga and in other Pacific societies.

Background

As a nation of approximately 100,000 people, Tonga would be considered a microstate in contemporary terms, but it is also home to one of the larger Polynesian populations that is not part of a culturally European nation. Tonga is a constitutional monarchy, ruled by a king. Tonga's Magistrate's Courts are lower-level national courts in a two-tier system. The Supreme Court is the higher-level court, and it is a court of general jurisdiction, which means that it is both a trial court and a court of appeal for the Magistrate's Courts. Magistrate's Courts, in principle, are limited by law to the hearing of criminal misdemeanors and small civil claims, although, at the discretion of the Supreme Court judges, they also sometimes hear more serious cases. All of the court personnel in the Magistrate's Courts are Tongan – the magistrates, the police prosecutors, the defense lawyers, the clerks, and the police officers. The procedures are all conducted in the Tongan language. In contrast, the judges in the higher-level Supreme Court are British, and the procedures are bilingual in Tongan and English.

Magistrate's Courts have been in existence since the 1840s, when Tāufa'āhau, who later became the first king of Tonga, produced his first code of laws, the Vava'u Code of 1839. In doing so, he followed the suggestion of Wesleyan missionaries. They advised him that if he wanted to maintain independence for Tonga, it was desirable for Tonga to closely resemble a European nation, which meant, among other things, instituting rule by law. Creating a set of laws for the islands of Tonga was thus a crucial step in making Tonga resemble European nations. Sione Lātukefū (1974) sees Tāufa'āhau's creation of his own magistrates

through the Vava'u Code as an important political move that took away from chiefs the authority to resolve disputes and reserved that authority to Tāufa'āhau as future king and to the emerging Tongan state.

Since that first move, Tongan law and Tongan courts have been involved in a continual process of modernization and Westernization. Despite Tongans' efforts to present evidence to the outside world, particularly the British outside world, that their local polity resembled a European nation, Great Britain made Tonga a protectorate in 1900, a status Tonga retained until receiving independence in 1970. Tonga itself was not so much of interest to the British as it was perceived to be within the geographical sphere around Fiji, which the British needed to control to establish and maintain sugar cane plantations in Fiji using East Indian labor (Scarr 1967). Elizabeth Wood-Ellem (1999) documents some of the struggles between Queen Sālote and the British chief justices of the Tongan Supreme Court during the early middle part of the 20th century. Today the constant transformation of the Tongan legal system continues, in part through the influence of the British judges of the Supreme Court.

Law, then, has long been and continues to be an important site for an imagining of the Tongan nation-state that articulates Tonga with the rest of the world.

The Sequential Structure of the Tongan Criminal Proceeding

Tongan criminal misdemeanor cases have what I refer to as a "global discourse structure." This term comes from Gregory Matoesian's (1993) analysis of rape trials. It refers to an underlying or abstract sequential structure of units of discourse that make up a larger unit. Matoesian used the concept to distinguish between the "global" structure of a trial (which would be made up of such sequentially ordered units as jury selection, opening statements, prosecution case, defense case, and closing statements) and its moment-by-moment "local" management.

The global structure of the criminal misdemeanor procedure in the Tongan Magistrate's Courts is familiar, in that it is similar to what one would see in U.S. courts. As I have already noted, however, the procedure takes place entirely in Tongan, and Tongans consider all of what goes on in Tongan legal activity to be Tongan. The familiarity of the procedure is due primarily to U.S. and Tongan shared legal heritage as former British colonies and to transnational processes of legal change that, as I indicated earlier, go on continuously. Figure 1 is a summary representation of this global structure. As shown in this figure, the procedure has seven separate and distinguishable sections, topics, or discourse units. But this representation of the global structure of the procedure also shows that these seven topics can be grouped into three parts: a beginning, a middle, and an end.

The basic point to be made about these three parts, which I elaborate in later sections of this article, is that the beginning and end parts draw on British legal ideology, whereas the middle part draws ideologically on traditional Tongan morality.

Data Base

The data to be analyzed here come from 18 hours of transcribed and translated tape recordings of Magistrate's Court proceedings in two jurisdictions, a regional rural court and a town court, on the main island of Tongatapu. This body of data represents approximately half of the data actually tape-recorded in such courts during the period 1987–89.

Beginning	**Legal Outer Framing**
Call of the Case Charge Plea	
Middle	Moral Inner Core
Factual/Moral Basis for Charge Testimony Counseling	
End	Legal Outer Framing
Sentencing	

Figure 1: Sequential structure of Tongan criminal misdemeanor procedure

Table 1 provides a breakdown of the kinds of cases that were completely resolved during those 18 hours of proceedings, as opposed to the far more numerous cases that were only partially heard and were continued or postponed to a later time. Approximately one-third of the 86 cases, or 31, involved vehicle violations, most commonly, failure to have obtained quarterly vehicle licenses (yes, one had to purchase them four times a year) or nonfunctioning taillights and lights over license plates. Another third of the cases, or 28, came from the arrests of people who were drunk in public places, usually along the roads where people walked, but also in hotels and at weekend dances held in village halls all over the island.

Misdemeanor crimes in those two high-frequency categories are considered less serious than crimes in the remaining two categories: verbal and physical aggression (18 cases), consisting of charges of "bad language" and of assault, and property violations, including theft and property damage (9 cases). Together these two categories comprise the remaining third of the completed cases. The greater seriousness of these cases was reflected both in more severe sentences or higher fines given to those found guilty and in the more frequent and lengthier moralizing about the badness of the acts involved. I use cases of bad language, assault, and theft in the following section to illustrate the contrast between the modern legal external framing in the beginning and ending of court proceedings and the Tongan traditional moral evaluation of cases in the middle, or center, of proceedings.

Table 1: Criminal charges disposed of in magistrate's court

Criminal charge	Number of cases
Drunk in public place	28
Aggression	
Bad language	6
Assault	12
Property violations	
Theft	5
Property destruction	2
Trespass	2
Vehicle violations	31
Total	86

Note: Based on 18 hours of transcribed tape recordings of magistrate's court procedures (approximately half of the taped magistrate's court data base) in two jurisdictions presided over by four magistrates in ten court sessions, 1987–89.

The number of charges rather than the number of defendants or hearings/cases is counted. A few were charged with more than one crime. A few hearings/cases involving more than one defendant in the same event were heard together. Magistrates found defendants guilty on all charges but one, regardless of plea. Includes only completed cases with disposition and does not include the more numerous cases that were cancelled or postponed, often after partial hearing.

Traditional and Modern Representations of the Nation in the Tongan Magistrate's Courts

The discourse structure of the Tongan criminal procedure organizes ideas ideologically into an outer frame derived from modern law shared by all nations and an inner core that interprets bad acts in ways marked as distinctly Tongan and traditional. Tonga is projected both as a modern nation among nations, like other nations, and as a distinctly Tongan nation with roots in and authority from a precontact historic past.

The legal framing identifies Tonga as a nation ruled by law, like other nations around the world. It reproduces the courts and the roles of judge, policeman, defendant, victim, and witness that exist in all nations. The legal framing is evident in discourse units, such as the call of the case and the taking of a plea, that one can find reproduced on any day of the week in U.S. courts. Through the legal activity a permanent written record of the crime is created, to be controlled by the Tongan government in a perpetual surveillance of its citizens. The legal framing also links the defendant to the violation of specific written laws. These laws, in turn, constitute a Tongan nation-state that is committed to the "rule of law."

The legal framing offers a universalistic rhetoric in which any person who violates the law can be found guilty. Written statutes actually specify that the

law is violated by "any person" who engages in particular actions (e.g., Law of Tonga 1966:315) This means that a defendant's social identities are not relevant to the evaluation of what he or she is alleged to have done. The idea that people of a nation are "equal under the law" is important ideologically in global democratic rhetoric.

A legal rationale that applies equally to all citizens of the nation-state is part of what makes Tonga a "modern" nation-state. Many Tongans value Tonga's modernness as intrinsically worthy (e.g., Helu 1992). It is also in Tongans' interest that their state be perceived by outsider Europeans as modern and up-to-date in its laws and legal system. This perception helps Tonga maintain the same "plausibility" as a nation, and, therefore, the same autonomy, for which Tongans were striving in the middle of the 19th century, when they produced their first law code to prove to Westerners that they could govern themselves.

The Tongan moral framing that prevails in the center of the criminal proceeding differs from that of the external legal framing. It identifies the Tongan nation-state as distinctly Tongan and appeals in its authority to the loyalty of a specific ethnic identity, that of Tongans. Here one finds the magistrate and the police prosecutor, and sometimes other players, using a strong moralizing tone, lecturing and reproaching the defendant. One finds apologizing and counseling of the types common in everyday Tongan discourses, not to mention those of other Pacific societies.

One also finds explicit invocation of *anga faka-Tonga*, 'the Tongan way,' in the center of the criminal proceeding, and reference is made to the way in which bad acts defined as criminal go against the Tongan way.[2] Invocation of the Tongan way is a key expression of the ideas of tradition and custom in the middle of the legal procedure. Reference to anga faka-Tonga connects the Tongan pre-European-contact past with present-day Tonga and Tongan ways of doing things. What Tongans consider anga faka-Tonga today would be considered neotraditional by anthropologists. To the outside, the Tongan way would also be seen as incorporating much that is recognizably Western European. Yet it is still distinctly Tongan ideology in practice, as I demonstrate below.

A final important way that the moral center of the procedure is different from its outer legal framing lies in the way that parties to the proceedings imagine the defendant, victim, and witnesses. These roles are imagined as existing in particular kinds of relationships involving aspects of social identity that are central to Tongan life. The magistrate and the police prosecutor evaluate the bad act of the defendant in light of expectations of those social roles. For example, a chronic thief, a person who has pulled plants out of the growing gardens of others, will be asked if he is a farmer or a landowner. If he is a landowner, why is he not a farmer? Why does he not grow his own food instead of taking that of others?

Often, something about the position of the defendant is imagined in a way that gives him more than average responsibility or duty, which he has failed to fulfill, and calls for restraint of some kind that he has lacked. Thus, the man who has his own land or is a farmer yet who steals the crops of others should be particularly ashamed.

So, whereas the framing rhetoric of law is universalistic, the Tongan moralizing in the middle of the procedure is not. It deals with roles and role relationships central to the way Tongans make sense of social action, and what those roles are shifts from case to case.

I now look more closely at the legal external framing and the moral center of Tongan Magistrate's Court criminal proceedings, drawing on cases of assault, theft, and bad language, the most serious kinds of charges in the data base, to illustrate their qualities.

The Legal Framing

The "beginning" of the procedure comprises the call of the case, the charge, and the plea. The call of the case consists of a clerk calling the defendant's name and case number to summon the defendant forward. The case number tied to the defendant's name is a fundamental feature of the government's written record keeping of activities in the court system.

The charge, read to the defendant by the magistrate, is a formulaic but factual description of the crime the defendant is charged with and includes the date and place where the act was committed and identification of the statute under which the defendant is being charged. Literally all of these same elements are present in the beginning of U.S. guilty plea procedures (Philips 1998). Through these elements in the individual defendant's procedure, the specifics of the defendant's case are linked indexically to the general and abstract written law that governs the nation.

The following transcript excerpt illustrates the form of the charge.[3]

Transcript excerpt 1

Paragraph 6, Chapter 26

Lao 'o Tonga.
Law of Tonga.

In this instance, the charge is one of swearing, or using bad language in a public place. Note the reference to *hala pule'anga*, 'government road,' and to *loto kolo*, 'village center.' Both are public places. The key and core phrase is *leakovi'i*, 'You swore." Every charge contains such a formulaic accusation in verb form, as in "Na'a ke tā," "You hit," in assault charges, and "Na'a ke kaiha'a," "You stole," in theft charges.

Transcript excerpts 2 and 3 illustrate the parallel construction in instances of these charges:

for all crimes.

In the first part of the procedure, the defendant is also asked by the magistrate to plead guilty or innocent. Overwhelmingly, defendants plead guilty. But in contrast to U.S. criminal procedure, in which those who plead guilty and those who plead not guilty are treated very differently, the global structure of the Tongan criminal procedure remains similar following the formal plea itself, both for those who plead guilty and for those who plead innocent.

The "end" of the procedure consists of the sentencing, in which the magistrate tells the defendant what his sentence is. Here is the sentence in the bad language case:

Transcript excerpt 4

Na'a fai 'i he feitu'u fakapule'anga,
It was done in a public place,

ko e hia ia 'oku mamafa (ange). [#5]
this crime is expensive. [#5]

Mo'ua pa'anga fitu, ē?
Fined seven dollars, eh?

The sentence is usually a fine; failure to pay the fine results in time in prison. Two dollars is the lowest fine, so a seven-dollar fine, as in the bad language case, is relatively high, particularly in a society where few people have a cash income. The sentencing is always the external ending boundary of the procedure.

Both the beginning and the end of the procedure are abbreviated and highly routinized. Anyone in any nation could be treated this way in court. The same information is given by the magistrate and received by the defendant in each case. One learns little to nothing about the defendant, usually a male, or what he did from these framing sections. In some less serious cases – the automobile violations and the public drunkenness cases – these beginnings and endings often constitute the entire procedure.

The Moral Center

In the "middle" of the procedure, the magistrate first turns the floor over to the police prosecutor, who offers what I refer to in Figure 1 as a factual basis for the charge. Here the policeman describes in greater detail to the magistrate just what it is that the defendant did. He also tells the magistrate whether the defendant has a criminal record and, if so, what it contains. He usually also offers the first moral evaluation of the defendant's action in Tongan cultural terms. This evaluation entails both emotionally laden words of condemnation and explanations of why what the defendant did was bad. To call this part of the procedure the moral basis rather than the factual basis for the criminal charge in the Tongan court might be more appropriate.

In the testimony that often follows the statement of factual basis, the magistrate takes back control of the floor and invites statements from and asks questions of the defendant and of any victims or witnesses who might be present. But testimony does not always occur. If it does, it occurs at this juncture, in cases of both guilty pleas and not guilty pleas. In this unit of discourse, people not only testify as to what happened but also offer moral evaluations of the events they describe, as the police prosecutor has done before them.

Defendants often offer apologies to victims, and victims often express their forgiveness to defendants. But apology is not always followed by forgiveness, and forgiveness is not always preceded by apology. As I noted earlier, ritualized public apology in conflict resolution is held by Pacific anthropologists to be an areal cultural trait for conflict resolution in Polynesia (e.g., Rensel and Howard 1995),

although its occurrence is also well documented for Fiji (Arno 1993; Hickson 1975). Apologizing and forgiving can be thought of as Tongan speech genres that are inserted into the middle of a recognizably Western European legal procedure.

'Counseling' follows testimony and closes the middle of the procedure. The quote marks around the term indicate that it is a gloss for the Tongan word *'akonaki*. 'Akonaki is a Tongan genre of discourse. Persons in authority counsel those under their authority who have been involved in conflict, and counseling usually takes place in relatively private situations. Parents do it with children, and ministers do it with members of their congregation. Counseling is also well documented for Polynesia and parts of Melanesia (Boggs and Chun 1990; Watson-Gegeo and Gegeo 1990).

In court, the magistrate directs his attention to the defendant and talks to him about why what he did was a bad thing to do and how he should stop this bad behavior. Every kind of case I have mentioned received moral evaluation from police prosecutors and magistrates, including evaluations oriented around features of the parties' social identities. For example, those drunk on the road were told that they could either be killed or cause an accident because of their behavior (usually depicted by police prosecutors as a staggering and weaving walk), and older men were reproached for being old enough to know better and for leading younger men into trouble. But not every *instance* of each kind of case received a moral evaluation. Only in the cases of bad language, assault, and harm to property did virtually every instance entail elaborate moralizing, which was predictably tailored to the crime in some way as well as to the identities of the parties involved.

What is more, each type of case – assault, bad language, and theft – associated with a predictable kind of moralizing and an evocation of particular kinds of social identities, if they are even remotely relevant.

Assault

For example, in assault cases, the relative ages of the defendant and the victim are regularly a focus of the magistrate's attention. Most of the assault cases stem from conflicts between young men that took place in public contexts. Relative age is brought up explicitly in the moral evaluation of every assault case in which the defendant is older than the victim, which was true in most of the assault cases.

Transcript excerpts 4, 5, and 6 are all derived from one assault case and show how the magistrate repeatedly returns to the age issue:

Transcript excerpt 5

Sione, 'oku ke ta'u uo **ua**.
Sione, you are 22.

Lau ta'u 'e fitu
Count seven years

Pea toki 'au ki he tokotaha launga.
before the complainant reaches you.

Transcript excerpt 6

'Oku kei si'i . . .
He is still young

Transcript excerpt 7

Ka neongo ia kuo fakamolemole'i
Although this young

koe 'e he ki'i tokotaha ko 'eni
person has forgiven you,

mahalo 'oku 'ilifia pē
maybe he is just afraid

. . . he 'oku ke fu'u lahi koe.
. . . because you are older.

Implicit in such moral evaluations is the idea that the older person should not hit the younger person, in part because the older person should have more self-restraint and should set a good example. Defendants in these cases, however, sometimes explained that they felt they were owed but had not been shown respect by their younger victims. They offered this information as a mitigating factor in the evaluation of their behavior.

Relative age was also pertinent in other kinds of cases, but less regularly so. Specifically, in male youth group cases, such as group theft, group stoning of a vehicle, and group making of home brew, older defendants in the group being charged with the crime were singled out for greater legal attention. They were given longer lectures and stiffer fines than younger defendants for having led others in crime and for having acted as bad examples.

Magistrates often asked young defendants what their birth-order position was within the family. Several times when the defendant was very far down the birth order, for instance, the tenth or later child, I heard magistrates express the opinion that he probably was not getting enough attention from his parents.

Birth order matters generally because, interacting with gender, it helps determine the relative rank of a child within his or her sibling group, according to Tongan normative ideas about these things. The family is the crucible in which children learn how to negotiate relative rank. Tongans carry their family experiences of rank with them through life and apply those experiences by analogy to other relationships. The senior–junior relationship, then, is more generally what seems to be at issue in court proceedings.

Some senior–junior rankings raised in the court are clearly of a modern nature. For example, in one case of assault, the older defendant was an insurance agent, whereas the younger victim drove a van for a hotel. The defendant suggested that his greater status as an insurance agent called for but did not elicit respect from the victim. Such instances are relatively recent mappings of enduring Tongan ways of thinking about the junior–senior relationship. Arguably, the defendant in this case was trying to make his interpretation part of a neotraditional concept of the junior–senior relationship. But in my data the defendants' efforts to argue that their own rank was disrespected were never

The senior–junior relationship is also one of those elaborated in traditional Tongan culture. For example, all kava ceremonies involve a ranked order of kava drinkers, with relative position determined by the participants' associations with ranked chiefly lines. These same lines are incorporated selectively into the Tongan state in the form of noble titles. The noble titles are ranked as well, and titles are also grouped into *ha'a*, fictive kin groups, each of which has senior and junior chiefly lines within it.

Their imagining of the defendant and the victim in a senior–junior relationship in assault cases, then, is an example of how magistrates highlight aspects of social identity important to Tongans as they condemn certain acts as bad.

Theft

Theft and property damage cases also are associated with a conventionalized Tongan morality. Specifically, in such cases, the term *fonua*, 'country,' is used in a way that suggests the defendant is not doing good for the nation. *Fonua* also means 'land.' In theft and property damage cases, magistrates urge defendants to "*nofo fakafonua*," which Tongans translated as 'be a good citizen.' To me, the phrase expresses something more like 'stay, keep with, or continue on doing for the country.' Magistrates also urged defendants in these cases to "*fai e me'a ma'a e fonua*," 'do good things for the country/village/people.' The focus of the moralizing in these cases, then, is on a harm done to a collective social body rather than, say, to an individual victim.

The prototypical case of theft is of crops or pigs. Root crop theft from gardens in the bush is so common that many victims do not bother to take it to court, but they let their awareness of the theft be widely known locally. I noted earlier that defendants who have access to land for farming are particularly chastised for stealing crops. When theft is from shops, the moralizing shifts to a focus on the defendant's getting a job or being a paid worker so that he can buy rather than steal, as in excerpt 8.

Transcript excerpt 8

'o e fonua.
of the village/country.

'Oku fiema'u
If you want something

pea 'o ngāue totongi
then get a job

'o ma'u ai ki'i sēniti.
to get a little money.

The term *fonua* has strong traditional connotations that link past and present concepts of the Tongan political entity. It is a rich, multifaceted, and productive concept, often used metaphorically. For example, in the film Kava Kuo Heka: Royal Kava Ceremony of Tonga (1998), Eric Shumway discusses how the narcotic drink kava is referred to as "fonua" in royal kava ceremonies. The king's matāpule, or 'talking chief,' says to the noble on whom a title is being bestowed, and who has just been served the first cup of kava, "There (in your hands) is the country." In this context the precontact Tongan political entity composed of a Tui'i Tonga, chiefly title holders, and commoners is identified with the contemporary nation-state of constitutionally authorized king, nobles, and commoners through the use of the term *fonua*.

Whereas Shumway's example of the use of *fonua* has decidedly chiefly connotations, the invocation of fonua in the court cases connotes a commoner role. A chief may hold the land in his hands, metaphorically, but a commoner is expected to cultivate the soil, to provide labor. This obligation includes labor for the king and for the noble, as when messages are sent out to the villages to provide a certain number of *pola*, or 'feast trays' piled with food, for a given kingly or noble event involving a feast.

Theft cases thus activate the identity of Tongan citizen to reprimand the thief. The good Tongan citizen works for what he or she gets and does not simply take from the people (although some would argue this is exactly what nobles do). The image is one of a distinctly Tongan kind of citizenship, rooted in the role of the precontact commoner who labored on the land.

Bad Language

The majority of cases of *lea kovi*, or 'bad language,' are brought by young unmarried women against men. These cases involve situations in which men have spoken in anger to women in what is defined as a 'public place,' *feitu'u fakapule'anga*. Angry speech can involve swearing, threats, or imply insulting speech, usually shouted out. Elsewhere (Philips 2000), I discuss these cases in detail.

The particular traditional Tongan role relationship the magistrate imagines to be relevant in these cases is that between *tuonga'ane*, 'brother,' and *tuofefine*, 'sister,' the terms used in the cross-gender sibling relationship. These terms are also extended to cross-gender relations with more distant relatives, particularly cousins in the same generation. The brother–sister relationship is one calling for mutual respect, but especially for respect from the brother to the sister. The sister is ritually superior to or above the brother, and sisters have some authority

over brothers. Certain kinds of speech, particularly sexual joking and references to the body, are forbidden between brothers and sisters and forbidden to others when they are in the presence of men and women in a brother–sister relationship.

The brother–sister relationship is invoked in bad language cases when real relatives are involved, when brothers and sisters are present and overhear the angry speech, and even when a brother and sister may have heard about the event.

Among several key dyads, the brother–sister relationship is, ideologically, the most explicitly elaborated gender dyad at all levels of Tongan society. It figures prominently in historical accounts of the traditional Tongan polity (e.g. Māhina 1986) and in contemporary elaborations of Tongan nationalist discourses, particularly in newspaper, radio, and television accounts of the activities of the present king's daughter, Princess Pilolevu, who outranks her brothers, one of whom will be king someday.

In cases of bad language, magistrates regularly make reference to the brother–sister relationship. It is common for them to say something like, "No one knows if you might be related." In excerpt 9 below, the magistrate tells a defendant, "You don't know if they were your relatives," referring to the two young women at whom the defendant had sworn.

Transcript excerpt 9

Ko e 'ulungaanga palakū
That was a disgusting thing

na'a ke fai.
you did.

Na'a ō kinaua,
They two went,

ko si'i ongo faifekau
the two little missionaries

ke fakamafola
to spread the gospel

'e fu'u kape mai.
and you swore repeatedly.

'Ikai ke 'ilo na'a
You didn't know

ko **homou kāinga.**
if they were **your relatives.**

It is also common for magistrates to exhort the defendant, "*Nofo feua*," 'Stay mutually respectful.' This exhortation takes a form similar to that of exhortation given to thieves discussed in the previous section, "*Nofo fakafo*" 'Keep doing good for the country.' For Tongans, this exhortation to stay mutually respectful conjures up the image of a large public gathering where people not necessarily know one another. It is specifically the brother–sister relation-

and maintaining the mutual respectfulness associated with that relationship that are of prototypical concern when envisioning such a scenario.

In practice, then, the brother–sister relationship is the model for cross-gender conduct in Tongan public life that is generally offered in the bad language cases. In invoking this relationship, magistrates link present to past political orders and promulgate on behalf of the Tongan government a gendered nation-state for which the key trope is the family sibling dyad, the brother–sister relationship.

So far I have described how, in the middle of the criminal proceeding, magistrates offer a distinctively Tongan moral framing of the more serious criminal misdemeanors of assault, theft, and bad language. In each type of case, the defendant is imagined as involved in a particular kind of relationship with the victim and with others – the senior–junior relationship, the comember of village and nation relationship, and the brother-sister relationship.

Not all invocations of imagined identities, however, are tied to specific kinds of cases. The identity of Christian religious person, for example, is activated in a wide range of cases, and often this identity is activated by victim, witness, and defendant, as well as by prosecutor and magistrate.

Christians

For example, in Transcript excerpt 9, just discussed, the magistrate refers to the two young women who were sworn at as "ko e si'i ongo faifekau," which is understood in English as 'the two little Mormon missionaries.' This is mentioned, along with their possibly being "sisters" to the defendant, as a reason why the bad language is especially bad. The women themselves were the ones who had originally raised their religious identity in this case, suggesting they had been the target of religious persecution by the defendant. But the magistrate also chooses to follow up on their focus.

A second example of activation of religious identity comes from the assault case quoted earlier, in which the senior–junior relationship was emphasized. Here the police prosecutor was the one to raise the defendant's identity as a Christian:

Transcript excerpt 10

Ko e tangata ia
This man

'oku ne tauhi
is a caretaker

hangehangē ko ha pisope nai.
Acting like a bishop perhaps.

The defendant is a caretaker of and has janitorial responsibility for a Mormon chapel, and he assaulted the victim in the chapel. When the police prosecutor says that the caretaker is acting like a bishop, he is referring to the person with ministerial responsibilities, the person with the highest authority within the chapel. He is suggesting that the defendant acted like he was of higher status in the church hierarchy than was actually the case.

My final example of the use of religious identity is related to a charge of driving without a driver's license. The defendant offers religious pursuits as his reason for driving without a license, in his effort to mitigate what he has done:

Transcript excerpt 11

Kole atu pē 'eiki sea,
May I request your honorable chair,

ko e me'alele na'a ku hanga 'o ngaue 'aki
the vehicle I proceeded to use

ne u 'alu pē mo haku kaunga tangata pē
I only went with just my friends

ki Liahona ki he temipale.
to Liahona to the temple.

Ko e homau siasi.
It's our church.

In counseling the defendant, the magistrate responds to this explanation:

Transcript excerpt 12

Pea ko 'ete 'alu koe ki he temipale,
And as you go to the temple,

te fai lelei, fai totonu
do what is good and honest

pea ke toki hū ki he fale ko ia.
and then go into that house.

Kae 'oua te 'alu ta'e laiseni
But don't go without a license

he 'oku 'ikai ke tali 'e Sisu
because Jesus does not welcome

'a e lotu 'a e kau
the prayer of those who

'alu ta'e laiseni.
go without a license.

I have argued so far that when court personnel raise particular identities and apply them to parties involved in a crime, they are indicating that what is bad about the crime is the violation of expectations of behavior associated with those identities. Court personnel sometimes suggest that a crime is worse because the victims are Christians, as in the bad language case, indicating that Christians and their activities call for special respect. They also suggest that a crime is worse when the defendant is acting in a Christian role, as in the other examples, because the defendant is not behaving in a manner consistent with a Christian persona when he commits a crime.

Although Christianity may, on the surface, appear to be an ideological and organizational complex without precontact roots, its dominant forms in Tonga have been wedded to what are viewed by Tongans as traditional precontact Tongan ways of doing things. Here Christianity is aligned with a neotraditional order, as is common in Pacific societies. In Tonga, the dominant religious group, the 'Free Wesleyan Church,' or Siasi Uesiliana Tau'atāina, the king's church, produces much discourse that links it to a traditional political and cultural order. For example, kava ceremonies are held for the male leaders of the congregation before Sunday church services. During church services, repeated mention is made in greetings and prayers of the noble who controls the land where the village and the church are located. The beautiful and honorific forms of language used to talk about God and Jesus in church are also identified with the nobles and the king and are used to talk about them in other nonreligious contexts. At Sia'atoutai, the Free Wesleyan Church seminary for the nation, students are instructed in traditional ways of conversing around the kava bowl.

Tonga is an aggressively and ideologically overtly Christian nation in its political practices. The cross on the nation's flag is often referred to in political discourse as identifying Tonga as a Christian nation. Although the Free Wesleyan Church is ideologically dominant in Tonga, religious tolerance is extended by the government to other Christian denominations, like the Mormonism that appears in the examples in this article. This tolerance holds true even when those denominations are seen as failing to maintain traditional Tongan culture in their religious practices in the way that the Free Wesleyans do. This commitment to religious tolerance goes back to the early-19th-century period of missionization when Catholics and Methodists competed for converts. That same tolerance is not extended to non-Christian forms of organized religion.

The more general point here, once again, is that Tongan moralizing strategies in the courtroom activate particular social identities that are important in Tongan culture and that mark the Tongan nation-state as distinctly Tongan.

In a variety of ways, then, the center, or heart, of the Tongan legal proceeding asserts a Tongan morality in which a bad act is not just intrinsically bad, or bad in a universal way for all who do it, but bad because of the particular kinds of social relationships in which it is embedded. This morality contrasts with the legal framing of the court procedure, in which an act is a crime regardless of who commits it. The modern legal discourse is a universalizing discourse, whereas the traditional Tongan moral discourse is a socially differentiated discourse.

Local Configurations of Traditional and Modern Nationalist Ideologies

So far I have looked at one configuration of Tongan modern and neotraditional enactments of the state in the Magistrate's Courts in Tonga. I now consider how this configuration compares with the multiple representations of the nation-state that appear in other discourse environments in Tonga and elsewhere in the Pacific.

The Magistrate's Courts

In the preceding section I described the way legal and moral representations of crimes provide both Western and Tongan visions of the Tongan nation-state in one legal context, the Magistrate's Courts. The outer legal framing displays a nation guided by the rule of law, which applies to all persons, to all citizens of Tonga. The inner moral framing displays a distinctively Tongan national culture in which citizens are socially differentiated according to identities central to the ways in which Tongans make sense of their lives. The outer framing is routinized and tailored to a specific crime. The inner framing is productive and variable strategically tailored to social identities thought to be specific to the defendant and victims in individual cases yet still constrained by the nature of the legally defined criminal act of which a defendant has been accused.

Rather than a single overriding interpretation of events, one finds dual legitimization of the acts of the courts through multiple ideologies. The authority of the Tongan courts is not coherent ideologically but deliberately multisourced.

This ideological diversity can be conceptualized as a consequence of the movement of legal ideas from Western European economic centers. Western legal and Tongan moral ideas have been co-present in Tonga since the early 1800s. Pressure on the Tongan nation-state from the West to become more Western in its legal practices has been part of Tongan development since that time. Although this pressure has come primarily from Great Britain, it also comes from Britain's common-law English-speaking former colonies such as New Zealand, Australia, and the United States.

The legal and moral framings of crimes in the Magistrate's Court are kept separate and, yet, are configured in relation to each other in courtroom discourse. In this context, these discrete ideologies are tailored to be compatible with one another and supportive of the same case dispositions. They are not opposed to one another and are not pitted against one another in struggle, as in Marxist representations.

Nor do the modern and neotraditional framings of crime exist in a dominant/subordinate relationship in this context. The Western inclination may be to think of the introductory framing of a piece of discourse as its overriding frame and, therefore, to think of law as the dominant frame here. A case, however, can also be made for the middle of the procedure as the ideologically dominant part of the procedure. Thinking of a discourse event as having a center and a periphery in characterizing the locations of the legal and moral representations of crime identifies a key place for the center (Arnheim 1988) in a way that is not true when the focus is on the boundedness of an interactional encounter.

There is abundant evidence of the importance of the concept of "the center" in Tongan culture. The Tongan word for 'center' is *loto*. *Loto* can also mean 'middle,' as in *loto kolo*, 'the middle of the village.' It also means 'the inside,' as in *loto 'api*, 'inside the house.' These meanings suggest the presence of many people and high levels of human interaction. When applied to the individual, *loto* means 'heart,' 'emotions,' and 'will' – what is inside the individual and dominates consciousness. All of these meanings suggest the power of the center for Tongans

What is outside the moral center, for example, the bush, where cultivation takes place, is often conceptualized as wild, dangerous, and the potential locus of supernatural threat.

Both the outer framing and the inner heart of the Tongan Magistrate's Court procedure, then, can be understood to carry great potential interpretive importance. Other Tongan domains, however, reveal different configurations of traditional and modern ideologies of the nation-state.

Other Tongan Political Domains

For example, in the Tongan Supreme Court, the trial court of general jurisdiction that deals with felonies rather than with misdemeanors, Western legal framings of crimes are hegemonic. There is no systematic place for a framing of crimes as violations of a specifically Tongan morality. The activities of the Supreme Court are presided over by a British judge and are fully bilingual in English and Tongan. Lawyers and judges who work in the Supreme Court overtly express a concern to be modern and to constantly modernize.

To a surprising degree the cases heard in this court involve economic and other organizational structures with a presence in other countries such as New Zealand and the United States. In one case, for example, the defendant was an employee of the Bank of Tonga and had stolen money from the bank, which at that time was partly owned by interests in New Zealand. Another case involved kickbacks accepted by employees of the Tongan Commodities Board, which regulates agricultural trade with other countries. A third case involved a charge of contract violation, in which the ultimate employer was the Mormon Church, which is based in the United States.

The procedures in the Tongan Supreme Court appear to be designed to persuade both outsiders and Tongans alike that in Tonga transnational commercial activities can be conducted in a way that is consistent with European expectations.

Nevertheless, in the domain of the Tongan Supreme Court, Tongan tradition or specifically Tongan culture was often potentially relevant. For example, in the case of the Bank of Tonga employee, the theft from the bank involved both deception of relatives from whose account money was taken and theft on behalf of a relative. Yet in the trial discourse there was no overt or explicit orienting to the particular duties owed by Tongans to family members of the sort I have documented for the Magistrate's Courts. Those in the courtroom, including the British judge, the Tongan lawyers, and the Tongan jurors, were aware of the kinship relationships involved and may have been mindful of these kin ties in some aspects of their handling of the case. These understandings, however, were left implicit.

If one compares the configuration of traditional and modern ideological representations of the Tongan nation in the Magistrate's Courts and in the Supreme Court, important differences emerge. First, in the Supreme Court, there is no overtly ideological multiplicity to be configured and, therefore, no systematic ideological opposition or struggle and no accommodation or appeal to multiple

sources of authority. Modern Western legal interpretations are completely dominant. The systematic orienting to neotraditional Tongan ways of doing things that one finds in the Magistrate's Courts is erased. This is because the Supreme Court is, almost by definition, the place in which Tonga displays to the outside its willingness and ability as a nation-state to deal with Western European nations through legal practices that derive from those nations. Westerners view the decisions made in the Supreme Court as more serious and important than those made in the Magistrate's Courts. Neotraditional interpretations of crimes are incompatible with these concerns.

This functional differentiation of higher and lower trial courts is historically continuous with a similar functional differentiation under British colonial administration as part of the British policy of indirect rule. In the court system widely imposed by the British as part of the introduction of their concept of "rule of law," lower-level trial courts were left in the hands of local populations. Higher-level trial courts were controlled by the British, who also allocated legal matters they considered most important, such as the right to impose the sentence of punishment by death, to the courts they controlled.

Although modern legal rhetoric dominated Supreme Court discourse, a public and conflictful ideological opposition between modern and neotraditional visions of the Tongan nation was associated with the emergence of the Pro-Democracy Movement during the same period of time that I was studying the Tongan courts (1985–90). At the heart of the Pro-Democracy Movement was the key position that commoners deserved greater representation relative to nobles in the national Legislative Assembly, the Fale Alea, than was the case at that time.

The Tongan Constitution dictates that commoners and nobles, or titled chiefs, separately elect the same number of representatives to the Fale Alea. Commoners and nobles use separate voting rolls, and each group elects representatives from among its own. As I show in the next section, this system of elected representation bears a strong similarity to the systems in Samoa and Fiji, in part because of a shared colonial heritage.

Presently, nine nobles represent 29 nobles, and nine commoners represent approximately 90,000 commoners in the national legislature. The Tongan Constitution also provides that the king's 12 appointed cabinet ministers be voting members of the Fale Alea. In practice, the commoner representatives can never outvote the combination of the noble representatives and the cabinet members on any issue where the latter groups are aligned against them, which frequently occurs.

The Pro-Democracy Movement pursued the idea that a more democratic system would give greater representation to the commoners. This position was opposed by the nobles and those with whom they are aligned. The nobles argue that the continued political dominance of the traditional hereditary class of chiefs is more culturally appropriate for Tonga. Thus, they offered a neotraditional position in opposition to the democratic position. So far, the neotraditional position has held, and the commoners continue to be weakly represented in the Fale Alea.

The Pro-Democracy Movement and the opposition it generated produced intense political debate that changed rapidly over the years and moved across

wide range of political activities in the public sphere. Debate in the Fale Alea was tape-recorded and played on the radio on Friday nights, and people all over the country listened to it over gatherings around the kava bowl and in their homes. New magazines and newspapers and new organizations started up specifically to expand the range of public fora for discussion of the issues raised in political debate. Sunday church sermons and feasts were eventually penetrated by the political discourse, as prominent members of the Free Wesleyan Church became active in the democratic movement.

This political debate was not evident in the Magistrate's Courts in any way. But people actively involved in the political conflict tried to use the Supreme Court to control their political opponents by filing suits involving libel and defamation of character, as well as other issues. It appeared that the Supreme Court judges made an effort over the years to limit the court's involvement in the political conflict, but litigants eventually succeeded in getting the debate into that court in specific cases.

The Pro-Democracy Movement has been cast as one involving opposition between traditional and democratic concepts of nation-state government (e.g., Lawson 1996). It is also seen by Tongans as a conflict opposing the traditional and the modern (Helu 1992), recalling the slippage and overlap in meaning between the "democratic" and the "modern." F. Helu (1992) discusses the positive associations Tongans have with political concepts considered modern or not part of traditional Tongan political ideologies. It is clear that in the realm of national political debate, as in the Tongan courts, the concept of "modernism" is locally alive. If one compares the configuration of traditional and modern representations of the nation-state in the Magistrate's Courts with that of the Supreme Court and of the Pro-Democracy Movement, important differences emerge. In the Magistrate's Courts, there is an accommodation between modern and neotraditional frameworks, and both are produced by the same state representatives. Neither vision dominates the other. In the Pro-Democracy Movement, neotraditional and modern representations exist in opposition, not accommodation. Their goals are mutually incompatible, not compatible as in the Magistrate's Courts. In the political debate generated by the Pro-Democracy Movement, the neotraditional forces have largely prevailed. In the Supreme Court, in contrast, there is neither accommodation nor opposition of traditional and modern visions of the state but, rather, dominance of modern law and erasure of neotraditional interpretations of crime.

The Pro-Democracy Movement has had a fluid quality to it, in its rapid change and movement across social domains of discourse, and it has been shaped by globalization processes, most immediately, those of rapid transmission of information through print and radio. Although less dynamic by comparison, court discourses are not lacking in the potential for change. For example, defendants in the Magistrate's Court pushed to have misdemeanors they committed while they were engaged in religious activity excused or pardoned in some way, although they were not successful in their efforts. Defendants in assault cases argued, again without success, that their own senior status relative to their victims should be a mitigating factor in the court's consideration of their actions. It would not take

major shifts in court discourse, however, for such factors to be accommodated. Even so, there was clearly an excitement associated with newness and change in the Pro-Democracy Movement that one did not find in the courts.

Other Pacific Nations

The Pacific was the last part of the world to be decolonized. Most contemporary Pacific nations received formal independence from colonial powers in the 1970s. Concepts of "tradition" are central to Pacific nations' claims to the national distinctiveness that is thought to warrant national sovereignty. And the use of tradition as an ideological resource and source of authority in contexts of political innovation in the Pacific is well documented (e.g., Borofsky 1987; Jolly 1992; Linnekin 1991; White and Lindstrom 1997).

Recent discussions of Pacific national imagining in which tradition figures have taken place within a rhetoric of multiplicity, contestation, competition, tenuousness, and ambivalence (Foster 1995b; Kelly and Kaplan 2001; Lawson 1996; Otto and Thomas 1997b). For Melanesian countries such as Vanuatu, the Solomon Islands, and Papua New Guinea, discourses opposing the colonial and the traditional, in which the colonial was rejected and the traditional drawn on as the basis for national identity, were salient in early years of independence. This opposition is still of great importance. Other local sources of multiple representations of the nation are also now important (Otto and Thomas 1997a).

Some recent anthropological analysis of ideological multiplicity in Melanesian nation imagining expresses concern that the idea of the nation itself is only weakly developed, particularly in rural areas of these countries. Local appropriations of and oppositions to national imagery and authority threaten the nation (Clark 1997; Foster 1995b; Jacobsen 1995; Otto and Thomas 1997b). Here, ideological diversity in the imagining of the nation-state comes across as harmful to national stability. In Fiji, ideological contestation between traditional indigenous visions of the nation and the democratic visions of Fijian Indians and others has played a role in the repeated political coups that have occurred there since 1987. The idea that multiple ideologies can be compatible is treated as imaginable in Melanesia (e.g., Kaplan 1995; Sokomanu 1992), but not actual.

In Tonga, the idea of the nation is pervasive. Political sovereignty is highly valued (Morton 2001).[4] There is very little anticolonial rhetoric, in part because official nationalist discourses deny that Tonga was ever colonized in the first place. Although Tonga was granted independence from Great Britain in 1970, Tongans do not think of Tonga as a new nation. They trace the formation of their nation back to the mid-1800s, as I did at the beginning of this article. To counter the view that they were colonized with a range of arguments, including the fine-grained distinction attributed to Queen Sālote (Wood-Ellem 1999) that Tonga was never a British protectorate but was, rather, a "protected state." From the Tongan point of view, their legal system is Tongan, not British. There is more than one way to be modern, and there can be a Tongan way. The weakness of association between the modern and the colonial in Tongan political discourse is part of what makes it possible for the traditional and the modern to be

compatible as well as in oppositional relationships in Tonga. It may be more difficult to develop a local concept of a modern nation in Pacific countries where "modern" is understood to mean "colonial." On the other hand, in Melanesia as well as in Tonga, there may be substantive compatible relationships among traditional and nontraditional nationalist ideologies in some domains and discourses. But such relationships have not been a focus of research in Melanesia.

Tonga arguably stands in contrast to some countries in Melanesia in its particular configuration of nationalist ideologies. But it does share part of its prodemocracy oppositional discourse with some nations, specifically Samoa (formerly Western Samoa) and Fiji. Since the coups in Fiji in 1987, all three countries have had public, internationally reported debates concerning the institutionalization of chiefly privilege at the national governmental level. In Fiji, the greater salience of the opposition between Indians and Fijians has obscured the ideological differences between chiefly and commoner positions to some extent. The constitutions in all three of these countries build chiefly privilege into the legal basis for elected representation in the national legislatures. In each country titled chiefs have significantly greater representation than commoners do in the national legislative process. In each country commoners have made efforts in the past two decades to enhance their representation (Franco 1997; Helu 1992; James 1997; Lal 1992; Le Tagaloa 1992; Macpherson 1997; Morton 2001; Powles 1979; Rutz 1995). And in writing about these movements, some observers have conceptualized the chiefly prerogative as traditional and the commoner movements as modern or democratic (e.g., Lawson 1996), although the usefulness of the concept of "modern" also has been questioned (Kelly and Kaplan 2001). In each nation, chiefly privilege has held, albeit with some changes in Samoa's system of representation (Le Tagaloa 1992).

Even though these movements have been experienced as nation specific and have been written about as such, they should also be seen as a regional transnational discourse. The prehistories and colonial histories of Tonga, Samoa, and Fiji are strongly connected. From the early 1800s on, missionaries and European governmental representatives throughout this area and in Tahiti and Hawaii, as well, exchanged drafts of law codes that encoded chiefly privilege (Ellis 1829; Lātūkefu 1974; Powles 1979), so the regional transnational nature of this chiefly–commoner opposition is not new.

It is clear from comparison that Tongan ideologies of nation-state share with those of other Pacific nations the invocation of tradition and the opposition of tradition to something Western, be it a modern vision, a colonial vision, or a democratic vision. And, as I have already suggested, there is some slippage and sharing of meaning among these terms and interchange in their usage. Accounts of traditional and modern ideologies of nation-state making in other parts of the Pacific, however, foreground situations in which these kinds of ideologies occur in opposition. Tonga has oppositional discourses, too, but it also has examples of accommodation and erasure of ideologies, as in the Tongan courts, that are difficult to find in accounts of other Pacific nations.

Several factors help explain this difference between Tonga and other Pacific nations. First, colonial histories throughout the Pacific are quite different. It is

also clear that local people in different Pacific nations conceptualize their colonial histories very differently, in ways that cannot be completely explained by their experiences. Finally, it is likely that where accommodations of traditional and modern ideologies of the nation-state occur in other Pacific nations, they do not receive the attention that the more oppositional discourses receive because they are not as worrisome or threatening.

In general, then, the configuration of traditional and modern nationalist ideologies varies within Tonga and among Pacific nations. The particular accommodation of ideologies found in the Tongan Magistrate's Courts cannot be generalized to Tongan society as a whole. But that such an accommodation exists at all is significant and characteristic of Tongans and of their willingness to claim the modern as their own.

Discussion and Conclusion

I now turn to discussion of how anthropological representations of ideological diversity discussed early in this article help make sense of the ideological multiplicity described here, and I consider how the image of an ecology of ideas can address concerns that have not been developed in these theoretical traditions.

Both traditional and modern representations of the nation-state are widespread in the Pacific island nations. This prevalence is consistent with the postmodern idea that global capitalism and revolutions in information transmission have caused a loss of a master narrative, or an all-encompassing, authoritative, and taken-for-granted worldview. In Tonga and elsewhere, local tradition and Western modernism are both sources of authority that can be invoked in support of particular representations of the nation, so the sources of authority are multiple.

Moreover, it is possible to see the various political ideologies that have been described here as modern, Western, colonial, and democratic, as having come into the Pacific as a consequence of the globalization of capitalism, consistent with a postmodern perspective. It is usually not easy, however, to identify a postmodern era during which certain specific processes played a role in configuring specific ideologies. Both the Tongan Magistrate's Courts and the Supreme Court of today draw on neotraditional and modern ideas about the Tongan legal system that go back to contact between Tongans and Western Europeans in the early 1800s. Pro-democracy movements in Tonga and elsewhere have likewise been shaped by colonial establishment of the legal categories of chief and commoner in laws from the same period. At the same time, this political movement has definitely been strongly shaped by discourse in print and radio media of the kind held to be influential in postmodern theory. The Tongan Pro-Democracy Movement also has the quality of fluid, rapid movement, or flow, of culture across national boundaries and nationally internal institutional boundaries of the kind thought by some to be characteristic of culture in the present day.

Further, as expected from such a perspective, it is clear that legal culture and political culture have been moving from economic centers of capitalism

economic peripheries. There are also regional processes of cultural movement, however, that are not particularly well attended to in anthropological thinking on the movement of culture. Notably, here, the opposition between local "tradition" and some version of the modern, democratic, or colonial, is widespread in Pacific microstates' envisioning of their own nation-states. That opposition is one regional phenomenon. On a smaller scale, the common discourse on chiefly versus commoner representation in the national legislature shared by the cultural triangle of Tonga, Samoa, and Fiji is also a regional transnational phenomenon that does not just involve center and periphery.

One may ask how useful it is to think of the cultural processes documented here in terms of the image of "flow" that characterizes anthropological imagining of movement of culture. Yes, the movement of culture is fluid, both at the microlevel of social organization, as words in face-to-face communication flow out of people's mouths, and at the macrolevel, in which one is encouraged to envision rivers of goods and people moving across national borders. But there is also structure in the moment, at any given moment in time, and that structure is often repeated over and over, as in the Magistrate's Courts. Ideas are configured in relation to each other and kept bounded and discrete through the structure of discourse. There are also various kinds of constraints on flow. Culture on the move cannot and does not go anywhere and everywhere. Here I have focused on the compatibility of traditional and modern ideologies as a factor that shapes when, where, and how such ideologies can appear together or in some kind of relationship.

Characterizations of globalization and transnationalism, then, encourage thought about how ideas move – where they come from, where they are going, and how they can get there. Such characterizations are less helpful for seeing the structure of ideological diversity in the moment, in cultural practice.

Marx-influenced representations of culture, in contrast, offer useful starting points for talking about how ideologies are structured in discourse. In Marx-influenced characterizations, ideologies are bounded, multiple, and exist in relationships with one another. The relationship between any two ideologies is inevitably shaped by a power struggle between dominant and subordinate sectional interests, characterized by opposition, conflict, and the resistance of the subordinated.

I have argued here that whereas such an oppositional framework applies to the pro-democracy movements in Tonga and elsewhere, other configurations are possible in situations of multiple representations of the nation-state besides oppositional configurations. In the Tongan Magistrate's Courts, modern and neotraditional framings of crimes coexist and provide a dual legitimation for court decisions, with few signs of struggle or domination and subordination. In the Supreme Court the neotraditional is erased so that the modern legal framing of crimes is dominant.

Marx-influenced representations of ideological multiplicity commonly posit a single oppositional relation for a given society or group studied. The variation in configurations of ideological diversity from situation to situation that I have described for Tonga points to problems with this vision. The organization of

ideological diversity is inevitably more complex than the Marxist model i practice. A related Marxist assumption is that the consequence of an ideologic dialectic is a new synthesis that itself is whole and coherent. Ideological chang is more piecemeal and layered than that assumption implies. This is evide when one considers the connections between the colonial period and the prese in the nature and ordering of modern and neotraditional nationalist discours in Tonga and elsewhere.

Recent anthropological visions of ideological diversity contribute a gre deal to an understanding of contemporary configurations of modern an neotraditional visions of the nation-state in the Pacific and elsewhere. The streng of ideas derived from discussions of globalization and transnationalism lies their emphasis on cultural process and change, particularly in their empha on the movement of culture, so that forms of culture come together in ne ways. The strength of Marx-influenced approaches lies in their emphasis on the boundedness and structuring of ideological multiplicity.

An image of the ecology of ideas can be useful for bringing cultural structu and the movement of culture together. Ideas live in discourse and are order relative to one another through discourse structure. Discourse domains interactional spheres are the different environments into which ideas enter, ta hold, and have a life. Ideologies are like plant species, entering into and inhabit different discourse environments.

Multiple species can coexist in the same environment. They accommod one another and are part of each other's environment. When plant species mo into a new environment and try to colonize it, they encounter other plants t are already part of that environment. Those other plant species can mak easy or difficult for new plants to gain a foothold. New species of plants ma may not displace those species already present. So, too, with ideas. When n ideas enter a discourse environment, their fates vary, depending in part on nature of their relationship with ideas already present in that environment. Id may be compatible or incompatible to varying degrees, and their relationsh may change over time, generally transforming how ideologies are configure discourse and creating a historical layering of different varieties of ideolog multiplicities, in the present case, varieties of the neotraditional and the mod in nation-state imagining.

These issues of compatibility are evident in the examples of configurat of ideological diversity in Pacific nation-state making that I have discussed h In the Tongan Magistrate's Courts there was an accommodation between mod and neotraditional representations of a Tongan nation-state. But the Supr Court was not an environment friendly to neotraditional discourses. Tor neotraditional ideas about the duties associated with particular social ident were as relevant in that setting for making sense of crimes as they were in Magistrate's Courts. But the use of the Supreme Court to link Tonga to the o side world and the attendant need to display Western law to gain credibility Western nations have made the Supreme Court a context in which neotraditi discourses have not thrived as they do in the Magistrate's Courts.

In the Tongan Pro-Democracy Movement, ideas moved rapidly across discourse environments, looking for a home and finding many, some only temporarily. The neotraditional discourse that maintains the power of nobles or chiefs over commoners was activated in opposition to the Pro-Democracy Movement, and this neotraditional discourse has so far prevailed. The modern discourse of the Pro-Democracy Movement and the neotraditional discourse of the nobles and their supporters have been incompatible and have not found mutual accommodation in the Fale Alea, Tonga's National Assembly.

As noted earlier, the same struggle over political representation in national legislatures has gone on in Fiji and Samoa, with similar maintenance of chiefly power. That these struggles have gone on during the same period in several small Pacific island nations in close proximity is not simply coincidental. In Tonga the Pro-Democracy Movement was largely experienced as a specifically Tongan phenomenon. Similarly, the political conflicts over representation in national legislatures in Fiji and Samoa are usually described as nation specific. But the oppositional discourse over representation in national legislatures was truly a transnational phenomenon. These countries responded similarly to similar ideas not only because they are in close communication but also because the political environments into which these ideas moved were similar. This environmental similarity was due to a common heritage of colonial law that made the legal categories of chief and commoner foundational to electoral representation as well as to a good deal else. Thus Tonga, Fiji, and Samoa have similar political environments that, in some respects, have made those countries receptive to a particular configuration of modern and neotraditional political images of the nation.

But whereas Tonga embraces and actively develops ideas associated with a "modern" nation-state in legal and other political domains, this has not been the case in many parts of Melanesia, most notably New Guinea. There, as others have described, an opposition exists in nationalist rhetoric between traditional and colonial ways of conceptualizing political power rather than an opposition between traditional and modern ways of doing things, as in Tonga. In decolonizing Melanesian contexts, in which the ongoing effort has been to replace the colonial with the neotraditional, there does not seem to be much place for or receptivity to a concept of "the modern" because of its associations with colonialism.

In the various discourse environments I have considered, then, the specific nature of the traditional and modern ideologies one encounters in a given environment plays an important role in how those ideologies can be configured in relation to each other.

Ideas do not float in the air, and they do not exist only in the heads of individuals. Ideas live in discourse. They are configured by the social organization of face-to-face interaction and by the sequential structure of discourse. Analysis of the ecology of ideas in discourse practices contributes to an understanding of why and how cultural constructs not only change but also endure, how they shrink and expand, how they are restricted and elaborated across discourse environments, and how nondominant ideas get preserved over time. Ideas find

a compatible locale and colonize it. They do not so much flow across social terrains and saturate them like water, as they are like plants moving into new ecological niches, some of which are more hospitable than others at a given moment in time. It is at the level of discourse structure that new ideas push their way into the conscious life of a society.

Acknowledgments

Support for this research was provided by the Wenner-Gren Foundation for Anthropolog Research and the National Science Foundation Linguistics Program. I thank the Gov ment of Tonga and the people of Nukunuku, particularly the Vili Salakielu family, making this work possible. I also thank Diane Riskedahl for coding Tongan courtroom data, Deborah Tannen and Diana Eades for organizing opportunities for earlier presentations of this material, Pete Becker for discussion of the concept of "the center," and Jack Bilmes, Elizabeth Kennedy, Patricia MacCorquodale, Myra Dinnerstein, Sheila Slaughter, and the anonymous readers for the *American Ethnologist* for comments on earlier versions of this article.

Notes

1. In his writing and teaching, Dell Hymes drew a parallel between Anthony Wallace's (1961) idea of culture as the organization of individuals' diverse forms of knowledge and a speech community as consisting of the socially systematic organization of speakers' diverse forms of communicative competence. A community, then, was fundamentally characterized not only by shared norms for socially appropriate behavior but also by internal differentiation (Hymes 1968). And this was true not just of urban, modern communities but of all communities of every scale from the village to the nation for which some shared norms existed for appropriate speech usage. Hymes envisioned for all communities a plurality of codes, speech events, and speech genres.
2. Throughout this article, conforming to standard linguistic practice, English glosses of Tongan words and phrases are enclosed by single quotation marks.
3. Line divisions in Tongan transcript excerpts 1 and 2 are based on intonational units; in the other excerpts on grammatical units. The orthography and word endings and beginnings are based on contemporary written conventions in Tongan newspapers and magazines. Numbers in square brackets preceded by the pound sign indicate pauses of greater than two-seconds length, for example, [#5]. Where material has been omitted from excerpts, three dots are used to indicate the location of the omission. Words in bold direct the reader's attention to aspects of the excerpts that are the focus of analysis in the discussion.
4. Aiono Le Tagaloa (1992) indicates that sovereignty is greatly appreciated in Samoa as well. Political sovereignty is also valued by Maori and Hawaiians, who do not have it because they are constituted and self-constituting as ethnic minorities within the nation-states of New Zealand and the United States, respectively (Linnekin 1990). The idea of the independent nation as highly desirable may generally have penetrated Polynesian populations to a greater degree than it has Melanesian populations.

Argumentation Studies and Discourse Analysis: The French Situation and Global Perspectives

Christian Plantin

Formulated in the 1960s and 1970s, the earliest French discourse analytic programmes initiated by Foucault or Pêcheux were seldom argumentation oriented; nonetheless, argumentation studies now appears to be a popular branch of discourse analysis, at least in France. The reasons for this evolution are rather complex; some are closely linked to the specificity of the French situation, others are more general.

This article analyses the development of the complex relations between argumentation studies and discourse analysis as follows:

(1) In order to clarify the definition of the word 'argument' in French and American English, some divergent meanings are examined.

(2) This section argues that the discourse-analytic programme has specific 'conditions of production' of its own, that is, historically situated. The historical decline of rhetoric, expelled from the curriculum at the turn of the century, is part of the context. Until the late 1980s and the Perelman revival, the prevailing intellectual and academic background had been characterized by ignorance and a distrust of rhetorical argumentation.

(3) Grize's 'natural logic' (1982, 1990, 1996) and Anscombre and Ducrot's 'argumentation within language' (AwL) theory (Anscombre, 1995; Ducrot, 1972, 1973, 1984, 1988; Ducrot and Anscombre, 1986; Ducrot et al., 1980) are briefly discussed from the discourse analysis point of view. These programmes have restored the study of argumentation to

Discourse Studies vol. 4, no. 3, 2002, pp. 343–368.

favour in France, where it is currently the research paradigm most referred to in recent work.

(4) This section examines the present situation in France which is characterized by a strong new interest in argumentation in all disciplines. This is fuelling a tendency towards the use of argumentation theories – classical or modern – for practical, short-term (some might say, short-sighted) analytic purposes, focusing on the corpora under analysis. Complex models integrating insights from interaction theory and enunciation theory are needed.

(5) A proposal is made for a better integration of argumentation studies in the discipline of discourse analysis, based on the conception of argumentation as opposite points of view, either in face-to-face confrontation or in written arguments sometimes lasting for several centuries.

This article is based on the premise that research into the history of rhetoric and argumentation, as well as in specific discourse analytic trends that emerged in France during the 1970s, has some permanent value in that a better understanding of a discpline's historical development can be a good introduction to its current problems.

1. Pre-Theoretical Lexical Research

There is a significant difference in meaning between the lexico-semantic fields associated with the word *argumentation* in French (F) and in American English (AE). Whereas *argumentation* (F) is indeed a good counterpart of *argumentation* (AE), the words *argument, argumenter* (F)/*argument, to argue* (AE) are *faux amis*, false friends; in most of their occurrences, *an argument* (AE) is not *un argument* (F), and *to argue* (AE) doesn't translate as *argumenter* (F). In other words, the obvious morphological parallel between the following two series of words can be semantically and theoretically misleading in some major aspects:

American English (AE):	an argument, to argue, argumentation, argumentative, argumentativity
French (F):	un argument, argumenter, arguer, argumentation, argumentatif, argumentativité.

To Argue, (an) Argument

In a basic study, O'Keefe (1977) suggests 'two meanings of *argument* and *argue*' along the following lines:

- *to argue* (1) = 'to give reasons' (Webster); following this definition, *to argue* can be constructed with a singular or plural subject, and is followed by a 'that' clause. *To argue that P* is a monological activity.
- *to argue* (2) = 'to have a disagreement; quarrel; dispute' (Webster); following this definition, *to argue* is constructed with the preposition *about*, and refer

to a vast domain of interactions ranging from normal discussion to verbal and paraverbal fights. *Arguing with X about P* is a dialogical activity.

These definitions demonstrate how these two distinct lexico-semantic fields can be distinguished in American English.

In French, the verb *argumenter* is an excellent equivalent of *to argue* (1) = 'to give reasons', but a very poor translation of *to argue* (2) which corresponds to '*discuter (de manière agressive)*' (F); *argumenter* (F) never means 'to quarrel'. All the words belonging to its lexico-semantic field have this monosemic meaning: *un argument* (F) is always a logical argument, never 'a quarrel', etc. Therefore, the use of the French set of words is more restricted than the use of the seemingly parallel American English set of words; the French set of words denotes a logico-linguistic activity, without any interactional, potentially aggressive, connotation.

In the following examples, neither *argument* (F) nor *argumentation* (F) can be used to translate *argument* (AE):

Alice, who was always ready for a little argument = *une bonne discussion*

Alice didn't want to begin another argument = *recommencer à se disputer*

If you lose an argument... = *si vous n'avez pas le dessus dans une discussion*

Two further points:

- *un argument* (F) can designate through synecdoche (in which a part represents the whole), the complete discourse 'good reasons + point of view', just like 'an argument' (1) (AE).
- the meaning of the (not very usual) French verb *arguer (de)* differs from *argumenter* (F) in a curious way. In the sentence '*Pierre argue de P*', the speaker mentions Pierre's position or argument, without identifying himself with his position. Therefore, *arguer de P* (F) is typically used to report the opponent's argument or to distance oneself from an argument. By saying '*M. Le Pen argue de...*' the speaker mentions Le Pen's argument and distances himself or herself from the discourse of the extreme right-wing leader.

Argumentative, Argumentativity (AE)

The problem becomes acute with *argumentative* (F) vs *argumentative* (AE); *argumentatif* (F) is derived from *argument*, and only carries a meaning related to 'building up a good logical argument'. However, *argumentative* (AE) is more likely to mean *argue with X:* thus, an argumentative character (AE) = *une personne querelleuse* (F).

All this demonstrates that there is a risk of misunderstanding French expressions like *l'orientation argumentative d'un énoncé*, which are basic to Anscombre and Ducrot's theory of argumentation, whose semantic thesis implies that 'any sentence conveys as (part of) its meaning an orientation towards a conclusion.' The (practically unavoidable) word-for-word translation 'the argumentative orientation of an utterance' should not be taken to refer to or evoke any form of

verbal aggression; the production of argumentatively oriented utterances does not denote an aggressive personality.

The conclusion therefore is that the lexical field of *argumenter* (F) is semantically homogeneous and always denotes a verbal–intellectual activity consisting of 'giving good reasons', i.e. 'constructing an argument'. Therefore, a practical rule could be to think solely of *argumentation* (F/AE) when dealing with French words like *argument, argumenter, argumentative* and *argumentativité.* Table 1 sums up these analogies and differences.

Table 1: Analogies and differences in American English (AE) and French (F) for basic forms of the word 'argument'

American English (AE)	French (F)
argumentation	argumentation
to argue (1) (to argue that –)	argumenter
to argue (2) (to argue with –/ about –)	discuter, se disputer
an argument (1)	un argument
an argument (2)	une discussion, une dispute
argumentative (1)	argumentatif, -ive
argumentative (2)	ergoteur, raisonneur (Collins), querelleur
argumentativity (1)	argumentativité
argumentativity (2)	l'agressivité verbale

Note: Argumentative (1) (AE) and argumentativity (1) (AE) have been introduced as a development of the argumentation, argue (1) line.

Thus, from a theoretical point of view, we can conclude that the field of argumentation studies corresponds very well to the field of the *études de l'argumentation*; however, the study of argument covers a broader field, of a more fiery nature, i.e. the field of 'conflict studies'. I come back to this point later in this article.

2. The Legacy

It could be argued that discourse analysis has a past: rhetoric. According to its classical definition, rhetoric is the theoretical and practical science of public speaking with a heterogeneous audience, including resolute opponents, enthusiastic supporters and sceptical, scrupulous or stubborn 'don't knows'. Through (more or less carefully planned) discourse, speakers choose specific words to represent their views and opinions and convert their audience towards their preferred line of action. This rhetorical procedure can be applied to all public discourse – judicial, political, religious and ceremonial.

In the US, contemporary rhetoric is a traditional component of speech studies. This situation contrasts strongly with the prevailing situation in France, where the brilliant development of the history of rhetoric can be contrasted with the scarcity of practical rhetorical analysis of contemporary (non-literary) material. This may parallel the development of discourse analysis; for example, it could

be unwise to oppose rhetoric without practice and examine discourse analysis without studying its history. Maybe this only adds to the controversial relationship between discourse analysis and rhetorical analysis: are they separated by an 'epistemological abyss' or simply by a series of historical accidents and academic routines? The indisputable fact is that the analysis of contemporary discourse is carried out quite independently of the conceptual framework of rhetorical analysis; a major part of this very conceptual framework has come under the apparently more acceptable term of 'argumentation studies'. The discourse of discourse analysis has been built up on the implicit rejection (or neglect, or absence) of rhetoric. in keeping with a century-long historical trend, that needs to be at least outlined here.

In the late 19th and early 20th centuries, rhetoric was excluded from the universities and logic became a formal discipline. Some aspects of the present situation of argumentation studies in France can be considered to be a consequence of this historical trend. At that time, argumentation studies was certainly not a specific field. In order to get an initial idea of what happened then, this article now examines argumentation's closest relatives: logic and rhetoric.

Argumentation Studies in Relation to Rhetoric

As a basic part of rhetorical creativity, argumentation studies were affected by the disappearance of rhetoric from the new-born Republican university's syllabus at the end of the 19th century. Rhetoric was criticized and eliminated as a non-scientific. therefore illegitimate, study. In France, practical rhetoric has never recovered from this type casting; only the history of rhetoric is considered a suitable subject for the academic field.

In order to understand what happened to rhetoric at that time, one has to keep in mind the historical and political background, that is, the 1870 defeat of France by Germany and the necessity for a new start in politics as well as in intellectual life. Politically, this new start was the Third Republic.

In intellectual life, this was a period of intense political and ideological activity, of the re-conception of knowledge and, consequently, re-definition of the basic tasks of the university and reformation of the curriculum. This general remodelling was promoted by the Third Republic, on the basis of both a secular and a positivist view of science, culture and society.

The impulse for these transformations was a new conception of knowledge: 'positive knowledge'. History was the rising star, the prototypical positive method able to deliver scientific knowledge in the field of the humanities. Positive knowledge was seen as contradictory to 'formal knowledge', the best example of which was rhetorical 'know how'. No considerations of consensus, opinion, topoi, doxa, amplification or eloquence could be defended when confronted with the positive findings of historical research.

Thus, rhetorical knowledge is no knowledge at all. Moreover, two aggravating circumstances reinforced the case against rhetoric: (i) the predominance of Jesuit education in a period of intense contest between the church and the state (which ended with the 1905 separation of church and state); and (ii) owing to its use in

Jesuit colleges, the fact that rhetoric was linked to Latin, with all rhetorical exercises being practised in that language. This period marked a peak in the never-ending quarrel over the place of Latin in literary studies, similar to the modern movement for an emancipation of French from Latin. A secular state would thus strive to eliminate rhetoric from the educational curriculum as it was synonymous with one-sided religious education.

Consequently, the new curriculum in French studies was re-shaped as an historical approach to literature, as opposed to a rhetorical one: new forms of academic expression (French composition, literary history, commentary on literary texts) appeared in high schools (*lycées*). All these new forms explicitly excluded rhetoric, even if the classical rhetorical forms and devices remained in practice throughout this period, as well as in our own – how could it be otherwise?

Therefore, it was not surprising that, owing to its link to an earlier conception of education, rhetoric became the obvious symbol of an out-dated religious education compared to the positive knowledge promoted by the modern Republican university. This is the basis for rhetoric's continuing status of illegitimacy in France. A symbolic measure was taken in 1885, when the 12th grade in high school was renamed: formerly the 'rhetoric class' (*classe de rhétorique*), it now became anonymously known as 'the last year' (*la classe de terminale*); see Collinot and Mazière, 1987; Compagnon, 1983; Douay-Soublin, 1992; Fumaroli, 1980, 1999.

Since the discipline of argumentation studies was closely associated with rhetorical studies, it was clearly on the wrong side. But how far? To my knowledge, this question has never received an appropriate answer. However, it should be emphasized that the rhetoric that was excluded from the syllabus – Jesuit rhetoric – was not focused on argumentation but on *praelectio*, that is to say, text explanation and amplification: a form of oratory not intended to convince by proof and debate, but to subjugate by verbal power.

Argumentation Studies as Logical Studies: Neo-Thomism

Thus, it would be an over-simplification to conclude that the exclusion of rhetoric would inevitably bring about a decline in argumentation studies. Other considerations concerning logic must come into play. These are well known. They correspond to the new status of logic as a branch of mathematics. The publication of the *Begriffschrift* by Gottlob Frege in 1879 marked the turning point from which logic was no longer seen as the 'art of thinking'. In France, two major works testify to this long drawn-out evolution: (i) Arnauld and Nicole's *Logique* in 1662 (the full title is *La Logique ou l'art de penser contenant outre les règles communes plusieurs observations nouvelles propres à former le jugement* (Logic or the art of thinking, containing as well as the common rules, some new observations on forming judgements); and (ii) works such as Condillac's *Traité de l'art de raisonner* (Treatise on the art of reasoning) in 1796. In the latter the 'art of reasoning' is the art of studying mathematics.

Logic became that 'formal' discipline against which 'natural logic', 'informal logic' and 'substantial logic' were to rebel one century later. In 1888, Anthelme Chaignet published *La rhétorique et son histoire* (Rhetoric and its history), the first introductory book to Aristotle's argumentation theory – and a very good one

Is it possible to conclude that, along with rhetoric and traditional logic, argumentation studies were finally abandoned at the turn of the century? This conclusion would require further investigation. A conceivable hypothesis is that the interest in argumentation lived on but in the restricted domain of religious education, as a part of neo-thomist philosophy.

In 1879, Pope Leo XIII published the encyclical *Aeterni Patris*, which established Thomas Aquinas as a quasi official philosopher for the catholic church. There is certainly a connection between this publication and the fact that important developments relating to traditional logic, as well as valuable examinations of different kinds of arguments can be found in philosophical handbooks such as Abbé Henri Colin's, *Manuel de philosophie thomiste* (Manual of thomist philosophy) (1926) dedicated to higher religious education. Important treatises like Maritain's (1966) *Eléments de philosophie II –L'ordre des concepts – Petite logique (logique formelle)* (Elements of philosophy II: Order of concepts – Minor logic [formal logic) could also be considered proof of a permanent interest in logic as a philosophy of natural cognition in a neo-thomist framework.

A second point needing more investigation concerns argumentation as a practice. As mentioned earlier, this period was highly polemical in religious, political and scientific matters. It might be suspected that, in some way, well-intentioned passionate religious polemists resorted to the age-old argumentation techniques to contest the best-established scientific results – particularly in the field of history, anthropology and geology – on topics such as the age of the earth or the date of the first appearance of human beings.[1] There was clearly a clash between argumentative discourse and the reality of scientific proof. Stepping outside their field of validity, argumentative practices were prey to devastating refutations of the conclusions they delivered and, further, at risk of being invalidated as a potentially interesting method of investigation in any field.

To sum up: at the turn of the century, rhetoric was associated with a group characterized by its religious fervour and anti-Republicanism and was thus excluded from the state education curriculum; logic had turned into a branch of mathematics, whereas argumentation studies were restricted to neo-thomist philosophy and religious education. Finally, argumentation practices were discredited by irrelevant interventions in the most advanced scientific fields. This situation was to remain unchanged until at least the 1970s.

The 1960s and 1970s: The New Rhetoric without Influence

The 1950s saw the revival of well-known and much celebrated argumentation studies such as Perelman and Olbrechts-Tyteca (1976[1958]) and Toulmin (1993[1958]) as well as Curtius (1948), Lausberg (1960) and Ong (1958). A small book published by Jean-Marie Domenach, *La propagande politique* (Political Propaganda) (1950) should be added to this brilliant set. Domenach's definition of the aims of propaganda is quite similar to Perelman's definition of argument, except in one respect: Domenach emphasizes the fact that beliefs are created and reinforced not only by discursive means but also – and maybe above all – by voice and gesture accompanying discourse, as well as a whole set of semiotic

signs such as music and pictures, in addition to forms of organized public action (for example, demonstrations).

The classical topos of the 'renaissance', or revival, of rhetorical argumentation should be considered in the light of the background sketched in the preceding section; rhetoric and argumentation studies had to win a new legitimacy. In this connection, two works are generally mentioned. Roland Barthes' (1970) essay *L'ancienne rhétorique – aide mémoire* (The Ancient Art of Rhetoric – A Memo) was a short reminder of the classical structure of rhetorical theory. The same year, Groupe Mu (Dubois et al., 1970) published *Rhétorique générale* (General rhetoric). This fascinating book analyses figures of speech from a linguistic point of view, following the general approach of structuralism applied to semantics. Although conducted in Liège, Belgium, this research mentions Perelman only in a footnote. It looks like proof of the divergence between the two areas of research. To a certain extent, the structuralist programme of rhetoric could be designated a 'Rhetoric within language' approach, to borrow the title of Ducrot's AwL programme.

However, none of these works stimulated any research that would bring about a practical revival of rhetorical argumentation, neither in education, nor as a social, discourse-theoretic discipline.

We now need to consider the reception of Perelman's book in France. It seems that Perelman and Olbrechts-Tyteca's *Treatise* was not practised in the 1960s and 1970s, if it was read at all; his book was therefore not very influential at that time. This claim must be qualified on two counts. First, Perelman's work has always been well known in the specialist circle of philosophers of law. Second, the new rhetoric appears to be a central theme of reflection for the Neuchâtel school, formed by Jean-Blaise Grize (1982, 1990, 1996), as shown by the topics of the very first issues of the journal *Travaux du centre de recherches sémiologiques* (CdRS) during the early 1970s: for example, Vignaux (1969–70), Borel (1969–70; Borel et al., 1983) and Grize (1971: see Appendix).

Nonetheless, the general trend seems clear. In Belgium, rhetorical argumentation was flourishing around Perelman's circle, natural logic was developing in Switzerland: however, in France at that time, it seems that nothing significant was happening in the field of rhetorical analysis applied to discourse – development of a new rhetoric. Perelman was not a 'cultural leader' (especially since his work had absolutely no influence on education). To account for this fact we must consider the prevailing intellectual atmosphere of the period. Roughly speaking, the leaders of intellectual life were such brilliant personalities as Louis Althusser, Gilles Deleuze, Michel Foucault, Jacques Lacan and Michel Pêcheux. The general intellectual atmosphere and the prevailing ideological orientation favoured views of discourse and speech in radical opposition to the general programme of argumentation studies. The main areas of conflict were as follows:

- The new rhetoric could be criticized for its insufficient theorizing. From a structuralist point of view, the arguments proposed by the new rhetoric were incohesive. Nonetheless, the restriction of argumentation to discourse was quite in tune with the then predominant structuralist method

or ideology, advocating a strictly literal approach to the text, ignoring any pragmatic considerations.

- According to rhetorical argumentation, speakers plan and structure their discourse around certain 'conscious' goals. During the 1960s and 1970s, criticism was levelled against the concept of 'author' or 'intentionality' in favour of socio-psychological determinations of discourse. This can be seen in the discourse analysis programme advocated by Pêcheux whereby discourse analysis aims to bring discourse back to its 'conditions of production'. This would seem to imply that discourse cannot be 'accounted for' by its internal structure and avowed meaning and function, but only by the external, material conditions in which it was produced – that is, the social conditions of its occurrence and the social standing of its source (the speaker) from a Marxist point of view, as well as the psychoanalytic constraints on his or her speech. For such an investigative programme, rhetorical argumentation could only be denounced as a form of illusion, an illusory attempt made by the subject to control his or her discourse.
- Finally, opposition was evident on socio-political grounds. These fields of study base their research on contestation and the radicalization of conflict, which is in marked contrast to the policy of negotiation and rational mediation generally associated with argumentation studies.

This is the situation that prevailed more or less until the end of the 1980s. Subsequently, a new period began with the return of Perelman's *New Rhetoric* (1976[1958]), which is now quite widely read, along with Ducrot and Grize. But traces of this century-long distrust of argumentation can be easily found – for example, the fact that major works in English, such as Hamblin's (1970) *Fallacies* are still generally unknown.

3. The Turning Point of the 1970s: Argumentation Reinstated

In the 1970s, the works of Ducrot and Grize were influential in the re-introduction of the concept of argumentation into the field of human sciences and discourse analysis. Both have contributed to the re-definition of the usual meaning of the term.

Natural Logic

Since the 1970s, Jean-Blaise Grize, Denis Apothéloz, Marie-Jeanne Borel and Denis Miéville have developed the concept of 'natural logic' at the Centre de Recherches Sémiologiques at Neuchâtel University; particular attention was always paid to the linguistic, psychological and sociological implications. As mentioned earlier, the works of Perelman and Ducrot were well-known and regularly discussed at Neuchâtel; in contrast, the Neuchâtel Centre's work was not acknowledged by Perelman and Ducrot. The Neuchâtel Centre's research is regularly written up in books and in the Centre's journal, *Travaux du centre de*

Recherches Sémiologiques de Neuchâtel, which is probably the only journal in French to be published over the last 30 years, focusing on argumentation from a logico-epistemic perspective. It is beyond the scope of this article to discuss the natural logic programme in detail (see Van Eemeren et al., 1996) but attention is now drawn to some significant points.

The 'natural logic' programme can be seen as part of the general trend developed in the 1970s in which formal logic was criticized as unsubstantial. The term 'natural' applies to a logic of dialogue and a logic of objects. It is a logic of dialogue only in a restricted sense of the word: the dialogue usually consists of a speaker or writer addressing an utterance (or text) to a listener (or reader). This is very similar to the classical rhetorical situation, where orators try to modify or change their audience's opinions without the benefit of any positive feedback. This contrasts sharply with the 'formal dialectic' programme.

The concept of 'logic of objects' is at the very core of the natural logic programme. The theory deals with 'objects of thought', 'images' or 'representations'. The aim of natural logic is to investigate the thought processes at work in the production or reception of a text. The text is considered important only in that it provides clues to the reconstruction of the underlying thought process; the theory is not a linguistic, but rather a cognitive, theory of argumentation. Though processes mirror linguistic processes (a full understanding of these processes would require a good knowledge of Culioli's theory of language). At first sight these processes can be grouped together as: (i) 'mental operations': formation concept of an object and of a predicate – these concepts are taken from the domain of 'pre-notions'; and (ii) judging, that is predicating and asserting. The result of these processes is a representation or schematization, expressed by an utterance. Grize's basic position is that all these processes have an argumentative value. If we consider only the linguistic counterparts of these processes, this theory might be called an AwL theory that differs from that of Ducrot. The argumentative value of an utterance comes from its global structure, resulting from a coherent series of operations (or choices). This representation is dialogical in that it contains not only a representation of a state of affairs but also an image of the listener, audience and the situation, combined with the self-representation of the speaker.

Schematization (the representation of subject, predicate, speech act and thematic elements) shows the content under a certain light (*éclairage*), or point of view; in other words, it adds to the semantic content by providing listeners with an orientation towards a certain conclusion, or insight. Following this approach, arguing involves 'schematizing', building up a schematization and presenting it to the audience or listeners, who have the option of accepting or rejecting it. The argumentative strength of a schematization comes from the fact that it mirrors reality. The general task of argumentation studies is to study the hidden mechanisms (or mental operations) behind the superficially acceptable appearance of a schematization. Arguing is a hidden process. The best argument is silence. Grize states: if you can't provide the facts, build the most acceptable schematization you can. The resulting conception leads to a better consideration of the self-denying, non-Popperian, character of everyday argument.

It should be pointed out that no mention has been made so far of the classical argumentative relationship between argument and conclusion. An image of 'scaffolding' (*étayage*) most aptly represents this relationship: the argument 'props up' or 'backs up' the conclusion. A specific argumentative text expresses what Grize calls a 'reasoned organization'. Its argumentative value is the combined result of the schematization and propping-up procedures.

The way an object is introduced into a discourse, its subsequent transformations, the way it is connected with other objects or beings, etc., plays a central role in the dynamics of schematization. This is a very important technical point, very easily transferred to the study of argumentation in dialogue or interactions. The centrality of categorizing or classifying procedures in the arguing process is certainly one of the many stimulating ideas one can find in Grize's natural logic.

The 'Argumentation within Language' [Argumentation dans la Langue] Theory

Oswald Ducrot introduced the concept of argumentation in a 1973 paper entitled 'Les échelles argumentatives'. His programme is generally known as 'the theory of argumentation within language', following the title of a 1983 book co-authored with Jean-Claude Anscombre, *L'argumentation dans la langue* (see Van Eemeren et al., 1996). The focus in this section is on one theoretical point: Ducrot's theory of argumentation is a theory of meaning.

Argumentation is introduced as a very specific technical concept functioning in the field of linguistic semantics. The specificity of this use of the concept of argument is frequently acknowledged by Jean-Claude Anscombre, who speaks of *l'argumentation dans notre sens* (our concept of argument). Of course, this remark does not imply any criticism of the concept, but it does imply that its relation with the classical concept of argument is problematic, and that its application to the classical field of argumentation studies cannot be taken for granted. The best-known results of the theory (the analysis of connectives, operators, of polyphony – not to mention a new concept of topos) which are now taken as basic instruments of general discourse analysis, are only manifestations of a deeper insight into the nature of linguistic meaning. Let us consider Ducrot's favourite example, the utterance 'the weather is fine' (P1). What is the meaning of P1? According to Ducrot, it should not be conceived as a description of a certain state of affairs. To understand the meaning of P1 is to understand what the speaker is aiming at when he or she utters it; for example, an invitation to go to the beach. Uttering a sentence is pointing to something else, a possible continuation 'beyond the sentence', a second utterance 'let's go to the beach' (P2). However, this concept of meaning is certainly not free from paradox. It is certainly a significant insight, and an excellent tool for analysing argumentation in speech and discourse (*parole*). A metaphor can help. A proverb – Chinese of course – says that when the wise man points to the stars, the fool looks at the finger. Here the finger is P1; the star – out of reach – is P2, and the fool is the one who tries to find 'in' P1 the meaning of P1; P1 has no other meaning than pointing to P2.

The same thesis on meaning can be found in other fields, in history for example. An historian would say that the meaning of an historical fact cannot be understood either when or where it occurs. An event has no meaning as such: its historical significance can only be understood in relation to subsequent events – to its consequences rather than its causes. An analogy can also be found in ethics, where it is acknowledged that to confer value on an act, one must consider its consequences. In other words, the value of the means is the value of the end; or, the meaning of an utterance is linked to its set of consequences. To a certain extent, the AwL theory of meaning can be seen as a kind of systematic *ad consequentiam* theory of meaning. Interpreted in an Aristotelian framework, this theory states that the meaning of a sentence is the final outcome of the sentence, i.e. its desired conclusion. Last, but not least, this coheres with the well-known fact that conclusions often come first and arguments are sought afterwards. By definition, for a lawyer, his or her client must be proved not guilty (P2, conclusion). How can he or she prove it? By finding something to say, i.e. an argument P1. Later the lawyer utters P1 with the meaning P2; that is, it (the sentence, spoken by the lawyer) will aim at the conclusion P2 'My client is innocent'. In other words, when the lawyer says 'P1!', if his or her opponent reacts by saying: 'What does that mean? That she is innocent?', this opponent is using a concept of meaning that perfectly demonstrates Ducrot's theory. This is because, according to Ducrot's theory, there is an equivalence between 'P1 is an argument for P2' and 'P2 is the meaning of P1'. This equivalence can be suggested as follows:

P1 is an argument for P2

P1 is a good reason to do, believe, admire, etc. P2

P1, therefore P2

P2 is a consequence of P1

in or by saying P1, the speaker wants to prove P2

the speaker says P1, because his or her goal is to prove, suggest, etc. P2

when the speaker says P1, he or she means P2

P2 is the meaning of P1

Ducrot's concept of meaning is a theory of meaning 'in language' [*en langue*], not a theory of meaning in context. P2 is seen as a conclusion aimed at by P1 (i.e. the meaning of P1) according to strictly linguistic criteria; in other words, the grammatical acceptability of the discourse P1 + P2.[3]

Some consequences of this theory must be considered. First, in the expression *argumentation dans la langue*, the word *langue* must be taken in its strict Saussurian sense, as opposed to *parole*, 'speech or discourse'. An explicit translation would be something like 'argumentation depends on linguistic competence'. This statement should sound surprising. However, the fact that this concept of argument was accepted without discussion can be considered as a symptom of the total absence of any classical or Perelmanian concept of argument in the intellectual field at that time. All classical theories see argumentation as a discursive

phenomenon, and the capacity to argue as definitely not a characteristic of linguistic competence, but a specific discursive (interactional) competence, that can be improved by teaching and practice. Language as such cannot be argumentative any more than it is always clear; it is the discourse and speakers who make it so.

Other disturbing – or exciting – consequences must be faced as well. The verb corresponding to *argumentation* in the AwL theory is certainly *arguing that* . . . *To argue that P* is combining a set of utterances and deriving a conclusion from a set of premises. If *arguing that P* is the equivalent of practising linguistic competence, that means that as soon as you speak, you argue. If we accept this conclusion, how can we explain the numerous speech acts we are used to studying? All speech act theory would have to be revised. Another consequence must be emphasized: if argumentation is 'within language', it cannot be good or bad; argumentative discourse can only be grammatically correct or incorrect. Again, I'm not suggesting that these consequences cannot be defended, only that they cannot be accepted without discussion.

The AwL theory is only concerned with the linguistic aspects of sentence connection. It approaches and explains our discourse on the basis of linguistic competence, as demonstrated by the practice of integrating pragmatics within language [*pragmatique intégrée*]. There is no autonomy of discourse in Ducrot's approach, discursive phenomena are explained in terms of an underlying linguistic competence. Consequently, the most puzzling aspect of the AwL theory might be that it has been immediately considered a major contribution to discourse analysis, along with theories of narration or description (whereas they are not compatible). It seems that the old discursive magic of the word 'argumentation' remains alive and well in the new linguistic re-definition of the word.

Grize and Ducrot's approaches to argumentation are central to the understanding of what is going on in today's research in France. Although very different at first sight, they share a number of theses. Both are generalized theories of argument: there is no sentence without a certain '*éclairage*' (Grize) and no sentence without an orientation (Ducrot). As a consequence, neither theory includes a 'critical component'. There is not much that you can do to oppose a schematization or an orientation. That's why the idea of a 'criticism of argument', of a fallacy theory, sounds very strange in this context; and the recent Perelmanian vogue will certainly not change the situation very much.

4. An Overview of Argumentation Research and Applications

Arguing is a rhetorical activity. However, in France at present, the concept of rhetoric is undergoing a post-modern drift of its own. In contrast, under the leadership of Marc Fumaroli, the development of the history of rhetoric (particularly in the fields of education and literature) is quite remarkable (Fumaroli, 1990). In my opinion, the possibility of a revival of a practical rhetoric – a rhetoric that embraces its historical evolution as well as the new machinery of modern communication – is quite limited (Reboul, 1991). The main reason for

this is that the new disciplines of communication, interaction studies and discourse analysis have definitely taken over the analytical and practical functions of rhetoric in these fields.

At the moment, broadly speaking, the most diverse academic fields are taking a strong (and relatively sudden) interest in argumentation, so that it is now more or less considered as a discourse analytic discipline. Therefore, one could argue that argumentation studies in France are in a desperate state of fragmentation; or that they are omnipresent, acting as a powerful 'fertilizer' for human and social sciences, even extending to hard sciences. From a philosophical point of view, the popularity of the concept could be commented on in several ways - for example, as the result of a fresh appraisal of the necessity for arbitration between people with incompatible values in specific cases (this should not sound new to Perelmanian ears). Political theorists have now become more conscious of the basically uncertain and controversial character of socio-political decisions, and tend to judge the legitimacy of a decision not by its conformity to a pre-existing law or rule, but according to the unique criteria that it must be the outcome of debate. In general, social cohesion is not grounded in a social contract or in mutual sympathy, but in the quality of debate promoted by the group. Of course, this does not preclude but, on the contrary, stimulates the socio-political manipulations of debate, particularly in the media.

There are no journals or book series exclusively dedicated to argumentation studies. Articles on argument are only to be found scattered randomly in academic journals or confined to special issues.[4]

Argumentation studies do not constitute a unified discipline; yet, considering the fact that arguing is basically a form of contextualized speech behaviour, could find a basic and comfortable home in the field of discourse analysis. R research is developing throughout the human and social sciences: law (Mc 1995); sociology (Boudon, 1991; Bouvier, 1994, 1999; Passeron, 1991); po science; psychology; linguistics (see section 3: in the field of discourse an Doury, 1996; Eggs, 1994; Plantin, 1990, 1996, 1998; Plantin et al., philosophy (Cossutta, 1996; Meyer, 1986; Meyer and Lempereur, 1990); literature (Amossy, 1991; Declerq, 1992); communication (Breton, 1996); cogni n and linguistics (see section 3: Baker, 1996, 1999; Vignaux, 1976, 1981, 1 , firs and second language acquisition, etc. The most common theoretical fra work are interactionism, cognitivism and linguistics, or discourse analysis. F earc extends via cognition studies and didactic disciplines to hard sciences ysics mathematics, etc.), where arguing merges with explaining, demonstra g and reasoning. Each discipline maintains a line of research in relation to ar ment ation studies, deeply influenced by the problematic and research sty of the field. For instance, philosophical problems concerning the ethics of com unica tion are developed in communication studies. The question of fallacy hich not considered a legitimate component of a linguistic approach, cou play role in the analysis of the reasoning process; in fact, the most exciting per pective are developing in more holistic directions.

In education, pioneering work on argumentation was carried out in profe sional education, in practical courses devoted to 'Expression and communica

techniques' [*Techniques d'expression et de communication*]. In general education, a kind of 'argumentative turn' was taken in 1996, when a practical exercise on argumentation was introduced as part of the *baccalauréat*.[5] Typically enough, this exercise is part of the test in French language and literature. Recent proposals (2000) have been made to introduce an explicit argumentative line into the *baccalauréat*'s philosophy syllabus. Given the symbolic and practical importance of the *baccalauréat* in the French education system, this could be considered as a kind of consecration for argumentation studies as a discourse-analytic discipline; however, all these academic exercises are based mainly on very classical literary materials, leaving no room for actual debates in interaction. All these innovations are hotly discussed. Publications in this field are flourishing (see the Pratiques articles listed in the Appendix).[6]

Weaknesses must also be acknowledged. Argumentation studies (historical approaches included) in France are 'ethnocentric', that is, entirely centred on Greco–Latin approaches. There is no living theoretical dialogue with our neighbouring Mediterranean traditions, i.e. Arabic and Jewish practices and thought on debate, rhetoric and argument.

The link to research in English is erratic; the general trend is completely at odds with one of its most influential paradigms – logic-oriented research on fallacy. There are exceptions, however, such as pragma-dialectic and, generally speaking, argumentation as a special kind of formal dialog.[7] The question of different types of arguments, often considered as basic, is never discussed as such in French research. There are not many contributions on, for example, *ad hominem* or *ad misericordiam* or *ad populum*. When these categories are mentioned (mainly in PhD dissertations), they are loosely used as labels, as convenient tools in the task at hand. On the other hand, the concepts of topos, doxa and stereotypes are often considered as basic. These two observations are of course related.

Research on connectives, originating in Ducrot's work as a consequence of his basic views on the semantics of discourse, is well developed. At one time, it was unduly popularized as the very core of argumentation processes or techniques, particularly in education. However, a well-documented and illustrated lexicon of connectives in French is still lacking.

Some essays, papers and dissertations in argumentation are developing in separate and specific paradigms, for example as 'theory-driven' contributions to the 'argumentation in language' theory. But, on the whole, research is 'data driven', i.e. based on large corpora in a variety of settings, the objective being to give the most accurate description of the data. This kind of research is generally eclectic in its resources. Depending on the level of description, it utilizes methods and concepts originating in different theoretical frameworks, argumentation in language, natural logic, neo-classical rhetoric, pragma-dialectic – and, occasionally, a faint hint of rhetoric. Though highly polysemic, the concept of argumentation is thus frequently considered as a global convenient 'resource concept' to be used liberally as a one-off application when analysing a discourse. But Ducrot's argumentation is not that of Grize, which is not that of Perelman, which is not – to mention just one – that of Woods and Walton (1992). The present situation could be characterized by a flight from theory, which is certainly not the best

way to react to alleged theoretical excesses of other ages. Constructive argument between the main trends in argumentation research are still needed.

The central weakness comes from the fact that the new interest taken in argumentation and the unquestionable development of research has not brought about a parallel development of education in argumentation theories and practices at the higher education level. Here lies certainly the most serious lacuna. At high-school level, teachers are supposed to teach argumentation competence; however, it appears that they have to rely mainly on self-training with some basic books and one-day crash courses. At university level, the situation is the same. The theory of argumentation, analysing argumentative discourse and interactions needs expertise. The contradiction is that nowadays, in France, there is no systematic academic teaching on these points. What is at stake here is certainly the future of argumentation studies. If nothing is done, if only to give a basic foundation to one concept of argument, or at least to articulate the current concepts, the word 'argumentation' could become just an interdisciplinary password, a kind of joker one can allude to at will in any scientific discipline or situation for an opportunistic remark.

5. Outline of a Discourse Analytic Framework for Argumentation Studies

This section outlines a programme encompassing argumentation studies within the field of discourse analysis. Ethnical considerations as to what could be typically French or un-French in this approach are not discussed.

Definition: Argumentation as Discursive Confrontation

The following discourse-analytic programme in argumentation diverges from the semantic or cognitive programmes inasmuch as it does not consider argumentation as a simple logico-semantic or cognitive capacity. Arguing is considered as a discursive activity, anthropologically grounded in a specific discursive situation.

The typical object of argumentation studies is as a specific form of discourse in interaction, characterized by conflicting points of views. This is compatible with the classical view that argumentation studies should emerge as a confrontation of assertions in classical judicial settings (rhetoric) or in a philosophic-scientific perspective (dialectic), as well as in contemporary views of argument in pragma-dialectics (Van Eemeren and Grootendorst, 1996). As Schiffrin (1994) states: 'argumentation seems to be a mode of discourse which is neither purely monologic nor dialogic . . . [a] discourse through which speakers support disputable positions' (pp. 17–18).

Discourse analysis is generally characterized by the nature of its data (naturally occurring sets of utterances) and its method (a functional approach based on a set of speech acts) (Schiffrin, 1994) in contrast to a structural paradigm, characteristic of classical grammar and operating with constructed data, drawn

from the analyst's competence, considered as typical of the general (or 'ideal') speaker–hearer.

It could be argued that, as far as theory is concerned – even functional theory – structural aspects come into play. In other words, one undisputable view is that there are linguistic constraints on the link between argument and conclusion. A second view is that no connector in French can be considered as having only an argumentative function, even *parce que* (because) or *donc* (so, therefore). The functional concept 'being an argument for such-and-such conclusion' can be ascertained only on a contextual basis; that is, the fact that the truth of a sentence or the approval of a line of action is uncertain or disputed.

According to the classical approaches of argumentation, argumentation consists of a recognizable pattern of (oral or written) utterances, each of which is functionally linked to the whole set. Consider, for example, the famous Toulmin example about Harry being a British subject since he was born in Bermuda. The utterance: 'Harry is a British subject, he was born in Bermuda' could either be an informative discourse about who Harry is, or a statement settling an argument: 'Harry was born in Bermuda, he's a British subject'. The reading of this discourse as an argument is contextually bound, the crucial contextual feature being that the current discourse is about the possible nationality of Harry. The introduction of the connective, 'so' excludes the informative reading; the introduction of the modal 'probably' does not necessarily imply an argumentative interpretation. The intonation pattern could also play a role in this choice. Thus, strictly linguistic–structural phenomena as well as contextual clues play a role in determining the argumentative interpretation of a string of utterances.

Argumentation cannot be defined as a genre of discourse: disputes can be staged in a play as well as in a novel or in a poem; they occur in highly institutionalized situations (in court, in houses of parliament), as well as in spontaneous everyday situations (family arguments), as vile propaganda as well as in the most noble educational or scientific activities.

From this point of view, argumentative discourse is very similar to narrative or descriptive discourse and the temptation here is to define a set of basic devices (argumentation, narration, description, etc.) which could be considered as the basic components of discourse which, when combined, could account for any form of discourse. But it is well established that narration and description can be argumentatively oriented (this could be built into a reason for considering argumentativity as a basic feature of discourse). It could be maintained that the 'fairiest' of fairy tales 'argues' for some conclusion about the world. Here the 'counterdiscourse' pragmatic criteria come into play: the fact that this story does not confront an adverse story is considered a good reason to speak of 'pure' narration or description.

Data: Texts and Interactions

Classical approaches to argumentation examined restricted types of discourses: syllogistic (or quasi-syllogistic) discourse for the logically oriented theories of

fallacy, short paragraphs for the new rhetoric and two-sentence discourses in the AwL theory. Only monological discourses are considered, and used mainly as examples. Natural texts are considered expansions (sometimes by increased length) of such core arguments.

As a discourse-analytic discipline, argumentation analysis must confront the problem of corpora at the outset. Although the basic data of argumentation studies are defined on the basis of discursive confrontation, they are not limited to data emanating from face-to-face interactions. Argumentative activity is best characterized by a perpetual to-and-fro between expression (*énonciation*) and interaction, a 'self'-centred moment, an 'other'-centred moment. Positions can be confronted through both written and oral discourse, occurring in a large variety of (institutional or private) settings. This heterogeneity must be taken into account in the constitution of corpora for argumentation analysis. From this point of view, theory must deal not only with constructed examples used for the sake of theory-building or illustration but also face complex data, coming from a variety of social or intellectual fields for interdisciplinary case analysis.

Two different kinds of corpora can be considered as eligible for the study of argumentation. First, the analysis of specific, face-to-face argumentative encounters in dialogue or polylogues, as in negotiation sessions, for example. At this point, argumentation studies has to add a socio-psychological dimension in group studies, and to take conflict studies into consideration. As noted at the beginning of this article, the American English lexical data point to an interesting theoretical question on the relationship between the study of the *arguing that* and *arguing with* process, that is, the relationship between argumentation studies and interpersonal conflict studies. To check how far these two fields are interconnected, we might take a look at *Conflict Talk*, a collection of essays edited by Allen D. Grimshaw (1990a), subtitled *Sociolinguistic Investigations on Arguments in Conversation*. In his substantial presentation and conclusion, Grimshaw never refers to 'argumentation studies', and never uses the word *argumentation* (1990b, 1990c). Two papers use the word *argument* to refer to their object, Goodwin and Goodwin (1990) 'Interstitial Argument' and Schiffrin (1990) 'The Management of a Cooperative Self during Argument: The Role of Opinions and Stories'. If I have checked correctly, they never use the word *argumentation*. The conclusion seems to be that the study of *arguing with* develops independently from the study of *arguing that*: no explicit relations are posited between these fields.

Second, argumentation analysis has, as a specific task, to build up discipline-specific corpora. Such corpora are constituted by the large set of interventions around a (more or less specific) argumentative question, not obligatorily of the loftiest order. Such an everyday problem could be, for example 'Should we build a new school or just repair the existing one?'. This kind of corpus is characterized by its heterogeneity. It will gather oral (prepared or spontaneous) interventions and written interventions; oral interventions will allude to written ones and written interventions will be grounded in oral ones. A variety of settings will come into play: private discussions at home, more formal ones in semi-institutional settings (parents' associations), leaflets, official public encounters at the town hall, not to mention the inevitable meetings of professionals. If things go wrong,

articles will appear in local newspapers, followed by letters to the editor, television reports, the courts might get involved, etc.

Tools and Concepts

Argumentation studies should not be too concerned about achieving autonomy or being a 'fundamental' discipline, either from a linguistic or a logical point of view. When analysing face-to-face argumentative interactions, argumentation analysis normally uses the basic tools of grammar and linguistics, interaction theory, discourse analysis, plus a set of specific concepts. From this perspective, analysing argumentation needs more than a simple set of elementary notions, not just the logical theory of the syllogism, nor the usual rules for adjusting discourse to one's partner, or for building up a coherent discourse.

In argumentative situations, concepts of interaction theory undergo a transformation. For example, preference for agreement turns into a preference for disagreement (that is, the answer of one's opponent is not expected to be in agreement with the first turn); politeness rules are modified. The tenant is not impolite when he or she appeals to his or her landlord: 'You have no right to raise my rent to such an extent!'; it's quite normal for the landlord to praise his or her apartment in order to justify the increase in the rent, although in friendly encounters, politeness principles prohibit trespassing on the other's territory or praising one's own property.

Subject and meaning: two controversial notions Classical discourse analysis[8] was characterized by the systematic and coherent denial of a set of notions (traditionally considered as simple and self-evident, which is certainly far from true), among which are the following propositions from Maldidier (1990):

> *Le sujet individuel et collectif. la communication intersubjective* (p. 50)
>
> The individual and collective subject, intersubjective communication
>
> *Les mots communiquent un sens, il y a des personnes et il y a des choses, du subjectif et de l'objectif. de l'émotionnel (rhétorique) et du cognitif (logique).* (p. 37)
>
> Words communicate a meaning, there are people and things, subjective and objective, emotions (rhetoric) and cognition (logic).

Meaning, subject, interdiscourse (*interdiscours*): three conceptual puzzles play a major role in classical discourse analysis, the positive emphasis put on the role of interdiscourse, a strong criticism of a set of notions around the concept of subject, and the will to build up a new concept of discursive meaning.

As far as argumentation studies are concerned, the most sophisticated concept of meaning developed in relation to argumentation theories is certainly Ducrot's concept of discursive meaning mentioned earlier. On the burning question of the subject, a certain vision of the rhetorical subject (maybe a classroom vision) seems to be the target of Foucault's (1969) criticism in the following passage:

> Discourse is not the majestically unfolding manifestation of a thinking, knowing, speaking subject, but, on the contrary, a totality, in which the dispersion of the subject

> and his discontinuity with himself may be determined . . . it is neither by recourse to a transcendental subject nor by recourse to a psychological subjectivity that the regulation of its enunciation should be defined, (p. 74. quoted in Williams, 1999: 84)

This dispersion and discontinuity can be interpreted (some would say distorted and defaced) in terms of the interplay of several sets of roles. First, *linguistic roles* (Austin's phonetic, phatic and rhetic acts); second, the *pragmatic–interactional roles*, including the dispersion and discontinuities on the part of the audience, as well as *generic roles*; third, *social roles* come into play, as well as *institutional roles* defining a specific encounter in a specific setting. Argumentative interaction, seen as a three-way interaction – a particular kind of trilogue, adds three specific roles to the interactional set: proponent, opponent and third party. In a specific interaction, these three roles can be enacted by specific persons or groups; they can also be enacted by the same person, at different stages of a monologue. Three discursive positions are correlated with these three roles: the proponent engages in a discourse of proposition; the opponent, in a counterdiscourse, or discourse of opposition; the third party takes responsibility for the topic of the argument. The argumentative roles relate to the *narrateur/narrataire* (narrator/listener) roles in narration, or the expert/non-expert roles in explanation. All work towards defining the foundation of the argument.[10]

The concept of interdiscourse which relates to a rather structuralist view of discourse meaning, could also be seen as a major discourse-analytic contribution. Incorporating a specific discourse into interdiscourse has a special significance for argumentation studies in large corpora, gathered around a specific argument. It can show how a certain class of argumentative forms have been used for many centuries. For example, during the 1997 debate on immigration and French nationality, the following argument was expounded:

> *On n'est pas Français parce qu'on est né à Roissy* [Paris airport]
>
> Just because you are born in Roissy does not mean to say you are French

This argument echoes an earlier argument set out in the drafts of the Napoleonic Civil Code during the 1800s:

> *Un enfant naît en France de parents étrangers: ceux-ci venaient d'arriver. Peu de jours après ils retournent dans leur pays: leur enfant les suit. Lui-même n'y reparaîtra peut-être de sa vie. On demande à quel titre un tel individu peut être Français.* (Weil, 1997: 15)
>
> A child was born in France to foreign parents who had just arrived. A few days later they went back to their country. Their child followed them, maybe he will never reappear in France for the rest of his or her life. How can he or she claim to be French?

Establishing such long-term argumentative stabilities can be argumentation analysis's contribution to the non-linear decoding advocated by general discourse analysis in opposition to the 'obviousness of a series of sentences' [*l'evidence des enchaînements*] (Maldidier, 1990: 16). But the value of linear analysis must not be underrated: the task of coherently attaching a system of labels characteristic of

the different argumentative operations is in no way an easy and trivial one, when dealing with long interactions involving several active participants.

Conclusion

Seen a generation later, the 1960s and 1970s criticism of the concepts of communication, subject and referential meaning curiously echoes the century-old criticism of the rhetorical approach to intersubjective communication with its all-too human array of moral, logical and emotional proof; only the paradigms backing th. criticism have changed. This programme has tried to establish a field of research on the epistemic, political and psychoanalytic components of discourse. These components were considered to be mainly unconscious and out of the speakers' control (individuals do not always fully comprehend what they are saying), but considered accessible to the analyst under certain theoretical conditions (analysis makes the meaning of the discourse clear). This position creates an abyss between ordinary and expert practices. Argumentation analysis shares neither this desperate view of the speakers, nor this esoteric view of the theory. After all, discourse analysis is a discourse that has proved as docile to its general conditions of production as any lay discourse can be, and the changes in these conditions have so far produced some changes in theoretical styles. Maybe all the concepts formerly criticized (and sometimes demonized) can be discovered. reshaped, in contemporary discourse analysis and in argumentation studies. This might be considered to be treason with regard to the original foundations of discourse analysis or, alternatively, the price theory has to pay to be true to its basic programme – the study of speech in context.

Notes

1. Copious examples of this fallacy of 'irrelevant and untimely argumentation' can be found. for example, in Jaugey (1960) or Moigno (1881). A prototypical example can be found in an argument of Chateaubriand (1877):

> Nous touchons à la dernière objection sur l'origine moderne du globe. On dit: "La terre est une vieille dont tout annonce la caducité. Examinez ses fossiles, ses marbres, ses granits, ses laves, et vous y lisez ces années innombrables. . . . Cette difficulté a été cent fois résolue par cette réponse: *Dieu a dûcréer et a sans doute créé le monde avec toutes les marques de vétusté et de complément que nous lui voyons.*
>
> We reach the last objection on the contemporary origin of the earth. One says: 'The Earth is old, everything denotes its obsolescence. Examine its fossils, its marbles. its granite, its lava, and you will read in them these innumerable years . . . This difficulty has been solved a hundred times with this answer: *God must have, and certainly has, created the world with all the marks of decay and additions that we see today.*

2. See Wenzel's bitter comments in Van Eemeren et al. (1987: 103).

3. In French this opposition is expressed in terms of '*sens*' vs '*signification*'; however some authors use '*sens*' for the linguistic meaning and '*signification*' for the meaning in context, and other authors vice versa.
4. The following – non-exhaustive – list gives an idea of the variety of these journals set out as follows: title of special issue, journal references and journal's academic field:

   La rhétorique aujourd'hui, *Mesure* 3 (1990). Paris: José Corti (literature, philosophy, education).

   Rhétorique et sciences du langage, *Verbum* (1993) 1–2–3. Nancy (linguistics).

   Argumentation et rhétorique, *Hermès* (1995) 15, 16. Paris: CNRS editions (cognition, communication, politics).

   Argumentation et sciences sociales, *L'année sociologique* (1994) 44, 45. Paris: PUF (sociology).

   L'argumentation en dialogues, *Langue française*, Garcia-Deban (ed.) (1990) (linguistics).

   Enseigner l'argumentation, *Pratiques* (1997), *Pratiques* 97. Metz (French studies, pedagogy).

5. Twelfth grade exam, taken on leaving high school.
6. As a second important point concerning research in education, it must be mentioned that a new program of the INRP (*Institut National de la Recherche Pédagogique*/National Institute for Pedagogical Research) focuses on argumentation in all high-school disciplines.
7. The ISSA Amsterdam Conference is playing a major role in improving this situation.
8. A distinction should be drawn between the second discourse analysis of the 19[illegible] and the original, or 'classical' perspective, developed by and around Foucault and Pêcheux in the 1970 or discourse analysis *stricto sensu*.
9. In *Forms of Talk*, Goffman (1981) identifies two complex structures: the reception format, *ratified participants* (*addressed* or *unaddressed*) as opposed to *bystanders* (*overhearers* or *eavesdroppers*); and the production format, *animator, author, figure* and *principal* (pp. 154ff., 173ff.). 'In short, the animator produces talk, the author creates talk, the figure is portrayed through talk, and the principal is responsible for talk' (Schiffrin 1990: 241). Ducrot et al. (1980) distinguishes between the complex set '*sujet parlant/locuteur/énonciateur*' on the production side and the 'auditeur/allocutaire/destinataire' set on the reception side (pp. 35–8).
10. It might be interesting to confront this notion in Goffman, and the parallel notion 'position' as defined in Foucault (1969), his chapters on 'La formation des modalités énonciatives' and 'La fonction énonciative'.

Extreme Case Formulations: A Way of Legitimizing Claims

Anita Pomerantz

Introduction

How do we convince others to buy a product, to believe in an idea, or to support a project? When we sell, convince, argue, defend, justify, accuse, complain, etc., we are attempting to have our fellow interactants arrive at certain conclusions. A major resource for doing this are the practices of description. A state of affairs is portrayed as believeable, obvious, compelling, unreasonable, illogical, etc. in the way a description of it is formed.

One practice used in legitimizing claims involves describing with Extreme Case formulations. Some examples of Extreme Case formulations are:

'brand new'
'completely innocent'
'he was driving perfectly'
'he didn't say a word'
'I really don't know who he is'
'no time'
'forever'
'every time'
'everyone'

This paper analyzes how Extreme Case formulations work in complaining, accusing, justifying, and defending. Within these activities, three uses of Extreme Case formulations have been isolated for analysis. They are:

(1) to defend against or to counter challenges to the legitimacy of complaints, accusations, justifications, and defenses;

Source: *Human Studies* vol. 9, no. 2/3, 1986, pp. 219–229.

(2) to propose a phenomenon is 'in the object' or objective rather than a product of the interaction or the circumstances;
(3) to propose that some behavior is not wrong, or is right, by virtue of its status as frequently occurring or commonly done.

Analysis

Instance 1: An Adversarial or Defensive Stance

Excerpt 1-A. The datum in Excerpt A comes from a telephone exchange between Bill and Ann who are strangers to one another. Bill phoned to speak with George, whom he does not know, in connection with an organization to which they both belong. George is not home; his wife, Ann, gets on the phone and tells Bill about George's involvement with another woman.

Ann does not articulate her assessment of George but rather describes incidents so as to have Bill reach the desired assessment. She describes incidents to portray how badly he has been to her.

[JG:1:21]

A: And so when he went away on Mother's Day and ·hh he went away on Saturday evening of (0.3) Mother's Day ·hh he spent the night (.) with her and all day Sunday and came home around about nine o'clock Sunday night ·hhh uh he didn't say u – one word he jus' came in put his pajamas o:n ·hhh a:n:d uh sat on th – couch f'r about five minutes and the'e went in: to 'is bedroom an went to bed . . .

Ann describes this incident in such a way as to have Bill see George's culpability. She describes the circumstances and actions that are constitutive of his 'wrongdoings.' In saying 'And so when he went away on Mother's Day,' Ann provides for the *timing* of George's action to be seen as part of his culpability. In identifying the day as 'Mother's Day,' she is trading on the common knowledge that Mother's Day traditionally is the day for honoring mothers.[1]

Ann next gives a correction of when he went away ('he went away on Saturday evening of (0.3) Mother's Day') that allows her to further detail his wrongdoings. In being more 'accurate', Ann adds that George slept with the other woman on the evening before Mother's Day and then spent all of Mother's Day with her.

'All day Sunday' is a description of the amount of time he spent with the other woman on Mother's Day. It gives the amount of time as a proportion of the unit, 'Mother's Day.' It specifies that the amount of time was all of it, the whole unit, the maximum possible. It is a description of an amount of time given as a proportion of a unit, i.e. the proportion 'all' of the unit 'Mother's Day.'

As well as indicating an amount of time, 'all day Sunday' operates to provide a sense for what that amount of time is for the matter in question. 'Just a day,' 'only a day,' 'all day,' and 'the whole day' are examples of sense-giving' formulations. The sense provided by 'all day Sunday', a Maximum Case formulation,

is that the amount of time is very long, too long, unacceptably long. 'All day Sunday' proposedly was an unreasonable and unacceptable amount of time to spend with the other woman on Mother's Day.[2]

Part of how a complaint is formed is to provide for the recognizability of the offender's wrongdoings. By describing the amount of time that he was with the other woman as the maximum case of Mother's Day, she claims this instance as a full and clear case of the wrongdoing that she described. In specifying 'all day Sunday,' she seems to be orienting to a non-sympathetic audience, an audience who might hear, 'he went away on Mother's Day' as a description of, for example, 'at some point during Mother's Day, he went away for a while.' She is orienting to an audience who might be looking for the illegitimacy of her complaints. She is speaking as someone who cannot assume sympathetic hearings.

An unsympathetic hearing is one in which a hearer reconstructs a circumstance that could be referenced by the description offered but that supports a position contrary to the original one. 'At some point during Mother's Day, he went away for a while' would be a non-sympathetic hearing of 'He went away on Mother's Day.' It describes a circumstance which is not constitutive of wrongdoings and hence would undermine the legitimacy of Ann's complaints against George. By specifying the Extreme Case of how long he was away, she is countering other possible reconstructions of lesser or no wrongdoings having occurred

Excerpt 1-B. Excerpts 1-B and 1-C (and the excerpt in note 2) are taken from a hearing in a Small Claims Court in England. The plaintiff is claiming damages from a firm that dry cleaned her dress. In the opening of the case, the adjudicator reviews the plaintiff's statement.

Adj: And, you state that- the dress (.) was new
Pla: It was brand new.

'Brand new' is an Extreme Case of 'new' – it is as new as can be. From the ensuing testimony, it is quite clear that the plaintiff has had the dress at least a number of months. Furthermore, she is not claiming that it was the first time that she wore it. In the literal sense, then, the dress is not brand new.

In confirming the adjudicator's statement, the plaintiff is not satisfied with the description, 'The dress is new.' She gives, instead, as the appropriate description 'brand new.' In specifying 'brand new,' she treats 'new' as a description that is not good enough to describe the newness of the dress. She seems to be oriented to the possibility of hearing 'new' as referencing possibilities that are different from the one she means to portray.

Interactants use Extreme Case formulations when they anticipate or expect their co-interactants to undermine their claims and when they are in adversarial situations. In being prepared for others to scale down her alleged losses, the plaintiff formulates them as maximum cases.

Excerpt 1-C. In the same case as Excerpt 1-B, the plaintiff later refers to the newness of the dress that has been damaged.

Pla: I mean it's <u>not</u> a question I'm making up stories or I want to come <u>along</u> here [illegible] why should I pay (out) for a brand new dress.

The plaintiff is accounting for why she brought the case to court. After dismissing the possibilities of her fabricating her account and wanting to go to court, she poses the rhetorical question, 'Why should I pay out for a brand new dress.' With it, she portrays as the alternative to going to court, 'paying out for a brand new dress.' She justifies taking the case to court by portraying the alternative to her taking this action as unfair and unacceptable. In describing her loss ('a brand new dress') with an Extreme Case formulation, she claims it as a large loss, unacceptably large. Undeservedly suffering a large loss is *prima facie* unfair and hence unacceptable. As such, remedial action was in order.

The plaintiff is successful in her justification if the precipitating circumstance, as she formulates it ('paying out for a brand new dress,') 'calls for' or 'demands' her taking the case to court. (See Excerpt 2-A for further discussion of justifying).

Instance 2: Attribution of Cause to the Object

Excerpt 2-A. In the following instance, C justifies her decision to sell halves of fruitcakes instead of the whole ones they were given to sell.

C : Anyway I'm u ha – uh what I'm having to do to people I know is cut them up and sell them ·hhhh uh a pound and a half for a dollar sixty five.
M: Oh you're doing that,
C : ·hhhhhh Well I'm doing it to the few people that I know because ever'time I say three twenty five they look at me like ·hh (.) you must be nuts woman,

In giving a reason for selling halves of fruitcakes, C describes a situation that precipitated her action. The precipitating situation was that prospective customers reacted to the price of the fruitcake as excessive. She describes the precipitating situation in terms of a proportional measure of frequency, 'every time.' The Maximum Case proportional measure, 'every time,' is a device that proposes regular, frequent, or patterned occurrences as opposed to odd, idiosyncratic or random occurrences. The import of the status of 'regularly occurring' versus 'odd' cases is that the former kind of case should be taken into consideration whereas the later kind of cases may or ought to be dismissed. 'Every time' is a device for indicating how something should be regarded, namely, as not dismissable.

In describing the customer's reaction as an 'every time' reaction, C builds for a cause to be attributed to other than the personalities or characteristics of the people reacting. By formulating it as an 'everytime' occurrence, the characteristics and personalities of any of the individual actors become unimportant. 'Everytime' proposes that regardless of who the prospective customer was, the reaction to the fruitcake was the same. The prospective customers become a collection of 'anyone in the circumstance.' By describing their reaction as an 'every time' occurrence, C suggests that the every time reaction is attributable to a quality of the object, i.e. the price of the fruitcake.

C does not offer her own assessment of whether the price of the fruitcake is too high. She has, though, lowered the selling cost by selling halves. In reporting

that the customers reacted every time to the price as excessive, C suggests that the price is excessive without asserting it on her own behalf.[3] The warrant or authority that she cites is 'every time'.

C is explaining why she sells halves of fruitcakes. The explanation consists of a portrayal of a precipitating situation, one that provides for her selling halves of fruitcakes to be the reasonable and/or necessary consequence. The precipitating situation that she describes is a problem situation: prospective customers react to the price of the fruitcake as excessive. For her action of selling halves to be recognized as reasonable or necessary, C makes a case for the customers' negative reaction as general and widespread. She makes the case by using a Maximum Case proportional measure, 'every time.' Most directly, with her use of 'every time,' she claims their reaction is general and widespread and, hence, one that cannot be ignored if the selling project is to be successful. Indirectly, she suggests, without committing herself, that the cause of the customers' reacting 'every time' to the price as excessive may lie in the fact that the price is excessive.

Excerpt 2-B. In the following datum, C is talking to his wife about a week at work during which time a co-manager was away.

> C: We got so much done (.) and more than that but everyone had this feeling that we were ·hhhh c-complishing things, you know we all felt real progress going on, ·hhhh it's just (.) so amazing, whenever he's around (.) he's utterly disparaging of our efforts, (.) and (.) and he's c-completely disruptive.

With this description of 'everyone' and 'we all', C is portraying the 'general' reaction to the co-manager's being away. It is a reaction that belongs to no one in particular in that it is formulated as a reaction of 'everyone.' 'Everyone' is a device for attributing the cause of the problem to the object. In using it, C proposes that the problems in the office are a consequence of the co-manager's personality, behavior, etc. Whereas C starts by describing everyone's reaction, he ends this segment describing attributes of the co-manager.

C has a history of difficult interactions with the co-manager. In this segment, C describes a circumstance that would constitute evidence for his maintaining that *he* is not even partially responsible for the troubles that he has with the co-manager. The lay-logic is something like: if others react the same way to the co-manager, then the co-manager is responsible for the difficulties.[4]

Excerpt 2-C. In the following excerpt, S is telling A about a friend of his.

> S: You'd like him. Everybody who meets him likes him.

Making a prediction about what another would or would not like is a way of displaying one's knowledge of the other. With 'You'd like him,' S predicts A's liking of his friend. In making this prediction, C normally would be presumed to know the sort of people that A likes.

With the addition, 'Everyone who meets him likes him,' S provides a clarification or shift in interpretation of 'you'd like him.' In formulating the category of those who like his friend as 'everyone who meets him,' C proposes that the

personality and characteristics of the subjects are irrelevant to the phenomenon. The cause of 'everybody who meets him likes him' is the object. He is a likeable fellow. In order to be heard to be talking about his friend's attributes and not about A, S uses 'everyone' as the subject, thus attributing the liking to his friend. (S then went on to talk about how his friend is just a real likeable person.)

Instance 3: Frequency of Occurrences Speaking for Rightness/Wrongness

Excerpt 3-A. The following is an excerpt of a call to a Suicide Prevention Center.

Desk : Do you have a gun at home?
(0.6)
Caller: A forty fi:ve,
Desk : You do have a forty fi:ve.
Caller: Mm hm, it's loaded.
Desk : What is it doing there,hh Whose is it.
Caller: It's sitting there.
Desk : Is it you:rs?
(1.0)
Caller: It's Da:ve's.
Desk : It's your husband's hu:h?=
Caller: =I know how to shoot it,
(0.4)
Desk : He isn't a police officer:r,
Caller: No:.
Desk : He just ha:s one.
Caller: Mm hm, It – u – Everyone doe:s don't they?
[Taken from Sacks Lecture: Fall 1964 Lecture 3]

The Desk is attempting to get the Caller to account for the gun in her house. After a series of attempts, he offers to the Caller an explanation that gives no explanation. 'He just ha:s one.' The Caller confirms, adding 'Everyone does don't they?'

'Everyone does' is a description of the prevalence of the practice. It formulates the prevalence as a proportion – it is the whole, the complete, or the total set. As such it is an Extreme Case formulation.

In saying 'Everyone does,' the Caller proposes that keeping a gun in the house is a normal and accepted practice rather than a special practice needing explanation.

In reporting the prevalence of a practice as a Maximum Case, a speaker is using prevalence to speak for the rightness of the practice.[5] What 'everyone does' is the way the 'right' way to behave and is not accountable.

A recipient may indeed want to challenge that claim that having a gun at home is normal, right, and unaccountable. One way to challenge its status as a normal and accepted practice is to challenge the Extreme Case formulation as a valid or accurate measure of the prevalence of the practice.

In the continuation of Excerpt 3-A, the Desk challenges the caller's assertion.

Caller: Mm hm, It – u – Everyone doe:s don't they?
(1.7)
Desk : Yah ee– e: – ah::: ih You have a forty fi:ve and it's loaded.
Caller: Mm:mm,
Desk : A:nd uh (0.4) I suppose maybe everyone in:hh evrywuh– in Burnside Park has one I don't know:w,
(0.7)
Caller: Well no: but I mean- (0.2) a lot of people have guns
Desk : Oh su:[re,
Caller: [I mean it's not– (.) [unusual.
Desk : [I s::– I: see.

The Desk challenges the Extreme Case proportional measure by specifying an area limitation and including doubt markers. He grants the possibility of its validity ('I suppose maybe' and 'I don't know') in her particular neighborhood ('in Burnside Park'). In naming a particular area, he has limited the population that 'everyone' would reference to an area about which she is entitled to know. In treating her assertion as 'possible,' he has taken a position of doubt vis-à-vis her certain assertion and turns it back to her for reconsideration.

The Desk has challenged the Caller's 'Everyone does' as a valid description of a population. To do so, he reshapes it as more credible by limiting the population to the caller's neighborhood, and then marking it as a possibility.

The challenge calls the Extreme Case formulation to task as a valid and accurate description of the prevalence of people owning guns. In response, the Caller reformulates the description, describing the practice as prevalent with a non-extreme formulation, 'a lot of people have guns.' She holds onto the status of owning a gun as normal and accepted by adding, 'I mean it's not unusual.' Disclaiming the contrastive status ('not unusual') seems to be a weaker claim for it being an accepted practice than 'everyone does.'

Excerpt 3-B. In the following excerpt, D and T are talking about T's being charged with the offense of accepting bribes.

D : You didn't do anything else– anything wrong o– other than what: everybody else on the police force did at that time. At Christmas time, we accepted =
T : = Oh man! Christmas time, it was like– I remember the days, Christmas time used to be like =
D : = Damn right. Christmas time, everybody accepted money.

In describing accepting money as what 'everyone' did, D proposes that it was a normal practice and hence an acceptable practice. In proposing it was a normal practice, D argues that T should not be charged with the offense.

Excerpt 3-C. A patient went to the doctor's office to get lab results. Upon checking, the receptionist saw that the patient's file was not back yet. The receptionist told the patient to phone the next day for the results.

Patient : That's not a problem?
Receptionist: No. People do it all the time.

The patient's question intends to check out whether phoning for the results would or would not be seen as an irregular or special request. In reporting, 'People do it all the time.' the receptionist proposes that patients' calling the office for lab results is normal and acceptable. The Extreme Case formulation, 'all the time', proposes that the patient's calling for lab results would not be viewed as irregular or a special request but as routine, acceptable patient behavior.

Conclusion

This paper has described three uses of Extreme Case formulations:

1) to assert the strongest case in anticipation of non-sympathetic hearings,
2) to propose the cause of a phenomenon,
3) to speak for the rightness (wrongness) of a practice.

The interactants in the illustrations were engaged in several types of activities, among which were complaining, accusing, justifying, and defending. As concluding remarks, a few comments will be made about why participants use Extreme Case formulations in these activities.

Part of the business of complaining involves portraying a situation as a legitimate complainable. This may take the form of portraying the offense committed and/or the suffering endured in a way such that it would not be dismissed as minor. So as to legitimize a complaint and portray the complainable situation as worthy of the complaint, a speaker may portray the offense and/or the suffering with Extreme Case formulations. In both accusing and defending, participants often present their strongest cases, including specifying Extreme Cases of their claims.

Part of justifying a course of action may involve portraying the precipitating circumstance as necessitating the action. The precipitating circumstance may be a problem circumstance which is portrayed as unfair, immoral, embarrassing, uncomfortable, or in some other way undesirable and/or intolerable. There is a shared assumption that the worse the problem, the more necessary it is to do something about it. In justifying, speakers use Extreme Case formulations to portray the circumstances that precipitated their actions as demanding their actions.

A problem that participants have when engaged in, or reflecting on, conflicts, complaints, criticisms, compliments, praise, etc. is to attribute the cause of the phenomenon. Who or what is responsible for the conflictual, complainable, praiseworthy state of affairs? One method that is used to determine what or who is responsible, i.e. to make an attribution, involves comparing the case in question to other similar cases. Through this procedure, persons determine that they are (are not) responsible for the state of affairs in question. Extreme Case proportional formulations ('everyone,' 'all,' 'every time') are used to indicate that any individual member of that category is not responsible for the state of affairs; that responsibility is to be attributed elsewhere.

The social order essentially is a moral order (Garfinkel, 1967). One of the ways of knowing what is acceptable and right is by finding out how people behave. There often is a shared assumption operating (one that is called into question on occasion): how people behave tells us what is the right way to behave. Proportional measures reporting the frequency or prevalence of practices are used to propose and substantiate the rightness and wrongness of those practices. Extreme Case formulations ('all the time,' 'everybody,' 'no one') propose behaviors are acceptable and right or unacceptable and wrong.

Notes

1. If the day were not part of the offensiveness of the occasion, it might have been referred to with a Relational term, e.g. 'So the next time he went away . . .' Relational identifications are commonly used to provide coherence in narratives. For a discussion of Relational identifications, see Pomerantz (forthcoming).
2. The use of 'all day' to provide the sense of an amount of time as 'unreasonably long' can be seen in the following complaint as well.

   Plaintiff: . . . 'n he said I'll clean it (.) for four o'clock ·hh 'n I walked round all day long if: (.) in an overall which was a three quarter length overall so how do I feel, . . .

   The plaintiff is portraying having suffered a great deal of discomfort. The discomfort includes wearing strange looking overalls at work while her dress was being dry cleaned. In portraying the discomfort, she describes the amount of time with an Extreme Case formulation 'all day long.' It conveys the sense of the amount of time as unreasonably long.
3. For a description of speakers' making limited claims on their own behalf when performing sensitive actions, see Pomerantz (1984).
4. The author's hypothesis is that given a problematic situation, it may take as little as one or two cases similar to one's own case to warrant attributing blame to the other and to formulate the phenomenon as 'he does it to "everyone".'
5. Speakers endorse (or show neutrality regarding) the rightness/wrongness of a proposal by the proportions that they report, e.g. 'all,' 'most,' 'some,' 'none.' In a role play experiment in which students negotiated a grade determination, a student described the plan that he endorsed as what 'most' professors do. When he was maintaining a course of action as a choice but not endorsing it he described it as what 'some professors' do. In stating a position against giving a B grade, he used the Extreme Case 'I don't think any professor would just give a person a B . . .'.

Discursive Social Psychology: From Attitudes to Evaluative Practices

Jonathan Potter

The aim of this chapter is to introduce a discursive approach to social psychology to people who are more familiar with the mainstream experimental social cognition tradition. After making some preliminary remarks about the history, aims and theory of discursive social psychology I will focus on what would traditionally be called the social psychology of attitudes. This topic has the virtue of being at the heart of social psychology for much of the century, and thus provides a familiar startpoint for anyone wishing to understand what is distinctive about the discursive approach, and how radical its respecification of traditional notions will be.

Discursive Social Psychology

Discursive social psychology is the application of ideas from discourse analysis to issues in social psychology. Its publication record goes back over a decade. The first analytic article published in a social psychological journal was in 1985 (Litton & Potter, 1985) and one of the major stimuli for the development of the approach was the book *Discourse and Social Psychology* (Potter & Wetherell, 1987). This parallels the development of a rhetorical approach to social psychology, whose first analytic article was published in 1985 (Billig, 1985) and whose major theoretical introduction, Billig's *Arguing and Thinking*, was also published in 1987 (now Billig, 1996). Since the end of the 1980s these two approaches have blurred together, and there has been a related interest in drawing on ideas from the perspective of conversation analysis (Atkinson & Heritage, 1984; Sacks, 1992) and applying them to social and cognitive psychological issues (Edwards, 1991, 1997;

Source: *European Review of Social Psychology* vol. 9, 1998, pp. 233–266.

Edwards & Potter, 1993; Antaki, 1994). In this chapter, unless I explicitly claim otherwise, I am using the phrase "discursive social psychology" to refer to a set of ideas and developments from discourse analysis, conversation analysis and rhetoric.

Work of this kind has mushroomed in the last few years across a wide range of disciplines and analytic topics. It has been concentrated particularly in the UK, but notable developments have taken place in Australia, Canada, Italy, The Netherlands, New Zealand, Scandinavia and Spain. In this chapter, the focus will be specifically social psychological, and I will ignore developments and debates in sociology and linguistics, as well as the issues which distinguish the form of discourse analysis discussed here from variants which evolved in linguistics (Brown & Yule, 1983), sociolinguistics (Sinclair & Coulthard, 1975), post-structuralism (Foucault, 1971) and cognitive psychology (van Dijk & Kintsch, 1983). Some of the differences between these approaches are summarized briefly in Potter (1996a) and explored in detail in Schiffrin (1994) and van Dijk (1996).

Theoretical and Meta-theoretical Characteristics of Discursive Social Psychology

Although the development of discursive social psychology was facilitated by the "climate of problematization" (Curt, 1994) engendered by the so called "crisis in social psychology" in the 1970s (Parker, 1989), and the intellectual space cleared by the work of Gergen (1973), Harré and Secord (1972) and Shotter (1977), its direct theoretical and analytic antecedents were developments in sociology of scientific knowledge (Gilbert & Mulkay, 1984), ethnomethodology and conversation analysis (Garfinkel, 1967; Sacks, 1992) and a range of notions from post-structuralism and particularly the work of Foucault and Barthes. Discursive social psychology is a broadly constructionist perspective and is commonly, although not always, associated with a relativist meta-theory rather than the realist, positivist metatheory that is still commonplace in experimental social psychology (Edwards, Ashmore, & Potter, 1995; Gergen, 1994).

Discursive social psychology is constructionist in two senses. On the one hand, it takes people to be constructing their worlds through their accounts and descriptions. That is, "reality" enters human practices by way of the categories and descriptions that are parts of those practices. The world is not already categorized by God or nature in a way that must be passively accepted; rather, it is constituted in one way or another as people talk it, write it, argue it and undermine it. On the other hand, discursive social psychology stresses that these descriptions and accounts that people use to constitute their worlds are *themselves* constructed; that is, fabricated in occasions of talk, or in specific texts, from words, metaphors and a range of discursive resources. This twin sense of construction marks out part of the subject matter of discursive social psychology: it researches the *practices* that are sustained by particular constructions of the world (accounts, descriptions); and it researches how those descriptions are built, how they are fitted to their context of use, and the resources they draw on (Potter, 1996b).

Discursive social psychology's constructionism is closely related to its relativist meta-theory. The emphasis on accounts and descriptions being built as parts of human practices has encouraged discourse analysts to consider the practices through which scientific "findings" are produced and the texts in which those findings are represented and warranted. That is, they have emphasized the requirement and virtue of reflexively considering the implications of research for science in general, and for scientific and social scientific texts, including social science texts such as this very one I am writing now (Ashmore, 1989; Mulkay, 1985). Some of the consequences and issues raised by relativist work, and its relation to broader themes in postmodernism, are discussed in Gergen (1991, 1994), Potter (1996b, 1998a) and Shotter (1993a,b). It is important to note, however, that not all researchers combine a discursive approach to social psychology with a relativist meta-theory (Billig, 1991; Gill, 1995; Harré, 1992; Parker, 1992).

For some years social psychologists have looked increasingly to social cognition for explanatory phenomena; the paraphernalia of scripts, schemas, heuristics, attitudes, beliefs, social representations, memory stores, categories, prototypes and so on (Fiske & Taylor, 1991). These become the players in a more general story that casts people as information processors, sifting and computing input and generating a range of outputs. In contrast, the central theoretical thrust of discursive social psychology is *anti*-cognitivist. This does not mean that nothing is assumed to be going on under people's skulls. Rather, discursive social psychology is moving *both* the *analytic* and *explanatory* focus from cognitive processes and entities to discursive practices and the resources they draw on (Edwards, 1997) That is, it studies activity itself – rather than the outcomes of activity or reports of activity, as is more common in mainstream social psychology. For example, rather than taking a measure of "opinion shift" before and after a group discussion, or getting participants to rate the conversation on a series of scales, the discussion *itself* will be studied in the form of a video/audio tape and transcript (McKinlay, 1988).

Discursive social psychologists have overwhelmingly worked with two kinds of materials. For much of the 1980s their primary focus was on open-ended interviews. More recently, they have increasingly worked on records of natural interaction of natural texts: newspaper reports, relationship counselling sessions, police interviews, social workers' talk with clients, transcripts of everyday talk, and so on. However, the contrast between interviews and records of natural interaction is not as great as might appear: for interviews are not being treated as a neutral machinery for harvesting psychologically interesting responses but as arenas of interaction in their own right, where the interviewer and interviewee's contributions are equally important (Potter & Mulkay, 1985; Widdicombe & Wooffitt 1995). The point to emphasize is that discursive social psychology studies interaction done through talk and texts and considers how that interaction is done, what resources it draws on, and how these things relate to broader questions in social psychology.

Relating Theoretical and Methodological Characteristics of Discursive Social Psychology

It is important to emphasize at the outset that discursive social psychology has a strongly empirical locus. It is not attempting to replace empiricism with theory or speculation or politics. Rather, the emphasis is on producing a rigorous analytic programme of mainly qualitative research where theoretical claims are closely related to systematic research studies. Nevertheless, it is hard to overestimate how different the analytic approach is from mainstream social psychology. This difference in method is closely related to distinctive theoretical elements in discursive social psychology. Let me give three examples to illustrate this.

First, discursive social psychology has not adopted the factors and outcomes notions that are closely bound up with traditional social psychological research and its use of experiments and questionnaires. Rather than viewing social life as a consequence of an interplay of factors which have more or less regular patterns and determinate outcomes, discursive social psychology conceptualizes social life as both *normative* and *rhetorical*.

Norms are treated as *orientated to* rather than *governing* action, so that we would expect to find regular deviations, although such deviations may themselves be marked by a range of accounts and sanctions and will therefore be inferentially rich (Heritage, 1984, 1988; Sacks, 1992; Wooffitt, 1990). Take the example of greeting. People have the expectation that a greeting will be returned: "Hello" will be responded to by "oh hi" – this is the *normal* thing to do. However, this does not mean that when a greeting is not returned people start to doubt the norms mative basis of greeting. Instead they are likely to engage in a range of inferences about the person or the context: they are rude, hard of hearing, sulking whatever, which will be displayed in their response to the non-returned greeting.

Rhetoric is treated in discursive social psychology as *orientated to* persuasion. The point of describing it like this is to emphasize that however good the rhetoric there is no guarantee that persuasion takes place. For example, a rhetorical move can have a range of rhetorical counter-moves. In an argument about race, a categorization, say, can be countered by particularization (Billig, 1985); or in a relationship counselling dispute a man criticized for pathological jealousy may turn the negative potential of that description around and argue that his partner is insensitive to his jealousy problem (Edwards, 1995).

The analytic point that flows from this is that it is not sufficient to identify a norm, or some rhetoric, *independently of the practices that they are part of*. This is why discursive social psychologists have focused on practices, whether it is the conversational interaction found in interviews, talk in a range of everyday or institutional settings, or texts such as newspaper articles or literary narratives.

The second point is closely related to the first. The goal of discursive social psychology is not to look beyond the apparent messiness of interaction to discover general patterns and laws lying beyond it; rather, it is focused on the specific *detail* of interaction and how that detail is precisely related to the activities that are being performed. The conversation analyst Sacks (1992) suggested that the of the detail of interaction, whether it be pauses and repairs, the selection

particular words, or the placement of interruption and overlaps, should be assumed to be *irrelevant* to interaction. The negative construction here is quite deliberate. The argument is not that a sniff, say, must always be related to the business of the current interaction rather than being a consequence of having a runny nose; it is that we should not assume that a sniff does *not* have the potential for doing interactional business, such as indirectly displaying disagreement (Roffe, 1997).

Discursive social psychologists, then, work at a level of analysis where much of the concern is with the specifics of what was said, the co-ordination of actions, the design of undercutting accounts and so on. However, this does not mean that their concern is merely with more "micro" features of interaction, at least as that notion has traditionally been understood in social science. For it is often at the level of specific arguments or detailed conversational patterns that "micro" issues of ideology, social structure and social setting become important (e.g. Billig *et al.*, 1988; Boden, 1994; Heath, 1992). Indeed, there has recently been dynamic debate reconceptualizing issues of talk, interaction and social structure (Boden & Zimmerman, 1991; Drew & Heritage, 1992).

The third point of difference from traditional research is that discursive social psychologists place less value on hypothetico-deductivism. The quality of discursive research is not taken to depend on the prior formulation of a specific question or a precisely specified hypothesis. Instead it has often been productive to collect and explore a set of materials without being constrained by a specific hypothesis. Part of the reason for this is that close attention to a video and transcript often reveal phenomena that were both previously unnoticed and unexpected. Starting with the materials rather than prior hypotheses is a way of allowing such phenomena into the analysis.

This is not to endorse naive inductionism, however. Such materials will be analysed against a backdrop of general theoretical concerns as well as specific research themes; a concern with racism say, or the use of descriptions in relationship counselling. Neither is it to reject hypothetico-deductivism in toto. At times, the process of analysing discourse can involve following up and checking hypotheses about the role and nature of particular constructions or forms of interaction.

One way of conceiving the general methodological orientation of discursive social psychology is by analogy with the disciplines of ethology and astronomy. Both are observational rather than experimental sciences. Both are fields where careful and systematic description provides a foundation for broader theoretical claims. And both are fields where the documentation of specific individual phenomena – tactical deception in a primate, perturbations in a planet's orbit – can be crucial for assessing the adequacy of general claims and theoretical systems.

Methodological Procedures in Discursive Social Psychology

There are a range of published accounts of different methodological and analytic aspects of discursive social psychology (Billig, 1987; Coyle, 1995; Gill, 1996; Potter, 1996c, 1997, 1998b; Potter & Wetherell, 1987, 1994, 1995; Wetherell & Potter, 1992; Wooffitt, 1990, 1993; Widdicombe & Wooffitt, 1995). It is important

to remember at this point that discursive social psychology is a new approach with a range of different strands to it. Although the references cited here show broad agreement, there is also methodological writing from a more Foucaultian perspective (Parker, 1992) and a more conversation-analytic perspective (Drew, 1995) which offers rather different methodological precepts.

The aim in this current chapter is not to duplicate this work but to highlight some of the features that are common in discursive social psychology to highlight its differences from work in the more familiar experimental tradition. To simplify discussion I will focus on three elements of the work: (a) research materials; (b) analysis; and (c) validation procedures.

Research Materials

Traditional social psychologists have been reluctant to deal with actual interaction, preferring to model it experimentally or reconstruct it via scales and questionnaires. Part of the reason for this has been the prevalent cognitive assumptions which have directed the research focus away from interaction and on to generative mechanisms within the person. In contrast to this approach, discursive social psychologists have emphasized the primacy of practices themselves, and have therefore focused on conversational interaction in interviews or natural settings, or documents of various kinds.

Where interaction is the focus, it is taped, either on audio or video, and transcribed. As discursive social psychology has developed the need for high quality transcription has become more fully recognized. The best and most widely used system was developed by the conversation analyst Gail Jefferson and uses symbols that convey features of vocal delivery that have been shown to be interactionally important to participants. A summary of the system is reproduced in the Appendix – a fuller description can be found in Ochs, Schegloff and Thompson (1996).

Analysis

There is no single simple recipe for analysing discourse. However, most analysis involves a period of coding which is principally designed to make the task of analysis simpler by sifting relevant materials from a larger body of transcript or documents and copying them into an archive. Such coding is inclusive and cyclical. It is not meant to prejudge analytic conclusions by eliminating potential instances prior to analysis. The process of analysis will often lead the researcher back to the original corpus as a better understanding of relevant phenomena suggests new examples. Preliminary coding of this kind differs from traditional content analysis (Krippendorf, 1980), where coding, and statistical manipulations, constitute the analysis itself.

Discourse analysis is a craft which is developed with varying degrees of skill. One useful way of conceptualizing analysis is as dependent on the development of an analytic mentality which is sensitive to a range of features of discourse. Elements that have been found to be revealing include; variability in and between different texts and stretches of talk; the detail of hesitations, repair, lexical choice

and so on; the rhetorical organization of discourse (how it is constructed to counter alternatives); and its accountability. Most analysis, whatever its overall goal, benefits from a good understanding of features of mundane conversational organization such as turn taking, adjacency pairs, repair, and preference organization (Levinson, 1983; Nofsinger, 1991; Schegloff, 1997).

Validation Procedures

Discourse researchers typically draw on some combination of four considerations to justify the validity of analytic claims. First, they make use of *participants' own understandings* as they are displayed in interaction. One of the features of a conversation is that any turn of talk is orientated to what came before and what comes next, and that orientation typically displays the sense that the participant makes of the prior turn. Thus, at its simplest, when someone provides an answer they thereby display the prior turn as a question, and so on. Close attention to this turn-by-turn display of understanding provides one important check on analytic interpretations (see Heritage, 1988). Some of the same considerations can be drawn on when dealing with single narratives or with texts (Edwards & Potter, 1992a: Wooffitt, 1992).

Second, researchers may find (seemingly) *deviant cases* most useful in assessing the adequacy of a claim. Deviant cases may generate problems for a claimed generalization, and lead the researcher to abandon it; but they may also display in their detailed organization precisely the reason why a standard pattern should take the form that it does (Heritage, 1995). For example, the claim that participants in television and radio news interviews normally avoid treating interviewers as accountable for views expressed in questions can be supported through detailed analysis of deviant cases where considerable trouble is produced by an interviewee treating his/her interviewer as expressing his/her own views (Heritage & Greatbatch, 1991; Potter, 1996b).

Third, a study may be assessed in part by how far it is *coherent* with previous discourse studies. A study that builds coherently on past research is more plausible than one that is more anomalous. For example, work on fact construction builds on the insights about accountability from earlier studies, and its success provides a further confirmation of the validity of those studies (Edwards & Potter, 1993). There is a sense, then, that each new study provides a check on the adequacy of previous studies that are drawn on. Those studies which capture something about interaction can be built on, those that do not are likely to become ignored.

Fourth, and most important, are *readers' evaluations*. One of the distinctive features of discourse research is its presentation of rich and extended materials in a way that allows the reader to make his/her own judgements about interpretations that are placed alongside of them. This form of validation contrasts with much traditional experimental and content-analytic work where it is rare for "raw" data to be included or more than one or two illustrative codings to be reproduced.

Whether they appear singly or together in a discourse study, none of these procedures *guarantee* the validity of an analysis. However, work in philosophy and sociology of science over the past 30 years has cast doubt on the possibility

of such bottom-line guarantees in science, whether provided by observation, replication or experimentation (Chalmers, 1992; Collins, 1985; Woolgar, 1988).

Discourse and Attitudes

One of the features of discursive social psychology is that it provides a root and branch respecification of a broad range of social psychological notions (Potter & Wetherell, 1987). By starting with the notion of attitudes it would be easy to give the impression that there are pre-existing objects – attitudes – which are understood in one way, or one set of ways, in mainstream social cognition work, and then understood in another way in discursive social psychology. However, this would understate the degree to which the attitude notion is constituted out of social psychological theory, and the extent to which the notion is dissolved in discursive social psychology into a range of other considerations.

Before going on to describe various strands of research that underpin this dissolution, it is important to note three things. First, compared with the mountain of mainstream work on attitudes, there is only a small amount of discursive work which relates to the topic. Second, as I noted above, the criteria for what counts as good research in this area are rather different from those in mainstream social psychology. Third, there is a strong emphasis on theoretical and conceptual development in this area; the balance between theorizing and researching is tipped rather more in the direction of theory than is common in mainstream work.

My discussion will follow six themes. First, it will provide a general account of the way discursive social psychology would deal with phenomena traditionally collected under the notion of attitudes. Second, it will review work on attitude variability and the problems it raises for standard notions of attitudes. Third, it will describe some research from a conversation-analytic perspective that has considered some of the practices through which evaluations are expressed in everyday settings and in political speeches. Fourth, it will overview some research which shows the way evaluations are bound up with broader systems of discourse or interpretative repertoires. Fifth, it will discuss the relation between making assessments and the construction of factual accounts. Sixth, and finally, it will consider how a number of the notions and variables that have been emphasized in recent and classic attitude research are respecified in discursive social psychology. This will focus in particular on function, consistency, vested interest and emotion.

Discourse and Evaluation

A discursive approach to evaluation will involve a number of key moves. In the first place, it will shift from considering attitudes as underlying mental constructs to focusing on people's practices of evaluation in particular settings. The term "practice" here is crucial; for the stress in discursive social psychology is on what is *done* with evaluations – their practical *use*, explicit or indirect – rather than their potential as an index of individual differences or as a predictor of

later actions. Discursive social psychology treats action as fundamental or, as Schegloff (1995) puts it, omnirelevant. So if you want to understand evaluations you need to consider carefully what people are doing with them in their "home" environments, rather than in the more arcane contexts of filling in attitude scales.

The second move is closely related to the first, and involves considering evaluations as they are constructed and understood by participants, rather than attempting to produce a technical definition which will improve on participants' understandings. Using the anthropological distinction, traditional attitude social psychology is an *etic* approach, where the analytic categories are refined with the aim of giving an increasingly precise and consistent psychologists' account of how attitudes should be understood. In contrast, discursive social psychology is an *emic* approach, where the topic is how evaluation is constituted in varied ways in participants practices. The aim is not to *improve* on participants' practices and understandings but to *explicate* their nature. That is, it is not designed to provide a more precise and unambiguous style of evaluation, but to understand how everyday evaluations with all their contradictions and ambiguities are used.

The third move is to develop an approach which accommodates to a wide range of different practices involving evaluation (some using the familiar language of attitudes and opinions, some not). Rather than assume that there is a single underlying logic, discursive social psychology will treat this heterogeneity as a potentially consequential and constitutive feature of such practices. The significance of this move can be illustrated by considering the manner in which attitudes are measured in recent social psychological research.

One commonplace technique of attitude measurement, particularly in the tradition associated with Fishbein and Azjen (1975; Azjen, 1988) uses semantic differential scales. These vary in number, point size, and content according to the study. Some haphazardly collected examples include; enjoyable–unenjoyable, good–bad, foolish–wise, harmful–beneficial, pleasant–unpleasant (Sparks, Hedderley, & Shepherd. 1992), good-bad, desirable–undesirable, positive–negative, beneficial–harmful (Prislin, 1996). worrying–reassuring, unpleasant–pleasant, punishing–rewarding, unenjoyable–enjoyable, useless–useful (Norman & Smith, 1995) and extremely good–extremely bad, like extremely–dislike extremely (Berger, 1992). Note that, apart from the three occurrences of good–bad. these words are all different. Nevertheless, they are taken to be measuring one thing; the person's underlying attitude to eating biscuits, exercise, legalized abortion, a new chocolate bar or whatever the relevant attitude object was.

From the perspective of discursive social psychology, the issue is not whether people are *able* to perform the task of filling in semantic differential scales related to a particular object; clearly they can make enough sense of it to provide scores for the researcher. Rather it is the theory of language, mind and action underlying this approach. Instead of assuming that there is a single underlying evaluation that can be expressed by scales attached to a number of different words, it suggests that we consider the *specifics* of the words used in these scales and their practical use.

Take, for example, the simplest of attitude measures (used by Berger, 1992) which involves just two scales; extremely good–extremely bad; and like

extremely–dislike extremely. These seem straightforward enough and it is not a surprise that Berger obtains a score of internal consistency (α) of 0.92 for judgements about a new chocolate bar. However, this does not mean that the words "good" and "like" are interchangeable in ordinary discourse. It is not hard to imagine uses in which the two conflict: "*Independence Day* was a bad movie, but I liked it" is a perfectly coherent thing to say; the word "bad" picks out the film's intrinsic merit, while "like" indexes something about the person. One way of thinking about this is that "good" is a word which involves public, shared or at least defensible criteria, while "like" is a personal claim that can be explicated, but does not require justification in the same way. This can be seen if we consider a disagreement in each case. It is perfectly sensible to disagree with someone who has claimed that *Independence Day* is a bad film, and various reasons could be offered for and against. However, it would be rather peculiar to claim that the person who said they liked it is *wrong*, that really they disliked it. Liking is typically treated as something a person has privileged knowledge of; if liking is denied this would not be to suggest that the person was mistaken but to suggest that they were lying (to ingratiate themselves, perhaps).

I am not wanting to suggest that discursive social psychology should perform abstract conceptual analysis of terms such as these. Such analyses can be revealing (Mulhausler & Harré, 1990: Sabini & Silver, 1982); yet they can easily underestimate the complexity and rhetorical flexibility of everyday discourse, as Edwards (1997) argues in the case of emotion. The point I am making is that traditional attitude measurement blurs potentially consequential distinctions. Indeed, this example suggests that the very term "good" can fall outside the commonplace social psychological focus on individual preferences. Some of the business that participants can do with the distinction between "liked" and "good" will be discussed shortly.

Variability of Attitude Expression

So far I have indicated some of the general features of a discursive social psychological approach to evaluation. As discursive social psychology developed, one of the main lines of criticism of traditional work on attitudes revolved around the identification of variability in the use of evaluative expressions (Billig, 1989; Potter & Wetherell, 1987; Wetherell, Stiven, & Potter, 1987). At its simplest the argument is as follows.

When evaluative expressions are looked at carefully and systematically, variability has been found that is theoretically consequential. The same individual can be found offering different evaluations on different occasions, or even during different parts of a single conversation. Generally such variability has either been missed or suppressed or ignored when more traditional techniques of attitude measurement are used. Such variability is an embarrassment to theories which hope to explain behaviour as a product of consistent, underlying, cognitively represented evaluative positions. In contrast, variability of this kind is expected within discursive social psychology, which has studied the way evaluations are flexibly constructed to mesh with specific ongoing practices. Variation is expected

as people perform different actions with their talk; for example, as they respond to assessments, align themselves with friends and differentiate themselves from enemies, and as they construct locally coherent versions of the social and moral world.

What is being suggested about variability can be illustrated by a recent and simple study by Burningham (1995). She examined accounts produced in the context of a "social impact assessment" designed to assess people's attitudes to a proposed road scheme. She demonstrated variability in the interview talk of single individuals. For example, one individual produced negative evaluations of road schemes because they destroy the countryside, but elsewhere in the interview produced positive evaluations of road schemes because they can be produced without damaging the environment. Without going into the detail of Burningham's study, its argument is that variations of this kind are produced because people are performing different tasks while talking about environmental damage, and these tasks are best performed through producing accounts involving differing evaluations.

Note that this account is not in terms of impression management. The suggestion is not that people have an actual attitude, whose expression they modify in accordance with social constraints of various kinds. Rather, the argument is that people engage in a family of evaluative practices. Some of these may implicate, for participants, issues of face: others may implicate, again for participants, issues of consistency. Yet neither theories of impression management nor traditional attitude theory make adequate sense of the organization of those practices in different situations.

There is now a range of studies which reveal variability in a wide range of different settings, including the talk and letters of research scientists (Gilbert & Mulkay, 1984; McKinlay & Potter, 1987; Mulkay & Gilbert, 1981, 1982, 1983, 1985; Potter, 1984, 1987, 1988); talk about race and racism (Potter & Wetherell, 1988, 1989, 1995; McCreanor, 1989; Nairn & McCreanor, 1990, 1991; Shi-xu, 1996; Wetherell & Potter, 1992); accounts of government communicators (e Molder, 1996); talk about gender, careers and inequality (Campbell, 1995; Gill, 1991, 1993; Marshall & Wetherell, 1989; Wetherell, Stivea, & Potter, 1987); talk about the Royal Family (Billig, 1991, 1992); claims in parliamentary discourse and newspaper articles related to a political dispute (Edwards & Potter, 1992a,b; Potter & Edwards, 1990, 1994); talk in work settings such as education and medicine (Billig *et al.*, 1988); talk about health and dieting (Lupton & Chapman, 1995; Wetherell, forthcoming) and social work (Roffe, 1996). The majority of these studies do not take "attitude variability" as their topic as, for the most part, discursive social psychologists have avoided presupposing a notion of attitudes and related theoretical apparatus; however, they are all studies of the construction of talk and texts which either includes variability in direct assessments or in talk closely related to the production of assessments.

It might be objected that this research on variability is inadequate, particularly given the huge investment in time and effort in traditional attitude studies, because it does not provide reliable and quantified measures of variability. The response to this would be that the aim of this research has not been primarily to

assess the extent of variability but to document its existence as a pathway to further analysis.

Moreover, variability is precisely the kind of phenomenon that can be obscured by the kinds of counting and coding prevalent in traditional attitude work, which can easily overestimate homogeneity at the expense of variability (see Potter & Wetherell, 1987; Potter & Litton, 1985). Such homogenizing is a consequence of using coding practices that take instances that may be superficially similar, but may display a range of differences that discursive social psychologists would treat as interestingly variable, and placing them in the same category. Without access to the original materials the reader is faced only with counts that appear homogeneous. As I noted above, one of the methodological virtues of some discourse research is the presentation of extended passages of the original materials that allow the analytic interpretations to be assessed by the reader. (It could be argued that inter-rater reliability would eliminate this problem – however, this just pushes the problem back to the training of raters; if they are inattentive to phenomena that discourse researchers would expect to be consequential, they will achieve high reliability scores regardless.)

Recently some studies have attempted to include measures of "attitude variability" along with other variables (e.g. Norman & Smith, 1995; Prislin, 1996; Sparks, Hedderley, & Shepherd, 1992). These studies can illustrate the sorts of reservations that discursive social psychologists have with the way variability is operationalized.

Take a study of attitudes to exercise by Norman and Smith (1995). They measure variability by items such as: "My feelings about taking exercise are sometimes favourable and sometimes unfavourable". There are a number of difficulties with this approach. First, it assumes that variability is "attitude variability". That is, it assumes that people have some inner position – the attitude – but that it varies over time. Discursive social psychologists have not started with the assumption that people must have consistent personally held evaluations that are carried from one context to another. The variability they are interested in is not a temporal fluctuation like changes in the weather, cloudy for a few days and then sun. Rather it is a discrete and specific variation tied to the nature of the action that is being performed. The point again is that evaluations are not treated as something that are carried around ready-made by participants but are worked up in a way that is suitable for what is being done. In discursive social psychology attitudes are *performed* rather than *preformed*.

The second problem is that it treats people as "honest souls" who can and will provide comprehensive, honest and reliable information about their actions and mental states. The irony here, of course, is that it is traditional social psychologists who criticized the "honest souls doctrine" of new social psychological approaches such as Harré's ethogenics in the 1970s (Harré & Secord, 1972). The apparatus of traditional attitude measurement relies much more centrally on people being honest souls than its discursive alternative does.

The third problem is closely related to the second. For all intents and purposes it treats as irrelevant the fact that "responding" to an attitude scale is an activity. What people may be doing with their words in these settings is not made a topic

of study; instead the words are treated as a pathway to the speaker's inner world. For example, it is possible to imagine that people might find it a much more accountable matter to answer that attitudes are highly variable for some topics – voting intentions, say – rather than others – the choice of a brand of biscuits, perhaps. Indeed, it is possible to imagine searching a corpus of conversations for situations where people describe their views as changed or changing, and to consider the kinds of interactions that such claims are a part of. This would start to consider what people are doing with such avowals, rather than treating them as transparent pathways to mental facts.

One discursive study which has focused in detail on the expression of strong views was conducted by Billig (1989). Billig's general suggestion (e.g. 1988a,b) was that evaluations are rhetorical. That is, people produce evaluations where there is at least the possibility of argument, and expressing an evaluation *for* something is often simultaneously the expression of an evaluation *against* something else. People tend not to argue the virtues of gravitational force, as it is taken to be something that simply exists; however, they argue the virtues of a federal Europe, and in doing so may be treated as arguing against particular forms of nationalism (Billig, 1995).

This suggests that it will be fruitful to study evaluations in their home environment of argument. And where Billig does this, with the case study of an individual who professes elaborately and frequently that they have strong views on the British Royal Family, his study documented considerable variation in those views. Indeed, Billig concludes:

> The metaphor of "holding" strong views is somewhat misleading, if it implies the possession of a pre-formed and unchanging mental object. Instead the business of holding strong views is an unfinished business, for the discourse of views involves creating new elaborations and qualifications. As their views are held, so they are formulated (1991, p. 191).

The "views" in this study are modified and finessed in the course of arguments with different people and as new rhetorical oppositions were built up.

In the end, the identification of variability in itself does no more than ask some searching questions about the workings of attitude theories. Variability can always be dismissed as the consequence of various "social influences" on attitude expression or as a product of examining situations where the attitude in question has not been made salient (although too many arguments of this kind can turn into an *ad hoc* list of modifications to sustain the existence of the object in the face of counter-evidence). The more important move in discursive social psychology is to use this variability as a resource for analysing the actions that people perform and the resources that they draw on to perform those actions.

Organizations of Evaluation

The previous section highlights the negative challenge that discursive social psychology presents to traditional attitude theory. In this section I will start to

illustrate the more positive contribution that can be made to a social psychology of evaluation. It will focus particularly on two areas of study where conversation analysis have highlighted features of interaction involving evaluation that have been passed over by attitude theorists (for a useful introduction to conversation analysis, see Nofsinger, 1991; for a discussion of its relation to discursive social psychology, see Potter, 1996c).

The first of these areas of study concentrates on the manner through which evaluations are made in mundane conversation. In a deceptively simple study, Pomerantz (1984) took a large number of careful transcripts of everyday conversation and went through them looking for places where a speaker made an evaluative *assessment* of something; that is, described something as good or bad. She was not concerned with traditional attitude issues – i.e. did this assessment reflect a stable underlying disposition?; would it correlate with something the participant said or did in another setting? – rather, she was interested in how assessments are part of interaction, and in particular in what happened immediately after one speaker had made an assessment.

Pomerantz found that there was a very strong regularity in what happens after assessments. Overwhelmingly, after one person has made an assessment the person they are speaking to follows it with one of his/her own:

J T's-it's a beautiful day out isn't it?
L Yeh it's just gorgeous . .

A (It) was too depre ssing
B [Ooooh it is terrible

The strength of the pattern is shown by the fact that people can elicit a view from another person simply by offering a view of their own, and also by the fact that silence after an assessment is often interpreted as a disagreement.

Pomerantz further noted some subtle, but again very regular differences between the patterning of a second speaker's assessment, according to whether he/she is offering agreement or disagreement. The two examples above are typical agreements. The second assessment follows with a minimum of delay, the agreement is made clear early in the turn, and the agreement is "upgraded". Thus, in the first case above, there is no delay before L starts to speak, the turn is started with the agreement ("Yeah") and the assessment is upgraded ("beautiful" is strengthened to "just gorgeous").

Disagreeing assessments follow a rather different pattern. There is typically some delay before the second turn, the disagreeing component is softened or qualified, and the disagreement appears later in the turn. Indeed, disagreements are often prefaced by agreements. The following examples illustrate some of these features (see Appendix for conventions used):

A . . . You've really both basically honestly gone your own ways
B Essentially except we've hadda good relationship at home

B . . . well a sense of humor, I think is something yer born with Bea.
A yea. Or it's c- I have the- eh yes, I think a lotta people are, but then I think it can be developed, too.

(All from Pomerantz, 1984: transcription slightly simp

Pomerantz (1978) extended this line of research to identify some of the regular features of compliments and self-deprecations. In the case of self-deprecations the standard patterning is reversed, with disagreements being performed immediately and with upgrade, while agreements are delayed and softened. Compliments are more complicated still, as the standard pattern of immediate agreement conflicts with social norms against explicit expressions of self-praise (boasting). Pomerantz identifies a range of different ways in which people manage these conflicting demands, including downgrading the praise, reassigning it to another person or object, or returning it to the speaker.

The important point, then, is that Pomerantz's research shows in the case of simple everyday assessments that they have a regular organization which depends on their specific position in an interaction. This influences both the strength of the evaluative expression and its organization. Now it could be argued that these are merely trivial evaluations made in mundane talk and that the apparatus of attitude measurement with its Likert and Osgood scales bypasses this to something more solid. In contrast to this, conversation analysts have argued that such mundane conversation is the home environment of many features of interaction. Participants learn about the nature and role of evaluation in these settings, and this knowledge is a backdrop to, and gives sense to, their actions when faced with, say, an Osgood semantic differential scale. Indeed, Myers (1996) has developed the implications of this work for reinterpreting what takes place in focus groups (see also Suchman & Jordan, 1990, on survey research; Antaki & Rapley, 1996; on quality of life measures). Far from being a trivial irrelevance, then, these sorts of everyday taken-for-granted practices of evaluation may be the foundation of more technical social science practices of evaluation.

The foundational role of studies of evaluations in everyday settings can be illustrated by showing the way they have helped to throw light on what at first sight seems a rather separate and conventionally more significant topic; the interaction of an orator with an audience. The conversation-analytic approach to oratory has been very different from that of traditional social psychology. It has shown that political oratory is in important respects like a conversation between a speaker and audience. Pomerantz showed that in everyday conversation, when a speaker makes an assessment, the person being talked to generally provides his/her own assessment. Now at a political rally, or the hall of a political conference, the audience cannot simply talk back; they cannot say, "Yes, the Labour policy on employment is disastrous", or, "Absolutely, we have got law and order cracked". However, there are conventional and effective ways of producing evaluations in these contexts; people applaud, cheer, boo or. more rarely, heckle.

Researchers into oratory have found that applause regularly follows parts of speeches where the speaker is making an assessment: a claim of the form, "Our party is brilliant", "Our policy is great", "Their party is awful" and so on (usually more subtly). Just as in an everyday conversation, then, when the speaker produces an assessment the audience will generally respond to it with their own assessment. However, the successful elicitation of clapping does not depend simply on making assessments in the course of speaking. Another feature of oratory is like everyday talk; and that is that people make extremely finely-tuned predictions about the

completion of prior turns. There is often no perceptible gap at all between one speaker finishing his/her turn of talk and the next speaker starting. This shows that people are not responding to turn endings, but are predicting when turns will end so they can synchronize their own contribution (Levinson, 1983; Sacks, Schegloff, & Jefferson, 1974). This phenomenon of predicting completions is particularly important in public speaking where the close co-ordination of possibly several thousand people is required in a setting where many of them may have a poor view of the speaker and degraded sound quality may mean they miss many of the subtleties of speech production.

Studies of oratory suggest this difficult problem of co-ordination is solved by the use of a range of rhetorical formats (Atkinson, 1984a, b; Heritage & Greatbatch, 1986). These are ways of constructing talk so that completions can be easily predicted. For example, in a study of almost the entire set of speeches from the 1981 party conferences in Britain, Heritage and Greatbatch (1986) identify six basic rhetorical formats; contrasts, lists, puzzle-solutions, headline-punchline, position taking and pursuit. All these formats provide information for the audience concerning precisely *when* applause is due. For example, with contrast structures - which are the most common formal – the audience is readied to applaud in good time by the onset of the first part and are thus well prepared by the completion of the second. The following example illustrates the standard pattern (see Appendix for conventions used):

Morris Governments will argue: (0.8) that resources are not available: (0.4) to help disabled people (1.3)
A→ The fact is that too much is spent on the munitions of war::,
B→ and too little is spent (0.2) on the munitions of peace
Audience Applause (9.2 seconds)
(Heritage & Greatbatch, 1986, p. 123)

In their study, Heritage and Greatbatch found that two-thirds of 1588 sets of applause followed one or more of these rhetorical formats. Put another way, if an evaluative claim is couched in one of these rhetorical formats it is at least twice as likely to get applause and in some situations may be nearly ten times as likely. Of course that is not all there is to it either. Speakers can use contrasts or lists in a confused way, downgrading their effectiveness, or they can enhance their effectiveness by combining formats or co-ordinating spoken oratory with suitable gestures (Atkinson, 1984a; Clayman, 1993; Grady & Potter, 1985).

The general point is that the study of assessments in mundane conversation has started to provide insights in areas where social psychologists have traditionally been concerned with a range of communicator "variables" such as attractiveness, credibility, similarity and status (Hovland, Janis, & Kelley, 1953; see Eagly & Chaiken, 1993, for recent discussion). It has moved the focus away from events and processes in the heads of individuals and on to the sorts of practices that go on when people are using evaluations in social contexts. Pomeranz's study allows us to compare making an assessment with other actions such as giving an invitation, say, or making an accusation. Heritage and Greatbatch's study shows

the way that assessments are a central part of political oratory, and that their "success" depends on subtle discursive organizations.

Evaluative Practices and Ideological Discourse

Another way in which discursive social psychologists have moved away from traditional notions of attitudes is that they have started to analyse the production of assessments as part of broader activities which are dependent on a range of symbolic resources, some discrete and some broadly patterned. In some ways the argument is similar to that made by social representations researchers, who have downgraded the importance of attitudes in favour of understanding the socially shared representations that people hold which underpin their attitudes (Moscovici, 1984). In the case of discursive social psychologists, the concern has been with the interpretative repertoires and rhetorical commonplaces that are used to make particular evaluations coherent and accountable. This line of work is most developed in three book-length studies; Billig (1992) on talk about the Royal Family; Billig *et al.* (1988) on the organization of everyday ideology; and Wetherell and Potter (1992) on discourse and racism; however, it is easiest to introduce the work by way of a relatively simple and small-scale early study (Wetherell, Stiven, & Potter, 1987).

Wetherell, Stiven, and Potter (1987) focused on men's talk about women's career opportunities in open-ended interviews. It did not attempt to ask these participants what their attitude was to women's career advancement; rather, the interviews gave them the opportunity to provide extended descriptions, explanations and judgements as they dealt with a range of questions and comments from the interviewer. Close analysis of the interviews found a regular pattern. On the one hand, the men supported the *principle* of women's career opportunities and attacked discrimination based on gender. On the other hand, the men offered a wide range of *practical* reasons for the failure of women to reach full employment equality, including references to such concerns as childcare, tradition, and emotional unsuitability to stressful work. Note the significance of this pattern. These men have the ability to affirm *both* support for women's employment equality (in principle) *and* support for continued inequality (because of important practical concerns). They can be what the authors dubbed "unequal egalitarians" who support a status quo of inequality while displaying themselves as non-sexist through their abstract support of egalitarian principles.

It is important to be clear about the implications of this study. In the first case, it suggests that using a traditional technique such as an attitude questionnaire, combined with attitude theory's notion of unitary individual preferences, will not be adequate to understand how these people construct evaluations about gender and employment. In a sense, they have contradictory views, positive and negative. But this is why an attitude approach is inadequate to capture what is going on here.

The second point to emphasize is that this interview talk may well underestimate the variation in such evaluations and the way in which they are used in practical contexts. For example, Gill's (1993) study of radio controllers' accounts

for the low representation of female DJs repeats the general pattern of support for principles of equality combined with practical reasons for failures to appoint more women. However, the specifics of the accounts are rather different, as the controllers are describing and justifying their own recruiting practice. It is notable that they construct accounts to present the lack of recruitment as a product of external factors rather than their own desires; for example, few women apply, or listeners do not like women's "shrill" voices.

An attitude researcher might counter at this point that these studies merely document the sorts of mismatch between "attitudes" and "behaviour" that result from the range of social constraints on "behaviour" that interfere with its smooth connection to "attitudes". However, this would be to miss precisely what discursive social psychologists have emphasized, which is the way talk is orientated to action. For in presenting their views as egalitarian, but their practice as constrained, they can counter potential criticisms from a liberal-seeming and female social researcher while explaining and justifying an unequal practice. Traditional attitude measurement and theory pays almost no attention to what is done by attitude talk, let alone what is done by different descriptions of behaviour.

Where traditional attitude theory has looked to the intrapsychic world of cognitive psychology for its explanations, discourse research has looked instead to conversational pragmatics, and more broadly to social and ideological conflicts. This line of thinking is developed in Billig *et al.*'s (1988) work on "ideological dilemmas". Their argument is that the common sense of everyday talking and arguing is organized around dilemmas which are often ideological in the sense that they relate to broader societal concerns with authority, legitimation and social organization. For example, they discuss the way classroom teaching is organized around a dilemma between student self-discovery and teacher control over learning outcomes (for a more developed study of education in this way, see Edwards & Mercer, 1987). The important point they make is that these dilemmas are not a problem that has to be resolved; rather, their tensions structure social settings and provide contradictory sets of resources that sustain current practices. In the case of Gill's (1993) radio controllers, for example, the contradictions between egalitarian values and discriminatory practice are not a problem for the stability of the institution; quite the reverse, they can help sustain its current status quo.

At this point it might seem that a monopolar attitude theory has been placed by a bipolar theory of dilemmas. I will take one more example to show the possibilities in a more complex situation. One of the studies reported in Wetherell and Potter (1992) considered Aotearoa (New Zealand) White majority group members' accounts of controversial topics related to ethnic relations: land rights, Maori language teaching, and affirmative action programmes. Across the corpus of 81 interviewees, along with materials from newspaper articles and records of parliamentary debates, a small number of what Billig (1987) calls "rhetorical commonplaces" were identified. These were brief arguments, often using the same phrases which were generally treated as clinching, or as invoking, principles that were beyond question. Some examples (from Wetherell & Potter, 1992, p. 177) are:

- Nobody should be compelled.
- Everyone should be treated equally.
- You cannot turn the clock backwards.
- Present generations cannot be blamed for the mistakes of past generations.
- Injustices should be righted.

Note that these commonplaces do not fall neatly into categories as values or empirical generalizations or ideological observations. In most cases they could be built as features of morality, or politics, or treated as empirical according to their use. This again illustrates the emic nature of discursive social psychology – the aim is not to impose an abstract coherence on to participants' discourse by treating it as generated by unitary individual attitudes or singular political ideologies. Instead, the aim is to appreciate the fragmentary organization of political evaluations, and to show that what might appear on the face of it vague or ambiguous actually has a fine organization.

One of the immediately obvious features of this list of commonplaces is that it does not fit easily together; righting injustices can conflict with not turning the clock backwards: and more generally, some of the commonplaces invoke individual rights while others stress practical considerations. Following Billig *et al.*, Wetherell and Potter argued that the contradictory nature of this discourse permits a very wide rhetorical flexibility which is shown when the participants argued against the courts dealing with Maori land disputes or schools teaching Maori to Pakeha (White) pupils. In broader terms, Wetherell and Potter argued that to understand the organization of racism and ethnic relations in New Zealand, notions of prejudiced attitudes were not adequate. Instead it was necessary to understand both how these innocuous and broadly liberal argumentative resources were used in practice to undermine political changes promoting the position of Maori and Polynesian groups, and how they are broad resources that have been established in the specific history of New Zealand culture and its political and social discourses. In general, the work described in this section has moved away from the study of individual preferences to attempting to understand how evaluations are bound up with practical and ideological questions.

Facts and Neutrality

One of the notable features of attitude research is that there is a negligible amount of work on neutrality or not holding an attitude. Moreover, while researchers have focused on evaluations, description hardly figures as a topic. People who tick "don't know" on attitude or opinion questionnaires are typically treated as uninteresting or a methodological problem to be managed. However, recent work in discursive social psychology has focused specifically on descriptions and factual accounts (Edwards, 1994, 1995; Edwards & Potter, 1993; Potter, 1995, 1996b; Potter & Edwards, 1990; Potter & Wetherell, 1988; Potter, Edwards, & Wetherall, 1993) and conversation analysts have explored the way neutrality is managed interactionally in particular settings (Clayman, 1992; Heritage & Greatbatch, 1991). I will discuss the conversation-analytic work first.

Heritage and Greatbatch (1991) studied interaction in broadcast news interviews. They found that, in contrast to everyday talk, the interviewees did not treat the interviewers as accountable for views and claims expressed in questions by the interviewer. Instead they treated them as animating the views of others or as producing abstract points for the sake of clarifying issues. It is rare for news interviewees to treat interviewers as expressing their own attitudes, and when this does happen it can lead to tricky interactional problems (Heritage & Greatbatch, 1991; Nofsinger, 1991; Potter, 1996b). In a complementary study. Clayman (1992) studied a specific technique that news interviewers used to construct their own neutrality. Typically, when they produce questions involving a contentious description of some state of affairs they construct it as a quote from a particular speaker, or they may treat it as what people in general have claimed. By doing this they construct their discourse as not motivated by their own attitudes or biases but merely reporting what other relevant parties have said. They are constructing themselves as without attitude.

It is important to stress that Clayman and Heritage and Greatbatch are not treating neutrality as a technical notion, but are treating it as an issue for participants. To claim that news interviewers are *displaying* neutrality through their discourse practices is not to claim that they are *actually* neutral according to some cognitive, political or sociological criterion. This move to consider the way stake, attitude and neutrality are managed by participants in practical settings is mirrored by work in discursive social psychology.

Edwards and Potter (1992a, 1993; Potter, Edwards & Wetherell, 1993) have argued that when people perform sensitive actions (such as making requests, turning down invitations, criticizing others) they often do so by way of descriptions. Take the following simple example, discussed in detail by Wooffitt (1992):

1	**A**	So tha:-:t
2	**B**	-k-khhh
3	**A**	Yihknow I really don't have a place **tuh sta:y.**
4	**B**	hh Oh: : : : .h
5	**A**	(0.2)
6	**B**	.hhh So yih not g'nna go up this weeken?
7	**A**	(0.2)
8	**B**	Nu : : h I don't think so.
9	**A**	How about the following weekend.
10	**B**	.hh Dat's the vacation isn't it?
11	**A**	.hhhhh Oh:. .hh ALright so: - no ha:ssle

Without going into details here we can note the way, in line 10, B turns down A's invitation. He registers inability to go on the trip without an explicit rejection, but by a (contrastive) description, "Dat's the vacation". Drew (1984) has claimed such inability accounts are pervasive when performing actions such as refusals, disagreements and rejections. The point to emphasize for the current discussion is what actions and accounts of this kind are not doing, which is making reference

to personal preferences; desires, wishes, attitudes. When was the last time you heard an invitation turned down by the speaker saying, "I won't come" because "I don't feel like it", or "I don't like you"? These are not activities where the language of attitudes is generally considered appropriate.

This phenomenon is not restricted to what might be thought of as rather trivial practices such as invitations and refusals. The same pattern can be seen in talk about race and ethnic relations, Potter and Wetherell (1988; see also Wetherell & Potter, 1992) performed a detailed analysis of a single case where the interviewee was making a range of derogatory and racist claims about members of minority groups. In the following extract the interviewee has been discussing the topic of crime:

Wetherell Yeah. Yeah, so it's partly sort of immigration, it's related to immigration?
Jones Umm. Yeah, we don't, seeing them coming through off the aircraft at night, half of them can't speak English, um, (.) If they can't speak English they're not going to be able to get a job, they're going to go and be in their little communities and (.) they're not going to contribute anything to the country. And they're going to get frustrated and they're going to get bored. And they're gonna, you know, there's nothing for them to do so the kids are going to start hanging around in the streets. At home Mum and Dad can't speak English and so the kids can't speak English. They go to school and suddenly they are confronted with English – "We can't speak that, and so what do we do?" – nothing. And so by the time they get to fifteen they just drop out, they have had it up to here with school and it's not the school's fault. They have brilliant lives, they have brilliant lives back in, family lives back in the Islands, that's where they should be.

The feature of this material I want to emphasize here is that the speaker is not constructing his talk in the language of attitudes. That is, he is not talking of his preferences for particular minority groups; indeed, he is not giving any direct formulations of his own psychological states. Instead, he is constructing versions of minority groups and their characteristics and actions from which evaluations could be inferred. Put simply, the negativity is constructed as lying out there in the world rather than being a feature of his own psychology. The upshot of this type of construction is that the speaker should not be held accountable for holding negative attitudes, rather the minority groups members should be held accountable for their problematic behaviour.

The upshot of this line of work is that situations where people are constructing descriptions are just as interesting, just as significant in social psychological terms, as those in which people are espousing attitudes. Moreover, it brings to the fore a set of concerns and questions which have not been tackled by social psychologists up to now. For example, if descriptions are as important as this work suggests for performing sensitive actions, then the study of how descriptions are constructed *so as* to perform actions becomes important, as does the question of how descriptions are constructed us *factual* and *independent* of the speaker.

Note, for example, the way independence from the speaker is constructed and value is made a feature of the world rather than the speaker in the following extract:

> **Jones** There have been a lot of ideas put out, what is it, that the majority of rapes are committed by Islanders or Mäoris and . .

Here the extremely negative description about rape is produced as an "idea put out" – that is, not an idea the speaker himself has produced. Furthermore, the phrase "what is it" acts a display of searching for a formulation that is not quite remembered. It works him up as not the kind of (racist, hostile) person who actively notes down negative items about minority groups, let alone produces them himself. The topics of action via description and fact construction are explored at length in Potter (1996b).

Respecification of Attitude Concepts

In this final section I will briefly review some of the theoretical notions that have been important in attitude research; function, consistency, vested interest. The aim is to show how these concepts can be translated from a cognitive to a discursive framework.

Function

The traditional view of function in attitude research focuses on the role holding an attitude might have for an individual. Probably the best-known scheme (Katz, 1960) has one function for each of the available theoretical systems for the time: the *utilitarian* function of an attitude is to maximize rewards (behaviourist); the *ego-defensive* function is to protect the self from unwelcome inner impulses (psychoanalytic); the *knowledge* function organizes coherence (cognitive); the *value-expressive* function expresses core values (humanistic). Whether these functions can be coherently specified and researched is outside the scope of this current discussion. The important point to emphasize here is that discursive social psychology is, at least arguably, working with a much more straightforward notion of function when it takes as its topic evaluative practices; that is, what people are *doing* by making evaluations (or displaying a lack of evaluation) in particular settings.

Some of the confusions that can arise with the traditional view of function can be seen in research using this view. Take Maio and Olson (1994), who studied attitude functions in relation to "attitude–value–behaviour relations" in the context of student non-smoking areas. Attitude functions were measured using Shavit's (1990) "thought-coding scheme", which the authors describe as a "method for directly measuring attitude function". Participants were asked to "list all of their thoughts that were relevant to" attending a dance to highlight a campaign for non-smoking areas. Then these "thoughts" were coded as either *value-expressive* or *utilitarian*. The problem from a discursive perspective is not just with the notion that thoughts are the kinds of objects that can be simply listed in linguistic form like the printout from a word processor, although this is certainly a major

problem, it is with the untheorized manner in which statements are assigned to a particular function. For example, they give as a paradigm example of a value-expressive thought:

> Smokers should not be permitted to smoke anywhere.
>
> Smoking is an unhealthy act.

The difficulty highlighted by the sort of discourse work on evaluative practices and ideological dilemmas discussed above is that isolated phrases of this kind can be used in a wide range of different ways. It is not hard to imagine "smoking is an unhealthy act" used as the account element in a practical, *utilitarian* request for a neighbour to stop smoking. For discourse workers, function needs to be identified through studies of talk in settings rather than through assigning decontextualized materials to categories by analytic fiat.

Consistency

Consistency has been one of the most fundamental theoretical notions in attitude work ranging from Heider's balance theory, Festinger's cognitive dissonance, to more recent social cognition approaches (see Fiske & Taylor, 1991). Consistency is also treated as important in discursive work. However, there is a major difference, which is that in discursive social psychology consistency is not treated as a logical relation than can be assessed by the researcher. Instead, it is treated as a participants' concern. This highlights two features that have not been traditionally emphasized.

First, consistency can be managed across settings; studies of evaluative talk show the way different explanatory and evaluative repertories can be drawn on in different passages of talk, or in different settings (Billig, 1991; Gilbert & Mulkay, 1984; Wetherell & Potter, 1992). Second, and more significantly, consistency is not something that is merely, factually, the case or not. Detailed studies of discourse show the way consistency can be constructed and undermined using a range of different rhetorical devices (Potter, 1996b). Again, the logic of this is to start from a study of the way consistency is managed in practice rather than making prior analytic judgements which may be at odds with some or all participants and may reflect a range of untheorized prejudices.

Vested Interest

Some researchers have recently emphasized the importance of "vested interest" as having an important role in mediating the consistency of attitudes and behaviour (e.g. Crano & Prislin, 1995). The argument is that behaviour is likely to follow attitudes where there is a vested interest, but not where such an interest is absent. There are already discourse-analytic cautions on the notions of "attitude" and "behaviour". "Vested interest" has been a topic in discourse research. However, just as with consistency, the focus has been on how vested interest is constructed and managed in particular accounts and settings. For example, several studies have emphasized the way the vested interest of other

built up as a procedure for discounting their claims or actions (Edwards & Potter. 1992a, 1993; Potter, Edwards, & Wetherell, 1993) and Potter (1996b) has argued that vested interest of one kind or another is pervasively attended to when descriptions are constructed as factual. Traditional research on vested interest and attitudes has systematically underplayed the constructive and rhetorical work done with vested interests in natural settings through using a range of methodological techniques. For example, Crano and Prislin (1995) use vignettes where vested interest is predefined rather than being something that has to be worked up, played down, and made relevant or irrelevant.

Emotion

It is worth ending with a brief comment on emotion, as it has been a commonplace feature of a range of attitude theories to treat attitudes as having a cognitive and an affective component. In Zanna and Rempel's (1988) influential definition for example, attitudes are evaluative categorizations depending on information about cognition, past behaviour and *emotion*. Indeed, emotions have often been treated as a background motivator, something essentially separate from, and underlying, the rational information-processing world of cognition. Without going into detail here, discursive social psychologists have recently been developing a rather different approach which considers the way emotion displays and emotion talk figure in interaction (Buttny, 1993; Edwards, 1997, forthcoming; Harré, 1986).

For example, Edwards explores some of the roles of emotion descriptions in relationship counselling sessions, noting how they can play important parts in narratives that construct moral identities for the parties and warrant particular outcomes. He emphasizes in particular the importance of the multifaceted nature of emotion talk, and the ways it can be rhetorically worked up as rational vs. irrational, cognitively grounded vs. cognitively consequential, event-driven vs. dispositional, or even cognitive vs. emotional. It is this very flexibility that allows it to be a powerful resource in interaction. In terms of a discursive social psychology of evaluation, the linking of attitudes and emotions makes sense when suitably translated into a study of evaluative practices where displaying strong views or opinions may well involve psychological constructions that would previously have fallen into psychology's rather loosely theorized category of emotion.

Conclusions

The aim of this paper has been to introduce discursive social psychology by discussing how it has respecified, and how it could further respecify, the problematics of attitude research. The basic move is away from an in-the-head notion that has people carrying around the mental equivalent of ready filled-in Likert scales for the attitude objects in their lives, and towards a notion of heterogeneous evaluative practices which are used in different settings for different purposes. Alongside this respecification comes an emphasis on the symbolic systems (categories, commonplaces, interpretative repertoires) which are resources for

constructing evaluations, and the way evaluations are rhetorically worked up by participants as located within individuals in some settings while being separated from individuals and made features of the world in others.

Acknowledgements

I would like to thank Charles Antaki, Michael Billig, Derek Edwards and Margaret Wetherell for their comments on an earlier draft of this article, as well as Miles Hewstone, Wolfgang Stroebe and two anonymous referees.

Appendix: Brief Transcription Notation

Um::	Colons represent lengthening of the preceding sound; the more colons, the greater the lengthening.
I've-	A hyphen represents the cut-off of the preceding sound, often by a stop.
↑Already	Up and down arrows represent sharp upward and downward pitch shifts in the following sounds. Underlining represents stress, usually by volume; the more underlining the greater the stress.
hhh hh .hh	"h" Represents aspiration, sometimes simply hearable breathing, sometimes laughter, etc.; when preceded by a superimposed dot, it marks in-breath; in parenthesis inside a word it represents laugh infiltration.
hhh [hh .hh] [I just]	Left brackets represent point of overlap onset; right brackets represent point of overlap resolution.
.,?	Punctuation marks intonation, not grammar; period, comma and "question mark" indicate downward, "continuative", and upward contours respectively.
( )	Single parentheses mark problematic or uncertain hearings; two parentheses separated by an oblique represent alternative hearings.
(0.2) (.)	Numbers in parentheses represent silence in tenths of a second; a dot in parentheses represents a micro-pause, less than two tenths of a second.
°Hm mmm°	The degree signs enclose significantly lowered volume.

Were You Ever in a Situation Where You Were in Serious Danger of Being Killed? Narrator–Listener Interaction in Labov and Waletzky's Narratives

Uta M. Quasthoff

It is one of the characteristics of a "classic" that everyone in the field – and many more readers outside of it – think they know it by heart. Only, when the work is reread for some special reason, it turns out that it contains aspects that had not been noticed in the course of previous readings. In the conviction that my own theoretical perspective on narrative has remarkably changed over the past 30 years, and assuming that Labov and Waletzky (1967/this issue: henceforth L&W) is indeed a "classic," I will reread the original article for the purposes of this article, looking for hints that can be taken as an early fundament of an interactive concept of narrating (see Quasthoff, 1990, 1997, for a more detailed description of this interactive approach).

Narrator–Listener Interaction in L&W

The descriptive format presented in L&W is a structural one in the classical linguistic sense. This means that each linguistic unit to be described must be attributed to one speaker, because a structural concept including more than one participant was not available (and not asked for) in the linguistic methodology of the 60s. Once the reader's attention is focussed on the interactive quality of narrating, however, a variety of traces hinting at the narrator–listener cooperation can be discovered in the article. For reasons of space I only follow up on one.

Source: *Journal of Narrative and Life History* vol. 7, no. 1–4, 1997, pp. 121–128.

which concerns an empirical feature of the narratives documented by L&W as a result of their elicitation technique.

The Danger-of-Death Question

When the subject is asked if he were ever in serious danger of being killed, and he says "Yes," he is then asked, "What happened?" He finds himself in a position where he must demonstrate to the listener that he really was in danger. The more vivid and real the danger appears, the more effective the narrative. (L&W, this issue)

In many of the narratives given in L&W (this issue), I noticed precisely the same kind of cooperation between listener and narrator in the opening of the story that we found in our developmental data (Hausendorf & Quasthoff, 1992, 1996), with the reservation that this pattern was limited in our data to the interaction of adult listeners with 5-year-old narrators (as opposed to 7-, 10- or 14-year-olds):

Example 1

[1] (Were you ever in a situation where you thought you were in serious danger of getting killed?) I talked a man out of – Old Doc Simon I talked him out of pulling the trigger. (What happened?) (L&W, Narrative 1; similar in Narratives 3, 4, 5, 6, 8, 9. 10, 11, 14)

Example 2

Adult:	Hast du das mitgekriegt	Did you notice that
	Da war doch plötzlich n	there was suddenly
	Krach da ne?	a bang huh?
Child:	Ja ich habs mitgekriecht	Yeh, I saw what happened
Adult:	Mensch erzähl mir mal	Man, tell me
	wat warn da los?	what happened?

(Hausendorf & Quasthoff, 1992, p. 248; 1996, p. 212)

Of course, this does not imply that the narrative skills of the adults or adolescents in L&W operate at the same level as 5-year-olds. Rather, the structural similarity might be related to the orderedness of narrator–listener interaction in general and the contextualizing power of specific patterns of this interaction, which results in the constitution of different kinds of (social) context (Quasthoff, 1994). In particular, I therefore scrutinize these structural patterns of narrative interaction in the next section.

Structural Descriptions of Narrative Interaction

Unlike the classic structural orientation in narrative analysis, the interactive orientation requires a level of structural description that is interindividual, representing the interactive achievement, which is more than the addition of single speaker- or listener-bound units. We solved this problem of how to describe this

level by condensing a sequential model of narrative interaction from empirical analyses. The basic idea of this model of narrative production is a three-fold analysis of *jobs* (or *tasks*), *devices*, and *forms* in the reconstruction of the interactive process. The descriptive level of the jobs covers the global tasks to be fulfilled jointly by both participants in dyadic conversation. Consequently, this descriptive level does not yet allow the differentiation into narrator and listener.

The tasks are structural in nature and sequentially ordered. They are assumed to be generally applicable to all instances of the realization of the respective discourse unit and are thus context-free: If a narrative was successfully told, the organizational jobs must have been done, no matter how and no matter by whom. Methodologically, the jobs are the *tertium comparationis* (the common third) for developmental or sociolinguistic comparison – aside from their providing the structural concept for the dyad's achievement.

The devices, on the other hand, are formulated narrator- and listener-specific. They are sequentially ordered on the basis of local implicativeness: If someone realizes Move A, then a move of the Type B (or C) is to be expected on the basis of local "conditional relevances," which are framed globally. In other words, these conditional relevances operate on a local as well as on a global basis. They constitute the sequential implications, which in turn constitute the predictions of our empirical model in that they form an ordered sequence of local turns as moves in the respective fulfillment of global tasks.

These sequential dependencies form the specific interactive patterns that are typical of adult–child interaction or other situational frames – such as the one documented in L&W. In our developmental data, it is essentially the adult's use of the global and local constraints on the child's successive activities that could be reconstructed as developmental mechanism.

The forms refer to the linguistic surface realizations of the semantic-pragmatic units of the devices. Only at this level of description do language- or code-specific structures come into play. Forms as well as devices have been found to be not only different for the narrator and listener, but also for children of different age groups (as opposed to adults) and even for adults in interaction with children of different age levels.

Figure 1 shows an illustration of the organizational jobs required by the conversational realization of a narrative discourse unit.

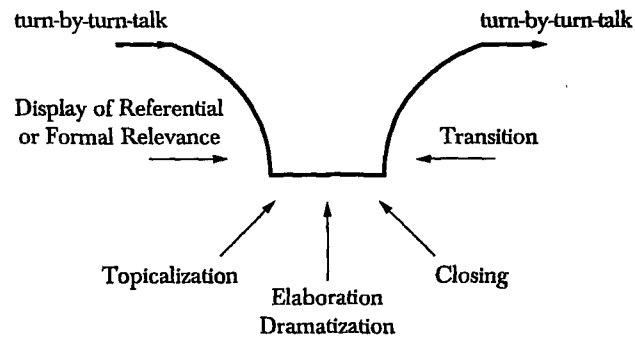

Figure 1: Organizational tasks of a narrative discourse unit in conversation

Narrative discourse units have to be prepared by the display of thematic relevance with respect to the narrative's content (or the display of formal relevance with respect to narrating as an activity). In other words, the turn-by-turn talk has to provide a contextual condition for the sequential placement of a narrative; it has to reach (or to be driven to) a point where topicalizing of a narrative is at least a possible next turn in the interaction.

In noninterviewlike, ordinary conversation, a context thematically relevant to the danger-of-death stories could be talk about danger or fights or killings in big cities. These topics would make the narrative-topicalizing question "Were you ever in a situation . . ." a possible next turn. This question represents a listener device structurally oriented towards some nonspecific but reportable event, thus governing the narrator into his or her topicalization device, which often has the form of an *abstract* (Labov, 1972):

Example 3
I talked a man out of – Old Doc Simon I talked him out of pulling the trigger (L&W, 1967/this issue, p. 5).

Example 4
My brother put a knife in my head (L&W, 1967/this issue, p. 7)

The contingent topicalization of a reportable event by narrator and listener represents the structurally decisive point in narrative interaction, which has to be followed by a global next turn – a narrative discourse unit. If such a unit is withheld after topicalization, there must be an account (cf. narrative No. 5 in L&W, this issue, which is our Example 5, following).

On the basis of this structural description we can reconstruct more precisely the type of opening represented previously in Example 1:

Interviewer: topicalization: question/reportability in a nonspecific sense (*situation where you thought you were in serious danger ...*)
Narrator: topicalization: answer/reportability in a specific sense (abstract: *I talked a man out of – Old Doc Simon I talked him out of pulling the trigger*)
Interviewer: topicalization: question/elaboration (*What happened?*)
Narrator: answer/beginning of elaboration (orientation: *Well, in the business I was associated at that time, the Doc ...*)

The structural description shows how the interviewer, by use of the local device of adjacency pairs (yes-no question, wh-question), establishes global conditional relevances step by step. The (future) narrator's first answer, which still can be heard locally, receives its global nature – becomes an abstract – due to the interviewer's succeeding question: "What happened?"

When this kind of opening is compared to a prototypical self-initiated story, in which the narrator ties the abstract directly to the topically coherent context, one can see that L&W's elicitation technique expands topicalization by localizing this structural juncture, which is the same technique adult listeners intuitively use

to ensure narrative communication with children, whose mastery of global-structural demands is limited (Hausendorf & Quasthoff, 1992, 1996; Quasthoff, 1997).

In the next section I discuss possible reasons for this structural similarity in different kinds of narrative interaction.

Comparison to Ontogenetic Data

If we compare the interaction with a 5-year-old child in Example 2 with the elicitation of a narrative told by a 72-year-old speaker in Example 1 more explicitly, we find the following structural similarities: In both cases the listener starts with a yes–no question that – if affirmatively answered – puts the narrator under the obligation to tell a story according to the global conditional relevances shared by socialized members of the respective discourse culture. This is the way L&W describe the general procedure in the quotation given previously. Consequently, the structural analogy so far can be easily explained by the fact that it seems to be an effective elicitation technique, used in both settings by listeners who are interested in steering their interactive partner into storytelling.

At first glance, the structural analogy seems to exclude the narrators' devices: Due to a lack of global competence, the child seemingly explicitly acknowledges the structural obligation ("Yeh, I saw what happened"), but still does not proceed to follow up on it before the adult makes the structural obligation explicit ("tell me what happened"). The adult narrator in the L&W example (Example 1), however, does not explicitly answer the yes–no question, but immediately produces what can be heard as an abstract. What makes the comparison so irritating, however, is the fact that the 72-year-old speaker, just as the child, does not open the narrative proper immediately after the abstract, but seems to wait for his listener's elaborating question: "What happened?"

Having reached this degree of analytic sensitivity in relation to the phenomenon, we find a number of narratives in the L&W data in which the narrator in fact does answer the yes–no question explicitly:

Example 5
[5] (Were you ever in a situation where you thought you were in serious danger of being killed?) Yes. (What happened?) I don't really like to talk about it. (L&W, 1967/this issue, p. 8)

Example 6
[9] (Did you ever have a feeling, or a premonition, that something was gonna happen and it did happen?) Yes, I did. (Tell me about it.) (1967/this issue, p. 9)

Example 6 in particular is in total analogy to Example 2, including the explication of the global conditional relevance into narrating ("Tell me about it").

In our ontogenetic study, we analyzed not only the developmental progress of narrative skills in children but also the intuitive variation of adult listeners'

devices and forms in adjustment to the child's age. As was mentioned previously, we found the described pattern of narrative topicalization only in the interaction between adult and 5-year-old narrators. In informal interaction with 7-, 10-, and 14-year-old children, listeners reduced the described two steps to one compact interactive move by simply displaying a lack of knowledge regarding the event in question. That is, they neither localized nor explicated global narrative constraints. Rather, they implied the global relevance of their activities simply by establishing the eventability and reportability of a specific event. This pattern is illustrated in Example 7, showing a fragment of a conversation with a 7-year-old child.

Example 7

Wat warn da unten	"What kind of bang was that
fürn Krach	down there
wer hat da so rumgeschrien?	who was shouting?
n Erwachsener und ganz böse	an adult and very angrily
hab ich schreien gehört	I heard shouting
bis oben ins Erzieherzimmer	all the way up in the teacher's lounge
hab ich das gehört	I heard that
wat warn da los?"	what happened there?"

07–112–07

The fact that in interaction with 7-year-olds in our data, adults did not use this localizing and explicating elicitation technique and that the children did not rely on it anymore clearly excludes an analysis in terms of competence. It rather leads to the assumption that the interactants mutually display a particular relationship towards each other that includes a certain unwillingness on the part of the interviewees to tell even highly reportable stories: Although 5-year-olds, who wait for a request to elaborate a topicalized story, display a lack of structural competence, fully competent speakers, who do the same, appear to be reluctant to tell the story. Remembering L&W's remark that the data stem either from face-to-face interviews or group situations in which the interviewer did not necessarily play the central role (1967/this issue, p. 4), we are steered into an ethnographic issue: The mutual display and thus the interactive establishment of an outside or inside relationship. Obviously, the different types of narrative topicalizations produced and mutually displayed the issue of a (sub)cultural boundary between narrator and listener to different degrees. The use of a localizing pattern by listener and narrator, resulting in the display of a low degree of readiness to tell a personal experience, (re)produces a frame (Goffman, 1974) of cultural distance.

By looking for traces of narrating as an interactive process in L&W, we have not only found these traces but also indications of the "interactive" function of narratives (Quasthoff, 1980): Situational contexts are established via narrative interaction. Thus, L&W has been proven to be a real "classic" – ahead of its time in many aspects.

The Inference-Making Machine: Notes on Observability

Harvey Sacks

Lectures

One of the basic things I want to be able to give you is an esthetic for social life. By that I mean, in part, that you should have some sense of where it is deep and to be able to see and to pose problems. I'll try to do somewhat more than that. I'll also try to develop a variety of notions of what kind of business sociology is, what its problems look like, what the form of the solutions to those problems are, and perhaps, to some extent, some of those solutions.

The kinds of phenomena we are going to be dealing with are always transcriptions of actual occurrences in their actual sequence. And I take it our business is to try to construct the machinery that would produce those occurrences. That is, we will find and name some objects and find and name some rules for using those objects, where the rules for using those objects will produce those occurrences.

We'll start off with a transcribed segment of conversation. It comes at about the fifth interchange into a first telephone conversation, where A is a staff member of a social agency that B has called. B was told to call this agency because of some marital troubles he's having. A doesn't know anything about B's marital troubles except what B tells him.

1 A: Yeah, then what happened?
2 B: Okay, in the meantime she [wife of B] says, "Don't ask the child nothing." Well, she stepped between me and the child, and I got up to walk out the door. When she stepped between me and the child, I went to move her out

Source: *Human Studies* vol. 12, no. 3–4, 1989, pp. 13–23.

of the way. And then about that time her sister had called the police. I don't know how she . . . what she . . .

3 A: Didn't you smack her one?
4 B: No.
5 A: You're not telling me the story, Mr. B.
6 B: Well, you see when you say "smack" you mean "hit."
7 A: Yeah, you shoved her. Is that it?
8 B: Yeah, I shoved her.

Now apart from the four or five previous interchanges, these persons do not know each other; they've never met. And I could put it that – though it's not exactly correct to say it this way – we find that nonetheless, given essentially statement 2, A is able to have some notion of what it is that has happened – in a story that he has only heard part of. Without knowing B at all, A can say *Did you smack her one?*

And there is more than that, too. Because it would be one thing if A had some expectation about what the sequence of events was that brought on the coming of the police, where A would use that expectation to make a guess, but if it turns out that he's told it's not so, then, so far as he knows, it's not so. But apparently A has a stronger grasp of the situation already, in the sense that it's not merely that he can have a guess, but that he takes it that – perhaps without regard to what B tells him – his guess is correct.

And we can notice that the fact that A has a guess here is not anything very extraordinary for B. He doesn't say, as a person sometimes says, *What makes you say that?* He says *No.* And when it's proposed that his *No* is not correct, he doesn't say, *Look, I'm telling the story. How the hell would you know?* (Parenthetically. when I say *He doesn't say . . .*, that is a rhetorical device on my part for loosening you up. I don't mean it in a serious sense. I am not making a statement that is intendedly descriptive. To propose seriously, descriptively, "A doesn't say x" is another order of proposition). But B takes it that A does know, and B corrects himself.

Furthermore, A is able to see, as well, that B "isn't telling the story." And I want to briefly focus on that kind of thing – seeing lies. I want mainly to focus on it because it seems that adult intuition may be misleading in trying to see what the problem is that seeing lies poses.

In one of the early classics of psychoanalysis, a paper entitled "On the Origin of the Influencing Machine in Schizophrenia," Tausk (1933) reports on one of his patients. The patient was a young schizophrenic girl, and one of her symptoms he found in the following way. He often questioned her, and one time when he was questioning her she started laughing at him. He asked, *What are you laughing at?* She said, *Why do you always ask me questions? After all, you know what I'm thinking.*

And Tausk worked at this symptom – that schizophrenics think other persons know their thoughts. Now the problem had been posed: How is it that schizophrenics come to think that others know their thoughts? And he tried to solve this problem.

Now Freud's comments upon the presentation of the paper are included in the journal. He says that's not the problem at all. After all, when you learn (at least your first) language, you learn it from your parents, from adults. And children must take it that adults, having given them the concepts, know how they're being used, know how the child is using them. So the problem is not how is it that people come to think that others know their thoughts, but how is it that people come to think so deeply that others don't know their thoughts?

And now, in a characteristic type of observation, Freud says that the crucial event is the first successful lie. That event must be traumatic. The kid must have to say, *My God, they don't know what's going on!*

Whether that's so or not, I certainly don't know. But intuitively I take it that most adults don't see things that way, and that it's certainly not an inconceivable formulation. And the segment of conversation we're looking at has a form which is very characteristic in adult–child interchange; that is, the mother says to the child, *What were you doing?* The child gives some answer, and the mother, who wasn't there, says, *No you weren't;* the child then corrects himself. And it isn't the case that persons proposing that one is lying, or "not telling the story," are treated as doing something quite extraordinary.

Now let's try to begin to consider what our task is if we're going to build a machine that could in the first place produce the conclusion 3 with the information presented in 2.

A first rule of procedure in doing analysis, a rule that you absolutely must use or you can't do the work, is this: In setting up what it is that seems to have happened, preparatory to solving the problem, do not let your notion of what could conceivably happen decide for you what must have happened.

So, for example, when we get this kind of conclusion drawn at 3, you might say to yourself, "how in the world could anybody think so fast?" Because this just comes off. There is no pause more than three seconds between 2 and 3. You're going to say, "How? People aren't that smart." And therefore what happened must be something very simple, something that will require only a simple solution.

And that leads to our second rule. There is no necessary fit between the complexity or simplicity of the apparatus you need to construct some object and the face-value complexity or simplicity of the object.

These are things that you have to come to terms with, given the fact that this has, indeed, occurred. And people walk around, insofar as they're doing lay affairs, with the notion that if somebody does something pretty simply, pretty quickly, or pretty routinely, then it must not be much of a problem to explain what they've done.

There is no reason to suppose that is so. I'll give you an analogical observation. In a recent review of a book attempting to describe the production of sentences in the English language – a grammar, in short – the reviewer observes that the grammar is not terribly successful, though it's not bad, and it remains a fact that those sentences which any six-year-old is able to produce routinely have not yet been adequately described by some persons who are obviously enormously brilliant scientists.

Of course the activities that molecules are able to engage in quickly, routinely, have not been described by enormously brilliant scientists. So don't worry about the brains that these persons couldn't have but which the objects seem to require. Our task is, in this sense, to build their brains.

Now, what features do we need to build into this machine? The first thing, of course, is that it is an inference-making machine. That is to say, it can deal with and categorize and make statements about an event it has not seen.

And the first thing about the sort of events it can handle is that the events are sequential. In the segment we're looking at, if we keep things very simple, what we see is that if we have *a, b, . . . d,* then if we suppose in speaking about A that he's a user of the machine we're going to have to build, he can find what c is.

He is not merely in a position to make a guess about c, but there are stronger features to this machine. When we normally think of an inference-making machine, we might imagine he gets *a, h,* and *d,* he's invited to guess what c is, he guesses something, is told *No,* he says *Okay.* That doesn't happen. For him, there is some fit operating between *a, h, c,* and *d,* such that the fact that he's told that what he proposes as c has not occurred does not constrain him from continuing to insist that his version of c occurred.

You can quickly contrast that to the situation of a riddle. I ask you a riddle and invite you to give an answer. You give an answer and I say *No, the answer is . . .* something else. And by definition that's the answer. When people do riddles you don't get an insistence, *No,* I'm *right.* The inference-making machine we are building can handle riddles, but riddles set up a simpler task than those which this machine is capable of handling.

Now let's begin to examine, in a rather informal way, how it is that the machine user, A, seems to make conclusion 3 and then 5. You're invited to use the information you have as a member of the same society that these two people are in.

What you have is something like this, roughly: A knows that the scene is a family problem. So, *a* is the family quarrel, *b* is the guy moving to the door, *d* is the police coming. And c is the grounds for the police to have come. That is, apparently on some piece of information the police have come, and that piece of information is the thing that A has guessed at. A apparently knows, then, what good grounds are for the police to be called to a scene. And he's able to use those grounds, first to make a guess, and then to assess the correctness of the answer to that guess.

We can note as well that it's not simply the case that A and B don't know each other, but we have a set of other persons who are being talked about, and A is listening to this. Whatever A knows about B, he certainly knows less about these others. A knows essentially only the set of terms that B uses to name them: that there is something called a sister, something called a wife, something called a child.

It seems to me that the information that is being used by A is held in terms of collections of these categories, categories like "wife", "sister", "child". For one, you can easily enough come to see that for any population of persons present there are available alternative sets of categories that can be used. Someone referred to as a "sister" can also be referred to as a "bus driver", a "Democrat", a

"readhead", and so on. That, then, poses for us an utterly central task in our descriptions: to have some way of providing which set of categories operate in some scene – in the reporting of that scene or in its treatment as it is occurring.

We might get a rather finer sense of the gearing of inferences to these categories by just shuffling one category around a little. For example, would the same inference be made if it were "my sister," not "her sister," who had called the police? The rules with respect to who owes what to whom, and who takes care of whom may be so formulated that those things matter a great deal. The inference in this case might then be not that the husband had produced some activity which served as good grounds for calling the police, but that the wife had done so.

And that is extremely important because it is an awesome machine if one needs to know only that it is "my wife" and "her sister." And you can do this because it holds for every like unit in society that you don't need to explore the particulars of any given situation; for example, *Well, tell me some more about your wife's sister. Is she prone to hysterics?* (where such information would be absolutely essential in psychology).

If what I've been saying is even somewhat so, then it is not merely that the notion that you need to know a great deal about somebody before you can say this or that about them may be a lot of nonsense. What is of interest is that it is the way that society goes about building people that makes such a notion a lot of nonsense. That is, a task of socialization is to produce somebody who so behaves that those categories are enough to know something about him.

One thing I want to watch for is what we can call "order of depth" in dealing with various kinds of occurrences. So, for example, considering A, suppose there is a list of good grounds for police to be called to a scene and that list is built into A's brain, as a mature member of the society, and he can, when told of some scene where the police come, throw out an item from that list as a guess (and perhaps furthermore insist on it being correct). That would be one order of depth.

But one of the things we're going to be watching for is how simple or how complex this animal is. "And one of the ways to approach that issue might be by asking, for example, if it is the case that we need, for dealing with "the police arriving", a machine – a set of rules, that is, and a set of objects that those rules handle – which is altogether distinct, such that if something else happens we need another machine for making another kind of inference. Or is it the case that we'll find that this use of an inference from the police situation is absolutely similar to the way in which some other event is found? In the latter case, "police" becomes one category of a general machine that handles a whole set of things. If that is so, then the task of describing how this animal operates will be tremendously simplified. And the work of the animal itself is, of course, tremendously simplified.

One thing that's interesting about such a machine is the following. It is clearly the case – A knows it and B knows it – that the police don't only come for the good grounds that police come for. Cranks call up the police all the time, and police answer calls that turn out not to be based on good grounds. But apparently

that fact has a special status. In general it seems that the proper ways that police come to a house are available to members and may be used, for example, to decide what happened at that house. And if you see somebody being led away by the police, you may feel that you know what's up with him – at least generically; that is, that he's done something wrong.

That suggests two things: First, the fact that some procedure which has a correct way of getting done gets done correctly – independent of any issue of people getting harassed or misunderstood – may be quite crucial in permitting persons to find the sense of an event which happened by reference to that procedure. Second – and here we're going to pose one of the central dilemmas of Western civilization – a person who stands in the position of having some procedure that has a correct basis for use applied to him stands in the position of having that procedure presumptively correctly applied. And we can give that problem a name: Job's problem.

Job, the rich, good man, had lost all his wealth, his children, his possessions. His friends come to him, and there are series of long discussions. What his friends propose is, "Look, you take it that God punishes the wicked and rewards the good. We take it the same way. Your situation is understandable only if you're guilty. So confess." And for Job the problem is, "I don't know that I'm guilty. I'm convinced that I'm not guilty. But then how could this have happened to me?"

A central dilemma, then, is that some procedure that has a proper way of operating may not so operate. Kafka is dealing with the same kind of issue. And our Mr. B is in the same boat. What A suspects may, indeed, have happened. Or B may have just felt "What can I say? After all, A knows how those things happen, and how am I going to insist that it's not so?" That is, a problem that people in a range of circumstances can be faced with is: Is there a way available to provide for some event to have happened apart from the normal and proper way these things happen?

Now we are talking about something quite general here. When we talk about it by reference to the police, we are not talking about a procedure set up by and for the police. Rather, it may be the case that in order for the police to operate successfully they have to be able to produce their activities so that these ways that members have of looking at activities can be applied to the police.

Likewise, when I talk about Job I'm not engaging in a bit of literary criticism. Job's problem focuses on a central problem of the way that persons go about orienting to the occurrence of events, and that is that it is somehow extremely important that the inferences they do make can be taken as correct – and thereby that those persons who produce those activities described by these sequences so behave as to provide for the fact that these sequences do describe them.

In that regard it is interesting to note that the phenomenon of presumptively correct descriptions, and behavior produced to fit those descriptions, can be found by reference to illegitimate as well as legitimate activities. So, for example, in his book *Order and Rebellion in Tribal Africa,* in the chapter "The Reasonable Man in Barotse Law," Gluckman offers us the "reasonable wrongdoer".

> The last case suggests that the Barotse have a picture not only of reasonable and customary right ways of behaving, but also a picture of the reasonable wrongdoer – the reasonable thief, adulterer, slanderer, and so forth.
>
> By this paradox – the reasonable wrongdoer – I sum up the fact that wrongdoers in any society also behave in customary ways which are socially stereotyped.
>
> There is the "criminal slouch" as against the "scholarly stoop", the spiv's clothes and hairstyle, the whole manner of loitering with intent to commit a criminal action.
>
> When there is only circumstantial evidence, these sorts of actions build up before the judges until they conclude that . . . the total picture is that of a reasonable wrongdoer – as we say, a person guilty beyond reasonable doubt.
>
> And I have heard cases which indicate that these customary ways of doing wrong in fact influence adulterers and thieves, so that they give themselves away in circumstances in which they could have acted so as to cover up their misdeeds. (1963, p. 190)

Our task, then, is not simply to be building a machine that can make inferences and make them in the strong way that I've proposed. A problem for a sociology interested in describing socialization will consist in large part of how it is that a human gets built who will produce his activities such that they're graspable in this way. That is to say, how it is that he'll so behave that these sequencing machines can be used to find out what he's up to.

Now, what I have been proposing could be restated as follows: For members, activities are observables. They see activities. They see persons doing intimacy, they see persons lying, and so on. It has been wrongly proposed that people do not see, for example, "my mother", but what they really see is light, dark, shadows, an object in the distance. But persons do see things like "my mother", and things like activities. And that poses for us the task of being behaviorists in this sense: Finding how it is that people can produce sets of actions that provide that others can see such things.

Earlier I observed that one way that persons go about seeing activities is by reference to some procedures that they take it properly occur as the activities occur. That is, it can be seen that Mr. B smacked his wife by virtue of the fact that the police came – by virtue of the fact that the police come when people smack their wives. While in many of its aspects the use of procedures to find the sense of some set of observables, the phenomenon to which I gave the name Job's problem, is utterly central, this fact of observability of actions is much more generic.

We can be led, then, to investigate, for example, how it is that persons learn that the activities they have gone through are observable by virtue of their appearances. where, again, this observability is not specific to each activity but is learned as a general phenomenon.

We could suppose that the following report might be the sort of thing we could use to find out how this learning takes place and to see where those things may or may not be difficult. It is a quotation from *One Boy's Day* by Barker and Wright (1951, p. 23). What they did was to have a bunch of people follow a kid

around all day, writing down everything he did that they could. They worked in half-hour shifts, and they compiled a record of his day.

> 7:20
> Raymond got up from his chair. He went directly out of the kitchen and into the bathroom.
> Coming from the bathroom, he returned to the kitchen. His mother asked pleasantly, "Did you wash your teeth?" Mr. Birch looked at him and laughed saying, "My gosh son, you have tooth powder all over your cheeks." Then both parents laughed heartily.
> Raymond turned instantly and went straight to the bathroom. He smiled as though he were not upset by his parents' comments.
> He stayed in the bathroom just a few seconds.
> He came back rubbing his face with his hands. The tooth powder was no longer visible.

Presumably Raymond can learn, through things like this, that his parents can tell that he washed his teeth by virtue of the appearance on his face of tooth powder. That fact sets up the phenomenon that I'll call, generically, "subversion".

With this example in hand, you can think of the way that children can learn subversion, having learned that the procedure is applied to them. For example, they will wash those aspects of their body that are at a glance observable so that when they appear it seems that they have washed. And the fact that this adaptation goes on provides, then, the sense in which they orient to this way that their activities are grasped.

In watching these obviously trivial things that children might do, it is conceivable that one may have analyzed matters that are treated as being of larger moment. So, for example, the segment I just gave you, in which Raymond's having brushed his teeth was seen in his face covered with some white powder, is in its character extremely central and deserves the name "generic". Simply enough, the first human event in Judaic-Christian mythology consists of man's discovery that his moral character is observable. We might call it Adam's problem.

> And when the woman saw that the tree was good for food, and that it was pleasant to the eyes, and a tree to be desired to make one wise, she took of the fruit thereof, and did eat and gave also unto her husband with her; and he did eat.
> And the eyes of them both were opened, and they knew that they were naked; and they sewed fig leaves together, and made themselves aprons.
> And they heard the voice of the Lord God walking in the garden in the cool of the day: and Adam and his wife hid themselves from the presence of the Lord God amongst the trees of the garden.
> And the Lord God called unto Adam, and said unto him, where art thou?
> And he said, I heard Thy voice in the garden and I was afraid because I was naked; and I hid myself.
> And He said, who told thee that thou wast naked? Hast thou eaten of the tree whereof I commanded thee that thou shouldst not eat?
> And the man said, the woman whom Thou gavest to be with me, she gave me of the tree, and I did eat. (Ch. 3.6–12 *Genesis,* King James Version)

And Adam learns, like Raymond learns, that one has to come to terms with the fact that from one's appearances the activities one has engaged in are observable.

Confirming Allusions: Toward an Empirical Account of Action

Emanuel A. Schegloff

Introduction

The primary goal of this article is to provide an account of a previously undescribed action that parties to talk-in-interaction may do. Ideally, it would begin by launching directly into an account of this action, but, perhaps more than is ordinarily the case, it is first necessary to set the undertaking into a theoretical context relevant to sociologists. The kind of introduction that turns out to be in point for the project – one relevant to its presentation rather than its conception and execution – is informative about both the topic and about sociology's development and current situation as a discipline.

This article is conversation-analytic in orientation. In common with many such papers, it invites reading not primarily for its bearing on so-called sociolinguistic themes but as a contribution to both basic sociological theory and appropriate methods for developing it. Past preoccupations have put the economy and the polity, religion or culture, or personality, character and "human nature" (as in theorizing inspired by Freud) at the center and foundation of social and sociological theory. In spite of a recurrently expressed recognition by sociologists from Durkheim and Mauss to Bourdieu (to cite only the French lineage – the German one might be from Simmel to Habermas, the American one, from Mead or Parsons to Goffman or Garfinkel) that language figures centrally in the organization of social life, it has remained peripheral to the main thrusts of the discipline. Several strands of contemporary theorizing (most notably those associated with the names of Bourdieu and Habermas) have sought to put language, communication, and "practice" in a position of comparable theoretical "gravity"; still, none has yet provided a clear depiction and exemplar of how

Source: *American Journal of Sociology* vol. 102, no. 1, 1996, pp. 161–216.

the prima facie, observable embodiment of sociality – action, activity, and conduct in interaction – as effectuated through the deployment of language and the body can be put at the center of theorizing about the social and can be grounded and elaborated in detailed, empirical analysis of that conduct.

The need to establish the relevance of "describing a previously undescribed action" as a sociological undertaking reflects the absence from sociology's past of a phase of naturalistic observation – one given over to the accumulation of accounts of the basic inventory or repertoire of social actions and forms of social conduct which constitute the primary observable referents of the sociality of this social species (the cognate for interaction to the database supplied to comparative-historical inquiry by the work of historians, to demographers and other quantitative students of social structure by the gathering of official social statistics, etc.).[1] Perhaps it is because sociology never went through such a phase as a discipline that it did not quite know what to do with Erving Goffman who, more than any other sociologist, tried to draw the discipline's attention to aspects of this raw material and its relevance to the discipline, though I will suggest below that his effort in this regard was itself problematic (see also Schegloff 1988*a*).

Goffman had better luck with anthropologists. In part this was because anthropologists had had good reason over the course of the development of their discipline to wonder what some "natives" were "doing" by conducting themselves in a certain way, for example, by talking in a certain way. Both linguistic obstacles and so-called "cultural differences" could pose quite sharply the problem of "recognizing actions," and then the analytic problems of describing what those actions were and how they were done or accomplished. Aside from the encounter with actions that had no cognate in their own culture, there were also "indigenous" ways of doing actions that *did* (appear to) have a place in the field-worker's culture but whose enactment was different (see, e.g., Frake 1964). Both the practical exigencies of fieldwork in an "exotic" setting and anthropology's principled disciplinary commitment to explicate the detailed diversity and specificity of human culture funneled attention to "the different." By the mid-1960s to early 1970s anthropologists converged from different routes (some of which subsequently diverged again) on an orientation to "culture" as the *ways of doing things* – whether as linguistic or cognitive procedures (as in Goodenough 1957, 1964), ways of meaning (Geertz 1973) or ways of communicating (Gumperz and Hymes 1964) – under rubrics such as "ethnoscience," "componential analysis," "ethnosemantics," "ethnography of communication," and/or simply "cultural anthropology."

When my late colleague Harvey Sacks offered an undergraduate class in social science in 1965, his characterization of a culture as "an apparatus for generating *recognizable* actions" (1992, 1:226), this was not out of keeping with the theoretical zeitgeist of the anthropology of the time. And when he proposed as an analytic task that we provide an account for how "describing" was done (1972, p. 332; see also the transcript of a lecture in the spring of 1966 [Sacks 1992, 1:236–37]), this could be understood as a confluence between ethnomethodology's interest in practical theorizing and commonsense interpretation

on the one hand (Garfinkel 1967), and, on the other, a then-current anthropological interest in describing how actions are done, albeit in this case actions from one's own culture.

But as the persistent, bemused popularity of Horace Miner's classic paper (1956) "Body Ritual among the Nacirema" shows, the same sort of attention to, and description of, actions in one's own culture never had quite the same resonance, even in anthropology. The actions were "transparent" to comembers of the culture; even naming them by action names might appear a bit arch and scholastic. Even more so was this treatment accorded accounts of the practices, rules, or mechanisms by which these actions were done. They just "were" invitations, requests, promises, insults, and so on. For mainstream sociology, and even for most of its new tributaries of the time, this sort of orientation to this society's actions apparently constituted an unassimilable – or uninteresting – proposal and undertaking.

Perhaps the development of a serious cultural sociology can change that, if by "cultural sociology" we understand something that includes not only high and popular culture, and not only that "anthropological" sense of culture that features values, beliefs, taste, fashion, and so on, but one that focuses on the "repertoire" of actions and practices out of which the quotidian life of the members of a social species is fashioned. To the degree that this ambition can be realized, cultural sociology serves simply as a key part of a serious general sociology, and not just theoretically (as it was in Parsonian theory) but empirically. It is this ambition that this article pursues.

After a brief précis of largely *conceptual* modalities of addressing "action" within sociology and without, the article reviews several *empirical* accounts of the practices for doing particular actions, as background to the present undertaking, which is to describe a new type of action and the mode of inquiry by which it was come upon.

Action and Actions

With all the commitment of major segments of the social science community, and sociology in particular, to "action" as a pivotal component of social life and its disciplined study, actual action – and particular action*s* – have been curiously absent from sociological inquiry and discourse.[2] At times they appear to be virtually epiphenomenal expressions of "underlying" factors, processes, and variables – norms, rationality, conformity, power, system functions, and the like, but important largely as the public face, the accessible display and indicator, of those underlying forces. Nowhere has the contrast between conceptual centrality and empirical dismissal been more marked than in the Parsonian "theory of action," which played so prominent a role in the sociology of the middle decades of this century. The "action" that figured so centrally for Parsons was a conceptual or analytic unit – the "unit act," with theoretically conjectured components such as the inescapable facets of action – actor, goals, means and conditions, and so forth (Parsons 1937). Actual actions were "merely" concrete

and empirical and of interest only insofar as they could be analytically decomposed into the then-current terms of theorizing (cf. Heritage 1984*b*, pp. 103–34).

Paradoxically, the main alternative has been to presume actions *central*, only then to look elsewhere for the "unofficial" – and therefore more "real" – agenda, as in much of Goffman's writing. Goffman, whose microethnography might have been thought to cast him as the most likely observer and analyst of social actions, more often took the tack that whatever else ordinary actors might in the first instance appear to be doing – walking, calling the doctor, offering medication, sanctioning rule violations, expressing intimacy by holding hands, serving a meal, waiting, and so on – what was sociologically key was that they were managing impressions and information (Goffman 1959, 1963*b*), attending to considerations of face (Goffman 1955, 1967), organizing the allocation of attention and involvement (Goffman 1963*a*), and so forth. First-order actions here are cast as the official or ostensible version of what is going on, a veil whose penetration and revelation is the true calling of the sophisticated, perspicuous sociologist or anthropologist.[3] But in these quarters no more attention was given than elsewhere to whatever persons might be thought – or observed – *in the first instance* to be doing. Ordinary social actions have thus fallen between the several sociological cracks; they are not to be found in action theory, in the microethnography of everyday interaction, or in the study of the underlying organizing social processes that drive social life.

Different as they may appear, these "approaches" come to the materials of everyday life with a theoretical filter that separates the sociological wheat from the chaff, the gold from the dross, the important from the trivial, the real from the apparent, the enduring from the transient. Generally this has resulted in accounts that formulate the actions being characterized not by reference to the projects of the actors who enacted them and were their recipients, but only by reference to the terms of the theory that was "processing" them, the only terms by reference to which they were taken to matter – as in Bales's (1950) reduction of all actions to 12 characterizations, formulated by reference to the then-current stage of Parsonian action theory. With all the differences between the various sociological treatments, actual, empirical, naturally occurring garden-variety actions have been found wanting in their own terms, from whatever direction the approaches approached (cf. Drew and Heritage [1992, pp. 10–16], who find virtually no writing by sociologists on the actions done by talk).

Aside from the theoretically motivated or presuppositionally grounded sources of this treatment of ordinary actions, there was a likely methodological source as well. Methodologically no one fully exploited the use of recording technology (audio or video) to provide the opportunity for freezing the object of inquiry – the stream of conduct of which social settings are composed – for the repeated detailed examination that might allow the analyst to shed, at least partially, the relentless interference of vernacular familiarity in the analytic depiction of actions. For example, although much of Bales's data was recorded on audiotape after the challenge of coding the stream of behavior in real time

was recognized as problematic, the audiotape was erased for reuse as soon as the "acts" had been coded. The results of the coding were taken to be "the data," leaving actual, recorded conduct as a kind of scientific detritus.

Vernacular familiarity was very likely one obstacle to the passage of the problem of recognizable action from anthropology to sociology. By contrast with work in "strange" settings, the action-import of usages in one's native or well-assimilated language or culture may fade into invisibility by virtue of its very familiarity. The same commonsense knowledge of the culture, and the semiotics, pragmatics, and discourse structure of a language that helps to constitute our cultural and linguistic competence blinds us and impedes our capacity to get at the constitution of action *technically*. Indeed, the combination of native knowledge and the absence of recorded specimens of the quotidian can obscure for us that there is a distinctive project to be undertaken here. We need to exploit the newly available technologies not only to do better – more "precisely" or compellingly – what has previously been done by observation in real time or through ethnographic elicitation; we need to ask what new analytic possibilities are made available by this new technology, and these may follow on the new observational possibilities. The increasingly sophisticated recording technologies of the last three decades may thus be to this area of inquiry what the microscope was to the life sciences earlier.

This is by no means a new idea. To realize its possible benefits, however, we need to press inquiries into what speakers can do – *do* do – with language and the other resources deployed in interaction. And we need to press those inquiries especially with materials to which we bring native competence and cultural membership. If this undertaking falls to any discipline in the current map of the social sciences, it falls to sociology. The prospect is the development of an account of action in interaction grounded in the observable details of conduct in naturally occurring social settings, which can be juxtaposed to the abstract and theoretical accounts of past and current work, accounts which were grounded in conceptual and normative considerations and invoking the common culture's stipulated understanding of typical courses of human conduct that are taken to be shared by the writers and readers of this professional literature.

Some years ago, Sacks (1992, 2:419–20) began a course of lectures by underscoring the troubles of studying talk-in-interaction with imagined or typified data, but his point extends to other nonnaturally occurring data as well.

> What I want to argue is that if a researcher uses hypotheticalized or hypotheticalized-typicalized versions of the world, then, however rich his imagination is, he is constrained by reference to what an audience, an audience of professionals, can accept as reasonable. . . . One is then debarred from using these kinds of materials [hypotheticals which are not credible to an audience]. And that debarring of lots of things that actually occur, at least presumably affects the character of social science very strongly.

By contrast, Sacks continued,

> a base for using close looking at the world for theorizing about it is that from close looking at the world you can find things that we couldn't, by imagination, assert were there: One wouldn't know that they were typical, one might not know that they ever happened, and even if one supposed that they did one couldn't say it because an audience wouldn't believe it. Where, then, if we can add to the stock of things that can be theorized about we will have done something more or less important – if the things that we've added have any import to them.

Thirty years later, this remains a robust ideal and a useful measure of many research projects. Indeed, one point of this article is of just this sort. It is to explore something that speakers of language in interaction do observably do with it, and to add thereby to an inventory of sorts, a catalog of recognizable social actions in this culture, in this case one which language is used to accomplish in interaction. The aim is to find it and provide an account of it empirically and precisely, not imaginatively or typically or hypothetically or conjecturally or experimentally, and to use actual, situated occurrences of it in naturally occurring social settings to control its description. Whatever the value of previous philosophical, conceptual, and text-based theories of action may turn out to have been, there is a separate and distinct place for an empirical theory or account of action, or action. What might it look like? How might we arrive at it? For an empirically grounded account, we need to deal with the latter question first, and the first step in addressing it is to assemble at least a moderate set of descriptions of particular actions – a corpus to which an empirical theory of action can be answerable and by which it can be constrained.

Describing Actions

But what does a description of an action look like? Before proceeding with the account of the action that is the focus of this analysis it may be useful to sketch a few accounts of actions and the practices for accomplishing them produced in past work.[4]

Even quite elementary procedural accounts of the practice(s) for doing some action ("elementary" both in the sense of "simple" and in the sense of "explicating the elements"), grounded as they are in the empirical detail and specificity of actual instances, open the door to empirical examination and, where appropriate, critique and modification. For example, once Sacks ([1964–65] 1992, 1:97) had proposed that greetings are done by putting some greeting term in first position in a conversation (". . . something is a 'greeting' only if it's a 'greeting item' in a 'greeting place'"), it was possible to examine the "hello" with which most American "private" telephone conversations begin to assess whether it is the action "greeting" that these "greeting items in greeting places" are employed to accomplish, and are taken to accomplish by their recipients, as the basis for subsequen

action. This was not a conceptual undertaking and critique but an empirical one (Schegloff 1967, 1968, 1986), and it yielded the proposal that at least *these* apparent greeting items in first position in a conversation were understood by parties to the incipient conversation to be doing *not* greeting, but answering the summons embodied in the phone's ring (with consequences such as the subsequent occurrence of an exchange of greeting terms which *were* doing greeting).

So one form that an account of an action can take is a characterization of some form or practice of talking and some characterization of the place or location in which that practice is employed – as in articulating a greeting term in an initial slot or exchange in a conversation. Relatively few actions have their procedural basis exhausted by an account of this sort, and in accounts of this sort relatively few can invoke the availability of a limited set of "dedicated" linguistic resources such as "greeting terms." But "greeting" is not the only action we can explicate in this way. In an exchange with an "artificial intelligence" computer scientist at a conference in which "compliments" were being discussed, I asked for an account of how a computer might be programmed to "do" a compliment and, very likely taking this as a request for a "speech-act" type of account, my colleague declined even to try. But one can begin with something as simple as "Select a positive assessment term for some feature of the recipient/interlocutor or interlocutor's just prior conduct." Although more is clearly necessary (as is a specification of even this much), a simple account of the constructional elements and their positioning is often a good start on an at least partial account.

One important consequence of undertaking such an account is that it can yield empirically grounded results at variance with our commonsense intuitions about how some action is accomplished or what action some utterance is to be understood to have accomplished. For example, in her account of assessments in conversation, Pomerantz (1984) focuses on responses to assessments, specifically on agreements and disagreements with them. The "position" component of her account is specified as the turn following an initial assessment, and one question she entertains is how "agreeing" and "disagreeing," respectively, are done in response to the initial assessment. Commonsense intuition might suggest that offering in the next turn an assessment of the same object that has just been assessed and offering an assessment of the same class or valence (i.e., positive if the prior assessment was positive, negative if it was negative) would go a long way toward describing "agreeing with an assessment." Consider the following exchanges (taken from Pomerantz [1984, pp. 68–69]):

Excerpt a (GJ:1)
A: She's a fox!
L: → Yeh, she's a pretty girl.

Excerpt b (NB:VII:2)
E: e-that Pa:t isn'she a do:[:ll?
M: → [iYeh isn't she pretty,

Excerpt c (AP:1)
G: That's fantastic.
B: → Isn't that good.

As readers may already have gathered from the framing with which I presented these fragments, the responses in these exchanges are of the "same sort" (in these cases all positive); but they contrast with instances such as the following (Pomerantz 1984, p. 65):

Excerpt d (JS:II:28)
J: T's- tsuh beautiful day out, isn't it?
L: → Yeh it's just gorgeous . . .

Excerpt e (MC:1)
A: Isn't he cute
B: → O::h he::s a::DORable

These "same sort" assessments are "upgraded," (Pomerantz 1984, p. 65) and do indeed accomplish agreement. But the second assessments in excerpts a–c are "downgraded" (p. 68), and although they are of the "same sort," they are taken as disagreements by the first speaker and are followed by reassertions of a "higher" assessment (pp. 68–69):

Excerpt a (GJ:1)
A: She's a fox!
L: Yeh, she's a pretty girl.
A: → Oh, she's gorgeous!

Excerpt b (NB:VII:2)
E: e-that Pa:t isn'she a do:[:ll?
M: [iYeh isn't she pretty,
(.)
E: → Oh: she's a beautiful girl.

Excerpt c (AP:1)
G: That's fantastic.
B: Isn't that good.
G: → That's marvelous

So the description of the action of agreeing with an assessment turns out to involve more than "same object, same valence in next turn," but must include (because the data show that the *parties do* it that way) practices of upgrading, downgrading and the like. Pomerantz goes on to describe other practices in the talk that are elements of the accomplishment of agreeing and disagreeing with assessments as well, ones that would almost certainly elude an "untechnical" examination, one not informed by repeated and detailed examination of actual occurrences. (The centrality of action itself aside, sociologists may register that other key features of a social order are implicated in such exchanges – assessments being one key locus of social and cultural norms regarding "the good, the true, and the beautiful," and agreement/disagreement being one interactional locus of consensus and conflict. These little exchanges are, then, the mundane sites in which the grand, macrotheoretical themes about norms and values and cultural capital are played out.)

Another form which accounts of actions can take shows them to be the outcome of specifiable practices of talking, or classes of such practices. One class of such practices may be termed "formulating," and a number of formulating practices have been shown to serve as ways of accomplishing determinate actions. For example, Sacks (from a lecture given in the spring of 1966 [1992, 1:300–305]; and another in the fall of 1968 [1992, 2:71–83]) shows how the practices of formulating for a new arrival to a conversation what was being talked about before his arrival ("We were in an automobile discussion") can serve as a possible invitation for the person to join in or not, as the case may be. Pomerantz (1980) shows how speakers' formulations of their own "limited access" to a setting or occurrence as a way of talking about it ("Your line's been busy," "I saw you drive by last night," "You were in room 252 a long time this afternoon," etc.) can serve to solicit their interlocutors' account of that setting or occurrence without explicitly requesting it. Elsewhere (Schegloff 1988*a*, pp. 120–28) I link "negative observations" or the formulation of an occurrence as an absence ("You didn't get an ice cream sandwich") to the doing of complaining. And so forth.

Another type of finding shows how alternative vehicles for implementing a facet of the talk – for example, doing it with or without delay (cf. Pomerantz 1984; Sacks [1973] 1987; Schegloff 1988*b*) – serve to accomplish additional actions as well, such as aligning with or against, agreeing or disagreeing, encouraging or discouraging.

The upshot of this discussion is that the description of an action and how it is done can extend in many, not necessarily anticipatable directions. The stance toward their object that formulations in the talk embody, the timing and delivery of the talk, the selection of implementing linguistic and body-behavioral resources – all have entered into past accounts. And what can count as "actions" in the first place has also involved a mixture of the familiar and unfamiliar. Jefferson (1984, [1983] 1993) shows that choice of interpolation by a current recipient of the talk (e.g., as between "uh huh" and "yeah") can display either projected continuing recipientship on their part or an incipient move to assume speakership, possibly with a change in topic. Heritage and Sorjonen (1994) show that starting a question with "and" can do the activity of making the question-to-follow sustain an already ongoing activity rather than constituting a new departure in the talk. I too have shown that some apparently paradoxical utterances ("Can I ask you a question?") can serve to mark what directly follows as a "parenthetical" preliminary to something else that will follow *it* (Schegloff 1980).

Virtually all of these results emerge from an "unmotivated" examination of naturally occurring interactional materials – that is, an examination not prompted by prespecified analytic goals (not even that it be the characterization of an action), but by "noticings" of initially unremarkable features of the talk or of other conduct. The trajectory of such analyses may begin with a noticing of the action being done and be pursued by specifying what about the talk or other conduct – in its context – serves as the practice for accomplishing that action. Or it may begin (as did the research reported below) with the noticing of some feature of the talk and be pursued by asking what – if anything – such a practice of talking has as its outcome.

Whatever trajectory of inquiry is followed, to support an empirically grounded account of action at least three distinct elements ought ideally to enter into an account of the action that some utterance implements.

1. First, the account requires a formulation of what action or actions are being accomplished, with compelling exemplifications in displays of data and analysis, including ways of "testing" the claim via confrontation of problematic instances and apparent "deviant cases," if possible. (The next six sections below are in various ways addressed to this task.)

2. Second, there must be a grounding of this formulation in the "reality" of the participants. Here the investigator undertakes to establish that the formulation is not an academically analytic imposition on conduct that may have been quite differently understood and experienced by the participants. This requires some demonstration that the interlocutors in the data being examined have understood the utterances (or other conduct) in question to be possibly doing the proposed action(s) or that they are oriented to that possibility – a demonstration ordinarily grounded in the interlocutors' subsequent talk or conduct (see Sacks, Schegloff, and Jefferson [1974, pp. 728–29] on proof procedures; also Heritage 1984*b*, pp. 254–60). This immediately subsequent talk, being appropriate to – or even responsive to – what preceded it, ordinarily displays an understanding of what that preceding talk was "doing." (This issue is addressed intermittently in three sections below, from "A Candidate Solution" through "Evidence from Avoidance and Nonoccurrence.")

3. A third element of a proper account of an action is an explication and analysis of what it is about the observed talk or other conduct or the practices embodied in it, which makes the enactment of that talk/conduct possibly an instance of the proposed action, and makes it analyzable by the coparticipants as an instance of that action, that is, why or how that practice can yield that action. It is not enough to show that some utterance was understood by its recipient to implement a particular action (and, indeed, sometimes this is not possible because it was not so understood, though it "might have been"). In order to provide analytically the grounds for the possibility of such an understanding, an account must be offered of what about the production of that talk/conduct provided for its recognizability as such an action; that is, what were the methodical, or procedural, or "practice-d" grounds of its production. Once explicated and established, this serves as part of the account of the utterance/action, *whether or not it was so understood by its recipient on any particular occasion.*[5] If the account of action in which we are interested is to be understood as informing the deployment and uptake of particular acts by participants in singular contexts in real time, then it must include a specification of the methodic basis for the construction, deployment, and recognition of this action. (This matter is addressed below in "The Fit between the Practice and the Action.")

Although not each of these elements can always be provided in full and compelling form, whether for analytical or editorial reasons, these three elements ought to provide the minimum points of reference for a minimally satisfactory analysis. The ensuing sections of this article offer, instead of further discursive

or programmatic elaboration, possible exemplars of what such a grounding for an empirical account of action might look like.

To revert, then, to where we began, the primary goal of this article is to describe a previously undescribed action that parties to talk-in-interaction may do and something of its provenance and uses. It is a contribution to addressing a lacuna in what should be a central area of inquiry for sociological theory and analysis – the database without which there cannot be an empirically grounded theory of action(s). In this regard, I am reporting on what might merit the term "discovery" in this corner of the world of inquiry into the foundations of sociality – I want to describe a possible discovery of an action and something of how that came about.

I will proceed developmentally, from (1) some initial observations and a puzzle that they posed to (2) the collection of a set of potentially relevant materials and the isolation within it of a core collection of fragments of talk bearing on the initiating observations to (3) an initial statement of a candidate solution to the originating puzzle – the phenomenon I mean to be introducing. That phenomenon is then further elaborated with respect to underlying practice and provenance.

Initial Noticings and a Puzzle

In the course of examining with a seminar (whose contribution I hereby acknowledge) a telephone conversation between two sisters-in-law in their 60s, the two fragments of talk shown in excerpts 1 and 2 were encountered several minutes and topic shifts apart. (The notational conventions most important for reading the transcribed data in this article may be found in the appendix. I cannot urge strongly enough that the reader examine the data excerpts closely, and not "read around them." It is not possible to understand the claims and arguments of the text properly without doing so.)

Excerpt 1 (Berkeley II: 103–114; simplified)
Evelyn has been called to the phone.

1	Evelyn:		= Hi: Rita
2	Rita:		Hi: Evelyn:. How [are y'
3	Evelyn:		[I hadda come **in another room.**
4	Rita:		Oh:. Uh huh. =
5	Evelyn:		= I fee:l a bi:ssel verschickert.
6			(0.2)
7	Rita:		W-why's 'a:t,
8			(0.4)
9	Rita:	→	uh you've had sump'n t' dr^ink. =
10	Evelyn:	⇉	= I had sump'n t' dri:nk.
11	Rita:		Uh huh.

Excerpt 2 (Berkeley II: 157–168; simplified)

1	Rita:	. . . y'know we: went to the mo:vies. =
2		= We went to: uh:m. uh to: (m) u(h):
3		What's *the name of ( ) ((off-line))

4	Evelyn:		(Sh'beau)?
5	Rita:		(** **) (Millbrae) ((off-line))
6			Millbrae. which is over past Burlingame.
7			(0.2)
8	Evelyn:	→	Yeah th[at's 'n far away.
9	Rita:		[(and-)
10	Rita:	⇉	That's far away. And- there were two good movies . . .

The initial observations concerned the arrowed turns in each of these excerpts. Two aspects of these turns invite attention and together prompt a puzzle. First, their speakers appear to be doing some sort of agreement; indeed, for reasons that remain to be explicated later, they appear to be doing the particular species of agreement that we ordinarily term "confirmation." Second, they do this confirmation by repeating that which is being agreed with.

The initial puzzle was, Is something special going on here? What are these repeats doing? Or, more precisely, what (if anything) are these repeats being distinctively used to do when employed as the means for agreeing or confirming?

One of the ingredients of this puzzle is that, while some sort of agreement or confirmation seems to be involved in these fragments, the most familiar forms for doing it are not being used, namely, (*a*) agreement tokens such as "yeah," "uh huh," and the like, (*b*) pro-termed versions of the talk being agreed with, such as "I did," or "It is," or upgraded or intensified versions of these, such as "It certainly is," or (*c*) forms that can be more specifically used and heard as ones for *confirmation*, forms such as "that's right," as in excerpt 3. Here a teacher confirms a child's observation (at the single-headed arrow) with a change-of-state token "Oh" (Heritage 1984*a*), a confirmation form ("that's right"), and an intensified or underscored reassertion of what is being confirmed.

Excerpt 3 (Philadelphia preschool)

Jason is reporting the mispositioning of a felt marker, which indicates the presence or absence of each child.

1	Jason:		Somebody put mine right there.
2			((gap))
3	Jason:		There.
4			((gap))
5	Jason:		I didn'.
6	Teacher:		I can't imagine why that ha:ppened Jason.
7			((gap))
8	Teacher:		But I'm really glad that you're here. = ·hhh
9			Check and see if there's any down on the
10			bottom that people forgot to hang up.
11	Girl 1:	→	That was Alison's job.
12	Teacher:	⇉	Oh that's right. It is Alison's job.
13	Girl 1:		A: l i s o n ! ((calling out for her))
14	Girl 2:		Ma:rk is absent.

Whatever their actual relative frequencies, the question remains whether selection among these forms is a locus of order and constitutes a set of practices for differentially implementing particular actions.[6] And, if so, exactly what might someone be doing by confirming in *this* way – that is, by repeating, and (to make explicit another feature of these two instances, excerpts 1 and 2) by repeating *in the next turn*, that which is being agreed with or confirmed?

Assembling a Database

One way of proceeding is to assemble a collection of fragments of talk-in-interaction in which "repeats" are employed, in order to enrich the set of exemplars of whatever it is we are investigating (if, indeed, it is an "it" at all – something not known at the outset of the inquiry). We assemble the collection of repeats "generously," that is, with an ample and inclusive net, including types of repeats which prima facie appear *different* from our target instances. This will allow us – indeed *force* us – later on, when we discard these instances, to make explicit just what it is which makes them different from our targets, and thereby potentially to specify progressively just what (if anything) is distinctively going on in the fragments which set us off. As a by-product, we may also be led to encounter other orderly forms, uses, and positionings of repeats – some of them familiar, some of them pointing to other new projects to be pursued.

There is not the space here to elaborate the major initial differentiations that discriminate the sorts of occurrences with which we began – the kernel of the "core collection" – from the several other varieties of repeats that an initial canvass of the data revealed. But in seeking initially to decide only *which* other occurrences of repeats belong with our initial two instances, we are led to make the following discriminations – there will be seven of them – which I will only list and briefly explicate, but not exemplify or explore in any detail.

First, repeats may be done either by the speaker of the first saying or by some recipient of the first saying. Either sort of party may use repeats for a range of different uses, but those ranges of uses are different for the two classes of "repeater." Our core collection contains only repeats by someone *other* than the initial sayer of the repeated utterance.

Second, as noted in passing earlier, the repeat can be in the turn after the first saying or in any subsequent turn. The repeats that we are tracking are in next turn after the first saying. (The reader will by now have noticed from the first three data excerpts that initial sayings are marked by single-headed arrows, and the turns in which they are repeated – or could have been – are marked by double-headed arrows.)

Third, repeats by a recipient in the turn after the first saying can occupy or enact at least three different types of sequential position. (1) a repeat may be used *to initiate a sequence*, most commonly (but not invariably, cf. Jefferson [1972]) a repair sequence addressed to some problem of hearing or understanding (Schegloff, Jefferson, and Sacks 1977), as in excerpt 4.[7]

Excerpt 4 (Shiffman:378)

1	S:		Did you work for somebody before you worked for Zappa?
2	O:		Yeh many many
3			(3.0)
4	O:		Canned heat for a year
5	S:		Didya?
6	O:		Poco for a year
7	T:		Ooh when they were good?
8	O:	→	Bangor-Flunt Madura fer a y- couple years
9	T:	⇉	Bangor Flunt Madura?
10	O:		Bangor Flying Circus
11	J:		O:h yeh I [remember Bangor Flying Circus
12	L:		[Ye::ah
13	J:		Played at Creation
14	L:		Yeh

(2) a repeat may be used *responsively, in second position in a sequence*, either in a complementary relationship to the prior utterance, for example, as an answer to a question (as in excerpt 5), or in a reciprocal or exchange relationship to the prior utterance, as in exchanges of such ritual tokens as greetings or farewells (e.g., the exchange of "bye bye"s in excerpt (6).

Excerpt 5 (BB gun)

1	Bonnie:		C'd yuh bring it to the meeting?
2			(0.4)
3	Bonnie:		the lo:ngest one you [hav]e.
4	Jim:		S[ure.]
5			(0.4)
6	Bonnie:		[An]
7	Jim:	→	[The] longest one?
8	Bonnie:	⇉	The longest one.

Excerpt 6 (Pink book)

1	B:		Okay Vaness. I'm (·) gonna get going.
2	V:		Okay.
3	B:		Alright?
4	V:		Alright.
5	B:		See you this evening.
6	V:	→	Okay bye bye. =
7	B:	⇉	= Bye bye.

Or, (3), and finally for now, a *repeat may be in, or may embody, a sequentially third position, where it may serve to receive or register* an utterance that was produced in second position as a response to some first position utterance (as in excerpt 7

Excerpt 7 (Upholstery shop)

1	Mike:		W'll what are yer religious beliefs.
2	Vic:	→	Uh, (0.7) S'preme being.
3	Mike:	⇉	Supreme being.

Of the three positions I have mentioned, the repeats in our core collection occur mostly in the second position – that is, as responses of some sort, a few in the third, but not as sequence initiators.

A fourth discrimination made in assembling the core collection of the target repeats is between "identical" and modified resayings of the prior utterance. Now what counts as "identical" turns on how the criteria are drawn; there will almost always be differences of prosody or intonation, for example, between initial and subsequent sayings. For our purposes, we will distinguish between those repeats which, on the one hand, resay *all*, rather than part, of the prior turn-constructional-unit or clause (often the whole of prior turn), and say it using *the same words* (except for transformations to satisfy the constraints of speaker-change and deixis),[8] and those, on the other hand, that modify the diction of the turn on its resaying. With respect then to lexical composition, the instances included in our core collection are *identical repeats* (with deictic and speaker-change adjustments), rather than transformations or paraphrases of the first saying.

Fifth, the repeats of prior turn can be all that occurs in the next turn or they can be combined with other talk. Even the two instances from the core collection with which we began show that either of these may be the case. However, if there *is* talk of another sort in the turn in addition to the repeat, it turns out that it *follows* the repeat.

A sixth, and related, feature of those repeats in sequentially second and third position that appear to be doing some form of agreement with prior utterance is that the turn in which the repeat is done may include *other forms of agreement besides the repeat* or may not, and if there *are* other forms of agreement, these may precede the repeat or follow it. Of the 60 or so instances in the core collection of what has emerged as the target phenomenon here, the vast majority have no other forms of agreement in the turn. Virtually all those that *do* include agreement tokens have them *after* the repeat and not before it. The significance of this (and of the preceding paragraph) is that the first such component of a turn can occasion the relevance of turn transfer (Sacks et al. 1974, p. 704) that, if acted upon, can block further components of the turn from being effectively produced. The highly regular initial positioning of these repeats within their turns displays an orientation to getting *them* said in their speakers' turns, even if nothing else gets said there.

From a quite broad collection of repeated utterances, we have progressively focused our attention to those that are repeated, *virtually identically*, in *next turn*, *by recipients of the first saying*, with the repeat embodying a *second or third position* in its sequence. We are looking at repeats that are doing agreement. The repeats either are *all* of what is in the turn *or are the first thing* in the turn.

Recall that we have been trying to circumscribe the sort of practice instantiated by our initial instances. It is not that other values on each of the variables I have described do not occur; many of them do. But each of those combinations invites its own inquiry: for each we must inquire whether it defines a natural class of cases, a class of practices of talk, a particular way of doing some action(s). We cannot pursue those inquiries here; we are in search of what is getting done by the practice whose features we have been specifying.

A further, seventh, characteristic of the instances with which we began is useful in discriminating between other repeats meeting the specifications so far adduced that belong in our core collection and those that do not. This characterization makes reference not to the repeat itself, but to the initial saying of the utterance involved – the one indicated by the single-headed arrow in excerpts 1 and 2. The feature is that the speaker of the initial saying, in saying it, is offering a candidate observation, interpretation, or understanding of the *recipient's* circumstances, current or past.[9] And it is that recipient who repeats the utterance in next turn. It is *this* feature that lends the specific aspect of "confirmation" to what would otherwise be more broadly characterized as "agreements." It being *their* circumstances that are formulated by the first saying of the utterance in question, they are presumed to be authoritatively informed about those circumstances, and their agreements are thus "confirmatory."

Now it may appear, especially with this last quite substantial constraint, that the class of forms that was the target has been exhaustively specified, if not virtually defined. But note that, even with all of these features or constraints, a participant in an occasion of talk-in-interaction who means to respond affirmatively to some interlocutor's proffered understanding of their circumstances can still do so with a common agreement token (yes), as will be seen later in extracts (15) and (16) below.

What we have done so far, then, is *not* the provision of an account of what this practice of talk-in-interaction in particular is doing or is being used to do. The specification of these seven features has served to define a domain of occurrences – a universe of data to which an account of this practice (if it *is* a practice) should be adequate and against which it can be assessed. What remains is to develop and assess such an account: What (if anything) *is* someone doing by agreeing with such a prior utterance – confirming it – by the use of a repeat of that utterance?

A Candidate Solution: Confirming Allusions

Let me offer an initial account, which I will then explicate on excerpt 2. In the instances in our core collection, we can note that the sense of what is being confirmed can be seen to have been "planted" (so to speak), or conveyed, in the preceding talk, but to have not been said "in so many words," or in *any* words "explicitly." The other participant, the one whose utterance is being repeated – the "first sayer," so to speak – has, by that utterance, formulated explicitly an understanding of what the recipient had conveyed without saying. By repeating that "explication," the "confirming party" not only confirms the *sense* that the utterance proposes is to be made of what preceded. In addition, the confirmer confirms that that sense *had* been "alluded to," *had* been conveyed without being said. The repeat confirms the allusion, and confirms it *as* an allusion.

I use the term "allusion" here very broadly, including diverse usages from "hinting" to such "nonliteral" tropes as metaphor, metonomy, and analogy. There seems little point in discriminating which literary usage some vernacular

expression might be taken to exemplify. Nor is it the case that "allusions" can only be to other texts, though this is a very common form of literary allusion.

With respect to the notion of a nonliteral trope, I understand the current view held by some that no clear distinction can be drawn between the literal and the nonliteral. Although semiotically speaking it may well be that anything can mean anything, it is striking that in ordinary uses of the vernacular, participants do not behave that way. They use the talk, and certain resources in it, to do just these things, and they understand it as doing just these things. They wrest the ordinary from the indefinitely many possibilities and from the possibilities of indefiniteness. That includes the literal and not, the direct and not.

How then do these repeats confirm allusions? In excerpt 2, for example, Rita reports that she and her husband went to the movies in a town whose name she first searches for and then consults her husband to retrieve (thereby marking it as possibly unfamiliar). She then provides a possible basis for the "difficulty" of the reference, by characterizing the town as "over past Burlingame."

Excerpt 2 (Berkeley II: 157–168; simplified)

1	Rita:		. . . y'know we: went to the mo:vies. =
2			= We went to: uh:m. uh to: (m)u(h):
3			What's* the name of ( ) ((off-line))
4	Evelyn:		(Sh'beau)?
5	Rita:		(** **) (Millbrae) ((off-line))
6			Millbrae. which is over past Burlingame.
7			(0.2)
8	Evelyn:	→	Yeah th[at's 'n far away.
9	Rita:		[(and-)
10	Rita:	⇉	That's far away. And- there were two good movies . . .

Now there are various ways to "locate" a place geographically in talk-in-interaction, various ways to formulate where it is (Schegloff 1972). Even among place references that formulate location by reference to some landmark, a place that is "past X" can ordinarily also be "this side of Y." By characterizing Millbrae as "over past Burlingame," Rita can be heard to be characterizing it as a place "far away." (And indeed she later explains that she had wanted to see the movie in question when it was in Berkeley where she lives, but that "it was gone. so I knew it was the only place we could go to see it.") But she does not explicitly *say* "far away"; she *does* "formulating it as 'far away.'"

Evelyn shows her understanding of what is going on here in the next turn by characterizing the place that Rita has referred to as "far away." Rita's repeat of that, in contrast to "yeah" or "that's right," shows not only agreement with the proposition that Millbrae is in fact "far away," but that *that* is what she had been doing – conveying "far awayness" – by the practice that she had employed in her preceding talk. She thereby also underscores that it is not that *she* is agreeing with *Evelyn's* characterization of the distance; but that *Evelyn* was agreeing with her depiction of the distance, conveyed by the form or practice of her locational formulation. This matter of who is agreeing with whom may seem petty, but parties to conversation *do* care about it, and it *can* be interactionally quite consequential, as we will see before we are done.[10]

In excerpt 8, this operation of the repeat is underscored by the confirmer's subsequent remark:

Excerpt 8 (Shreve: 2)
Interview with Susan Shreve on National Public Radio concerning her recent novel.

1	Edwards:		Why do you write juvenile books.
2			(0.5)
3	Edwards:		[’s that- b- (0.?) [hav]ing [children?]
4	Shreve:		[Because I love child[ren]. [I really do:] =
5			= ·hh I enjoy children:, ·hh I started writing: (·)
6			juvenile books fer entirely pra:ctical reasons, ·hh
7			(·)
8	Shreve:		[u- u-
9	Edwards:	→	[Making money::.
10	Shreve:	⇉	Making [money
11	Edwards:		[yes ((+laughter))
12	Shreve:	⇉	that- that practical reason hhh
13			(·)
14	Shreve:		I’ve been writing juvenile books for a lo:ng. .

The interviewer has understood "entirely practical reasons" as an allusion to the need for earning money, and he formulates that as his understanding in the next turn. In *repeating* his formulation to confirm it, Shreve confirms as well the status of "practical reasons" as an allusion to making money (perhaps a more "tasteful" allusion to it). Her follow-up remark – "*that* practical reason" – is addressed just to making this tie back to "practical reasons" as the allusive reference source quite clear, and a bit of laughing together marks their coimplication in introducing the "grubby" subject into a discussion of the arts (see Jefferson, Sacks and Schegloff 1987).

This fragment, then, should serve not only as another instance in which veiled or allusive reference, or a conveyed but not explicated sense or meaning, is brought "into the open." It also shows this process itself being overtly recognized and marked by the participants.

However, neither "self-conscious design" nor "intentional" deployment (whatever those terms are understood to mean) is criterial to this analysis. In offering as alternative formulations that something had been "planted," "alluded to," "conveyed without being said," I mean to circumlocute the issue of intentionality or design. "Planted," "hinted at," and "alluded to" appear virtually inescapable to carry that implication in their vernacular usage, and I will accordingly limit their use in favor of "conveyed without being said." This fundamentally commonsense (and in some views culturally specific; see Duranti 1988; Ochs 1988) usage of "intentionality" is of equivocal analytic relevance or use here and in any case is subject to a continuum of experience that belies bold contrasts.[11] The following exchange may embody a limiting case – and an informative one. An "assistant professor type" is observed entering his department's main office, to be greeted by a staff member:

Excerpt 9 (EAS:FN)

1	She:	↑Hey there!	((Highly animated))
2	He:	↑Hey there!	((Echoed intonation))
3	She: →	You're back in town?	
4	He: ⇉	I'm back in town.	

One's physical presence is hardly an allusion; it is a palpable embodiment of presence. But it is nonetheless inexplicit – conveyed without being said. One's presence has been presented, so to speak, but not formulated explicitly. So it is inexplicit conveyance that is being confirmed in this exchange, not any specific trope, whether literary or vernacular. Were the term "allusion" employed here, it would be as a term of convenience, to serve as an occasional relief from the more cumbersome "inexplicit conveyance."

Although *agreeing* with another's explication of an inexplicit "message" may not always indicate a prior orientation to conveying it, *agreeing by repeating* may be a practice that does just that. That, at least, is the proposal being explored here. That proposal is that the repeat is designed to *indicate* a prior orientation to convey, but that may stand in an indeterminate relation to the orientation that informed the prior talk. The most proximate exchange in which the confirmatory repeat figures, then, can be a contingent part of the larger sequence in which it occurs and *doing* something in it, and not just an objective indicator of what happened earlier.

Exploring the Practice in Diverse Contexts

It will be useful to linger a bit with a number of additional fragments from the core collection assembled to explore this "candidate phenomenon"; they readily lend themselves to explication along the lines already suggested and give a sense of the robustness of this usage. They allow us to explore some of the forms of inexplicitness that get explicated in these episodes, and, relatedly, the uses parties to conversation may have for talking allusively or indirectly in the first place.

In excerpt 10, a separated couple are discussing the return of their teenaged son to his father after having had a visit in another city with his mother. The father has called to find out when the son should be expected to arrive via car, only to be informed of a change of plan by the mother:

Excerpt 10 (MDE:MTRAC: 60–1:2)

1	Marsha:	= He's flying.	
		(0.2)	
2	Marsha:	En Ilene is going to meet im:, Becuz the to:p wz ripped	
3		off'v iz car which is tih ssay someb'ddy helped th'mselfs.	
	Tony: →	Stolen.	
		(0.4)	
	Marsha: ⇉	Stolen. Right out in front of my house.	

Marsha's initial account for the shift to "flying" is that "the top was ripped off'v his car" (the "top" involved is apparently a cloth top to a convertible model). Marsha herself catches the ambiguity potentially hearable in "ripped off," between the idiom for "robbery" and the physical act of tearing, and extends her turn in order to disambiguate it. The form she chooses is, however, still "nonliteral," a kind of irony – "somebody helped themselves." The sense of what has happened has, then, been *conveyed* without being given its "common name." When Tony offers "stolen" as literally what happened, Marsha not only confirms that that is what has happened, but does so with a form that confirms as well that that is what she was conveying in her prior talk (Schegloff 1988*b*, 1992*b*).

With this instance in hand (and the orientation it shows parties to have to idiomatic usages), we can return to excerpt 1 and understand it also to involve an ambiguity.

Excerpt 1 (Berkeley II: 103–114; simplified)
Evelyn has been called to the phone.

1	Evelyn:		= Hi: Rita
2	Rita:		Hi: Evelyn:. How[are y'
3	Evelyn:		[I hadda come **in another room.**
4	Rita:		Oh:. Uh huh. =
5	Evelyn:		= I fee:l a bi:ssel verschickert.
6			(0.2)
7	Rita:		W-why's 'a:t,
8			(0.4)
9	Rita:	→	uh you've had sump'n t' dr^ink. =
10	Evelyn:	⇉	I had sump'n t' dri:nk.
11	Rita:		Uh huh.

The ambiguity here turns on the Yiddish word *verschickert.* It can be used to refer both to mild intoxication roughly translatable as "tipsy," or to refer to a cognate state (if I may put it that way) arrived at without benefit of alcohol, roughly translatable as "punchy" or "groggy." ("A bissel," by the way, means "a little.") Rita apparently understands it in the second sense (possibly because Evelyn says, not that she *is* "a bissel verschickert," but that she *feels* that way). Offered as an answer to the question "How are you?" such a response invites the inquirer to pursue the matter and inquire after the causes of the reported state (Sacks 1975; Jefferson 1980; Schegloff 1986), typically via a "what happened" to produce that state. And this is what Rita does ("Why's that?"). But when an answer with an account is delayed, she appears to have reanalyzed the prior response as intending the first of the senses suggested earlier ("tipsy" being the one actually more literally related to the root of the word, which means "drunk"), and she offers that as her understanding ("You've had something to drink"). In confirming with a repeat, Evelyn not only verifies the supposition as to how she came to be in the state she is in, but invokes the presence of that meaning in her own immediately prior talk.

The locus of inexplicitness, and the focus of explication, need not be concentrated in a specific expression, word or phrase. It can somewhat more

diffusely inform a discursive unit such as a narrative. In excerpt (11), Vera is engaged in reporting on the visit of her children and grandchildren, one consequence of which is making audiotape copies of various of her music records for them. (If this one "reads" differently, it may be because it is taken from British data, as are other excerpts whose identifying number is marked with an asterisk.)

Excerpt 11* (Rahman B:2:JV[14]2; #12)

1	Vera:		Any rate ehv eh ah'm tapin' fuh Bill no:w:
2			etheh little devils with the ta:pes you kno:w
3	Jenny:		Oh: they pull the tap [es (puhhaps do they)]

20	Vera:		['n ah sai [d ah-[.hh [ah'll tape] it
21			[fohr you] =
22	Jenny:		[Y e : s.]
23	Vera:		= en John Denver they want doing · yih [know,]
24	Jenny:		[ehhhh] =
25		→	heh so yuh busy at it [again.]
26	Vera:	⇉	[So: ah]'m busy at it
27			agay: [n. yih[nuhhh
28	Jenny:		[·hhhhh[hu:h · uh

Initially Vera just reports that she is taping, but then she begins a series of brief stories, in each of which an indirect indication by her daughter or her son-in-law elicits an offer by Vera to make a tape. Note that Vera reports Jean's remarking on her having a certain record (lines 6–7), which Vera shows herself to have treated as a "hint" of some sort by responding with "why" (line 12). And Bill calls another record "smashin" (lines 17–18), which prompts a separate offer to tape. Then there is a third artist that "they want doing" (line 23), and the sense is conveyed of the cumulative burdensomeness of the undertaking. This sense is extracted and crystallized by Jenny ("so yuh busy at it again") after the third of the "assignments" has been mentioned, when they have become more than occasional – and is confirmed by Vera, both as to content and as to prior implication.

Excerpt 11 allows us to see clearly that some telling may be constructed by its teller, and/or be taken by its recipient, to embody and/or

that the teller is taking to the tale, some stance being taken up, or some action being done. When a recipient makes that explicit in the uptake, the teller can confirm both the particulars of the uptake, its "propositional content" so to speak, and that he or she was engaged in such a "project." But note that by doing it in this manner, Vera can avoid any actual, explicit complaining and still have her burden registered and appreciated. There can be, then, grounds for talking allusively and for practices that deal with such talk. (So also in excerpt 10 above is there a specific basis for talking allusively; that is a common practice for organizing the delivery of bad news, a theme discussed in Schegloff 1988*b*.)

Excerpt 12 offers another environment in which there are systematic grounds for allusive talk and accordingly systematic grounds for usages that are addressed to allusive talk.

Excerpt 12 (Brun-Cottan [1989, chap. 5, p. 2])
M is returning F's call; first several utterances not recorded.

1	M:		. . . you:::
2	F:		I'm well: thank you.
3	M:		·hh(d) you sound like you have a jo:b hh
4	F:		No I do:n(hh) (hh)'t. ·hh
5	M:	→	Oh you're not tha:t wel[l.
6	F:	⇉	[I'm not that well, ·hh
7	M:		Oh: goodness::.
8	F:		I- before we get into anything else. . .

The women in this episode are part of a mutual-help network of women all looking for work as assistant producers in the Hollywood movie industry. Note that M is returning the call, which is to say that F called her in the first instance. F may, then, have had a "reason for the call," one important such warrant being "news to tell." When F responds to a "howaryou" with an emphatic "I'm well" (line 2), M hears in it a possible allusion to the occurrence of something that would make F emphatically well – a job.[12]

As noted in the discussion of excerpt 1 above, this is a sequentially strategic place for such an occurrence. Answers to "howaryou"s in the openings of telephone conversations are specifically a position for preemptively launching first topics (Schegloff 1986), and particularly for first topics that announce good or bad news. Raising first topics of these sorts preemptively can be a way of avoiding awkward conjunctions of the good and bad news of the respective parties. *Alluding* to the news is a strategic way of proceeding in that it allows a recipient who has claimably higher priority news – either good or bad, but especially of the opposite type than otherwise seems about to be told – to decline to pursue the matter and initiate their own first topic instead.

But in the episode from which excerpt 12 is drawn, M does pursue the matter, and does so in a characteristic way – she offers (line 3) a candidate understanding of what she takes it the other may have meant to convey. As it happens she's wrong, and F tells her so (line 4) by denying the formulation of her possible news. M then offers another candidate understanding (line 5), this one designed to register a more careful calibration of the well-being that F's initial response

to the inquiry conveyed and displaying that it was that utterance and its articulation that was the (inexplicit) source of her prior candidate understanding. Now F means not only to confirm the degree of well-ness that M has ventured, but also that this is what her "I'm well" had been designed to convey. Rather than doing the confirmation by a form, such as, for example, "No, I'm afraid not," she does the confirmation by repeating the proposed explication of what she had conveyed allusively earlier, "I'm not that well."

Less Transparent Instances

With some clear instances in hand, we can examine occurrences that may initially appear problematic. These, it turns out, are better examined not forward in time (from the inexplicit conveying to the explication) but in retrospect, starting with the repeat's suggestion that an inexplicit message had been conveyed and then seeking it out in the earlier talk.

As excerpt 13 shows, the line between what was said and what was conveyed, between the "explicit" and the "implied," can be drawn very finely indeed.

Excerpt 13* (Drew: Student [A:I:7:10–11])

1	B:		but e- I mean he was in a terr:ible state, because they- W ( )
2			they took away the roof of his mouth an' his cheek bone an'
3			all the inside of his nose.
4			(0.8)
5	B:		an' his one eye they've sewed^up.
6			(0.5)
7	P:		^e::h::::
8			(0.5)
9	B:		((cough)) (0.4) yeah and th[en-
10	P:		[so he's in quite a state
11			[reall [y*is he.*
12	B:		[Oh he[is, an' of course he can't eat: you see,
13			or swallow so he's just having these fluids and things,
14			(0.9)
15	P:		^oo::h[:
16	B:		[he's so thin that I think 'tis really (·) quite
17			unbelievable you know that anybody could be so thin.
18	P:		O::^h:[:^
19	B:		[and still sort of (0.3) sit u(h)p if (h) you kn(hh)ow
20			what I mean.
21	P:		^o::h:: ^God[:]:
22	B:		['tem]
23			(·)
24	P:	→	He can't eat any solid food at all [; then?
25	B:	⇉	['e can't
26		⇉	eat any solid food at all at the moment.
27	P:		o^o::h^my:-

Initial examination of this episode can use the exchange at the arrows to provide prima facie grounds for treating this as an instance of the phenomenon we have been trying to describe. P has offered a candidate understanding of the situation of the patient being described in gory detail by B, and B has confirmed with a repeat. On the account so far offered of such repeats, we are invited to see that B had earlier alluded to, or somehow otherwise inexplicitly conveyed, just the understanding that P here proffers.

When we try to do this, it may appear that excerpt 13 is not a good instance of the phenomenon, is perhaps counterevidence, or an exemplification of some other use of the confirmation-by-repeat practice. For it appears that B had not conveyed this sense *in*explicitly earlier, but had said "can't eat" in so many words (lines 12–13). But we should then note that what B had said earlier was that he (the patient) "can't eat . . . or swallow . . . so he's just having these fluids." This could be taken literally, to mean that he cannot *ingest orally*, and "having fluids" then refers to IVs, or intravenous feeding. Alternatively, "eat" could be taken more narrowly, as a contrast to "drink," with "having fluids" then referring to that ability to drink and implying that "can't eat" refers only to "food"; note that in this hearing it is an *implication* that "can't eat" refers only to food. P's eventual candidate understanding is that he "can't eat *any solid food at all*," which makes *explicit* one understanding of what the reference to "having fluids" now turns out to have done *inexplicitly* earlier, which B's repeat confirms.

There are two points to be registered and stressed here. First, we must recognize that, for understanding the production of the talk, the relevant senses of "explicit" and "implicit" or "inexplicit" are *not* those of the professional student of logic, semantics, pragmatics, or rhetoric, but those of the participants themselves; and the level of detail worth working out is given by the concerns of the participants' lives, not those of professional students. (It is *their* mutual acquaintance they are talking about, and the extent of *his* permanent disfigurement and incapacity.) We are here getting at the *members' then-relevant* sense and practice of explicitness.

Second, looking at the data in this way (i.e., back from the confirmatory repeat to the preceding talk to search out what is now being claimed to have been made allusively available earlier) can provide "professional" analysts a methodological resource for the analysis of a class of especially challenging occurrences – those in which speakers design their talk, at least in part, to mask what they are doing from coparticipants. To the degree to which they succeed, they challenge analysis and compelling explication by professional analysts as well. Among these special challenges to analysis are deception, lying, pretense, simulation or covering up. When done fully adequately, they will in the nature of the case appear to defy analysis for what they are (cf., e.g., Jefferson 1986).

Allusion provides a milder version of the same phenomenon. With it speakers do indeed avoid explicit saying or doing. At the same time, however, speakers do introduce the import of what they are about into the interactional occasion (as in Vera's story in excerpt 11 above). But professional analysis does not settle for implicit "senses" of what another has introduced, as "lay analysis" by interactional coparticipants may; it seeks explicit statement of what has occurred

and how, and it is just this which an alluder, an inexplicit conveyor, has *not* done, has on occasion *specifically not* done. It is useful then to find a post hoc form of talk which appears to provide a sort of internal grounding for such analysis. For, if it *is* the case that confirmation-repeats can do what I have proposed they do, they can serve for the occasions in which they occur as data-internal verification that inexplicit conveyance had been oriented to by the participants. The study of allusion and inexplicitness can thereby be rescued from allusiveness and inexplicitness of its own and can be grounded in a corpus of in situ participant-attested occurrences.

Evidence from Avoidance and Nonoccurrence

I want to offer one last sort of evidence and display of the practice of agreeing-by-repeating for confirming allusions that builds from its nondeployment rather than from its deployment. One is exemplified in avoidance – an observable withholding of the practice; the other is an analytically grounded claim of relevant nonoccurrence.

Avoidance

One often compelling sort of evidence for a claimed practice, orientation, or organization in talk-in-interaction is the *eventfulness of its absence*, or *an orientation to avoiding it* as well as achieving it. If some practice of talking is used to do some action, then there will be occasions on which a participant will undertake to avoid that action, and that will involve avoiding that practice of talking.

Excerpt 14 offers a possible instance of such an occurrence. Two student couples are having dinner together. Vivian and Shane have just told about a cheap lobster lunch that Shane had eaten that day, which he had not mentioned to his "friend" Michael. Michael goes on to recount (ironically, or half so) another incident of less than generous conduct on Shane's part.

Excerpt 14 (CD:II:23–25)
The possible selfishness of Shane has just been (perhaps ironically) alluded to

1	Michael:	Shane thinks he's doin'me a big favor'm riding th'bike'ee
2		siz'ey I'm unnuh gitta durink.
3		(0.9)
4	Nancy:	m-(h) mn Oh(h) o [N-hn
5	Shane:	[heh heh
6		(·)

35	Shane:		An (·) he s'd (we:y) muh man at's w'tche ge::t,
36	Nancy:		mm hm hm
37			(0.8)
38	Michael:	→	Eez gitt'n li'l cheap there·ha:[h.
39	Shane:	⇉	[Y:ah. I
40		⇉	think he's gett'n a li'l bit uh ti:ght. wid is eh::p
41			(1.4)
42	Shane:		B't I had the big glass . . .

In Michael's story, he and Shane were exercising when Shane left to get something to drink, promising half to Michael on his return. Michael then reports exercising vigorously in anticipation of a substantial drink, only to have Shane reappear with a tiny cup of potable. At this point, Michael's companion, Nancy, chimes in with an admonishing tone (line 30).

In his response, Shane takes the tack of reporting "just the facts" (Pomerantz 1978, 1987). He offers no characterization of the parties or the events, attributes no blame, offers no assessments or excuses. He reports what the service person, Vic, served him, what he said to the service person on behalf of a larger serving, and the rebuff he received in return (lines 31–35). When, in response to this account, Michael says of Vic the service person (line 38), "He's getting a little cheap there," this is *Michael's* (the complainant's) blame attribution.

Were such a characterization offered by Shane, it could be seen as self-exculpating and self-serving. Its production by Michael is precisely a redirection of the blame – which he had appeared to be directing at *Shane* – now to *Vic* (the service person). This redirection of blame away from Shane as an action of Michael's would be subverted if Shane were understood to have himself planted this sense of Vic having been at fault for the episode, with Michael merely making

it explicit, which is what a repeat-confirmation by Shane of Michael's characterization could be heard to claim.

Note then that Shane appears *specifically to avoid* the repetition that would implement that practice. His turn repeats the frame from Michael's turn, "He's getting a little . . .," but just where the descriptor "cheap" would go, there is first the insertion of the word "bit," then there is a moment of hesitation with a display of a bit of a search ("uh"), and finally the selection of a sense-retaining *alternative* to "cheap," namely "tight." Shane has come to the very verge of a possible allusion-confirmation before veering away.

There is little doubt that Shane's construction of his account is indeed built to provide for an analysis of Vic as cheap and as the culprit of the tale – most obviously by the "no quarter given" response that he attributes to Vic. And very likely this is reflected in his (Shane's) initiation of an utterance form that would confirm that Michael had picked up just what he – Shane – had meant to convey. But there are good grounds for the diversion of this utterance form before it is brought to fruition. The overt blaming of Vic is left as something that *Michael* has done and Shane has agreed with, not as something that Shane has planted for Michael to pick up. Here then is one way in which an issue mentioned much earlier in this account – the apparently petty "*who* is agreeing with *whom*" – *can* and *does* matter. And the talk is adjusted midcourse to achieve a particular stance on just that issue by avoiding an already-in-progress allusion confirmation (see also Mandelbaum 1993).

Nonoccurrence

In other episodes, we find sequential and interactional contexts with the features that elsewhere are found to occasion allusion-confirmations (arguably "environments of relevant possible occurrence"; see Schegloff 1993), but in which no such confirming repeats are produced. In such instances, there has been some inexplicit conveying or allusion, the recipients of which subsequently make explicit their understanding of what had been conveyed. In the turn following that candidate understanding, the stage is set for a repeat that would confirm both the sense and the prior indirect conveyance of what is being checked. But in these exchanges the prior conveyor eschews the confirming repeat and employs some other ("single-barreled" so to speak) form of agreement/confirmation.

These instances might initially be taken as another version of the test-by-avoidance, explored in excerpt 14, but they are different and somewhat weaker in analytic warrant. In excerpt 14, a confirmatory repeat was apparently underway and was then suppressed at the last moment. There, one is warranted in speaking of its absence or avoidance in the strongest sense, because its relevance has already been introduced by the participants – by their very launching of its deployment. But the practice of confirming allusions by repetition of their explication has not yet been shown to have that order of relevance for parties to talk-in-interaction that would make it relevantly, eventfully absent if not done at all. Still, in excerpts 15 and 16 below we can see that the conditions for embodying this practice were present by juxtaposing them to other, analytically

comparable episodes in which confirmatory repeats *were* employed (a sort of "paired comparison"). We can then ask if there is any interpretive or analytic relevance to the practice *not* having been invoked though "eligible," and we can ask whether this "eligibility" would have been available as an interpretive resource to the *participants* and thereby have made available to *them* as a noticeable absence – and therefore an interpretable and consequential one – the nonactivation of the practice of a confirmatory repeat.

In excerpt 15 two women are discussing B's recent trip.

Excerpt 15 (SBL 2:3:2; Sacks [1992, vol. 2, p. 140])

1	A:		Didje have a nice time?
2	B:		Oh, wonderful.
3	A:		Goo::d, [good.
4	B:		[just wonder[ful.
5	A:		[Where'dju go::.
6			(0.6)
7	B:		We were in northern California, up- (0.2)
8			weh (hhh)- (0.4) way up in the mountains too.
9			(0.4)
10	A:		Oh well we wen' up there oh:: about thr- .hh
11			I'd say about three weeks ago we was up at
12			Maripo:sa, .hh[hh
13	B:		[Uh huh
14	A:		an'up in the Mother Lode country en we
15			[wen' all through those ghost tow:ns.
16	B:		[( )-
17	B:		Oh:: I see, Well we were up uh. .hh intuh Red
18			(0.5) Red Blu:ff?
19			(0.4)
20	A:		Oh::.
21	B:		([ )
22	A:	→	[You wen' up further then.
23	B:	⇉	Yes.
24	A:		Uh [huh,
25	B:		[Uh huh,

In response to A's inquiry about where she went, B responds by locating the general area ("northern California"), and then with a formulation that "does" referring to extended penetration into the mountains – "way up in the mountains" (lines 7–8). Keying on the reference to northern California, A then counters with her own recent trip to the area. Her references, however, display an orientation less to nature and the mountains than to conventional tourist destinations ("the Mother Lode country," "those ghost towns," lines 14–15). As A has used B's account as the occasion for her own, the comparability of the account and their events has been potentially activated and A's trip is taken as offering a version of "way up in the mountains." To this, B then counterposes the extent of her own trip, offering as the point of comparison the name of the place defining the area she reached (lines 17–18). Note about it that it is offered as possibly less

readily recognizable (and hence, perhaps, remote) – there is a pause and a bit of a search before it is articulated, the name itself is not delivered fluently, and when delivered it is packaged with an upward intonation, as if to ask whether A recognizes it or knows where it is (in an operation not unlike the "try-marking" discussed in Sacks and Schegloff [1979]). At the same time, it is offered for its tacit display that she (B) had traveled higher up into the mountains than had A (and that "up into the mountains" was the relevant orientation of her trip).

In many respects, then, this episode is similar to excerpt 2, in which one of the participants also characterizes a place with a practice that "does formulating it as far." In excerpt 2, it may be recalled, the recipient responds by extracting the point as "That's far away"; here in excerpt 15 the recipient does something similar – she extracts the upshot (if I may put it that way), "You went up further then." In excerpt 2, this was confirmed with a repeat, employing the practice already explicated. In 15, in an arguably comparable sequential environment, and with confirming agreement also being done, the action is implemented with agreement tokens – "Yes, uh huh." B does not confirm, then, (Dare we say that she declines to confirm?) that her earlier formulation had been designed to convey indirectly the comparative reach of their respective trips, and she avoids thereby the "one-upsmanship" that this might have been heard to embody.

But there can be other grounds for not employing a confirming repeat in an environment apparently primed for it. In excerpt 16 a request is turned away by recounting a tale that conveys the difficulties the request entails without saying no in so many words. When the requester makes the upshot explicit, the possibility for a confirmatory repeat presents itself.

In excerpt 16 Madeline has called a second time asking to talk to her friend Gina and is told by Gina's mother, Marcia, that Gina will not be back home until later.

Excerpt 16 (Madeline 2, 1:9–38; simplified)

1	Madeline:	okay. = I was just wundering y'know ·hhh (0.3) could

29	Marsha:	⇉	no::. an- = an:d uh hh (·) in the mean time I'm a<u>fraid</u>
30			that the <u>i</u>nsect lif:e has moved ba:ck. =

If we continue to exploit paired comparisons between instances, as we did in juxtaposing excerpt 15 with excerpt 2, then excerpt 16 invites juxtaposition with excerpts 11 and 14. In excerpt 11 Vera could be understood to have built into her telling of a tale a stance, a point of view, that her interlocutor could extract and offer for confirmation; when offered by Jenny, that stance was confirmed by Vera with a form that confirmed that it had indeed been conveyed by the telling. In excerpt 14 Shane recounted the tale of getting something to drink in a fashion that conveyed the unyielding stinginess of the service person and barely escaped confirming that he had conveyed this in the telling. Similarly in excerpt 16, Marsha's telling (lines 14–18, 23–25) is designed to convey the nonviability of Madeline's proposal by reporting its nonviability in the past. (Note that the telling is launched in response to Madeline's anticipation of a rejection, "It's just not possible, huh?" at line 13.) Indeed, it is so overbuilt to convey this that a confirmation by repeating Madeline's proposed gist, "It didn't work out, did it" (line 27) might well have been hearable as a dry, cutting sarcasm. Instead, Marsha confirms with an agreement token and goes on to add to the account additional difficulties as grounds for not accommodating the request.

Excerpt 16 provides an occasion for taking up briefly another ingredient of this "confirmation venue" and this confirmation practice. Confirming repeats can convey a range of affective stances toward the other and toward the matters being addressed in the talk. They can convey satisfaction, congratulation, mockery, and the like – even perhaps discovery, as when the upshot proposed by the interlocutor reveals to the teller a tack they had taken of which they were unaware. In the excerpts examined earlier in this article, for example, a note of resignation is conveyed in excerpts 2 ("far away") and 12 ("not that well"). Just as Shane in extract 14 veered away from doing a confirmatory repeat and thereby avoided the appearance of having himself deflected blame for the incident being discussed, so can we entertain the possibility (though no comparable analytical basis has been developed for it here) that Marsha in excerpt 16 eschews a confirming repeat by reference to the cutting sarcasm it could represent after as broadly conveyed a stance as she had portrayed.

There is a suggestion here, then, of yet another level of action, of practice, and of analysis that can be relevant to the phenomenon being examined. Confirming by repeating is a practice, I have argued, for confirming that the candidate understanding distilled by the other had indeed been previously conveyed inexplicitly

Now we are noting that the doing of *this* action can itself become the vehicle for another, in a fashion even more tightly woven into the fabric of the local context. If the inexplicit conveying had been subtle, sophisticated, challenging *for this recipient*, then a confirmatory repeat can appreciate the other's perspicacity. If in the face of a broad and heavy-handed "indirection" a recipient still undertakes to check it out, a confirmatory repeat can come off as sardonic and patronizing. But aside from its relationship to the preceding inexplicit conveying, other resources can be involved in achieving these effects, notably those of prosody and intonation, whose practices at the present time still elude compelling analytic specification. For now this additional layer can itself only be broadly indicated, but cannot be explored with any empirical or analytic detail. On the horizon, however, appears yet another lamination that an empirical account of action must be able to deal with.

Finally, it seems cogent to remark that in excerpts 15 and 16 it is virtually certain that nothing of interest would have been seen at all were we not already familiar with the practice of confirming allusions and its environments of possible occurrence. Here then we may have some of the most distinctive fruits of inquiry in rendering what would otherwise be invisible visible in its very absence.

The Fit between the Practice and the Action: A Sketch

How are we to understand the fit between this practice – repeating more or less identically the candidate understanding of one's prior talk or other circumstances proposed by another – and the action which it appears to accomplish – confirming both the candidate understanding and that its gist had been previously conveyed inexplicitly by the one who now confirms it? What suits this practice for doing this action? How does it work? There is space here for only a sketch.

Such an account begins with the observation that parties to talk-in-interaction may also apply the practice of identical repeats to their own prior talk.[13] For example, they may do this when the start of their turn becomes implicated in overlap with other talk – whether a simultaneous start by another incipient speaker or an extension of the preceding talk by the prior speaker. As that overlap is resolved, the speaker of the "surviving" turn may "recycle" the beginning of their turn, now in the clear, as does Kathy at the arrowed turn in excerpt 17.

Excerpt 17 (KC-4:07; taken from Schegloff [(1973) 1987])

1	Rubin:		Well thee uhm (·) (a paz) they must have grown **a culture.**
2			(0.5)
3	Rubin:		You know, (·) they must've I mean how lo- he's
4			been in the hospital for a few day:s, right?
5			{(1.0)/·hhh}
6	Rubin:		Takes a [bout a week to grow a culture,]
7	Kathy:	→	[I don think they grow a] I don think
8		→	they grow a culture to do a biopsy.
9	Rubin:		No::. (·) They did the biopsy while he was on the table.

One import of this practice is a display or claim by the speaker that what they are saying now is what they were saying before (in the overlap), rather than (for example) addressing responsively what the other party was saying *during* the overlap. Note that the resources of language make it possible to say the same thing (or do the same thing) in *different* words (see, e.g., Schegloff [1976] 1984, pp. 40–41); saying the *same* words appears designed specifically to underscore that what is being said now is the very thing that was being said before.

Resaying in the same words to show/claim that what is being said now is the same thing that was being said before is not limited to use by the "victor" in the environment of emergence from overlapping talk. It can be used by the apparent "loser" after the victor has completed the turn they were producing. In excerpt 18, Kathy and her husband, Dave, are commenting on a weaving of Kathy's which their guest, Rubin, has admired.

Excerpt 18 (KC-4:36–7)

1	Kathy:		So once I'd set up the warp, i' w's very simple to
2			jus' keep- jus' to weave it.
3			((pause))
4	Kathy:		You know [( )
5	Dave:	→	[(But listen tuh how long)]
6	Rubin:		[In other words, you gotta string up thee]
7			you gotta string up thee colors, is that it =
8	Kathy:		= [Right]
9	Rubin:		= [in thee] in thee [warp.]
10	Kathy:		[right] right.
11	Dave:	⇉	(But listen) tuh [how long it took to put in the] =
12	Kathy:	→	[A n d t h e n each weft-]
13	Dave:		= the the warps [(though)
14	Kathy:	⇉	[And then each weft y'know then I did
15			I s- my warp was . . .

Note Dave's reuse of the same words at line 11 after "losing" to Rubin in the overlap at lines 5–6. More striking still is Kathy's reentry at line 14 after losing to Dave at lines 11–12. She begins her reentry by reusing the same words ("And then each weft") to establish that what is being said now is the same thing that was being said before . . . and then, having accomplished that, she *drops that* ... *of talking in favor of another.*

Nor is this practice of repeating one's own prior words limited to proximate environments of overlap and its resolution. Across *various* spans of talk and *various* routes by which a speaker's talk comes (in their view) not to have been addressed, they may use a repeat of their own earlier words to reintroduce the earlier contribution into the talk, and to do so in a manner that claims that they are doing just that – doing/saying again what they did/said before, and that they (and it) are not being responsive to what may have transpired in the interaction since the previous saying.

If repeating one's own prior words is a way of doing "what I'm saying now is what I was saying before," why is that practice not employed in the context examined in this article? That is, why does the speaker whose prior talk

has been formulated by its recipient in a candidate understanding not repeat that prior talk as a way of showing that they are saying now what they said before? In the turn after a proffered candidate understanding, a repeat of the *previously* articulated saying (the inexplicit saying) would be declining to confirm when confirmation had been solicited. It would, in effect, reject the candidate understanding proffered by the recipient and reassert the adequacy, indeed insist on the necessity, of the way in which it had been said before.

In excerpt 19, for example, Colonel Lehroff, the director of civil defense, is calling the home of the manager of the municipal truck yard – one "Phil."

Excerpt 19 (CDHQ, 15; Openings, 299; from Schegloff, 1992b, p. 1322)

1	Phil:		Hello?
2	Lehroff:		Phil!
3	Phil:		Yeh.
4	Lehroff:		Josh Lehroff.
5	Phil:		Yeh.
6	Lehroff:		Ah:: what've you gotten so far. Any requests to
7			dispatch any trucks in any areas,
8	Phil:	→	Oh you want my daddy.
9	Lehroff:	⇉	Yeah, Phi [l,
10	Phil:		[Well he's outta town at a convention.

As it happens, the phone has been answered by the truck manager's son, whose name is also Phil and who, upon hearing the caller's identification (line 2), understands himself to have been identified and ratifies the "recognition" (line 3). The mutual identifications being completed, the caller proceeds to the first topic, a topic recipient-designed for the answerer whom the caller thinks he has identified and recognized and whom he had called to raise this very topic. But raising that topic reveals to Phil that his understanding of Lehroff's first turn was wrong, and he offers (line 8) his now-transformed understanding of it. When Lehroff responds (line 9), he first confirms the candidate understanding with an agreement token and then repeats his own earlier turn whose understanding he has just confirmed. But in this sequential context, that repetition has the effect of confirming the prior saying with a protestation of sorts. Its effect is to underscore that he had said just the right thing in the *first* instance, one which should not have been a source of trouble. So, although the repeat of his own prior talk *does* the work of saying here what was said there, when done in the face of a differently formulated and articulated account, it *insists* on the form of the prior saying and does not simply confirm the proffered understanding of it. The latter is done by a simple agreement token.

In an environment in which there has been an allusion or inexplicit conveying in the prior talk of which the recipient has proposed an explicit upshot, an identical repeat of the prior saying by its speaker amounts to an insistence on that mode of saying in the face of a proposed alternative, and thus a possible rejection of the alternative – the explication. But the earlier point remains: a way of identifying a later saying with an earlier one is to use the same words. Doing an identical repeat, *but of the explication*, confirms the understanding that it proposes and does

so with a practice otherwise employed for marking the thing being now said as the thing previously said.

Provenance

Virtually all of the instances so far presented of the phenomenon and practice of which we have been developing an account come from occasions of interaction that could be vernacularly characterized as between intimates – between members of a family, long-standing friends, and so on. And the occurrences could be plausibly understood as contextually specific along these lines; for example, it is to the intimately related (it might be proposed) that speakers undertake to convey something inexplicitly and confirm such undertakings when it becomes relevant to do so; it might even be taken as a mark or indicator of intimacy, or as a move to invoke or establish such a relationship.

This turns out not to be the case. It is striking that the practice described here and the action that it implements are found across a range of settings and social relationships from quite intimate ones to rather formal and public ones, and across variation in other variables (such as class, gender, culture, power, etc.) conventionally understood to embody facets of the decisive relevance of context for interaction. In addition to the earlier exemplars (e.g., excerpt 8, which is drawn from the mass media setting of the news interview with the novelist), only a few are displayed here to provide a sense of the ways in which the practice appears in this diverse range of social settings – from a teaching case conference in a major university medical school hospital (excerpt 20 below), to an editorial conference at a major metropolitan newspaper (excerpt 21 below), to a criminal courtroom in session (excerpt 22 below), and a commercial transaction at an outdoor farmers' market (excerpt 23 below). If the analyses of the several segments discussed here (and others not displayed in order to conserve space) are on target then this practice of confirming allusions has been successfully employed in each instance by the participants in that occasion, in that setting, in that relationship, and were so understood by the other participants, across variations in the parameters of context and participation. Consider then:

Excerpt 20 is taken from a case conference in a major university medical school and hospital. About 45–50 staff members are in attendance, including senior faculty, residents, interns, and so on. A resident in pediatrics ("Pr" in the transcript) has been called upon to launch the presentation of a report on a recent case of great interest. She has been reporting the presenting symptoms and the previous treatment history. Just before the beginning of the excerpt, she has inadvertently juxtaposed two incongruous observations that have elicited an outburst of laughter, and she is searching the room for her supervising hemotologist ("M2" in the transcript). He has just arrived (late) at the conference, and responds to being spotted by Pr with "Don't blame me" (line 5).

Excerpt 20 (Boyd, leukemia case conference, 1:29–2:14)

1	Pr:	<u>Hey</u> I'm doing this all by myself. Where's my- <u>Oh</u>.
2		There he is. (·) Ha hah.

3	Grp:		Ha ha ha ha huh huh huh.
4	Pr:		Ha hah hah hah hah <u>hah</u>:
5	M2:		(Don't blame me for it.)
6	Pr:		So. (·)U:m(·)
7	M2:		J [a-] (Jackie) [Stop there =
8	Pr:		[No.] [Oh.
9	M2:		= There's almost an <u>in</u>finite number of things tuh
10			dis- discuss on- on this case between thuh new
11			technique of di<u>a</u>lysis we use an' a helluva lot of
12			other things. You presented thee: I'm sorry tuh be
13			late I wz uh (·)( ).
14	Pr:		N- I j's presented thuh presenting histry'n I
15			haven't gone into his subsequent course. =
16			= I wi [ll quickly go into °that=°
17	M2:		[That's fine.
18	M2:		= No. I'd like tuh talk about where we are.
19		→	You talked abou'what happened at thee other hospital?
20	Pr:	⇉	I talked about what happened at thee other hospital.
21			He did git one (0.2)
22	??:		(right)
23	Pr:		do- he got one course of- they started him on:
24			uh: protocol, (·) an' he got (·) h wz started on
25			unchemo .hh thuh day before 'n <u>that</u>'s whin he
26			subsequently had an <u>acute</u> deterioration . . .

When Pr is about to resume her account, M2 intervenes in the case presentation. In the utterance at lines 9–13, which he self-interrupts with his apology for coming late, he had begun to formulate what Pr had already presented, and at lines 14–16 she delivers her account of her presentation to that point, "I just presented the presenting history," and how she proposes to continue. M2 then undertakes to redirect the case presentation, but asks Pr whether she had discussed what treatment the patient had received at the other hospital, something one might have thought would have been included under "the presenting history" and which therefore Pr has already suggested has been conveyed. To this inquiry she responds (line 20) with a confirming repeat, "I talked about what happened at the other hospital," an allusion confirmation here delivered in a manner (intonationally) that carries overtones of testiness (conveying "Of course I talked . . .").

Excerpt 21 is taken from the daily editorial news conference of a major metropolitan newspaper, at which the stories to be carried, their placement in the paper, and so on, are determined.[14] Some 15 participants contribute vocally to the proceedings, including – in the excerpt to follow – the business editor (BE), the managing editor (ME), and the city editor (CE), the last of whom puts forward a candidate story for the consideration of the others.

Excerpt 21 (Clayman: editorial conference, 7/24/89:12–13)

1	CE:	This story is cute.
2	?F:	hhh! (0.8)hhh
3	CE:	Kid yesterday w- uh <u>S</u>unday goes out to the p<u>a</u>rk with

4			his parents, (0.4) [really liked the park.
5	?F:		[((whispering))
6			(0.5)
7	CE:		So what happens?
8	?F:		*(This is)*
9	CE:		He wakes up in the middle of the night, (·) Sunday-
10			(·) Sunday night, (0.3) decides that he is gonna get
11			outta the house, this is in Logan Squa:re, and go back
12			to the park. (1.0) This is a three year old kid.
13	??:		hhh
14	CE:		Gets lost on the way, (0.2) police- somebody calls the
15			cops at about three a'clock in the morning and says
16			hey there's a kid on the street. (0.2) Cops come out,
17			pick the kid up, (0.3) take him to the station, .hh he
18			goes through hamburgers, he goes through all kinds of
19			uh junk food, (1.0) finally the cops: give up. = I mean
20			the- uh little- the little kid can't remember his
21			name or isn't telling it, (0.5) can't remember his
22			address, (0.4) uh: cops take him out on the street
23			just for a- a walk along tour of the neighborhood
24			hoping that you know maybe if the kid will remember
25			something, .hh kid spots his cat (0.8) follow the cat
26			into this apartment building he's follow the cat-
27			follow the cat into an apartment building (·) knock on
28			the door (0.7) Mommy comes- comes out 'nd says WHAT
29			THE HECK ARE YOU DOING OUTTA HERE. (0.4) As
30			it turns out she's always hated the cat until this morning.
31			(1.0)
32	ME:		(She) loves the [cat now ((laughter))
33	BE:	→	[She didn't realize her son was missing?
34	CE:	⇉	Didn't realize her son was missing.
35			(0.6)
36	GE:		Sleeping at three in the morning I'd think I'd
37	BE:		> Oh what time was h- you know what time he was
38			brought home?
39	CE:		Uh::early today.
40	BE:		Oh
41			(3.0)

The story is recounted in a manner that requires its hearers to "solve it" for its interest as (presumably) a "human interest story." In particular, the final components of the telling are left for "working up" by its recipients, and the telling is directly followed by such interpretive upshots. First the final component of the story has its implied contrast made explicit; "hated the cat until this morning" (line 30) being contrasted with "loves the cat now" (line 32), while leaving the basis for this turnaround still unexplicated. Then the penultimate component of the telling, which had been delivered as a stripped-down direct quotation of the mother's utterance upon opening the door and seeing the child outside ("What the heck are you doing out here?" lines 28–29), has its import formulated by a

recipient for confirmation by the teller ("She didn't realize her son was missing"). The teller both confirms the understanding that it makes explicit and confirms that the telling had been designed to convey it without saying it in so many words – perhaps achieving thereby a demonstration of its potential solvability by readers as well and, accordingly, its worthy candidacy as a publishable human interest story.

In excerpt 22 we are afforded not only a direct representation of an episode of confirming an allusion but a journalistic account of it as well, in which this understanding is embodied at several levels. The exchange occurred in a court of law, during the early legal maneuverings in the O. J. Simpson case, in which a popular celebrity was accused of murdering his ex-wife and a friend of hers, an event whose aftermath was given extensive and prolonged exposure in the news media.

Excerpt 22 *(New York Times*, national edition, June 23, 1994, p. A12)

As a grand jury looking into the murder of Mrs. Simpson and Mr. Goldman continued to hear evidence today, Mr. Simpson's lawyer, Robert L. Shapiro, appeared with the defendant in Municipal Court and demanded that prosecutors speed their release to him of the evidence they are presenting to the grand jurors . . .

Mr. Shapiro went out of his way to point to the discrepancies between many details that have been reported by local and national news organizations and the small number of details publicly confirmed.

"I've been hearing reports of all this evidence that's been found, and the material we have doesn't show any of it," the lawyer told Judge Patty Jo McKay, referring to documents turned over to him by the District Attorney's office. He specifically mentioned a bloody ski mask that, according to some press reports, was found in Mr. Simpson's home after the killings.

When Ms. Clark, the prosecutor, replied that the papers given Mr. Shapiro listed all the evidence in the District Attorney's possession, Judge McKay interrupted and asked

→ directly, "So you are saying there is no ski mask?" The

⇉ prosecutor replied, "There is no ski mask." [end of story]

Note several points about the account in excerpt 22: First, the journalist takes it that the judge has heard the prosecutor to be conveying something indirectly, which the judge then addresses by "ask[ing] directly" (lines 18–19). Second, the prosecutor's reply confirms the judge's supposition of what she was saying and confirms that she *was* conveying it indirectly; the reply thereby suggests that the prosecutor also (like the journalist) understood the judge to have heard that she (the prosecutor) was conveying something indirectly, answered in a way that addresses that possible hearing, and confirms it. Third, this was for the journalist, and the editorial oversight agent, a pointed – and apparently satisfactory – way of ending the story. (On the journalistic practices involved here, especially concerning the journalist's incorporation of the question in reporting the information delivered in the answer, see Clayman [1990].)

Finally, in excerpt 23, Liz, a purveyor of "air plants" at an outdoor farmers' market, is approached by a customer who had previously purchased plants from her.

Excerpt 23 (Menzies, farmers' market: the air plant merchant)

1	Liz:		Hi::	
2	Cust:		I want to ask you something.	
3	Liz:		Sure	
4	Cust:		I bought three of those uh you	((points to a
5			know like ( ).	tray of plants))
6			One of them died out.	
7			((gap))	
8	Cust:		Uhh	
9	Liz:		It did,	
10	Cust:		Yeah	
11	Liz:	→	The other ones are doing well,	
12	Cust:	⇉	The other ones are doing well.	
13	Liz:	→	They were all in the same area,	
14	Cust:	⇉	Same thing, yeah.	
15	Liz:		Ohh.	
16	Cust:		Yeah	
17	Liz:		They were'n the little shells,	
18	Cust		Yeah, in the little shells, yeah.	

This episode allows us again to refocus on the central action with which we have been concerned – confirming allusions – by juxtaposing in contrast the practices for confirmation of other suppositions with the confirmation of a supposition grounded in a prior inexplicit conveyance. Note, then, that the specificity of an assertion ("One of them died out"; line 6) may be taken to convey that other than the specified referent is not implicated in the utterance. When Liz undertakes to make that explicit (line 11), her inference is met with a confirming repeat (line 12). By contrast, other inquiries by Liz about the plants in question, which are also confirmed by the questioner, were *not* previously conveyed indirectly, and these confirmations (lines 13–14, 17–18) are *not* done by repeats of that which is being confirmed. (But note the equivocality of the exchange at lines 17–18, which may reflect the equivocality of the pointing at lines 4–5.)

These episodes from work settings, ranging from the informality of an outdoor market to the formality of a court of law in session, underscore the robustness of the practice of confirming allusions across social and interactional contexts and across compositional features of the participants. Here, at least, the interactional phenomenon does not appear to vary across, "contexts" as conventionally understood. It appears then that not everything must.

Concluding Considerations

So that is the little phenomenon I have meant to introduce: a practice of talk-in-interaction used to implement a distinctive action – an agreeing repeat used

do "confirming an allusion." Not one of the apparently major actions that compose the fabric of the everyday life of the society, whether dramatic or mundane . . . any more than *E. coli* or *Drosophila* were apparently important organisms in the larger biological scheme of things. Not, then, like requests and offers and their acceptances and declines, by which goods and services get moved around a society. Not, then, like askings and tellings and the like, by which information gets circulated around a society. But it is one of the actions that compose the culture's repertoire, and from it there may be something to be learned about actions as an object of inquiry (as was the case with other, apparently "limited" actions [Schegloff 1986]). As compared to the grosser types of action involved in the sequences we have examined – which we could formulate as "confirmation" and "disconfirmation," one or the other of which is virtually *mandated* by an interlocutor's offering of a candidate understanding to a speaker of what the speaker has just said – the form that the confirmation takes appears to be what might be called an "*optional* action." Confirming by repeating the proposed upshot as a way of ratifying its prior inexplicit conveyance is, then, a relatively minor hue in the cultural, discursive, and behavioral palette of commonplace inter action. The breadth of its provenance (in spite of its relative infrequency) should indicate that the fabric of ordinary sociality may be more finely woven and more subtly shaded than has been generally entertained, and that this is so across the conventional differentiations of social categories that professional social science and vernacular opinion are both inclined to believe fundamental to social organization. Yet it *is* socially organized and socially deployed, and accessible to systematic, empirical inquiry.

Perhaps the "minor" status of our object of inquiry should be appreciated from another perspective. The preoccupation of the present report is but a corner of a much larger domain omnipresent in talk (and arguably in any use of language) in which talk is laced through and through with inexplicitness and indexicality and, in the nature of the case, requires "solving" by hearers. In the episodes examined in this inquiry we peek at a corner of this domain, in which hearers make their understandings – their solutions – explicit, seek confirmation of them, and get that confirmation in a particular form. But for talk (or other forms of conduct, for that matter) to go on and – through it – interaction (and all "practical action," as was argued by Garfinkel [1967]), such inexplicitness is being "solved" all the time. Its results are displayed (even when not formulated) in the ensuing talk and action and are subject to repair there if found problematic (Schegloff 1992*b*). The arguable omnipresence of inexplicitness and indexicality is not incompatible with its differential importance and treatment across the ranges of social settings. The text of this report suggests types of interactional "moments" for which inexplicitness is specially relevant. On a different – socio-political – canvas, the study of political discourse has long been familiar with the ways in which repressive social and political organization can put a premium on the exploitation of inexplicitness in discourse – as, for example, in Leo Strauss's (1952) account of the exoteric and esoteric traditions of writing in the discourse of political theorizing and the interpretive possibilities thereby opened up. So the "downplaying" of the import of our topic needs to be properly

understood. It is not that the *domain* involved here is minor; it is rather that this particular action is of relatively modulated import when compared to some other types of action and when assessed relative to the larger domain of the working of language in interaction of which it taps one type of development.

One last observation. Until I grappled with a collection of actual, naturally occurring repeats, and with the assembling of this core collection in particular, I had not the slightest idea that there *was* such a function, such an action, such a practice in talk as "confirming that something had been conveyed inexplicitly," – confirming both *the* allusion and *that it had been* an allusion. This is not the sort of action that is part of the articulable vernacular culture (what Giddens [1984] terms "discursive culture"); there is no speech act term for it; it is not readily accessible to intuition, although without a native's cultural knowledge it might not be detectable in an examination of interactional materials. (The bearing of this point on the possibility of a universal, rational, aprioristic pragmatics of the sort projected by Habermas cannot be explored here, but should be weighed by those committed to such a project. The Habermasian view presumes that we know, or *can* know, preanalytically and preempirically what persons actually do and how, and this may well *not* be so.)

At a time when the possibility of genuine discovery grounded in careful examination of empirical material is often taken to be compromised by the particular cultural commitments of inquirers or of their culture, or to be arguably nothing more than a function of the presuppositions of (the) inquiry *per se* (and all this especially relevant where the cultural is involved), it may be salutary to weigh the evidence of the present inquiry. Surely the presuppositions of the enterprise are germane to the formulation of the problem – concerned with what action some form of talk is doing – as well as to the conception of what an answer might look like. But arguably these presuppositions serve not to *subvert* the claims of the inquiry but to *underwrite* them; for it seems clear that a pervasive, if not omnirelevant, orientation and concern of parties to interaction about any utterance of an interlocutor is "Why that now?" (Schegloff and Sacks 1973, p. 299), and a prime candidate solution generically is, "What is the speaker doing thereby?" – that is, what action is that utterance doing or being used to do? The presuppositions of this academic inquiry, then, are themselves meant to be grounded in the generic relevancies of ordinary actors in the quotidian activities out of which their lives in interaction are composed.

If the proposals of this article are on target, then, it reports the finding of something that was not presupposed, was not even imagined. It *is* possible to find new things, things that could not have been conceived before the inquiry, though if inquirers presume otherwise and act accordingly, they will guarantee the reaffirmation of their presumption. This has direct consequences for how one does one's work. With materials of the sort being examined here, one cannot simply go through the stream of conduct seeking to identify which previously known action, phenomenon, practice, and so on, a given "bit" exemplifies. ("Confirming an allusion" would not have been an available analysis of an utterance in conversation before this inquiry, and confirming repeats would have been

left unanalyzed, or worse, given an ad hoc – and most probably a vernacular – interpretation.) One needs to ask about each new object of examination what it could be possibly doing, and ask, as well, what could constitute an object of examination to which this question could be put, that had not been so considered before.

With such a study policy applied to the raw material of the society's life, how many other such unknown jobs, functions, actions, practices – such as confirming allusions – might there turn out to be? Hundreds? Thousands? Yet these make up the cultural inventory of the society, elements of which the parties assemble and parse in the moment-to-moment constituting of its quotidian embodiment, and that serve as the prima facie rationale for the deployment of language. It is about these that a theory of action is presumably theorizing. Without knowing them, there is the prospect that we lack articulate, theoretically informed access to a substantial bulk of our culture, and rely on our vernacular understanding of typicalized courses of action – designed *for the working of the society* and not *for the working of its disciplined study* – to process much of the basic material of our inquiry. We lack the social equivalent of the presumed 90% of the physical matter of the universe now unaccounted for and termed "dark matter." Without bringing this inexplicit part of our culture and of the basic repertoire of practical conduct under empirically grounded analytic control, we are unlikely to grasp at the deepest level how either language or action or sociality work.

Appendix: Transcription Conventions

A brief guide to a few of the conventions employed in the transcripts may help the reader in what may appear to be a formidable undertaking. It is apparent from the excerpts printed in this article that some effort is made to have the spelling of the words roughly indicate the manner of their production, and there is often, therefore, a departure from standard orthography. Otherwise:

→	Arrows in the margin point to the lines of transcript relevant to the point being made in the text.
( )	Empty parentheses indicate talk too obscure to transcribe. Letters inside such parentheses indicate the transcriber's best estimate of what is being said.
hhh	The letter "h" is used to indicate hearable aspiration, its length roughly proportional to the number of "h"s. If preceded by a dot, the aspiration is in-breath. Aspiration internal to a word is enclosed in parentheses. Otherwise "h"s may indicate anything from ordinary breathing to sighing to laughing, etc.
[	Left-side brackets indicate where overlapping talk begins.
]	Right-side brackets indicate where overlapping talk ends, or marks alignments within a continuing stream of overlapping talk.
((points))	Words in double parentheses indicate transcriber's comments, not transcriptions.
(0.8)	Numbers in parentheses indicate periods of silence, in tenths of a second.

(·)	A dot in parentheses indicates silence of less than two tenths of a second.
:::	Colons indicate a lengthening of the sound just preceding them, proportional to the number of colons.
becau-	A hyphen indicates an abrupt cut-off or self-interruption of the sound in progress indicated by the preceding letter(s) (the example here represents a self-interrupted "because").
He says	Underlining indicates stress or emphasis.
dr^ink	A "hat" or circumflex accent symbol indicates a marked pitch rise.
=	Equal signs (ordinarily at the end of one line and the start of an ensuing one) indicates a "latched" relationship – no silence at all between them.
°Then°	Material between degree marks is markedly quieter than surrounding talk.

Fuller glossaries may be found in Sacks et al. (1974, pp. 731–34) and in Atkinson and Heritage (1984, pp. ix–xvi).

Acknowledgements

Earlier versions of the present text have been presented in a number of venues, including the Linguistic Institute, Stanford University (1987), the Nordic Council Summer Course on Spoken Interaction, Mullsjö, Sweden (1987), the nineteenth congress of the Applied Linguistics Association of Australia, Melbourne (1994), and as the Brittingham Lecture, Department of Sociology, University of Wisconsin – Madison (November 1991). My thanks for useful comments on earlier drafts or presentations of this material to Jack Bilmes, Steven Clayman, Françoise Brun-Cottan, Susanna Cumming, Paul Drew, John Heritage, Robert Hopper, Lena Jayussi, Gene Lerner, Douglas Maynard, Elinor Ochs, and Sandra Thompson. I am especially indebted to Paul Drew for drawing my attention to relevant British data. The paper which appears here is quite different from the one I meant to publish, in large measure because of the input of the *AJS* referees, whose impact continues to be substantial, even if only anonymously acknowledged.

Notes

1. When George Homans (1961) undertook to offer a synthetic account of "Social Behavior: Its Elementary Forms," it was not actions that he described. I should note that I use here a different sense of "naturalistic" than the one that informs the discussion in Matza (1969), which, e.g., includes ethnography – both participatory and interview based – within naturalism, whereas I would treat ethnography as an alternative.
2. As will become obvious in the ensuing text, the "action" or "social action" under discussion here is not "political action" or "social action" in the interests of social change. These have, of course, figured centrally in a wide range of sociological undertakings over the historical career of sociology as a discipline, and with special intensity in the last 35 years or so. The focus here is rather on the "action" composing the moment-to-moment flow of daily life in – and outside – interaction.
3. They may also have figured for Goffman – like the allocation of opportunities to participate, resources to assure mutual understanding or remedy its breakdown, etc. – as a kind of underlying set of "system requirements," a proper object of attention for

"communications engineering" (or perhaps, in this case, social engineering), but set in contrast to the real social science interest in interaction, which addressed itself to "ritual requirements" (see Goffman 1976, pp. 265–70). For a fuller discussion, see Schegloff (1988*a*, pp. 93–100).

4. Space limitations preclude an account of what the description of an action looks like in the main academic enterprise in this domain – speech act theory, especially of the sort introduced by Austin (1962, 1970) and developed in a distinctive direction by Searle (1965, 1969, 1976). Speech act theory might be of special interest to (some) sociologists because it has been adopted as a theoretically central element of Habermas's theoretical project from the early stages (1970) until its recent major statements (1984–87), in spite of its atomistic, asocial, ahistorical, and decontexted character. For a discussion contrasting speech act theory with conversation-analytic approaches to describing actions, see Schegloff (1992*a*, pp. xxiv–xxvii). For some obstacles to applying speech act theory to actual utterances, see Schegloff (1988*c*). Efforts to develop a more empirical form of speech act theory grounded, e.g., in linguistics (see, e.g., Labov and Fanshel 1977) have met with only qualified success and have not proven generative of further work (see the critical discussion in Levinson [1983, pp. 226–83]).

5. This paragraph should make apparent the misunderstanding embodied in some "interpretivist" and "constructionist" treatments, according to which a recipient's understanding of some utterance is definitive of its import and the utterance itself has no "objective" import. This view (and its attribution to conversation analysis) is mistaken on many counts, not least of which is its total subversion of the possibility of analytically specifiable "misunderstanding"; for if a recipient's understanding is definitive, what leverage is there for claiming it to be a *mis*understanding? What basis is there for the claim that a recipient *failed to understand* the import of an utterance? Care must be taken, then, to distinguish between, on the one hand, the *professional analyst's* undertaking to establish the understanding of some utterance in some interaction – which should indeed seek to ground itself in the recipient's displayed understanding, if possible, and on the other hand *the recipient's* undertaking to understand the import of some utterance, which clearly cannot be so grounded, for that would presume its own outcome. The recipient's conduct requires engagement with the methods or practices that inform the production of the talk being "analyzed," and the professional analyst's undertaking must make reference to these as well if it is to address both the speaker's and the recipient's parts in bringing off an accomplished, recognizable action. These considerations are critical to an empirical account of action.

6. There are grounds in earlier work for considering such a possibility, e.g., the aforementioned argument by Jefferson (1984, 1993) that "yeah" and "uh huh" interpolated into another speaker's talk can do contrasting actions, or Schegloff's proposal (1986, pp. 1245, 1434) that "Did I wake you?" and "Are you awake?" asked by a caller just after the start of a telephone conversation, implement quite different actions in spite of their apparently identical (topical) content – the former a preapology, the latter a preannouncement of bad news.

7. Note that excerpts 4–7 are intended to exemplify the sequential positions being discussed in the text, not the phenomenon being tracked in the inquiry or alternatives to it.

8. This may involve as well changes in verb tense, epistemic marking (such as adding a frame such as "I think" to an otherwise identical repeat), etc. What is excluded is that use of the term "repeat," which includes such transformations as paraphrase, as in Tannen (1987*a*, 1987*b*, 1989) and others (e.g., Norrick [1987] and other contributors

to Johnstone [1987]) who employ this looser usage. From the point of view of practices of speaking, it would appear that paraphrase is specifically an *alternative* to repetition (and to quotation) and involves very different uses for, and procedures of, constructing an utterance. An appreciation of just such differences underlies Elinor Ochs Keenan's (1977) treatment of repetition among children and Heritage's (1985) treatment of news interviewer conduct. See also Gonzales (1995). Running paraphrase and repetition together risks underspecifying both practices and vitiates claims about their functions and uses.

9. There is an element here of what the linguist William Labov described some years ago as "the rule of confirmation," namely "If A makes a statement about B events, then it is heard as a request for confirmation," where "B events" refers to "known to B [hearer], but not to A [speaker]"; see Labov and Fanshel (1977, p. 100). A complementary practice is described in Pomerantz (1980).
10. See the discussion of excerpt 14 below. See also Lerner (1987, pp. 125–26 nn. 4, 5, and p. 212).
11. Although taken from written discourse, the following characterization offered by the journalist Lance Morrow may well also be relevant to talk-in-interaction, *mutatis mutandis*: "I only realized I was making the allusions afterward. . . . It wasn't entirely advertent. But then I said, what the hell, leave them in'" (quoted in Safire 1991).
12. It is true, as a number of people have commented, that individuals may differ in their deployments of the conventional responses to this inquiry. Still, personal styles appear to be grounded in their relationship to the common usages in which "fine," "okay," and/or "good" are the "no news" mild positive responses, with superlatives and disaster on either side. One may know about a particular other that, when they say "fine," they are "great," or they are "terrible," but the distinctiveness of this knowledge is based on the otherwise operative understandings of that response term. In any case, in excerpt 12, M shows that she hears F's response to be an "upper" by the terms of her pursuit of it, even though that hearing turns out to be incorrect.
13. See the first specification of the domain being explored in this article, at p. 401 above.

Narrative as Self-Portrait: Sociolinguistic Constructions of Identity

Deborah Schiffrin

The stories that we tell about our own and others' lives are a pervasive form of text through which we construct, interpret, and share experience: "we dream in narrative, daydream in narrative, remember, anticipate, hope, despair, believe, doubt, plan, revise, criticize, gossip, learn, hate and love by narrative" (Hardy 1968:5). So wide and diverse a distribution of stories make it unsurprising that narrative form, meaning, and use have been the object of scholarly attention in fields ranging from developmental psychology (e.g. J. Bruner 1986, 1990, Bamberg 1987, Nelson 1989), social psychology (Harré 1987, Gergen & Gergen 1988), and clinical psychology (Polkinghorne 1988), to literary theory (Bal 1990, Prince 1990), folklore (Bauman 1986), sociology (Riessman 1993), and sociolinguistics (Labov 1972b, Labov & Waletzky 1967, Jefferson 1978).

In contrast to some of the fields just mentioned, sociolinguistic studies have focused largely on oral narratives that recount personal experience. Labov (1972b, Labov & Waletzky 1967) has described such narratives as discourse units which have a fairly regular textual structure. After being prefaced by an *abstract* (a statement of the general theme or point of the story), a narrative is continued with an *orientation*: a background description of where, when, & by whom the events were performed. The events themselves ("what happened") are recounted in temporal order (in the *complicating action*); and *evaluation* of those events, i.e. their significance to the speaker and for the point of the story, is linguistically embedded within narrative clauses, as well as stated in separate clauses. An optional *coda* provides a temporal and topical transition from the world of the story to the interaction in which it was told.

As analysts of narrative and discourse processes have shown (e.g. Chafe 1990, 1994), an important process underlying the sorts of textual structures

Source: *Language in Society* vol. 25, no. 2, 1996, pp. 167–203.

identified by Labov is *verbalization*: the way we symbolize, transform, and displace a stretch of experience from our past – what we have done, and what has happened to us – into linguistically represented episodes, events, processes, and states. Prior research also tells us that this process of transforming personal experience into verbal performance is interwoven with the way stories are socially and culturally situated. When we verbalize an experience, we situate that experience *globally*: by drawing on our cultural knowledge and expectations about typical courses of action in recurrent situations, we construct story topics, themes, and points (Propp 1958, Polanyi 1985, Chafe 1990, Bamberg & Marchman 1991). We also situate that experience *locally*: we verbally place our past experiences in, and make them relevant to, a particular "here" and "now," a particular audience, and a particular set of interactional concerns and interpersonal issues (Jefferson 1978, Ryave 1978, Schiffrin 1984b).

My interest in this article is how the ability of narrative to verbalize and situate experience as text provides a resource for the display of self and identity. I develop this interest by focusing on two stories, told by Jewish-American women about troublesome issues in their families, that reveal aspects of the storytellers' selves and social identities. After briefly discussing how prior work on narrative, self, and identity motivates my study, I analyze the two stories. In each story, a mother reports interactions in which a younger woman in her family (a daughter, a daughter-in-law) did something that conflicted with family expectations. Both speakers use their stories to construct positions that pivot between solidarity and distance, between the provision of autonomy and the exercise of power. The conclusion summarizes my analyses in more general methodological and theoretical terms, and briefly compares the view of identity offered here with another perspective in sociolinguistics.

Narrative, Self, and Identity

A great deal of scholarship suggests that narrative language contributes to the construction and display of our sense of who we are – our own personal being as an integrated whole, with properties of stability and continuity over time. Thus Polkinghorne 1988 suggests that narrative structure is a way to arrive at an understanding of the self as a whole; our actions and experiences gain meaning through their relationship to one another, as well as their relationship to general themes or plots. J. Bruner argues (1987:15) that we eventually "*become* the autobiographical narratives by which we tell about our lives" [emphasis in original]. One reason that narrative can have this self-transforming role is that narrative language provides a process of subjunctivization: it reveals our presuppositions (our implicit meanings), permits multiple perspectives (different prisms through which we can view the world), and allows subjectification (reality can be filtered "through the consciousness of protagonists in the story"; Bruner, 25). Kerby suggests (1991: 52–53) that a pre-narrative social matrix of plots acts as the basic material from which "our more explicit self-reflections are formed along their narrative threads, both retrospectively and prospectively." The human

self is not "behind the [narrative] acts, visible and fully formed at their inception; the self is rather a result of actions, something that actions imply" (Kerby, 56). Linde 1993 suggests that narratives form an integral part of the overall coherence of our life story, and of our presentation of self as a moral person. Like the other authors noted, Linde suggests that this process is facilitated by linguistic properties of the narrative genre – the use of language to convey temporal continuity, a self/other distinction, and reflexivity of the self (see also Carr 1986).

Other scholars (e.g. Gergen 1987, Harré 1987) believe that the discursive display of the self through narrative is but one instance of a more general and compelling process by which the self is constructed through virtually all discourse. Thus Taylor 1991 states that the self neither pre-exists all conversation nor arises just from interlocutors' responses; rather it arises within conversation – dialogical action that, by its very nature, marks a place for the new locutor who is being inducted into it. Harré 1991 locates the emergence of the self not just in dialogical action, but in the particular discursive practices – e.g. accounts and avowals – associated with occasions of talk (see also Edwards & Potter 1992). Harré & Gillett (1994, Chap. 7) develop the idea that we actively structure our discursive activities in light of prescriptive norms and validations of self. Not only do we respond in anticipation of how we wish to be understood, but we verbally locate ourselves (and position ourselves, Davies & Harré 1990) in relation to discourse contexts, thereby defining ourselves through what we say, how we say it, and to whom we say it.

It is also well established that stories are resources not just for the development and presentation of a self as a psychological entity, but as someone located within a social and cultural world. Thus J. Bruner (1990:52) locates the emergent narrative self at the nexus of the social and cultural world: narrative deals with "the stuff of human action and human intentionality . . . [mediating] between the canonical world of culture and the more idiosyncratic world of beliefs, desires and hopes." In other words, telling a story allows us to create a "story world" in which we can represent ourselves against a backdrop of cultural expectations about a typical course of action; our identities as social beings emerge as we construct our own individual experiences as a way to position ourselves in relation to social and cultural expectations (see also Chafe 1994 on story schemas). When our socio-cultural expectations change, so too do our perceptions of identities. Thus E. Bruner 1986 shows that Native American ethnographies (which he thinks of as "narratives," see also Kerby 1991) have changed from themes of "assimilation," whose main characters are "victims," to themes of "resistance," whose main characters are "heroes."

The way we tell our stories also reveals a self that exists within a cultural matrix of meanings, beliefs, and normative practices. Research from a variety of traditions reveals that both the style and substance of stories are sensitive parameters of ethnicity (Michaels 1981, Gee 1991, Minami & McCabe 1991. Blum-Kulka 1993); social class (van Dijk 1992); gender (Riessman 1990, Attanucci 1993); age (Cohler 1982, Coupland & Nussbaum 1993); and region (Bauman 1986, Johnstone 1990). Still other research links story-telling style and substance to social roles and contexts at both interactional and institutional levels.

Thus Heath 1983 and Ochs & Schieffelin 1989 show how story-telling facilitates socialization into family roles, and how the acquisition of literacy skills during family story-telling provides an important scaffolding for the social roles and behaviors appropriate to school. The form of our stories (their textual structure), the content of our stories (what we tell about), and our story-telling behavior (how we tell our stories) are all sensitive indices not just of our personal selves, but also of our social and cultural identities.

Although all studies of personal narrative can further our knowledge of how narrative displays our self and identity, stories about women in families offer a particularly interesting site for such analyses. The family provides our first set of social relationships (and is thus said to provide a semiotic background for virtually all of our stories, Jonnes 1990); it also remains a traditional nexus of social life and cultural meaning for many women.

One particular relationship within the family, the mother/daughter relationship, is fraught with an ambivalence that is well documented in our culture both through literary works – e.g. Amy Tan's *The Joy Luck Club* (1989), *The Kitchen God's wife* (1991) – and through scholarly studies that stress the social and psychological sources, and consequences, of such ambivalence (Wodak 1986, Walters 1992, Kaplan 1993). Some popular authors blame daughters' ambivalence toward their mothers on a fear of becoming like their mothers. Thus Nancy Friday's *My mother, my self* (1977) describes emotional parallels between mothers and daughters that are difficult for daughters to resolve. In *The mother puzzle*, Judith Schwartz (1994) wonders whether she can become a mother without becoming *her* mother. Other authors offer advice to mothers who are confronted by their daughters' ambivalence. Thus Evelyn Bassoff, *Mothers and daughters* (1989), tries to help mothers maintain connections with their daughters, while also allowing them to form independent identities during adolescence.

Our cultural beliefs about mother/daughter relationships suggest several sociolinguistic reasons why mother/daughter stories offer especially good opportunities to examine the way narrative displays self and identity. First, stories are often told to justify one's own actions, not only during overt conflict, but also during subtle disputes over rights and obligations – exactly the kind of interactional tensions that arise from ambivalent relationships like those characteristic of mothers and daughters. Second, the narrated recounting and resolution of such tensions can highlight the different expectations and obligations associated with social identities, as well as the way we react to the normative practices expected of us. Third, the management of interpersonal conflict within a story world often requires story characters to use language in ways that are said to be related to gender (a key aspect of both "mother" and "daughter" identities). Various authors (e.g. Brown 1980, Maltz & Borker 1982, Goodwin 1990, Tannen 1990, Sheldon 1993) suggest that women avoid direct confrontation when they are trying to convince other people to pursue a course of action or adopt a belief. The study of narrative actions in mothers' stories thus provides an opportunity to discover womens' own perceptions and their enactments of particular interactional strategies to settle (or avoid) conflict. Finally, "mother" and "daughter" identities are themselves multifaceted: although gender is shared, age is not

The combination of these attributes may lead to a relationship built upon the two potentially conflicting dimensions of solidarity (based on same gender) and distance (because of different ages and power relationships in the family).

In sum, prior scholarship suggests that narrative is a powerful textual resource through which we manage our selves and identities. Although the study of all personal narrative provides a rich site in which to locate analyses of various identities, I focus in the next section on two stories told by mothers, both concerning conflict with younger women in their families.

Analysis of Stories

This section presents my analysis of two stories, "That cured her!" and "It's only a name!". Each story reports trouble with a younger female family member whose action defies normative expectations in the family, and thus threatens family solidarity: dating someone unacceptable to the family, or not using the term of address expected by the family. The general cultural theme of each story is thus similar – the integration of outsiders, who are unfamiliar and whose norms and practices may differ, into the nuclear family. My analysis attends primarily to the language used in the stories (the form and meaning at both sentence and text levels) and to how that language is used to both reveal and resolve the family trouble. I also make use of socio-linguistic knowledge about the performance of social actions through the use of words, as well as social and cultural knowledge about families and family roles. Although I compare the two stories when relevant during their analysis, I reserve more abstract comparisons for the end, when I am more specific about how the stories situate and verbalize experience, and how I locate "self," "position," and "identity" in the texts.

"That Cured Her!"

This is a story told during a section of a sociolinguistic interview in which Jan and Ira (a middle-aged, middle-class Jewish-American couple) are discussing intermarriage. Such intermarriage is defined primarily among American Jews as marriage outside of one's religion, i.e. between Jews and Gentiles, rather than as marriage with someone of a different race. In sociolinguistic interviews carried out in the late 1970s with three Jewish families, I found that their sentiments toward intermarriage ranged from tolerance to disapproval. These sentiments seem to match the diversity of opinion found in the Jewish community at large. Articles on intermarriage in Jewish publications reveal roughly two views: some advocate welcoming those in interfaith marriages into the community (to encourage the continuation of a tradition among their children); others advocate excluding those in interfaith marriages from the community (to send the message that such marriages are not acceptable). Regardless of the solution put forth, the increasing rate of such marriages – and the assimilation that they both reflect and engender – is seen as a threat to the continuation of a thriving

The story that I discuss here is about a date that Jan's daughter has with someone who is not Jewish, *a Gentile boy* (29). Jan's story creates and builds an opposition between "us" (Jewish people) and "them" (Gentile people), thus supporting a larger social structural opposition between different religions. More central to my purposes here, the story also reveals how Jan challenges her daughter's claim to competence in a particular domain of life: choosing friends and relationships. Teenagers face an inherent status contradiction within their families. Because "child" is a family status that is structurally subordinate to "parent," children are expected to yield to parental perceptions of inequity in power and status, in short to do what parents want. But as children make a gradual transition to adulthood, it is also expected that they will learn to take responsibility for their own decisions. A key part of the tension between teenagers and parents thus rests on striking a balance between subordination and equality, dependence and independence. Choosing friends and going out on dates crystallizes this tension: both are activities that might lead to relationships whose closeness can not only supplement, but compete with, the rights and obligations underlying the bond between parent and child. It is thus not surprising that Jan, as a parent, would want to maintain some control over whom her daughter dates. But neither is it surprising, from the daughter's point of view, that such an effort to maintain control would challenge the daughter's claim to self-sufficiency and independence.

Before Jan tells her story, Ira and Jan are describing their son during a more general discussion of intermarriage.

1 Ira: Yeh well I'll– I'll tell y– y'see when kids are [away=
2 Jan: [they
come into contact with everybody.
3 Ira: =kids are away from home and– and–
4 for example uh . . .
5 Jan: What about Craig?
6 He's gone out with girls that are Indian::
7 Ira: Oh yeh.
8 He's very liberal, but [eh
9 Jan: [He sees no difference.
10 Ira: he– he don't see any difference whatsoever.
11 He says that eh we're old fashioned.
12 If he– if [he's [if he likes somebody=
13 Jan: [If he likes some [body he's gonna go out.
14 Ira: =he's gonna go out with 'em.
15 Well?

The excerpt begins during a discussion of intermarriage. After a general explanation of why their own sense of appropriate social boundaries is being violated by *kids* (1–3), Jan and Ira describe the behavior of their son Craig (5–14). Although the daughter is not yet mentioned in this section, it provides an important local context for the upcoming introduction of the daughter, as well as for Jan's upcoming story about the daughter.

The beliefs and behavior reported in this section are presented in a par-

me, as well as (or instead of) each other. Initially, Ira and Jan share both authorial and animator roles (Goffman 1981): each is responsible for the content of their own talk and the presentation of their own words. Thus Ira begins to make a generalization in 1 (*Yéh well I'll- I'll tell y- y'see when kids are away*), but is overlapped by Jan before he reaches a turn transition place (during *away*). Although he briefly accedes the floor to Jan – who proposes a completion of Ira's sentence with 2 (*they come into contact with everybody*) – he returns to his prior generalization in 3 (*kids are away from home and– and–*), without attending topically to Jan's proposed completion. Thus, although Jan completes an utterance that Ira had initiated, Ira also returns to his own utterances; Jan does not actually remove Ira from the floor.

Ira's authorial role is reduced, however, during their next joint presentation.[1] Although Ira does complete his own utterance, either after Jan's contribution (in 10) or during it (in 12), his role in building a topic has diminished. Rather than using his own words to complete his utterance, Ira's 10 (*he– he don't see any difference whatsoever*) adds only minimally to Jan's 9 (*He sees no difference*). Similarly, Ira's *if he likes somebody . . . he's gonna go out with 'em* (12, 14) repeats, with only a minimal addition, Jan's 13 (*if he likes somebody, he's gonna go out*). Because Ira is using Jan's words as the basis for completing his utterance, he is reducing his role as author of the jointly presented belief about intermarriage.

Thus far, Jan and Ira are involved in making essentially the same point to me: they are contrasting their own view of intermarriage with their son's view. Their divergence from their son's belief is conveyed by Ira's 11 (*he says that we're eh . . . old fashioned*) and their sense of futility over their son's behavior is conveyed by Ira's 15 (*Well?*, cf. Schiffrin 1987, Chap. 5).

Ira then shifts the topic of talk from Craig's behavior to that of their daughter:

16 Ira: Now my daughter went out with eh– she went out with a couple Gentile kids,
17 and she said that=
18 Jan: she wouldn't go out with them [again.
19 Ira: = [she
wouldn't go out with them [again.
20 Jan: [She said they're too different.
21 Ira: She said that uh they're just eh–[th-=
22 Jan: [they're different.
23 Ira: =they're different.
24 Jan: She says, "It's not what I'm used to."
25 Ira: So em . . .

Ira's use of *now* introduces the daughter in a way that compares her to the son (Schiffrin 1987:230–40). The participation framework established thus far then continues: Jan completes Ira's utterances (18, 22), while Ira's repetitions and elaborations of those completions (19, 23) maintain Jan's status as author. Note that two key points are produced by Jan and repeated by Ira in 18–19 (*she wouldn't go out with them again*) and 22–23 (*they're different*). Both points use lexical repetition to build a contrast between the son and the daughter: whereas the son *sees no difference* (9), the daughter finds that *they're different* (20, 22–23); the son will *go*

out with 'em (14), but the daughter will not *go out with them* (18–19). Also contrasting the behavior and values of son and daughter is reported speech. Jan and Ira both use indirectly reported speech (in *she said that* (17, 21), to present their daughter as one who herself has certain sentiments and is committed to certain beliefs. By making their daughter both the author and principal (Goffman 1981) of beliefs that they themselves hold, Jan and Ira need not openly testify to their own views about intermarriage (cf. Wodak 1992). Jan also uses directly reported speech to allow her daughter to present her own values in 24 (*She says, "It's not what I'm used to"*). By representing her daughter's beliefs through speech attributed directly to the daughter, Jan assigns her daughter still more agency and responsibility for a belief – simultaneously removing herself from an open commitment to that view (i.e., she is not speaking as a principal) and from acknowledgment of any responsibility for bringing about that belief.

We have concentrated so far on how Ira and Jan co-produce a consensual opinion about intermarriage, and on how they contrast the beliefs of their two children. We have said little about the story that Jan will tell – partially because there is little in what Ira and Jan have thus far said that necessarily indicates that a story is coming. Ira, in fact, prepares to close the son/daughter comparison after Jan's 24 (*She says, "It's not what I'm used to"*) with the turn-transitional *So em* . . . (25). But Jan goes on to recontextualize the three aspects of the daughter's point of view noted in 18 (*she wouldn't go out with them again*), 22 (*they're different*), and 24 (*It's not what I'm used to*), in a narrative about her daughter's date with *a Gentile boy* (28):

26	Jan:	One was a– his father was a friend of my husband's.
27		And when I heard she was goin' out with him,
28		I said, "You're goin' out with a Gentile boy?"
29		She says, "Well Daddy knows his father."
30		I said, "I don't care."
31		So she introduced him,
32		and they went out,
33		and she came home early,
34		and I said, "Well, y'goin' out with him again?"
35		She says, "Nope."
36		I said, "Did he get fresh?"
37		She said, "No!"
38		She says, "But he's different!"
39		She says, "I'm not used t'Gentile boys."
40		That cured her!
41		She'd never go out with one again.

Two very different perspectives on the daughter's behavior are presented during Jan's story, one in the complicating action (27–39), one in the evaluation (40).

The complicating action in Jan's story is comprised largely of constructed dialog (Tannen 1989, Chap. 4) that performs actions directed to, and in response to, Jan's daughter. The first interchange precedes the daughter's actual date, in 27–30. Jan's first verbal action in 28 (*"You're goin' out with a Gentile boy?"*) follows

an off-record politeness strategy (Brown & Levinson 1987), whereby two different speech acts or intentions can be attributed to a single utterance. Since this strategy allows a speaker to deny either intention (e.g., one can say, "But I didn't mean that . . ."), it can be used to reduce the degree to which the illocutionary force of a particular speech act imposes upon another (i.e. upon a hearer's negative face).

"*You're goin' out with a Gentile boy?*" can be interpreted as either a question or a challenge. Although "*You're goin' out with a Gentile boy*?" is syntactically a declarative statement, it is presented with final rising intonation – an intonation that often provides a declarative statement with functional status as a question (Quirk et al. 1972:386, Stenstrom 1984, Selting 1992, Schiffrin 1994a:66–69). But note that the information status underlying "*You're goin' out with a Gentile boy*?" is *not* typical of questions. The preparatory condition of questions requires that the speaker does not know "the answer," e.g. does not know if a proposition is true (Searle 1969:66), in the sense that it is an "answer" which the speaker is attempting to elicit. Since Jan has already told us that she *heard* (the daughter) *was goin' out with him* (27), what she states in "*You're goin' out with a Gentile boy*?" is a proposition whose truth value is already known to both parties. In addition to violating the speech act conditions for questions, asking a question whose answer is already known to both parties violates a Gricean maxim of quantity: if a question seeks information that is already available, it is more informative than is required for the current purposes of the exchange. This suggests that Jan's "*You're goin' out with a Gentile boy*?" has a meaning and function in the exchange beyond seeking information about the truth of a proposition.

A good way to check an interpretation of an utterance as a speech action, especially when that utterance allows more than one interpretation, is to see how interlocutors themselves seem to interpret the action. Such interpretations are available through interlocutors' response to the action. Note, then, that the response appropriate to a *yes–no* question – to confirm or deny the proposition – is not what Jan's daughter provides. Rather, the daughter's response in 29 ("*Well Daddy knows his father*") recategorizes the social membership of the date, defining him as someone whose father is known by her own father. Like Jan's own introduction of the date in 26 (*his father was a friend of my husband's*), the response "*Well Daddy knows his father*" places an outsider (*a Gentile boy*) in a familiar realm of people within Jan's personal domain (people *Daddy knows*). By reducing the social and personal distance between Jews and Gentiles, "*Well Daddy knows his father*" justifies the daughter's plan to go out with a Gentile boy.

Justifying one's own behavior is not the kind of action that typically follows questions. Rather, justifications (and defensive moves in general) typically follow a challenge. Labov & Fanshel suggest (1977:97) that challenges assert or imply "a state of affairs that, if true, would weaken a person's claim to be competent in filling the role associated with a valued status." Under this interpretation, *goin' out with a Gentile boy* is an act that would weaken the daughter's claim to competence in the role of incipient adult, one who is able to choose her own friends and relationships. Because challenges make the status of the listener so problematic (Labov & Fanshel, 124), they are often followed by remarks that redress a perceived imbalance, and that seek to re-establish a claim of competence in a

particular role. Thus the daughter's "*Well Daddy knows his father*" redresses the imbalance in status implied by her date with *a Gentile boy*, by recategorizing him as someone whose identity is defined not by religion, but by personal relationship.

Note now that Jan's "*You're goin' out with a Gentile boy*?" seems confrontational simply because it is followed by a justification of the date – a defensive move. However, since conflict talk requires at least three moves, e.g. assertion/challenge/defense (Schiffrin 1984a, Vuchinich 1990), the actions in the story world are not actually embedded in conflict talk. In fact, Jan's next move (*I said, "I don't care"*) explicitly denies the confrontational gloss that "*Well Daddy knows his father*" had attributed to "*You're goin' out with a Gentile boy*?" The stress and intonation of "*I don't care*" is critical to this communicative force. The contrastive stress on *I* and the low-high-mid intonation contour (with each level on one of the three syllables) convey a lack of emotional involvement with the daughter's date, and/or with Ira's acquaintance with the date's father. (By contrast, level intonation with equal stress on each syllable *would* be confrontational, since it would convey a rejection of the daughter's justification.) Jan's lack of involvement is critical both for the redefinition of prior action and for the delimitation of a next action: if Jan doesn't care that her daughter is *goin' out with a Gentile boy*, there is no interactional need for the daughter to defend herself. Thus "*I don't care*" transfers responsibility for the daughter's action to the daughter herself: whatever justification the daughter wants to provide for her own behavior results from her *own* moral sense of right or wrong.

In the next interchange (31–41), Jan continues to portray her daughter as someone responsible for her own actions. The first few complicating action clauses in this section provide a good example of how the process of verbalization – transforming an experience into a linguistically encoded series of events – intersects with the theme and point of a story.

Note, first, that the first three events are reported from Jan's perspective as a parent at home: the daughter *introduced him* (31) to Jan, she left the home (*went out*, 32) and then she returned (*came home*, 33). These three events are conjoined, without terminal intonational break, with a fourth event in 34 (*and I said, "Well, y'goin' out with him again*?") that follows the daughter's return home. Thus, despite the distinct temporal juncture between events preceding the date (31–32) and those following the date (33–34), these four events are verbalized as one syntactic and intonational unit. Presenting these events together, despite their more objective temporal parameters, suggests that they form a single, subjectively defined episode in the story. This same subjective boundary is also suggested by the changed size and intonational and syntactic shapes of the next events: the questions and answers following the date (35–39) are presented as single sentences with parallel syntactic structures and asyndetic connections (i.e. no *and*).

The process of verbalization just noted intersects with the theme and point of Jan's story: the episode (in 35–39) that is differentiated syntactically and intonationally from the prior episode is the interchange in which Jan recontextualizes her earlier presentation of her daughter's beliefs. After the daughter's response in 35 (*"Nope"*) to the question about another date (34), Jan asks a second question in 36 (*"Did he get fresh*?", i.e. make unwanted physical contact) as a

possible account for the daughter's negative "*Nope.*" The daughter rejects this account in 37 ("*No!*"), and then *volunteers* her own reasons: "*But he's different!*" (38), "*I'm not used t'Gentile boys*" (39). It is during this interaction that Jan recontextualizes her earlier report of her daughter's position: *she wouldn't go out with them again* (18), *they're different* (22), *She says, "It's not what I'm used to"* (24). Each general statement from Jan's earlier presentation is textually tied to a specific story event through repetition of key predicates (*go out with, be different, be used to*) and through presentation in the same order in the text. The pronominal switch from *them* and *they* (18, 22) to *him* and *he* (34, 36) also recontextualizes the general beliefs previously presented by Jan as specific reactions to one date. (The specific reactions are then reframed back to a generalization about *Gentile boys*, 39). Note also that the importance of what the daughter says for Jan's story is highlighted through the use of the historical present tense (Schiffrin 1981), with the quotative verb (*says*) prefacing just those responses to Jan's questions ("*Nope,*" 35; "*But he's different!*", 38; "*I'm not used t'Gentile boys,*" 39) that recontextualize her earlier statements. Observe, finally, that the daughter's responsible (agentive) role is iconically captured through the use of directly reported speech: just as the daughter is portrayed as an agent in the world who can take responsibility for her own actions, so too she is animated as a character in the story world who speaks for herself.

In addition to the processes of verbalization just described, the content of the complicating action is also crucial to the point of Jan's story. So far, nothing in the complicating action of the story has revealed Jan's criticism of intermarriage. Rather, it is an evaluation clause in 40 (*That cured her!*), at the end of her complicating action, that starkly conveys exactly what her story world has not revealed. Jan's negative attitude toward intermarriage is conveyed through a metaphorical view (indicated by the verb *cure*) of human behavior and relationships as an organism that can be diseased. Through this metaphor, *That cured her!* conveys a criticism of intermarriage (disease is undesired) as well as a desire to end intermarriage (disease is something that people seek to end). *That cured her!* thus clearly reveals something quite different than Jan's actions in the story.

Following her evaluation, Jan closes the story with a narrative coda (*She'd never go out with one again*, 41) that restates the point of the story – previously stated in the abstract (18) and as specific events (34–35) as the general outcome of the date. Note important changes in the referring terms that evoke the daughter's date. A specific individual (*a Gentile boy*, 28) has become a general representative of a group (a general indefinite *one*) in the coda (*She'd never go out with one again*, 41). Not only does this reproduce the daughter's own generalization in 39 (*She says, "I'm not used t'Gentile boys"*), but it also returns the story from an earlier level of specificity in 34 (*"Well, y'goin'out with him again?"*), within the story world, to the level of generality from the narrative abstract: *she wouldn't go out with them again* (18). Thus 41 moves away from specific narrative events to a general evaluative coda of those events.

We have seen that what happens in the story world continues the portrayal of the mother/daughter relationship hinted at earlier: Jan's daughter is someone who takes responsibility for her own beliefs and actions; Jan does not have to openly endorse the daughter's beliefs or enforce her actions. Jan then presents

a second story, conjoined with *and* to continue – **and evaluate – the first** story (Schiffrin 1987, Chap. 6)

42 Jan: And when she met my son-in-law,
43 she thought he wasn't Jewish.
44 So she says, "I don't think I'm gonna go out with you because my mother would object."
45 I said, "Why did you say me, I didn't even know you were gon– met him."
46 She said, "Well, I didn't think he was Jewish. And I didn't want t'go out with him."
47 But it turned out he was Jewishhhhhh=
48 Ira: hhhhhhyeh.
49 Jan: =And then they got married.

Jan's report of her daughter's initial encounter with the man she later married (*my son-in-law*, 42) replays the point of her earlier story, but with a slightly different set of characters and events.[2] This time Jan says nothing at all about the daughter's plans (cf. "*You're goin' out with a Gentile boy*?", 28) or reaction ("*Did he get fresh*?", 36). Rather, it is the daughter herself who aborts a date, and volunteers her own reason for doing so in 44 (*she says, "I don't think I'm gonna go out with you because my mother would object"*). It is interesting that Jan is said to be the one responsible for the daughter's behavior; this is consistent with the earlier story in which Jan's "*You're goin' out with a Gentile boy*?" was interpreted by her daughter as indicative of a negative attitude toward interfaith marriage. Just as Jan denied this agentive role in her earlier story (with "*I don't care*," 30), so too, she denies it again in 45 ("*Why did you say me, I didn't even know you were gon– met him*"). As the next reported move reveals, however, the daughter is actually using Jan to animate a belief for which she herself is principal: *She said, "Well, I didn't think he was Jewish. And I didn't want t'go out with him*" (46). Thus, not only has the daughter internalized Jan's attitude about intermarriage – again behaving the way her parents want her to, without having been told to do so – but the daughter is also replicating Jan's interactional strategy: just as Jan avoided open confrontation with the daughter about *goin'out with a Gentile boy*, so too the daughter avoids openly telling someone that she *didn't want t'go out with him.*

Jan's story presents her daughter as someone who acts the way her parents want her to, even when she is not told to do so, by recontextualizing in the complicating action, through the daughter's own words, three points that Jan and Ira had jointly presented prior to the story: *she wouldn't go out with them again, they're different, It's not what I'm used to.* Thus the story shows that it is the daughter herself who stops doing the action that had threatened family solidarity: she does not date anyone whose religion would make marriage unacceptable to her parents.

Before turning to the next story, it is important to note that what is critical to Jan's story and her display of self is not just presentation of her *own* actions, but of her daughter's actions, as well as the interaction between them. Jan's portrayal of her daughter during their interaction is what shows her to be taking responsibility for her own actions. The consistency of these actions with her parents' beliefs further portrays her as someone who is situated well within the family

norms and practices. It is for these reasons that Jan can convey a neutral (rather than disapproving or critical) attitude toward her daughter's interfaith date, and to act permissive (rather than controlling) toward her daughter; in brief, she constructs a position of mother/daughter solidarity and closeness. However, the metaphor in Jan's story evaluation (*That cured her!*) displayed Jan as critical of her daughter's date – an attitude at odds with her neutral and tolerant stance in the story world. Such an attitude is more consistent with a position that denies autonomy to the daughter, and distances mother and daughter from one another by emphasizing the asymmetry of their relationship. Thus the actions and interaction in Jan's story world displayed a mother/daughter relationship quite different from that displayed by Jan's story evaluation.

"It's Only a Name!"

This is a story told by Zelda (like Jan, a middle-aged, middle-class Jewish-American woman) about a different family trouble: her daughter-in-law's inability to call her by an address term normative for Zelda's family, either "Mom" or first name. Address terms are a source of potential conflict in American discourse: what we call each other symbolizes the social relationship between addresser and addressee, often in terms of power and solidarity (Fasold 1990, Chap. 1). The use of kinship terms for direct address has an additional meaning simply because such terms label the social relationship binding the addressor (e.g. a child) and addressee (e.g. a parent). Thus the symbolic meaning of address terms makes the daughter-in-law's inability to use either a kinship term ("Mom") or first name ("Zelda") a threat to the solidarity of Zelda's family.

Although the topic of "It's only a name!" differs from that of "That cured her!", the general cultural theme of the two stories is similar. Both stories center around the need to integrate outsiders into the nuclear family; an individual who deviates from family norms poses a threat to that integration. Whereas Jan's story was about the threat of marriage with an "outsider" (and thus a potential need to incorporate an in-law of a different faith into the family), Zelda's story is about the threat posed by someone who has already become an "insider" (her daughter-in-law) but refuses to act like one. Interestingly, the symbolic meaning of the daughter-in-law's solution to the naming problem, namely using "nothing," replicates the central cultural dilemma underlying Zelda's story: being called "nothing" implies a lack of familiarity and/or certainty, exactly what has to be overcome if outsiders are to be integrated into one's family.

In contrast to Jan's story, which began as Jan developed her husband's comparison between daughter and son during a discussion of intermarriage, Zelda's story is told in response to a direct question that I ask during a discussion of address terms. (CA here marks complicating action clauses, E marks evaluation clauses.)

1 Debby: What does your uh daughter-in-law call you?
2 Zelda: Well, that's a sore ⌐spot.
Debby: ⌊hhhh
3 Zelda: My <u>older</u> daughter-in-law does call me Mom.=

	4	Zelda:	=My younger daughter-in-law right now is up to nothing.
CA	5		She [had said–
		Debby:	[Oh
E	6	Zelda:	We had quite a discussion about it.
E	7		We did bring it out in the open.
CA	8		She said that um . . . that she– just– right now, she's:– it'll take her time.
E	9		Now they're marrie:d, it's gonna be uh . . . I think eh . . . five years, =
		Debby:	Um hmm.
	10	Zelda:	=that they'll be married.
CA	11		And she said that eh it was very hard t's:– call someone else Mom beside her mother.
CA	12		So I had said to her, "That's okay!"
CA	13		I said, "If you– if you can't say Mom, just call me by my first name!
		Debby:	[Umhm
E	14	Zelda:	So, we had quite a discussion about it.
E	15		It was a little heated [[at one time. =
		Debby:	[Yeh]
	16	Zelda:	She said, "All right," she'll call me Zelda.
CA	17		But she still can't bring herself to say Zelda,
CA	18		so she calls me nothing!

Although Zelda's story is situated in prior discourse that is very different than Jan's, the story is similar in several ways. First, like Jan, Zelda recontextualizes a point *prior* to her story in 4 (*My younger daughter-in-law right now is up to nothing*) within the events of her story (*so she calls me nothing*!, 18). Second, Zelda also presents herself in her story world as accepting and permissive, with criticism more reserved for her evaluation. The complicating action clauses in Zelda's story are also relatively free of criticism; the evaluation clauses reveal a more critical view of the daughter-in-law's behavior. These aspects of Zelda's self-presentation help construct a dual position, pivoting between solidarity and distance, similar to that constructed by Jan. Despite these similarities, the specific textual construction of Zelda's dual position differs from Jan's story: whereas Jan's story textually segregates her neutral from her critical stance, Zelda consistently weaves the two sides of her dual position together in her story and her post-story evaluations.

So pervasive is Zelda's intertwining of solidarity and distance toward her daughter-in-law that a duality appears as soon as she begins to answer my question *What does your uh daughter-in-law call you*? (1). Since Zelda has two daughters-in-law, who address her differently, she cannot felicitously answer my question without mentioning both. But rather than begin by repairing, and then providing, the information I had requested, Zelda begins with the general evaluation *Well, that's a sore spot* (2), based on the same metaphorical view of behavior and relationships as Jan's. Since "a sore spot" is a small but ongoing irritation in an otherwise healthy system, *that's a sore spot* conveys that there is some small, ongoing trouble in the use of address terms.

When Zelda does goes on to repair and present the information that I had requested, she provides a hint as to what is causing the *sore spot*. Her repair of *a* daughter-in-law is based on the comparative *my older daughter-in-law* (9)

comparative indicates two members of that family category. Zelda uses *do* to report that this daughter-in-law calls her *Mom* (3). Both negatives and *do* can be contrastive in discourse. However, whereas the use of negatives reveals that an event does *not* fill an expectation, the use of *do* can convey that an event *does* fill an expectation. Thus *My older daughter-in-law does call me Mom* (3) conveys an expectation of being called "Mom."

Zelda's answer is informationally completed by *My younger daughter-in-law right now is up to nothing* (4). Yet, like the other parts of her answer thus far, this too reveals trouble. *Up to* is an aspectual and evaluative verbal particle that can convey not only progression past a baseline (e.g., a temperature can *go up to 104*, Clark 1974) but also progression toward a desired goal or endpoint (e.g. we can be *up to the last chapter in a book*, or *only up to Chapter 2*). By saying that her daughter-in-law *right now is up to nothing*, Zelda presents her as moving along a trajectory of some kind. But as we find out later, when Zelda says *But call them something* (36), *nothing* is opposite to the desired endpoint. In combining an aspectual particle that conveys accomplishment (approaching a goal) with an action (call her *nothing*) which is viewed not as an accomplishment, but as an undesirable goal, she conveys a negative attitude (cf. the expression *up to no good*) or a sense of irony or sarcasm – another hint of the trouble to come in the story.

Although the complicating action clauses of Zelda's story are relatively free of criticism, evaluation devices throughout the story continue to reveal trouble. Thus Zelda begins the story events with *She had said* (5), but self-interrupts to gloss the interaction as *quite a discussion* (6). Like *a sore spot*, this is a mitigated report of trouble. Prior disagreement with the daughter-in-law is conveyed by intensifying (with *quite a*) the description of the speech event *discussion*. But *discussion* conveys a less intense disagreement than other metacommunicative terms such as *fight* or *argument*. In 7, *We did bring it out in the open* also affirms the value of having a discussion (not only through use of *do*, but through the evaluative deixis *bring it out*).

The complicating action reports an interaction between Zelda and her daughter-in-law in which both are portrayed as reasonable people who do not engage in verbal conflict. The first full story event is the daughter-in-law's account for why she does not call Zelda "Mom": *She said that um . . . that she– just– right now, she's:– it'll take her time* (8). Rather than respond to (accept or reject) her daughter-in-law's account in a story event, Zelda uses embedded orientation clauses to reveal her rejection of the account. In 9–10, *they're marrie:d, it's gonna be uh . . . I think eh . . . five years that they'll be married* juxtaposes the daughter-in-law's plea for more time with mention of the substantial period of time that has already passed (*five years*), thus implying that the account is not acceptable.

The daughter-in-law provides a second account for her failure to call Zelda "Mom": *And she said that eh it was very hard t's:– call someone else Mom beside her mother* (11). Note that addressing a mother-in-law as "Mom" creates a symbolic parallel between a relationship created through marriage (in-law relationship) and one that is typically created biologically (parent/child relationship). It is this symbolic alignment – addressing someone *beside her mother* with a term previously reserved for her mother – that the daughter-in-law finds *very hard* to create.

After accepting the second account in 12 (*So I had said to her, "That's okay*!", Zelda presents an alternative: *I said, "If you– if you can't say Mom, just call me by my first name*!" (13). The structure and function of this move is a central part of Zelda's presentation as a cooperative person who accommodates her daughter-in-law's needs; it also helps reveal why *so she calls me nothing*! (18) is a sequentially inappropriate and face-threatening move in the interchange.

Note first that, although *That's okay* is a transitional move (because of *okay*; Merritt 1984, Beach 1993), it does not specify which party should take responsibility for the next move. However, the conditional structure of 13 transfers responsibility for the next move to the daughter-in-law; and as we see in a moment, it makes it difficult for her not to comply. *Just call me by my first name*! is presented as a consequence that follows from an antecedent *if*-clause (*if you can't say Mom*), whose shared information status (Haiman 1978, Akatsuka 1986, Ford & Thompson 1986, Schiffrin 1992) had been guaranteed by the daughter-in-law herself in 11 (*she said that eh it was very hard t's:– call someone else Mom beside her mother*). In addition to basing her alternative on supposed common ground, Zelda adopts a view of the problem that parallels the account provided by the daughter-in-law herself. Recall that *Just call me by my first name!* is presented as a consequence of what the daughter-in-law *can't* do (*if you can't say Mom*), i.e. a consequence of an inability (i.e. the basic meaning of *can*). Being unable to do something is semantically compatible with finding that act *very hard.* Finally Zelda minimizes the difficulty of adopting her alternative *call me by my first name with just.* Thus "*If you– if you can't say Mom, just call me by my first name!*" does a great deal of work for Zelda. By basing the alternative being offered on the daughter-in-law's own account, grounding it in shared information, and minimizing its degree of imposition, it not only transfers responsibility for the next move to the daughter-in-law, and tries to guarantee its cooperative nature, but it also helps construct a position of solidarity with the daughter-in-law.

However, a speech act analysis of "*If you– if you can't say Mom, just call me by my first name!*" suggests that the solidarity being constructed by these moves is somewhat fragile. On one level of analysis, "*If you– if you can't say Mom, just call me by my first name!*" is a directive. *Call me by my first name* is an imperative (a syntactic form often associated with directives) that clearly fills the felicity conditions for directives – e.g. the sincerity condition that S wants H to do A, the essential condition that it counts as an attempt to get H to do A (Searle 1969). On a sequential level of analysis, however, "*If you– if you can't say Mom, just call me by my first name*!" functions as a compromise: it replaces a previously unfulfilled act (call me "Mom") that S wanted, with an act (call me "first name") that S is willing to accept because it is assumed to be more within the realm of H's ability, desires, or beliefs (a preparatory condition). Since compromises adjust what S wants so that it is more in line with what H is presumed to want, compromises share a crucial characteristic with commissive speech acts (which focus more on H's wants than S's), such as offers. Indeed, we typically say that we *offer* (not *request*) a compromise.[3]

Defining "*If you– if you can't say Mom, just call me by my first name!*" as an offer helps explain why the outcome of the interaction is so unsatisfying to Zelda.

Offers can be face-threatening acts – an interactional meaning that makes their rejection a delicate matter for both speakers and hearers. As I discuss elsewhere (Schiffrin 1994a: 112–13), offers are face-threatening to both S and H because they are predicated on two kinds of "wants." The first want inheres in an assumption, made by S, that H might want the goods or service being made available. Because S has no guarantee that A is what H does want, S must guess what H wants. But since guessing another's desires means making assumptions about another's internal state, an offer can threaten H's negative face, i.e. the desire that one's own needs and wants be unimpeded and unintruded upon (Brown & Levinson 1987). The second want inherent in offers can be viewed as a sincerity condition (Searle 1969): S wants to do something for H. But this too has a hidden cost: if H rejects an offer, H is in effect saying that H does not want what S wants. This can be a threat to S's positive face, i.e. the desire that others want the same thing that self wants (cf. Brown & Levinson).

As noted earlier, Zelda's offer of a compromise (*just call me by my first name!*) was based on the daughter-in-law's own account – an evocation of common ground that should guarantee its successful outcome. But as we have just noted, a wrong guess about what H wants (leading H to reject an offer) can display a failed presumption of familiarity, (i.e., S does not know H well enough to make an accurate guess about what H wants), and thus can create a threat to S's positive face. This makes rejected offers potentially threatening not only to the self/other relationship ("I don't know you well enough to guess what you want"), but also to the self ("you don't want what I want").

Note now that the daughter-in-law does agree to Zelda's alternative in 16 (*She said, "All right," she'll call me Zelda*). As presupposed by the implicative verb in 17 (*she can't bring herself*), the daughter-in-law has also tried to say "Zelda." Nevertheless, the interchange concludes when the daughter-in-law rejects Zelda's offer and does not comply with her request: *so she calls me nothing!* (18). The fact that the daughter-in-law does not provide an account is all the more troubling. Accounts mitigate precisely the face threats noted earlier: accounts can provide a reason independent of the self/other relationship as to why H does not want what S thinks H wants. By calling Zelda *nothing*, without explaining why, the daughter-in-law is threatening Zelda's positive face: she doesn't want what Zelda wants, and Zelda does not know her well enough to guess what *she* wants. This face threat actually mirrors the symbolic problem created by the use of "nothing" as an address term: both imply an uncertain, unfamiliar relationship. The sequence of acts in the story world thus displays, on a local level, the same symbolic problem created by using "nothing" as an address term. These in turn manifest the social and cultural dilemma underlying Zelda's story: how to bring a person who is unfamiliar, and whose practices are unpredictable, into the familiarity and certainty of one's family.

Although I reserve most comparisons between Zelda's and Jan's stories for later, some brief comparisons are relevant here. In the earlier discussion of Jan's story, we noted that Jan remained neutral and permissive in her story world. Zelda's self-presentation in her story world is similar: she is cooperative and face-saving. Except for the final affront in 18 (*so she calls me nothing.!*), the daughter-in-law

also behaves cooperatively; i.e., she offers accounts for her non-compliance in 8 (*it'll take her time*) and 11 (*it was very hard t's:– call someone else Mom beside her mother*), and it is presupposed that she tries to *say Zelda* (17). Thus the actions in the story worlds of both stories portray people who do not engage in open verbal conflict.

Another similarity between the two stories is the use of narrative evaluation for criticism: neither Jan nor Zelda use story events to reveal the family problem with which they are confronted. Our earlier analysis showed that Jan's criticism of her daughter was reserved for an external evaluation clause. Zelda's criticism is in evaluation clauses that are interwoven with her story events. We have already noted how embedded orientation clauses in 9–10 (*Now they're marrie:d, it's gonna be uh . . . I think eh . . . five years that they'll be married*), rather than narrative events, reject the daughter-in-law's account. Note also that Zelda repeats her earlier gloss (*So, we had quite a discussion about it*, 14) and is explicit about its emotional tone (*It was a little heated, at one time*, 15) within the sequence of moves that themselves are cooperative. However, consistent with Zelda's ongoing construction of a dual position, even these criticisms are mitigated: the term *discussion* (14) does not necessarily convey confrontation; the intensity of the anger metaphor *heated* (Lakoff & Johnson 1980) is reduced with *a little.*

Note finally that both Jan and Zelda populate their story worlds with story characters whose speaking behavior parallels their agentive roles in their families. Jan's daughter took responsibility for her own actions: she was also presented as a story character who animated her own beliefs, enacting them through directly reported speech. But Zelda's daughter-in-law does not take a responsible, agentive role in the family: she does not follow through with a behavior to which she had agreed; even worse, her lack of compliance (calling Zelda *nothing*) results in the absence of verbal behavior. It is only when the daughter-in-law does act agentively – when she accepts the compromise "*All right*" (16) – that Zelda allows her to speak for herself. In all other uses of constructed dialog, Zelda uses indirectly reported speech (in 8, *She said that um . . . that she– just– right now, she's:– it'll take her time*, and in 11, *And she said that eh it was very hard t's– call someone else Mom beside her mother*), or switches to indirect speech (*She said . . . she'll call me Zelda*, 16). Thus, just as the agentive family role of Jan's daughter was iconically conveyed in her story world construction of the daughter as someone who speaks for herself, the non-agentive family role of Zelda's daughter-in-law was iconically conveyed in her construction of her story world character as someone who does not animate her own words.

Earlier we saw that the symbolic meaning of address terms makes the daughter-in-law's inability to use a kinship term or first name *a sore spot*; saying *nothing* creates a symbolic vacuum in her relationship with Zelda, marking it as uncertain and open to negotiation. Despite this symbolic problem, Zelda minimizes the consequences of being called *nothing* immediately after her restatement of the problematic behavior in 18 (*so she calls me nothing!*) – thus, like Jan, replaying and elaborating the point of the story after its resolution. Rather than tell another story, however, Zelda uses several *lists* as evaluative devices (a list is a discourse structure in which similar items are clustered together; Schiffrin 1994b).

The first list provides four items whose positive value contrasts with the negative behavior just reported, thereby helping to construct a position of solidarity between Zelda and her daughter-in-law:

19 She do– but we're very cl– we're on very good terms,]=
Debby: [Yeh.
20 Zelda: =she's a very sweet girl
21 and I like her very much
22 and uh: we don't have any differences.

Zelda's display of acceptance begins with *but* as a marker of contrast (Schiffrin 1987, Chap. 6) and a statement of her closeness with her daughter-in-law (*very good terms*, 19). Next is a positive attribution (*she's a very sweet girl*); and Zelda's feelings about the daughter-in-law (*and I like her very much*). In 22, *And uh: we don't have any differences* summarizes (through paraphrase of 19) the lack of dissension in the relationship. Both the repeated use of the modifier *very* (19, 20, 21) and the list-like presentation of good qualities (with no terminal intonational break between them) enhance their evaluative function for the story; i.e., each quality adds to the others to build a cumulative picture of a generally good relationship (Schiffrin 1994b). Zelda thus disengages a verbal behavior (*calls me nothing*) from its symbolic meaning: even though the behavior is problematic, it is not a threat to family solidarity.

However, after minimizing the problematic consequences of her daughter-in-law's behavior, Zelda reinforces her complaint by bringing up her son's use of *first names for her mother and father*. The shift in position is again initiated with *but*:

23 But, that's the eh: just the– y'know the point that eh–
24 her– eh my son calls her mother and father by their first names.
25 Which is fine!
26 That's all right!

By mentioning that her *son calls her mother and father by their first names* (24), Zelda reinforces the acceptability of the alternative address term that she had suggested – showing, also, that she is a reasonable person who accepts diversity in her family. But Zelda's mention of her son also reveals a lack of family symmetry, a non-reciprocity, that can itself be seen as troubling. Although her son shows appropriate respect for his in-laws, her daughter-in-law (his wife) does not reciprocate. Furthermore, although Zelda was able to teach her son the right thing to do, her in-laws did not do so with their daughter. Thus the offense has repercussions potentially wider than the relationship between Zelda and her daughter-in-law.

My comments to Zelda partially sustain the dual position being created through Zelda's story:

Debby: Yeh I think so.
Zelda: Yeh.
Debby: What does she call your husband? The same problem?

Zelda: Eh:yeh. I don't think she says anything [yet.
Debby: [Yeh. It's hard I imagine.
Zelda: I imagine it [is:
Debby: [Yeh.

During our interchange, I first define the daughter-in-law's behavior as a problem when I prompt Zelda's answer to my question *What does she call your husband?* with *The same problem?* After Zelda's answer (*yeh. I don't think she says anything yet*), I adopt the daughter-in-law's perspective with *Yeh. It's hard I imagine.* Zelda's repetition (*I imagine it is*) also helps to mitigate the problematic status of the daughter-in-law's behavior.

We noted earlier that, in contrast to the cooperative and face-saving nature of the story events, Zelda's narrative evaluations reveal criticism as well as acceptance of her daughter-in-law. The next part of Zelda's post-story evaluation – a list of family members who use the appropriate address terms – continues to show the same pattern. However, Zelda also becomes more critical of her daughter-in-law in this section. Thus, although Zelda's story implicitly rejects the daughter-in-law's account in 8 (*it'll take her time*) to say "Mom", she explicitly denies the validity of that account through her list. The list opens with a general rule about using address terms that prescribes behavior exactly opposite to that preferred by the daughter-in-law:

27 And you *have* to start in the beginning.

The force of Zelda's rule is here conveyed not just through stress on the modal *have* (conveying both obligation and contrast), but through the list of people who have followed the rule, and therefore provide evidence for its validity. First is the older daughter-in-law (mentioned earlier in 3):

28 Now my daughter-in-law did.
29 My older daughter-in-law from the very beginning she said Mom,
30 so she's used to it.=[
Debby: [Yeh
31 Zelda: =Mom and Dad.

The older daughter-in-law *did* [follow the rule] in 28 (note the stress again): she *said Mom* from *the very beginning* (29) and therefore got *used to it* (30).

Before mentioning the second person who evinces her rule, Zelda becomes more openly critical in another way. She embeds an evaluative gloss in her list that reveals the stark asymmetry between herself and her daughter-in-law:

32 See it doesn't ma– it's only a name!

Warranted by the older daughter-in-law's behavior (28–31) is a conclusion about the symbolic non-importance of terms of address: *it doesn't matter* (interrupted) and *it's only a name!* The formulaic phrase *it's only a name!* reveals the asymmetry

between Zelda and her daughter-in-law. If "Mom" truly is *only a name*, then Zelda should be able to accept not being called "Mom," or even being called "nothing." However, since we know that Zelda wants to be called *something* (36), Zelda is, in effect, saying that names lack symbolic meaning only for the addressor (the daughter-in-law) and not the addressee (Zelda). Put another way, "Mom" clearly has a perlocutionary effect on the hearer (Zelda), but it should have no intended illocutionary force for the speaker (the daughter-in-law). Thus *it's only a name!* clearly conveys a symbolic asymmetry and distance between Zelda and her daughter-in-law: a verbal practice which is rich with meaning for Zelda should be devoid of symbolic meaning for the daughter-in-law.

Zelda continues her list of people who follow the rule (*in the beginning*, 34) with her son:

33 And Ron– we told Ronny too,
34 in the beginning,
35 you call– if you can't say Mom and Dad, call them by their name.

Note that Zelda explicitly offers her son the same alternative (*if you can't say Mom and Dad, call them by their name*, 35) that she offered to her younger daughter-in-law (*I said, "If you– if you can't say Mom, just call me by my first name!*, 13).

Zelda then makes more explicit her preference for "first name" over "nothing" (36–37); and after imitating the way one calls someone "nothing" (an imitation that I build upon), the turn continuers *yeh* and *right* (Schegloff 1981) allow her to maintain the general floor to rebuild the earlier list (19–22) of her daughter-in-law's good qualities and to embed it into the current list of people who follow the general rule:

36 But call them something.
37 Not "uh::::"
Debby: Yeh [hh and wait for them to [hear "uh::"
Zelda: [yeh [Right.
38 And she's an intelligent girl
39 and she's a nice girl.
40 She gives us the biggest respect.
41 And she's really nice.
42 I like her very much.
43 It's just that she can't say it.

Each positive quality counters a potentially negative implication of using "nothing" or being called "nothing": the behavior does not reflect intelligence (38), personality (39, 41), or lack of respect (40); it has not affected Zelda's feelings (42). In contrast to this overall good relationship, conveyed with superlatives (*biggest*) and intensifiers (*nice, really, very*), is the problematic behavior: *It's just that she can't say it* (43).

The last person in Zelda's list of family members who follows the rule is Zelda herself:

44 Now I remember when I first got married,
45 and I was in that situation.
46 And eh the first– like the first ... few times, I didn't say anything.
47 And my husband said to me, "Now look. It isn't hard. Just say 'Mom'."
48 He says, "And I want you to do it."
49 And I did it.
50 And I got used to it.

Like her daughter-in-law, Zelda had trouble saying "Mom" when she *first got married* (44), and she *didn't say anything* (46). But when her husband stated his preference through a variety of directive forms, including an imperative (*Just say "Mom,"* 47) and a "want" statement (*"And I want you to do it,"* 48), Zelda complied with her husband's wishes (*And I did it,* 49) overcoming her initial discomfort (*And I got used to it,* 50). Thus, although Zelda's own experience is partially like that of her younger daughter-in-law, it diverges at a crucial point: Zelda does what she is told to do.

As we have seen in this section, Zelda continues to display a dual position of both solidarity toward and distance from her daughter-in-law. Although she reinforces her positive feelings about her daughter-in-law, she is also more openly critical of her behavior, rejecting her earlier account and revealing a stark asymmetry as to the symbolic importance of address terms. In addition, because the behavior of each person mentioned in the list conforms to Zelda's rule, its cumulative effect is to justify Zelda's view of her daughter-in-law's behavior as problematic. Thus, like Zelda's story and its embedded evaluations, Zelda's post-story evaluation also helps construct a dual position.

To summarize: calling a mother-in-law "Mom" or by her first name has different symbolic meanings. "Mom" reinforces the family relationship: it creates an analogy between a relationship created through marriage (the in-law relationship) and a parent/child relationship. Although first names can display an asymmetric power relationship (i.e., the one with more power uses a first name to address the one with less power), they can also display a relationship of solidarity and equal status, thus maintaining some of the intimacy and camaraderie associated with families.

Being called "nothing" leaves a symbolic vacuum in the relationship between Zelda and her daughter-in-law; it marks their relationship as uncertain and still open to negotiation. Not only can such instability create an impression of family trouble, but it replicates the central cultural dilemma underlying Zelda's story: unfamiliarity and/or uncertainty is exactly what has to be overcome if outsiders are to be integrated into one's family. Zelda uses different forms of evaluation to combat the impression of trouble and to resolve the general dilemma. She minimizes the trouble through the metaphor *sore spot*; she glosses the interaction as a *discussion* that was *a little heated*; she describes her daughter-in-law and their relationship in positive terms; she mentions people who do follow the expected norms. Thus Zelda disengages a linguistic practice – the use of an address term – from the social relationship and more general social problem that it can symbolize: she complains about her daughter-in-law's behavior, but denies the symbolic meaning of that behavior.

In discussing Jan's story "That cured her!", we noted that Jan presented herself in two different ways: she was neutral and permissive in the story world, but critical and controlling in her story evaluation. A similar disjunction appears in Zelda's story, resulting in a dual position that also pivots between solidarity and distance, and between the provision of autonomy and the exercise of power. However, the textual construction of Zelda's position differed from Jan's in several ways. Whereas Jan's dual position was apparent in the story only through a single evaluation clause, isolated from the complicating action, Zelda's dual position was woven into the story through external evaluation clauses and other evaluative devices. Whereas Jan's evaluation revealed only a negative view of her daughter's behavior, Zelda's evaluation was both negative and positive; i.e., her evaluation balanced criticism of her daughter-in-law with praise. Although both women evaluated their stories after completion, Jan used a second story to do so, while Zelda used lists. In what follows I further compare the two stories in the context of more general methodological and theoretical conclusions concerning narrative language, self, and identity.

Conclusion: Narrative Language, Self, and Identity

Despite a rich and varied research tradition focusing on this topic, there are surprisingly few linguistically detailed analyses of how particular stories display their tellers' sense of who they are. One outcome of this is that there is no set of general sociolinguistic tools through which to analyze how narrative language reveals self and identity. In this section, I discuss my analyses in more general methodological and theoretical terms in relation to verbalizing and situating experience, discursive representations of self and identity, and sociolinguistic perspectives on identity.

Verbalizing and Situating the Stories

I suggested earlier that the way we verbalize and situate our experience as text (both locally and globally) provides a resource for the representation of personal and social identity. My analysis tried to capture these processes by focusing on the language used before, during, and after the stories themselves. Here I mention some of the ways that Jan and Zelda verbalized and situated their stories in relation to their displays of identity.

Both stories were locally situated in ongoing discourse on several different discourse planes simultaneously. Jan's story began as part of a general discussion of intermarriage. Although Jan and Ira were describing their son's dating behavior together, and it was Ira who initiated a comparison with their daughter, Jan gained authorial status and the turn-taking rights to recontextualize the daughter's position on intermarriage within a story. Thus Jan's story was locally situated within a more general discourse topic (intermarriage), within which she claimed specific rights to develop a particular subtopic (her daughter's position) through a story. Jan's story tied the subtopic to the more general topic by paraphrasing

general formulations from prior talk as constructed dialog that was particular to one specific interchange. Each general statement from Jan's earlier presentation was referentially tied to a specific story event through repetition of key predicates; through presentation in the same linear order; and through pronominal switches from the general *them*, to the specific *him* and *he*, and then back to the general *Gentile boys*. The daughter's position was replayed yet again in post-story talk, when Jan told another brief story about her daughter. Thus Jan's story was situated both referentially, in terms of general discourse topic and specific discourse entities, and evaluatively, in that the same point is built in relation to both pre- and post-story talk.

Although Zelda's story was situated in a question/answer exchange, it too was locally situated on different planes of discourse simultaneously. Zelda's story began as part of a discussion of family naming practices. Because my question asked about Zelda's *daughter-in-law*, Zelda repaired the referential domain to two daughters-in-law when she mentioned her *older daughter-in-law*. Although Zelda's repair could have had a purely informational or referential function in relation to prior discourse (establishing the correct domain of our discourse topic), it also had evaluative functions: what was predicated of the older daughter-in-law (*does call me Mom*) revealed Zelda's expectation about what she would like to be called, prefigured the point to be developed in her story, and defined a practice whose distribution in Zelda's family provided a later source of evaluation in the list of family members who use appropriate address terms.

In addition to being referentially and evaluatively tied into pre-story talk, Zelda's story was also linked with her post-story talk. For example, the list of the daughter-in-law's positive qualities, first presented immediately after Zelda's story (19–22), was also embedded in Zelda's later list of family members who use the appropriate address terms (38–42). The list of family members also added a new layer of evaluative information relevant to Zelda's story. By providing evidence for the validity of Zelda's rule (*you have to start in the beginning*, 27) the list clearly revealed Zelda's rejection of the daughter-in-law's account for not calling Zelda "Mom" (an account only implicitly rejected in Zelda's story). Still another link between Zelda's story and post-story list was through discourse referents and the referring terms used to evoke them. The main referent in Zelda's story (her younger daughter-in-law) remained a main referent in Zelda's list (or accessible topic, in the terms of Ariel 1990). Evidence for this was Zelda's use of the pronoun *she* to evoke the younger daughter-in-law in an environment that often *dis*favors the use of pronouns as next-mentions of prior referents. Specifically, Zelda evoked the younger daughter-in-law through *she* in *And she's an intelligent girl* (38), even though the most recent, semantically compatible antecedent in the text was the older daughter-in-law (*Now my daughter-in-law did*, 28). (Note that this referent was itself pronominally continued as *she* in 29–30, and therefore also had status as an accessible topic.)

Both stories were also globally situated in relation to a similar cultural theme: how to integrate outsiders, whose beliefs and practices may differ from one's own, into one's family. That such integration may create difficulties was revealed through the same metaphor in both stories

relationships as an organism. This metaphor pervades both our public and private discourse (e.g., we complain about *social ills*, an *unhealthy society*, we try to *cure* social problems). Thus its use as evaluation of the reported encounters situates the story topics – intermarriage, terms of address – in culturally salient and socially familiar terms. Both stories also told about a threat to family integration by re-creating particular encounters, during which that threat was interpersonally negotiated through routinized and face-saving sequences of speech acts. The stories thus instantiated the belief that face-to-face interactions can help solve more general social and cultural dilemmas (a sentiment captured in Zelda's *We did bring it out in the open*). Like the "society as organism" metaphor, the belief that talk can help solve problems is widespread and pervasive (e.g., psychotherapy is viewed as a "talking cure").

The way that the two experiences were verbalized as narrative also shows some similarities. Both stories crystallized what was probably an ongoing family issue into brief verbal interchanges in which familiar sequences of speech acts, realized through relatively conventional linguistic strategies, were used to reveal family trouble and its resolution. But because the stories did not include the third move necessary to our definitions of conflict talk, the speech acts themselves could not be defined as conflictual. Even the act initially responsible for each particular interchange was absent from the stories. Thus, although Ira announced the source of family trouble prior to Jan's story (*my daughter went out with a couple Gentile kids*), the date that actually led to the interchange was not reported as an event in the story, but only presupposed by Jan's adverbial *when* clause (*when I heard she was goin' out with him*).

The process of verbalizing an experience was reflected not only in the contents of the stories (what was said or not said), but also in how syntactic form, information status, and contextualization cues were used to convey pragmatic meanings central to the themes of the stories. The syntactic contrast between directly and indirectly reported speech, for example, had a role in the construction of story characters: the way Jan's daughter accepted responsibility was enacted through direct speech; the way Zelda's daughter-in-law avoided responsibility was enacted through indirect speech. Another example of the pragmatic role of syntax was in Zelda's offer of a compromise in "*if you can't say Mom, just call me by my first name!*" What made this move accommodating was its verbalization as a conditional sentence with a preposed (rather than postposed) *if*-clause, whose information status as shared knowledge had been textually grounded. A final example is the use of intonation as a contextualization cue. Both Jan and Zelda disengaged themselves from controversy through reported speech (*I don't care!, That's okay!*) whose communicative force was conveyed not only lexically, but intonationally: both used a low-high-mid intonation contour (with each level falling on one of the three syllables in their utterances) that seems to conventionally indicate a lack of emotional involvement.

By situating and verbalizing a specific experience in the ways just described, Jan's and Zelda's stories allowed them to display different aspects of self, to construct a position in relation to a family member, and to present themselves in a "mother" identity. Note that I have been using the terms *self*, *position*, and *identity*

as if their definitions, relation to one another, and means of identification in text were always clear. But just as it was important to summarize the processes by which the stories verbalized and situated experience, it is also important to relate the constructs of self, position, and identity to one another, as well as to sociolinguistic analysis of narrative.

Narrative Displays of Self, Position, and Role

Narrative is a means by which to arrive at an understanding of the self as emergent from actions and experiences, both in relation to general themes or plots and as located in a cultural matrix of meanings, beliefs, and practices. The form, content, and performance of narrative thus all provide sensitive indices of our personal selves and our social and cultural identities. In this section, I am more explicit about how I related the concepts upon which I depended (e.g. self, position, identity) and how I located them in the narratives.

My analyses showed that both Jan and Zelda displayed themselves in two different ways, i.e. as relatively accepting and as critical. The way these two displays of self were linguistically differentiated in the stories coincides with J. Bruner's distinction (1990) between epistemic and agentive selves.[4] He suggests that we present ourselves epistemically when we state our beliefs, feelings, and wants; agentive aspects of self are revealed when we report actions directed toward goals, including actions that have an effect on others. Jan and Zelda both presented themselves as figures taking actions (primarily verbal actions such as saying *I don't care!, That's okay!*) that were part of cooperative interactions. These presentations were displays of agentive selves. But far from permitting and accepting practices not in keeping with family norms, the evaluations of both speakers viewed such practices metaphorically as disease that could either be *cured* or remain *a sore spot.* These beliefs, and their indication of family trouble, were displays of epistemic selves. Thus the evaluations in both narratives presented epistemic selves that were at odds with the agentive selves displayed in the complicating actions.

Although it may seem that agentive selves would be naturally housed in complicating actions, and epistemic selves in evaluation clauses, the actual correlation between self and text was not quite so neat. Not only were epistemic selves not restricted to external evaluation clauses, but they did not appear solely through the linguistic forms in which we might expect them (e.g. as first person epistemic factives like *realize, know,* or emotive factives like *be glad*). As in most analyses of oral narrative, I found that speakers convey their attitudes, feelings, and beliefs – the very stuff of the epistemic self and of narrative evaluation – in a variety of ways.

Event clauses in the complicating actions of both stories, for example, had epistemic functions simply because the actions performed were conventionally associated with certain speaker intentions and/or attitudes. To be more specific, since making a request is a felicitous speech act only if the speaker wants the hearer to do a particular act, the performance of a request displays a particular attitudinal state – in Searle's words (1969), a sincerity condition.

Thus, when Zelda requested that her daughter-in-law just call her by her first name, we can assume that this was something that Zelda wanted, and thus was a display of an epistemic self.

Just as the linguistic display of an epistemic self was not restricted to a single section of text, neither was it confined to a single predicate type. Thus the third person attribution *she's a very sweet girl* was conjoined (with no intonational break) to the first person statement *I like her very much* in Zelda's list (a text structure in which similar items are clustered together). Since both seemed to reveal Zelda's positive attitude toward her daughter-in-law, both displayed an epistemic self. Negative attitudes toward social conduct were also inferable in a variety of ways, including action clauses that had evaluative functions. For example, Zelda depended on reported actions as evaluation during her list of family members who behaved appropriately – a list that included her own reported actions (e.g., *I did it, I got used to it*). Finally, even the clearest presentations of Jan's and Zelda's criticism were not direct statements of attitude, e.g., "I didn't like what she did." Rather, both speakers relied on metaphors (*That cured her!, Well, that's a sore spot*) to convey their feelings about non-normative practices in their family.

In addition to widening the range of ways in which we can display an epistemic self, my analysis also moved the linguistic display of self from a clause level to a text level. This allowed us to see that presentations of self may contradict (as well as reinforce) one another; in addition it showed that we present ourselves through the forms and meanings of textual patterns that cannot always be anticipated until we do a detailed examination of particular ways of speaking, and the interpretation of the social and cultural meanings of what is said. Thus the use of syntactic and textual forms as varied as constructed dialog, lists, and repetition – and a consideration of how these (and other) forms were sequentially and socially situated – worked together to display different aspects of self.

Moving the display of agentive and epistemic self to a textual level (and even more, to the way texts reconstruct interactions) also helps to build a connection between our linguistic displays of self and the construction of positions (Davies & Harré 1990). Many of the actions and attitudes that we represent through speech are interactional in nature: when we perform an action through speech, we are acting *toward* another person with some possible effect on that person. We have beliefs and attitudes not only about situations and events in the world, but about other people, as well as their role in situations and events. Thus the agentive and epistemic selves that we display linguistically, through reported actions and beliefs in a story world, provide a sensitive index to our ongoing relationships with others in that story world. It is this indexical relationship – between agentive and epistemic selves, on the one hand, and ongoing relationships, on the other – that I have tried to capture through the term *position*. To take a concrete example from my analysis, Zelda's *If you can't say Mom, just call me by my first name!* can be seen as an agentive display that indexed a position of solidarity with her daughter-in-law. Thus the way we use language to display epistemic and agentive aspects of self, during our stories, positions us in relation to the characters in those stories: what we say we do and believe within a story world continually reflects, and has consequences for, the way we construct our social relationships within those worlds.

So far I have reviewed the way that I have expanded the range of linguistic resources for the display of self; I have located those displays in texts, and suggested that such displays interactionally position speakers within a story world. Implicit in my analysis was that our story-world positions help reveal the social roles that we are occupying within a story. Traditional sociological frameworks view role as the typical activity engaged in by an occupant of a particular social status (with status viewed as a position in a system of positions; see Goffman 1964 and references therein). But roles are not viewed as properties of individuals alone: our roles and statuses are bound together by sets of reciprocal expectations and obligations about what to do, and about how and when to do it. To take a simple example, when I am teaching, I am expected to act in a certain way: to speak with some authority, raise topics for discussion, and give instructions. But such conduct will "work" only if others engage in the practices expected of them by taking up the reciprocal status of "students," e.g. allowing me an extended floor of talk, building on my topics, and following my instructions. We sustain our roles and statuses, then, in the face-to-face interactions and the everyday practices through which we reveal and negotiate reciprocal expectations about how to act and what to believe (Goffman 1967, 1971, Cicourel 1972). Put differently, who we are is sustained by our ongoing interactions with others, and the way we position ourselves in relation to those others. Likewise, when we report interactions through which to construct positions in narrative, we offer our audience a glimpse of ourselves as an occupant of a social status engaged in role-relevant behavior – but one who is located in a time, place, and situation quite different from that of the interaction in which our story is told.

The story-world role displayed by Jan and Zelda in the two narratives was the role of "mother." Although I propose that their "mother" role was partially established by their story-world positions (which balanced solidarity with distance, autonomy with control), it is helpful first to review more obvious indicators that a "mother" role is being enacted in both stories. The most obvious indicator that Jan and Zelda were speaking as mothers is the way they referred to their story-world interlocutors: Jan spoke of her *daughter* (rather than use her first name); Zelda spoke of her *daughter-in-law* (rather than first name or *my son's wife*). Another obvious indicator is that evaluative comparisons remained within the realm of the family: Jan compared her daughter to her son, while Zelda compared her two daughters-in-law, her son, and herself as a daughter-in-law. Note finally that one of Zelda's complaints in her story, that she is not called "Mom," specifically defined a symbolic domain for Zelda as a mother.

Other indicators that Jan and Zelda were speaking as mothers in their stories are less obvious, depending more on social and cultural expectations for occupants of a "mother" role. First, both Jan and Zelda constructed representations of self through their responses to another woman's deviation from expectation – a deviation that threatened family solidarity. Their reported efforts to remedy the deviation, to maintain family standards and control threats to family relationships, displayed relatively traditional aspects of the role of "mother" in American middle-class society, conforming with the role of "mother" as one

whose focus is the domestic world of home and family. Second, by telling me their stories, Jan and Zelda were engaged in what Goffman 1959 calls impression management. However, the impressions that they managed, through both the events and evaluations of their stories, were not just impressions about self, but also about family. This conforms with the role of "mother" as one centered on the expressive/symbolic domain of family life more than the instrumental/material domain.

Finally, the dual positions discussed in this article – positions that pivot between solidarity and distance, between the provision of autonomy and the exercise of power – also seem to define Jan and Zelda as mothers, although perhaps in a more specialized capacity and relationship as mothers of adolescents or adults. The actions and reactions of both Jan and Zelda struck a delicate balance between acceptance and rejection of a non-normative practice. This balance not only underlies the dual positions just noted; it also epitomizes the conflict between closeness and distance noted by many authors to characterize mother/daughter relationships. The linguistic construction of dual positions in both stories thus allowed Jan and Zelda to present pictures of self in relation to another woman in their families, pictures that preserve their closeness with that woman at the same time that they permit some distance.

The need to balance closeness with distance, and autonomy with control, is of course not unique to either parent/adult child or mother/daughter relationships. Creating such balance in all social relationships is often facilitated through linguistic strategies of indirectness. The dual positions displayed by Jan and Zelda in their roles as mothers both relied on indirectness. Besides not directly telling another person how to act, both womens' strategies depended on an intricate disengagement of the literal and more conventional meanings of what is said from situated inferences about what is meant. Thus one of Jan's central actions in "That cured her!" was "*You're goin' out with a Gentile boy?*" Jan's daughter interpreted this question as a challenge, but Jan relied on its literal function, as an information-seeking question, to display a lack of involvement in her daughter's decisions. Zelda's reliance on indirectness was somewhat more complicated. Zelda disengaged a linguistic practice, the use of an address term, from the social relationship that it can symbolize. By listing valued attributes of her daughter-in-law and describing the closeness in her family, Zelda implicated that the conventional meaning of being called "nothing" did not apply to her specific relationship with her daughter-in-law. Thus Jan and Zelda both created dual positions by disengaging the general and conventional meanings of words from the individual and particular inferences that words can evoke.

I have reviewed the ways that I relate self, position, and role, and how I locate these concepts in sociolinguistic analyses of narrative. I have suggested that the agentive and epistemic selves displayed by Jan and Zelda helped construct dual positions that indexed them in the social role of "mother." Finally, I will briefly compare the view of social identity that has emerged from this analysis with another view in sociolinguistics.

Sociolinguistic Constructions of Identity

This article has used a detailed analysis of two stories to show how the language used in narrative creates a story world in which both agentive and epistemic displays of self can position a story teller in a matrix of actions and beliefs that together display a social identity. The analysis suggested that social identity is locally situated: who we are is, at least partially, a product of where we are and who we are with, both in interactional and story worlds.

To use a visual analogy, we can say that telling a story provides a self-portrait: a linguistic lens through which to discover peoples' own (somewhat idealized) views of themselves as situated in a social structure. The verbalization and textual structure of a story (analogous to the creation of form and composition in a portrait) combines with its content, and with its local and global contexts of production, to provide a view of self that can be either challenged or validated by an audience. Blum-Kulka's distinction (1993:363–65) among three different aspects of narrativity provides another way of capturing this analogy: just as a self-portrait displays oneself (the artist) through both the contents and means of production of an image (e.g. the use of color, the composition), so too a story displays oneself (the teller) through both a tale and the telling of an experience.

Of course it is hardly surprising to say that language displays social identity and relationships. This is a common assumption of sociolinguistics and other contextual approaches to language, and the view that identity is locally situated is well established in interactional and conversation-analytic approaches to discourse (Schiffrin 1994a). But my suggestion that identity is locally situated does differ somewhat from the view of identity assumed by some sociolinguistic analyses, especially those that focus on levels of language structure other than the textual. Sociolinguistic studies of variation, for example, often assume that identities are like fixed attributes that are permanent properties of speakers. It is this assumption that underlies the variationist practice of coding identity as a categorical variable, remaining constant despite contextual changes. Thus speakers like Jan and Zelda would be coded as White, middle-class, middle-aged Jewish women. They would be assumed to maintain that very same identity, with the same constellation of features, regardless of the activity or interaction in which they were engaged. The view offered here suggests that identity is neither categorical nor fixed: we may act more or less middle-class, more or less female, and so on, depending on what we are doing and with whom. This view forces us to attend to speech activities, and to the interactions in which they are situated, as a frame in which our social roles are realized and our identities are displayed – and even further, as a potential resource for the display (and possible creation) of identity. Our transformation of experience into stories, and the way we carry it out, is thus a way to show our interlocutors the salience of particular aspects of our identities.

This view of social identity need not conflict with the methodological and theoretical interests of those sociolinguists seeking to identify and explain communitywide variation in language use (cf. Eckert & McConnell-Ginet 1992, Rickford & McNair-Knox 1993). In fact, variationists can build on this view of

identity in two ways. First, on a very practical methodological level, variationists can modify the way identity is coded as a factor or constraint. Just as variationists already build into coding procedures the belief that there are no single-style speakers (Labov 1972a), so too they can incorporate the notion that identity is dynamic, i.e. that there are no single-identity speakers. In coding the identities displayed during the two stories discussed here, for example, one might emphasize gender and/or family role – a role that might be downplayed in other sections of the interaction. Second, on a more conceptual level, variationists can rethink their view of social identity. The identities that we display and that others act upon during sociolinguistic interviews, and during the narratives told during such interviews, are no less situated than those whose relevance emerges during other activities. We are continually locating and relocating ourselves, defining and redefining ourselves and our worlds: telling a story about a personal experience is merely another example of a process that pervades our ways of speaking, acting, and being in the world. Perhaps integrating an understanding of this process into all areas of sociolinguistics will help us explain how both social and linguistic heterogeneity are not only community products, but also locally situated interactional processes.

Notes

Much of this article was completed while I was a visiting associate professor at the University of California, Berkeley. I am grateful to the participants in the narrative discussion group at Berkeley (organized by Suzanne Fleischman and funded by the Townsend Center for the Humanities), and in my seminar on discourse analysis, for stimulating discussions about narrative and insightful comments on some of the data analyzed here. Sections of this article were also presented at the American Dialect Society Tribute to William Labov in Philadelphia (1992), at the University of Colorado, Boulder (1993), and at the GLSI at Georgetown University (1995). Members of each audience have provided extremely helpful comments; so also have two anonymous referees.

1. Although I do not discuss it here, there are further indications of Ira's shift in participation status, e.g. Ira's unfilled search for an example in 4, Jan's offer of *Craig* as an example in 5, and Ira's *but . . . eh* as a turn-transition device in 8.
2. The reference to *my son-in-law* is a striking shift in deictic center (use of a referring term appropriate to speaking time, rather than narrative time). Perhaps it is used to prefigure the outcome of the story.
3. Schiffrin (1994a: 72–76) discusses the relationship between offers and requests.
4. Although I speak of agentive and epistemic selves, this is for convenience only: I view both as *aspects* of self, not distinct "acting" vs. "feeling" selves.

The Discourses of Food in the World System: Toward a Nexus Analysis of a World Problem

Ron Scollon

> "We are the flour in your bread, the wheat in your noodles, the salt on your fries. We are the corn in your tortillas, the chocolate in your dessert, the sweetener in your soft drink. We are the oil in your salad dressing and the beef, pork or chicken you eat for dinner. We are the cotton in your clothing, the backing on your carpet and the fertilizer in your field." Cargill corporate brochure 2001, cited in du Bois (2005: 19).

Corporate Control of the World's Food Supply

In its commodities marketing brochure the Cargill corporation boasts that if you eat at all, you are likely to be eating a Cargill food product. Bob Kohlmeyer, a former manager at Cargill, comments,

> "For people who want to buy corn, there really isn't much choice but to come to us." (du Bois 2005: 13).

The world's food supply is rapidly being corporatized and corporate control of food is being monopolized. The consequences of this are disastrous both for those who can afford these industrialized foods in the developed nations and for those who cannot afford the foods themselves but are forced by economic conditions in the world system to work in the fields as their producers.

Source: *Journal of Language and Politics* vol. 4, no. 3, 2005, pp. 467–489.

According to a new report by ActionAid International (du Bois 2005), one third of the processed food in the world is produced by just 30 companies. For example, just three companies own 85 percent of the world trade in tea. In Mexico, one company – Wal-mart – now accounts for 40 percent of the retail food market. If also we consider staple foods such as grain and seed, so crucial in daily nutrition everywhere in the world, international trade in grain is 90 percent under the control of five corporations, and just one company, Monsanto, controls 91 per cent of the world's genetically modified seed.

For those who shop in the increasingly gargantuan, cost-cutting stores of which Wal-mart is only the most successful example among many, perhaps this means some reduction in the cost of living. For those with income levels that allow them to invest in these transnational food corporations, corporatization and monopolization are good developments which provide them with higher returns on their investments. The destruction of small-scale food producers from farmers to local grocery stores and the massive impoverization of Third World laborers and whole communities, however, is the cost of a cheaper cup of tea or loaf of bread. As one tea worker in Tamil Nadu, India puts it,

> "Earlier we used to buy fish or meat once or twice a week. Now that has stopped completely. We can't even think of it on wage day. We've stopped buying vegetables. Before we used to buy vegetables on credit and pay on wage day. Now we can't manage that. Can't cut down on rice because it fills everyone's stomachs, but we can't afford vegetables and dal anymore." (du Bois 2005: 11)

There are devastating consequences of the current and rapid restructuring of food production in the world system (Wallerstein 1983). There are, of course, many analyses of the rapidly globalizing world system. Wallerstein, however, is generally credited with originating the term 'globalization'. His work over three decades has been to elucidate the political and economic restructuring of the economies of nationalism into one of a world system. While, sadly, the work of Wallerstein is not yet well known among linguists and discourse analysis, Blommaert (2005) is an example of a linguistic anthropologist who has also used the concept of the world system to good effect as a theoretical construct upon which to ground his discourse analyses. Here, through reference, I wish to signal that the approach I am taking in this paper and in current work is to seek to focus on the persistent and difficult issue of what is also referred to as the globalization discourse of neo-liberal, neo-capitalist, or new capitalism (Chouliaraki and Fairclough 1999; Fairclough 2003).

What my approach attempts to do, however, is to seek out and to analyze rather minute and concrete moments in the daily lives of social actors in which these very broad discourses of the world system are made real in the actions of common people. While socio-political discourse analysis contributes much to our understanding of the world system and the social issues which arise from globalization, we are often left with little purchase on moments of action in common daily lives where these world processes are grounded. My goal is this

paper is the rather modest one of sketching out the role of discourse analysis in addressing an issue of world consequence through in such concrete moments of action. I argue, as have other critical discourse analysts (Chouliaraki and Fairclough 1999; Wodak 2001; Fairclough 2003), that discourse analysis has much to contribute as part of our analytical approach. Overall I would neither claim that discourse analysis (in any variety) can really solve such problems nor would I want to let discourse analysis be pushed aside as not being relevant to them. Or to put this yet another way, I want to suggest a way in which discourse analysis can be an integral part of a more complex network of analysis that crosses disciplines, situations, time frames, and the very difficult gap between academic analysis and action in the world. The comprehensive term I would like to use for this kind of analysis is 'nexus analysis'. A nexus analysis consists of focal points or nexus which are mediated actions through which circulate cycles of discourse (Scollon and Scollon 2004a).

What does It Mean?

I will begin with the label on a common can of tomatoes (Figure 1, Tomato Label).

A can of tomatoes encompasses a complex world of discourse. In the text-image box we read,

> "HEALTHWISE:
> Development of cancer depends on many factors. Eating a diet low in fat and high in fruits and vegetables, foods that are low in fat and may contain

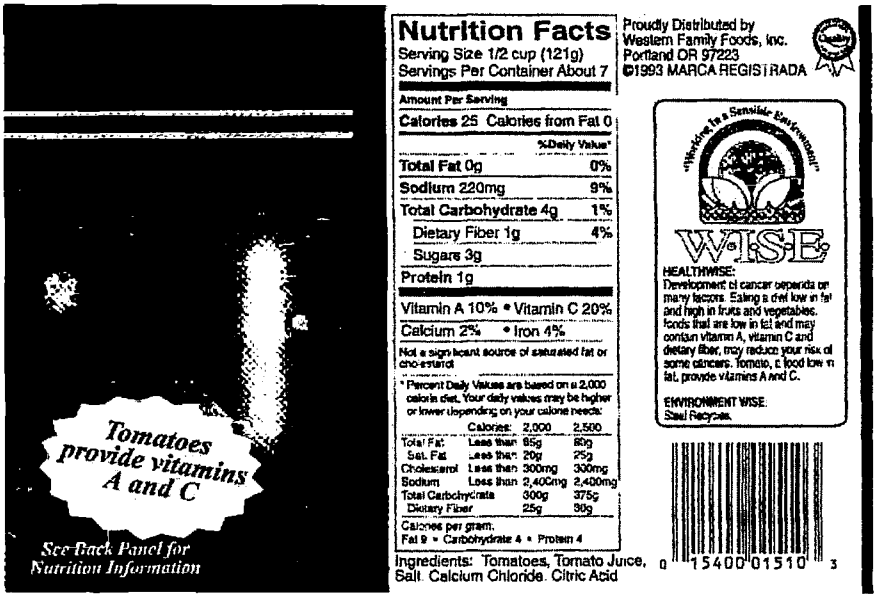

Figure 1: Tomato label

vitamin A, vitamin C and dietary fiber, may reduce your risk of some cancers. Tomato, a food low in fat, provide vitamins A and C.

ENVIRONMENT WISE:
Steel Recycles."

This appears to the right of the larger text box of FDA required 'Nutrition Facts'. Together with the bar code box, the list of ingredients, and the identification of the company which made the product these make up the back panel of the label.

The front panel consists of the company name, the main ingredient – tomatoes, whole, peeled – and the net weight which are all superimposed on a photo of tomatoes. The flash star says, "Tomatoes provide vitamins A and C," below which it says, "See Back Panel for Nutrition Information".

Taken all together this forms a semiotic aggregate (Scollon and Scollon 2003) of at least eight texts and images. As an entry to the need for discourse analysis in understanding corporate responsibility in our daily nutrition we can ask: Does this text box tell us that eating this can of tomatoes will help to prevent cancer? First, we can observe that this is rather strongly hedged: "depends on many factors," "may contain vitamin A, Vitamin C and dietary fiber," "may reduce your risk of some cancers". The designers have focused the attention on "cancer," "reduce risk," "tomato," and "vitamin A and C". This focusing is accomplished through multimodal semiotics (Kress and van Leeuwen 1996, 2001; Scollon and Scollon 2003). The flash star suggests, but does not claim, that all we need to know is that tomatoes provide vitamins A and C. Further clarification is displaced to the back label. This is an important manipulative strategy to separate crucial information into different discursive spaces, whether that be on the front and back of the same can as in this case or into different times and media as when the label makes a claim which can only be substantiated by going to a website and engaging in prolonged email or telephone discussions with customer service (Scollon 2005).

The label implies or suggests but does not directly claim that these tomatoes will prevent cancer. To analyze this subtle claim further requires us to step back from these texts themselves to investigate the historical–institutional trajectories that have led to their presence on the label in the first place. The nutrition facts are required by the US Food and Drug Administration (FDA), but it remains a question for analysis whether these nutrition facts have any pragmatic function at all beyond keeping the producer legal with the FDA? The website of the ADM company – one of that small number of companies noted by the ActionAid statistics given above (du Bois 2005) – notes:

"ADM provides an extensive range of regular and specialty flours, fats and oils, sweeteners, cocoa and chocolate. In fact, ADM is your one-source supplier for virtually all the baking ingredients you'll ever need: dough conditioners, release agents, starches and gums, glutens, food acids, fillings and icings, complete bakery mixes – even ingredients that can add valuable nutrition claims to your product's label" (http://www.admworld.com/naen/food, accessed January 31, 2005, 11:44am AKT)

It is clear that ADM believes that there is market value not only in the foods one sells but in the nutrition claims made on product labels.

In the United Kingdom as well as in the United States there is an active discussion going on in the news about whether or not such products as chocolate bars should be given a health warning. They already have nutrition facts posted but it seems that people do not read them because apparently that is not keeping people from eating so many that their health is in danger. Who has time to read the nutrition facts and warnings? Debby Oakley, whom *The Guardian* describes as a 46-year-old mother of three who works as a secretary in Bristol, finds herself buying junk food when the children clamor for it. She says,

> "If you've got young children and you work, you can't read the labelling because you haven't got time. If they package it clearly, then I don't mind, but if it has small print, then I don't have time to read the labels" (Revill and Ahmed 2003).

The Managing Director of Cadbury's, a company known for its candy and chocolates, takes a different and predictable rhetorical position. Andrew Cosslett objects to placing health warnings on their candy by saying, "I don't think a Curly-Wurly is a dangerous thing." (Cozens 2003). But we can see that the linkage between public health and personal health is mediated by texts of particular genres – nutrition facts labels and this "W-I-S-E-" text box or the health warnings now on tobacco, drugs, and alcohol products. We can also see that these texts open up a large number of questions for discourse analysis about how people read texts in the flow of daily life.

Mediated Discourse Analysis

The cycles of discourse within which such labeling and the claims made circulate are often wide and complex. They include not only the immediate texts we confront, but also the designers and their designs, government regulators and their regulations, producers of the products we consume, the retailers who sell the products and, finally, the consumers who buy the can of tomatoes, open it, and use it in their cooking.

In what follows I first suggest that for an engaged discourse analysis the most useful focus of our attention is human action rather than language or texts.[1] A close focus on language leads to important insights about language but tends to lead away from engagement with the social issues which we are trying to address. We have called this approach mediated discourse analysis (R Scollon 2001a, 2001b; S Scollon 2001, 2002). As a form of discourse analysis this approach shares much with and relies heavily upon the work of others in critical discourse analysis, interactional sociolinguistics, sociocultural psychology, and anthropological linguistics. To the extent that mediated discourse analysis takes a different stance it is in its focus on the mediated action (Wertsch 1991, 1998) rather than discourse itself.

In this case, for example, we might focus on the action of the person who takes the can from the grocery shelf and decides to buy it. Our initial concern is not with such things as the analysis of implicature relations between images and texts in advertising, *per se*, though such an analysis is also essential in our focus on action. Our interest is in how such implicatures are used by people in taking actions which involve that can and those texts. We want to know how someone in a particular case actually uses the combination of text and image genres on the tomato can. It may well be that once the can is identified as containing whole tomatoes, the rest is noise or background image. The analysis of those texts may, in fact, be irrelevant to the common actions of buying, opening, and cooking the tomatoes. Does this cook, or actually purchaser, use or need to use the whole complex of linguistic and semiotic tools provided on the label or is the picture of the bowl of cooked tomatoes enough? Or the words, "Tomatoes, WHOLE PEELED" placed in the *ideal* position above the photo of the bowl of tomatoes in the *real* position (Kress and van Leeuwen 1996)? In each case it is an empirical question to be examined whether or not linguistic, semiotic, or discourse analysis is useful for that analysis.

Further, this focus on human action is complex, because action itself is complex, both in the moment of occurrence and in the historical trajectories which give rise to action. Mediated discourse analysis, therefore, examines the mediated action as it occurs within a nexus of practice. Any action is enabled by the historical bodies (habitus) of the social actors who take the action, the interaction order or social relationships which are currently ratified among them, and the aggregate of discourses in that place which are available to mediate the action. In this way an action occurs at a nexus of practice which is defined by the cycles of discourse which circulate through that moment of action (Scollon and Scollon 2003, 2004a, 2005).

Again, if we focus on the action of selecting this can of tomatoes from the grocery shelf we can quickly identify several discourses which are enabling of this action. The purchaser may habitually buy this brand of tomatoes for making spaghetti sauce and so the action entails little more than seeing a familiar color label. She or he may regularly buy this brand but is now shopping in a different store and so needs to rely on aisle identifications to locate what she is looking for. She or he may make reference to a scribbled shopping list. We have referred to these as the 'discourses in place'. They would include product, aisle, and store brands, labels, and layout and designs. They would also include shopping lists, a question to a store manager about where the canned tomatoes are. Whatever discourses are present in that site of engagement which mediate the action.

We would also want to include the social interaction order as this action takes place. The purchaser might be shopping alone in the afternoon with few limits on her or his time and so can consult the labels of several competing cans and make an informed decision about what to buy. On the other hand, as the woman quoted in *The Guardian* story has commented, if you are shopping with children you may have almost no time free of monitoring their activities in which to attend to the discourses present on the labels. Actions may or may not be collective

in the moment of action but in any case the interaction order among participant is a crucial aspect of how any discourse(s) present may be taken up in accom plishing the action.

The third crucial element has already been mentioned, that is the historica bodies (or habitus) of the social actors who are taking the action. We have pre ferred to use Nishida's (1958) term 'historical body' over 'habitus' as used by Bourdieu (1977) both because it is the prior term in our own usage and becaus(of the greater clarity in Nishida's work of the biological individuality of th(historical body as well as the theoretical tie to what he calls 'action-intuition (Scollon and Scollon 2005).

A man who always buys the same kind of tomatoes goes about the task o purchasing them in a way that is very different from that of another man whc has been sent out to get "a can of tomatoes" but who has no history with this action. Two women shopping together may find that one of them has a well-established practice of reading the labels carefully while the other buys recognized products quickly on the basis of the package design. Each will select the product differently with a different sub-set of actions and, if they are together these differences in historical body, i.e., established practices, will cause needed adjustments to accommodate the other as they are linked together within the interaction order of two people shopping together. These three elements are shown in Figure 2, Three Elements of a Nexus Analysis.

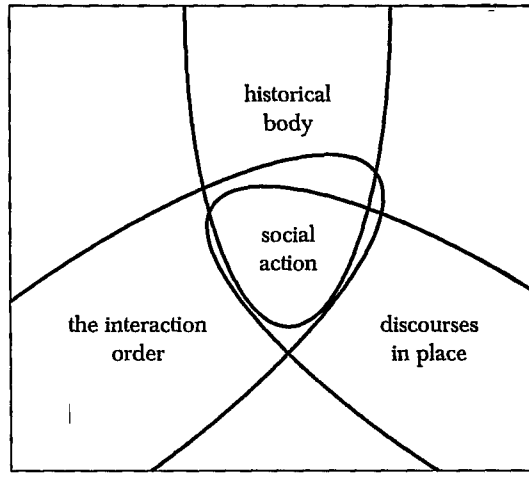

Figure 2: Three elements of a nexus analysis

As we have expanded the circumference of our analysis from the close focus on the mediated action, these three analytical perspectives are the organizing framework of a nexus analysis: the discourses in place, the interaction order, and the historical bodies of the social actors. One further concept needs to be developed here to understand the term 'cycles of discourse' or 'discourse cycle' (Figure 3). This is the concept of resemiotization (Iedema 2003). Bernstein (1990) has used the term 'recontextualization' Silverstein and Urban (1996)

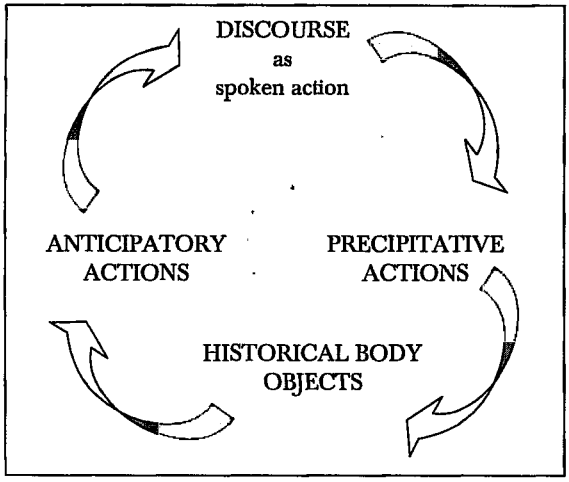

Figure 3: Discourse cycle

'entextualization' and Vygotskians generally would speak of 'internalization' (Scollon and Scollon 2004a). Iedema relies on the earlier ideas of Latour (1996) and Mehan (1993).

Put simply, a resemiotization is the transformation of a meaning from one semiotic form into another.

The shopping list that our shopper carries can give a simple example of the concept of resemiotization. Perhaps there is a bit of conversation at home about what to cook for dinner. This establishes that a spaghetti sauce needs to be made. That, in turns, leads to a survey of the pantry where no canned tomatoes are found. That leads to putting 'tomatoes' or 'canned tomatoes' on the shopping list. In the store reading that word leads to the action of going down the appropriate aisle and selecting the can from the shelf. A fragment of a conversation becomes an action of looking in the pantry, writing a word or two on a piece of paper, reading those words and then taking the subsequent action of selecting the can.

We have thought of these successive changes of meaning on analogy with the water cycle in which water may solidify into ice or evaporate into water vapor, but throughout the cycle retain some core molecular identity as H_2O. This is only an analogy and we should not be too fixed in its application. It would be impossible to establish the essential form of meaning which is transformed in these successive resemiotizations. What is important to capture, however, is that discourse may relate to discourse via non-discursive semiotic means. Talk is transformed as physical action, physical action becomes the written word, physical mental action of reading becomes the physical action of handling a can. The tomato can in the shopping cart transforms this prior cycle into a material object which in some way 'freezes' the cycle into a decision (Norris 2004).

To recapitulate, then, mediated discourse analysis takes the moment of an action as the focal unit of analysis. This mediated action is the site in which three analytical entities coalesce: the historical body of the participants, the interaction order within which they are socially organized, and the discourses which circulate

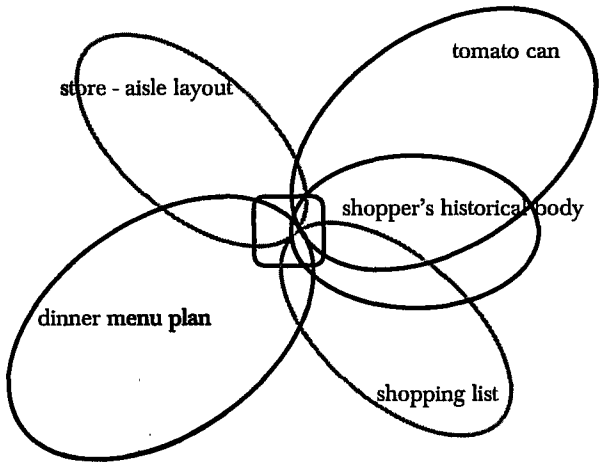

Figure 4: Nexus analysis

through this moment of action. These 'discourses' circulate, as I have suggeste through processes of resemiotization such that they may be present as talk, te image, material objects, and the thoughts and actions of the participants in tl action. A nexus analysis, in consequence, is not only the analysis of the action the focal point but also of the discourses (objects, historical bodies) which circula through a moment of action.

We could schematically represent this nexus with the diagram in Figure A Nexus Analysis. It is important in reading this to think of the loops as cycl of discourse, not as the circles of a Venn diagram. For example, the 'shoppir list' loop suggests the cycle of conversation, searching the pantry, making a li and reading it in the store. The 'dinner menu plan' represents a conversatic about inviting guests to dinner, contacting them, putting together a menu an so forth. Each of these different cycles comes together at the moment of selectir the can for purchase though to be sure each has a different significance an degree of importance in this action, and this may not be the only moment action where the cycles converge.

Action and Discourse: Nexus Analysis

While it may seem paradoxical on first glance, the shift in focus from languag or text to human action actually entails an increased role for discourse analysi This is because our study of action is itself predicated on discursive constructio of action; to study action boils down to studying how people represent action. I short, we cannot study action without somehow representing action and as soo as we do, we are involved in this representational action at a more global leve

This is not just the familiar observer's paradox which has been with us least since Heisenberg (1958). Of course we cannot observe an action with

somehow being involved in that action, either directly through our presence or indirectly through the presence of our observational devices from cameras and tape recorders to the formal instruments of survey research. What I am getting at is something Kenneth Burke called our attention to fifty years ago (Burke 1969 [1945]) in his book *The Grammar of Motives.* Any action – all actions – may be construed in several different ways. Burke proposed a pentad of five major motives that may be configured in our descriptions. And because any action may be construed in several ways, *how* an action is construed is a value expression on the part of whoever makes the construal. This is a point elaborated by critical discourse analysts as well, of course (e.g. Fairclough 1992; Chilton 2004), as well as in positioning theory or discursive psychology (e.g. Harré and Moghaddam 2003).

Burke's pentad of motives are 'scene', 'purpose', 'agent', 'agency', and 'act', and it might take us a bit too far afield to go into a careful elaboration of his meaning. A simple example, however, will help to clarify. We might say a person is buying the can of tomatoes with which I began in order to make a tomato sauce for dinner. This description of the action places the motive for the action in the domain Burke calls *purpose.* She does X in order to accomplish Y.

But we might also have set up this description as any one of several 'scenic' motives, that is, motives that derive from the social scene or situation or the world outside of the individual social actors taking the action. Quite broadly I might have said that she bought the can of tomatoes because the world-wide system for the distribution of foods brought that can into the store at a lower price than any of the competitors.

Burke would also argue that this act could be construed from an agentive perspective. That is, it could be construed as an action arising from the motive of caring for her own health. As distanced observers we cannot know which of these motives might be the one(s) construed by the social actors in an action; as engaged observers we must ask what are the consequences of our own construals as well as those of the participants in the action.

To move to a different kind of example, a website for a natural foods company exploits these multiple accountings for action to enlarge its market audience.

> "At nSpired we specialize in making the best tasting, all natural (and/or organic) healthy food alternatives possible for individuals who are on restricted diets – be they self-imposed reasons (organic, Kosher, vegan, weight management, etc.) or because of allergies or ingredient avoidance needs (wheat/gluten, diabetes, lactose intolerance, heart health, etc.). Each of our brands caters to the special needs of these very special people." (nSpired Natural Foods 2003).

Note the agentive motives ("self-imposed reasons") which are given: "organic, Kosher, vegan, weight management, etc." In contrast to these are "allergies or ingredient avoidance needs". These motives, by implication, are not agentive or self-imposed reasons for food avoidance. They are somehow external to the agency of the person. These include "wheat/gluten, diabetes, lactose intolerance, heart health, etc." There are many positions to investigate in this example.

Perhaps "weight management" is not, after all, self-imposed, but mandated by the doctor. Perhaps wheat/gluten avoidance is self-imposed. These categories imply, if nothing else, that we choose to do some things like eat organic food but some other things just happen to us like food allergies.

Even the contrast that is set up between "self-imposed reasons" and "avoidance needs" is important to examine. In this ontology-epistemology of human action one arrives at doing some things by rational reasoning processes and then acts accordingly; other things come to us from the world around us and about all the agency we have in the matter is ducking them somehow if we can. These discursive choices of motives are laden with determinations of guilt and innocence, of choice and victimization. And, of course, whether you have chosen to eat nSpired Natural Foods or been cornered into that position by external forces such as your doctor, your children, or your spouse, it is clear from the mention of your "special needs" and the third person reference to "these very special people" that you, the consumer, are rather out of it. 'Normal', 'non-special people' just eat, never mind the motives. A trope of 'motiveless' behavior by contrast produces the user of these nSpired Natural Foods as someone needing special attention.

Using this line of analysis we can see the role of anticipatory discourse (de Saint-Georges 2004, in press) in setting up conditions for subsequent actions. The *nSipred* website sets some actions within a motive framework of agentive actions and others within a scenic motive. Things may just happen to a person.

At the outset I characterized the corporatization and monopolization of the world food system as a problem, a social problem which merits the engagement of discourse analysts. I have also noted that for those with the resources to invest in this system of food production this is not a social problem but a source of income. We could see the purchase of the can of tomatoes as a reasonable action of a consumer within a particular scene (it was a good price), more agentively as having an interest in promoting one's health (tomatoes may contribute to lowering the risk of cancer). In the same way the 'same action' might be set within one set of cycles of discourse as a source of income for the retailer, the distributor, the producer, the corporate grower, and any investors in these corporate entities, or we could see it as an action that further impoverishes the agricultural workers. Within a nexus analysis framework the statement of the issue is already an ideological commitment to a discursive line of argumentation.

I am arguing that there is no analysis of any action that is not embedded in a complex nexus of descriptions of motives. Those differing motives are often in a dialectic of change in which participants seek to achieve hegemony for their own characterization of the action. The discourse analyst is either in the game as one who ratines the existing hegemonic meanings through acquiescence or she or he may intervene in the action by offering up alternative discursive characterizations. Either way, the discourse analyst is an activist because our activities result in descriptions – research reports, conference papers, journal publications, and books which seek to provide a hegemonic description or at least a contestation of what *really is going on.*

While there is no way out of this engagement, as I see it, still such an engagement is also never unilateral; it is always a negotiation. For me the crucial move is to address the question of how we can make our engagements in social issues count for something in the world of issues we confront daily. From this point of view there is no typical or required subject matter for a discourse analyst; what is important is to take up issues where our analytical voices can make a useful contribution. To do this we might start anywhere, including in the domains in which we already have a solid footing. What I want to do is to open up the circumference of our analyses, to borrow another term from Burke, to see how and why and where alternative analyses can make a difference. We have called this opening of the circumference of our work 'nexus analysis' (Scollon and Scollon 2004a).

The Discourses of Food in the World System

In what follows, then, I will put forward a rough sketch of one area in which we ourselves are beginning to work under the broad project title: The Discourses of Food in the World System.[2] And here the 'we' I am using refers to my colleague Suzie Scollon and myself along with a growing group of people with common interests. In this project we are seeking to outline a set of discursive links between action at the momentary level of individual social actors and the very broadest cycles of exchange across the world system (Wallerstein 1983).

It is a crucial element of mediated discourse analysis that theorizing must be tied to the concrete, real-world, material actions of humans. While social problems are abundant, we have chosen to focus on the discourses of food in the world system. This gives us a very broad issue to address but at the same time an issue which is ours personally with each mouthful of lunch, with each sip of café mocha, and with each can of tomatoes we use in making soup. We ourselves are inextricably part of this discourse and so, while many issues might have been identified, this is one we cannot escape.

I will introduce this project with an example. A pre-adolescent girl is allergic to corn which makes her nervous and hyperactive. On the advice of an allergenist her parents carefully screen food products which come into their meals to avoid her allergic reactions. One day after a meal including a common baked product they regularly eat without reaction she becomes agitated and hyperactive. They then notice that the food package has a bright yellow sunburst graphic image with the word "new". Further examination of the list of ingredients compared with an old package shows that the baking company has added corn to its formula in making this formerly corn-free product. The parents then place this food on their no-buy list of foods.

A social change takes place along a complex cyclic trajectory which includes, in this case, an individual's allergic reaction to a specific food (corn), a family's practices of avoidance (reading product labels, purchases, cooking and serving meals), a baking company's product branding and labeling (a brand which once

meant 'no corn' now must be re-interpreted to mean 'corn'), that same company's production formulas (the changing cost of ingredients, competition with other similar product's formulas, corn producers' production and marketing strategies directed at intermediate consumers rather than end-consumers), Food and Drug Administration policies concerning labeling, and medical advice and practices concerning allergies. This complex cycle of discourse includes multiple transformations from text to material object to social practice; corn is represented by a baking formula, a 'new' sunburst graphic, words on a list of ingredients, an allergenic reaction, and, for the family, a new but null practice – the avoidance of further purchase and consumption of this brand of consumer product.

Social actors and their mediated actions are located throughout this cycle of discourse at many strategic points: a research chemist developing new, more economical strains of corn; a marketer seeking increased market share for the company's product; a baker developing new techniques for baking a re-formulated product, an allergenist treating a pre-adolescent patient or that girl's parents trying to carry out the treatment; a nutritionist preparing a policy for the Food and Drug Administration concerning mandatory labeling of food ingredients; or a girl who now cannot eat a product she had come very much to enjoy. A full nexus analysis of these cycles includes the historical bodies of very different social actors, the material objects (corn, corn flour, cardboard packaging with a graphic image and ingredients list), and the interaction order (allergenist, parents, and child), but also the large human, social, and material entities involved from corn farmers and agricultural research companies to national government agencies and associations of medical practitioners.

The discourse analyst may enter such a cycle of discourse at any one of many points: the analysis of product labeling, the study of face-to-face medical interviewing, the study of the internalization of product meanings into practice, the transformation of a marketing policy to sell more corn by-products into a new formula for a more traditional baked food, or the public hearings and other information gathering processes of a governmental agency in preparing its policy statements. And I should emphasize that discourse analysts have already conducted studies very much like these in several cases (Wodak 2001). Cook's (2004) important research in this area has focused directly on the marketing of genetically modified foods.

The Discourses of Food in the World System project extends such existing analytical processes. We are seeking to develop a comprehensive strategy for linking multiple projects into a network as a nexus analysis (Scollon and Scollon 2004). Our goal is to systematically make visible through our analyses the multiple ways in which discourse connects such phenomena as a girl's breakfast and a research chemist's laboratory analyses, a farmer's price/per/bushel for corn, the formula of a baked commercial product, and a graphic designer's yellow sunburst 'new' on the package.

We are organizing our project around a constellation of three separate projects which are linked in this nexus of the world system of food production, distribution, and consumption. Each one of these sub-projects investigates in some

detail a particular theme of central importance to our understanding of the discourses of food in the world system. These projects are:

- *Prandial practices: Eating from the market to the disposal*
- *Corn, tea, and intellectual property: The industrialization of food in the world system*
- *Mad cows, scallions, and global climate change: Food in personal and public health*

The first project, the *Prandial practices* project, begins at the focal nexus of actions which constitute our daily nutritional practices. Each time we buy food in the market, eat at a restaurant, or dispose of our garbage we produce nodes on a system of food production, distribution, and consumption. This project brings to light the array of food practices that are deeply embedded in our experience both as individuals and as members of particular social and cultural groups. We shop at the village market or at the discount food center; we pay with the negotiated number of coins as buyer and seller or with digital credit transactions that involve world financial institutions; we cook in private home kitchens or communal canteens; we eat convivially with much conversation or alone in the privacy of silence; we carefully compost the remains of our food or we chuck it down the disposal to join the effluent flow into the river.

Each of the myriad practices of consumption links us to other people who share those practices and divides us from those who do not. Our prandial practices link us to social worlds and to economic cycles that go far beyond our own gardens, markets, kitchens, and tables into the food production and distribution demands of the world system. This project begins with the common meal and reaches outward to discover the links to food in the world system through the close study of practices of shopping or restaurant selection, cooking, eating, disposal, and social interactions that center on food.

This latter interest in social interaction addresses the many ways in which the ingestion of substances from common foods to health supplements and pharmaceutical treatment affect behavioral and psychological activities of their users. A meeting slows to a dull pace; a coffee break is taken in which the participants enjoy an array of grain and sugar-packed snacks and a strong dose of caffeine and when the meeting reconvenes we find that simultaneous talk, overlapping, or agitated responses at a rapid pace become the interactional norms. Here we focus on the alterations that occur in the interaction order, participation frameworks, and styles of social interaction that occur because of changes in the behaviors and states of participants who have consumed food or drugs as part of a routine prandial practice (a coffee break, lunch, snack, dinner) or as part of a scheduled medication regime. Our interest is in the ways in which discourse as social interaction is entrained to the consumption of foods.

The second project, *Corn, tea, and intellectual property,* opens up the circumference of our observations and analysis to those world systems which produce and distribute our daily foods. This project directs attention to the industrial production of food and an extended range of food products with a special focus on such internationally significant foods as corn, soy, and tea. Corn takes the highly salient and recognizable form of yellow kernels on the cob at one extreme, but

at the other very opaque end of this spectrum it is the powder base maltodextrin in stamp and envelope glue. As a kind of neo-Whorfian hypothesis question we ask: When is corn 'corn' and when it is linguistically redistributed as 'glucose', 'fructose', 'sorbitol', or 'maltodextrin' in products often not imagined as food products at all such as envelopes and postage stamps. The first concern of this project is to map the cycles of industrial transformation from a common food plant in the farmer's field to a food additive or an industrial product sold on the world market. We are particularly interested in conducting a critical (Burkean) motive analysis of the linguistic ways in which foods become re-labeled or resemiotized as they move away from their more commonly recognizable forms, as they stop being food and become, as ADM puts it:

> "ingredients that can add valuable nutrition claims to your product's label" (http://www.admworld.com/naen/food, accessed January 31, 2005, 11:44am AKT)

If we take up the question of corn for a moment we can look at the problem of the mother who needs to avoid corn in the family diet because of her children's allergies. Where is she likely to find corn? The list presented by the National Corn Growers' Association (www.ncga.com) gives twenty-two main categories including adhesives and binders, paper-making supplies, pharmaceuticals, building materials, and cleaning products. Each of the categories has many subcategories. The NCGA estimates some 3,500 commercial and industrial products are made of corn.

The Great Smokies Medical Center of Asheville, NC (www.gsmcweb.com) provides a website to assist people with allergies in finding and avoiding corn. This website gives a comparably extended list of corn products. As dietary sources of corn they list over 60 foods from infant formula which contains a very high percentage of corn to wine, from bourbon to chewing gum, from vinegar to table salt. Non-dietary sources include aspirin, chalk, paper cups, toothpaste, and laundry starch.

While on the one hand allergenists advise those with a corn allergy to simply avoid corn, the industry is working assiduously to make certain that this avoidance is virtually impossible. As Cargill has said,

> "We are the flour in your bread, the wheat in your noodles, the salt on your fries. We are the corn in your tortillas, the chocolate in your dessert, the sweetener in your soft drink. We are the oil in your salad dressing and the beef, port or chicken you eat for dinner. We are the cotton in your clothing, the backing on your carpet and the fertilizer in your field" (Cargill corporate brochure 2001, cited in du Bois 2005: 19).

If we then imagine the mother of this girl who is trying to take the action of avoiding purchasing (and cooking and serving) corn, we realize that a significant piece of linguistic analysis will have to go into each product selection. Reading the ingredients list may not in itself be sufficient. Corn is frequently packaged as an ingredient under a large array of names. It travels as dextrose, glucose, dextrin

maltodextrin, lecithin, fructose, high fructose, vegetable starch, thickeners, sweeteners, syrup, vegetable oil, alcohol, maize, and sorbitol among many other non-'corn' names.

It is not a minor linguistic task for an individual consumer to cope with this very complex array of names and products, and it is one that seems to me is worth our consideration. This is one way in which the common consumer is cornered into making an impromptu linguistic analysis that goes considerably beyond the ordinary practical competence of the lay person. To put this in another way, it is one way in which corporate interests are able to exert their hegemony over the world food system by using a language and a discourse that is largely opaque and inaccessible to the people who need the information in order to undertake important actions. As I have argued elsewhere (Scollon 2005), it is an important strategy for such interests to displace the crucial information discursively into other media (websites, email exchanges, telephone calls to customer service, or written correspondence), spaces, and times which lie outside the crucial moment of the mediated action.

A second and important aspect of this sub-project is focused on the fact that corn, like soy, is now for all intents and purposes an intellectual property, not simply a food because of the nearly complete genetic modification of the entire panoply of US corn production. Intellectual property is an entirely discursive form of property: Its value is as discourse (codes, texts, symbols, formulas, images, designs, genetic codes) not material objects (CDs, books, photos, ears of corn or their seeds) – the author owns the text or genetic code, the consumer owns only the physical object, the book or ear of corn – and it is protected through discourse such as policies, laws, and contracts.

Until very recently food in virtually all of its forms was a material object that could be owned like any physical object. It could be bought and sold, grown, cooked, and eaten. As we now alter the genetic codes of foods and register those codes as intellectual property, we transfer those foods from material commodities to discursive ones. You may own the ear of corn but you may not save and replant the seed to grow more corn as you had been able to do for all the centuries of mankind (Cook 2004). Our main interest in this part of the project is to examine the consequences for sociopolitical and economic relations within the world system of this transformation from material object to discursive object through the study of genetically modified food organisms, principally corn and soy. As ActionAid International (du Bois 2005) has pointed out, there is a highly complex but tightly linked nexus of economic relations among world powers, industrial production, national economies, and the common day-to-day social, behavior, and medical problem of a mother seeking to avoid allergens in the foods she prepares for her children.

Finally, the third project, *Mad cows, scallions, and global climate change*, focuses directly on the consequences for both public health and personal health of these systems of production, distribution, and consumption of food. The project begins by examining the health problems which increasingly arise from the transportation of foods around the earth. Over 500 people in Pennsylvania are sickened, a few die from Hepatitus A, and the cause is thought to be scallions grown in Mexico. People in Hong Kong and Toronto fall ill from a deadly flu-like infection

that is believed to have been transmitted first from Chinese chickens to humans and then by humans around the globe. The beef industry of Great Britain is destroyed by the infection of cattle being fed on the remains of other diseased animals. Thus scallions are removed from ethnic Mexican cuisine, chicken from Chinese meals, and beef from the dinner tables of a nation of beefeaters.

The US and the UK elevate obesity to the highest levels of public health risk and Cadbury's managing director, Andrew Cosslett objects to the government suggestion that candy bars should be labeled as dangerous saying, "I don't think a Curly-Wurly is a dangerous thing." And a recent Pentagon report adds to the fright by saying that global warming could, by the year 2020 – just sixteen years from the time in which I am writing – result in massive famines, redistributions of the world population and food production centers, and as a consequence in wars and armed conflicts over food resources. Two recent reports on climate change which more fully develop these points are Hassol (2004) and US Climate Change Science Program (2004).

From infected animals to common confections there is an increased concern over personal health throughout the First World. At the same time that frightening public health scenarios such as BSE ('Mad cow disease') develop around the world, it becomes clear just how easily they might be manufactured by political enemies and so the US has passed a Bioterrorism Act to require all foreign sources of food to register with the FDA before importation of foods to the US. Thus discourse enters into the policing of the global flows of food in forms which range from registrations and certificates of imported foods to government requirements for nutrition labeling or health warnings.

Discourse analysis enters into this in two ways: First, we are interested in the increasing use of documentation as an instrument of social and political surveillance. This surveillance works both at the borders of nations across which foods are imported or exported and at the level of individual consumers through marketing surveys. But we are also interested in how knowledge about public and personal health is disseminated to and throughout the public. When a health warning is added to a product which already has a printed listing of nutrition facts, do we infer that the nutrition facts listing has lost its communicative meaning? How do the government and food producers communicate information about foods to the public and how does the public learn to take up this information in a way that is significant for personal health?

So now to summarize how these three projects are linked together, the *Prandial practices* project is linked to *Corn, tea, and intellectual property* in its examination of the ways in which world-wide food production comes into the sphere of daily life through practices of consumption. It is also linked to the *Mad cows, scallions, and global climate change* project as an ethnographic project which examines how public health issues from Hepatitis A and obesity to global climate are taken up as private health questions at the moments of significant action, that is at moments of consumption. The first focuses on the practices of daily food consumption, the second on the world-wide industrialization of food production and consumption, and the third on the consequences of this world food system for public and personal health.

Corn, Mad Cows, and Mad Linguistics: Is This Discourse Analysis?

We have set out the theoretical – methodological framework we are using for these projects under the term nexus analysis (Scollon and Scollon 2004a). While there is little that is new in the framework – researchers in a variety of fields have addressed many of the problems in which we are interested – perhaps two things are distinctive: First, we consider discourse (and therefore linguistic analysis) to be a major component of the circulation of the social problem under analysis. We share this crucial point with researchers working in critical discourse analysis. But, secondly, we consider the actions of social actors to be the most useful theoretical unit of analysis, not texts or language or discourse alone. To define a nexus analysis as succinctly as I can at this stage of development I can say that a nexus analysis takes as its central focus the action of a human social actor acting with mediational means. This it owes to activity/practice theory. A bite of a hamburger is the sort of thing we have in mind here. Where it extends activity theory is to then seek the trajectories of persons, objects, and discourses through this moment of human action. In this, nexus analysis is fundamentally ethnographic when it focuses on human actions, on the one hand, and historical when it focuses on the texts and other material objects which circulate through moments of action on the other.

Is this discourse analysis? My answer is both "yes" and "no". It is "yes" in the sense that discourse analysts have much to bring to the table in this kind of analysis. It is "no" in the sense that an exclusive focus on language and discourse will not be sufficient to engage the full range of knowledge that we need to deal with social problems of major human import. This is a form of discourse analysis that is linked in a nexus with other disciplines where our contribution is to address social problems through our analysis of discourse.

Notes

1. This is not simply taking linguistic action as the prime as has been done in speech act theory or more broadly in pragmatics or natural language philosophy. Within mediated discourse analysis action which has no linguistic component at all is treated theoretically on a par with action which is mediated through language (Scollon 2001a).
2. For another discussion of this project see Scollon and Scollon (2004b). A network of web-essays on The Discourses of Food in the World System is available at: http://www.aptalaska.net/~ron/FOOD%2005/DOFweb/index.htm.

A Discourse-Centered Approach to Language and Culture

Joel Sherzer

My intention here is to delve into an ancient topic in the history of linguistics and anthropology, the relationship between language and culture. This topic is both so ancient and so basic to these disciplines and yet so thorny that, like other ancient and thorny questions (for example, the origin of language), it is a given of the disciplines, not talked about much in general terms, and even considered by many to be either tabu or else too old-fashioned to speculate about. But, and in some ways like the question of the origin of language, certain developments in anthropology and linguistics make it possible to talk about the relationship of language and culture in new and interesting ways. The development I have particularly in mind is the analysis of discourse that is rooted in social and cultural contexts of language use and considers questions of speech play and verbal art to be central.

Concern with the language-culture relationship finds its best-known modern expression in the writings of Franz Boas, Edward Sapir, and Benjamin Whorf. Boas insisted on the study of language and languages as essential to training and research in anthropology. Part of his reasoning, as expressed in the introduction to the *Handbook of American Indian Languages* (1911), is that language patterns are unconscious and provide access to unconscious cultural patterning otherwise inaccessible to researchers. This position leads rather naturally to what has come to be called the Whorf or the Sapir-Whorf hypothesis, namely that language (that is, grammar) constitutes the means with which individuals think and therefore, especially as stated in its strongest form, language (that is, grammar) conditions or determines cultural thought, perception, and world view.[1]

Since my aim here is to recast the relationship among language, culture, and society, it is necessary to begin with some brief definitions. For the purposes of

Source: *American Anthropologist* vol. 89, no. 2, 1987, pp. 295–309.

my argument here and in keeping with conceptions of culture from Sapir to Geertz and Schneider, I view culture as symbolic behavior, patterned organizations of, perceptions of, and beliefs about the world in symbolic terms. According to this definition, the locus of cultural behavior can be a single individual. It is more typically manifested in or shared by groups of individuals. Society is the organization of individuals into groups of various kinds, groups that share rules for the production and interpretation of cultural behavior and typically overlap and intersect in various ways. Language is both cultural and social. It is cultural in that it is one form of symbolic organization of the world. It is social in that it reflects and expresses group memberships and relationships. Language includes grammar, but goes beyond grammar. As a sign system, language has the interesting property of being both unmotivated and arbitrary (purely symbolic in semiotic terms) and motivated (iconic and indexical in semiotic terms).[2] It is unmotivated and arbitrary from the point of view of its properties as a formal, abstract system. It is motivated from the point of view of the meaningfulness and appropriateness that individuals feel about their language as it is used in actual social and cultural contexts. This takes us to discourse.

Like culture, society, and language, different people define discourse in different ways. In my view, discourse is a level or component of language use, related to but distinct from grammar. It can be oral or written and can be approached in textual or sociocultural and social-interactional terms. And it can be brief like a greeting and thus smaller than a single sentence or lengthy like a novel or narration of personal experience and thus larger than a sentence and constructed out of sentences or sentence-like utterances. My definition of discourse is purposely vague. This is because discourse is an elusive area, an imprecise and constantly emerging and emergent interface between language and culture, created by actual instances of language in use and best defined specifically in terms of such instances.

Notice that according to my conception, discourse includes and relates both textual patterning (including such properties as coherence and disjunction) and a situating of language in natural contexts of use. Context is to be understood in two senses here: first the social and cultural backdrop, the ground rules and assumptions of language usage; and second, the immediate, ongoing, and emerging actualities of speech events. Obviously the textuality of a brief greeting is slim, the essence of its structure being the sociocultural and interactional matters lurking behind it. On the other hand the textual structure of a three-hour myth narration will be quite intricate and complicated. Nonetheless it too intimately involves sociocultural and interactional features and these must be attended to analytically.

The Boasian tradition within American anthropology and linguistics did not ignore discourse. Quite the contrary. Boas and Sapir and their students insisted on the collection and publication of texts as part of a three-fold investigation of language, which consisted of grammar-texts-dictionary. But while texts were collected and published, they were not analyzed as discourse per se. They rather served the function of providing both linguistic and ethnological data. Furthermore, this tradition conceives of texts as fixed, inscribed objects and not in terms of text-context, language-in-use relationships.

Taking a discourse-centered approach to the language-culture relationshi enables us to reconceptualize the Sapir-Whorf hypothesis. Instead of asking suc questions as does grammar reflect culture or is culture determined by gramma or are there isomorphisms between grammar and culture, we rather start wit discourse. which is the nexus, the actual and concrete expression of the languag culture-society relationship. It is discourse which creates, recreates, modifie and fine tunes both culture and language and their intersection, and it is especiall in verbally artistic discourse such as poetry, magic, verbal dueling, and politica rhetoric that the potentials and resources provided by grammar, as well as cultura meanings and symbols, are exploited to the fullest and the essence of language culture relationships becomes salient.

The perspective I argue for here has illustrious predecessors, Sapir and Whor themselves primary among them. Sapir, in his book *Language*, and elsewhere views language as a resource for social and expressive usages and notices th poetic potential inherent in grammar. He compares language to a "dynamo cap able of generating enough power to run an elevator" but operating "almost ex clusively to feed an electric doorbell" (1921:14). Roman Jakobson insists in many places (e.g., 1968) on the intimate association of grammar and poetry. It is in verbally playful and artistic discourse that we find language turned on to its fulles potential and power, possibilities inherent in grammar made salient, potentials actualized. It is where, I believe, we should look for the language-culture-though intersection. Whorf's concept of "fashions of speaking" goes beyond grammar to include style and some of his examples (e.g., 1956:148–156) include forms o discourse (see Hymes 1961, 1974 for discussions of Whorf). Nonetheless, Whorf like Sapir and Boas, and in spite of their commitment to the collection and publication of texts, lacks a consistently systematic distinction between language structure and language use.

Dell Hymes's concept of cognitive style moves the Sapir-Whorf hypothesis beyond purely grammatical concerns into the area of verbal style, and his recent work in Native American narrative (1981) focuses on language-culture intersections as manifested in discourse. Paul Friedrich (1979, 1986) reformulates the Sapir-Whorf hypothesis, placing what he calls the "poetic imagination" at its heart. Dennis Tedlock (1983:324) chides anthropologists for dealing with culture as if there were no discourse, as if the natives never speak. The natives Tedlock describes do speak and the narratives they speak are highly poetic.

Erving Goffman (1974) conceives of language, culture, and society as providing resources which take on meaning and structure by means of the communicative frames that activate them. Investigators of such everyday and institutional verbal behavior as face-to-face and telephone conversations, negotiations, interviews. gatekeeping, therapy, and court cases, while not focusing or insisting on verbal art or speech play per se, are very much concerned with the ways in which language-culture-society relationships emerge as pragmatically and strategically salient in discourse (see Erickson 1981; Gumperz 1982; Labov and Fanshel 1977; and Schegloff 1981).

Increasingly, contemporary research in linguistic anthropology takes discourse as its starting point, theoretically and methodologically, for linguistic

and cultural analysis. As distinct from viewing texts as metaphors (in the sense of Geertz 1973), an increasing number of researchers, each in quite different ways, analyzes discourse, large and small, written and oral, permanent and fleeting, as not only worthy of investigation in its own right, but as an embodiment of the essence of culture and as constitutive of what the language-culture-society relationship is all about.[3]

My discussion so far has been general. Now to some illustrative examples. My first has to do with the way a grammatical category is used in poetic, magical, and political discourse. Grammatical categories, especially optional grammatical categories, were the focus of much of the discussion in the Sapir-Whorf tradition. Sapir, Whorf, and adherents to the hypothesis associated with them often focused on grammatical categories which are not found in Indo-European languages and are in this sense exotic. These grammatical categories reflect a different way of expressing meaning from "our" ways, and, perhaps, a different unconscious patterning of thought.

It is because grammatical categories are economical and efficient ways of expressing meaning, particularly when compared with the cumbersome translation that rendering in other languages, such as English, requires, that they often have a poetic feel to them and seem to touch at the heart of the genius of a language and especially the language-culture-thought relationship. This is no doubt part of what Sapir meant when he compared Algonquian words to tiny imagist poems. Optional grammatical categories provide speakers with conscious or unconscious decisions, choices, ways of expressing meaning, which, I would say, are actualized in discourse.

This example comes from the language of the Kuna Indians of Panama. It is a grammatical category used to express body position in relation to action. This category, which indicates ongoing action as well as body position, is encoded in a set of four verbal suffixes: *-kwici* (standing, in a vertical position); *-mai* (lying, in a horizontal position); *-sii* (sitting); *-nai* (perched, in a hanging position). Several aspects of this grammatical category are worth noting, as they contribute to or serve as a backdrop to its use in discourse. First, it is an optional category. That is, any verb can be used without necessarily marking it for position. Second, many verbs are associated with one of the set of positionals as the most normal, ordinary, natural, or unmarked usage. Thus:

sunmak-kwici (talking-standing)
kam-mai (sleeping-lying)
maskun-sii (eating-sitting)
ua so-nai (fishing-perched)

Since this category is optional, its use in a particular context is salient, that is noticeable. It becomes all the more salient when it is either used in a marked way (e.g., *kap-sii* "sleeping-sitting," for someone who falls asleep on a bench in the public gathering house) or contrasted with other possibilities in a verbally playful or artistic way, as in the two illustrative cases I will now provide.

The first is a magical chant which is addressed to the spirit of a dangerous snake and is used to raise the actual snake in the air (see J. Sherzer 1991).

The magical power of the chant works in the following way. The spirit, on hearing the chant addressed to it in its special language, immediately does what the narrative of the chant describes and, at the same time, the real, actual snake does so as well. As in all Kuna magical and curing chants, this one is literally teeming with and organized in terms of mosaics of grammatically and semantically parallel lines. Parallel lines are often identical except for a difference in a single word or morpheme. The lines that concern us here occur at the climax of the chant, the moment at which the chanter tells the snake he is raising it in the air. This occurs as follows. The snake is first described as dragging and turning over, in the *-mai* (horizontal) position, that is free on the ground, in two grammatically parallel lines.[4]

kali mokimakkemaiye
kali piknimakkekwamaiye
The vine (euphemism for snake) is dragging *-mai* (in horizontal position).
The vine is turning over *-mai* (in horizontal position).

Then there is a magical formula:

"*unni na pe onakko' anti sokekwiciye*"
"Simply indeed I raise you' I am saying."

during which the snake is raised in the air. Then it is again described as dragging and turning over, but this time in a *-nai* (hanging) position, in two lines which are identical to the two I quoted above except for the change to the suffix *-nai*. They are thus parallel to one another and constitute a couplet parallel to the earlier one.

kaliti mokimakkenaiye
kali piknimakkenaikusaye
The vine is dragging *-nai* (in hanging position).
The vine is turning over *-nai* (in hanging position).

The text never explicitly and specifically states its most important meaning, that the specialist has actually succeeded in grabbing and raising the snake. Rather, this is expressed economically and laconically, by means of the simple shift from one verbal suffix of position to another, within a parallel line framework.

There are several points to be made here. First, the *mai/nai* opposition is a basic element in the general poetic structuring of this text. By occurring regularly throughout the text, followed by the suffix *-ye*, the positional suffixes contribute, in conjunction with pauses and musical melody, to the marking of lines within the text, an important aspect of their poetry. These suffixes also enter into and contribute to the parallelistic structure of the text. And the *mai/nai* alteration is, in the terms used by Roman Jakobson, a projection of the paradigmatic axis onto the syntagmatic axis, precisely Jakobson's definition of poetry. Here we have then a good example of what I call the *poeticization of grammar* – the grammatical function of a grammatical element or category is backgrounded, or combined with a poetic one. But in addition, the shift from *-mai* to *-nai* at the climactic

moment of the text, has a very powerful semantic effect crucial to the magic of the chant. When the snake is in the *-mai* position, in the first two lines quoted, it is still on the ground. But when it is in the *-nai* position, in the two later lines, it is "hanging" or "perched" in the air, that is, the chanter has performed the magical action of raising it, precisely through the magic involved in shifting from *-mai* to *-nai*, from horizontal position to hanging position. Through this mini-max solution (Labov 1972:349), this packing of a maximum of meaning into a minimum of form, grammar becomes poetry and poetry becomes magic. Notice that the difficulty, really impossibility, of translating into English these poetic/magical lines which constitute the most heightened moment of the text is an argument for my point that discourse, especially verbally artistic discourse, is the expression of the essence of the relationship, often unconscious, between language and culture.

A completely different usage of the grammatical category of position occurs in the figurative, symbolic language characteristic of Kuna politics, centered in the Kuna gathering house, the meeting place for political leaders together with members of their communities. The particular discourse form I draw on here is the speech performed as an inauguration for a new chief (see Howe 1977 and J. Sherzer 1983:96–97). These speeches are typically bristling with intersecting and overlapping metaphors and other figures – for chiefs and other political leaders – which speakers creatively draw on, manipulate, and create narratives out of. In one speech I have recorded and analyzed, the speaker uses the positional suffixes metonymically, in conjunction with a complex of metaphors. largely drawn from the Kuna plant and animal world, in order to represent Kuna political structure. Chiefs are *-nai* (hanging) because they are perched in their hammocks in the center of the gathering house when they chant myths in public performances, or *-mai* (lying) because they rest or even sleep in these same hammocks while other chiefs are chanting or at various times during the day. Chiefs' spokesmen are *-kwici* (standing) because they stand when making speeches in the gathering house or *-sii* (sitting) because they sit on special benches surrounding the chiefs. And ordinary villagers are *-sii* (sitting) because they sit on ordinary benches behind both chiefs and spokesmen.

Here the metaphor of chiefs as *-mai* (lying) is combined with the metaphor of chiefs as poles[5]:

walakan mamait, tayleku pel ipya kwinnitik.
The poles who are lying here, it seems all have their eyes alert.

Just as poles rot, chiefs become bad:

immar nunkumai, pe takke tayleku, suar icakkwasaar tayleku nunkumai.
Something is lying rotting, you see it seems, a bad pole it seems is lying rotting.

Here the metaphor of chiefs as *-nai* (perched) is combined with the metaphor of chiefs as animals, again, in this case, in a negative sense, symbolizing chiefs who have turned bad:

usis tulakan taylee simuryapa namaynai pe ittoto pittosursin.
You will hear the *usis* bug people it seems chanting-perched within the knot hole don't you hear.
akkwaser namaynai pe ittotappo.
You will hear the spider chanting-perched there.
iskwir namaynai pe ittotappo takken soke.
You will hear the cockroach chanting-perched there see I say.
tior tayleku tior tatakwat namaynai.
The scorpion it seems Grandfather Scorpion will be chanting-perched.

In this example, the grammatical category of position is poeticized, not by functioning in the creation of line structure and parallelism as in the magical snake-raising chant, but by entering into the figurative complex basic to the poetic rhetoric of Kuna political discourse.

Taken together, these two examples demonstrate the ways in which the grammatical category of position is exploited and actualized in the verbally artistic discourse of the Kuna. My point here is not that the Kuna, because of their language, are more aware of position or more capable of perceiving position than are speakers of European languages, as the best-known interpretation of the Sapir-Whorf hypothesis would have it. Heightened awareness, conscious or unconscious, emerges from the multiple inputs provided by language-culture relationships. The grammatical category of position is a resource, a potential, a way of conceiving and perceiving the world which the Kuna language offers and which is made salient by entering into a web and network of associations actualized in discourse, especially verbally artistic discourse. This is Sapir's dynamo. The resulting depth, thickness, and intricacy is what Clifford Geertz finds characteristic of culture.

The Kuna grammatical category of position, especially as manifested in the snake-raising chant, reveals aspects of grammatical and semantic relations and relations between language and culture rarely studied by anthropologists and linguists, precisely because they can only be discovered through attention to actual instances of discourse. Traditional and conventional methods would not reveal the full meaning and potential of this grammatical category. Notice in particular that the shift from *-mai* to *-nai*, from the horizontal to the hanging position, in the crucial, climactic lines of the snake-raising chant, depends on the possibility, in this particular context, of ranking or ordering the suffixes semantically with regard to one another. That is, *-nai* is stronger, more powerful than *-mai* and it is on this fact that both the poetry and the magical power of the text depend. This kind of economical shift to a stronger or more powerful form within a set of grammatical or semantic relations is an instance of a phenomenon widespread in the world, the exploitation of sets of alternatives in discourse. It is often a crucial feature in a set of related forms of dialogic discourse – comebacks, verbal dueling, and bargaining. This takes me to my next extended example.

I draw this example from a short article by K. M. Tiwary dealing with a grammatical process widespread in India and beyond, known as the echo-word

construction (Tiwary 1968). The language Tiwary describes is Bhojpuri, spoken in northern India. The echoword construction is a form of reduplication in which a word is repeated without its initial consonant, sometimes with a vowel change. Thus the word *dudh* (milk) is reduplicated as *dudh-udh.* It is the kinds of meanings this grammatical process takes on and its use in discourse that interests me here. According to Tiwary, the echo-word construction serves as a label for the semantic field in which the base word occurs. Thus *dudh-udh* means "milk and the like" or "dairy products." Notice then that any member of the set of dairy products can be "echoed" to produce a word which can potentially be used as a label for the whole set. For example, *dehi* (curd) or *maTha* (butter-milk). But in actual discourse the selection is by no means neutral, in several ways and for several reasons. First, semantic fields are not absolute givens that are merely reflected in language use. Rather it is language use which creates and develops semantic fields. This is an illustration of what I mean when I say that language does not reflect culture but that language use in discourse creates, recreates, and modifies culture. Meaning, which is at the heart of the symbols-oriented conception of culture I am operating with here is on the one hand a mental construct; but it is a mental construct that is influenced by, as well as it influences, actual language use. Tiwary points out that the echo-word construction can be used as a secret-language of concealment. For example, a child, in the presence of his parents. from whom he wants to conceal the fact that he smokes, can ask someone, for example, a servant, to buy cigarettes for him in the market by overtly asking him to buy *deslai-oslai* (a box of matches and the like). The parents do not know. but the speaker and addressee do, that the semantic field of matches includes in this case cigarettes and that it is really cigarettes that the speaker wants.

Second, the choice of echo-word label for a semantic field is not neutral because the members of the field are often ranked hierarchically in one or another way. Returning to dairy products, the ranking of them depends on social and economic differences between the speaker and the addressee. If the addressee is of the lower income class, it is appropriate to select *maTha-oTha* (buttermilk and the like), since buttermilk is used by those who cannot afford other dairy products. On the other hand, forms such as *dudh-udh* (milk and the like) or *dehi-ohi* (curd and the like) are appropriate for individuals of means, who can afford these items.

It is in bargaining, and the verbal dueling which is at the core of the kind of elaborate bargaining that occurs in India, that we see this grammatical process operating to the fullest. If I am a buyer in a market and want to purchase goods for the lowest possible price, I will call dairy products *maTha-oTha,* thereby indicating that I am the kind of person who uses buttermilk and therefore cannot pay high prices. If on the other hand I am a seller and want to maximize both the politeness I demonstrate to a potential buyer and his or her ability to pay a high price, I will use *dudh-udh* or *dehi-ohi,* thereby showing respect for the buyer as a social person and also expressing my expectations that he or she can pay high prices. Ultimately there is a negotiation of both the linguistic form to be used and the price. With regard to the echo-word construction, Tiwary notes.

as I have for the Kuna category of position, that it is impossible to uncover its full meaning without studying naturally occurring discourse in actual social and cultural contexts.

In different parts of Asia such verbal-dueling bargaining occurs in different ways. In Bali, market bargainers use the lexical sets that reflect social caste and social rank, for example, the five or six different ways of expressing the meaning "eat." Sellers will often select forms that are relatively high socially, showing polite respect for potential buyers, but also an expectation of receiving a high price. As in India, buyer and seller verbally duel and negotiate both appropriate linguistic form and price of goods.

In the following example seller (S) and buyer (B) jokingly duel about the price of an item eventually purchased, both of them switching language levels as part of the give and take of language play and barter. Under each word of Balinese I have indicated its level as "a" (relatively high: *alus*) or "b" (relatively low or ordinary: *biasa*).[6] In one utterance, a speaker uses Indonesian, the national language of Indonesia; I have indicated this with "I."

S: *napi pindang?*
(a) (b)
How about some salted fish?
B: *ji kuda niki?*
(b) (b) (a)
What's the price?
S: *niki, anak pindang bes ageng jié.*
(a) (b) (b) (b) (a) (b)
This one, is a very big fish.
B: *inggih!*
(a)
(Yes)!
S: *kala nak ji tigang atus, cingakan dumun, kéné nyangluhné, to to.*
(b) (b) (b) (a) (b) (a) (a) (b) (b) (b) (b)
But the price is 300 [rupiahs], look at this, this is tasty.
B: *tiga ratus! bengu jié boné ah.*
(I) (I) (b) (b) (b) (b)
Three hundred! It smells very rotten.
S: *kangge?*
(a)
Do you want it?
B: *tak éket nggih?*
(b) (b) (a)
250 OK?
S: *tak telung benang nggih. mamané bé ni angkelé uug basangné, bé*
(b) (b) (b) (a) (b) (b) (b) (b) (b) (b) (b)
grago uluh-uluhe. siki?
(b) (b) (a)
270 OK. The fish got a broken stomach, because it had a small meal. You want only one?

B: *polih tak éket?*
(a) (b) (b)
Is 250 enough?
S: *siki siki?*
(a) (a)
Just one just one?
B: *kalih-kalih.*
(a) (a)
Two-two.
S: *aéng mokoh-mokohné, nasné pempen?*
(b) (b) (b) (b)
These are big, do you want the head in the **bag***?*
B: *baang apa?*
(b) (b)
To give to what?
S: *baang kucit, baang méng.*
(b) (b) (b) (b)
To give to a pig, to give to a cat.

Notice that after the price has been determined, all the forms used by buyer and seller are relatively low (b).

Tiwary, in his discussion of the Bhojpuri echo-word construction, provides an interpretation that assumes that language is a mirror reflection of culture and society. "This construction reflects certain set expectancies of a society in which the economic distinctions are glaring, quite old, and widely accepted for them to be congealed into linguistic constructions" (1968:36). I do not deny the economic and social distinctions. In both India and Bali they are old and indeed glaringly omnipresent. But I want to offer an alternative interpretation for both the Indian and the Balinese cases, one that sees discourse as the mediation between language and culture. The verbal dueling that is the centerpiece of economic bargaining negotiates status and role as it does price. It functions as if interlocuters either do not know one another's caste and socioeconomic status or else that such status is fluid, to be determined in actual verbal interaction. Both of these propositions are of course false, but nonetheless constitute the assumptions of verbal dueling and bargaining. This informal, colloquial, popular. and fleeting discourse form then is a verbal counterpoint played against the backdrop of the quite real Indian and Balinese social, economic, and verbal worlds, that of sharply defined and expressed caste and status distinctions. Verbal dueling, in its own playful way, also reinforces these distinctions. This is most serious and deep verbal play. In this example, as in the Kuna forms of ritual discourse, we see not an isomorphic matching up of grammar and culture, but rather discourse as a rich, intricate, and dynamic expression of, mediator of, and indeed creator and recreator of the language-culture-society-individual nexus.[7]

One final illustration concerns our own culture and society and the notion of cultural logic, as reflected in narrative. One of Whorf's favorite and best-known examples contrasts Hopi and Indo-European tense-aspect systems. Whorf argued that Hopi grammar is more attentive to verbal aspect than to tense, while Indo-European languages are just the opposite. He suggested that this makes Hopi a

more appropriate language, for example, in which to talk about contemporary physics. This was more of a rhetorical stance I feel than an actual belief on Whorf's part, but it makes its point. But again, where is discourse in all of this? Nowhere, or at least surely not prominent in Whorf's discussions.

Whorf's view of Hopi grammar has been challenged recently by Ekkehart Malotki (1983), who provides a massive set of sample sentences in which Hopis talk about tense and time in very concrete terms. But the Whorf-Malotki argument is about grammar, not about the actualization of grammar, in this case, tense and aspect, in discourse. This conflation of grammar and discourse, on the part of both Whorf and Malotki, confuses the issue. If we look, not at grammar, but at discourse, then a deeper correctness of Whorf's insight, namely that it is possible for a language to pay more attention to aspect than to temporality, emerges.

One quite appropriate place to examine tense-aspect systems is in narratives, which are reformulations of previous events. Narratives in English, and indeed in all European languages, whether written or spoken, formal or informal, are essentially a replay of a series of events in temporal sequence. That is, the organizing principle of Western narrative is time (see Genette 1972; Labov and Waletzky 1967; Mitchell 1981; Prince 1973). Notice that I did not say past tense, since the present tense (sometimes called the historical present in such cases) can be used as well to reflect temporal sequences in the past. And in colloquial, spoken narratives, such words and particles as "well," "so," "then," "OK," and "and" are used to move descriptions along in temporal sequence.

Here is a rather typical example of an American English oral narrative, a portion of a hunting-related story told in central Texas about the exploits of a coyote and deer.[8]

But that little ol', little ol' yearlin', up there, man he threw up that tail 'n' went runnin' off round up through, round the edge of the hill.
An' uh, when he did, then, the ol' coyote time he creeped on up where the deer was.
An' he's standin' there, sniffin' the ground, sniffin' the ground. I was watchin' through the binoculars. He's out about a hundred 'n' fifty yards.
Man all of a sudden, that rascal jus' tore loose a-runnin'. I mean jus' diggin' it like this. He wasn't he didn't start off you know sumthin' that turned round and looked like this 'n' then run. He just took off to runnin'.
And ah. I was watchin' him run, cause he's runnin' up this sendero.
About, oh two hundred 'n' fifty yards up there before we got to brush.
'N' then what do you think run in run up in them glasses with him while I was watchin' him run goin' this away?
Whadda you think run in there with 'im?
That ol' doe.
That ol' doe run right in there with him an' she could run up close enough to 'im, to where his tail was was between her front legs like this, went running.
But she had to skip one step to get at 'im with that foot.
And when she'd skip one step, then he'd gain, he'd gain a step.
Then she couldn't reach 'im.
And an' then, then she'd catch up with 'im again, an' when she tried to catch that next step like that, she couldn't git 'im.
Then ah, she was runnin' 'im like that an' then here them two little ol yearlin's they come runnin' off out here right on the edge o' the sendero watchin' mama run the

The temporal ordering of events in this narration is identical to their original, actual ordering, or at least as we as listeners are supposed to imagine them as having occurred. Given the temporal organization of most narratives told in European languages, it is not surprising that narrative theorists, often without knowledge of non-European narrative traditions, define narrative universally in terms of temporal sequence. But this is not necessarily so in other languages, cultures, and narrative traditions. Instead of Hopi, let me return to the Kuna, whose narratives I am much more familiar with. Kuna grammar offers much more elaboration in aspect than tense. And Kuna narratives, while they do reflect temporal order, focus much more on aspectual matters, the location, direction, and ways actions are performed, so much so that Western readers have difficulty following translations.

Here is a passage that is particularly difficult for English readers, who tend to find it temporally illogical; but it was not for the Kuna audience that heard it.[7]

tek ipakwen maskuttasunnoe.

visiting chief: *aaa.*)

Well one day always as they were going to eat.
"While they were beginning to eat" it is said the boy always said to his sister "near the grandmother's house then there is something growing" he says ah.
visiting chief: So it is.)
"It was growing on top of the ground something very small was growing" he says.
visiting chief: Yes.)
Well the grandmother saw that it was getting bigger what-was-it?
visiting chief: what was growing?)
Yes.
Well slowly it rises it keeps growing up keeps growing up keeps growing up indeed it produced fruit.
visiting chief: Yes.)
Well when it produced fruit its flesh got ripe in fact it was pepper.
visiting chief: Pepper.)
Mm, "pepper," see it is said.
visiting chief: Yes.)
Well the grandmother is taking care of, a pepper plant and the pepper plant belonged to the grandmother ah.
visiting chief: aah.)
The pepper my friend got-ripe (voice vibrates) that is what happened to the pepper.
And as for the boy who had died, while he was beginning to eat, he always said to his baby sister.
visiting chief: Yes.)
"Sister go to that grandmother who is there and ask for some pepper for me see I want to eat with pepper ah."
visiting chief: Yes.)
She would always go to ask her.
visiting chief: Yes.)
Well she went there and said to the grandmother "I want some of your pepper."
visiting chief: Yes.)
The grandmother says "all right" and the grandmother would always go to gather pepper for her.
visiting chief: Yes.)
pepper. gather well the grandmother was there.
Well one day, while eating again, she went to ask again.
visiting chief: Yes.)
And she (the grandmother) says to the girl "you go and gather the pepper see."
visiting chief: Comment.)
"Well she went to gather the pepper" it is said.
Yes to the grandmother's place. Comment.)
Well, she always went to the grandmother's place to gather it, the grandmother is the owner of the pepper plant.
Well a person began to speak from inside the ground to the girl who was gathering pepper.
(visiting chief: aaah.)

In this passage the narrator constantly jumps back and forth from place to place, from the home of the brother and the sister to the home of the grandmother

to the grandmother's garden, and in time, from when the brother was alive to when he had died and was buried under the pepper plant, always being quite precise about the movement and direction of actions and the ways in which actions are performed. One feature of this narration that non-Kuna find particularly strange is the fact that the pepper plant is growing before the boy dies and that the boy is later found buried under the plant, as if his burial had caused the plant to grow.

There is no doubt that this passage is illogical for a Western European or North American audience or readership. But what we are talking about here is cultural logic, as expressed in discourse. Contemporary, postmodern novelists, in Europe and North and South America, consciously break with Indo-European temporal logic, in order to achieve avant-garde effects, producing texts quite similar in some ways to Kuna narratives (see Dina Sherzer 1986).

Here is a passage from a novel by the most recent nobel prize winning author, Claude Simon (1981:21)[10]:

> He is fifty years old. He is general-in-chief of the artillery of the army in Italy. He lives in Milan. He wears a tunic with a collar and breastplate embroidered in gold. He is sixty years old. He oversees the completion of the terrace of his castle. He is shivering, wrapped up in an old military greatcoat. He sees black spots. At night he will be dead. He is thirty years old. He is a captain. He goes to the opera. He wears a three-cornered hat, a blue tunic tight at the waist, and a drawing-room sword.

Notice how difficult it is to follow temporal progression in this text. But as distinct from Simon's text, which is felt to be avant garde by its intended readers, Kuna narratives are not avant garde for the Kuna. Quite the contrary. They are steeped in Kuna tradition and represent a natural and logical intersection between Kuna language and culture. The degree to which the seeming logic of our own narrative structure is also an expression of the intersection of language and culture is best appreciated through comparison with such radically different possibilities as Kuna. And it is important to recognize that this cultural logic is not a result of or an isomorphic reflection of a particular tense-aspect system. Rather, discourse, in this case narrative, draws on tense-aspect, as it draws on other features of the grammar and the lexicon, in the creation of temporal and spatial cultural logical systems.

Both linguists and anthropologists have traditionally treated discourse as an invisible glass through which the researcher perceives the reality of grammar, social relations, ecological practices, and belief systems. But the glass itself, discourse and its structure, the actual medium through which knowledge (linguistic and cultural) is produced, conceived, transmitted, and acquired, by members of societies and by researchers, is given little attention. My stance here is quite different from the traditional one, and reflects a growing interest in discourse in many disciplines. I view language, culture, society, and the individual as all providing resources in a creative process which is actualized in discourse. In my discourse-centered approach, discourse is the broadest and most comprehensive

level of linguistic form, content, and use. This is what I mean by saying that discourse and especially the process of discourse structuring is the locus of the language-culture relationship. Furthermore, it is in certain kinds of discourse, in which speech play and verbal art are heightened, as central moments in poetry, magic, politics, religion, respect, insult, and bargaining, that the language-culture-discourse relationship comes into sharpest focus and the organizing role of discourse in this relationship is highlighted.

This is a theoretical position. But it has methodological implications as well, for both anthropologists and linguists. Since discourse is an embodiment, a filter, a creator and recreator, and a transmitter of culture, then in order to study culture we must study the actual forms of discourse produced and performed by societies and individuals, the myths, legends, stories, verbal duels, and conversations that constitute a society's verbal life. But discourse is also an embodiment of language. Grammar provides a set of potentials. Since these potentials are actualized in discourse they can only be studied in discourse.

Acknowledgments

I am grateful to Greg Urban and Anthony Woodbury for many discussions about the issues raised here. Our joint efforts appear as Sherzer and Urban (1986) and Sherzer and Woodbury (1987). Steven Feld, Dina Sherzer, K. M. Tiwary, Greg Urban, and Anthony Woodbury commented on an earlier version of this paper. I owe a particular debt to Jane Hill for her incisive comments and suggestions on various versions of this paper and especially for provoking me to keep worrying about them.

Notes

1. It is important to recognize that Boas, Sapir, and Whorf were clearly each struggling with the question of the relationships between grammar, thought, and culture. Thus seemingly contradictory positions can be found within their own writing on these questions. In particular, the strictly and strongly causal view that language determines thought or culture, often attributed to Whorf, can be found nowhere explicitly in the writings of Boas, Sapir, or Whorf.
2. A point nicely expressed by Emile Benveniste in 1939. See also Friedrich (1979:1–61).
3. Among others, see Ellen Basso 1985; Keith Basso 1979; Bauman 1986; Feld 1982; Gossen 1974; Hanks 1986; Heath 1983; McLendon 1981; Philips 1983; Scollon and Scollon 1979; Tedlock 1985; Urban 1986; and Woodbury 1985.
4. From *The Way of the Snake*, performed by Pranki Pilos of Mulatuppu, San Blas, Panama. For transcription of Kuna discourse, see Sherzer (1983:41–42).
5. From a speech performed by Muristo Pérez of Mulatuppu, San Blas, Panama.
6. The binary *alus/biasa* distinction is a common way of talking about language levels in Bali. The actual situation is often more complicated and some of the words in the example provided here enter into lexical sets with more than two members (see Kersten 1984; Ward 1973; and Zurbuchen 1981). Notice that the language of the market is not a random mixing of languages and levels, a reflection of speakers' lack of knowledge of their own languages and appropriate language use. Quite the contrary.

It is a sophisticated manipulation of the resources provided by the complex Balinese sociolinguistic situation, a manipulation involving economic strategies, politeness, play, and humor.

7. Long and ritualized forms of verbal dueling are extremely common in the world, found among urban Blacks in the United States, Mexican Indians, Mestizo populations in South America, Turkish adolescents, and probably many other places. The basic principle of verbal dueling is for each speaker to provide a comeback which "tops" its predecessor by being maximally semantically more powerful with a minimal economy of formal effort, as defined within an underlying framework of grammatical and semantic relations (see Bricker 1976; Dundes, Leach, and Özkök 1970; Gossen 1976; and Labov 1972). The relationship between verbal dueling and bargaining is an intriguing one, worthy of further exploration.
8. Told by G. H. of Austin, Texas. In this transcription, I use English orthography together with the symbol', following conventional means of rendering English oral speech in print. In the representation, performance lines begin flush left. They are determined by a long pause coupled with noticeable falling pitch. Within lines, short pauses without noticeable falling pitch are indicated with a comma; short pauses with falling pitch, with a period. A long pause without falling pitch is represented as a long space within a line.
9. From *The Hot Pepper Story*, performed by Mastayans of Mulatuppu, San Blas, Panama. In this transcription and translation, each performance line, determined by pause and intonation patterns, is represented by a line of written text. Pauses within lines are represented by spaces. Stretched out speech is represented by dashes between syllables. The performance is in the form of a dialogue between Mastayans and a visiting chief, whose comments are also represented here (see Sherzer 1987).

Linguistics as Metaphor: Analysing the Discursive Ontology of the Object of Linguistic Inquiry

Shi-Xu

1. Introduction

One of the most lively and important developments in the contemporary scene of the social and human sciences has been 'the turn to language' as is often called (or 'linguistic/rhetorical turn'). In this move many a scholar have shifted their attention from the 'object' of enquiry to the language of enquiry. There is already a deluge of articles and books critically reflecting upon the language of economics (e.g. McCloskey, 1986), anthropology (e.g. Clifford, 1988; Pratt, 1986), sociology (e.g. Weigert, 1970; Gilbert and Mulkay, 1984), psychology (e.g. Soyland, 1994; Danziger, 1997), history, (e.g. White, 1973), philosophy (e.g. De Man, 1978; Rorty, 1978) and science (e.g. Latour, 1987; Bazerman, 2000); see also Simons' *Rhetoric in the Human Sciences* (1989). All this work fundamentally questions the role of language in representing human and social realities. For example, it is argued that Freud's discourse of the human mind as a set of hidden layers to which ordinary people have no access serves to enrol and encourage them to seek further information about themselves (Soyland, 1994; cf. Vološinov, 1987).

The science of language itself – modern Western linguistics, however, has seemed slow and reluctant in responding to this discourse–reflective move. Its own discourse continues to get short shrift. By and large, linguistics remains preoccupied with its perennial concerns – linguistic theories and analysis and so on; even alternative and opposing approaches are more often than not concerned with offering more valid and more reliable accounts. The marginalisation of the

Source: *Language Sciences* 1.23, 2000, 439–446.

discourse-of-linguistics project is best attested to by the continued success of linguistic formalism and functionalism – the two most important, competing ways of thinking and talking about language.

Is linguistic science independent of discourse and rhetoric that have been found to be part of the same activity in the sister disciplines? Or is it indeed a more rigorous and superior form of representation among the human sciences, as has been imagined since the inception of modern Western linguistics? I think rather that the general lack of interest in the language of linguistics has to do with a deep-rooted and widespread credo in the field: namely, language, whether from a formal or functional point of view, is a pre-given object or thing, on the one hand, and, on the other, there is a transparent, objective, scientific language to represent that thing, at least possibly (cf. Grace, 1987; Tyler, 1995). Therefore, the scientific discourse of linguistics is unproblematic for, perhaps even irrelevant to, the linguistic enquiry itself. The clear manifestation of this attitude is that it is generally not discussed, but taken for granted (for exceptions see below).

In this study I put these beliefs in abeyance and take up the language of linguistics as the focus of attention; here 'language' refers to language use in the social context or 'discourse' for short. Specifically, I shall be looking at how, in both formal and functional linguistic theorising, the foundational notion of 'language' is related to the use of metaphors. My primary aim is to show that properties of discourse, such as metaphor, persuasion, self- and other-presentation, are not peripheral, but central and intrinsic to the presumption and conceptualisation of the object of linguistic research. In other words, I shall try to demonstrate that the very stuff called 'language' or 'the linguistic system' and the like, which have preoccupied western linguistics for much of the century, are in part a product of particular ways of speaking and writing.

The empirical data for the present thesis are selected from the writings by Chomsky (i.e. 1957, 1979 and 1981) and Halliday (1973, 1978, 1985/1994), the leading exponents of linguistic formalism and functionalism, respectively. I use data from both the formalist and functional paradigms, because I am concerned with modern Western linguistics *as a whole*. I have chosen Chomsky and Halliday for case study not just because of their celebrated scientific accomplishments, but also because of their tremendous *influence*, through text and talk, upon the linguistics community and beyond.

Through analysis of discourse, it will be seen, first, that in delimiting and defining the presumed object for linguistic investigation – 'language' Chomsky and Halliday draw on a few metaphors regularly so that these specific metaphors penetrate the object itself. The purported object then becomes immanently and intrinsically metaphorical. Secondly, and more importantly, it will be observed that those figurative devices are also used 'literally', that is, as real grounds, in other parts of theory-building and argumentation. There is therefore a deeper sense in which linguistics is constituted out of elements of discourse. In addition, it will be noted that the tropologically originated concepts of language serve *rhetorical and social purposes*: they help to justify one's own research practice (e.g. idealisation of linguistics; writing of grammar), hence to persuade readers and enlist researchers, and dismiss or refute other, alternative approaches. Thus, what

will be witnessed is that 'language' 'exists' and 'has' this or that property not because it really does, but because certain metaphors were there to enable it, and because some individual and social business has to be done.

Before I turn to a theoretical and analytical discussion of discourse and science, some caveats are in order. Firstly, pointing to the interest of the discourse of linguistics is of course not to deny the intellectual worth of linguistics. There is nothing inherently wrong with, say, pursuing mathematical representation or grammaticalisation of human language. But my hope is that the linguistics discourse project will advance our thinking on the nature of linguistics and its object of research. For one thing, explorations in the status of discourse in linguistic enquiry may enhance our awareness of the reflexivity of our own 'representational' means. For another, highlighting the rhetorical, metaphorical dimensions of linguistic enquiry as I do may lead to insights into the discursive nature of the object that linguists try to describe and explain.

Secondly, in pointing to the metaphors used in linguistics, I do not mean to suggest that linguists may not be aware of the fact that they do use metaphors. My interest is rather examining how the metaphors have been used *in effect*, e.g. in the presumption and conceptualisation of the object of enquiry and the subsequent methodological approach. Thus, in making transparent the functions of the metaphors, I shall try to reveal what Burke calls the 'paradox of substance' (Burke, 1962, p. 56). It will be seen that, although describing the properties of one category metaphorically in terms of those of another concedes that they are not really the same phenomenon, Chomsky and Halliday use certain metaphors as *rational argument* in linguistic deliberation. So, here, let me state emphatically that my point is not that metaphors are used in linguistics writing nor that they are used for purposes of clarification as is commonly believed; rather they have been become the defining, organising and penetrating features of linguistics, including its presumed object of research.

Thirdly, in claiming that linguistics, including its object of study (not just theoretical-writing!), is imbued with metaphorical substance, I do not want to suggest that it should not be. As will be explained in the next section, a constraining assumption of mine is that discourse is an inextricable part of socialscientific research (and human reality more generally) and that therefore there is no such thing as 'perfect' and 'pure' social science divorced from discourse. Admittedly, my own writing here is rhetorical, at times metaphorical, too, and therefore subject to critical discourse analysis. But it is crucial to note here that this theoretical circularity does not have to be vicious in effect: rather, I wish to call attention to this discursive dimension of (linguistic) science and to suggest that criteria should be developed in the academic (linguistic) community with which we can distinguish acceptable kinds of discourse from others – say, using metaphors as rational argument; I shall return to this point in the final section.

Finally, it should be mentioned that already there are important metadiscursive studies of linguistics, with special reference to history (e.g. Sampson, 1980; Harris, 1993; Huck and Goldsmith, 1995), politics (e.g. Newmeyer, 1986; cf. Schegloff et al., 1996), philosophy (e.g. Derrida, 1976, 1981; Harris, 1981; Taylor, 1992) and speech acts (e.g. De Beaugrande, 1992). However

have such attempts been disproportionately few in number, but there are many areas still unexplored as well, such as the relationship between discourse and the basic ideas in linguistics and the role of discourse in affecting methodological choices. The present study focuses attention on the effects and consequences of metaphors on the conceptualisation of the object of linguistics and on the choice of approaches to it. (Shi-xu, 1996, 2000)

2. A Social-Constructionist-Linguistics Framework

2.1. Definition and Nature of Discourse

The theoretical framework underlying the present study is Social Constructionist Linguistics (SCL). This is a research programme that I am developing and which is inspired by many critical insights in the social and human sciences (e.g. Fairclough, 1989, 1995; Gumperz and Levinson, 1996; Tyler, 1995; Van Dijk, 1993; Shweder, 1990; Wertsch, 1991; Gergen, 1994; Billig, 1987; Harré and Gillett, 1994; Potter and Wetherell, 1987; Edwards and Potter, 1992; Antaki, 1994, to name but a few). In this programme on human language, it is reasoned that the object of research should be (defined as) *primarily linguistic-symbolic activity in real-life contexts* ('discourse' for short), and discourse is viewed as co-constitutive of our social experience (actions and events 'around' us) and our individual experience (thoughts and feelings 'inside' us), constitutive, that is, through concepts, categories and other meaning-making processes of our discourse. In connection with this view of discourse, furthermore, the discourse researcher is regarded as having an active role to play in both the phenomena s/he investigates and the conclusions s/he draws and therefore should take academic and societal responsibilities (see also Shi-xu, 1997, chap. 1 and 2). For lack of space, I shall only briefly describe this concept of discourse.

2.1.1. Discourse as Constructive

Discourse is not a mirror or representation of reality. Rather, discourse is dynamic and creative: it offers a version of reality, thereby imposing a particular structure on it. For example, international news media have recently portrayed the 'same' past history of Hong Kong in different ways, e.g. as a glorious transformation from a fishing village into an international economic power and as infamous colonial oppression and exploitation.

2.1.2. Discourse as Dynamic Interplay between the Individual and Linguistic, Social-Interactional and Cultural Rules and Structures

Discourse is an emergent phenomenon in which individuals draw upon, employ and transform, linguistic resources – structures (e.g. words), processes (e.g. metaphor) and rules (e.g. grammar), in both production and interpretation. Similarly, they orient their discourse towards the social Other, be it the second, third or generalised person (i.e. 'you', 's/he/they', a potential interactant). Moreover,

in producing and interpreting discourse they also make use of, maintain and develop cultural ways of thinking and acting.

2.1.3. Discourse as Co-Constitutive of the Social Human Reality

Discourse is not a form of linguistic activity that is merely ('descriptive') about the social and private worlds. Rather, discourse partakes of or makes up the private world 'inside' us and the social–cultural world 'around' us. When greetings are uttered or pleasantries exchanged, for example, a certain social bond is established or maintained thereby; what specific content or form the discourse takes is only a trivial if not irrelevant matter.

2.2. Social Science as Discourse

Having outlined a view of discourse, I shall proceed to sketching out a theoretical notion of the specific 'discourse of the social and human sciences', for backing up subsequent empirical analysis. As alluded to at the outset, detailed analysis of the discourse of both natural and human sciences has indisputably dismantled the boundaries of scientific knowledge and practice and revealed the penetration of ordinary discourse and rhetoric (e.g. Latour, 1987, Simons, 1989, Gilbert and Mulkay, 1984). In the words of Simons (1989, p. 5), 'In the new metalanguage of the human sciences, behaviours, cultures, entire historical epochs might be viewed as texts, scientific data as symbolic constructions, scientific descriptions and theories as narratives, mathematical proofs as rhetorical tropes, the ongoing activities of scientific communities as conversations.' Given this contra-Popperian view of scientific knowledge (cf. Popper, 1959), we should better speak of *scientific discourse* (SD) instead of science. Furthermore, the distinction between natural and social sciences has also been de-constructed as subject to discursive-rhetorical work (Gieryn, 1995). (The irony is, though, as Swales points out (Swales, 1990, p. 176), 'social scientists are engaged in a cognitive and rhetorical upgrade of Method at a time when their mentors in the hard sciences are beginning, rhetorically at least, to downgrade its importance.') Since I am primarily concerned with the modern social and human sciences as a form of discourse – call it 'social scientific discourse' (SSD), in the following I shall devote my attention only to the latter, side-stepping the complications of argumentation. Building upon the observations made in the field which I just referred to, I shall touch upon three interrelated aspects of SSD which I think will lead to productive discourse analysis, though of course still other features may be observed.

A first basic feature of SSD is that it is not independent of the speaking/writing-individual. As part of the discursive activity, the scientist has personal merits as well as limitations which obviously will be reflected in the research process and product, i.e. SSD. S/he is also rhetorical in that s/he is concerned to enrol audience and enlist followers, often in a concealed manner (see Soyland, 1994), not least because discoveries that fail to be persuasive or cogent will not find an outlet in the first place. One of the common manifestations of the personal touch of SSD is the presentation of the academic Other in our

light, as may have become part of the received genre of academic writing. In addition, another example of the personal element of SSD is the influence of scholarly predecessors and authorities.

Secondly, SSD creates and constitutes its own objects of enquiry, a point that Foucault has made abundantly clear (Foucault, 1970). From a different perspective, there is a dynamic, essential relationship of the scientific enterprise to its subject matter. Man, society, mind, and indeed, language, are not pre-given things in the world, such that social and human sciences are then devised to study them. Power interests or ideologies play an important role in creating and recreating such disciplinary objects and the disciplines themselves through the meaning-making resources of discourse, e.g. concepts, presumptions, metaphors (cf. Martin, 1998, pp. 10–11). This may be especially true of modern Western linguistics, in which the notion of 'natural science' as a superior paradigm of (gaining) knowledge has been used as a key device for creating its object – language, hence 'linguistic science'. One needs only to recall Saussure, Bloomfield, Hjelmslev or Chomsky as examples.

Thirdly, because social scientific theories and practices are constructed out of the structures and processes of discourse, there is no clear demarcation line between SSD and discourse more generally (cf. Berger and Luckmann, 1966; Grace, 1987, p. 3; Pearce, 1995; Stewart, 1995). Consequently, the content of SSD is not stable but evolving and emerging and its boundaries are blurred (cf. Bazerman, 1998, p. 16). Effectively there will be no cut and dried distinction to be drawn between social science and common sense, nor between scientific discourse and conversation (e.g. variability and flexibility). It has been well documented that scientific discourse also involves self-presentation, social enlistment, alliances and power, for example through rhetorical alignments of citation and reference (Latour, 1987), through offering value, significance and promise (Bazerman, 2000), and through 'the long-standing [. . .] and widespread use of "hedges"' (Swales, 1990, p. 175).

Immediately I must add that saying that it is hard to distinguish in practice SSD from (lay) discourse does not mean that it is impossible in principle. On the contrary, I believe that there are norms or criteria to be found, to be observed, and to be developed, for critically evaluating SSD; I shall deal with such questions when we look at empirical instances in the analytical section (see also Conclusions). However, a discussion of the normative issue in SSD falls outside the scope of the present study.

2.3. Metaphor

In the present study, I shall focus on one particular process of discourse: metaphor. The Western literature on metaphor dates back at least to Aristotle; it is large and varied. Generally, it may be said that traditional approaches have been mainly either literary (e.g. Aristotle's *Poetics*) or philosophical (Richards, 1936; cf. Soyland, 1994, p. 199), in which a metaphor is seen as a linguistic process which is given a novel meaning/use as opposed to the previous or usual meaning/use of a term or expression (e.g. 'Language is a weapon') or something

abstract or unspecified is given a concrete meaning (e.g. 'Language is an instrument/cognitive structure'). In either case, the notion of the 'literal' meaning of a word is decisive for distinguishing the 'metaphorical'. However, calling a piece of discourse 'metaphorical' on grounds that one can find a 'primary', 'original' or 'usual' meaning for it in the history of the language is largely a philosophical or semantic exercise. Such observations are interesting, but they leave out the meanings of discourse in the actual context.

In the present SCL framework, a theory of metaphor is subsumed under the theory of discourse as outlined above. That is, metaphor is a special process of discourse (other kinds being argumentation, explanation, narration). Thus, metaphor and the metaphorical process of meaning-making are not seen as primarily opposed to 'literary' meaning in a idealised or de-contextualised sense, but rather as a discursive practice (see below). Following Goatly (1997), I define 'metaphor' as a *comparative* discursive process, i.e. using the property or properties of one category to characterise another category. The present notion of metaphor involves a broad comparison that includes such processes as simile, analogy, metonymy, synecdoche as well as the conventionally classified 'metaphor'. As such, metaphor is a particularly useful device for linguistics, as we shall see below, because 'language' (such as 'the linguistic system', 'cognitive device', 'meaning potential') as envisaged in formal and functional approaches respectively is neither available for observation nor actual in life.

Here it is important to emphasise that there is a sense in which metaphor is a matter of participants' or speakers' own discursive practice; that is, it is something that language users themselves offer and accept as such. Such metaphorical meaning is often accomplished through *meta-discursive* strategies such as 'like', 'similarly', 'in a sense', 'just as . . . so', 'the same', 'can be viewed as' and the like. Of course the same meaning can be achieved by implicit, indirect or extra-linguistic means, e.g. contextual, mutual presuppositions, or worn-out metaphorical expressions like 'tree diagram of linguistic structure' or 'instrument of communication of experience'. To preserve the clarity of the present argument, I shall present data of the former – explicit – kind.

3. Formalist and Functionalist Foundations as Metaphor

In the following the citations may sometimes be long but the reason for that is to give the reader as much contextual information as possible in the space available. The bold type in all the quoted examples below is added by me for emphasis, unless otherwise indicated.

3.1. Chomsky: Language as Cognitive Device

That Chomsky's notion of human language as a cognitive device is a decontextualised, fictive and therefore useless idea is not the argument I want to pursue here. My task is rather to show that Chomsky's understanding of language, in his own expository discourse, is literally *premised upon* a couple of specific

metaphors which he regularly employs that such metaphors have guided his methodological approach and furthermore that they have been motivated at the same time to belittle or demean alternative ways of thinking about and doing linguistics.

3.1.1. Physical-Science Metaphor

Following the founding father of modern Western linguistic science, Saussure (1966), Chomsky assumes a notion of human language as something not directly available for observation. Consequently, imaginary ways of thinking and speaking about it become imperative. What Chomsky chooses to do is to think and talk about it *in terms of something else* – hence metaphor. To illustrate:

> [1] Syntactic investigation of a given language has as its goal the construction of a grammar that **can be viewed as a device of some sort** for producing the sentences of the language under analysis. (Chomsky, 1957, p. 11)

More specifically, Chomsky prefers to use the metaphor of natural, physical, hard science in his characterisation of, and, more importantly, prescription for, linguistics. He suggests that, in theorising about the object of linguistics and linguistic research, we should follow the natural-science paradigm by picturing some hidden, sophisticated phenomenon ('cognitive device' as he calls it) and then speculating about its laws ('grammar') by empirical falsification. In this sense, Chomsky is not using the object of science and its research methodology merely as a metaphorical means to clarify for us or enlighten us upon the object of linguistics and the way to go about doing linguistics. Rather, the substance of that metaphor has actually been equated with the presumed object of linguistics and linguistic research. It has got into linguistics, as it were. More generally, this practice of using metaphor as justification shows that the distinction between 'transitive objects of science' and 'intransitive objects of science' (as in Bhaskar, 1975) and, indeed, boundaries between sciences are co-created by discursive work (cf. Gieryn, 1995). Such work may be exemplified by the following quotation:

> [2] **Any** scientific theory is based on a finite number of observations, and it seeks to relate the observed phenomena and to predict new phenomena by constructing **general laws** in terms of hypothetical constructs such as (in **physics**, for example) "mass" and "electron". **Similarly**, a grammar of English is based on a finite corpus of utterances (**observations**), and it will contain certain grammatical rules (**laws**) stated in terms of the particular phonemes, phrases, etc., of English (**hypothetical constructs**). These rules express structural relations among the sentences of the corpus and the indefinite number of sentences generated by the grammar beyond the corpus (**predictions**). (Chomsky, 1957, p. 49)

In this fragment, it can be observed, to start with, that the objects of linguistic investigation (such as 'grammar', 'grammatical rules') are not described in their

own terms, but rather in terms of something else. Specifically, characteristics of the physical world and natural sciences are adopted by Chomsky as the comparative vehicle, viz. simile (N.B. 'Similarly'), to define the object and procedure of linguistic research. That is, although language is not available for observation, we can imagine it to be something like 'mass' and 'electron'. When this way of thinking is adopted, other possibilities of characterisation are excluded thereby.

As indicated above, language has been presumed to be an object unavailable for observation. Through the currently preferred, figurative process of mapping the properties from the different domain of the physical world onto the domain of 'language' in question, however, an otherwise unobservable 'object' is written into being. Note in addition that, since for Chomsky language is a psychological entity (Chomsky, 1979), the science metaphor here creates a psychological object simultaneously. (Later on I will show how Chomsky uses this preferred science metaphor to his own advantage.)

More importantly, there is a sense in which the science metaphor has penetrated Chomsky's purported object of linguistics and research into it. For, despite the explicit metaphorical process, Chomsky also insists that linguistics conform to the paradigm of physical science. Observe that, according to him, 'any scientific theory' should have the format of physics – that is the norm for all sciences. Therefore, linguistics should do the same. Observe also that the brackets have been used as equations and accordingly grammatical rules *are* law. Thus, paradoxically, *this* simile is not simply a simile but has become the very rationale for his prescribed linguistics. It is not surprising then that this metaphorically engendered view is consistent with essentialistic presumptions about language in other parts of his writings (Chomsky, 1957, p. 13), 'The grammar of L **will thus be** a device that generates all of the grammatical sentences of L and none of the ungrammatical ones'; similarly (p. 18), 'Assuming the set of grammatical sentences of English to be given, **we now ask what sort of device** can produce this set (equivalently, what sort of theory gives an adequate account of the structure of this set of utterances)'.

There is still another kind of reason for asserting that specifically chosen metaphor has co-constituted Chomsky's linguistics. Namely, not only does not he draw upon the science metaphor, but he does so regularly and persistently to the extent that, denied its use, he would have little to go by for his linguistics. To put it another way, if we took away his science metaphor, there would be little left in his concept of language and linguistics. Let me quote just a few instances to give a sense of his pattern of thinking and talking:

> [3] **Once that system is identified [in science generally], one can try to determine its nature, to investigate theories concerning its structure.** To the extent that such a theory can be formulated, it is possible to ask on what basis the system is acquired, what are the analogues in it to universal grammar, its biologically given principles. **Similarly,** study of performance presupposes an understanding of the nature of the cognitive system that is put to use. Given some level of theoretical understanding of some cognitive system, we may hope to study in a productive

way how the cognitive system is used, and how it enters into interaction with other cognitive systems. **Something like that should be the paradigm for psychology, I think.** Of course, this is an oversimplification. One cannot legislate the "order of discovery". **But** this paradigm seems **to me basically correct.** (Chomsky, 1979, p. 49)

[4] I am personally interested in the possibility of **testing** linguistic **hypotheses.** Certain questions cannot be resolved by sole reliance on the customary methods of linguistics. [. . .] Linguistics can hope to characterize the class of possible grammars, that is, establish the abstract properties which every language must satisfy. Similarly, study of a particular language can at best specify abstract properties of its grammar. It is **something like the study of algebra:** every abstract algebra can be realized by many different real systems. **The theory of groups** can be realized by the number system, or by the rotation of objects. **In a similar way** the formal systems of the linguists can correspond to different real systems [. . .]. (Chomsky, 1979, p. 48)

[5] Certainly one must preserve the experimental sophistication of behaviourist psychology, but in order to employ it rationally. **The same thing is true in physics:** perhaps there are more sophisticated experimental techniques than those devised by physicists to answer interesting questions, but which have no relevance to questions of scientific interest. It would then be senseless to define **physics** in terms of this technology of experimentation. In itself this technology has no interest, apart from its possible relevance to significant questions. **In the same way,** psychological experiments have no interest, unless they can be put to use to sharpen our understanding of significant theories that can be developed concerning **some significant object of study.** (Chomsky, 1979, p. 47)

In these fragments, again, 'psychology', 'universal grammar/possible grammars', 'abstract properties', 'cognitive system', 'the formal systems/real systems', etc. are described in terms from science, like algebra, the theory of groups, physics. Beyond this metaphorical process, we also notice that he gives his personal injunction as a rational authority on the model of the science metaphor: 'should be the paradigm for psychology', 'basically correct' (for Chomsky's expression of rationality as social act see De Beaugrande, 1998).

3.1.2. Promissory Notes

Derrida once said (Derrida, 1976, p. 145), 'Writing always leads to more writing, and more and still more'. To this, one might add that such extended writings form a scheme of arguments and help reflexively to reinforce the preferred writing. This is the kind of phenomenon we shall see in this sub-section. That is, I want to suggest that the conception of linguistics based on the science metaphor has affected other (and subsequent) parts of Chomsky's writing and linguistic theorising and that, conversely, these parts have helped sustain the original conceptual assumption.

The specific data evidence I shall present here is what Soyland (1994) has called 'promissory notes', in which promises are made about the *eventual* discovery of 'internal' linguistic realities (cf. the 'promissory notes' Soyland finds in psychology; see also 'the truth will out' in Gilbert and Mulkay, 1984). Such promissory discourse is not just consistent with, but also logically follows from, the metaphorical conception of language as a hidden rule-system. Since the concealed phenomenon is already presumed, it is only natural to talk of taking Time to reveal it. Consequently, promissory writing, along with the language-as-hidden discourse, rhetorically encourages students to join the 'discovery' expedition. I shall come back to the persuasive aspect of Chomsky's theorising in the next sub-section. Thus, on account of this extended Time-metaphor, it may again be asserted that the idea of language as a thing-to-be-discovered is a metaphorical accomplishment. Look at some of Chomsky's promises:

> [6] What **seems to me particularly exciting about the present period** in linguistic research is that we can **begin to see the glimmerings** of what such a theory might be like. **For the first time**, there are several theories of UG that seem to have the right general properties over an interesting domain of fairly complex linguistic phenomena that is expanding **as inquiry into these systems proceeds.** (Chomsky, 1981, p. 4)

> [7] To be sure, it is **too early** to hope for definitive answers from such experiments ['click' experiments to establish cognitive structure of the sentence]. **But the logic** of the situation is **sufficiently clear.** It is **possible** that significant relationships between perception and sentence structure **will** be experimentally demonstrated. (Chomsky, 1979, p. 45)

> [8] [I]t is only through the detailed investigation of these particular systems that we have any hope of advancing towards a grasp of the abstract structures, conditions and properties that **should, some day,** constitute the subject matter of general linguistic theory [universal grammar]. **The goal may be remote, but** it is well to keep it in mind [. . .].
>
> [. . .] I think that we are, in fact, **beginning to approach a grasp of** certain basic principles of grammar at what may be the appropriate level of abstraction [of UG]. (Chomsky, 1981, p. 2)

> [9] While it is, needless to say, **much too** early to hope for a realistic proposal of this sort in the case of UG, **nevertheless** it is perhaps useful to take note of some of the conditions that such a theory should satisfy. (Chomsky, 1981, p. 10)

In these fragments several kinds of promissory ploy relating to Time can be found which entail the true and objective existence of linguistic realities. Among these are assurance of discovery by 'logic' (e.g. 'the logic [. . .] is sufficiently clear', 'should'), affirmation of possibility of discovery (e.g. 'is possible', 'will be [. . .] demonstrated'), specifying the amount of time, space or work needed for

discovery (e.g. 'too early', 'remote', 'as inquiry [. . .] proceeds'), the beginning of discovery – the device of 'seeing light at the end of tunnel' (e.g. 'beginning to approach a grasp of [. . .]', 'begin to see the glimmerings of [. . .]', 'for the first time') and – 'untypical' of scientific discourse – expressing the personal elation of discovery ('seems to me particularly exciting about the present period').

3.1.3. Justifying Own Approach and Undermining Alternatives

Just as Chomsky's science metaphor has enabled his promises about linguistic truths, this same discursive mechanism has also been carried over into Chomksy's linguistic argumentation as the very basis of rationality and validity. That is, Chomsky's chosen science-metaphor has been employed as the ground for defending his own approach and refuting alternative ones. In such discourse, metaphor again acquires the status of 'real' argument; linguistic argumentation becomes entangled with properties of ordinary discourse. More importantly, in such cases, we see that the metaphor informing Chomksy's notion of language and linguistics is motivated socially and ideologically as well: it serves to justify his own theory and practice and to reject or exclude other rival approaches. Just a few examples will illustrate the point.

> [10] Phenomena that are complicated enough to be worth studying generally involve the interaction of several systems. **Therefore** you *must* [italics original] **abstract some object** of study, you **must eliminate** those factors which are not pertinent [. . .] **In the natural sciences** this isn't **even** discussed, it is self-evident. In the human sciences, people continue to question it. **That is unfortunate.** (Chomsky, 1979, p. 57)

Here the nature of language is implicitly taken to be *the same* as the nature of an object in the natural sciences (NB. 'That is unfortunate', the presupposition of which makes it apparent that they *are* the same). In this way, the metaphorical origin of the notion of language we saw earlier is obscured. But the point I want to make here is that collapsing the distinction between the human and natural sciences and deploying the latter as the standard for the former is not a disinterested course of action; rather, they do two good turns for Chomsky. First, it should be noticed that the recourse to the natural sciences here occurs in a particular context, when, as anyone familiar with the linguistics literature would know, his practice of isolating and idealising linguistic objects is being loudly and often ungenerously criticised. Erasing the metaphorical origin and turning the linguistic object into a natural-science object, along with the corresponding methodological approach, serve rhetorically to shield himself from the attacks and, moreover, to justify his practice. In terms of Chomsky's own implicit argumentation: since the object of linguistic research is connected with other things but since it can be isolated from them, just as in natural science, abstraction and idealisation are only a logical imperative. This leads to my next point.

Second, Chomsky's recourse to natural science in the conceptualisation of language serves to undermine and exclude other approaches. Specifically, this

social effect is accomplished through: (1) presuming the paradigm of natural science to be the sole approach to scientific knowledge on the one hand and at the same time; (2) emphasising the difference or deviance of other approaches from this paradigm. This discursive strategy is at times implicit and at times explicit in his interview text/talk:

> [11] In my opinion, many psychologists have a **curious** definition of their discipline. A definition that is **destructive, suicidal. A dead end.** They want to confine themselves solely to the study of performance – behaviour – yet, as I've said, it **makes no sense** to construct a discipline that studies the manner in which a system is acquired or utilized, but refuses to consider the nature of the system. In my opinion, in order to do good psychology one **must** start by identifying a cognitive domain – vision, for example – that is to say, a domain which can be considered as a system, or a mental organ, that is more or less integrated. (Chomsky, 1979, p. 49)

> [12] M.R. [interviewer, in the context of talking about sociolinguistics]: Aren't sociologists seeking to preserve the methods they use at present, their interviews, surveys, statistics, and so on, which take the place of scientific practice?
>
> N.C. [Chomsky]: Again, in itself this type of approach is neither good nor bad. **The question is** whether it leads to the discovery of principles that are significant. We are back to the **difference** between natural history and **natural science**. In natural history, whatever you do is fine. If you like to **collect stones**, you can classify them according to their colour, their shape, and so forth. Everything is of equal value, **because you are not looking for principles. You are amusing yourself**, and nobody can object to that. **But in the natural sciences**, it is **altogether different.** There the search is for the discovery of intelligible structure and for explanatory principles. **In the natural sciences**, the facts have no interest in themselves, but only to the degree to which they have bearing on explanatory principles or on hidden structures that have some intellectual interest. [. . .] **Natural science**, as **distinct from** natural history, is **not** concerned with the phenomena in themselves, but with the principles and the explanations that they have some bearing on. There [sic] are **simply two entirely different things.** (Chomsky, 1979, pp. 58–59)

> [13] **No discipline can** concern itself in a productive way with the acquisition or utilization of a form of knowledge, **without** being concerned with the *nature* (italics original) of **that system of knowledge.** [. . .] If psychology were to limit itself to the study of models of learning or perception or speech while **excluding from its field of investigation the system itself** that is thus acquired or utilized, it would **condemn itself to sterility.** That kind of delimitation of psychology would be quite **pointless.** At this point, **linguistics understood as the study of the system**

> **of language seems to fill a conceptual gap** in the manner in which psychology is often conceived. (Chomsky, 1979, pp. 43–44)

In these instances, the criterion of scientific research is spelt out following the model of *natural science* – as depending on whether one starts with a presumption of some hidden phenomenon and then goes on to look for the laws underlying it. That this is the *only* standard for *all* scientific activity is implied through modal expressions like 'should', 'must', 'properly', '[n]o discipline can [. . .] without [. . .]'. Next to this standard, other approaches (e.g. sociolinguistics, process-oriented psychology) are singled out as deviating from that standard – by negation ('you are not looking for principles') and by contrast (e.g. 'altogether different', 'simply two entirely different things'). Effectively, they are banished from science. Worse still, the current metaphorical process renders the alternatives as of no intellectual value. Thus borrowing from natural science is but a guise, in a way, for justifying his own, much attacked practice of idealisation on the one side and for defeating rival ways of doing psychology and linguistics on the other. In this way, too, his talk of sociolinguistics as 'stone collecting', 'amusing oneself', and of process-oriented psychology as 'suicidal', 'dead end', 'pointless', etc. becomes only neutral, or, indeed, natural-ised. As an aside, it may also be pointed out here that it is apparent that in such instances Chomsky opposes the kind of psychology that does not conceptualise its object of investigation in the *natural-science* way as he does. But this effectively also undermines and excludes any non-Chomskyan type of linguistics, because he has categorised language and linguistics as part of psychology (Chomksy, 1979).

3.2. Halliday: Language as (Instrumental) System

Similar to the science metaphor in Chomsky's linguistic writing, there are metaphors built into the theoretical and methodological foundations of Halliday's systemic linguistics. (So placing the case of Halliday here is not meant to contrast with that of Chomsky. They are not discussed together, however, because different kinds of metaphor are at stake.) Just as Chomsky presupposes language as a hidden cognitive device, entirely consistent with Saussure's argument for conceiving language as unobservable *langue*, so Halliday makes comparable assumptions about what he terms 'the meaning potential', 'instrument', 'language/linguistic system', '(lexico)grammar', 'code', or 'unconscious', etc. That is, the real starting-point of Halliday's research programme is something *potential*, as opposed to the actual (language use). What I shall pay special attention to below is, likewise, how metaphors have gone into the formation of this 'something potential' and how they have consequently become the foundations or justifications for the systemic-functional approach.

3.2.1. Language as Language Development

To start with, it may be noted that, in Halliday's systemic-functional view of language (1973, 1978, 1985), the basic characteristic of language is 'functional', in the sense that its interior is assumed to have been shaped by and therefore reflects the external social environment and human needs (in addition to other

senses of the term). This extra-linguistic object is described by Halliday (1978, p. 2) as 'both "good to think" and "good to eat"'. The question I want to ask in this study is how the 'functional' nature of language itself is defined and defended and subsequently deployed. There is no external evidence for the functional organisation of language, as Halliday states (1973, p. 23). Therefore, (in addition to trying to find evidence from within a language) Halliday turns to comparative or metaphorical means, which I find to be three in kind, viz. language as (1) child language development; (2) cultural and human evolution, and (3) the unconscious. In this subsection, I shall focus on Halliday's reliance on Malinowski's observation of language *development of the child* and, in close connection with that, Malinowski's thesis that *ontogeny provides an analogue for* phylogeny:

> [14] It was in **the language of young children** that **Malinowski** saw most clearly the functional origins of the language system. [. . .] **Similarly** all uses of language [. . .] were to be explained in terms of certain very elementary functions. It **may be true** that **the developing language system of the child in some sense traverses, or at least provides an analogy for**, the stages through which language itself has evolved. (Halliday, 1973, p. 23)

> [15] To say this is in effect to claim, **with Malinowski**, that **ontogeny does in some respect provide a model for** phylogeny. **We cannot examine the origins of language.** (Halliday, 1973, p. 34; see also p. 44)

> [16] The social functions which language is serving in the life of the child determine both the options which he creates for himself and their realizations in structure. **We see this clearly in the language of young children**, once we begin to think of language development as the development of the social functions of language and of a meaning potential associated with them. **However**, although this connection between the functions of language and the linguistic system is clearest in the case of the language of very young children, **it is essentially, I think**, a feature of language as a whole. The internal organization of natural language can **best** be explained in the light of the social functions which language has evolved to serve. (Halliday, 1973, pp. 33–34)

In these statements it can be seen, first of all, that Halliday, following Malinowski, makes speculations about the functional structure of language by explicitly drawing upon its similarity with language development (N.B. 'Similarly', [14]), analogy with language development ('provides an analogy for', [14]), the model of language development (N.B. 'provide a model for', [15]), the inference from language development (N.B. 'We see this clearly in', 'is the clearest in the case of', [16]), and even 'substance' of language development (N.B. 'traverse', [14]). In other words, the characteristics of the child language development are mapped onto the adult language. At this point, it may be noted that there is a further sense in which a metaphorical process is involved in the characterisation of the functional nature

of language. That is, some of the comparative processes are extrapolative or uncertain (N.B. 'It may be true', [14] and 'in some sense', [14]). Elsewhere Halliday (1973, p. 24) declares that Malinowski's functional thesis on the child language is merely conjectural: 'Malinowski's ideas were *rather ahead of his time*, and they were *not yet backed up by adequate investigations of language development*' [emphasis mine].

However, despite the fact that Halliday makes explicit use of comparative processes, it can be argued, paradoxically, that such ploys are not merely heuristic or pedagogical; rather, they are defining, constraining and penetrating in the presumption of the functional character of language. In other words, they constitute the description itself. For one thing, we have to view such metaphorical uses in the wider argumentative context of modern Western linguistics, where and when the 'functional' is being countered with the 'formal', as represented for example by Chomsky's approach. For another, the metaphor of the child language development, though only tentative in Halliday's wording, has been used as a potential *argument* for the preferred functional understanding.

Let us take the last quote [16] for example. As anyone familiar with Halliday's systemic-functional linguistics would recognise, the first statement is its basic theoretical conception of language. This is being warranted by the case of 'the language of young children' because it is offered as what might be called evidential ground; N.B. 'We see this clearly in [. . .]'. On top of that, as if that piece of evidence were not solid enough, an appeal to personal rationality is offered; N.B. 'it is [. . .] I think, a feature of language as a whole' in the ensuing sentence. More crucially for our thesis here, the foregoing suggestive characteristic of the child language has been turned into something essentialistic in the same appeal to individual authority: it has become 'is essentially [. . .]'. Still another signal for reading this metaphor as argumentative is that in the final sentence there is an attempt to exclude other alternative (e.g. formal) ways of explaining language by the use of 'best'; otherwise, the sentence roughly echoes the initial statement. Given these strands of evidence we may assert that at the base of Halliday's notion of language is a discursive metaphor of the child language development.

3.2.2. Language as Evolution

Closely related to the metaphorical notion of language as language development is the construction of language as an evolutionary system in Halliday's writing. That is, the functional organisation of language is built upon a parallel argument from a different plane, viz. cultural and linguistic evolution. Specifically, it is presumed that the adaptive process of language over hundreds and thousands of years gives language a functional character. In the words of Halliday (1973, p. 22):

> [17] [. . .] another question, no less significant, is that of the relation between the functions of language and language itself. If language has evolved in the service of certain functions, that may in the broadest sense be called 'social' functions, has this **left its mark**? Has the character of language been shaped and determined by what we use it for? **There are a number of reasons for suggesting that it has** [. . .]. (Halliday, 1973, p. 22)

Two points need to be highlighted here. First, Halliday posits here two separate issues, evolution of language on the one hand and 'language itself' on the other. Second, the evolutionary concept in question is to be traced, outside linguistics, through Malinowski, Darwin, back to Aristotle, where structure, biological or behavioural, is seen as derived from and adaptive to human needs and social environment. In addition, it is apparent that there is no evidence for the alleged 'evolution' of language, as Halliday himself admits (1973, p. 23), 'There are no living specimens of its [i.e. language's] ancestral types' and (1973, p. 34) '[w]e cannot examine the origins of language'.

What Halliday is trying to suggest here however is that a process – cultural and linguistic evolution – has shaped the product – the linguistic system; n.b. 'left its mark' and 'There are a number of reasons for suggesting that it has'. Because two separate domains are involved here and because there is an inferential process between the two, whose very basis is doubtful, we may claim that the recourse to the evolutionary idea is argumentative and that the functional nature of language is premised on this metaphorically originated argument. To further illustrate this point, let us look at another example:

> [18] [I]t is the uses of language that, **over tens of thousands of generations, have shaped** the system. Language has **evolved to satisfy** human needs; and the way it is organized **is functional with respect to these needs – it is not arbitrary.** (Halliday, 1985, p. xiii)

Here the notion of the functional system of language may again be seen as grounded in a metaphorical argument – inferring from matters of a different domain, viz. cultural and linguistic evolution (see also Halliday, 1973, p. 23, for uses of 'all stages of cultural evolution' and 'level of linguistic evolution'). I have already alluded to the wider argumentative context enshrouding the functional and formal explanations of language. Here I need only to point out two textual features as evidence for the potentially contentious nature of the presumed functional organisation of language. One is the description 'and the way it is organized is functional [. . .]'; it is consistent with the foregoing factual statements as a 'logical' consequence (despite the vague conjunction 'and'). Another is the negation of the opposite of being functional – 'not arbitrary'. From these moves it may be seen that recourse to the metaphors of 'cultural evolution' and 'linguistic evolution' is argumentatively motivated, in spite of Halliday's realisation/admission that there is no evidence for them (Halliday, 1973, p. 23). Further, it may be argued that the metaphorical basis of Halliday's linguistic construction is embedded in a degree of reflexivity in his functional explanation of language, as implicit in the current excerpt: Language is explained in terms of 'human needs' and yet at the same time the latter are assumed to be reflected in the former (N.B. 'functional with respect to these needs').

3.2.3. Language as Unconscious

Still another metaphorical notion that Halliday draws upon in defining the nature of language is 'the unconscious'. Since 'the unconscious' comes in via the ...

of speech in Halliday's linguistic theorising, we might as well begin with that. Following Saussure, Halliday maintains that the language system is best captured from the spoken mode (rather than the written). The reason why speech is more suitable is, according to Halliday (1985, pp. xxiii–xxiv), that it contains richer information about language: 'Why is speech important? [. . .] potential of the system is more richly developed, and more fully revealed, in speech. [. . .] It is in spontaneous, operational speech that the grammatical system of a language is most fully exploited [. . .]. This is why we have to look to spoken discourse for at least some of the evidence on which to base our theory of the language' (cf. Halliday, 1985, p. xxv).

If Halliday wants to base linguistic theory on (the grammar of) speech, then what is his basic conception of it? The key term for it that Halliday uses is 'unconscious' as in:

> [19] There are perhaps two main reasons for this [why speech is important for theorising grammar], underlying both of which is **the same general principle, that of the *unconscious*** [italics original] **nature** of spoken language. [. . .]. Lying beyond both the points raised above is **the unconscious nature of spontaneous** speech [. . .]. (Halliday, 1985, pp. xxiv–xxv)

But what does he mean by 'the unconscious'?

> [20] The complexity of spoken language is **more like that of dance**; it is not static and dense but mobile and intricate, **like,**
> [an extended spoken sample]. (Halliday, 1985, p. xxiv)

> [21] In spoken language, we perform without thinking. Talking is **like walking** (and **developmentally the two go together**; protolanguage goes with crawling, language with walking): if you think about it, **you stumble (which is a metaphor we often use)**. (Halliday, 1985, p. xxv)

> [22] So far as I know, no-one who is tone deaf speaks his language on a monotone, or with an intonation that is in any way disordered; **such people merely have trouble in bringing it to consciousness**, and therefore in analysing that of their own language or learning that of a foreign one. **In the same way**, those who are 'grammar deaf' make all the same subtle semantic distinctions as other speakers of the language; yet they fail to recognize them when they are pointed out; and will even deny that they are possible. (I know of no **quick cure for this condition. But a good dose of analysis of spontaneous speech can help.**) (Halliday, 1985, p. xxvi)

So here, we do not have to go back to Freud's or Jung's psychoanalysis of 'the unconscious' to understand what 'the unconscious' of human language constitutes. These passages on the unconscious of language are rich in metaphors. 'The conscious' that Halliday speaks is predicated of further metaphors, such as

'walking', 'dancing', '(pathological) condition'. Therefore it may be said that the complex system of language that Halliday pursues is defined by a layer-upon-layer and one-after-another metaphor: language-as-the-unconscious-as-walking/dancing/ condition. Such heavy, exclusive reliance on properties of other chosen categories in functionalist theory reflects not just the difficulty of conceptualising and defining the object of research in its own terms and, indeed, in any other ways, but also the thorough-going discursive, metaphorical mediation, and saturation, of what is taken for granted in linguistic enquiry.

More interestingly and more importantly, there may be certain attempts observed here that are made at the same time to justify, and thereby naturalise, those metaphors employed. The two brackets in [21] are a case in point. Following the explicit use of the notion of 'walking' as metaphor, there is, paradoxically, a first bracketed allusion to 'development' when speaking and walking take place simultaneously. The bracketing move at this juncture, despite its potential meaning of playing down relevance, accomplishes in effect the argumentative role of rationalising and naturalising the concept of speaking as walking. In addition of this justification through (developmental) time, there is the implicit resort to *common sense* for warranting the preferred metaphor: When Halliday reminds us that the metaphor of stumbling is something we 'often use', we are invited to take his words to mean 'therefore that metaphor is not really metaphorical but true'.

In example [22], we can find yet another way of defending the notion of grammatical unconsciousness. Here the unconscious is paralleled with the capacity of tone-deaf people to make tone distinctions in practice. It is not that ordinary laypeople do not have the grammatical unconscious, according to Halliday, it is merely that they have a 'pathological condition' in that respect, and that what they need for it is a large 'dose' of spoken grammar. In this way, one metaphorical process is reinforced and effectively naturalised by another kind of metaphor.

3.2.4. Justification for Writing Grammar

Using metaphors to shape and define the object of linguistic research is entirely consistent with the Saussurean notion of *langue* as an arcane phenomenon for linguistic science. Saying that the human language system is really like child language, a possible product of unspecified linguistic and cultural evolution, and that it exists at the level of the unconscious (as dance does) serves to create an intellectual interest in demystifying it. Moreover, since grammar is viewed as the 'central processing unit' of a language and discourse (Halliday, 1985, p. xxii and pp. xxxiv–xxxv), a need to spell it out arises naturally as well. Hence Halliday declares the pursuit of the 'internal' organisation of language to be the primary goal of functional linguistics (Halliday, 1973, p. 45). In this subsection, we shall see that the chosen metaphors that we witnessed earlier serve fittingly to warrant the subsequent practice of writing (functional) grammar.

> [23] This [talking is like walking] means that the categories of our language represent unconscious rather than conscious slices of meaning; and this **is one of the main problems for a grammatical theory.** (Halliday, 1985, pp. xxiv–xxv)

[24] The meaning is built into our unconscious. [. . .].
This book [*Introduction to Functional Grammar*] **is** [. . .] **an interpretation of** the English code. (Halliday, 1985, p. xxvi)

[25] **[A] grammar is an attempt to crack** the code. (Halliday, 1985, p. xxxi)

[26] In order to understand how language works, **therefore, we have to engage with the grammar.** (Halliday, 1985, pp. xxxiv–xxxv)

In these fragments it may be seen that there is a tacit assumption of an obscured, sophisticated and controlling system. Such a phenomenon is implicit in or invoked by such constructions as 'one of the main problems for a grammatical theory', 'the English code', 'to crack the code', 'to understand how language works [. . .] we have to engage with the grammar'.

It may also be noted that in these excerpts the taken-for-granted hidden code is in fact used as the argument or rationale for the enterprise of grammatical theory. For, the presumed particular nature of the linguistic system, or indeed 'the conscious', effectively suggests the necessity of deciphering work, hence grammar-writing. In fact, Halliday explicitly tells us the need for and importance of the job of working on grammar (e.g. 'The meaning is built into our unconscious', 'we have to engage with the grammar').

Earlier we saw that language is viewed as having the nature of child language development, as being evolved, and as unconscious (as in walking and dancing). With respect to the present notion of 'code' or 'grammar', these metaphorically charged conceptions are perfectly consistent; only they are presupposed here. Thus, looking back on the metaphorical mediations in the background, one may realise that the present job of writing the grammar is indeed justified and highly valuable. And reading the grammar will enlighten us on ourselves. In this sense we may assert that the choice and use of specific metaphors have a constraining and penetrating effect on the (subsequent) linguistic practice (in this case, writing the grammar). Another way of saying this is that the justification for the job of writing grammar is facilitated by positing a central processing system that is evolved and unconscious.

4. Concluding Remarks

In this paper, I attempted a re-orientation of linguistics. Instead of proceeding from the traditional premises and pursuing the conventional aims, I took the discourse of linguistics as the topic of research and examined in some detail the ways in which the basic, taken-for-granted 'real' object of modern Western linguistics is presumed, discussed and utilised, with special reference to the use of metaphor.

Through discourse analysis in the SCL perspective, we found that the foundational presumptions of 'language' in both Chomsky's and Halliday's linguistic

theories are in fact grounded in and penetrated by preferred and recursive metaphors. In other words, the very stuff named 'language', 'the cognitive device', or 'the linguistic system', is not simply a thing that is pre-given, pre-existing, out there in the human world, something that linguists only have to theoretically model and empirically specify. It has been rendered present and real by linguistics-writers through metaphorical and rhetorical devices.

Not only have metaphors been used to make present, define and fashion the object of linguistic enquiry, but we also saw that they have affected linguistic theory formation and argumentation by functioning as rational arguments and by facilitating other assumptions about language. For instance, they are used to form the basis for dismissing or refuting alternative approaches and theories of language on the one hand and for justifying one's own practices or accounts on the other. In this sense, the way that the object of enquiry is presumed and conceptualised is also oriented to ideological interests. From these metaphorical, rhetorical and social perspectives, I may assert more generally that there is a profound kinship of 'the object of linguistic enquiry' with ordinary, commonsensical discourse – to adapt Foucault's turn of phrase: 'the profound kinship of language with the world' (Foucault, 1970, p. 43).

Findings and observations of the kinds that we have made here may be utilised to help open up possibilities of changing existing linguistic discourse and thinking. For example, we can start re-formulating questions so that integration of disciplines, say linguistics, discourse analysis and social theory, becomes possible. Since discourse is a constituent part of linguistics, we can also try to positively act upon the object of study, e.g. by creating helpful (versions of) linguistic reality, say 'language used in real circumstances' for examining its effects on people's lives. Further, given the current case findings, it should now be realised that norms of linguistics discourse should be developed, such as avoidance of argumentative use of metaphors, especially when justifying one's own approach and refuting others'.

Clearly, the present case study is but a preamble to a more inclusive examination of other parts of linguistic theory writing and to a wider-ranging study of the discourse of linguistics writing as a whole. Here I have concentrated only on a few metaphorical and rhetorical aspects of the foundational notions (of language) in a few (though most influential) works of a couple of leading linguists. I am convinced that more data analysis will show for instance that there may be other kinds of metaphorical basis, say geological or arboreal. There may be marked variations and inconsistencies in linguistics writing (say between theoretical ideals and practical analysis). And there may be dominant ideologies in particular theoretical formulations to exclude the social-academic Other. In fact, I hope that what we have seen in this study will serve to signal the benefit of reconsidering the discourse of linguistics as a whole.

Acknowledgements

I would like to express thanks to the anonymous referees and Robert Arundale, Desmond Allison, Stephen Tyler for reading earlier versions of the paper and providing me with constructive comments.

The Writing of Research Article Introductions

John Swales and Hazem Najjar

Research on Introductions to Research Articles

Introductions to research articles or papers have become in the last few years an important proving ground for our current capacity to understand the process and product of specialized academic writing. The extensive case studies of Latour and Woolgar (1979), Knorr-Cetina (1981), and Gilbert and Mulkay (1984) provide solid evidence for the complexity of the compositional process at the introduction stage. All three studies show that writing an introduction to a research article is not simply a wrestling with words to fit the facts, but is also strongly modulated by perceptions of the anticipated reactions of peer-colleagues. Knorr-Cetina's analysis of the evolving drafts of a single paper is particularly revealing. She is able to show how the first draft's bold announcement of a new method ultimately becomes the reporting of a comparative analysis, how the early exuberance of the primary researchers turns into the careful understatement of a wider group.

Bazerman's studies of disciplinary variations in introductions, particularly Bazerman (1981), have also made a significant contribution to our understanding. According to Bazerman, in the "harder" sciences, author and intended readership are likely to share criteria for the judging of a new knowledge claim. In contrast, the social science researcher or humanities scholar may well address a situation in which there is little consensus – given the greater likelihood that the potential readership will approach the text with widely varying schemata and from diverse methodological and ideological viewpoints. In these areas, therefore, authors embarking upon introductions "have it all to do." They are wise to make the most of the opportunity the introduction provides to create a plausible context for the ensuing findings so that as many readers as possible are attracted to their perspective.

Source: *Written Communication* vol. 4, no. 2, 1987, pp. 175–190.

Introductions have also been a major context for debate about research methodology. Issues of the value of "subject specialist informants," their selection and their integration into a hermeneutical cycle have been sited in discussion of research article introductions (Huckin & Olsen, 1984; Selinker, 1979). This type of text has also figured prominently in the quest for the identity and boundary criteria required to establish textual subdivisions of a discoursal or rhetorical character (Bley-Vroman & Selinker, 1984; Crookes, 1986; Swales, 1981). In addition, certain studies of particular linguistic features of research writing have either concentrated on introductions or compared the function and distribution of selected features across introduction, method, result, and discussion sections. In the former case, there have been investigations into the in-text creation of complex noun phrases (Dubois, 1982) and of tense and citational form and function (Oster, 1981; Swales, 1983); in the latter case, of *that*-nominals (West, 1980), tense (Heslot, 1982), first person pronoun versus the passive (Tarone, Dwyer, Gillette, & Icke, 1981), and authorial comment (Adams Smith, 1984).

The nature of the preferred types of informational and rhetorical structure in research article introductions and of the best ways of characterizing that structure are also lively contemporary issues. A common approach is to opt for some version of a problem-solution model (Hoey, 1979). Zappen (1983) will serve as an illustration of this type of analysis – and Zappen's analysis of his first text can be seen in Figure 1. Zappen argues, following Toulmin (1972), that the researcher continuously needs to address the context of the intellectual discipline wherein he or she is located; or to put it another way, research writing needs to be audience sensitive. More specifically, "The researcher addresses the goals, current capacities, problems, and criteria of evaluation that derive from and operate within that discipline" (Zappen, 1983, p. 130). And, as we might expect, Zappen's analysis follows this series of subcontexts: *goal* in the first paragraph, *current capacity* (the best we can do at the moment), *problem* (However, . .), *solution* (In the present work, . .), and *criteria for evaluation.* However, this type of analysis runs into a number of problems. In general terms, it runs counter to the broadly held perception that there is neither a simple nor a close relationship between discovery as a cognitive and experimental activity and the formal "empiricist" statement of how that discovery came about. More directly relevant is a sense that the Toulmin-Zappen model with its emphasis on a disciplinary audience, on the researcher addressing the *external world,* fails to account sufficiently for the authors' rhetoric as it pertains simultaneously to research *content* and to the authors' *own* research career. For example, one striking feature of the introduction Zappen discusses is that it is firmly embedded within the highly localized field of the researchers' own previous work. All the four references in the opening paragraph are to Neelakantaswamy, and only one reference overall (8) is to the work of others. Further, there is a fair amount of comment that (with one exception) evaluates positively the authors' work and less positively the work of others. For instance, the text opens with a broad claim that the authors have developed not "a number" or "a series" but "*a class*" of microwave radiators. These are "compact," "simple," and have "practical utility"; indeed they are

COAL	In the recent past, Neelakantaswamy et al. (1-4) developed a class of microwave radiators termed as "Gaussian-beam launcheru" to produce a focused exposure field in biological experiments for partial-body irradiations. These compact and simple structures with their ability to focus the microwave energy in a very small region indicate their practical utility, in the areas of biological researches and medical applications of microwaves, such as for selective heating of diseased/cancerous tissues. These launchers can also be used in noninvasive beam-wave reflectometric and spectrometric instrumentations for measuring complex permittivity of biological material at microwave frequencies, as indicated by Neelakantaswamy elsewhere (5-7)
CURRENT CAPACITY	When compared to the microwave beam-launching system described in (8), which consists of a plane-wave irradiated dielectric sphere (lens), the launcher formed by combining a scalar horn and dielectric sphere (1) is a more practical sources of microwave Gaussian beam. However, the use of a dielectric
PROBLEM	sphere as the focusing lens results in significant amount of spherical aberrations in the focal field, as indicated by Neelakantaswamy et al.in (9) ....
SOLUTION	In the present work, a Gaussian-beam launcher is formed by placing a dielectric hemisphere (instead of a full sphere) at the aperture end of corrugated circular waveguide (scalar horn). This enables a reduction in the path length of the ray in the lens-
CRITERIA OF EVALUATION	medium, and hence the spherical aberration effects are relatively minimized. Further, by using a hemisphere in the place of a full sphere, the launcher structure becomes less massive and smaller.

Figure 1: A problem-solution model of article introductions (Zappen, 1983)

"more practical" than other types. Toward the close, one of their apparent defects is said to be "relatively minimised." The exception to the positive evaluation of their own work lies in the *problem* section, where the authors need both to motivate their present work and to justify its publication by showing that their contribution to the discipline, while previously established as significant and reference worthy, is as yet incomplete. Therefore, even in Zappen's own example, there seems to be more "going on" than an audience-sensitive problem-solution model can easily admit – and one of those things is a quasi-contingent account of the relevant research history.

An alternative to problem-solution models is the create-a-research space model, which attempts to capture rather more of "the dark side" (Swales, 1981, 1984). At the outset, the writer of an introduction has the option of trying to establish that his or her particular area of research is of some significance. This is most commonly done by claiming that the area is nonperipheral; authors may claim that there is interest in it, or that it is important or relevant, or that it has been widely investigated, or that standard procedures have evolved (Move 1). This done, Move 2 summarizes selectively the relevant previous research. The rhetorical role of Move 3 is to show that the reported previous research is not complete. This is principally achieved by indicating a gap in the previous work, by raising a question or by indicating that a new explanation is needed.

Sometimes the onset of Move 3 will be marked by a contrastive connector like *however*, and often Move 3 will contain some negative element. Sometimes negation will occur at the thematic sentence-initial position and be expressed through quantification (*little, no, none of, few*), and sometimes it will be realized through choice of verbs like *fail, neglect, lack, been restricted to*, and the like. Finally, in Move 4 the *gap* is turned into the research space for the present article, or an offer is made to answer the question raised in Move 3. This is commonly realized by a purpose statement ("The aim of the present paper is to give . . .") or by simple description ("In the present work, a Gaussian-beam launcher is formed by . . ."). On occasion, Move 4 is also signaled by a switch from the impersonal style used in Moves 1–3 to the use of *we*. And inevitably, the smaller the research space (the less evident the existence of an unfilled ecological niche in the research area), the greater the rhetorical *work* needed.

We have thus reached a position where it would seem reasonable to assume that a research article introduction typically closes with a promissory statement, variously indentifiable as an offer of a solution, as a clarification of research purpose, or as an advance notice of what is to come.[1] However, it is much less clear whether the close will also contain a summary announcement of the principal findings. Although we know that the principal findings (PFs) will normally be summarized in the second half of the "informative" abstract and will be reported and discussed at some length in the results and discussion sections, there seems to have been little attention given to the question of whether announcements of principal findings (APFs) are also inserted at an introduction's close (as was indeed the case in the Neelakantaswamy and Hong extract analyzed by Zappen). The only study known to us is a preliminary unpublished investigation by Kinay, Muloshi, Musakabantu, and Swales (1983). In a sample of 50 introductions drawn more or less at random from a range of fields and journals, all but 5 contained clear Move 4 promissory statements. However, only ten of the remaining 45 (22%) also included an APF. Kinay et al. also looked for a possible relationship between the absence of a homotopic abstract and the presence of an APF in the introduction. Of the eight papers without abstracts four also had no bottom line, and so kept their readers in suspense about their findings until the results section, thus suggesting, on very limited evidence, that the correlation may be weak.

The present article reports on a localized case study of the APF apsect of article introductions in two contrasting fields (physical science and psychology) and over time – to ascertain whether there have been any changes in writing practice over the last few decades. To that end we have examined introductions from the *Physical Review* of 1943, 1963, and 1983 and from the *Journal of Educational Psychology* in 1963 and 1983. A major motivation for undertaking this research derived from our observations that handbooks, manuals, and style sheets for prospective authors of research papers appeared to ignore the issue, disagreed amongst themselves, or seemed to be offering prescriptions not in accord with the actual practice of many successful authors ("successful" in the operational sense of succeeding in getting their manuscripts published).

Announcing Findings in Introductions: A Survey of Manuals

There is no discussion of the APF question in several of the works surveyed, such as Peterson (1961), Jones (1971), O'Connor and Woodford (1976), and Michaelson (1982). Where it is discussed, the overall weight of advice is to include APFs in introductions. Thus the Royal Society, in its *General Notes on the Preparation of Scientific Papers* (1965, p. 6), advises that

> the introduction should state the reasons for the work (with brief reference to previous work on the subject), the object of the work, *and the main achievements.* (our emphasis)

Calnan and Barabas (1973, p. 86) give six functions for the introduction, of which the fifth is:

> to record the most significant finding so that the reader is alerted early and can assess the evidence for it as he reads.

Similarly, Dudley (1977, p. 12), in a volume entitled *The Presentation of Original Work in Medicine and Biology*, observes:

> A sentence or even a short paragraph at the end of the introduction *which says what the work has or has not achieved* as well as what it set out to achieve may catch the reader's attention and invite him to test for himself by further reading whether or not he agrees with the contentions expressed. (our emphasis)

The most trenchant version of this advice is contained in the well-known volume by Day (1983) on *How to Write and Publish a Scientific Paper.* The fourth and final suggested rule for a good introduction is as follows:

> It should state the principal results of the investigation. Do not keep the reader is suspense; let the reader follow the development of the evidence. An O'Henry surprise ending might make good literature, but it hardly fits the mold that we like to call the scientific method. (Day, 1983, p. 31)

In contrast, recommendations to dispense with an APF in introductions are rarer and more muted. For instance, the IEEE style guide (as cited by Mitchell, 1968, p. 161) demurs by implication:

> The *Introduction* orients the reader with respect to the problem and should include the following:
>
> (1) The nature of the problem
> (2) The background of previous work

(3) The purpose and significance of the paper
(4) The method by which the problem will be attacked
(5) The organization of the material in the paper

In fact, we have traced only one manual writer who unequivocally recommends dispensing with an APF, and that is Huth (1982, p. 53):

> Some authors close the Introduction with a short statement of the research findings. This practice has been justified as a device to hold the reader's attention: it has been criticized as moving the conclusion from its logical place in the sequence of the argument. One reason for keeping the conclusion at the end of the paper is that many journals now publish full summaries or abstracts on their title pages. Why give the answer twice at the beginning of the paper?

Within the specific contexts of the two journals analyzed in the following section, the survey so far has considered general or secondary sources of advice. The primary sources will naturally be the relevant style guide for the two journals. For the *Physical Review* the primary document is the American Institute of Physics *Style Manual* (1978). In fact, the APF issue is not directly addressed, the closest approximation being the following section on "purpose" (1978, p. 54):

> Every legitimate scientific paper has a purpose that distinguishes it from other papers on the same general subject. Make clear in the introduction just what this purpose is. In other words, orient the reader with respect to the point of view and emphasis of the paper, and *indicate what in particular the paper will accomplish.* (our emphasis)

The phrase "the paper will accomplish" is possibly ambiguous, perhaps deliberately so, but it is clearly less explicit about the necessity for an APF than an injunction to indicate what the paper "has accomplished." Thus it would seem that prospective contributors to the *Physical Review* are not externally constrained to close their introductions with an announcement of principal findings, even if the overall trend in general advice would suggest they would be well-advised to do so.

Mullins's (1977) *A Guide to Writing and Publishing in the Social and Behavioral Sciences* follows the American Psychological Association guidelines, which are in turn adopted by the *Journal of Educational Psychology.* The relevant section is (Mullins, 1977, p. 21):

> In the final paragraph of the problem statement (of article introductions) briefly and clearly present:
> - The article's single focus
> - The central hypothesis
> - The research method
> - The major findings (optional but common)

It would therefore seem that educational psychologists are encouraged more directly than their counterparts in physics to follow an APF policy in their submissions to one of the leading journals in the field. In the next section we will present our findings as to what actually happens, as opposed to what might be expected to happen, following prescription, recommendation, and commentary.

Types of Introduction Close in Two Journals

The corpus consists of 110 article introductions selected from two journals, both of which require homotopic abstracts:

A. 66 articles from the *Physical Review (PR)*

(1) 22 from Second Series, 1943 (volume 63, Nos. 1–6)
(2) 22 from Second Series, 1963 (volume 129, No. 1)
(3) 22 from *Physical Review A: General Physics* Third Series, 1983 (volume 27, No. 1)

B. 44 articles from the *Journal of Educational Psychology (JEP)*

(1) 22 from 1963, volume 54, Nos. 1–3
(2) 22 from 1983, volume 75, Nos. 1–2

All the articles had clear introduction sections, either self-announced as in the case of the *Physical Review* or followed by a section entitled *Method* as in *JEP*. All the articles in the corpus were also immediately preceded by abstracts. However, the format of the *JEP* changed somewhat in the period between 1943 and 1963, and it was eventually decided to exclude 1943 *JEP* articles for this reason.

The introductions were placed into one of five categories according to the following scheme:

Class A – The introduction contained not Move 4-type statement introducing the present research and no announcement of principal findings (APF).
Class B – The introduction contained a Move 4-type statement but no APF.
Class C – The introduction contained no Move 4 but an APF.
Class D – The introduction contained both a Move 4 and an APF.
Class E – The analysis of the introduction is too uncertain and doubtful to permit categorization.

The corpus provided a single incontrovertible example of Class A:

(1) In general, the substances most favorable to inelastic scattering (of protons) are light elements with high (p.n.) thresholds. (end of introduction) (*PR*, 43)

However, there were several others that seemed intermediate between Class A and Class B (our emphases):

(2) Their well conceived experiments *suggested to us the desirability of repeating* this work with the mass spectrometer as a detector of ionization. (end of introduction) (*PR*, 43)

(3) Consequently, *it was expected* that infra-red studies of antimony *would* contribute toward unravelling its band structure. (end of introduction) (*PR*, 63)

The first has a surface realization of the switch to first person (a typical marker for the onset of Move 4), while in the second the underlying agent of the passive verb can be presumed to be the present experimenters and not previous researchers, and thus would have been realized as "by us" in surface structure. Nonetheless, reference to present work remains implicit and reconstructable rather than manifest in the actual text; for that reason, we have categorized such cases as Class A.

In contrast, the typical Class B introduction ends with an explicit promissory statement, most frequently signaled by *this*/the *present*, but also marked by first person usage or by *here*, *now*, or *reported* (with or without other signals). Thus we find:

(4) The main purpose of the experiment reported here was to . . .
(5) The study reported herein was designed to . . .
(6) The purpose of this study was to explore . . .
(7) In this paper we give preliminary results of . . .
(8) It is one of the aims of this paper to determine . . .

However, in Class B, the actual findings or results are not specified in any detail, and certainly in less specific and less usable form than even in the homotopic abstract. Class B introductions are concerned with what will be done, not with what has been found.

There were only two cases of Class C. The shorter is given below:

(9) Therefore, it is of interest to examine the validity of the approximation of neglecting the field connections to the dielectric constant. The error introduced by this approximation will be explicitly calculated and shown to be small or negligible under most circumstances. (*PR*, 63)

The first sentence is classified as Move 3 (hypothesis raising) partly because of its intrinsic rhetorical function and partly because of the arguments we have presented for not assigning Move 4 status to citations like (2) and (3) above. The second sentence, taken as a whole, would seem to be an APF given the conclusion that the error is shown to be "small or negligible." A suitable illustration of a Class D introduction (a statement on the present research plus an APF) is the Zappen text shown in Figure 1, which closes with an outline of the changes made in the launcher. Space does not permit any consideration of the relatively small number of introductions that we have been unable to categorize.[2]

Table 1 shows the results of the classification scheme as it applies to the two samples from the journals. Class B and Class D are the two types of introduction that contain an explicit announcement of either the purpose or the topic of the present research. The fact that these two classes predominate (83%) in the *Physical Review* sample provides useful support for the appropriateness of existing models of article introduction information structure. In 29 of our 55 cases, *Physical Review*

Table 1: Types of introduction in two journal samples

	A. The *Physical Review*			B. The *Journal of Educational Psychology*			
Year	Class A	Class B	Class C	Class D	Class E	Totals	% with bottom line (C & D)
A – 1943	3	10	0	8	1	22	36%
A – 1963	2	9	1	9	1	22	44%
A – 1983	0	7	0	12	3	22	55%
Totals	5	26	1	29	5	66	45%
B – 1963	1	17	1	1	2	22	9.0%
B – 1983	0	17	0	1	4	22	4.5%
Totals	1	34	1	2	6	44	6.8%

authors then went on to indicate their principal findings, and in 1 case (Class C) did so directly without bridging previous research and present findings via a Move 4 statement (see example 9 above). Table 1 also shows that statements of results/findings have slowly but steadily become more common over the last forty years, reaching 55% in 1983. However, the relatively small sample size would suggest that further investigations will be needed before we can reach any firm conclusions about such a trend.

The figures for the *Journal of Educational Psychology* are highly contrasting, for there were only three APFs (a disclosure rate of 6.8% as opposed to 45%), and one of these is of a highly generalized nature:

(10) Thus, the present study corrects many of the methodological and interpretive pitfalls of previous studies of cross-racial ability patterns. (end of introduction) (*JEP*, 83)

In fact, many of the introductions are quite long, especially in the 1983 sample, and there is consequently much cyclic working through of Move 2–3–4 sequences. Nevertheless, the manifold opportunities to announce results are consistently declined. On occasion, this has given rise to the rhetorically curious situation of the authors referring to their results as if they had been given, when in fact they have not been indicated:

(11) The major objective of the study was to develop and test the effects of a brief curriculum of special preparation for the analytical portion of the GRE Aptitude Test to assess the susceptibility of three analytical item types to short-term intervention designed to improve performance on the item types. The results were intended to aid decisions about the composition of the analytical section of the test when it becomes fully operational. (end of introduction) (*JEP*, 83)

It is customary to classify abstracts as either indicative or informative. *Indicative abstracts* are commonly defined as those containing information on purpose, scope, and methodology, but not on results or conclusions. *Informative abstracts*

the other hand, are expected to include those final two elements (Cremmins, 1982). The psychologists in the sample we have examined seem to have a decided preference for *indicative* introductions.

Discussion

The corpus study described in the previous section raises a number of issues. An obvious one is the apparent mismatch between advice in the appropriate manuals and actual practice. The guide for physics researchers makes no mention of either the necessity or the suitability of indicating results at introduction close, and yet it would seem to be an increasingly common practice for *Physical Review* articles to contain such indications. On the other hand, Mullins's claims that in the social and behavioral sciences indicating main findings is "optional but common." Our study of the *Journal of Educational Psychology* shows that an APF is certainly optional but equally certainly is by no means common (with three occurrences out of a possible total of 44). In fact, Mullins's observation about "optional but common" would seem to fit the physic's data well, but not the data from Mullins's designated area. It might therefore be concluded that many of the style manuals are descriptively inaccurate in terms of the rhetorical feature discussed in this article. As applied linguists we would certainly wish to advocate the continual interaction of description and prescription, for without ongoing descriptive analysis of rhetorical trends, prescriptions can become otiose and obsolete. The authority that accrues to generalizations derived from the study of actual texts might in turn lend sufficient credence to style guides for them to be "honored more in the observance than in the breach" by authors and their editorial gatekeepers.

A second issue concerns the disparity between the two sets of data and its possible causes. The two journal samples clearly differ in the degree of APFs in introductions; and, given that this difference is equally clearly not a direct consequence of the instructions given to the authors, then, in the absence of contrary evidence, it is at least possible that the difference is also one of discipline. Why should this be? Why should half the physicists opt for a third mention of principal findings (abstract, results, *and* introduction) while virtually none of the psychologists did so? It is conceivable that the physicists' succinct, verbal announcements are not seen, within that discourse community, as actually constituting results, given the highly quantitative nature of physics. On the other hand, the psychologists may feel that the nature of their results makes it rhetorically unwise to give their readers early access to them. Some evidence for this kind of interpretation derives from the fact that many of the educational psychology introductions followed the promissory statement – typically of the hypothesis to be investigated – with an introduction final sentence or sentences that dealt not with results but with *method*. However, a text-based study such as this has interpretive limitations once the discourse analysis and the comparison between description and prescription has been completed. A fuller explanation of the phenomena reported would seem to require some seeking out of the beliefs and judgmental processes of those concerned with the research writing process – authors, editors, *and* manual writers.

Notes

1. The point we wish to emphasize at this juncture is that these two models remain in fairly close agreement with regard to the number and boundaries of rhetorical subsections or "moves" required to account for a typical type of short research article introduction (longer introductions are usually more rhetorically complex and often contain cyclic iterations of subsection sequences). The difference essentially resides in the evaluation and interpretation of subsections, which then becomes manifest in a difference between the attached glosses and labels. Although a resolution of this disagreement lies outside the scope of this article, it is worth observing that we may need both kinds of metaphorical caricature in order to capture the general movement of the arduously crafted introductory sections of research articles. We may need to account for both description and persuasion, for both reportage and promotion, for cool, logical textual surfaces as well as ego- and group-centric subtexts. Indeed, it is likely that this dual approach will be useful irrespective of whether the investigator is a sociologist of knowledge, a discourse analyst, a rhetorician, or – as many of the authors already cited – an individual in some way concerned with the teaching of technical and research communication to either native or nonnative speakers of English.
2. However, it is now necessary to point out that 10 out of the 110 introductions opened with a Move 4-type "introducing present research" statement. Although *prima facie* this finding might seem to disconfirm the viability of the Zappen and Swales models, we would argue that an anomaly percentage of under 10% is perfectly acceptable in discoursal and textual studies. Even more than syntax, discourse is a study of propensities and predilections. Discourse "rules" are generalizations that are permeable to exceptions, rather than laws falsified by a single counterinstance. If in Sapir's famous phrase, "all grammars leak," so all the more should we expect to find leakage, deviance, and creativity in the information structures of discourse, even when the analysis is restricted to conventionalized and well-established genres. Initially we noted that *fronted* fourth moves were somewhat more common in *JEP* than PR (6 out of 10 in 40% of the corpus). Subsequently, we investigated the possibility that authors might opt to introduce their own research at the beginning if the introductory section was to be lengthy and complex in an effort to provide a focus for a discursive survey both of previous research and of various kinds of issues. To some extent this is true, at least in the sense that 4 of the 6 *JEP* "4-fronted" introductions are more than 800 words long. However, one of these 6 introductions is but 130 words in length. On the other hand, the positioning of Move 4 does not bear directly on the topic of this article for it is clear that the researcher has ultimately the same opportunity for inserting an announcement of principal findings, irrespective of whether he or she opens the introduction by referring to the present research or (pre)closes it in this way.

The Relativity of Linguistic Strategies: Rethinking Power and Solidarity in Gender and Dominance

Deborah Tannen

Introduction

In analyzing discourse, many researchers operate on the unstated assumption that all speakers proceed along similar lines of interpretation, so a particular example of discourse can be taken to represent how discourse works for all speakers. For some aspects of discourse, this is undoubtedly true. Yet a large body of sociolinguistic literature makes clear that, for many aspects of discourse, this is so only to the extent that cultural background is shared. To the extent that cultural backgrounds differ, lines of interpretation and habitual use of many linguistic strategies are likely to diverge. One thinks immediately and minimally of the work of Gumperz (1982), Erickson and Shultz (1982), Scollon and Scollon (1981), and Philips (1983). My own research shows that cultural difference is not limited to the gross and apparent levels of country of origin and native language, but also exists at the subcultural levels of ethnic heritage, class, geographic region, age, and gender. My earlier work (Tannen 1984, 1986) focuses on ethnic and regional style; my most recent work (Tannen 1990) focuses on gender-related stylistic variation. I draw on this work here to demonstrate that specific linguistic strategies have widely divergent potential meanings.[1]

This insight is particularly significant for research on language and gender, much of which has sought to describe the linguistic means by which men dominate women in interaction. That men dominate women is not in question; what I am problematizing is the source and workings of domination and other interpersonal intentions and effects. I will show that one cannot locate the source of

Source: Deborah Tannen, *Gender and Discourse*, 1994, pp. 19–52.

domination, or of any interpersonal intention or effect, in linguistic strategies such as interruption, volubility, silence, and topic raising, as has been claimed. Similarly, one cannot locate the source of women's powerlessness in such linguistic strategies as indirectness, taciturnity, silence, and tag questions, as has also been claimed. The reason one cannot do this is that the same linguistic means can be used for different, even opposite, purposes and can have different, even opposite, effects in different contexts. Thus, a strategy that seems, or is, intended to dominate may in another context or in the mouth of another speaker be intended or used to establish connection. Similarly, a strategy that seems, or is, intended to create connection can in another context or in the mouth of another speaker be intended or used to establish dominance.

Put another way, the "true" intention or motive of any utterance cannot be determined from examination of linguistic form alone. For one thing, intentions and effects are not identical. For another, as the sociolinguistic literature has dramatized repeatedly (see especially McDermott and Tylbor 1983; Schegloff 1982, 1988; Erickson 1986; Duranti and Brenneis 1986), human interaction is a "joint production": everything that occurs results from the interaction of all participants. The source of the ambiguity and polysemy of linguistic strategies that I will explore here is the paradoxical relationship between the dynamics of power and solidarity.

Overview of the Chapter

In this chapter I first briefly explain the theoretical paradigm of power and solidarity. Then I show that linguistic strategies are potentially ambiguous (they could "mean" either power or solidarity) and polysemous (they could "mean" both). Third, I reexamine and expand the power and solidarity framework in light of cross-cultural research. Finally, I demonstrate the relativity of five linguistic strategies: indirectness, interruption, silence versus volubility, topic raising, and adversativeness (that is, verbal conflict).

Theoretical Background

Power and Solidarity

Since Brown and Gilman's (1960) introduction of the concept and subsequent elaborations of it, especially those of Friedrich (1972) and Brown and Levinson ([1978]1987), the dynamics of power and solidarity have been fundamental to sociolinguistic theory. (Fasold [1990] provides an overview.) Brown and Gilman based their framework on analysis of the use of pronouns in European languages which have two forms of the second person pronoun, such as the French *tu* and *vous*. In English the closest parallel is to be found in forms of address: first name versus title–last name. In Brown and Gilman's system, power is associated with nonreciprocal use of pronouns; in English the parallel would be a situation

in which one speaker addresses the other by first name but is addressed by title – last name (for example, doctor and patient, teacher and student, boss and secretary, building resident and elevator operator). Solidarity is associated with reciprocal pronoun use or symmetrical forms of address: both speakers address each other by *tu* or by *vous* (in English, by title – last name or by first name). Power governs asymmetrical relationships where one is subordinate to another; solidarity governs symmetrical relationships characterized by social equality and similarity.

In my previous work exploring the relationship between power and solidarity as it emerges in conversational discourse (Tannen 1984, 1986), I note that power and solidarity are in paradoxical relation to each other. That is, although power and solidarity, closeness and distance, seem at first to be opposites, each also entails the other. Any show of solidarity necessarily entails power, in that the requirement of similarity and closeness limits freedom and independence. At the same time, any show of power entails solidarity by involving participants in relation to each other. This creates a closeness that can be contrasted with the distance of individuals who have no relation to each other at all.

In Brown and Gilman's paradigm, the key to power is asymmetry, but it is often thought to be formality. This is seen in the following anecdote. I once entitled a lecture "The Paradox of Power and Solidarity." The respondent to my talk appeared wearing a three-piece suit and a knapsack on his back. The audience was amused by the association of the suit with power, the knapsack with solidarity. There was something immediately recognizable in this semiotic. Indeed, a professor wearing a knapsack might well mark solidarity with students at, for example, a protest demonstration. And wearing a three-piece suit to the demonstration might mark power by differentiating the wearer from the demonstrators, perhaps even reminding them of his dominant position in the institutional hierarchy. But wearing a three-piece suit to the board meeting of a corporation would mark solidarity with other board members, whereas wearing a knapsack in that setting would connote not solidarity but disrespect, a move in the power dynamic.

The Ambiguity of Linguistic Strategies

As the preceding example shows, the same symbol – a three-piece suit – can signal either power or solidarity, depending on, at least, the setting (for example, a board meeting or student demonstration), the habitual dress style of the individual, and the comparison of his clothing with that worn by others in the interaction. (I say "his" intentionally; the range of meanings would be quite different if a man's three-piece suit were worn by a woman.) This provides an analogue to the ambiguity of linguistic strategies, which are signals in the semiotic system of language. As I have demonstrated at length in previous books (see especially Tannen 1984, 1986, 1990), all linguistic strategies are potentially ambiguous. The power–solidarity dynamic is one fundamental source of ambiguity. What appear as attempts to dominate a conversation (an exercise of power) may actually be intended to establish rapport (an exercise of solidarity). This occurs

because (as I have worded it elsewhere) power and solidarity are bought with the same currency: The same linguistic means can be used to create either or both.

This ambiguity can be seen in the following fleeting conversation. Two women were walking together from one building to another in order to attend a meeting. They were joined by a man they both knew who had just exited a third building on his way to the same meeting. One of the women greeted the man and remarked, "Where's your coat?" The man responded, "Thanks, Mom." His response framed the woman's remark as a gambit in a power exchange: a mother tells a child to put on his coat. Yet the woman might have intended the remark as showing friendly concern rather than parental caretaking. Was it power (condescending, on the model of parent to child) or solidarity (friendly, on the model of intimate peers)? Though the man's uptake is clear, the woman's intention in making the remark is not.

Another example comes from a letter written to me by a reader of *You Just Don't Understand: Women and Men in Conversation.* A woman was at home when her partner arrived and announced that his archrival had invited him to contribute a chapter to a book. The woman remarked cheerfully how nice it was that the rival was initiating a rapprochement by including her partner in his book. He told her she had got it wrong: because the rival would be the editor and he merely a contributor, the rival was actually trying to solidify his dominance. She interpreted the invitation in terms of solidarity. He interpreted it as an expression of power. Which was right? I don't know. The invitation was ambiguous; it could have "meant" either. I suspect it had elements of both. In other words, it was polysemous.

The Polysemy of Power and Solidarity

If ambiguity denotes meaning one thing *or* another, polysemy denotes meaning one thing *and* another – that is, having multiple meanings simultaneously. The question "Where's your coat?" shows friendly concern *and* suggests a parent–child constellation. The invitation to contribute a chapter to a book brings editor and contributor closer *and* suggests a hierarchical relationship.

One more example will illustrate the polysemy of strategies signaling power and solidarity. If you have a friend who repeatedly picks up the check when you dine together, is she being generous and sharing her wealth, or is she trying to flaunt her money and remind you that she has more of it than you? Although the intention may be to make you feel good by her generosity, her repeated generosity may nonetheless make you feel bad by reminding you that she has more money. Thus, both of you are caught in the web of the ambiguity of power and solidarity. It is impossible to determine which was her real motive, and whether it justifies your response. On the other hand, even if you believe her motive was purely generous, you may nonetheless feel denigrated by her generosity because the fact that she has this generous impulse is evidence that she has more money than you, and her expressing the impulse reminds you of it. In other words, both interpretations exist at once: solidarity (she is paying to be nice) and power (her being nice in this way reminds you that she is richer)

In this sense, the strategy is not just ambiguous with regard to power and solidarity but polysemous. This polysemy explains another observation that initially surprised me: Paules (1991) reports that waitresses in the restaurant where she did ethnographic field work were offended not only by tips that were too small, but also by tips that were too large. The customers' inordinate beneficence implies that the amount of money left is insignificant to the tipper but significant to the waitress.

Brown and Gilman are explicit in their assumption that power is associated with asymmetrical relationships in which the power is held by the person in the one-up position. This is stated in their definition:

> One person may be said to have power over another to the degree that he is able to control the behavior of the other. Power is a relationship between at least two persons, and it is non-reciprocal in the sense that both cannot have power in the same area of behavior. (255)

I have called attention, however, to the extent to which solidarity in itself can be a form of control. For example, a young woman complained about friends who "don't let you be different." If the friend says she has a particular problem and the woman says, "I don't have that problem," her friend is hurt and accuses her of putting her down, of acting superior. The assumption of similarity requires the friend to have a matching problem.[2]

Furthermore, although Brown and Gilman acknowledge that "power superiors may be solidary (parents, elder siblings)" and "power inferiors, similarly, may be as solidary as the old family retainer" (258), most Americans are inclined to assume that solidarity implies closeness, whereas power implies distance.[3] Thus Americans regard the sibling relationship as the ultimate in solidarity: "sister" or "brother" are often used metaphorically to indicate closeness and equality.[4] In contrast, it is often assumed that hierarchy precludes closeness: employers and employees cannot "really" be friends. But being linked in a hierarchy necessarily brings individuals closer. This is an assumption underlying Watanabe's (1993) observation, in comparing American and Japanese group discussions, that whereas the Americans in her study saw themselves as individuals participating in a joint activity, the Japanese saw themselves as members of a group united by hierarchy. When reading Watanabe, I was caught up short by the term "united." My inclination had been to assume that hierarchy is distancing, not uniting.

The anthropological literature includes numerous discussions of cultural contexts in which hierarchical relationships are seen as close and mutually, not unilaterally, empowering. For example, Beeman (1986) describes an Iranian interactional pattern he dubs "getting the lower hand." Taking the lower-status position enables an Iranian to invoke a protector schema by which the higher-status person is obligated to do things for him or her. Similarly, Yamada (1992) describes the Japanese relationship of *amae*, typified by the parent–child or employer–employee constellation. It binds two individuals in a hierarchical interdependence by which both have power in the form of obligations as well as rights vis-à-vis the other. Finally, Wolfowitz (1991) explains that respect/

power — solidarity
asymmetry — symmetry
hierarchy — equality
distance — closeness

Figure 1: Unidimensional model

deference is experienced by Suriname Javanese not as subservience but as an assertion of claims.

The Suriname Javanese example is particularly intriguing because it calls into question the association of asymmetry with power and distance. The style Wolfowitz calls respect politeness is characterized by both social closeness and negative politeness.[5] It is hierarchical insofar as it is directional and unequal; however, the criterion for directionality is not status but age. The prototypical relationship characterized by respect politeness is grandchild–grandparent: a relationship that is both highly unequal and very close. Moreover, according to Wolfowitz, the Javanese assume that familial relations are inherently hierarchical, including age-graded siblings. Equality, in contrast, is associated with formal relationships that are also marked by social distance.

We can display these dynamics in the following way. The model that reflects American assumptions conceptualizes power and solidarity as opposite ends of a single continuum simultaneously representing symmetry/asymmetry, hierarchy/equality, and distance/closeness. (See Figure 1.) In contrast, the cross-cultural perspective suggests a multidimensional grid of at least (and, potentially and probably, more) intersecting continua. The closeness/distance dimension can be placed on one axis and the hierarchy/equality one on another. (See Figure 2.)

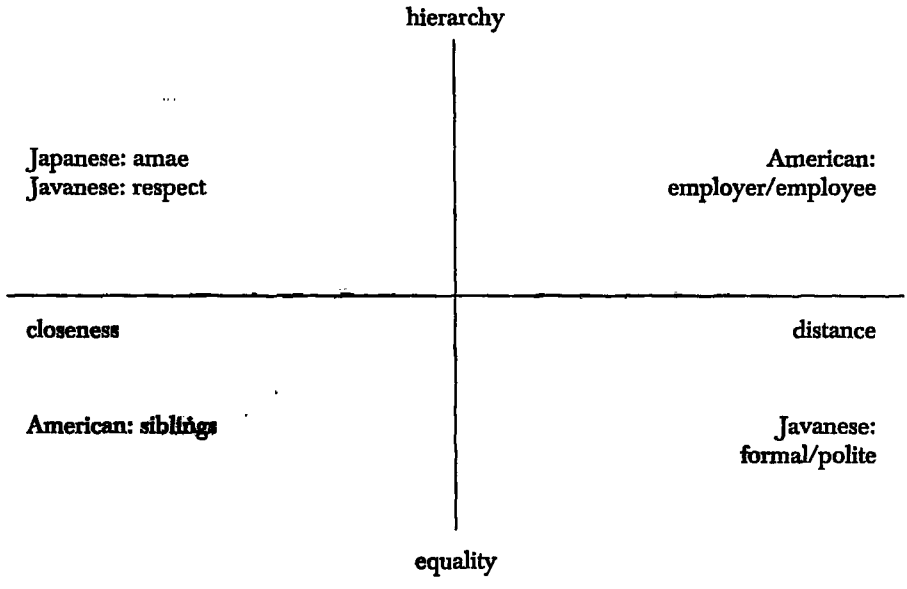

Figure 2: Multidimensional model

Indeed, the intersection of these dimensions – that is, the co-incidence of hierarchy and closeness – may account, at least in part, for what I am calling the ambiguity and polysemy of power and solidarity.

Similarity/Difference

There is one more aspect of the dynamics of power and solidarity that bears discussion before I demonstrate the relativity of linguistic strategies. That is the similarity/difference continuum and its relation to the other dynamics discussed.

For Brown and Gilman, solidarity implies sameness, in contrast to power, about which they observe, "In general terms, the *V* form is linked with differences between persons" (256). This is explicit in their definition of "the solidarity semantic":

> Now we are concerned with a new set of relations which are symmetrical; for example, *attended the same school* or *have the same parents* or *practice the same profession.* If A has the same parents as B, B has the same parents as A. Solidarity is the name we give to the general relationship and solidarity is symmetrical. (257; italics in original)

The similarity/difference continuum calls to mind what I have discussed elsewhere (Tannen 1984, 1986) as the double bind of communication.[6] In some ways, we are all the same. But in other ways we are all different. Communication is a double bind in the sense that anything we say to honor our similarity violates our difference, and anything we say to honor our difference violates our sameness. Thus a complaint can be lodged: "Don't think I'm different." ("If you prick me, do I not bleed?" one might protest, like Shylock.) But a complaint can also be lodged: "Don't think I'm the same." (Thus, women who have primary responsibility for the care of small children may be effectively excluded from activities and events at which day care is not provided.) Becker (1982:125) expresses this double bind as "a matter of continual self-correction between exuberance (that is, friendliness: you are like me) and deficiency (that is, respect: you are not me)." All these formulations elaborate on the tension between similarity and difference, or what Becker and Oka (1974) call "the cline of person," a semantic dimension they suggest may be the one most basic to language; that is, one deals with the world and the objects and people in it in terms of how close (and, I would add, similar) they are to oneself.

As a result of these dynamics, similarity is a threat to hierarchy. This is dramatized in Harold Pinter's play *Mountain Language.* Composed of four brief scenes, the play is set in a political prison in the capital city of an unnamed country that is under dictatorial siege. In the second scene, an old mountain woman is finally allowed to visit her son across a table as a guard stands over them. But whenever she tries to speak to her son, the guard silences her, telling the prisoner to tell his mother that it is forbidden to speak their mountain language in the capital. Then he continues: (Spaced dots indicate omitted text; unspaced dots are a form of punctuation included in the original text.)

GUARD

. . . And I'll tell you another thing. I've got a wife and three kids. And you're all a pile of shit.
Silence.

PRISONER

I've got a wife and three kids.

GUARD

You've what?
Silence.
You've got what?
Silence.
What did you say to me? You've got what?
Silence.
You've got *what?*
He picks up the telephone and dials one digit.
Sergeant? I'm in the Blue Room . . . yes . . . I thought I should report, Sergeant . . . I think I've got a joker in here.

The Sergeant soon enters and asks, "What joker?" The stage darkens and the scene ends. The final scene opens on the same setting, with the prisoner bloody and shaking, his mother shocked into speechlessness.

The prisoner was beaten for saying, "I've got a wife and three kids." This quotidian statement, which would be unremarkable in casual conversation, was insubordinate in the hierarchical context of brutal oppression because the guard had just made the same statement. When the guard said, "I've got a wife and three kids. And you're a pile of shit," he was claiming, "I am different from you." One could further interpret his words to imply, "I'm human, and you're not. Therefore I have a right to dominate and abuse you." By repeating the guard's words verbatim, the prisoner was then saying, "I am the same as you."[7] By claiming *his* humanity and implicitly denying the guard's assertion that he is "a pile of shit," the prisoner challenged the guard's right to dominate him.[8] Similarity is antithetical to hierarchy.

The ambiguity of closeness, a spatial metaphor representing similarity or involvement, emerges in a nonverbal aspect of this scene. In the performance I saw, the guard moved steadily closer to the prisoner as he repeated the question "You've got what?" until he was bending over him, nose to nose. The guard's moving closer was a kinesic/proxemic analogue to the prisoner's statement, but with opposite effect: he was "closing in." The guard moved closer and brought his face into contact with the prisoner's not as a sign of affection (which such actions could signify in another context) but as a threat. Closeness, then, can mean aggression rather than affiliation in the context of a hierarchical rather than symmetrical relationship.

The Relativity of Linguistic Strategies

The potential ambiguity of linguistic strategies to mark both power and solidarity in face-to-face interaction has made mischief in language [illegible]

wherein it is tempting to assume that whatever women do results from, or creates, their powerlessness and whatever men do results from, or creates, their dominance. But all the linguistic strategies that have been taken by analysts as evidence of subordination can in some circumstances be instruments of affiliation. For the remainder of this chapter I demonstrate the relativity of linguistic strategies by considering each of the following strategies in turn: indirectness, interruption, silence versus volubility, topic raising, and adversativeness or verbal conflict. All of these strategies have been "found" by researchers to express or create dominance or subordination. I will demonstrate that they are ambiguous or polysemous with regard to dominance/subordination (that is, power) or distance/closeness (that is, solidarity). Once again, I am not arguing that these strategies *cannot* be used to create dominance or powerlessness, much less that dominance and powerlessness do not exist. Rather, my purpose is to demonstrate that the "meaning" of any linguistic strategy can vary, depending at least on context, the conversational styles of participants, and the interaction of participants' styles and strategies. Therefore the operation of specific linguistic strategies must be studied more closely to understand how dominance and powerlessness are expressed and created in interaction.

Indirectness

Lakoff (1975) identifies two benefits of indirectness: defensiveness and rapport. Defensiveness refers to a speaker's preference not to go on record with an idea in order to be able to disclaim, rescind, or modify it if it does not meet with a positive response. The rapport benefit of indirectness results from the pleasant experience of getting one's way not because one demanded it (power) but because the other person wanted the same thing (solidarity). Many researchers have focused on the defensive or power benefit of indirectness and ignored the payoff in rapport or solidarity.

The claim by Conley, O'Barr, and Lind (1979) that women's language is really powerless language has been particularly influential. In this view, women's tendency to be indirect is taken as evidence that women don't feel entitled to make demands. Surely there are cases in which this is true. Yet it can also be demonstrated that those who feel entitled to make demands may prefer not to, seeking the payoff in rapport. Furthermore, the ability to get one's demands met without expressing them directly can be a sign of power rather than of the lack of it. An example I have used elsewhere is the Greek father who answers, "If you want, you can go," to his daughter's inquiry about going to a party. Because of the lack of enthusiasm of his response, the Greek daughter understands that her father would prefer she not go and "chooses" not to go. (A "real" approval would have been "Yes, of course, you should go.") I argue that this father did not feel powerless to give his daughter orders. Rather, a communicative system was conventionalized by which he and she could both preserve the appearance, and possibly the belief, that she chose not to go rather than simply obeying his command.

Far from being powerless, this father felt so powerful that he did not need to give his daughter orders; he simply needed to let her know his preference, and she would accommodate to it. By this reasoning, indirectness is a prerogative of the powerful. By the same reasoning a master who says, "It's cold in here," may expect a servant to make a move to close a window, but a servant who says the same thing is not likely to see his employer rise to correct the situation and make him more comfortable. Indeed, a Frenchman who was raised in Brittany tells me that his family never gave bald commands to their servants but always communicated orders in indirect and highly polite form. This pattern renders less surprising the finding of Bellinger and Gleason (1982, reported in Gleason 1987) that fathers' speech to their young children had a higher incidence than mothers' of both direct imperatives (such as "Turn the bolt with the wrench") *and* implied indirect imperatives (for example, "The wheel is going to fall off").

The use of indirectness can hardly be understood without the cross-cultural perspective. Many Americans find it self-evident that directness is logical and aligned with power whereas indirectness is akin to dishonesty as well as subservience. But for speakers raised in most of the world's cultures, varieties of indirectness are the norm in communication. In Japanese interaction, for example, it is well known that saying "no" is considered too face-threatening to risk, so negative responses are phrased as positive ones: one never says "no," but listeners understand from the form of the "yes" whether it is truly a "yes" or a polite "no."

The American tendency to associate indirectness with female style is not culturally universal. The above description of typical Japanese style operates for men as well as women. My own research (Tannen 1981, 1984, 1986) suggests that Americans of some cultural and geographic backgrounds, female as well as male, are more likely than others to use relatively direct rather than indirect styles. In an early study I compared Greeks and Americans with regard to their tendency to interpret a question as an indirect means of making a request. I found that whereas American women were more likely to take an indirect interpretation of a sample conversation, Greek men were as likely as Greek women, and more likely than American men *or women*, to take an indirect interpretation. Greek men, of course, are not less powerful vis-à-vis women than American men.

Perhaps most striking is the finding of Keenan (1974) that in a Malagasy-speaking village on the island of Madagascar, women are seen as direct and men as indirect. But this in no way implies that the women are more powerful than men in this society. Quite the contrary, Malagasy men are socially dominant, and their indirect style is more highly valued. Keenan found that women were widely believed to debase the language with their artless directness, whereas men's elaborate indirectness was widely admired.

Indirectness, then, is not in itself a strategy of subordination. Rather, it can be used either by the powerful or the powerless. The interpretation of a given utterance, and the likely response to it, depends on the setting, on individuals' status and their relationship to each other, and also on the linguistic conventions that are ritualized in the cultural context.

Interruption

That interruption is a sign of dominance has been as widespread an assumption in research as in conventional wisdom. One rarely encounters an article on gender and language that does not make this claim. Most frequently cited is West and Zimmerman's (1983) finding that men dominate women by interrupting them in conversation. Tellingly, however, Deborah James and Sandra Clarke (1993), reviewing research on gender and interruption, do not find a clear pattern of males interrupting females. Especially significant is their observation that studies comparing amount of interruption in all-female versus all-male conversations find more interruption, not less, in all-female groups. Though initially surprising, this finding reinforces the need to distinguish linguistic strategies by their interactional purpose. Does the overlap show support for the speaker, or does it contradict or change the topic? I explore this phenomenon in detail in chapter 2 of *Gender and Discourse* (1994), but I will include a brief summary of the argument here.

The phenomenon commonly referred to as "interruption," but which is more accurately referred to as "overlap," is a paradigm case of the ambiguity of power and solidarity. This is clearly demonstrated with reference to a two-and-a-half-hour Thanksgiving dinner conversation that I analyzed at length (Tannen 1984). My analysis makes clear that some speakers consider talking along with another to be a show of enthusiastic participation in the conversation, of solidarity, creating connections; others, however, assume that only one voice should be heard at a time, so for them any overlap is an interruption, an attempt to wrest the floor, a power play. The result, in the conversation I analyzed, was that enthusiastic listeners who overlapped cooperatively, talking along to establish rapport, were perceived by overlap-resistant speakers as interrupting. This doubtless contributed to the impression reported by the overlap-resistant speakers that the cooperative overlappers had "dominated" the conversation. Indeed, the tape and transcript also give the impression that the cooperative overlappers had dominated, because the overlap-aversant participants tended to stop speaking as soon as another voice began.

It is worth emphasizing the role of symmetry, or balance, in determining whether an overlap becomes an interruption in the negative or power-laden sense. If one speaker repeatedly overlaps and another repeatedly gives way, the resulting communication is unbalanced, or asymmetrical, and the effect (though not necessarily the intent) is domination. But if both speakers avoid overlap, or if both speakers overlap each other and win out equally, there is symmetry and no domination, regardless of speakers' intentions. In an important sense, though – and this will be discussed in the last section under the rubric of adversativeness – the very engagement in a symmetrical struggle for the floor can be experienced as creating rapport, in the spirit of ritual opposition analogous to sports. Further, an imbalance can result from differences in the purpose for which overlap is used. If one speaker tends to talk along in order to show support, and the other chimes in to take the floor, the floor-taking overlapper will tend to dominate.

Thus, to understand whether an overlap is an interruption, one must consider the context (for example, cooperative overlapping is more likely to occur in casual conversation among friends than in a job interview), speakers' habitual styles (for example, overlaps are more likely not to be interruptions among those with a style I call "high involvement"), and the interaction of their styles (for example, an interruption is more likely to occur between speakers whose styles differ with regard to pausing and overlap). This is not to say that one cannot use interruption to dominate a conversation or a person, but only that it is not self-evident from the observation of overlap that an interruption has occurred, was intended, or was intended to dominate.

Silence versus Volubility

The excerpt from Pinter's *Mountain Language* dramatizes the assumption that powerful people do the talking and powerless people are silenced. This is the trope that underlies the play's title and its central theme: By outlawing their language, the oppressors silence the mountain people, robbing them of their ability to speak and hence of their humanity. In the same spirit, many scholars (for example, Spender 1980) have claimed that men dominate women by silencing them. There are obviously circumstances in which this is accurate. Coates (1986) notes numerous proverbs that instruct women, like children, to be silent.

Silence alone, however, is not a self-evident sign of powerlessness, nor volubility a self-evident sign of domination. A theme running through Komarovsky's (1962) classic study of *Blue-Collar Marriage* is that many of the wives interviewed said they talked more than their husbands: "He's tongue-tied," one woman said (13); "My husband has a great habit of not talking," said another (162); "He doesn't say much but he means what he says and the children mind him," said a third (353). Yet there is no question but that these husbands are dominant in their marriages, as the last of these quotes indicates.

Indeed, taciturnity itself can be an instrument of power. This is precisely the claim of Sattel (1983), who argues that men use silence to exercise power over women. Sattel illustrates with a scene from Erica Jong's novel *Fear of Flying*, only a brief part of which is presented here. The first line of dialogue is spoken by Isadora, the second by her husband, Bennett. (Spaced dots indicate omitted text; unspaced dots are a form of punctuation included in the original text.)

"Why do you turn on me? What did I do?"
Silence.
"What did I do?"
He looks at her as if her not knowing were another injury.
"Look, let's just go to sleep now. Let's just forget it."
"Forget what?"
He says nothing.

. . .

"It was something in the movie, wasn't it?"
"What, in the movie?"

". . . It was the funeral scene . . . . The little boy looking at his dead mother. Something got you there. That was when you got depressed."
Silence.
"Well, *wasn't* it?"
Silence.
"Oh come on, Bennett, you're making me *furious*. Please tell me. Please."

The painful scene continues in this vein until Bennett tries to leave the room and Isadora tries to detain him. The excerpt certainly seems to support Sattel's claim that Bennett's silence subjugates his wife, as the scene ends with her literally lowered to the floor, clinging to his pajama leg. But the reason his silence is an effective weapon is her insistence that he tell her what's wrong. If *she* receded into silence, leaving the room or refusing to talk to him, his silence would be disarmed. The devastation results not from his silence alone but from the interaction of his silence and her insistence on talking, in other words, the interaction of their differing styles.[9]

Researchers have counted numbers of words spoken or timed length of talk in order to demonstrate that men talk more than women and thereby dominate interactions. (See James and Drakich 1993 for a summary of research on amount of talk.) Undoubtedly there is truth to this observation in some settings. But the association of volubility with dominance does not hold for all settings and all cultures. Imagine, for example, an interrogation, in which the interrogator does little of the talking but holds all the power.

The relativity of the "meaning" of taciturnity and volubility is highlighted in Margaret Mead's (1977) discussion of "end linkage," a concept developed jointly by Mead, Gregory Bateson, and Geoffrey Gorer. The claim is that universal and biologically constructed relationships, such as parent–child, are linked to different behaviors in different cultures. One of their paradigm examples is the apportionment of spectatorship and exhibitionism. In middle-class American culture, children, who are obviously the weaker party in the constellation, are expected to exhibit while their more powerful parents are spectators. (Consider, for example, the American child who is prompted to demonstrate how well s/he can recite the alphabet for guests.) In contrast, in middle- and upper-class British culture, exhibition is associated with the parental role and spectatorship with children, who are expected to be seen and not heard.

Moreover, volubility and taciturnity, too, can result from style differences rather than speakers' intentions. As I (Tannen 1984, 1985) and others (Scollon and Scollon 1981, Scollon 1985) have discussed, there are cultural and subcultural differences in the length of pauses expected between and within speaking turns. In my study of the dinner conversation, those who expected shorter pauses between conversational turns began to feel an uncomfortable silence ensuing while their longer-pausing friends were simply waiting for what they regarded as the "normal" end-of-turn pause. The result was that the shorter pausers ended up doing most of the talking, another sign interpreted by their interlocutors as dominating the conversation. But their intentions had been to fill in what to

them were potentially uncomfortable silences, that is, to grease the conversational wheels and ensure the success of the conversation. In their view, the taciturn participants were uncooperative, failing to do their part to maintain the conversation.

Thus, silence and volubility cannot always be taken to "mean" power or powerlessness, domination or subjugation. Rather, both may imply either power or solidarity, depending on the dynamics discussed.

Topic Raising

Shuy (1982) is typical in assuming that the speaker who raises the most topics is dominating a conversation. However, in a study I conducted of videotaped conversations among friends of varying ages recorded by Dorval (1990), it emerged that the speaker who raised the most topics was not always dominant, as judged by other criteria (for example, who took the lead in addressing the investigator when he entered the room?). In a 20-minute conversation between a pair of sixth-grade girls who identified themselves as best friends, Shannon raised the topic of Julia's relationship with Mary by saying, "Too bad you and Mary are not good friends anymore." The conversation proceeded and continued to focus almost exclusively on Julia's troubled relationship with Mary.

Similarly, most of the conversation between two tenth-grade girls was about Nancy, but Sally raised the topic of Nancy's problems. In response to Nancy's question "Well, what do you want to talk about?" Sally said, "Your mama. Did you talk to your mama?" The ensuing conversation focuses on events involving Nancy's mother and boyfriend. Overall, Sally raised nine topics, Nancy seven. However, all but one of the topics Sally raised were questions focused on Nancy. If raising more topics is a sign of dominance, Sally controlled the conversation when she raised topics, although even this was subject to Nancy's collaboration by picking them up. It may or may not be the case that Sally controlled the conversation, but the nature of her dominance is surely other than what is normally assumed by that term if the topics she raised were all about Nancy.

Finally, the effect of raising topics may also be an effect of differences in pacing and pausing, as discussed above with regard to my study of dinner-table conversation. A speaker who thinks the other has no more to say on a given topic may try to contribute to the conversation by raising another topic. But a speaker who was intending to say more and was simply waiting for the appropriate turn-exchange pause will feel that the floor was taken away and the topic aggressively switched. Yet again, the impression of dominance might result from style differences.

Adversativeness: Conflict and Verbal Aggression

Research on gender and language has consistently found male speakers to be competitive and more likely to engage in conflict (for example, by arguing, issuing commands, and taking opposing stands) and females to be cooperative and more likely to avoid conflict (for example, by agreeing, supporting, and making suggestions rather than commands). (Maltz and Borker [1982] summarize some of this research.) Ong (1981:51) argues that "adversativeness" is universal

but "conspicuous or expressed adversativeness is a larger element in the lives of males than of females."

In my analysis of videotapes of male and female friends talking to each other, I have begun to investigate how male adversativeness and female cooperation are played out, complicated, and contradicted in conversational discourse. In analyzing videotapes of friends talking, for example, I found a sixth-grade boy saying to his best friend,

> Seems like, if there's a fight, me and you are automatically in it. And everyone else wants to go against you and everything. It's hard to agree without someone saying something to you.

In contrast, girls of the same age (and also of most other ages whose talk I examined) spent a great deal of time discussing the dangers of anger and contention. In affirming their own friendship, one girl told her friend,

> Me and you never get in fights hardly,

and

> I mean like if I try to talk to you, you'll say, 'Talk to me!' And if you try to talk to me, I'll talk to you.

These examples of gendered styles of interaction are illuminated by the insight that power and solidarity are mutually evocative. As seen in the statement of the sixth-grade boy, opposing other boys in teams entails affiliation within the team. The most dramatic instance of male affiliation resulting from conflict with others is bonding among soldiers, a phenomenon explored by Norman (1990).

By the same token, girls' efforts to support their friends necessarily entail exclusion of or opposition to other girls. This emerges in Hughes' (1988) study of girls playing a street game called foursquare, in which four players occupy one square each and bounce a ball into each other's squares. The object of the game is to eliminate players by hitting the ball into their square in such a way that they fail to hit it back. But this effort to "get people out" is at odds with the social injunction under which the girls operate, to be "nice" and not "mean." Hughes found that the girls resolved the conflict, and formed "incipient teams" composed of friends, by claiming that their motivation in eliminating some players was to enable others (their friends) to enter the game, since eliminated players are replaced by awaiting players. In the girls' terms, "getting someone out" was "nice-mean," because it was reframed as "getting someone [a friend] in." This dynamic is also supported by my analysis of the sixth-grade girls' conversation: Most of their talk was devoted to allying themselves with each other in opposition to another girl who was not present. So their cooperation (solidarity) also entails opposition (power).

For boys power entails solidarity not only by opposition to another team, but by opposition to each other. In the videotapes of friends talking, I found that all the conversations between young boys (and none between young girls)

had numerous examples of teasing and mock attack.[10] In examining preschool conversations transcribed and analyzed by Corsaro and Rizzo (1990:34), I was amazed to discover that a fight could initiate rather than preclude friendship. In the following episode, a little boy intrudes on two others and an angry fight ensues. This is the way Corsaro and Rizzo present the dialogue:

> *Two boys (Richard and Denny) have been playing with a slinky on the stairway leading to the upstairs playhouse in the school. During their play two other boys (Joseph and Martin) enter and stand near the bottom of the stairs.*
> Denny: Go!
> (*Martin now runs off, but Joseph remains and he eventually moves halfway up the stairs.*)
> Joseph: These are big shoes.
> Richard: I'll punch him right in the eye.
> Joseph: I'll punch you right in the nose.
> Denny: I'll punch him with my big fist.
> Joseph: I'll-I-I-
> Richard: And he'll be bumpety, bumpety and punched out all the way down the stairs.
> Joseph: I-I- I'll- I could poke your eyes out with my gun. I have a gun.
> Denny: A gun! I'll- I- I- even if-
> Richard: I have a gun too.
> Denny: And I have guns too and it's bigger than yours and it poo-poo down. That's poo-poo.
> (*All three boys laugh at Denny's reference to poo-poo.*)
> Richard: Now leave.
> Joseph: Un-uh. I gonna tell you to put on- on the gun on your hair and the poop will come right out on his face.
> Denny: Well.
> Richard: Slinky will snap right on your face too.
> Denny: And my gun will snap right-

Up until this point I had no difficulty interpreting the interaction: The boys were engaged in a fight occasioned by Joseph's intrusion into Richard and Denny's play. But what happened next surprised and, at first, perplexed me. Corsaro and Rizzo describe it this way:

> At this point a girl (Debbie) enters, says she is Batgirl, and asks if they have seen Robin. Joseph says he is Robin, but she says she is looking for a different Robin and then runs off. After Debbie leaves, Denny and Richard move into the playhouse and Joseph follows. From this point to the end of the episode the three boys play together.

At first I was incredulous that so soon after their seemingly hostile encounter, the boys played amicably together. I finally came to the conclusion that for Joseph picking a fight was a way to enter into interaction with the other boys, and engaging him in the fight was Richard and Denny's way of accepting him into their interaction – at least after he acquitted himself satisfactorily in the

fight. In this light, I could see that the reference to poo-poo, which occasioned general laughter, was the beginning of a reframing from fighting to playing.[11]

Folklore provides numerous stories in which fighting precipitates friendship among men. One such is attributed by Bly (1990:243–44) to Joseph Campbell's account of the Sumerian epic, *Gilgamesh.* In Bly's rendition, Gilgamesh, a young king, wants to befriend a wild man named Enkidu. When Enkidu is told of Gilgamesh,

> his heart grew light. He yearned for a friend. "Very well!" he said. "And I shall challenge him."

Bly paraphrases the continuation: "Enkidu then travels to the city and meets Gilgamesh; the two wrestle, Enkidu wins, and the two become inseparable friends."[12]

A modern-day academic equivalent to the bonding that results from opposition is to be found in the situation of fruitful collaborations that began when an audience member publicly challenged a speaker after his talk. Finally, Penelope Eckert (personal communication) informs me that in her research on high school students (Eckert 1990) she was told by boys, but never by girls, that their close friendships began by fighting.

These examples call into question the correlation of aggression and power on one hand, and cooperation and solidarity on the other. Again the cross-cultural perspective provides an invaluable corrective to the temptation to align aggression with power as distinguished from solidarity. Many cultures of the world see arguing as a pleasurable sign of intimacy. Schiffrin (1984) shows that among lower-middle-class men *and women* of East European Jewish background, friendly argument is a means of being sociable. Frank (1988) shows a Jewish couple who tend to polarize and take argumentative positions, but they are not fighting; they are staging a kind of public sparring, where both fighters are on the same team. Byrnes (1986) claims that Germans find American students uninformed and uncommitted because they are reluctant to argue politics with new acquaintances. For their part, Americans find German students belligerent because they provoke arguments about American foreign policy with Americans they have just met.

Greek conversation provides an example of a cultural style that places more positive value, for both women and men, on dynamic opposition. Kakava (1989) replicates Schiffrin's findings by showing how a Greek family enjoy opposing each other in dinner conversation. In another study of modern Greek conversation, Tannen and Kakava (1992) find speakers routinely disagreeing when they actually agree, and using diminutive name forms and other terms of endearment – markers of closeness – precisely when they are opposing each other.[13] These patterns can be seen in the following excerpt from a conversation that took place in Greece between an older Greek woman and myself. The woman, whom I call Ms. Stella, has just told me that she complained to the police about a construction crew that illegally continued drilling and pounding through the siesta hours, disturbing her nap:

Deborah: Echete dikio.
Stella: Ego echo dikio. Kopella mou, den xero an echo dikio i den echo dikio. Alla ego yperaspizomai ta symferonta mou kai ta dikaiomata mou.
Deborah: You're right.
Stella: I am right. My dear girl, I don't know if I'm right or I'm not right. But I am watching out for my interests and my rights.

My response to Ms. Stella's complaint is to support her by agreeing. But she disagrees with my agreement by reframing my statement in her own terms rather than simply accepting it by stopping after "I *am* right." She also marks her divergence from my frame with the endearment "kopella mou" (literally, "my girl," but idiomatically closer to "my dear girl").

The following conversation is also taken from Tannen and Kakava (1992). It is, according to Kakava, typical of her family's sociable argument. The younger sister has said that she cannot understand why the attractive young woman who is the prime minister Papandreou's girlfriend would have an affair with such an old man. The older sister, Christina, argues that the woman may have felt that in having an affair with the prime minister she was doing something notable. Her sister replied,

Poly megalo timima re Christinaki na pliroseis pantos.
It's a very high price to pay, Chrissie, anyway.

I use the English diminutive form "Chrissie" to reflect the Greek diminutive ending *-aki,* but the particle *re* cannot really be translated; it is simply a marker of closeness that is typically used when disagreeing, as in the ubiquitously heard expression "Ochi, re" ("No, *re*").

Conclusion

The intersection of language and gender provides a rich site for analyzing how power and solidarity are created in discourse. But prior research in this area evidences the danger of linking linguistic forms with interactional intentions such as dominance. In trying to understand how speakers use language, we must consider the context (in every sense, including at least textual, relational, and institutional constraints), speakers' conversational styles, and, most crucially, the interaction of their styles with each other.

Attempts to understand what goes on between women and men in conversation are muddled by the ambiguity and polysemy of power and solidarity. The same linguistic means can accomplish either, and every utterance combines elements of both. Scholars, however, like individuals in interaction, are likely to see only one and not the other, like the picture that cannot be seen for what it is – simultaneously a chalice and two faces – but can only be seen alternately as one or the other. In attempting the impossible task of keeping both images in

focus at once, we may at least succeed in switching from one to the other rapidly and regularly enough to deepen our understanding of the dynamics underlying interaction such as power and solidarity as well as gender and language use.

Notes

This chapter began as a paper entitled "Rethinking Power and Solidarity in Gender and Dominance," which was published in *Proceedings of the 16th Annual Meeting of the Berkeley Linguistics Society*, edited by Kira Hall, Jean-Pierre Koenig, Michael Meacham, Sondra Reinman, and Laurel A. Sutton, 519–29 (Berkeley: Linguistics Department, University of California, Berkeley, 1990). A significantly revised and expanded version appears in *Gender and Conversational Interaction*, a volume I edited, published by Oxford University Press in 1993. That rewriting was carried out while I was in residence at the Institute for Advanced Study in Princeton, New Jersey. Further revisions – improvements, I hope – which I made to the version that appears here (some in response to much-appreciated comments from Paul Friedrich) were carried out while I was a fellow at the Center for Advanced Study in the Behavioral Sciences in Palo Alto, California. I have lifted the summary of this chapter directly from the overview that appears in the 1993 publication.

1. I use the term "strategy" in its standard sociolinguistic sense, to refer simply to a way of speaking. No implication is intended of deliberate planning, as is the case in the common parlance use of such expressions as "military strategy." Neither, however, as Gumperz (1982) observes, are linguistic strategies "unconscious." Rather, they are best thought of as "automatic." That is, people speak in a particular way without "consciously" thinking it through, but are aware, if questioned, of how they spoke and what they were trying to accomplish by talking in that way. This is in contrast to the "unconscious" motives of Freudian theory about which an individual would be unaware if questioned. (For example, most men would vigorously deny that they want to kill their fathers and marry their mothers, but a strict Freudian might claim that this wish is "unconscious.")
2. This example is taken from Tannen (1990).
3. I myself have made the observation that asymmetry is distancing whereas symmetry implies closeness, for example, with regard to the ritual of "troubles talk" and the way it often misfires between women and men (Tannen 1990). Many women talk about troubles as a way of feeling closer, but many men frequently interpret the description of troubles as a request for advice, which they kindly offer. I have observed that this not only cuts off the troubles talk, which was the real point of the discourse, but it also introduces asymmetry: If one person says she has a problem and another says she has the same problem, they are symmetrically arrayed and their similarity brings them closer. But if one person has a problem and the other has the solution, the one with the solution is one-up, and the asymmetry is distancing – just the opposite of what was sought by initiating the ritual.
4. This assumption is made explicit by Klagsbrun (1992), who, in a book about sibling relationships, writes, "Unlike the ties between parents and children, the connection among siblings is a horizontal one. That is, sibs exist on the same plane, as peers, more or less equals" (12). But Klagsbrun gives a pivotal example of how she was frustrated as a child (and continues to be hampered, as an adult) by always being

bested by her *older* brother. It is clear from the example that she and her brother were not equals because of the difference in their ages – and, one might argue, their genders.

5. Negative politeness, as discussed by Brown and Levinson ([1978]1987), entails honoring others' needs not to be imposed on.
6. Scollon (1982:344–45) explains that all communication is a double bind because one must serve, with every utterance, the conflicting needs to be left alone (negative face) and to be accepted as a member of society (positive face). The term "double bind" traces to Bateson (1972).
7. I have demonstrated at length (Tannen 1987, 1989) that repeating another's words creates rapport on a metalevel: It is a ratification of the other's words, evidence of participation in the same universe of discourse.
8. Following the oral presentation of this paper at the Berkeley Linguistics Society in 1989, both Gary Holland and Michael Chandler pointed out that the prisoner may be heard as implying the second part of the guard's statement: "and you're a pile of shit."
9. This scene illustrates what Bateson (1972) calls "complementary schismogenesis": Each person's style drives the other into increasingly exaggerated forms of the opposing behavior. The more he refuses to tell her what's wrong, the more desperate she becomes to break through his silence. The more she pressures him to tell her, the more adamant he becomes about refusing to do so.
10. Some examples are given in Tannen (1990). Whereas the boys made such gestures as shooting each other with invisible guns, the girls made such gestures as reaching out and adjusting a friend's headband.
11. Elsewhere (Tannen 1990:163–65) I discuss this example in more detail and note the contrast that the boys fight when they want to play, and the girl avoids disagreeing even when she in fact disagrees.
12. Another element of this epic, as Bly recounts it, is that Gilgamesh lures Enkidu away from the wild animals with which he had been happily living by sending a temple prostitute who throws off her clothes at the appropriate moment. She is simply the vehicle for the two men to get together. Much could be said about this aspect of the epic, but my purpose here is only to draw attention to the way the men use fighting as a means to friendship.
13. Sifianou (1992) independently observes the use of diminutives as solidarity markers in Greek conversation.

Talk and Institution: A Reconsideration of the "Asymmetry" of Doctor–Patient Interaction

Paul ten Have

The idea that interaction between physicians and their patients is "asymmetrical" is widely shared among both participants and observers of medical encounters. It is assumed as a "social fact" that the roles of doctors and patients differ, and that this difference corresponds to that of leaders and followers. This "fact" has been explained in various ways by contributors to medical sociology, whether causally or functionally, but it is only during the past ten years or so that research has been directed to the details of the interaction that are masked by a gloss such as "asymmetry." The accumulated findings of this research, and further work along these lines, can contribute to a radical reassessment of conventional reasoning regarding institutional behavior. While traditionally the asymmetry of doctor–patient interaction was considered as an effect of institutional structures, rules or resources, it now becomes possible to think the other way around, in the manner developed over the years by ethnomethodology, and see how asymmetries are produced *in and through the details* of physicians' and patients' situated interactions. In this chapter, I will show some of the ways in which participants in medical encounters "talk an institution into being" (Heritage 1984a:290) and thereby accomplish "asymmetry".

Medical encounters are tightly organized events. At one level, they display a rather conventional organization in terms of phases devoted to specific consecutive tasks in the encounter, i.e. complaint presentation, verbal and physical examination, diagnosis, and treatment, prescription and/or advice (see also Heath 1986). But, on a more detailed level, this overall organization has to be realized

Source: Deirdre Boden and Donald H. Zimmerman (eds), *Talk and Social Structure: Studies in Ethnomethodology and Conversation Analysis*. 1991. pp. 138–163

through series of concerted activities that are sequentially organized. This chapter is focused at this more detailed level. It is there that "asymmetry" seems to be produced. But it will prove useful to reconsider the connections between these two levels of organization at various points in the argument that follows. I shall want to argue that locally organized sequential events contribute to the phased organization of the encounter as a whole, but that they are also framed by it.

In the discussion that follows I will explore and elaborate on general aspects of the constitution of asymmetry in doctor–patient interaction, drawing on two resources: (1) research findings of authors like Fisher, Frankel, Heath, Mishler, Todd and West, who have studied medical interactions in detail, and (2) my own work on general practice consultations in the Netherlands (ten Have 1987). To say that doctor–patient interaction is asymmetrical implies that two kinds of comparison are made. First, there is a comparison of what is done, and what may be done, by physicians and patients respectively during the encounter. Secondly, those asymmetries are compared with a model of symmetrical interaction assumed for informal conversation among peers. In other words, characterizations of medical interactions typically tend to contrast the action repertoire of doctors and patients and then contrast this pattern with ordinary conversation. While these comparisons may be analytically helpful, one should resist the temptation to accept these contrasts, especially when stated in absolute terms, as adequate empirical descriptions. In fact, both the differences in behavior between physicians and patients, and the differences between consultations and conversations are relative, changing from one occasion to another and from one moment to the next. It is only in their actual dealings with each other that participants in medical encounters "produce" asymmetry in various ways and to a variable extent. Institutional structures are not only external constraints on participants' actions; they are also actively used as a resource for those actions.

The contrasts mentioned are used primarily analytically and descriptively, but moral overtones are not always absent. It seems that a "morality of equality" is hard to avoid and more symmetrical or conversational forms of interaction are somehow preferred. On the other hand, it may be argued that making consultations more like conversations would either tend to be a hypocritical masking of unavoidable asymmetry or would actually destroy the consultation as such. While this is certainly an interesting debate,[1] for present purposes I will try to avoid it. Following a policy of "ethonomethodological indifference" (Garfinkel and Sacks 1970), no moral judgments are implied in my use of the contrasts, although some of the authors I discuss – especially Mishler – either implicitly or explicitly tend to introduce such judgments into their contrasts.

Aspects of Asymmetry

Basically, asymmetry in doctor–patient interaction is of two kinds. First, there is an asymmetry of topic: it is the patient's health condition that is under review, not the doctor's. Associated with this, there is a second kind of asymmetry: of tasks in the encounter.

Patients' tasks mainly involve reporting their symptoms, answering questions, and accepting physicians' decisions, while doctors are supposed to listen to complaints, to investigate the case, and to decide on a diagnosis and a treatment. Although the initiative for the encounter is primarily the patient's, this task distribution involves quite "natural" interactional dominance by the physician, enacted through questioning, investigating, and decision-making behavior, coupled with interactional submission by the patient, achieved through answering, accepting and generally complying with the doctor's orders and suggestions.

Recent research in the details of medical interaction, including my own work (ten Have 1987), would seem to support general conclusions such as the following:

1. Local initiatives that establish a conditional relevance for specific kinds of second actions, such as questions, orders and proposals, are mostly taken by physicians and seem to be "dispreferred" when taken by patients (Todd 1984; West 1984:71–96; Frankel 1990).
2. The interactional control that seems to follow from this is reinforced by restrictive ways in which these initiatives are often used, especially by questions that allow for only short factual answers (Frankel 1984, 1990; Mishler 1984:59–91).
3. Questions put by physicians come mostly in series, in such a way that answers by patients are enclosed in and framed by the doctor's contributions: that is to say, the preceding question and the acknowledgment that follows it, and/or a next question, that in many cases comes interruptively (Frankel 1984, 1990; Mishler 1984:59–91; Todd 1984; West 1984:53–64).
4. The questions themselves, together with their topical flow and topic changes, are generally not accounted for by physicians; in particular, motivation for physicians' questions is not provided, and topic changes – which may be initiated quite abruptly – are not marked as such (Mishler 1984:95–121). In this way the patient is not informed on the reasoning process that supposedly guides the doctor's actions.
5. A similar lack of information is engendered by physicians' use of the "third turn" in questioning sequences: items like "okay," "uhuh" and "yes," as well as summarizing formulations, do not display for the patient what the physician makes of the answer, but only mark whether or not further elaboration is needed (Atkinson 1982; Frankel 1984).
6. These tendencies often seem to be instrumental in a noted biomedical selectivity in that physicians tend to ignore those aspects of patients' utterances that report on subjective experience, personal circumstances and social conditions (Frankel 1984; Mishler 1984; Todd 1984). Elliot Mishler (1984:164) has called this a "context stripping" approach. An important exception to this tendency is found in those cases where the physician specifically focuses on context in an approach that stresses psychosomatic aspects of diagnosis and treatment (ten Have 1989).
7. Finally, the asymmetries mentioned will accumulatively, so to speak, result in a tendency for decisions that are mainly based on the doctor's

perspective on the case, guided by his questioning and relative lack of knowledge of the relevancies stemming from the patient's orientation to the problem (Paget 1983; Fisher 1984; Todd 1984). That is, in all the above instances, it takes specific efforts on the part of patients to counter tendencies leading to such a result, unless physicians take steps to provide them with occasions to influence the proceedings.

In essence, then, the literature reviewed suggests two major trends in the interactional style taken by physicians in their dealing with patients, one of monopolizing initiatives, and another of withholding information. Studies of medical interaction have, as their major focus, the phases of the consultation producing data, especially the physician's questioning of the patient. Questioning is analyzed as a series of two-part or three-part sequences: a question followed by an answer, with the optional addition of a "third turn component" by the questioner (cf. Frankel 1984). In the following sections, I discuss some aspects of the ways these sequential possibilities are used by the participants, that is how "asymmetry" is locally produced or circumvented. In so doing, I will not only consider cases that conform to the major trends, summarized above, but also instances that run counter to those trends.

Asymmetries of Initiative

Generally, as noted, patients take the initiative for the encounter as such: it is their decision to consult at this specific moment. Within the encounter, however, they seem to "lose" this initiative when the doctor's questioning takes over. It is this "takeover" that is of special interest in studying the accomplishment of "asymmetry."

While patients may decide if and when they come to their physician's consulting hour, it is the doctor who decides when they may enter his room. When inviting a patient to enter, a doctor acts like a host, inviting the patient to sit down and – possibly after some small talk – to provide the reason for his or her visit. In the initial invitation, the physician may refer to what he remembers or reads in his record concerning previous visits (cf. Heath 1981, 1982b). But, in the data for my study, typical invitations are quite direct: "Vertel het es," which amounts to "What's up?" or, more literally, "Tell me what it is." The "it" here appears to refer to the reason for the visit. In new cases, the patient will typically explain his or her[2] reason for coming by describing major complaints in one or two sentences, as in the following instances.[3]

1 ((D = Physician, P = Patient))

9 **D:** Vertel het es
10 **P:** Ja ik ben zo gewéldig aan **diarhée en 't** wil niet *o*ver gaan

9 **D:** What's up
10 **P:** Yes I have so **much diarrhóéa and it** won't go aw*ay*

As can be seen, such a statement does not formulate a request, it states a reason for coming to the doctor and provides him with material for his upcoming questioning. In this way it functions as a request for diagnosis and/or treatment. When specific request forms are used, they tend to implicate a specified check-up, as in the following instances.

2a

7 **P:** E:h kunt u kijken of ik zw*a*nger **ben**
8 (0.4)
9 **P:** (Ghh)

7 **P:** U:h can you check to see if I **am pr*e*gnant**
8 (0.4)
9 **P:** (Ghh)

2b

27 **P:** Ja daar *zi*tten we weer heh
28 **D:** Daar *zi*tten we weer ja
29 **P:** Ik heb t'r nog tw*ee* dingen bij dat e:h moet u dus even naar kijken
30 **D:** En dat is
31 **P:** (Eerst es) naar m'n k*ee*l (1.2) en naar d*e*ze kn*ie*

27 **P:** Yes here we *a*re again huh
28 **D:** Here we *a*re again yes
29 **P:** I have t*wo* more things that uh you have to take a look at for a moment
30 **D:** And that is
31 **P:** (First uh) at my thr*oa*t (1.2) and then at th*i*s kn*ee*

In responding to the doctor's invitation in this subdued way, patients defer to the professional to decide what should be done next, whether a diagnosis and/or treatment is necessary and/or possible. These first utterances of the complaint also specify the body region that deserves his attention. Thus, patients provide their doctors with material for questioning in their very first utterances and physicians get an opportunity to "take back" the initiative they gave their patient just one moment ago.

Both patients and physicians thus contribute to the start of an interaction format, namely questioning, that is oriented to the establishment of medically relevant facts. Within this format, the physician has the initiative and the patient is restricted to a responding role. In some cases, however, one can observe the emergence of a different format oriented to the history and the larger context of the complaint(s), rather than to just the facts. This format implies a more active role for the patient, as a teller of his or her own story. Extract 3 may be considered as an instance where such an alternative format is seen to emerge.

3

17	**D:**	Dat is een h*e*le:: hh 'h geschiedenis met jou
18		geweest in eh januari heh
19	**P:**	Ja ( )
20		(.)

24	**P:**	(it's just that) for a couple of months I
25		had (.) a *co*ld and then it was over and then it was gone
26	**D:**	Yes
27	**P:**	And S*un*day I suddenly got uh (.) a real headache
28	**D:**	Yes
29	**P:**	(I had it all-) all over th*is* side
30	**D:**	Yes
31	**P:**	And Sunday n*igh*t I got uh pain in my chest here
32	**D:**	With coughing or something or whatever-

We have entered the consultation at the moment the physician finishes reading the patient's record card. Presumably referring to the last entry, he displays an interest in the sequel to the "history" he finds recorded there (line 21). In other words, he provides for a story to be told. The patient, then, does tell a story of sorts (lines 24–31). It is a tightly organized "unit" (cf. Houtkoop and Mazeland 1985), especially in the sense that the earlier parts display their own incompleteness, that is, that the major point, what may be called the "pressing complaint," is yet to come. This is achieved in a number of related ways:

1 by starting earlier in time (line 24), thus suggesting that the very reason for the present visit has not yet been discussed;

2 by mentioning relatively permanent states (lines 24–5), this effect is strengthened,[4] suggesting its status as "background information";
3 by adding a second item (line 27) to a previous one (line 24), it is suggested that a "list" is being constructed, which again heightens the expectation of more to come, that is, a third item to the list (cf. Jefferson 1990 on lists in casual conversation, and Atkinson 1983, 1984, on lists in various other contexts).

While in this case interactive structuring by the physician and the patient seems to complement and facilitate the production of a fuller historical account, this need not always be the case. Physicians may suggest fuller accounts, while patients stick to "just the facts," as well as the other way around. In the latter instance, patients are observed to use devices, those mentioned above and others, to change their local interactional identity from that of a "respondent" into that of an "informant."[5]

What these observations indicate is that although patients generally play their submissive part in the established "asymmetrical" format, possibilities also exist for patients to extend their chances to bring in materials on their own, which are sometimes successfully used. We should note that the devices for doing so are quite ordinary ones, regularly deployed in casual conversations, as well as in various other settings. What is noteworthy, however, is their "covert" character: they seem to hide their action potential, the initiative their user is taking. In other words, patients seem to disguise their interactional initiative by refraining from formulating requests, by giving the initiative back to the physician rather quickly, or by using quite subtle and covert devices to hold off the doctor's questioning interventions.[6]

Questioning

Most researchers who have studied doctor–patient interaction in detail have given their primary attention to questioning sequences and consider the doctor's handling of these sequences as their primary instrument of interactional control. The central idea, summarized above, is that physicians have a privileged access to the first position in such sequences, which gives them control of what can coherently be said in the second position as an answer, and provides them with a possibility to come back after a minimally complete answer with a third position item, or a next question. In this way access to the first position is seen as a major entry into interactional control.

In this section, I will consider the concept of asymmetrical questioning *per se*, while in the next I will focus on some uses of the third position within it. The thesis of a dispreference for patient-initiated questions was, to my knowledge, originally developed by Frankel (1990). This concept was also used in a study by West in her analysis of 21 family practice consultations (1984; see also West 1983). West examined all questions that figure in this collection; most, 91 per cent of the total number asked, were initiated by the physicians, and these were also more successful (98 per cent versus 87 per cent answered). But West does not restrict herself to such an overall quantitative analysis. As she writes:

> Stronger evidence for the dispreferred status of patient questions is furnished by closer inspection of the form they take. In the course of this analysis, I assembled a collection of all patient-initiated questions from these exchanges. What is most striking in this collection is the presence of marked speech perturbations in the speech objects used by patients to construct their queries. . . . In fact, of the total of 68 questions posed by patients, 46 per cent (31) displayed some form of speech disturbance in the course of their production. Put simply, patients displayed considerable difficulty "spitting out" their questions. (1984:88–9)

She continues, later: "By and large . . . physicians' formulations of questions exhibited little evidence of speech disturbances" (West 1984:168).

Although I do not want to dispute the general thesis of a party-bound preference or dispreference for questions in consultations, I do have some difficulties with this research. Firstly, in my view, the analytic category of "question" is a difficult one. Although West (1984:73–80) deals briefly with some problems, I also see others. For instance, in my observation patients very frequently formulate their "ignorance" or "doubts" in various medical matters. These utterances do not have a question form and do not create a "conditional relevance" for an answer in the next slot. But they do display what the patient would like to know, or on which issues he or she would like to have an expert's opinion. Such utterances are often ignored by the physician, but sometimes they are taken up, possibly much later in the encounter, as in the next example:

4		(from the same consultation as 3)
51	**P:**	'hh ma- 'k ben gister expres
52		een beetje op bed gebleven ik denk 't zal wel
53		iets van kou zijn ik heb die- (.) die- in laten smeren met Dimedalgam heet dat=
54	**D:**	=Dimidalgam (.) ja dat is tegen spierpijn (en[zo)
55	**P:**	[Ja maar dat
56	**D:**	'h[h dat helpt n[iet
57	**P:**	[e:h [(helpt) weinig
		:
96	**D:**	Want ik hoor d'r niks aan (.) in je longen (.)
97		aan de binnekant is d'r niks (.) en eh je hoest ook niet
		:
126	**D:**	Ik denk dat het toch eh die dat 't iets is met
127		spieren[wat je daar hebt heh die pijn 'hh dat 't
128	**P:**	[(Merkwaardig)
129	**D:**	een soort e::h spierpijn is
51	**P:**	'hh but- yesterday I
52		especially stayed in bed a bit I think it is
53		something like a cold I have di-di- (.) di- smeared it with Dimedalgam it's called

54 **D:** Dim*i*dalgam (.) yes that is for muscular pain
[(and such)
55 **P:** [Yes but that
56 **D:** 'h[h that doesn't he[lp
57 **P:** [u:h [(help) much
:
96 **D:** Because I don't h*ea*r anything there (.) in your
97 lungs (.) there's n*o*thing inside (.) and
uh you also aren't c*ou*ghing
:
126 **D:** I do think that after all uh that that it's uh p*ai*n
127 something in your muscles[that what you have there
128 **P:** [(Strange)
129 **D:** 'hh that it's a kind of uh muscular pain

The physician, in this case, can be seen to check the two lay diagnoses that the patient reports to have considered earlier (lines 52–3), concluding that the first cannot be confirmed while the second is plausible.

In other words, it is difficult to set clear limits on the category of "question." Patients have a variety of ways in which they can make known to their physician their informational needs. Moreover, some of these more covert "questioning" approaches would be unlikely candidates for inclusion in West's analysis, although they may, in fact, be quite practical ways of getting physicians to provide desired information.

Secondly, while many questions put by physicians have a constraining effect on what *may* be coherently said as an answer to them, this is not *necessarily* the case. Although many questions provide for only yes/no or other kinds of short and factual answers, others specifically leave it to the patient to structure his or her report in the manner he or she sees fit:

5 (from different encounters)
13 **D:** Waar dacht je z*e*lf aan?
:
32 **D:** Waar kan dat nou vand*aa*n komen denkt u?
:
38 **D:** E:n hoe k*o*mt-tattan?
:
43 **D:** Wat is dat allemaal?
:
118 **D:** Hoe ging het v*e*rder met u de laatste tijd?
:
179 **D:** Hoe v*oe*lt u zich verder?

13 **D:** What are you thinking of yours*e*lf?
:
32 **D:** Where does that come fr*o*m do you think?
:
38 **D:** A:nd how does that c*o*me about?

43 **D:** What is that on the whole?

:

118 **D:** How have you been bes*ide* that lately?

:

179 **D:** How do you f*ee*l beside that?

In other words, West's analysis, by not differentiating as to the amount of control exercised by questions, runs the risk of overstating the interactional restrictions actually imposed by physicians.

Thirdly, also lacking in this type of research is a consideration of the sequential environment in which the objects under review are used. Specifically, I want to suggest that a dispreference for patient-initiated questions is most strongly present in the data-gathering phase at the beginning of the encounter. In that phase, a period of rapid and restrictive questioning – labelled "differential diagnosis" in the professional jargon of physicians – is often found. At other times during the consultation, however, and especially after the physician has stated his conclusions regarding diagnosis, treatment or advice, patient-initiated questions seem much less dispreferred or not at all. In fact, in my data, most patient questions posed in the environment of what I call the acceptance are uttered without any disturbance or other displays of a dispreferred orientation.[7]

In summary, I am proposing that while a questioning format is dominant in the data-producing phases of most medical encounters, and patient-initiated questions are largely dispreferred then and there, this should not be generalized to suggest that patients are automatically, so to speak, restricted in their possibilities to give and request new information throughout the encounter. Physicians can moreover frame their questions in ways that are less restrictive, and patients can use their answering slots to provide new information or suggest that they would like to be informed on specific points, as noted. Furthermore, the dispreference for patient-initiated questions seems to be phase specific. Patients have options to bring up their own points both before and after questioning, as part of their complaint(s) or as questions attached to the physician's decisions. West (1984:95–6) quotes Frankel saying: "It would be inappropriate to view the issues of control and responsibility in the medical encounter as properties of individuals," and she adds: "Instead, we are compelled to view such matters as micropolitical achievements, produced in and through actual turns at talk" (1984:95–6). Although in full agreement with these statements, I am suggesting that they be taken even more seriously than they have been until now. This is not to deny that physicians largely control the proceedings during medical encounters, but it is important to stress that this is not the automatic effect of institutional forms: rather it must be enacted by both parties and both of them have possibilities for less asymmetrical interaction.

Physicians' Uses of the Third Position: Assessments

Earlier, I summarized the literature on medical interaction as indicating two major trends in the style taken by physicians in their dealing with patients, one

of monopolizing initiatives and the other of withholding information, at least during questioning. Having discussed the first trend above, I now turn to a consideration of the second. Atkinson (1982), Frankel (1984) and Heritage (1984 a and b) variously suggest that physicians and other professionals use "third turns" in quite specific ways when dealing with clients (see also Mehan 1979). Specifically, they tend to refrain from commentary, utterances displaying alignment, or any indication of their own information processing. Thus physicians, as well as other professionals, use two kinds of strategies, one active and one passive, to achieve an ongoing asymmetric display of knowledge, feelings and functioning.

Atkinson (1982) has suggested that a variety of routine utterance types – such as second assessments, second stories and newsmarks – are generally absent in professionals' contributions to lay–professional interaction; Heritage (1984a, b) has also specifically noted the absence of "Oh" as a "change of state" marker in these settings. Both authors maintain that the specific character of "formal" or "institutional" interaction is especially, but not exclusively, observable in such third turn usage. Heritage calls this – referring to Garfinkel – one of the "identifying details" of such interactions (see also Zimmerman 1984).

Researchers who have given attention to physicians' use of the third position report a variety of turns such as acknowledgments, assessments, corrections and summaries (Fisher 1984; Frankel 1984; Todd 1984; Houtkoop 1986). Frankel, for instance, has analyzed over a thousand questioning sequences in the data-gathering phase of ambulatory care encounters. In over 60 per cent of them a third turn option was used. Dividing the utterances into two classes, acknowledgments and assessments, according to the absence or presence of contrast terms like good/bad, right/wrong, etc., he finds that assessments were almost never used by physicians, accounting for less than 3 per cent of his cases. Acknowledgments, on the other hand, were very frequent and were mostly given in short forms like "uhuh," "okay" and "I see." And he adds:

> One explanation for the large number of acknowledgements found in these data is that acknowledgements are used primarily to accomplish sequential as opposed to interpretive operations in discourse. Neutral third turn responses such as, "Mmh hmh," "okay," "I see," etc., operate without any obvious intrusion on the style or content of that which follows. Instead, their major effect is to invite speaker continuation by signalling receipt of prior information and nothing more. Assessments differ from acknowledgements functionally by introducing the speaker's reaction to, or interpretation of, the information supplied in an answer. (1984:157–8)

Generally, these tendencies roughly correspond to what I observe in my data from the Netherlands. Although perhaps to a lesser extent, Dutch physicians also seem to avoid assessments and newsmarks, for example. The fact that they do not always do so, however, offers the possibility of analyzing the exceptions. By investigating what may be done when such objects are in fact used, we may gain insight into what is accomplished by avoiding such use.

As a first approximation of such an analysis, I would like to propose a typification of episodes within medical encounters, as follows:

1. Episodes which have a marked "conversational" quality and in which non-medical topics are discussed, such as "small-talk."
2. Episodes which have a less marked "conversational" quality, which have more or less to do with medical topics, but are relatively marginal to the consultation's main "agenda."
3. Episodes in which the main medical agenda is being developed explicitly.

Quite often, in medical encounters, parties' talk does not continuously address the main topic(s) of the occasion, that is, the major complaint(s). In particular, immediately before or after dealing with their main business (type 3), parties tend to indulge in some non-medical small talk (type 1). This can also happen when the major activity does not require talking as such, for example during the physical examination (cf. Frankel 1983). Such occasions, especially toward the closing of encounters, can also be used by patients to elicit some minor medical advice, or to submit some medical idea of their own, even if it is not related to the major agenda (type 2). Elsewhere (ten Have 1987, 1989) I have tried to demonstrate that this variation in topic corresponds to a variation in interactional style. The style in type 3 tends to be the most formal, with type 1 the least formal in regard to such issues as the use of address terms, conversational restraints, and general asymmetry of interaction. In the following discussion we will observe a similar variation as regards the use of the third turn.

When objects like assessments and "Oh"-receipts are used in environments otherwise marked as belonging to type 1 or type 2, they may be seen to contribute to a process which we may gloss with a term like "informalizing." The following instances may serve as examples:

6a ((during an "inserted conversation"))

P: (Nou ja) die verhuizerij da's natuurlijk een
verv[elende (zaak)
D: [Da's een r*a*mp=
P: =*O*::h
P: (Well yes) that moving business that's of course
a ted[ious (affair)
D: [It's a dis*a*ster
P: *O*::h

6b ((during the writing out of the prescription the patient has suggested that his colds are caused by the airconditioning at his workplace: the physician reacts as follows))

223 **D:** E:hm (.) als-tie aldoor uit dezelfde h*oe*k waait
224 (.) 'hh als je st*aa*t (.) dus ik zal maar zeggen
t*e*gen die *ze*[re *zij* aan['hh dat zou h*ee*l best
225 **P:** [Hmm [hm
226 **D:** =kunnen ja (.) ik vind het altiid w*aa*rdeloos die

227 *air*-conditioning=
228 **P:** =Ik v:- ik heb ter een bl*oe*dhekel aan

223 **D:** U:hm (.) if it always blows from the same c*or*ner
224 (.) 'hh when you are standing (.) as it were
on the a[ching side ['hh that v*er*y well
225 **P:** [Hmm [hm
226 **D:** =could be it yes (.) I always think
227 it's useless that airconditioning=
228 **P:** =I th- I really h*a*te it

Many instances of physicians' assessments in environments of type 3 also seem to do a job of "informalizing." In the instance quoted next, a strong negative assessment (in line 8), related to a central complaint, seems to be "a tease," which signals that the physician does take the complaint rather lightly, as have others before him (cf. line 11).

7 ((O = Observer))

7 **P:** Ik heb me gebr*a*nd (.) zondag=
8 **D:** =St[om
9 **P:** [Ik dacht h*ee*l ev- *ja*[inderd] *aa*d (.) ik heb
10 **O:** [(huhhuhhuh)]
11 **P:** het eenenander*aa*n (ge) moeten horen (uhHUHhuh)
('K wou) t*o*ch maar even z*ie*:n=
12 **D:** =J*a*

7 **P:** I burned myself (.) S*u*nday=
8 **D:** =St[upid
9 **P:** [I thought for a mo- yes[indee]d (.) I've
10 **O:** [(huhhuhhuh)]
11 **P:** had to listen to something-or-*oth*er (uhHUHhuh)
(I would) see for a moment yet
12 **D:** Y*e*s

The next excerpt concerns a case of a patient who stumbles into the consulting room because of an ankle that should have healed by now but hasn't. Here the doctor's strong assessments of her condition seem to function to ward off her possible complaints about this lack of medical success.

8

1 **D:** Ja
2 **P:** Morgen[(uhm)
3 **D:** [*I*s het nog zo *e*rg
4 **P:** Jaha
5 **D:** O:h nee
6 **P:** Ja *ee*rlijk
7 **D:** Ja
((voorstellen observant))
9 **D:** N*ee* u bent verdorie aan

1 D: Yes
2 P: Morning[(uhm)
3 D: [*I*s it still so b*a*d
4 P: Yehes
5 D: O:h no
6 P: Yes *hon*estly
7 D: Yes
((introduction of observer))
9 D: *No* you are an invalid damn it when you do walk like that
10 P: Yes

The two cases to be considered next stem from an encounter where a "biomedical" questioning is followed up with an episode during which the biographical background of the medical complaints is discussed (cf. ten Have 1989). In both instances quoted, the physician assesses parts of the patient's report with "difficult" (lines 102, 216). This report concerns problems the patient experiences in her dealings with her 18-year-old son.

9

99 P: Ja en hij heeft dus om de haverklap geen werk
100 D: (Nja)
101 P: Dus nou ja dat vind ik dus wel eh: (3)
102 D: M*oe*ilijk heh
103 P: J*a*: vind ik w*el*
:
212 P: Jaha maar ja n*u* weet-ie natuurlijk dat ik
213 gew*ee*st ben (.) krijgt-ie te horen
214 D: *O*kee
215 P: (Huh)
216 D: Zeh- 't is *e*rg moeilijk een di*ee*tje (.) vie-
217 vier weekjes (.) d*e*ze poeders

99 P: Yes and so he is often out of work
100 D: (Nyeah)
101 P: So well yes I think that so well uh (3)
102 D: D*iff*icult huh
103 P: Y*e:s* that's what I *really* think
:
212 P: Yehes but n*ow* he knows naturally that I've
213 been there (.) he will hear about that
214 D: *O*kay
215 P: (Huh)
216 D: Say- it's v*ery* difficult a little d*i*et (.) fo-
217 four little weeks (.) these powders

The first instance fits in a strategy in which the physician focuses on the mother's feelings in order to be able to discuss them later as "part of the problem" (ten Have 1989). In the second instance, the assessment is delayed, comes after "okay" and "say," and creates the impression of an inserted afterthought. The doctor

has just suggested that she should keep in the background regarding details of her son's life, that she should avoid the impression that she is continually concerned about him. But now she mentions a complication to that, he will learn that she has been around at his place. By hastily inserting "it's very difficult" the physician accepts that it may be hard to follow his advice, while at the same time making it clear that he is not going to discuss these difficulties any further. His accepting assessment makes further detailing on her part superfluous. In fact, this assessment is part of a successful effort to initiate a closing of the encounter.

While the uses of assessments in the preceding cases seem to be tied to the specific occasions involved, some other instances are, in my view, examples of a more systematic application of assessments: in fact, they mostly come in series. In the following cases, and in others like them, such a string of assessments is used *vis-à-vis* children and seem to display a specific orientation to their identity *as* children. That is, uses of assessments here and elsewhere are part of a certain style of speaking to children that is not bound to a specific topic or occasion, but is chosen by some adults in any kind of talking to the children. Some aspects of this style are displayed in the transcripts quoted in 10. In the first example, for instance, the doctor uses "sir" as an address term to a six-year-old boy, while the "pseudo-curse" in line 7 has the same "jolly" unseriousness. In the second example we see that the assessments are given to both medical and social aspects of the little girl, while in line 16 the mother displays an understanding of the doctor's efforts as trying to engage the child in conversation.

10a

5 **D:** Zo (.) vert*e*l het es men*ee*r
6 **P:** Ik heb steeds h*oo*fdpijn
7 **D:** W*e*l (.) *po*tverd*o*rie hoe komt d[at
8 **P:** [En als ik gaat
9 ho*e*sten danna (.) ko- gaat het h*ie*r pijn doen en op m'n h*oo*fd
10 **D:** J[*a*?
11 **P:** [En als ik n*ie*st *oo*k

10 **D:** Y[*es*?
11 **P:** [And when I sn*ee*ze *too*
12 **D:** O:h (.) And do you have to **cough a *lot* Peter**
13 **P:** Yes
14 **D:** Yes? (.) that's annoying lad

10b ((M = mother))

8 **M:** Maja heb zo'n last van maaien
9 (0.7)
10 **M:** H[eh?
11 **D:** [Da's lastig (.) kr*ie*belen ze Maja?
12 (0.4)
13 **D:** R*o*tdingen heh? heb je je dipl*o*ma gehaald? *ja* heh?
14 (0.5)
15 **D:** Sch*i*tterend zeg
16 **M:** Nou kun je praten
17 **P:** Jha

8 **M:** Maja is very much troubled by maggots
9 (0.7)
10 **M:** H[uh?
11 **D:** [That's annoying (.) do they *i*tch Maja?
12 (0.4)
13 **D:** T*err*ible things hm? Did you get your dipl*o*ma?
D: Yes huh?
14 (0.5)
15 **D:** Really splendid
16 **M:** Well can you talk
17 **P:** Yhes

So we may conclude that at least some physicians use a special "conversational" line of conduct when they deal with children, even when the main topic is being developed.

A similar "conversational" approach is sometimes discernable in the ways in which physicians deal with elderly patients. It may not be a mere coincidence that the patients who are "praised" for their "good behavior" in the next two examples are, to judge from their voices, elderly persons.

11a ((after the patient has told his physician that he hasn't been taking any medicine recently))

135 **D:** Helemaal niks (.)[D*a*'s knap
136 **P:** [( )
137 **P:** J*a*h j*a*h
138 **D:** Heh?

135 **D:** Nothing at all (.)[Well *d*one
136 **P:** [( )
137 **P:** Y*es* y*es*
138 **D:** Hey

11b

28 **P:** En ik ben op de w*ee*gschaal gaan staan en ik weeg
P: nou *a* [chtennegentig
29 **D:** [O::::h

30 D: dat zijn goeie
31 P: Jah
32 D: berichten

28 P: And I went to stand on the scales and I now weigh ni[nety eight
29 D: [O::::h
30 D: that is good
31 P: Yes
32 D: news

So, generally speaking, use of assessments in physicians' reactions to patients' answers, or other kinds of telling, displays an orientation to that telling that treats it lightly, as part of small talk, of marginal topics, or it is part of a wider "conversational" approach taken especially with persons with a non-adult status.

"Oh" in Physicians' Third Turn

As noted above, both Atkinson and Heritage maintain that "Oh" is one of the kinds of items that professionals rarely if ever use in their talk with clients, while it is quite commonly used in ordinary conversation. Heritage summarizes some of his findings in this latter area as follows:

> Through the use of the particle, informed, counterinformed, or questioning parties can assert that, whereas they were previously ignorant, misinformed or uninformed, they are now informed. Correspondingly, the informing, counterinforming, or answering party is reconfirmed as having been the informative, knowledgeable, or authoritative party in the exchange. By means of the particle, the alignment of the speakers in their sequence-specific roles is confirmed and validated. (1984b:315)

So through the use of "Oh," a preceding item is labelled as having been informative, and, at the same time, the respective roles of the parties *vis-à-vis* the informing process is displayed. While patients quite often mark what their physicians tell them as news by the use of "Oh," doctors rarely do the same with patients' informings.[8]

Thus, I have been looking for exceptions to this general tendency in my corpus, locating 30 instances in which a physician receives a patient utterance with "Oh." Using the same typology of episodes as I did earlier, I observe that ten cases were used in environments that can be characterized as non-medical (small talk, etc.: type 1). Another ten cases were found to occur in episodes that, although more or less medical as to the topic under discussion, could be seen as relatively marginal in relation to the main medical agenda (type 2).

An example of the first type may be seen in the following extract which occurs at the beginning of the physical examination, often a moment when the physician starts some kind of small talk (cf. Frankel 1983):

12 ((at the start of the physical examination))

72 **D:** (Hmhm) (.) In welke b*a*r werk je? in welke bar w*e*rk je?
73 **P:** Paradiso op de Markt
74 **D:** Ohh (.) 'h als je eventjes d*i*t uitdoet

72 **D:** (Hmhm) (.) Which b*a*r do you work **in? which** bar do you w*o*rk in?
73 **P:** Paradiso on the Market
74 **D:** Oh (.) 'h if you could take this off

An instance of the second type, below, is taken from an episode toward the end of a consultation in which the physician has asked the patient how her husband is doing. When she mentions a side-effect of tablets the physician prescribed, he receipts this with "Oh" (line 3).

13 ((near the end of the consultation, about patient's **husband**))

1 **P:** Ja: en 't is niet zo *e*rg maar nou die tabl*e*tten
2 die: e:h krijgt-ie 't van aan z'n m*aa*g
3 **D:** Oh (.) da's vervelend (.) moet ie ze met een beetje m*e*lk innemen
4 **P:** Beetje melk innemen
5 **D:** Ja (Da's beter)
6 **P:** Oh

1 **P:** Ye:s and it's not so bad but now those tablets
2 tho:se uh his stomach hurts from them
3 **D:** Oh (.) that's bad (.) he has to take them with a bit of m*i*lk
4 **P:** Bit of milk
5 **D:** Yes (That's better)
6 **P:** Oh

In relation to the collections from type 1, small-talk environments, and type 2, those marginal to the consultation, we might say that apparently physicians feel free to relax their professional habitus, since they are not being informed as a professional at these moments, at least not concerning the topic that is the major reason for the consultation. So we might conclude that the major discrepancy concerning the use of "Oh" is to be found in the type 3 data on the main business of the consultation. For this reason I will give most attention to this last set.

Before I do so, however, I will present a summary description of my findings concerning the type 1 and type 2 collections, as well as some suggestions from Heritage's essay on the use of "Oh" in ordinary conversation, in relation to these findings. In most cases from these collections, the information receipted with "Oh" is of a kind to which the teller has a privileged access, for instance, biographical details. In many cases, also, the information involved contradicts apparently existing expectations, either as displayed by the recipient or as set up by

previous information given by the teller. In some cases, "Oh" marks the moment at which the recipient understands a point the teller is trying to make, a moment of recognition.

These observations are mostly in line with the conclusions of Heritage, although the frequency with which Oh-receipted information has a biographical character may be specific for the types of situation considered in the present essay. An important point made in scattered remarks throughout Heritage's paper is that an important difference exists between "Oh"s followed by inquiries, assessments, or formulations, on the one hand, and what Heritage calls "freestanding" "Oh"s, on the other. The last type is often used in such a way that a further elaboration of the topic under discussion is not invited, or is even discouraged. As he writes: "Whereas 'oh' may propose a change of state in response to an informing, it is entirely opaque as to the quality or character of the change of state proposedly undergone by its producer" (1984b:325). For this reason, informers may wait for an "unpacking" of this opaque message, and when none is coming conclude that the recipient is unwilling to give one. At the same time, an oh-receipt makes it clear that the informing has had some effect, and that further informing may be superfluous. Because of these suggestions, "Oh" often has a sequence terminating effect. Heritage notes that freestanding "Oh"s are less common. In my data, I count one in the type 1 collection, four in the type 2, and three in the type 3. In the interest of space I will only discuss the latter examples.

In the ten cases that make up my type 3 collection, most of the general findings mentioned above are recognizably relevant. For example, biographical information is clearly involved in the next case,[9] which also illustrates a process of counterinforming.

270 **D:** And up to that time you[just
271 **P:** [( )
272 ( )
273 **D:** menstruated r*e*gularly
274 ( )

275 **D:** N[o?
276 **P:** [Well not r*e*gular[ly
277 **D:** [( )
278 **D:** =Oh it was never regu[lar
279 **P:** [No
280 (0.9)
281 **P:** No because I was (here) a few years back
282 for this too

The specific aspect on which the physician is informed is clearly displayed by him in his "oh it was never regular" (line 278). In this way the topic is kept open for further elaboration.

A similar display of understanding is given in the next case,[10] where the information concerns another kind of private information, the location of pain in the body.

15

32 **D:** En waar z*i*t dat precies die kr*a*mp?=
33 **P:** =Hier is 't=
34 **D:** =Oh daar *e*cht in die kuit ja

32 **D:** And where is that cr*a*mp exactly?=
33 **P:** =It's here=
34 **D:** =Oh *righ*t there in that calf yes

In three other cases, "Oh" is also followed by a formulation of the produced understanding, although in these the formulations are not restricted to the "gist" of it, but also extend into an "upshot formulation" – to use the terminology developed by Heritage and Watson (1980). In all these cases an "oh" plus formulation displays confident recognition.

This leaves three remaining cases in which "Oh" is not followed by a formulation or something similar, and where the "Oh" is not part of some kind of "conversational" series, as in the cases quoted earlier. In the interests of space, I shall merely summarize my analyses of these three instances. These are "freestanding" occurrences of "Oh" where the "quality or character of the change of state" is left entirely "opaque" – as Heritage has formulated it – and where the physician initiates a topic shift or change soon afterwards. This condition has the effect of confronting the analyst, too, with an opaque action, allowing for only tentative interpretation at best. These oh-receipts occur in environments that can be seen as somehow awkward or delicate. In two of the three instances, the physicians seem to challenge the information provided, but when the patients confirm their previous stance, they subsequently acknowledge this with a freestanding "oh" and change topic soon thereafter. In this way they mark that they have noted the "opinions" expressed without offering any assessment of the information "noted" in this way.

These interpretations are far from definitive. The opaque and hinting quality of a freestanding "oh" and its tendency to contribute to a subsequent termination

of the current sequence makes it difficult to provide any interpretation from further sequential development.

My analysis of the 30 instances of "Oh" produced by physicians during consultations has suggested two generally valuable interpretations. On the one hand, the use of "Oh" may be a part of, and contribute to, a "conversational" quality an episode in which it occurs may have. And, on the other, it may indicate that the information so receipted may be seen as one to which the informer has some kind of privileged access. The latter may concern biographical information as well as private opinions and feelings. In some special instances this last marking was tentatively interpreted as part of a challenging episode, occurring when a patient stuck to a contested report on her feelings. In this way the "Oh" seemed to give an extra mark of "this is your private opinion." While such a use is not uncommon in informal conversation, its rarity in professional reactions to clients' informings could add to its impact.

Asymmetry Reconsidered

I have suggested throughout this chapter that "asymmetry," often conceived of as a given and constant feature of medical interaction, should instead be seen as an interactionally achieved and varying aspect of the interactional stream produced by doctors and patients. It is not my intention to deny that phenomena that can be glossed as "asymmetries" are massively present in medical encounters. But I should like to stress that the choices participants have to act more or less in accord with institutional expectation, that is, in a more or less "asymmetrical" or "formal" way, can be exploited by them to create specific kinds of episodes and to achieve analyzable interactional effects. More research is needed to specify what has only been suggested in broad terms here. The strategy pursued, to give specific attention to practices that depart from the routine, seems to be a promising one. The covert ways in which patients can try to influence the course of the consultation, alternatives to restrictive questioning, and alternatives to the third turn "uhuh," are all topics deserving more detailed exploration in the near future.

Consultations are sometimes almost like conversations. At other times they resemble interrogation. But mostly they are somewhere in between, zigzagging between the two poles in a way that is negotiated on a turn-by-turn basis by the participants themselves, whether they are Anglo-Saxons or Dutchmen.

Notes

Earlier versions of this paper were read at the Talk and Social Structure conference, and subsequently at the 11th World Congress of Sociology, Research Committee for Sociolinguistics, in New Delhi in August, 1986, and at the International Conference on Discourse in Institutions at the University of Dortmund in October 1986.

1. This debate could start with Atkinson's (1979a) observations concerning efforts to "humanize" judicial proceedings by making them less "formal" and more like "conversations." He suggests that such efforts tend to ignore the inherent functionality of many institutional arrangements, such as the achievement of "shared attentiveness."
2. Except for fragment 15, all physicians quoted are male; patients, however, are both male and female. I have adapted my use of pronouns to this circumstance.
3. The data extracts are presented in a simplified form (see appendix); the Dutch version will be followed by an English gloss, which is intended to capture the utterance as it was spoken, and not to provide fully colloquial English.
4. Harrie Mazeland pointed out to me that this can be done by using verbs like "to be" or "to have" for background items, as opposed to verbs like "to get" for the pressing complaints: compare, in 3, lines 24–5 with lines 27 and 31.
5. This contrast between "respondents" and "informants" as locally constituted identities is currently being developed by Harrie Mazeland in a conversation analytic study of sociological research interviews.
6. This discussion, being restricted to "talk" as its topic, does not consider non-vocal devices. Christian Heath (1986) makes it clear that movements of the body can be used very effectively as "covert initiatives."
7. These findings are partially similar to what Frankel (1990) reports. He also mentions that most of his patient-initiated questions were put forward towards the end of the consultation, specifically at "unit boundaries," but – contrary to my findings – his examples display many dispreference markings, such as pauses, token acknowledgments and announcements, preceding the questions, even at those locations.
8. Just how rare this is cannot at the moment be specified. As far as Heritage knows it is very rare indeed in English language material. In eight complete consultations from my corpus, however, where patients used "Oh" 31 times, I have found that physicians produced 14 cases of "Oh." My intuition is that this does not represent a "language" difference. "Oh" seems to function in a similar way in both languages. It may be an aspect of a more informal style practiced by Dutch physicians, especially by general practitioners who know their patients for years.

The Construction of Conflicting Accounts in Public Participation TV

Joanna Thornborrow

This article examines the occurrence of the conversational historic present (CHP) tense in the institutional context of media discourse – specifically, its use as an interactional resource in the talk of "lay" speakers in public participation television. The study arises from a continuing research interest in lay speaker participation in media discourse (Livingstone & Lunt 1994), particularly in speakers' use of narratives in mediated contexts (Thornborrow 1997). In collecting recordings of a series of broadcasts involving different forms of audience participation (the transcripts are of naturally occurring talk from British and American talk shows, and from an American television court series), I began to notice that, when two participants were involved in telling their own version of the same story, there were significant differences between the ways in which the first and second stories got told. In second accounts, there seemed to be a fairly consistent shift occurring from past tense forms to the CHP in main event clauses. By contrast, the use of CHP in such clauses was practically absent from all first accounts. This recurring feature of second, conflicting accounts of previously told stories in the data warranted closer attention.

This analysis will explore two issues: first, the occurrence of CHP as a situated, interactional resource for telling conflicting stories; and second, the way that its use in this mediated context might be explained as a means of accomplishing a specific action – the construction of publicly accountable, alternative accounts.

Theoretical Background

The analysis in this article is broadly informed by interactional discourse analysis and by Goffman's notion (1981) of FOOTING and PARTICIPATION frameworks.

Source: *Language in Society* vol. 29 no. 2 2000 pp. 257–277

It also draws on and develops previous work on the occurrence of CHP in narratives (Wolfson 1978, 1981, Schiffrin 1981, Johnstone 1987, Leith 1995). My aim is to examine the occurrence of this grammatical form as a discourse feature which contributes to a particular kind of action undertaken by speakers in the context of public participation TV: the situated production by co-present speakers of conflicting accounts of the same event, or sequence of events.

In Wolfson's account (1978) of tense alternation between the past and the CHP, she describes CHP as an interactional variable rather than a semantically marked verb form. As such, it is highly dependent on speaker–audience relationship, within a particular genre or speech event. While she acknowledges that CHP may function to structure experience from one speaker's point of view, and also to dramatize that experience, Wolfson maintains that it is the switch itself – from past tense forms to CHP, or vice versa, signaling a change from narration into PERFORMANCE – that is significant, rather than semantic content or value of actions narrated in either tense.

Wolfson also looked at the sociolinguistic variables of age, occupation, ethnicity, and status that might affect the likelihood of CHP's occurring in narrative speech events; in relation to these variables, she found that performance is likely to occur when speakers are sure that their stories will be understood and appreciated by their audience – i.e., when levels of similarity and empathy between participants are high. The degree of narrative performance can therefore be a discursive resource for constructing intimacy between speakers, since CHP is a variable that is sensitive to symmetrical social relations.

Schiffrin 1981, in a quantitative analysis of tense variation between past tense and CHP, argues that CHP is both (i) a stylistic device used by narrators to signal vividness and drama, and (ii) a discourse feature which organizes the narrative into chronological segments. In Schiffrin's analysis, the direction of the switch IS significant, and she finds that the switch back to past tense forms from CHP serves the function of separating distinct narrative events (1981:56). She also claims that CHP is a grammatical resource which foregrounds the speaker's experience (1981:46) and, in doing so, acts as an internal evaluation device through which narrators can present events as if they were happening there and then, from their particular point of view.

Schiffrin's account of the evaluative function of CHP could also be characterized in interactional terms as enhancing the degree of speakers' commitment to what is being said – i.e. to their version of the story at hand. To use Goffman's notion of "footing," which describes the structural relationship between speakers and their utterances, CHP may well be a grammatical device on which speakers systematically draw so as to foreground the "principal" of their story. In other words, speakers may switch to CHP in order to mark their level of commitment to their story, and the extent to which they are "the party to whose position the words attest" (Goffman 1981:226). The specific nature of the participation framework in my data – where the different accounts are being produced for a co-present, overhearing audience – may also contribute to a second narrator's use of CHP as a discursive device which can function to construct a more believable version of a story, once a first version has been heard.

In an analysis of two separate tellings of the same folktale by the same speaker, Leith 1995 found (a) that CHP was the norm in a performed narrative; (b) that in his data it frequently marked the onset of a complicating action; and (c) that it was highly likely to occur in contexts where dialog was being recounted, "as if the 'now' of dramatic speech creates a sense of present action" (1995:60). He notes, like Wolfson, the highlighting effect of the switch to CHP through the event of the switch itself; and like Schiffrin, he identifies its organizing function in the telling of different event sequences. Leith also argues that the use of CHP depends to a great extent on the relationship between the teller and the audience: The greater the degree of solidarity between the two, the greater the frequency of CHP. However, he suggests that the use of CHP is most often a performance variable which is determined by genre and which, in many cases, functions as a generic marker for the production of short comic narratives, jokes, and in his data, folktales.

Finally, Johnstone 1987 analyzes verb tense alternation in a category of verbs she calls "dialog introducers," such as *say* and *go*, in stories involving the teller's encounter with some form of authority figure. She found that, in reported dialog, the talk of the non-authority (the teller) and of the authority figure was distinguished by a switch in tense from past to CHP, and that this switch was systematic; the story teller's talk was always introduced in the past tense, while the talk of the authority figure was introduced in CHP (1987:39). Johnstone argues that story tellers draw on the evaluative function of CHP to mark relative social status; but like Leith, she suggests that patterns of tense choice in oral narrative also depend on a range of factors in individual rhetorical contexts.

Taking up this point in order to develop an account of when and why speakers shift into CHP, we must pay closer attention to the contextual, situated use of this form as an interactional resource. I noticed that, in every case in my data where two conflicting versions of the same events were produced by participants, the second teller (however briefly) shifted from using past tense forms in main event clauses to using CHP. Hence I want to examine how this shift may be understood as a rhetorical form that is interactionally relevant to the situated context of the talk.

Levinson 1988, in his discussion of Goffman's ideas about the production format of utterances, notes that there are clear grammaticalized forms in many languages for displaying a speaker's level of personal commitment to what is being said, as well as for distinguishing the role of relayer or transmitter of a story from its informational source. These forms, Jakobson's "evidentials" (1971), can be realized in some languages by the modality of an utterance. Levinson mentions the case of one American Indian language (Hidatsa) where there are "systematic patterns in relation of first tellings to second tellings" (1988:185). In others, evidentials are realized through systems of contrastive suffixes indicating authorship, or through the use of aspect markers, e.g. in the telling of myths and historical tales (1988:186). It may well be that a speaker who is producing a second telling of the same story, from a different viewpoint, can also grammatically mark this telling through an evidential form which indicates "principalship" rather than "authorship." The use of CHP may turn out to be one such device

and one that is particularly sensitive to what Schegloff 1981 terms "interactional contingency." In the context of public participation TV, the use of CHP in second, conflicting accounts appears to be a linguistic resource on which speakers routinely draw in order to mark their account as different from the preceding speaker's.

Data Sources

My data corpus is taken from TV broadcasts in Britain, from 1997 and 1998, which involve different kinds of public participation in talk shows and television "courts." The transcripts in this article are of talk from the following programs: *Esther* (BBC 1, August 1997); *Judge Judy* (Carlton, August 1997), and *Montel* (Channel 4, August) 1997). First, extracts of these programs were transcribed where there was evidence of narrative sequences in the talk of lay participants. I then looked for instances where the same story, or account of events, was told by two different participants. To use Blum-Kulka's (1997) framework of "telling, tale, and teller," I was looking for sequences of talk where the tale was constant (i.e. the same events are being recounted), while the teller and the telling changed within the relatively short space of a sequence of TV time. The telling – the way the tale gets to be told by different tellers – is the object of analysis here. I found that, although the contexts for these tellings are rather different, the same phenomenon occurs in all of them.

In the TV courtroom, the setting is the equivalent of a small claims court where members of the public can be awarded claims of up to $5,000. The host of this show, Judge Judy, is described in the opening voice-over as a "real judge," and plaintiffs and defendants are called up to the bench to put their cases to her. She then rules in favor of one or the other, and the judgments made are apparently legally binding. The talk shows – one British, hosted by Esther Rantzen, and one American, hosted by Montel Williams – consist respectively of discussions about jealousy, and about teenage girls who have been thrown out of their homes by their parents. In each show, selected participants are foregrounded as having particular stories to tell in relation to the program's theme. These people are separated from the rest of the studio audience and occupy their own studio space, either facing the audience, in the case of Esther, or in the case of Montel, seated in a row next to the host, facing the TV cameras with their backs to the audience.

Analysis

The context for this talk can be broadly characterized as institutional, mediated, and multi-party. For my purpose here, the relationships between speakers seem to be best accounted for in terms of Goffman's "ratified participation" frameworks, rather than according to more typical sociolinguistic categories of social status, gender, or ethnicity. It is the participant roles occupied by the speakers

that determine what kinds of actions they undertake in the talk, rather than their relative social status. Indeed, social status seems largely irrelevant in these contexts; and this will pose a problem for the claim that, quantitatively speaking, the use of CHP is more likely when there is a high degree either of familiarity or of symmetrical social status among participants.[1] Speakers' relation to the audience is complex and multi-layered; although they may be familiar with one or two members of the audience (e.g. when members of the same family are present), the majority of participants are non-familiars, and there is a high degree of asymmetry between the role of lay participant and the hosts of these shows.

Why do these stories come about, and how are they comparable? The main feature that they share is that they provide a conflicting version of a previous participant's account of some sequence of events. The two narratives are either from opposing claimants in the TV courtroom, or from two audience members, usually from the same family. Both tellers have an experience of the same event: They were present when the events occurred, so they have a legitimate right to tell the story as it happened to them. Returning to Goffman's analysis of footing, they are AUTHOR, ANIMATOR, and PRINCIPAL; they also "figure" centrally in the story they tell (it's about them). In the TV courtroom data, the litigants represent themselves, and much of their evidence is given in the form of what Conley & O'Barr (1990:178) have called "litigant narratives." Philips (1990:197) has described the format of courtroom discourse as "typically . . . one in which each of two sides presents its view of relevant events, and then fact finders, a jury or a judge, choose which of the two versions of reality they consider to be most plausible."

So there is quite a lot at stake for these tellers: They have to convince a third party, the judge, that their version is the more plausible one. In the talk show data, there is perhaps less at stake (no money changes hands). But there is nevertheless an element of credibility involved, in that speakers are engaged in putting a second version of events across as convincingly as possible, to an audience who have already heard a first version.

What changes take place between first telling and second telling? In other words, which linguistic and discursive resources do participants use to differentiate their second telling from the first telling?[2] I begin by looking at an instance of a switch to CHP in a non-mediated, ordinary conversational context. In a study of the way stories get retold in naturally occurring conversation, Norrick 1998 has analyzed the way speakers embed the same story into different contexts for different audiences – focusing on the ways in which a story may differ, and in which it remains constant on separate occasions. In collaborative retellings of a familiar story, he found that speakers both contest and confirm other speakers' versions of events; but he never really examines how these contestations are accomplished by participants. In an earlier article, Norrick 1997 examines the function of collaborative retelling of familiar stories in terms of ratifying group membership and reinforcing group values; but again, he does not address the issue of when conflicting accounts occur, or of how they are dealt with by speakers.

The first data extract below, taken from Norrick 1997, provides some evidence that, in the production of a second, conflicting version of a preceding story,

speakers are likely to use CHP. This particular extract is used by Norrick to illustrate shifting group dynamics between different family members, as each participant attempts to contribute to the story. However, I found it interesting because it contains a sequentially produced first and second account of the same event by two different speakers.

(1) "Poodle"//Norrick 1997. Participants: Annie & Lynn (sisters), **Jean (their cousin)**, Helen (Annie & Lynn's mother)

1.	Lynn:		Remember [when–]
2.	Jean:		[it was] terrible
3.	Lynn:		Jennifer, the first time Jennifer had a perm
4.			when she came home. It was the funniest thing.
5.	Jean:		She put something on her head, a bag or something?
6.	Lynn:		She wore her–
7.	Annie:		huh huh huh
8.	Lynn:		Well she wore her–
9.	Helen:		"Hair ball, hair ball" Yeah. Because she–
10.	Annie:		She just always had this hood on. And she ran
11.			right upstairs,
12.	Lynn:	→	No. First she threw her bag up the stairs, almost
13.			hit me.
14.	Annie:		Oh yeah
15.	Lynn:	→	Then "bang." The door slams. And I'm like– I was
16.			on the phone. I was like "Ah I don't know. My sister
17.			has just walked in. I think something's wrong."
18.			[then she ran up the stairs.]
19.	Annie:		[oh that's it.]"I look like a damn poodle."
20.			{general laughter}
21.	Lynn:		Like sobbing. "I look like a poodle."

Here Lynn (the younger sister) attempts to introduce a story about another sister, Jennifer. In 1:1, *Remember* is actually Lynn's second attempt to introduce this story; she has trouble establishing her role as story "teller," since the story is a familiar one which is known to all the participants. Jean (1:5), Helen (1:9) and Annie (1:10) all contribute to the telling, but at 1:12, Lynn explicitly contests Annie's account of Jennifer's actions: *No. First she threw her bag up the stairs, almost hit me.* Annie's *Oh yeah* (1:14) indicates her alignment with Lynn's version of events, and Lynn continues with a much more "performed" account of the story: *Then bang. The door slams. And I'm like– I was on the phone.*

It is here (1:15) that the switch to CHP occurs, once Lynn has gained the floor as principal teller. The switch is momentary, lasting through only two verb phrases; but according to Norrick's transcript, it clearly does occur. Following Wolfson, this occurrence could be accounted for as the speaker's switching into performance; and it is appropriate and predictable in this context because of the symmetrical relationship in play between the teller and her audience as members of the same family group, when the speaker is confident that her story will be understood and appreciated by the other participants. Following Schiffrin, the switch would have an evaluative function as well as a stylistic, dramatizing effect;

the speaker is foregrounding her own experience of the recounted events. I sug gest that there is also an element of believability at stake here. The use of CH at this point in the talk is a significant interactional resource for Lynn, in order t establish her story as the accurate version – and it also functions as a rebuttal sinc it is produced immediately after Annie's first account, the accuracy of which Lyn has contested. Furthermore, the shift to CHP in Lynn's version occurs in mai event clauses, not just in the dialog-introducing clauses identified by Johnston

Turning now to data from a talk show, we find that the host (Esther Rantzer has just summarized a problem experienced by Maria and Tony. She addresse Maria (2:1), who produces an account of a particular incident as evidence for he claim that *he's got worse* (2:2). A general claim about not being able to go out i followed (2:9) by a story of one particular occasion when her husband's jealous caused problems for the whole family.

(2) "The Party"//1//Esther 8/97

1.	Est:		do you– has he changed over the **years**
2.	Mar:		yeah he's got worse (.) actually
3.	Aud:		((laughter))
4.	Est:		[in what way]=
5.	Aud:		[((laughter))]
6.	Kel:		=((screechy laugh))
7.	Mar:		well we can't go (down)the pub (1.0) like we could
8.			never go to a night club (.) could never go in a pub
9.		→	(.hh) like we went to a party (.) and there was a bit
10.			of an incident (.hh) like Kelly (.)that's my daughter
11.			in the blonde hair (1.0)(.hh) a young chap(1.0) had
12.			fancied her n'asked for her telephone number (1.0)
13.			(.hh) n'it caused a bit of an argument over it Tony
14.			thought (.) that I was taking the young chap's
15.			telephone number (1.0) so it was quite embarrassing
16.			(.) n'we had to leave the party (.hh) (1.0) we didn't
17.			have a row at– we had a f-few disagreements at the
18.			party (.hh) but when we had come out (1.0)I was in
19.			tears n'Kelly was in tears (.) it caused so much
20.			disruptions at the party (1.0) that we had to
21.			leave =
22.	Est:		= was this a bit up [setting] for you
23.	Kel:		[((clears throat))]
24.	Est:		Kelly too
25.	Kel:		[yes] [yes]it was
26.	Mar:		[n'Kelly] missed out on the boy [friend]

The story shows the classic structure of a Labovian oral narrative, with an abstract (*we went to a party n'there was a bit of an incident*, (2:9), orientation sequences, a series of complicating actions and a resolution (*we had to leave the party*), some evaluation clauses (*it was quite embarrassing* and *it caused so much disruptions at the party*), and a coda (*Kelly missed out on the boyfriend*). It is told, however, entirely in the past tense, with no switch to CHP.

This is also the first account of a sequence of events, and it is contested a few moments later in a second account by Tony in ex. 3. The host turns to him (3:1) and asks him not for his version of the story, although that is what he ultimately produces; instead, she poses another question relating directly to the effects of his actions.

(3) "The Party"//2//Esther 8/97

1.	Est:		do you think this is making (2.0) everyone's lives
2.			a bit miserable (.) Tony
3.			(2.0)
4.	Ton:		yeah they say th'it does (1.0) makes my life miserable
5.			as well really (.hh) but like (.) other things th–
6.			at the party it was a different (.) situation there we
7.			was all just (.) sitting having a drink n'I was I was
8.			told why don't you go (.) to the bar (.) an'the
9.		→	minute I was at the bar n'I looked round she's talking
10.			to someone else an'straight away (.hh) the old
11.			jealousy comes in an' gets you n'I think what's going
12.			on then she come up and said get a pen get a pen (.hh)
13.			I gotta give that fella the number
14.			[n'I'm like what? it's not for me] it's for Kelly (.)
15.	Aud:		[((laughter ----------))]
16.	Ton:		so I went hold on n'I'm s–[march across the dance
17.	Mar:		[((laughs ----------
18.	Ton:		floor don'I]
19.	Mar:		----------]--- >))
20.	Ton:		an'Kelly's behind goin' no no no not me not me so
21.			straight away I'm thinking (.) [well what's] going on
22.	(Kel)		[((laughs))]
23.		→	(.hh) an'I (.) lose my temper from there on in
24.	Est:		so it wrecked the party from your point of view and
25.			indeed from your family's point of view
26.	Ton:		yeah
27.	Est:		is it wrecking your life all this (.) suspicion
28.			suspicion suspicion

Tony begins his account of events at the party with an embedded preface (3:6): *at the party it was a different situation.* In so doing he sets up his story as different, as an account which is going to conflict with Maria's. We now know not only that a story is coming up, but also that it will take issue with the events as they have been described by the preceding teller. At 3:9 the first switch into CHP occurs; and until the resolution (for Tony) in 3:23 (*so I lose my temper from there on in),* the majority of the narrative is told using CHP. Here not only the dialog is produced in CHP, but also most of the main event clauses:

she's talking to someone else
the old jealousy comes in an gets you
I think what's going on
get a pen get a pen

n'I'm like what
it's not for me it's for Kelly
I'm s– march across the dance floor **don'I**
n' Kelly's behind going no no
straight away I'm thinking
what's going on
I lose my temper

If we are to take the switch into CHP as an indication of level of narrative performance through the stylistic dramatization created by these present tense forms – not just in the dialog sequences, but in most of the main events in the story – then this second account is clearly "performed" to a much greater extent than the first. (I have taken *come* in 3:12, *then she come up and said*, to be a non-standard past tense form). What is interesting about this story, though, is that the occurrence of CHP here runs counter to both Wolfson and Schiffrin's claims. They propose that the switch into CHP can be seen as "an index of proffered commonality" (Wolfson 1978:236) and is therefore likely to occur when the speaker is of equal status and sure of the empathetic stance of the audience toward the story. But in ex. 3, the speaker is addressing a studio audience which for the most part is unfamiliar to him, and a host whose status as a media celebrity and controller of the show should be producing a relationship of social distance rather than familiarity. Nor does the switch function as an indicator of a generic shift into a different kind of discourse, e.g. a joke or funny anecdote, as Leith points out may sometimes be the case (1995:68). The story is nonetheless a performance in the sense that it is publicly produced from a front-stage position, on camera, to a studio audience. Why should this second, conflicting account contain a high-level use of CHP, when the first account does not? The answer to this question is possibly more likely to be found in this story's sequential position in relation to the preceding one – and in what the speaker is accomplishing by producing it – than in a simple switch into performance in relation to sociolinguistic variables of intimacy and symmetrical status.

To explore this idea further, we can turn to extracts 4 and 5 from the TV court series, *Judge Judy*. Here, because of the nature of the courtroom setting, the discourse is predictably more adversarial; the judge questions claimants and invites them to put their cases, essentially through providing their accounts of events. It is thus a discourse setting where conflicting accounts of the same sequence of events are highly likely to occur. However, unlike other forms of courtroom discourse (cf. Harris 1984, Philips 1990, Drew 1992), where the story is elicited principally through a highly preallocated system of turn-taking through counsel questioning, the participants in the TV courtroom answer directly to the judge. There is thus a much greater variation in participant interaction in evidence here: not just question/answer turns, but also disputes, opinions, and some degree of interaction between plaintiff and defendant.

The case I examine here concerns two roommates who are in dispute about a deposit on the lease of an apartment. In the transcribed sequence, the judge has called on Jennifer (the plaintiff) and Shannon (the defendant) to give an account of what was said in a telephone conversation between the two women

on the night that Jennifer was told to leave the apartment. Shannon goes first and tells her story of events (4:5–17). In her account, she uses CHP in quotation of direct speech as dialog, e.g. *I suggest you don't come home this evening* (4:5), and in a reporting verb, e.g. '*she goes*' (4:12). However, Schiffrin found in her data that the report of spoken interaction is the most frequent and likely context where CHP occurs, and that the use of *go* in particular is limited to prefacing only direct quotes in the present tense (1982:68). Occurrences of CHP in this type of clause can be seen at the arrowed lines below:

(4) "The Phone Call"//1//Judge Judy 18-08-97

1.	Jud:		let me– would you (.) tell me again (.) what you told
2.			her in that phone conversation [you had]
3.	Sha:		[(s'I recall)]
4.	Jud:		an argument
5.	Sha:	→	as I re (collect xxx) she said I suggest you don't
6.			come home this evening (.) I'd a friend that was
7.		→	there from ((–)) I said well I suggest (.) you go to
8.			Cindy's house the– the other girl who was at her
9.			apartment (.) uh our apartment (.h) had answered the
10.			phone when this whole verbal (.) dispute started (.hh)
11.		→	and erm (1.0) after (.) I said well I go I suggest you
12.		→	go to Cindy's (.) and she goes well you know (.) I– I
13.		→	don't know if she said I'll call the police or what
14.		→	happened and I said well (.) no I'll call the police
15.			myself and if they come (.) if it comes down to it (.)
16.			I have a copy of the lease (.) so what

The dialog sequences are produced in CHP here; but in every other event clause (apart from *goes* in 4:12), Shannon uses the past tense forms *told* and *said* to frame her report of the conversation between her and Jennifer. However, in Jennifer's account of the same telephone conversation, we find a pattern similar to Tony's use of CHP in ex. 3. Here is how Jennifer tells her story – marked, as Tony's was, with a preface signaling an upcoming contesting version of events (5:2).

(5) "The Phone Call"//2//Judge Judy 18-08-97

1.	Jud:	so then you moved out
2.	Jen:	yeah but that's not what I recall happening (.) what
3.		happened was that my friend Cindy came over she was
4.		staying over that night because (.) I was afraid to
5.		stay (.) alone in this apartment with her (.hh)
6.		and =
7.	Sha:	= I wasn't even home that evening n'you [and]she's
8.	Jen:	[right]
9.	Sha:	she's =
10.	Jen:	= I came home she wasn't home (.h)(.) [and she
11.	Jud:	[so your
12.	Jen:	called]
13.	Jud:	friend Cindy] was staying in the apartment

15. → calls (.) call me (.) every nasty name you could imagine
16. → accusing me of playing her messages (.) which I had
17. [no idea what she was talking about] yes =
18. Jud: [this was on the phone conversation] =this was the
19. phone conver[sation]
20. Jen: [and so](.) she was just screaming at me
21. → calling me terrible things she [hangs up]the phone
22. Sha: [(I don're–)]
23. Jen: → calls back I let the machine get it because I (.)
24. wasn't gonna talk to her under (.) y'know with her
25. talking like that (.hh) and (.) she left a message
26. saying (.) you better move out (.) or I'm having you
27. arrested (.) you don't have a copy of the lease (.hh)
28. [a few minutes] later–
29. Sha: [(what difference)] what difference does it
30. matter if you have a copy of the lease or not (1.0)
31. what difference does it make (.) can you =
32. Jud: =ok=
33. Sha: = is that
34. [is that it]
35. Jud: [so you believed] so you moved out
36. Jen: → right (.) a few minutes later the police arrive they
37. → get a call from Manhattan Beach (.) that there was a
38. burglary (.) in =
39. Jud: =so the police arrived =
40. Jen: =((that one))yes
41. (.) and they heard her message (.) and [that's wh–]
42. Jud: [you're not]
43. going to tell me about the pol– y'listen to me (.) you
44. can't tell me what the police heard (.) [but] the
45. Jen: [right]
46. Jud: police did arrive
47. Jen: yep they did
48. Jud: did you move out that night
49. Jen: yes [(that evening)]
50. Jud: [what are you] suing her for
51. Jen: I'm suing her because I (.) feel I'm entitled to my
52. deposit back [—]

In this second account of the events that night, it is not just the dialog sequences that are reported in CHP, but significantly, also some of the main event clauses in the narrative:

she calls me every nasty name you **could imagine**
accusing me of playing her messages
she hangs up the phone
calls back
I let the machine get it (this could be **either past or CHP**)
the police arrive

The degree of performance in this account is consequently much greater than that in the first account, where the story is constructed basically as a report of a conversation. CHP forms are limited to the representation of dialog in the first account, and all the reporting clauses in which Shannon recounts the main events occur in the past tense:

I told her
she said
I said
the other girl had answered the phone
I don't know if she said . . . what happened
I said well

Here we can see the same phenomenon recurring in a different TV context, but one where the speakers are engaged in doing the same kind of discursive work: producing a second version of events that have already been recounted by a first teller. Crucially, the second tellers are producing accounts which conflict with the first tellers' version; and in both data extracts discussed here so far, their accounts contain significant use of CHP, producing a level of performance which is absent from the first accounts.

Another sequence from the TV courtroom data shows the same pattern even more clearly, when three separate accounts are given of the same events. This case involves a dispute over repairs to a car which led to a fight between two men, Nathan and Dave. The first story of the fight is told by Nathan, the plaintiff:

(6) "The Fight"//1//Judge Judy 14-8-97

1.	Jud:	let's hear it now let's hear about the violence (2.0)
2.		'cos that's what your suing [for right]
3.	Nat:	[the first] violence
4.		occurred like I say was on Wednesday in his drive where
5.		he grabbed me by the throat and threatened that I could
6.		not back out of this deal that we're too far in to it
7.		and would cause me traumatic injury if I (.) insisted
8.		(.) he had me by the throat and ripped my shirt off
9.		n'punched me in the guts three times =
10.	Jud:	=did you do that
11.		sir
12.		(1.0)
13.	Nat:	his father [was]
14.	Jud:	[ju–] u– did you do that
15.	Dav:	oh no Ma'am

In this first account, there is no use of CHP. As we have seen in other first tellings so far, the main event clauses are all past tense clauses:

he grabbed me
threatened that I could not back out
he had me by the throat

ripped my shirt off
punched me in the guts

Next in the sequence is an account given by an eyewitness to the fight; although it is told from a different perspective, his version of events is similar to the first one, insofar as it is produced in support of the first teller's version.

(7) "The Fight"//2//Judge Judy 14-8-97

1.	Jud:		ok could you just take your hands out of your
2.			pockets [you're not] afraid of that right=
3.	Wit:		[yes ma'am] =no ma'am
4.	Jud:		alright (.) did you witness anything physical on that
5.			date between these two [people]
6.	Wit:		[yes I] did
7.	Jud:		tell me exactly what you [saw]
8.	Wit:		[well] I was sitting
9.			in the car as they were doing their conversation
10.			(.) Dave ended up taking a swing at Richard (1.0)
11.			and hit him in the side
12.	Jud:		Richard is this (.) person who (.) who was al- who I
13.			call Nathan 'cos that's [what's]in it =
14.	Wit:		[yes] =yes [Nathan]
15.	Jud:		[ok]
16.	Wit:		Richard didn't do nothing (.) Dave got irritable (.)
17.			grabbed him by the neck (.) threw him up against a
18.			door in a wall(1.0) then threw him to the ground (.) and
19.		→	then started hittin' to him (.hh) I jump over (1.0)
20.			opened up the door (.) said Nancy please call the
21.			police (.) I jumped on Dave's neck (1.0) and as I did
22.			that (.) he got off Richard (.) Nathan (.) and then we
23.			both rushed into the house
24.			(1.0)
25.	Jud:		ok (.) would you have a seat thank you

The narrative action clauses through which the witness recounts the key moments in the development of the fight as he saw it – from the opening orientation (7:8), *well I was sitting in the car*, through the complicating action clauses of the fight, and up to the resolution (7:23), *then we both rushed into the house* – are all in the past tense. The account does contain one occurrence of CHP, *I jump over* (7:19), and the witness's tense switch at this point seems to correspond to Schiffrin's finding that CHP occurs when a new episode in the story is being introduced. In effect, the clause *I jump in* marks the moment in the story when the current speaker becomes involved in the action. After that, he switches back to using past tense forms to finish his story.

However, when the defendant, Dave, is subsequently called to give HIS account of the fight, he uses CHP from the very beginning of his story, and he continues to use it throughout the sequence. This is the third time the story has been told; and in this account, the only occurrence of a past tense form is when he uses the reporting verb *said*.

(8) "The Fight"//3//Judge Judy 14-8-97

1.	Jud:	OK
2.	Dav:	I walk out (1.0) I'm very aggressive (.) I'm yelling
3.		(.) I'm cussin' at him (.) everything (1.0) I'm
4.		saying I want my car back (.) I'm saying I don't
5.		wanna deal with you any more (1.0) I'm not fixing the
6.		car you're not keeping my car you gotta get outa my
7.		life (.) all deals are off (.hh) he then looks at me
8.		(.) an he says well (.) that ain't gonna happen (.) I
9.		say (.) a little while ago you told me you're gonna
10.		bring my car back I'm at my house waiting for two
11.		hours I call you four times (.) you're hanging up on
12.		me (.) what's the deal you change your mind again I
13.		want my car back (.hh) I physically get in front of
14.		him before he go– goes in his house (1.0) I'm like
15.		this both hands up (.) Nathan (.) stop this (.) you
16.		don't wanna do this (.) so (.) next you know he
17.		physically grabs me (.) goes to push me out of the way
18.		(1.0) Nathan (1.0) he's pushin' [me]
19.	Jud:	[ssh] he's pushin' you
20.	Dav:	yeah (.) yeah he's not fighting with me (.) he's not
21.		striking me (.) he's pushin' me outa the way (.)
22.		he's just trying to get in his door
23.	??	(cool?)
24.	Dav:	I grab onto him problem is is his porch is slippery
25.		(1.0) I'm falling down he's pushin' me outa the way
26.		(.) I pull him around (.) spin him around (.) put him
27.		on ground I got my arm on his neck (1.0) an' I'm
28.		holding him
29.	Jud:	somebody said to me (.) somebody that I was
30.		having a verbal dispute with
31.	Dav:	alright [—]

In Dave's version of the fight with Nathan, the use of CHP contributes to the highly performed character of this story, in contrast to the two accounts that have just preceded it. In both previous accounts, it was Dave who allegedly started the fight; but in Dave's account, he claims (8:17) that it was Nathan who *physically grabs* him, thus putting him in a position of having to defend himself. Dave's use of CHP in this sequence seems to function on various levels: first, as a stylistic device to dramatize performance; second, as Schiffrin's "internal evaluation device," reproducing the fight as he experienced it from his perspective; and third, as an indicator of his level of commitment to this version of events, which foregrounds the principalship of his story. I suggest that its occurrence in this particular context, in an account which conflicts with the two preceding versions, is also significant in that it contributes to the third speaker's public bid for greater believability over the first two speakers' version of events. One way that speakers may accomplish this is by increasing the degree of the story's "performedness," and Dave indeed does this to a marked degree in his telling of a story that has been

In all the data discussed so far, the participant role of second (or in the last case, third) teller in these media contexts contains a further dimension which was lacking in the non-mediated example of ex. 1: a dimension of having already figured in a first teller's version. Consequently, Tony, Jennifer, and Dave are all in a position of having to produce an account which somehow will enable them to redress the situation in such a way that they will figure more favorably. In other words, they have to account for their actions to an audience which has already heard what they have done in a first teller's version. Schiffrin has claimed that, in the context of argument, "stories can be used to support a speaker's claim . . . because they lead the listener towards a sympathetic alignment with the position being argued" (1990:253). We are not dealing with argument as such here, but the issue of alignment seems relevant to the position of speakers involved in producing second, conflicting accounts of first stories. Since the story has already been heard by the studio audience and the courtroom participants, the problem facing the second tellers is to find a way of producing the same story again, but in a version which aligns the audience sympathetically with their position rather than with the position of the first teller. I suggest that the shift into CHP is a discursive resource available to producers of these second stories; it enables them to foreground their level of commitment to their story through a performed present version of past events as they experienced them – their principalship. It also enables them to produce a story where their actions are presented to an audience as justifiable and accountable. Both these actions seem crucial in sympathetically aligning the story recipients (judge, host, studio audience) to the second teller's position, and in producing a version of a story which functions as a rebuttal of the previous speaker's version.

In the extracts discussed so far, all the accounts have been produced by speakers within a relatively short interval, in terms of TV time. Tony's version of "The party" comes straight after Marie's; Jennifer's version of "The phone call" immediately follows Shannon's; and Dave is asked for his version of "The fight" immediately after Nathan and his witness have given their accounts of what they saw. In the next extract, taken from the Montel Williams Show, two versions of a story appear with a much greater interval. Montel is considering the case of three teenage girls who have been thrown out of home by their parents. He invites the girls to tell their stories in the first part of the show; then, after the break, he invites their parents to respond to their children in the second part. The second version of the story below, even after editing, occurs at a much later stage in the proceedings than the first version. Nevertheless, the second teller still briefly switches into CHP, while the first teller does not use it at all. Here is the first account, produced by Angel with some intervention from Montel, of what happened while her parents were away one weekend:

(9) "The Break-In"//1//Montel Williams 8-97.

1	MW:	What did your mother do to you
2	Ang:	.hhh well (.) she kicked me outa the house
3		because she took away my keys (.) n'so I had
4		to break in to get clothes out of my house (.)
5		while they were out of town .hhh =

7 and Dad were outa town (.) you broke in to their
8 house
9 Ang: [huh – wu– xxxxxxxxxxxxx)]
10 MW: [and to get some things and you said well]
11 so now I (already) broke up may as well have a
12 coupla friends over
13 Aud: ((laughter))
14 MW: so the friends came over had a little party (s)
15 Ang: (w)ell no (.) three friends I wou [ldn't call that]=
16 MW: [three friends]
17 Ang: =a party but
18 MW: little beer=
19 Ang: =they they acted like it was a party
20 y[eah]
21 MW: [little beer]
22 Ang: a little beer [yeah]
23 MW: [little] pizza
24 Ang: little pizza [yeah]
25 MW: [what] else did you do
26 Ang: erm nothin' we just watched movies (.) stayed there
27 for a little while (.) pizza man came an' (.)
28 went n' (.) snitched on us for not paying him
29 (.) a dollar that we owed him .hhhh [and–
30 MW: [then they called
31 back up and told your mother that
32 Ang: yeah (.) and she freaked out about it like always
33 (.)'cos (.) s'just how she is I guess she's a little
34 church lady
35 Aud: ((xxxx))
36 MW: and she pitched you outa the house
37 Ang: yeah

Angel's story is to a large extent co-narrated by Montel, who supplies some of the orientation and evaluation. The main events are told by Angel: Her parents had taken away her key, so she broke into the house to get some things (9:2–5); she watched movies with friends, ordered a pizza, and underpaid by a dollar (9:26–29); and finally, her mother found out and *freaked out* (9:32–34). However, she is not given the discursive space to produce her own story in her own words.[3] Montel even produces the coda (9:36): *and she pitched you outa the house.* Angel does produce some evaluative elements, e.g. *three friends I wouldn't call that a party* (9:15), *they acted like it was a party* (9:19), *s'just how she is I guess she's a little church lady* (9:33–34); but she does not switch to CHP at any point in her account of the events which led to her being thrown out of home. Later on in the program, however, her parents give their side of the story (without any intervention on the part of Montel). This is her mother, Karen's, account of what happened:

(10) "The Break-In"//2//Montel Williams 8-97
1 MW: okay but now we're at the point where where (.)
2 she's been thrown out why

3	Kar:		.hhh erm (.) it's been an ongoing problem for
4			the last few months (.) we've had occasion to
5			leave our home (.) and when we leave (.) I don't
6			feel (.) at sixteen seventeen that she should be
7			left on her own because I know she likes to party
8			'n those are things I don't want done in my house
9			.hh an'so we always tell her to find a place
10			she has friends whose parents welcome her to their
11			home (.) and this last weekend when this happened
12			(.) she packed her suitcase (.) I asked her do you
13			have everything you need (.) yes I said I don't want
14			you to come into the house we're locking it (.) stay
15			at your friend's house (.) I won't come in (.) we come
16		→	home from the weekend (.) she's been in the house
17			erm (.) had broken into the house broken a lock
18			between our garage and the kitchen to get into the
19			house (.) er my sister had come in to check on er (.)
20			the animals had found beer in the refrigerator
21			n'this type of thing (.) erm (.) a message on the
22			recorder from the pizza delivery place that they
23			had been– there had been a problem (.) I called there
24			(.) ah the pizza kid had been shorted money
25			he said that somebody in the house had kind'v (.)
26			bullied him (.) er that was his story erm (.) an'
27			we have asked her and asked her not to do this (.)
28			an'it was like it was the final straw what do you
29			do (.) we've talked to her we've we have gone to some
30			counseling I have asked her to go to counseling so
31			we can try to resolve our problems (.) she doesn't
32			want to because she doesn't think she has a problem
33	MW:		you're shaking your head no (.) why

In her account of the weekend's events, Karen uses CHP, predictably, in those sections of the story where she is reporting dialog between herself and her daughter (10:13–15). Then, in 10:15, she shifts into CHP at a key point in the narrative: *we come home from the weekend* which marks the transition between the parents' absence and their return. She continues with one more narrative clause in the present perfect, *she's been in the house*, before switching back into a past verb form *had broken into the house* (10:17). This sequence within Karen's narrative, although brief, again is evidence of a second teller's use of CHP in an alternative, conflicting version of a previously produced, first teller's account.

Conclusion

So far, I have discussed the use of CHP as a consistent and recurring feature in second tellings of stories within the mediated context of public participation TV. I have argued that it occurs particularly where speakers are producing a story for an audience (and in the TV courtroom data also for a judge).

it not just as an alternative version of previously recounted events, but as a version in which their actions are made accountable to the audience. I suggest that CHP is a linguistic resource which can enable speakers to realize levels of principalship and of performedness in these second tellings, which contribute to producing this accountability – and consequently to causing a potential realignment of the audience to the second speaker's version of events and a rebuttal of the first version. Before concluding this analysis, I will turn to two more data extracts, one of which contains an example of conflicting accounts which are realized in a non-narrative format; the other contains a single story with no conflicting version. In neither of these sequences do the participants use CHP, which in my data seems to be a characteristic feature of second, conflicting accounts.

In the following extract, the participants (two male partners) have been talking to Esther Rantzen about the jealousy in their relationship which had led to one of them making a suicide attempt. This is how the first man describes his feelings:

(11) "Suicide"//Esther 8-97

1.	Man1:	erm (1.0) I wanted to kill the other person (.)
2.		I really started to fantasize about killing the
3.		other person (.hh) I wanted to wreck his career
4.		(.hh) erm (.) I wanted to kill my partner (.) I
5.		wanted to kill myself (.) a::nd (.) I started
6.		making some suicide bids (.) II grabbed a knife
7.		and tried to slash my wrists in the kitchen =
8.	Man2:	=((mmm))
9.	Est:	did you know him then
10.	Man2:	yeah (.) this was in my kitchen

Here the man is directing his talk at the studio audience, who are the primary recipients of the story through the mediation of Esther Rantzen. However, a shift in the participation framework of the talk occurs as the sequence progresses, when the second man produces further evidence of his former partner's jealous behavior during a trip to Brighton (line 7):

(12) "Brighton"//Esther 8-97

1.	Est:		so it's the [ultimate revenge]
2.	Man1:		[and it's going to] trash his life
3.	Est:		yeah
4.	Man1:		it's the ultimate revenge
5.	Est:		but you didn't do these things
6.	Man1:		no=
7.	Man2:	→	=no but he done done other things (.) like (.)
8.			with my other partner (.) erm (.) he would then
9.			follow us (.) down to Brighton (.) to see where
10.			[we were going to see what we were doing]
11.	Man1:	→	[I didn't follow you we] we ended
12.			up in the same town I did not follow you =
13.	Man2:		=but your
14.			car was behind us almost *a*ll the w*ay* =
15.	Aud:		=((laughter))

This story is contested by the first man, but not in the form of a second account. In this instance, the conflicting point of view is realized by a direct denial of the preceding version of events (lines 11 and 12 in the transcript below), and more significantly, it is realized within a dispute sequence between the two speakers, who are directly addressing each other rather than the studio audience. The interaction between the two men becomes argumentative, with interruption and overlapping talk (lines 10–11), and with M1 repeating part of his overlapped utterance *I did not follow you.* At lines 13–14, M2 makes a counter-claim – *but your car was behind us almost all the way* – which provokes a response of laughter from the audience. Clearly, the first man's claim that he had just *ended up in the same town* was not a sustainably believable one at this point. So the participation framework here differs from that of the earlier part of the story in two respects. First, instead of referring to each other in the third person, as in ex. 11, they use second person pronouns as they begin to address each other directly (lines 11–14). Second, the talk shifts from the narrative mode of the suicide attempt story to a confrontational dispute between the two men concerned. Although they remain ratified participants in the speech event, in ex. 12 the studio audience is no longer being directly addressed as the primary recipient of a story as it is in ex. 11. The main point here, then, is that CHP seems to be used most typically in this context when a particular configuration of participancy holds: i.e. in the construction of second, conflicting accounts which are addressed to a third party (or parties, in the case of the wider studio audience).

There are many single-version stories told by one teller in my data from these shows which do not contain any instances of CHP. One example, again from "Esther," is the following extract where a participant is giving an account of his jealous reactions when out shopping with his girlfriend. He uses present tense forms in his story, not to recount a specific event, but to recount a typical scenario that occurs whenever they go shopping together (lines 11–14):

(13) "Tesco's"//Esther 8-97

1.	Est:		so it's insecurity is that right Simon =
2.	Sim:		=my biggest
3.			worry (.) in the whole world I think is
4.			losing her (.) I mean (.) we used to go to
5.			Tesco's (.) all the time to do our shopping like
6.			everybody else (.) but now we have to go sort
7.			of just before closing time
8.			[because] there's so much hassle=
9.	Est:		[(so)]
10.	Mar:		=((laughs))
11.	Sim:	→	like y'go I go to the (.) pick some strawberries and
12.			I turn around an' there's s– couple of blokes sort of
13.			going (( )) and I s– suddenly I just wanta (1.0)
14.			ram my trolley into them or=
15.	Aud:		=[((laughter))]
16.	(?):		=[((xxxxxxxx))]
17.	Sim:		or I make I make eye contact and (1.0)
18.	(?)		" "

19. Sim: I try to (.) I mean I (.) I haven't yet (1.0)
20. done anything physical but I have been =
21. Est: = so these
22. aren't people talking to [Amanda these] are people
23. Sim: [no not at all]
24. Est: just looking at [her]
25. Sim: [just] looking
26. Est: over the strawberries =
27. Sim: = just(.) or over
28. anything =[(xxxxxx)]
29. Aud: =[((laughs))]
30. Est: washing powder or anything [and you] cannot bear it
31. Sim: [anything]
32. Est: now [—]

So in the context of these shows, when there is only one version of a story, as in this last example, or when the conflicting version is produced within a different participatory framework, as in ex. 12 above, participants (in my data at least) do not appear to draw on CHP as a discursive resource to construct their narratives.[4]

To conclude, I have analyzed the use of CHP in the context of media narratives, particularly its use by second tellers in versions of events which conflict with previously told stories. I have found instances of speaker shifts into CHP which correspond to both Wolfson and Schiffrin's models of CHP occurrence; but I have argued, in support of Leith's point, that we must focus on the situated, rhetorical function of CHP if we are to determine why speakers use it in specific contexts. In the discursive framework of TV courtroom and talk show – where participants are engaged in producing personal experience narratives in which they have to present their actions to third parties as both believable and accountable, and particularly where these actions have already been presented by a previous participant from a different, often negative, perspective – the use of CHP is a particularly salient feature of their talk. Although not limited to these second, conflicting accounts, CHP is a recurring discursive device routinely used by participants in the data. It enables second tellers to mark their commitment as the principal of their utterances (in Goffman's terms) and not just to tell their version of the events, but to tell it differently and believably, and to work at redressing the way they figure in a story which renders their previously told actions justifiable and accountable.

Notes

I am very grateful to colleagues, participants at the Stirling University 1997 Broadcast Talk Seminar, and two anonymous reviewers for their thoughts and comments on this essay.

1. One instance where social status may be a factor in a speaker's non-use of CHP is in ex. 9, where the asymmetrical status between talk show host Montel Williams and teenage guest Angel is particularly marked as he participates in the telling and evaluation of her story.

2. The focus of this analysis is specifically on the relationship between tense shifts and speaker footings; although there are undoubtedly other ways in which second accounts differ from preceding ones, I do not have space to discuss those differences here.
3. It is worth noting here that Angel is manipulated into telling this story in part using Montel's version of events rather than her own, resulting in a story which is not singly animated and authored, in Goffman's terms.
4. I am not suggesting here that, in single-version stories in mediated contexts, speakers never switch to CHP; rather, its use is routinely salient in second speakers' versions.

The Clause as a Locus of Grammar and Interaction

Sandra A. Thompson and Elizabeth Couper-Kuhlen

1. Introduction

In this article, we are interested in how the study of language and the study of interaction can mutually inform one another. We focus especially on what the study of interaction can contribute to an understanding of linguistic 'structure', as part of an enterprise that is coming to be known as 'Interactional Linguistics'. But instead of taking 'linguistic structure' for granted, we wish to problematize it, to come closer to an understanding of what the nature of the orderliness that linguists call 'structure' is. We will show that the study of interaction has everything to do with the answer to this question.

At the heart of 'linguistic structure' is what linguists call 'grammar', by which we mean regular patterns at the level of sounds, words, and larger units such as phrases, clauses, and sentences. It is not an exaggeration to observe that many of the findings in Interactional Linguistics have contributed to a radical new understanding of the nature of 'grammar', in large part due to Duranti's Thesis 1 (this special issue), 'the primacy of interaction'. As Schegloff has pointed out (1996b), it is in interactional settings that we can see grammar 'at work', and can thus begin to appreciate what 'grammar' must be understood to be. Three major contributions to a new understanding of grammar have arisen from a focus on grammar at work.

The first contribution is the recognition that the routinized patterns that we call grammar exist because speakers need routinized ways to implement *actions*. In fact, the nature of the actions being implemented has been shown to have much to do with the grammatical shape that turn units take. Drawing on recent scholarship in Conversation Analysis, we find that certain kinds of action

Source: *Discourse Studies* vol. 7, no. 4–5, 2005, pp. 481–505.

precipitate certain kinds of grammar. An obvious example would be the fact that certain types of questioning, as Heritage and Roth (1995) have shown, motivate non-interrogative syntax (see also Heritage, 2002; Schegloff, 1996b; Weber, 1993). The actions being implemented by grammar are also eminently *interactional*. This is because they are embedded in sequentially organized courses of action (Schegloff, 1995, 1996a, 1996b). These interactional dimensions can be seen to implicate grammatical choices at more subtle levels as well. For instance, the work of Fox (1986, 1987) has shown that the choice of a full Noun Phrase or a pronoun in English conversation is bound up with the display of the structure of conversational sequences.

A second, related, contribution to come from the analysis of grammar in interaction is the recognition that grammar is knowledge of how to *do* things (Bybee, 2002b) and how to do things *together* (Clark, 1992, 1996) – that is, it is *shared* knowledge in a very literal sense of the word. And since clauses are shaped in contingent situations of interaction, grammar is constantly being shaped and re-shaped, constantly undergoing revision and redesign as it is deployed in everyday talk. The work of Goodwin has shown that grammatical constructions as they emerge in conversation are sensitive on a moment-to-moment basis to aspects of verbal and non-verbal *recipiency* (Goodwin, 1979, 1980, 1981, 1989, 1995). Grammar thus cannot be a wholly fixed property of individual human brains. Instead it must be thought of as *socially distributed* (Fox, 1994; Ochs et al., 1996; Schegloff, 1991), *emergent* (Helasvuo, 2001a, 2001b; Hopper, 1987, 1988, 1990, 1998), *responsive to contingency* (Ford, 2004), and thoroughly *temporal* (Goodwin, 2002; Hopper, 1992). Duranti's Thesis 3 notes the problematic relation of our enterprise to established disciplines. We might add in this respect that there are numerous researchers working in the field of linguistics who do not yet embrace this emergent view of grammar.

A third contribution of analyses of interaction to our understanding of grammar is the recognition that if linguistics is to provide an account of the way people really use language, then its perspective on the nature of grammar must be both interactionally sensible and cognitively realistic. Duranti's Thesis 5, referring to 'units of analysis', brings us to the concept of *formats*, or *schemas*, as a valuable notion for the study of language in interaction. We've been struck by how strongly studies of conversational data support the position that speakers draw not only on lexical material, but also on formats which they use recurrently. These formats can be found at all levels of language organization: phonological, morphological, and syntactic. For example, one regular phonological format can be related to the generalization that English syllables often begin with the combination of sounds *sl-*, as in *slip, slide, sleep*, etc., or *sn-*, as in *snake, snap, snicker*, etc. With *b*, on the other hand, although words beginning with *bl-* are common, as in *black and blue*, there are no words beginning with *bn*. Phonological, morphological, and syntactic formats are widely studied within linguistics. It is these formats which are seen in an interactional linguistic perspective as resources or tools for contingently building turns at talk and implementing actions (see Ford, 2004, for valuable discussion).

Edelman (1992) suggests that the human brain is exquisitely adapted to re-

for solving everyday problems. With frequent repetition, as synapses become strengthened, these routines become crystallized as habits, what we call 'formats'. Grammar can thus most fruitfully be seen as *procedural* knowledge (Bybee, 2002b), as a collection of *crystallizations of linguistic routines* (Bybee, 2001a, 2001b, 2002a, 2002b; Bybee et al., 1994; Haiman, 1994, 1998; Hopper, 1987, 1988, 1998). In other words, grammar is best understood as what has been ritualized from interactions, as a very loosely organized set of richly and complexly categorized memories people have of how they and fellow speakers have resolved recurrent communicative problems. Once again, what is fascinating about these grammatical formats is the ways in which they are tied to certain types of social actions and specific sequential contexts.

When we talk about language in interaction, then, we are not so concerned with staking out a new 'subdiscipline' as we are with discovering the nature of grammar seen as social action and interaction. We are interested in learning more about *grammatical formats as interactional practices*,[1] as sedimented ways of resolving recurrent communicative problems. Being linguists, we are also concerned to investigate interactional grammar in as wide a variety of languages as possible. This is because we observe that the set of tools each language offers its speakers is different. Consequently, we find ourselves asking how the same communicative problems, assuming these to be more or less universal, shape different types of grammatical solutions. We ask this not only because we are curious (we are this too!), but also because we wish to explore and understand how grammar is *shaped* by interaction. How much variability is possible? What are the limits of variability? Conversely, we find ourselves asking to what extent the different grammars we observe in the languages of the world themselves shape interactional practices. Here too the ultimate question for students of language in interaction is, How is interaction shaped by grammar?

That is, taking a cue from Levinson (this special issue), we might liken the relationship between grammar and interaction to the reflexive relationship between kinship systems and interaction. Both grammatical systems and kinship systems are inherently contested and 'fuzzy'; both systems arise from interaction. But then they come to have an emergent, if loose, structure of their own which can in turn influence the way interactions crystallize into recurrent patterns. In the case of talk-in-interaction, this means that, for example, different patterns of turn and sequence organization, repair, overlap behavior, and turn extension emerge in different languages partly due to the systematic grammatical regularities in each language (DuBois, 1987, 2001; Hopper, 1987, 1988, 1998).

We would like to illustrate some of these points now by showing how they bear upon one kind of linguistic 'structure' found in interaction, the clause, using data from our own and others' research.

2. Interaction and the 'Clause'[2]

Perhaps the most central task facing people talking together is that of figuring out what actions the utterances of others are implementing. This question is crucially

dependent upon what counts as an utterance. Based on a lifetime of experience with a language, speakers come to be able to project the trajectory of an utterance in progress, what it will take for that utterance to come to completion (Goodwin, 1979, 1980, 1981, 1986, 1989, 1995), and thereby to project what action is being implemented by that utterance in the given context. One of the primary findings of studies of language in interaction is that *grammar* plays a major role, arguably *the* major role, in enabling this projection.[3]

Now, as Sacks et al. (1974) have pointed out, places where speakers routinely behave as though another's turn has ended are precisely 'the possible completion points of sentences, clauses, phrases, and one-word constructions' (p. 721).[4] That is, it turns out that no matter what language we look at, the stretches of talk which are routinely projected and treated as *complete* in talk-in-interaction are *grammatical formats*. And we observe that one of the most frequent types of grammatical format regularly taken to be complete in the languages we have looked at is a format consisting of particular predicates (in English these are verb complexes) and the phrases that 'go with' it. Linguists will recognize this unit of [predicate + phrases that accompany it] as the 'clause'. With Schegloff (1996a, 2001b (see note 1)), then, we are claiming that the favorite unit of linguists, the *clause*, is a unit of interaction, but, following Helasvuo (2001a, 2001b, [2003]), we wish to go one step further and claim that the clause is in fact the *locus* of interaction in everyday conversation.[5] In fact, no matter what language we consider, the clause is one of the most frequent formats which speakers orient to in projecting what actions are being done by the utterance of others, and in acting on these projections (Auer, 1992, forthcoming). So the clause can be thought of as a crystallization of solutions to the interactional problem of signaling and recognizing social actions.

Why and how does the clause represent a solution to this problem? We suggest that the answer may be that the *predicate*, the sine qua non of clause formats, is the element that enables recipients to know what social action is being carried out by a given utterance in a given sequential context. This means that the clause is precisely that unit which permits significant projectability. (Tanaka (1999) persuasively makes this argument for Japanese; we are extending her argument to suggest that the clause is a locus of significant projectability for all languages.) Indeed, what characterizes clause-size formats is the fact that their key element is a predicate. Knowing how to anticipate where a predicate is likely to occur, and sometimes even what the nature of that predicate is likely to be, is what allows for more or less predictable trajectories. Orienting to predicates, would be next speakers can monitor the course of an utterance in progress for its projectable completion and thus be in a position to recognize the social action it is implementing. *The clause, then, with its crucial predicate, appears to be a unit which facilitates the monitoring of talk for social actions.*[6]

Interestingly, however, the way in which clauses afford grammatical projectability varies significantly from language to language. In this article, we will only focus on English and Japanese, but we hope that our treatment of these two typologically different languages will suggest directions for future research with interactional data from many other languages.

2.1 The Clause in English

To take English as a first example (as Clark and colleagues (http://www-psych.stanford.edu/~herb/), Ford and Thompson, 1996, Helasvuo, 2001a, 2001b, and Ono and Thompson, 1995, 1996, have shown), conversational data are rich with evidence that speakers organize their interactions around the completion of clause formats. These formats tend to be alike: a 'subject' noun phrase ('NP') – most typically a pronoun (Du Bois, 1987, 2001; Givón, personal communication: Scheibman, 2002) – is followed by a verb complex and possibly other items that strongly tend to occur with that verb complex, such as an 'object' noun phrase, a prepositional phrase, adverb, or adverb phrase.

The extract in (1) illustrates common clause-size formats for English. Here Alice is complaining about how hard it is for her and her husband Ron to live with another couple. We include the entire sequence for discussion purposes, but lines 12–15 constitute the part we're interested in at the moment:

(1) A Tree's Life (59.02)[7]

[Transcription follows the conventions of Du Bois et al. (1993); see the Appendix for a summary. Each line represents an intonation unit.]

1		ALICE:	... god I still can't believe Tim bitching around and,
2			.. he lied too.
3			... he said that he talked to Ron,
4			and all this other shit?
5		MARY:	about what.
6		ALICE:	... about % ... the way ... they were feeling,
7			... of them being the only ones cleaning the **house**,
8			and all this other shit?
9			... (H) I mean what they don't realize,
10			is like,
11			... shit,
			Subj. NP / Verb (complex) / Prep. Phrase
12	→		when Ron / gets home / from wor=k,
			Subj. NP / Verb (complex) / Prep. Phrase
13	→		... I / wanna spend time / with Ro=n,
			Subj. NP
14	→		because Ron,
			Verb (complex) / Prep. Phrase
15	→		... usually doesn't get home till / (@)nine or ten.
16		MARY:	...yeah.
17		ALICE:	unlike Tim,
18			he has to w=ork,
19			for every little dime that he makes.
20			...You know?
21		MARY:	.. [Yeah=].

22 ALICE: [He doesn't] get any breaks.
23 MARY: ...Yeah%,
24 ...Tim is on salary=,
25 and he can take lea=ve,
26 and,
27 ALICE: Mhm,
28 ... and [he earns] lea=ve,
29 MARY: [he's] –
30 ALICE: ... he gets sick leave,
31 ... we don't get shit.
32 MARY: ... (TSK) I don't know.
33 ... (H) ... It is really hard living with another couple.

We note that most of the turn components in this extract are clause formats. But if we focus our attention just on the part of Alice's complaint in lines 12–15, we can see that this is a *compound* turn format, whose components are clauses, consisting of the Subject NP, then the verb complex, and then the NPs and prepositional phrases that go with it. The clause in line 13 is a potential turn unit in itself, but it is latched prosodically to the clause in lines 14–15, which provides a potential final component for this turn-in-progress, and indeed, by the time it ends, the complaint it is carrying is treated by both Alice and Mary as finished. Mary registers Alice's complaint with a minimal acknowledgement in line 16,[8] prompting Alice to extend her complaint in subsequent talk (which she does by adding further clauses). Our point here is to demonstrate the salient role that the clause format plays in turn design, and to observe that English clause formats have the characteristic shape shown in lines 12–15. This means that when an English speaker hears an NP near the beginning of a turn unit, s/he can predict that a verb complex is likely to follow, and upon hearing that verb complex, can narrow down the range of types of linguistic elements that it would take to complete the clause in context and thus to bring the turn unit to a point of possible completion.[9]

As this extract shows, in clausal English formats the predicate tends to occur relatively early, with NPs and other elements that it projects following it. It is based on this kind of recurrent orderliness that Schegloff (1987, 1996b) has proposed that the *beginning of the turn* in English is a key locus for projectability, and later research has confirmed this. In other words, we could say that the recurrently regular syntactic resources deployed by speakers of English tend to permit *early projection* of turn trajectories.

In addition to clause-size patterns, we also find recurrent types of words and phrases, which play a crucial role in projectability in English. Prosodic patterns combine with these lexical, phrasal and syntactic patterns to allow predictions about probable trajectories.[10]

2.2 The Clause in Japanese

When we turn to other languages, what we find is the same principle of projectability, but which may play itself out in formats revealing a quite different clausal

organization. In Japanese, for instance, we find the clause, understood as [predicate + phrases that accompany it], playing a major role in speakers' ability to project what the turn is doing, but the clause is built according to different principles.

The work of Fox et al. (1996), Hayashi (1999, 2001, 2003, 2004) and Tanaka (1999, 2000, 2001a) shows that Japanese speakers recurrently design turns such that NPs and adverbial elements – should they occur – are found *before* the predicate. In addition many referents are inferred rather than explicitly mentioned. So in Japanese there is little indication of where the clause is going until the predicate occurs. Instead, the turn unit is built up bit by bit in an incremental fashion, resulting in what these researchers have called, in contrast to English, '*delayed (or late) projectability*'.

On the other hand, Japanese has a set of *utterance-final elements*, particles and other morphemes, which are crucial for the interpretation of the epistemic/evaluative stance the speaker is taking towards the material, and which follow the predicate. Together with the predicate, these utterance-final elements mark the turn as complete and ready for speaker transition.[11] Turn completion in Japanese thus overwhelmingly coincides with grammatical, typically clausal, completion, that is the predicate together with the optional utterance-final elements (see Matsumoto, 1995, and Tanaka, 1999, for quantitative support).

As a representative example, let's consider extract (2) from Tanaka (1999: 40) (transcription as in original, where = = indicates latching of two turns with no intervening pause):

(2) (Telephone conversation)

1	→	Y:	>Getsuyoobi ni wa ikeru to omou – n n da yo=
			Monday P TOP can go QUOT ***think*** *– NZR COP FP*
			'((I)) **think** ((I)) can go on Monday'
2			=kokontokoro chotto sa [dearuiteta [mon de sa:-
			these days little bit FP going out VN since FP
			'but since ((I))'ve been running around a bit these days'
3		K:	['N ['N
			'Yeah'
4		Y:	nakanaka [yorenakute<]
			rather can't stop by
			'It's been rather difficult to stop by'
5		K:	[Warui ne]
			bad FP
			'Sorry for the trouble'
6		Y:	Uun
			'Not at all'

Focusing on line 1 of this example, Tanaka points out that the unit begins with a phrase *getsuyobi ni*' 'on Monday' marked by a topic marker (TOP), often found with expressions of time or location or other frame-setting expressions; next

comes the predicate *ikeru* 'can go' followed by a quotative marker *to* (QUOT), which tags the material preceding it as reported talk or thought. That is, the quotative marker *to,* in tagging the preceding material as a quote, projects a verb of saying or thinking to follow. Finally, in the event, comes the main predicate *omou* 'think'. The last three morphemes are particles which form a phrase with *omou* 'think', and can be considered together with it as indicating an epistemic or evaluative stance toward the earlier material, namely that the speaker is expressing a willingness to run the errand in question on Monday and is reassuring her interlocutor about this. As Tanaka notes (1999: 106–7), the positioning of *omou* 'think', together with its particles, reveals that the point at which the action of this turn, namely the display of a stance, is accomplished comes relatively late.[12] Compare this with the English translation where *think* comes early in the clausal unit.

This difference in the clausal grammar of these two speech communities has strong implications for other aspects of social interaction. Whereas English grammar typically allows early projection of the social action that might be being done by that turn, the grammatical organization of Japanese means that full import of the social action being 'carried' by that turn may not be projected or known until later in that turn. So we might expect to find interactional patterns or practices in these two speech communities reflecting this difference in projectability, and indeed, this is what we do find. As we shall show below, next-turn onset, co-construction, and turn-unit extension – to mention only three interactional phenomena – all are realized differently in Japanese as opposed to English.

3. Interactional Evidence for the Clause as a Locus of Interaction

So far we have claimed that the clause, understood as [predicate + phrases that accompany it], underlies recurrent practices in talk-in-interaction, but that these practices differ in ways that reflect the differences in clause grammar from one language to another. Our evidence for this claim comes from three practices which reveal speakers' *orientation* towards the clause. In other words, we aim to show that speakers regularly behave in certain ways that suggest they are orienting to turn gestalts that have clausal organization.

3.1 Next-Turn Onset

Strong evidence supporting the hypothesis that the clause is an interactionally relevant unit comes from the way would-be next speakers position legitimate incomings with respect to the turn underway. We find that orderly next-position incomings are routinely placed *at the completion* of a clause rather than anywhere *before* its completion.[13] This observation holds across the two typologically unrelated languages we are considering here, although what counts as a possibly complete clause in each case varies significantly. To see what this means for English, for instance, let us return to example (1) from above:

(1) A Tree's Life (59.02)

9		ALICE:	... (H) I mean what they don't realize,
10			is like,
11			... shit,
12	→		when Ron gets home from wor:k,
13	→		... I wanna spend time with Ro:n,
14	→		because Ron,
15	→		... usually doesn't get home till (@)nine or ten.
16		MARY:	... yeah:.

We observe that Mary's response (line 16) to Alice's complaint in lines 9–15 is positioned at the end of the clause *Ron, ... usually doesn't get home till nine or ten.* It is not positioned after *Ron* (line 14), although Alice's pause in line 15 might have provided Mary with an opportunity to come in. This, we suggest, can be related to the fact that on the occurrence of *Ron* the clausal unit is not yet complete. (The argument here is not that at the completion of every clause there will be a speaker transition, but only that when speaker transition does occur, it will routinely be placed respecting a clause boundary.) In order for the unit begun in line 14 to become possibly complete and therefore enable the listener to discern the social action it is performing, a predicate – and in the context of the predicate chosen for this situation, some further specification of that predicate – is due. Once the expected items have been produced, the complaint Alice is adumbrating becomes clear, and a next-turn response to it can, and does, legitimately set in.

In Japanese, on the other hand, as we have noted, clauses are organized rather differently, not only because their elements are positioned such that their main predicate comes late rather than early in the unit, but also because referents associated with the predicate – e.g. subjects and objects – can remain unexpressed. The following example demonstrates this:

(3) Tanaka (1999: 114) (unexpressed elements have been placed in double parentheses in the English gloss)

K and Y have been talking about some strawberry jam that K had previously made for Y.

1	→	K:	>tabeta?<=
			eat-Past
			'Did ((you)) eat ((it))?
2	→	Y:	=>tabeta<
			eat-Past
			'((I/we)) ate ((it))'
3	→		oishikatta yo=
			delicious-Past FP
			'((It)) was delicious'
4		K:	=Honto
			'Really?'

Following Tanaka, we notice here that following K's production in line 1 of the simple predicate *tabeta*, the past tense form of the verb 'eat' in Japanese, the floor shifts smoothly to Y. Although the action of eating clearly has an eater and something that is eaten, these entities do not need to be expressed in order for the unit to reach possible completion. Similarly, in line 3, it is sufficient for Y to say *oishikatta* 'was delicious'; she does not say what was delicious, and indeed, for many speakers, this would be the only natural expression in this context.[14] Her unit is therefore possibly complete once the predicate has been produced,[15] and K's response in line 4 is positioned accordingly. In other words, the next speaker (both Y in line 2 and K in line 4) waits for the predicate before responding but does not wait for further constituents to be produced: next-turn responses come *no sooner than* but also *no later than* the (final) predicate.

A comparison of the English and Japanese examples reveals that in each case next speakers are orienting to the clause, but that what contributes to a possible clausal format differs from language to language. A clause in both languages requires some kind of predicate, but whereas with certain English predicates speakers also expect certain arguments to be expressed (as a rule the subject before, and all other arguments after, the predicate), Japanese speakers do not necessarily expect clausal referents to be made explicit.[16] In both cases, however, speakers' orderly placement of next turns shows that they are orienting to possible *clausal* completion *in the current turn.*

This observation holds true even for those cases in which a current speaker goes on to append material after a point of possible clausal completion:[17] would-be next speakers routinely orient to the potential clause boundary by coming in at this point, although they may inadvertently find themselves in overlap with the current speaker. As Jefferson (1973) and others have pointed out, elements positioned *post*-possible completion are more vulnerable to overlap than, say, elements positioned *pre*-possible completion. And this appears to be a robust finding regardless of language. But once again the *type* of element which routinely gets post-positioned varies considerably from language to language. For English, for instance, Sacks et al. (1974) and Schegloff (1996b) have pointed to the prevalence of tag questions, address terms, politeness markers and the like in this position. Ford et al. (2002) point out that English increments typically involve adverbial constituents. We note that all of these elements – although they can in principle be placed within the clause – are more typically positioned at its edges. This reflects the fact that they are external to the clausal format. And they are frequently overlapped by an incoming next speaker. Here is an example from our data collection:

(4) Carsales 5 (Ono and Thompson, 1995: 248)

1 G: .. (H) the only thing you can do is be the best you can.
2 .. [right]?
3 D: [but definitely].

In this example, G comes to a point of possible completion at the end of his clause in line 1. It is just at this point that D concurs with *but definitely*, but inadvertently,

D's turn unit overlaps with the tag *right* (as shown by the brackets), which G has just appended at the same time to his possibly complete clause in line 1. Yet D's turn is exquisitely 'well-placed' in the sense that it comes just at the end of a clausal format with prosody suggesting completion of a turn. This is reflected in the fact that none of the characteristic speech perturbations found to accompany violative incomings are present here (French and Local, 1983; Schegloff, 1987).[18]

Japanese speakers are also observed to position elements after a clause which is potentially complete, i.e. after the production of a final predicate and optionally one or more utterance-final elements. However, the post-positioned elements typically instantiate syntactic constituent types which are rather different from those found in this position in English: according to Iwasaki and Ono (2001), they may be not only adverbials as in English, but also subjects and objects. Even though these post-positioned elements are not always set off by a prosodic break from the possibly complete clause itself, strikingly, next speakers regularly position their incoming with respect to the clause boundary – and not with respect to the post-positioned elements (Hayashi, 2003; Tanaka, 1999). Here is an example which illustrates this:[19]

(5) Tanaka (1999: 117f.) (orthography slightly modified)

(H is talking about a wedding reception he went to, which was attended by many people of high social standing, where he felt totally out of place)

1		H:	=hijooni:: (.) uitotta n desu kedo *extremely stood out N COP CONJ* '((I)) really stood out'
2	→		[watashi tte..hh e(h)e.hh *I ADVP* 'as for me .hh e(h)e .hh'
3	→	I:	[iya sonna koto nai n chau? *no such thing not N different* 'No, that couldn't be, could it?'

H's turn unit comes to a point of possible completion with the predicate *uitotta*, the past form of the verb 'stand out', and several utterance-final elements (line 1). Although H goes on to produce further post-positioned constituents *watashi tte* (line 2), in this case a previously unexpressed subject plus an adverbial particle, his interlocutor orients to the possible clausal completion at the end of line 1 by positioning a response immediately thereafter (line 3). Speaker I's incoming turn and speaker H's post-positioned constituents consequently end up being in overlap.

In sum, we have tried to make two points in this section. First, the positioning of legitimate incomings by next speakers in both English and Japanese shows an orientation to the clause as a possible turn constructional unit. Second, what counts as a possibly complete clause is significantly different in the two languages – and speakers' behavior in each language reflects these typologically different grammatical formats. Clausal formats in English require certain accompanying referents (such as subjects and objects) to be expressed: clauses in Japanese typically do not. Next speakers in both languages make legitimate incomings

when the *clausal exigencies* in each case have been met. We have focused on a single speaker's production of a minimally complete clausal unit in this section. In the following sections we turn to the joint production of (minimal) clausal units and to the extension of clausal turn units in the two languages.

3.2 Joint Utterance Completion

Another primary piece of evidence for viewing the clause as a locus of interaction comes from the well-known ability of participants to collaborate in completing the turns of others (Ford et al., 2003; Hayashi, 1999, 2001, 2003; Hayashi and Mori, 1998; Helasvuo, 2001b; Lerner, 1991, 1996, 2004; Lerner and Takagi, 1999; Mondada, 1998; Morita, 2002; Ono and Thompson, 1995; Szatrowski, 2002a, 2002b). From the examples and discussion of these authors, it is clear that speakers are strongly clause-oriented in jointly constructing utterances. That is, what second speakers tend to add to a first speaker's contribution is either (1) the second clausal component of a multi-clausal unit or (2) the last word or two of a mono-clausal unit. To be able to do this, speakers must rely on their knowledge of clausal formats (as derived from their extensive experience).

Extract (6) illustrates the collaborative construction of what Lerner calls a 'compound TCU format', consisting of a 'preliminary component' and a 'secondary component':

(6) Lerner (1991: 445) [here (.) indicates a very short pause]

1	→	R:	if you don't put things on yer calendar [preliminary component]
2			(.)
3	⇒	D:	yer outta luck. [secondary component]

Extract (7) illustrates so-called 'terminal item completion':

(7) (Garrison Keillor, DAT 012)

1		S:	and he said the only thing worse
2			than second hand smug-
3			God!
4			second hand smoke is (.)
5			<moral smugness>
6		J:	hah hah hah
7	→	S:	which is again really
8	⇒	J:	accurate
9		S:	yeah

We note that the grammatical formats which permit both kinds of joint turn production are profoundly clausal in nature:

(8)

	SubjNP	Verb complex	NP	Prep. Phrase
[clause 1]	if you	don't put	things	on yer calendar
	SubjNP	Verb complex		
[clause 2]	yer	outta luck.		

and

(9		SubjNP	Verb Complex
	[clause]	which	is again really accurate

In Japanese we also find speakers jointly producing a turn-at-talk, but as Hayashi (2003) shows, co-construction in this language is typically 'delayed'. If a compound TCU is in the process of emerging, a Japanese co-participant may supply the secondary component, but typically only following a noticeable pause and often accompanied by an acknowledgement token:

(10) Hayashi (2003: 83):

9	→	Kanji:	.hh anmari komakai chekku made shi[tetara: *too much detailed check even do:if* ".hh if ((they)) check in too much detail,"
10	⇒	Muneo:	[( )
11	⇒	Muneo:	u : : :n. "Uh huh."
12		Yurie:	[u : : : : :n. "Uh huh."
13		Kanji:	[nanka : : : "'like,"
14	⇒	Muneo:	gisugisu shi[chau shi ne.] *stiff do and FP* "((the relationship among the employees)) will become awkward, right?"
15		Kanji:	[u : : : : : : : : :n.] "Yeah"

In line 9 of this example, Kanji produces the first part of a conditional sentence format *anmari komakai chekku made shitetara*: 'if they check in too much detail', a 'preliminary component' of a 'compound TCU format' in Lerner's terms. Muneo provides minimal acknowledgements in lines 10 and 11 before proceeding to co-construct the format by providing a secondary component in line 14. This pattern stands in marked contrast to English co-constructions, where it has been remarked that speaker transitions in joint turn construction are, as a rule, seamless (Falk, 1980; Szczepek, 2003).

Much more frequently, however, Japanese co-participants who co-construct another's turn supply only the terminal element of an emerging mono-clausal unit:

(11) Hayashi (1999: 479):

1	H:	asoko o:: (0.2) tetetetto orite[itta]ra shoomen ni:.= *there O [mimetic] go.down:if front in* "If you go down there, in front of you,"
2	K:	[u:n] "Uh huh."

3		K:	=u:n. "Uh huh."
4		H:	denwa ga- ano mi[dori] no denwa ga:[:] *phone SB uhm green LK phone SB* "Phones, uhm, green phones"
5	→	K:	[aru] [a]ru aru *exist exist exist* "are there." "are there, are there."

In line 4, H says 'phones, uhm, green phones'. In line 5, K then produces a predicate (the verb *aru*) that grammatically completes the emerging clause and turn.

Thus, as Hayashi argues, although speakers of both languages engage in the joint production of clausally formatted turns, Japanese co-productions are 'delayed' in comparison to English ones, because secondary components of compound TCUs are regularly produced only after a pause and optionally after a continuer, and because terminal-item co-construction of monoclausal units typically involves only the terminal item, which is generally the predicate (Hayashi, 2003). Arguably 'delayed' co-construction in Japanese can be traced back to the 'delayed projectability' of its grammatical formats: it is simply not apparent until late in the turn what it will take for a clausal format underway to be complete.[20]

What these examples show, then, is that the grammar of a language constrains the types of formats available to speakers for resolving communicative and interactional problems. The recurrent patterns revealed by the data in co-construction reflect the kinds of grammatical formats available for speakers, and, as we have seen, these grammatical formats vary in terms of whether they facilitate early or late projection.

3.3 Turn Unit Extension

As a final piece of evidence for the interactional and cognitive relevance of the clause, we would like to consider the phenomenon of 'incrementing' or TCU continuation (Auer, 1996; Ford et al., 2002; Goodwin, 1981; Schegloff, 1996a, 2001a). What our cross-linguistic research is showing is that although all speakers, regardless of language, on occasion need to continue a possibly complete turn by extending it, the recurrent grammatical strategies they use to do so differ from one language to another. The way speakers do turn unit extension in all languages, however, tends to involve an orientation to clausal formats.[21]

Following Schegloff (1996a), we will define turn unit extension as syntactically dependent material placed after the possible end of a turn-constructional unit.[22]

In English, turn unit extensions or 'increments' strongly tend to involve a piece of language that has the structure of a recurrent phrase (or clause) in the language, and which in other contexts may appear in final position *within a single turn unit.*

Consider, for example, the increment in (12), which ensues when the speaker Guy asks a question in the service of a request, but does not get an immediate reply:

(12) Nbi-1[23]

1		Guy:	W'why don'I: uh (0.6) I'll call uh (.)
2			Have you got(.) uh: Seacliffs phone number?h
3			(1.1)
4	→	Guy:	by any chance?
5			(0.3)
6		Jon:	Yeeah?

The unit *by any chance* in line 4 is not produced here as part of the turn unit *Have you got Seacliff's phone number?* in line 2. Instead, once the longish pause of more than a second has made it clear that no answer is immediately forthcoming, it is 'tacked on' to the prior unit, perhaps to modulate the relative abruptness of the requesting action it was implementing (that is, relative to the offering action of line 1). This 'increment' provides another point of possible completion, which Jon, the next speaker, utilizes for his reply. We note that the expression *by any chance* is a recurrent phrase of English and one which appears within a single *clausal* turn unit in precisely this position on other occasions, as is shown by the extract in (13):

(13) Nbi-1

1	Guy:	Is Cliff dow:n by any chance?
2		=diyuh know?

In other languages, however, this kind of turn unit extension is much less common, if not unknown. In Japanese, for example, grammatical formats in which such phrases typically occur at the ends of clauses are rare.[24] Recall that in Japanese, clausal turn units are built up with adverbials and predicate-accompanying NPs occurring *early* and the predicate occurring *late.* In addition, as we have noted, the referents in a Japanese clause are regularly unexpressed (see example (3) earlier).

Given the fact that referents are generally not mentioned, it is not surprising that a frequent strategy for extending a turn unit in Japanese is to 'fill in' a Noun Phrase which could have appeared early but didn't. Example (14) is taken from our data (Couper-Kuhlen and Ono, forthcoming), *Akichan* being a female given name:

(14) Ryokoo 6

1		R:	soshitara @ oo- asoko$_i$ ikanakatta – n da tte.
			then Au- there go:not:PAST NZR COP I.hear
			'I hear (she) didn't go (to) Au- there then'
2	→	R:	**[oosutora]ria$_i$ akichan**
			Australia
			'Australia' 'Aki'
3		H:	[doko e]?
			where to
			'to where?'

In this example, speaker R constructs a clausal turn unit in line 1 which can be taken as grammatically, prosodically, and interactionally complete, although it does not specify who is not going, nor where they are not going. Speaker R, however, perhaps intimating a problem – and in overlap with H's initiation of repair (line 3) – continues his turn in line 2, 'filling in' the unexpressed referents in line 2. We note that these noun phrases are not marked for finality by the typical 'finality-marking' final particles (Tanaka, 1999): in fact, they would not be found in this position in single clausal turn units on other occasions. *Oosutoraria* 'Australia' specifies *asoko* 'there' in line 1, *Akichan* would be located where the @ symbol occurs in line 1. Both elements would *precede* the verb *ikanakattan* 'did not go' and the other utterance-final elements.[25]

In (14), then, the current speaker comes to a point of possible turn completion, ending with a typical set of utterance-final elements, and then goes on to add an extension. But in Japanese, unlike the typical situation in English, this extension is *not* an element that would be found in final position in a single clausal turn unit, because speakers would not have heard such an element in this position in a single turn unit. Rather it is a non-final element that was unspecified in the preceding turn unit. So, this (Japanese) way of using grammatical strategies as a resource for turn-unit extension is radically different from the way in which speakers of English typically do 'adding on'.[26] And we are suggesting that this difference has everything to do with the clausal formats that experience has shown have been the most successful in their respective communities. The differing strategies for turn unit extension reflect the differing way in which clausal turn units are built up in these respective languages. At the same time they underline the tight relationship between the available grammatical resources in a language and the regular responses to interactional demands that speakers find themselves making day in and day out.

4. Conclusion

In this article we hope to have shown what happens when we look at grammar as action and interaction. We find that grammar must be thought of as distributed and emergent, and that its units of analysis are *formats* – patterns or templates – which can be thought of as crystallizations of common solutions to communicative problems and interactional tasks.

We have singled out the most prominent of these format types – the clause – and have shown how it saliently serves as a resource for constructing turns at talk and for projecting possible completion. At the same time, by examining English and a typologically quite different language, Japanese, we have shown that exactly *how* the clause affords projectability is different from language to language. In fact, the type of projectability depends crucially on the nature of clausal grammatical formats which are available as resources: in some languages these allow early projection in the turn unit, in others they do not.

Variable projectability in the clause has repercussions on interactional practices. We have examined three situations where there is a noticeable difference:

next-turn onsets, co-construction, and turn-unit extension. In each case we have seen that the practices used are precisely the ones which clausal grammatical formats in the given language 'license' (to use a stylish word). In other words, addressing Duranti's Thesis 6, the need for explicit evaluative principles, our research shows that the (variably projecting) clausal formats are precisely the ones we find speakers operating with. This evidence suggests to us that *clauses* are interactionally warranted units.

Our more general point here is that conversational data give us valuable evidence that it not only makes sense to talk about grammar, or linguistic 'structure', but that understanding this structure must come from studying the regularities in the practices engaged in by people talking to each other. Another way to put it is that a model of linguistic 'structure' must be no more and no less than a model of the way *often-used formats* are acquired, stored, processed, and used as resources by speakers in the everyday business of communicating. What scholars of language in interaction are trying to do is to understand what kinds of formats speakers are operating with and the ways in which these formats work in everyday interactions.

Appendix 1: Transcription Conventions

.	final intonation unit
,	continuing intonation unit
?	appeal intonation unit
–	truncated intonation unit
.. or (.)	short pause
...	medium length pause
(x.x)	pause of x.x seconds
%	glottal catch
(H) or .hh	inhalation
=	lengthening (except where indicated)
[ ]	speech overlap
(TSK)	alveolar click
@ /hh/heh	laughter
><	faster rate
underlining	extra amplitude or intensity

Appendix 2: Glossing Conventions

ADVP	adverbial particle
FP	final particle
LK	linking morpheme
N	nominalizer
O	object marker
P	particle
QUOT	quotative particle

SB subject marker
VN verb nominalizer

Acknowledgements

We thank Mary Bucholtz, Ignasi Clemente, Charles Goodwin, Marjorie Harness Goodwin, Makoto Hayashi, Yumiko Kawanishi, Jean Mulder, Alessandro Duranti, and especially Tsuyoshi Ono and Hiroko Tanaka for valuable discussion of the issues raised in this article. We are responsible for the way in which we've made use of their input.

Notes

1. We are indebted to Schegloff for pointing out (e.g. 1996a, 2001b) that grammatical units must be understood to have emerged from the exigencies of talk-in-interaction: 'units such as the clause, sentence, turn, utterance, ... *all* are in principle *interactional* units' (emphasis original) (2001b: 235).
2. For us, and for most other empirical linguists working from usage data, 'clause' is understood as [predicate + phrases that accompany it], while 'sentence' is a term reserved for a unit that can consist of either a clause or a combination of clauses.
3. This article is thus a further effort in a series of interactional linguistic articles responding to the challenge launched by Sacks et al. (1974) when they wrote 'How projection of unit-types is accomplished ... is an important question on which linguists can make major contributions' (p. 703: n. 12). See also Auer (1996), Ford and Thompson (1996), Hayashi (1999, 2003, 2004), Kim (1999), Selting (1996, 2000), Steensig (2001), and Tanaka (1999, 2000, 2001a, 2001b).
4. This quote reflects the distinction we drew in note 2 between 'clause' and 'sentence': we observe, however, that this distinction is sometimes not made by other researchers in the analysis of conversation.
5. Helasvuo (2001a, 2001b) focuses on the 'clause core' (that is, the predicate and its 'core' arguments) as especially important for interaction in both Finnish and English, and we agree that there are ways in which the clause core functions significantly in interaction. However, since we are interested in projectability here, we will consider many aspects of clause organization, in addition to the 'core'/'non-core' distinction, which allow speakers to project turn gestalts.
6. It is well known that many turn units and turns do not consist of clauses in themselves. However, it is striking that most of these are constructed *with reference to* a nearby verb or predicate. A simple example would be a question–answer pair in which the answer is not itself a clause, but is understood with reference to a prior clause, as in this sequence from our materials:

   (i) Melissa: (H) what day is tomorrow?
   Brett: ... the twenty-ninth.

   Here, the turn which carries out the social action of responding to the question consists, obviously, of a Noun Phrase (NP), which constitutes the answer precisely because it is construed with reference to the immediately preceding clause, canonically constructed according to the English grammatical format involving a subject NP and a predicate nominal. We won't be able to pursue this any further here; we simply note that the prevalence of this type of turn strengthens our claim of the centrality of the 'clause' as an interactional unit.

7. Most of our English examples come from the Corpus of Spoken American English, Part I (Du Bois, 2000); for transcription conventions, see Appendix 1 and Du Bois et al. (1993).
8. If Alice's turn is a complaint about a non-present third party, it should make some co-complaining or expression of congruent affect on the part of her interlocutor relevant next (Günthner, 2000). What Mary does in line 16 is hardly this, however, which may be what prompts Alice to specify a further aspect of the situation which she finds complainable.
9. Once this clausal and actional projection has been made, the speaker need not wait until the actual unit end has been reached, but may opt to come in immediately, thus producing recognitional overlap with the ongoing (but predictable) completion of the unit (Goodwin and Goodwin, 1987, 1992; Jefferson, 1973). We return to this point below.
10. We note, however, that the prosodic issues are complex. What seems clear is that emerging prosodic contours are routinely judged by interlocutors as to whether they are possibly whole *gestalts* or not; what may not be so clear is at what exact point in an emerging contour prosody allows judgments about a speaker's intention to continue. See Szczepek Reed (2004) for discussion.
11. Although in Japanese recipients frequently provide continuers following the incremental bits being used to build a turn, substantive responses are typically reserved for (projected) turn completion (Hayashi, 2003; Tanaka, 1999).
12. We believe that this utterance could be analyzed as conveying more than one action, but we emphasize Tanaka's point that the stance-taking predicate, that is, the primary indicator of the way the utterance is to be taken, is reserved for final position.
13. We exclude for the moment so-called recognitional onsets, where a next speaker comes in as soon as the trajectory of a turn has been recognized (Jefferson, 1983), and concurrent displays of recipiency such as those Goodwin and Goodwin (1987, 1992) have described.
14. It is particularly striking that line 2 is grammatically identical to line 1, yet the two utterances are performing two quite distinct social actions. As Tanaka does, we take this to underscore the heavy reliance on inference in referring in Japanese.
15. In the case at hand its completion is also signaled by the final particle *yo*.
16. If the arguments were made explicit, they would tend to appear as a rule before the predicate (Tanaka, 1999).
17. This can occur with or without a prosodic break at the possible clause boundary.
18. See also the examples cited in Sacks et al. (1974: 704f.).
19. See Ono and Suzuki (1992) for further discussion of elements that can follow the predicate in Japanese conversation.
20. In addition, because Japanese is a postpositional language, markers of clausal 'subordination' appear in final position in the clause. This means that preliminary components are not identifiable as such until late in the clause, thus accounting for the delay encountered in co-constructing compound TCU formats.
21. As Schegloff notes, 85 percent of the increments he found are added to host turn units that are clauses (2001a: 9).
22. Schegloff's definition of 'increments' is: elements of talk added to the TCU and the turn which re-occasion possible completion; that is, which constitute extensions to the TCU or the turn ... and which themselves come to another possible completion of the TCU or turn (1996b: 90).

23. For extracts (12) and (13), the following transcription conventions hold:
    : lengthening
    (x.x) pause of x.x seconds
    (.) very short pause
24. See Couper-Kuhlen and Ono (forthcoming), Hayashi (2003), and Tanaka (1999) for further discussion of turn-unit extension in Japanese.
25. See Kim (forthcoming) for an enlightening discussion of a similar situation in Korean.
26. We do not wish to claim, however, that every turn extension in Japanese is of the type that would never occur in turn-final position. See Tanaka (1999) for further discussion.

The O.J. Simpson Case as an Exercise in Narrative Analysis

Robin Tolmach Lakoff

The definitions of terms like "culture" and "society" are vexing problems for the social sciences. Still more complex are the deeper questions that underlie them. How do we form cultural identities and come to see our individual selves as members of a cohesive and coherent social group? What is the glue that makes a culture cohere – and, at least as important a question, what happens when that glue becomes ineffective?

Some aspects of cultural cohesion, and its opposite, are obvious and well-studied: speaking the same language; professing the same religion; dressing similarly; having similar manners. Others are more subtle, more part of members' innate grammars: sharing pragmatic systems and nonverbal expression modalities. But there is one component of culture that is both particularly crucial for the formation of cohesion, and yet less than fully explicit: the making and appreciation of shared narratives.

Language is intrinsic to the development of cultural identity. We say metaphorically that we "speak" (or "don't speak") "the same language," to mean that we are (or aren't) in sync, share (or do not) common values and purposes. Judging from discussions that permeate our media and reach into the highest levels of government, Americans are currently experiencing an agonizing questioning of the role and necessity of common linguistic identity in the making of national cohesion. We are publicly worried about forces that seem to be breaking the century-old "melting pot" apart: "special interests," "identity politics," "tribalism," "Balkanization," and "multiculturalism" are some of the terms bruited about, with connotations ranging from positive to negative. The existence of so many words, reminiscent of the profusion of terms for "snow" among the Eskimos,

Source: *Discourse Processes* vol. 23, no. 3, 1997, pp. 547–566.

suggests the salience of the concept in current American discourse. Laws to reduce immigration (illegal and otherwise), and make English the official language of the United States, have strong grass-roots support. These bills are concrete representations of our fear of cultural diffusion. They have grounding in the *literal* fear of no longer understanding and being understood if all of us were to *speak different languages* in our public and private lives: the loss of our symbolic cultural coherency.

Language itself is a great creator of identity (cf. Gumperz, 1982; Hymes, 1972). But perhaps even more significant is what we do with language: our notions about appropriate speech acts, discourse types, narrative and other structures. Sharing these creates a sense of unity, actual and metaphorical, the *we*. *We*, the people of the United States, begins the preamble of our founding document, the Constitution, thereby beginning our shared narrative. Hence any signs that the knowledge or acceptance of these shared narratives is eroding are viewed with alarm and create widespread distress. Neoconservative alarm over "postmodern" doubt about historical truth, the erosion of the literary canon, and "situational ethics" finds a sympathetic audience in the general public.

Linguistics in Text Analysis

So the use that cultures make of the narratives their members construct and repeat can tell us something about the cultures themselves. But what sort of analytic tools and stance are required? That is, at the moment, a somewhat difficult question. Over the last few decades, many fields have made incursions into the analysis of larger linguistic structures, fields as disparate as communication, discourse analysis, text theory, and conversation analysis, as well as my own field, linguistics. These fields differ greatly in their histories, methods, and theoretical assumptions, even as they share a common focus of interest, the understanding of language.

Linguistics has perhaps the most complex origin of all. For one thing, it was in a sense created at least twice, once at the end of the eighteenth century, in Europe, as a historical field concerned with the origin and interrelationships among the Indo-European languages, which by the late nineteenth century had developed in France, under Saussure and his students, into French structural linguistics. In America at the start of the twentieth century, Boas and his students began to develop the field of anthropology as a science. They stressed that responsible researchers had to take a strictly objective and nonmentalistic position on their data and take pains to avoid bringing the preconceptions of their own Euro-American cultures to the analysis of the very different societies they were observing in the Americas and elsewhere.

Leonard Bloomfield, who had been trained as an anthropologist, in the 1920s began to codify the field of "American structural linguistics," its rules and presuppositions directly derived from Boasian anthropology. Saussurean and Bloomfieldian "structural linguistics" share little but their names and their foci of interest. Where Saussure's was heavily theoretical, abstract, universalistic,

and mentalistic, Bloomfield's emphasized the surface traits of individual languages, and insisted that analysts avoid making claims about meaning or function, as those would necessarily entail interpretation, or "mentalism." The Bloomfieldian viewpoint worked reasonably well for a generation or two of American scholars whose major concern was the description and cataloguing of a large number of "exotic" languages before they became extinct. Collecting word lists and determining phonological inventories often superseded any deep concern with syntactic structure or anything more complex or abstract. But eventually, some scholars trained in this school began to turn their attention to these deeper matters, especially as they became interested in English. And once they did so, Bloomfieldian methods failed. By the 1950s there was significant dissatisfaction. Normal science, as Kuhn might say, had ceased to operate.

Into the breach came Chomsky, himself a product of late Bloomfieldian linguistics combined with formal logic and the philosophy of language – an uneasy alliance, to be sure. Transformational generative grammar, the basis of which was laid out in Chomsky's (1956) *Syntactic Structures*, claimed to be a total rejection of American structuralism, although this is less true than his adherents tend to think. Chomsky's method was highly mentalistic, both in its aims (using language data as a "window to the mind," and moving from the superficially accessible forms of language to their deeper, intuitively discovered structures) and methods (use of data made up by the investigator; testing of that data by that investigator's own mental judgments). That mentalistic stance allowed syntax (and eventually semantics and pragmatics) to be done in a relatively precise and (at least theoretically) falsifiable way, but (as should be intuitively obvious but curiously was not to the transformational intuitionists), positively invited all sorts of corruption.

There were, and are, other problems with the transformationalist approach (in which I include many of its current avatars). The assumption was still made that the texts to be analyzed were to be taken from the oral repertoire. But they were not "natural" speech products, or even utterances elicited less than spontaneously from informants. They were sentences created in the analyst's mind, in a vacuum, unconnected to any other sentences, and therefore highly artificial. And since the "sentence" was the highest level of interest to transformational syntax, questions about the cohesion of larger texts went largely unasked. There was a small irony here: if language was worthy of study as a window to the mind, a highly significant aspect of human psychological functioning necessarily went unexplored. Also, transformational grammar's mentalism induced believers to see language as created autonomously in the minds of individual speakers, rather than as a collaborative exercise in making meaning and achieving communication (or avoiding it, as the case might be). The concept of language as "discourse," that is, a means of creating and reinforcing group cohesion and making group meaning, was not and could not have been a facet of transformational theory. See Lakoff (1989) for more discussion of this topic.

At least some of the other frameworks mentioned above take that larger view. But they tend to create incomplete analyses because of their own theoretical constraints. Conversation analysis (CA), for instance, is strongly antimentalistic,

and so cannot consider why speakers have chosen one or another way of completing their turns, or how those choices affect other participants or the flow of conversation. Nor can CA say much about the workings of texts that are not dyadic: since the "turn" is the basis of CA, discourse in which turns play a minimal role cannot be meaningfully studied.

Communication theory tends to look at larger texts from the top down, seeing the whole structure (the political speech or newspaper article) as the basic unit, and goes on to assess its effect on hearers or readers as a whole, as demonstrated by polls or focus groups, rather than through examination of the linguistic forms themselves. It examines the development and repetition of patterns (sound bites, slogans) as a step in the creation of a campaign or a societal decision (an election). But communication theorists are generally not trained to see these large units as composed of smaller segments; they do not, as linguists do, see language as (in Saussure's phrase) "a system in which everything holds together" (un système où tout se tient).

So current theories have problems when applied to the understanding of large units of language. What is needed is a combination, but territoriality combined with departmental structure have made that difficult.

I began my career as a transformational syntactician around thirty-five years ago. Since then, I have moved steadily (if not always consciously) away from many though not all of the assumptions of transformational generative grammar. I no longer believe that analysts of language can construct the data that will form the basis of their analyses. I don't think sentences can be studied in isolation, or that linguistic grammar can be fully understood without reference to the context in which forms are used. But I do think that, if we are careful and check our intuitions with others, we can still use those intuitions to gauge the effects, if not the intentions, of utterances. We *must*, or many of the most interesting and important things about language will forever remain unexaminable. I acknowledge the potential for corruption in intuitive methodology. But weighing the possibility of learning nothing at all against the possibility of making claims that later are disproved, I opt for the latter. Besides, even the most empirical approaches have misinterpreted data. I propose in the remainder of this paper to show how one renegade transformational syntactician turned pragmaticist turned discourse analyst approaches a current text. The "text" to be examined is, unusually, not one extended utterance by a single speaker, but a series of utterances, mostly in print, by a variety of writers, about a single event that achieved its meaning over a period of 1 1/2 years: the criminal trial of Orenthal James (O.J.) Simpson and its eventual verdict. I am suggesting that this composite, multiply composed text can be viewed as a cohesive unit that acquired different meanings for different participants in its making, and changed its meaning as time went on. Further, the way in which real-world events were discussed and understood by the media, and thus filtered through to their audience who then made their own meanings, both arose out of and contributed to the creation of the culture, and subcultures, in which they were located. Discourse creates culture and is created by it. It may bring about cultural cohesion, diffusion, or both.

The Simpson Case as an Example of Several Things

Readers may wonder about the text I have selected. Rather than a difficult or classical document of proven intellectual substance, my text is a form of discourse intellectuals hold in disrepute. Many of them spent the time between June, 1994 and October, 1995 in a state of open contempt for the proceedings, considering the public's insatiability for this material a sign of their proletarian minds and decadent tastes.[1] But I think this case and its sequelae tell us something important. I believe the nonintellectual public is a pretty good judge of the meaning of narratives (a term they would never be caught dead using, of course). Cultural arbiters grumble that ordinary people tune out of discussions of the economy, or foreign affairs, but are attentive to the O.J. story and similar titillations. Some of these cases do turn out to be trivial. But many receive attention because they force us all to confront our culture's deepest doubts and fears about itself and where it is headed. The Simpson case, coming as it does near the millennium, touches on almost every vexing and insoluble problem the United States as a society is currently grappling with: racism and the difficulty of achieving equality; sexism in its most noxious manifestations, public and private; fame and wealth, and their influence on behavior and treatment; the impossibility of discovering truth via the justice system; science as our new religion, or fail-safe discovery procedure. The telling and retelling of the Simpson narrative served a function – from crime to trial to verdict to aftermath, warts and all.

Moreover, even as my intellectual compeers groused about O.J. overkill and swore they paid no attention to the courtroom contretemps, they were very well informed. They knew about Judge Ito, the makeup and personalities of the "dream team," the predicted outcome of the trial, and almost as many of the significant details as the most hopeless O.J. addict tied to the TV.

I obviously had to be very selective in my choice of representative texts. The amount of data is almost literally infinite. There is no way one human being, or even a team, could sift through *everything* produced, in the U.S. and outside, in print and electronic media, over the more than two-year (thus far) duration of Simpsonmania. I have therefore chosen a sample in a highly unscientific way, but one that I feel is representative. I restricted my study to the print media, and used the following sources:

1. *The New York Times,* which covered Simpson at less length than many other journals, but often in depth. Further, the *Times* is the "paper of record" in America: what the *Times* covers is, historically, "the news," and the way the *Times* covers it is, retrospectively, the way Americans remember events of the past.
2. *The San Francisco Chronicle.* Aside from convenience (since I live in the Bay Area), the *Chron* functions as a sort of corrective to the *Times* in a study of popular culture. Where the *Times* is measured, distant and sober, the *Chron* is excitable and instantaneous; where the *Times* avoids full front-page headlines except under the gravest circumstances, they are business as usual in the *Chronicle.* Besides, the *Chron* is a California paper, and

Simpson is a California event: locals understand in a way New Yorkers, or other foreigners, can't possibly. (California, it is often and rightly said, is a state of mind.) On Sunday the *Chronicle* merges with its sister the *Examiner* to produce a single paper, so that some of my references are to the latter.

3. *Newsweek.* As a weekly newsmagazine, *Newsweek* sifts where dailies pour. It distills and summarizes the most important stories of the week. It also represents a more general American voice than either the elitist and eastern *Times* or the populist and western *Chronicle.*
4. *The New Yorker.* This magazine has (despite the ministrations of its new editor, Tina Brown) few pretensions to populism or generality: it has functioned for generations as the touchstone of cultural elitism, "not for the little old lady in Dubuque," as they like to say. So the stance the *New Yorker* takes toward current events tends to be analytical in ways that a journal, even one with weekly rather than daily deadlines cannot be. It can explore small and seemingly peripheral points at length, a luxury denied even weekly newsmagazines.

My aim in this analysis was to focus on how the selected print media created and reflected the Simpson phenomenon: what they reported, how they reported it, the prominence they gave to it or certain aspects of it, the tone in which they reported it. My concern is with the way language, in the form of large cohesive discourse units, that is, *texts* of various kinds, creates cultural cohesion or destroys it, and makes our daily reality. I am also interested in the way in which these smallish individual texts create a larger text or *metatext* – what we have come to know as "The O.J. story."

Culture Creation in the Simpson Case through Shared Narrative: Polynarrativity

The telling of stories itself is an active and creative process. As such it may serve individuals and the groups of which they are members in a defensive or psychologically protective function, through a defense mechanism referred to in psychoanalytic theory as "passive to active," a subcase of reversal (cf. Freud, 1957). An example of the working of this defense can be seen in a child who is taken to the doctor and suffers some pain – say, an injection. Then for the next few days the child reenacts the event again and again with her toys, or her friends, as patients, and herself as the doctor. By taking the active role, eventually the child makes the trauma psychologically tolerable. Analogously, adults who have been through trauma reenact it verbally, telling continuously reworked stories, until the terror abates. For example, after the Loma Prieta earthquake in the Bay Area in 1989, everyone felt the need for at least a month to tell their experiences during the quake to anyone who would listen.

By making narratives they brought plot (order, coherence, meaning, reason) to a formerly inexplicable experience, thereby imposing control over a world

that had become dangerous, chaotic, and unpredictable.[2] The Simpson case exposed numerous tears in the social fabric, things we weren't ready to face about ourselves and our society. So it was important to participate together as a group in the creation of the narrative: to watch, and make personal sense of, the car chase; to be able to discuss it endlessly, putting one's own (media-borrowed, to be sure) spin on it; to make it *our story*, one whose outcome we could (we felt) predict; and, once our prediction was borne out, we could (we hoped) come together again in recovery.

Members of a complex and fragmented society such as ours can seldom claim to truly share any experience in the sense of knowing, or even believing, that they were all together when it occurred, creating it as a group experience. To exist at all, shared stories must be media-mediated: there is no literal campfire we can all gather around. Over the last fifty years there have been a few such cases: the events surrounding the assassination of J.F. K. in 1963 (watched by an estimated 93% of the population); the Apollo moon landing in 1969 (96%); the first day of the Gulf War in 1990 (84.5%). We can add to these O.J. Simpson's low-speed car chase on June 17, 1994, watched by a very large percentage of the population, and the verdict in the Simpson trial (October 3, 1995), viewed as it was announced at 10 A.M. by an estimated 90%. (These figures are taken from the *San Francisco Chronicle* of October 4, 1995.)

It could be argued that these events do not represent collaboratively *made* narrative: the narratives themselves were provided by the media. But by watching with everyone else we became participants, and by reconstructing the story with one another at all our gatherings for weeks on end, by speculating about what really happened, what it all meant, and what the consequences would be, we became makers of the story and controllers (in some sense) of events.

From the start, the Simpson narrative did not behave in an orderly way. It assumed a life and coherence of its own. There was never one single narrative, but always numerous ones. But at least prior to the verdict, in the white community, there was a belief that the multiple narratives shared a central core, that *they were all about the same thing*: they were cohesive if multiple. We were engaged in *polynarrativity*, the weaving of narratives one over the other in the form of concentric circles. But the totality comprises a single document, a shared group understanding of what it was all about. All the circles surround a single point. Since we all experienced each of these circles, the totality contributes to our sense of group identity, collaboration in the making of meaning, and cohesion. The circles represent "our" single point of view; presuppose agreement on what "the" story is, and presuppose how "we" will be affected at the end, by whatever outcome emerges. Presupposed is the continued existence and functioning of "our" system; the possibility of points of view that are not "ours" is not acknowledged at all in this model. Each imaginary circle represents one level of the discourse.

LEVEL 1: the center, is outside the narrative proper and in fact unknowable. It is the "real truth," what actually happened.

LEVEL 2: is the story presented by the prosecution (and the alternate version offered by the defense, along with the deconstruction of the prosecution narrative by the defense). In an adversarial trial by jury, it is the task of the prosecution

to present to the jury a "most plausible" scenario: a narrative in which all the known facts ideally fit together to form a seamless whole in which the jury can believe, and which identifies the defendant as the only person who could have committed the crime, the prosecution story as the only way in which the crime could have taken place "beyond a reasonable doubt."

The defense's job, on the other hand, is to unravel and cast doubt on the prosecution's narrative. Popular courtroom fiction like *Perry Mason* and *Matlock* suggests that a good defense attorney (aided by his ingenious private investigator) will present an alternate, more plausible, scenario, exonerating his client. The Simpson defense team hinted at its intention to do so in its opening statement, in which it alleged that the murders were committed by drug dealers in revenge for unpaid drug debts (or something); and that the physical evidence against their client (the blood, the gloves, the hair and fibers ....) were planted by racist and venal police officers in order to frame Simpson. In normal trial procedure, the defense virtually never offers an alternate narrative. While the Simpson defense's opening statement promised such a narrative, it was never provided in the courtroom.

The problem at LEVEL 2 in this case was that the prosecution narrative was not totally satisfactory. The prosecution never fully explained how O.J. alone could have committed two elaborately brutal murders in the very short time allotted, nor did it prove motive to everyone's satisfaction. One dismissed juror remarked that testimony about incidents of spousal abuse seemed beside the point: everyone fights, not everyone murders. Jurors were unconvinced by the DNA evidence.

LEVEL 3: This is the narrative that the jurors, first separately and then as a group, must make of the LEVEL 2 narrative and its connection to LEVEL 1, as they see it (the jury as "trier of fact"). Normally the jury's job is to use the defense deconstruction as a guide to determining the airtightness of the prosecution narrative. Has the prosecution established guilt beyond a reasonable doubt? They may, of course, adopt the prosecution theory in toto, or reject it in toto. They may, and often do, adopt parts of it in order to construct their own most-plausible narrative. If that narrative still places the defendant in the position of perpetrator, they will produce a "guilty" verdict, even though they arrive at that conclusion by a path different from that of the prosecution, or may, as a compromise, find the defendant guilty of a "lesser included offense," a less serious crime than he is charged with by the prosecution. Other things can happen. The jurors may disagree on whether any plausible narrative can be made of the data they have encountered at all, in which case the jury will hang: there will be no verdict. Or the jurors may dislike one another so intensely that they are unwilling or unable to collaborate during deliberations in the construction of the single narrative that is the requisite unanimous verdict, and again the result will be a mistrial. Or – as happened here – the jury may perceive its role in the story-making not as the *discoverer of truth*, but as the *sender of the message*. This is especially apt to happen when the "truth" is fuzzy, the "message" simple, and the interest of the outside world in the case exceptional. Both are narrative functions, but only the former is traditionally the role of the jury. The latter is legally called *nullification*, and, while legal, is heartily disliked by prosecutors and judges.[3]

In a normal trial, the conclusion of LEVEL 3, the verdict, is the final narrative. A guilty verdict may be appealed to a higher court. But an appellate court does not construct a narrative, but rather serves an interpretive function, the literary critic to the jury's/prosecution's storyteller. Its task is to determine whether the spinners of the tale utilized all the materials available in a legitimate way. The narrative normally ends at LEVEL 3, but not in this case.

LEVEL 4: is the level of media commentary. The media and their audience may see what the jury sees, or something more, or something else. With a sequestered jury, the media get both to experience and to create narrative to which the jury is not exposed. Indeed, the major purpose of sequestration is to keep the media narrative from influencing the jury. But the jury may be influenced by the very *absence* of input from media and acquaintances. In a world in which people are normally exposed incessantly to huge amounts of information, its sudden disappearance is an inducement to go off on various kinds of deep ends, to the point of paranoia (as seemed to happen on this jury, on the evidence of the stories of the jurors and ex-jurors themselves).

Moreover, the jury's impenetrability is not absolute. As long as the principal actors (attorneys and judge) are demonstrably influenced in their presentation of their cases and adjudication of them by media response, their attitudes will trickle down to the jury, however subtly. A sequestered jury is apt to be rendered overdependent on what they can glean from the judge and the attorneys by their isolation from other creators of meaning. (For discussion of jurors' dependence on judges' nonverbal signals even in nonsequestered trials, cf. Blanck, Rosenthal & Cordell, 1985.)

More seriously, the justification of sequestration is based on outmoded ideas about communication – namely, that silence equals noncommunication, and that the absence of utterance is a void. But we know better. We know that silence, where utterance would be expected, is eloquent. The absence of access to opinion does not create a vacuum.

Jurors are *supposed* to construct individual accounts of testimony (LEVEL 3), eventually to be compared with and related to the constructs of the other jurors during deliberations. The jury as a whole produces its own seamless narrative in response to what they have heard during the trial. But ordinarily what filters in from the world outside, illegally but invariably, provides checks and balances against the internal scenario the juror is constructing, based on the juror's life experiences, idiosyncratic cognitive structures, stereotypes, and prejudices. Without the external corrective (particularly in a jury that was sequestered for nearly a year), jurors' understandings of what is going on in court can become more and more distorted, their individual narratives increasingly idiosyncratic. I an ordinary trial (illegally but typically), jurors do discuss court events with on another, testing their individual perceptions against a group consensus. But wih jurors in this case closely monitored by court personnel and encouraged to report on one another, the sharing of narratives was less apt to occur, so that each juror's individually constructed scenario remained virginal, and grew increasingly bizarre.

At LEVEL 4, the media *report*, that is, reiterate what was said, and show on pictures of the trial events. But this involves some subjective interpretation.

What bits of the six-hour trial day should be put into the five-minute evening news segment? What pictures should be used to show which figures to advantage or disadvantage?

Beyond that, the Simpson criminal trial spawned an army of media commentators. Every network, every local TV station had its own legal analyst, sometimes several. Talk shows regularly scheduled these or other experts to summarize recent events and predict the future course of the trial. They assessed what each bit of evidence "meant," and whether it was good or bad for prosecution or defense. They interpreted the behavior of the principals: was Judge Ito controlling the attorneys? was Marcia Clark/Johnnie Cochran behaving in accordance with normal courtroom procedure? was their dress appropriate? They wrung meanings out of the Delphic mutterings of dismissed jurors: was race an issue in the jury? was spousal abuse seen as a predictor of murder? They tried to determine what it all meant: there would/would not be a verdict; O.J. would/would not testify; the defense would/would not present a case (cf. Carlsen, 1995; Chiang, 1995d; Davidson, 1995; Margolick, 1994a; Margolick, 1995a).

LEVEL 4 also made reference to the incessant polls of ordinary citizens and attorneys. These showed (among other things) a steady increase in belief in Simpson's guilt, but at a significantly lower level in the black (60%) than in the white (80%) community; a belief both among attorneys and the common folk that O.J. would not be convicted, with a somewhat higher percentage voting for a mistrial (due to either the dissolution of the jury before it could reach a verdict, or its inability to reach a verdict) than for outright acquittal; and a decrease from 63% in January of 1994 to 50% in June 1995 of public faith in the justice system (CBS Evening News poll, June 9, 1995).

There was speculation at this level too about what the defense would do: not make a case at all (but then, the jury would worry about the defense opening statement); whether or not they would put O.J. on the stand (if they did, the prosecution would get to grill him in cross examination; if they didn't, the jury would wonder why: cf. Chiang, 1995e; Margolick, 1995d). There was also puzzlement throughout the media about some of the ragged ends left in the prosecution's case: why no testimony about the low-speed car chase, the $10,000 and passport found in the glove compartment of the notorious Ford Bronco? why no testimony from A1 Cowlings? why not recall Kato Kaelin to the stand to see if he's really perjured himself? (Some of these questions may be answered, or at least reopened, at Simpson's civil trial, due to begin in the fall of 1996.)

LEVEL 5: is the media's gloss of their role at LEVEL 4. Here the media look at themselves and their influence. What was the role of cameras in the courtroom? the role of reportage on the behavior of the principals? the role of eventual celebrity on the jurors? They also raised deeper and broader questions about the fallout from the trial on American society generally. Was it accentuating our already dangerous racial polarization? imbuing us with cynicism about the justice system? causing us to reevaluate our love affair with fame? (cf. Chiang, 1995c; Estrich, 1995; Graham, 1995; Margolick, 1994a; Margolick, 1995b; Margolick, 1995c; Navarro, 1995; Rimer, 1995). Also discussed at this level were polls showing that the majority of the population were sick of O.J. and not

listening anymore. But these reports had to be considered along with other facts, such as the continued high ratings of shows with O.J. reportage, and the awareness that even those pollees who were most adamant in their denunciation of trial coverage seemed familiar with every detail in the unfolding drama.

LEVEL 6: is the post-verdict take on What It (LEVELS 1–5) All Meant: the verdict itself (of course); the reactions to it by all communities involved; the events of the trial; predictions about the role of the trial in future trials; changes in trial procedure as a result of the trial. Would it cause us to press for changes in the conduct of trials? Suggestions, encouraged if not originating with this trial, have been made: to permit non-unanimous verdicts in criminal cases; even to scrap the jury system completely in favor of an inquisitorial system (or anything rather than this!). Examples of this level are noted in the next section.

LEVEL 7: is the creation of cultural allusions about the trial, the recognition by the culture that it has become a significant cultural artifact: metaphors, jokes, allusions public and private (cf. the discussion below).

LEVEL 8: is the interpretation of all of the foregoing levels into the ultimate coherent narrative, or metanarrative (of which this paper is one attempt, the symposium mentioned in Footnote 1 another).

We all share these eight levels. Together they create a sense of *one* narrative, *our* narrative. In somewhat circular fashion, our original interest in the O.J. drama that arose because of his celebrity status created our desire to participate in that shared narrative; but then the awareness that we as a culture had actually achieved that rarest of moments, a shared experience, brought our interest up to the level of obsession and kept it there.

Cultural Disintegration through Non-Shared Post-Verdict Narratives: Multinarrativity

Multinarrativity is the existence and acknowledgement of *competing* or opposing narratives from several points of view, often contradictory. If prior to the verdict the Simpson case was an example of polynarrativity, that is, consensual narrative, multinarrativity took over from the moment of the verdict. Media analysis has since then focused on the multiple understandings of the crime and its aftermath. The explicit recognition of our differences, so sharply and unavoidably manifested in the verdict, became the story and reminded us with each retelling that we *are* diverse, we *do* speak different languages. Seriously problematic and possibly unresolvable is the fact that the verdict worked not so much as a vindication of O.J. Simpson as an indictment of our system of criminal justice: the "message" Johnnie Cochran asked the jury to send. And worst of all to the majority public is the fact that this indictment was delivered by members of a double minority community: black women. As jurors do, they gave the trial its ultimate meaning. But this was one of the first times in the world's history that a group so composed could make the meaning of an event important to the culture as a whole.

The verdict itself came down with a noticeable *thud.* As America sat and listened and watched, there was a moment of deep silence and incredulity.

And then, in an instant, consensus split irretrievably apart. Black viewers stood up and cheered; whites wailed, jeered, gaped in disbelieving silence. The media recording the event noted the dual response, and *that* quickly became the item. Thus the *Chronicle* on October 4 carried a full-page headline in the largest type the paper possesses: O.J. SET FREE. (Carlsen, Rojas & Walker, 1995.) The rest of page 1 was likewise occupied by O.J. stories. At the bottom left was the stunner: "Jury United, But Nation Remains Divided" (Garcia, 1995). Nearly the whole 14 page first section of the paper was occupied with Simpsoniana. The *Times*, of course, was more measured. Its headline covered only half the front page: "Jury Clears Simpson in Double Murder; Spellbound Nation Divides on Verdict" (Margolick, 1995e). A single article discussed both major facts, but a second article underneath (Gottlieb, 1995) emphasized the second: "Deep Split in Reactions to the Verdict." The *Times* had several pages of coverage within, as well as Op-Ed pieces by Turow (1995) and Rich (1995), and an unsigned editorial, "The Simpson Verdict."

Overall, the immediate press reactions read as attempts to regain some sort of grip or control. There was denial that the verdict *meant* anything. It was explained away as the result of prosecutorial blunders (Turow); police misbehavior (the *Times* editorial and Rich); an anomaly that neither explains anything nor requires explanation (all of the above). In the next several days, the print media moved to the second stage of trauma control: rationalization. Now attempts were made to make sense of the verdict as well as the divided public response to it. The *Times* ran another editorial "False Lessons of the Simpson Trial," moving toward a positive perspective: the trial and verdict show the need for reforms; rather than inveighing against Simpson's use of wealth in securing acquittal, consider making changes in the system to guarantee that indigent defendants get better representation. On the Op-Ed page the same day (October 5), Maureen Dowd weighed in with "O.J. as Metaphor," making reference to L.A. genre detective fiction like Raymond Chandler, Nathanael West's *The Day of the Locust*, Colin Powell, Anita Hill, and various other cultural icons. The effect was to background the verdict in a reflection on America itself. On its front page the *Times* reported on the interviews with the jurors (Egan, 1995), showing the reasoning behind the verdict – another attempt to deflect the fears engendered by the divisiveness of the response by showing the jurors themselves as individuals, not members of a racial bloc. The *Chron*'s page 1 article of October 5, on the other hand, kept up with the action: "O.J. Calls In While Jurors Speak Out" (Carlsen & Wildermuth, 1995). The effect of juxtaposing O.J. and the jurors is to stress the racial connection between them, as well as to suggest a sort of psychological linkage between them: two kinds of unmitigated gall.

Elsewhere in the paper is a turning away from the meaning of the trial to the verdict's possible aftermath: "Don't Expect Manhunt for Bundy Drive Killer" (Lieberman, 1995). Discussion in both papers turns to changes in the law that trial anomalies, evidence problems, and the verdict itself may bring (as with three *Times* Op-Ed pieces on October 6, one by A.M. Rosenthal, one by Bob Herbert, and one by Anthony Lewis. All see the verdict as a symptom of problems that need to be fixed: racial inequality for Herbert and Lewis, and runaway juries

for Rosenthal. Page 1 of the *Chronicle* of the same day considers the long-term implications of the trial and verdict for the black community: the verdict may create more problems than it immediately seems to solve (Moore, Walker & Minton, 1995). But the next day, in an editorial, the paper sees the case as "a legal aberration" that should not inspire immediate changes in the system ("The O.J. Simpson Case: A Legal Aberration"). Discussion in the *Chronicle* over the next several days alternates between worries about "race relations" (October 8) and "a plague of bad cops," i.e., Mark Fuhrman's role in the verdict (also October 8). *Newsweek*, in its first post-verdict issue (October 9) headlines its lead National Affairs story "Judgment Day," under a photo of a tearful O.J. Simpson receiving the verdict. The story concentrated on the jury as individuals and as a group (Reibstein, 1995). The following story (Cose, 1995) discusses Johnnie Cochran's playing of the "race card." Finally in this series, a last *Times* Op-Ed piece, this one by William Safire on October 12, contemplates the situation "After the Aftermath": Simpson is guilty of inciting the black jurors to create the atmosphere of racial divisiveness that is so distressing the country now. He is "guilty of ordering the exploitation of his race to the detriment of his race" (Safire, 1995). So *we* can ignore the "message" with impunity.

After this the discussion calms down. The media address themselves less to the trial and verdict and their interpretations, and more to day-to-day developments (Simpson's on-again, off-again TV interview in particular, and much later, Simpson's selling of his $29.95 video, gearing up for the civil trial, and the spate of post-trial books by most of the principals). But most of *Newsweek*'s October 16 issue was devoted to Simpson as a Special Report, subtitled "The Verdict: Whites vs. Blacks • Inside the Jury • O.J. and His Kids," thereby covering the field. Sections of the magazine covered "The Reaction"; "The Verdict"; "Looking Back"; and "The Impact," occupying 67 of the issue's 88 pages. And in *The New Yorker* of October 23, Jeffrey Toobin looked back at the trial as "A Horrible Human Event" (Toobin, 1995).

As rationalization died down, a desire to find scapegoats for the debâcle became important, as in some of the articles cited above, which variously blamed Simpson, the jurors, Cochran, the prosecutors, the justice system, and the media for the verdict and the distress at it. The aim was to deny that the divisiveness stirred up by the verdict had any real meaning, as it would if it *should* have happened. Since someone is to blame, it *should not* have happened, and therefore reasonable people did not have to pay attention. But the obsessiveness with which the blame game was played showed the futility of the effort.

More recently there have been attempts at a final stage in trauma management, reconciliation. We agree that these events have occurred, that they have meaning, and that the "message" was not in error – something must be done. There have been attempts to reduce the whole business to something more like an ordinary trial, so that we won't have to think about it any more. There has been some discussion in the press about what O.J. is "really" like, with reference to his approaching civil case (*Newsweek*, February 19, 1996). By showing him as a man leading a "charged, voracious life," the article deflects attention from the trial to its protagonist, making him in a sense more like an ordinary human figure,

less like a metaphorical symbol for all that ails us. An article in the *San Francisco Examiner* (Opatrny, 1996) discusses an offer by a group of "supersleuths" to help him find the killer, gratis. And an article in *Newsweek* on July 8 talks about the "party of the century" (a reference of course to the "trial of the century"), thrown by Simpson at his estate to benefit an organization that protects battered women. Articles like both of these demystify Simpson, making him look rather like a blunderer, an ordinary human being if one quite likely guilty of a heinous crime. But true reconciliation is slow in coming, if it is coming at all. The bitterness of the last several articles, many months post-verdict, suggests that anger at Simpson, both for the crime the majority continue to believe he committed, and for forcing so much unresolved societal business into our consciousness, continues unabated. The only way to diminish the pain is to demote Simpson from superhero-murderer to oafish lying blunderer.

Multinarrative occurred outside the media reports as well. It was a regular feature of the trial itself, contributing to the public's (and the media's) bewilderment at much of what was going on. From the start, the defense and the prosecution not only were telling different stories, or at least promising to (as would be expected), but appeared to be living under different narrative and discourse conventions. This became evident early on in discussions of jury selection; from reports of race-based dissension within the jury; and from Cochran's and others' discussion of their willingness to play "the race card." It showed up too in the styles of Cochran's and Darden's, final arguments.

Cochran's was a traditional black preaching style, after the rhetorical model of Martin Luther King Jr. and Jesse Jackson. The style conveyed many things to the predominantly black jury (and the black members of the viewing audience): a sense of shared community, a connection between Cochran and the jurors as a "we" who *speak the same language*, a language not "theirs"; a speech style traditionally used by the preacher, the most prestigious and trusted member of the community and hence automatically engendering trust. It is highly emotional, strongly persuasive rather than expository. It uses shared cultural allusions (especially Biblical references), as well as many mnemonic devices derived from its original use with a nonliterate audience, e.g. rhymes and jingles: "If the gloves don't fit, you must acquit."

Darden, on the other hand, was working under a double obstacle: as a black man, he was taking the white community's side, making *their* narrative. He did it using white man's legal argumentation style: intellectual, deliberately low-key and unemotional. It is no wonder that he didn't get much credence – or much affection – from the jury.

Cultural Reintegration via Metanarrative

Two final, perhaps paradoxical outcomes of the trial are an enrichment of the cultural narrative at all levels, and a reinforcement of some general beliefs and narrative strategies, permitting a reintegration or reaffirmation that *we* – all of us – share enough to justify our sense of ourselves as constituting a cohesive culture

This reintegration was facilitated by the use of several types of narratives: jokes and metaphors (frequent sources of societal cohesion); opinion polls (a newer way of summarizing and organizing ourselves); and, newest of all, a profusion of websites on the internet dedicated to the dispersal of Simpsoniana. The Simpson case provided huge amounts of all of these, creating a new cohesion through the liberal use of allusions that underscore how much we all share. Thus, for instance, we share expectations about *forms* jokes take – e.g., the good news/bad news format of several in the Simpson collection – even if we do not share the subtexts that make sense of the jokes themselves. Similarly, Americans share a love and respect for polls, even though those polls show deep divisions among us.

That high regard for polls, statistics and such arises out of and reinforces the predominant culture's belief in science and numbers as ways of understanding the world. Our interest in O.J. polls may indirectly reassert our cultural belief in the value of science, dealt a blow by the jury's cavalier dismissal of the DNA evidence. The fact that we *can* (apparently) quantify our agreements to disagree is a kind of magical reassurance to our frazzled selves: yes, there still *is* cohesion despite the appearance of the opposite.

The Simpson web sites covered everything – evidence that went beyond what could be found in the traditional media, on both sides; court transcripts; brief biographies of the major protagonists; as well as jokes. The web sites provided a more interactive framing of the O.J. discourse than was available in the traditional media, a way for all non-Luddites in the society to vent both individual and collective emotions.

Similarly, jokes and metaphors are woven into the cultural fabric, giving all of us texts we can share by which we can reach across dissension and create at least a brief semblance of mutual understanding. If Jay Leno can tell O.J. jokes to a (presumably) mixed audience and get laughter in response, we can feel, rightly or not, that there is still a *there* there, a cultural bedrock, and cohesion may yet be restored.

Conclusions

We (the culture under analysis) have come to see the O.J. Simpson drama as an exercise in postmodern doubt and indeterminacy. Its events and outcome are multiply ambiguous. It is no longer clear who has the right to make our meaning for us, or whether there is even an "us" for whom a meaning can be made. The trial and especially the verdict are, I think, best seen as being really about interpretation. Who determines the meaning of public events, and for whom?

And finally, we (the analysts of the culture via discourse) can see the foregoing discussion as an exemplification of theory and method. Language is the "window," here, not so much to the Chomskyan individual mind as to the culture's mindset: what is spoken and what presumed; what is expressed directly, what euphemized; what chaotic and fragmented events are collected together and organized to become the conventionalized narrative that we name "The O.J. Case," how

the ways we make language and use that language to shape our world-view define and identify us as members of a cohesive culture, those who "speak the same language."

Notes

1. Not all of them, though. An article in *The New York Times* of September 25, 1996, describes a conclave of "intellectuals" gathered in a New York meeting hall to discuss the ramifications of the case.
2. For a discussion of the role of plots in individual lives, cf. Aftel (1996). I would argue that groups rely on plots in ways analogous to the ways individuals do, to give meaning and coherence to their lives.
3. The verdict in this case has been called by some "nullification," a definition questioned by others. Nullification, going back to English common law, is a jury's refusal to stick to its legal role as the "trier of fact," vs. the judge, the "trier of law." At the end of a trial, the judge instructs the jury in the relevant legal definitions. The jury's job is to decide whether the claims alleged by the prosecution are true, or which ones are true; and on that basis, to determine which if any legal charge is appropriate. So if a jury were to decide that it believed that Simpson had killed Nicole Brown Simpson and Ronald Goldman, its job would be to find that some form of homicide had taken place, depending on their assessment of the circumstances first or second degree murder, or voluntary or involuntary manslaughter.

   A jury nullifies when it decides that the law in question is unjust or inapplicable, and therefore acquits a defendant even though it is incontrovertible that the circumstances were as the prosecutor argued (e.g., they have heard a confession by the defendant). Nullification is a message of societal dissent, the common people criticizing the powerful.

   I think the Simpson verdict went beyond nullification in its normal sense: it criticized not a law by itself, but the underlying system by which the laws are made and enforced. We might call it "metanullification," a word as frightening as the concept it embodies.

The Identity Work of Questioning in Intellectual Discussion

Karen Tracy and Julie Naughton

And so uh, the strategy then would be a sort of piling on, an accumulation, bit by bit until finally you were satisfied twenty years later that you were able to say what was going on in this study.

The above excerpt comes from a lengthy question addressed to a student presenter in a departmental colloquium. This question formulation, as is true of question formulations generally, does a number of different kinds of identity work. One kind it does is to imply how the speaker sees the recipient's scholarly work (and hence the recipient). In this paper we examine this kind of identity-work process; that is, we explore the ways in which one person's talk (questioning) can influence another person's situated intellectual identity.

The context in which we examine this question is intellectual discussion in the academy. We regard it as critical to study identity work in specific interactive situations. The meaning of conversational moves, we would argue, cannot be adequately understood unless account is taken of what is communicatively routine, possible, and believed desirable in a specific situation. Elsewhere (Tracy & Baratz, 1993) we detail why intellectual discussion as a type of talk occasion deserves careful scholarly attention. Suffice it to say that intellectual discussion is an important but understudied form of talk; in the university context, it is a central forum in which scholarly identities are shaped.

In examining the altercasting potential of questions, this study seeks to contribute to a larger project investigating intellectual discussion in the academy (Tracy & Baratz, 1993, 1994; Tracy & Carjuzáa, 1993; Tracy & Muller, in press). By "intellectual discussion" we mean interactive occasions in which talk about

Source: *Communication Monographs* vol. 61, 1994, pp. 281–302.

ideas is primary; colloquia, "brown bags," research seminars, reading groups, and professional or interdepartmental symposia are the names academics routinely use to describe this kind of occasion. We use a more abstract label than the ones academics spontaneously use to highlight how the talk occasion is a genre of academic discourse (Swales, 1990).

In this particular study, we consider how discussants' questioning practices create, support, and challenge some particular situated identities question-recipients could be expected to desire. Within much psychological (e.g., Graesser, 1990; Lehnert, 1978) and educational (e.g., Hunkins, 1989) theorizing, questions are treated as transparent devices to get information. That questions simultaneously propose/reflect identities of speakers and recipients has largely been ignored. For this reason, the study of questioning rather than more obviously identity-relevant speech actions (e.g., accounts, disclaimers, praise, criticism) seemed a particularly suitable focus. If there is no "time out" from identity work, which we believe to be the case, then we should be able to display identity-work processes not only in obvious speech actions but also in those that are regarded as relatively neutral and task-focused. After providing a more elaborated conception of identity and identity work, and showing what prior research has found about links to questioning, we describe the discourse data and the study's interpretive approach – a new method we label identity-implicative discourse analysis. The heart of the article describes three aspects of intellectual identity desired by participants in such discussion occasions and shows how distinct features of discussants' questioning practices can challenge these identities; the article's conclusion draws out theoretical and methodological implications.

Identity Work and Questioning

Identity

Scholars writing (or talking) about persons and communicative practices use three sets of ostensibly similar terms: (a) self and self-presentation (e.g., Baumeister, 1986; Tedeschi, 1990), (b) face and facework (e.g., Brown & Levinson, 1987), and (c) identity and identity work[1] (e.g., Shotter & Gergen, 1989). While superficially similar, the sets implicate very different views of the social world and assumptions about persons. We adopt the identity/identity work concepts because the terms are most consistent with our theoretical commitments.

First, we believe that a person's sense of who he or she is, is strongly rooted in situated communicative experiences. The concept "identity" captures this social grounding. Fitzgerald (1993), for instance, defines identity as who one is/how one acts in a given situation. Identity is *self in situation*, and central to this concept is the notion that self is constructed, maintained, and challenged by self's and interlocutor's communicative practices. In contrast, the concept "self" aligns persons primarily with the internal cognitive world: The self is an entity housed in a body and the repository of internal feelings, thoughts, and intentions (Geertz, 1984; Potter & Wetherell, 1987).

Second, identity and identity work highlight the way communication is implicative for both parties. Not only does communication involve presenting self, but it also involves altercasting the other. And, although any study may choose to focus on speakers' or recipients' identities – (as we do in this study) – to use identity as the theoretical lens is to make it less likely to forget that altercasting is occurring simultaneously.

Third, while both "face" and "identity" implicitly reject the internalized, decontexualized view of self, the concept "face" does so in a way that does not entirely escape a cynicism and sense of superficiality ("It's just a matter of face") (e.g., Folger & Poole, 1984). In contrast, identity gives a moral and emotional seriousness to the situated self, a view we think wise to cultivate.

A final reason we prefer the concept identity to face is to free our inquiry from the high level of abstraction present in Brown and Levinson's (1987) conceptions of positive face (desire to be appreciated and approved of by selected others) and negative face (desire to be free from impingement from others). While Brown and Levinson recognize that there will be cultural variations in how these wants are expressed, the concerns are formulated as universal ones that are relevant to all people in all situations. We do not see this claim as an unreasonable characterization of people's situational concerns; we do see it as unhelpful. People's situated identity concerns are more particular and contextualized than positive and negative face. Thus, our final reason for adopting the concept identity is because it encourages formulations of persons' concerns in situationally sensitive manners (e.g., Edwards & Potter, 1992).

Questioning as Identity Work

While questioning has been extensively researched (e.g., Goody, 1978; Graesser, Roberts, & Hackett-Renner, 1990; Hunkins, 1989; Kearsley, 1976; Walton, 1989), the number of studies examining how questioning does identity work or what kind of identity work gets done is considerably more limited. Much of the information must be pieced together from studies whose central purposes were not identity issues. For instance, Goody (1978) developed a two-dimensional model of questioning to capture the multiple task and social (identity) purposes operating across a range of everyday settings in Gonja society. At the identity level, Goody distinguished questions that gave deference from those whose primary function was to control another. Goody was interested in questions and identity in an opposite direction from the approach we take. That is, she began with established identities in the society and looked to see how question function varied by questioner's status. In contrast, we are interested in how question content and formulation can imply identities in situations like intellectual discussion. From within our identity framework, we would recast Goody's discussion as recognizing that questions can imply the status identity of parties.

That the content and form of questions, and even the right to ask them, will vary based on the status relationship between participants is perhaps the best established "fact" of the relationship between questioning practices and identity. Exactly how questioning practices are affected by status relationships is quite

complex and dependent on the nature of the situation. Interviews with a President of the United States (Orr, 1980) or high ranking government officials (Walton, 1989) will yield variation in questioning practices quite different than job interviews (Jablin & Miller, 1990), courtroom exchanges (Penman, 1990), and classroom teaching (Dillon, 1988a, 1988b).

In the courtroom there has been the most focused investigation of the identity work of questioning. Penman (1987, 1990) argues that the official game of courtrooms is to get information. Courtroom rules, she shows, are designed to insure that this purpose remains central. But at the same time that questioning is used to get information to enable informed decisions, identity work is getting done. Most prominently, attorneys use questions to display some witnesses as reasonable, honest people and others as deceptive, sleazy, or untrustworthy. Through the ways questions are formulated and sequenced (and witnesses answer them), a picture of a witness' character is offered to the judge and jury. Woodbury (1984) shows how attorneys draw upon the interactive presumptions entailed by the grammatical form of a question to build a positive or negative moral character for a witness. For instance, to ask a question in the negative ("You didn't go to the door?") conveys that the question-asker is surprised by what a person asserted. Surprise in everyday life is routinely exhibited when a person does not act in a way that is expected or reasonable. Thus, for a questioner to act surprised (which a negatively worded question conveys) can be used to portray a witness' action, and hence the witness, as unreasonable.

In intellectual discussion, it is also reasonable to expect participants to care that they are (and are seen as) a person of good character. But given the nature of the occasion, this concern is likely to be less focal. A focal concern for academics talking about ideas is likely to be their own intellectual competence (Tracy & Baratz, 1993). What does it mean to be intellectually competent during intellectual discussion in the academic setting? In particular, what kinds of variation exist in questioning practices, and how do they speak to intellectual identity?

Discourse Data and Interpretive Method

Discourse Data

The primary data upon which we draw are discussions that occurred in an academic department's weekly colloquia. The department was a Ph.D.-granting communication program at a large state-affiliated research university in the United States ("State U"). The departmental colloquium involved faculty and graduate students meeting for approximately 90 minutes in a seminar-type room. The room included a rectangular table that could seat 15, with additional chairs for another 15 around the outside of the room. A typical colloquium included 8 or 9 faculty and 7 to 15 graduate students. One of the departmental members, or occasionally a visitor from another department or university, would make a presentation; a 30–40 minute discussion would typically follow. Beginning in 1988 and extending over an 18-month time period, weekly colloquia were audiotaped.

Of these colloquia, discussion periods from 10 occasions, as well as selected excerpts from others, have been transcribed.[2]

In addition to the colloquium discourse from State U, we draw upon several other types of intellectual discussion materials. Included are: (a) interviews with graduate students and faculty at two universities,[3] (b) a short segment of a dissertation defense, and (c) an excerpt from a seminar held at a national communication association.

In transcribing discussion and interview exchanges, we recorded exact words, repetitions, partial formulations, and nonfluencies. We did not attempt to capture pronunciation peculiarities, timing, overlap, or intonational emphases. As several discourse theorists have noted (Coupland, 1988; Craig & Tracy, 1983) the appropriate level to transcribe is always dependent on a particular study's aims. Given our interest in examining identity strategies across lengthy segments of text, it seemed most reasonable to transcribe at this intermediate level of detail.[4]

Identity-Implicative Discourse Analysis

The interpretive discourse approach we are developing is influenced by two traditions. The primary tradition is the range of discourse–analytic approaches evidenced in the work of Potter and Wetherell (1987), Gumperz (1982), Tannen (1984), and Brown and Levinson (1987). A secondary tradition is the communicative research tradition that considers what message strategies people use to accomplish particular communicative goals (e.g., Cody & McLaughlin, 1990; Wilson & Putnam, 1990).

Similar to the discourse–analytic work of interactional sociolinguists (Gumperz, 1982; Tannen, 1984), identity-implicative analysis draws upon in-depth knowledge of the culture to arrive at proposed plausible meanings of strategies. We see this as critical in light of our presumption that identity concerns and identity work processes are highly situation-bound. Since much identity work is done implicitly through conversational comments directed to the task, it is essential to make visible community beliefs about routine and desirable behavior. For the intellectual discussion occasion, then, the discourse interpretations we propose draw upon information gathered from in-depth interviews and extended participant-observation as well as the actual text itself.

Similar to message–strategy approaches, identity-implicative discourse analysis seeks to describe likely relationships between conversational moves and outcomes. We recognize that any specific conversational action could have very different meanings (outcomes) than the ones described. For instance, the actual situated meaning of the conversational move could change if participants possessed a certain relational history, if the vocal intonation were atypical, or if unusual facial expressions were present. Since our analysis does not attend to all aspects of conversational action or every kind of contextual feature, we cannot, and do not, claim to capture what actually happened.

Like Brown and Levinson (1987), we are primarily interested in making visible *potential* likely meanings of conversational devices. Just as Brown and Levinson show how a whole set of conversational devices can be seen as positive

or negative politeness strategies, we too seek to show how certain conversational moves can plausibly implicate aspects of intellectual identity. Stated somewhat differently, we are not primarily making claims about what actually happened – what speakers in the particular instances intended and what recipients actually inferred. Instead, through close analysis of discourse instances, we seek to describe meanings of conversational actions that are plausible given the situation type of interest.

Assessments of the plausibility of the interpretations offered in the article can be made in several ways (see Potter & Wetherell, 1987; Tannen, 1984, for discussions of interpretation validity). For this type of discourse, we would especially highlight Tannen's "aha" factor. If the interpretations offered are plausible, then readers – most of whom could be expected to have experience with this kind of talk occasion – should exclaim aha! "Something they have intuitively sensed will have been made explicit" (Tannen, 1984, p. 38).[5]

Our analysis seeks to characterize the situated identity concerns to which participants orient and to describe the conversational moves that implicate these identities. The article's focus is on the altercasting potential of questions. But because discourse practices are implicative for both parties, we occasionally note a potential identity implication for a speaker.

Identity-implicative discourse analysis is accomplished in an iterative manner. With regard to intellectual discussion, this means that a plausible interpretation of the identity concerns operating is identified by asking of discourse expression: "What facet(s) of identity is made salient by talking in just this particular way?" Then the conversational practices that do this identity work are uncovered by asking: "What aspects of discourse, in particular and specifically, lead to these identity inferences?" Consider now how questioning practices do identity work.

Identity Implications of Questioning

From the interviews (Tracy & Baratz, 1993) we knew that participants at State U wanted to be seen as intellectually able. Using this knowledge of participants' likely identity concern as an initial analytic frame, we then studied the discourse to specify more precisely the best (i.e., most contextually relevant) ways to formulate this abstract and obviously multicomponent concern. Based on our analysis, we argue that three facets of question-recipients' intellectual identity are made visible through questioning practices: (a) whether the question recipient is appropriately knowledgeable, (b) to what degree the question-recipient is intellectually original, and (c) how intellectually sophisticated is a question-recipient.

For each identity concern we give evidence of its situational salience and provide an analysis of how features of questioning practices implicated it. We show how the use of marked and unmarked question forms implicate whether an academic is appropriately knowledgeable. Then, we display how time-oriented references and interest queries can be directly, or obliquely, embedded in questions to challenge another's originality. Finally, we explore how lexical choices unveil intellectual frameworks and, in so doing, challenge a recipient's intellectual sophistication.

Knowledgeability and Use of Marked/Unmarked Forms

In domains of life in which people are emotionally and/or economically invested, they typically seek to be, and be seen as, knowledgeable. In university settings where discussion is about ideas, to be knowledgeable is far from an easy task. Always, there are more authors to be read, technical information to be mastered, and ideas that require understanding and integration with other ideas. In this academic setting, knowledgeability can never be other than bounded and a matter of degree. No person can know everything. Hence, while being a highly knowledgeable person is a desired identity, there is simultaneously a recognition that not knowing, at least under certain circumstances, deserves to be recognized as reasonable.

The judgment of whether it is reasonable (or unreasonable) for a question-recipient to know particular information is built into question formulations. As Pomerantz (1988, p. 366) notes, "a speaker unavoidably builds into an information-seeking question an expectation that the recipient should know, may know, probably does not know, etc. the sought-after information." In other words, in the question formulation we see the speaker's assessment of the recipient's knowledgeability level. That this identity-relevant information is routinely present is especially visible when an initial formulation is repaired. Consider the significance in Excerpt 1 of a faculty member's (Roy) reformulation of a question to a graduate student presenter (Sue).

Excerpt I[6]

Roy: Uhm this is a kinda follow up, I guess on the perceptions thing. *Did you, are you aware, I would assume that,* that studies looking at self attributions and other attributions of competence generally show a pretty high correlation?
Sue: hmm mm
Roy: That, that is generally true? That that person's own self rating of competence correlates pretty highly with ratings of those surrounding?

Roy's question is attempting to get information about the relationships between self attribution and other attribution for judgments of interactive competence. Of note is the fact that he begins his question three times using different phrasings each time. From these repairs we can infer that he was dissatisfied in some way with his first two formulations. But what exactly is being repaired?

We would suggest that he is dissatisfied with what his initial formulations imply Sue should know. Each formulation implies a different knowledge expectation of Sue. By far the strongest formulation is displayed in the first formulation ("Did you"). It is typically the case that when a speaker begins an utterance, its ending can be projected. If Roy had continued with his initial formulation, it is likely he would have said something like "Did you look at the relationship. . . ." To ask someone if they did something, suggests it is an activity that could be expected. This is likely to be the case unless a speaker mitigates ("Did you by any chance") or reverses the presumption ("You didn't look at . . ., did you?"). Roy's immediate repair suggests that he does not want to imply that Sue should know what he is asking. His second formulation softens this expectation

("Are you aware"), making it more reasonable if Sue is not able to address the issue. This formulation nonetheless still conveys that what is being asked is a kind of information that well-informed others should know. Roy's last formulation ("I assume that studies looking at") conveys the weakest implication that Sue should know the information being asked. It turns the utterance into a statement focused on the question-asker's knowledge rather than a query directed toward the other. While it does ask her to confirm whether something is true, it sidesteps whether or not she is responsible to have this requested information. Roy's reformulation work, then, gives evidence that at least at some tacit level, speakers orient to the potential identity threat to a person's knowledgeability implied by a question's form.

Question formulations imply whether an asker has a strong or weak expectation that the recipient will be knowledgeable. But it is not the case that all expectations need to be marked; the unmarked form in such discussions is one where question formulations rather straightforwardly presume recipient knowledgeability about that which is being asked. This presumption is conveyed by the *absence* of mitigators and qualifiers oriented to the issue of knowing.

Excerpt 2
So did, did, in what you said then, does the Inquirer think of themselves as, as in an adversarial relationship with organized religion?
Excerpt 3
So what exactly is a computerized conference in your view?
Excerpt 4
What was it that he was using that, to establish his authority, to keep the authority relationship between him and his audience?

While Excerpts 2 ("in what you said then") and 3 ("in your view") do include conversational markers that make the question less demanding by dint of treating it as a question of opinion rather than fact, neither these two, nor the others, problematize whether the question-recipient will know what is being asked. This then is the invisible side of identity work. When presenters supply information to unmarked questions, question-recipients enact their role as the "expert" and knowledgeable person in the domain of talk. But should a recipient not know the answer to a question where knowledgeability is presumed, he or she will need to do conversational work to overturn a negative identity implication. If successful interactive work is not done, then an implication is left standing that the question-recipient has limited knowledge in an area where another expected fuller knowledge.

An exchange between a faculty presenter (Ed) and a faculty discussant (David) displays such conversational work. Ed has presented a study about religious-news coverage in the media. In the discussion period, embedded in a rather lengthy comment, David asks Ed's opinion about a particular scholarly literature. Given the absence of mitigators directed to likelihood of knowing, David's question can be seen as implying the reasonableness of expecting Ed to be knowledgeable and familiar with authors who write about this literature. But as Ed's answer unfolds, it becomes clear that this presumption is not accurate. Consider the exchange

Excerpt 5

David: I just am wondering uh how does this relate to [name of specific literature], for example, are those in your views, those are reflections of newspaper interests? . . .[7]

Ed: Uh, huh well I, you know it's not something that I've given a great deal of thought to because I, I myself have never been very taken with uh the, what you call [name of specific literature] . . . I haven't thought about this before now but now, being intrigued by the idea, perhaps making, say what kind of connection might be possible there. I mean I don't know. And, and I'd also have to say that that's a literature I tend not to read a great deal because I haven't found it ( ) I think I got involved in this study originally . . . I'm obviously not a journalist scholar . . . Okay, I'm sorry I mean I just that's sort of a, of a, of a, of an admission about it. It's not a literature that I have been taken with in the past and it just did not seem to be very fruitful, you know.

Ed is doing considerable work in his answer to justify and make reasonable his lack of familiarity with a literature that David had presumed related to what he was talking about. In his response, besides accepting responsibility for not knowing ("OK I'm sorry"), Ed also suggests that his lack of familiarity exists because of the quality of the literature ("never been very taken," "not seem to be very fruitful"). In characterizing the literature this way, he makes visible an alternative meaning for his not knowing – it's a set of ideas not worth knowing. Whether members of a discussion group treat a presenter's alternative framing as an acceptable reason not to know or discount it and judge the person to be poorly read will undoubtedly depend on individual discussants' personal relationships to and assessment of the ideas and authors under discussion.

In Excerpt 5, we showed how the presumption of knowledge built into a question's form threatened a recipient. One might conclude from this, that if speakers have doubts about whether a recipient knows the answer, it will always be less face-threatening if the question formulation presumes the reasonableness of not knowing. This, we contend is not the case. Just as a question may threaten another's identity by presuming he or she should know something he or she does not, so too can a question formulation threaten another's identity by assuming that the recipient is unlikely to know that which others regard as part of being competent. Consider the following question posed by a faculty member to a graduate–student presenter who has given a talk about the differences between face–to–face interaction and [situation X] type of interaction.

Excerpt 6

Uh, [Fred], you mentioned that uh the research on difference between face to face and [situation X type of interaction] is somewhat contradictory. I wonder if you have uh, well I put it, could you point to an example of a particular point on which research, uh it sort of seems to conflict? And uh, if you have thought at all about 'why, why it may seem to conflict? Or uh, if there's any explanation for why the research seems to be conflicting.

In formulating his question to Fred this way, the faculty member does considerable work to make it okay for Fred to not have a very well thought-out answer. Rather than straightforwardly asking for Fred to give an example, the faculty member asks him to "point to" one. The pointing formulation makes reasonable more vague, less detailed information than if a person was asked to "give" an example. Moreover, the example "pointed to" need illustrate no more than research that "sort of seems to conflict." In addition, in asking for an explanation of the conflict, he explicitly recognizes that Fred may not have previously thought about this ("if you have thought at all"). Thus, this question formulation does a lot of work to make it "OK" for the student responder to not have a good answer. The sheer amount of conversational work, in fact, calls attention to itself. Why, we might ask, is this faculty member doing so much work? To presume that a presenter would have difficulty giving an example of his central claim is not an identity-neutral claim. This is a competency to be expected of all community members including the most novice. Thus, while it seems plausible that the faculty member was working to avoid putting Fred on the spot, the amount of conversational work done to make reasonable an inadequate answer implicitly conveys to all who are present that a negative intellectual assessment is being made of Fred by the question-poser. Similar to Ed's situation (Excerpt 5), the situated assessment of Fred's knowledgeability will depend on his response. If rather than haltingly try to come up with an example, which is what Fred did, he had challenged the implication (e.g., "Of course I can supply an example, why wouldn't I? One place the research conflicts is . . ."), then Fred could have overturned the faculty member's implication that he had limited knowledge on something the community expected him to know.

In sum, through the presence of knowledgeability-limitation markers, or through their absence, question formulations imply whether the recipient is expected to know a particular piece of information. In conjunction with community beliefs about the requested information and the recipient's actual response, knowledgeability-limitation markers shape whether the question–recipient is seen to be appropriately knowledgeable. While this aspect of identity work is most visible when question-posers repair their question formulation or when a mismatch occurs between projected and actual knowledge levels, it is routinely available in question formulations.

Intellectual Originality, Time References, and Interest Queries

When novice researchers (graduate students) are taught how to do scholarly work, the task is typically conceived as one of helping students master technical skills and disciplinary-bound argumentative conventions. That an academic can routinely make reasonable claims that are well-evidenced is a sought-after intellectual identity. But this aspect of competence is only part of what most academics seek; they also wish to be seen as doing interesting, novel work. Academics desire to be judged original thinkers. Kaufer and Geisler (1989) argue

that for an idea to be labeled "new" it must show its ties to earlier ideas while displaying that the introduced idea is more than a tired repetition of what others, including self, have said before.

Within our framework, a failure to tie to past work evidences inappropriate knowledgeability. Originality assessments will be more strongly tied to an academic's ability to say something new. In addition, besides being new, an original idea must be interesting (Davis, 1971) – it must elicit an increased attentiveness from people.

In this kind of discussion forum, challenges to a presenter's originality are made in two ways. One way is to link a presenter's topic to other work done in a non-present time frame and either directly state or imply the similarity of the two kinds of work. The other is to directly query whether what a person is doing is interesting or through language loading imply that it is not.

Questions that directly described another as doing no more than what had been done in the past were not common but could be found. Consider the following question put by a faculty member to a graduate student.

Excerpt 7

I noticed that most of the literature you review is from the eighties (uh huh) and some of it goes back to the seventies but nothing goes back to the ancient period of the fifties (group laughter) . . . *Didn't we have a human relations model back in the fifties? . . . Well what's new here since Roethlisberger and Rogers? What's new in the way of these variables? We're hearing the same stuff.*

In Excerpt 7 the faculty member not only directly and straight-forwardly asks if there is anything new in what is being said ("What's new in the way of these variables?") but went on to explicitly label what the student is presenting as "the same old stuff." In tying the student's topic to the past in this manner, this faculty member conveys a strong assessment of the student's work (and hence the student) as unoriginal.

While Excerpt 7 is the only instance in the discussion discourse of an originality challenge made so directly, the academic interviews attest to their presence as well as memorability. Faculty member Joan recounted this kind of identity challenge in her graduate-school colloquia experiences.

Excerpt 8

It wasn't just that it was heated debate . . . it was that, uh personal affront was intended and was taken in the course of, of this discussion. And perverse human that I am, I liked it . . . I loved seeing mild-mannered people sort of take incredible barbs and uh, digs at one another and people who had to work together forevermore, uh say things like, uh "*how's this different from your dissertation twenty years ago*?"

But while originality often may not be challenged directly, it is there as an ongoing interactional sensitivity. Consider what is implied in the following comment-question made by an outside departmental faculty member (Roger) in the opening questioning of a Ph.D. dissertation defense.

Excerpt 9

There's really a lot of interesting things I'd like to talk about and I have to be strategic because I know that other people have a lot of the same questions. Um, I really liked reading it. It's really well written. It's really fascinating. I, I um, it gets me back into traditional sociology too, which I haven't done for a while. And it was so much fun to read and *realize that people continue to find this stuff interesting.* Um, I guess the first thing is, starting at a grand theoretical level, um it seemed to me that, you know I don't read in discourse analysis per se. You know well *I was trying to get a grasp on what's the really interesting question?* What's the contribution here, you know? And it seemed that here, the one thing that you said was that developing a notion that [concept X's] occur . . . *I guess it reminded me very much of when we used to read and always criticize Parsons, when I was first a graduate student,* the notion, you know that people are somewhat captured by their roles. . . . [345 more words] And so I see kind of, two general, not clearly related theoretical questions. And I just wanted you to comment on to what extent you're about those things.

Following his explicitly face-supportive comments (e.g., "It's well written. It's really fascinating"), Roger goes on to make a lengthy comment-question, the thrust of which is to ask the student to disambiguate between two potentially contradictory claims in the study. As such, the question primarily challenges the student's argumentative skillfulness, a broad-based and discipline-specific identity we do not consider here.

Embedded in this argumentative challenge, however, is an oblique challenge to the student's originality. Roger's question formulation challenges the student's originality in two ways. The first challenge is conveyed by time references embedded in this question. By characterizing the central issue in the student's work as the same as what occupied scholars more than a decade ago ("people continue to find this stuff interesting" and "it reminded me very much . . . of when I was first a graduate student"), Roger conveys that he sees the project as "dated" and doing no more than what has been done before.

Roger also challenges originality by marking the task of figuring out what is newsworthy and interesting as problematic. In describing himself as "trying to get a grasp on what's the really interesting question," Roger implies that figuring out what's interesting takes considerable work. And although he specifically mentions a reason that would account for the difficulty as potentially his fault ("I don't read in discourse analysis per se"), given his considerably higher levels of experience/status and the implicit structure of the utterance – a pro forma disclaimer (I don't read in X but it doesn't seem interesting), we are led to see it as a politeness move to soften a challenge rather than an account he is offering for a problem he has.

In the next excerpt (Excerpt 10) we see both a time-linkage and an interest-query challenge made. In contrast to Excerpt 9, however, rather than directly questioning how someone's work is interesting, the question-poser characterizes the recipient's work with language that implies the work is dull, plodding, and boring. In addition, the time linkage made is to the future rather than the past. Consider how these two moves operate together to challenge the presenter's originality.

that for an idea to be labeled "new" it must show its ties to earlier ideas while displaying that the introduced idea is more than a tired repetition of what others, including self, have said before.

Within our framework, a failure to tie to past work evidences inappropriate knowledgeability. Originality assessments will be more strongly tied to an academic's ability to say something new. In addition, besides being new, an original idea must be interesting (Davis, 1971) – it must elicit an increased attentiveness from people.

In this kind of discussion forum, challenges to a presenter's originality are made in two ways. One way is to link a presenter's topic to other work done in a non-present time frame and either directly state or imply the similarity of the two kinds of work. The other is to directly query whether what a person is doing is interesting or through language loading imply that it is not.

Questions that directly described another as doing no more than what had been done in the past were not common but could be found. Consider the following question put by a faculty member to a graduate student.

Excerpt 7

> I noticed that most of the literature you review is from the eighties (uh huh) and some of it goes back to the seventies but nothing goes back to the ancient period of the fifties (group laughter) . . . *Didn't we have a human relations model back in the fifties? . . . Well what's new here since Roethlisberger and Rogers? What's new in the way of these variables? We're hearing the same stuff.*

In Excerpt 7 the faculty member not only directly and straight-forwardly asks if there is anything new in what is being said ("What's new in the way of these variables?") but went on to explicitly label what the student is presenting as "the same old stuff." In tying the student's topic to the past in this manner, this faculty member conveys a strong assessment of the student's work (and hence the student) as unoriginal.

While Excerpt 7 is the only instance in the discussion discourse of an originality challenge made so directly, the academic interviews attest to their presence as well as memorability. Faculty member Joan recounted this kind of identity challenge in her graduate-school colloquia experiences.

Excerpt 8

> It wasn't just that it was heated debate . . . it was that, uh personal affront was intended and was taken in the course of, of this discussion. And perverse human that I am, I liked it . . . I loved seeing mild-mannered people sort of take incredible barbs and uh, digs at one another and people who had to work together forevermore, uh say things like, uh "*how's this different from your dissertation twenty years ago*?"

But while originality often may not be challenged directly, it is there as an ongoing interactional sensitivity. Consider what is implied in the following comment-question made by an outside departmental faculty member (Roger) in the opening questioning of a Ph.D. dissertation defense.

Excerpt 9

There's really a lot of interesting things I'd like to talk about and I have to be strategic because I know that other people have a lot of the same questions. Um, I really liked reading it. It's really well written. It's really fascinating. I, I um, it gets me back into traditional sociology too, which I haven't done for a while. And it was so much fun to read and *realize that people continue to find this stuff interesting.* Um, I guess the first thing is, starting at a grand theoretical level, um it seemed to me that, you know I don't read in discourse analysis per se. You know well *I was trying to get a grasp on what's the really interesting question?* What's the contribution here, you know? And it seemed that here, the one thing that you said was that developing a notion that [concept X's] occur . . . *I guess it reminded me very much of when we used to read and always criticize Parsons, when I was first a graduate student,* the notion, you know that people are somewhat captured by their roles. . . . [345 more words] And so I see kind of, two general, not clearly related theoretical questions. And I just wanted you to comment on to what extent you're about those things.

Following his explicitly face-supportive comments (e.g., "It's well written. It's really fascinating"), Roger goes on to make a lengthy comment-question, the thrust of which is to ask the student to disambiguate between two potentially contradictory claims in the study. As such, the question primarily challenges the student's argumentative skillfulness, a broad-based and discipline-specific identity we do not consider here.

Embedded in this argumentative challenge, however, is an oblique challenge to the student's originality. Roger's question formulation challenges the student's originality in two ways. The first challenge is conveyed by time references embedded in this question. By characterizing the central issue in the student's work as the same as what occupied scholars more than a decade ago ("people continue to find this stuff interesting" and "it reminded me very much . . . of when I was first a graduate student"), Roger conveys that he sees the project as "dated" and doing no more than what has been done before.

Roger also challenges originality by marking the task of figuring out what is newsworthy and interesting as problematic. In describing himself as "trying to get a grasp on what's the really interesting question," Roger implies that figuring out what's interesting takes considerable work. And although he specifically mentions a reason that would account for the difficulty as potentially his fault ("I don't read in discourse analysis per se"), given his considerably higher levels of experience/status and the implicit structure of the utterance – a pro forma disclaimer (I don't read in X but it doesn't seem interesting), we are led to see it as a politeness move to soften a challenge rather than an account he is offering for a problem he has.

In the next excerpt (Excerpt 10) we see both a time-linkage and an interest-query challenge made. In contrast to Excerpt 9, however, rather than directly questioning how someone's work is interesting, the question-poser characterizes the recipient's work with language that implies the work is dull, plodding, and boring. In addition, the time linkage made is to the future rather than the past. Consider how these two moves operate together to challenge the presenter's originality.

Excerpt 10

Jim: I have one more question. It really strikes for me at the heart of the whole methodological question we've been talking about.

Jill: Uh huh

Jim: One scenario would be for you to spend the next 20 years of your life uh doing replications with similar stimulus materials but methodological variations. Like you could do MDS, you could do videotape, you could, if you want make sure you had similar stimulus materials because otherwise we might worry about whether or not you had comparability of results. And so uh, the strategy then would be a sort of piling on, an accumulation, bit by bit until finally you were satisfied twenty years later that you were able to say what was going on in this study of [X]. And uh, then another approach might be to uh, go for something much more dramatic and I'm not quite sure what that would be. It would be the kind of thing where we could all say YES, for sure, that's it, no question about it. Uh, as a philosophy of science is this accumulated approach one that you can justify in light of work in social psychology or communication, interpersonal communication?

Consider the "choice" Jim offers Jill regarding her future 20 years of research. She can either continue what she is doing extending her findings step by step. To do this is to engage in "piling on" and "bit by bit accumulation," or she could decide to do something "where we could all say YES, for sure, that's it, no question about it." Jim's language is loaded with negative evaluation toward where Jill seems to be going and positive evaluation toward what is labeled as the alternative possible path. His language implies that Jill's intended path is boring, pedestrian, and insignificant whereas the other is exciting, interesting, and valuable.

In addition, consider how Jim characterizes the net results of Jill's intellectual work in the future ("Spend the next 20 years of your life uh doing replications with similar stimulus materials but methodological variations"). Such a characterization creates a vivid picture of Jill doing virtually the same thing (not anything "new") for a lengthy time period. Furthermore, in using "20 years" as his future reference, Jim uses a unit of time that has particular cultural meaning. "Twenty years," we would argue, is a specific time unit used to reference a person's life work; it is a time marker that calls up assessment of the significance and value of what a person has been doing (or is planning.to do). Because all actions occur in time and are expected to take particular amounts of time, references to time can become implicit ways to criticize (or praise) another's decisions and projected actions. Thus, Jim's reference to "20 years" conveys a negative assessment of Jill's potential originality if she continues on her current trajectory. In sum, through linkages to time, as well as queries about a work's interest-value, question posers can raise challenges to recipients' intellectual originality.

Intellectual Sophistication and Framework Problematizing through Lexical Choices

In addition to knowledgeability and originality, the activity of questioning can reveal a recipient's level of intellectual sophistication. "Intellectual sophistication" is an attribution made of academics who display the ability in their talk (or writing) to recognize the intellectual tradition within which they work, to grant its

limitations while articulating its advantages, and to reveal awareness of what is entailed by and inconsistent with their framework.

That ideas are situated within intellectual traditions and involve particular assumptive frameworks is a belief so widely shared that it requires no defense. Theoretical traditions – what we label intellectual frameworks – include epistemological and methodological commitments as well as knowledge of particular authors regarded as seminal. Differences in frameworks are especially notable across disciplinary boundaries (Bazerman, 1988; Tracy, 1988), but they exist within all scholarly communities.

Theoretical frameworks are called up in the way scholars talk about their own research and question others about theirs. Each intellectual tradition uses a vocabulary of central terms. To the initiated, these terms serve as cues of a speaker's intellectual framework. Just as an experienced sailor can recognize a large underwater iceberg from a small piece of ice in the ocean, so too can lexical choices cue intellectual traditions. For example, among language and social interaction scholars, talk about the "accomplishment of everyday experience" cues ethnomethodology (Garfinkel, 1967). References to speech communities and speech events bring forward the ethnography of communication (Hymes, 1974); mentions of "experimental control" and "manipulation check" cue an experimental paradigm. Thus, in the issuing of a question, a speaker dons the cloak of an intellectual tradition.

When question formulations operate within the tradition of the question–recipient, the intellectual framework is backgrounded; assumptions remain implicit, unspoken, and tacit. The discussion goes forward focusing on the substantive thrust of the question. But when a questioner's lexical choices highlight or problematize the framework *as a framework*, a question-recipient is well-advised to back up and justify his or her assumptions. At such a juncture, the issue of the choice of that particular framework versus some other becomes salient. If a question recipient does not recognize that a framework challenge has been made or inadequately defends his or her choice, the person displays self as having limited ability to move among intellectual worlds. In other words, the person displays a lack of intellectual sophistication. Consider, now, how this process works.

In Excerpt 11 Lee (a graduate student) asks Beth (a graduate student) about several specific choices she made. In her presentation Beth had described a experimental study where participants were presented written conversational materials and asked to make judgments about what a party said.

Excerpt 11

Lee: OK so there was one example of a [X] message if they were to get one at all?

Beth: There were three examples. There was one example of [X] in the high/low, one in the low/high and one example in the low/low . . . (33 more words)

Lee: Yeah I got that. Now was the particular [X] message of the same sort?

Beth: Not, not all. Those that varied across conversation so the [X] example from the [Jane] and [Sue] conversation might have been different from the [X] example in the [Jim] and [Todd] situation.

Lee: Do you think that would have caused any kind of differences?

Beth: Is the question as to whether the differences in the [X] strategy might have? It's also possible the differences in the situation might

Lee: So you

In this sequence, Lee's questions convey concerns about Beth's experimental choices. They do not, however, problematize Beth's starting framework. In exploring whether variation in the study's outcomes can be attributed to other factors than the ones manipulated, Lee participates in an experimental framework. In so doing, she tacitly supports Beth's starting assumptions. Contrast Lee's questions of Beth with those from faculty member Sam at a slightly later point in the same discussion.

Excerpt 12

Sam: Did you have any dilemmas of choice in terms of experimentation here? Did you, did you *sacrifice* uh uh external validity for *control* at any point?

Beth: Uh yeah the, well I, our readings, I mean when they, when they read the conversations or read the scenarios that, yeah that *sacrifices* external validity for the purpose of *control* and what I was interested in controlling were things like information and uh, that kind of thing, so yeah.

Sam: So how far would you be willing to generalize this in light of the *sacrificing* that you did do?

In his questioning, Sam, like Lee, asks Beth to reflect on her choice making as a researcher. In contrast, however, Sam's lexical choices subtlely mark Beth's intellectual framework as problematic. Evidence that Sam is querying the framework (experimental research) rather than operating within it is two-fold.

First, his initial formulation asks about categories of action ("dilemmas of choice in terms of experimentation") rather than any specific choice Beth made in the experimental study she is discussing. Not focusing on a particular conveys that the issue is bigger or more basic than the specific choice, a move that goes with framework challenges.

Second, the reformulation of his question, made in the same initial utterance, replaces a relatively neutral phrase ("dilemmas of choice") with a formulation that carries negative evaluation of the experimental frame ("sacrificing external validity for control"). Among social scientists an accepted belief, well-documented in introductory research methods textbooks (e.g., Anderson, 1987; Bowers & Courtright, 1984), is that a good study must attend to multiple criteria that often are seemingly at odds with each other. Good research is expected to optimize a balance between internal and external validity. But while good research attends to both, different traditions prioritize criteria differently. Thus it is generally accepted that good experiments satisfy internal validity better than other methods but do less well on external validity.

In asking Beth if she "sacrificed" something, Sam suggests that she has gone too far in the process of weighing competing criteria. Note, too, that Sam's question implies the direction in which Beth has gone too far: She sacrificed "external validity," the criterion nonexperimental traditions most often accuse experimental work of inadequately considering. Moreover, in using the word *control* rather than internal validity, Sam further tilts the comparison. Beth's decision is not cast as one between equally desirable goods (internal and external validity) but between a good (external validity) and the negative consequences of the means (control) used to achieve the other good (internal validity). *Control* as a

lexicial choice highlights that contrivance and a lack of naturalness have been opted for. Through this co-occurring set of lexical choices, Sam problematizes Beth's starting framework.[8]

Does Beth recognize this simple question as a framework challenge and hence a bid to display her intellectual sophistication? We think she does, although she is unable to address it well. That Beth is aware of a challenge is suggested by the high level of nonfluency in her answering comment. Her answer begins in four different ways ("uh yeah the," "well I," "our readings," "I mean when they") before she proceeds fluently. False starts give us information about the level of difficulty a speaker perceives in a question. Beth's unusually high number of false starts implies that she has recognized a difficulty.

The substance of her response, however, does not address the framework challenge. Her response, in fact, buys into Sam's negative characterization ("yeah that sacrifices external validity for the purpose of control"). We would suggest that to display herself as intellectually sophisticated, Beth needed to acknowledge her commitment to an experimental research tradition while arguing for its value compared to other approaches. To do this Beth needed to call into question what was presupposed by Sam's use of the word *sacrifice* as well as reframe her tradition using positively loaded language. For instance, if Beth had said, "I wouldn't use the word *sacrifice.* All research involves trade-offs between internal and external validity. My research is experimental and as such has stronger commitments to internal validity than more anecdotal approaches do," she would have displayed a higher level of intellectual sophistication than she did.

Besides implicitly criticizing an intellectual framework, a questioner's lexical choices can problematize whether a presenter is operating within the intellectual framework he or she has claimed. Excerpt 13 is from an all-day professional seminar among a group of established scholars who share an ethnographically based intellectual frame. In his presentation Larry has criticized the "flecks of positivism allegiances" evident in the work of others present at the seminar. In response to a first question, Larry argues for his interpretive approach to knowledge being better than the traditional positivistic ones. He characterizes the positivistic tradition with negatively loaded language ("it's very susceptible to being aligned with hegemonic forces, colonization, and so forth") and describes his stance positively. (His stance is "performative, processual, open, open to new insights, more voices, particularly minority voices can join the conversation.") Following this response, Thomas, another seminar participant notes the following.

Excerpt 13

Tom: As I listen to your answer to the question, I'm tempted to turn the tables on you some, particularly in terms of your language which I might turn around and talk about the arrogance of nonpositivism [[short simultaneous talk]] the use of the word "contradictions," the use of the word "polemic" [Larry: is loaded], suggest to me an either/or. And it seems to me particularly as I hear your earlier comment about pluralism, your comment now in reference to this question, that the real position is not either/or, it's both/and [Larry: yes] in a sense that . . . [187 more words]

> **Larry:** Yeah I, no quarrel there. And you are right to chasten me if anything that I said seems not to be embracing pluralism. You know I argue, I certainly argue with the positivists. But as I said earlier, not to displace that, not, to engage in a conversation. Now I'm committed not only to cultural pluralism but to methodological pluralism.

Tom's comment/question characterizes Larry as speaking in a way that is inconsistent with his intellectual framework. It suggests that an intellectual committed to pluralism would see value in many different perspectives and would not talk in disparaging or dismissive ways about views different from his/her own. In choosing the word *arrogant*, Tom implicitly accuses Larry of talking in a manner inconsistent with commitments of his intellectual frame.

Larry's response recognizes the validity of the framework challenge and seeks to address it. By making explicit the interactive thrust of Tom's comment as well as the reasoning on which it rested ("no quarrel there . . . you are right to chasten me if anything I said seems not to embrace pluralism"), Larry shows recognition of an entailment of his intellectual framework. At the same time he works to reframe the meaning of his conversational behavior (he's arguing with the positivists to engage in conversation not to put them down). In recognizing and granting the legitimacy of an entailment while showing how his actions should not be read as inconsistent with it, Larry displays intellectual sophistication.

In sum, how intellectually sophisticated an academic is, becomes salient when a question problematizes the person's intellectual framework. Such problematizing is accomplished through subtle lexical choices. That is, particular linguistic formulations cue intellectual traditions and in so doing may unveil what is typically tacit and hidden – that presenters' ideas are sensible only within particular assumptive structures. Relatedly, specific formulations can convey a questioner's doubts about a tradition or doubts that a person is operating within a claimed tradition. Thus, when a questioner's lexical choices make the presenter's framework problematic, the presenter's intellectual sophistication is challenged. Of note is the fact that the challenge can end up supporting the person's intellectual sophistication as was seen with Larry or can reveal its relative absence, as seen with Beth.[9]

Discussion and Conclusions

In this study we have shown how three aspects of questioning practices altercast question–recipients in terms of their level of knowledgeability, originality, and intellectual sophistication. Our analysis, admittedly, provides neither an exhaustive description of the conversational moves intellectual discussants use nor a comprehensive typology of situationally salient identities. What we have sought to do is provide a discourse-grounded view of several important pieces of the identity-shaping process in academic intellectual discussions.

We expect that conversational moves identified through this study will be found in other communicative contexts. For instance, the use of knowledgeability limitation markers would seem relevant in any interactive context where

a person's identity is tied up with being knowledgeable about a domain. Thus, we would expect to see variants of what was observed in this study in the courtroom, in classrooms, in negotiation sessions, and so on. In contrast to knowledgeability, intellectual originality and sophistication seem more context–specific identities. Yet even for these identities, we think some of the discourse moves will be found to occur in a range of everyday situations, although undoubtedly to accomplish somewhat different interactional purposes. For instance, we think the use of the "20 years" time reference, discussed in the originality analysis, will be found to be used in a wide range of interactive situations to criticize another's course of action ("Are you going to be doing this 20 years from now?") or defend one's own choice ("If I don't take this risk, 20 years from now I'll feel I blew my big opportunity").

A Distinctive Type of Discourse Analysis

In this study we illustrated a new kind of discourse analysis that we think can be a useful tool for researchers interested in better understanding communicative practice. Like its discourse-analytic neighbors, conversation analysis (e.g., Atkinson & Heritage, 1984) and interactional sociolinguistics (e.g., Gumperz, 1982), it shares a commitment to looking carefully at extended segments of naturally occurring talk. But this approach differs in significant ways from each of these neighbors.

In contrast to conversation analysis, which focuses on structures or organization of conversation or social action, identity-implicative analysis is centrally interested in the link between conversational practices and interpersonal outcomes. One result of this focus difference is that identity-implicative discourse analysis draws upon ethnographic background information in interpreting discourse texts. That is, identity-implicative discourse analysis seeks to go beyond what is visibly displayed to speak to issues of what may be routinely inferred. In so doing, it draws upon knowledge gained through participation in a community to make visible the community's most likely interpretive practices.

In addition, identity-implicative discourse analysis relies less heavily on sequential structure information than conversation analysis does. That is, conversation analysis uses the recipient's response to evidence the discourse interpretation offered; identity-implicative discourse analysis may use this information but does not necessarily do so. A reason less weight is given to sequential information is that there is no assumption that recipients' responses will show orientation to identity issues. Thus, extracting conversational moves from a longer utterance is seen as a way to focus an analysis and make a discourse claim clearer.

As noted before, identity-implicative discourse analysis is more similar to the interactional sociolinguistics of Gumperz (1982) and colleagues. Nonetheless, two important differences from this discourse analytic approach are noticeable. First, rather than being interested in culturally based identities (nationality, ethnicity, gender) as interactional sociolinguistics has been, identity-implicative discourse analysis is primarily interested in personality-level (being seen as reasonable, fair, smart, etc.) and occupational identities. Second, in contrast to the analytic emphasis given to paralinguistic cues in interactional sociolinguistics,

identity-implicative discourse analysis focuses upon conversational practices that are potentially more consciously controlled and strategically used – word and phrase choices, topical framings, doing/avoiding specific speech acts, and so on. As such, identity–implicative discourse analysis would seem to offer a way to be more textually and contextually sensitive while addressing the kinds of process-outcome research questions that have been central to communicative inquiry.

Implications for Research and Theory

We see three arenas for which this study has theoretical implications: (a) future questioning research, (b) Brown and Levinson's (1987) politeness theory, and (c) the current metatheoretical debate about approaches to scholarly inquiry.

First, the study suggests that questioning research done from a content-analytic perspective could gain additional insights if attention were also given to actual discourse. For instance, Allwinn (1991) did a field experiment to investigate the effects of social and cognitive factors on question formulation. In the methodological section of the paper, he mentions how coding problems arose because of participant repairs (e.g., "I would . . . Could . . . I need to know how to play this game" [p. 175]). Allwinn's "problem" was that the three formulations produced different categorization conclusions. We would suggest that the content of repairs is not just error but can be used, as was displayed in the knowledge-ability analysis, to provide insights into the social and cognitive processes of interest to many researchers.

Relatedly, rather than seeking to develop a situationally abstracted theory of questioning (e.g., Allwinn, 1991; Goody, 1978), we think it will be more beneficial to study questions in the everyday situations in which they occur. Questions are tools to accomplish interpersonal purposes; to pursue a theory of "questions" essentializes them in ways that we think will be unproductive. For academic discussion, a valuable direction would be to better understand how questioning practices enact a questioner's intellectual identity. While we touched on this issue at several places in this analysis, and have considered it elsewhere with regard to participants' institutional identities (Tracy & Carjuzaa, 1993), it clearly warrants more systematic investigation.

Second, this analysis raises an issue for Brown and Levinson's (1987) politeness theory. In particular, it points to a difficulty in their conceptions of face-threat and face-support. Politeness theory locates face-threat and face-support in different places. Face-threat is located in the speech act; speech acts possess certain inherent face threats. Requests, for instance, threaten a recipient's desire not to be imposed upon (negative face) while criticism threatens a recipient's desire to be approved of (positive face). Face-support, in their theory, is located in the selection and amount of conversational devices (positive and negative politeness strategies) that can accompany the performance of the speech act. Conversational devices are presumed to mitigate face threat.

Our analysis calls this locational divide into question. We found face-support and face-threat inextricably intertwined both for selection of speech acts and for the use of particular conversational devices. That is, while it is clearly the case

that a questioning of framework assumptions is a strong face-threat, a framework challenge was also a significant way for a questioner to support the discussant's intellectual sophistication. In challenging, a questioner could be providing an opportunity for the other to display a desired identity that is difficult to evidence. Thus, the performance of a "face-threatening act" could be an indirect means of face-support. Similarly, conversational devices were not always face-supportive. Knowledgeability limitation markers, for instance, were not only found to mitigate face-threat but, under certain circumstances, to intensify it further.

Finally, at a meta-level this study contributes to the interdisciplinary and ongoing debate about how study of the social world is best conducted. For our purposes we can describe the debate as the logical empiricist position (Chaffee & Berger, 1987) versus the interpretivist, social constructionist position (Edwards & Potter, 1992; Shotter, 1989). This study is an instantiation of social constructionist research through its focus on identity construction through discourse, its commitment to studying communication in naturally occurring contexts, its eschewal of universalizing claims, its discomfort with highly abstract categories, and its preference for situationally salient concepts. In choosing this framework rather than the logical empiricist one, we seek not only to promote the social constructionist view of inquiry but to illuminate a distinctive way to operate within the tradition to create insights into how communicative processes construct who we are, the world we live in, and what we consider as knowledge.

Acknowledgements

This research was partially supported by a grant from the University of Colorado. The author thanks Anita Pomerantz, Robert Craig, Sheryl Baratz and several anonymous reviewers for helpful comments on an earlier draft of this article.

Notes

1. *Identity* is a term gaining widespread use in the social sciences and humanities among scholars taking a social constructionist viewpoint (e.g., Hecht, 1993). *Identity work* is our term which flips the focus of the identity concept from the situated self to the communicative actions at the discourse level.
2. Discussions selected for transcription reflect all possible configurations of given identities – faculty and students in the department, and faculty and students outside the department. Within that broad constraint, selection of discussions was influenced by: (a) audio-tape quality: depending on the placement of the recorder and which participants were most talkative, tapes varied in their audibility. Better audibility tapes were selected; (b) perceived level of discussion involvement: based on participation-observation, discussions where more participants seemed involved were selected over those where fewer participants seemed involved; (c) our knowledgeability as authors about the broad-based approach to knowledge taken by a presenter (social scientific, humanistic) or a specific topic. We avoided discussions where the topic was overly foreign to us and/or one that we judged to require a particularly specialized kind of

3. Descriptions of the interview schedules are available in Tracy and Baratz (1993) and Tracy and Muller (in press).
4. We chose to include false starts and reformulations because such conversational devices can give evidence of how speakers are fine-tuning their intended message (Greene, Lindsey, & Hawn, 1990). Because we were not primarily interested in structural features of talk, we opted not to transcribe at the fine-grained level typically exhibited in conversation-analytic studies (e.g., Atkinson & Heritage, 1984).
5. The issue of how to assess qualitative claims is one about which many scholars have had something to say. Of note is the fact that this issue has been most salient in disciplines that have a quantitative tradition and a strong commitment to objectivity. Thus, researchers in sociology, communication, and education have worried more about the issue than cultural anthropoliogists where ethnography has been dominant and the role of the researcher as a subjective instrument is taken for granted. Discussions within these quantitatively influenced traditions often frame the issue of qualitative claim assessment drawing on the concepts of quantitative research – reliability and validity (e.g., Kirk & Miller, 1986; LeCompte & Goetz, 1982). We see these concepts as problematic when applied to interpretive work; the terms presume a research frame (objective representation) incompatible with the starting assumptions of interpretive research. Argument assessment is crucial, but adopting assessment criteria appropriate to a different kind of argument is not the answer. At present, the general criteria we (and other discourse analysts) use are: (a) argument plausibility and (b) argument interest–value. These are in need of methodological explication, a task which we plan to tackle in future work, but which is beyond the scope of this paper.
6. In the excerpts, all names of people and institutions have been changed. In addition, at certain points we have replaced specific topical comments with a characterization of the topic. We do both of these practices to minimize the likelihood of participants' identities being recognizable. This is a particular sensitivity in this research project since at least some of the readers of this paper are from the same academic community as the discussion participants being studied. The departmental colloquia studied inhabited an ambiguous space between public and private discourse. On the one hand they were open to the public; announcements of time and place were printed in the campus paper each week and any interested party was encouraged to attend. On the other hand, attendance was largely restricted to departmental members. Because of this, permission to tape was sought, and granted, in several different ways. First, the departmental group gave their informed consent to be audio-taped following a discussion of the project in which they had a unanimous vote. Although neither the group, nor the senior author, knew exactly what purposes the tapes would be used for, the departmental group did know the author was interested in issues of facework. Second, whenever a presenter was not a member of the departmental group, his or her explicit permission was obtained before taping.
7. This comment has two kinds of mitigators. The first ("in your view") frames the issue as a matter of opinion rather than fact. This framing gives the answerer more maneuvering room than if it were framed as a right/wrong answer. The second mitigator can be seen in the opening phrase "I just am wondering." We would suggest that in an unmarked question there is a presupposition that the question is serious and central to the issue of discussion. Prefacing a question with a "wondering" statement marks it as a spontaneous thought and not necessarily central to the topic at hand. This potentially does two kinds of facework. It marks the question-asker as aware that the [illegible] may be tangential, and it recognizes the possibility that the issue may not be

a central concern of the speaker. We would suggest that the inability to respond to a question about a marginal topic is less serious than an inability to respond to a central topic.

8. Judgments that lexical choices are intended by a speaker to problematize a framework are undoubtedly easier to make the better one knows a question poser's intellectual frame. When a questioner's starting framework is known to be different than the one a presenter takes, we expect framework challenges to be especially likely. In such a situation, wording choices that are negative in very subtle ways will often be taken as (and intended as) challenges. Sam had frequently expressed criticism of experimental research; for this reason we judge it highly unlikely that discussants did not hear Sam's question as a framework challenge.
9. It is to be expected that graduate students will display lower levels of intellectual sophistication than more experienced academics. This is the case because intellectual sophistication is developed by a person participating in discussion communities where framework challenges occur. For many academics this kind of challenge does not occur until they take academic positions in institutions different from the ones they were trained in.

Discourse and the Denial of Racism

Teun A. van Dijk

Discourse and Racism

One of the crucial properties of contemporary racism is its denial, typically illustrated in such well-known disclaimers as 'I have nothing against blacks, but . . .'. This article examines the discursive strategies, as well as the cognitive and social functions, of such and other forms of denial in different genres of text and talk about ethnic or racial affairs.

The framework of this study is an interdisciplinary research programme at the University of Amsterdam that deals with the reproduction of racism through discourse and communication. In this research programme several projects have been carried out that analysed everyday conversations, textbooks, news in the press, parliamentary discourse and other forms of public and organizational communication (van Dijk, 1984, 1987a, 1987b, 1991).

The guiding idea behind this research is that ethnic and racial prejudices are prominently acquired and shared within the white dominant group through everyday conversation and institutional text and talk. Such discourse serves to express, convey, legitimate or indeed to conceal or deny such negative ethnic attitudes. Therefore, a systematic and subtle discourse analytical approach should be able to reconstruct such social cognitions about other groups.

It is further assumed in this research programme that talk and text about minorities, immigrants, refugees or, more generally, about people of colour or Third World peoples and nations, also have broader societal, political and cultural functions. Besides positive self-presentation and negative other-presentation, such discourse signals group membership, white ingroup allegiances and, more generally, the various conditions for the reproduction of the white group and their dominance in virtually all social, political and cultural domains.

Source: *Discourse & Society* vol. 3, no. 1, 1992, pp. 87–118.

The theoretical framework that organizes this research programme is complex and multidisciplinary. Systematic descriptions of text and talk require an explicit theory of discourse. Relating such discourse structures to mental represenations such as models, attitudes and ideologies about ethnic events, groups and the ethnic organization of society and culture, presupposes a sophisticated psychology of social cognitions. And a study of the functions of discourse in the reproduction of white group dominance should take place within the broader perspective of a social and cultural theory of racism and ethnicism.

Such a multidisciplinary approach to the role of discourse and communication in the reproduction of racism first operates at the societal micro-level of everyday situated interactions, discourse and social cognitions of individual group members. Secondly, this micro-level 'reality' of racism 'implements' the overall structures and processes of dominance and inequality at the meso- and macro-levels of groups, social formations, neighbourhoods, institutions, organizations and even nations and whole world regions. At the same time, the study of the interdependency of the micro- and macro-structures of racism, also requires an analysis of the relations between cognition and action, that is, at the micro-level, between mental models of group members and their practices, and at the macro-level, between social group attitudes and ideologies, on the one hand, and societal structures, on the other hand.

Another important hypothesis that emerges from this earlier work is that political, media, academic, corporate and other elites play an important role in the reproduction of racism. They are the ones who control or have access to many types of public discourse, have the largest stake in maintaining white group dominance, and are usually also most proficient in persuasively formulating their ethnic opinions. Although there is of course a continuous interplay between elite and popular forms of racism, analysis of many forms of discourse suggests that the elites in many respects 'preformulate' the kind of ethnic beliefs of which, sometimes more blatant, versions may then get popular currency. Indeed, many of the more 'subtle', 'modern', 'everyday' or 'new' forms of cultural racism, or ethnicism, studied below, are taken from elite discourse (see van Dijk, 1987b, 1992, for detail). This hypothesis is not inconsistent with the possibility that (smaller, oppositional) elite groups also play a prominent role in the preformulation of anti-racist ideologies.

Within this complex theoretical framework, our earlier studies of text and talk examined, among other structures, dominant topics of discourse, text schemata, for instance those of story-telling and argumentation, as well as local semantic moves (such as the disclaimer mentioned above), style, rhetoric and specific properties of conversational interaction.

We suggested above that one of the results of this earlier work was that in text and talk about ethnic or racial minorities, many white people follow a double strategy of positive self-presentation, on the one hand, and a strategy of expressing subtle, indirect or sometimes more blatant forms of negative other-presentation, on the other hand. Indeed, especially in public discourse, outgroup derogation seldom takes place without expressions of ingroup favouritism or social face-keeping.

The Denial of Racism

The denial of racism is one of the moves that is part of the latter strategy of positive ingroup presentation. General norms and values, if not the law, prohibit (blatant) forms of ethnic prejudice and discrimination, and many if not most white group members are both aware of such social constraints and, up to a point, even share and acknowledge them (Billig, 1988). Therefore, even the most blatantly racist discourse in our data routinely features denials or at least mitigations of racism. Interestingly, we have found that precisely the more racist discourse tends to have disclaimers and other denials. This suggests that language users who say negative things about minorities are well aware of the fact that they may be understood as breaking the social norm of tolerance or acceptance.

Denials of racism, and similar forms of positive self-presentation, have both an *individual* and a *social* dimension. Not only do most white speakers individually resent being perceived as racists, also, and even more importantly, such strategies may at the same time aim at defending the ingroup as a whole: 'We are not racists', 'We are not a racist society'.

Whereas the first, individual, form of denial is characteristic of informal everyday conversations, the second is typical for public discourse, for instance in politics, the media, education, corporations and other organizations. Since public discourse potentially reaches a large audience, it is this latter, social form of denial that is most influential and, therefore, also most damaging: it is the social discourse of denial that persuasively helps construct the dominant white consensus. Few white group members would have reason or interest, to doubt let alone to oppose such a claim.

Face-keeping or positive self-presentation are well-known phenomena in social psychology, sociology and communication research, and are part of the overall strategy of impression management (Brewer, 1988; Brown and Levinson, 1987; Goffman, 1959; Schlenker, 1980; Tedeschi, 1981). In interaction, people try to act, and hence to speak, in such a way that their interlocutors construct an 'impression' of them that is as positive as possible, or at least speakers try to avoid a negative impression (Arkin, 1981).

Theoretically, impressions are person representations, that is, mental schemata that feature an organized set of categories by which people are judged, usually along several dimensions and with respect to several social norms, interests or criteria. Such judgements may be local or situational, and pertain to current actions or cognitions, but they may also be about more permanent, context independent, 'personality' characteristics of an individual.

It may be assumed that whereas people may want to avoid a negative impression in any situation, they are probably more anxious to avoid a general negative evaluation about their personality, than to avoid a negative judgement about one particular action in one specific situation. To be categorized as 'a racist' or even as being 'intolerant', presupposes a more enduring characteristic of people, and is therefore a judgement that is particularly face-threatening. Hence, when speakers emphasize that 'they have nothing against blacks' (or other minority groups), such disclaimers focus on a more permanent attitude, rather than on

the specific (negative) opinion now being expressed about some specific outgroup member or some specific ethnic or racial action or event.

What such disclaimers try to do, thus, is to block inferences from this particular instance to a more general impression. After all, a specific negative opinion about a particular ethnic group member or a particular act, may well be found to be justified, whereas a more general negative opinion about ethnic minorities might be seen as constitutive of a racist attitude.

In the latter case, a negative attitude may be found acceptable only when pertaining to a specific characteristic of a group, for instance when someone assumes that refugees often enter the country illegally, or when blacks are seen as insufficiently 'motivated' to get a good education or to get a job. In that case, the judgement may be warranted with references to (alleged) negative actions or attitudes of the outgroup. It is not surprising, therefore, that when such negative judgements are qualified as 'racist', racism is emphatically denied.

We see below that in such cases the charge is often reversed: the person who accuses the other as racist is in turn accused of inverted racism against whites, as oversensitive and exaggerating, as intolerant and generally as 'seeing racism where there is none', as Right-wing British newspapers like to put it (van Dijk, 1991). Accusations of racism, then, soon tend to be seen as more serious social infractions than racist attitudes or actions themselves, e.g. because they disrupt ingroup solidarity and smooth ingroup encounters: they are felt to ruin the 'good atmosphere' of interactions and situations. Moreover, such accusations are seen to impose taboos, prevent free speech and a 'true' or 'honest' assessment of the ethnic situation. In other words, denials of racism often turn into counter-accusations of intolerant and intolerable anti-racism.

Types of Denial

We see that denials come in many forms, each with its own cognitive, emotional, social, political and cultural functions. We have situational and general denials, personal ones and group-based ones. Although people who speak about other groups usually talk as ingroup members, there may well be a tension between individual opinions and those shared by the ingroup. Those who deny that they are racists usually imply that they comply with the general, official group norm that prohibits racism, and that, therefore, they are decent citizens. Such individual disclaimers often presuppose that the whole group is not racist.

On the other hand, there may be situations where individuals deny racist opinions or practices while acknowledging that the group as a whole, or at least some or many other group members, may not share such tolerance. Such combined denials/admissions are rare, however, since criticizing the ingroup may be a characteristic strategy of anti-racists (Taguieff, 1988), whereas denials of individual racism are often typical of racist opinions. On the other hand, individual denials of racism may strategically be made by comparison to 'others', e.g. one's neighbours or customers, and then takes the form of a *transfer* move:

'I have nothing against them, but you know my customers don't like to deal with black personnel. . . .'

The act of denial itself, thus, also comes in different guises. Generally, denials are part of a strategy of *defence*, presupposing explicit or implicit accusations. In that case, people may deny to have engaged in negative acts, to have broken the law or some social norm, or to have some negative, overall personality characteristic of which they are *actually* accused by an interlocutor. On the other hand, denials may also be pre-emptive, as is the case in positive self-presentation or face-keeping, that is, they may focus on *possible* inferences of the interlocutor.

Action is theoretically analysed as a combination of cognition (intention) and activity. One may admit having engaged in an action that may have been interpreted as negative, but at the same time deny the negative cognitive counterpart: 'I did not intend it that way.' That is, in strategies of defence, the crucial condition of responsibility for negative action lies in intentions: good intentions are seen as implementations of good attitudes, and hence as characteristic of good social membership or good citizenship.

This distinction between intention and activity also permeates many aspects of criminal law, and for instance distinguishes between murder and manslaughter. Intention, and especially long-term planning and willingly engaging in criminal offences are at least an aggravating condition of crime. On the other hand, accidents, incidents, 'on the spur of the moment', or emotionally defined acts, and similarly non-planned actions are partly excusable and hence less serious. This is, by definition, especially the case in spontaneous everyday interaction.

Note that intention denials, as we may call them, are strategically very effective, since the accuser has few ways to actually prove negative intentions. This is particularly also the case in discrimination trials, where it is often hard to prove that the negative action was not committed because of other, acceptable reasons. For instance, a newspaper may repeatedly and prominently publish reports about minority crime, but may at the same time defend such practices by claiming to publish 'the truth', and thus deny prejudiced opinions about minority crime and hence deny spreading such prejudices with the intention of discrediting minorities or inciting racial hatred. This is among the most classical cases of media racism (van Dijk, 1991).

On the other hand, although intentionally committed crimes are usually evaluated as more serious, people are assumed to have control over their activities, and hence also over their intentions. This may mean, for instance, that people are responsible for the *possible* consequences of their actions, even when such consequences may not have been the actual purpose of such actions. That is, if it can be shown that people could have known that their acts have negative consequences, then they are at least partially responsible for such consequences, especially if these would not have occurred without their actions. For instance, a politician who gives an interview that criticizes welfare cheating by minorities, knows that such allegations will be published, and that such a publication may further confirm negative prejudices among the media audience. Such a politician may deny discriminatory intent or purpose, and claim that he or she only wanted to 'tell the truth'.

In other words, we now have the following types of denials:

1. act-denial ('I did not do/say that at all');
2. control-denial ('I did not do/say that on purpose', 'It was an accident');
3. intention-denial ('I did not mean that', 'You got me wrong');
4. goal-denial ('I did not do/say that, in order to . . .').

In the last case, there is also a denial of responsibility: if there were negative consequences, I did not have control over them. We have already suggested that especially the media routinely deny responsibility for what the audience may do with media contents. Theoretically, legally and morally, these are the more difficult dimensions of the denial of racism. In most cases, one would need repeated acts/texts of the same kind, in different situations, and occasional expressions of plans, intentions or goals in order to 'prove' negative intentions or goals. It is not surprising, therefore, that also in discrimination lawsuits, intentions may sometimes be declared irrelevant, and that people are judged only by the direct or even indirect (statistical) consequences of their actions.

Another form of denial is the class of acts that may be categorized as *mitigations*, such as downtoning, minimizing or using euphemisms when describing one's negative actions: 'I did not threaten him, but gave him friendly advice', 'I did not insult her, but told her my honest opinion', etc. Mitigation strategies are particularly important in social situations where the relevant norms are rather strong. Thus, we may assume that the more stringent the norm against discrimination and racism, the more people will tend to have recourse to denials and hence also to mitigations.

Indeed, the very notion of 'racism' may become virtually taboo in accusatory contexts because of its strong negative connotations. If used at all in public discourse, for instance in the media, it will typically be enclosed by quotes or accompanied by doubt or distance markers such as 'alleged', signalling that this is a, possibly unwarranted if not preposterous, accusation, e.g. by minorities themselves or by (other) anti-racists. Acts in which racism is undeniable tend to be described in terms of 'discrimination', 'prejudice', 'stereotypes', 'bias', 'racial motivation', but not as 'racist'. Generally, the notions of 'racism' and 'racist' in European and US public discourse are reserved for *others*, for instance, extremist, right-wing, fringe groups and parties outside of the consensus. Also, the notion of 'racism' may be used to describe racism abroad or in the past, as is the case for apartheid in South Africa or the period of slavery, reconstruction and segregation in the USA. As a general term denoting a whole system of racial or ethnic inequality, exclusion or oppression in western societies, racism is used primarily by minority groups or other anti-racists. In other words, the use of euphemisms presupposes the denial of systemic racism of the ingroup or dominant society. This is also the case in much scholarly discourse about ethnic relations (Essed, 1987).

Note that this denial of racism should partly be attributed to the fact that the concept of racism is (still) largely understood in the classical, ideological sense, of seeing other ethnic or racial groups as being inferior, or as overt, official, institutional practices, as is the case for apartheid (Miles, 1989). The more

'modern', subtle and indirect forms of ethnic or racial inequality, and especially the 'racism', or rather 'ethnicism' based on constructions of cultural difference and incompatibility, is seldom characterized as 'racism', but at most as xenophobia, and more often than not, as legitimate cultural self-defence (Barker, 1981; Dovidio and Gaertner, 1986).

Besides denial proper, there are also a number of cognitive and social strategies that are more or less closely related to denials. The first is *justification*, as we already saw in the case of the newspaper justifying special attention for minority crime by referring to the 'truth' or the 'right to know' of its readers. Similarly, in everyday conversations, people may justify a negative act or discourse relative to a minority group member by justifying it as an act of legitimate defence, or by detailing that the other person was indeed guilty and, therefore, deserved a negative reaction. In other words, in this case, the act is not denied, but it is denied that it was negative, and explicitly asserted that it was justified (for details, see Antaki, 1988; Scott and Lyman, 1968; Tedeschi and Reiss, 1981).

Similarly, negative acts may be acknowledged as such, but at the same time *excused* (Cody and McLaughlin, 1988). In this case, at least part of the blame may be put on special circumstances, or rather on others. Owners of clubs may admit to having discriminated against blacks by not letting them in, but may make an appeal to the circumstance that already so many other blacks were in the club. The same is routinely the case in immigration debates at a higher political level: we do not let in more immigrants or refugees, in order to avoid aggravating the ethnic tensions in the inner cities. The latter case may in fact be presented as a justification and not as an excuse, because the act of refusing entry is not admitted to be a negative act, but as a constitutional privilege of states.

Stronger excuse strategies are alleging *provocation* and *blaming the victim*. Thus, the police may feel justified to act harshly against young black males, as is the case in many European and US cities, because of alleged provocations, drug offences, or other stereotypically assigned negative actions of young blacks. Government policies, again both in Europe and the US, routinely justify or excuse 'tough' measures against minorities by claiming that they are themselves to blame: lack of integration, failing to learn the language, lacking motivation to find a job and cultural deviance, are among the grounds for such blaming. Unemployment, lacking success in education, miserable housing and welfare dependence, among other things, are thus routinely attributed to negative characteristics of the 'victims' themselves. Note that such stronger strategies usually imply a denial of own failing policies.

Finally, the strongest form of denial is *reversal*: '*We* are not guilty of negative action, *they* are' and '*We* are not the racists, *they* are the *real* racists.' This kind of reversal is the stock-in-trade of the radical Right, although less extreme versions also occur in more moderate anti-antiracism (Murray, 1986). The British tabloids, as we see later, thus tend to accuse the anti-racists of being intolerant busybodies, and the real racists. Similarly, the French Front National typically accuses those who are not against immigration of non-Europeans as engaging in 'anti-French racism'. More generally, anti-racists tend to be represented as the ones who are intolerant, while lightly accusing innocent and well-meaning

citizens (i.e. us) of racism. We see that reversals are no longer forms of social defence, but part of a strategy of (counter-)attack.

Sociocultural and Political Functions

Although usually manifesting itself, at the micro-level of social organization, in everyday conversation and interpersonal communication, the denial of racism not only has individual functions. We have seen that people deny, mitigate, justify or excuse negative acts towards minorities in order to emphasize their compliance with the law or with norms and to stress their role as competent, decent citizens. That is, even in interpersonal situations, the moral dimension of denial has social presuppositions. It does not make sense to deny racist acts as a moral or legal transgression if the group or society as a whole agrees with you, as is/was the case during official apartheid policies in South Africa, or during the reconstruction and segregation period in US history. Indeed, more generally, it may be said that when racism ethnicism or ethnocentrism are openly advocated or legitimated by the elites and the leading institutions of society, the less we should find denials, let alone excuses of racist acts and discourse.

However, in present-day European and US societies, where discrimination and racism are officially banned, and norms have developed that do not tolerate blatant expressions of outgroup hate, denial takes a much more prominent role in discourse on ethnic affairs. We suggested that this is not only true at the personal level. Also groups, institutions or organizations as a whole, at a meso- or macro-level of social organization, may engage in such strategies of denial. In that case, denials may take the form of a shared opinion, as a consensus about the ethnic situation. For instance, since discrimination and racism are legally and morally prohibited, most western countries share the official belief that *therefore* discrimination and racism no longer exist as a structural characteristic of society or the state. If discrimination or prejudice still exist, it is treated as an incident, as a deviation, as something that should be attributed to, and punished at the individual level. In other words, institutional or systemic racism is denied.

Hence, positive self-presentation and face-keeping are not limited to individuals, but also, if not more strongly, characterizes the more public discourse of institutions and organizations. Universities in the USA routinely print on their letterhead that they are 'Equal Opportunity Employers', not only because such employment practices are the law, but also because this is good PR. Organizations, no more than individuals, do not want to be known as racist among their personnel, among their customers or among the public at large. Moreover, ethnic and racial tolerance, and even affirmative action, are symbols of social progress and modernity, which by association may be related to the quality of the products or services of an organization. This is of course most literally true when organizations employ highly talented members from minority groups who may enhance quality of products and especially services for a growing clientele of minorities. Self-interest in this case may well be consistent with ideologies of social policy.

However, social policies may conflict with organizational or business interests and ideologies, for instance in more consequential forms of affirmative action such as quota. In this case, other values, such as the freedom of enterprise, and especially economic competitiveness, are posed against the values that underly social policy. Refusing quotas, therefore, is most emphatically denied to be an expression of discrimination or racism, for instance, because it is seen as quality-degrading instead of equality-enhancing and to be an unacceptable form of group-favouring. Thus, ultimately, also in state or business organizations, the acceptance of affirmative action, will move within strict boundaries defined by the interests and the power of the (white) elites that control them.

The social functions of the institutional denial of racism are obvious. If liberal democracies in Europe and the US have increasingly adopted laws and norms that presuppose or guarantee equality, freedom, if not brother- or sisterhood, for all, the ethnic or racial inequalities implied by discrimination or racism would be inconsistent with official ideologies. Instead of recognizing such 'imperfection', it is more expedient to deny such fundamental inconsistency, or at least to explain it away as incidental and individual, to blame it on the victims, or to characterize it as a temporary phenomenon of transition, for instance for new immigrants.

If racism is defined as a system of racial or ethnic dominance, it is likely that the denial of racism also has a prominent role in the very reproduction of racism. This is indeed the case. Dominance and inequality provoke resistance. However, when the dominant consensus is that there is no racism, minority groups and their protests or other forms of resistance have a very hard time to be taken seriously (Essed, 1991). In systems of apartheid and officially sanctioned segregation, things are clear-cut, and the power difference so blatant that the enemy is well defined, and resistance well focused.

However, in modern, increasingly pluralist societies that have laws and even prevalent norms against (blatant) prejudice, discrimination and racism, this is much less the case. If tolerance is promoted as a national myth, as is the case for the Netherlands, it is much more difficult for minority groups to challenge remaining inequalities, to take unified action and to gain credibility and support among the (white) dominant group. Indeed, they may be seen as oversensitive, exaggerating or overdemanding. The more flexible the system of inequality, the more difficult it is to fight it.

The white consensus that denies the prevalence of racism thus is a very powerful element in its reproduction, especially since successful resistance requires public attention, media coverage and at least partial recognition of grievances. If leading politicians and the media refuse to acknowledge that there is a serious problem, there will be no public debate, no change of public opinion and hence no change in the system of power relations. Change in that case can only be put on the agenda by actively creating the kind of public 'problems' that can no longer be overlooked, such as demonstrations or even 'riots'. Other serious problems, such as high minority unemployment or educational 'underachievement', may well be recognized by the elites, but it is routine to deny that they have anything to do with racism. 'Occasional, unintentional discrimination' is merely taken as one, marginal element in such social problems.

We see that the social functions of the denial of racism are closely associated with the political ones. Decision-making, agenda-setting and public opinion management, both nationally and locally, favour a definition of the ethnic or racial situation in which the element of 'racism' is carefully eliminated, simply because it implies that *we* are the real problem, and not *they*. Immigration, employment, education or social policies, thus, need to be founded on an ideology that skilfully combines humanitarian values and self-interest.

By selectively attributing racism to the extreme Right, it is both denied as being a characteristic of the own ingroup of moderate white citizens, and at the same time better manageable, for instance by occasionally prosecuting the more overt right-wing racists. Recognizing that many subtle forms of everyday racism are rife throughout society would be lending support to a form of sociopolitical analysis that is no longer manageable: if it is true, how can it be changed? After all, we already have laws against discrimination, and if these do not work properly, what else can we do to change the 'mentality' of the people? The result of such complex underlying structures of political decision-making is that overall denial is flexibly coupled with incidental admissions of the more blatant 'exceptions' to the rule.

We see that the denial of racism is not only part of a strategy of personal, institutional or social impression management and ideological self-defence, it also is a form of sociopolitical management. It helps control resistance, and at the same time makes political problems of an ethnically or racially pluralist society more manageable. In sum, denial is a major management strategy.

Finally, we may ask whether the denial of racism also has more specific cultural functions. Obviously, since different groups and their respective cultures are involved, and racism also requires definition in terms of cultural hegemony, its denial should also have cultural dimensions. One such dimension is the combination of denying racism or ethnocentrism with the self-affirmation of tolerance as a feature of contemporary 'western' culture. In the same way as democracy, technology, Christianity and western values are thus, at least implicitly, presented in textbooks, political discourse and the media, as superior to other cultures, also western 'tolerance' is contrasted with, for example, intolerant cultures, at present especially with Muslim fundamentalism (Said, 1981).

Western discourse during the Rushdie affair is a clear case in point. Public debate during this affair focused not only on freedom of speech and the arts, but at the same time on stereotypes about the fundamentalist if not 'fanatical' elements of Muslim culture. That anti-Arab racism played a prominent role in this debate was emphatically denied, e.g. by claiming universality of western values. In other words, in the same way as white people may deny racism and at the same time present themselves as tolerant citizens, western culture as a whole may deny racism or ethnocentrism, and emphasize tolerance.

That such cultural claims are closely linked with the management of world politics, as was also shown during the Gulf War, hardly needs to be spelled out. The same is true, more generally, in the management of the relations between the North and the South, e.g. through strategies of denying neo-colonialism or imperialism, self-interest in international aid and by affirming the 'leading' role

of the western world. In sum, the western denial of racism and ethnocentrism, and its social, political and cultural implications, plays a role from the level of interpersonal relations, to the global level of intercultural and international relations. At all levels, such denial functions essentially to manage resistance, dissent and opposition and hence as a strategy in the reproduction of hegemony (Lauren, 1988).

Conversation

Everyday conversation is at the heart of social life. Whether in informal situations, with family members or friends, or on the job with colleagues or clients or within a multitude of institutions, informal talk constitutes a crucial mode of social interaction. At the same time, conversations are a major conduit of social 'information-processing', and provide the context for the expression and persuasive conveyance of shared knowledge and beliefs.

In ethnically mixed societies, minority groups and ethnic relations are a major topic of everyday conversation. Whether through direct personal experience, or indirectly through the mass media, white people in Europe and North America learn about minorities or immigrants, formulate their own opinions and thus informally reproduce – and occasionally challenge – the dominant consensus on ethnic affairs through informal everyday talk.

Our extensive discourse analytical research into the nature of such everyday talk about ethnic affairs, based on some 170 interviews conducted in the Netherlands and California, shows that such informal talk has a number of rather consistent properties (van Dijk, 1984, 1987a):

1. Topics are selected from a rather small range of subjects, and focus on sociocultural differences, deviance and competition. Most topics explicitly or implicitly deal with interpersonal, social, cultural or economic 'threats' of the dominant white group, society or culture.
2. Story-telling is not, as would be usual, focused on entertaining, but takes place within an argumentative framework. Stories serve as the strong, while personally experienced, premises of a generally negative conclusion, such as 'We are not used to that here', 'They should learn the language' or 'The government should do something about that.'
3. Style, rhetoric and conversational interaction generally denote critical distance, if not negative attitudes towards minorities or immigration. However, current norms of tolerance control expressions of evaluations in such a way that discourse with strangers (such as interviewers) is generally rather mitigated. Strong verbal aggression tends to be avoided.
4. Overall, speakers follow a double strategy of positive self-presentation and negative other-presentation.

It is within this latter strategy also that disclaimers, such as 'I have nothing against Arabs, *but* . . .' have their specific functions (Scott and Lyman, 1968).

Such a denial may be called 'apparent', because the denial is not supported by evidence that the speaker does not have anything against 'them'. On the contrary, the denial often serves as the face-keeping move introducing a generally negative assertion, following the invariable *but*, sometimes stressed, as in the following example from a Dutch woman:

(1) uhh . . . how they are and that is mostly just fine, people have their own religion have their own way of life, and I have abso*lutely* nothing against that, *but*, it *is* a fact that if their way of life begins to differ from mine to an *extent* that . . . .

Talking about the main topic of cultural difference, the denial here focuses on relative tolerance for such cultural differences, which, however, is clearly constrained. The differences should not be too great. So, on the one hand, the woman follows the norm of tolerance, but on the other hand, she feels justified to reject others when they 'go too far'. In other words, the denial here presupposes a form of limited social acceptance.

Speakers who are more aware of discrimination and racism, as is the case in California, are even more explicit about the possible inferences of their talk:

(2) It sounds prejudiced, but I think if students only use English . . . .

The use of English, a prominent topic for 'ethnic' conversations in the USA, may be required for many practical reasons, but the speaker realizes that whatever the good arguments he or she may have, it may be heard as a form of prejudice against immigrants. Of course the use of 'It sounds' implies that the speaker does not think he is really prejudiced.

One major form of denial in everyday conversation is the denial of discrimination. Indeed, as also happens in the Right-wing media (see below), we also find reversal in this case: we are the real victims of immigration and minorities. Here are some of the ways people in Amsterdam formulate their denials:

(3) Yes, they have exploited them, that's what they say at least, you know, but well, I don't believe that either. . . .
(4) Big cars, they are better off than we are. If anybody is being discriminated against, our children are. That's what I make of it.
(5) And the only thing that came from her mouth was I am being discriminated against and the Dutch all have good housing, well it is a big lie, it is not true.
(6) And they say that they are being dismi discri discriminated against. That is not true.
(7) Listen, they always say that foreigners are being discriminated against here. No, *we* are being discriminated against. It is exactly the reverse.

In all these situations, the speakers talk about what they see as threats or lies by immigrants: a murder in (3), cheating on welfare in (4), a radio programme where a black woman says she is discriminated against in (5), and neighbourhood services in (6) and (7). In conversations such reversals may typically be heard in working-class neighbourhoods where crime is attributed to minorities, or where

alleged favouritism (e.g. in housing) is resented. Poor whites thus feel that they are victims of inadequate social and urban policies, but instead of blaming the authorities or the politicians, they tend to blame the newcomers who, in their eyes, are so closely related to the changing, i.e. deteriorating, life in the inner city. And if *they* are defined as those who are responsible, such a role is inconsistent with the claim that *they* are discriminated against (Phizacklea and Miles, 1979).

Note that this consensus is not universal. Negative behaviour may be observed, but without generalization and with relevant comparisons to Dutch youths:

(8) And that was also, well I am sorry, but they were foreigners, they were apparently Moroccans who did that. But God, all young people are aggressive, whether it is Turkish youth, or Dutch youth, or Surinamese youth, is aggressive. Particularly because of discrimination uhh that we have here . . .

Here discrimination is not reversed, and the young immigrants are represented as victims of discrimination, which is used to explain and hence to excuse some of their 'aggressiveness'. Such talk, however, is rather exceptional.

The Press

Many of the 'ethnic events' people talk about in everyday life are not known from personal experiences, but from the media. At least until recently, in many parts of Western Europe and even in some regions of North America, most white people had few face-to-face dealings with members of minority groups. Arguments in everyday talk, thus, may be about crime or cultural differences they read about in the press, and such reports are taken as 'proof' of the negative attitudes the speakers have about minorities.

Our analyses of thousands of reports in the press in Britain and the Netherlands (van Dijk, 1991), largely confirm the common-sense interpretations of the readers: a topical analysis shows that crime, cultural differences, violence ('riots'), social welfare and problematic immigration are among the major recurrent topics of ethnic affairs reporting. In other words, there are marked parallels between topics of talk and media topics.

Overall, with some changes over the last decade, the dominant picture of minorities and immigrants is that of *problems* (Hartmann and Husband, 1974). Thus the conservative and right-wing press tends to focus on the problems minorities and immigrants are seen to create (in housing, schooling, unemployment, crime, etc.), whereas the more liberal press (also) focuses on the problems minorities have (poverty, discrimination), but which *we* (white liberals) do something about. On the other hand, many topics that are routine in the coverage of white people, groups or institutions tend to be ignored, such as their contribution to the economy, political organization, culture and in general all topics that characterize the everyday lives of minorities, and their own, active contributions to the society as a whole. Thus, in many respects, except when involved in

Practices of newsgathering as well as patterns of quotation also show that minorities and their institutions have literally little to say in the press. First of all, especially in Europe, there are virtually no minority journalists, so that the perspective, inside knowledge and experience, prevailing attitudes and necessary sources of journalists tend to be all-white, as are also the government agencies, police and other institutions that are the main sources of news in the press (van Dijk, 1988a, 1988b). Even on ethnic events minority spokespersons are less quoted, less credibly quoted, and if they are quoted their opinions are often 'balanced' by the more 'neutral' comments of white spokespersons. Especially on delicate topics, such as discrimination, prejudice and racism, minority representatives or experts are very seldom heard in a credible, authoritative way. If at all, such quotes are often presented as unwarranted or even ridiculous accusations.

It is at this point where the overall strategy of denial has one of its discursive manifestations in press reports. Of course, as may be expected, there is a difference between liberal, conservative and right-wing newspapers in this respect. Note, however, that there are virtually no explicitly anti-racist newspapers in Europe and North America. The official norm, even on the Right, is that 'we are all against racism', and the overall message is, therefore, that serious accusations of racism are a figment of the imagination.

Liberal newspapers, however, do pay attention to stories of explicit discrimination, e.g. in employment (though *rarely* in their own newsrooms or news reports), whereas right-wing extremism is usually dealt with in critical terms, although such coverage may focus on violent or otherwise newsworthy incidents rather than on racist attitudes per se. By such means ethnic or racial inequality is redefined as marginal, that is, as individualized or outside the consensus. Thus, the Dutch liberal press extensively reports cases (accusations) of discrimination, and the same is true in the USA. In the right-wing press, discrimination is also covered, but from a different perspective. Here, it is usually covered as a preposterous accusation, preferably against 'ordinary' people, or embedded in explanations or excuses (the act was provoked).

Whereas discrimination gets rather wide attention in the press, racism does not. Indeed, discrimination is seldom qualified as a manifestation of racism. One of the reasons is that racism is still often understood as an ideology of white supremacy, or as the kind of practices of the extreme Right. Since the large majority of the press does not identify with the extreme Right, any qualification of everyday discriminatory practices as 'racism' is resolutely rejected.

For large sections of the press, only anti-racists see such everyday racism as racism, which results in the marginalization of anti-racists as a radical, 'loony' group. For much of the press, at least in Britain, the real enemies, therefore, are the anti-racists: they are intolerant, anti-British, busybodies, who see racism everywhere, even in 'innocent' children's books, and even in the press.

It is not surprising, therefore, that reports on general aspects of racism in one's own society or group tend to be rare, even in the liberal press. Anti-racist writers, researchers or action groups have less access to the media, and their activities or opinions tend to be more or less harshly scorned, if not ridiculed. For the right-wing press, moreover, they are the real [illegible]

attributed to a multicultural society, because they not only attack venerable institutions (such as the police, government or business), but also provide a competing but fully incompatible definition of the ethnic situation. It is this symbolic competition for the definition of the situation and the intellectual struggle over the definition of society's morals, that pitches the right-wing press against left-wing, anti-racist intellectuals, teachers, writers and action groups.

Let us examine in more detail how exactly the press engages in this denial of racism. Most of our examples are taken from the British press, but it would not be difficult to find similar examples in the Dutch, German and French press. Because of its long history of slavery and segregation, the notion of white racism is more broadly accepted in the USA, even when today's prevailing ideology is that, now minorities have equal rights, racism is largely a thing of the past.

Racism and the Press

The denial of racism in and by the press is of course most vehement when the press itself is the target of accusations. Reflecting similar reactions by other editors of Dutch newspapers to our own research on racism in the press, the Editor-in-Chief of a major elite weekly, *Intermediair*, catering especially for social scientists and the business community, writes the following in a letter:

(9) In particular, what you state about the coverage of minorities remains unproven and an unacceptable caricature of reality. Your thesis 'that the tendency of most reports is that ethnic minorities cause problems for us' is in my opinion not only not proven, but simply incorrect (*translated from the Dutch*).

This reaction was inspired by a brief summary of mostly international research on the representation of minorities in the press. The Editor's denial is not based on (other) research, but simply stated as a 'fact'. It is not surprising that the article, on recent news research, was not published despite my having been initially invited to write such a piece.

Other editors take an even more furious stand, and challenge the very academic credentials of the researcher and the university, as is the case by the Editor of the major conservative popular daily in the Netherlands, *De Telegraaf*, well known for its biased reporting on minorities, immigrants and refugees:

(10) Your so-called scientific research does not in any sense prove your slanderous insinuations regarding the contents of our newspaper, is completely irrelevant and raises doubt about the prevailing norms of scientific research and social prudence at the University of Amsterdam (*translated from the Dutch*).

We see that whatever 'proof' may be brought in one's painstaking analyses of news reports, the reaction is one of flat denial and counter-attack by discrediting the researcher. Examples like these may be multiplied at random. No newspaper, including (or especially) the more liberal ones, will accept even a moderate charge of being biased, while allegations of racism are rejected violently. Recall that these newspapers, especially in Europe, generally employ no, or only one

With such an editorial attitude towards racism, there is a general reluctance to identify racist events as such in society at large. Let us examine the principal modes of such denials in the press. Examples are taken from the British press coverage of ethnic affairs in 1985 (for analysis of other properties of these examples, see van Dijk, 1991). Brief summaries of the context of each fragment of news discourse are given between parentheses.

Positive Self-Presentation

The semantic basis of denial is 'truth' as the writer sees it. The denial of racism in the press, therefore, presupposes that the journalist or columnist believes that his or her own group or country is essentially 'tolerant' towards minorities or immigrants. Positive self-presentation, thus, is an important move in journalistic discourse, and should be seen as the argumentative denial of the accusations of anti-racists:

(11) [Handsworth] Contrary to much doctrine, and acknowledging a small malevolent fascist fringe, this is a remarkably tolerant society. But tolerance would be stretched were it to be seen that enforcement of law adopted the principle of reverse discrimination (*Daily Telegraph*, Editorial, 11 September).

(12) [Racial attacks and policing] If the ordinary British taste for decency and tolerance is to come through, it will need positive and unmistakable action (*Daily Telegraph*, Editorial, 13 August).

(13) [Racial attacks against Asians] . . . Britain's record for absorbing people from different backgrounds, peacefully and with tolerance, is second to none. The descendants of Irish and Jewish immigrants will testify to that. It would be tragic to see that splendid reputation tarnished now (*Sun*, Editorial, 14 August).

(14) [Immigration] Our traditions of fairness and tolerance are being exploited by every terrorist, crook, screwball and scrounger who wants a free ride at our expense. . . . Then there are the criminals who sneak in as political refugees or as family members visiting a distant relative (*Mail*, 28 November).

(15) We have racism too – and that is what is behind the plot. It is not white racism. It is black racism. . . . But who is there to protect the white majority? . . . Our tolerance is our strength, but we will not allow anyone to turn it into our weakness. (*Sun*, 24 October).

These examples not only assert or presuppose white British 'tolerance', but at the same time define its boundaries. Tolerance might be interpreted as a position of weakness and, therefore, it should not be 'stretched' too far, lest 'every terrorist', 'criminal' or other immigrant, takes advantage of it. Affirmative action or liberal immigration laws, thus, can only be seen as a form of reverse discrimination, and hence as a form of self-destruction of white Britain. Ironically, therefore, these examples are self-defeating because of their internal contradictions. It is not tolerance per se that is aimed at, but rather the limitations preventing its 'excesses'. Note that in example (15) positive self-presentation is at the same time combined with the well-known move of reversal. They are the real racists', 'We are the real victims' W[illegible]

Denial and Counter-Attack

Having constructed a positive self-image of white Britain, the conservative and tabloid press especially engages in attacks against those who hold a different view, at the same time defending those who agree with its position, as was the case during the notorious Honeyford affair (Honeyford was headmaster of a Bradford school who was suspended, then reinstated and finally let go with a golden handshake, after having written articles on multicultural education which most of the parents of his mostly Asian students found racist). The attacks on the anti-racists often embody denials of racism:

(16) [Reaction of 'race lobby' against Honeyford] Why is it that this lobby have chosen to persecute this man. . . . It is not because he is a racist; it is precisely because he is not a racist, yet has dared to challenge the attitudes, behaviour and approach of the ethnic minority professionals (*Daily Telegraph*, 6 September).

(17) [Honeyford and other cases] Nobody is less able to face the truth than the hysterical 'anti-racist' brigade. Their intolerance is such that they try to silence or sack anyone who doesn't toe their party-line (*Sun*, 23 October, column by John Vincent).

(18) [Honeyford] For speaking commonsense he's been vilified; for being courageous he's been damned, for refusing to concede defeat his enemies can't forgive him. . . . I have interviewed him and I am utterly convinced that he hasn't an ounce of racism in his entire being (*Mail*, 18 September, column by Lynda Lee-Potter).

(19) [Honeyford quits] Now we know who the true racists are (*Sun* Editorial, 30 November).

These examples illustrate several strategic moves in the press campaign against anti-racists. First, as we have seen above, denial is closely linked to the presupposition of 'truth': Honeyford is presented as defending the 'truth', namely the failure and the anti-British nature of multiculturalism. Secondly, consequent denials often lead to the strategic move of reversal: *we* are not the racists, *they* are the 'true racists'. This reversal also implies, thirdly, a reversal of the charges: Honeyford, and those who sympathize with him, are the victims, not his Asian students and their parents. Consequently, the anti-racists are the enemy: *they* are the ones who persecute innocent, ordinary British citizens, *they* are the ones who are intolerant. Therefore, victims who resist their attackers may be defined as folk heroes, who 'dare' the 'anti-racist brigade'.

Note also, in example (17), that the 'truth', as the supporters of Honeyford see it, is self-evident, and based on common sense. Truth and common sense are closely related notions in such counter-attacks, and reflect the power of the consensus, as well as the mobilization of popular support by 'ordinary' (white) British people. Apart from marginalizing Asian parents and other anti-racists by locating them outside of the consensus, and beyond the community of ordinary people like 'us', such appeals to common sense also have powerful ideological implications: self-evident truth is seen as 'natural', and hence the position of the

others as 'unnatural' or even as 'crazy'. The anti-racist Left, therefore, is often called 'crazy' or 'loony' in the right-wing British press.

Moral Blackmail

One element that was very prominent in the Honeyford affair, as well as in similar cases, was the pretence of censorship: the anti-racists not only ignore the 'truth' about multicultural society, they also prevent others (us) from telling the truth. Repeatedly, thus, journalists and columnists argue that this 'taboo' and this 'censorship' must be broken in order to be able to tell the 'truth', as was the case after the disturbances in Tottenham:

(20) [Tottenham] The time has come to state the truth without cant and without hypocrisy . . . the strength to face the facts without being silenced by the fear of being called racist (*Mail*, 9 October, column by Lynda Lee-Potter).

Such examples also show that the authors feel morally blackmailed, while at the same time realizing that to 'state the truth', meaning 'to say negative things about minorities', may well be against the prevalent norms of tolerance and understanding. Clamouring for the 'truth', thus, expresses a dilemma, even if the dilemma is only apparent: the apparent dilemma is a rhetorical strategy to accuse the opponent of censorship or blackmail, not the result of moral soul-searching and a difficult decision. After all, the same newspapers extensively *do* write negative things about young blacks, and never hesitate to write what they see as the 'truth'. Nobody 'silences' them, and the taboo is only imaginary. On the contrary, the right-wing press in Britain reaches many millions of readers.

Thus, this strategic play of denial and reversal at the same time involves the construction of social roles in the world of ethnic strife, such as allies and enemies, victims, heroes and oppressors. In many respects, such discourse mimics the discourse of anti-racists by simply reverting the major roles: victims become oppressors, those who are in power become victims.

Subtle Denials

Denials are not always explicit. There are many ways to express doubt, distance or non-acceptance of statements or accusations by others. When the official Commission for Racial Equality (CRE) in 1985 published a report on discrimination in the UK, outright denial of the facts would hardly be credible. Other discursive means, such as quotation marks, and the use of words like 'claim' or 'allege', presupposing doubt on the part of the writer, may be employed in accounting for the facts, as is the case in the following editorial from the *Daily Telegraph*:

(21) In its report which follows a detailed review of the operation of the 1976 Race Relations Act, the Commission claims that ethnic minorities continue to suffer high levels of discrimination and disadvantage (*Daily Telegraph*, 1 August).

Such linguistic tricks do not go unnoticed, as we may see in the following reaction to this passage in a letter from Peter Newsam, then Director of the CRE.

(22) Of the Commission you say 'it claims that ethnic minorities continue to suffer high levels of discrimination and disadvantage'. This is like saying that someone 'claims' that July was wet. It was. And it is also a fact supported by the weight of independent research evidence that discrimination on racsal grounds, in employment, housing and services, remains at a disconcertingly high level (*Daily Telegraph*, 7 August).

Denials, thus, may be subtly conveyed by expressing doubt or distance. Therefore, the very notion of 'racism' usually appears between quotation marks, especially also in the headlines. Such scare quotes are not merely a journalistic device of reporting opinions or controversial points of view. If that were the case, also the opinions with which the newspaper happens to agree would have to be put between quotes, which is not always the case. Rather, apart from signalling journalistic doubt and distance, the quotes also connote 'unfounded accusation'. The use of quotes around the notion of 'racism' has become so much routine, that even in cases where the police or the courts themselves established that racism was involved in a particular case, the conservative press may maintain the quotes out of sheer habit.

Mitigation

Our conceptual analysis of denial already showed that denial may also be implied by various forms of mitigation, such as downtoning, using euphemisms or other circumlocutions that minimize the act itself or the responsibility of the accused. In the same Editorial of the *Daily Telegraph* we quoted above, we find the following statement:

(23) [CRE report] No one would deny the fragile nature of race relations in Britain today or that there is misunderstanding and distrust between parts of the community (*Daily Telegraph*, Editorial, 1 August).

Thus, instead of inequality or racism, race relations are assumed to be 'fragile', whereas 'misunderstanding and distrust' is also characteristic of these relations. Interestingly, this passage also explicitly denies the prevalence of denials and, therefore, might be read as a concession: there *are* problems. However, the way this concession is rhetorically presented by way of various forms of mitigation, suggests, in the context of the rest of the same Editorial, that the concession is apparent. Such apparent concessions are another major form of disclaimer in discourse about ethnic relations, as we also have them in statements like: 'There are also intelligent blacks, but . . .', or 'I know that minorities sometimes have problems, but . . .'. Note also that in the example from the *Daily Telegraph* the mitigation not only appears in the use of euphemisms, but also in the *redistribution of responsibility*, and hence in the denial of blame. Not we (whites) are mainly responsible for the tensions between the communities, but everybody

is, as is suggested by the use of the impersonal existential phrase: '*There is* misunderstanding . . .'. Apparently, one effective move of denial is to either dispute responsible agency, or to conceal agency.

Defence and Offence

On the other hand, in its attacks against the anti-racists, the right-wing press is not always that subtle. On the contrary, they may engage precisely in the 'diatribes' they direct at their opponents:

(24) [Anti-fascist rally] The evening combined emotive reminders of the rise of Nazism with diatribes against racial discrimination and prejudice today (*Daily Telegraph*, 1 October).

(25) [Black sections] In the more ideologically-blinkered sections of his [Kinnock's] party . . . they seem to gain pleasure from identifying all difficulties experienced by immigrant groups, particularly Afro-Caribbeans, as the result of racism . . . (*Daily Telegraph*, Editorial, 14 September).

(26) [Worker accused of racism] . . . The really alarming thing is that some of these pocket Hitlers of local government are moving into national politics. It's time we set about exposing their antics while we can. Forewarned is forearmed (*Mail*, Editorial, 26 October).

These examples further illustrate that denial of discrimination, prejudice and racism is not merely a form of self-defence or positive self-presentation. Rather, it is at the same time an element of attack against what they define as 'ideologically blinkered' opponents, as we also have seen in the move of reversal in other examples. Anti-racism is associated with the 'loony left', and attacking it therefore also has important ideological and political implications, and not just moral ones.

'Difficultiees' of the Afro-Caribbean community may be presupposed, though not spelled out forcefully and in detail, but such presuppositions rather take the form of an apparent concession. That is, whatever the causes of these 'difficulties', as they are euphemistically called, they can not be the result of racism. Implicitly, by attributing 'pleasure' to those who explain the situation of the blacks, the newspaper also suggests that the Left has an interest in such explanations and, therefore, even welcomes racism. This strategy is familiar in many other attacks against anti-racists: 'If there were no racism, they would invent it'. It hardly needs to be spelled out that such a claim again implies a denial of racism.

The amalgamation of comparisons and metaphors used in these attacks is quite interesting. That is, in one example an ironic reference is made to the 'emotive reminders' of Nazism, and in another these same opponents of Nazism are qualified as 'pocket Hitlers'. Yet, this apparent inconsistency in sociopolitical labelling has a very precise function. By referring to their opponents in terms of 'pocket Hitlers' the newspapers obviously distance themselves from the fascist opinions and practices that are often part of the more radical accusations against the Right. At the same time, by way of the usual reversal, they categorize their opponents precisely in terms of their own accusations, and thus put them in a role these opponents most clearly would abhor.

Thus, the anti-racist Left is associated with fascist practices, ideological blinkers and antics. Apart from their anti-racist stance, it is, however, their (modest) political influence which particularly enrages the right-wing press – although virtually powerless at the national level, and even within their own (Labour) party, some of the anti-racists have made it into local councils, and therefore control (some) money, funding and other forms of political influence. That is, they have at least some counter-power, and it is this power and its underlying ideology that is challenged by a press which itself controls the news supply of millions of readers. What the denial of racism and the concomitant attacks against the anti-racists in education or politics is all about, therefore, is a struggle over the definition of the ethnic situation. Thus, their ideological and political opponents are seen as symbolic competitors in the realm of moral influence. Whether directed at a headmaster or against other ordinary white British or not, what the right-wing press is particularly concerned about is its own image: by attacking the anti-racists, it is in fact defending itself.

Parliamentary Discourse

In close symbiosis with the mass media, politics plays a prominent role in the definition of the ethnic situation. In Western Europe, decision-making by the administration and the bureaucracy, and parliamentary debates in the 1980s and 1990s increasingly deal with ethnic affairs, immigration and refugees. Persistent social inequalities, unemployment, affirmative action, educational 'disadvantage', popular resentment against immigration and the arrival of 'waves' of new refugees from the South, are among the major topics on the political agenda.

Our analysis of elite discourse, therefore, also needs to pay attention to parliamentary discourse, also because different ideologies, opinions and interests may openly clash there, especially also about 'delicate' issues such as minorities and immigration. Therefore, we examined some major debates on these topics in the parliaments of the UK, the Netherlands, France and Germany, as well as in the US Congress.

Note that such discourse, perhaps more than any other discourse, is 'for the record'. All speeches and even spontaneous interruptions are recorded and published, even if some countries allow later 'editing'. Speeches, therefore, are seldom spontaneous, and usually carefully prepared, written statements read out loud. For delicate topics such as ethnic affairs, we may expect that such discourse is heavily monitored, politically as well as morally. With the exception of some extremist right-wing parties, e.g. the Front National in France, blatantly racist talk is very rare in present day western parliaments.

However, as we have seen above, there are more indirect and subtle ways to express underlying opinions and attitudes, whether more liberal or more conservative ones. Despite the difference in style and function, we found that parliamentary discourse has some striking resemblances with other forms of talk about ethnic minorities, such as positive self-presentation, denial of racism and negative other-presentation. Therefore, let us examine, finally, what specific patterns the denial of racism takes in western parliaments.

Nationalist Self-Glorification

Parliament is the prime forum for nationalistic rhetoric. This is particularly true when international norms and values, such as democracy, equal rights and tolerance are involved. Accusations of racism in such a context, may easily be heard as a moral indictment of the nation as a whole, and are therefore permitted, though resented, only in partisan debates, in which one party accuses the other of racism. After all, racism is always *elsewhere*, and always a property of the *others*.

Against this background, it may be expected that any debate on ethnic affairs, and particularly those in which the rights of minorities or immigrants are at stake, nationalist positive self-presentation is an important strategic prelude to statements that precisely intend to limit such rights. Let us give some examples from each of these parliaments. All examples are taken from the parliamentary records of the respective countries, and from debates held between 1985 and 1990. The detailed context of the discussion is not given here, nor are the speakers or parties identified. For the purpose of this article we merely identify the countries involved, e.g. in order to show the similarity of such talk across national boundaries.

(27) Our debate today not only regards the refugees, but our whole society, and the responsibility of Europe and the Netherlands to maintain fundamental human rights in the world. The right of asylum is the national component of a consistent human rights policy (the Netherlands).

(28) I believe that we are a wonderfully fair country. We stick to the rules unlike some foreign governments (UK).

(29) Our country has long been open to foreigners, a tradition of hospitality going back, beyond the Revolution, to the *Ancien Régime* (France).

(30) France, which has shown the world the road to democracy and to human rights, France land of welcome and asylum, France present on five continents, could not yield to racial hate (France).

(31) I know of no other country on this earth that gives more prominence to the rights of resident foreigners than does this bill in our country (Germany).

(32) This is a nation whose values and traditions now excite the world, as we all know. I think we all have a deep pride in American views, American ideals, American government, American principles, which excite hundreds of millions of people around the world who struggle for freedom (USA).

(33) There are so many great things about our country, all the freedoms that we have, speech, religion, the right to vote and choose our leaders and of course our greatness lies in our mobility, the ability to each and every one of us, regardless of the circumstances of our birth, to rise in American society, to pursue our individual dreams (USA).

Although nationalist rhetoric may differ in different countries (it is usually more exuberant in France and in the USA, for instance), the basic strategy of positive self-presentation appears in all Houses: we are fair, respect human rights, have a long tradition of tolerance, etc. It is not uncommon to hear in *each* parliament, that at least some representatives think of their own country as the most liberal, freedom-loving, democratic, etc. in the world.

Fair, But . . .

Such self-glorification, especially when introducing a debate on minorities or immigration, has various functions in parliamentary discourse. For those groups or parties that oppose legislation in favour of minorities or immigrants, positive self-presentation often functions as a disclaimer, that is, as an introduction for a '*but*', followed by arguments in favour of special restrictions, as is also the case in the following fragment from a radio interview with Dutch Prime Minister Ruud Lubbers:

(34) In practice, we should come to opportunities and possibilities for them, but in practice we should also come to a less soft approach. There should be a line like: we also hold them responsible [literally: 'we address them'].

Elsewhere we find a nearly routine combination of fairness on the one hand, and firmness, realism, pragmatism, etc., on the other hand:

(35) National and international responsibility for people in emergency situations, combined with obligations that follow from agreements, are our policy principles. This should remain as it is. But of course we need to take measures, especially when it is clear that many improper, not bona fide, apparently unfounded applications for asylum are being made, and that in some cases also the problems people experience are being exploited for commercial ends (The Netherlands).

(36) It is fair to establish visa controls as long as there is mutual agreement about them between the countries involved. They are the best way to control immigration fairly, so that those who properly qualify to come here or to leave this country to visit other countries can do so. Such controls make sure that people have the right qualifications for travel (UK).

(37) If we are to work seriously for harmony, non-discrimination and equality of opportunity in our cities, that has to be accompanied by firm and fair immigration control (UK).

(38) The period of expansion of our country has been at an end for more than 15 years, and this population of foreigners lives in the midst of a French population that is deeply touched by recession and unemployment, a question we must deal with humanely but also reasonably, because I do not hesitate to say that after the time of illusions comes necessarily that of realism (France).

(39) It belongs to this fair balance of interests that the further immigration of foreigners must be limited, because for each society there are limits to the ability and the readiness to integrate (Germany).

(40) This substitute offers the House of Representatives an opportunity to enact a landmark civil rights bill that is both fair and pragmatic (USA).

This remarkably similar rhetoric of fairness ('fair, but strict', etc.) in the different countries also seeks to combine two opposed ideological or political aims, namely the humanitarian values of tolerance or hospitality on the one hand, and the common-sense values of 'realism' on the other. In other words, the humanitarian aims are recognized, but at the same time they are rejected as being too idealistic and, therefore, impractical in the business of everyday political

management and decision-making. The reference to fairness also serves as an element in a 'balance', namely in order to mitigate the negative implications of proposed legislation, such as limitations on further immigration in the European debates, and limitations on the 1990 Civil Rights Bill (eventually vetoed by President Bush) in the USA.

Positive presentation of such legislation, and of the parties or groups who support it, also involves strategic argumentative moves such as apparent altruism ('It is in their own best interests'), choice of the lesser evil ('Restriction of immigration prevents conflicts in the inner cities') and other moves that emphasize that the speaker or party has the national interest, the interests of their own (white) population, as well the interests of the minorities and the immigrants or refugees in mind. Such a 'predicament' is sketched by the Dutch Secretary of Foreign Affairs, Mr van den Broek:

(41) The government is confronted with a Dutch society which reacts dividedly to the increasing number of asylum applications. [Some people want a liberal admission policy.] On the other hand, there are more or less latent movements who consider the influx of aliens as a threat to Dutch society.

Interestingly, governments tend to listen especially to those citizens who agree with the attitudes such governments have helped to create in the first place, as was the case with the refugee scare in the Netherlands during the last few years. That is, there is no real predicament, only a semblance of balancing popular feelings and interests. By using the populist argument for immigration control, thus, the government is able to legitimate its own policies by claiming support it has manufactured itself. This is done by creating a panic about 'waves' of refugees entering the country, a definition of the situation that is largely adopted also by the press, so that it also reaches the public at large (van Dijk, 1988c).

Denial of Racism

In such a political context of public impression management, the denial of racism plays a prominent role. Whatever the political orientation or party involved, including the extremist Right, all parliamentarians, emphatically reject any accusation or suggestion of prejudice, discrimination or racism. Indeed, the more racist the opinions professed, the more insistent are the denials of racism, as may be apparent in the following quotes from representatives of the Front National in the French Assemblée Nationale:

(42) We are neither racist nor xenophobic. Our aim is only that, quite naturally, there be a hierarchy, because we are dealing with France, and France is the country of the French.

(43) No, the French are neither racist, nor antisemitic, nor xenophobic nor revisionist. They may be worried in the face of an immigration which is out of control, in the face of an Islam pure and hard that might cross the Mediterranean. But the French stay tolerant.

Note that in both cases, an explicit or implicit *but* follows the denial. In the first case, the speaker (the leader of the Front National, Le Pen) even claims that it is 'natural' to have a hierarchy between the own group, the French, and the immigrants. This assignment of a 'natural' right to a superior position, is at the heart of racist ideologies. The second example is more indirect, and focuses on the 'worries' of ordinary French people, faced with a different culture and a different religion. Besides the discursive and political strategy of populism, which is very prominent in such debates ('The people would resent it', 'You should listen to what ordinary French, English . . . people say'), we also find the element of euphemism: we are not racist, only worried. Here is a more sophisticated example of such a strategy:

(44) The French are not racist. But, facing this continuous increase of the foreign population in France, one has witnessed the development, in certain cities and neighbourhoods, of reactions that come close to xenophobia. In the eyes of the French unemployed man, for instance, the foreigner may easily become a rival, towards whom a sentiment of animosity may threaten to appear.

Following the usual *but*, we do not find, as in other disclaimers, a negative statement about immigrants, but rather an explanation of the reaction of the 'common man' (women are apparently not involved). Note that the way this explanation is formulated ('continuous increase', 'rival') suggests understanding, if not an excuse, as in the usual accounts of racism in terms of economic competition. The denial of racism itself is rather complex, however. It is a denial that holds for the French in general. It is followed by a partial concession, duly limited by heavy mitigation and hedging ('coming close to xenophobia', 'a sentiment of animosity may threaten to appear'), as well as limited in place ('in certain cities'). In other words, prejudice, discrimination and racism are local incidents, and should also be seen as being provoked by continuous immigration, arguments we also found in the right-wing British press.

When restrictive measures are being debated, those who support them feel impelled to remind their audience, and the public at large, that such political decisions have nothing to do with prejudice or racism:

(45) I hope that people outside, whether they are black or white and wherever they come from, will recognize that these are not major changes resulting from prejudice (UK).

(46) My Hon. Friend and I will continue to apply a strict but fair system of control, not because we are prejudiced or inhumane, but because we believe that control is needed if all the people who live in our cities are to live together in tolerance and decent harmony (UK).

Such denials need argumentative support. Saying only that the measures are 'fair' may be seen as too flimsy. Therefore, we find the moves we have found earlier, such as concern for the inner cities. Note that such arguments also imply a move of transfer: we are not racist, but the poor people in the inner cities are, and we should avoid exacerbating the mood of resentment among the population

at large. This argument is rather typical of what we have called 'elite racism', which consistently denies racism among the own elite group, but recognizes that others, especially poor, white people may fail to be as tolerant.

Denial and Reproach

In the analysis of the British press, we have found that denials of racism easily transform into attacks against anti-racists. Such a strategy may also be found in parliamentary discourse. Thus, conservative representatives will not accept accusations or even implicit suggestions that their stricter immigration or ethnic minority policies are categorized as racist by other politicians. Since the official norm is 'that we are all tolerant citizens', such allegations are declared unacceptable:

(47) Addressing myself to the people of the left, I repeat again that we are . . . I have noted in your words, my God, terms such as racism and xenophobia, that those who do not support your proposals would be judged with the same terms. It should be understood once and for all: we are not racists because we combat your text (France).

(48) You will allow me to tell you that in no circumstance this debate should be prejudged by insinuating that, on these benches, the only antiracists are over there, whereas we, by opposition, would be racists (France).

(49) Well, now can we also agree this afternoon that you can have different philosophies about how to achieve through law civil rights and equal opportunities for everybody without somehow being anti-civil-rights or being a racist or something like that (USA).

One interesting case may be found in a German debate on the new Aliens Bill. When one of the Green Party representatives qualifies the provisions of the Bill as 'racist', a term that is as unusual in official German discourse as it is in the Netherlands, conservative representatives are furious. Even the Speaker of the Bundestag intervenes:

(50) A chill ran down my back when our colleague . . . said that this bill was a form of institutionalized racism. Whereas the older ones among us had to live twelve years under institutionalized racism, Ladies and Gentlemen, I beg you, and in particular our younger colleagues, to show respect for these terrible experiences, and not to introduce such concepts to our everyday political business.

In other words, evaluations in terms of racism are limited only to the Nazi past, and are banned from official political discourse. At most, the term *Ausländerfeindlichkeit* (literally: animosity against foreigners) may be used. 'Racism' thus is by definition too strong, if only because the present situation cannot be compared to the monstrosities of the Nazis. A similar attitude exists in the Netherlands, where racism is also avoided as a term in public (political, media) discourse because it is understood only in terms of extremist, right-wing ideologies of racial superiority.

Reversal

Although moderate reproaches directed against anti-racist delegates are not uncommon in parliament, reversal is rather exceptional. However, it is quite typical for right-wing party representatives, such as those of the Front National in France. Being routinely accused, also explicitly, of racism, they go beyond mere denial, and reverse the charges. For them, this means that the others, and especially the socialists, allegedly letting in so many immigrants and granting them equal rights, are guilty of what they call 'anti-French racism':

(51) There exists a form of racism, my dear colleagues [interruptions] that is passed over silently, but of which the manifestations nowadays reach an insupportable level and a scope that should concern us: that is anti-French racism.

Another way of reversing the charges is to accuse the anti-racists of being themselves responsible for creating racism, if only by not listening to the people and by letting so many non-European immigrants enter the country:

(52) Well, France today, according to what those creatures of the world tell us who often have come to take refuge in our country . . . France is the least racist country that exists in the world. We can't tolerate hearing it said that France is a racist country. . . . In this respect, this law proposal, because of the debate that is taking place at this moment, secretes and fabricates racism!

These examples taken from several western parliaments show that although the debate may be couched in less extremist terms than in much of the right-wing or tabloid press, or in everyday conversations, rather similar strategies and moves are used to talk about ethnic affairs, Most characteristic of this kind of political discourse is not merely the nationalist self-praise, but also the strategic management of impression: whatever we decide, we are fair. Since, especially in Europe, ethnic minorities, let alone new immigrants and refugees, have virtually no political power, this 'balancing act' of presenting policies as 'firm but fair' is obviously addressed primarily to the dominant white public at large. When defined as humane without being too soft, thus, the government and its supporting parties may be acceptable as essentially reasonable: we take energetic measures, but we are not racist.

In other words, besides managing impressions, such political discourse also manages its own legitimation by manufacturing consent on ethnic policies, and at the same time manages the politics of ethnic affairs, immigration and international relations.

Conclusions

Whether in the streets of the inner city, in the press or in parliament, dominant group members are often engaged in discourse about 'them': ethnic minority

groups, immigrants or refugees, who have come to live in the country. Such discourses, as well as the social cognitions underlying them, are complex and full of contradictions. They may be inspired by general norms of tolerance and acceptance, but also, and sometimes at the same time, by feelings of distrust, resentment or frustration about those 'others'.

Topics, stories and argumentation may thus construct a largely negative picture of minorities or immigrants, e.g. in terms of cultural differences, deviance or competition, as a problem or as a threat to 'our' country, territory, space, housing, employment, education, norms, values, habits or language. Such talk and text, therefore, is not a form of individual discourse, but social, group discourse, and expresses not only individual opinions, but rather socially shared representations.

However, negative talk about minority groups or immigrants may be heard as biased, prejudiced or racist, and as inconsistent with general values of tolerance. This means that such discourse needs to be hedged, mitigated, excused, explained or otherwise managed in such a way that it will not 'count' against the speaker or writer. Face-keeping, positive self-presentation and impression management are the usual strategies that language users have recourse to in such a situation of possible 'loss of face': they have to make sure that they are not misunderstood and that no unwanted inferences are made from what they say.

One of the major strategic ways white speakers and writers engage in such a form of impression management is the denial of racism. They may simply claim they did not say anything negative, or focus on their intentions: it may have sounded negative, but was not intended that way. Similarly, they may mitigate their negative characterization of the others by using euphemisms, implications or vague allusions. They may make apparent concessions, on the one hand, and on the other hand support their negative discourse by arguments, stories or other supporting 'facts'.

Also, speakers and writers may abandon their position of positive self-presentation and self-defence and take a more active, aggressive counter-attack: the ones who levelled the accusations of racism are the real problem, if not the real racists. They are the ones who are intolerant, and they are against 'our' own people. We are the victims of immigration, and we are discriminated against.

It is interesting to note that despite the differences in style for different social groups, such discourse may be found at any social level, and in any social context. That is, both the 'ordinary' white citizens as well as the white elites need to protect their social self-image, and at the same time they have to manage the interpretation and the practices in an increasingly variegated social and cultural world. For the dominant group, this means that dominance relations must be reproduced, at the macro- as well as at the micro-level, both in action as well as in mind.

Negative representations of the dominated group are essential in such a reproduction process. However, such attitudes and ideologies are inconsistent with dominant democratic and humanitarian norms and ideals. This means that the dominant group must protect itself, cognitively and discursively, against the damaging charge of intolerance and racism. Cognitive balance may be restored only by actually being or becoming anti-racist, by accepting minorities and

immigrants as equals, or else by denying racism. It is this choice white groups in Europe and North America are facing. So far they have largely chosen the latter option.

Strategic Maneuvering: Maintaining a Delicate Balance

Frans H. van Eemeren and Peter Houtlosser

1. Metatheoretical Starting-Points

"Quirites!" This is the infamous one-word speech by which Julius Caesar won his rebellious legions over to fight the republican army in North Africa, in 46 BC. After having fought a great number of battles under Caesar's command, the soldiers had refused to follow him again. Caesar's use of the word *quirites* as form of address had a devastating effect. According to the classical scholar Anton Leeman (1992), 'quirites' was the dignified word a Roman magistrate used to address an assembly. Caesar's use of this word to his soldiers made it clear to them that they had not only lost their privilege of being addressed as *commilitones*, or 'comrades,' but were even no longer entitled to a Roman general's normal form of address for his soldiers: *milites*. "We are *milites*!" they reportedly shouted when they all volunteered to follow Caesar once more into battle. Ceasar's use of the 'neutral' *quirites* as a qualification is an excellent illustration of how the communicative and interactional meaning of argumentative language use can only be grasped if the discourse is first put in a functional perspective in which its social context and the commitments assumed by the participants are duly taken into account.[1]

Argumentation theorists, however, are not just interested in the effectiveness of argumentation in convincing people of a certain viewpoint, but also in the standards argumentative discourse should comply with in order to be sound. For many, the *raison d'être* of the study of argumentation is even the critical analysis of argumentative discourse – i.e., the interpretation and evaluation of actual cases in the light of normative standards for argumentative conduct (van Eemeren, Grootendorst, Jackson & Jacobs, 1993, 37). Argumentative discourse is therefore

Source: Frans H. van Eemeren and Peter Houtlosser *Dialectic and Rhetoric: The Warp and Woof of Argumentation Analysis*, 2002, pp. 131–159.

a research subject with an empirical dimension as well as a critical dimension, and the study of argumentation can best be seen as part of the broader enterprise that van Eemeren (1990) dubbed 'normative pragmatics.' In the normative pragmatic approach we envisage, argumentative discourse is judged not only in terms of its success in gaining the audience's assent, but also in terms of its problem-solving capacity, i.e., its appropriateness for doing the job of resolving a difference of opinion.[2] Our 'pragma-dialectical' ideal for judging argumentative discourse is to check to what extent the defense of standpoints against critical reactions is in agreement with a procedure for testing the acceptability of standpoints that is 'problem-valid' as well as 'intersubjectively (or conventionally) valid.[3]

2. The Pragma-Dialectical Model of Critical Discussion

The model of 'critical discussion' is the theoretical device developed in pragma-dialectics to define a procedure for testing standpoints critically in the light of commitments assumed in the empirical reality of argumentative discourse (van Eemeren & Grootendorst, 1984).[4] This model provides a description of what argumentative discourse would be like if it were optimally and solely aimed at methodically resolving a difference of opinion about the tenability of a standpoint.[5] It specifies the resolution process, the stages that can analytically be distinguished in this process, and the types of speech act that are instrumental in resolving the difference in each particular stage. In the *confrontation* stage, the difference of opinion is defined. In the *opening* stage, the various kinds of commitment are established that are the starting point of the discussion and serve as a frame of reference during the discussion. In the *argumentation* stage, arguments and critical reactions are exchanged. In the *concluding* stage, the result of the discussion is determined.

In real argumentative discourse, at every stage of the critical discussion projected in the discourse, specific obstacles may arise that can be an impediment to the resolution of the difference of opinion. These impediments are traditionally known as *fallacies*. The pragma-dialectical rules for critical discussion, which provide a procedural definition of the general principles of constructive argumentative discourse, are designed to prevent such obstacles from interfering or from being detected as interfering with the resolution process. Unlike the rules of formal dialectics, which are rules for generating rational arguments, the pragma-dialectical rules do not only pertain to argumentation proper; they aspire to cover all speech acts performed in all stages of a critical discussion. They are supposed to reflect all necessary conditions for resolving a difference by means of argumentative discourse.

The procedures for ensuring critical reasonableness developed in pragma-dialectics not only lay claim to problem-validity, but they are also, as they should be, in various ways based in argumentative reality. On a philosophical level, would-be arguers have a 'pragmatic' rationale for accepting these procedures as guiding principles. The acceptability of the procedures is not derived from any external source of authority or some metaphysical necessity, but depends on their

suitability for resolving a difference of opinion on the merits for which they are designed (van Eemeren & Grootendorst, 1988). Viewed philosophically, this rationale for judging intersubjective or conventional validity may be called *pragmatic* because pragmatists characteristically decide the value of any proposal on its contribution to solving the problem they are out to solve.[6]

The pragmatic basis of the pragma-dialectical procedures for maintaining critical reasonableness is also apparent from the way taken out of the *Münchhausentrilemma* (Albert, 1985). Ending up in 'infinite regress' or a 'logical circle' is to be avoided. The justifications given at the point in the resolution process where the argumentation starts by 'justificationists' of all makes, whether they favor a 'geometrical' or an 'anthropological' conception of reasonableness, always amount to some philosophical form of *Letzbegründung* that is dialectically arbitrary. More or less axiomatically, a certain starting point is then declared sacrosanct because its truth is evident on the grounds of intellectual intuition or empirical experience. With Barth and Krabbe (1982) and other critical rationalists, we prefer a pragmatic option that is neither final nor philosophically charged. We speak of reasonable argumentation only if the argumentation is backed by a 'concession' which is part of the starting point (explicitly or implicitly) recognized by the other party, irrespective of the kind of reason they may have for this recognition.[7] It is worth noting that this contextual approach, situating argumentation in the actual process of dispute resolution, is hermeneutically in perfect agreement with the 'logical propaedeutic' of the Erlangen school of dialogue logic, which resorts to a starting point that is already given – or, as these German scholars say, "immer schon da" (Kamlah & Lorenzen, 1984).[8]

3. Strategic Maneuvering in Resolving a Difference of Opinion

In a pragma-dialectical analysis, argumentative discourse is 'reconstructed' as an attempt to resolve a difference of opinion.[9] This reconstruction results in an *analytic overview* of the resolution process – a representation of the discourse in terms of a critical discussion (van Eemeren & Grootendorst, 1992, 93–94). The analytic overview constitutes the basis for a critical evaluation. It clarifies the difference of opinion at issue and the positions of the participants. It identifies the procedural and substantive premises that serve as the starting point of the discussion. It surveys the arguments and criticisms that are – explicitly or implicitly – advanced, the argument schemes that are used, the argumentation structures that are developed. And it determines the conclusion that is reached. The model of critical discussion provides a survey of all speech acts and combinations of speech acts that operate in the various stages of the resolution process. It therefore serves as a heuristic and analytic tool for the reconstruction of the speech acts that are relevant to resolving a difference of opinion, but may remain implicit or opaque in the actual discourse (van Eemeren, Grootendorst, Jackson & Jacobs, 1993).

People engaged in argumentative discourse are characteristically oriented toward resolving a difference of opinion and may be regarded as committed to

norms instrumental in achieving this purpose – maintaining certain standards of reasonableness and expecting others to comply with the same critical standards.[10] This does not mean, however, that these people are not interested in resolving the difference *in their own favor.* Their argumentative speech acts may even be assumed to be designed to achieve precisely this effect.[11] In other words, there is not only a 'dialectical,' but also a 'rhetorical' aspect to argumentative discourse.[12] Initially, the pragma-dialectical method of analysis concentrated solely on the dialectical aspect. Meanwhile we have shown that the reconstruction of argumentative discourse can be strengthened considerably by incorporating rhetorical considerations in the analysis, and particularly in its justification (van Eemeren & Houtlosser, 1998, 1999, 2000a, 2000b, 2001, 2002).

The combination of rhetorical and dialectical lines of analysis we favor amounts to a systematic integration of rhetorical considerations in a dialectical framework of analysis.[13] In argumentative discourse, whether it takes place orally or in writing, it is generally not the arguers' sole aim to win the discussion, but also to conduct the discussion in a way that is considered reasonable. The arguers' rhetorical attempts to have things their way can therefore be regarded as being incorporated in their dialectical efforts to resolve the difference of opinion in accordance with the proper standards for a critical discussion. This means in practice that in every stage of the resolution process, irrespective of whether it is the confrontation stage, the opening stage, the argumentation stage or the concluding stage, the parties may, while being out for the optimal rhetorical result at that point in the discussion, be presumed to hold also to the dialectical objective of the of the discussion stage concerned. In their efforts to reconcile the simultaneous pursuit of these two different aims, which may at times even seem to go against each other, the arguers make use of what we have termed *strategic maneuvering.* This strategic maneuvering is directed at diminishing the potential tension between pursuing at the same time a 'dialectical' as well as a 'rhetorical' aim.

As we see it, a pragma-dialectical analysis benefits in at least three ways from using this conception of strategic maneuvering in reconstructing argumentative discourse. By getting a clearer view of the rhetorical aspects of the discourse, we get a better and more comprehensive grasp of what may rightly be called 'argumentative reality.' By achieving a more thorough and more subtle understanding of the rationale behind the specific instantiation of the various discussion moves, our analysis of the argumentative discourse becomes not only more profound but also more clearly justified. By gaining a more realistic insight in the strategic design of the discourse, we develop a more mature sense of the whys and wherefores of the various fallacious moves that occur in ordinary argumentative practice.

4. The Traditional Conceptions of Dialectic and Rhetoric

How does our position relate to the traditional conceptions of dialectic and rhetoric? As has been made clear abundantly in the earlier chapters of this volume, already since Aristotle there has been a distinct division between rhetoric and dialectic, in spite of their initial close connection. Plato viewed dialectic as a means of

finding the truth. Aristotle developed it in the *Topics* into a system of regulated dialogues for refuting a claim, starting from concessions of the other party. In the *Rhetoric* Aristotle provided the conceptual framework for the study of rhetoric by his 'argumentative' definition of rhetoric as an ability or capacity (*dynamis*) in each case to see the available means of persuasion. Beside the Aristotelian perspective, an Isocratian tradition developed that concentrated more on style and literary aspects. In Cicero's *De oratore* (Ed., 1942) these aspects are integrated in the Aristotelian framework and until the seventeenth century western history of the theory of rhetoric remained foremost Ciceronian, although after its rediscovery in the fifteenth century, Quintilian's *Institutio oratorio* became the major classical authority on rhetoric in education (Kennedy, 1994, 158, 181).[14]

In medieval times dialectic achieved an importance at the expense of rhetoric, which – after the study of *inventio* and *dispositio* was moved from rhetoric to dialectic – was reduced to a doctrine of *elocutio* and *actio*. With Ramus this development culminated in a strict separation between dialectic and rhetoric, with rhetoric being devoted exclusively to style, and dialectic incorporated into logic (Meerhoff, 1988).[15] Although there were these precursory symptoms of a widening gap between rhetoric and dialectic, according to Toulmin (2001), the division did not become 'ideologized' until after the 'Scientific Revolution.'[16] Then the division resulted in two separate and mutually isolated paradigms, each conforming to a different conception of argumentation, which were considered incompatible. Rhetoric has within the humanities become a field for scholars in communication, language and literature.[17] With the further formalization of logic in the nineteenth century, dialectic almost disappeared from sight.[18] Although in the twentieth century the dialectical approach to argumentation has been taken up again, there is still a yawning gap in conceptualisation as well as understanding among argumentation theorists between the theorists who opt for a dialectical approach and the protagonists of a rhetorical approach.[19]

On closer inspection there have nevertheless always been authors who saw a connection between rhetoric and dialectic (see van Eemeren & Houtlosser, 1998). For Aristotle, rhetoric is the mirror image or counterpart (*antisptrophos*) of dialectic;[20] in the *Rhetoric*, he assimilates the opposing views of Plato and the sophists (Murphy and Katula, 1994, Ch. 2). According to Reboul, Aristotle wrote "que la rhéorique est le 'rejeton' de la dialectique, c'est à dire son application, un peu comme la médicine est une application de la biologie. Mais ensuite, il la qualifie comme une 'partie' de la dialectique" (1991, 46). For Cicero rhetoric is also *disputatio in utramque partem*, speaking on both sides of an issue. In late antiquity, Boethius subsumes rhetoric in *De topicis differentiis* under dialectic (Kennedy, 1994, 283). According to Mack, dialectic is for Boethius more important, "providing rhetoric with its basis" (1993, 8, n. 19). The development of humanism "provoked a reconsideration of the object of dialectic and a reform of the relationship between rhetoric and dialectic" (Mack, 1993, 15). In *De inventione dialectica libri tres* (1479/1967), a major contribution to humanist argumentation theory, the remarkable scholar Agricola builds on Cicero's view that dialectic and rhetoric cannot be separated and incorporates the two into one theory. Unlike Perelman and Olbrechts-Tyteca (1969), who much later bring elements from dialectic into rhetoric, Agricola merges elements from rhetoric into dialectic.[21]

To overcome the sharp and infertile ideological division between dialectic and rhetoric, dialectics is in pragma-dialectics – more or less in line with Agricola – viewed as a theory of argumentation in natural discourse and rhetorical insight is fitted in with a dialectical approach. Van Eemeren, Grootendorst, Jackson and Jacobs define dialectic as "a method of regimented opposition" in verbal communication and interaction "that amounts to the pragmatic application of logic, a collaborative method of putting logic into use so as to move from conjecture and opinion to more secure belief" (1997, 214).[22] By conceiving dialectic pragmatically as discourse dialectic, a conception of dialectic is promoted that differs in various ways from the conceptions favored in Aristotelian dialectic or formal dialectics. Rhetoric is in pragma-dialectics viewed as the theoretical study of the various kinds of practical persuasion techniques. There is no reason to assume that the rhetorical norm of artful persuasion is necessarily in contradiction with the ideal of reasonableness that lies at the heart of pragma-dialectics. Why would it be impossible to comply with critical standards for argumentative discourse when one attempts to shape one's case to one's own advantage? In fact, argumentative moves that are considered rhetorically strong by a critical audience will in practice almost certainly be in accordance with the dialectical norms applying to the discussion stage concerned.[23] Viewed from this perspective, there is a sound basis for overcoming the traditional division between dialectic and rhetoric by integrating the rhetorical dimension into the pragma-dialectical method of analysis.[24]

5. Maintaining a Delicate Balance

An understanding of the role of strategic maneuvering in resolving differences of opinion can be gained by examining how the opportunities available in a certain dialectical situation are used to handle that situation for a certain party in the most favorable way. Each of the four stages in the resolution process is characterized by a specific dialectical aim. Because the parties involved want to realize this aim to their best advantage, they can be expected to make the strategic moves that serve their interest best. In this way, the dialectical objective of a particular discussion stage always has a rhetorical analogue and the presumed rhetorical objectives of the participants must be specified according to stage: it depends on the dialectical stage one is in what kind of advantages can be gained.

In the confrontation stage, the dialectical objective of the parties is to achieve clarity concerning the specific issues that are at stake in the difference of opinion and the positions that each of the parties assumes. Viewed rhetorically, the parties will aim to direct the confrontation in the way that is the most beneficial from their own perspective. This means that each party will attempt to achieve a definition of the disagreement that favors the issues each of the parties wants to discuss and the positions each of them would like to assume.

The dialectical objective of the opening stage is to establish an unambiguous point of departure for the discussion. This point of departure consists of intersubjectively accepted procedural and material starting points – the mutual

'concessions' – and also includes an agreement about the division of the burden of proof. The rhetorical aim of each of the parties is to arrive at a point of departure that serves their own interest best. Each party's strategic maneuvering will be aimed at establishing the most workable starting points and the most opportune allocation of burden of proof.

In the argumentation stage, the dialectical objective is to test the tenability of the standpoints that have shaped the difference of opinion in the confrontation stage, starting from the point of departure established in the opening stage. Viewed from a rhetorical perspective, the parties will aim to make the strongest case and to launch the most effective attack.

The dialectical objective of the parties in the concluding stage is to establish the result of the critical testing procedure and to decide jointly whether the protagonist can maintain his standpoint in the light of the criticisms advanced by the antagonist or whether the antagonist can maintain his position of doubt even considering the arguments advanced by the protagonist. Viewed rhetorically, each party will attempt to claim victory and their strategic maneuvering will be designed accordingly.

In the view we developed, strategic maneuvering can take place in making an expedient choice from the options constituting the 'topical potential' associated with a particular discussion stage, in selecting a responsive adaptation to 'audience demand,' and in exploiting the appropriate 'presentational devices.' Both parties may be expected to select the material they can handle well, or that suits them best, develop the perspective most agreeable to their audience, and present their contributions in the most effective way. With respect to each of these three aspects of strategic maneuvering, both parties have an opportunity to influence the result of the discourse in their own favor.[25]

The *topical potential* associated with a particular dialectical stage can be regarded as the set of relevant alternatives available in that stage of the resolution process.[26] As Simons (1990) observes, the ancient Greeks and Romans were already aware that on any issue there is a range of 'stratagems' that can be called upon when discussing a case. Perelman and Olbrechts-Tyteca rightly emphasize that from the very fact that certain elements are selected, "their importance and pertinence to the discussion are implied" (1969, 119).[27] Apart from endowing elements with a 'presence,' deliberate suppression of presence is also a noteworthy phenomenon of choice (1969, 116).[28]

As regards choosing from the topical potential, strategic maneuvering in the confrontation stage aims for the most effective choice among the potential issues for discussion – restricting the 'disagreement space' in such a way that the confrontation is defined in accordance with the party's preferences.[29] In the opening stage, strategic maneuvering attempts to create the most advantageous starting point, for instance by calling to mind, or eliciting, helpful 'concessions' from the other party. In the argumentation stage, starting from the list of 'status topes' associated with the type of standpoint at issue, a strategic line of defense is chosen that involves a selection from the available *loci* that best suits the speaker or writer. In the concluding stage, all efforts will be directed towards achieving the conclusion of the discourse desired by the party concerned, by pointing out, for instance, the consequences of accepting a certain complex of arguments.

For optimal rhetorical result, the moves that are made must in each stage of the discourse also in such a way be adapted to *audience demand* that they comply with the listeners' or readership's good sense and preferences. Argumentative moves that are entirely appropriate to some may be inappropriate to others. In general, adaptation to audience demand will consist in an attempt to create in each stage the required empathy or 'communion.' In the confrontation stage, this may, for example, be manifested by the avoidance of unnecessary or unsolvable contradictions. According to Perelman and Olbrechts-Tyteca, disagreement with respect to values is sometimes communicated as disagreement over facts, because that disagreement is easier to accommodate. As a rule, a speaker or writer's effort is directed to "assigning [...] the status enjoying the widest agreement to the elements on which he is basing his argument" (1969, 179). This explains why, in the opening stage, the status of a widely shared value judgement may be conferred on personal feelings and impressions, and the status of a fact on subjective values. In the argumentation stage, strategic adaptation to audience demand may be achieved by quoting arguments the listeners or readers agree with or by referring to argumentative principles they adhere to.

For optimally conveying rhetorical moves, the available *presentational devices* must be strategically put to good use. This means that discursively effective means should be sought to convey the various moves in the discourse. The phrasing and stylistic framing of the moves should be systematically attuned to their discursive effectiveness – exploiting the Gricean maxims of Manner in a specific and deliberate way.[30] In *De oratore*, Cicero (Ed., 1942) observes an unbreakable unity between expression and content – *verbum* and *res*. Anscombre and Ducrot identify expression with orientation: "Signifier, pour un énoncé, c'est orienter" (1983, i), or, as Anscombre puts it, "diriger le discours dans une certaine direction" (1994, 30). According to Perelman and Olbrechts-Tyteca, all argumentative discourse presupposes "a choice consisting not only of the selection of elements to be used, but also of the technique for their presentation" (1969, 119).

Rhetorical figures are specific modes of expression that can be used as presentational devices; they are ways of presenting that make things present to the mind.[31] Perelman and Olbrechts-Tyteca regard a figure as argumentative if it brings about a change of perspective (1969, 169).[32] Among the rhetorical figures that can serve argumentative purposes are, of course, classical ones such as rhetorical questions and *praeteritio* – drawing attention to something by saying that you will refrain from dealing with it. The success of a figure depends on the stage of the discourse in which it is employed. Figures such as *metalepsis* can, for instance, in the opening stage facilitate the transposition of values into facts, as in "remember our agreement" for "keep our agreement" (Perelman & Olbrechts-Tyteca, 1969, 181). And figures such as *conciliatio* – in one interpretation, adopting the opponent's premises to support one's own position – can be brought to bear to prepare the way for convincing the opponent in the argumentation stage.

Although the three aspects of strategic maneuvering, which run parallel with important classical areas of interest – topics, audience-orientation, and stylistics –, can be distinguished analytically, in actual practice they will usually work together.[33] We shall say that a fully-fledged 'argumentative strategy' is being

followed only if the speaker's or writer's strategic maneuverings in the discourse converge with respect to choosing from the topical potential, adapting to the audience demand, and the exploitation of presentational devices. Argumentative strategies in our sense are methodical designs of moves for influencing the result of a particular dialectical stage, or the discussion as a whole, to one's own advantage, which manifest themselves in a systematic, coordinated and simultaneous exploitation of the opportunities afforded by that stage. There are specific confrontation strategies, opening strategies, argumentation strategies and concluding strategies. Among the confrontation strategies used in defining the difference of opinion when choosing the issues that define the 'disagreement space' are evasion and 'humpty-dumpty ing.' There are also specific opening strategies, such as creating a broad zone of agreement or, the opposite, a 'smokescreen.' The argumentation strategies include spelling out desirable – or undesirable – consequences that are supposed to immediately convince – or intimidate – the opponent. A notorious concluding strategy is forcing the audience to 'bite the bullet.' The various rhetorical styles of argumentative discourse can be characterized in terms of a particular combination of such strategies. Clearly, the one strategy or style is more acceptable than the other is.

6. Fallacies as Derailments of Strategic Maneuvering

In pragma-dialectics, argumentative moves are only considered sound if they are in agreement with the rules for critical discussion. Any violation of any of these rules obstructs the aim of dispute resolution and the move concerned is then considered fallacious. Clear criteria are required to determine methodically for all the moves in all the stages of the resolution process whether or not it is a violation of a certain rule and may thus be regarded fallacious. Our concept of strategic maneuvering as an attempt to alleviate the potential tension between arguing perfectly reasonably and having things one's own way can be of help in clarifying the problems involved in identifying such criteria.

All the moves made in argumentative discourse can be regarded as designed both to uphold a reasonable discussion attitude and to further a party's case. This does not mean that these two objectives will always be in perfect balance. On the one hand, arguers may neglect their persuasive interests for fear of being perceived as unreasonable; on the other hand, in their assiduity to win the other party over to their side, they may neglect their commitment to the critical ideal. Neglect of persuasiveness comes down to bad strategy – or even to a blunder (Walton & Krabbe, 1995). It harms the arguer but not the adversary and is therefore not 'condemnable' in the sense of being fallacious. A party, however, whose strategic proceedings allow its commitment to a reasonable exchange of argumentative moves to be overruled by the aim of persuading the opponent, may victimize the other party. Then the strategic maneuvering has got 'derailed,' and is condemnable for being fallacious. All derailments of strategic maneuvering are fallacious and all fallacies can be regarded as derailments of strategic maneuvering.

This view of the fallacies explains why in actual argumentative practice fallacies are often not immediately *apparent* or *manifest*. A party that maneuvers strategically will normally pretend to uphold at all times a commitment to the rules of critical discussion. Thus, a standing presumption of reasonableness is conferred on every discussion move (see also Jackson, 1995). This presumption is operative even when a particular way of maneuvering violates a certain discussion rule and is thus fallacious. Echoing Aristotle's definition of a fallacy as cited by Hamblin (1970, 12), we may say that the maneuvering then still 'seems' to obey the rules of critical discussion, although in fact it does not.[34] If the rule violation is a deliberate violation, it is imperative for the party that is guilty of the violation to convey quite clearly that its commitment to reasonableness still stands, because if it were clear that this is not so, any persuasive effect of the move would be lost immediately. If the violation is unintentional – the move is simply a mistake – it is nevertheless still a fallacy in the pragma-dialectical sense: the move concerned may seem rhetorically strong as well as dialectically acceptable to the offender, but is in fact not reasonable. Such an unintended infringement is, of course, not irreversible. Once the other party has pointed out that an offense against reasonableness has been committed, this offense may be instantly repaired.

Our view of fallacies as derailments of strategic maneuvering can also be of help in developing criteria for identifying fallacious argumentative behavior. In our view, each form of strategic maneuvering has, as it were, its own continuum of sound and fallacious acting. Fallacy judgments are in the end always contextual judgments of specific instances of situated argumentative acting. Neither does this predicament mean, however, that that there must, of necessity, always remain a gray – or even dark – zone, nor that no clear criteria can be established in advance to determine whether a particular way of strategic maneuvering goes astray. Particular 'types' or 'categories' of strategic maneuvering can be identified, and for each of these types specific conditions can be formulated that need to be fulfilled if the maneuvering is to remain dialectically sound. Certain instances of strategic maneuvering can then be recognized as sound while other instances of strategic maneuvering can be pinned down as fallacious because the relevant conditions are not satisfied.

7. Argumentation *In Vivo*: 'Clear Thinking in Troubled Times'

We illustrate how integrating rhetorical considerations into a pragma-dialectical theoretical framework can be of help in achieving a satisfactory analysis and evaluation of argumentative discourse by giving a reconstruction of an 'advertorial' published by Shell in the *Observer* of November 19, 1995. Although the argument remains partly hidden, this advertorial is a good example of argumentation *in vivo*. Having only just recovered from the damage suffered from the Brent Spar case, Shell responds to the massive, worldwide protests inflamed by the conviction and execution by the Nigerian regime of the writer, dissident critic and environmental activist Ken Saro-Wiwa. In the process, the company maneuvers strategically to defend its economic and political involvement in Nigeria.

At first sight, the text appears to be pretty straightforward: Shell informs the public of the nature of its involvement in Nigeria. As soon as it is taken into account, however, that the advertisement was published at a time when Shell was accused of lending support to the dictatorial Nigerian regime, and it is assumed that Shell responds relevantly to the accusations, it becomes clear that the advertorial is not just a slightly colored piece of information, but rather a defense of Shell's actions and an attempt to convince the public of the superiority of Shell's policies in Nigeria.

CLEAR THINKING IN TROUBLED TIMES

In the great wave of understandable emotion over the death of Ken Saro-Wiwa, it's very easy for the facts to be swamped by anger and recriminations. But people have the right to the truth. Unvarnished. Even uncomfortable. But never subjugated to a cause, however noble or well-meaning. They have the right to clear thinking.

The situation in Nigeria has no easy solutions. Slogans, protests and boycotts don't offer answers. There are difficult
5 issues to consider.

First, did discreet diplomacy fail? Perhaps we should ask instead why the worldwide protests failed. Our experience suggests that quiet diplomacy offered the very best hope for Ken Saro-Wiwa. But as worldwide threats and protests increased, the Government position appeared to harden. As Wura Abiola, daughter of the imprisoned unofficial winner of the last Nigerian presidential election said on Newsnight "The regime does not react well to threats. I believe that this is
10 the way of showing that they will not listen to threats." Did the protesters understand the risk they were taking? Did the campaign become more important than the cause?

There have also been charges of environmental devastation. But the facts of the situation have often been distorted or ignored. The public – who rightly care deeply about these issues – have too often been manipulated and misled.

There are certainly environmental problems in the area, but as the World Bank Survey has confirmed, in addition to the
15 oil industry, population growth, deforestation, soil erosion and over-farming are also major environmental problems there.

In fact, Shell and its partners are spending US$100 million this year alone on environment-related projects, and US$20 million on roads, health clinics, schools, scholarships, water schemes and agricultural support projects to help the people of the region. And, recognising that solutions need to be based on facts, they are sponsoring a $4.5 million independent environmental survey of the Niger Delta.
20 But another problem is sabotage. In the Ogoni area – where Shell has not operated since January 1993 – over 60% of oil spills were caused by sabotage, usually linked to claims for compensation. And when contractors have tried to deal with these problems, they have been forcibly denied access.

It has also been suggested that Shell should pull out of Nigeria's Liquefied Natural Gas project. But if we do so now, the project will collapse. Maybe for ever. So let's be clear who gets hurt if the project is cancelled.
25 A cancellation would certainly hurt the thousands of Nigerians who will be working on the project, and the tens of thousands more benefiting in the local economy. The environment, too, would suffer, with the plant expected to cut greatly the need for gas flaring in the oil industry. The plant will take four years to build. Revenues won't start flowing until early next century. It's only the people and the

And what would happen if Shell pulled out of Nigeria altogether? The oil would certainly continue flowing. The
30 business would continue operating. The vast majority of employees would remain in place. But the sound and ethical business practices synonymous with Shell, the environmental investment, and the tens of millions of dollars spent on community programmes would all be lost. Again, it's the people of Nigeria that you would hurt.

It's easy enough to sit in our comfortable homes in the West, calling for sanctions and boycotts against a developing country. But you have to be sure that knee-jerk reactions won't do more harm than good.
35 Some campaigning groups say we should intervene in the political process in Nigeria. But even if we could, we must never do so. Politics is the business of governments and politicians. The world where companies use their economic influence to prop up or bring down governments would be a frightening and bleak one indeed.

Shell. We'll keep you in touch with the facts.

8. An Integrated Pragma-Dialectical Analysis

In our analysis we shall show for each discussion stage how Shell strategically uses the topical potential of the discussion situation, adapts its message strategically to the beliefs and preferences of the audience, and strategically exploits certain presentational devices.

Confrontation Stage

Shell's advertorial constitutes a response to accusations leveled against its involvement in Nigeria as well as a justification of its policies. Viewed rhetorically, the advertorial is therefore both an apologia and a policy statement.[35] Shell's claim in the apologetic part (lines 4–22) is that its involvement in Nigeria is not blameworthy. The main claim defended in the political part (lines 23–37) is that it should continue its involvement in Nigeria. Both claims are subsumed under the general position that Shell's presence in Nigeria is justified.

The object of the apologetic defense is 'juridical.' Shell addresses two issues: its involvement in the death of Ken Saro-Wiwa and the part it plays in environmental devastation. When dealing with the first issue (lines 6–11), Shell opts for the status of *qualitas:* the company has made serious attempts to help Saro-Wiwa, but the protesters, sloganeers and would-be boycotters frustrated these attempts. In addressing the second issue (lines 12–22), Shell assumes the status *coniecturalis*, shifting the issue to other causes of environmental devastation and thereby suggesting that its share in the devastation is negligible.

In its discussion of the main policy claim, Shell selects three issues to deal with: its participation in Nigeria's Liquified Natural Gas project (lines 23–28), its overall involvement in Nigeria (lines 29–34), and its non-intervention policy (lines 35–37). All three issues relate to the fundamental ('stock') issue of advantages and disadvantages: pulling out of the project and withdrawing from Nigeria altogether would have undesirable

Making use of the pragma-dialectical tools for reproducing the structure of argumentation, this analysis can be represented as follows:

Juridical: (1) Shell is not to be blamed

1.1a Shell is not to be blamed for the death of Ken Saro-Wiwa
- 1.1a.1a Shell has made efforts to help Saro-Wiwa
- 1.1a.1b These efforts were frustrated by the campaigners

1.1b Shell is not to be blamed for any environmental devastation
- 1.1b.1a There are other problems in the area
  - 1.1b.1a.1 The World Bank confirms this
- 1.1b.1b Shell is in fact contributing to saving the environment
  - 1.1b.1b.1a They are substantially subsidizing environment-related projects
  - 1.1b.1b.1b They are substantially subsidizing other 'good' projects
  - 1.1b.1b.1c They are substantially subsidizing an environment survey
- 1.1b.1c A substantial component of environmental devastation is not caused by Shell
- 1.1b.1c.1a In the Ogoni-area 60% of the environmental devastation is caused by sabotage
- 1.1b.1c.1b The contractors have been denied access when they tried to deal with these problems
- 1.1b.1c.2 Shell has not been operative in the Ogoni-area since 1993

Policy: (2) Shell's Involvement in Nigeria is justified

2.1a Shell should not pull out of the NLG-project
- 2.1a.1a The people would suffer
- 2.1a.1b The environment would suffer
- 2.1a.1c The future Nigerian government would suffer
  - 2.1a.1a–c.1 If Shell would pull out of the NLG-project, the project would collapse

2.1b Shell should not pull out of Nigeria
- 2.1b.1 The people of Nigeria would get hurt
  - 2.1b.1.1 All kinds of advantages for the Nigerian people would be lost

2.1c Shell should not intervene in Nigerian politics
- 2.1c.1a Politics is the business of politicians
- 2.1c.1b A world in which oil companies use their influence to prop up or bring down governments would be a frightening and bleak world

Figure 1: Dialectical analysis of the argumentation structure of Shell's advertorial

In this analysis Shell's strategic maneuvering is not yet fully taken into account. By leaving the main claims addressed in the confrontation stage implicit in its presentation, Shell is able to select from the available 'disagreement space' the issues that are easiest to cope with. One of the main accusations directed at Shell at the time was that it indirectly supported the regime. Shell was, of course, expected to address this difficult issue, but refrains from doing so. At least explicitly, for at the very end of the text Shell declares that the company will not intervene in Nigerian politics (lines 35–37) and adds (in line 37) that it rejects *propping up* a government as much as bringing it down – thus implicating

that, in addition to not intervening, it also does not support the regime. In this way, Shell accommodates to audience demand by addressing the issue of support without explicitly answering the accusation involved. It can do so by exploiting the fact that the text, at this stage, has changed from an apologia into a policy statement. This change makes it only natural that the last paragraph of the text reads as another justification of Shell's policy. Nevertheless, Shell is back to its apologetic endeavor: the issue is no longer whether Shell should adopt a certain policy, but whether the company is, politically and morally, *to blame* for its policy.

This disclosure of Shell's manipulation of the 'intervention' issue calls for a slightly different structural analysis:

Juridical: (1) Shell is not to be blamed

1.1a Shell is not to be blamed for the death of Ken Saro-Wiwa
1.1a.1a Shell has made efforts to help Saro-Wiwa
1.1a.1b These efforts were frustrated by the campaigners

1.1b Shell is not to be blamed for any environmental devastation
1.1b.1a There are other problems in the area
1.1b.1a.1 The World Bank confirms this
1.1b.1b Shell is in fact contributing to saving the environment
1.1b.1b.1a They are substantially subsidizing environment-related projects
1.1b.1b.1b They are substantially subsidizing other 'good' projects
1.1b.1b.1c They are substantially subsidizing an environment survey
1.1b.1c A substantial component of environmental devastation is not caused by Shell
1.1b.1c.1a In the Ogoni-area 60 % of the environmental devastation is caused by sabotage
1.1b.1c.1b The contractors have been denied access when they tried to deal with these problems
1.1b.1c.2 Shell has not been operative in the Ogoni-area since 1993

[1.1c' Shell is not propping up the Nigerian regime]
1.1c'.1 Shell should not intervene in Nigerian politics
1.1c'.1.1a Politics is the business of politicians
1.1 c'.1.1b A world in which oil companies use their influence to prop up or bring down governments would be a frightening and bleak world

Policy: (2) Shell's involvement in Nigeria is justified

2.1a Shell should not pull out of the NLG-project
2.1a.1a The people would suffer
2.1a.1b The environment would suffer
2.1a.1c The future Nigerian government would suffer
2.1a.1a–c.1 If Shell would pull out of the NLG-project, the project would collapse

2.1b Shell should not pull out of Nigeria
2.1b.1 The people of Nigeria would get hurt
2.1b.1.1 All kinds of advantages for the Nigerian people would be lost

Figure 2: Integrated pragma-dialectical analysis of the argumentation structure of Shell's advertorial

This amendment to the structural representation of the argumentation clearly illustrates that taking rhetorical considerations into account can have real consequences for the analysis.

Opening Stage

Taking account of Shell's strategic maneuvering in the opening stage of the projected discussion makes it clear that the company creates a solid starting point for its case. It does so in the first place by contrasting the factual basis of its views with the emotional basis of the opinions of its opponents.

> The company makes it clear that its position is only based on objective facts. Some facts are known due to the company's own experience (lines 6–7), some other facts are provided by authorities such as Wura Abiola – the daughter of the then imprisoned winner of the last election (lines 8–10) – or by the World Bank (lines 14–15). Shell even makes a few concessions to strengthen its image of objectivity. One of these is the undeniable fact that there are indeed environmental problems in the Nigeria region (line 14).

Shell further enhances its credibility as an objective, disinterested and rational protagonist, as well as its humanitarian ethos.

> Shell enhances its credibility by emphasizing its knowledge of Nigerian affairs (lines 6–7, 16–19, 25–28, 29–32), its reliance on genuine data and respect for the truth (lines 2–5, 12–15, 18–19, 33–34, 39). In its presentation, Shell sustains this image by labeling the issues as "difficult" (line 4), eluding "easy solutions" (line 4), and having to do with "unvarnished truth" (line 2) rather than being "subjugated to a cause" (line 3). To enhance its humanitarian ethos, Shell shifts the focus of attention from its own problems to a concern with the problems of Nigeria: SHELL HELPS! (lines 6–7, 16–19, 25–27, 30–32). This is the perspective it is going to exploit thoroughly in its argumentation, elaborating extensively on its "development aid."

In contradistinction to Shell, the public is portrayed as allowing its judgements to be clouded by emotions (lines 1–2) and being easily manipulated and misled (lines 12–13). The campaigners are even worse: they are people whose perceptions are suffused with anger and recriminations (line 2), who utter nothing but "slogans, protests and boycotts" (line 4) and for whom the campaign has become more important than the cause (lines 10–11).

Shell also maneuvers strategically with the positions of the parties in the discussion. Dialectically speaking we have here two opposing parties – Shell and the campaigners – and a third party – the public – that is supposedly neutral.[36] At the time, however, public opinion was against rather than in favor of Shell, and Shell was fully aware of this. Therefore, the rhetorical situation was so that

Shell was not only required to resolve a mixed dispute with the campaigners, but also with the public. Nevertheless, the company initially acts as if there was only a standard 'non-mixed' dispute, thus adjusting this situation to its own objectives. Shell even treats the public as a possible ally, ready to close ranks with Shell against the campaigners (lines 1–32).

> This definition of the positions in the dispute is reinforced by the way in which Shell adapts to its audience: it attempts to create a degree of communion that makes its starting point more easily acceptable. Goodwill is invoked by flattering the public at this stage: they are sensible people who are concerned about the same problems as Shell; they are entitled to clear thinking and can cope with the unvarnished truth (lines 2–3). Thus the public is dissociated from Shell's opponents in the conflict.

In addition, Shell appeals to the public's responsibility: because rights imply duties, it is the public's duty to think clearly and accept only what is objectively true, however unsettling the truth may be (lines 2–3,33–34,39).

> One of the presentational means used to strengthen Shell's communion with the public consists in addressing them in the way a father speaks to his children: although the emotions they feel are "understandable" (line 1), they should learn the truth; and although they "rightly care deeply" (line 13), they are easily "manipulated and misled" (line 13), especially when a cause seems "noble and well-meaning" (line 3).

But if they take sides with Shell, all will end well. On the other hand, if they don't, chances are that they end up in the same bad position as the campaigners: cloaked in a warning, the public is put on a par with those it was initially, together with Shell, supposed to ridicule (lines 33–34).

> Among the presentational devices Shell employs to widen the dissociation between the campaigners and the public, is the passive voice: "there have [...] been charges" (line 12), "the facts [have] been distorted" (line 12), "it has been suggested" (line 23), et cetera. In this way, the campaigners are portrayed as anonymous accusers. Shell's repeated use of antithesis serves to put more emphasis on the contrast between its own clear thinking and rational attitude and the irrational attitude and muddled thinking of the campaigners (and sometimes the public): it is "facts" versus "emotions" (lines 1–3), "discreet diplomacy" versus "threats and protests" (lines 6–10), "clear thinking" versus "troubled times" (title), et cetera.

Argumentation Stage

In the case of the juridical not-to-blame claim (1), Shell selects for its defense primarily factual arguments from authority; in the case of the policy claim (2), the arguments are causal and pragmatic. The first issue associated with the 'Shell

is not to blame' claim, Ken Saro-Wiwa's death (1.1a), invokes Shell's own authority (lines 6–7) and that of Wura Abiola (lines 8–10). The second blame-issue, environmental devastation (1.1b), calls in the authority of the World Bank (line 14–15) as well as Shell's own authority (lines 16–19). The policy issues – Shell's withdrawal from Nigeria's Liquified Natural Gas project (2.1a) and from Nigeria in general (2.1b) as well as Shell's intervention in Nigerian politics (which we reconstructed as a disguised argument for the not-to-blame claim) – are all dealt with by pointing at the supposedly catastrophic consequences (lines 23–28, 29–32, 35–37).

Shell's preference for factual arguments from authority and causal arguments is entirely in line with its recurrent emphasis on the factual status of its position. Factual and causal arguments are often regarded more conclusive kinds of support: facts cannot be doubted and a causal chain suggests, unlike an analogical relation, a tight and unbreakable connection.

> There is one exception to the factual and causal treatment: Shell's refutation of the accusation that it supports the Nigerian regime (lines 35–37). Although the advertorial appears to provide causal argumentation, it is clear that in this case a causal argument will not do. Because the inference from Shell's non-intervention statement to the implied claim that it does not support the Nigerian regime cannot be causally warranted, from necessity, a weaker – symptomatic – inference has to do the job.

When we look at the way in which Shell's argumentation is adapted to its audience, two types of maneuvering stand out. The first pertains to the issue of blame. In refuting any suggestion of guilt with regard to both Ken Saro-Wiwa's death and environmental devastation, Shell exploits the SHELL HELPS perspective earlier invoked. Shell has helped Saro-Wiwa by means of discreet diplomacy (lines 6–7); and Shell has helped to get environmental devastation under control by providing financial and material aid (lines 16–19, 25–27, 30–32). In both cases, Shell claims, the effects of its help were frustrated by the actions of others (lines 10–11, 20–22).

In the justification of Shell's policy standpoint, adaptation to the audience takes place by evoking a frightening perspective of catastrophe and collapse: if Shell pulls out, calamity awaits the people of Nigeria (lines 24, 28, and 32). By referring to "the people [...] that *you* would hurt" (our italics), the public is once more reminded of its responsibility (line 32). By also emphasizing that "the environment, too, would suffer" (line 26), Shell employs an argument based on the figure of *conciliatio*: Shell's opponents' supposed concern about the Nigerian people and the environment is turned against them. The perspective of calamity is contrasted with that of Shell's prolonged activities in Nigeria, when the "sound and ethical business practices" synonymous with Shell will continue to bear their blessed fruit (lines 30–32).

> As can be expected, in refuting the 'blame'-issues a businesslike style prevails. The facts are (in lines 6–10 and 14–22) supposed to speak for themselves. In its presentation of the arguments for the policy standpoint,

Shell hammers in the picture of calamity by asking suggestive rhetorical questions – "What would happen if Shell pulled out of Nigeria altogether?" (line 29) – and by issuing warnings – "So let's be clear who gets hurt if the project is cancelled" (line 24) and "Again, it's the people of Nigeria you would hurt" (line 32). At a certain stage (in lines 29–32), some concessions are presented in a staccato of short and unconnected sentences that suggest lack of coherent thinking. They are then followed by a long and carefully constructed sentence that suggests that Shell has the situation under control. There is again no lack of suggestive wording: "the oil would certainly continue *flowing*" (with connotations of 'uncontrolled' and 'idle'), "the business would continue *operating*" (*cui bono*?), and "the vast majority of employees would *remain in place*" (but will they work?) (lines 29–30, our italics).

Concluding Stage

By leaving the general conclusion of the discussion of its involvement in Nigeria implicit, Shell suggests that it has said all there is to say and that the conclusion is obvious. What else can the readers conclude than that Shell is neither to blame for the killing of Ken Saro-Wiwa nor for any environmental disaster? On the contrary, Shell is a great help to the people of Nigeria and should stay there to prolong its generous 'development aid.'

To ensure that the public reaches this favorable view, Shell again makes an appeal to the public's responsibility. Having paved the way by the repeated warnings that the fate of the Nigerian people is in their hands, Shell strikes the final blow at the end of the text, when it starts to lecture the people about their attitude. The public acts irresponsibly: their opinions of the Nigerian problems amount to empty slogans, and their response is nothing but a knee-jerk reaction that can only harm this poor developing country (lines 33–34). They do indeed need Shell to put them straight.

Shell's last move in the argumentation stage of the discussion was to invoke a straightforward image of doom and horror. This exploitation of the presentational device of a metaphor is aimed at eradicating any idea that the company could be doing a thing so evil as supporting the Nigerian regime (lines 36–37). The implication of this move for the concluding stage of the discussion is clear: if it is evident to all what horrific consequences supporting the Nigerian regime will have, Shell can only be accused of such misbehavior by those extreme malevolents whose sole aim is to destroy Shell's political and moral ethos.

The final words, "We'll keep you in touch with the facts" (line 39), are not just a slogan, but should reassure the public that Shell will prevent the menacing perspective of a frightening and bleak world from becoming a reality – clear thinking will prevail. These words, however, also convey a veiled counteraccusation: You, the public, are not capable of keeping in touch with the facts. This is why Shell will do it for you.

9. An Evaluation of Shell's Strategic Maneuvering

The Use of Conciliatio

We would like to elucidate the pragma-dialectical approach to evaluating argumentative discourse by first discussing a specific instance of strategic maneuvering: Shell's use of the figure of *conciliatio*. In a *conciliatio*, the proponent uses an argument of the opponent to support his own standpoint. In terms of strategic maneuvering, making use of a *conciliatio* amounts to making a selection from the available argumentative potential that is evidently expedient and clearly optimally adapted to the opponent's starting point. Certain presentational devices, such as the use of a rhetorical question, are well-suited to make it obvious that the argument the proponent is going to use is in fact already part of the opponent's commitments.

Because the opponent's adherence is secured in advance, this form of strategic maneuvering is rhetorically strong. Because the proponent proceeds by arguing *ex concessis*, it is also pre-eminently dialectical. The danger of derailment stems from the fact that the opponent may be assumed to agree with the *content* of the argument, but may *not* be assumed to agree with the way in which the argument is used to support precisely the opposite standpoint. According to the correctness conditions applying to the speech act of advancing argumentation, an argument only counts as a felicitous attempt to convince the opponent if both parties not only accept the propositional content of the argument but also accept this proposition as a potential justification of the standpoint at issue (see van Eemeren & Grootendorst, 1992). In the case of a *conciliatio*, the former is – typically – granted, but the latter is most unlikely – at any rate in the first instance.

This speech act analysis points to a condition that can be of help in evaluating actual manifestations of *conciliatio*: such manifestations can only be 'sound' if the proponent offers sufficient support for his view that the argument taken over from his opponent has an overriding justificatory potential with regard to his standpoint and leaves it eventually to the opponent to decide whether this is indeed the case.[37] The use of *conciliatio* can be said to be a 'derailment' if the proponent just presupposes that the adopted argument has an unquestioning justificatory potential for his standpoint and leaves the opponent no room to question this presupposition. If a *conciliatio* is in this way derailed, the proponent relies on a starting point that is not yet accepted by the opponent and commits the fallacy of *begging the question*. A good example of *conciliatio* is provided in John LeCarré's novel *A Perfect Spy*. The main character in the book is a boy who is raised by everyone but his father, a real, albeit amiable, charlatan. Now and again the father comes to visit the boy. Each time when he gets ready to leave again the boy starts to cry. The father wants to stop him from crying and tries to achieve this like this:

> Do you love your old man? Well then ...

The *conciliatio* works as follows. First, the father attributes to the boy the proposition that is to be taken over from him ("I love my old man") by means of

a rhetorical question. Then he implies, by adding "well then ...," that *if*, or *given that*, the boy adheres to the proposition that he loves his old man, he should also accept the – implicit – standpoint that he should stop crying. Because it is clear that the father does not add any further support for this implication and his wording suggests that this is all there is to be said, it can be concluded that his strategic maneuvering by means of *conciliatio* has got derailed.

In 'Clear thinking in troubled times,' Shell also makes use of a *conciliatio* when the company justifies its not pulling out of Nigeria's Liquified Natural Gas project by pointing out that not Shell but the Nigerian people and the environment would suffer if Shell pulled out (lines 25–26). These arguments are clearly derived from the opponents' professed concerns for the people and the environment: given their political preferences, Shell's opponents may be assumed to be in favor of a prospering native population and a non-polluted environment. At the propositional level, Shell can therefore be sure of acceptance. But how does the oil company proceed to ensure the opponents' acceptance of the justificatory potential of these two points for its standpoint that Shell should not pull out of the project? Shell does so by claiming that there is a causal relation between Shell's pulling out of the project and a deterioration of the human and environmental circumstances. In this way, Shell lends at least some support to the view that its opponents' arguments have an overriding justificatory potential for its standpoint. Although the insertion of "certainly" conveys a suggestion of obviousness, Shell does not actually deter the reader from questioning the supposed causal link. Therefore, no actual derailment of strategic maneu-vering with *conciliatio* has taken place and it is not appropriate to accuse Shell of question begging.

We shall now have a closer look at Shell's strategic maneuvering in the various stages of the discourse and point out some fallacies that are committed.

Confrontation Stage

Our first evaluative observation is that Shell slyly manipulates the issues of the discussion: the company addresses the crucial issue of its involvement in Nigeria only in an implicit way. As transpired in the analysis, Shell emphasizes that it is undesirable that companies use their economic influence to prop up or bring down governments to support its standpoint that the company should not intervene in Nigeria. In order to defend this standpoint, however, it suffices to argue that it is wrong for companies to use their economic influence *to bring down* governments. Adding that the company's influence may also never be used *to prop up* governments is only relevant if Shell implicitly also attempts to convey the idea that *it does not support the Nigerian regime.* This is, in fact, precisely the point Shell should get across because when the advertorial was published the primary accusation was that Shell kept the Nigerian regime going.[38] Shell is apparently unwilling to confront this accusation outright, but needs to deny it all the same. The company does this implicitly by providing an argument from which the denial can be deduced.

Shell thus engages in a confrontation strategy of circumvention. The company employs this strategy to evade the crucial issue in the diff-

According to the dialectical standards, one of the rules of critical discussion is that arguments should be relevant to the standpoint at issue. This rule is violated in Shell's argument for the reconstructed standpoint that Shell does not support the Nigerian regime: it is undesirable for companies to use their economic influence to prop up or bring down governments. Although this argument is analytically relevant to the standpoint – it is precisely because of this analytic relevance that the standpoint could be reconstructed – , it lacks any evaluative relevance:[39] that it is undesirable to use economic influence to prop up or bring down governments may lend support to the political standpoint that Shell should not intervene in Nigeria's political situation, but could never support the *factual* standpoint that Shell does not support the Nigerian regime.[40] In the process, Shell not only violates the relevance rule for critical discussion, but also the *language use rule*: given that what now only becomes apparent after a radical reconstruction would have been immediately clear if Shell had advanced the standpoint explicitly, Shell is guilty of being misleadingly vague.

By using a distorted arrow for the fallacious maneuver in the defense of Shell's standpoint that it does not support the Nigerian regime, we can give the following evaluative overview of the formal representation the structure of Shell's argumentation:

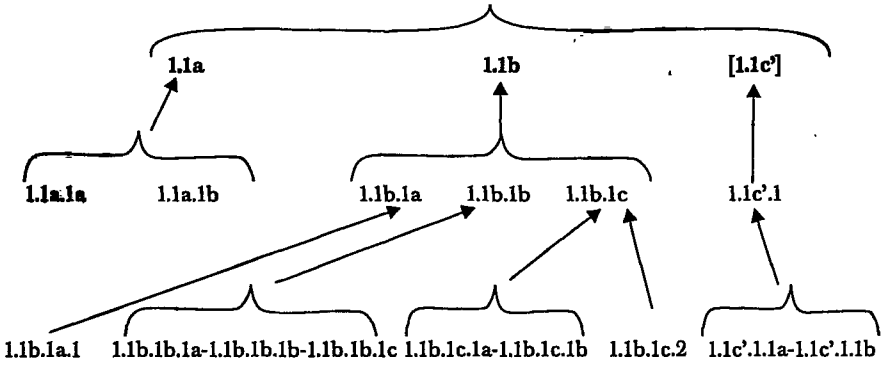

Figure 3: Partial pragma-dialectical evaluation of shell's advertorial as analyzed in Figure 2

Opening Stage

The dominant opening strategy is involving the readers as closely as possible in Shell's view. In the first instance, this is achieved by acting as if the public is not really in opposition to Shell, but has merely some doubts – resulting from ignorance rather than careful reflection. Shell thus presents the public as a possible ally rather than a potential opponent. In leading on the readers in this way, Shell chooses an opening strategy of inclusion. Near the end of the advertorial, when the public's comfortable position is suddenly made questionable, the final consequence of this strategy becomes apparent: a public that does not take sides with Shell should distance itself from this reasonable position and join the

campaigners – which has by then become a highly unattractive perspective. How is the use of this strategy to be evaluated? First, we should notice that at the end of the text Shell offers the public an unrealistic alternative when it confronts the public with the need of a choice. In times when the need of support is overwhelmingly urgent, forcing the public in a you-are-with-or-against-us situation could be acceptable in a policy speech. In an apology aimed at proving someone's innocence, however, this strategy is clearly inadmissible: establishing the facts is not a matter of making choices, let alone the choices presented by Shell. In this case, Shell is guilty of fallacious maneuvering: the company creates a *false dilemma.* Second, it should be noticed that the dilemma presented here can only have persuasive force because it is based on Shell's perpetual *ad hominem* attacks on the campaigners. Most of these attacks are abusive (the campaigners are unrealistic idealists, sloganeers who distort or ignore facts, irresponsible egocentrists who do not understand the risk they are taking), some are just circumstantial (the campaign became more important than the cause). Had the campaigners been portrayed as sensible people, the dilemma would not have existed. These *ad hominem* fallacies are thus a constitutive part of the fallacious maneuvering.

Argumentation Stage

The strategic maneuvering favored by Shell in the argumentation stage consists in founding its arguments on facts and authority and in suggesting that its actions are motivated by charity. This points to a combination of the argumentation strategies of certification and humanization. It is not so hard to see what could go dialectically wrong: derailments of the *ad verecundiam* type and ethical fallacies may occur. But do they occur? In the *ad verecundiam* case, the issue is whether making an appeal to authority is acceptable to the adversary and, if so, whether the authority appealed to is a genuine and relevant authority. The first question cannot really be answered in this monologal situation, but the last two questions can. The authorities Shell appeals to are Wura Abiola, the World Bank and Shell itself. Wura Abiola's authority is invoked to sustain a view concerning how the Nigerian regime tends to react when threatened. Her authority is supposedly based on the fact that she is the daughter of a former presidential candidate. The question is now: can she, just because of that background, indeed be regarded as an expert on the psychology of Nigerian politics? The fact that, apart from Shell, Newsnight too values her opinion on this issue may be seen as evidence that she can. This argument from authority is therefore probably not fallacious. This is also the case with the appeal to the authority of the World Bank to sustain certain data concerning environmental devastation. Although we have only Shell's word for it that the data that are mentioned are correct, the World Bank may indeed be expected to provide authoritative information that is also relevant. A remaining reservation can still be that Shell does not say whether the World Bank Survey puts the other environmental problems indeed on a par with the problems caused by Shell. It could well be the case that the latter problems outweigh the former by far.

A more definitive judgement can be given when we consider Shell's emphasis on its own authority as an expert on Nigerian affairs. This emphasis, which is present throughout the text but pre-eminently in Shells reference in line 6 to its own experience in dealing with the issue of Ken Saro-Wiwa's pending execution, exemplifies how strategic maneuvering cannot only derail but also be weak. The maneuvering derails because whether Shell knows best how to handle the situation in Nigeria is precisely the issue. It is also weak because neither Shell's opponents nor the public can be expected to accept Shell's authority at face value.

Shell's strategy of bestowing a pre-eminent status on factual reasoning connects well with its appeals to authority. It is, again, not too difficult to see what kind of fallacious maneuvering could take place. Are the "facts" presented by Shell indeed facts? And if so, are they relevant to the case? It is noticeable that Shell, in presenting its arguments against the accusation of environmental devastation, states the facts of the case in an unclear way. Who are the claimants in the sabotage cases? Who are the saboteurs? It is the elusive phrasing that prevents these questions from being answered. Again, Shell commits the fallacy of using misleadingly vague language. A similar fallacious strategy can be detected in Shell's argumentation against the accusations that it did nothing to prevent Ken Saro-Wiwa's execution. Shell suggests that the facts speak for themselves, but whether they do is another matter. A host of presuppositions is smuggled in that take an agreement for granted which probably not exists. Asking whether "discreet diplomacy" failed, for instance, presupposes that Shell has indeed made diplomatic efforts to save Ken Saro-Wiwa, that these efforts were rightly made in secret, et cetera. In all these instances, Shell can be accused of violating the *starting point rule* that allows arguments to be advanced only on the basis of a commonly accepted starting point. Apart from the dubious status of the facts, it is not transparent what relevance the facts are supposed to have. This maneuver connects in fact closely with Shell's recurrent reference to its charitable motives. It is, for instance, unclear how exactly combating environmental devastation relates to Shell's financing of roads and health clinics. Apparently the company does a lot of good, but should this automatically mean that it cannot be guilty of environmental devastation? Shell violates, again, the *relevance rule* of critical discussion.

Concluding Stage

Shell's concluding move is to use a strategy of termination. After having first implied that the public might end up on a par with the campaigners, the company concludes by invoking a catastrophic scenario that would become reality should the campaigners' wishes be fulfilled. The aim of this move clearly is to discourage the public to maintain any doubts concerning Shell's dealings in Nigeria. Instead of concluding that its standpoints are adequately defended by its own arguments, Shell thus suggests that its standpoints are acceptable because no doubts

can be raised against them. In this way, Shell makes a fallacious attempt to end the discussion.

10. Conclusion

The analysis of Shell's advertorial shows how in argumentative discourse the rhetorical opportunities offered by the dialectical situation can be used strategically in making a self-serving choice from the available topical potential, responding expediently to audience demand, and making a crafty use of presentational devices. The strategy of circumvention used by Shell in the confrontation stage consists in manipulating the difference of opinion, and changing its focus, by highlighting and addressing selectively only those issues that Shell can cope with and dealing only indirectly with the main issue it is expected to address. The strategy of inclusion, which is dominant in the opening stage, amounts to involving the public as closely as possible in Shell's view of the case by presenting them as a possible ally rather than an opponent and leading them in this way up the garden path. In the argumentation stage, Shell's strategic maneuvering combines the strategies of certification and humanization: while demeaning its opponents as not knowledgeable and irresponsible, Shell lends the prerogative to causal reasoning based on 'authorized' facts (restricted to those facts that can be put in a perspective that is attractive to the public) and establishes at the same time its own image as a social conscience company. Shell's concluding strategy of termination appeals to the public's common sense by impregnating them with responsibilities that are at variance with their present unrealistic attitude through rubbing in the facts. All told, Shell's defense cannot be evaluated so positively as its clever use of *conciliatio* may have suggested. Several of Shell's moves are derailments of strategic maneuvering that are fallacious because they violate a rule for critical discussion. Shell's advertorial is, in fact, a good illustration of how supposedly clever strategic maneuvering can become rhetorically inappropriate when it is dialectically not acceptable.

In this chapter we have shown that the analysis and evaluation of argumentative discourse benefits in several ways from using rhetorical insight in a pragma-dialectical reconstruction. It may also have become apparent that a satisfactory rhetorical reconstruction cannot be carried out either if dialectical considerations are not taken into account: the rhetorical function of a speech act can only be determined systematically if it is first put in a well-defined perspective of what is at stake in a certain stage of the discourse. Because the methodical enrichment we have obtained allows us to get a firmer grasp on the various aspects of strategic maneuvering, we achieve a deeper and more comprehensive view of what may be called 'argumentative reality.' Gaining a thorough understanding of the strategic rationale behind specific discussion moves made in argumentative discourse strengthens the analysis by making it not only more profound and more informed but also better-justified. Achieving a clear view of the strategic design of the

discourse also results in a more refined sense of when and why certain types of strategic maneuvering are to be considered fallacious in actual argumentative practice.

Notes

Earlier versions of this paper were published in *Discourse Studies* (1999), *Argumentation* (2000a), and *Informal Logic* (2002). A different version will appear in the Proceedings of the First International Workshop on Semantics, Pragmatics, and Rhetoric, held in Donostia/San Sebastian in November 2001.

1. For the principles of 'functionalization,' 'socialization' and 'externalization' involved in this approach, see van Eemeren and Grootendorst (1984, 4–15).
2. For the 'dialectification' of the study of argumentative discourse that is, in our view, required in this endeavor, see van Eemeren and Grootendorst (1984, 14–18).
3. Unlike in the 'geometrical' and 'anthropological' philosophies of argumentation distinguished by Toulmin (1976), argumentative discourse is thus inherently connected with conducting a 'critical discussion,' and reasonableness is neither reduced to instrumental rationality nor to achieving a cultural-determined mutual agreement. This critical philosophy of argumentation embodies a Popperian concept of reasonableness that does not restrict the possibility of arguing reasonably to a particular discipline say academic epistemology. Instead, in a critical rationalist vein, reasonable argumentation can occur in all spheres of life, inclusive of those in which value judgments may play a major part, such as political discourse and private deliberation.
4. Unlike formal dialectics, pragma-dialectics is a discourse dialectic, closely aligned with a pragmatic approach to communication and interaction. This, however, does not automatically mean that formalization is right away excluded. Because pragmadialectics involves the development of a model of regimented ways of resolving a difference of opinion, this approach to argumentation is formal in a procedural sense. Ultimately, it always depends on the stage of development a theoretical approach has reached what the possibilities for formalization are: in some instances formalization is premature and would spoil the view of the phenomena concerned while in other cases refraining from formalization prevents a theory from developing any further. In practice, it may be the case that the state of theorizing is such that only certain parts or aspects of the subject-matter are ready for formal treatment while others can only be formalized at the expense of harmful reductions.
5. It is important to realize that in a critical discussion also standpoints can be 'tested' whose acceptability is not a matter of truth. Coherence in the sense of the avoidance of pragmatic inconsistency is then, of course, required. See Putnam (2001, 23).
6. Although the quality of the pragma-dialectical rules depends on their problem-solving validity, the additional requirement of intersubjective validity creates a pressure to ascertain that people who aim to resolve their differences by means of argumentative discourse will maintain norms that are, at least for the most part, equivalent with the pragma-dialectical rules. To determine precisely to what extent the pragma-dialectical rules agree with the norms favored by ordinary language users, we test their inter-subjective validity by carrying out a prolonged series of empirical investigations. The results provide a general insight into ordinary arguers' reasonableness conceptions (see, e.g., van Eemeren, Meuffels & Verburg, 2000). At the University of Amsterdam,

indicators of moves that are relevant to resolving a difference of opinion. The scope of the inventory extends to indicators of counterarguments, 'argument schemes,' and structural relations between arguments, and also to indicators of moves in other stages of the resolution process, such as expressing antagonism, granting a concession, and adding a rebuttal (see, e.g., Snoeck Henkemans, 1995).

7. Toulmin calls such pragmatism "an honest foundation for knowledge" (2001, 174). This pragmatic approach is also important in distinguishing between 'real' and 'artificial' (or 'academic' or 'philosophical') doubt. The starting point for 'real' doubt lies in argumentative practice. Peirce once reminded us that having (real) doubt is not so easy as putting forward a lie. It is good to realize that 'fallabilism' does not mean that everything needs to be doubted, but only that doubt should be expressed if there is reason to express it. Putnam regards it as the most important insight achieved in American pragmatism that one can be 'fallibilistic' and 'anti-skeptical' at the same time (2001, 29–30).
8. Among rhetoricians there is a confusing tendency to call such a pragmatic basis of argumentation or discussion rules 'rhetorical.' We prefer to reserve the term *rhetorical* for references to (clear and distinct concepts from) rhetorical theory. For a recent and serious attempt to connect rhetoric and pragmatics theoretically, see Dascal and Gross (1999), who acknowledge "that it is a union with problems on both sides of the aisle" (p. 108).
9. It goes without saying that argumentative discourse, or any other kind of discourse, can also be analyzed from other perspectives, with other goals. As Kant already observed, the one analysis cannot necessarily be reduced to or translated into the other.
10. According to Putnam, we are governed by norms of rationality and reasonableness that have to us become values in their own right (2001, 76–77). See for some empirical confirmation of this claim van Eemeren, Meuffels and Verburg (2000).
11. Linguistic pragmatics suggests already a strong argument for this approach: Why perform a speech act, in particular that of advancing a standpoint, if it is not for gaining acceptance?
12. Using the label 'rhetorical' in this way does not necessarily imply a conception of rhetoric that equates rhetoric without any ado with 'winning,' let alone with 'winning at all cost' (or a similar goal). It does mean, however, that rhetoric, whatever safeguards are added, is in our view in the end always, and undeniably, associated with getting your point as intended across to the audience. According to Simons (1990), rhetoric is, most neutrally, the study and the practice of persuasion. Kienpointners (1995, 453) points out that many scholars see rhetoric as "a rather narrow subject dealing with the techniques of persuasion and/or stylistic devices," but others conceive of rhetoric as "a general theory of argumentation and communication" (while still others deny that it is a discipline at all).
13. We aim at integrating rhetorical insight into a dialectical framework, instead of the other way around, because our primary interest was and is the resolution of differences of opinion by putting standpoints to the (critical) test.
14. In later years, a distinction can be made between philosophically oriented persuasion rhetoric, inspired by Aristotle and Whately, and elocutionary, decorative, belletristic rhetoric. As Gaonkar (1990) explains, in the United States there is also a tradition stemming from Burke that expands the frontiers of rhetoric from 'persuasion' to 'identification'-as-an-explanation-for-social-cohesion. According to van Eemeren, Grootendorst, Jackson and Jacobs (1997, 213), modern-day persuasion theories are "heavily oriented to analysis of attitude formation and change" and bear little resemblance to Aristotle's rhetoric.

15. According to Mack, with the foundation of the universities, from the thirteenth century onward dialectic became the "intellectually dominant part of the *trivium*, while rhetoric was left with the important practical task of teaching official letter-writing" (1993, 8).
16. Although the nature, speed and coherence of this 'Scientific Revolution' are questioned in recent studies in the history of science, such as Shapin (1996), Toulmin's general observation still stands, albeit more so in its subtler version expounded in Toulmin (2001) than in the cruder version Toulmin put forward in his Jefferson Lecture of 1997, where he identified the Peace of Westphalia (1648) as the breaking point.
17. According to Toulmin, rhetoric was until recently by many logicians seen as no more than "the deceptive peddling of falsehoods" (2001, 12).
18. A similar development has taken place in the history of juridical theorizing. See Hohmann, this volume.
19. Among the dialectical theories of argumentation with a formal character, apart from Barth and Krabbe (1982), are Hamblin (1970), Rescher (1977) and Woods and Walton's joint studies of the fallacies (1989). Influential modern rhetorical approaches are Perelman and Olbrechts-Tyteca's (1969) 'new rhetoric' and some traditions in American speech communication (see van Eemeren et al., 1996, Ch. 7).
20. Reboul (1991, 46) observes that for *antistrophos* the translators "donnent [...] tantôt analogue,' tantôt'contrepartie.'" He adds: "*Antistrophos*: il est gênant qu'un livre commence avec un terme aussi obscur!"
21. Mack explains that Agricola's work is unlike any previous rhetoric or dialectic: "[He] has selected materials from the traditional contents of both subjects" (1993, 122). In Meerhoff's (1988, 273) view, "pour Agricola, [...] loin de réduire la dialectique à la seule recherche de la vérité rationelle, il entend parler de celle-ci en termes de *communication*."
22. We agree with Toulmin: "If we accept a pragmatic view of theorizing [such as Dewey's], it is not hard to escape from the imbalance in our ideals about Reason that we have inherited from Modernity" (2001, 172).
23. Other theoreticians, such as Reboul, also recognize that rhetorically strong argumentation should comply with dialectical criteria: "On doit tout faire pour gagner, mais non par n'importe quels moyens: il faut jouer [le jeu] respectant les règles" (1991, 42). See also Wenzel (1990).
24. For more far-reaching proposals, in which rhetoric is subordinated to dialectic, see, for example, Natanson (1955). See also Weaver (1953).
25. A party that utilizes the material available in the context concerned in the most expedient way, taking carefully into account the beliefs, preferences and expectations of the other party or audience, and verbalizing its contributions in the most appropriate way, can be said to *optimally adjust (to) the situation at hand* (cf. Jacobs, this volume).
26. In the way we use the term, there are *aggregates of topical potential* or 'topical systems' for all discussion stages, not just for the argumentation stage.
27. 'Presence' can, of course, also be accomplished by non-verbal means, such as pictures and tables. See Groarke (2002).
28. How suppression of presence can be used strategically, is clearly illustrated in Edward Kennedy's 'Chappaquidick speech.' See van Eemeren, Grootendorst, Jackson and Jacobs (1993, vii–xi), and van Eemeren and Houtlosser (1998).
29. For the notion of 'disagreement space,' see van Eemeren, Grootendorst, Jackson and Jacobs (1993, 95).
30. According to Dascal and Gross "style is both a level at which discourse is pitched ([...] a register) and a set of semantic, syntactic, and prosodic variants within that

register" (1999, 122). We agree, but would like to add a pragmatic element to the second meaning.

31. Perelman and Olbrechts-Tyteca regard a rhetorical figure as "a discernible structure, independent of the content, [...] a form (which may [...] be syntactic, semantic or pragmatic) and a use that is different from the normal manner of expression, and, consequently, attracts attention" (1969, 168).
32. If the argumentative role of figures is disregarded, their study will," in Perelman and Olbrechts-Tyteca's opinion, "soon seem to be a useless [or literary] pastime" (1969, 167).
33. It is often wrongly assumed that audience adaptation is the overriding, if not the only, characteristic of rhetoric. Rhetoric is then without any further ado equalized with giving in to audience demand. There is also a tradition in which the use of presentational devices is taken to be the main characteristic of rhetoric. Rhetoric is then primarily viewed as stylistics. In fact, topical selection could just as well be seen as the general umbrella characteristic of rhetoric. In the latter case, rhetoric would be aptly described as the art of finding the appropriate loci of persuasion. In our view, none of these one-sided conceptions of rhetoric does justice to the intricate relationship inherent in any form of adequate strategic maneuvering.
34. This characterization can thus be of help in explaining the deceptive character of the fallacies.
35. See for the *apologia* as a text genre, e.g., Ware and Linkugel (1973) and Benoit and Lindsey (1987). For a characterization of policy statements, see Freeley (1993).
36. When two parties have contradictory standpoints, the dispute is *mixed*. When one party has a standpoint and the other party is neutral in the sense that it questions the standpoint but has no standpoint of its own, the dispute is *non-mixed* (van Eemeren & Grootendorst, 1992, 16–22).
37. Additional conditions are that the proposition concerned is really part of the opponent's commiments and that the proponent himself is prepared to live up to the commitments involved.
38. There were cries for intervention after Ken Saro-Wiwa had been sentenced to death and had not yet been executed, but no such cries were heard *after* the execution, i.e., at the time when Shell published its advertorial. By then, the only demand was that Shell should get out of Nigeria.
39. See for the distinction between analytic and evaluative relevance van Eemeren and Grootendorst (1992).
40. Even for the standpoint that Shell should not intervene, this argument offers only very weak support, but because this explicit standpoint is much less controversial than the implicit standpoint, this support might suffice.

The Representation of Social Actors

Theo van Leeuwen

1 Introduction

The question I shall attempt to answer in this chapter can be formulated simply: what are the ways in which social actors can be represented in English discourse? Which choices does the English language give us for referring to people? In addition I shall address another, more specific question: how are the relevant social actors represented in an instance of a particular kind of racist discourse – a discourse which represents immigration in a way that is founded on fear – the fear of loss of livelihood and the fear of loss of cultural identity as a result of the 'influx' of immigrants who are perceived as 'other', 'different' and 'threatening'.

The first of these two questions is a grammatical one, if, with Halliday, we take a grammar to be a 'meaning potential' ('what *can* be said') rather than a set of rules ('what *must* be said'). Yet, unlike many other linguistically oriented forms of Critical Discourse Analysis, I shall not start out from linguistic operations such as nominalisation and passive agent deletion, or from linguistic categories such as the categories of transitivity, but instead seek to draw up a *sociosemantic* inventory of the ways in which social actors can be represented, and to establish the sociological and critical relevance of my categories before I turn to the question of how they are realised linguistically.

There are two reasons for doing so. The first stems from the lack of bi-uniqueness of language. Agency, for instance, as a *sociological* concept, is of major and classic importance in Critical Discourse Analysis: in which contexts are which social actors represented as 'agents' and which as 'patients'? But sociological agency is not always realised by linguistic agency, by the grammatical role of 'Agent'; it can also be realised in many other ways, for instance by possessive pronouns

Source: Carmen Rosa Caldas-Coulthard and Malcolm Coulthard (eds), *Texts and Practices–Readings in Critical Discourse Analysis*, 1996, pp. 32–70.

(as in 'our intake of migrants') or by a prepositional phrase with 'from', as in example 1.1, in which the grammatical Agent is sociologically 'patient':

1.1 People of Asian descent say they received a sudden cold-shoulder from neighbours and co-workers.

There is no neat fit between sociological and linguistic categories, and if Critical Discourse Analysis, in investigating for instance the representation of agency, ties itself in too closely to specific linguistic operations or categories, many relevant instances of agency might be overlooked. One cannot, it seems, have it both ways with language. Either theory and method are formally neat but semantically messy (as in the dictionary: one form, many meanings), or they are semantically neat but formally messy (as in the thesaurus: one concept, many possible realisations). Linguists tend towards preserving the unity of formal categories. I shall here attempt the opposite approach, hoping to provide a set of relevant categories for investigating the representation of social actors in discourse.

Halliday (1985: ch. 10) has approached the problem of the lack of bi-uniqueness in another way, through his theory of grammatical metaphor: certain linguistic realisations are 'literal' or 'congruent', others 'metaphorical' or 'incongruent'. But in Halliday's account 'congruent' would seem to mean 'congruent with the grammatical system', rather than 'congruent with reality', the kind of congruence which, in the end, underlies most definitions of metaphor. For Halliday a clause like 'The report confirms '. . .' would not be a metaphor, because it does not violate the criterion that verbal processes do not require a human 'Sayer' as their subject (cf. Halliday, 1985: 129). I would prefer to see 'the report confirms . . .' as just one of the ways in which we can refer to social actors in their role as 'Sayers', as metaphorical or unmetaphorical as any other way, but endowed with its own specific sociosemantic import and hence social distribution: it is likely to be found in contexts where the authority of utterances is bound up with the official status or role of 'Sayers' and/or the official status of genres. In the context of literature, on the other hand, it would be less likely to occur, because there the authority of utterances is bound up with the charismatic personality of the writer, so that we would expect 'Shakespeare says . . .' rather than 'the play says . . .', for instance. I would therefore prefer to ask: how can 'Sayers' be represented – impersonally or personally, individually or collectively, by reference to their person or their utterance, etc. – without privileging any of these choices as more 'literal' than others, and without thereby also privileging the context or contexts in which one or the other tends to occur as more normative than others.

The second reason is somewhat different, and follows from the assumption that meaning belongs to culture rather than to language and cannot be tied to any specific semiotic. Language can represent social actions impersonally, as in this headline:

1.2 Allied air activity over battlefield intensifies

but so can pictures – think of the difference between, on the one hand, 'personalised' pictures of bombardments, say in feature film sequences showing, in close up,

the faces of the crew as they drop the bombs, as well as the faces of the villagers down below as they are about to be bombed, and, on the other hand, diagrams of the same event, for instance maps with large arrows pointing at the targets and schematic drawings representing the explosions.

There is no space here to explore this point in detail (cf. van Leeuwen, 1987, for the representation of social actors in music; Kress and van Leeuwen, 1990, and van Leeuwen, 1993a, for parallels between language and images). Nevertheless, the categories I shall propose in this chapter should, in principle, be seen as pan-semiotic: a given culture (or a given context within a culture) has not only its own, specific array of ways of representing the social world, but also its own specific ways of mapping the different semiotics on to this array, of prescribing, with greater or lesser strictness, what can be realised verbally as well as visually, what only verbally, what only visually, and so on. And these arrangements will also be subject to historical change, sometimes even violent change, as in iconoclasms. The point is important for Critical Discourse Analysis, for, with the increasing use of visual representation in a wide range of contexts, it becomes more and more pressing to be able to ask the same critical questions with regard to both verbal and visual representations, indeed, with regard to representations in all the 'media' that form part of contemporary 'multimedia' texts.

Despite all this, this chapter still attempts to be grounded in linguistics. Each of the representational choices I shall propose will be tied to specific linguistic or rhetorical realisations. To return to my earlier examples, in the case of 'Shakespeare' the representational choice is that of 'nomination' and the realisation the use of a proper name, while in the case of 'the report confirms . . .' the representational choice is that of 'utterance autonomisation' (see section 11 below) and the realisation the substitution of the utterance for its Sayer, hence a form of metonymical reference. The difference is that my primary focus is on sociological categories ('nomination', 'agency', etc.) rather than on linguistic categories ('nominalisation', 'passive agent deletion', etc.) and that the system network, the 'array of choices', I shall present in section 13 will range over a variety of linguistic and rhetorical phenomena, and find its unity in the concept of 'social actor', rather than in a linguistic concept such as, for instance, 'the nominal group'.

Finally, the chapter is part of a larger project (see van Leeuwen, 1993a; 1993b) in which I am attempting in addition to map how other elements of social practices (the social activities that constitute them, the times when and the locations where they occur, the dress and body grooming that go with them, etc.) are represented, and how representations add further elements to this, for instance the purposes and legitimations of the social practices, and the sentiments that accompany them. In short, the question addressed in this chapter is part of a larger question: how are social practices transformed into discourses about social practices – and this both in the sense of what means we have for doing so, and in the sense of how we actually do it in specific institutional contexts which have specific relations with the social practices of which they produce representations.

2 'Our Race Odyssey'

Below I reproduce the first three sections of 'Our Race Odyssey', the text from which I shall draw most of my examples, and which I use to demonstrate how the categories I propose may be used in text analysis. It was published as the leading feature article in 'Spectrum', the Saturday supplement of the *Sydney Morning Herald*, a conservative broadsheet newspaper, on 12 May 1990.

The descriptive framework I shall present in the following sections was worked out with the aid of a much larger and generically diverse corpus of texts which included fictional narratives, comic strips, news stories, newspaper editorials, advertisements, textbooks and scholarly essays, all dealing, in some form or other, with the subject of schooling, and more specifically with the transition from home to school (van Leeuwen, 1993b). As one text can never provide instances of all the categories and modes of representation, I shall, throughout the chapter, also use examples from this corpus.

1 2001: Our Race Odyssey.
2 This country will be vastly different next century if Australians feel they cannot voice legitimate fears about immigration without being branded racists, argues David Jenkins.
3 In Florence last month 80 young white thugs, many wearing costume masks and armed with iron bars, roamed the narrow cobbled streets attacking African street vendors.
4 In France, where non-European immigrants make up 6.5 per cent of the population, former president Valéry Giscard d'Estaing proposed a total halt to immigration.
5 In Japan, a nation with a strong tradition of keeping foreigners at arm's length, similar concerns are being expressed about a mere trickle of Third World immigrants.
6 Japan's National Police Agency had to apologise recently for circulating an internal memo to police stations claiming that Pakistanis working in Japan 'have a unique body odour', carry infectious skin diseases and tell lies 'under the name of Allah'.
7 The mayor of Kawaguchi has 'joked' that with so many dark-skinned foreigners in town, Japanese are having trouble seeing them at night.
8 In Peru, where the son of Japanese immigrants is a presidential front-runner, the situation is reversed.
9 A racist backlash against ethnic Asians has been unleashed by those who resent the prominence of centrist candidate Alberto Fujimori.
10 People of Asian descent say they have been insulted in the street, denied entry to elegant restaurants and received a sudden cold-shoulder from neighbours and co-workers.
11 In Canada, where the 250,000-strong Sikh community has pressed for the right to have Mounties in turbans and where 22,000 Hong Kong Chinese arrived last year, bringing bulging wallets to cities like Vancouver,

12 'Native Vancouverites will be made to feel like strangers in their own city as the influx of Asians and their capital freezes them out', wrote one reader of *The Province* newspaper in Vancouver.
13 If you were sitting in Canberra and doing no more than reading the daily newspapers you would be entitled to be a bit concerned by these developments.
14 They italicise the lesson that people, whatever their race, display their less attractive characteristics when they feel threatened and unable to cope with rapid change in the society around them.
15 They highlight the fact that racism is seldom far below the surface – whether it is in Western Europe, in Asia, in North or South America.
16 They may even call into question some aspects of Australia's immigration programme, which is now running at close to record levels, with annual net migration of about 150,000, including 60,000 migrants from Asia.
17 Is the Australian Government concerned?
18 Not a bit.
19 Prime Minister Bob Hawke says he is 'philosophically' a high-migration man.
20 He thinks our current intake is about right.
21 'I hope that as we go on,' he said recently, 'that we may be able to look at higher levels of immigration.'
22 Is the Prime Minister entitled to be quite so confident that we have got our immigration policy settings right?
23 Is he entitled to believe that this nation, which only recently shed the White Australia Policy, is somehow impervious to racist sentiment?
24 On the evidence to date there is some reason to suppose that he is.
25 We have had one of the most successful immigration programmes in the world.
26 Forty per cent of Australians were born overseas or have at least one parent who was born overseas; in Sydney, the figure is 49 per cent.
27 We have become one of the most diverse groups of people in the world.
28 We have achieved all this with remarkably little disharmony or dislocation.
29 We are entitled to be proud – not apologetic – about our immigration programme.
30 We are entitled to be resentful about the damaging distortions that are presented as fact by Bruce Ruxton, who spent the major part of his three-year military career as an army cook, when he marches into TV studios in Singapore and Hong Kong.
31 We have avoided most of the problems that bedevil Western Europe because few of our non-European migrants have been poor, black, unskilled, Muslim or illegal.
32 They have tended to be Asian and they tended to come, at least until recently, from an educated elite that was English-speaking and middle-class.

33 However, all that is changing.
34 Migration from traditional source countries like Italy and Greece has dried up.
35 Migration from the Third World, especially Asia and the Middle East, is becoming increasingly important.
36 And though many of the new migrants are educated high-achievers from places like Singapore and Hong Kong – 'uptown' people in American terminology – others are 'downtown' people from places like Vietnam, the Philippines and Lebanon.
37 The 'downtown' migrants tend to be unskilled or low-skilled, tend to have high unemployment rates – Lebanese, Turks and Vietnamese have unemployment rates three to four times the national average – and tend to be significant users of social welfare.
38 With these changes is coming a change in community attitudes.
39 Many Australians, the 1988 Fitzgerald Committee reported, were 'bewildered' by the changing face of Australia.
40 They did not feel they understood or could influence this change.
41 They felt 'besieged' by immigration.
42 They believed that the immigration program existed for the benefit of politicians, bureaucrats and the ethnic minorities, not for Australians as a whole.
43 This concern, the report noted, was reflected in surveys which showed that the level of support for stopping immigration altogether was at a postwar high.
44 If you stop for a moment and consider all this you will see that there is something very odd going on.
45 On the one hand we have a Prime Minister who says he is philosophically disposed to high migration, a Prime Minister who has been presiding over a near record intake of migrants.
46 On the other we have public support for immigration at an all-time low.
47 This suggests a yawning gap between what people think about immigration and what politicians and other community leaders feel they can or should say about immigration.
48 It is hardly surprising therefore that the immigration debate is building again.
49 Hardly surprising that there are calls for major cuts in the program.
50 Hardly surprising that a number of critics want to see our intake halved to 70,000 to 80,000, which would bring it into line with our postwar average.
51 Australia, these critics suggest, is being generous to a fault – and in danger of saddling itself with a lot of unwanted problems as a result.

3 Exclusion

The 'Race Odyssey' text draws on a representation of the social practice of immigration itself, as institutionalised in Australia, as well as on the representation

of other social practices, which serve to legitimise (or delegitimise) it: the practices of writing government-commissioned reports on immigration, or of conducting public opinion surveys about it, for instance. All these practices involve specific sets of social actors, but in a given representation, for instance that of the 'Race Odyssey' text, a feature article in a conservative middle-class newspaper, not all the social actors are included. Some are represented, for instance Prime Minister Bob Hawke, who 'presides over a near record intake of migrants', others excluded, for instance the people who 'brand as racist' those who 'voice legitimate fears about immigration'. Representations include or exclude social actors to suit their interests and purposes in relation to the readers for whom they are intended. Some of the exclusions may be 'innocent', details which readers are assumed to know already, or which are deemed irrelevant to them, others tie in close to the propaganda strategy of creating fear, and of setting up immigrants as enemies of 'our' interests.

Exclusion has rightly been an important aspect of Critical Discourse Analysis. To mention just one classic example, Tony Trew (1979: 97ff) showed how, in *The Times* and the *Rhodesian Herald* (*anno* 1975), the police were excluded in accounts of the 'riots' during which they had opened fire and killed demonstrators, because it was in the interest of these papers and their readers to attempt to 'justify white rule in Africa', and this required

> a suppression of the fact that the white regimes apply violence and intimidation, and suppression of the nature of the exploitation this makes possible. It requires that the regimes and their agents be put constantly in the role of promoters of progress, law and order, concerned to eliminate social evil and conflict, but never responsible for it.
>
> (Trew, 1979: 106)

Some exclusions leave no traces in the representation, excluding both the social actors and their activities. Such radical exclusion can play a role in a critical comparison of different representations of the same social practice, but not in an analysis of a single text, for the simple reason that it leaves no traces behind. In my study of the representation of schooling (van Leeuwen, 1993b), for instance, I found that fathers were radically excluded in texts addressing teachers, but included in many children's stories, even if often only briefly, during the breakfast preceding the first school day, or as givers of satchels, pencil cases and other school necessities. Children's stories aimed at a mass market sometimes included school support staff, but excluded the headmistress, while more 'up-market' children's stories included the headmistress but excluded people lower than teachers in the school hierarchy, in what is clearly a class-related pattern of inclusion and exclusion.

When the activities (e.g. the killing of demonstrators) are included, but some or all of the social actors involved in it (e.g. the police) are excluded, the exclusion does leave a trace. We can ask 'but who did the killing?' or 'but who was killed?', even though the text does not provide the answers. In this case a further distinction should perhaps be made, the distinction between *suppression* and *backgrounding*.

In the case of suppression, there is no reference to the social actor(s) in question anywhere in the text. Thus we learn, in the 'Race Odyssey' text, that someone or some institution surveyed the opinions of the public, but we do not find out which individual or company or other institution did it, which takes away at least one possible avenue of contesting the results of the 'surveys'. In the case of backgrounding, the exclusion is less radical: the excluded social actors may not be mentioned in relation to a given activity, but they are mentioned elsewhere in the text, and we can infer with reasonable (though never total) certainty who they are. They are not so much excluded as de-emphasised, pushed into the background.

How is suppression realised? First there is, of course, the classic realisation through passive agent deletion. Example 3.1 tells us that 'concerns are being expressed', but not who expresses them:

3.1 In Japan similar concerns are being expressed about a mere trickle of Third World immigrants.

Suppression can also be realised through non-finite clauses which function as a grammatical participant. In example 3.2 the infinitival clause 'to maintain this policy' is embedded to function as the Carrier of an attributive clause, and this allows the social actor(s) responsible for the 'maintenance' of the policy to be excluded – and they *could* have been included, for instance, as 'for local education authorities'. The downranking of the process ('maintain') makes the fact that exclusion has taken place a little less accessible, the trace a little less clear:

3.2 To maintain this policy is hard.

It is almost always possible to delete 'Beneficiaries', social actors who benefit from an activity. Example 3.3, for instance, does not include those to whom the 'National Police Agency' apologised (the Pakistanis who had been offended?):

3.3 Japan's National Police Agency had to apologise recently for circulating an internal memo to police stations claiming that Pakistanis working in Japan 'have a unique body odour', carry infectious skin diseases and tell lies 'under the name of Allah'.

Nominalisations and process nouns similarly allow the exclusion of social actors. 'Support' and 'stopping', in example 3.4, function as nominals, although they refer to activities. The same applies to 'immigration'. Again the excluded social actors *could* have been included, for instance through postmodifying phrases with *by, of, from*, etc., but they haven't been:

3.4 The level of support for stopping immigration altogether was at a postwar high.

Processes may also be realised as adjectives, as is the case with 'legitimate' in example 3.5. Who 'legitimises' the 'fear'? The writer? We cannot be sure. The fears simply *are* legitimate, according to this representation:

3.5 Australians feel they cannot voice legitimate fears about immigration.

The activity in example 3.6 involves a human actor, the teacher who opens the door. But coding the activity in middle voice (Halliday, 1985: 150–1) necessitates the exclusion of the agentive participant. The context may lead us to infer that the teacher was involved, but there can be no certainty – it might, for instance, have been the wind. The clause invites a reading in which the opening of the door, the intrusion of the teacher in the child's world of play, is given the force of a natural event.

3.6 The door of the playhouse opened and the teacher looked in.

It is often difficult to know whether suppressed social actors are or are not supposed to be retrievable by the reader, or, indeed, the writer. Example 3.4, for instance, does not tell us who is involved in the act of 'stopping immigration'. Is this because readers are assumed to know already, so that more detailed reference would be overcommunicative, or is it to block access to detailed knowledge of a practice which, if represented in detail, might arouse compassion for those who are 'stopped'? The point is that the practice is here represented as something not to be further examined or contested.

Backgrounding can result from simple ellipses in non-finite clauses with *-ing* and *-ed* participles, in infinitival clauses with *to*, and in paratactic clauses. In all these cases the excluded social actor is *in*cluded elsewhere in the same clause or clause complex. It can also be realised in the same way as suppression, but with respect to social actors who *are* included elsewhere in the text. The two realisations background social actors to different degrees, but both play a part in reducing the number of times specific social actors are explicitly referred to.

To discuss the pattern of inclusion and exclusion in the 'Race Odyssey' text, it is necessary to bring the various ways in which each category of social actor is represented under a common denominator. These common denominators do not, of course, form a more transparent or congruent way of referring to them. They merely serve as an anchor for the analysis, a kind of calibration. For the purposes of analysis, then, I shall call 'racists' those social actors who, actively or otherwise, oppose immigration and immigrants in countries other than Australia, and I shall refer to those who do the same in Australia as 'us'. Again, this is not to say that the latter are *not* racist, but merely to follow the distinction that underlies the way the author argues his case. I shall refer to the immigrants themselves as 'them', to the (Australian) Government as 'government', to the various experts invoked by the writer as 'experts', to the writer himself as 'writer', and to his readers, who are sometimes addressed directly, as 'addressees'. Bruce Ruxton, the 'racist' Australians love to hate, is a category on his own ('our racist'), and finally there are a few minor characters who appear only once, the 'anti-racists' who 'brand as racist' the 'legitimate fears of Australians', 'Allah', 'European Governments' and (Japanese) 'police stations'. Table 1 displays the patterns of inclusion and exclusion.

Table 1: Inclusion and exclusion in the 'Race Odyssey' text

	Included %	Backgrounded %	Suppressed %
'racists' (N=24)	67.25	20.25	12.5
'us' (N=46)	72	24	4
'them' (N=98)	61	38	1
'government' (N=32)	73	18	9

Although the differences are not dramatic, it is clear that the most frequently included social actors are the Australian Government and 'us', Australians, who voice 'legitimate fears', while the most frequently backgrounded or suppressed social actors are, on the one hand, the immigrants, and on the other hand those in other countries who commit such racist acts as 'insulting' and 'denying entry to elegant restaurants', and, indeed, people in general, as they are 'naturally inclined to racism' and will 'display unpleasant characteristics when they feel threatened'. In short, those who do not take part in the 'debate' between the Australian people and its government which the writer stages for us in his argument form to some extent a backdrop to this debate.

I do not want to make great claims for treating texts statistically. On the contrary, it is important to realise that the frequencies may shift with the stages in the writer's argument. In the first section of the text, where the writer discusses racism in other countries, migrants are backgrounded in 17 per cent of cases. As soon as the writer moves to his discussion of Australian immigration policy, this increases to 36 per cent. In other words, the migrants close to home are backgrounded more often. In any case, the pattern of inclusion and exclusion must be integrated with the *way in which* they are represented, which I shall discuss in the remainder of this chapter.

What, finally, remains most opaque in this text? First, the voice of the opposition – those who 'brand as racist' Australians 'who voice legitimate fears' are fully suppressed. Second, many of the 'racists' in other countries: we are not told who exactly is responsible for 'insulting people of Asian descent' or 'denying them entry to elegant restaurants', for example. Third, the voice of legitimation, which 'legitimises fears', and which 'entitles' Hawke and 'us' to the view which, by virtue of their sheer prominence in the text, the writer obliquely favours. And finally, those who have to do the dirty work of actually 'stopping' ('halting', 'cutting', etc.) the immigrants.

4 Role Allocation

I shall now consider the roles that social actors are given to play in representations, an aspect of representation which also plays a significant part in the work

of many critical linguists (e.g. Fairclough, 1989; Fowler, 1991; Fowler *et al.*, 1979; Kress and Hodge, 1979; van Dijk, 1991): who is represented as 'agent' ('Actor'), who as 'patient' ('Goal') with respect to a given action? This question remains important, for there need not be congruence between the roles that social actors actually play in social practices and the grammatical roles they are given in texts. Representations can reallocate roles, rearrange the social relations between the participants. Here is an example, from the field of television studies:

> *4.1 Children seek out aspects of commercial television as a consolidation and confirmation of their everyday lives.... The kids use it [television] subversively against the rule-bound culture and institution of the school.*
>
> (Curthoys and Docker, 1989: 68)

> *4.2 Television affects children's sex-role attitudes.... Furthermore, television has been shown to influence more subtle areas such as racial attitudes and cultural views.*
>
> (Tuchman *et al.*, 1978: 232)

Leaving aside aspects of the representation of social actors we have not yet discussed (objectivations such as 'television' and 'subtle areas'; abstractions such as 'aspects of commercial television') and the exclusions (e.g. in 'racial attitudes and cultural views'), the two major categories of social actor represented are 'children' and 'television'. In Example 4.1, 'children' and 'the kids' are, grammatically, Actor in relation to activities such as 'seeking out' and 'using' (and also, if one ignores the backgrounding, of 'consolidating' and 'confirming'), while 'television' ('aspects of commercial television' and 'it') is the Goal of both these processes. In 4.2, 'television' is Actor of 'affect' and 'influence', while 'children' ('children's sex-role attitudes'; 'subtle areas such as racial attitudes and cultural views') are Goal. In other words, in one of the representations (that of a populist, 'active audience' theory) the active role is given to children, the passive role to television, while in the other (that of the 'effects' or 'hypodermic needle' theory of mass communication) the active role is given to television and the passive role to children. The two examples deal, in the end, with the same reality, but which of them corresponds best to that reality is of course a problem text analysis cannot solve. What we *can* do, however, is investigate which options are chosen in which institutional and social contexts, and why these choices should have been taken up, what interests are served by them, and what purposes achieved.

I shall say, then, that representations can endow social actors with either active or passive roles. *Activation* occurs when social actors are represented as the active, dynamic forces in an activity, *passivation* when they are represented as 'undergoing' the activity, or as being 'at the receiving end of it'. This may be realised by grammatical participant roles, by transitivity structures in which activated social actors are coded as Actor in material processes, Behaver in behavioural processes, Senser in mental processes, Sayer in verbal processes or Assigner in relational processes (Halliday, 1985: ch. 5). In 4.3, for example,

In 4.4, on the other hand, 'young white thugs' are activated and 'African street vendors' passivated. In other words, while in other countries there may be active racists, in Australia the migrants play the active (and 'threatening') role, and 'we' are at best activated as 'Sensers' in relation to mental processes such as 'feeling'.

4.3 They felt 'besieged' by immigration.

4.4 80 young white thugs attacked African street vendors.

When, as in these cases, activation is realised by 'participation' (grammatical participant roles), the active role of the social actor in question is most clearly foregrounded; note how, in examples 4.1 and 4.2, active roles are realised by participation, passive roles in other, more highly transformed ways. But activation can also be realised in other ways, for example through 'circumstantialisation', that is by prepositional circumstantials with by or *from*, as with 'from neighbours and co-workers' in:

4.5 People of Asian descent suddenly received a cold-shoulder from neighbours and co-workers.

Premodification (e.g. 'public' in 'public support') or postmodification (e.g. 'of Asians' in 'the influx of Asians') of nominalisations or process nouns can also realise activation. A frequent form of this is 'possessivation', the use of a possessive pronoun to activate (e.g. 'our intake') or passivate (e.g. 'my teacher') a social actor. By comparison to participation this backgrounds agency, changing it into the 'possession' of a process which has itself been transformed into a 'thing'.

Passivation necessitates a further distinction: the passivated social actor can be *subjected* or *beneficialised*. Subjected social actors are treated as objects in the representation, for instance as objects of exchange (immigrants 'taken in' in return for the skill or the money they bring). Beneficialised social actors form a third party which, positively or negatively, benefits from it. In 4.6, for instance, 'about 70,000 migrants' are subjected to the activity of 'bringing in'; in 4.7 'cities like Vancouver' are beneficialised in relation to 'bringing':

4.6 Australia was bringing in about 70,000 migrants a year.

4.7 22,000 Hong Kong Chinese arrived last year, bringing bulging wallets to cities like Vancouver.

There is a cryptogrammatical criterion for considering both these roles passivations: Goals as well as Beneficiaries can become subjects in passive clauses. But there is of course also a grammatical criterion for distinguishing them: Beneficiaries can take a preposition (although they do not have to: see Halliday, 1985: 132ff), Goals cannot (with the exception of very few cases, such as 'What did John do with the dinner?').

Phenomenon in a mental process, or Carrier in an effective attributive process (Halliday, 1985: 143) – 'African street vendors' in 4.4 is an example. It can also be realised by 'circumstantialisation' through a prepositional phrase with, for instance, *against*, as in 4.8, where 'ethnic Asians' are passivated:

4.8 A racist backlash against ethnic Asians has been unleashed by those who resent the prominence of centrist candidate Alberto Fujimori.

And it can also be realised by 'possessivation', usually in the form of a prepositional phrase with of postmodifying a nominalisation or process noun, as with 'of some 54,000 skilled immigrants' in 4.9:

4.9 An intake of some 54,000 skilled immigrants is expected this year.

Finally, adjectival premodification can also passivate, as, for example, with 'racial' in 'racial tolerance', where (people of different) races are passivated; the example also *abstracts* the social actors represented.

Beneficialisation may be realised either by participation, in which case the beneficialised participant is Recipient or Client in relation to a material process, or Receiver in relation to a verbal process (Halliday, 1985: 132–3). Table 2 shows how the 'Race Odyssey' text allocates roles to the most frequently represented social actors.

It is clear that 'racists', 'government' and 'us' most often act upon the immigrants, be it materially or symbolically, and that the immigrants themselves are activated only, or almost only, in relation to one action, the act of immigrating ('influx', 'arriving', etc.), and this mostly in nominalised and deeply embedded form.

Table 2: Role allocation in the 'Race Odyssey' text

	Activated %	Subjected %	Beneficialised %
'racists' (N=21)	81	14	5
'us' (N=40)	85	12.5	2.5
'them' (N=66)	53	45	2
'government' (N=29)	86	7	7

5 Genericisation and Specification

The choice between generic and specific reference is another important factor in the representation of social actors; they can be represented as classes or as specific, identifiable individuals. Compare, for instance, the following two texts:

5.1 The reference is specific since we have in mind specific specimens of the class tiger.

5.2. Classification is an instrument of control in two directions: control over the flux of experience of physical and social reality . . . and society's control over conceptions of that reality.

(Kress and Hodge, 1979: 63)

The first example betrays a view of reality in which generalised essences, classes, constitute the real, and in which specific participants are 'specimens' of those classes. In the second example the real is constituted by the 'flux of experience', by a specific, concrete world, populated with specific, concrete people, places, things and actions, and 'classification' is seen as an operation upon this reality, which creates a kind of second order reality, a 'conception of reality'.

Sociologists have linked such concepts of reality to social class. For Bourdieu (1986) concrete reference to immediate experience is linked to the habitus of the working class, that is, to the principles that lie behind their appreciation of art, music and literature, behind their moral and political judgements and so on. 'Distance, height, the overview of the observer who places himself above the hurly-burly' (Bourdieu, 1986: 444), on the other hand, is linked to the habitus of the dominant class, the bourgeoisie, and Bourdieu approvingly quotes Virginia Woolf's dictum that 'general ideas are always Generals' ideas'. From this perspective, he says, specific reference is a 'blind, narrow, partial vision' (Bourdieu, 1986: 444). In a similar vein, Bernstein (e.g. 1971: 197) has argued that 'elaborated codes' give access to 'universalistic orders of meaning', while restricted codes give access to 'particularistic orders of meaning', and that access to these codes is class-determined.

The difference can be observed, for instance, in the way that social actors are represented by different sectors of the press. In middle-class oriented newspapers government agents and experts tend to be referred to specifically, and 'ordinary people' generically: the point of identification, the world in which one's specifics exist, is here, not the world of the governed, but the world of the governors, the 'generals'. In working-class oriented newspapers, on the other hand, 'ordinary people' are frequently referred to specifically. The following two examples illustrate the difference. They deal with the same topic and the articles from which they are taken appeared on the same day, their news value deriving from the same statement by Australia's Minister for Sport and Recreation. The first comes from the *Sydney Morning Herald*, a middle-class oriented newspaper, the second from the *Daily Telegraph*, a working-class oriented newspaper:

5.3 Australia has one of the highest childhood drowning rates in the world, with children under 5 making up a quarter of the toll, this is the grim news from Government studies of Australia's high incidence of drowning. The studies show over 500 people drown in Australia every year, with backyard swimming pools the biggest killers for children under 15. The Minister for Sport and Recreation, Mr Brown, said the childhood drowning rate was higher than developed countries such as Britain and the US and comparable with many Asian countries. He said children should be encouraged to swim and parents should learn resuscitation techniques.

5.4 The tragic drowning of a toddler in a backyard swimming pool has mystified his family. Matthew Harding, two, one of twin boys, had to climb over a one-metre 'child-proof' fence before he fell into the pool. Mrs Desley Harding found Matthew floating in the pool when she went to call the twins in for tea yesterday. 'I have got no idea how he got in the pool', said Mrs Harding at her home in Wentworthville South today.

Genericisation may be realised by the plural without article, as in 5.5:

5.5 Non-European immigrants make up 6.5 per cent of the population.

and it may also be realised by the singular with a definite article (5.6) or indefinite article (5.7):

5.6 Allow the child to cling to something familiar during times of distress.

5.7 Maybe a child senses that from her mother.

If mass nouns are used for generic reference to a group of participants, the article will be absent, but this form can also be used for specific reference: generic reference is clearly dependent on a complex of factors, including also tense, and 5.8 has been interpreted as specific mainly because of the absence of habitual or universal present tense:

5.8 Staff in both playgroups and nurseries expressed willingness to supply information if asked and regretted that their opinions were not valued more.

The presence of a Numerative, finally, has been interpreted as realising specific reference.

Even though one expects a certain amount of generic reference in a general argument, which is what the 'Race Odyssey' text purports to be, this does not mean that all categories of social actor are equally often genericised. 'Racists' in other countries, and 'them', the immigrants, are genericised most often (32 and 48 per cent respectively) and so symbolically removed from the readers' world of immediate experience, treated as distant 'others' rather than as people 'we' have to deal with in our everyday lives. The 'government' and 'us', on the other hand, are less often genericised (17 and 15 per cent respectively).

6 Assimilation

Social actors can be referred to as individuals, in which case I shall speak of *individualisation*, or as groups, in which case I shall speak of *assimilation*. Given the great value 'which is placed on individuality in many spheres of our society (and the value placed on conformity in others) these categories would have to be of primary significance in Critical Discourse Analysis. Examples 5.3 and 5.4

already showed that middle-class oriented newspapers tend to individualise elite persons and assimilate 'ordinary people', while working-class oriented newspapers quite often individualise 'ordinary people'. In my study of 'schooling texts' (van Leeuwen, 1993b) I analysed an item from the ABC (Australian Broadcasting Corporation) radio programme 'Offspring', which deals with issues of interest to parents. One of the expert panellists in the programme made an explicit plea for individualisation, but – experts will be experts, and schools schools – individualisation was, itself, assimilated. The children, despite the emphasis on difference, were represented as groups:

6.1 However you manipulate the age of entry into school, you are always going to have the situation where you have children of different kinds of development and with different skills coming into a school programme. And the important thing is to make sure that the programme is adapted to meet the needs of all these children coming in.

I shall distinguish two major kinds of assimilation, *aggregation* and *collectivisation.* The former quantifies groups of participants, treating them as 'statistics', the latter does not. Aggregation plays a crucial role in many contexts. In our society the majority rules, not just in contexts in which formal democratic procedures are used to arrive at decisions, but also and especially in others, through mechanisms such as opinion polls, surveys, marketing research, etc. Even legislative reform is increasingly based on 'what most people consider legitimate'. For this reason aggregation is often used to regulate practice and to manufacture consensus opinion, even though it presents itself as merely recording facts. Example 6.2 can be seen as an instance of this use of aggregation:

6.2 This concern, the report noted, was reflected in surveys which showed that the level of support for stopping migration altogether was at a postwar high.

Individualisation is realised by singularity, and assimilation by plurality, as with 'Australians' and 'Muslims' in 6.3:

6.3 Australians tend to be sceptical about admitting 'Muslims'.

Alternatively, assimilation may be realised by a mass noun or a noun denoting a group of people, as, for instance, with 'this nation' in 6.4 and 'the community' in 6.5:

6.4 Is he [i.e. Prime Minister Hawke] entitled to believe that this nation, which only recently shed the White Australia Policy, is somehow impervious to racist sentiment?

6.5 The 250,000-strong Sikh community has pressed for the right to have Mounties in turbans.

Aggregation is realised by the presence of definite or indefinite quantifiers, which either function as the Numerative or as the Head of the nominal group, as with 'a number of critics' in 6.6 and 'forty per cent of Australians' in 6.7:

6.6 A number of critics want to see our intake halved to 70,000.

6.7 Forty per cent of Australians were born overseas.

The 'Race Odyssey' text individualises 'racists' and 'immigrants' only when they are also elite persons (Valéry Giscard d'Estaing, the mayor of Kawaguchi, and the presidential candidate (son of immigrants) from Peru, the only 'immigrant' in this category). The individualisation of racism within Australia, in the person of Bruce Ruxton, 'our racist', shows that, in the press, notoriety confers as much elite status as does high office.

'We', the people of Australia, are of course mostly collectivised, not only through the first person plural, but also through terms like 'Australia', 'this nation', 'the community', etc. The government, on the other hand, is mostly individualised – the leader as a strong individual, the people as a homogeneous, consensual group.

'Experts' are collectivised ('the committee', 'surveys'), which helps to signal their agreement. In the remainder of the article, however, they are often individualised, which allows their titles, credentials and institutional affiliations to be showcased.

As indicated already, immigrants are most frequently aggregated, treated as 'statistics', and rather than that this is used to realise frequency modality (as in 'many Australians'), it makes them not only the object of 'rational' economic calculation, but also that large horde 'legitimately feared' by Australians.

7 Association and Dissociation

There is another way in which social actors can be represented as groups: *association*. Association, in the sense in which I shall use the term here, refers to groups formed by social actors and/or groups of social actors (either generically or specifically referred to) which are never labelled in the text (although the actors or groups who make up the association may of course themselves be named and/or categorised). The most common realisation of association is parataxis, as in this example:

7.1 They believed that the immigration program existed for the benefit of politicians, bureaucrats, and the ethnic minorities, not for Australians as a whole.

Here 'politicians, bureaucrats and ethnic minorities' are associated to form a group opposed to the interests of 'Australians as a whole'. But, rather than being

which exists only in relation to a specific activity or set of activities, in this case their beneficiary role in relation to immigration.

Association may also be realised by 'circumstances of accompaniment' (Halliday, 1985: 141), as in:

7.2 They played 'higher and higher' with the other children.

In this case the association is, perhaps, even more fleeting and unstable.

Possessive pronouns and possessive attributive clauses with verbs like 'have' and 'belong' can make an association explicit without naming the resulting social grouping. In this case, however, the association is represented as more stable and enduring, and, indeed, 'possessive', as in this example, where 'problems' is clearly an abstract reference to a specific kind of immigrant: with other kinds of immigrants an association may be formed, with this kind of immigrant it must be 'avoided':

7.3 We have avoided most of the problems that bedevil Western Europe because few of our non-European migrants have been poor, black, unskilled, Muslim or illegal.

In many texts associations are formed and unformed ('dissociation') as the text proceeds. In one children's story I studied, for instance, there existed, prior to entering school for the first time, an association between two children from the same neighbourhood. As they walked to school and shared their worries, they were always referred to as 'Mark and Mandy'. But the association was disbanded as soon as they entered the classroom. From that moment they were referred to either separately, or as part of the collective of the 'class'.

There are only a few associations in the 'Race Odyssey' text: the lines between the parties are sharply drawn. Two of the associations lump different ethnic origins together ('Asia and the Middle East', 'Lebanese, Turks and Vietnamese'), another associates the 'neighbours and co-workers' who give 'ethnic Asians' the cold-shoulder. The cases of 'our non-European migrants', 'politicians, bureaucrats and ethnic minorities' I have already mentioned.

8 Indetermination and Differentiation

Indetermination occurs when social actors are represented as unspecified, 'anonymous' individuals or groups, *determination* when their identity is, one way or another, specified. Indetermination is typically realised by indefinite pronouns ('somebody', 'someone', 'some', 'some people') used in nominal function, as in this example from a children's book, where a member of the school support staff is indeterminated:

8.1 Someone had put flowers on the teacher's desk.

Here indetermination *anonymises* a social actor. The writer treats his or her identity as irrelevant to the reader. Indetermination can also be realised by

exophoric reference, and in this case it endows social actors with a kind of impersonal authority, a sense of unseen, yet powerfully felt coercive force:

8.2 They won't let you go to school until you're five years old.

Indetermination can also be aggregated, as, for example, in: 'many believe . . .', 'some say . . .', etc.

Differentiation explicitly differentiates an individual social actor or group of social actors from a similar actor or group, creating the difference between the 'self' and the 'other', or between 'us' and 'them', as with 'others' in:

8.3 And though many of the new migrants are educated high-achievers from places like Singapore and Hong Kong – 'uptown' people in American terminology – others are 'downtown' people from places like Vietnam, the Philippines and Lebanon.

There are only two cases of this in the 'Race Odyssey' text, the one just quoted, and the 'other community leaders' (i.e. other than 'politicians and bureaucrats').

When I compared middle-class oriented and mass-market oriented children's stories about the 'first day at school' (van Leeuwen, 1993b), I found that differentiation plays an important role in the former, but does not occur much in the latter. Middle-class children are apparently encouraged to see themselves as individuals, different from 'the other children', and much of the trauma of 'the first day', as represented in these stories, consists in a kind of identity crisis, the child's discovery that she is not unique:

8.4 Mummy, did you know there is another Mary in my class?

The readers of the mass-market oriented stories, on the other hand, are encouraged to take pleasure in their ability to conform successfully.

9 Nomination and Categorisation

Social actors can be represented either in terms of their unique identity, by being *nominated*, or in terms of identities and functions they share with others (*categorisation*), and it is, again, always of interest to investigate which social actors are, in a given discourse, categorised and which nominated. In stories, for instance, nameless characters fulfil only passing, functional roles, and do not become points of identification for the reader or listener. In press 'stories' something similar occurs. We saw, for instance, how a middle-class newspaper nominated only a high-status person, a government minister, while a working-class oriented newspaper, in an article on the same topic, nominated 'ordinary people' (examples 5.3 and 5.4). The press, and not only the press, also tends to nominate men and women in different ways (cf. the types of nomination discussed below). The following sets of examples were taken from the same *Guardian* articles:

9.1 Dwight Harris, aged 32 . . . his wife Beverley, aged 33.

9.2 Carole Maychill, a 32-year-old captain . . . Colonel Robert Pepper.

Nomination is typically realised by proper nouns, which can be *formal* (surname only, with or without honorifics), *semi-formal* (given name and surname, as with 'Dwight Harris' in 9.1) or *informal* (given name only, as with 'Beverley' in 9.1). Occasionally what we might call 'name obscuration' occurs: letters or numbers replace names (e.g. 'Mr X') so that nomination can be signified while the name is, at the same time, withheld. All nominations can be used as vocatives and do not occur with a possessive pronoun, except in contexts of special endearment (e.g. 'My Cathy . . .') at least in English – in other languages the possessive pronoun does not necessarily suggest special endearment (cf. the French 'Mon Capitaine', 'Mon Général').

Items other than proper names may be used for nomination, especially when, in a given context, only one social actor occupies a certain rank or fulfils a certain function. Nominations of this kind in fact blur the dividing line between nomination and categorisation. They are common in stories for young children, with characters referred to as 'The Little Boy', 'The Giant', 'Rabbit', etc., even in vocatives:

9.3 Turkish Sultan, give me back my diamond button.

Nominations may be titulated, either in the form of honorification, the addition of standard titles, ranks, etc. as with 'Dr' in 9.4, or in the form of affiliations, the addition of a personal or kinship relation term, as with 'Auntie Barbara' in 9.5:

9.4 In 50 years, Dr Price says, 26 per cent of the Australian population will be Asian.

9.5 They started out, Auntie Barbara pushing Debbie in her pram.

Press journalists often use what Bell (1985: 98) has called 'pseudo titles', such as 'controversial cancer therapist Milan Brych'. As in standard titles, the definite article is absent in such pseudo titles, but otherwise categorisation and nomination are mixed here, or rather, categorisations are used as unique identities, much as in the children's stories quote above.

The 'Race Odyssey' text nominates heads of government (Valéry Giscard d'Estaing, Prime Minister Bob Hawke), 'our racist' Bruce Ruxton, 'experts' (especially in the section that follows the excerpt in section 2 above, where four different experts are quoted extensively, all in favour of cutting back immigration, and all nominated and titulated), and the writer, who thereby places himself in high company. Not nominated (and absences are as significant in critical discourse analysis as presences) are 'racists' in other countries, 'us' Australians, and, of course, the immigrants, with the exception of that high-status immigrants' son, Alberto Fujimori, the Peruvian presidential candidate.

10 Functionalisation and Identification

I shall distinguish two key types of categorisation, *functionalisation* and *identification*. Functionalisation occurs when social actors are referred to in terms of an activity, in terms of something they do, for instance an occupation or role. It is typically realised in one of the following ways: first, by a noun, formed from a verb, through suffixes such as *-er, -ant, -ent, -ian, -ee, e.g.* 'interviewer', 'celebrant', 'correspondent', 'guardian', 'payee'; second, by a noun formed from another noun which denotes a place or tool closely associated with an activity (a noun which, in Halliday's terms (1985: 134ff) forms the 'Range' of that activity) through suffixes such as *-ist, -eer, e.g.* 'pianist', 'mountaineer'; third, by the compounding of nouns denoting places or tools closely associated with an activity and highly generalised categorisations such as 'man', 'woman', 'person', 'people' (occasionally functionalisations such as 'assistant'), as in 'cameraman', 'chairperson'.

Identification occurs when social actors are defined, not in terms of what they do, but in terms of what they, more or less permanently, or unavoidably, are. I have distinguished three types: *classification, relational identification* and *physical identification.*

In the case of classification, social actors are referred to in terms of the major categories by means of which a given society or institution differentiates between classes of people. In our society these include age, gender, provenance, class, wealth, race, ethnicity, religion, sexual orientation, and so on. But classification categories are historically and culturally variable. What in one period or culture is represented as 'doing', as a more or less impermanent role, may in another be represented as 'being', as a more or less fixed identity. Foucault (1981) has described how, in the late nineteenth century, the discourse of sexology introduced a new classification category, 'sexual orientation'. Social actors who previously were functionalised ('sodomites') were now, increasingly, classified:

> Homosexuality appeared as one of the forms of sexuality when it was transposed from the practice of sodomy onto a kind of interior androgyny, a hermaphrodism of the soul. The sodomite had been a temporary aberration; the homosexual was now a species.
>
> (Foucault, 1981: 42)

At present the category of 'belonging to a company or organisation' begins to play a more important role in identification (cf. 'a Warwick University scientist', 'a Hambro Countrywide Chain spokesman').

The extent to which functionalisation and classification are distinct is also historically and culturally variable. Sociological role theory goes a long way in blurring the two types of categorisation:

> Every role in society has attached to it a certain identity. As we have seen, some of these identities are trivial and temporary ones, as in some occupations that demand little modification in the being of their practitioners. It

> is not difficult to change from garbage collector to night watchman. It is considerably more difficult to change from clergyman to officer. It is very, very difficult to change from negro to white. And it is almost impossible to change from man to woman. These differences in the ease of role changing ought not to blind us to the fact that even identities we consider to be our essential selves have been socially assigned.
>
> (P. L. Berger, 1966: 115)

Psychological or psychologising discourses, on the other hand, stress the boundaries strongly, as in this question from interviewer Caroline Jones's series of Australian Broadcasting Commission radio programmes *The Search for Meaning*:

> So what would you want to say about that split we seem to have made in our habit of thinking between that which we are (our being) and how we value that; and our doing, all our performance, our work? There's a real split there, isn't there, in our society.
>
> (Jones, 1989: 136)

Do we have an identity beneath the many roles we play? Or is our identity the sum of the roles we have learnt to play? My concern here is not to solve this problem, but to point out that the English language allows us to make a choice between functionalisation and identification, and that the use of this choice in discourse is of critical importance for discourse analysis.

That the choice has a grammatical base, a base in the language itself, can be seen from the rank order of the two types of categorisation in nominal groups. Identifications can be, and frequently are, Classifiers in nominal groups, functionalisations only rarely. One can, for example, say 'the Asian teacher', 'the homosexual musician', 'the woman doctor', but not (or only in a derogatory sense) 'the teacher Asian', 'the musician homosexual', 'the doctor woman'. Only relational identifications (see below) occasionally allow functionalisations to become Classifiers, as, for example, in 'your teacher friend'. Also, classifications and physical identifications cannot be possessivated, except, again, in a derogatory sense (cf. my use of 'our racist'). Relational identifications, on the other hand, are almost always possessivated, But possessivation does not play the same role here as in functionalisation: possessivated functionalisations signify the activation (as in 'his victim') or subjection (as in 'my attacker') of the possessing participant, while possessivated relational identifications signify the 'belonging together', the 'relationality' of the possessivated and possessing social actors (as in 'my daughter' or 'my mother').

Relational identification represents social actors in terms of their personal, kinship or work relation to each other, and it is realised by a closed set of nouns denoting such relations: 'friend', 'aunt', 'colleague', etc. Typically they are possessivated, either by means of a possessive pronoun ('her friend'), or by means of a genitive ('the child's mother'), or postmodifying prepositional phrase with *of* ('a mother of five').

The role of relational identification is, in our society, less important than that of classification and functionalisation, especially where personal and kinship relations are concerned. The intrusion of such relations into the sphere of public activities may be branded as 'nepotism' or 'corruption' (unless you are a monarch). In other societies, however, it plays a key role. Von Sturmer (1981) has described how Australian Aborigines, when they first meet, introduce themselves primarily in terms of relational identification. They 'search for relations whom they share and then establish their relationship on that basis' (1981: 13). This differs from western introductions, where nomination and functionalisation ('What do you do?') are the key to establishing a relation, and where classification ('Where are you from?') comes in only when a social actor displays signs of differing from the social norm, for instance a foreign accent, or a dark skin. Not so among Aborigines:

Mareeba man: 'Where you from?'
Mickey: 'I'm Edward River man. Where you from?'
Mareeba man: 'I'm Lama Lama man . . . do you know X?'
Mickey: 'No. Do you know Y?'
Mareeba man: 'No. Do you know Z?'
Mickey: 'Yes, she's my auntie.'
Mareeba man: 'That old lady's my granny. I must call you daddy.'
Mickey: 'I must call you boy. You give me a cigarette.'
(von Sturmer, 1981: 13)

Where kinship relations continue to be functionally important in our society, as is the case especially with the relation between mothers and children, the relevant terms become polyvalent: 'mother' can be used as a functionalisation ('mothering' is not the act of bringing a child into the world, but the act of giving care to a child, while 'fathering' signifies only the act of begetting a child!), as a nomination ('Mother . . .') and as a relational identification ('my mother . . .'); similarly, 'child' can be a classification as well as a relational identification.

We might also note that, by the criteria developed here, terms like 'lover' and 'caregiver' (as synonym for 'parent') introduce a measure of functionalisation into the sphere of personal and kinship relations. Projections of the future development of personal and kinship relations in our society, such as those in Alvin Toffler's *Futureshock* (1970) do indeed predict increasing functionalisation, for example the institutionalisation of 'professional families', couples bringing up other people's children for money, to allow these children's parents to devote themselves to their careers.

Physical identification represents social actors in terms of physical characteristics which uniquely identify them in a given context. It can be realised by nouns denoting physical characteristics ('blonde', 'redhead', 'cripple', and so on) or by adjectives ('bearded', 'tall') or prepositional phrases with *with* or *without* postmodifying highly generalised classifications such as 'man', 'woman', etc.:

10.1 A little girl with a long, fair pigtail came and stood next to Mary Kate.

10.2 'What are you doing there?', shouted the man with the large moustache.

Physical identification occurs a good deal in stories, sometimes only when a character is introduced, as in 10.1, sometimes throughout, as in the story from which 10.2 is taken. It provides social actors with a unique identity in the temporary or permanent absence of nomination, and does so by means of a salient detail. But it also, and at the same time, focuses the reader or listener on the social actor's physical characteristics, and this may be done selectively, for instance on the basis of age or gender, as in these examples from the (Australian) *Daily Mirror*: 'stunning blonde singer Toby Bishop', 'chubby-cheeked Laura Vezey, 2'.

In contrast to nomination, physical identification is always overdetermined (see section 12): physical attributes tend to have connotations, and these can be used to obliquely classify or functionalise social actors. 'Large moustaches', for example (see example 10.2), derive, perhaps, from the moustaches of Prussian army officers, connoting a sense of rigid disciplinarianism, not only in armies and schools, but also in other contexts. The borderline between physical identification and classification is therefore far from clearcut, as is obvious from the use of skin colour for classification, or from the connotations that cling to such representations of women as 'blonde' or 'redhead'. However, even when used for the purposes of classification, the category of physical identification remains distinct, because of its obliqueness, its overdetermination, and its apparent 'empirical' innocence.

Finally, social actors can be referred to in interpersonal, rather than experiential terms. For these instances I use the term appraisement: social actors are appraised when they are referred to in terms which evaluate them, as good or bad, loved or hated, admired or pitied. This is realised by the set of nouns and idioms that denote such appraisal (and only such appraisal), as, for instance, 'the darling', 'the bastard', 'the wretch' – or 'thugs' in:

10.3 80 young white thugs attacked African street vendors.

It would appear, incidentally, that negative appraisements are more plentiful than positive ones, especially in some registers, such as that spoken by Miles Davis in his ghostwritten autobiography:

10.4 I told the motherfucker as he was going out of the door 'I told you not to go in there, stupid'.

(Davis, 1990: 13)

As can be expected, the 'Race Odyssey' text does not categorise the individuals and groups it represents to the same degree. 'Racists' and 'immigrants' are categorised a good deal more than are 'we', Australians. And when 'we' are categorised, it is in terms of our shared national identity ('Australians') – the single instance of functionalisation is 'critics'.

'Racists' are classified by provenance and ethnicity ('Japanese', 'native Vancouverites', etc.) and in one case by age and race (the case of the 'young white

thugs'). 'Immigrants' are classified by provenance or ethnicity in 50 per cent of cases, by class (e.g. the 'downtown' and 'uptown' immigrants) in 20 per cent of cases, by race ('dark-skinned', 'black') in 13 per cent of cases, by education or skilledness in 10 per cent of cases, and once each by wealth ('poor') and religion ('Muslim'). By and large their treatment in the representation is not all that different from that of the 'racists'. 'Racists' and 'immigrants' also are the only categories of social actor that are occasionally represented in terms of relational identity. Both constitute, in this discourse, the main 'others' for 'us', Australians, and therefore also the main object of classification.

High-status social actors, on the other hand, such as 'government' and 'experts', are always functionalised (the few instances of functionalisation of 'racists' and 'immigrants' also concern high-status persons, such as the 'mayor of Kawaguchi' and the Peruvian presidential candidate. It is a pattern which, I would think, is by no means specific to this text.

11 Personalisation and Impersonalisation

So far I have discussed representational choices which *personalise* social actors, represent them as human beings, as realised by personal or possessive pronouns, proper names or nouns (sometimes adjectives, as, for example, in 'maternal care') whose meaning includes the feature 'human'. But social actors can also be *impersonalised*, represented by other means, for instance by abstract nouns, or by concrete nouns whose meaning does not include the semantic feature 'human'. I shall distinguish two types of impersonalisation: abstraction and objectivation. Abstraction occurs when social actors are represented by means of a quality assigned to them by the representation. One example is the way in which 'poor, black, unskilled, Muslim or illegal' migrants are referred to by means of the term 'problems' in 11.1: they are being assigned the quality of being problematic, and this quality is then used to denote them. Another example is the substitution of 'the changing face of Australia' for 'the new migrants' in 11.2:

11.1 Australia is in danger of saddling itself up with a lot of unwanted problems.

11.2 Many Australians . . . were 'bewildered' by the changing face of Australia.

Objectivation occurs when social actors are represented by means of reference to a place or thing closely associated either with their person or with the activity they are represented as being engaged in. In other words, objectivation is realised by metonymical reference. A number of types of objectivation are particularly common: *spatialisation, utterance autonomisation, instrumentalisation and somatisation.*

Spatialisation is a form of objectivation in which social actors are represented by means of reference to a place with which they are, in the given context, closely associated. This happens, for instance, when 'Australians' are substituted by 'Australia', as in 11.3:

11.3 Australia was bringing in about 70,000 migrants a year

Utterance autonomisation is a form of objectivation in which social actors are represented by means of reference to their utterances. This is the case, for instance, with 'the report' and 'surveys' in 11.4, and because it lends a kind of impersonal authority to the utterances, it is often used in connection with the utterances of high-status and 'official' spokespeople:

11.4 This concern, the report noted, was reflected in surveys which showed that the level of support for stopping immigration altogether was at a postwar high.

Instrumentalisation is a form of objectivation in which social actors are represented by means of reference to the instrument with which they carry out the activity which they are represented as being engaged in:

11.5 A 120 mm mortar shell slammed into Sarajevo's marketplace.

Somatisation, finally, is a form of objectivation in which social actors are represented by means of reference to a part of their body, as in:

11.6 She put her hand on Mary Kate's shoulder.

The noun denoting the body part is almost always premodified by a possessive pronoun or genitive referring to the 'owner' of the body part, and perhaps we should, in such cases, speak of 'semi-objectivation'. Nevertheless, possessivated somatisation still adds a touch of alienation, of Mary Kate not being involved herself: not Mary Kate, but Mary Kate's *body* is being touched, in an unwanted and intimidating intrusion.

More generally, impersonalisation can have one or more of the following effects: it can background the identity and/or role of social actors; it can lend impersonal authority or force to an activity or quality of a social actor; and it can add positive or negative connotations to an activity or utterance of a social actor. When, for instance, 'Australia' is activated in relation to the activity of 'bringing in migrants' (example 11.3), the text does not tell the reader who is responsible for the activity, just as in the case of nominalisations and passive agent deletions. For this reason impersonalisation abounds in the language of bureaucracy, a form of the organisation of human activity which is constituted on the denial of responsibility, and governed by impersonal procedures which, once put in place, are wellnigh impermeable to human agency. Abstractions, finally, add connotative meanings: the qualities abstracted from their bearers serve, in part, to interpret and evaluate them.

The 'Race Odyssey' text impersonalises 'immigrants' often (eighteen times), most of the other categories of social actor only rarely – 'racists' are impersonalised once, 'us', Australians three times, the 'government' once, and 'experts' twice. The writer of the article, on the other hand, impersonalises himself every time he refers to his activities ('italicising', highlighting', 'calling into question', etc.) and the only personalised reference to him is the byline ('David Jenkins argues . . .').

Most of the impersonalisations of 'immigrants' are abstractions (83 per cent), and what is abstracted is, in eight out of fifteen cases, quantity: 'immigrants' are referred to as 'levels', 'settings', etc. The qualities of being 'problematic' (see 11.1), of 'changing Australia' (11.2) and of 'race' (as in 'racial tolerance') account for the other cases.

Utterance autonomisation occurs in relation to 'experts' and also in relation to the writer of the article, who represents himself every single time as though, through his person, 'the facts speak for themselves', as realised by the substitution of anaphoric reference to preceding sections of text for reference to his person:

11.7 They [i.e. these developments] highlight the fact that racism is seldom far below the surface.

12 Overdetermination

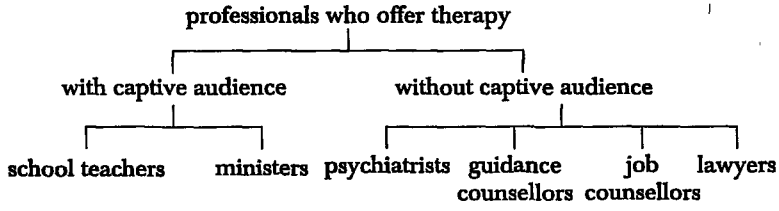
Overdetermination occurs when social actors are represented as participating, at the same time, in more than one social practice. One of the children's stories that I analysed, a Dutch story called *De Metro van Magnus* (van Leeuwen, 1981), features a character called 'The Unknown Soldier'. Magnus, the hero of the story, finds The Unknown Soldier (who is 'maybe 18 years old' but 'looks more like a boy than like a man') in the Unknown Soldier Square, where he sits, rather forlorn, at the foot of a huge abstract monument dedicated to The Unknown Soldier. As this monument bears little resemblance to a soldier, Magnus assumes that the 'man-boy' must be The Unknown Soldier. The latter, after some hesitation, agrees. He is glad to get a name, because he himself does not know who he is (he is 'unknown'). Magnus and The Unknown Soldier then go to a place 'rather like a school', where The Unknown Soldier fails miserably at answering the questions asked by 'the man with the large moustache' (already featured in example 10.2). Thus The Unknown Soldier is connected to at least two social practices, warfare and schooling, and comes to symbolise the subjected participant in both these practices, and indeed in all practices that produce victims and underdogs. Magnus's own name is also overdetermined, since he is both little, a child, and 'magnus': through his name he transcends the difference between 'what adults (can) do' and 'what children (can) do'.

I have distinguished four major categories of overdetermination: *inversion, symbolisation, connotation* and *distillation.*

Inversion is a form of overdetermination in which social actors are connected to two practices which are, in a sense, each other's opposites. This happens, for instance, in the well-known comic strip *The Flintstones.* The activities of the Flintstones are very much those of a twentieth-century American suburban family. The Flintstones themselves, however, are overdetermined: they *do* things twentieth-century families do, but they *look like,* and are nominated as, prehistoric cavedwellers. In other words, they have been transformed from [+ contemporary] to [– contemporary] – while still involved in contemporary activities. Reference

thus broadens to include prehistoric as well as contemporary practices, perhaps in order that the latter may be viewed as 'natural', as transcending history and culture: overdetermination is one of the ways in which texts can legitimise practices. The 'Magnus' example above is also a case of inversion: Magnus has been transformed from [+ child] to [– child], while still involved in childlike activities.

Symbolisation, as I use the term here, occurs when a 'fictional' social actor or group of social actors stands for actors or groups in non-fictional social practices. The 'fictional' actor often belongs to a mythical, distant past. This distance then allows the actors and the activities in which they engage to refer to several non-fictional actors and practices. Will Wright (1975), in a study of Westerns, has shown how the participants and activities in Westerns changed in the early 1960s towards a pattern which he calls the 'professional plot'. Characteristic of this kind of plot is the transition from individualisation (the lone gunfighter who arrives in town on his horse) to collectivisation, the team of fiercely independent men who work for money rather than for love, justice or honour, are technically competent and highly organised, and form a tightly knit elite with a strong code of solidarity within the group. Wright then shows how these 'professional heroes' and their exploits can be linked to a number of social practices and the social actors involved in them, noting, for instance, how in business the individual entrepreneur has made way for the executive team, in science the individual genius for the efficient research team, and so on, and how the values of such teams are very similar to the values of the heroes of 'professional Westerns': here, too, one finds high technical competence, work for financial rewards, group solidarity against outsiders, and so on. Thus the 'professional heroes' in Westerns can stand for a variety of social actors in actual social practices: doctors, scientists, politicians, business executives, etc. The township, the 'weak society' for which the 'professional heroes' work, can stand for such social actors as the doctor's patients, the corporation's consumers, the politician's voters, etc. In other words, the social actors, and, indeed, the other elements of 'professional Westerns' are overdetermined. Bruno Bettelheim (1979) has similarly mapped the social actors and activities in fairy tales on to contemporary and actual social practices, notably those of the modern middle-class family.



Connotation occurs when a unique determination (a nomination or physical identification) stands for a classification or functionalization. This definition essentially accords with the way Barthes (1967; 1970; 1977) defined 'myth' or 'connotation'. Connotations, said Barthes (1977: 50) are discontinuous', 'scattered traits', the knowledge of which is established by cultural tradition:

> A 'historical grammar' of iconographic connotation ought thus to look for its material in painting, theatre, associations of ideas, stock metaphors, that is to say, precisely, in 'culture'.
>
> (Barthes, 1977: 22)

We have already come across an example when we discussed the case of the 'man with the large moustache' (example 10.2): the reader's knowledge of popular

culture associates such moustaches with the Prussian military, and then projects into the 'man with the large moustache' all the dualities which the popular culture tradition associates with the Prussian military. Such knowledge is not necessarily conscious. It is 'mythical' knowledge. The signs 'are not understandable, but merely reminiscent of cultural lessons half-learnt' (J. Berger, 1972: 140) – perhaps most frequently learnt from the mass media, movies, comic strips, and so on.

Distillation realises overdetermination through a combination of generalisation and abstraction. It is perhaps best explained by means of an example. A section of a chapter from Ivan Illich's *Deschooling Society* 1971), which I have analysed in some detail elsewhere (van Leeuwen, 1993b), establishes, in the course of the text, the following taxonomy:

Three observations can be made about this taxonomy. First, while 'psychiatrist', and perhaps also 'guidance counsellor', can be seen as true hyponyms of 'therapist', the professions of 'schoolteacher', 'minister', 'job Counsellor' and 'lawyer' are not usually classified as therapeutic. Practitioners may adopt some of the values and manners of therapists, but therapy is not a central aspect of their activities. In other words, Illich has abstracted what would normally be regarded as peripheral qualities and then elevated them to the status of generalisations. This is borne out by the way he formulates the superordinate term: 'professional' can be regarded as a true generalisation of 'schoolteachers', 'ministers', etc., and it is this term which is used as Head of the nominal group.

Second, 'therapy' features only in the Qualifier of the nominal group. The term cannot, by itself, be used to refer to teachers. In other formulations Illich uses 'therapist' as Circumstance of Role ('the teacher-as-therapist') – again, 'therapist' is a circumstantial rather than a central feature. The same can be said for 'with captive audience' and 'without captive audience': in relation to 'schoolteacher', 'minister', etc. this is circumstantial, and hence an abstraction rather than a generalisation. One cannot say that schoolteachers are a kind of 'with captive audience'.

Third, and most importantly in the present context, the taxonomy is not exhaustive. It is not constructed in order to chart the field of therapy, but in order to de-legitimise the activities of teachers by means of a comparison (the intrusion of fields other than those that form the main topic of a text for the sake of comparison always has a legitimising or delegitimising function). Illich compares the activities of schoolteachers to the activities of ministers and priests. The church is an institution which, in the eyes of the 'radical' readers Illich is addressing, has already been de-legitimised long ago. The de-legitimation of

schools, on the other hand, is a more controversial matter. Through overdetermining teachers, through connecting them to both school and church, some of the already achieved de-legitimation of the church can be transferred to the school, to teachers and their activities: 'Children are protected by neither the First, nor the Fifth Amendment when they stand before that secular priest, the teacher' (Illich, 1971: 38).

Distillation, then, is a form of overdetermination which connects social actors to several social practices by abstracting the same feature from the social actors involved in these several practices.

Finally I shall briefly discuss the two most common forms of inversion, *anachronism* and *deviation*. Of the former we have already encountered an example, that of the Flintstones; science fiction can provide another example. Here social actors are projected into the future (and, perhaps on to another planet as well) – but their activities often bear a remarkable resemblance to contemporary practices. Anachronism is often used to say things that cannot be said straightforwardly, for instance to offer social and political criticism in circumstances where this is proscribed by official or commercial censorship, or to naturalise ideological discourses.

In the case of deviation social actors involved in certain activities are represented by means of reference to social actors who would not normally be eligible to engage in these activities. In children's stories about the first day at school, for instance, reference to children might be replaced by reference to animals, a transformation of the feature [+ human] into [– human]:

12.1 *The teacher wrote the name down in the register: NOIL.*
Then she finished calling the register.
'Betty Small', she said.
'Yes', said the little girl.
'Noil', said the teacher.
'Yes', said the lion. He sat next to the little girl, as good as gold.

This overdetermination fuses 'what children (can) do' and 'what animals (can) do', and so causes the child to be represented as, at the same time, human and animal, 'civilised' and 'uncivilised', and also as at the same time weak ('small', 'little') and strong. The deviation lies in the transgression of the rule that animals cannot go to school: more naturalistic stories about the first day at school invariably include the episode of the dog who wants to come to school too, but is not allowed to, and then feels sad and abandoned, while the child does not, or at least not initially, understand why his or her dog may not come to school. When, in a fantasy story like the one quoted in 12.1, animals transgress the eligibility rule and do go to school, they must necessarily fail. In the case of Noil, the lion, this does not happen, however, until after Noil has scared off the little boy who teases Betty Small in the playground.

Deviation almost always serves the purpose of legitimation: the failure of the deviant social actor confirms the norms. In the case of Noil and Betty Small it justifies the eligibility rule and so legitimises school as the necessary transition

from a state of being in which children 'are at one with the animals', to a state of being in which they 'rise above animals', a state of being in which paradoxically, they are represented as 'small', 'little', and timid, rather than confident and assertive in their new status.

The 'Race Odyssey' text features only one overdetermination, the title, which overdetermines a process, rather than the social actors involved in it, the process of 'coming home after a long journey', of finding 'our' ('racial') identity. If I had chosen to exemplify my account of the representation of the social actors involved in the immigration process with a fictional example, I would probably have had a greater number of instances of overdetermination to discuss.

13 Conclusion

Figure 1: summarises, in the form of a system network, my answer to the question with which I started out: what are the principal ways in which social actors can be represented in discourse. The square brackets in the diagram stand for either/or choices (e.g. social actors must be either 'activated' or 'passivated'), the curly brackets stand for simultaneous choices (e.g. social actors can be both 'activated' and 'personalised', or both 'passivated' and 'personalised' and so on). I hope that my discussion of the various categories in the network has made it clear that, in actual discursive practices, the choices need not always be rigidly 'either/or'. Boundaries can be blurred deliberately, for the purpose of achieving specific representational effects, and social actors can be, for instance, both classified and functionalised. In such cases the categories remain nevertheless useful for making explicit how the social actors are represented.

The network brings together what linguists tend to keep separate: it involves a number of distinct lexicogrammatical and discourse-level linguistic systems, transitivity, reference, the nominal group, rhetorical figures, and so on, because all these systems are involved in the realisation of representations of social actors. Nevertheless, there is some linguistic consistency in the network. Initially, it involves three of the major types of transformation, deletion (systems 1 and 2), rearrangement (systems 3–5) and substitution (systems 6–22). Each type of transformation involves distinct linguistic systems: deletion involves voice, and also nominalisation and adjectivalisation, rearrangement principally involves transitivity, while substitution is initially realised by aspects of the structure of the nominal group – the Deictic and Postdeictic, that is, the system of reference (systems 7, 8, 10 and 12), and the Numerative (system 9) (Halliday, 1985, ch. 6; Matthiessen, 1992, ch. 3.2) and then by lexis, different classes of noun, including aspects of morphological structure (systems 13–18). Systems 19–22, finally, involve various forms of metaphor and metonym. More globally, the three sections, 7–12, 13–18 and 19–22, involve, respectively, reference, lexis (the field of nouns referring to human beings) and metaphor.

I shall, finally, summarise my discussion of the 'Race Odyssey' text, which, of course, has restricted itself to the representation of social actors, and therefore not dealt with many other salient and critically relevant features of this text.

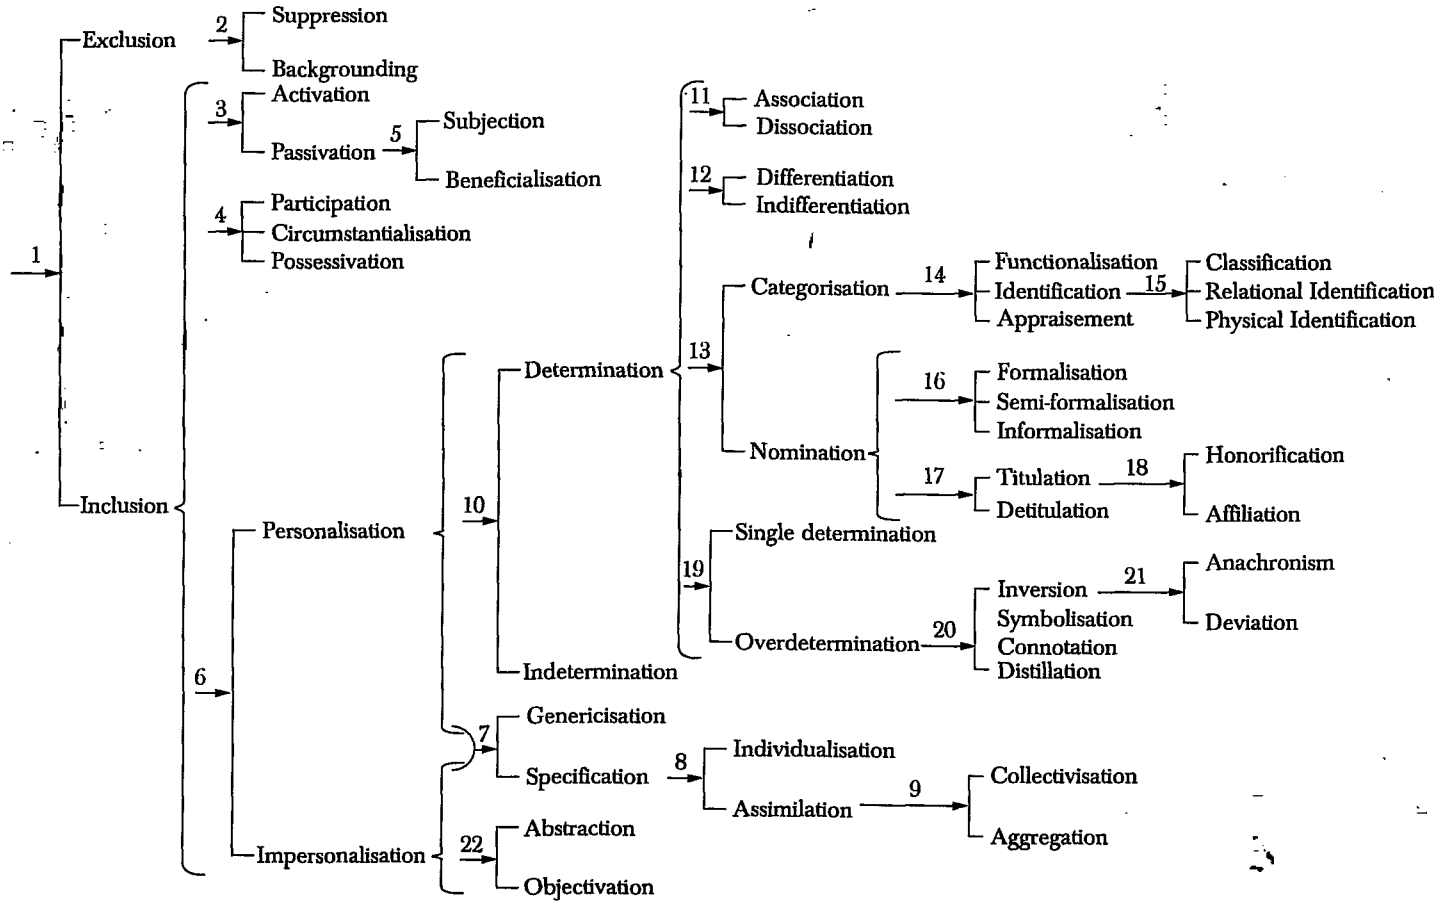


Figure 1: The representation of social actors in discourse: system network

Those who, in some way or other, are represented as being 'concerned about' or actually opposing immigration and immigrants in countries other than Australia, I have referred to as 'racists': in the article they are unfavourably compared to opponents of ('high') migration in Australia, who have 'reasonable' rather than 'racist' concerns about immigration. As we have seen, representation of these 'racists' is relatively often suppressed or backgrounded. This has to be offset against the fact that the exclusions follow very definite categorisations, such as '80 young white thugs'. It can be argued that the article invites us to interpret these vague or missing representations in the light of this initial categorisation, which has no equivalent in the representation of Australian opponents of immigration. 'Racists' are also often referred to generically, and they are individualised and nominated only when elite persons are concerned. On the other hand, they are frequently activated in relation to (passivated) immigrants, and this with respect to both material and verbal processes such as 'denying entry' and 'insulting' and mental processes such as 'being concerned'. When they are classified they are most frequently classified in much the same way as are immigrants, by 'where they are from', so that they have at least this in common with those other undesirables, the immigrants themselves. The only negative appraisement, finally, occurs in connection with this category of social actors, and it occurs the very first time they are referred to (again, the case of the '80 young white thugs').

Bruce Ruxton, the home-grown 'racist', is represented as equally undesirable. But, unlike 'racists' abroad, he is never backgrounded, and individualised as well as nominated. Like other 'racists', he is highly activated in relation to (passive) immigrants. In other words, at home one can easily single out the few deviant individuals who, unlike 'us', Australians, deserve the epithet 'racist', and then turn them into the notorious personifications of prejudice and bigotry which 'we' all (and especially the media) love to hate. Abroad, on the other hand, racism is much more pervasive.

Another group of social actors who oppose or worry about immigrants and immigration is formed by 'us', the Australian people 'as a whole'. This group is more sympathetically treated – less often backgrounded, less often referred to generically, and classified, if at all, only as 'Australians'. If they are activated, it is in relation to mental processes such as being 'bewildered' and 'not understanding', 'feeling unable to cope', and so on, rather than in relation to material and verbal processes, as in the case of the 'racists'. And finally, they form a collective, which underlines their supposed consensus about immigration issues.

The immigrants themselves I have referred to as 'them', and 'they' are relatively often backgrounded, and often referred to generically, which helps to distance the reader from them. They are either assimilated or aggregated, and the aggregations help to represent them as a large 'horde' about to invade 'us', and as the object of 'rational' calculation, rather than as fellow human beings. They are also represented abstractly, and this, again, frequently involves the abstraction of their number. More than any other category of social actors they are classified, by 'ethnic origin', class, race, level of education, wealth, and so on – differences which are not made in relation to 'us', Australians. And immigrants from different

ethnic origins are sometimes lumped together in what I have called 'associations', to create further categories of migrant. If they are activated, finally, it is almost always in relation to one activity, that of 'immigrating': in every other respect they are acted *upon* by others.

The government is rarely backgrounded or referred to generically, and often individualised and nominated, that is, personified in the person of the Prime Minister. It also transcends classification and is always functionalised and playing a highly active role in relation to the immigrants. The social actors who form the executive arm of the government, however, those who must actually 'stop' the immigrants, are suppressed: the article keeps the reality of 'cutting back immigration' at a comfortable distance from the reader.

'Experts' are represented in two ways. Either they are treated like elite persons (highly activated, functionalised, individualised, nominated and titulated) or their utterances are autonomised and/or collectivised, to imbue them with impersonal authority and a sense of consensus among experts.

The writer of the article also refers to himself, and to his readers. The latter are addressed directly, the former makes 'the facts' speak in his stead ('They [i.e. these developments] highlight the fact that racism is seldom below the surface'). Whether or not the writer is also the social actor who legitimates the 'fears' of 'us', Australians, and 'entitles' 'us' (and Prime Minister Hawke) to our feelings of pride, concern, etc., is not clear: although the legitimising social actor plays an important role in the process of immigration, reference to him or her is always suppressed. Perhaps we are not too far from the truth if we recognise here, through traces in the text itself, the active role of the media in this social process, despite the careful stance of neutrality suggested by the way in which most of the representation is attributed to sources other than the writer himself.

Predicaments of Criticism

Jef Verschueren

Introduction

In *The Cultural Origins of Human Cognition*, Michael Tomasello (1999) argues that there is only one explanation for the fact that modern humans, in less than a quarter of a million years, developed the cognitive skills necessary 'to invent and maintain complex tool-use industries and technologies, complex forms of symbolic communication and representation, and complex social organizations and institutions' (1999: 2). The explanation is cumulative cultural learning, enabled by a single biological adaptation, the capacity to identify with conspecifics, to understand them as intentional and mental beings like the self. Central to the use of this capacity, which makes it possible to collaborate and to preserve cultural modifications over time, is discourse. As humans still share 99 percent of the genetic material of the great apes, however, moral growth has not necessarily gone hand in hand with cultural development, as 20th-century history amply illustrates. The ability to collaborate also implies more sophisticated abilities to dominate. And also in that process, discourse takes a central position. The study of discourse, therefore, is serious business, involving a responsibility to contribute to collaborative knowledge-gathering for the benefit of society, a responsibility to do so critically and a responsibility to engage in public debate. Many linguists and anthropologists understand this very well.

My main concern in this article is the empirical status, factually and potentially, of 'critical' claims made in socially relevant forms of linguistic research. Language is a formative agent in social, cultural and political processes, and the social world is really a world of communication, discourse and rhetoric. A solid understanding of communicative, discursive and linguistic practices is therefore mandatory for anyone interested in optimizing the quality of life in areas as diverse as the family, education, work contexts, business, news production and

Source: *Critique of Anthropology* vol. 21, no. 1, 2001, pp. 59–81.

consumption, politics and the like. Hence the need for *critique*. But the very goal of optimization, i.e. that which makes the understanding in question socially relevant, hinges crucially upon the convincingness of the understanding. Without the power to convince others, any specialist understanding remains unproductive. Moreover, it is a fundamental right of the academic's target audience, however narrow or broad, to resist being persuaded. Scholarship differs from the mere voicing of opinions in that it has to be based on clear arguments, preferably underscored with empirically observable facts. It is particularly this empirical status that has to be achieved in order for research to be convincing, and hence relevant in a down-to-earth sense. Hence the need for *critical scrutiny of critique*. If critical approaches to language use in the context of social practices fail to be convincing as a result of a lack of theoretical and methodological rigour (e.g. by 'forgetting' contexts, as illustrated by Blommaert in this volume), they destroy their own *raison d'être* and make the task all the more difficult for anyone who does observe the basic rules of documentation, argumentation and explicit presentation. The following article is based on my own past and present frustrations in this regard, as related to some of the pertinent research traditions.

Though the quality of the work could vary dramatically, the heyday of so-called 'critical linguistics' in the 1970s and 1980s provided ample cause for frustration from this point of view. In a booklet on some aspects of international news reporting (Verschueren, 1985), therefore, I found it necessary to dissociate myself from common practices in a tradition in linguistics which I could fundamentally sympathize with but which I felt was subjecting the media, as well as other institutions, to a circus trial, playing fast and loose with the observable facts in order to support preconceived claims. Important things have changed since then. In particular, the social scientific as well as linguistic theoretical grounding of critical linguistic work has gained sophistication, for instance in the critical discourse analysis associated with the work of Norman Fairclough (Fairclough, 1989, 1992a, 1992b, 1995a, 1995b; Chouliaraki and Fairclough, 1999) which, for that reason, will be my point of reference in the rest of this article. This point of reference will be exclusive (except in the second section, 'Predicaments of criticism', which deals with broader issues far beyond the tradition represented by Fairclough). There will be no attempts to make any claims that are supposed to hold for all the work that associates itself with the label 'critical discourse analysis' (a field which is too diverse, in normal circumstances, to fit into the reification implied in the acronym CDA; see Blommaert and Bulcaen, 2000), let alone with other critical approaches such as the 'natural histories of discourse' approach (Silverstein and Urban, 1996) about which other articles in this collection (*COA* 21(1), 21 (2)) have relevant things to say. I will use the acronym CDA here with the explicit understanding that it bears only on the bounded corpus made up of Fairclough's writings, even if this could be considered a representative sample of the wider tradition about which I will avoid explicit generalized claims. Having clarified this I can summarize what follows as an attempt to show that, in spite of the gains, there is a dramatic need for quality control, a need to get back to basics, if we want socially relevant forms of linguistic research to have an impact. In other words, Fairclough's version of CDA, in my analysis of its research practice, has not managed to alleviate the frustrations.[1]

The Big Issue

I have already mentioned the fundamentally communicative or discursive nature of social life. All discourse or communication, furthermore, constitutes action embedded in a context and with real-world consequences. The big issue for any critical approach to language use is the fact that in this world of communication almost nothing is ever exactly what it looks like. The reason is simple: communication is basically about 'meaning', and meaning is an intangible phenomenon. The intangibility of meaning derives from two factors. First, it is impossible to interpret any piece of communication without taking full account of the action or activity type it belongs to with all the contextual ramifications this involves. Consider, as a recently emerging example, why the internet is such an unreliable source of information. The main reason is not that people are liars – though they can be that, too. The simple fact that the internet is an uncontrolled medium where everyone can communicate whatever he or she pleases results in a network of communicative fragments originating in very different settings, corresponding to very different goals and ambitions, and requiring very different forms of interpretation. Not everyone who posts a message wants to provide information. What is involved may simply be a form of self-expression or self-representation. There may also be jokes that are not easy to recognize as such. Or there may be hidden agendas. Commercial considerations may be involved. One function of internet messages may even be to infect other people's accounts with 'viruses'. And so on and so forth.

The second determinant of the intangibility of meaning is the impossibility of full explicitness. By definition, every piece of communication contains meaning that is not directly 'visible' or literally 'said'. The range extends from the simplest presuppositions to the most complex ideological frameworks (the latter being constructed with the help of the former).

CDA is rooted in such observations, which it shares entirely with theories of pragmatics (as in Verschueren, 1999c), and to which it adds its own specific focus on those intangibles that are related to the ideological side of the spectrum, defined as patterns of meaning which easily escape the language user's awareness but which firmly support established social relationships of dominance and inequality. Situating myself in a broadly conceived field of pragmatics as an interdisciplinary cognitive, social and cultural perspective on language use, and reading through Fairclough's *oeuvre*, I find myself agreeing with most of the premises of his work. For example, I am fully sympathetic to the following claims:

(i) that power relations in society are supported ideologically by naturalized ways of speaking about relevant issues, thus hiding or consenting to the patterns of domination, sometimes 'misconceiving' events and actions, and usually disregarding unmet needs;
(ii) that social changes are reflected in changes in discourse;
(iii) that awareness of this role of language should be promoted as an antidote to the docile acceptance of inequality and its consequences;

(iv) that all analysis has to take into account textual, interactional and contextual phenomena;
(v) that analysis should not be restricted to description, but that it should proceed to interpretation and explanation as well.

Furthermore, though I lack Fairclough's inclination towards the technicalities of systemic-functional linguistics or SFL (e.g. Halliday, 1994) as a linguistic reference point for his analyses, I recognize many of SFL's foundational theses, such as the multifunctionality of every stretch of speech. Also, a coherent theory of pragmatics must share with SFL the observation of linguistic choice-making as the basic process involved in language use, and the consequent acceptance of fundamental variability as the phenomenon underlying that process.

Briefly, I regard Fairclough's theory of society and the role of discourse as well as his theory of language as fundamentally well-founded. It is somewhat surprising, therefore, that the picture changes drastically when looking at sample analyses which he introduces for purposes of illustration. I will point out two preliminary problems before saying a few words on the predicaments of criticism in general and before subjecting Fairclough's CDA to more detailed scrutiny.

First, much of the earlier work in 'critical linguistics' was not only disturbing because of the extent to which biases were allowed into the analysis, but also because it tended to present 'findings' that were entirely predictable on the basis of elementary insights into the pragmatics of language use. In particular, the observation that the media reflect the ideological status quo or preferred versions of events was offered over and again as a so-called research result. But as we all know, no communication is possible at all without a form of common ground (or whatever label one would want to give the world of inexplicit meaning which utterances have to be anchored in – remember what was already said about the impossibility of full explicitness). So why should a different dictum hold for the type of communication involved in, for instance, news reporting? At a higher level of sophistication, we find traces of the same pattern in Fairclough's work. From his first book in 1989 to the latest in 1999 he keeps stressing the hybridity of discourses in the (late) modern world. Thus he observes, for instance, that texts produced by educational institutions have adopted elements from the discourse of advertising. He links this phenomenon, quite correctly, to the economic pressures put on education in Britain. Again, this is presented as a major research 'finding'. Yet the hybridity in question was largely predictable from known contextual facts (even if those were constituted by recent political-historical processes induced by Thatcherism and neo-liberalism): if educational institutions are forced to sell themselves in order to survive, then selling themselves is what they will do, and they will adopt the available discursive means for doing so while adapting them to their own needs. Adaptability, after all, is another key notion for understanding the pragmatics of language. In both cases, the simpler and the more sophisticated, though continued documentation of the observations remains a useful exercse, the presentation of predictable patterns as 'findings' distracts from what ought to be the more interesting questions related to the way in which they contribute to the generation of meaning – an issue about which

nothing can be said until detailed analytical attention is focused on precisely that process. For instance, as long as the approach is merely symptom-oriented it is not possible to study whether and how parents' and students' actual interaction with schools is affected, whether and how the critical attitude supposedly taught in schools clashes with the non-critical self-promotion of schools, or whether and how forms of self-criticism are allowed into the advertising language as a way of strengthening its self-promotional impact.

A second problem should be pointed out in a preliminary fashion. Interpretative and explanatory claims in Fairclough's work usually involve judgements or forms of evaluation. Chouliaraki and Fairclough (1999) stress the need for an evaluative stance: not all discourses are equally acceptable or beneficial or 'good'. I agree. But I cannot help finding most of the specific interpretative-evaluative claims in Fairclough's work suspect. Let me give just one example at this stage. In an illustrative analysis of a text soliciting support for a 'Christmas Appeal' launched by *The Big Issue*, a newspaper distributed by homeless people in Britain, Chouliaraki and Fairclough (1999: 10–16) find fault with a phrasing of the following kind:

(1) a. 'The Big Issue exists to challenge stereotypes and to help homeless people reclaim their sense of self-worth and dignity by earning a living – all year round.
b. [. . .]
c. But we are committed to providing homeless people with the resources they need to break out from the damaging culture of long-term homelessness and find homes, jobs and better futures.'

They observe that this is 'the sort of language professional politicians use', because it mixes the vocabulary of academic social science (*challenge stereotypes, sense of self-worth, resources, culture of long-term homelessness*) and everyday life (*earning a living, find homes, jobs*). In particular they point to: the 'density of ' "nominalisations" ': *homelessness* and *self-worth* are said to 'abstract from the experiences and relationships of real life by the grammatical device of turning processes and relations involving particular people (for example, *I don't have a home, homeless people often don't think much of themselves*) into abstract nouns'.

On the basis of this they conclude:

> Although homeless people are socially marginalised, the text does not attempt to incorporate the voices or experiences of marginalisation, rather it uses a mainstream political language. (Chouliaraki and Fairclough, 1999: 13)

I focus on this comment from a wider 'analysis' because it relates to a passage towards which the authors are positively inclined because it shows that the designers of the 'advertisement' are not willing to abandon the language of social engagement altogether in favour of the logic of commodities which underlies the form of the message (professional-looking advertisement vs. other possibilities

such as xeroxed letters). Thus the 'judgement' in the quoted interpretation-evaluation is one of the milder ones in relation to this example. Looking at the details, however, it shows insufficient regard for text as well as context. At the textual level, the above extract is immediately preceded by the following opening paragraph:

(2) 'You know the sort of thing. Photo of a wretched looking rough sleeper slumped in a doorway. Snow. Very cold. Contrast his suffering with the consumption and gaiety of Christmas. Throw in a few shocking statistics about the ill health and premature death of homeless people.
But we've decided not to do that. [(1)]'

This opening announces what the appeal will *not* do. As with any other form of negation, the negated meaning is nevertheless present. I would not go so far as to say that 'the voice of the marginalized' and their experience are clearly there. Even in the case of a more direct appeal, this would be an undue romanticization of 'the authentic', the voice of 'the people' or 'the dispossessed'. However, placing the text in a wider discourse context, the content and style of other appeals, relying more strongly on images of marginalization, is drawn into the message by invoking the contrast, however 'populist' and commercial the mode of delivery may be. Furthermore, the unacceptability of homelessness – related to its unbearability – is emphasized by explicitly taking a position against its acceptance as a permanent state. The catch phrase at the top could not be more unambiguous:

(3) 'Homeless this Christmas.
But not for life.'

This is an expression of hope, and there is no attempt to hide that this is somehow hope against hope, as emerges from the portion of text that Chouliaraki and Fairclough left out when commenting on (1), namely (1)b which says:

(4) '[(1)a.]
[(1)b.] But, we need your support. The obstacles homeless people like Carl face are huge and the way back from life on the streets is long and difficult. We won't pretend that it is easy.
[(1)c.]'

Nor is 'the voice of marginalisation' – using this term with the reservations hinted at above – left entirely abstract. Such a claim could only be made when abstracting linguistic features such as nominalizations from the overall message of the text in which other-than-linguistic means may also be used to counterbalance the effects of abstraction: there is reference to Carl, an individual rather than a category, whose young and appealing face (which definitely does what the text says, i.e. challenge stereotypes of homeless people which are pervasively present in discourse about them) is the central visual aspect of the message.

Briefly, what seems to be transpiring through the interpretative-explanatory

the result of a careful step-by-step analysis that reflexively questions its own observations and conclusions. It may be well worth the effort, therefore, to subject critical analyses to some criticism. This is a general directive which is by no means to be applied exclusively to CDA, but to any form of socially relevant research (linguistic or not), and which involves issues that go beyond the details of actual research practice. Before further expanding on the case of CDA (in the third section of the article, on Fairclough's version of CDA), therefore, let me say a few words about the predicaments of 'criticism' in general.[2]

Predicaments of Criticism

In the humanities and social sciences, we have witnessed over the last couple of decades the growth of a field called 'cultural studies'. The emergence of this field was the product of a critical reflex based on dissatisfaction with a state of affairs in which philosophy, linguistics, literary criticism, sociology, anthropology, psychology, history and the like, were leading institutionally separated lives of their own, characterized by self-perpetuating authoritative trends crystallized in educational curricula, and supported by grant-giving and job-selection mechanisms. The idea was that the critical awareness needed to make academic activities socially relevant was inevitably stifled by the institutional constraints imposed by the self-preservational priorities of separately existing academic disciplines. 'Cultural studies', profiled as necessarily interdisciplinary, was designed as an escape from this quagmire. It was profiled, in other words, as an essentially 'critical' enterprise transcending disciplinary boundaries, constraints and vested interests.

However, 'criticism' in this sense is vulnerable in at least three ways. First of all, it was not long before 'cultural studies' started to assume all the properties of a traditional discipline, even if it has affected academic life favourably and with lasting results along the way. It turned into an integral part of curriculum design. It showed up in job descriptions and, under the influence of active publishing policies by some publishing houses, as a section header in numerous bookstores. If these are not fully vested interests yet, we are certainly witnessing the vesting of interests. At some universities, there are now full-grown sections and/or programmes for 'comparative cultural studies'. In many ways, this is the end of criticism or the introduction of new dogma, since the intercultural dimension of human life is probably the least amenable to a 'comparative' approach. For one thing, cultural variability is such that it lends itself to rapid change. Further, when cultural paradigms are made to interact (whatever that may mean), this creates a new situation for the understanding of which a comparison of the paradigms concerned is of minimal importance. Moreover, observable differences between cultures are rarely fundamentally different from those between individuals, social classes, men and women.

Second, and directly related to the first weak spot, we can assume that the linkage between academic activities and social relevance, if adopted without sufficient critical awareness, does not guarantee a really 'critical' approach. Or,

> One might suspect that if every academic were really a politician . . . and were really subject to the political interactions of the nation-state, academics would be more vulnerable to state control and ideological orthodoxy. If politicization erases the boundary between the academy and public discourse, the result will not be a gain in relevance but a loss of the very ideal sought by politicization, the ideal of multiple cultural spaces all protected from invasion by each other or by the state. (1994: 118)

In other words, the delicate balance between scientific and social values requires that, though a pre-existent perspective, point of view or ideology cannot – and should not – be abstracted from when engaging in research activities, specific social and political commitments should be linked to scientific authority only if they follow from, not guide, the research. In order to safeguard the relevance of anchoring research in social and political reality, it must be possible for the research and its conclusions to receive the epithet 'critical' without their necessarily being conducted and formulated – as often seems to be the case now – by scholars with professed and well-defined political commitments. Or, reversing the perspective, 'one's morality as a specialist cannot be allowed to do duty for one's morality as a citizen' (Burke, 1969: 31). None of this means that scholars should take a vantage point detached from social reality. The balance we should be looking for allows for a view of 'research as a part of reality' that 'entails neither a rejection of scientific method nor a refusal to recognise ways in which it often differs from other forms of discourse' (Rampton, 1997: 19).

Third, the community-building processes that are the necessary prerequisites for the development of academic practices, whether 'critical' or not, involve risks that may undermine critical potential. Although the following remarks apply in much the same way to most traditions, i.e. also to a much wider and more vaguely defined one such as 'pragmatics' (see Verschueren, 1999b), let me try to illustrate this with reference to the case of CDA. For one thing, every effort is being made to establish CDA as a recognizable discipline. At the most trivial level this is reflected in the tendency to use capitals in the label (or evolving labels) for the tradition and, derivatively, in the flow of acronyms: CLS (for 'critical language study', the first general label offered by Fairclough to contrast his approach with earlier forms of critical linguistics), CLA (for 'critical language awareness', the label for what is identifiable as the main goal of the entire enterprise), CDA (for 'critical discourse analysis', the dominant label now), and TODA (for 'text-oriented discourse analysis', a label introduced to define the specificity of the approach in contrast to less text-oriented forms of discourse analysis in the French tradition, in particular Foucault). As in many other contexts, the acronyms not only serve as useful abbreviations, they also contribute significantly to the reification of what they stand for. By labelling 'critical discourse analysis' as CDA, the approach which is being advocated acquires existence as an entity in the realm of academia, an established tradition or discipline irrespective of the fluid status of 'critical', 'discourse' and 'analysis'. Similarly, the acronym TODA gives the impression of a stable and well-defined methodological angle. Less trivially, efforts are made to establish a community of critical discourse analysts. The result

is that mutual support seems to override mutual critique, resulting in a 'critical community' of like-minded scholars. The best expression of this tendency is probably to be found in Fairclough's article 'Discourse and Text' (1992c; reprinted as chapter 8 in Fairclough, 1995b) in which he comments on the 20 articles that appeared in the first four issues of the journal *Discourse & Society*. He argues that the analyses in some of the articles could have been stronger and more convincing if they had paid closer attention to textual analysis, others if they had paid more attention to intertextual properties. But the whole tone is one of support. The methodological concern seems to be inspired entirely by the idea that more evidence could be amassed to support specific conclusions. Although certain aspects of misorientation are pointed out in relation to one or two articles, none of the substantive conclusions or research 'findings' are challenged in any way. The entire exercise, therefore, looks like a community-building effort rather than a search for enhanced understanding.

The Case of Fairclough's Version of CDA

The Gap between Analyses and Conclusions

Let us return to what can be perceived as the major weakness of Fairclough's CDA, as illustrated with reference to *The Big Issue*: conclusions are rarely warranted by the textual analyses – nor does this seem to be a requirement. Fairclough posits a three-stage process for discourse analysis. The first stage is 'description', concerned with the formal properties of texts. The second is 'interpretation', situating the text as discourse, characterized by processes of production and interpretation, against a background of assumptions. The third is 'explanation', situating the discourse in relation to social processes at the institutional and societal level. Aware of methodological vulnerability, Fairclough presents practical guidelines for analysis on various occasions in the forms of questions to be asked by analysts (e.g. Fairclough, 1989: 110–11, 1992b: ch. 8, 1995a: ch. 10). Most of them are extremely useful for anyone developing a critical interest in texts, especially at the level of description, but also in relation to some elements of interpretation, especially those bearing on aspects of implicit meaning. However, already in the step from description to interpretation a methodological gap appears. Fairclough says that at the stage of interpretation, the analyst is basically engaged in the same sort of activity as the language users producing and interpreting, relying on the same kinds of 'members' resources':

> At this stage of the procedure, it is only really self-consciousness that distinguishes the analyst from the participants she is analysing. The analyst is doing the same as the participant interpreter, but unlike the participant interpreter the analyst is concerned to explicate *what* she is doing. (1989: 167)

Already at this stage, in other words, Fairclough seems to be giving up on the issue of empirical evidence. In response to challenges on this count, based

on the observation that – as it stands – Fairclough's analyst's interpretation can only be seen as one interpretation amongst many possible ones, without any sort of 'scientific' guarantee that it would be more 'accurate' or 'true' or 'valuable', Chouliaraki and Fairclough distinguish between 'understanding' and 'explanation' (originally the third stage) as two dimensions of the 'interpretative process'. They say:

> . . . CDA does not itself advocate a particular understanding of a text, though it may advocate a particular explanation. (1999: 67)

They thus eliminate claims about a privileged status for the analyst's understanding (or what in earlier versions would have been called the analyst's interpretation). In doing so, they also eliminate the need for any sort of methodological rigour to be applied in the search for an interpretation or understanding. In the same move quoted above, they try to salvage the notion of 'explanation', conceived as follows:

> The position of the analyst in explanation is more easily distinguishable from that of the participant in that the 'resources' the analyst draws upon here are derived from a social theory . . . (Fairclough, 1989: 167)
>
> An explanation re-describes properties of a text (including the range of understandings it gives rise to) by using a particular theoretical framework to locate the text in social practice. (Chouliaraki and Fairclough, 1999: 67)

In other words, the only real requirement for explanation is a good social theory. Nothing is said about the empirical dimension that is required to link data and theory. The theory being preconceived, it is not surprising, therefore, that 'findings' tend to be predictable and that a gap emerges between textual analysis and conclusions – even for many of those who, like myself, share large portions of the theory – as soon as the question of evidence is asked. Texts are simply made into carriers, as it were, of what one already assumes to be the case. Rather than proceeding from description via explanation to positioning, with interpretation at the core of all stages of the investigation, positioning comes first and interpretation is marginalized.

The methodological weakness of CDA has been pointed out by many others already, most forcefully perhaps by Schegloff (1997). Schegloff warns that social-theoretical preoccupations may impose interpretations that have little to do with the analysed discourse. He argues that all analytical claims have to be justified by formal analysis. In particular, he rejects the use of elements of 'context' unless formal analysis shows that the discourse participants themselves orient towards those elements. While I believe that Schegloff's notion of context is far too narrow and his emphasis on formal analysis borders on the reintroduction of some of the constraints of structuralism which CDA, amongst many other present-day tendencies in pragmatically oriented linguistics, has fortunately managed

context which can be shown empirically to function in the meaning-generation processes involved in a particular discourse are, by definition, more relevant to an analysis than elements that cannot be shown to leave identifiable traces. The search, therefore, has to be as systematic as possible, guided by sound and rigorous linguistic methodology. *The minimal guideline should be that whatever can be detected on the basis of a 'formal' analysis* (broadly conceived, with a wider notion of context than Schegloff's),[3] *can never be ignored.*

Let me give one example to illustrate what I mean. The example concerns a report in the *Lancaster Guardian* (12 September 1986), commented upon by Fairclough (1989: 50–2, 124):

(5) '*Quarry loadshedding problem*

Unsheeted lorries from Middlebarrow Quarry were still causing problems by shedding stones on their journey through Warton village, members of the parish council heard at their September meeting.

The council's observations have been sent to the quarry management and members are hoping to see an improvement.'

Summarizing, Fairclough comments as follows:

(i) The central element of the title is a nominalization, which results in the fact that 'we don't know who or what is shedding loads or causing loads to be shed – causality is unspecified.'

(ii) The attribution of responsibility is avoided: 'the quarry management figure only in the second paragraph in this representation as in receipt of the council's *observations*, a term which again avoids attributing any responsibility (it might have been *complaints*).

(iii) This newspaper report serves the economic power-holders: 'The power being exercised here is the power to disguise power, i.e. to disguise the power of quarry owners and their ilk to behave antisocially with impunity.'

As to (i), who is 'we'? One has to be a relatively uncooperative reader in order not to know. In fact, causality is specified by the noun 'quarry' in the title: there is no real vagueness about the link between the quarry, and hence those in charge of the quarry operations, and the stones. An identification of individual agents, mentionable by name, might be beyond the means of the reporter, if not completely impossible, as well as beyond the level of what is relevant for most of the people concerned, let alone for the readers. Moreover, for many readers of the *Lancaster Guardian*, it is probably quite clear from reading the title exactly what the issue is about. We must assume that there is an intertextual link between this report and earlier ones, so that much of the text-internal vagueness disappears. This intertextuality is marked explicitly by means of the adverb *still* in the first sentence, which presupposes that similar events have entered the accessible discourse world before. As to (ii), the quarry management is in fact identified unambiguously as the responsible authority; otherwise, it would not make sense for the council to turn to them with the observations which

explicitly said to be meant to induce improvements. The indirectness involved in *observations* may be a fully accurate representation of the style of the council's letter, and there will be no mistake in the audience's mind as to their status as a *complaint*. As to (iii), because of the well-marked repetitiveness of the 'load-shedding problem', and because the locus of responsibility is clear, most readers can indeed be expected to be shaking their heads thinking over the impunity of the quarry management with regard to its neglecting to do anything at all to prevent the problem from recurring, something which is definitely assumed to be in their power.

No doubt the article could have been written differently, focusing on the extent to which the quarry management had been evading its responsibility. And, indeed, the fact that this is not done may be related to the structures of dominance and power which newspapers tend to be part of. Yet, there are too many additional, potential if not observable, dimensions involved in the communicative anchoring of this example to warrant grand conclusions. Minimally, an empirical attitude would force us to introduce nuances in the theory-induced judgement offered by Fairclough.

The Metapragmatic Framing of Analyses

Let me now address the issue of the way in which Fairclough's theoretical, methodological and terminological paradigm may impose a look at linguistic data that does not match the reality of communicative practice.[4] I will focus on Fairclough's analysis of two samples of doctor-patient interaction (Fairclough, 1992b: 138–49; results of this analysis are also referred to in most of his other books). The samples are (6) and (7) below; (6) was borrowed by Fairclough from Mishler (1984) and it represents an interview between a male doctor and a female patient recorded in the US; (7) also involves a male doctor and a female patient and was recorded in the UK.

(6) *Sample 1*

[Full stops mark silences, each representing one-tenth of a second; colons indicate prolonged sounds; square brackets mark overlaps; round brackets indicate unclear fragments.]

DOCTOR: Hm hm ... Now what do you mean by a sour stomach?
PATIENT: .....What's a sour stomach? A heartburn
like a heartburn or someth [ring.
D: [Does it burn over here?
5 P: Yea:h.
It li– I think– I think it like– If you take a needle
and stick [Ya right [.... there's a pain right here [..
D: [Hm hm [Hm Hm [Hm hm
P: and and then it goes from here on this side to this side.
10 D: Hm hm. Does it [go into the back?
P: [It's a:ll up here. No. It's all right
[up here in the front.

15 ..... Wel:l when I eat something wrong.
D: How– How soon after you eat it?
P: ..... Wel:l .... probably an hour .... maybe [less
20 D: [About an hour?
P: Maybe less ..... I've cheated and I've been drinking which I shouldn't have done.
D: .....
[Does drinking make it worse?
25 P: [(...) Ho ho uh ooh Yes. ... . Especially the carbonation and the alcohol.
D: .... Hm hm ..... How much do you drink?
P: ..... I don't know ... Enough to make me
30 go to sleep at night ..... and that's quite a bit.
D: One or two drinks a day?
P: O:h no no no humph it's (more like) ten. [... at night.
D: [How many drinks– a night.
35 P: At night.
D: ....
.... Whaddya ta– What type of drinks? ..... I [(...)–
P: [Oh vodka .. yeah vodka and ginger ale.
40 D: .....
..... How long have you been drinking that heavily?
P: ..... Since I've been married.
D: .....
... How long is that?
45 P: (giggle ..) Four years. (giggle)

(7) *Sample 2*

[Full stops mark short pauses; dashes indicate pauses; square brackets show overlap; unclear fragments are in round brackets.]

PATIENT: but she really has been very unfair to me . got [no
DOCTOR: [Hm
P: respect for me at [all and I think. that's one of the reasons
D: [hm
5 P: why I drank s [o much you [know– a [nd em
D: [hm [hm hm [hm are you you back are you back on it have you started drinking [again
P: [no
10 D: oh you haven't (unclear [...)
P: [no . but em one thing that the lady on the Tuesday said to me was that . if my mother did turn me out of the [house which she thinks she
D: [....

15 P: may do . coz . she doesn't like the way I've been she has turned me o [ut befo [re . and em . she said that.
D: [hm [hm
P: I could she thought that it might be possible to me for me to go to a council [flat
20 D: [right yes [yeah
P: [but she
Said it's a very em she wasn't [pushing it because . my
D: [hm
P: mother's got to sign a whole [lot of [things and
25 D: [hm [hm
P: e: . she said it's difficult [and em . there's no rush over
D: [hm
P: it. I I don't know whether . I mean one thing they say in AA is that you shouldn't change anything . for a year
30 D: hm
hm Yes I think I think that's wise . I think that's wise (5 second pause) well look I'd like to keep you know seeing you keep . you know hearing how things are going from time to time if that's possible

Fairclough provides an analysis against the background of a theory some of the core notions of which are captured as follows:

> In terms of . . . analytical categories . . . **interactional control** is a dimension of *text structure*, **modality** a dimension of *grammar* (though a conception of grammar which is very much oriented to meaning, such as that of Halliday 1985), and **politeness** an aspect of what I called '*force*'. **Ethos** transcends the categories, as I shall explain below, and is motivated by *the focus on the self.* (1992b: 138, bold and italics added)

The analysis itself is metapragmatically framed as in Table 1, where the first column simply numbers the points of comparison, the second column offering the descriptive and interpretative phrasings used for example (6), Fairclough's Sample 1, the third column for example (7), i.e. Fairclough's Sample 2 (bold and italics are always mine.)

Table 1: Metapragmatic framing of samples (6) and (7)

1.	"Sample 1: 'Standard' Medical Interview" (6)	"Sample 2: 'Alternative' Medical Interview" (7)
2.	"[. . .] the interaction is organized around **questions** from the *doctor*, which are **answered** by the *patient*. [. . .] nine **cycles**, each of which is initiated by the doctor. [. . .] In some cases (lines 10, 13, and 27) the doctor's question is proceeded [sic] by an element which overtly acknowledges or accepts the patient's previous	"The most striking difference between the two samples in terms of interactional control features is that **the question-response-assessment cycle** is missing from sample 2, which is structured around *a lengthy account* by the patient, with the doctor giving *a great deal of feedback* in the form of *minimum response tokens* [. . .]."

(*Table 1 continued*)

answer. I shall call it an **'acceptance'**. Even when this is absent, the fact that the doctor proceeds to the next question, rather than asking a follow-up question, may be taken as implicitly accepting the patient's previous answer." "The doctor, *then*, is closely **controlling** the basic organization of the interaction [. . .]."	"There is evidence of the **negotiated nature of turn distribution** in the doctor's question (11. 6–7), which is articulated rapidly and quietly as an aside, showing the doctor's sensitivity to the way he is 'intruding' onto the patient's 'floor'. [. . .] Further evidence is the **long pause** by the doctor in 1. 30 after his assessment, which appears *to be making the 'floor' available again* to the patient to continue her account if she wishes to, [. . .]."
3. "A further corollary of this basic organization is to do with **'topic control'**. It is mainly the doctor who introduces new topics through his questions, for example when he shifts in lines 1–13 from what is meant by 'sour stomach', to where 'it burns' to whether the pain 'goes into the back', to when the patient gets the pain. Notice, however, that *the patient does introduce a topic* in 11. 21–22 – drinking – which the doctor takes up in 1. 24. I return to **this exception** below."	"The mode of **topical development** is that of conversation and of the 'lifeworld': *the patient is 'talking topically' without sticking to a single topic*, but shifting across a series of *interconnected topics* [. . .]." "Yet one cannot simply conclude that the doctor is surrendering interactional control to the patient. [. . .], there remain manifest control features even here: *the fact that the doctor does ask* ***the medically important question*** *about the patient's drinking*, [. . .]."
"[. . .] the patient acknowledges having done wrong by drinking, but the doctor does not pursue this admission. He *seems concerned only with the effect of alcohol on the patient's medical condition.* [. . .] One has the sense of the doctor shifting and constraining topic in accordance with a **pre-set agenda**, which the patient is not being allowed to disturb." "Looked at from the patient's point of view, this routine can come across as *a series of disconnected and unpredictable questions*, which is perhaps why the patient's answers, in contrast to the doctor's questions in the first part of the extract, are preceded by **hesitations** (11. 15, 18, 29, and 42)."	"He does so, however, with a **reticence** which is *uncharacteristic of traditional medical practice* and traditional doctor-patient relations [. . .]."
4. "Modality concerns the extent to which producers commit themselves	"The assessment in 1. 29 has **an explicit 'subjective' modality marker** ('I think'),

(*Table 1 continued*)

(*Table 1 continued*)

to, or conversely distance themselves from, propositions: their degree of 'affinity' with the propositions. [. . .] *inseparable from the relationship (and 'affinity') between the producer and other participants in the discourse.* In 11. 2–3, for example, the patient defines a 'sour stomach' as 'a heartburn like a heartburn or something'. The patient first glosses it with a 'folk medicine' term, then distances herself from the gloss by demoting it into a simile ('like' a heartburn), and then further distances herself from it by hedging it [. . .] with 'or something'. This is **low affinity modality**. [. . .] does she select low modality because she is not sure how accurate the gloss is, or because she is reluctant to claim anything resembling medical knowledge in an interaction with a legitimized medical expert? Propositional truth and social relations, *knowledge and power, seem to be intricately linked in such cases.*"	which makes it clear that the assessment is *just the doctor's opinion*, and *tones down its authoritativeness* [. . .]: 'that's wise' on its own would imply access on the doctor's part to implicit, and mystified, sources of professional judgement."
5. "Let me turn to politeness. [. . .] she speaks at this point in a 'teasing', 'flirtatious' or 'childish' tone, which may be interpreted as a way of mitigating the threat to her self-esteem, her 'face' [. . .], of her admission. By contrast, *the doctor's questions about the patient's drinking are unmitigated, bald, and even rather brutal* (1. 41): [. . .]."	"The one question is [. . .] produced as an aside, and it consists of *a vague and disfluent initial formulation* ('are you you back on it') followed by a more explicit formulation ('have you started drinking again'). *These features of the question minimize its face-threatening potential* and in that sense heighten its **politeness**. The *suggestion of further interviews* is also **polite** in that sense. It is very *indirect*: [. . .]. And he hedges his suggestion twice with 'you know' and *hesitates* (keep . you know hearing'), again giving a sense of *disfluency*."
"The **absence of politeness** can be linked to the more general concept of **ethos** – [. . .]. Doctors in standard medical practice manifest what one might call **a scientific ethos** [. . .] which is variously realized in [. . . and] the absence of niceties of interpersonal meaning such as	"Whereas in sample 1, the doctor's style of speaking accords with **a scientific ethos**, in this sample the doctor's *reticence, tentativeness, and apparent disfluency* accord with **a lifeworld ethos**: doctors in this sort of medical interview appear to be rejecting the elitism, formality, and distance of the medical

(*Table 1 continued*)

politeness, which would suggest an orientation to *the patient as a person* rather than a scientific orientation to *the patient as a case.*	scientist figure in favour of a (frequently simulated) 'nice', 'ordinary' person, a 'good listener'. *This accords with general shifts in dominant cultural values in our society, which devalue professional elitism and set a high value on informality, naturalness, and normalness.*"
6. "[. . .] evidence of ***a mismatch*** *between the medical perspective and the perspective of ordinary experience* in the way in which the doctor filters out parts of the patient's turns which, for him, are off topic. Whereas the doctor consistently manifests the **'voice' of medicine**, the patient's contributions mix **the voice of 'the lifeworld'**, or ordinary experience [. . .]."	"Sample 2 also differs from sample 1 in terms of **intertextuality**. *There is nothing analogous to the dialectic of the voices of medicine and the lifeworld* that I noted in the latter. Rather, the doctor appears himself to be drawing upon the voice of the lifeworld – for example, in portraying future interviews in terms of 'hearing, how things are going' [. . .]."
"The voices of medicine (M) and the lifeworld (L) **interrupt one another** repeatedly: L interrupts M in 1.21 (from 'I've cheated'), M interrupts L in 1. 24 ('Does drinking make it worse?'), L interrupts M in 1. 29 ('Enough to make me go to sleep') and vice-versa in 1. 31 ('One or two drinks a day?'), L interrupts M in 1. 42 ('Since I've been married') and vice-versa in 44 ('How long is that?'). [. . .] M and L are in *contestation.* [. . .] the repeated incursions of L appear before the doctor's questions (11. 23–4, 27, 37, 41, and 44). *Whereas the doctor rarely draws upon L, the patient uses M extensively, and is far more accommodating to the doctor in that sense than vice-versa.*"	"[. . .] the doctor *does exercise control,* even if *in an uncharacteristic manner.* We can see this fact in terms of interdiscursivity (constitutive intertextuality), by postulating *a* ***convergence*** *of standard medical interview genre with other genres,* such that some of the interactional control features of the former are maintained, but realized in an indirect and mitigated form under the influence of the latter. *The* ***acts*** *themselves emanate from one genre, their* ***realization*** *from others.* What are these other genres? I have referred already to conversation, but **conversation** is present here as a constitutive element of another genre, **counselling**. [. . .] The search for models for counselling has not surprisingly led outside *institutional discourse* to *conversational discourse,* where such values (manifest here in the doctor's *reticence* and *mitigation*) are widely realized, for instance in the lifeworld figure of the 'good listener'." "He does so, however, with a **reticence** which is *uncharacteristic of traditional medical practice* and traditional doctor-patient relations [. . .]."

When reflecting upon the premises that are taken for granted in Fairclough's metapragmatic framing of discourse examples (6) and (7), the following observations can be made (where the numbers correspond to those in the first column of Table 1):

1. The contrastive labelling of the two samples as 'standard' vs. 'alternative' is not just descriptive, but it is evaluative, 'standard' meaning 'traditional' and predictably being viewed less favourably against the background of Fairclough's theory of society. (This ascription of evaluative intentions could not be made on the basis of the labelling of the two events alone; it is fully supported, however, by other clearly evaluative details of the contrastive descriptions provided, as commented on briefly below.)

2. In any ordinary sense of the term, the Sample 2 doctor gives very little feedback. The evidence adduced for the 'great deal of feedback' is to be found in the 'minimum response tokens' or, to use a different term, back-channel cues. Based on the transcriptions, there are indeed twice as many occurrences of such signals of listener behaviour in Sample 2 than in Sample 1. However, the frequency is no doubt structurally determined by the overall interactive pattern which is question-answer in Sample 1 and narrative in Sample 2. In order to follow Fairclough's assessment, then, we should be able to weigh the relative feedback value of asking questions (which the doctor in Sample 1 does a lot) vs. simply signalling that one is listening to a story.

Fairclough observes, quite correctly, the question-answer cycles in Sample 1, with the doctor doing the questioning. *Then*, however, he suddenly equates the asking of questions with interactional control. This equation ignores the fact that answers to questions may exert as much control over an interaction as questions. The least one can say is that in Sample 1 there is more interaction, and that more meaning negotiation is taking place. Yet the concept of 'negotiation' is applied exclusively to Sample 2, where style features of a question asked by the doctor, namely its rapid articulation and its quiet delivery as an aside, are adduced as evidence. Why does this show 'sensitivity to the way he is "intruding" onto the patient's "floor"', rather than a temperamental inclination to avoid assertiveness? And why does a long pause in the case of Sample 2 have to be interpreted as a yielding of the floor (described as a purposeful act), rather than a lack of anything to say, or even a lack of interest, or simply the desire to end the interview?

3. Why is the patient's topic-shifting in Sample 2 still described as a coherent form of behaviour, whereas the questions asked by the doctor in Sample 1 are said to be disconnected and unpredictable, even if they are supposed to be part of a pre-set agenda? Why is this pre-set agenda presented as irrelevant, even if all the questions relate directly to the medical topic brought up by the patient herself, namely drinking, whereas the Sample 2 doctor's asking about drinking is characterized as 'the medically important question'? Why does Fairclough maintain that the topic in Sample 1 is completely controlled by the doctor if the one topic that is brought up by the patient, drinking, fully determined the rest of the exchange? And why is the Sample 1 patient's introduction of this one topic described as an 'exception' if it has such a strong structuring influence?

Why are the patient's hesitations in Sample 1 supposed to result (even if modified by 'perhaps') from the so-called disconnectedness and unpredictability of the doctor's questions? An explanation that is at least as likely is that the sensitive topics addressed by the doctor call for a great deal of self-monitoring on the part of the patient.

In relation to Sample 2 the doctor's reticence is praised as a superior way of keeping some interactional control. Is it not simply the case that the doctor exerts control in a differently 'stylized' way? Should we not keep in mind that reticence (as in some psychiatric approaches) can be experienced by a patient as a truly extreme form of control?

4. Why this talk about 'low affinity' in relation to Sample 1? Is the patient not just trying to find the proper level of expression to communicate as well as possible? And if we want to use such terms, why doesn't Fairclough apply it to the doctor's behaviour in Sample 2? No doubt, 'toning down authoritativeness' sounds better. But isn't the doctor's expression simply non-committal – and hence characterized by low affinity?

5. Before condemning the doctor's questions in Sample 1 as 'unmitigated, bald, and even rather brutal', should we not take into account that the patient herself brought up the topic to which the questions relate? Furthermore, how does one observe an 'absence of politeness'? And why is the doctor in Sample 1 supposed to be treating the patient as a case only? Why, for that matter, is treating a patient as a case contrasted with treating a patient as a person? What happened to treating a patient as a patient, which would require a good combination of the two?

Why, on the other hand, is the doctor's suggestion in Sample 2 that there should be further interviews be seen as a form of politeness? Isn't this suggestion rather abrupt as well? Isn't it a nice and friendly way of shoving the patient out of the door?

6. Why are the 'voice of medicine' and the 'voice of the lifeworld' supposed to 'interrupt' each other and to be 'mismatched' in Sample 1? What happened to the possibility of observing their 'interaction'? And is there a real voice of medicine in Sample 1 to begin with? Why, on the other hand, are the medical interview genre and the conversational/counselling genre supposed to 'converge' harmoniously in Sample 2, rather than to clash and compete?

Briefly, the systematic introduction of desired forms of contrastiveness in the form of highlighting and metalinguistic categorization devices makes many points of comparison fade away. In other words, the analysis genuinely distorts some of the data. There are at least two basic principles of analysis that are ignored. First, some general *aspects of context* are fully neglected. Many of the differences between Sample 1 and Sample 2 are directly explicable on the basis of the fact that in Sample 1, (a) the patient comes to the doctor with a clear medical problem and (b) there is very little familiarity between doctor and patient (a fact which is manifested by the contents of some of the doctor's questions). In cases like this, Ockham's Razor should be applied – especially since it also allows us to stick more closely to what is empirically observable. A second mistake is the treatment of *form-function relationships* as stable

would reject such stability himself if asked explicitly. In the criticized analyses, the following kinds of relations are treated as stable:

asking questions = X ↔ reticence = Y
more dysfluency = more politeness
long pauses = making the floor available
etc.

The fundamental negotiability of language in the process of meaning generation (taking place with real language users in real contexts of use) should at all times be the basic guideline. And the central focus of an analysis should always be the empirically observable meaningful functioning of linguistic forms in their cognitive, social and cultural context.

Conclusion

Within the scope of this article, unfortunately, there is no space to spell out the ground rules for empirical ideology research (see, however, Verschueren, 1995, 1996, 1999a: ch. 8, for some preliminary guidelines). It should be clear, however, that in spite of the similarities between my criticisms and some earlier ones (e.g. as voiced by Stubbs, 1997), I would by no means draw the same conclusions (e.g. that – simplifying a little – whatever Fairclough or CDA in general can possibly say is speculation). There would be no point in my critical excercise in that case. The negative tone of the foregoing pages is meant to be fully constructive. There can be no improvement without an observation of flaws. In order to give Tomasello's 'cumulative cultural learning' a chance in a scholarly endeavour that really matters, linguists and anthropologists studying the social functioning of discourse should develop a culture of mutual criticism. After all, since all talk is embedded in the complexity of human life, the discourse we produce is as vulnerable as the discourse we analyse and may suffer from the same shortcomings. A *culture of mutual criticism* may be the only guarantee for unprejudiced observation and serious learning, even though it may *require* the risky kind of community-building that was identified as one of the predicaments of criticism in that it may itself *endanger* the perpetuation of such mutual criticism. However vulnerable this may make us, it may also be our best chance for being taken seriously – a not-so-unimportant goal in spite of its utilitarian overtones.

Notes

This paper was first presented during the 98th Annual Meeting of the American Anthropological Association, Chicago, 20 November 1999 (session on 'The relevance of critique in discourse analysis'). Its present formulation has benefited from later discussions with or comments from Jan Blommaert, Paul Chilton, Jim Collins, Monica Heller, Luisa Martín Rojo, Ben Rampton, Stef Slembrouck, Karen Sykes, Rachel Whittaker.

1. Before getting down to business, let me point out that I am fully aware of the fact that any observant CDA audience may criticize the foregoing introduction on the basis of its heavily late-modern economy-inclined metaphorization: *optimizing, quality of life, news production and consumption, unproductive, target audience, quality control, impact, getting down to business.* They may refer to the *instrumentalization* and *commodification* of scientific work that is implied, and I may be blamed for subjecting academia to processes of *colonization* from the corner of society which embodies the main patterns of capitalist domination. Finally, my pointing this out at this stage may be characterized as a pre-emptive *appropriation* of criticism. Whatever the labels (useful in themselves though often used lightheartedly) may be, I don't mind as long as they capture the idea that, at the end of the day, the critical work undertaken by linguists should, in my view, make a difference. Never mind the contribution of the foregoing sentence to the *conversationalization* of a formal academic genre and to the production of a *hybrid* text – as long as I get my message across (though this is yet another unacceptable metaphor).
2. Part of the following section also occurs, in roughly the same words, in Verschueren (1999b), where a critical attitude to some major work in pragmatics is advocated. This should convince readers that the present article is not part of a sectarian struggle over hegemony between 'rival' traditions such as 'pragmatics' and 'CDA'.
3. My notion of context allows for the potential relevance, in linguistic analysis too, of any ingredient of a speech event that can be shown to contribute to meaning generation processes, while Schegloff's would require 'visibility' in the forms to be analysed. (See also Blommaert in this volume.)
4. On language ideologies, see Woolard and Schieffelin (1994), Schieffelin et al. (1998) and Blommaert (1999).

Positioning and Interpretative Repertoires: Conversation Analysis and Post-Structuralism in Dialogue

Margaret Wetherell

As Teun van Dijk (1997) noted in a recent editorial for *Discourse & Society*, it is no simple matter to differentiate 'good' from 'bad' discourse analysis. Although it is not the case that 'anything goes' in discourse work, it seems unlikely that any single set of evaluative criteria will prove sufficient. This, however, does not preclude discourse analysts from attempting to advocate or legislate their own 'gold standard' for analysis (or editors from making evaluative judgements). And, indeed, in a recent article also published in *Discourse & Society*, the conversation analyst Emanuel Schegloff (1997) has tried to formulate just this kind of standard.

Schegloff takes to task various forms of (unspecified) critical discourse analysis and argues that such analyses should be grounded in what he describes as the 'technical' discipline of conversation analysis. Schegloff suggests that as a result of this technical exercise critical discourse analysts may find that the discursive phenomena of interest are quite other than they assumed. Conversation analysis is also offered as a corrective to what Schegloff presents as the grandiosity of critical discourse analysts. This grandiosity is evident, according to Schegloff, when analysts impose, in an act of intellectual hegemony, their own frames of reference on a world already interpreted and endogenously constructed by participants. Finally, Schegloff suggests that conversation analysis provides a principled method for reaching some form of closure in the face of the infinite regress of possible interpretations stressed by deconstructionist and postmodern perspectives.

The aim of this article is to comment on and explore Schegloff's proposals in relation to some data and in this way to contribute to the wider debate about

the criteria for the evaluation of discourse analysis. I argue that conversation analysis does indeed offer a useful discipline for discourse analyses conducted under a broadly 'critical' aegis but this discipline needs to be two way. Conversation analysis alone does not offer an adequate answer to its own classic question about some piece of discourse – why this utterance here? Rather, a complete or scholarly analysis (as opposed to a technical analysis) must range further than the limits Schegloff proposes.

This discussion is also relevant to and emerges from a particular disciplinary context – discourse analysis as it has been developing in social psychology. It has become common-place in social psychology in recent years to distinguish between two or more styles of discourse analysis (see Antaki, 1994; Burman and Parker, 1993; Parker, 1990; Widdicombe and Wooffitt, 1995). Typically, the boundary lines are drawn between styles of work which affiliate with ethnomethodological and conversation analytic traditions and analyses which follow post-structuralist or Foucauldian lines. Thus Widdicombe and Wooffitt distinguish between a discursive psychology offering a fine grain analysis of the action orientation of talk (e.g. Edwards, 1997; Edwards and Potter, 1992) and investigations concerned with the imbrication of discourse, power and subjectification which take their lead from the work of Foucault (e.g. Hollway, 1984; Marks, 1993).

In contrast to this division into 'molecular' and more 'molar' styles of analysis, or 'critical' versus 'non-critical' discourse analysis, this paper argues for a more synthetic approach in line with earlier attempts to weave a range of influences into a viable approach to discourse analysis for social psychological projects and topics (see Potter and Wetherell, 1987; Potter et al., 1990; Wetherell and Potter, 1992). I suggest that although the terms of engagement between post-structuralism and ethnomethodology/conversation analysis need revisiting, a stance which reads one in terms of the other continues to provide the most productive basis for discourse work in social psychology, in much the same way, for example, as cultural anthropologists and ethnographers of communication (see Duranti, 1992; Lindstrom, 1992; Maybin, 1997; Ochs, 1992) have found an eclectic approach to be the most effective. I first introduce the data at issue in this article, then review Schegloff's take on conversation analysis and some post-structuralist writings as two contrasting potential analytic frames, before returning to the data and an evaluation of the adequacy of what each offers.

'Four in One Night'

The stretch of discourse presented in the Appendix comes from a relatively large-scale project on the construction of masculine identities (Edley and Wetherell, 1995, 1996, 1997; Wetherell, 1994; Wetherell and Edley, 1998). Part of this project involved an intensive reflexive ethnography (Atkinson, 1989) conducted in and around the sixth form common room of a single sex boys' independent school in the United Kingdom and included interviews with small groups of white,

17–18-year-old male students. Each group of three was interviewed around eight times, meeting for an hour each week with the interviewer (Nigel Edley), for a period of approximately two to three months. The aim of this ethnography was to examine the construction of middle class masculine identities in one institutional site and the interviews covered aspects of the young men's daily lives, social relations within the common room, their anticipations of their future working and domestic lives, relationships with women and with male friends, sexuality, popular culture, feminism, homophobia, masculine stereotypes, and so on.

The material in the Appendix comes from the fifth session of one of these small group interviews (with Group C) around half-way into the session. The participants (Phil, Aaron and Paul) and the young women referred to in the conversation, but not the interviewer, have been given pseudonyms. This extract begins with the interviewer introducing a new topic of conversation, picking up on a previous but unexplicated allusion to some events involving Aaron during the weekend.

Extract One

1 Nigel: Okay yeah tell me about going with four people in one
2 night=

This formulation is heard as a request to Aaron for a description of the events which Phil eventually supplies with and on behalf of Aaron (lines 10–74). The description concerns Aaron's behaviour at a pub on the Friday night and at a party on the Saturday night and the nature of his involvement with four different young women. The discussion of this topic prompted by Nigel Edley (which in fact continues for many more turns than reproduced in Appendix One) moves on to consider the evaluation of the event (lines 76–93).

Extract Two

73 Phil: So that like took me aback somewhat (0.3) so that was
74 a good weekend for you
75 (.)
76 Nigel: Is that good?

After some discussion of the 'stick' or criticism Aaron received from his friends, Nigel intervenes once more to re-focus the discussion on the morality of Aaron's actions.

Extract Three

94 Nigel: =Yeah I mean I wasn't sort of saying is four in two
95 days good I mean it's impressive [you know]
96 Aaron: [hh [hhh] hh
97 Phil: [hhhhh] hhhh
98 Nigel: But I me::an like (.) it presumes that erm that's:: a
99 creditable thing (.) yeah? Is it?

After Phil and Aaron discuss Aaron's position on 'the moral low ground' the fourth participant in the discussion (Paul) is invited into the conversation and asked for his views.

Extract Four

116 Nigel: Right (.) okay (0.2) what do you think Paul?

Paul defers giving an immediate response and establishes his views instead through a kind of Socratic dialogue which prompts Aaron and Phil to reformulate again the nature and status of what happened (lines 116–76).

The interviewer's questions key into two very pervasive and inter-related discursive activities – describing events (formulating their nature) and accounting for and evaluating those events. There is, of course, an enormous amount of interest in these data for the discourse analyst, including, for instance, the delicate business of telling a story on behalf of someone else, the large amount of ventriloquizing and reported speech, its use and discursive functions in Aaron's accounts particularly, the role of laughter, Phil's double position as Aaron's supporter and 'tormentor' and the organization of the discourse within the frame of interview. The aspects I wish to select for further discussion include the construction of multiple versions of 'what happened', and the related construction of what I call 'troubled' and 'untroubled' identities.

Before examining these features, however, I first set up conversation analysis as a potential analytic frame for this material, focusing in particular on Schegloff's (1991, 1992, 1997) writings on method and context, and then some post-structuralist writings (Laclau, 1993; Laclau and Mouffe, 1985, 1987; Mouffe, 1992; Shapiro, 1992) as an alternative frame. How might each perspective understand discourse of this kind? What concepts are offered for analysing this talk?

Conversation Analysis

In traditional sociology, or in traditional social psychology for that matter, a satisfactory analysis of the kind of material found in the Appendix would relate the patterns found to some external social cause or some internal psychological motivation. The interest would be in Aaron's *actual* actions as these can be deduced from descriptions. In explanation it might be sufficient, for example, to say that Aaron's behaviour ('four in one night') is caused by his attitudes towards women and his internalization of gender ideologies or perhaps could be caused by his developmental stage as an adolescent experimenting with sexuality.

What distinguishes the analytic frame of ethnomethodologists and conversation analysts, of course, is their disinterest in this question of external social or natural causes, and their rejection of the side-step which takes the analyst immediately from the conversation to something seen as real and determining behind the conversation (Garfinkel, 1967; Heritage, 1984). For Schegloff, talk-in-interaction of the kind exemplified in the Appendix represents 'a' or even 'the' prime socio-cultural site. It is the place where culture and 'the social' happen.

And, what is of interest is what the conversation means for the participants as they intersubjectively build a social order.

Conversation analysts study the way in which social organization is accomplished in talk. According to Duranti and Goodwin (1992: 192), the study of conversation 'permits detailed analysis of how participants employ general, abstract procedures to build the local particulars of the events they are engaged in'. Such procedures, however, are seen as flexibly applied situated social practices rather than prescriptive, all-or-nothing, rules. Procedures might include, for instance, competence at turn-taking, recognition of sequential organization and conditional relevance such as that a question, for example, typically demands an answer (Schegloff, 1968).

Analysis proceeds from the general observation that in talk participants display to each other, as they perform their own contributions, their understanding of the setting and context, and their grasp of the emergent activities. Members of society display what they know – their practical reasoning skills and competencies. It is possible to see, for example, how utterances are designed to do tasks while the replies or turns of other participants demonstrate how those utterances are intersubjectively understood and are taken up (Sacks, 1992). The focus of conversation analysis is thus on the reflexive accomplishment of conversation. Conversation analysis attempts to provide a good description of conversational activities but is also an explanation of those activities in the limited sense that description depends on a particular view of the nature of social organization and social order.

Schegloff's (1991, 1992, 1997) writings on methodological principles are based on his analytic experience but also on this view of what conversation is and the relevance of this discovery for understanding social life. In his 1997 article, as noted earlier, his particular target is forms of critical discourse analysis which in developing accounts of topics such as gender and power relations become, as Schegloff sees it, loose and ungrounded and risk mistaking their object. Schegloff argues that although as members of society we (scholars and analysts) might know who is oppressed, who count as the 'good guys' (sic) and the 'bad guys' (sic), it is self-indulgent to import this knowledge a priori into analysis. Similarly, we should not impose our more scholarly and theoretical concerns, our preoccupations with topics such as the organization of ideological discourse, for example, upon lay members of society. He suggests that, paradoxically, a more satisfactory kind of critical/political analysis might result if critical analysts focused instead solely on the endogenous concerns and orientations of participants.

This plea for the foregrounding of participant orientations and the backgrounding of analysts' concerns and categories is linked to a further requirement that all analytic claims should be empirically grounded. It should be possible to 'point' to the data and make visible the moments when things happen. The analyst must be able to show that participants had the orientation claimed for them and should be able to demonstrate how participants' subsequent behaviour in the turn by turn organization of talk *displays* this understanding.

Schegloff (1992) argues that talk has many potentially relevant contexts including what he calls distal or external contexts (such as the class, ethnic, gender

composition of an interaction, the institutions and ecological, regional and cultural settings in which they occur) and proximate contextual variables (such as the sort of occasion participants take an interaction to be, the speaker/listener slots or roles available, and so on). The crucial thing, however, in the face of this omni-relevance and the infinitude of possible perspectives on what happened is what is relevant for the participants. Analysis, then, in this view, must be compatible with what Schegloff calls the internal sense of an interaction. It must take seriously the object of inquiry in its own terms and must recognize the hugely advantageous feature of studying talk-in-interaction that this is one socio-cultural site furnished internally with its own constitutive sense, with, as Schegloff (1997) states, a defeasible sense of its own reality.

Social Postmodernism

In many respects the analytic frame provided by Laclau and Mouffe and by Shapiro could not be more different. Laclau and Mouffe's work has been aligned with what Nicholson and Seidman (1995) call 'social postmodernism'. This designation reflects their aim of mobilizing post-structuralist perspectives on discourse, signification and the decentred subject to develop more effective socialist and radical democratic political projects. Whereas Schegloff focuses on talk-in-interaction, Laclau and Mouffe make 'discourse' their topic. Whereas Schegloff takes members' methods as the organizing principle for the material he studies, Laclau and Mouffe focus instead on the structuring effects of 'discursive articulations' and 'nodal points'. While Shapiro recommends a genealogical eye towards the 'proto-conversations' which constitute institutionalized forms of intelligibility.

Laclau and Mouffe's understanding of discourse is an inclusive one. Discourse is equated with the social or with human meaning making processes in general. Their definition of discourse includes both linguistic and non-linguistic elements. As an example of this combination, Laclau and Mouffe (1987) ask their readers to consider the activity of building a brick wall. The entire activity of building is made up of speech acts ('pass me that brick') and physical acts (placing brick on top of brick) yet both kinds of acts acquire their meaning in relation to each other and to the socially constructed and stabilized system of relations we recognize as 'building a brick wall'. They point out that not only is the 'being' of objects (such as bricks) established in this way, and therefore what these objects are for humans, but also the character, identity and the 'being' of social agents. Thus, again to use one of their examples, the 'discourse of football' establishes that a certain spherical object is a 'ball' while some bits of metal and netting become 'the goal'. Equally, any person who takes up a defined stance in relation to the spherical object and bits of wood becomes a 'player', or a 'goal-keeper'.

In other words, Laclau and Mouffe conceive the social space as a whole as discursive. Or, as Laclau (1993: 341) puts it, '(s)ociety can . . . be understood as a vast argumentative texture through which people construct their reality'. In line

constructed is both verbal and nonverbal. For Laclau and Mouffe it makes no sense to distinguish between the discursive and the extra-discursive or talk and the world – there is rather an unceasing human activity of making meanings (the horizon of discourse) from which social agents and objects, social institutions and social structures emerge configured in ever-changing patterns of relations.

As good post-structuralists, Laclau and Mouffe argue that signification (and thus the social) is an infinite play of differences. Meaning can never be finally fixed; it is always in flux, unstable and precarious. The being of objects and people can never be encapsulated, once and for all, in a closed system of differences. Laclau and Mouffe balance, however, this emphasis on openness and non-finalizability, the 'radical relationalism' of the social, with claims about a process of organization rather vaguely described as 'discursive articulation' or the forming of 'nodal points', 'discursive clumps' or 'ensembles'. Things recognized as people and objects and the relations between these entities are pulled together or emerge in stable forms which may last for quite long historical periods. Power is recognizable in the formation of these articulations and nodal points. Indeed power seems to be the capacity to 'articulate' and to make those articulations not only 'stick' but become hegemonic and pervasive. The influence of both Foucault and Gramsci on Laclau and Mouffe's formulations is evident here.

For Laclau and Mouffe, people or social agents are both passive and active. On the one hand, people seem to provide the energy required for meaning-making and articulation. On the other hand, as Mouffe argues, the individual subject becomes de-centred, not the author of his/her own discursive activity and not the origin point of discourse:

> We can . . . conceive the social agent as constituted by an ensemble of 'subject positions' that can never be totally fixed in a closed system of differences, constructed by a diversity of discourses, among which there is no necessary relation, but a constant movement of over-determination and displacement. The 'identity' of such a multiple and contradictory subject is therefore always contingent and precarious, temporarily fixed at the intersection of those subject positions and dependent on specific forms of identification. It is therefore impossible to speak of the social agent as if we were dealing with a unified, homogeneous entity. We have rather to approach it as a plurality, dependent on the various subject positions through which it is constituted within various discursive formations. (Mouffe, 1992: 372)

This position has important implications for traditional notions of ideology, false consciousness and objective group interests. The concept of false consciousness assumes that social agents have real or true identities (as members of the proletariat, for example) and real or true interests which go with those social identities which they may misperceive, simply not recognize or which can be obscured and invisible. Instead, Laclau and Mouffe (1987) argue that identity and interests do not operate in this way, in advance of social and discursive

independently of the consciousness of the agents who are their bearers', (p. 118). Interests emerge from discursive configurations and must be mobilized and made discursively available.

In Shapiro's writings it is possible to find an explication of Foucault's notion of genealogy which helps articulate the kind of analytic activity which might emerge from these formulations. Shapiro argues that '(i)ntelligible exchanges are always situated . . . the context–meaning relation subsumes a complex history of struggle in which one or more ways of establishing contexts and their related utterances has vanquished other competing possibilities' (1992: 38). The task of genealogy, then, and analysis, is to render strange usual or habitual ways of making sense, to locate these sense-making methods historically and to interrogate their relation to power.

I return now to the material in the Appendix. There are two claims I wish to make in relation to these data which bear on the analytic frames presented here. First, in contrast to post-structuralist accounts of the decentred subject, but commensurate with conversation analysis and ethnomethodology, I want to emphasize the highly occasioned and situated nature of subject positions and the importance of accountability rather than 'discourse' *per se* in fueling the take up of positions in talk. Detailed analysis of conversation allows a different view of 'constituted identities'.

Second, I argue that for a complete rather than merely 'technical' analysis of this material it is necessary to consider the forms of institutionalized intelligibility, to use Shapiro's term, which comprise members' methods. I will suggest that the way in which Schegloff marks the boundaries around conversation is unhelpful and unproductive. The more inclusive notion of discourse found in post-structuralist writing and exemplified in Laclau's notion of the argumentative texture of social life provides a better grounding for analysis. In developing both these points I draw on analytic concepts from social psychological discourse analyses such as variability (Potter and Wetherell, 1987), ideological dilemmas (Billig et al., 1988) and interpretative repertoires (Potter and Wetherell, 1987; Wetherell and Potter, 1988) which take a more integrated stance towards traditions such as conversation analysis and post-structuralism.

Troubled and Untroubled Subject Positions

Post-structuralist theorists, with their more global view, rarely have their noses pressed up against the exigencies of talk-in-interaction. Rarely, are they called on to explain how their perspective might apply to what is happening right now, on the ground, in this very conversation. Theoretical concepts emerge in abstract on the basis of often implicit assumptions about the nature of interaction, language or social life. The notion of subject position explicated by Mouffe (1992) is a good example, and its paucity becomes apparent if we consider in detail just some of the many positionings of Aaron in the material in the Appendix in relation to formulations of the nature of the event ('four in one night') and the way in

One useful way into such analysis (Potter and Wetherell, 1987) is to look for variability in accounts and formulations – tracking the emergence of different and often contradictory or inconsistent versions of people, their characters, motives, states of mind and events in the world – and asking why this (different) formulation at this point in the strip of talk? One early formulation or positioning for Aaron comes in line 9:

Extract Five

1	Nigel:	Okay yeah tell me about going **with four people in one**
2		night=
3	Phil:	[=All::right ((bangs table))]
4	Aaron:	[hhhhhhh hhhhhh hhhhhh h] hh no::=
5	Phil:	=Go on=
6	Paul:	On the record=
7	Phil:	=Was it was it this f .hh
8		(.)
9	Aaron:	I don't know I was a bit drunk=
10	Phil:	=I I'll tell he was drunk I'll tell you what I know
11		[because] I am never drunk
12	Nigel:	[Hm mm]
13	Phil:	Because I'm dead smug [erm:::]
14	Aaron:	[He's never] drunk it's true=

As conversation analysis reminds us, Aaron's positioning of himself as drunk is highly occasioned and needs to be seen in the context of the surrounding conversational activities. Nigel's request in line 1 for an account ('tell me') makes a description conditionally relevant as an appropriate next turn (Schegloff, 1968). Aaron, however, after registering what sounds like dismay at the emerging topic (line 4), and after some interventions from Phil and Paul, demurs ('I don't know I was a bit drunk'). Such 'dispreferred responses' (see Pomerantz, 1984) usually come supplied with an account for 'non-compliance' and in this case the drunkenness provides the grounds. Phil's next utterance (line 10) indicates that he also hears Aaron in this way since he uses his own sobriety as a credential (legitimated by Aaron) for why it might be appropriate for him to tell the story instead as a qualified witness. Indeed it turns out that this is one of those stories of prowess that may be better left to others to tell on one's behalf.

By now, however, several positions are already in play. Aaron's drunkenness has been laid on the table, while his laughter and 'no::' in line 4, Phil's urging ('go on') and Paul's insistence on the importance of being 'on the record' also establish a context and a range of positions for Aaron as well as an audience in relation to the as yet enigmatic event.

As Antaki et al. (1996) note in relation to the identity work in some data they analyse:

> Such bringings-to-bear are briefly over and done, of course, but their accumulated record is what gives a person their (portfolio of) identities.

> as instances of times when the person was (understood to be) a linguist, a Kennel Club member and so on. The speakers are doing three things at once: invoking social identities, negotiating what the features or boundaries of those identities are and accumulating a record of having those identities. They will be able in the next round of their interactional history, to draw on having all been exposed to this conversational display of identities. (p. 488)

Further examples of these activities of invoking social identities, negotiating their features and accumulating a record are evident in the following extracts, beginning with Extract Six. These examples illustrate the highly indexical nature of subject positions or the importance of the exact circumstances of the invoking for understanding what is invoked, just as it was necessary to look at the conversational circumstances surrounding Aaron's invocation of his drunkenness in Extract Five to fully comprehend this self-positioning. Extract Six begins with the conclusion of Phil's often interrupted narrative of Aaron's weekend:

Extract Six

67	Aaron:	=We were very lucky that day
68	Phil:	We were erm and we were walking back and he says
69		oh I went with Janesy on Friday and I went yeah you
70		went with three birds last night you went with one on
71		Friday this was in his good month
72	Nigel:	Hm mm
73	Phil:	So that like took me aback somewhat (0.3) so that was
74		a good weekend for you

The context for what happened now becomes formulated as being part of or illustrative of a 'good month' or a 'good weekend'. Such 'fortune' could, of course, either be presented as agentic and internally attributed (seen as a personal achievement) or externally attributed as 'luck'. As is typical in talk (Edwards and Potter, 1992), both these possible, and potentially inconsistent, positionings emerge in the following discussion with Aaron later returning to the 'lucky' theme (see line 160 in Extract Nine) having raised it initially in line 67 (Extract Six) and more directly owning his 'good fortune' in the conversation which follows Nigel's next intervention.

Extract Seven

76	Nigel:	Is that good?
77	Phil:	Well in his books yes you know=
78	Aaron:	=hhhh.h [yeah]
79	Phil:	[The thing] is you got so much stick for it
80	Aaron:	Well yeah I could take the stick because it was
81		almost like (0.2) a good ego trip when everyone was
82		taking the stick oh you got off with her ah ha ha
83		yep I did so what's your problem? [Oh, er, errr]

Aaron re-frames the criticism he received ('stick') as 'a good ego trip' and to demonstrate how he handled it he constructs a piece of hypothetical dialogue with an imagined interlocutor where the interlocutor challenges him ('Oh you got off with her'), Aaron responds in a forthright way ('Yep, I did, so what's your problem'), leaving the imagined challenger confused and at a loss ('oh er errr'). The context for the event as something Aaron can be personally proud of becomes more firmly established invoking an as yet untroubled identity. In Extract Eight, Nigel as interviewer then attempts, in a complex discursive act, to repair a potential misreading of his earlier question in line 76: 'is that good?' His question leads to further formulations of Aaron's position:

Extract Eight

94	Nigel:	=Yeah I mean I wasn't sort of saying is four in two
95		days good I mean it's impressive [you know]
96	Aaron:	[hh [hhh]hh
97	Phil:	[hhhhh] hhhh
98	Nigel:	But I me::an like (.) it presumes that erm that's:: a
99		creditable thing (.) yeah? Is it?
100		(0.2)
101	Phil:	No because you're on the moral low ground
102	Aaron:	But I don't mind being on the moral [low ground]
103	Phil:	[Oh no you don't]
104		mind I I it didn't fuss me at all you know and I wasn't I
105		thought it was quite (.) it was quite impressive you
106		know you're sort of thinking that's shocking because it
107		never happens to me um:: .h hhh
108	Aaron:	Hhhh
109		(0.3)
110	Phil:	But he was (.) by some people in the group he was li
111		(.) they were just taking the piss it wasn't serious no-
112		one it didn't really bother anyone at [all]
113	Nigel:	[Hm mm]
114	Phil:	It was like Aaron was on the moral low ground because
115		he was like (.) gigolo Casanova whatever

In lines 94–5 Nigel first distances himself from Aaron and Phil's formulation of 'good'. He then notes, however, that the possible description 'impressive' might apply. Aaron and Phil's laughter may suggest that this is heard as a joke, as ironic or as problematic in some way. This reading seems likely because 'impressive' as a description follows Nigel's repair of his own possible positioning as someone who might concur with the definition of 'good' emerging in previous turns. 'Good' framed as 'impressive prowess' has become a more troubled position especially when it is now put in line 99 in conjunction with 'creditable'.

In line 101 Phil (temporarily, as it turns out) concurs with Nigel's troubling of Aaron's position. He formulates Aaron's conduct as not creditable because he is 'on the moral low ground'. At this point Aaron has a number of choices – he could accept Phil's assessment in entirety, [illegible]

and evaluation of his behaviour. Interestingly, he accepts Phil's description but presents himself as someone who doesn't mind occupying that cultural slot. In the process, of course, the indexical nature of that social space 'the moral low ground' becomes evident. Aaron moves to untrouble or normalize this position. And Phil re-adjusts his own position accordingly (see lines 103–15), distancing himself from the identity of someone who might be 'fussed' by Aaron's behaviour. Having been initially disapproving and with a hearably strong moral line, Phil's criticism of Aaron becomes re-characterized as not serious. While the position of Aaron in combination with 'the moral low ground' become reworked to be in line with other recognizable characters in stories of male sexual performance: 'like gigolo, Casanova, whatever'.

The final part of the discussion where Paul enters more fully as a participant adds some new positionings for Aaron and reworks two positions already available.

Extract Nine

116	Nigel:	Right (.) okay (0.2) what do you think Paul?
117		(0.3)
118	Paul:	Did you=
119	Phil:	=Are you ap[palled?]
120	Paul:	[When you] .hh no (.)s [when you went out]
121	Nigel:	[Not appalled?]
122	Paul:	I jus I'll tell you in a minute when you went out
123	Nigel:	hh[hhh]
124	Unknown:	[hhhh]
125	Paul:	When you went out on that Friday (.) evening you were
126		out on the pull yeah?=
127	Aaron:	=No
128	Paul:	This (.) you were not?=
129	Aaron:	=Just out [as a group]
130	Phil:	[Just out] as a group of friends
131	Paul:	On the Saturday you were out on the pull?
132	Phil:	No
133	Aaron:	.hh [not really]
134	Phil:	[He was] drunk=
135	Aaron:	=I wasn't drunk [unconscious] (.) I was very merry I
136	Phil:	[((inaudible))]
137		was like (.) all erm (.) all like social guards were down
138	Paul:	Yeah (0.2) and (0.3) whe::n (.) so and (0.4) when you
139		got off with the first one [did you]
140	Aaron:	[hhhhhhh hhh]
141	Phil:	Who was first? Can you remember?
142	Paul:	On the Friday
143	Aaron:	Er::::m on the Friday that that was Janesy
144	Paul:	Did you have any sort of like intonation ((sic)) of
145		carrying the relationship further?
146	Aaron:	No
147	Phil:	((inaudible – sounds like one nighter))
148	Paul:	So so you basically went for as many pullings off as
149		you could get in a weekend?

150 Phil: No
151 Aaron: I didn't go for it it just
152 (.)
153 Paul: It just happened?
154 Aaron: Well yeah (.) it's not so much I thought right ((hits
155 the desk)) this weekend (.) keep your pecker up lad
156 you're away [it's] not like that it's just that I
157 Phil: [hhh]
158 (.)
159 Paul: With any of them [did you feel]
160 Aaron: [I get lucky very ((inaudible))]
161 Paul: that they'd be like a follow on?
162 Phil: He didn't know who half of them were do you .hh hh
163 Aaron: Ah er I didn't (.) I mean it wasn't (.) I mean it wasn't
164 like a right gitty thing to do it was like the other
165 half knew as well that it wasn't gonna be
166 (0.4)
167 Phil: Mm
168 Aaron: Erm (0.2) no it's it's you're getting it all wrong it's
169 it's (0.2) it wasn't (0.4) errr Aaron come up with the
170 phrase you want to say (.) it wasn't alright this kid's
171 gonna get off with me then we're gonna go out oh no
172 we're not gonna go out what a git it was (0.2) I'm
173 gonna get off with this lad and that's alright
174 Phil: Fancied a bit of rough you know
175 Aaron: Fancied a bit of rough
176 Phil: As and it was mutual I imagine

This is an enormous amount happening here which cannot be analysed in detail. What I wish to note is Paul's new description of Aaron's activities as 'out on the pull' (in line 126). This account seems to be heard as an uncalled for accusation in relation to the events of Friday night and Aaron and Phil issue denials and collaborate as a duet in attempting to reformulate and minimize the actions so described – 'just out as a group of friends'. Interestingly, when Paul moves the conversation to the events of Saturday night Aaron's denial at this point becomes weak ('not really', line 133). In line 134 Phil offers another re-characterization for Saturday night. He summons up and recalls another available identity in Aaron's 'portfolio' – Aaron was drunk. In lines 135–7 Aaron modifies and qualifies this potentially damaging identity to lay the stress on drunkenness and loss of inhibition.

In lines 144–5 Paul goes on to develop more of his accusation – he suggests that Aaron had no intention of carrying on the relationship and this helps instantiate what it means to be 'out on the pull'. The crux of the argument as Aaron subsequently interprets it seems to be about intention and responsibility. The pattern of responses suggests that Paul's rhetoric is persuasive and he has successfully created what seems to be a troubled identity for Aaron – the identity of being intentionally or callously promiscuous – going from one woman to another with no thought of a longer-term relationship. This formulation leads Aaron to first disavow the identity of a lad who deliberately goes out planning sexual

conquests (someone who thinks 'keep your pecker up', line 155), then to try and reinstate the identity of 'being lucky' (line 160). Finally, he produces his longest description so far (lines 168–73) as he attempts to resist Paul's characterization through a formulation of his own mental state, his own talk to himself and the mental state and self-talk of the young women involved. He characterizes himself as not intentionally 'going for it', and posits the young women as similarly motivated by a casual sexuality so that his motives and state of mind were mirrored by the motives and state of mind of 'the other half'. Phil then collaborates with this account suggesting the young women 'fancied a bit of rough' and thus the encounter was mutual.

To summarize, multiple and potentially inconsistent subject positions are in play in this stretch of discourse for Aaron: he is drunk, lucky, on the pull, having a good month, on the moral low ground, engaged in consensual sexual play with young women who fancied a bit of rough, not intentionally going for it, his conduct is impressive and so on – indeed, this list does not exhaust all the positions evident in the complete discussion in the interview. The flow of interaction variously troubles and untroubles these positions. As we have seen, one formulation leads to a counter-formulation which is in turn resisted. In fact the question of how to evaluate Aaron's actions, as often happens in social life, remains unresolved and ambiguous, and these various threads and Aaron's 'portfolio' of positions remain available to be carried forward to the other contexts and conversations making up the 'long conversation' (Maybin, 1994) which is the sixth form common room culture.

To evoke a further analytic concept from social psychology, some order can be placed on these various positions by noting that they fit within several recognizable broader interpretative repertoires available to the young men. The term interpretative repertoire is an attempt to capture the 'doxic' (Barthes, 1977) nature of discourse. An interpretative repertoire is a culturally familiar and habitual line of argument comprised of recognizable themes, common places and tropes (doxa) (Potter and Wetherell, 1987; Wetherell and Potter, 1988, 1992; Wetherell et al., 1987). The repertoires in the quoted extracts include male sexuality as performance and achievement, a repertoire around alcohol and disinhibition, and an ethics of sexuality as legitimated by relationships and reciprocity (Hollway, 1984, calls this the 'have and hold' discourse). These interpretative repertoires comprise members' methods for making sense in this context – they are the common sense which organizes accountability and serves as a back-cloth for the realization of locally managed positions in actual interaction (which are always also indexical constructions and invocations) and from which, as we have seen, accusations and justifications can be launched. The whole argument does not need to be spelt out in detail. Rather, one fragment or phrase (e.g. 'on the pull', 'social guards were down') evokes for listeners the relevant context of argumentation – premises, claims and counter-claims.

Re-evaluating Subject Positions

What, then, is the significance of this analysis (carried out in line with the spirit of Schegloff's methodological principles if not with his concern for detail) for

Mouffe's post-structuralist account of subject positions? Mouffe (1992) presents subject positions as constructed in discourse, and the tenor of her account makes discourse the constituting agent. She argues that 'we can . . . conceive the social agent as constituted by an ensemble of "subject positions" that can never be totally fixed in a closed system of differences, constructed by a diversity of discourses, among which there is no necessary relation, but a constant movement of over-determination and displacement' (p. 372). Subject positions, and thus the identities of participants in social life, are determined by discourses and in this sense are prior, already constituted, and could be read off or predicted from knowledge of the relevant discourse.

Mapped on to the material in the Appendix, this view has some cogency in the sense that Aaron and Phil's choice to position Aaron within a repertoire of male sexuality as performance and proud achievement constructs for him and for others a context which may have ramifications beyond his control or intention. Aaron is certainly positioned; but it also seems a misdescription to make discourse the active agent here. What more clearly fuels positioning is accountability or participants' orientations to their setting and the emergent conversational activities. It is also very clearly the case that what a subject position comes to be is only partly the consequence of which discourse it can be assigned to. We saw, for instance, that the invocation of positions and thus their significance and connotation is indeed local, highly situated, and occasioned. In effect, as Schegloff argues, the sense of an interaction depends on what kind of thing it is for participants.

Such a perspective gives a more grounded view on what Mouffe (1992) goes on to describe as the contingent and precarious nature of identity, and on Laclau's (1993) notion of the 'radical relationalism' or openness of social discursive practices. It is not so much that these features arise due to the nature of signification per se but because of the reflexivity built into social interaction and the emergent and transformative properties of that interaction. Contingency, precariousness and openness arise in part because utterances are designed to do interactional tasks and do not thereby entail descriptive closure and cognitive consistency. The replies or turns of other participants demonstrate how those utterances have been intersubjectively understood as well as performing further actions. And all of this is contingent on the interactional moment.

I do not wish to suggest, however, that critical discourse analysis should thus become Schegloff's 'technical' analysis or that I see 'technical' analysis as an initial necessary discipline which should be carried out before any other statement about a piece of discourse could apply. As noted earlier, I see the 'discipline' as two-sided. A post-structuralist approach allows a perspective on talk which helps more thoroughly account for 'why this utterance here'.

Argumentative Threads

If the problem with post-structuralist analysts is that they rarely focus on actual social interaction, then the problem with conversational analysts is that they rarely raise thesir eyes from the next turn in the conversation, and, further, this

is not an entire conversation or sizeable slice of social life but usually a tiny fragment. Schegloff's methodological principles are fitted for the analysis of small pieces of conversation in detail. His recommendation that critical analysts first perform a 'technical analysis' is impractical – there may well be, for instance, thousands of interruptions which could be analysed in any social psychological or ethnographic study of discourse such as our work on masculinity. But, more crucially, Schegloff's suggestion rests on an unnecessarily restricted notion of analytic description and participants' orientation.

Schegloff argues that analysts should not import their own categories into participants' discourse but should focus instead on participant orientations. Further, analytic claims should be demonstrable. Schegloff's notion of analytic description uncontaminated by theorists' categories does not entail, however, that no analytic concepts whatsoever will be applied, as the example of his own analyses demonstrates. Rather, concepts such as conditional relevance, for example, or the notion of accountability, or preferred and dispreferred responses are used to identify patterns in talk and to create an ordered sense of what is going on. Presumably Schegloff would argue that this does not count as imposing theorists' categories on participants' orientations since such concepts are intensely empirical, grounded in analysis and built up from previous descriptive studies of talk. As already noted, the advantage for Schegloff of such an approach is that it gives scholarly criteria for correctness and grounds academic disputes, allowing appeals to the data, and it closes down the infinity of contexts which could be potentially relevant to something demonstrable – what the participants take as relevant.

It is not clear, however, when the concepts of more critical discourse analysts should be seen as crossing Schegloff's invisible boundary line from the acceptable deployment of concepts for the description of discursive materials to importing analyst's own preoccupations. Would a descriptive analysis, for example, guided by Foucault's concept of genealogy, of the 'institutionalized forms of intelligibility' organizing social relations in the sixth form common room of a boys' independent school and the interpretative repertoires and forms of common sense these make available to Aaron, Phil and Paul count as importing theorists' preoccupations? Would Schegloff's boundary line be breached if, as part of such an analysis of the available interpretative resources, we attempted to develop a feminist commentary on the social and cultural significance of the patterning and the tensions and contradictions in the use of these resources not to mention their crass and highly offensive nature?

The crucial issue here, for Schegloff, is the point at which analysis departs from evident participant orientations and one problem from a critical perspective is that Schegloff's sense of participant orientation may be unacceptably narrow. We have seen already that in practice for Schegloff participant orientation seems to mean only what is relevant for the participants in this particular conversational moment. Ironically, of course, it is the conversation analyst in selecting for analysis part of a conversation or continuing interaction who defines this relevance for the participant. In restricting the analyst's gaze to this fragment, previous conversations, even previous turns in the same continuing conversation become irrelevant

for the analyst but also, by dictat, for the participants. We do not seem to have escaped, therefore, from the imposition of theorists' categories and concerns.

Any piece of discourse analysis, of course, will involve restrictions on what is studied. Conversation analysis is not alone in this. If we adopt, however, Laclau and Mouffe's more inclusive notion of the 'argumentative texture' of the social and definition of discourse as the unceasing human activity of making meaning, a more productive sense of participant orientation and relevance is possible. Analysis works by carving out a piece of the argumentative social fabric for closer examination – a set of similar seeming conversational activities, say. Schegloff's approach demands that analysts then lose interest in the argumentative threads which run through this set as warp and woof connecting it in again with the broader cloth. The genealogical approach in contrast suggests that in analysing our always partial piece of the argumentative texture we look also to the broader forms of intelligibility running through the texture more generally. This is what Shapiro (1992) means by the concept of 'proto conversations' – the conversational or discursive history which makes this particular conversation possible.

With this tack, of course, we haven't solved Schegloff's problem of infinite relevance but, in practice, participants' orientations understood in this more inclusive way turn out to be manageable. As good ethnography of communication demonstrates (e.g. Cicourel, 1992; Lindstrom, 1992; Ochs, 1992) it is not necessary to say everything about the argumentative fabric of a society to say something, and something furthermore which is scholarly, complete, and insightful concerning participant orientations, and which takes those orientations as constructed by more than what is immediately relevant or set by the previous few turns in the conversation.

This point can be developed in another way. In effect, there are two approaches at stake to what counts as an adequate answer to the question – why this utterance here? For Schegloff, for example, the material in the Appendix is adequately analysed when we have described the principal conversational activities and shown how participants' utterances contribute to and are occasioned by those activities. From my perspective, however, this is not an adequate account. An adequate analysis would also trace through the argumentative threads displayed in participants' orientations and would interrogate the content or the nature of members' methods for sense-making in more depth.

Why, for instance, does Aaron respond to Paul's accusation that he is 'on the pull' with an argument which formulates the young women involved as also wanting casual sex (lines 163–73), thus attempting to make his own actions no longer 'a right gitty thing to do'? Why, in this community, among these members, might this possibly work as an adequate justification? Why is this assumed to be a possible 'good defence'? It is important and interesting from a feminist perspective that these young men only appeal to some notion of autonomous female sexuality at this point in their conversation. Indeed, why is Paul's intervention heard in the first place as a critique which deserves an answer? Why in this community does it seem to trouble identity to 'be on the pull' but multiple sexual encounters can be also successfully framed as 'good'?

We should also be interested in the 'heteronormativity' (Kitzinger, personal communication) evident throughout this discussion which supplies a further taken for granted discursive back-cloth organizing these young men's participant orientations and their members' methods for making sense. A more adequate analysis of 'why this utterance here' would also explore the silences and the absences in this material – the argumentative threads which are hearably not part of these participants' orientations and everyday sense-making. Crucially, it would be concerned with the ideological dilemmas (Billig et al., 1988; see also Billig, 1987, 1991) evident in the struggle and collaboration over how to formulate Aaron and his actions. The movement of contextualization and the troubling of positions gives some insight into the contradictory and inconsistent organization of the broader interpretative resources these young men are actively working over as they try to negotiate both 'good' and 'gitty'. Surely a complete or scholarly analysis would try to clarify, interpret and discuss these resources.

Conclusion

In this article, I have tried to develop a critique of both post-structuralist writers on discourse and Schegloff's methodological prescriptions for analysts. I have argued that a focus on participants' orientations can be extremely revealing about the formation of subject positions. Such a perspective substantially changes our view of the subject constituted by discourse and his or her 'ensemble' of subject positions. I have also tried to suggest, however, that in accusing critical discourse analysts of intellectual hegemony, Schegloff is performing his own act of colonization in seeking to impose one narrow understanding of participants' orientations and relevance on the field as a whole. A further central aim was to intervene in the construction within social psychology of contrasting camps of discourse analysts and to suggest further reasons for preferring a more eclectic approach.

What role, then, do I see for Schegloff's technical analysis? Is it, as he proposes, a first step in the long process of genealogical analysis or other kinds of critical discourse analyses focused on socio-political issues? My aim was not to endorse this division of labour – conversation analysis then ethnomethodology then post-structuralist analysis or ethnography of communication or critical discourse analysis – but to suggest that for social psychological discursive projects a more synthetic approach is required focused on the development of analytic concepts which work across some of these domains such as, for instance, the notion of positioning, interpretative repertoires, ideological dilemmas, and so on.

More specifically, critical discursive social psychology is that discipline which focuses on the situated flow of discourse, which looks at the formation and negotiation of psychological states, identities and interactional and intersubjective events. It is concerned with members' methods and the logic of accountability while describing also the collective and social patterning of background normative conceptions (their forms of articulation and the social and psychological consequences). It is a discipline concerned with the practices which produce persons, notably discursive practices, but seeks to put these in a genealogical context.

It could be evaluated using Schegloff's 'gold standard' – empirical demonstrability – but other conventional criteria for evaluating scholarship are also relevant such as coherence, plausibility, validity, and insight – especially when analysts include, as I believe they should, investigation of the social and political consequences of discursive patterning.

Appendix: Transcript and Transcription Notes

1	Nigel:	Okay yeah tell me about going with four people in one
2		night=
3	Phil:	[=All::right ((bangs table))]
4	Aaron:	[hhhhhhh hhhhhh hhhhhh h] hh no::=
5	Phil:	=Go on=
6	Paul:	On the record=
7	Phil:	=Was it was it this f .hh
8		(.)
9	Aaron:	I don't know I was a bit drunk=
10	Phil:	=I I'll tell he was drunk I'll tell you what I know
11		[because] I am never drunk
12	Nigel:	[Hm mm]
13	Phil:	Because I'm dead smug [erm:::]
14	Aaron:	[He's never] drunk it's true=
15	Phil:	=Friday you went with Janesy on Friday?
16	Aaron:	I did yes:::
17	Phil:	Out down the pub I I missed this completely a
18		complete shock to me=
19	Aaron:	=.hhhh
20	Phil:	Erm (.) went out down the pub one night as we do (.)
21		erm I went home because I like live out of town er
22		these stopped later (0.2) I was not aware of anything
23		following night big party I mean there was like
24		200 people there I would have thought big field (.) you
25		know disco and all that shit (.) erm Aaron got
26		absolutely out of his face (.) I was going out with
27		someone she didn't turn up sh she rang me [and told me]
28	Nigel:	[Hm mm]
29	Phil:	She might not be going
30	Nigel:	Hm mm
31	Phil:	Um:::
32	Aaron:	It was Karen
33	Phil:	It was Ka Karen erm something wrong [with her] mum
34	Aaron:	[hhhhh hh]
35	Phil:	wasn't it or something I can't remember what it was=
36	Aaron:	=Ah that's a good excuse
37	Phil:	Anyway [(0.2) sorry yes Aaron]
38	Aaron:	[hhhhh hhh hhhh]
39	Phil:	Erm so Aaron got really drunk and he went with
40	Aaron:	hhhhhhhhhhh [hhhh hhhh]

42		Cathy Brewin=
43	Aaron:	=No it wasn't Cathy Brewin it was another Cathy=
44	Phil:	=Cathy Cathy someone
45	Aaron:	It wasn't Cathy Brewin=
46	Phil:	=And you don't know who the other one was do you?
47	Aaron:	No
48	Phil:	You forgot her name=
49	Aaron:	=Yeah=
50	Phil:	=Or didn't even find out=
51	Aaron:	=Right=
52	Phil:	=It was just you could see him at various points of the
53		evening with this girl like on the floor in this field (.)
54		and I knew it was Aaron but I didn't know who the girl
55		was because she kept changing
56	Nigel:	Hm mm
57	Phil:	And you lost someone's purse didn't you?
58	Aaron:	Yeah (0.2) .hh hh
59	Phil:	And um (0.2) then we walked
60	Aaron:	hhhh
61	Phil:	we decided to walk back from this party it was like
62		out past ((small village)) so we had to walk back to
63		((local town))
64	Nigel:	Hm mm
65	Aaron:	.hh good idea Aaron .hh=
66	Phil:	=Yeah=
67	Aaron:	=We were very lucky that day
68	Phil:	We were erm and we were walking back and he says
69		oh I went with Janesy on Friday and I went yeah you
70		went with three birds last night you went with one on
71		Friday this was in his good month
72	Nigel:	Hm mm
73	Phil:	So that like took me aback somewhat (0.3) so that was
74		a good weekend for you
75		(.)
76	Nigel:	Is that good?
77	Phil:	Well in his books yes you know=
78	Aaron:	=hhhh.h [yeah]
79	Phil:	[The thing] is you got so much stick for it
80	Aaron:	Well yeah I could take the stick because it was
81		almost like (0.2) a good ego trip when everyone was
82		taking the stick oh you got off with her ah ha ha
83		yep I did so what's your problem? [Oh, er, errr]
84	Nigel:	[Hm mm]
85	Aaron:	[Errr]
86	Phil:	[None of them] were particularly pikey so you were
87		alright really
88	Aaron:	No (.) they weren't .hh none of them were like majorly
89		pikey .hh (.) one or two perhaps could have like
90		(.)
91	Phil:	I don't know I don't know I think I know this Cathy

92		bird I know Jenny I know Cathy thing I don't know who
93		the other one was and neither do you so can't tell=
94	Nigel:	=Yeah I mean I wasn't sort of saying is four in two
95		days good I mean it's impressive [you know]
96	Aaron:	[hh [hhh] hh
97	Phil:	[hhhhh] hhhh
98	Nigel:	But I me::an like (.) it presumes that erm that's:: a
99		creditable thing (.) yeah? Is it?
100		(0.2)
101	Phil:	No because you're on the moral low ground
102	Aaron:	But I don't mind being on the moral [low ground]
103	Phil:	[Oh no you don't]
104		mind I I it didn't fuss me at all you know and I wasn't I
105		thought it was quite (.) it was quite impressive you
106		know you're sort of thinking that's shocking because it
107		never happens to me um:: .h hhh
108	Aaron:	Hhhh
109		(0.3)
110	Phil:	But he was (.) by some people in the group he was li
111		(.) they were just taking the piss it wasn't serious no-
112		one it didn't really bother anyone at [all]
113	Nigel:	[Hm mm]
114	Phil:	It was like Aaron was on the moral low ground because
115		he was like (.) gigolo Casanova whatever
116	Nigel:	Right (.) okay (0.2) what do you think Paul?
117		(0.3)
118	Paul:	Did you=
119	Phil:	=Are you ap[palled?]
120	Paul:	[When you] .hh no (.) s [when you went out]
121	Nigel:	[Not appalled?]
122	Paul:	I jus I'll tell you in a minute when you went out
123	Nigel:	hh[hhh]
124	Unknown:	[hhhh]
125	Paul:	When you went out on that Friday (.) evening you were
126		out on the pull yeah? =
127	Aaron:	=No
128	Paul:	This (.) you were not? =
129	Aaron:	=Just out [as a group]
130	Phil:	[Just out] as a group of friends
131	Paul:	On the Saturday you were out on the pull?
132	Phil:	No
133	Aaron:	.hh [not really]
134	Phil:	[He was] drunk=
135	Aaron:	=I wasn't drunk [unconscious] (.) I was *very* merry I
136	Phil:	[((inaudible))]
137	Aaron:	was like (.) all erm (.) all like social guards were down
138	Paul:	Yeah (0.2) and (0.3) whe::n (.) so and (0.4) when you got
139		off with the first one [did you]
140	Aaron:	[hhhhhhh hhh]

142	Paul:	On the Friday
143	Aaron:	Er::::m on the Friday that that was Janesy
144	Paul:	Did you have any sort of like intonation ((sic)) of
145		carrying the relationship further?
146	Aaron:	No
147	Phil:	((inaudible – sounds like one nighter))
148	Paul:	So so you basically went for as many pullings off as
149		you could get in a weekend?
150	Phil:	No
151	Aaron:	I didn't go for it it just
152		(.)
153	Paul:	It just happened?
154	Aaron:	Well yeah (.) it's not so much I thought right ((hits
155		the desk)) this weekend (.) keep your pecker up lad
156		you're away [it's] not like that it's just that I
157	Phil:	[hhh]
158		(.)
159	Paul:	With any of them [did you feel]
160	Aaron:	[I get lucky very ((inaudible))]
161	Paul:	that they'd be like a follow on?
162	Phil:	He didn't know who half of them were do you .hh hh
163	Aaron:	Ah er I didn't (.) I mean it wasn't (.) I mean it wasn't
164		like a right gitty thing to do it was like the other
165		half knew as well that it wasn't gonna be
166		(0.4)
167	Phil:	Mm
168	Aaron:	Erm (0.2) no it's it's you're getting it all wrong it's
169		it's (0.2) it wasn't (0.4) errr Aaron come up with the
170		phrase you want to say (.) it wasn't alright this kid's
171		gonna get off with me then we're gonna go out oh no
172		we're not gonna go out what a git it was (0.2) I'm
173		gonna get off with this lad and that's alright
174	Phil:	Fancied a bit of rough you know
175	Aaron:	Fancied a bit of rough
176	Phil:	As and it was mutual I imagine

Transcription Notation

The form of transcription notation used was modified from the system developed by Gail Jefferson.

One or more colons indicate the extension of the previous sound, e.g.: Tha::t

Laughter is marked by hh the number of hh is a rough marker of duration of laughter while .hh indicates an audible intake of breath.

A? is used to mark upward intonation characteristic of a question.

Underlining indicates stress placed on a word or part of a word.

Extended brackets mark overlap between speakers. The left bracket indicates the beginning of the overlap while the right bracket indicates the end, e.g.:
hh [hhh]
[hhhh]

Double parentheses indicate transcriber's descriptions.

Numbers in parentheses, e.g. (0.2), indicate pauses in tenths of a second while (.) indicates a micropause.

An equals sign = indicates the absence of a discernible gap between the end of one speaker's utterance and the beginning of another speaker's utterance.

Acknowledgements

This article benefited from discussion of an earlier draft and related debates in the discourse groups at the Open University and Loughborough University, United Kingdom, and Massey University and Auckland University, New Zealand. I am particularly indebted to Derek Edwards for his thoughtful responses to my initial arguments and to Charles Antaki, Stephanie Taylor, John Clarke, Celia Kitzinger, Katie MacMillan and Jonathan Potter for their comments. Thanks also to Nigel Edley not only for his useful suggestions but also for allowing me to use an extract from our joint research on masculinity which was funded by United Kingdom Economic and Social Research Council Grant No. R000233129.

Turning the Tables: Antisemitic Discourse in Post-War Austria

Ruth Wodak

> It would be absurd to deny that many Austrians responded to some extent to the Nazis' racial propaganda; however, when they saw how antisemitism was actually put into practice, they were cured. One could safely say that sympathy for the persecuted Jews eradicated antisemitism in Austria. I do not believe that this issue will ever again assume even the slightest importance (Leopold Figl, the first elected Federal Chancellor of the Austrian Second Republic).[1]
>
> [The international press] is dominated by the World Jewish Congress. This is well-known (Kurt Waldheim).[2]

If it had been meant seriously, the Austrian Chancellor's optimism after 1945 was unfounded. In fact, Figl must have known better, since he had been present at meetings of the Council of Ministers immediately after 1945, where antisemitic sentiments were expressed by some other members of the government in conjunction with the debate about reparations payments to Austrian Jews who had survived the Shoa (see Knight, 1988). Figl's disingenuous remark can thus be regarded as but a further element designed to buttress Austria's positive image in the world.

Almost forty years later, public discourse about Jews in Austria in the course of the 'Waldheim affair' recalled earlier times and gave rise to a great deal of concern in the Jewish community organization (Gemeinde).[3] The immediate occasion for this was the criticism which Jewish organizations, among others, directed against Kurt Waldheim, then campaigning for the Austrian presidency, and his hitherto hidden past. The Waldheim affair has exposed the tenuousness of official Austria's post-war *Lebenslüge* about the widespread complicity of

Austrians in the Nazi abomination, and the attendant denials of the existence of antisemitic prejudice in the post-war period this entailed (see Gruber and de Cillia, 1989; Wodak 1989a, 1990a, b, c; Wodak and de Cillia, 1988).

On the one hand, after 1945 the open expression of anti-Jewish hostility is subject to a public political taboo. Instead, one enumerates the Jewish friends one has or praises those Jews who contributed so much to Austrian culture (the standard 'philo-Semitic' discourse; cf. Stern, 1989). On the other hand, one expresses despair at not being allowed to criticize individual Jews. These predominantly foreign Jews are described as 'dishonourable' or worse, and they stand as representatives for Jews as a whole.

Within the limited scope of this paper, it is impossible to consider all aspects of the question of who speaks or writes in an antisemitic way for or to whom in what form and to what effect.[4] I therefore begin with a brief sketch of the historical-sociological context of post-war antisemitism in Austria and indicate the register (both in terms of form and content) of antisemitic prejudice currently possible in contemporary Austria.

1. A New Antisemitism in Austria?

The Austrian sociologist Bernd Marin (Bunzl and Marin, 1983) has characterized antisemitism in Austria after 1945 as an 'antisemitism without Jews', since Jews constitute only .1 percent of the Austrian population (in Vienna, .5 percent). Moreover, antisemitism is stronger in those areas where Jews no longer live and where previously practically no Jews had lived, and among people who neither have had nor have any personal contact with Jews. In addition, according to Marin, it is an 'antisemitism without antisemites', since prejudice against Jews has been publicly forbidden and tabooed. Nevertheless, there is still 'antisemitism in politics'.

Whatever general validity Marin's thesis had prior to 1986, the results of our study suggest that Marin's findings are applicable to the period since then only with significant modifications.

The taboo against open expressions of explicitly antisemitic beliefs, for example, which Marin posited in an abstract form, has remained, but the means of circumventing it linguistically have extended its boundaries in such a way that the taboo itself appears to have lost some of its significance. Anti-Jewish prejudices which had remained hidden began to surface and were increasingly found in public settings. Quantitative sociological studies (Bunzl and Marin, 1983; Weiss, 1987; Kienzl and Gehmacher, 1987)[5] have continually confirmed that a relatively high percentage of the Austrian population is open to antisemitic resentment.

The persistence of antisemitic attitudes is then ascribed to a small group of right-wing radicals. The number of such (radical) antisemites can thus be carefully delimited, and their numbers be shown to be falling. 'Antisemitism' is also frequently identified with a purely racial variety of anti-Jewish prejudice, which is

excluding or minimizing other antisemitic traditions in Austria, such as the Christian or the Christian social traditions.

If one looks at the history of the political parties in the Austrian First Republic, for example, it is clear that the line dividing the different currents of antisemitism was indistinct. There has remained a reservoir of antisemitic prejudice from which, appropriately packaged, one could (and can) draw as occasion required. Since 1945, moreover, new motives for antisemitism have arisen. What the German Jewish author Henrik Broder said about the Germans is certainly applicable to the Austrians as well: they will never forgive the Jews for Auschwitz. The collapse of the Third Reich forced many, in Austria as in Germany, to confront the extent of the Nazi crimes. Doubts, guilt feelings, the need to justify or rationalize one's behaviour encouraged the development of strategies for 'dealing with the past': playing down the events themselves, denying all knowledge of them, transforming the victims into the causes of present woes (by not letting bygones be bygones, i.e. by simply continuing to exist). Moreover, since the Moscow Declaration[6] offered Allied support to Austria's claim to have been (collectively) the first 'victim' of Hitlerite aggression, such reversals could draw upon an especially potent legitimation.

This putative victim status made it also possible to deny any responsibility which went beyond individual crimes; the new search for identity could produce a stronger feeling of nationalism, which in turn reinforced a specific definition of insiders and outsiders, of 'us' and 'them'.

Since 1945, there have been intermittent scandals involving antisemitic prejudice. In 1967, for example, the openly antisemitic outpourings of Thaddeus Borodajkiewicz, economics professor in Vienna, led to protests by both his opponents and supporters. At one of these, one of Borodajkiewicz's opponents was killed by the economic professor's neo-Nazi supporters. This was the occasion for a bi-partisan demonstration against political violence, but no corresponding campaign against his views. Borodajkiewicz himself was forced into early retirement (see Welzig, 1985). In the 1970 national assembly electoral campaign, posters of the candidate of the Austrian's People's Party for chancellor, Josef Klaus, emphasized that he, unlike his opponent Bruno Kreisky, whose Jewish origins were only too well known, was 'a genuine Austrian' (see Wodak and de Cillia, 1988). Simon Wiesenthal's publication in 1975 of material about the leader of the Freedom Party,[7] Friedrich Peter, ostensibly linking him to massacres carried out by the SS-unit to which he had belonged, was the occasion for a spate of public invective against Wiesenthal led by Bruno Kreisky. Kreisky insinuated, for example, that Wiesenthal had been a Gestapo informer. Another Kreisky comment, in an interview with a foreign journalist, 'if the Jews are a people, they are a lousy [*mies*] people', moreover, could in this context only serve to provide Jewish 'cover' for hostilities against Wiesenthal by those less schooled in the dialectical complexities of Kreisky's views.[8] Against the wave of antisemitic hostilities unleashed by the events of 1986, however, those prior scandals appear as minor affairs indeed.

Antisemitism in post-war Austria must therefore be viewed chiefly in relation to the various ways employed in dealing with alleged or real guilt, with alleged

or actual accusations about the Nazi past. Both the large, traditional reservoir of antisemitic prejudice as well as a general, traditional discourse of collective experiences and attitudes provide discursive remedies, while several new topoi have been added. The forms of expression are very different, manifest or latent, explicit or very indirect. But each and every one appears to be a discourse of justification (or varieties of justification and defence).

2. Antisemitic Stereotypes (Prejudice Content)

Of the many clichés and contents of prejudice that are associated with Jews, we will only list the four that occurred most frequently in 1986. We cannot deal in detail with the historical underpinnings of these prejudices, but refer readers to the literature as a source for the unusual features and uniqueness of the 'antisemitic syndrome' (see, inter alia, Adorno, 1973; Allport, 1987; Heinsohn, 1988; Poliakov, 1987; Pulzer, 1966; Wodak, 1990).

2.1 Christian antisemitism. According to this prejudice, Jews are regarded as the murderers of Christ, as traitors, Christian antisemitism was found especially in the mass media in 1986 (in the press and also in the semi-public sphere). These prejudices have the longest and most consistent history in Austria, being deeply embedded in the collective experience and in the 'collective subconscious' (Erdheim, 1984).

2.2 The 'dishonest' or 'dishonourable' Jew, the 'tricky Jew'. This prejudice has its origins in Judas' betrayal of Christ. On the other hand, this view is also based on economic stereotypes: in the Middle Ages Jews were responsible for lending money at interest (they were excluded from most other occupations). This cliché was used repeatedly with reference to the World Jewish Congress (WJC) in the course of the Waldheim debate in 1986.

2.3 The Jewish conspiracy. The Jews in the world dominate or control the international press, the banks, political power and capital, and they are planning the world conspiracy, e.g. the 'campaign' against Waldheim or against Austria (see Mitten, 1991; Wodak, 1990a).[9]

2.4 Jews are privileged. This new prejudice relates directly to the Holocaust. The Jews who 'emigrated' and thereby were able to avoid a far worse fate have no reason to complain. Emigration is not especially terrible, and Jews who were not in concentration camps have no grounds to be angry in any case.

3. The 'Fear of Revenge'

The collapse of the Third Reich in 1945 gave rise to several additional reasons for fearing the wrath of the 'vengeful Jew'. One was the fear of the discovery of war crimes and the persecution and conviction of war criminals. Another was the fear that the stolen ('aryanized') property could be demanded back. Finally, there was fear that the exiles would merely wish to return to their homeland.

against their former persecutors, but they might become dominant and again 'over-judaize' certain professions.

Feelings of guilt can be easily transformed into aggression towards those whose mere presence is an implicit 'attack'. One reacts defensively or by turning the tables on the victims themselves.

4. Attack is the Best Defence: The Discourse of Justification

There are various possible ways of dealing with or reacting to such an attack, be it real or imagined. We have distinguished macro-strategies, i.e. basic (conscious or unconscious, planned or spontaneous, or irrational) alternatives in social behaviour from the micro-strategies dependent on them (linguistic realizations).[10]

One reaction to perceived criticism is actually to deal openly with it, to show regret or remorse, to reappraise one's actions and accept blame in certain cases or qualify one's responsibility in others. This, however, rarely occurs, for such arguments usually take place in situations that are rife with conflict and pent-up emotions. And it is in these that the strategies we discovered become the means for transporting prejudice. One can attempt to impede the discussion, for example, or to ignore the situation (i.e. 'let sleeping dogs lie').

If this strategy does not work, the controversial event can be trivialized. In this way the persons involved, i.e. the perpetrators of these acts, are rendered harmless (i.e. there were not many, one does not know them, etc.), or a euphemism is employed to describe the acts themselves, for example in the use of 'emigration' to describe 'expulsion'. Such a trivialization can manifest itself in different ways, either by rationalization (i.e. there are really objective reasons for antisemitism); by accusing someone else (i. e. someone else is guilty, too); by shifting the blame (i.e. it was someone else's fault), by personalizing it (i.e. only one individual is to blame); or by depersonalizing it altogether (i.e. somebody was to blame), or by making fun of the accusations (i.e. the attackers exaggerate and dramatize them in an unacceptable way). Guilt as such is not, in principle, denied, but rather rendered meaningless.

Apart from merely shifting responsibility for events on to named or unnamed persons, the disavowal of personal knowledge or involvement can also involve a mechanism of victim–victimizer reversal, or the designation of a scapegoat in the case of group conflict (the enemy from the outside). In an argument among individuals, the blame can by mutual agreement be placed on someone who is not present. The defamation and debasement of the opponent belongs to this group of micro-strategies, since this makes blaming the victim, i.e. the victim–victimizer reversal, especially easy. In this case, possible feelings of guilt are transformed into aggression and into a counter-attack. This mechanism explains, for example, how the 'Kreisky–Peter–Wiesenthal affair' eventually became merely the 'Wiesenthal affair' (see Wodak et al., 1990).

Yet another alternative is to deny the guilt in principle. Accusations and attacks are distorted or invented and ascribed to opponents who had not made

them, at least not in the form alleged. A systematic distortion of the facts takes place. One is thus justified in protecting oneself or planning counter-attacks against such 'infamous' attacks. In this way a second reality is constructed, a portrayal of an enemy against which every measure of defence is permissible.

5. Anti-Jewish (Antisemitic) Language Use: The Pervasiveness of Antisemitic Prejudice in Public Life in Austria

The degree of threat and hostility towards Jews expressed in language can vary greatly: different forms and different degrees of directness and boldness can be differentiated according to context and speaker. In analysing the material, four hierarchical levels of antisemitic statements were identified which correspond to the different individual strategies of justification. A connection can be seen between the content of prejudice, political context, setting, speaker and form of expression.

Level 1. Trivialization and relativization of antisemitism and the uniqueness of the Holocaust (putting the blame on someone else, generalizing). This occurred in totally formal and official contexts such as news broadcasts and informational programmes on Austrian radio and television. The issues of a world conspiracy and Christian issues dominate on this level.

Level 2. Statements with the content: 'antisemitism is the Jews' own fault' (victim–victimizer reversal). Such remarks are packaged differently (as direct accusations, as threats or as insinuations) and occur in many contexts, especially in semi-public ones (i.e. broadcast interviews or in TV discussions) and finally also in the memorial vigil (anonymous discussions on the street, in the centre of town, June 1987, due to a memorial vigil dedicated to the victims of World War II) (see Wodak, 1990a,b). Greed, dishonesty and vindictiveness constitute the contents of additional prejudice.

Level 3. All traditional antisemitic prejudices appear: (a) implicit (stories, allusions); or (b) explicit (generalizations). This requires either less formal contexts or especially protected (well-known) figures. This level corresponds to the third macro-strategy of justification discourse, the systematic distortion and the creation of a stereotyped image of one's opponent (*Feindbild*).

Level 4. Direct and open abuse of Jews. Such labels appeared – if at all – only in anonymous settings, in the memorial vigil, for example, or in complaint calls to the Austrian television network. Outside of such settings the perceived public sanctions against such statements would restrict their occurrence almost completely.

A qualitative text analysis, however, cannot restrict itself to the linguistic level alone. The way in which the types of content are presented and the patterns of argumentation which always appear are of equal significance. They contribute to the organization of the whole text and influence the use of certain linguistic devices. All macro-strategies fit into the patterns of justification identified above, from denial to reversal and counter-attack. Before we look at an example fo-

a formal situation, we would like to present several typical forms of antisemitic language behaviour from varying contexts, all of them from the Waldheim electoral campaign of 1986 (de Cillia et al., 1987; Mitten et al., 1989).

5.1 Predication and Assertion

Predication and assertion ascribe certain characteristics to people and groups of people. They are an important linguistic device for constructing a dichotomous world, which in turn functions to make judgments concerning 'insiders' and 'outsiders' or 'them' and 'us'. Predications can also assume the character of abuse, according to the context and explicitness of the four hierarchical levels. 'That whippersnapper, General Secretary Singer . . . the private club with that bombastic name, World Jewish Congress . . . the wheeling and dealing of the first president of the club, N. Goldmann, with the Arabs, the arch-enemy of the Jewish state' (*Neue Kronen Zeitung* (*NKZ*), 2 April 1986).

An excerpt quoted from a press conference of the Jewish Gemeinde in Vienna on 18 June 1986 is given below. It represents a collage of statements by spokespersons of the Austrian People's Party and serves as an example for the device of predication and the content of dishonesty:[11]

> Untrustworthy and dishonourable methods. Dishonourable members of the World Jewish Congress. Untrustworthy – dishonourable and full of hate. Lies – deception and breaking promises – having no culture and simplistic and unfounded hate. The crying of the puppets of the World Jewish Congress motivated by hate and the need for admiration. Assassins. Mafia of slanderers. The epitome of baseness. Bribed witnesses. Methods of the mafia. Astoundingly stupid. Dirty self-aggrandisement campaigns. The habitual slanderer Singer.

5.2 Allusions

Allusions can be manifested in very different ways, for example, by means of citations, formal text construction, word choice, vagueness. All forms of allusion, however, share the characteristic that the connection between two contents is established implicitly rather than explicitly, and assumes previous knowledge on the part of the audience. Consequently, the responsibility for the interpretation is shifted onto the readers, who are believed to know the background of the insinuation (for example, 'dishonourable lot' [*ehrlose Gesellen*]).

In a letter which Karl Hödl, then vice-mayor of Linz, wrote on 12 May 1987 to Edgar Bronfman, the president of the World Jewish Congress, we find Christian antisemitism transmitted in the form of allusions. The writer of the letter makes a comparison between Bronfman as a Jew and Hödl as an 'Austrian, Christian and trained jurist', who must 'defend himself' against 'infamous attacks' – thus as a representative for Waldheim and all Austrians. The letter also contains an analogy between Waldheim's persecution by the World Jewish Congress (WJC) and the

Jews' handing over of Jesus to the Romans. Finally, Hödl contrasts the revengeful Judaism of the Old Testament to a (forgiving) Christianity: 'An eye for an eye, a tooth for a tooth is not our European attitude. The basic Talmudic tendency to preach in the whole world is left up to them and theirs.' Similar analogies between the murder of Christ and the critique of Waldheim were found in a series of newspaper commentaries from 1986 and 1987 (e.g. Wodak et al., 1990; Wodak, 1990c, for example).

5.3 Quotations (Discourse Representation)

Quotations are an ever-recurring part of antisemitic language use. It is precisely this form of argumentation that has the appearance of being especially objective and rational. Quotations often enable a speaker or author to transport antisemitic prejudice without having to take responsibility for the statement. This is especially true of quotations by generally recognized authorities and, in the special case of antisemitic argumentation, of quotations by Jews, which are intended to reinforce the argument ('alibi Jews' such as Kreisky, Wiesenthal, etc.). In addition to deflecting authorial responsibility, quotations can be employed to cloak extreme antisemitism, while the quotations themselves can serve as allusions in the sense noted above. Decisive in this case is the specific way in which the statements of a third person are reported.

The term 'discourse representation' has been suggested for this basic aspect of media coverage (Hak, 1987). Not only the text that was actually expressed in the course of the coverage, but also the situation in the text at hand was almost always reported as well. Newspapers and the Austrian radio broadcasting company (ORF) made the most frequent use of this technique (cf. the example below), and the cases varied according to content and explicitness, and corresponded to the hierarchical levels 1–3.[12]

6. Case Studies

6.1 Scenes from a Noonday News Programme – A Case Study

The WJC held a press conference in New York on 25 March 1986. To a certain extent this constituted a turning-point in the Waldheim affair, especially because the entire country of Austria felt as if it had been attacked. Almost the entire programme (always a full hour from 12–1 o'clock every day except Sunday) was devoted to important aspects of the 'campaign' or to an alleged 'interference' in Austria's internal affairs and to commentaries on these subjects. In the evening news programme, a telephone interview with Waldheim was broadcast. A wide variety of views were obtained from important representatives of the political scene in Austria (Wodak, 1989b,c). The representatives of the WJC were the only ones who were not interviewed. A summary of press reports was read as was a commentary on a 'discussion about antisemitism', a formulation which is itself an euphemism.[13]

6.2 The Situation on 25 March 1986 – What Really Happened?

On 22 March 1986, the WJC published the CROWCASS listing (Central Registry of War Criminals and Security Suspects) which showed that after 1945 Waldheim had been sought by the US Army for alleged war crimes. This list also recorded (as it turned out mistakenly) that Waldheim had served in the counter-intelligence section (Abwehr) of Army Group E, which the press release of the WJC duly noted. At its press conference in New York three days later, 25 March, historian Robert Herzstein produced documents which showed that Waldheim had served in the military intelligence section (Ic) rather than the counter-intelligence section (Abwehr).[14]

At this latter press conference, neither Herzstein nor the WJC referred to Waldheim as 'an officer in the Abwehr', as the evidence Herzstein presented showed the CROWCASS listing to have been mistaken.

The reporting in the Austrian media on 25 March amalgamated these two press conferences (as well as an interview with WJC leaders which had been published on 24 March). The general tone was defensive, as though all Austrians had been implicated by the link between Waldheim and the Abwehr. This is the element that was focused on and distorted; the WJC, as well as Herzstein, were portrayed as having referred to Waldheim as an officer in the Abwehr (see also Mitten, 1991).

It thus became possible to defend oneself against an untrue accusation, and this in turn justified in advance any and all counter-attacks. At the same time, the 'accusations' and substantiated facts which the WJC or Herzstein actually raised were swept under the rug. With few exceptions, the Austrian media became passive supporters of the 'campaign with "the campaign"', i.e. the Waldheim propaganda line, merely by their (at least) sloppy handling of statements and documents.

6.3 What was Reported? – The Mittagsjournal *on 25 March 1986*

The news programme itself was introduced as follows:

> The discussion about the past of the ÖVP's presidential candidate, Kurt Waldheim, has reached a new climax since Sunday. The announcement by WJC representatives to present further serious accusations against the former UN General Secretary at a press conference which will take place this afternoon in New York has given a new twist to the discussion. It certainly has to do with claims about Waldheim's involvements, but the discussion is also already concerned with the extent to which the WJC is interfering in Austria's internal affairs. For the former chancellor, Kreisky, there are indications of this direction. In a *Morgenjournal* interview today, Kreisky expressed his disapproval of the WJC General Secretary's statements and also defended Kurt Waldheim against such accusations.

The introductory presentation itself reveals patterns of interpretation and argumentation. Nearly an entire new programme was devoted to a press

conference that *had not yet taken place and to a discussion of 'accusations'* which had not yet been made, providing Austrian politicians with the opportunity to exonerate themselves, as it were, pre-emptively. The moderator trivialized the 'discussion' and 'claims about Waldheim's involvement' in possibly being privy to information regarding war crimes in the Balkans, and with Kreisky's help he called listeners' attention to the change of 'interference in Austria's internal affairs' (we-discourse). The factitive portrayal of the WJC's ostensible (and arguably invented) 'accusations' accords it a certain status (discourse representation as a micro-strategy), while it is unclear what the WJC actually claimed (vagueness). In the broadcast, Waldheim was referred to by means of (positive) descriptive expressions (i.e. presidential candidate and especially former General Secretary of the UN) which tended to reflect the emphases of his campaign publicity. In contrast, the WJC was referred to by name three times in this short text, and these and other examples show how this name itself permits and can even trigger prejudiced associations such as world conspiracy, promoting the introduction of such strategies as black and white depiction or personalization and defamation.

The former Austrian chancellor, Bruno Kreisky, was the first Austrian politician to be quoted:

> *Kreisky*: First of all, I knew nothing about any of the things being asserted about Dr Waldheim as a person. However, if I had known, I would certainly not have withheld my recommendation in this case uh uh, because it all happened a long, long time ago. And he was a young man . . . But that is not what it is all about at all. The point is, that certain groups, albeit very small ones, are interfering in the Austrian campaign . . . with both candidates in an improper way in my opinion. I am not prepared to tolerate this. But these groups have been fighting me for decades. . . .
>
> *Interviewer*: Dr Kreisky, your party argues that, it is said, that to a certain extent he admits that he was there, that he did not say that from the beginning. How do you see this?
>
> *Kreisky*: Yes, well, that is none of my business. I don't want to have anything to do with it. Oh, it is all very unpleasant, and I don't want to have anything to do with it.

Kreisky justified and defended Waldheim as opposed to 'certain circles' [*gewisse Kreise*] by employing the strategies of rationalization and trivialization (both micro-strategies of the macro-strategy of mitigation) and also moved onto the next macro-strategy, i.e. 'making a clear break with the past'. On the other hand, Kreisky resorted to counter-attack, utilizing a group of macro-strategies in the discourse of justification: the disclosures have nothing to do with Waldheim's past – thus, every right to 'debate the past' is denied; the more important issue is that 'certain circles' (cliché), although small, have been persecuting Kreisky for years (contents of victim–victimizer reversal and world conspiracy, expressed as allusions and distortions). Kreisky thereby directed the WJC attacks to himself and to a certain extent then had to defend himself against them. Distortion and unwarranted inferences actively contribute to the *Feindbild* of the WJC. This discourse is not new, but is a way, typical of Austria, of dealing with the Nazi past, which Kreisky had previously used in connection with Friedrich Peter

Kreisky serves a three-fold purpose here: as the 'alibi Jew' (his words thus carry more weight), as former chancellor and socialist (even the opposition stands by Waldheim), and finally, as a worldly wise and world-travelled diplomat (he can certainly estimate Waldheim's worth). In responding to the journalist's unpleasant and persistent questions, Kreisky employs a further macro-strategy of justification, already mentioned above: he simply cuts off the discussion!

Ivan Hacker, president of the religious community, is interviewed next:

Moderator: . . . The Israelite religious community [Gemeinde] felt compelled last night to initiate a discussion, which amounted to taking a stand and expressing great concern and a warning about the sentiments that are being unleashed. [The idea] that the making public of documents [should] be characterized at once as slander and a smear campaign was disputed. . . .

Hacker: We reject any linguistic dictums that at once nullify the publication of documents about Dr Kurt Waldheim's past with labels such as slander and smear campaign. By showing contempt for the exposers and making the Jews the scapegoat. This personal appeal to suppressed emotions on the part of certain ÖVP functionaries is what we condemn the most. Because it gives the Brownshirts and antisemites a new claim to legitimacy and reveals shameful political calculations.

Interviewer: . . . Are you referring specifically to Dr Graff?

Hacker: Certainly, Graff. . . . But we condemn the tendency of individual SPÖ functionaries just as much for going along with this dismissal of the past and distancing themselves from disclosures about it. The same calculated thinking is employed here to get the same votes. We deeply regret the apparently widespread view in Austria that the appeal to Hitler–Germany and to doing one's duty [i.e. in the German Wehrmacht], as it is put, produces a stronger solidarity than does a declaration for a new democratic Austria. . . .

Interviewer: . . . Does this remark [i.e. doing one's duty] refer to Dr Waldheim?

Hacker: Him too. . . . I am referring to everyone who says that, not only Waldheim. . . .

Interviewer: . . . How do you view uh statements of individual WJC functionaries. . . . That can't be very pleasant for you as die president of the Israelite religious community in Austria?

Hacker: It's not at all pleasant. But the Jewish world organization is a totally . . . democratic, independent organization. Therefore, he [Israel Singer, general secretary of the WJC] must take responsibility for whatever he has said. . . .

Interviewer: In any case, you don't see it as the WJC interfering in the Austrian presidential election?

Hacker: Interference. One can view it in different ways. I see it as the WJC tracing the history of a certain General Secretary of the UN. . . .

Interviewer: . . . How can one stop this escalation of emotions?

Hacker: If I could answer this question, I would not be sitting here at this table, but would be one of the leading politicians in the world.

Thus, after Kreisky, a 'Jewish fellow citizen' [*jüdischer Mitbürger*] had a chance to speak. Hacker was upset and made a point of the 'sentiments of the Austrians'; he accused both parties of trivialization and of playing a dangerous game; he saw through this specific way of dealing with the past. The interviewer, however, did not pursue these extremely pointed statements or the opposing discourse,

are presented as interference in the Austrian election campaign. Both topic and level are changed, and Hacker is no longer able to find the generally held, analytic first level of argumentation.

This opposing view therefore remains isolated and personalized and mitigated by Kreisky in his role as 'alibi Jew'. Following Hacker, the programme quoted the view of one of the main architects of the 'campaign within the "campaign"', Michael Graff. It was introduced as follows:

> General Secretary of the ÖVP, Michael Graff, who, according to Hacker, had appealed personally to suppressed emotions, again stated his views regarding the discussion about Waldheim and the current state of the presidential election campaign. . . .

The presentation contained an interpretative pattern: the accusation against Graff is personalized. 'According to Hacker', there are latent threats – this mitigates the content and trivializes it. In reality, the discussion was less about Waldheim personally than about Waldheim's past and his way of dealing with it. This way of describing it alters and distorts the content of the debate.

Graff first attacked the SPÖ and suggested that lying behind the 'infamous slander campaign' are economic-political reasons and an attempt to distract voters' attention away from the governing party.

> The slander campaign, which has been sparked in the vicinity of the Chancellor and has naturally spread like wildfire, is out of the control of those who set it; it is on its way and the damage it will do to Austria both from the inside and the outside is unforeseeable.

Two things are noticeable here: first, the affective use of language and the abundance of metaphors, which paint an especially threatening picture. Second, the victim–victimizer reversal and we-discourse. Austria (in effect Waldheim and Waldheim supporters) is accordingly the victim of a 'slander campaign', and the instigators, whoever they may be, are accountable for any damage. On this occasion Graff still placed the original instigators in Austria. Then, however, he turned to attack the WJC, whose charges he describes as 'indescribable' and 'much exaggerated'.

> *Moderator*: He [Graff] is firmly convinced that Waldheim had nothing to do with war crimes. And the only purpose of the documents which are announced for this afternoon in New York is to contribute to the mud-slinging. Graff responded as follows to the Israelite Gemeinde's warning about antisemitic information, without knowing the details of their position.
>
> *Graff*: It is exactly this type of discussion that worries me so much. I said in my interview on the *Morgenjournal* that I am very concerned about the behaviour of individual representatives of the World Jewish Congress, because it is precisely such exaggerated attacks that can unleash emotions in this country, and no one wants

> this . . . Of course we must take the statements of our Jewish fellow citizens seriously. And I deeply regret that because of this unqualified campaign, which in the meantime uh uh has also been criticized by Kreisky, graves have been dug up. I uh find that the instigators of this campaign have themselves to blame for this. And they will have to live with this burden.

After this Graff called on the government to defend Waldheim and to investigate who had leaked the documents in this case.

Graff appeared to respond to Hacker's accusation, but merely repeated his statement, thereby getting the chance to justify himself and also to have the last word. Graffs reference to Kreisky, moreover, completely trivialized Hacker's statement. The affective use of language is especially noticeable in the labelling of the WJC and the alleged 'campaign', which could engender any number of possible associations.

The macro-strategy employed by Graff consists chiefly in ignoring the content of the accusations made by the WJC. Instead, he defended himself against accusations which the WJC had not made (war criminal, etc.) or against those which he could not have known about (distortion and preemptive justification). He could thus turn the tables: he was given free reign to attack the victims – who are themselves to blame for the emergence of antisemitic sentiments because of their exaggerated accusations, thus also to blame for the suffering of Austrian 'Jewish fellow-citizens' (differentiating between 'good' and 'bad' Jews). His remarks that Austria must defend itself against these attacks, and the government must protect the individual Waldheim, rest on the assumption that Austria as a whole has been attacked, but is made credible only by means of systematic distortions, manoeuvres of we-discourse and a scapegoat strategy. Indeed, the contents of the actual accusations and the debate about the past, etc., were intentionally distorted. Hacker's opposing discourse was weakened and the discourse of justification won out, as it was additionally strengthened by the presentation as well as by the time and placement allotted to it in the 'Journal'.

The next sequence in the programme is a summary of opinions on the matter in Austrian newspapers. Then Mario Ferrari-Brunnenfeld, an under-secretary in the ministry of health and member of the FPÖ (Freedom Party of Austria), was asked for his views on the matter:

> In answer to the question of why the third parliamentary party has kept itself out of the debate surrounding Waldheim, the current Secretary of State said in the Ministry of Health. . . .
>
> *Ferrari-Brunnenfeld*: We will not interfere in the dispute about the presidential candidates in the future either. Although we very much regret the form this dispute has taken on. And that foreign countries are beginning to interfere in the internal affairs of Austria at this particular time, because of the awkward handling of the election campaign. Uh then I believe that uh that uh the problem that we have regarding this national uh presidential election, we do have one uh, that uh a presidential candidate does not own up to his past, has provided the starting-point of

In answer to the question of whether he also had misgivings about the possibility of antisemitism, Ferrari-Brunnenfeld replied:

> I think the Israelite Gemeinde would have been smarter to keep out of this discussion. And secondly, I don't believe that it's a racial issue, but rather that the Jewish organizations have themselves intervened in a discussion with the motto 'Stop thief!' suddenly entering the forum of public discussion, so to speak. I mean that as far as I know – and I do get around – there's no sign of anything like neo-antisemitism. But I believe that the Jewish organizations are sparing nothing to make it a point of discussion, and a lot of neutral citizens are naturally asking what's going on? Who asked them? Who asked for their opinion? It's purely an internal matter of Austria.
> *Interviewer*: What you're saying then is that the Jewish organizations themselves are to blame if there is a new discussion about antisemitism?
> *Ferrari-Brunnenfeld*: As grotesque as it sounds, that's how it looks to me. . . .

Ferrari-Brunnenfeld thus also defined the WJC's role as unjustified interference from 'abroad' in 'internal things of Austria' (we-discourse), but considered the main problem to be the way Waldheim had dealt with his past. He accused Waldheim of 'not owning up to' his career in the German Wehrmacht, a sentiment probably designed to address a specific constituency in his own party, the (German) 'national' wing.

When antisemitism was introduced, Ferrari-Brunnenfeld shifted into dominant 'campaign discourse' mode very smoothly. He first attempted to trivialize the problem, and then accused the 'Jewish organizations' of trying to make themselves look good. Then he reverts to the victim–victimizer reversal: the Jews are themselves to blame for their misfortune!

The press conference of the WJC took place as scheduled that afternoon (CET). At this conference no mention was made of Waldheim in connection with the Abwehr. On the evening news programme *Abendjournal* Waldheim was interviewed via telephone about the allegations the WJC had ostensibly made about him:

> *Interviewer*: You've heard the report from our New York correspondent about the press conference the World Jewish Congress gave today. Uh we can uh summarize uh these accusation approximately like this: it can be proven that you were a Nazi; you lied for forty years; you knew about and personally took part in partisan activities – all are accusations that are diametrically opposed to the positions you have previously held.
> *Waldheim*: Yes, I categorically deny these accusations. Uh, the former Chancellor Kreisky has also already explained that these accusations by the uh World Jewish Congress have to do with, and I quote, with 'monstrous baseness' [*ungeheure Niedertracht*].

Following this exchange, Waldheim offered a lengthy justification based on the themes of 'doing one's duty' and having served in the Wehrmacht, 'just like hundreds of thousands of other Austrians'. Kreisky thus serves as Waldheim's 'alibi' Jew, and by quoting Kreisky, Waldheim can shift the responsibility for

past is pursued by neither Waldheim nor any of the other politicians who were quoted. The description of Waldheim as an officer in the Abwehr (contained in the CROWCASS listing, and reported – once – by the WJC), is central to his justification. He can legitimately dismiss this one accusation; all others are thereby similarly dismissed or simply ignored. Towards the end of the interview Waldheim is asked:

> Dr Waldheim, would it be correct to summarize your statements in the following way: there is nothing correct, nothing true in what the World Jewish Congress publicized in New York today?
> *Waldheim*: I wouldn't say that. Well, the fact, that I was seen uh there and was present there, is true. . . .

After this vague and euphemistic explanation, Waldheim again very strongly denies accusations, especially those that were never made.

> One last question, Dr Waldheim: You continue to maintain that you knew nothing about the deportation of Jews, specifically about those from Thessaloniki?
> *Waldheim*: I continue to maintain this. There is no reason to change my statement.

The interviewer does not address the principal questions raised by the WJC, but is railroaded into discussing details considered (by Waldheim) to be relevant. In this way, Waldheim's justification is the absolute and uncontested conclusion for the official ORF news on this day.

7. Conclusions

All the politicians interviewed in these two radio news programmes employed similar strategies: trivializations, denial and finally cutting off the discussion when the discussion dealt with Austria's Nazi past; distortion, defamation and pre-emptive defence against charges still unknown when the discussion dealt with the WJC. The introductory passages and interviewers' questions reinforced this discourse. The order of speakers interviewed in the programme, i.e. Hacker's inconspicuous position between Kreisky and Graff, made the opposing arguments relatively ineffective. The diversion and avoidance strategies were successful: the discussion no longer had to do with Waldheim's past, but rather with Waldheim as Austria. It was not about post-war Austria and antisemitism, but about the WJC, their accusations which, in addition, had been systematically distorted.

The scapegoat strategy, 'Iudeus ex machina' (see Wodak, 1989a) and the construction of this *Feindbild* can be clearly seen in *actu* in this news broadcast. The premiss is we-discourse, which all the politicians without exception used. One defends oneself against foreign countries and their interference in Austria's internal affairs. In this way the criticism of Waldheim's dealings with his past was transformed into a plot against Austria contrived by vengeful Jews seeking admiration. When such a reality is constructed by influential politicians in a public

forum such as a news broadcast, it is not surprising that antisemitism is expressed much more explicitly in other contexts (such as the memorial vigil).

Did 1986 change anything? Has the antisemitic language use become more obvious? Antisemitic prejudices are ubiquitous in Austria. Since 1986, however, some taboos have fallen away in certain public realms, especially in the media. Although the more subtle expressions of prejudice are usual in such formal contexts, certain persons are entitled to employ cruder or more blatant forms in such contexts as well, conjuring up images of an enemy by reverting at the same time to a mystified past and to Austria's sham existence. The connection between justification and counter-attack, between guilt and the construction of a *Feindbild*, is ineluctable.

Acknowledgement

I would like to thank Michael Agar, Gerhard Botz, Teun van Dijk and Richard Mitten for their very useful comments and criticism on earlier drafts of this article, as well as Ardith Meier and Richard Mitten for their help in translating and editing this paper. The details of the whole study are published in Wodak et al. (1990).

Notes

1. Interview with the *Shanghai Echo*, quoted in *Der Neue Weg*, no. 10, the beginning of June 1947, p. 11.
2. 'Comment expliquez-vous que la presse internationale ait été aussi largement critique envers vous? (Il s'emporte.) Mais parce qu'elle est dominée par le Congrès juif mondial, c'est bien connu!' Interview with Claire Trean, *le Monde*, 3 May 1986.
3. In Austria, religions have institutions recognized in law which record the number of members. The 'Israelitische Kultusgemeinde' is the official representative of Austrian Jews. There is no Anglo-American equivalent, and the term 'Jewish Community' is conventionally not restricted to those who officially declare themselves Jews on religious grounds. For this paper, when this particular Jewish institution in Austria is meant, the German *Gemeinde* is employed.
4. Two case studies which were part of the project 'Sprache und Vorurteil' (Language and Prejudice) were able to shed some light on the Waldheim Affair and on an earlier dispute between Simon Wiesenthal, then Austrian Chancellor Bruno Kreisky, and the then head of the Austrian Freedom Party (FPÖ) Friedrich Peter. Both affairs were examined qualitatively in public and semi-formal settings. The whole register of the forms and contents of antisemitic prejudice could be identified in both. This register appears continuous: an appropriate prejudice is sought and found according to situation. The project report (Wodak et al., 1990; Projektteam 'Sprache und Vorurteil', 1989) includes all the data as well as the theoretical and methodological approaches employed in the study.
5. Questionnaires and standardized interviews, and telephone surveys even more so, have serious limitations in prejudice research, since especially in the area of taboos it

is almost impossible to obtain opinions and attitudes; therefore, the studies differ from each other. Hilde Weiss' questionnaire appears to be sophisticated and she reaches several important conclusions. Other opinion surveys already fail in their formulation of the questions (cf. in detail regarding this, Projektteam 'Sprache und Vorurteil', 1989).

6. The Moscow declaration, issued by the foreign ministers of the US, Great Britain and the Soviet Union in October, 1943, included the statement that Austria 'was the first victim of Hitler's typical policy of aggression'.
7. Between 1945 to 1949, former members of what were termed 'more incriminated' Nazi organizations were disenfranchized as a part of the de-Nazification policy. In the 1949 elections, the Union of Independents, which reorganized the (German) 'nationally inclined', captured 20 seats. The Freedom Party [*Freiheitliche Partei Österreichs*] was formed in 1954 out of the Union of Independents. Friedrich Peter was chairman of the FPÖ in 1975. For background on this 'affair' see van Amerongen (1977); Wodak et al. (1990).
8. Kreisky's own conception of nationhood derives from the Austrian Socialist theorist Otto Bauer. Bauer's criterion for a nation was that it be a 'community of fate' (*Schicksalsgemeinschaft*). Neither Bauer, who died in 1938, nor Kreisky would concede that the Jews are a nation. This in itself is a legitimate position to defend, and Kreisky's pejorative and contemptuous aside probably referred to the difficulty of the Jews conforming to his (unspecified) criteria of nationhood. This, however, in no way mitigates the charge of irresponsibility, and, in the context, would easily be seen as pandering to the anti-Wiesenthal hostilities of the FPÖ voters.
9. One example from our data illustrates this point. The then leader of the People's Party, Alois Mock, said the following in an interview on *Zeit im Bild*, a TV-news broadcast on 5 June 1986: 'That guy Singer travels around the world and, aided by the pressure of the international media, suddenly demands that one look at documents from the archives that have been available for forty years. Many say okay, we can take a look at them. We are not going to risk the pressure and the argument with the men who were even able to place the large international media at their disposal in an unprecedented manhunt [*Menschenhatz*]' (*Zeit im Bild*, 5 June 1986).
10. For the entire range of these, of which only a few representative samples can be offered here, see Projektteam (1989). Regarding the concept of 'strategy', see ibid., Ch. 7.2 (cf. also Lutz and Wodak, 1987).
11. The entire interview illustrates numerous strategies of justification (see Wodak et al., 1990).
12. For other examples of such linguistic realizations, especially from the semi-public and anonymous spheres, see Projektteam (1989). We have limited ourselves here to those patterns which are actually found in the example passage. The hierarchy of explicitness mentioned above contains the full range of possible antisemitic forms of expression.
13. The complete context, analysis and text can be found in Wodak et al. (1990). Here, the most important politicians are presented as well as the supplementary comments made by the moderator. The Austrian radio station is a state monopoly (ORF). This example shows better than most others how reality is distorted and how the *Feindbild Jud* was constructed.
14. For the purpose of this article it is sufficient to note his service. The Abwehr section of Army Group E could have brought Waldheim *ceteris paribus* closer to activities judged criminal by the Military Tribunal at Nuremberg than would have his duties in the military intelligence. For details on this point, see Kurz et al. (1988).
15. See Wodak et al. (1990).
