CONTENTS

VOLUME I

Appendix of sources xi
Editor's Introduction: The Study of Discourse: An Introduction xix

1. Interviewing Persons with a Learning Disability: How Setting Lower Standards May Inflate Well-Being Scores *Charles Antaki* 1
2. Discourse Studies and the Ideology of 'Liberalism' *Robert de Beaugrande* 21
3. The Discourse Structure of News Stories *Allan Bell* 58
4. Crossing Genders, Mixing Languages: The Linguistic Construction of Transgenderism in Tonga *Niko Besnier* 90
5. The Power and Politics of Genre *Vijay K. Bhatia* 111
6. On the Complexity of Discourse Complexity: A Multidimensional Analysis *Douglas Biber* 127
7. The Dialogic Unconscious: Psychoanalysis, Discursive Psychology and the Nature of Repression *Michael Billig* 158
8. Investigating Narrative Inequality: African Asylum Seekers' Stories in Belgium *Jan Blommaert* 182
9. "You Gotta Know How to Tell a Story": Telling, Tales, and Tellers in American and Israeli Narrative Events at Dinner *Shoshana Blum-Kulka* 221
10. Dialogue and Confrontation in Venezuelan Political Interaction *Adriana Bolívar* 261
11. Personal Web Pages and the Semiotic Construction of Academic Identities *Carmen Rosa Caldas-Coulthard* 275
12. Role and Position of Scientific Voices: Reported Speech in the Media *Helena Calsamiglia and Carmen López Ferrero* 295
13. Relativity and Its Discontents: Language, Gender, and Pragmatics *Deborah Cameron* 322
14. The Analysis of Discourse Flow *Wallace Chafe* 334
15. Missing Links in Mainstream CDA: Modules, Blends and the Critical Instinct *Paul Chilton* 349

VOLUME II

16. The Interpenetration of Communicative Contexts: Examples from Medical Encounters *Aaron V. Cicourel* 1
17. Answers and Evasions *Steven E. Clayman* 20
18. Author Identification, Idiolect, and Linguistic Uniqueness *Malcolm Coulthard* 62
19. Bodies, Beaches and Burn-Times: 'Environmentalism' and Its Discursive Competitors *Nikolas Coupland and Justine Coupland* 78
20. Figures of Speech: Figurative Expressions and the Management of Topic Transition in Conversation *Paul Drew and Elizabeth Holt* 96
21. Universal and Culture-Specific Properties of Greetings *Alessandro Duranti* 126
22. Moaning, Whinging and Laughing: The Subjective Side of Complaints *Derek Edwards* 159
23. Trial Discourse and Judicial Decision-Making: Constraining the Boundaries of Gendered Identities *Susan Ehrlich* 183
24. The Occasioning and Structure of Conversational Stories *Susan M. Ervin-Tripp and Aylin Küntay* 200
25. Discourse, Social Theory, and Social Research: The Discourse of Welfare Reform *Norman Fairclough* 229
26. Coherence in Text vs. Coherence in Mind *T. Givón* 258
27. Action and Embodiment within Situated Human Interaction *Charles Goodwin* 304
28. Constructing Inferences during Narrative Text Comprehension *Arthur C. Graesser, Murray Singer and Tom Trabasso* 338
29. Space: Irrealis Objects in Technology Policy and Their Role in a New Political Economy *Philip Graham* 390

VOLUME III

30. Medical Discourse: Sociohistorical Construction *B.L. Gunnarsson* 1
31. Tactical Uses of Stories: Participation Frameworks within Girls' and Boys' Disputes *Marjorie Harness Goodwin* 14
32. The Terms of Agreement: Indexing Epistemic Authority and Subordination in Talk-in-Interaction *John Heritage and Geoffrey Raymond* 46
33. Politeness, Power and Provocation: How Humour Functions in the Workplace *Janet Holmes* 76

34. Stance and Engagement: A Model of Interaction in Academic Discourse *Ken Hyland* 102
35. When Talk isn't Cheap: Language and Political Economy *Judith T. Irvine* 122
36. Political Discourse: The Language of Right and Left in Germany *Siegfried Jäger* 147
37. The Uses and Representations of Local Languages in Tourist Destinations: A View from British TV Holiday Programmes *Adam Jaworski, Crispin Thurlow, Sarah Lawson and Virpi Ylänne-McEwen* 168
38. Notes on 'Latency' in Overlap Onset *Gail Jefferson* 193
39. Sociolinguistic Resources, Individual Identities, and Public Speech Styles of Texas Women *Barbara Johnstone* 219
40. The Role of Knowledge in Discourse Comprehension: A Construction–Integration Model *Walter Kintsch* 238
41. Heteronormativity in Action: Reproducing the Heterosexual Nuclear Family in After-hours Medical Calls *Celia Kitzinger* 279
42. Oral Genres of Humor: On the Dialectic of Genre Knowledge and Creative Authoring *Helga Kotthoff* 306
43. Against Arbitrariness: The Social Production of the Sign as a Foundational Issue in Critical Discourse Analysis *Gunther Kress* 337
44. Narrative Analysis: Oral Versions of Personal Experience *William Labov and Joshua Waletzky* 359
45. Gender, Discourse and Semiotics: The Politics of Parenthood Representations *Michelle M. Lazar* 391
46. Reconstructing Topical Sensitivity: Aspects of Face-Work in Talks between Midwives and Expectant Mothers *Per Linell and Margareta Bredmar* 418

VOLUME IV

47. The Body Literate: Discourse and Inscription in Early Literacy Training *Allan Luke* 1
48. You Know, It Depends *Ronald Macaulay* 23
49. Analysing Self-Constituting Discourses *Dominique Maingueneau* 42
50. Grace: The Logogenesis of Freedom *J.R. Martin* 67
51. Division and Rejection: From the Personification of the Gulf Conflict to the Demonization of Saddam Hussein *Luisa Martín Rojo* 96

52. Multimodal Resources for Turn-Taking: Pointing and the Emergence of Possible Next Speakers *Lorenza Mondada* 126
53. The Political Function of Narrative in Organizations *Dennis K. Mumby* 158
54. Talking to Children in Western Samoa *Elinor Ochs* 176
55. Nominal and Temporal Anaphora *Barbara H. Partee* 203
56. The Organization of Ideological Diversity in Discourse: Modern and Neotraditional Visions of the Tongan State *Susan U. Philips* 242
57. Argumentation Studies and Discourse Analysis: The French Situation and Global Perspectives *Christian Plantin* 277
58. Extreme Case Formulations: A Way of Legitimizing Claims *Anita Pomerantz* 302
59. Discursive Social Psychology: From Attitudes to Evaluative Practices *Jonathan Potter* 311
60. Were You Ever in a Situation Where You Were in Serious Danger of Being Killed? Narrator–Listener Interaction in Labov and Waletzky's Narratives *Uta M. Quasthoff* 342
61. The Inference-Making Machine: Notes on Observability *Harvey Sacks* 349
62. Confirming Allusions: Toward an Empirical Account of Action *Emanuel A. Schegloff* 359
63. Narrative as Self-Portrait: Sociolinguistic Constructions of Identity *Deborah Schiffrin* 406

VOLUME V

64. The Discourses of Food in the World System: Toward a Nexus Analysis of a World Problem *Ron Scollon* 1
65. A Discourse-Centered Approach to Language and Culture *Joel Sherzer* 21
66. Linguistics as Metaphor: Analysing the Discursive Ontology of the Object of Linguistic Inquiry *Shi-Xu* 39
67. The Writing of Research Article Introductions *John Swales and Hazem Najjar* 63
68. The Relativity of Linguistic Strategies: Rethinking Power and Solidarity in Gender and Dominance *Deborah Tannen* 76
69. Talk and Institution: A Reconsideration of the "Asymmetry" of Doctor–Patient Interaction *Paul ten Have* 99
70. The Construction of Conflicting Accounts in [illegible] 121

71. The Clause as a Locus of Grammar and Interaction
Sandra A. Thompson and Elizabeth Couper-Kuhlen 14
72. The O.J. Simpson Case as an Exercise in Narrative Analysis
Robin Tolmach Lakoff 16
73. The Identity Work of Questioning in Intellectual Discussion
Karen Tracy and Julie Naughton 18
74. Discourse and the Denial of Racism *Teun A. van Dijk* 20
75. Strategic Maneuvering: Maintaining a Delicate Balance
Frans H. van Eemeren and Peter Houtlosser 23
76. The Representation of Social Actors *Theo van Leeuwen* 26
77. Predicaments of Criticism *Jef Verschueren* 30
78. Positioning and Interpretative Repertoires: Conversation Analysis and Post-Structuralism in Dialogue *Margaret Wetherell* 32
79. Turning the Tables: Antisemitic Discourse in Post-War Austria
Ruth Wodak 35

Editor's Introduction: The Study of Discourse: An Introduction

The Emergence of a New Cross-Discipline

In the mid-1960s, the humanities and the social sciences witnessed a remarkably synchronous paradigm shift with the birth of several new but mutually related 'interdisciplines' such as semiotics, psycholinguistics, sociolinguistics, pragmatics as well as the study of discourse.

The articles collected in the volumes of this book are prominent contributions to the latter field of study, traditionally called *Discourse Analysis*, but more appropriately labeled *Discourse Studies*, because it is not limited to a method of analysis, as is the case for *Content Analysis* in the social sciences, but also has important theoretical objectives. And because the study of discourse manifests itself in virtually all disciplines in the humanities and social sciences, it is appropriate to speak of a new 'cross-discipline' or even a 'trans-discipline'.

The story of this new field of study has been told many times, and is as exciting as the contributions it has made to our insights into language use, communication and social interaction. For some of the mother and sister disciplines, this story of the emergence of the study of discourse may be summarized as follows.

Anthropology

Already in the early 1960s, among the first to recognize the relevance of the study of discourse anthropologists such as Dell Hymes (1972) became interested in the ethnographic study of communicative events (beyond the traditional study of myths and folklore), a direction of research followed by many other anthropologists under the label of the 'ethnography of speaking' (or the 'ethnography of communication'; Bauman & Sherzer, 1974; Saville-Troike, 1982) and then more broadly within linguistic anthropology (Duranti, 2001).[1]

Linguistics

Linguists were not lagging far behind during the late 1960s, when some of them realized that the use of language obviously was not reduced to the structures of isolated, abstract, invented sentences – as was the case in structural and generative grammars – but needed analyses of structures 'beyond the sentence' and of

whole 'texts', for instance to account for anaphora and coherence. Whereas initially still largely within the formal paradigm of 'text grammars', also this linguistic approach soon merged with the other approaches to a more empirical analysis of actual language use. The names associated with these early attempts at text and discourse grammars are János Petöfi (1971), Wolfgang Dressler (1972), and Teun A. van Dijk (1972, 1977), in Europe, and Joseph Grimes (1975), Tom Givón (1979), Sandra Thompson and Bill Mann in the USA, the latter two under the label of *Rhetorical Structure Theory* (Mann & Thompson, 1988). The roots of the European text grammars, apart from the obvious influence of Noam Chomsky's generative grammar, are however diverse and range from literary theory and semiotics to Russian formalism and Czech and French structuralism.

Although not under the label of 'text grammar', also early studies in Functional Systemic Grammar, founded by Michael Halliday in the UK (and then Australia), paid much attention to discourse, for instance in the account of 'cohesion', the grammatical expression of semantic coherence (Halliday & Hasan, 1976). This work was later followed by a large number of other studies on the grammatical and semiotic aspects of discourse in the same SF-paradigm (among many other studies, see, e.g., Martin, 1992).

Formal Grammar

On the other hand, increasingly formal and explicit studies of language use for discourse participants, coreference, deictic expressions and tenses, continued to be engaged in, from the 1970s both by logicians and philosophers, such as Hans Kamp (1981) and his *Discourse Representation Theory* and others influenced by the mathematician and formal philosopher Richard Montague. This approach states that discourse semantics is dynamic and depends on context.

Pragmatics

Within the tradition of British analytical philosophy, the 1960s also saw the very successful birth of another new interdiscipline, namely pragmatics. Based on the work of Austin (1962) on *How to Do Things with Words*, it is especially the study of John Searle (1969) on speech acts and an influential essay of H. P. Grice (1975) on conversational maxims that sparked a flow of studies on language use extending the traditional focus on syntax and semantics with a pragmatic component, accounting for the illocutive functions of language in terms of speech acts, implicatures and other aspects of contextually based language use. More generally, Pragmatics has become the discipline that houses many of the studies of language use beyond grammar, such as the influential work on politeness by Penelope Brown and Stephen Levinson (Brown & Levinson, 1987).

Semiotics

Within the study of literature and the arts, the mid-1960s also witnessed the emergence of semiotics, the general study of signs and symbol systems. Originally

based on the work of philosopher Charles Sanders Peirce, and structural linguists such as Louis Hjelmslev and André Martinet, this new discipline became popular especially due to the work of Umberto Eco (1976) in Italy, and Roland Barthes (1964) and many others in France. Semiotics was not limited to language, stories and other forms of discourse, but was also studied in other semiotic codes, such as images, film, dance and architecture. Within discourse studies, semiotics has especially been propagated, in a rather different paradigm, by the work of Gunther Kress, and Theo van Leeuwen (Kress & van Leeuwen, 1990; van Leeuwen, 2005).

Conversation Analysis

In sociology, the interest in discourse emerged within the broader framework of 'ethnomethodology', a direction in microsociology focusing on the ways people understand and manage their everyday life. Under the influence of Harold Garfinkel (1967), on the one hand, and of Erving Goffman (1959, 1961), on the other hand, this interest in mundane interaction became very popular with the study of conversation, pioneered by Harvey Sacks, Manny Schegloff, Gail Jefferson in a very influential article in *Language* (Sacks, Schegloff & Jefferson, 1974), followed by many other studies in several disciplines. Whereas discourse grammars studied sequences of sentences, Conversation Analysis (CA) closely analyzed interactional sequences and phenomena such as turn taking, interruptions, pauses, laughter, opening and closing conversations, and many other properties and strategic moves of spontaneous talk now being accessible due to meticulous transcriptions of audio and video recordings (the influential collections by Atkinson & Heritage, 1984; and Drew & Heritage, 1992).

Sociolinguistics

At the end of the 1960s, appeared another new discipline at the boundaries of linguistics and the social sciences, *Sociolinguistics*. Although initially studying variation of grammar, especially pronunciation, due to variables as class, age or gender, some of these studies, also by the founders of sociolinguistics, Bill Labov (1972a, 1972b) and Susan Ervin Tripp (1972), focused on naturally occurring discourse, such as child discourse, storytelling about everyday experiences or the verbal play by African–American adolescents (Gumperz & Hymes, 1972). From a different perspective, later work in 'interactional sociolinguistics' provided more insight into details of interaction and their relation to the social context (Gumperz, 1982a, 1982b).

The Psychology of Text Processing and Artificial Intelligence

A few years later, at the beginning of the 1970s, also cognitive psychology (such as the work of Walter Kintsch, 1974) went beyond the self-imposed limitations of the study of the mental processing of words and isolated sentences, and began to study the production, comprehension and memory of discourse in general

and of stories in particular. Thus, it could be shown that the notion of macrostructure, first developed in text grammar (van Dijk, 1972, 1977, 1980), also had a cognitive basis, for instance in the production and comprehension of discourse topics (van Dijk & Kintsch, 1983). This direction of research soon became very popular in cognitive psychology, also because of its many obvious applications, for instance in education and the mass media.

One of the many influential notions introduced in this research is that of a *mental model* – a representation of events and situations in 'episodic memory' (the record of all our personal experiences) – as the basis of all discourse production and understanding (Johnson-Laird, 1983; van Dijk & Kintsch, 1983).

Another important contribution came from the closely related field of Artificial Intelligence (AI), namely the fundamental role of *knowledge* in discourse processing, for instance in the form of mental 'scripts' of prototypical episodes (Schank & Abelson, 1977).

Although much of this work was (and is) carried out in the various domains of cognitive science, it also has had much influence in linguistics, sociolinguistics, psycholinguistics and the study of literature, such as studies on the comprehension of radio messages (Lutz & Wodak, 1987).

Methodological Common Ground

We see that more or less at the same time, namely between the mid-1960s and the early-1970s, we witness closely related new disciplines emerging in the humanities and the social sciences. Despite their backgrounds in different mother disciplines, and despite a large diversity of methods and objects of study, these new disciplines of semiotics, pragmatics, psycho- and sociolinguistics, ethnography of speaking as well as conversation analysis and discourse studies had several things in common. We may summarize this methodological common ground as follows:

- Interest in properties of 'naturally occurring' language use by real language users, instead of a study of abstract language systems and invented examples.
- A study of larger units than isolated words and sentences, and new basic units of analysis: texts, discourses, conversations or communicative events.
- Extension of linguistics beyond grammar towards a study of action and interaction.
- Extension to non-verbal (semiotic) aspects of interaction and communication: gestures, images, film and multimedia.
- Focus on dynamic cognitive or interactional moves and strategies.
- Study of the role of the social, cultural and cognitive contexts of language use.
- Analysis of a vast number of hitherto largely ignored phenomena of language use: coherence, anaphora, topics, macrostructures, speech acts, interactions, turn-taking, signs, politeness, mental models, and many other aspects of discourse.

It might be speculative to relate this renewal in the humanities and social sciences to the more general revolutionary spirit of the end of the 1960s, as we also know it from the Civil Rights Movement in the USA, the feminist movement worldwide, as well as the student movements both in the USA and Europe. Yet, it is probably no coincidence that against the broader background of African-Americans rebelling against racism, of women opposing patriarchy, and students protesting against traditional university hierarchies, the end of the 1960s also saw the emergence of new scholarly paradigms. Not seldom, these were also defined by young scholars rejecting the theories and methods of their teachers and of the traditional orientations in literature, linguistics, sociology, anthropology and psychology.

Note though, that the social and political nature of the changes in society did not (yet) lead to similar changes in the disciplines. Indeed, initially many of the changes of the new disciplines were formal and only defined by a broader object of study, rather that inspired by a revolutionary spirit aiming to change society. There are (generally European) exceptions to this general 'apolitical' beginning of discourse analysis and sociolinguistics, especially in Germany and Austria, such as the work by Dittmar (1976) on sociolinguistics, by Leodolter (=Wodak) (1975) on language in the courtroom, Wodak (1986) on therapy groups and Wodak & Schulz (1986), on the *Language of love and guilt* – discourses between mothers and daughters.

Although in the social sciences especially frequent reference was made to the 'Critical Theory' of the Frankfurt School, the new studies of signs, speech acts, language variation, stories, communicative events, conversation, film, text processing or discourse structures seldom took place within a broader sociopolitical movement of dissidence and opposition against social inequality. References to Adorno and Benjamin, for instance, initially were found in literature or in the philosophy of the social sciences, rather than in the new disciplines of language use and discourse. More frequent references to the work of Habermas had to wait until Habermas himself had discovered pragmatic theory (Habermas, 1981). In that respect, at least in these disciplines, academic theory and social movement remained two distinct areas of social practice. It is only with such later developments as critical discourse studies that these two different forms of dissent merged.

Integration and Further Developments

Although most of the new (inter- or cross) disciplines mentioned above had different backgrounds, objects, methods and sometimes inconsistent philosophies, the last decades have witnessed increasing integration in the broad field of the study of language use. In the following decades, much work in pragmatics, sociolinguistics, conversation analysis and the ethnography of speaking often overlapped, especially because of their shared interest in the study of conversational interaction in social contexts.

Discursive Psychology

These interdisciplines were soon joined by other directions of research and new paradigms in the 1980s, such as *Discursive Psychology* within social psychology, interested especially in the way 'psychological' notions (such as 'memory') are enacted in discourse in general, and conversation in particular (Potter & Wetherell, 1987). Rejecting individual cognitive psychology, laboratory experiments and traditional social psychological notions such as attitudes, *Discursive Psychology*, as pioneered by Michael Billig (1987, 1988), Jonathan Potter (1996), and Derek Edwards (1997), thus sought alignment with ethnomethodology and conversation analysis, on the one hand, and the work of (the later) Wittgenstein, and the social constructivism of Rom Harré and Kenneth Gergen, on the other hand.

Interaction and Cognition

Whereas earlier studies in literature, semiotics and text grammar largely focused on the analysis of written texts, nearly all work in the interdisciplines just mentioned focused on spoken language in general, and on 'talk in interaction' in particular.

Only in cognitive science and some directions of discourse grammar, pragmatics, sociology and anthropology do we find a more cognitive orientation towards the study of language use and discourse – an orientation on the 'mind' generally rejected or ignored by interactional approaches to discourse (see the contribution in van Dijk, 2006). These developments have their counterpart in cognitive linguistics, for instance in the work on meaning and metaphor by George Lakoff (Lakoff & Johnson, 1980) – work that also has found application in (critical) discourse studies.

There should be little doubt that before long also this broad gap between interaction and cognition will be bridged, especially since discourse obviously is both a form of social interaction, as well as a form cognition of communication, and because there are many 'mental' notions that are crucial in any kind of discourse study, such as meaning, coherence, topics, inference, presupposition, knowledge, belief, opinion, and so on. Indeed, the very notions of action and interaction cannot properly be defined without 'cognitive' notions such as plan, aim, goal, purpose, coordination, monitoring, and so on. It is within the study of discourse that such an integration of cognitive and interactional approaches is most fruitful. The last decades have seen extraordinary advances in both the study of interaction and that of cognition, and the time has come to integrate these results. Insight into the detailed mental strategies (and their neurological basis) of discourse production and comprehension may thus be combined with what we now know on the details of interactional moves and strategies.

Critical Discourse Studies

At the end of the 1970s, another direction of research emerged in the study of discourse: Critical Discourse Analysis (CDA), originally introduced in a seminal

book by Roger Fowler, Gunther Kress, Bob Hodge and Tony Trew, *Language and Control* (1979), and later developed by Norman Fairclough (1989) in the UK, Ruth Wodak (1989) in Austria and Teun A. van Dijk (1993) in the Netherlands (for introduction, see, e.g., Wodak & Meyer, 2001). Although some isolated scholars earlier showed some interest in a more critical approach (e.g., Mey, 1985), we have seen that most of the new studies of language use emerging in the 1960s were at first quite apolitical. Rather late when considered against the revolutionary background of the end of the 1960s referred to above, Critical Discourse Analysis finally began to focus on issues of power, domination, and social inequality, and on the relevance of gender, race and class in the study of text and talk.

Much of this critical work was paralleled by similar work done mostly by feminist women on the relations between language, discourse and gender, and on the ways male domination is reproduced in text and talk (for an early study, see Kramarae, 1980; for the vast number of later studies, see the references in Holmes & Meyerhoff, 2003). Although at first not explicitly carried out within a CDA-framework, much work on gender and discourse is in fact an excellent example of a CDA approach (for an explicit CDA approach to gender studies see, e.g., Lazar, 2005; Wodak, 1997).

Other studies, such as by Wodak and van Dijk, especially focused on the reproduction of racism and anti-Semitism in discourse, for instance in political discourse, the press, and textbooks (among many studies, see, e.g., van Dijk, 1993; Wodak, et al., 1990; Wodak & van Dijk, 2000).

In the same way as the study of discourse spread in most of the humanities and social sciences, also the more critical approaches to language, discourse and interaction can now be found in many disciplines. The awareness has grown that with the increasingly powerful methods of the explicit and systematic description of talk and text, and the more sophisticated theories of cognition and interaction in their social and institutional contexts, discourse and conversation analysts are well prepared to tackle more complex and socially relevant issues.

Though, still reluctantly by the more formally inclined scholars interested in more 'autonomous' approaches to structures of text and interaction, it has become more widely accepted that discourse is profoundly embedded in society and culture, and hence, closely related also to all forms of power, power abuse and social inequality. It has been shown how ethnic prejudices and ideologies are daily produced and reproduced by political and media discourse of the elites, and thus contribute to the reproduction of racism. The same is true for everyday sexism in many kinds of discourse – from conversation to advertising – and the reproduction of the system of male domination.

Obviously, such a critical focus on the discursive reproduction of social inequality cannot be limited to a narrow discourse or conversation analytical approach, and requires further integration with the social sciences. Such an integration will also need to go beyond the gaps that still influence much of scholarly practice, such as between micro and macro approaches in sociology, or between cognitive and interactional approaches throughout the social sciences. This will also require further integration of the discipline that so far as remained

rather distant from the developments in discourse studies, namely political science – a strange phenomenon when we realize that policies and politics are 'done' virtually only in text and talk.

Finally, besides such a critical perspective in the study of discourse, we face the challenge of a vast number of urgently required applied studies. These fields of applications are many, and fortunately much work is already under way. Perhaps most relevant here are the many application in the field of education, from first and second language learning and literacy, to the development of curricula, textbook, classroom interaction, and teaching and learning in general – most of which is discursive (in the broad semiotic sense: text, talk, sound and image). Similar observations hold for the applied studies of the mass media, of journalism education and of course the field of psychological intervention. Indeed, there are few applied fields of study and intervention that do not have an important discursive dimension, and besides its critical perspective, discourse studies need to increasingly also focus on concrete practical issues of contemporary societies.

Dimensions of Discourse and Fields of Discourse Studies

The historical sketch – given above – of the emergence of discourse studies in the various disciplines of the humanities of the social sciences, and its increasing integration with its sister disciplines, such as semiotics, pragmatics and sociolinguistics, already provides first insights into the various dimensions of discourse and the fields of the new cross-discipline. Let us now examine this configuration of the new discipline and its object of study more closely.

Thus, for instance, we on the one hand have *cognitive* studies of the mental processes involved in the production or comprehension of discourse, and *interactional* studies of everyday conversation or institutional talk, on the other hand. The same is true for more *cultural* approaches in the ethnography of speaking, and – in a quite different, more critical, perspective (focusing on e.g., popular culture or youth culture) – in the 'Cultural Studies' developed by Stuart Hall and others in the UK (Hall, et al., 1978). Strangely, following the same general division of the mother disciplines, the *historical* approach to discourse – outside of the theory of historiography and oral history – so far has been quite marginal in discourse studies, with the exception of, for instance, the work on anti-Semitism by Ruth Wodak (Wodak, et al., 1990).

Besides these interdisciplinary approaches in discourse studies, the 'core' of the new discipline remains *the systematic and explicit analysis of the various structures and strategies of different levels of text and talk.* Let us briefly review these, also in order to show how the vast field of discourse studies is organized in various subdisciplines that also have become more or less independent, as also was the case for, say, lexicology, phonology, syntax and semantics within linguistics.

Discourse Grammar

The strong influence of linguistics on discourse studies and its development still shows in the prominent position of grammatical analysis in many discourse studies. We have seen above that this influence of linguistics also played a central role in the development of discourse studies, namely in the first 'text grammars'. We also saw that various directions in formal grammar (as well as in logic and formal philosophy) continue to be one of the productive areas of formal discourse analysis. Unfortunately, this formal direction of research is virtually unknown in other domains of discourse studies.

Within less formal 'discourse grammars', we continue to have studies of the *sound structures* of discourse (Bolinger, 1989; Brazil, 1975), for instance in studies of intonation, as well as studies of *discourse syntax* (Givón, 1979) continuing for instance the early work on anaphora, which also has links to formal discourse studies.

Strangely, *discourse semantics* has remained an underdeveloped area of discourse grammar. Yet, if there is one level of discourse that contributes to the specific discursive nature of text and talk, it is the study of meaning, as we also know from the first studies of coherence in the 1960s and 1970s. Part of discourse semantics, and shared with work in cognitive linguistics, is of course the research on metaphor, already mentioned above. Also very relevant is the study of semantic implication (entailment) and presupposition, for instance as one of the basic dimensions of coherence: In order to establish coherence relations between the propositions of a discourse, we often need to spell out the 'missing links' of the propositions implied or presupposed by the propositions explicitly expressed in discourse.

There are many more aspects of discourse meaning that need systematic analysis and that cannot simply be reduced to the semantics of words and sentences. For instance, discourse may describe (prescribe, account for, etc.,) events, actions and actors and may do so in many ways: more or less explicitly or implicitly, more or less generally or specifically, more or less precisely or vaguely, with many or few details, as background or as foreground, and so on. There are many constraints on sequences of descriptions, such as an increasing focus from broader to narrower objects of description (e.g., from a house to a room in the house, from a room in the house to furniture in the room, and from furniture to an object on such furniture, and so on – and in general not vice versa). The same is true for descriptions of time and tense sequences and, the way persons and social actors are described, and so on.

One new line of research, carried out within the general framework of Functional-Systemic grammar, is that of Appraisal Theory, which examines the way opinions are expressed in discourse (Martin & White, 2005).

Discourse meanings may be characterized in terms of sequences of propositions, but we know that meanings are not limited to local or sequential structures, but also may characterize whole discourses. The classical example are the 'topics'

of discourse, traditionally described in terms of 'semantic macrostructures', and typically expressed in headlines, leads, introductions, conclusions, initial 'thematic' sentences, and so on (van Dijk, 1980). In linguistic terms, topics are global meanings that dominate the local meanings of sequences of sentences or turns of talk. In cognitive terms, topics represent the most important information of a discourse, as it is being assigned by speakers/writers or recipients. Topics also represent the kind of information that is best recalled when understanding discourse, and it is the kind of meaning we usually plan ahead before starting (or continuing) to speak or write. Despite the fundamental relevance of such global meanings in the organization and processing of discourse, it is strange that many directions of discourse and conversation analysis ignore or do not make explicit such global semantic structures. Indeed, much more semantic research will be necessary to examine in much more detail the relations between such 'macrostructures' and the 'microstructure' of local meanings of words and sentences. At the same time, these studies of local and global meanings of discourse of course need to be related to the *cognitive analysis* of discourse, also because they require an explicit account of the fundamental role of knowledge in the local and global coherence of text and talk.

We see that both at the local and the global level of discourse meaning, there is a vast area of discourse analysis that remains virtually unexplored, but that should form an important element of future research on discourse grammar.

Stylistics

Better explored, especially also in sociolinguistics and literary studies, has been the dimension of language and discourse 'style', for instance in what has come to be known as the subdiscipline of *stylistics* (Eckert & Rickford, 2001; Scherer & Giles, 1979). Notoriously difficult to define exactly, also because it has so many non-linguistic meanings (such as the style of clothes, houses, people, etc.,), style may briefly be defined in terms of the variable expression of discourse as it is conditioned by aspects of context.

The most obvious manifestations of style may be found, as we also know from sociolinguistics, in the various way people may pronounce *sounds*, thus producing more or less formal, more or less casual, more or less higher or lower class 'styles' of speech. Contrary to involuntary 'accents', such sound variation is called part of the 'style' of a discourse if the speaker is able to control such variation of pronunciation, for instance to accommodate to the way the recipients speak, or to signal familiarity or a more formal relationship.

Similarly, also lexical variation has traditionally been seen as one of the basic characteristics of discourse style, usually under the condition that the underlying meanings remain (more or less) the same. In other words, 'saying the same thing in other words' has often been the rather informal definition of style. Again, such variation is stylistic if it has contextual conditions or consequences, as when politicians or newspapers of different political ideologies use the lexical item 'freedom fighter' or 'rebel', rather than 'terrorist', or vice versa, or want to keep a balanced expression when talking about 'insurgents'. That is, word choice

is one of the ways people betray their underlying opinions, social attitudes and ideologies, also because the use of lexical items is associated with underlying norms and values.

Apart from such 'ideological' variation of lexical style, there is also a more social one, for instance in order to express or establish more or less formal positions or relationships. Thus, politicians in the UK will rather speak about 'expelling economic immigrants' than about 'throwing scroungers out of the country' as some racist tabloids (and politicians) may do, in which case popular styles may combine with racist (ideological) style. Lexical styles typically come in levels, such as high (very formal, official), medium (everyday public), and low (colloquial, popular) or even very low (vulgar) levels of expression. More in general, thus, lexical style signals important aspects of the context, such as the formality of the event, the social power, position and status of speakers or recipients, the relations between the participants, the opinions and ideologies of the speakers, and so on.

Such is not only the case for lexical style (or pronunciation) in talk, but also shows at other levels of discourse, as we know from the stylistic difference between an English broadsheet, quality newspaper (now also often in smaller format) such as the *Guardian*, on the one hand, and the popular style of the tabloid *The Sun*, on the other hand, which also shows in size, type and color of headline, pictures, lay-out and many other forms of multimodal expression. The same is true for the difference between the syntax of a *Guardian* editorial and that of a *Sun* editorial.

Although usually limited to a study of context-dependent grammatical variation of expressions (sounds, lay-out, words, sentences), we might extend stylistic analysis also to other levels of discourse, as long as we maintain one (lower) level constant. For instance, elite and popular newspapers may write very different stories about the 'same event' (that is, with the same underlying topic or semantic macrostructure), adding or omitting different details, and we might also call this a difference of 'style' between the newspapers.

Rhetoric

Discourse studies is often defined as the contemporary discipline of what used to be called *rhetoric* since antiquity, that is, the practice and study of 'good' public speaking and writing, for instance in parliament, in court or in literature. Also today, and especially in the USA, the 'new' rhetoric is sometimes defined as a special (sub) discipline in the humanities that overlaps with discourse studies. As is the case for stylistics, rhetoric is often associated with the study of literature, rather than with the study of discourse more generally (among a vast amount of studies of rhetoric, Sloane, 2001).

In order to avoid collapsing rhetoric with discourse studies in general, we narrowly) define rhetoric as the subdiscipline of discourse studies focusing on the use of special 'rhetorical' structures of text and talk, such as metaphors, comparisons, irony, hyperboles, euphemisms, etc., that is, the kind of structures that were traditionally called 'figures of style' in classical rhetoric. Unlike other

structures of text and talk, these 'rhetorical' structures are optional, and used especially to convey or produce specific effects, for instance as part of strategies of persuasion. These 'figures' emphasize or de-emphasize meaning and thus, draw special attention of recipients, which may lead to less/better memory of the meanings thus, [de]emphasized. For instance, if politicians or newspapers want to diminish the negative associations of the word 'racism', they may use the less harsh term 'popular discontent' instead. And vice versa, if they want to emphasize the negative aspect of the arrival of many new immigrants, they might typically use the expressions 'wave' or 'invasion', which are at the same time metaphors and hyperboles (van Dijk, 1993).

Given these examples, it is not surprising that rhetoric is especially popular in the humanities – for instance in the study of literature – and in the social sciences, for instance in studies of political rhetoric or advertising, although strictly speaking such studies should not be limited to figures of speech, but also deal with the cognitive effects of such language use on the recipients and the whole communicative context. Also, it should be emphasized that discourse has many other 'persuasive' dimensions apart from these special rhetoric structures, such as argumentation, the use of emotion words, and so on.

Superstructures: Discourse Schemas

Whereas stylistics and rhetoric were traditionally closely related to literature and grammar, there are other structures of text and talk that go far beyond the grammatical characterization of discourse, and which may be called 'superstructures', because they are abstract *form-schemas* that globally organize discourse across sentence boundaries.

A well-known example is the form-schema of argumentation, including such conventional categories as premises and conclusions. These have been further detailed in contemporary argumentation studies, a major subfield of discourse studies (van Eemeren, Grootendorst, Henkemans, 1996).

Similarly, stories are often analyzed in terms of abstract narrative schemas, featuring such categories as Summary, Orientation, Complication, Resolution and Coda, more or less in this order, as we know from much narrative studies, another large field of discourse studies (Labov & Waletzky, 1967; Ochs & Capps, 2001).

In the same way, many other discourse genres have 'canonical' structures that have become conventional and more or less fixed 'forms' or 'formats' of a genre. A scholarly article typically consist of such categories as Title, Abstract, Introduction, Theoretical Framework, Data/Subjects, Analysis, Conclusions, depending on the discipline and the subject matter. News reports in the press similarly have one or more Headlines, a Lead, Main Event Description, Context, Backgrounds, History and Comments, as formal categories for the organization of specific kinds of information – typically obtained by different news production strategies, sources or professionals (van Dijk, 1988). Many professional and institutional discourse types may have such conventional formats. Even informal conversations have such fixed formal categories, such as greetings and leave [illegible]. Much work on professional genres deals with such 'schematic'

structures of text and talk (Bhatia, 1993; Gunnarsson, 1997; Swales, 2004; Ventola & Mauranen, 1996).

Note that all these structures are *global*, and not local: Just like topics or semantic macrostructures, they characterize discourse as a whole, or apply to larger fragments of discourse. Also, even when originally they might have had specific meaning functions, they are *formal* categories defining abstract schemas. Thus, the headline of a news report is a fixed, obligatory category that applies to any news report, whatever its meaning or content. Yet the *function* of such a headline is semantic and cognitive: It expresses the main topic of the text, which in turn organizes its local meanings, and signals the most important information about an event.

Whereas most other structures of sentences and discourse correspond to various subdisciplines, there is no subdiscipline that specifically deals with these schematic structures in general. Rather, different text types or genres may be associated with such schemas, as we have seen for the conventional schema of an argumentation.

Discourse Pragmatics

We have seen that pragmatics is one of the overlapping sister-disciplines of discourse studies: Many studies of discourse are also called 'pragmatic' because they somehow have to do with the study of 'language use', rather than with grammar. Here such a general use of the term 'pragmatics' will be avoided, because obviously the study of 'language use' also takes place in socio- and psycholinguistics and other disciplines, and we prefer to use the notion in a more restricted, technical way than as some kind as 'wastepaper basket' of linguistics as the philosopher Yehoshua Bar-Hillel used to say). Part of such a broader study of language use, as we also have seen above, are for instance the ways language users express or signal politeness and deference, and in general manage 'face'. Thus, whereas the study of grammar and style specifically focuses on *form*, and semantics focuses on *meaning*, these pragmatic aspects rather are specific properties of *interaction*, such as the social relations between participants.

Incidentally, although nearly all internationally influential studies referred to in this chapter are written in English, we should not forget that vast amounts of discourse studies have been published in French, German, Spanish, Russian and other major languages. Thus, the study of discourse pragmatics was carried out in Germany already since the early 1970s, for instance in the work of Wunderlich, Ehlich, and Rehbein (see the papers in Wunderlich, 1972), scholars who later contributed many other studies in the field of discourse analysis. The same is true, for instance, for the work on pragmatic discourse markers and argumentation by Ducrot (1972, 1980, 1984), in France. It is not feasible here to review all relevant work in other languages than English.

More specifically, pragmatics will here be understood as the subdiscipline of discourse studies focusing on speech acts or illocution, that is, the specific social acts accomplished by language users and that typically are (only) accomplished by text or talk, such as assertions, promises, questions, congratulations, and so on.

Like sentences and their meanings (propositions), also speech acts usually come in sequences, as is the case in conversations, parliamentary debates, and other types of discourse. And as we do for sequences of propositions, also sequences of speech acts can be said to be locally or globally coherent, for instance when one speech acts provides reasons for the next one (such as in the sequence Assertion-Request 'It's stuffy in here. Could you please open the window?'). Similarly, the global speech act performed by this chapter is one of an assertion, whereas the global speech act of an editorial in the press may be an accusation or a recommendation and the weather forecast a prediction (van Dijk, 1981).

Conversation Analysis

Last but not least, the vast field of research commonly labeled 'Conversation Analysis' (CA) specifically focuses on the *interactional* nature of language use and discourse. Although early work in CA specifically dealt with informal, spontaneous everyday conversation, later studies also more generally deal with 'talk in interaction', that is, also with institutional dialogues of many kinds. Emerging from microsociology and ethnomethodology, these studies are specifically interested in the 'local order' of social structure, and how also institutions and organizations are daily produced and reproduced by talk (Boden & Zimmerman, 1991; Drew & Heritage, 1992).

Although often presented as a separate subdiscipline, the study of talk-in-interaction obviously belongs to the broader study of discourse. Many of the interactional aspects of talk are closely related to grammar, semantics, pragmatics and other dimensions of discourse: Turn taking is based on clues from intonation, syntactic structure or meaning units. Openings and closings of talk are schematic categories that have similar functions as Introductions, Headlines, on the one hand, or with Conclusions, on the other hand, prominent in many spoken or written types of discourse. Moves and strategies of interaction are organized also in terms of meaning, as is the case for agreements and disagreements. Self-presentation strategies have both interactional as well as semantic and formal characteristics, as we also know from such well-known disclaimers as *"I am not a racist, but..."*. Indeed, most of the conditions of local and global coherence, of style and rhetoric, characterize both spoken and written discourse, and it does not make sense, therefore, to distinguish two disciplines of discourse studies. On the other hand, studies of written discourse (for instance in argumentation), should not neglect the interactional dimension of such discourse. And in many forms of Computer Mediated Communication (CMC) today, such as chatting, talk-in-interaction is written or multimodal rather than spoken.

In sum, the complex and subtle structures and strategies of interaction are multiply related to all other levels and dimensions of discourse, and may be studied in a unified framework. Studies on the formal or meaning aspects of discourse may be complemented by a study of their interactional dimensions, and vice versa, as we have seen above, the analysis of talk in interaction is inextricably related to other local, sequential and global dimensions of discourse, from intonation and syntax, local and global meanings, to schematic organization and speech acts.

Genre Analysis

From the brief summary given, we see that the study of discourse is a vast field, consisting of many subdisciplines, and at the same time overlapping with other new interdisciplines, such as sociolinguistics, and with sister disciplines such as pragmatics and semiotics. It either is a part or overlaps with virtually all mother disciplines of the humanities and social sciences.

This overlap with other disciplines also produces the kinds of studies that focus on different *genres*, such as the study of many types and subtypes of text and talk in politics, the media, education, science, law, business, the bureaucracy and also parliamentary speeches, news reports, editorials, textbooks, classroom lessons, laws, business letters, phone calls, annual reports, meetings, bureaucratic forms along with a host of other genres (Bhatia, 1993; Lemke, 1990).

Note though that genres are not merely described in terms of their structures at any of the dimensions mentioned above, but especially also in terms of their *contexts* (van Dijk, 2007). Thus, a parliamentary debate has very few exclusive structures – its topics, its forms of rhetoric, its argumentation, and so on may be part of any discourse about the same subject – and hence needs to be defined in terms of specific context categories, such as MPs, political parties, government and opposition, constituents and voters, as well as in terms of political goals and processes, knowledge and ideologies. Some of these contextual elements may be accompanied by specific discourse forms, as when members of the same party in British parliament are traditionally addressed as 'my honourable friend'.

Such contextual approaches may be combined with the more traditional descriptions of discourse genres in terms of their structural characteristics, for instance stories in terms of narrative schemas, style, topics or the perspective of the narrator, or news reports in terms of its canonical schema, featuring headlines and leads, and other categories – besides some special lexical items preferred in news discourse (e.g., the short formal word 'bid' in English headlines, rather than the longer noun 'attempt').

Note that genre analysis is merely a collective label for what in many respects have become more or less autonomous subdisciplines of discourse studies, such as conversation analysis, narrative analysis, argumentation analysis, the study of classroom interaction, political discourse analysis, media discourse analysis, and so on.

With the usual increasing specialization we know from other disciplines, it is likely that in the future we'll have discourse analysts specialized in the study of news in the press, high school textbooks, schizophrenic talk, parliamentary debates, life stories, soaps (telenovelas), and so on for many hundreds of other discourse genres defined as discursive social practices.

Applied Discourse Studies

Although we may thus expand the field of discourse studies as far as the study of the human activity of text, talk and communication may bring us, we now have summarized at least some of its major subdisciplines. Each of these subdisciplines

has its own background, theories, terms, objects of analysis, methods, aims, introductions, handbooks, journals, conferences, and even associations of scholars.

Each of these subdisciplines have a more *applied* dimension, when no longer mere theory or description is relevant, but concrete applications, interventions and the use of science in the solution of social problems are required. *In linguistics*, we are familiar with the use of grammar in the study of first or second language learning, translation, and other aspects of language use. In discourse studies, the number of possible applications is so vast that they cannot even be summarized here, because they pertain to any aspect of language use, interaction and communication, from literacy to the formation of journalists, peace negotiation and the critique of advertising and political manipulation. Pervasive and probably most relevant are all applications in education, such as curricula, the production of adequate (and non-racist, non-sexist, etc.,) textbooks, programs of classroom intervention, testing and so on.

Now we have some more insight into the structures of talk and text, as well as their cognitive basis and social and cultural contexts, we in principle are also in a better position to engage in the treatment of the many social issues that have a discursive dimension. People may not first think of text and talk when dealing with racism, for instance, until it is shown that racist prejudices and ideologies that are the basis of racist discrimination are largely acquired by discourse, especially the public discourses of the elites, e.g., in politics, the mass media and textbooks. Much critical and practical studies on discourse combine theoretical, descriptive and 'applied' dimensions, and indeed hardly differentiate between such dimensions of scholarly activity. Critical discourse analysis focuses on social problems and not on scholarly paradigms, and tries to understand and solve such problems with any kind of method, theory or description that may be relevant – taking into account the experiences and perspectives of the participants.

Looking Ahead: The Future of Discourse Studies

In the previous pages we have occasionally formulated speculations and wishes about the future developments of the study of discourse. If the 'logic' of the historical development of the language sciences is followed, in which the nature and size of the object of study was gradually extended from sounds, words, syntax, meanings, speech acts, and interaction, to the contexts of society, culture and cognition, we may expect that research in the coming years will consolidate this further expansion as well as explore new extensions.

More – and More Explicit – 'Traditional' Descriptions

Firstly, there are 'traditional' areas that need (much) more attention, such as the study of the many dimensions of discourse semantics, and the further integration of micro- and macro-semantics. Secondly, we need a much more explicit

integration of rhetoric into the study of discourse, instead of the separate, more traditional formulation of 'figures of speech'. Thirdly, the complex notions of style and register need to be made more explicit than has been done so far, thus also integrating linguistic, sociolinguistic and discourse analytical studies of language use in its social context. And finally, we need more general insight into the structures of conventional discourse formats, beyond the well-known ones of narrative and argumentation. Many discourse types have such canonical schemas, related also to their interactional and institutional functions, and much more classical descriptive work will be necessary within a more general, typological approach of discourse. This is finally also the case for a more general theory of genre and specific genre descriptions. In that respect, discourse analysis is still a young discipline. The number of discourse types hardly ever studied is probably much bigger than the discourse types that have been studied.

Semiotic Extensions and Computer Mediated Communication

It has already been emphasized that discourse studies overlaps with its sister discipline of semiotics with which ideally it should merge in the future – both being involved in the study of communicative events. Thus, even when limiting the study to discourse in a more traditional sense, we need to realize that such discourse has many 'non-verbal' dimensions, such as intonation, gestures, applause, music and other aspects of oral performance, as well lay-out, printing types, color, pictures, drawings, film, and so on for written discourse (van Leeuwen, 2005). In sum, also under the influence of the tremendous variety of Computer Mediated Communication (CMC) discourse and communication events have become truly 'multimedia' events, in which sounds, music, movement and images combine, in which spoken and written modes of discourse are closely integrated, for instance in 'chats', and in which 'interaction' (e.g., between humans and machines) has acquired new meanings (Danet, 2001; Herring, 1996). Most of these forms of discourse still need to be studied, and in that respect also discourse studies is still a young discipline.

Other Disciplines

We have seen how discourse studies emerged from several disciplines in the humanities and social sciences, especially literary studies, linguistics, psychology, sociology and anthropology, later joined by communication studies. There are many more disciplines in which discourse is a valid and important object of study. We have mentioned political science and history, both disciplines that have regrettably played a less prominent role so far in discourse studies (and vice versa). There is no doubt that also these disciplines will have a strong discourse analytical dimension in the future. Even in such disciplines as geography and economics, discourses are objects of analysis, and discourse analysis may hence also play a more prominent role in those disciplines.

The Cognition-Interaction Gap

We hardly need to repeat what has already been said about the regrettable gap between social and psychological studies, focusing on interaction and cognition, respectively. Interaction and cognition mutually presuppose each other, and any integrated study of discourse in the future will need to deal with both these aspects of language use. Cognition will need to be studied also in a social paradigm because knowledge and beliefs are shared by other members of collectivities and acquired in forms of social interaction we call 'learning'. And vice versa, there are many aspects of interaction that are in fact cognitive dimensions of action, such as the very meaning or interpretation of social conduct, as well as notions such as intention, plan, goals, motivation, purpose, coordination, and so on. Modern cognitive science has a lot to offer to contemporary interaction studies, whatever the relevance of more autonomous approaches for the initial advancement of a new field. We not only need more cognitive and neurological studies of words and meanings, but also of the organization of more complex interactional and discursive structures, such as text schemata or topics, as well as the understanding and management of context.

Context

Indeed, while focusing on text and talk, we tend to forget the many dimensions of a theory of context that is still in the making and that needs to be further developed in the future, and in several (sub) disciplines. It is crucial in any account of the structures of text and talk to describe and explain how they may vary with different structures of the communicative event as these are subjectively represented in context models by the participants. Contexts and their impact on discourse are very complex and future studies need to disentangle these different dimensions of contextual control and consequences. Most studied have been gender, region and class as 'variables'. However, there are a vast number of other aspects of the social and communicative situation that need to be further studied in the future, such as time and space/place settings, the social and institutional roles and relations of participants, and the nature of intentions, plans and purposes as well as the fundamental role of knowledge in discourse production and comprehension. We need to know how local (micro) situations may thus combine with more global (meso and macro) levels of context interpretation and influence, for instance how daily practices of members of institutions are controlled both by specific interaction types (e.g., interviews or meetings) as well as more global (knowledge about the) structure of institutions or organizations.

Methods and Theories

Compared to formal grammar, most discourse studies are quite informal. This is as such no problem (also because informal studies are more accessible to more students and non-academic readers), but that does not mean that discourse analysis should be less explicit and systematic. The description of structures

and strategies at all levels earlier mentioned should take place in terms of explicit theories, and analyses of specific discourse types should be systematic and relevant, and not merely a personally-subjective interpretation, paraphrase or comment on text or talk, as is still often the case in many studies that purport to do 'discourse analysis'.

It should be stressed though that unlike content analysis discourse analysis is *not* a method but a discipline. There is no such thing as psychological or sociological analysis either. Even when studying the 'same' object, such as a news item or a parliamentary debate, we may have recourse to many 'methods', also depending on the kinds or structures we want to focus on, and especially also depending on our aims of study.

Conclusion

If we measure the success of a discipline by its propagation in other disciplines, the study of discourse has been very successful indeed. There are only a few disciplines and areas in the humanities and social sciences that have not engaged in some form of discourse studies. This is not only true for the mother disciplines of discourse studies, such as linguistics, cognitive psychology, sociology and anthropology, but now also for social psychology, communication studies, political science, history, and even for such less discursive disciplines as economics and geography. There is nothing surprising about that, because humanity, society and culture are primarily characterized by their social interaction in general and language use or discourse in particular. In fact, instead of wondering about the vast field and potential of discourse studies, one may ask why discourse studies as a general cross-discipline was not 'invented' before – although in a sense rhetoric had some of these functions since antiquity.

In this introduction we have briefly sketched the history and the organization of the new field of discourse studies, as well as formulated some suggestions for future developments. It may have become clear that the study of discourse has made considerable progress in a few decades since its early studies of narrative, conversation and grammar in the 1960s and 1970s. It is now a vast cross-discipline with equally vast sub-disciplines, each with its own handbooks, journals and congresses, as is the case for argumentation, narrative, media discourse and scientific discourse analysis. Within the original mother disciplines also many studies are associated with discourse analysis, as is obviously the case in literary studies, linguistics and anthropology. This is even more evident in sister-disciplines such as sociolinguistics, semiotics, ethnography, and especially pragmatics. All these new subdisciplines or sister disciplines of discourse studies also have entered the stage of useful applications in the study of social problems and implementation of many social practices.

In sum, discourse studies has come of age, and has become a major cross-discipline within and related to other major disciplines in the humanities and social sciences – and as one of the major disciplines accounting for the most human of all phenomena: language use.

Acknowledgement

For comments and suggestions on an earlier version of this chapter, I am indebted to Ruth Wodak.

Notes

1. To limit a potentially vast bibliography, this introductory chapter only will cite some influential books on discourse in English. For detailed further references, see the articles collected in this book.

Further Reading

Besides the basic books referred to above, here are some suggestions for further (especially also introductory) reading in various areas of discourse studies and its sister-disciplines:

General introductions to discourse studies: Georgakopoulou & Goutsos (1997); Johnstone (2002); Renkema (2004); Schiffrin (1993); Van Dijk (1997); Wooffitt (2005).

Readers of discourse studies: Jaworski & Coupland (1999); Wetherell, Taylor, & Yates (2001).

Handbooks of discourse studies: Schiffrin, Tannen & Hamilton (2001); Van Dijk (1985).

Conversation Analysis: Lerner (2004); Ten Have (1999); Ochs, Schegloff & Thompson (1996); Wooffitt (2005).

Pragmatics: Mey (2001); Verschueren (1999).

Sociolinguistics: Blommaert (2005); Bratt Poulston & Tucker (2003), Coulmas (2003); Holmes (1992); Sarangi & Coulthard (2000); Trudgill (1995); Wardhaugh (1998).

Stylistics: Eckert & Rickford (2001); Toolan (1997).

Rhetoric: Lucaites, Condit & Caudill (1999).

Critical Discourse Studies: Caldas Coulthard & Coulthard (1995); Fairclough (1995); Lazar (2005); Toolan (2002); Wodak & Meyer (2001).

Interviewing Persons with a Learning Disability: How Setting Lower Standards May Inflate Well-Being Scores

Charles Antaki

How does one ask people about their quality of life, and what does one do if those people have a learning disability? "Few would dispute that a basic aim of everyone who formulates questions for use in social research is to have their questions understood by respondents as intended" (Foddy, 1993, p. 183). Indeed, but "having their questions understood" is a special worry for researchers when the respondent has been diagnosed as having some cognitive disability. This article is about what can happen when questions are asked "sensitively."

Interview techniques and questionnaire design have been sites for sustained development for at least the past 50 years (Foddy, 1993). The debate has thrown up a number of problems with phrasing that seem solvable, and there are a number of authoritative sources to which one can turn for such solutions (e.g., Foddy, 1993; Fowler & Mangione, 1990). But there is reason to believe, since the opening-up of the interactional domain by ethnomethodologists and conversation analysts (Garfinkel, 1967; Sacks 1992), that things are not so simple. Recent developments in understanding "institutional talk," for example in the collection in Drew and Heritage (1992) and especially in close analyses of structured tests (Marlaire & Maynard, 1990; Maynard & Marlaire, 1992) and standardised interviews (Houtkoop-Steenstra, 1995, 1996; Suchman & Jordan, 1990), show that the work that goes on to actually ask a question and receive an answer is much more complicated than the official script might suggest, and this work poses a serious threat to claims that the questions are standardized.

Source: *Qualitative Health Research* vol. 9, no. 4, 1999, pp. 437–454.

The problem is exacerbated when the respondent is diagnosed to be in some way cognitively disabled and unable to understand complex questions. In such circumstances, the interviewer may not always be able to follow the strict letter of the interview schedule and is even more likely to fall prey to what Garfinkel (1972) notes happens whenever professionals actually make use of idealized instructions, formulas, rules, and so on. That is, the interviewer will mobilize her or his set of ordinary, unstated, advisory rules to deal with difficult cases. As Maynard and Marlaire (1992) found when examining the standardized testing of children on a linguistic task and referring to the interviewer's nonofficial talk, "the reportable score...depends upon this infrastructure, or substrate, or scaffolding, of organised, practical skills" (p. 196). In what follows, I want to look at this "interactional substrate." I shall make a close comparison between script and delivery in a set of quality-of-life assessments of people with learning disabilities (in North American terminology, people with mental retardation) to see just where the interviewers' unstated advisory rules take them. What I shall try to bring out is what the deviations from the script tell us about the interviewer's treatment of the respondent as being "incompetent," not only mentally but also socially, as a person with reduced personal expectations.

In making this claim, I shall be invoking the sorts of conversational devices identified by conversation analysis (CA). One question that will occur to readers is whether CA, with its base in the talk of people without a learning disability, can cope with the talk of people who are diagnosed as being not fully competent cognitively. This is, in part at least, an empirical matter, and so far as it has been tried, the answer seems to be that it can. Brewer and Yearley (1989) find that, leaving aside certain features that require normatively measurable memory abilities (such as large-scale sequential planning), learning difficulties did not debar people from using the kind of conversational structures and devices CA has identified in the talk of people without a learning disability. Separately, Wootton (1989) takes a possibly more difficult case of the talk of a child severely affected by Down's syndrome to demonstrate the illumination CA can give. Evidence in the 1990s has been accumulating more quickly, and certainly Perkins (1997), reviewing the work reported in a conference devoted to the analysis of order and disorder in talk, felt able to conclude that the applicability of CA is now uncontentious. Given all this, we can at least approach the talk of people with a learning disability with some faith that they will orient to the same communicative regularities in interaction as do people without such a disability.

The Scripted Questions

The standard, psychometric, psychological account is that quality of life is as publicly measurable as any other psychological state and by the same public means. Let me say that in this article, I take no position on whether the construct "quality of life" is a good or bad one nor on whether it serves this or that political purpose and so on. My only interest is in comparing the official description of what is meant to happen in the interview with exactly what does happen

(so far as we can tell from what the audio transcript shows us of the participants' own orientations to the action) and in saying something about the way the interviewers' unofficial and unstated practical reasoning allows, or prompts, a certain pattern of treatment to emerge and a score to be recorded.

Most quality-of-life assessments involve some kind of interview or questionnaire (Hughes, Hwang, Kim, Eisenman, & Killian, 1995). The particular questionnaire whose administration I shall be looking closely at in this article is the Quality of Life Questionnaire (QOL.Q) (Schalock & Keith, 1993; see also Schalock, Keith, Hoffman, & Karan, 1989, 1990, for its development; Rapley & Lobley, 1995, for its acceptable reliability for a British population). It is a routinely used, psychometrically validated, unexceptionable addition to the psychologists' battery of tests, and according to the psychologist responsible for its selection in the interviews we shall see below, it was chosen and administered without fuss or second thought.[1]

What is the "Official" Account of the Interview?

A word is in order on what I take to be the official version of what this interview should be like and against which I shall be offering a comparison from the interactional transcript. The introductory paragraph on this particular instrument reads as follows:

> The QOL.Q may be administered to persons with mental retardation who have an adequate receptive and expressive language. The examiner needs to be sensitive to the possibility that the respondent may not understand some of the items or the meaning of some of the words. If this happens, it is okay to paraphrase the item to improve understanding. If this happens frequently, or if the person is known not to have adequate receptive or expressive skills, it is acceptable to have two persons who know the individual well complete the questionnaire.

And after a paragraph of instructions to be read to the respondent, the instructions to the interviewer continue thus:

> If the respondent consents, the examiner proceeds to administer the 40 items. When reading the items, pay close attention to the exact wording. You may paraphrase items and repeat them as often as necessary to ensure the respondent's understanding of the item content.

As with any set of instructions, there is a great deal that remains implicit. Perhaps the most important omission is the lack of instruction about how to "paraphrase items and repeat them." It would seem to be of crucial importance that this be channeled along some principled guidelines, but none are provided. In other words, if interviewers depart from the script (as we know interviewers do from the work of Houtkoop-Steenstra, 1995, 1996; Maclaine & Mc[illegible], 1998;

Suchman & Jordan, 1990), then what they will be doing is not adhering to some strict psychometrically correct procedure guided by mental-heath theory (indeed. Garfinkel's [1967] argument is that such procedure is a chimera) but rather revealing some combination of their "training" and their unofficial folk craft in designing questions for these recipients. I shall try to show that the way they design their deviations is in the direction of what might be called *sensitiveness* and that this can have the effect of raising the respondent's score without official warrant.

The Data

The data are transcripts of 10 administrations of a questionnaire (as noted above, the Schalock & Keith [1993] QOL.Q) in a routine Psychological Services "audit" of people in supported housing in a city in Northern England (for a fuller description of aspects of these data not relevant here, see Antaki & Rapley, 1996a. 1996b; Rapley & Antaki, 1996). Respondents were all former residents of a local long-stay institution for people with learning disabilities (in U.S. terminology, mental retardation) and had been previously classified as having moderate or mild learning disabilities. Interviews were conducted in the participants' new homes. All participants were asked for, and gave, their consent to the tape recording.

I shall concentrate on one, typical interview between the psychologist and a man pseudonymised as MA and bring in examples from other interviews as I go along (each interview was conducted by one of two psychologists, and I shall not distinguish between them). Perhaps I should make clear that the persuasiveness or otherwise of my case rests on how well or badly I unravel the workings of scripted question delivery. It is not primarily a statistical demonstration done by counting up categories across cases; it is an argument that this is the kind of distortion that script delivery suffers as the interaction progresses. Nevertheless. there will be a couple of points in the argument where some brute statistics will help, and I shall provide them then.

Analysis

I shall turn first to an exemplary question-and-answer pair, then go through the range of such pairs as they increasingly deviate from the printed schedule. I will quote the official version of the question and the official response alternatives to make points about discrepancies between the official and the live versions. The notation used is derived from Gail Jefferson's conventions, which are widely adopted in CA (see Atkinson & Heritage, 1984, pp. ix ff) and which are set out in the appendix. In the extracts presented here, all personal names have been changed, as have most place names and any other details that might identify the respondent.

An Example of Sensitive Paraphrase

The following is a good example of the sort of paraphrase that reworks the official question into one that is easier for the respondent to answer:

Question 21: How did you decide to do the job or other daily activities you do now? *I chose it because of pay, benefits or interests* (3), *Only thing available I could find* (2), *Someone else decided for me* (1).
Actual delivery and response:

409		(3 secs, including paper rustling)
410	Interviewer.	how do you (.) decide to ↓do **what** (.) you >do at
411		the moment< (.)°↑yeh?_
412	MA	(well) clean ↑up
413	Int.	yeh? (.) d'y (.) d'y <u>do</u> what you do bec'z (...) you
414		↓have to: (.) or because you"re ↓told to (.) or cos you ↓want to do it
415	MA	to <u>do</u> it
416	Int.	hah?
417	MA	↑yeh
418	Int.	↓cos ↑you want to do things
419	MA	yes
420	Int.	°yeh?°
421		(2 secs)
422	Int.	ok (sniff) [moves onto next question]

Recorded score: 3

Notice here that the official question is about paid work, but the interviewer has previously established (in earlier lines 177–180, not reproduced in this article) that MA is "about 70" years of age (and thus older than retirement age). The interviewer has to offer a suitably reworded version. This comes out as "how do you (.) decide what (.) to >do at the moment<° yeah?°" (line 410). The previous material does not seem to offer much of an indication as to what such a pro-verb (as Sacks called them; see 1992, Vol. 1, pp. 342 ff) as *do* might stand for here (or even its phrasal version *do-at-the-moment*, delivered in a burst); so this is rather an underspecified paraphrase. MA has an attempt at specifying it with "(well) clean up," and the interviewer recycles the question in a further paraphrase, which nevertheless still uses the pro-form *do what you do*. We might wonder whether MA's turns at 415 (an echo of "to do it" from the interviewer's previous turn), 417 ("yeh"), and 419 ("yes") do constitute the score 3 and the sentiment "I chose it because of pay, benefits or interest" that it is meant to stand for; but for the moment, the thing to notice is the paraphrase.

Dijkstra, van der Leen, and van der Zouwen (1985) report that only about a third of questions in standardized interviews (with respondents without a learning disability) get a literal delivery. Things are rather worse in the interview with MA: Only 3 of the 28 question-and-answer pairs come up to the official presumption of strict literalness without paraphrase.

This is a point at which some further gross statistics might be helpful. To get a sense of how often in the entire 10-interview corpus questions deviated from literalness, I counted the times a question was delivered in a way that would count common sensically as *word for word* (a technically rather problematic phrase), *nearly word for word*, and, finally, *not word for word*. I hasten to say that each of these terms would bear a great deal of examination, but the purpose I want to make them serve here is exactly the sort of rough-and-ready judgment that (I imagine) would be made by the interviewers themselves while actually delivering the questions and without time for formal reflection and drafting. The criteria I used for literalness were that the item stem and its response alternatives be delivered word for word, with allowance made for some small degree of filled pausing ("ums" and "ers") and self-repair ("that hap- *happen* to you"). More generously, I allowed the substitution of synonyms or synonymous expressions (for example, substituting the word *work* for *employment*, or *a bit satisfied* for *somewhat satisfied*). I counted as "nonliteral" anything grosser: This ranged from reducing the number of response alternatives to wholesale paraphrase of the entire question.

The first pass is to see what is made of each question the first time it is asked. None of the 10 interviews had more than 3 exactly literal first-time deliveries of question-stem and response alternatives, and most (6) had only one such delivery. On a more liberal – but of course psychometrically discouraged – allowance of near literalness, each interview would yield about 3 more such deliveries. But even with this allowance, the most word-perfect interview had no more than 8 literal or nearliteral deliveries out of 33 occasions on which a question was asked for the first time, and the mean, over all 10 interviews, was about 13%, or 1 question in 8.

How literal were questions when they were repeated? The textbook instruction is that in response to unsatisfactory first answers, "the interviewer's job is to explain to the respondent that choosing one answer from the list is the way to answer the question . . . and to read the list of responses again" (Fowler & Mangione, 1990, p. 39). But this virtually never happened in this set of interviews. If we took a purely numerical count of all questions in the interviews (on a crude categorization, including first deliveries, repetitions, subsequent versions, corrections, and so on), the proportion of literal or near-literal versions of what is on the official schedule drops to about 2%. In other words, the conversation-analytic cliché of some phenomenon being "massively" the case works out here, for nonliteral delivery of a scripted question, to something like "98% of the time."

In other words, then, and speaking only of this set of interviews, an interviewer can be expected to pose people with learning difficulties literal, scripted, psychometrically proper questions only very infrequently; deviation of one kind or another is the norm. Now it is worth remembering that, as we saw in the instructions above, this particular questionnaire disarms textbook injunctions to literalness by allowing its administrators to paraphrase the items. But it does so without providing any guidance at all about what constitutes a proper or improper

departure from the wording on the page. That is left to the interviewers' discretion, so what they actually do say is a matter of some interest.

How Sensitive Questions Lower the Bar to Socially Positive Answers

Let us move on now to extracts that depart more markedly from the official script and in which the lowering of the criteria for a high score is still more exaggerated. Note, however, that I do not mean to suggest that every deviation from the script can usefully be characterized as one that lowers the bar to a socially positive answer, only that this is a common and striking pattern in the data and one with quite serious consequences, as I shall try to bring out below. I shall also start to bring in more evidence from other interviews in the set just to underline the point that what I am saying is not some eccentricity on the part of this interviewer or this interviewee. The extracts from the interview with MA always come first.

In the first case we look at, there are two things we have already seen (the simplification of the response alternatives and the interviewer's paraphrase). The feature I shall move on to now is the interviewer's nontake-up of possibly relevant material offered by the respondent.

Nonofficial Material Apparently Ignored

Scripted Question 24: How much control do you have over things you do every day, like going to bed, eating, and what you do for fun? ***complete*** (3), ***some*** (2), ***little*** (1).

Actual delivery and response (in part; we shall see its later development after discussing this segment):

521	Int.→	how ↑much:: (.) con↓trol (.) d'you have (.) over the
522		things you ↓do [°yeh?°
523	MA	[(eh?)
524	Int.	how much control do you have (.) over what you ↓do
525	MA	what (.) ↑'e::↓re?
526	Int.→	↑well (.) (li-) (.) ↑yeh (..) wha- (.) things that–like
527		going out (.) an' (.) when you get up an'
528	MA	well I (go out) (.) on a ↑Wednesday::=
529	Int.	=yeh
530	MA	up ↑Merchant↓man

Recorded score: 3.

On its first delivery (at 521–522), the interviewer's question is hearable as having been concluded at the end of the main clause ("the things you do"). So MA's "(eh?)" might be heard as a pass or a request for more. The interviewer recycles the question from the beginning but again only reaches the end of the main clause now slightly altered to "what you do"). Again, MA offers something, and this time his "what (.) "e::re?" is a specific candidate for clarification

(understandable as whether the question is about control over things "here" in his current, nonhospital, home). This would be in keeping with the spirit of the scripted question. But notice that the interviewer's take up is prefaced with a "well," signaling a disagreement (compare the immediate and emphatic "yes. here" he could have said). He goes on to diverge from MA's offer and reorient the question *away* from the current home, with the dis-preference markers of "well" and two repaired false starts ("(li) yeh (..) wha-") and a correction ("things that - like going out"). The phrase "an' when you get *up* an" that he adds is a partial move back to the domestic round that is specified in the official question, but it is not oriented to by MA.

In other words, the interviewer's delivery (and the respondent's uptake) deletes the specific domestic items of the official questionnaire in favor of leisure activity and, for leisure activity, allows the very specific going to (what is recognizable as) the pub to stand for the range of things the scripted question is meant to ask about (the "things you do every day"). This is in line with the deviation we saw above, where the question was delivered not as in the script. Here, a still stronger case can be made, I think, for the consequentiality of the deviation for the score that the psychologist enters. If we are to understand (as we are probably meant to) by the scripted phrase a general appreciation of all of life's mundane decisions, it would be easily argued that this narrowing alone renders the question a poor delivery of the script. More to the point, it is another example of lowering the bar: The respondent can score highly by controlling one thing in his life (going to the pub), even though the question asks about his life in general, a lowering that would be curious if offered to a person without a learning disability.

But there is more trouble ahead, and it is in the remainder of what MA gives. Or, to put it more finely, it is in the material that MA offers after the interviewer has offered what might be hearable as the termination of the topic and a preparation to move to the next. Note how, at line 535 below, the interviewer offers "right right." In the circumstances of the interaction – without a third-party mechanism for turn allocation (e.g., a chairperson, as in the selection interview discussed in Button, 1992, or the political meeting discussed in Larrue & Trognon, 1993) – it is the interviewer who disposes of the old topic as suitably answered and who can propose the next one. So his "right right," like the other terminators we have previously seen, can be oriented to as the close of a chapter and the alert that he is about to inaugurate a new one. But note that MA does not allow the interviewer to keep the turn:

531	Int.	right ↑so (.) are you in charge of doin'that?
532	MA	↓yes
533	Int.	yeah? (..)↓you don"t have to ask anyone if you can
534	MA	↑no no
535	Int.→	right right
536	MA→	(see) on a Thursday (..) I go to 't (...) club
537	Int.	mhm
538	MA	(they- they) complained said I- >not s'posed to (go in) in<
539		club (.) they said (you're-you not the boss) (..)

540	Int.	[HHhhh (..) right so ↑you"re in charge
541		[(rustle)
542		(rustle)
543	MA	(cough) If I (syll) club(syll) on a ↓Thursday I ↑would
544	Int.	°right°
545	MA	nothing to do with_them
546	Int.	°ok°=
547	MA	=↑is ↓it?
548	Int.	↑no::↓ I think you're ↑right
549		(2 secs, including some rustling)
550		↑ok(...) [Int. moves onto next question]

The interviewer solicits a yes or no answer to a pointed version of the scripted question at 531 and repeats a version of it at 533. The answers MA gives are consistent, and the interviewer's "right right" at 535 might indicate the point at which he makes an entry on the response sheet (a 3, standing for *complete*[control]).

But leaving aside the discrepancy we noted above between the range of activities in the script and the narrow focus of the delivery, what do we make of the material MA offers at 536? Some aspects of this stretch of talk have been analyzed elsewhere (Antaki & Rapley, 1996a), and a case can be made that here MA is embarking on a troubles telling (Jefferson, 1988), which the interviewer declines to accept as troubles recipient, and nothing comes of the story (which seems to hinge on MA being treated badly by people at a club: lines 538–539, "they complained said I-not s"posed to [go in] club"). The interviewer's specific use of a "so" initiator in his uptake offers what is to be taken as a formulation of what the respondent has said, but the interviewer's formulation is a patently nontroubled account: It puts it that MA is, in fact, "in charge." This effectively rules the trouble out of bounds as a pursuable topic unless MA corrects the interviewer, and we might read 543 and 545 to be an attempt at correction; but the interviewer's assessment of it with a near-idiomatic platitude ("no I think you're right," line 548) is a hearable shutdown (see, as above, Drew & Holt, 1988, on idioms as termination points of trouble tellings) and nontake-up. Moreover, the "so" formulation works as a declarative yes-no question, with the projected "yes" answer being positive; this is an efficient way of eliciting a "happy" answer from the respondent (and there is more on this effect of yes-no question design in Houtkoop-Steenstra & Antaki, 1998).

The record will show that the interviewer has just recorded (or will at some point record) the most positive entry of 3 for this answer, yet it would not be implausible to hear the trouble tale MA tells (about something like exclusion from a club) as being inconsistent with the *complete* control over "things you do every day" that a 3 represents. This is the larger point that I want to make: The interviewer is recording a high, positive score in spite of something that is at least reasonably possible to hear as not positive. What might be in operation is, again, the interviewer's upward recalibration of what would be, for a person without a learning disability, unsatisfactory.

Here is another example of how answers to this question attract a different lower standard for what counts as a positive answer about the degree of control the respondent can exercise in his or her life:

Code	MT/MR/JW	
605	I	>can I just come back to< the:se (.) Anne? Yeah?
606		(.) how much [control do you have over things you
607	AN	[(syll syll)

637	I	(.)°right° [↑(when-)]
638	AN	[I've ↑had me ↓↑pi:lls
639	I	good
640	AN	I ↑'ad them at ↓two o'↑↓clo:ck
641	I	right ((clears throat))
642	AN	me pills (↑zeppelin) and me big ↓white ↑one
643	I	°hh oh°
644	AN	I ↓did

Recorded score: 2 (*some* control)

Note the familiar pattern: paraphrase and reduction of the question, pursu of an answer in the face of what is treated as an irrelevant response (in line 61

and disattention to AN's concerns about not being sick (616) and taking her pills (636), which envelope the account of her "work." Again, the interviewer has to reduce all this into a single score, and she opts for 2 – *some* control. We might see this as another example of upgrading. The interviewer seems to treat AN's menial domestic duties as evidence that she has a middling amount of control. They might not seem so for a person without a learning disability.

Let us see another example of lowering the bar, this time in the way a question is "sensitively" edited right at the outset.

Question Edited Right at the Outset

Question 37: Do you participate actively in those recreational activities? ***Usually,*** *most of the time* (3), *Frequently, about half of the time* (2), *Seldom or never* (1)

Actual delivery:

CA	KK/TH		
1	I		at ↑Christ_mas (.) righ" (.) ok ↑then .hhh er:::
2			(3 secs)
3			°.hh right er::m°
4			(2 secs)
5			>so (↑when) you're at – when you're< at your ↓parties?
6			(..) ↑what d'you ↓do (.)
7		→	(>"ve a b"t of a<) (..) have a >bit of a< ↓drink do you?
8	JO		yea [hh:
9	I		[eh hehh hehh hehh hehh ↑do you ↓like your
10			drink (.) John?=
11	JO		=yeah
12	I		heheh (.) ↑what d'you ↓drink
13	JO		I ↑ager
14	I		heheheheh
15			(2 secs)
16			[moves on to next question]

We see the same pattern: The interviewer makes a colloquial, folk-theoretical guess, that, for John, what it means to "participate actively in those recreational activities" is to "have a bit of a drink." Not only has the interviewer made the question psychometrically unrecognizable by narrowing its field, the non-officialness of the language might encourage an answer different from what might be elicited by the formal version. In any case, it is another example of lowering the bar to a positive response in a way that would be odd, and perhaps unacceptable, to a person without a learning disability whose horizons for "participating actively in those recreational activities" would be wider than "having a bit of a drink."

In the last illustration of lowering the bar, let us take a more lengthy extract to see the interviewer's conflation of several questions.

Questions Conflated

Official Questions 36, 37, and 38:

Question 36: How often do you attend recreational activities (homes, parties, dances, concerts, plays) in your community? *3–4 per month* (3), *1–2 per month* (2), *less than 1 per month* (1)

Question 37: Do you participate actively in those recreational activities? *Usually, most of the time* (3), *Frequently, about half of the time* (2), *Seldom or never* (1)

Question 38: What about opportunities for marriage? *I am married, or have the opportunity to date anyone I choose* (3), *I have limited opportunities to date or marry* (2), *I have no opportunity to date or marry* (1)

Actual delivery and response (This is rather a long extract, used to make the point that Questions 37 and 38 are not explicitly delivered):

Recorded score (for each of the three questions): 3

The interviewer's initial question at 775 is a version of the official question (Question 36. listed above), which shows the reduction and transformation we noted above: It drops the alternatives, it paraphrases into more colloquial language, and it nominates a singular particular example. That much replicates the manner that has replaced the scripted version as standard as the interview has progressed. Of interest to us here, though, is the way in which the development of the answer (through a series of specifying prompts and MA's responses) gives the interviewer license to enter positive scores not only for this question but also for the related Questions 37 and 38, which he does not explicitly ask.

The motivation for the conflation might be to simplify the questions, perhaps by the avoidance of repetitions that violate conversational implicatures; but a

I have been arguing throughout, the way the simplifications are worded has the effect of lowering the bar to a positive social response. Let us deal first with the cognitive account of the simplification. In scripted interviewing, the interviewer has little institutional room for maneuver and must deliver the questions in series, even though this might violate conversational implicatures and occasion an interactional difficulty: for example, what might be heard as the respondent being "puzzled." Here is an example from Houtkoop-Steenstra's (1996) transcript of a telephone survey:

(The respondent has offered, 10 turns back, that he is "in the military")

37	I:	.hh ↑okay now we'd like to ask about your employment ↑STATUS
38		(.)
39		did you do any work for ↑PAY last week?
40	R→	did I do any work for pay? [yeah
41	I	[mmhmm
		(...)
42	I	A:nd what was your ↑JOB last week
43		that is what KIND of work were you doing
44	R→	.hhh uh:: I"m a platoon leader in the::- (0.5) ARMY
45		(...)

We can see that R's response at 40 is prefaced with a check, and his response at 44 is prefaced with an intake of breath and an "uh::," Both of these might be heard to mark some kind of nonsmoothness occasioned by the questions, and it would not be implausible to attribute it to the interviewer's violation of a Gricean maxim (perhaps quality) in repeating a question to which the answer has already been offered (that he is "in the military").

Now let us see whether this might happen in our data. The official questions ask how often the respondent "attends recreational activities," whether they "participate in those recreational activities," and whether they have "opportunities for marriage." As to the first of these, we see MA offer at 779 "(w'll) I go out on Saturdays," which is not obviously an answer to the question posed. His subsequent turns are no clearer. Now (at 788), the interviewer actually nominates a specific activity (going to football matches), which is a concretization (and, as we have seen before, a narrowing) of "recreational activities." The answer seems to be that MA does ("aye, I'm the::re"), but for reasons that are not obvious (but could be that MA is here pointing to the television set, or television room, as "there"), the interviewer further narrows the activity to the more sedentary "you watch it on the telly." The same lowering of the bar – in spite of MA's mention of more actively going somewhere – happens for cricket: At 798/800, MA says he "went e:r (...) ↑Old Trafford [...] watch cricket match" (Old Trafford is a stadium where cricket internationals – "Tests" – are staged), but the interviewer recalibrates this downward as "d'you watch the Test match on the telly?" The interviewer uses MA's answers to *these* unambitious questions – rather than the more active versions that MA himself offers – as license to enter the maximum positive score of 3.

As to the question on participation, it is possible that the interviewer has come to the judgment that such a question would be inappropriate for someone who is (as was established much earlier in the interview) about 70 years of age. Perhaps it would strike him as merely absurd to ask whether MA is an active sportsman (at 808, it is MA who asks the interviewer if he plays sports). This, of course, is plausible, but we might wonder why the maximum score of 3 is entered. As to Question 38 (opportunities for marriage), the answer to this is (apparently) conflated into the same stretch of talk (at least, no other more obvious material appears anywhere else), perhaps on the folk grounds that marriage opportunities are well indexed by the degree and scope of one's leisure activities (even though, here, these are narrowed by the interviewer to dancing, attending cricket and football matches, or watching them on the television). It is possible also that the interviewer is, still in a folk way, sensitive to a threat to MA's face and is reluctant to ask a question that might be unduly sensitive. In any case, there is nothing in the transcript that approximates the official question, unless it is line 844: "y"get out and meet people?" Yet, MA is scored as 3: *I am married, or have the opportunity to date who I choose.*

We might just pick up this orientation to Question 38 as a sensitive topic in another interview:

MT/KK	CL	
363	I	yeah (.) °↓right o↑kay°.hhh (..) ↑↑er:::m (...)
364		and you've ↑got a ↑boy↓friend ↑haven't ↓you
365	CL	yeh
366	I	aheheheh (..)* ↑what's his ↓name again?* ((*high pitch*))
367	CL	Steven
368	I	oh ↑that's ↓right (..) > (so) have you been
369		together for a< ↓long time?
370	CL	yeh (...)
371	I	°oh that's nice° .hhhh (..) °↓right° (..)
372		so [moves to next question]

Recorded score: 3

The interviewer at line 364 preannounces a question about CL's boyfriend. This is intelligible as a version of Question 38 ("What about opportunities for marriage?"). Note, again, the familiar paraphrase of the question and its reduction to domestic dimensions, and especially note that the interviewer shepherds the answer in the positive direction. By soliciting agreement that the respondent has a boyfriend, she prefigures a "no-problem answer" (Heritage & Sorjonen, 1994). She then asks his name and treats it as already known to her. This, again, might be a matter of the interviewer orienting to the sensitivity of "opportunities for marriage" to this respondent: She casts herself as fully appreciating the respondent's positive interpersonal situation – she knows her boyfriend's name. The "so" in line 368 to 369 ("so have you been together for a long time?") cements the question as having proceeded from an agreed premise (that the respondent does indeed have a boyfriend) because, as Houtkoop-Steenstra (1997) points

out, *so* in such contexts treats the presumption as factual. In doing all of this, however, the official scripted question, and its three alternative answers, is obliterated in favor of a question with a lower bar on which the respondent scores maximum points.

Discussion

What I wanted to do in this article was to use the apparatus of CA to examine the administration, by professionally trained interviewers, of a scripted questionnaire. These administrations yield quality-of-life scores that are now on the respondents' official records. The score is consequential both for the respondents (who might be resettled in a different environment or returned to the institution they came from) and for the social services authority that is responsible for them (whose provision of quality of life might be compared with other social service authorities). It is, apparently, in everyone's interest that the questionnaire be delivered faithfully to reproduce the item validity of the questions and not to introduce the sort of extraneous information that psychometricians cast as "noise."

Why, then, do we find only a very few question-and-answer exchanges (at best, about 1 in 8; at worst, about 1 in 50) that seem to reproduce the script with high fidelity? And why do we find consistent deviation from the official script by simplifying the response alternatives, or paraphrase, or the offering of a folk version of the question or conflation of several questions?

The start (but not the end) of the answer is, of course, that the script is a fiction, and interviewers have to use their practical reasoning to deliver its questions in real talk. CA work on interviews from Suchman and Jordan (1990) through Marlaire and Maynard (1990) to Houtkoop-Steenstra (1996) shows that in delivering scripts, interviewers balance two competing motivations: on one hand to play square with the psychometric prescription to be literal and on the other hand actually to deliver the questions in an interactionally sensitive way.

Some of that interactional sensitivity is foreshadowed and licensed by the interview schedule instructions, by the official diagnosis of the respondents as learning disabled, and by the manifest confusion and misunderstanding in (some of) their responses. But there is more to it than that. We not only see the interviewers design questions to lower the *cognitive* difficulty of the task, but they design questions to lower the bar of what will count as a *socially* positive answer. The interviewers mobilize what Garfinkel (1967) calls their unstated advisory rules or what Maynard and Marlaire (1992) call their unassessable interactional skills and turn the official questions into ones that the respondents can cope with. Thus, a formal question such as "do you participate actively in . . . recreational activities?" becomes "so (↑when) you're at- when you're at your parties (..) what d'you do (.) ('ve a b't of a) (..) have a bit of a ↓drink do you?" Or an answer like

"I help them [...] be good to them [...] mop for them [...] mop the kitchen out]" is taken as evidence of *some control* over "things you do every day, like going to bed, eating, and what you do for fun."

Such questions assume that the respondents cannot answer the "proper" or "normal" questions. Is lowering the social bar in this way understandable as motivated by generosity or perhaps by politeness? It is possible; certainly, Houtkoop-Steenstra (1997) suggests that a good number of the distortions she finds in survey questions might be accountable as illustrations of interviewers' attention to respondents' face, in Goffman's (1967) terms, and we also find evidence in this very set of data that yes/no questions can get designed so as to promote the most positive alternative on the official list of options (Houtkoop-Steenstra & Antaki, 1998). One might say, then, that to lower the bar is generously to head off the threat that the respondents' answers will embarrassingly fail to reach even the lower of the rungs on the ladder of alternatives.

But to assume the worst in that way is a curious infection of a technical, "clinical" exercise that is supposed to assume nothing. Moreover, to assume the worst is arguably against the respondent's interests. If a respondent's "high" score is achieved only because the hurdles are set low, then he or she ends up with a score that is ostensibly measured on questions of "normal" difficulty but actually given in response to easier ones. Thus, a respondent might score high on recreational activities just by watching television or on opportunities for marriage by agreeing with the question, "y"get out and meet people?" and so on. The questions are revised, and the answers edited, to make a judgment not about the respondent's quality of life but about the respondent's quality of life in the circumstances. But those circumstances disappear when the official score is entered in the records; then it becomes the score on the questionnaire as it is printed in black and white, with its questions of "normal" difficulty.

Maynard and Marlaire (1992) found children scoring badly because of the ways the interactional demands of the interview broke through its psychometric floodgates: These interactional demands were "good reasons," they observed, following Garfinkel (1967), "for bad testing performance." The interactional demands at work in these psychological quality-of-life interviews are just as powerful but this time with the converse effect. Rather than work to decrease the subject's score, sensitive questioning tends improperly to increase it: Using unofficial, low, folk criteria is, in other words, a bad reason for good testing performance.

I said at the outset that I would take no position on the political debate about quality-of-life testing. The conclusions of this study are nevertheless suggestive. They are, of course, based on one set of interviewers, with one set of respondents, and using one interview schedule. Nevertheless, the data offer evidence that questions are routinely transformed in such a way as to increase the probability of higher scoring to less ambitious questions. If there is to be a debate over whether interview testing attends properly to the interests of the respondents, then such a finding might contribute to it.

Appendix

Transcription notation: The transcription symbols used here were derived from those developed by Gail Jefferson (see Atkinson & Heritage, 1984, pp. ix–xvi).

(.) (..) (...)	(.) is a pause of about .2 of a second; (..) is about .5, and (...) is about .8 of a second
.hh	A dot before an "h" denotes an in breath. The more hs, the longer the in breath.
hh	An "h" denotes an out breath. The more hs, the longer the out breath.
hehh	Laughter syllables with some attempt to capture "color"
hahh	
Go(h)d	(h) denotes "laughter" within words
[^t]	dental click
(guess)	Roman text within brackets is the transcriber's guess at an unclear part of the tape.
cu-	A dash denotes a sharp cutoff of a prior word or sound.
lo:ng	Colons show that the speaker has stretched the preceding letter or sound. The more colons the greater the extent of the stretching
(syll syll)	Unclear speech rendered as approximations to number of syllables
run=	Equal signs link material that runs on
=on	
↑↓	Arrows indicate rising or falling intonational shift. Double arrows indicate very marked shifts
?	Upward intonation (not necessarily a question)
under	Underlining indicates emphasis
CAPITALS	Capital letters indicate speech noticeably louder than that surrounding it
°soft°	Degree signs indicate speech spoken noticeably more quietly than the surrounding talk. Double degree signs indicate greater softness
>fast<; <slow>	"Greater than" and "less than" signs indicate that the talk they encompass was produced noticeably quicker or slower than the surrounding talk
over [lap	Square brackets between adjacent lines of concurrent speech denote
[lap	the start of overlapping talk
→	Side arrow indicates point of special interest in the extract, addressed in the text
[...]	Material left out of the extract

Author's Note

I am grateful to Mark Rapley for making available the tapes analyzed here and for commentary, to Kevin McKenzie for help in preparing the data, and to Hanneke Houtkoop and Doug Maynard for comments on an earlier draft of this article.

Discourse Studies and the Ideology of 'Liberalism'

Robert de Beaugrande

> The word is the fundamental object of the study of ideologies. (Vološinov, 1973 [orig. 1929]: 15)
>
> Look at the very connotations of the word 'liberal', which outside the political context is taken to mean gentle, generous, nice. But put the political wrapping around it . . . (data from the Corpus of South African English)
>
> particularly in the West, we often use the word 'liberalization'. That is not a bad word. (data from the Bank of English)

A. Science and Ideology

'Ideology' is a deeply problematic term. In many registers of discourse, it routinely connotes some fixed, unreasoning dogma that foments conflicts, as when Shils (1958) cited Fascism, Nazism, Bolshevism, and McCarthyism as examples. Geertz (1973: 197 ff.) commented upon this conception:

> Like the politics it supports, it is dualistic, opposing the pure 'we' to the evil 'they', proclaiming that he who is not with me is against me. It is doctrinaire in that it claims complete and exclusive possession of political truth and abhors compromise. It is totalistic in that it aims to order the whole of social and cultural life in the image of its ideals, futuristic in that it works toward a utopian culmination of history in which such an ordering will be realised.

Source: *Discourse Studies* vol. 1, no. 3, 1999, pp. 259–295.

The favoured candidate to defend against 'ideology' in this darkly pejorative sense is held to be 'science' (Geertz, 1973; Zima, 1981; Pêcheux, 1982):

> the essential criteria of an ideology [are its] deviations from scientific objectivity [. . .] The problem of ideology arises where there is a discrepancy between what is believed and what can be [established as] scientifically correct. (Talcott Parsons)

Such a pronouncement complacently implies that science itself can and should be free of all ideology, and indeed heralds the 'end of ideology' (Geertz, 1973: 199) in the final triumph of 'objectivity' and 'correctness'.

Yet dictionary definitions suggest that 'ideology' is a more neutral, normal, and even necessary framework: 'a systematic body of concepts esp. about human life or culture' (*Webster's Seventh*, p. 413); 'a body of doctrine or thought that guides an individual, social movement, institution, or group' (*Random House Webster's*, p. 668); or 'a belief or set of beliefs, especially the political beliefs on which people, parties, or countries base their actions' (*Collins COBUILD*, p. 718). Surely these broad definitions might hold for science too.

Perhaps the ideology of science is so hard to recognize because there we encounter not so much a particular 'body of concepts' (or 'doctrines' or 'thoughts') as a set of general methods for arriving at 'concepts' – not so much a 'theory' as a modality for producing and testing theories. Such an ideology effectively functions as a *meta-ideology* – an *ideology of methods* as distinct from an *ideology of content* – and cannot be challenged and discredited in the direct and definitive ways that radical political ideologies like Nazism or McCarthyism can. Refuting a scientific theory like the 'steady-state theory' of the universe did not refute the science of astronomy or its methods, but rather vindicated its methods (in this case, observing red shift in the spectra of light dispersion).

But we do find a popularized ideology which can be called **scientism**, holding that only scientific knowledge is true and valid, and that the progress of science will eventually explain the entire universe and solve all of humanity's problems. This fits Geertz's pejorative sense quoted earlier by being 'totalistic' in that it aims to 'order the whole' of the universe, and 'futuristic in that it works toward a utopian culmination' of human knowledge. And the scientists may tend to be 'doctrinaire' in 'claiming complete and exclusive possession of the truth and abhorring compromise'.

The 'doctrinaire' stance can entrain the scientist in a lonely and vertiginous paradox: the history of science demonstrates that all scientific theories so far have been proven wrong, yet the ideology of scientism encourages you to claim your current theory to be, at long last, the sole true one, whereas the scientists who support rival theories must be mistaken or misled by personal or institutional biases (Kuhn, 1970; Gilbert and Mulkay, 1984). The paradox can erode the essence of science as an institution that should freely grant and defend the legitimacy of alternative explanations, and should acknowledge that these may contribute the most when we integrate them.

Scientism has also helped to inhibit science from accrediting ideology as a major object of scientific inquiry. Karl Mannheim's (1936) attempts to incorporate

a 'non-evaluative conception of ideology' into his 'sociology of knowledge' were stymied by the prospect that 'nowhere is resistance to claims of objectivity greater than in the study of ideology', as remarked by Geertz (1973: 195), who added: 'men do not care to have beliefs to which they attach great moral significance examined dispassionately, no matter for how pure a purpose [. . .] they may find it simply impossible to believe that a disinterested approach to critical matters of social and political conviction can be other than a scholastic sham'. Yet Geertz also saw a major 'problem' in the way 'social science' tries to 'handle ideology as an entity in itself – as an ordered system of cultural symbols rather than in the discrimination of its social and psychological contexts' (1973: 195 ff.).

Scientism thus subverts the authentic interests of science when the exaggerations and mystifications of the authority and power of science render the individual scientist unproductively possessive and defensive about his or her own 'objective truth'. Moreover, science is prevented from effectively confronting and discrediting anti-scientific ideologies such as racism and sexism, and from blocking their attempts to expropriate and exploit scientism and raid sociology, psychology, or genetics for 'proof' of the 'natural inferiority' of minorities and women.

If, as philosophers of science like Kuhn (1970) have emphasized, a scientific theory can be discredited only by another theory, then we may reasonably assume that an ideology can be effectively discredited only by another ideology – and not by some ivory-tower standpoint purporting to be free of all ideology (discussed later). Science can profitably investigate ideology, and, at the same time, explicitly develop creditable alternative ideologies for itself and for the institutions it sustains. Building upon Ulric Neisser's (1976: 2) concept of 'ecological validity', i.e. whether 'a theory has something to say about what people do in real, culturally significant situations' and says it in ways that 'make sense to the participants', we could promote the ideology of ecologism, wherein the theory and practice of science are dialectically reconciled in a transdisciplinary enterprise of sustaining humane and democratic practices of action, interaction and discourse (de Beaugrande, 1997). Some trends in this direction have already been emerging, witness the impact of the *Gaia Atlas of Planet Management* (Myers et al., 1993) and of Gell-Mann's (1994) landmark exposé of *The Quark and the Jaguar*. I would also see a similar drift in 'critical linguistics' and 'critical discourse analysis', even if these sometimes do not seem to provide for humane counter-ideologies.

B. The Ideology of Modern Linguistics

One science that has been deeply reluctant to study the nature and functions of ideology is modern linguistics. In the major treatises I have surveyed in fine detail, dating from the early 20th century up into the 1970s (de Beaugrande, 1991), the term 'ideology' simply does not appear. Adapting Geertz's terms from sociology, its absence might reflect the mainstream programme of linguistics, believing that the properly scientific method would be to 'handle language as an entity in

itself – as an ordered system of symbols rather than in the discrimination of its social and psychological contexts'.

This austere programme encouraged mainstream linguistics to develop an ideology of **idealization**, holding that language is based upon an ideal mode of order that is not readily evident in the ordinary practices of real discourse within society. Such was the source of the many static dichotomies that in effect *disconnect ideal language from real language*, such as 'langue versus parole' or 'competence versus performance' (de Beaugrande, 1998a). One label for this ideology, which is also being heavily camouflaged as a standpoint freed of all ideology, might be the neologistic term **linguisticism**. 'Linguisticism' sustains the doctrine that 'language' is an abstract, uniform, and stable system whose nature and properties can be determined only by the ratiocinations of 'linguistic theory' and not from observing and recording discursive practices. De Saussure (1966 [orig. 1916]: x) hinted as much when he speculated that 'other sciences work with objects that are given in advance', whereas in 'linguistics', 'it is the viewpoint that creates the object'. Hjelmslev (1969 [orig. 1943]: 18), who aspired to be a devout successor to de Saussure, was more dramatic: 'linguistic theory cannot be verified (confirmed or invalidated) by reference to any existing texts and languages'.

The same ideology was signalled, albeit less patently, by the declaration that 'language is a well-defined object in the heterogeneous mass of speech facts', whereas 'speech cannot be studied', nor indeed can it be 'put in any category of human facts, for we cannot discover its unity'(de Saussure, 1966 [orig. 1916]:14, 9, 11). The trend was reinforced half a century later, when Chomsky (1965: 3 ff., 201) announced that 'linguistic theory is primarily concerned with an ideal speaker–hearer in a completely homogeneous speech-community, who knows its language perfectly', whereas the 'observed use of language' 'surely cannot constitute the subject-matter of linguistics, if this is to be a serious discipline'; indeed, 'from the point of view of the theory', 'much of the actual speech observed consists of fragments and deviant expressions of a variety of sorts'.

The key question to challenge linguisticism might be: what shall be the sources of evidence for this 'primary concern', if, as Chomsky (1977: 192) cheerily grants, the 'ideal speaker does not exist in the real world'? The de facto answer would be: the 'linguistic intuition' of the linguist 'himself' as a 'native speaker' (Chomsky, 1965: 20). Yet Chomsky (1965: 8) has expressly denied that the 'speaker of a language' 'is aware of the rules of the grammar or even' 'can become aware of them'. So either linguists acting as native speakers are also unable to 'report' 'the rules of the grammar'; or else they hold superhuman powers for 'becoming aware of and reporting' what other speakers cannot. Either linguists do represent the community and cannot 'report'; or they can report and do not represent the community.

Viewed in this light, the ideology of linguisticism legitimizes a remarkable arrogation of power by the theoretical linguists to be the sole authorized representatives of a purely hypothetical 'speech-community' and therefore immune to contradiction or counter-evidence from real speakers in a real community. This arrogation sharply illuminates the consequences of linguisticism declining to study 'actual speech', and accounts for the tendency, typical of ideology, to

foment conflicts within the discipline. Once linguists have cut themselves off from the rational basis for developing and validating empirically sound theories of language, the fashion arises of fabricating 'linguistic theories' from the top down and applying them to odd handfuls of trivial invented sentences; and the contentious fragmentation of 'theoretical linguistics' we have actually seen is a natural consequence (de Beaugrande, 1998a).

The ideology of linguisticism has evidently foundered upon its own implicit dualism: equating *language* ('langue', 'system', 'competence', etc.) with *perfect order*, whilst equating *discourse* ('parole', 'speech', 'performance', etc.) *with massive disorder.* The direct corollary would be that using a language to produce discourse triggers an abrupt and catastrophic transition from stable and integrative order over to unstable and disintegrative disorder. Since this corollary is patently absurd, we must conclude that the linguisticism has made a capital mistake by attributing to 'language' an *idealized mode of order* which *is fully determined and finalized within the abstract system.* The ideology of 'ecologism' proposes instead a *dialectic* whereby the *real order of language elaborately supports the order of discourse without fully determining or finalizing it*; discovering how that support actually operates is now a stimulating challenge for a transdisciplinary science of text and discourse (de Beaugrande, 1997).

C. The Ideology of Corpus Linguistics

The early stages of corpus linguistics at present might be favourable for deliberating upon what ideology it could develop out of its strong potential to discredit the mainstream ideology of linguisticism. Corpus data immediately deconstruct the vision of 'observed use of language' constituting a mass of disorder and 'deviance'. But the order of discourse, not surprisingly, is not the mode of static and abstract order envisioned by linguisticism. We can easily recognize how the *standing constraints* that persist on the plane of the system (e.g. the English article going before the noun, not after it) continually interact with *emergent constraints* that are only decided on the plane of the discourse (e.g. the lexical choices appropriate to a political debate). And the *local constraints* among sets of selections and combinations interact with the *global constraints* of register, discourse domain, topic, and so forth. Linguisticism naturally projects disorder onto discourse after taking into account only a narrow and arbitrarily defined subset of local standing constraints which get reconstructed in a 'grammar' and hugely overburdened with the task of sustaining a fully determined and finalized system which is not (and cannot be) 'reflected' in discourse. As Sinclair (1991: 496) has remarked, 'much of the apparent disorder is created by the perspective that is initially adopted'.

Corpus research also suggests describing the order of real language in terms of **colligability**, subsuming the 'preferences' of some grammatical options for appearing with certain others and holding the 'grammar' together; and of **collocability**, subsuming the 'preferences' of some lexical options for appearing with certain others and holding the 'lexicon' together. In a dialectical parallel

the order of discourse partly realizes and is partly realized by the order of language in the actually occurring grammatical **colligations** and lexical **collocations.**[1]

The concept of the integrated **lexicogrammar** in systemic functional linguistics (e.g. Halliday, 1994) further suggests that the grammar and lexicon hold each other together. This factor could explain why so many 'grammars' sponsored by linguisticism and designed to be independent of the lexicon have remained so fragmentary and so remote from authentic data. The lexicon, in its turn being regarded as another heterogeneous mass of disorder, has received scant attention in mainstream linguistics (Bolinger, 1970).

A major principle that corpus linguistics could now field against linguisticism would be that the order of language is dynamic and transitory, and in principle not describable by any static or 'synchronic' theory. To a significant degree, a language is always in the process of being created and negotiated whilst discourse is in progress; and a different generation of linguistic theories will be needed to explain how. The ideology sustained by corpus linguistics would accordingly be a version of *dynamism* wherein the specification of a theory will be far more actively data-driven and 'bottom–up' than the theories sponsored by linguisticism. Theories will no longer originate 'from the top down' every time some ambitious linguist chooses to fabricate his or her personal idealization and illustrate it with a handful of fictional sentences. Instead, data-based theories will evolve by being adjusted and tuned through continuing research on steadily larger corpora of authentic discourse (Sinclair, 1997).

This evolution will undoubtedly affect the familiar dichotomies and divisions whereby those older theories aspired to freeze language into a Saussurian 'well-defined object'. If these are to survive the test of authentic data, they need to be deconstructed and re-theorized as *dialectical interactions*: langue – parole, competence – performance, synchronic – diachronic, syntagmatic – paradigmatic, grammar – lexicon, language acquisition – language learning, and so forth.

Alternatively, less familiar terms or concepts can be introduced wherever the data seem to justify them, such as the parallel dialectics between 'colligabilities' and 'colligations', and between 'collocabilities' and 'collocations'. In the present article, I explore the prospect that 'ideology' may also find a new home as one of the sources of global constraints upon the orders of language and discourse, e.g. in the broad sense of 'a systematic body of concepts about human life or culture' (compare Billig, 1991; Christie and Martin, 1997; Van Leeuwen and Wodak, 1998). These concepts would be applied during discourse below conscious awareness and thus seem to be fully identical with life or culture; and those who hold contrasting ideologies seem to be distorting the 'real world', whence the well-known tendency of ideologies to foment conflicts. To recognize the value of a contrasting ideology, you might first need to register the contingent and partial quality of your own; but doing so would require adopting, at least temporarily, another ideology from whose standpoint your own could be contemplated and contrasted. A vicious cycle impends: how to step outside your own ideology when you are not even able to see it as anything but the reality of life.

For similar reasons, criticizing or attempting to change another person's ideology may be perceived as acutely threatening, perhaps like trying to make them

switch from reasonable over to unreasonable. People may well defend and cling to their ideology even when they perceive symptoms of disorientation, fearing that they might lose whatever orientation they still have. The accumulating symptoms would foment increasing alienation, which could readily be expressed (though not alleviated) by hostility and aggression against people who hold a contrasting ideology.

How then can science investigate ideology if the latter is so deeply anchored at the base of human awareness? The principle of making an ideology explicit from the standpoint of a contrasting ideology might incur the usual risk of construing differences as distortions, especially where the ideology under investigation is defiantly positioned against science itself, as is religious fundamentalism. Also, even if we can design non-threatening techniques for bringing ideology to the conscious attention of the people who subscribe to it, we may risk transforming its functions we want to describe, perhaps in the way that literary techniques deliberately use framing or irony to undermine the illusion of reality in a narrative, and thereby disrupt the 'willing suspension of disbelief' (Coleridge) that literature solicits.

An alternative method would be to investigate large corpora of authentic data in terms of how ideologies leave *traces within the order of discourse*, even (or especially) when the discourse reflects or works out the *disorders* within the society (Wodak, 1996). The traces should be conspicuous wherever the discursive order sponsored by one ideology is experienced as discursive disorder from the standpoint of another ideology. Conversely, discursive order may be merely superficial when our data show the same conception being appropriated by contrasting ideologies in order to project a deceptive consensus, e.g. onto the meaning of 'democracy' (de Beaugrande and Williams, in press).

However, research with large corpora may well discover that far less conspicuous selections and combinations of discourse options are also sensitive to ideological groundings. Such was the discovery when feminism, though using more limited data, moved beyond the usual issues of 'sexist language' (e.g. male pronouns for everyone) to investigate the traces of the ideology of patriarchy inherent in the much deeper organization of domains like 'grammar' (de Beaugrande, 1988b; Cameron, 1992; Wodak, 1997; Kotthoff and Wodak, 1998). Certainly, the degrees of detail and delicacy within language that have been exposed by sorting and searching large corpora of data extend far beyond anything detected before (Sinclair, 1996). Might not a similar exposure be achieved for the traces of ideology?

What then of the ideology of research for the corpus linguists themselves? By the arguments advanced here, might they not overlook the traces of their own ideology and focus unduly on contrasting ideologies? One answer might be that research could recruit representatives of diverse ideologies, whereby the potential blind spots of any one would be compensated for by the vigilance of the others. To be sure, recruiting scientists by explicit reference to their personal ideologies would be a sensational tactic after scientism has cultivated for so long the illusion of science standing free of ideology. And the problem of even

identifying the suitable range of ideologies would be far from trivial, especially during early stages of the research.

An alternative answer could be that corpus research has a general effect of sensitizing researchers toward the normally naturalized constraints upon discourse, including ideological ones. The patterns that emerge from the multiple means to query a database are often unpredictable and surprising enough that we behold an image of own intuitions and habits of speaking which had never entered our conscious awareness before. As we repeatedly discover just which among the staggering range of potential selections and combinations are typically made, we are prompted to examine the order of discourses in unprecedented detail, a bit like the biologists who examined cell tissue under a powerful microscope for the first time. At the same time, we can escape the quandary of linguisticism which replaced real language with ideal language and then claimed superhuman access to the 'perfect knowledge' of the 'ideal speaker' by virtue of 'intuition' as distinct from data. Working with large corpus data emphatically refers the linguist back into the community of real speakers who produced and received the data and among whom we ourselves informally belong. How typical and representative we might be and how useful our intuitions might be are questions to be decided during the research and not by the glib arrogations of linguisticism (cf. Francis and Sinclair, 1994).

D. Ideology in Critical Discourse Analysis

The ancestors and precursors of what is presently called 'discourse analysis' include the data-driven approaches in linguistics and neighbouring disciplines (e.g. anthropology, ethnography, sociology) that were arrayed against the linguisticism of idealization, and were for decades targeted with dismissive polemics promulgating the doctrine that 'observed use of language' 'surely cannot constitute the subject-matter of linguistics' as a 'serious discipline'.

When 'discourse analysis' finally emerged as a field with that name in the 1970s, the early concerted efforts of western 'critical linguistics' were also getting under way (e.g. Mey, 1979 [orig. 1974]; Fowler et al., 1979). The 'critical' work was clearly distinguished by its resolve to accept 'ideology' (along with 'power', 'domination', etc.) as a legitimate object of investigation, finally in line with the neglected proposals of Vološinov (1973 [orig. 1929]: 9), who envisioned a 'Marxist theory of ideologies' as 'the bases for studies of scientific knowledge' before he disappeared in Stalin's death camps.

Perhaps to eschew the idealizing and formalist tendencies of conventional 'linguistics', this work adopted the broader heading **critical discourse analysis**, devoted to 'the analysis of linguistic and semiotic aspects of social processes and problems' (Wodak, 1996: 15). A key question for the new discipline is naturally how 'ideology' as such should be defined. In most of this research, the old pejorative connotations of 'ideology' have persisted but in a more precisely defined function: 'ideologies are particular ways of representing and constructing society which reproduce unequal relations of power, relations of domination

and exploitation' (Wodak, 1996: 18; compare now Wodak, 1997; Wodak et al., 1998). Fairclough (1992: 67) offers a similar definition: 'ideology is significations generated within power relations as a dimension of the exercise of power and struggle over power'. Lemke's (1995: 12 ff., his italics) definition seems the most darkly pejorative: 'ideology *supports* violence and is critically shaped by and in a context of violence' and by 'physical pain and social dehumanisation'.

No doubt such definitions reflect the justified urgency to critically analyse and deconstruct those ideological discourses which most actively legitimize or mystify power, inequality, domination, exploitation and violence, such as racism and sexism. Moreover, the traces of such ideologies in discourse should be the most accessible to practical analysis. However, in terms of the present discussion, building these pejorative effects into our basic definition of 'ideology' incurs at least three serious drawbacks. The first drawback concerns the ideological commitment of critical discourse analysis itself, especially when it repudiates the idealizing ideology I have called 'linguisticism'. By the definitions I have just quoted, the ideology of critical discourse analysis might be charged with sustaining one more 'exercise of power' and 'domination' – a prospect Fairclough (1996) himself has recently aired. How could we prevent our critical engagements with ideologies from being hit by the fall-out of a rigorously pejorative concept of ideology?

The second and closely related drawback follows from the plausible prospect that an ideology can be effectively opposed or deconstructed only from the standpoint of another ideology. A pejorative definition forecloses our efforts to develop ameliorative counter-ideologies, such as 'ecologism', which expressly promote equality and solidarity, e.g. in alliances with feminism and multiculturalism; and for defining such a counter-ideology to guide the projects of discourse analysis itself. Fairclough (1996, pers. comm.) has expressed concern that if 'ideology' as 'understood in the critical tradition' gets redefined as I propose, the concept might get 'appropriated', 'disarmed', or 'compromised', leaving us with the 'relativist conclusion that values are merely different, that all values are as good as all others'. Such relativist tendencies can undeniably be diagnosed in several trends in 'post-structuralism' and 'post-modernism' but by no means in 'ecologism', which insists that we cannot evade the choices between promoting *either* power *or* solidarity, *either* inequality *or* equality, and cannot retreat either into relativism or into objectivity. Fairclough would probably concur with ecologism that the hallowed 'scientistic' stance of objectivity in pursuit of 'pure truth' can imply an acquiescence to the existing structures of power and domination, as when a linguisticism dedicated to the 'ideal speaker–hearer in a completely homogeneous speech–community' elided the significant social consequences of language variations in a real speech–community (de Beaugrande, 1998a).

My point is rather that critical discourse analysis should not run the risk, inherent in many leftist and Marxist critiques, of appearing to offer only opposition and negation without a coherent alternative programme. At this stage of post-modern society, we behold a one-sided array of entrenched but ecologically unsound ideologies, such as consumerism, individualism, capitalism, free-marketism, and so on, whilst very few effective counter-ideologies on the other

side even have established names, let alone organized groups of adherents. Persuading people to exchange one ideology for another is hard enough; persuading them to throw out their ideology in favour of none at all seems frankly unrealistic.

The third and again closely related drawback concerns the question of whether *all* discourses are ideological (Hodge and Kress, 1988; Gee, 1990; Lemke, 1995) or *only some* discourses are ideological and others are not (Fairclough, 1995; Wodak, 1996; Van Dijk, 1998a). If (as is often the case) both positions favour a pejorative definition, the first is plainly the more pessimistic than the second in implying that power and domination will always control discursive practices; such an implication would certainly be rejected by emancipatory ideologies such as feminism. The second position would imply an enterprise of 'de-ideologizing' discursive practices: of purging ideologies rather than changing or replacing them. How this might be achieved without fostering some disorienting ideological vacuum remains to be seen.

Some of Fairclough's (1992: 91, my italics) deliberations might signify differences in *degree* rather than in *kind*:

> Is *all* discourse ideological? I have suggested that discursive practices are ideologically invested if they incorporate significations which contribute to sustaining or restructuring power relations.[. . .] But *all* discourse is *not thereby irredeemably* ideological. [. . .] the fact that *all* types of discourse are *open in principle, and no doubt to some extent in fact*, in our society to *ideological investment* does not mean that *all* types of discourse are *ideologically invested to the same degree.*

In a similar vein, Wodak's (1996: 19, my italics) conception of critical discourse analysis '*does not claim that all discourse* is ideological: "it does not follow that because *all practices are in ideology or inscribed by ideology,* all *practices are nothing but ideology*" (Hall, 1985: 103)'. And Lemke (pers. comm.) counsels that 'a discourse formation is not necessarily inherently ideological, but is so only by virtue of its uses; it is the social function of the discourse which is ideological, and not the discourse itself.

The question bears on both theory and practice. If we favour the data-driven theories advocated earlier, then we should not pre-empt our conception of 'ideology', which has only recently begun to be theorized in earnest. The broad conception I have advocated of 'ideology' being a source of global constraints upon discourse in general would be most conducive to putting our prospective theories of ideology onto the broadest empirical basis and would be more perceptive toward the covert ideological groundings which leave less conspicuous traces among the selections and combinations of discourse. A pejorative conception, in contrast, would tend to attract our vision to the more conspicuous traces we can already link to ideologies of power and domination in intuitive and pre-theoretical ways.

In terms of practice, fundamental problems impend when we try to distinguish the set of discourses (or the portions within a single discourse) which count as 'ideological' from the set which do not. Moreover, the pejorative definition

implies that once the 'ideological' ones have been discovered, the 'non-ideological' ones can be left out of our analyses, at least for the time being. But critical analysts, including Fairclough and Wodak, have often noted the significant tendency of ideological discourses of power to become less overt in order to encourage illusions of openness and democracy. If so, the demarcation between the two sets would be transient and unreliable, and we would tend to exclude some discourses whose ideological groundings could be discerned only after detailed critical analysis. This factor could be especially acute if the findings of critical discourse analysis itself become popularized in the news media, and the institutions of power and domination respond by adopting more devious and covert discursive strategies to escape detection.

Some of these problems might be attenuated by Fairclough's proposal to recognize differences in degree. But the problem may not prove much simpler of distinguishing *degrees of 'ideological investment'* (how ardently you support the ideology) from *degrees of discursive overtness* (how forcefully you express your support). A devious institution could exploit strategic confusion here too, such as covertly accepting one ideology (e.g. racism) while overtly promoting another (e.g. 'equal opportunity' achieved by phasing out affirmative action).

Fairclough (1992: 88 ff., my italics) was evidently aware of such problems when he critiqued the 'textual view of the location of ideology, which one finds in Critical linguistics – ideologies reside in texts':

> While it is true that the forms and content of texts do *bear the imprint of* (*are traces of*) *ideological processes and structures*, it is *not possible* to '*read off*' *ideologies from texts*, [. . .] because meanings are produced through *interpretations of texts*, and texts *are open to diverse interpretations* which may *differ* in their ideological import. [. . .] Claims to discover ideological processes solely through text analysis run into the problem now familiar in media sociology that text 'consumers' (readers, viewers) appear sometimes to be *quite immune to the effects* of ideologies which are supposedly 'in' the texts.

In my view, these arguments might lead to a different conclusion. Rather than saying that 'to read off' ideologies from texts is just 'not possible', we might say that *different interpreters can and often will 'read off' different ideologies from the same texts*. Even if we leave aside the old disputes over whether the 'sameness of the text' is a meaningful concept – an issue which has hardly been clarified by the 'post-structuralism' with its concepts like 'dissemination', 'bricolage', 'jouissance', 'free-play of the signifier', and so on (de Beaugrande, 1988a) – we may incur a replay of the chicken-and-egg problem: you 'read off the ideology' of a text under the controls of the ideology you already hold. But, as I have indicated, you are likely to focus on a contrasting ideology and interpret it as a distortion; conversely, you are not well positioned to 'read off' your own ideology, which would appear natural and transparent and so largely invisible.

Moreover, 'immunity' confirms rather then refutes my view: the control unconsciously exerted by your own ideology naturally generates resistance to the

'effects' of another sustained by a 'text'. Actual conversions would be limited chiefly to cases where you are uncommitted regarding the relevant ideological parameters, or where you become aware of some newer inclinations or sympathies, e.g. when your social position has switched from 'have-not' over to 'have' and your populism changes into elitism.

At all events, whether ideologies can be 'read off' from texts and how are empirical questions to be resolved through practical tests and not just theoretical pronouncements. At least, the prospects do not seem unfavourable for gathering and comparing a representative spread of 'read-offs' from a team whose ideologies mutually contrast. Also, extensive experience with corpus work might render critical analysts keenly attuned to the discursive traces of ideologies and hence far better at 'reading off' than we might have expected.

Still, Fairclough is indisputably justified in contending that analyses of the texts by themselves are far from sufficient. In his view,

> ideology is located both in the structures (i.e. orders of discourse) which constitute the outcome of past events and the conditions for current events, and in events themselves as they reproduce and transform the conditioning structures. It is an accumulated and naturalised orientation which is built into norms and conventions, as well as an ongoing work to naturalise and denaturalise such orientations in discursive events. (1992: 89)

The analyst would seemingly require extensive background data about 'past events' and 'current events', as well as about the processes of 'accumulating and naturalizing orientations' and 'conditioning structures' which have perhaps been 'transformed' anyway. Surely some 'reading off' from texts would be an allowable heuristic strategy for telling us where to look?

The insufficiency of texts in isolation has been made one point of contention in a tireless series of attacks by H. G. Widdowson against critical discourse analysis. He diagnoses 'confusion' 'about the nature of discourse (as distinct from text) and about analysis (as distinct from interpretation)', and has 'suggested that this confusion is bred of commitment' (Widdowson, 1995: 171). Fairclough (1996: 50) infers that critical discourse analysis is being accused of 'ideological commitment' and 'prejudice', and sees in Widdowson's attacks 'a version of the classical liberal distinction between' 'science and impartiality' vs 'ideology, commitment, prejudice and partiality'. But matters can hardly be so simple after Widdowson himself has affirmed:

> all the discourses of theory, including those of linguistics, are ideologically loaded, cultural constructs designed to establish control and a sense of security. This is not in the least surprising of course, since theories are made out of language. (Widdowson, 1991a: 39)

Notice the implication here that all discourses are ideological. Nor would Widdowson accept the attitude of mainstream linguistics to achieve an ideology-free scientific status by idealizing language, after he has roundly vowed that

'there can be no idealisation without ideology' (1991a: 39). His advocacy is substantially more general: he would

> not want to suggest that we should avoid the cultural partiality of disciplinary discourses and strive instead to be neutrally objective, [but rather that] we should guard against being too readily persuaded into believing in the validity of relevance of any particular discourse, no matter what apparent authority it might have. (1991a: 40)

So Widdowson is rebuking Fairclough and others on the grounds that

> a good deal of critical discourse analysis talks about the linguistic features of texts as if they inevitably expressed meaning, particularly ideological meaning, whether the writer intended them to or not. [. . .] Such analysis [. . .] states what the text means to the particular reader who happens to be assuming the role of analyst, and then claims that this is what the text itself means. (1991b: 5)
>
> There is rarely a suggestion that alternative interpretations are possible. There is usually the implication that the single interpretation offered is uniquely validated by the textual facts. (1995: 169)

What is being accurately described here is a favoured tactic of both *traditional and formalist literary criticism*, though neither of the two would want to appeal to 'ideological meanings'. Critical discourse analysis, in contrast, quite plainly asserts that

> interpreters are more than discourse subjects in particular discourse processes; they are also social subjects with particular accumulated social experiences, and with resources variously oriented to the multiple dimensions of social life, and these variables affect the ways they go about interpreting particular texts. [. . .] it is important to take account of the ways in which interpreters interpret texts if one is properly to assess their political and ideological effectiveness. (Fairclough, 1992: 136)

The 'overwhelming emphasis' in Fairclough's 'recent work' has accordingly been consigned to 'showing how shifting discursive practices, manifested in texts which are heterogeneous in forms and meaning, can be analysed as facets of wider processes of social and cultural change' (1996: 55). So Widdowson's rebukes are quite simply misplaced and vacuous.

The key difficulty I would see – one not raised by Widdowson – is that Fairclough's method consigns 'ideological effectiveness' only to the pursuit of domination, and not to resistance or solidarity. The field is thus not well fortified against relativism, as we encounter it when Widdowson elsewhere erases the profound ideological differences among three approaches to language. Labov's (1970: 192) contention that 'working-class speakers are more effective narrators,

reasoners, and debaters than many middle-class speakers who temporise, qualify, and lose their argument in a mass of irrelevant detail' is commented in these terms:

> we may wish to acknowledge that Labov's argument is devoted to a good cause and wish to be associated with the ideology which informs it. But [. . .] its promotion of a particular mode of use by referring to some absolute criterion of precision is, like the campaign of the Plain Language Movement, not essentially different from the efforts of [. . .] custodians to promote the mode of use of their preference by referring to some absolute criterion of correctness. (Widdowson, 1988: 346)

Here, relativism scales stunning heights by equating *egalitarian projects* to restore the dignity of stigmatized language varieties and to defend ordinary citizens against manipulation by powerful corporations and bureaucrats, with *elitist projects* to perpetuate and reinforce that very stigmatization.

Moreover, only the 'criteria' of 'correctness' *are absolute* because they cannot be rationally measured or justified. The criteria of 'plainness' and 'effectiveness' *are not absolute* because they can be rationally measured and justified in terms of mutual respect and openness among socially and linguistically diverse groups. The sociolinguistics of Labov and the 'the campaign of the Plain Language Movement' are sustained by counter-ideologies against a linguistic elitism which modern linguistics, in its aspirations to be an ideology-free science, could not effectively combat as long as it merely replaced a simplistic, crude idealization with a complex, sophisticated one.

Fairclough's writings imply that a counter-ideology would be 'partial' and 'sustain relations of domination':

> [Critical discourse analysis] would argue that we are all [. . .] writing from within particular discursive practices, entailing particular interests, commitments, inclusions, exclusions, and so forth; [. . .] Aspects of these discursive practices may serve to sustain relations of domination and may hence be ideological – no theory or science is immune from that possibility. (1996: 53)

Some optimism persists. His aspirations would thus be that 'the values of [critical discourse analysis] do not (unlike others) sustain relations of domination – they do not actually work ideologically' (1996: 49). Moreover, critical discourse analysis is theoretically better-placed to recognize its own 'partiality' than most theories.

Here I pursue a different tactic than has been advocated in these discussions. Instead of seeking to 'read off' the ideology of a given text (*pace* Fairclough), and also instead 'offering a single interpretation as uniquely validated by the textual facts' (*pace* Widdowson), I examine a large set of contexts for the terms derived from one central term which I think we would all peacefully grant to harbour ideological resonances, although (as we shall see) these are unstable and

contested. My analysis is not intended to be authoritative, much less 'validated' but rather heuristic in suggesting some topics and directions for the deeper analysis recommended by Fairclough. Just as corpus research continually points to questions we can pursue with a still larger or more specialized corpus, so might discourse analysis working with corpora find unexpected leads toward relations between discourse and society which only become well-defined whilst we examine large sets of authentic data.

E. On the Meanings of 'Liberal' in Three Corpora

I chose the term 'liberal' and its derivatives, such as 'liberalism' and 'liberalization', because they have been much used of late by groups with disparate interests in various meanings, e.g. for freedom from government regulations and for solidarity of white people with black people. The same tendency may well emerge from data-studies of other key terms in the discourses of post-modern society. I compare data drawn from three corpora representing different regions, the United Kingdom, the United States, and South Africa.[2] Before you read on, you might want to test your own intuitions about what the terms would mean if you used them yourself. Who are the 'liberals', and would you want to be one of them?

E.1 United Kingdom Data

The Bank of English was developed at Birmingham University by John Sinclair and his team, and as of June 1996 had reached the unprecedented size of some 323 million words of running text from contemporary spoken and written sources (Sinclair, 1996). The UK sources in this corpus returned exactly 1000 lines centring on occurrences of the keyword 'liberal' by itself or in its derivatives. I disregard the 288 lines for 'Liberal Democrat(s)' (and 34 for 'Liberal Party') on the grounds that the name of a political party can be notoriously arbitrary and opportunistic, witness the vastly different parties bearing this same name in the UK, Russia, and Japan.

Predictably, a fair number of occurrences, especially for the Process-Verb[3] 'liberalize' and its Noun-Form 'liberalization' concerned economic policy. Prominent collocates included 'economic' and 'economy' themselves as well as 'technological progress', 'capitalism', 'financial policies', 'free market', 'trade', 'protection', and 'privatization', with the 'IMF' near at hand [1–4]. I underline the contextual clues I find relevant to determining the meanings of the key-words.

[1] Driven by technological progress and economic liberalisation, global capitalism is changing fundamentally.
[2] financial policies that are consistent over time; liberalisation and privatisation to promote free markets.
[3] about the economy. The IMF wants a new government to liberalise the economy and privatise public companies.

[4] even essential. One is trade; to persuade voters that liberal trade is in their interests, less protection at home.

In such contexts, the core meaning would plausibly be: activities and policies designed to remove restraints on the 'free' manipulation of the 'market' of goods, services, and labour. In view of the adverse effects upon ordinary wage-earners and consumers, a deal of mystification may be needed to 'persuade voters that liberal trade is in their interests' [4].

Some corpus data gave more precise indications of what a 'liberal' system offers to 'investors', such as 'cheap labour' and 'few environmental restraints' [5]. The collocation 'liberalize + prices' (86 occurrences in the corpus) evidently offers a handy euphemism for raising prices with no controls, and consumers can be thankful if a 'small basket of foods' is exempted, though these may still be unaffordable to the 'unemployed' whose 'benefits' have been 'cut' [6].

[5] in Taiwan finds cheap property, labour, and raw materials, liberal investment laws and few environmental restraints.
[6] the prices of everything but a small basket of foods would be liberalised and generous unemployment benefits would be cut.

Such data may suggest why public discourse might be eager to maintain that 'capitalism' and 'liberal democracy' are 'inexorably' allied, e.g. by asserting that 'American micro-electronics accelerated the fall of communism' [7]. Yet that optimism is belied by data on societies like Chile, where 'economic liberalization' and 'market reforms' got so easily combined with 'political repression' [8], and by data explicitly linking 'liberal' with 'rapaciousness' [9] and with opposition to 'populism' [10].

[7] a movement towards ever higher technological capability. This movement has led, he argues, inexorably towards capitalism and liberal democracy. It was, for example, American micro-electronics that threatened to render obsolete the entire Soviet arsenal and thereby accelerated the fall of communism.
[8] Democracy is well established after the traumatic Pinochet interlude, which combined political repression with economic liberalisation. Chile had a 10-year start over other Latin American countries in market reforms, and began bringing down its own trade barriers without waiting for others to reciprocate.
[9] A tried-and-tested alternative to rapacious western liberalism was at hand. India's colonial past still shapes
[10] He will not turn populist, but instead push ahead with liberal policies and go faster with privatisation

Particularly intriguing were the attestations reminding us that favouring big capital over labour and consumers is also a cherished principle of the traditional

merger is under way to give us not just occasional alliances on specific issues like opposing 'monopoly' [13] – a stance many current 'liberals' have evidently abandoned anyway – but a political species of 'liberal conservatives' [14–15], or at least 'conservative governments' that find it expedient to call themselves 'liberal' [16].

[11] viewing city development conservative and liberal plans, plans to support the private market
[12] its American democratic inheritance. That conservative-liberal philosophy remained, and still remains, powerful
[13] In theory, it [the argument against monopoly] could be shared by liberals eager to break the power of big business and conservatives intent on restoring some semblance of perfect competition
[14] trace their ancestors to the liberal, parliamentary, elitist and moderate conservatives served any regime which served them.
[15] many Conservatives, those who can be called liberal Conservatives, were thoroughly opposed to the increasing trend towards economic collectivism
[16] voting system, it was not immediately known whether the Liberal (conservative) government would continue to run

The irony is all the richer in view of the habit of the British Conservative Party to

[17] blame everything that has gone wrong in British society on the liberal 1960s rather than on their party which has been in power since 1979.

Toward the opposite pole of the political spectrum, a few data alluded to the prospect of being a 'liberal communist', but specifically in eastern Europe, where 'new political movements' [18] or 'expulsion from the Party' would be imminent consequences [19]:

[18] But it would also encourage millions of liberal communists to form new political movements
[19] largely communists expelled from the Party for their liberal views. The second was the so-called Left Alternative,

The core meaning of 'liberal' could still be: policies designed to remove restraints on the 'free' manipulation of the 'market', but the implications would be starkly different within a strictly state-controlled economic system. In view of the later deterioration of the Russian economy, the western economists who congratulate 'capitalism' on its victory over 'communism' (e.g. in sample [7]) might ask themselves (or the Russians) if the horrendous effects of naked profiteering and corruption were perhaps just results of the most thorough and relentless application of 'capitalism' to a society which had no understanding of how to control and modulate it.

I was surprised to find 'bourgeois liberals' being opposed to 'affluent proletarians' until I noticed the context concerning how 'jokes are becoming less

[20] Unfortunately, as our humane, bourgeois liberal culture gives way to the affluent proletarian mass culture of Essex and Hollywood, our jokes become less subtle and a new element begins to emerge.

[21] So why is he so popular? Because thousands love his sexist, racist and deformed-people jokes and he has brilliant comic timing. Believes that wishy-washy white liberal do-gooders are undermining the soul of the British comedy.

Here, being 'liberal' would mean defending racial minorities, women, and the handicapped against the public ridicule which, we are briskly told, 'thousands love' and which constitutes 'the soul of the British comedy'. I have always wanted to ask the users of the dismissive label 'do-gooders' if they admire 'do-badders' and aspire to be among them.

'Liberals' who do defend racial minorities and women might be targeted by the New Right conservative backlash as 'radicals', but I found only one instance in UK data [22], plus one in which a concern for 'minority cultural rights' was contrasted with the 'language of tradition' and was 'despised' [23]. The routine attack upon liberalism in the UK data was closer to the opposite: being mindlessly uncommitted and vague in one's good intentions [24–26], rather than, say, being 'tough on crime' [27].

[22] And that fits into radical sort of liberal adult education awareness for some encouraging

[23] language of tradition but instead deploy the despised liberal rhetoric of minority cultural rights.

[24] How should one describe Bresson's cinema? A liberal humanist approach flounders in generalities

[25] men like Raplin exist shows what you get with a liberal agenda; You pump people full of drugs and pipe dreams

[26] Women can't be sexist as they are the oppressed? Bollocks. That is a lily-livered liberal wank view and holds no water with me. I can spot massive violent prejudice when I see it

[27] his 'tough on crime' policies unimpeded by Tumim's liberal interference. For how long, though, is a moot point.

The vulnerability of women emerged again when they, rather than men, were bluntly called 'sexists' who harbour 'massive violent prejudice' [26], much as the victims of racism and their defenders are called 'racists' by the New Right (Van Dijk, 1993, 1998b). A vicious twist with a long tradition was to cast aspersions ('lily-livered', 'wank') on the manhood of 'liberals' who champion women's rights.

In sum, the UK data indicated that the meaning of 'liberal' was most precisely determined in contexts of economic activity and policy, as a designation for 'privatizing' everything [2–3] and allowing the free market to run its course, unrestricted by such annoyances as 'environmental restraints' [5] and 'unemployment benefits' [6]. This stance happens to be dear to the traditional opposite,

'conservative' ideology [11–15]. The economic meaning was usually contextualized amelioratively to uphold the credo that

> [28] the virtues of the economic system that underpins liberal democracy significantly outweigh its vices

along with congratulatory invocations of benefits like 'higher technological capability' [7]. For foreign investors, the 'cheap labour' and the lack of 'environmental restraints' in Taiwan [5] simply constitute attractions for shrewd businessmen, rather than short-term and long-term degradations in the lives of the local inhabitants. Even 'political repression' can get contextualized into a laudable impulse for a 'head start' in 'market reforms' to 'bring down the trade barriers' [8], whereby Pinochet thanked the US and its CIA for overthrowing the democratically elected socialist government and installing him as dictator.

Intriguingly, the further away the contexts moved from the economic meaning, the more pejorative they became. Only a small part seemed to be motivated by threadbare New Right tactic of 'blaming everything that has gone wrong in British society on the liberal 1960s' [17]. A more decisive motive seemed to be the trenchant hostility in public discourse of spokespersons and groups against a different type of restrictions, namely those protecting of the rights of women, minorities, and accused offenders of the law. Such protections were defamed as the concern of 'wishy-washy do-gooders' and 'lily-livered wankers' [26], whilst the British public is being re-educated by a 'comedy' of 'sexist, racist and deformed-people jokes' [21]. So the ameliorative and pejorative contextualizations did not contradict each other after all, however much they may contradict the spirit of genuine democracy.

E.2 United States Data

The US data came from the US-based sources in the Bank of English and totalled 287 lines. Since 'the proportion of English from identifiable US sources in the Bank of English is maintained at around 25%' (Sinclair, pers. comm. March 1998), the overall frequency of occurrences was not significantly lower than for the UK data with 1000 occurrences for a volume three times as large, if we set aside the party name of 'Liberal Democrat(s)' with just seven occurrences in the US data vs 288 in the UK data. Perhaps the Americans, with their fossilized two-party system, take no keen interest in discussing the political parties of other nations.

Some data concerned the same economic activities and policies we saw in the UK data, again with 'liberalizing prices' as a handy euphemism for freely jacking them up [29–30], a move sometimes foisted upon a nation from the outside [30]. The notion that maintaining a 'liberal free-market' makes you a 'democrat' scaled the peaks of irony for the 'changed Khmer Rouge' [31], but then who can predict just how many 'millions' may 'die' in the 'killing fields' of the 'free market' as it rationalizes people out of their jobs and abolishes welfare and unemployment compensation?

[29] He wants a market economy instituted rapidly, with liberalized prices. He wants the state bureaucracies to drop the subsidies
[30] price reform. Jan Vanous: If Russia liberalizes prices, Ukraine has no choice but to follow
[31] some one million Cambodians died in the infamous Khmer Rouge killing fields. Until this month, the Khmer Rouge appeared intent on proving to the world that they've changed and are now liberal, free-market democrats.

Yet unlike the UK data, the US data also reflected the contradictory view that 'liberals' are opposed to current economic 'realities' or cannot apply their principles to these [32], and are out of touch with the broad population anyway [33]:

[32] is a little like Bill Clinton's: how to reconcile liberal principles with certain harsh realities
[33] The vast majority of Americans are not liberals. They should simply listen to the real speeches

Alternately, 'liberalism' was identified as the ideology specific to the 'bourgeoisie' [34] and the 'middle class and the rich', where the term 'money liberals' did seem piquantly apt [35]:

[34] The bourgeoisie is assumed to be necessarily liberal in politics and if a liberal order is not created then
[35] This is the stuff of social equality. But virtually none of these virtues are evident when all the government does is distribute cash benefits – even if, as money liberals typically recommend, benefits go to the middle class and rich as well as the poor.

Another contrast to the UK data emerged where 'liberals' were said to actually favour social welfare programs [36–37]. In both cases, the contexts connoted disapproval, e.g. in suggesting that 'liberals' were somehow acting unfairly by 'simply imposing taxes on the rich minority' in order to the 'fund the public sphere'.

[36] thought that congressional Democrats were tax-and-spend liberals, wedded to big government.[4]
[37] large tax increases needed to fund the public sphere – liberals can simply impose the increases on the rich minority

The diversity of social groups among or close to the 'liberals' was conspicuous in the US data, e.g. 'human rights' advocates and environmentalists [38], feminists [39] (whose cause disqualifies male supporters as 'lily-livered wankers' [26]?), blacks [40], or white spokespersons for blacks [41] (the core meaning in South Africa, as I later show):

[38] to recoup with a coalition of human rights-oriented liberals and antiwaste moderates
[39] Socialist feminism in the United States reemerged in the 1960s, when liberal feminists became frustrated with the pace of social reform and began to seek more fundamental sources of women's oppression. By focusing on women's economic roles
[40] says, 'He's got the wrong vision. He's not liberal and most blacks are liberal'
[41] It just is another example of benevolent white liberals dissecting and analyzing the attitudes of black people

Discursive moves to discredit 'liberal' ideology were more imaginative than in the UK data (back in [22–6]). The US data variously portrayed it not just as wishy-washy [42–3], but also subservient to ethnic groups like Arabs in 'caftans' and African Americans in 'dashikis' [44], 'not progressive' [45], deficient in 'understanding the 'stubborn facts of human experience' [46], incapable of integrating 'affective life' with 'intellectual interests' [47], 'sanctimonious' [48], 'fearful' of the 'plebs' [49], or compromised if not indeed criminalized by the support of 'drug users' who hold a 'permissive and anti-conventional outlook' [50–1].

[42] all we ever get to see is the conservative against the liberal, and the liberal has no politics at all, anyhow.
[43] the differences among individuals. This is because, to liberals, there is no absolute truth, everything is relative
[44] of a caftan or whatever those things are the Yankee liberals are all running around in now'. 'Dashikis'
[45] an idea of an agency to put even these into effect. The liberals of today are not a part of a progressive movement
[46] Lacking any true insight into these stubborn facts of human experience – corruption, evil, irrational desire – liberals also fail to understand that evil often lies beyond purely rational treatment
[47] The body, the unconscious, the pre-rational are all important to sound thought. But because the liberal has sought no positive discipline for emotion and feeling, there is an open breach between his affective life and his intellectual interests.
[48] GOP ticket in 1952. And the privileges of sanctimonious liberals chafed against his [Nixon's] prepolitical past: a childhood
[49] long enough to explore. In any event, among most French liberals, fear of the plebs outran their hopes for it.
[50] These veterans of the '60s era of sex and drugs and rock'n'roll support a liberal social agenda. And they're more attuned to the special-interest groups linked to the Democratic Party than to the big-business associations of the GOP.
[51] among those who have gone to college, drug users are more likely to have majored in the social sciences, fine arts, and humanities than in

the natural sciences. They are also more likely to favor liberal politics, to be estranged from religion, and to have a generally permissive and anti-conventional outlook

The oddest linkage of all was made among groups who are not convinced that 'the principle of free speech' should protect the hate speech of 'racists': 'bigots' got juxtaposed with 'liberals', and 'feminists' with 'sexists' (compare sample [26] again).

[52] not when they engage in violence or vandalism. But when they speak or write, racist assholes fall right into this Oliver Wendell Holmes definition – highly unpopular among bigots, liberals, radicals, feminists, sexists, and college administrators: 'If there is any principle of the Constitution that more imperatively calls for attachment than any other, it is the principle of free speech'

Applying 'the principle of free speech' to 'hate speech', where the 'negative presentation of the outgroup' (Van Dijk, pers comm.) casts aside all restraint, is an alarming demonstration of how the principles of democracy can be used to subvert it. This notion of 'freedom' is difficult to oppose from an 'ideology' of 'liberalism' that purports to 'outflank or transcend ideology' and puts its 'faith' in 'reason as a faculty that operates independently of any particular world view' (Fish, 1994: 134 ff.).

At all events, 'liberals' in the US can expect a barrage of 'attacks' [53], and even their 'contented moderation' is anathema to the 'red-hunters on the 'Right' [54]:

[53] today and continued his attacks on what he calls the liberal establishment. His main target was New York, a city

[54] For the time being, the tones of contented moderation had driven out the discourse of anguished zeal. Great Liberal Fear. But red hunters on the Right gave liberal intellectuals a terrible shock.

Not at all surprisingly, US politicians were far more wary than in the UK of being classed as 'liberal' [55–6], and 'measures' to 'repeal liberal rights' are being busily drawn up even (or especially?) for California [57].

[55] clear from Clinton's reactions over the weekend to the liberal label, him fighting back, that this ticket is not liberal

[56] McGovern: Well, I think Bill Clinton is probably more liberal than his present image. I hope my saying that won't harm his campaign

[57] the court overturned a portion of the initiative that would have stripped defendants of any rights that aren't provided by the US Constitution. That part of the measure was designed to repeal more liberal rights provisions in the California constitution.

Scorning 'liberals' for a failure to be 'tough on crime' (sample [27]) is an ironic argument in an age where the 'liberal free-market' is rapidly eroding opportunities for honest work.

The old antipathy between liberalism and religious doctrine, which has furnished history with some bemusing sidelights [58] (but compare sample [94] later), is currently focused upon the inflammatory issue of 'abortion' [59–60], where being 'liberal' means allowing the women involved to decide for themselves without being threatened by criminal prosecution.

[58] When in 1889 a canon of Santo Domingo de Calzado who had preached against freedom of the press and the 'damned error of liberalism' and called it a sin for Catholics to vote for Liberals, was brought to trial for 'having condemned political liberalism from the pulpit' he was supported by many of the region's clergy.
[59] he argued for better social services and more liberal abortion laws. But the sharpest criticism today
[60] that voters have overwhelmingly rejected a proposal to liberalize the country's strict abortion laws. Returns from

How this meaning might relate to economic ideologies is a deep question indeed. Is the fierce opposition to abortion (a) simply a gaudy political football of the New Right; (b) the centrepiece of a broad attack upon feminism and the rights of women; (c) a ploy to gain moral high grounds for the ideology of 'Christian fundamentalism' which can accuse the 'liberal' society of slaughtering the innocents; (d) a measure to encourage an oversupply of cheap labour in coming generations; or (e) some queasy mixture of all of these? Here is another issue for in-depth research.

The US data signalled a curious mix of disparate visions regarding the history of 'liberal' ideology [61–3], also disagreeing on whether or not it is currently coming or going [62–8]:

[61] rests upon a quite different set of premises. Liberalism in this sense was symbolically a child of Voltaire
[62] Outside a small circle of theorists, liberalism connoted a worldview defined in the 1930s and reborn in the early 1960s that no longer inspired many activists or voters.
[63] the New Republic is profoundly distressed to discover that liberalism has undergone an eclipse since 1912 when the bulk of
[64] argues that the Western idea of economic and political liberalism has triumphed over alternatives such as fascism.
[65] own credit and did a little something to vindicate liberalism by opposing unjustifiable appeals to arms.
[66] they will have to pay more attention to the discrepancies in their record. They will have to either shift liberalism to new and stronger ground or repair the manifest breaches in their defenses, liberals deserve the eclipse from which liberalism is suffering.

[67] the liberal remains unprepared to face the worst: and on the brink of what may turn out another Dark Ages, he continues to scan the horizon for signs of dawn. The record of liberalism during the last decade has been shameful evasion and inept retreat. Liberalism has compromised with despotism because despotism promised economic benefits to the masses

[68] Pragmatic liberalism has flatly betrayed ideal liberalism. The values that belong to the latter have been compromised away, vitiated, ruthlessly cast overboard. The permanent heritage of liberalism has been bartered for the essentially ignoble notion of national security, in itself a gross illusion

Taken all together, the US data were substantially less focused than the UK data, though important similarities could readily be detected. Perhaps because there is no respected 'Liberal Party' in US politics, the term has not stabilized an ameliorative economic meaning, but has been heavily coloured by the 'tax-and-spend' anathema accompanying the long-term attack on social welfare – ironically, a policy elsewhere proudly called 'liberal'. The non-economic meaning of 'liberal' is evidently being blurred by the highly vocal New Right offensive, enlisting the term to cast scorn upon their long and diffuse list of enemies all across society, including not just minorities and women (especially feminists), but also, intellectuals, environmentalists, and advocates of civil rights or of curbs on the economic power of the private capital that bankrolls the New Right. The blurring is consummate when those who obviously fall under the traditional economic core meaning of the term, such as Bill Clinton (contrast [32] with [55]), repudiate the label.

E.3 South Africa Data

The Corpus of South African English (CSAE) has recently been established at the University of Port Elizabeth under the supervision of Chris Jeffries and Linda Pearce Williams, and has grown from one million to some three million words. This corpus was originally inaugurated as part of the International Corpus of English (ICE) under the direction of the late Sidney Greenbaum at University College London (Greenbaum, 1996). These corpora would provide, for the first time in history, a base of authentic data about local varieties of English that have hitherto led a contradictory existence of being used by large populations but rarely recognized as valid alternative language systems.

Linda Pearce Williams has kindly supplied the total of 247 data lines from the CSAE. This total represents a vastly higher proportional frequency rate than for the UK and US data from the Bank of English, which is roughly 100 times larger. To appreciate why, we should keep in mind that in South Africa, the terms 'liberal' and 'liberalism' – but not 'liberalize' and 'liberalization', these being more recent economic terms – have long carried the highly specific meaning of mostly white people and policies that promoted the human rights of black Africans.[5] Such a meaning aroused much discussion and controversy in

the grim landscape of apartheid especially the founding of the Liberal Party in 1953. It was eventually outlawed in 1968 by a decree with the amazingly candid name, for a supposedly parliamentary state, of 'Prohibition of Political Interference Act'. Thus, the only 'Liberal Party' in my data to be actually banned was also the only one whose ideological position was most sharply defined in terms of promoting human rights.

Being 'liberal' in South Africa as the thumbscrews of apartheid were ruthlessly tightened would expose you to drastic hostility of the government and its allies in institutions and the media, in the form of house arrests, 'banning orders' and so on, but – presumably to avoid galvanizing white resistance – usually stopping short of the martyrdom by detention, torture, and killing, visited upon black activists like Steve Biko, the key advocate of 'Black Consciousness'. Moreover, some black Africans mistrusted the 'liberals' of trying to preserve the system in a milder modality to keep from radically transforming it. Biko himself once described 'the liberal establishment, including radical and leftist groups', as 'a curious bunch of non-conformists' and 'do-gooders' (that slap again!) whose 'artificially integrated circles are a soporific to the blacks while salving the conscience of the guilt-stricken whites' (1978 [orig. 1972]: 63 ff.).

In view of this historical background, the high frequency of occurrences in the CSAE is easily understood. More specifically, we can predict that the data will indicate how the ideology of 'liberalism' is being forcefully unsettled by the establishment of a democratic majority government in 1994. The uneasiness can be pungently sensed when the Liberal Students Association at Wits University ruefully announced a lecture on 'Resuscitating Liberalism'.

Reflections about the past 'mission' [69] were typically accompanied by perplexity on having lost it [70–74]. Some contextual cues, like 'pivoted and sold' [72], 'basking' and 'worshipful disenfranchised' [73], or 'jealousy' [74] may be symptoms of a spiteful serve-them-right tone of those who opposed the liberals all along.

[69] the liberal students of that time had a very clear mission in life. Our mission was to oppose apartheid. That was our purpose
[70] Some people say that the liberals' day was yesterday, a day when we were secure in the conducting of a holy war
[71] As I look at this hall I see some things haven't changed. But the cause has changed. I don't know what liberalism is or means now.
[72] The moral high ground that such liberals occupy is because they have been pivoted and sold to black people as true freedom fighters.
[73] they have lost the formerly serene sense of basking in the gratitude of the worshipful disenfranchised. As the bearer of a famous liberal name told me not long ago: they don't need us any more, you know
[74] I think there is a jealousy here. There are liberals, so-called, who feel displaced. They're no longer the black man's favourite whites

A prominent representation of 'university' influence was also indicated [75–6], with hints of elitism and radicalism even as contrasted with other 'liberals'.

e.g. respecting 'one-man-one-vote' suffrage [76], which was a rallying motto central issue both for the Black Consciousness Movement and the African National Congress (Biko, 1979: 126 ff.; Mandela, 1994: 239 ff.).

[75] we took it for granted that being liberal meant being a university person, or ex- or child-of. Also, being white.
[76] It was liberal to stand up for a better deal for the blacks, even for what was then called 'one-man-one-vote', which post-university liberals considered pretty terroristic in itself

Elitism was clearly one theme for disparaging white liberals:

[77] white 'liberals', however good their intentions, seem oblivious to their racial socialisation. Too many, of 'liberal' and sometimes 'left' persuasion, remain in a comfortable white social cocoon
[78] smacks of the typical liberal naivety and paternalism born out of white privilege

But then only white people who were well-situated could have had any effective political impact during the apartheid era; and those people did after all take a stand against the very system under which they had prospered and which could be expected to sharply curb their 'privileges'.

Today, their status as critical voices under the new system is being exploited to represent them having turned against 'blacks' [79], and to disqualify them as 'hypocrites' [80] and even 'racists' [81].

[79] In the old days the Afrikaner establishment saw liberalism as a hobby of upper-class English-speakers who disliked the Afrikaners more than they disliked the Africans. Now the new liberated establishment sees liberals as upper-class English-speakers taking whacks at blacks, on every available grounds
[80] we must expose First World hypocrisy by speeding up the democratic revolution in South Africa, for that is what your pathetic liberal drivel is really against.
[81] We spent all of the afternoon complaining about racist liberals (isn't it refreshing to find new ogres?).

Despite the sweeping changes, criticism of the new social order is subject to much the same derision as was criticism of the old:

[82] the proper liberal role is to make people cross with you. You've got to be gadfly, and if the rump of state does not get irritated
[83] Liberals ought to be over the moon, but in fact there is endless carping and griping. Open a paper, and there is some spokesperson of liberalism running something down, predictable and tiresome.
[84] the corpus of liberalism, which in the public mind becomes associated [illegible] and slightly hysterical denunciation.

Small wonder if some supporters of liberalism feel exasperated at public ingratitude:

[85] 'Liberal' is now a dirty word among those who were not even born when liberals fought for their rights.

In contrast to the UK data, the South African data nowhere associated 'liberal' with 'conservative', a term in the name of a political party on the far right in the apartheid context, witness such sinister data as these:

[86] Amnesty has also been granted to Conservative Party and Volksfront member Saint Michael Schutte for being in possession of seven AK-47 rifles
[87] a Conservative Party MP, DP du Plessis, repudiated fellow CP MP Koos Botha for bombing a school earmarked for black students.
[88] Convicted Hani murderer [Chris Hani, secretary-general of the South African Communist Party, shot down in April 1993 to disrupt the transition to democracy] and former Conservative Party politician Clive Derby-Lewis continued his testimony before the truth commission's amnesty committee

But 'liberal' was multiply associated with 'communist' [89–90, 93–94], although in a totally different meaning than we saw to be specific to eastern Europe in samples [18–19]. The apartheid regime had indiscriminately pasted the label on all their adversaries and persecuted them under the 'Suppression of Communism Act' of 1950. Even Joe Slovo, long-time General Secretary of the South African Communist Party and imprisoned on Robben Island together with the leaders of the African National Congress, was suspected of 'liberal' tendencies [91] despite being reputed (like Biko) to regard 'liberals' as 'hypocrites' [92].

[89] It was the hour of the raised voice of the liberals who saw themselves as the conscience of the nation. And it was also the time of the communist voices
[90] newspapers were seen to be unpatriotic reckless liberalistic communistic pinko. You know you know all those all those labels
[91] There are those who think that Slovo remained a true believer to the end, that the more liberal formulations of his last years were merely another tactical feint
[92] For Slovo, of course, all liberals are hypocrites and he is happily illiberal.

In more academic registers, the two ideologies were idiosyncratically linked in terms of their world-views [93–4], along with the 'semi-socialist ideas of the Christian culture' [94] (but compare sample [58]):

[93] the vacuity of the communist vision of human nature is equally discernible in the liberal anthropology of rationalist, autonomous individuality;

it cannot hope to escape the fate which befell its companion ideology. In this sense liberalism and communism are but the two sides of a single Modernist coin

[94] This vociferous form feeds on the radical liberal perspectives and sometimes semi-socialist ideas of the Christian culture of the educated

Nelson Mandela (1994: 285) himself certified in 1962 that 'the Liberal Party and the Communist Party were arch-enemies', but he too noticed how the terms were getting blurred together in order to discredit them both.

The academic data that collocated 'liberal' with 'egalitarian' and 'equality' were sternly pejorative:

[95] the appeal to basic rights can settle only a modest number of contentious issues, and the tendency of egalitarian liberal theory to make all contentious issues a question of right, [and to] blur the separation of the public and private spheres has even more disastrous consequences

[96] the dominant liberal obsession with equality leads to incoherence in theory and increasing conflict and antagonism in practice

After reviewing all these pejorative data we may feel a little wistful to hear recent calls to action like this one:

[97] Join the Democratic Party if you share its commitment to the values of liberalism and democracy and its vision of fighting for the freedom of every person to shape his or her own future.

The contexts were quite different and far less numerous for 'liberalization' in the meaning we saw in the UK data. Perhaps to avoid confusion with 'liberal' in the traditional South African meaning, 'neo-liberal' is currently used for the economic meaning. I found the same usage 224 times in the UK data but, interestingly enough, not even once in the US data, where we noticed some confusion about the history of the ideology ([61–8]).

The data displayed the typical collocatable terms like 'invest' [98], 'globalisation' [99], 'competition' [100], and 'privatisation' [100]. The 'suspicion' and 'hostility' of labour unions [101] provided clues about the implied meanings: 'invest offshore' [98] → evade paying the national income taxes vitally needed for better social services; 'join the international economy' [99] → bow to the will of multinational corporations and banks; 'fiscal discipline' [100] → no upgrading social welfare programmes; 'flexible labour markets' [100] → power of owners and management to fix wages; 'improved competition' + 'export drive' [100] → undersell other countries by underpaying the productive workforce at home (cf. de Beaugrande and Williams, in press). If [102] was a bit more frank, [103] was extremely so in calling these economic policies by some well-earned names.

[98] foreign exchange controls will be liberalised by allowing individuals to invest offshore for the first time

[99] the whole business of globalisation and liberalisation. We are now under enormous pressure as a country to join the international economy

[100] the foundation proposes a 'multi-pillared' strategy of legal reform, financial liberalisation, fiscal discipline, flexible labour markets, improved competition and an export drive.

[101] union movements, which now view privatisation with suspicion and hostility and which have expressed misgivings about trade liberalisation

[102] Any finance obtained from the World Bank would be on policy terms dictated by it. The usual neo-liberal conditions – privatisation, liberalisation of trade, monetary restraint or high interest rates, deregulation, cutting state subsidies, and so on.

[103] the global community we are supposed to be part of. The shift to the left is primarily a resounding rejection of neo-liberal society, in its uncaring, alienated politics, as well as its free market economics of unabashed profiteering

We might well speculate that the future well-being of the democratic South Africa will depend chiefly on whether the old 'liberalism' of egalitarian human rights can withstand the 'enormous pressure' from the 'neo-liberalism' of 'uncaring, alienated politics' and 'unabashed profiteering', whilst the huge majority of black Africans continue to live in poverty and hopelessness.

F. Further Issues for Analysis

The data presented here are but a small sample of 103 passages out of the total of 1534 data samples examined – not even one tenth, although still far more real data than you will find in many publications by linguists, especially by ones who idealize language. To work as a discourse analyst confronting plentiful corpus data, you are compelled to be selective and to rely in early stages on your own expectations and intuitions about which data might be more relevant or interesting. Later, the parameters you find will send you back to the larger sets in search of more specific or subtle indicators.

Obviously, the methods for doing a 'critical discourse analysis' of corpus data are far from established yet. Even when we have examined a fairly large set of attestations, we cannot be certain whether our own interpretations of key items and collocations are genuinely representative of the large populations who produced the data. But we can be fairly confident of accessing a range of interpretative issues that is both wider and more precise than we could access by relying on our own personal usages and intuitions. Moreover, when we observe our own ideological position in contest with others, we are less likely to overlook it or take it for granted.

Nor can I point to any consensus about which among the many analytic techniques of previous linguistics we might apply. Do we focus on morphology, syntax, semantics, or pragmatics, or some combination of these (de Beaugrande, 1996)? Or do we focus on less familiar factors like 'colligability' and 'collocability'

which cut across all of those in ways we are just beginning to grasp (de Beaugrande, 1998b)? Or, again, do we focus on the 'discursive structures, strategies, and moves' whereby ideological discourse enacts, 'at all levels of the text, the positive presentation of the ingroup and the negative presentation of the out-group' by means of 'polarisation', 'metaphor', 'hyperbolic emphasis', 'negative lexicalisation', 'rhetorical mitigation', 'euphemisation', and so on (Van Dijk, 1998b: 18)? Moreover, what are the implications of using key words as the units of search and analysis when our major interest is in contexts and in the positions of speakers (Lemke, pers. comm.)? We plainly need some means for searching and analysing relations among meanings or belief-systems as well, but the necessary software would demand a highly innovative design.

To be consistent with the principles described in section C, we cannot settle these questions from the top down, but only from our ongoing bottom–up work with plentiful data. Not merely do corpus data in no way manifest the disorder projected by 'linguisticism' since de Saussure, they manifest an amazingly delicate order despite their enormous quantity and variety. To deal with all that, we shall need to pursue multiple inquiries guided and co-ordinated by some evolving dialectical agenda, where a 'critical' ideology could strategically guide our focus toward interconnected data that are indicative of power and domination but also others of solidarity and equality.

Consider in this connection 'the principal observation of corpus linguistics in the last decade': 'meaning affects the structure profoundly' (Sinclair, 1991: 496). One significant reflex of this is that the collocability and colligability of any one item, such as a Noun or a Verb, are unequally distributed among its alternative forms, such as Singular and Plural (Sinclair, 1991: 494 ff.). I in turn found that the Adjective 'liberal' is far more variable and contested in its collocations than the Noun 'liberalism', whilst the Verb 'liberalise' or (in US data) 'liberalize' is by far the most restricted. The (invariably Third Person) Subjects of the Verb were nearly always governments, institutions, or whole countries, all representing enough power to make resistance seem futile. The Objects were nearly always abstractions, coming mainly from a single semantic domain with the headword 'economy', such as 'prices', 'trade', 'markets', 'financial system', and 'tariffs'; 'laws' appeared at a much lower frequency. A few data signalled ongoing evolutions in usage, such as using the Verb in Intransitive colligations, e.g.: 'two regimes which, having *liberalised* under pressures'; and 'steps were taken to explore whether Tanzania should *liberalise* politically as well as economically'. Clear innovations included the 'closet *liberalisers'* in the British Parliament, and the way Poland and Hungary were said to 'run import regimes that *out-liberalise* those of many OECD countries'. I can see no rational way to account for all these emergent constraints except by reference to the ideological status of the key words.

Whilst engaging with such data, you may detect a dual evolution in your interpretative work: both toward a *convergence* of meanings for a given key word among sets of data; and toward a *divergence* between sets so loosely associated as to make a common core meaning quite difficult to formulate. What might be the common core shared by the set of economic contexts (these from the UK data)

such as 'open and liberal economic policies' or 'the money-capital concept linked to the classical liberal ideology', and by the set of ironic goodwill contexts such as 'liberal Christian god' or 'dressing up their doctrine with a liberal sprinkling of post-Daisy Age happy harmonies', or again by the set of plenitude contexts such as 'a liberal supply of live food including small insects' or 'a liberal application of face powder on top of foundation'?

Or might the expectation that a given expression has a stable and determinate core meaning be unduly proximate to the 'linguisticist' vision of language being a stable and determinate system? Corpus data may be telling us that the meaning of an expression typically *requires* a band of fluctuation and indeterminacy in order to adapt so effortlessly to emergent constraints during discourse. Contestations over meanings are one implication of this band, as when the connotations of 'liberal' with generosity and freedom can be handily exploited for policies of selfishness and compulsion.

Still, the fluctuation could plausibly be constrained by the attractions of analogies among the meanings. We might consider if whether the meaning of 'liberal' as 'wishy-washy' [26] may stand in some analogy to the officially laissez-faire policies of the core economic meaning, or is merely an empty projection of 'negative lexicalization' (in the sense of Van Dijk, 1998b) to dismiss everyone to the left of the New Right, whatever their ideologies. If the analogy is implied, then it is itself just manipulative as the 'free' in 'free market'. The massive evidence marshalled by Martin and Schumann (1996) among others demonstrates that economic 'liberalism' in its current form is far from laissez-faire; multinational corporations, the World Bank, and the International Monetary Fund, are literally forcing their 'free market' ideology onto whole populations and governments with the conviction that

> continual wage reductions, longer work-hours, cuts in social welfare, even the complete abandonment of social welfare in the US, are supposed to make the nations 'fit' for global competition. (Martin and Schumann, 1996: 312; my translation)

The two financial journalists are moved to ask: 'how much free market can democracy stand?'

> Now what the founders of the post-war welfare states had learned from bitter experience is becoming ever more clearly visible: free-market economy and democracy are by no means inseparable blood-brothers, who harmoniously nourish prosperity for everyone. Instead, the two central guiding models of the old industrial states of the West stand in constant contradiction to each other. (1996: 311; my translation)

We could run extensive data queries to detect the means whereby public discourses in countries like the UK and the US carry a heavy 'ideological investment' (Fairclough) in papering over the 'contradiction', e.g. by thematizing the 'virtues of the economic system that underpins liberal democracy' [28].

We could also run multiple data queries to observe and describe the emergence of a set of evasive terms within the ideological proximity of economic neoliberalism to designate and yet obscure the complex and devious tactics for profiteering at the expense of ordinary workers: 'rationalizing', 'privatizing', 'restructuring', 're-engineering', 'downsizing', 'outsourcing', 'multiskilling', 'increasing productivity', and so on, all mean: fewer jobs with harder work for lower wages and no benefits at all, whilst the gains for owners and shareholders soar. The *New York Times* calculated from the statistics of the US Department of Labor that, between 1979 and 1995, 43 million workers lost their jobs; and two thirds of those who found other jobs were forced to accept much poorer working conditions (reported in the *International Herald Tribune*, 6 March 1996).

Then irony is consummated when neo-liberalism adopts the strategy of claiming to be no ideology at all. The European Union Commissioner for Competitiveness, Karl van Miert, recently defended privatization by declaring: 'the decision to liberalize certain branches which offer public services is *by no means ideological*, but the expression of a *natural adaptation* to economic and technical developments' (*Le Monde diplomatique*, January 1996, my translation and italics). His 'choice of words', Martin and Schumann (1997: 190 ff.) comment, 'already betrays the unexamined ideology that is always recognisable when politicians invoke "nature" whilst handing out state properties, tax revenues, and economic privileges'.

The echoes in Fairclough's concept of 'naturalization' are highly serendipitous here. We can return to our data to look for more subtle choices of language intended to make 'liberalism' seem natural if not virtually inevitable. I would highlight what is underlined in these data:

[1a] Driven by technological progress
[2a] financial policies that are consistent over time
[7a] a movement towards ever higher technological capability [. . .] has led [. . .] inexorably towards capitalism and liberal democracy
[10a] He will [. . .] push ahead with liberal policies and go faster with privatisation
[29a] He wants a market economy instituted rapidly
[30a] If Russia liberalizes prices, Ukraine has no choice but to follow
[12a] That conservative-liberal philosophy remained, and still remains, powerful
[34a] The bourgeoisie is assumed to be necessarily liberal
[64a] the Western idea of economic and political liberalism has triumphed over alternatives

When efforts are made to 'persuade voters that liberal trade is in their interests' [4], the contradiction is to be actually reproduced in the awareness of the population. They are to see themselves only as shoppers wanting cheaper goods, and to forget being also workers who will get lower wages to shop with when 'protection at home' has been abolished.

However, we also need to consider the prospect that ideological terms may *not* appear in a corpus with a frequency corresponding to their influence, because they have been quietly incorporated into the state policies. The radically 'conservative' Reagan–Bush governments and their supporters in the business and financial communities did not have to confuse the voters by expressly advocating 'liberal' policies, leaving their New Right allies free to hurl the term 'liberals' at the advocates of the rights of women and minorities and of social welfare programmes. Yet on an international plane, 'liberal' remains in vogue as an agreeable label for of economic policies that could be more honestly called 'unabashed profiteering'. Here too, instability in the meaning is an ideological advantage.

Still another advantage of the instability is to hinder the consolidation of an effective counter-ideology. What can we rationally call the opposite of 'liberal' policies when the usual converse 'conservative' is not merely unattractive for critical thinkers and ecologically oriented intellectuals, but is also becoming hardly distinguishable from 'liberal' anyway, as our data indicated? We certainly would not declare ourselves '*illiberal*' which the *Random House Webster's* variously defines as 'narrow-minded, bigoted, miserly, lacking culture or refinement' (p. 670).

Now, if ideological terms are so strategic for the advancement of the ideology itself, a lack of accredited terms for counter-ideologies is a serious problem. I have suggested the problem to be a general one, also holding for consumerism, individualism, capitalism, and free-marketism, now that the terms 'socialism' and 'communism' are losing favour. The problem is indeed one major motive for advocating a 'critical' enterprise that formulates and promotes an explicit counter-ideology such as 'ecologism', whose name can profit from the serendipitous echoes with the 'ecology movement' (e.g. Myers et al., 1993) and also with Neisser's (1976: 2) concept of 'ecological validity'.

I certainly could not deny that the sincere ambition of critical discourse analysts to transcend ideology is admirable, since their goal is to overcome practices of power and domination, as we have seen in section D. But I feel uneasy recalling the ominous precedents of various groups, including scientists and economists, whose self-serving denials to hold any ideology constituted one major motive for critical discourse analysis in the first place. Or, if we agree to call the 'ideology' (in my sense) of critical discourse analysis by some other name – say, 'position', 'agenda', or 'programme' – we risk being scolded for terminological squeamishness and also risk obscuring the oppositional status of our programme vis-a-vis the ideologies of domination. Besides, critical discourse analysis currently *does have power*, as manifested in being a favoured domain for books, journals, and even academic job descriptions – and also a conspicuous target for continual attacks such as Widdowson's.

At all events, I hope to have made a reasonable case for broadening our base to explore the ideological aspects of discourse made available by large corpus data before we can decide such questions as whether or not all discourse implies ideology. The various debaters of this question would presumably agree that the ideological constraints on and in discourse are substantially more pervasive

and subtle than most people, including most linguists, remotely suspect. If so, then surely we should look at extensive discourse data with an open mind respecting its potentially ideological character.

Our methods will of course demand extensive refinement for such tasks as sorting out corpus data according to ideologically relevant factors, such as political settings and historical periods, along with sources, registers, genres, audiences, and perhaps even individual speakers or writers. For example, we might well find significant distinctions between public speeches or editorials vs casual conversations in homes, pubs, or grandstands, even for the same groups of speakers. If an ideology encourages consistency on some issues, it may encourage inconsistency on others in order to avoid drawing distasteful conclusions and making painful admissions (Potter and Wetherell, 1987). Psychotherapy and psychoanalysis labour in a veritable minefield of such avoidances.

If, as so much work in critical discourse analysis implies, ideology is essentially a construct for power and closure, a paradox might be conjectured for the enterprise of developing an ideology of solidarity and equality wherein concurrent alternatives are accepted with openness and respect. I would again draw an analogy to a scientific theory, which in classical science wages war against all others until a newer theory discredits it. I would submit that this adversarial and confrontational notion of science should itself be regarded as a discredited theory or falsified paradigm. The significant problems of the post-modern, multicultural society can be solved only by 'post-classical science' that integrates alternatives (de Beaugrande, 1997). So too should 'ecologism' as an integrative ideology for both society and science transcend the combative proclivities of the ideologies of earlier ages with their horrifying rosters of atrocities. Only this integration can provide the consensus and strength to effectively deconstruct such anachronistic and recidivist ideologies as an 'economic neo-liberalism' propelling global society backwards into the primitive stages of robber-baron capitalism, non-unionized labour, subsistence wages, chronic unemployment, and endemic poverty. The alternatives are as clear as our imperatives: we *cannot choose not to choose* between power and solidarity, between inequality and equality.

Acknowledgements

I am much indebted to Teun van Dijk, Norman Fairclough, Jay Lemke, Jim Martin and Ruth Wodak for reading and commenting upon a previous draft of this paper.

Notes

1. On the origins of these terms, compare Firth (1968); Greenbaum (1974).
2. All three data sets were kindly extracted by Linda Pearce Williams from the Bank of English in Birmingham during her visit early in 1998, and from the Corpus of South African English at her home University in Port Elizabeth. I also wish to thank Stephen Bullon at COBUILD for completing some data lines for me.

3. 'Process-Verb' in the sense of functional grammar (Halliday, 1994; de Beaugrande, 1997), i.e. not an Auxiliary or a Modal Verb.
4. This line appeared in a UK source, but quoting a US source.
5. My sketch of South African politics is purely for the orientation of unfamiliar readers, and has drawn upon Plaatje (1982 [1916]); La Guma (1972); Biko (1978); Paton (1981); Kuzwayo (1985); Mandela (1994); and on the recent South African press (e.g. *Mail and Guardian*) as well as the corpus itself. Whether these representations are currently accredited and by whom is a question far beyond the scope of the paper; the continuing flood of discoveries, admissions, confessions and so on has plunged South Africa's sense of its own history into a ferment which may not settle down for many years.

The Discourse Structure of News Stories

Allan Bell

1 On Analysis

This chapter offers and exemplifies a framework for analysing the discourse structure of news. Why would one want to undertake such an enterprise? Why analyse news story structure? What is the pay-off for the labour-intensive analysis of the text of news stories?

Stories are central to human nature. The stories people tell are a core part of their social identity, and the construction of a life story is crucial to our self-identity. The idea of the story is also central to news media. Journalists do not write articles, they write stories – with structure, order, viewpoint and values. So the daily happenings of our societies are expressed in the stories we are told in the media.

In addition, the media are important social institutions. They are crucial presenters of culture, politics and social life, shaping as well as reflecting how these are formed and expressed. Media 'discourse' is important both for what it reveals about a society and because it also itself contributes to the character of society. Linguistic research on the media has always emphasized this last concern, focusing where issues of ideology and power are closest to the surface. But pre-requisite to all such questions is a sound discourse analysis, and this is something that students of media – in their eagerness to get to the 'real meat' of ideological detective work – have sometimes skimmed over at their peril.

To the linguist, a first answer to a question about why undertake such a study is 'because it is there'. News is a major register of language. Understanding how it works is important to understanding the functioning of language in society. Such a study also enables us to compare news with other kinds of stories, such as the ones people tell in face-to-face conversation. And we can compare the

Source: Allan Bell and Peter Garrett (eds), *Approaches to Media Discourse*, 1996, pp. 64–104.

discourse structure of news with other media genres such as editorials, and one type of news medium with another, for instance tabloid and broadsheet press, or newscasts on different television stations.

The text is central to news. News content is not independent of its expression, and we can only hope to have a clear understanding of the nature of news content by close analysis of the news text. A close, linguistically proficient analysis of the text needs to be the foundation for all attempts to unpack the ideologies underlying the news. Such an analysis shows that even simple-looking news stories are often rather complex, and the events they describe rather less distinct than we supposed. It also illuminates how stories are made. This is important for news audiences – to know something of how the news products they consume are manufactured. The very idea that the news is a 'product' may itself come as something of a surprise, and analysis can show something of the make-up of the product.

My approach to news discourse focuses on the question 'what does this story actually say happened?'. It begins by taking the news media's concentration on factuality on its own terms, together with the ordinariness of our acceptance, as readers, of such stories and what they tell us (cf. Scannell). It is not a question – at least initially – of whether these reports represent what 'really' happened. What we are *told* happened is important in the news just as it is in courts of law, which devote much of their time to scrutiny of accounts of events.

This analytical framework seeks chiefly to deduce an 'event structure' for a story – that is, to reconstruct, from the often fragmented information presented, what the story says actually happened. It thus concentrates on the basics of storytelling, which in the news are encapsulated by the journalist's 'five Ws and an H': who, what, when, where, why, how. Only after we are clear what the story says will we be in a position to see what it does not say. We will find, as shown below, that news stories are regularly not saying what we think they say on first reception. They are not telling a simple, clear tale, but are replete with ambiguity, unclarity, discrepancy and cavity.

Such close analysis is prerequisite to a more sophisticated approach to questions of ideology in news texts. It makes us aware of the complexity and ambiguity of news. It enables us to examine whether a headline fairly represents the story it accompanies. It shows who are the sources of information in the news – and which information has no explicit source at all. It leads us to consider why these particular events have been reported at all, and why they have been gathered together into a single published news story.

This chapter is organized thus: first I outline a framework for analysing the discourse structure of news, then exemplify it briefly through examining a number of single-sentence newspaper stories. I then present detailed guidelines for analysis of discourse structure, and proceed to close analysis of one news story. Lastly, I examine one of the most important and interesting aspects of news story structure – time – again with an example analysis of press stories.

2 The Framework

The approach to media discourse analysis used in this chapter was developed in Bell (1991). It draws on elements from general frameworks of story analysis, especially Labov's analysis of narratives of personal experience told in conversation (Labov and Waletzky, 1967; Labov, 1972), as well as from van Dijk's framework for analysing news discourse (1988b). The analysis of time in news stories derives from Bell (1995b, 1996). The frameworks used to analyse the structure of different kinds of stories have a lot of their elements in common (e.g. Labov, 1972; Rumelhart, 1975; van Dijk, 1988b). Labov's is one of the most familiar and contains six elements: abstract, orientation, action, evaluation, resolution and coda (see Bell, 1991 for application of this framework to news stories).

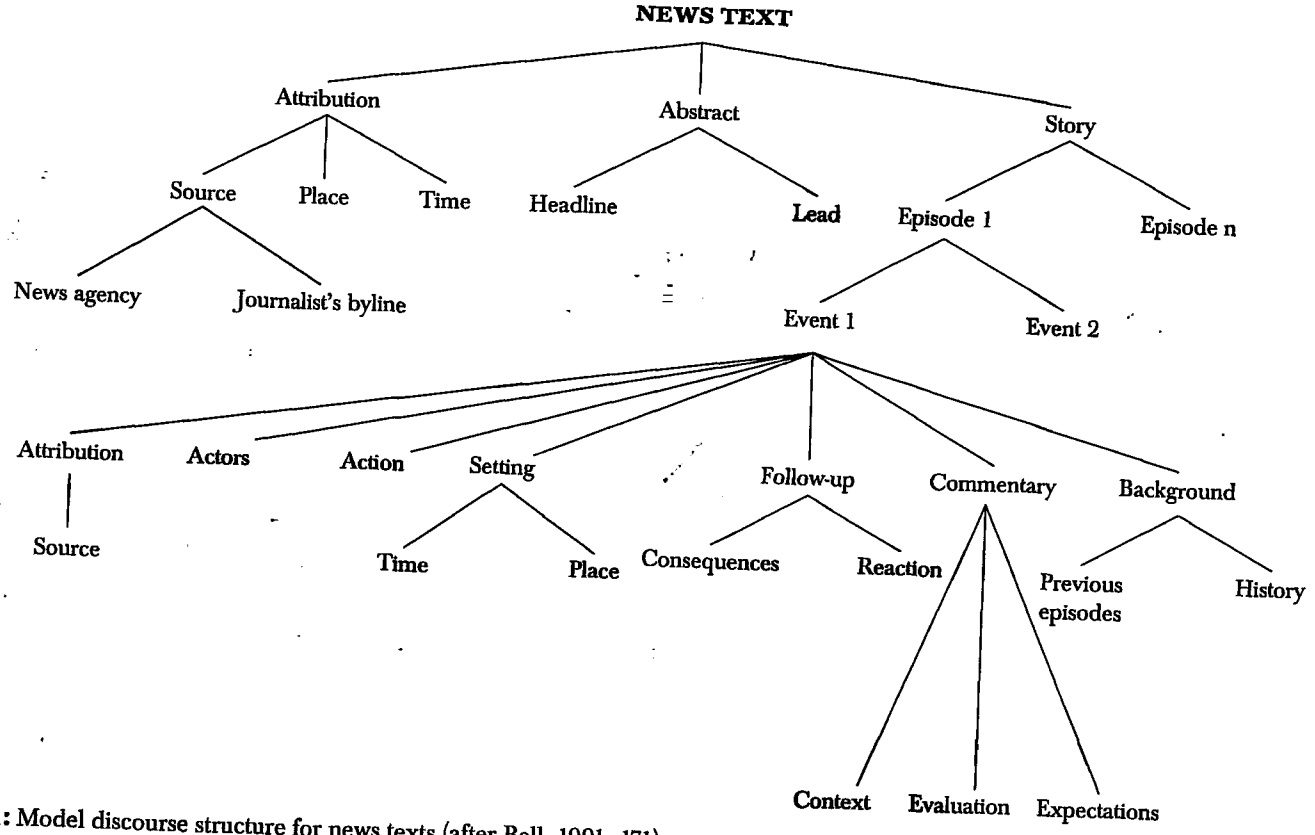

Figure 1 shows the elements needed to describe the discourse structure of news stories. A story normally consists of attribution, an abstract, and the story proper. Attribution of where the story came from is not always made explicit. It can include credit to a news agency and/or a journalist's byline, and may also state place and time ('dateline'). The abstract consists of the lead sentence or 'intro' of the news story and – for press news – also a headline. The lead covers the central event of the story, and possibly one or more secondary events. This necessarily entails giving in the lead itself some information on actors and setting involved in the event. The body of the story itself consists of one or more episodes, which in turn consist of one or more events. Events must describe actors and action, usually express setting of time and place, and may have explicit attribution to an information source. Episodes are clusters of events which share a common location or set of news actors (and need only be specified when a single story contains two or more clearly distinct sets of events).

As well as the above elements which present the central occurrences, there are three additional categories of material in a news story: background, commentary and follow-up. These represent the past, the (non-action) present, and the future of the events described in the main action of the story.

The category of *background* covers any events prior to the current action – story past time. These are frequently previous events which probably figured as news stories in their own right at an earlier stage of the situation. If the background goes back beyond the near past, it is classed as 'history'. Example 3 of the one-sentence stories below contains just such background.

Commentary provides the journalist's or news actor's present-time observations on the action, assessing and commenting on events as they happen (rather than the actual narration of the events themselves, or other parties' verbal reaction to them). It may provide context to assist understanding of what is happening, or evaluative comment on the action, or expectations of how the situation will develop. The story in figure 4 analysed below contains both context (S9: S = Sentence) and evaluation (S1, S3).

Follow-up covers story future time – any action subsequent to the main action of an event. It can include verbal reaction by other parties or non-verbal consequences. Because it covers action which occurred after what a story has treated

gure 1: Model discourse structure for news texts (after Bell, 1991: 171)

as the main action, follow-up is a prime source of subsequent updating stories – which are themselves called 'follow-ups' by journalists. The story in figure 6 below contains follow-up material in S2.

3 Analysing the Single-Sentence Story

This chapter deals with the structure of press news only, and a specific kind of press news: the 'hard' or 'spot' news which we recognize as the staple diet of daily media – stories of fires, wars, accidents, disasters, dangers and all manner of the mayhem that befalls human life. The minimal well-formed hard news story is just one sentence long. Many newspapers publish one-sentence stories, either to fill odd corners, or gathered in a column of news briefs. In a lot of broadcast news, many stories may consist only of a single sentence. The single-sentence story is also an appropriate proxy for examining the structure of longer stories in general. The news story is always focused in its first sentence – its lead or intro (Bell, 1991). We can see this most clearly when the story itself is reduced to just that sentence, but the lead is itself a microstory even when a full story follows. It compresses the 'news values' that have got this story through to publication.

The single-sentence story is therefore a good place to start as an introduction to analysis. Here are the texts of five one-sentence spot news stories published in British daily newspapers in February 1994. They are all from the international news agencies – Associated Press, Reuters and Agence France Presse – which act as models of Western journalistic style.

(1) **Clashes kill eight**
At least eight people have died in tribal fighting in the Bimbila region of northern Ghana. – AFP

(2) **Fumed out**
Tokyo: Two *sake* brewers were seriously ill after being overcome by fumes when one fell into a half-full vat and the other was trapped trying to rescue him. – Reuter

(3) **Deportation setback**
Storms over Iceland delayed the deportation from Norway yesterday of 12 American anti-abortion activists who had allegedly planned to stage demonstrations during the Winter Olympics and were detained by police when they arrived at Oslo's airport. – AP

(4) **Icicle horror**
A woman was fighting for life last night after a giant icicle fell 30 storeys from a New York skyscraper and speared her.

(5) **Awaiting the end**
Communist North Korea is building an underground mausoleum and waterproof glass coffin to await the death of its "Great Leader", President Kim Il-sung, a South Korean press report said. – AFP

Example 1 covers a single event and can be diagrammed as in figure 2 (in this and subsequent figures, some nodes of the structure are omitted to simplify the tree diagrams). It has a headline – 'Clashes kill eight' – as have all these single-sentence stories, and an attribution to the source agency, Agence France Presse. It consists of a single event, which specifies:

- actors – 'at least eight people'
- action – 'have died in tribal fighting'
- setting, specifically place – 'in the Bimbila region of northern Ghana'.

The structure of this story is as minimal as it can be. Yet, of course, even here it is quite likely that we are not dealing with just a single action – the eight victims may well have perished in widely separated incidents.

Example 2 compresses a chain of five actions into one sentence:

1 first *sake* brewer falls into vat
2 second brewer goes to save him
3 second brewer also gets trapped
4 both brewers overcome with fumes
5 both now seriously ill.

The most notable thing about example 2 is the order in which it tells these. My list above is in chronological order, that is the time sequence in which things actually happened, beginning at (1) and ending at (5). But the news typically begins with the most recent main happening (as also in examples 3 and 4). So the narrated order of the actions in story 2 is 5-4-1-3-2. It starts with the most

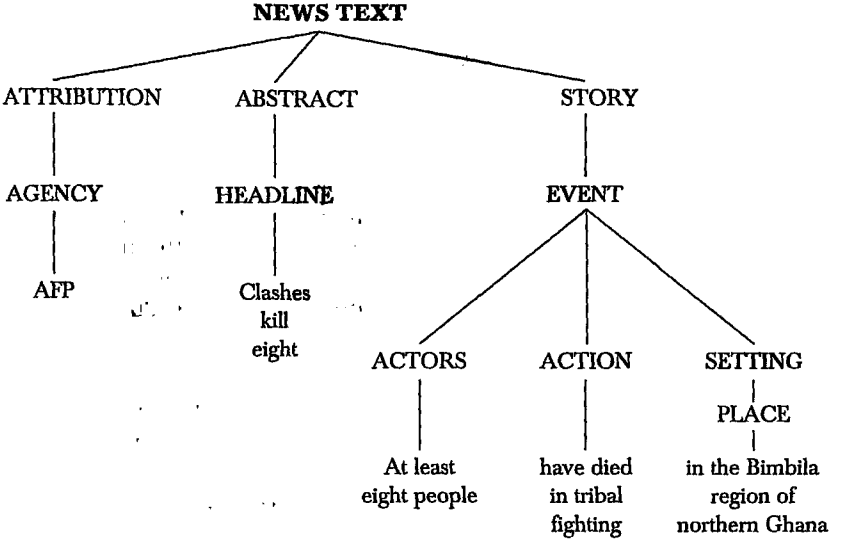

Figure 2: Discourse structure of the one-sentence story in example 1 (some nodes of the structure are omitted for simplification)

recent happening, then the next most recent, then goes back to the first and causal action, then fills in the remaining steps (again in reverse chronological order). The story is thus told in a radically nonsequential fashion – an issue we will return to in detail later in the chapter.

Most of these single-sentence stories overtly narrate more than one event. In terms of the model story structure indicated in figure 1, their structure is therefore complex. Example 3 contains a sequence of four events, with a complex embedding of background involving multiple time points and locations. The four events are (in chronological order):

1 Anti-abortion activists had allegedly planned to stage demonstrations during the Winter Olympics
2 detained by police when they arrived at Oslo airport
3 had been scheduled for deportation from Norway yesterday
4 deportation delayed by storms over Iceland.

Three of these events have their own different place specification. Each has a different time specification: event 1 includes a future ('planned to stage demonstrations') which did not in fact happen, and event 3 is as yet a 'non-event' which has still not occurred – deportation. Figure 3 diagrams the discourse structure of this example (again with some of the potential nodes of the tree diagram omitted to reduce complication). It shows some of the complexity of action, place and time that can be covered by even a single-sentence story. Such a story offers a considerable challenge to the reader's comprehension, as I shall discuss further below, particularly because of its multiple embedding of disparate events, some of which have not in fact (yet) happened. There is also obviously a lot more to be told about what has happened 'behind the scenes' of this story, the factuality of which will doubtless be in dispute between the different parties. The story also has one notable gap that readers have to fill from their world knowledge – why storms over Iceland should delay a deportation from Norway. We are probably to understand that the storms delayed or diverted an incoming aircraft on which the activists were meant to leave.

Looking across these five example stories, we can see patterns in their discourse structures. Firstly, all of them specify main event, news actors and place – the journalist's *what, who* and *where*. Example 1 contains only those elements. Time is expressed in most of them. News agency attribution is present in all except (4), and (5) also credits a local agency. But none attribute their information to any other source such as bystanders, spokespeople or officials.

Secondly, these stories proclaim their news value. As single-sentence stories, they probably originated as the lead paragraphs of longer stories from the international agencies. Their role is therefore to concentrate the news value of the whole story. News values are those factors which take a story into the news. They include attributes such as negativity, immediacy (or recency), proximity, lack of ambiguity, novelty, personalization and eliteness of the news actors (Bell, 1991). A story's news value focuses in the lexicon of newsworthiness in its lead sentence

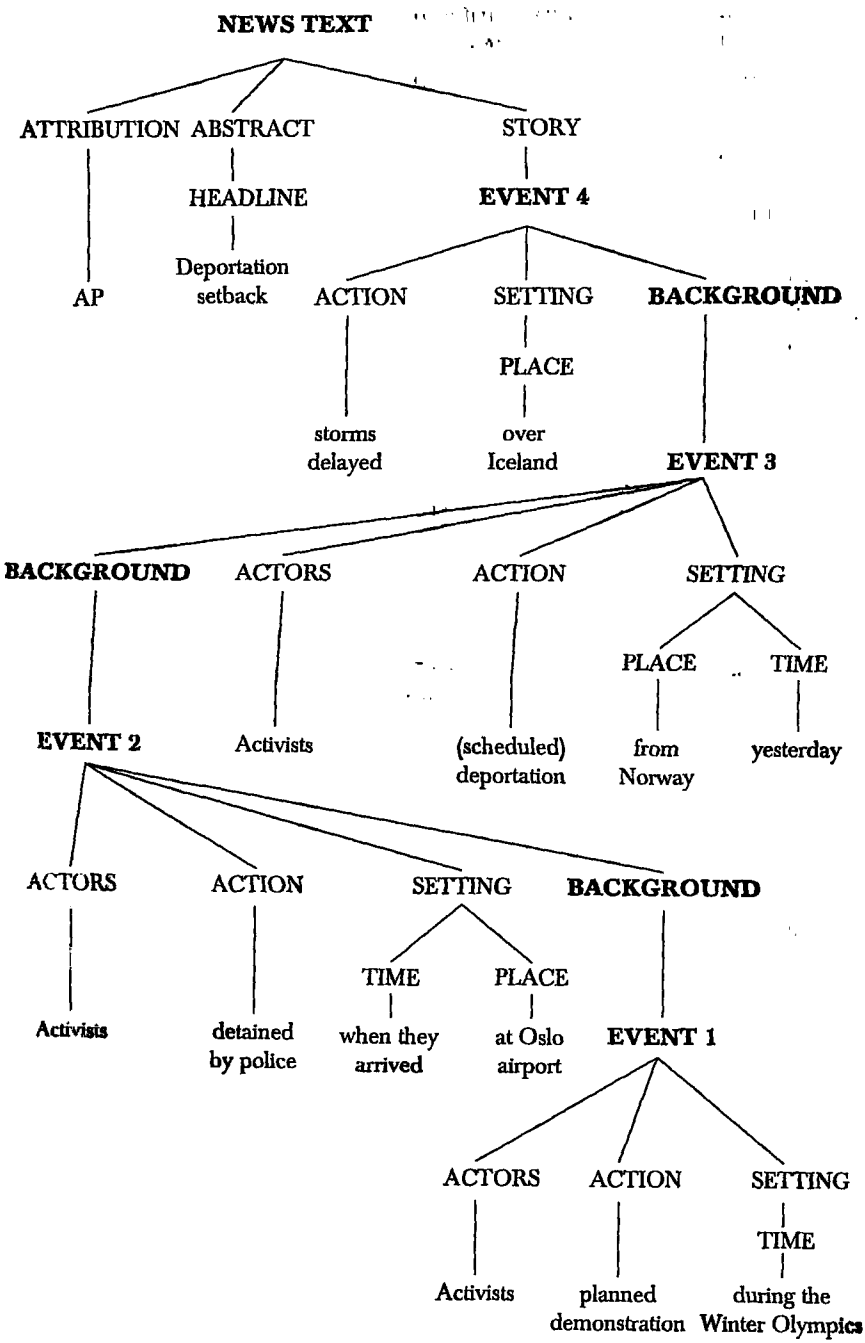

Figure 3: Discourse structure of the one-sentence story in example 3

In (4), for instance, almost every word makes a claim to news value: 'fighting for life', 'giant icicle', 'fell 30 storeys', 'New York skyscraper', 'speared'. Most of the stories contain death, violence, or the imminent threat of these. The facticity of the stories is stressed through the detail of person, place and time already mentioned, and through the use of figures.

Thirdly, all but one story (3) begin with *who* – the main news actor. The stress on personalization and elite news actors guides the order of constituents within the sentence, even if this will result in a passive-voice verb. News-writing mythology holds that verbs should be active, but passivization is quite common as the only means of getting the main news actors to the start of the sentence. We thus have a *grammar* of news value as well as a lexicon. Syntactic rules such as passivization are applied to serve the values of news discourse, as is linkage through temporal conjunctions such as *after* and *as* (2, 4). In most cases one event is the sequel to or result of another, as also in examples 3 and 4.

Fourthly, time is sometimes expressed directly in these stories as 'yesterday' or 'last night'. But often there is no direct reference to current calendar time. We interpret these stories as 'reported within the past day'. But this immediacy criterion may not always be the case, and some of these stories could well be days-old news (e.g. 1, 2) and we readers would be none the wiser.

Fifth, since these are all international agency stories, they often carry explicit place of origin in the dateline (2). Otherwise place is sometimes expressed in the canonical form of a prepositional phrase, such as 'in the Bimbila region of northern Ghana' (1).

Lastly, information content, brevity and clarity can be seen tussling with each other. Sometimes, as in (3), clarity is the loser and the result is a sentence or a story in which the degree of layering and the dispersion of the events reported jeopardizes comprehension. This accords with van Dijk's finding (1988b: 77) that lead sentences in news stories can often be syntactically and informationally complex.

4 What Does the Story Actually Say?

I now turn to consider in more depth one longer news story, subjecting it to close analysis of its discourse structure. The Guide to analysis below presents a step-by-step procedure for establishing what a story says happened – that is, the *event structure* of the story. The fruit of analysing the discourse structure of stories in this way is an understanding of what the story says actually happened. At least at this stage, I am concerned only with what the story says, not with whether or how closely that corresponds to 'the facts' of what happened.

The event analysis takes into account not just the overt specifying of events themselves, but what the story says about news actors, locations and times of occurrence in order to tease out the structure of the story. Moving through each of these aspects, we will commonly have to modify our conception of what

happened as further specification of persons, time or place makes it clear that our earlier models were inadequate.

Figure 4 contains the text of a very routine news story from the (UK) *Daily Mirror*. I chose such a story because it is common rather than exceptional. The first group of analyses seek to uncover what the story is telling us actually happened – what events occurred, where they occurred and when, and who was involved (that is, four of the journalistic five Ws and the H, with the exception of 'why' and 'how': cf. Manoff and Schudson, 1987). This analysis yields structures for these four aspects: events, times, places and news actors. In theory, these four should all mesh into a unified picture of what the story says happened. In practice, they often do not quite fit together, and it is precisely these differences which may cast the most interesting light on the story. The category labels I use below are from Bell (1991), reproduced earlier as figure 1, the model tree diagram of news story structure. Working through this example, I follow the sequence of steps indicated in the Guide, although not all the points listed there are useful for analysing this – or any individual – story. There is a logic to the order in which I have listed the steps, but not all steps are necessarily going to contribute equally to an understanding of every story. Neither are they necessarily always best followed in this particular order or independently of each other – it may often make sense to carry out some later steps before those I have listed here as earlier.

Guide

How to analyse and interpret the discourse structure of a news story. First number the sentences of the story. The first steps listed under each numbered point below (in roman type) are basic analytical moves. The later steps under each point – indented and in italics – are the more interpretive procedures.

What

1 **Headline**
What events take place in the headline? Summarize and number each event.

2 **Lead**
What events take place in the lead or intro? Summarize and number.

3 **Events**
What events take place in the story? Summarize and number, then enter numbers alongside each sentence of the story (as in figure 6).
Re-categorize events in headline and lead as necessary to correspond with the fuller picture you now have from the story as a whole.

What is the central event of the whole story? (Usually the main 'hard' news event in the lead.)

4 Headline, lead and story

What is the relationship of the headline to the lead?

What events in the lead are included/excluded in the headline?
What news values lie behind these inclusions and exclusions?
Is the headline a valid representation of the lead?

What is the relationship of the lead to the story as a whole?

What events in the story are included/excluded in the lead?
What news values lie behind these inclusions and exclusions?
Is the lead a valid representation of the whole story?
Is there any information that is given in the lead but not returned to in the rest of the story?
How does the lead begin telling the story as well as act as an abstract for it?

Who

5 Story attribution

Is the story as a whole attributed? To whom (agency, journalist)?

6 Sources attribution

Is there any attribution within the story? Who is attributed? (list)
Beside each sentence, note down whom it is attributed to (if anyone).
Precisely what is attributed and to whom?
What speech verb is used in the attributions? (list)

What claims do the attributed sources have to authority?
Who is quoted directly? Indirectly?
Why have the particular speech verbs been used?
What parts of the story are not attributed? Why?
Where is attribution unclear or ambiguous? Does this have any repercussions?

7 News actors

What news actors are mentioned? (list: people, organizations, nations, etc.)
How are they labelled or referred to? (list)

What kinds of people or entities are mentioned in the story?
Why are they in the news? Are the news actors elite?
Is the news story personalized?
Are there patterns in the way the story refers to them or labels them?

Does specifying who the news actors are modify the event structure you developed earlier?

Where

8 Places

What place expressions are used? (list)
Where do they occur in the story? (sentence number)

9 Place structure

What locations does the story take place in? (list)

Does the story stay in one location or move from place to place and back? Why?
Is it clear what is happening in which location?
What sort of places are the events happening in? Is there a pattern to this?

Does specifying locations in this way modify the event structure you developed earlier?

When

10 Times

What time expressions are used in the story? (list)
Where do they occur in the story? (sentence number)

11 Time structure

What is the time structure of the story? Take the time of the central event as Time 0. Label earlier events as Time -1, -2 etc., and later events as Time +1, +2 etc. in the chronological sequence in which they actually occurred. Beside each sentence, note down the number of the time or times at which the actions mentioned there occurred.

How does the order in which the story is told relate to the chronological order of events?
What has the story been written in this order? What values lie behind the order?
Does the order help or hinder a reader in understanding what is going on in the story?
Does specifying times of occurrence in this way modify the event structure developed earlier?

12 Background

Is any background given (events prior to the central action – either recent previous events or more historical events)?

Does any of the background indicate any particular ideological frame behind the story?

13 Commentary

Is there any commentary on events? – evaluation of events (editorializing)? Context for what has happened? Expectations of how the situation will develop?

Does any of the commentary (especially evaluation) indicate any particular ideology behind the story?

14 Follow-up

Is there any follow-up to the central action of each event (subsequent events, either reaction (verbal) or consequences (non-verbal))?

Does any of the follow-up indicate any particular ideology behind the story?

Event and Discourse Structure

15 Event structure

Collate your successive re-categorizations of what happened in the story, drawing on news actors, place and time as well as the actions themselves. List in chronological order the events and their associated actors, times and places and the sentence numbers in which they occur (as in table 1 example). This represents the event structure as you finally assess it to be. Note any alternatives, which represent discrepancies or unclarities in the story itself.

Is the story told in instalments? That is, do the events follow one after another or are they interspersed with each other?

16 Discourse structure

At this stage you can draw a tree diagram of the discourse structure (e.g. figures 2, 3, 5). Note that the apparent order which these example figures display is only arrived at after a succession of rough drafts! Such a structure is also idealized in the sense that it masks ambiguities and unclarities.

17 Cohesion

What linkages are expressed or implied between the sentences or events in the story? How? (list)

What linkages are omitted? (list)

What do the linkages (or their absence) between sentences or events mean for understanding the story?

Is a cause-and-effect relationship between different events implied by the way they are ordered?

Does the story flow smoothly, or does it jump about? Why?

18 Confusion

Has it now been possible to say precisely what happened in the story? Or are there still ambiguities, gaps or confusions, as exemplified in the possibility of alternative event or discourse structures? (list, explain)

EVENT STRUCTURE			TIME STRUCTURE
3	HL	**2 held as IRA blitz is foiled**	+2
1			0
1 (2?)	S1	POLICE and MI5 agents have swooped in an undercover operation which netted bomb-making equipment – and may have foiled a major IRA blitz on the British mainland.	0 (+1?)
1 (2?)	S2	They recovered enough Semtex explosive to devastate a large office block.	0 (+1?)
1? (2?)	S3	And security services believe they have intercepted a highly-placed IRA quartermaster who supplies equipment to terror cells.	0? (+1?)
3	S4	Last night two men were being held in London under the Prevention of Terrorism Act.	+2
		Pistol	
1	S5	One, in his 30s, was arrested at Accrington, Lancs, with between 10 lb and 15 lb of high explosives, bomb-making equipment, a pistol and ammunition in his car.	0
1	S6	Plain-clothes police wearing flak jackets and carrying semi-automatic weapons seized the suspect in a car park next to Charlie Brown's Auto Centre.	0
2	S7	Within two hours another man, in his 50s, was held at Wembley in North London.	+1
1	S8	A terraced house in Accrington was under police guard last night.	+2
3	S9	The suspects can be held for up to seven days before being charged or released.	+3

Figure 4: Example story with Event and Time Structures (*Daily Mirror*, **London**, 23 February 1994; reproduced by permission of Mirror Group Newspapers)

1 Headline

The headline appears to narrate two events – (1) the holding of two suspects, and (2) the foiling of an IRA blitz. The two events are clearly closely linked, or may even in effect be the same action – the blitz may have been foiled precisely through the capture of the two people. The journalistic 'as' of the headline would thus not be an accident; it would specify precisely the temporal and causal relationship between the two events. Alternatively, there may have been action which foiled the blitz, and then led to the capture of two suspects. We cannot tell from the headline alone. We must read on.

2 Lead

The lead appears to tell of one event: a security service 'swoop' which discovered bomb-making equipment. This action is clearly related to, but not quite identical with, the two events in the headline. The 'foiled' statement in the headline is now shown to be an evaluation of the significance of the raid rather than a separate action of any kind. We thus find that the lead sentence clarifies the ambiguity of the headline, but it of course remains possible that the operation consisted of raids on more than just one location.

3 Events

We can now move to tease out the event structure of the story as a whole. The lead and the following three sentences (i.e. S1–4) invite the interpretation that there has been a single raid. But the second half of the story tells of two suspects being arrested in widely separated locations. It takes until S7 to become clear that we are dealing with quite separate events, and it remains unclear whether they were in some sense part of a single security operation, or whether they coincided by chance. The central action of both events is clearly the respective raids (assuming that Wembley involved a raid – we are told only that the man was 'held', in a strangely active use of a stative verb, akin to 'arrested'). To this point, it seems we can describe the story as being about a total of three events, assuming we treat the continuing detention of the two suspects as a separate event:

1 Accrington arrest
2 Wembley arrest
3 detention of two suspects.

The Accrington arrest seems to be the central event of the story and most of the story apparently concentrates on it (see figure 4 for Event Structure).

4 Headline, Lead and Story

We have already seen that the content of the lead in this story disambiguates the headline. But a closer look at the headline shows that the '2 held' statement with which it begins does not derive from the lead at all but rather from S4. This is an infrequent pattern, since a majority of headlines are derived solely from lead sentences and not from information further down a story (Bell, 1991).

There is also a contrast in the modality of the verbs used in the headline and the lead. The lead hedges its evaluation as 'may have foiled', but the headline presents this as unvarnished fact – 'is'. The central event of the lead, the raid, is represented in the headline *only* by the gloss of 'foiled' – that is, the tentative evaluation expressed in the lead has become the unhedged description of action in the headline. This is a classic news 'over-assertion' of a kind I found commonly in a study of editing changes made to news copy (Bell, 1983, 1984). The original

copy-editor. The shift is driven by the attempt to make a story as definite as possible ('unambiguity' is one of the classic news values: Galtung and Ruge, 1965; Bell, 1991). So it appears that the headline is not a valid representation of the story as a whole to the extent that through omitting the modal verb, the headline overstates the certainty of the evaluation contained in the lead. Modality is probably rarely expressed in headlines.

Further, we are not told whose opinion it is that a major IRA blitz may have been foiled. There is no sourcing of the evaluation. It is not mentioned again in the body of the story. We are probably to assume the source is the 'security services' quoted in S3, but it may in fact be the product of the journalist who wrote the story. A more likely possibility is that this statement is a gloss inserted by the copy-editor in order to raise the news value of the story – to 'beat it up'. Evidence for this is the fact that it appears in S1 after a dash – an avoided piece of punctuation that betrays late and hasty addition of the second half of S1.

5 Story Attribution

This story attributes no journalist as author nor agency as provider. We must assume it is written by a staff reporter who was not 'bylined'.

6 Sources Attribution

More importantly, the story does not directly specify the source of its information. The nearest we get to sourcing is in S3 where we are told what 'security services believe' in relation to the results of their actions. We can presume they were also the source of some of the information about the event itself, as well as possibly of the evaluation in S1. The use of 'believe' rather than 'say' in S3 is probably significant, indicating either that the security services were not prepared to provide information 'on the record' for the media, or that this was a chance comment that the journalist has built into more than the source would have wanted. We can note that the S9 background about detention powers probably comes from the journalist's own knowledge rather than any source.

7 News Actors

The news actors specified in the story are:

security services (S3)
  police (S1, S6, S8)
  MI5 agents (S1)
two IRA suspects (S4)
  one arrested in Accrington (S5)
  second arrested in Wembley (S7).

There is also another reference to an IRA member – 'a highly-placed IRA quartermaster' (S3). The way the reference is phrased in S3 implies that this

character is not the same as the person/s involved in the events of S1–2. Use of co-ordinator 'and' to introduce the sentence, plus indefinite article 'a . . . quartermaster', implies a different person. If it was the same person we would rather expect a phrasing like 'security services believe the suspect is a highly-placed IRA quartermaster . . .'.

On the other hand, given the detail of weaponry listed with the Accrington suspect in S5, S3 seems more likely to also refer to him. But since that would entail S1–2 referring to the Wembley suspect, this interpretation is not entirely satisfactory either. The remaining possibility is that this refers to a third person not otherwise mentioned, but that seems least likely of all.

Notice how we are gaining more information as our analysis moves into the story, and that new information modifies our understanding of earlier information. But it does not always *clarify* that understanding, and at this point we have to say that the identity of the quartermaster is unclear. Such questions of reference identity are not uncommon in news. In studies of editing practice (Bell, 1984), I have found cases where editors were obviously unable to decode whether expressions in different sentences were meant to refer to the same or different places or people. Their attempts to clarify reference sometimes took the wrong interpretation, and converted a second reference to a city already mentioned in a story into a first reference to another city.

8 Places

The story uses expressions of place in the following:

blitz on the British mainland (S1)
held in London (S4)
arrested at Accrington, Lancs (S5)
with . . . ammunition in his car (S5)
seized the suspect in a car park next to Charlie Brown's Auto Centre (S6)
held at Wembley in North London (S7)
a terraced house in Accrington (S8).

What is not said is more striking than what is said: there is no specification of where the raids and arrests took place until S5 and below. This contributes to our unclarity about what has taken place.

We may also wonder why the story details 'Charlie Brown's Auto Centre', since this is unlikely to be known to anyone beyond the immediate Accrington area. For locals, however, the description might signify that the raid was in a central, busy area of the town, for example. This may be a clue that the origin of this part of the story was in a local Accrington reporter's account which has not been appropriately edited for national readership. In contrast, Wembley – which no Briton needs an introduction to – is glossed as being in North London, presumably for international readership. So within two sentences we have conflicting indications of the presumed readership, local versus international, through the kind of shared knowledge that is and is not presupposed.

9 Place Structure

It seems then that the story has (at least) three locations – raids in Accrington, Lancashire, and in Wembley, North London, plus the site or sites in London where the two suspects are being held prisoner. So we can confirm our specification of probably three events in the story. If we had more detail, we might wish to regard other actions – such as the guarding of a terraced house in Accrington S8) – as further separate events, since it seems likely that the house was not located at the car park which was the scene of the Accrington suspect's arrest.

What is most striking, however, is that the further we get into the analysis, the less clear it becomes exactly what we are being told happened. What on the surface appeared a simple little story turns out to be rather complicated and opaque. In particular, it is by no means obvious which of the two sets of news actors, locations and actions detailed in S5–7 are actually being referred to in S1–3. because those first three sentences contain no unambiguous references to persons, and no reference to place at all. For instance, we cannot be sure which place the Semtex explosive was found in (S2), or which (if either) suspect is the quartermaster of S3.

10 Times

The specification of time is often surprisingly sparse in a news story (aside from tense and aspect marking on verbs). It is frequently left to the inference that 'this must be recent because it is news'. The time expressions in this story are:

last night (S4)
within two hours (S7)
last night (S8)
for up to seven days (S9).

No time is expressed until the fourth sentence of the story, with the presumption of recency governing our reading up to that point. There is no specification of the time of day when the two arrests were made, although we know there was no more than two hours between them. We presume the arrests took place during the day before the story was published – certainly before 'last night'. But in fact it is possible that the news is older than this, dating from the night before last or even earlier. It is not uncommon for stories to remain silent on the time of their events. Occasionally it becomes obvious that the presumption of recency is wrong – and sometimes this silence on timing appears to serve the misleading implication of immediacy.

11 Time Structure

Closely related to teasing out the event structure of a story is specifying its time structure: what happened in what order, what is the story's chronology? The

time structure of this story is rather straightforward except for the lack of clarity over absolute timing, and what actions are part of what event.

Time structure is shown on the right of figure 4. We take the time of the main news action as T0 – the operation described in S1, which I will assume to refer to the Accrington raid (though it may cover both). Thus S1, 2, 5 and 6 all describe aspects of the raid. I will interpret S3 as also referring to Accrington. All these are therefore T0 events. S7 occurs at the time of the Wembley raid 'within two hours', therefore at T + 1: the next time point after T0. S4 and 8 both refer to 'last night', subsequent to both arrests, that is T + 2. S9 can be considered subsequent again, therefore T + 3.

This is a comparatively simple time structure, as even a short news story can easily involve ten or more actions in non-chronological order, as we will see in a later example. This story is also unusual in not leading with the most recent event, perhaps because of the staticness of 'held' that I noted earlier. But we can also note that the headline *does* in fact major on the most recent event – the detention of the two suspects. There has thus been a difference of opinion over what constitutes the central news event in this story. The journalist who wrote the story, including the original lead, thought it was the raid. The copy-editor who edited it and wrote the headline thought it was the detention of two suspects. Such disagreements are a common locus of newsroom anguish.

Because time is such an important element in news stories and merits more discussion and illustration, I will return to it below with examples where it plays a more important role.

12 Background

The category of background (cf. figure 3) covers events prior to the central action of the story, and may include either recent past events or more remote history. This story contains no background.

13 Commentary

Commentary concerns context, evaluation or expectations for events that are happening. In this story we have already noted the evaluative comments concerning foiling an IRA blitz (S1, headline), and the assessment of the significance of the security services' discoveries (S3). In addition, there is context given about the Prevention of Terrorism Act (S4), which spells out (S9) the provisions under which the suspects can continue to be detained.

14 Follow-up

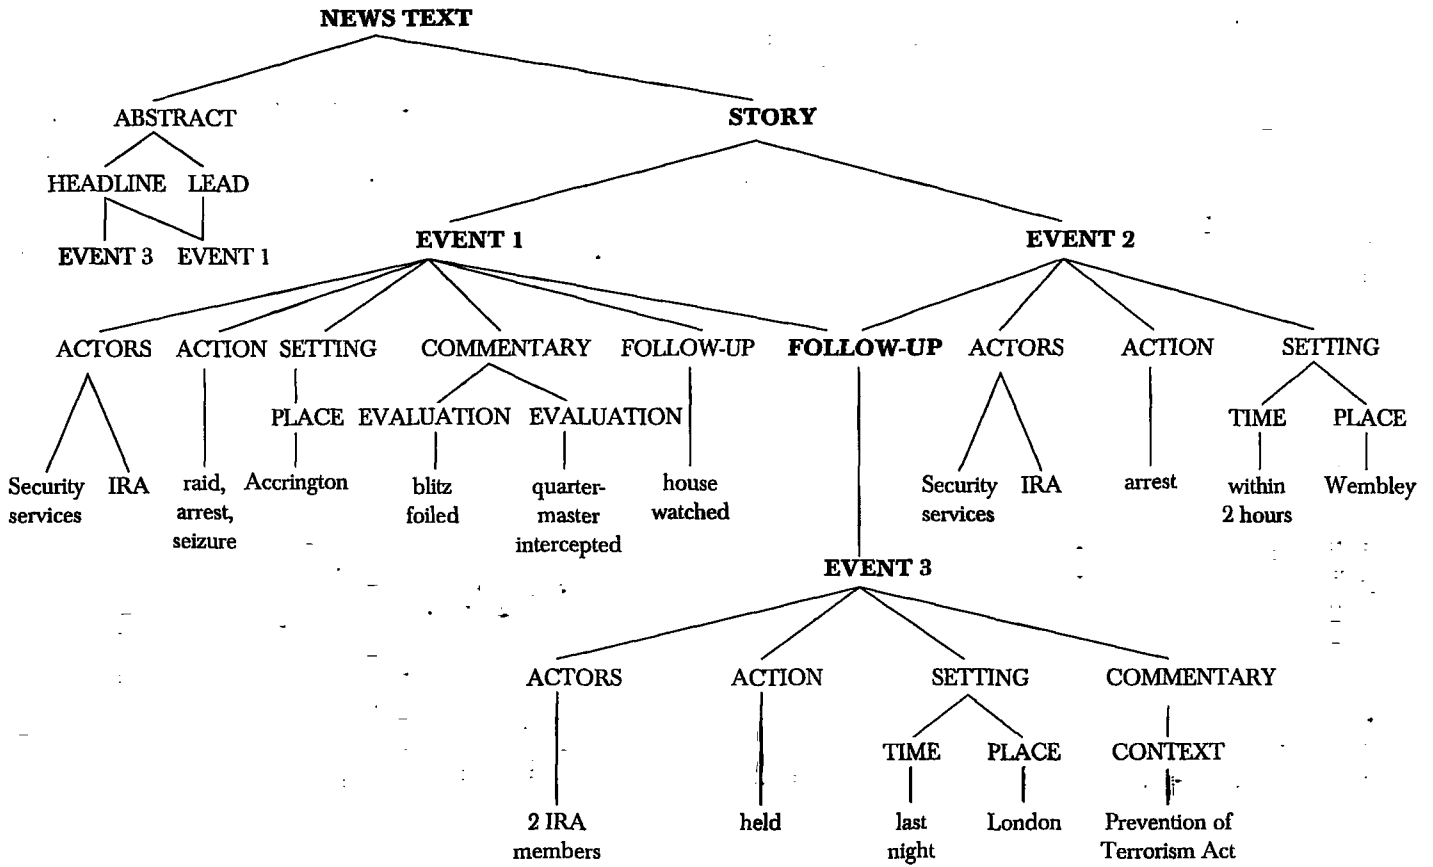
If we take the raids to be the central event of the story, then the detention of the two suspects counts as follow-up to that event. Follow-ups commonly become the lead in subsequent stories, and we have noted already that the headline (written later than the story, of course) tends in this direction.

15 Event Structure

We have noted the ambiguity and lack of clarity in the *who* and the *where* of this story. The left side of figure 4 shows the event structure as best I can judge it. Usually it is *time* that is the problematic factor in understanding what happened in a story. In this case it is the place structure which is the more confusing, and to a lesser extent the identity of the news actors, because it is by no means clear which place is referred to in different parts of the description – Accrington or Wembley. Table 1 schematizes this event structure, linking action, actors, place and time for each event.

Table 1: Event structure of IRA story (figure 4)

Event		Sentence	Actors	Place	Time
1	Raid, arrest, seizure	Headline S1, 2, 3, 5, 6, 8	Security services, IRA	Accrington	0 +2
2	Arrest	S7 (S1? 2? 3?)	Security services, IRA	Wembley	+1 Within 2 hours
3	Detention ('held')	Headline S4, 9	2 IRA members	London	+2, +3 Last night



16 Discourse Structure

Figure 5 diagrams the discourse structure of the story in accordance with the interpretation I have offered, again omitting some of the detail so that an already complex diagram does not get more complicated still. The neatness of the eventual tree should not disguise the fact that it presupposes a series of (albeit increasingly refined) rough drafts. Event 3 is placed as a follow-up to both events 1 and 2. The constituents of each event are the straightforward ones of actors, action and setting, plus commentaries and follow-ups.

If we take other interpretations of the ambiguous information in the story, it will mean shifting some constituents to other points of the diagram. So, if we understand the 'blitz foiled' comment as applying to both the Accrington and Wembley raids, we will attach that Evaluation to both events 1 and 2 (or possibly to the Story as a whole). If we decide the quartermaster was the Wembley suspect rather than the Accrington one, we will re-attach that Evaluation to event 2.

17 Cohesion

News stories are standardly written as a series of one-sentence paragraphs, and commonly express little linkage between the sentences. With each news sentence usually also its own paragraph, there is no larger unit of text organization. There is routinely no flow of time sequence from one sentence to the next, and a lack

gure 5: Discourse structure of IRA story in figure 4

of devices such as adverbs expressing linkages between sentences. It is common for cohesion between sentences to be unclear or non-existent, and we may be genuinely doubtful what actions within the story belong together, at what point location actually shifted, or what material is attributed to whom.

It is the lack of such signposting, together with the mix of locations, that contributes to the ambiguities of this story. In the absence of any indications to the contrary, we would normally take S1–3 to be describing a single set of happenings, although there are no explicit linkages to mark this. Things become clearer after S4 where links are expressed: 'one' at the start of S5 links the news actor back into S4, and 'the suspect' in S6 continues the thread of reference. The signposting in S7 equally clearly indicates that this is a different event – 'another man' in another place at another time. However, the jump back to Accrington again in S8 is rather disconcerting to a reader.

18 Confusion

I have noted a number of points where it is unclear, ambiguous or confused what actually happened in this story, to whom, and where. To list these as questions (such as a journalist doing a follow-up story might ask a source):

Were the two arrests part of a single operation or coincidental? (S1)
Which arrest did security forces consider represented a 'foiled IRA blitz'? (S1)
Was Semtex recovered at Wembley as well as Accrington? (S2)
Was the Accrington or the Wembley suspect the quartermaster? (S3)

The grounds for confusion in this story are possible because of the lack of cohesion and specific reference across the story. This is commonly a source of problems for accuracy of both reporting and understanding. In a study of reporting of climate change (Bell, 1994), I found that the practice of not expressing cohesive links between sentences of a story enabled one journalist to refer alternately to the greenhouse effect and ozone depletion between successive sentences of a story in a way that seriously confused these two basically distinct atmospheric phenomena.

The packaging of the two raids in one story implies that they and the suspects were closely linked. However, we are told so little about the Wembley arrest that we cannot be sure of this. In fact, when we examine the role of the security services as news actors in the story, 'police' are twice specified in relation to Accrington (S6, S8), but MI5 are mentioned only generally in the lead sentence. It seems possible that Accrington involved only the police, Wembley involved only MI5, and the timing was coincidence rather than a single operation. This unclarity of reference in fact serves to enhance news value through co-option of a minor story into a bigger story (Bell, 1991). One reading of the story is that most of the serious action is linked to Accrington, and very little to Wembley. The ambiguity of reference therefore enables the Wembley event to be co-opted to the Accrington raid, building it into more than it would be just on its own – when it might not have been reported at all.

The detailed analysis I have run through in this section has shown us a good deal about the character of this story – indications of how it was made, evidence of inconsistencies and gaps, and manifestations of the news values behind it. We can see the claims it makes to be newsworthy mainly in the negativity of its content – in the presence of conflict, discoveries of weapons and explosives, use of force – together with involvement of elite news actors (the security services), co-option of possibly separate stories to reinforce each other, reduction of ambiguity over the significance of the arrests, and possibly enhanced immediacy.

The journalist's own ultimate abstract of a story is the one-word 'slugline' by which each story is identified in the news processing system – now in practice also presumably the filename under which the story is saved in the computer. The slugline is often a good guide to news value, and it is instructive to speculate what slugline a particular story might have carried. The likely candidates on this example story seem to me to be: 'swoop', 'blitz' or 'foiled'.

5 News Time

Time, as we have seen in the analyses so far, is an important dimension of news stories and merits more discussion in its own right. Time is expressed in stories at different levels of language – in the morphology and syntax of the verb phrase, in time adverbials whether lexical or phrasal, and in the discourse structure of stories above the sentence. One characteristic of all kinds of stories appears to be so shared across genres and cultures that it has been called 'canonical' – events tend to be told in the chronological order in which they occurred.

Time in story has interested widely different groups of scholars (Toolan, 1988) – literary theorists, and cognitive psychologists researching discourse comprehension, as well as text and discourse linguists. Literary theory tends to treat chronological order as the unmarked or basic form underlying fictional narrative, and identifies the time structure of a novel as interesting just where it departs from chronology. Genette's general theory of narrative discourse (1980) developed in relation to Proust's *A la recherche du temps perdu* is primarily devoted to time. Time order is his dominant category, analysed in terms of 'anachronies' – departures from chronological sequence. Cognitive psychologists make the distinction between *event structure* and *discourse structure* (Brewer, 1985) – between the order in which events actually happened and the order in which they are told in a story (my own framework above allows for an event structure in discourse which is non-chronological). There is only one real-world event structure but many possible discourse structures. The chronological is apparently the 'natural' order because it matches its discourse structure to the event structure.

Fairy stories are typical – even archetypal – of the canonical time ordering of stories. So, in 'The Three Little Pigs':

> The first little pig meets a man carrying straw, buys the straw, and builds a house out of it. The big bad wolf comes, huffs, puffs, blows the house of straw down and eats up the pig.

The second little pig meets a man carrying sticks, buys the sticks, builds a house, and ends up getting eaten too by the wolf.

The third little pig meets a man carrying bricks, . . . etc.

But the wolf fails to blow the brick house down, the pig puts a pot on the fire to boil, the wolf climbs down the chimney to get at the pig, but instead gets boiled for dinner.

End of story.

Analysis of a Story's Time Structure

News is by nature time-bound – it is a perishable commodity. Time is a defining characteristic of the nature of news, a major compulsion in news-gathering procedures, and an influence on the structure of news discourse. Figure 6 shows the text of a typical agency story, as published in Wellington's *Evening Post* newspaper. The time structure of the story's events is listed down the right-hand side. Time zero is the story present, the time of the lead event in the lead sentence. Times prior to this are labelled Time –1 for the event immediately preceding, moving back up to Time –6 in this story, the earliest occurrence in the reported background. The story also reports on events subsequent to Time 0, labelled Time +1 (the diagnosis), and so on. Here I report only briefly for illustrative purposes on a more detailed analysis drawn from Bell (1995b).

The lead sentence covers three temporally and causally sequential events, but in reverse chronological order. The result (Higuchi's departure to hospital) precedes cause (hunger strike), which itself precedes prior cause (disqualification from elections). They are linked by temporal expressions, usually *after* for a sequence as in examples 2 and 4 of the single-sentence stories analysed earlier, or *as* for simultaneous events (as in the headline in figure 4). The temporal expressions commonly imply a causal link, even though this may not always seem warranted.

In figure 6, Time Zero is explicitly identified in the lead sentence – 'today' – with other earlier or later time points signposted in the later sentences. Some of the time references situate events in calendar time (*since August* in S6), others in relation to each other (*just 24 hours after* . . . in S1, *earlier* in S3), still others are deictic with the present as reference point.

Labov found that a defining characteristic of personal narrative as a form is the temporal sequence of its 'clauses'. That is, the action is invariably told in the order in which it happened, what I have labelled canonical order – 'matching a verbal sequence of clauses to the sequence of events' (Labov, 1972: 360). News stories, by contrast, are seldom if ever told in chronological order. The time structure of the story in figure 6 is very complex, with nine points in time identified in the analysis. The story as a whole divides into three sections: S1–2, S3–5, S6. The lead sentence alone covers three events and times, as we have seen. Each of the three sections represents a cycle through events taking us further back in time, presenting in reverse order of actual occurrence (plus a couple of excursions into story future time) the chain of events which have culminated in the lead

TIME		STRUCTURE
Protest cut short		
S1	Lima, Jan 18. – The estranged wife of Peru's President Alberto Fujimori was taken to hospital today just 24 hours after she began a hunger strike to protest at her party's elimination from congressional elections.	0 –2 –3
S2	Doctors said she was suffering from tachycardia, or an accelerated heartbeat.	+1
S3	Earlier, [deposed first lady Susanna] Higuchi, sitting under an umbrella in a scorching summer sun outside the National Electoral Board's headquarters, had pledged to press on with her protest.	–1
S4	The electoral board said on Monday Higuchi's Armonia-Frempol party had not qualified for the April Congressional vote because it failed to present a full list of candidates for the 120-member legislature.	–3 +2 –4
S5	Board member Manuel Catacora said today that since Higuchi had presented her party's congressional slate just 10 minutes before the filing deadline, a provision allowing parties five days to correct any error did not apply.	0 –4 0
S6	Higuchi, a 44-year-old civil engineer, has been estranged from Fujimori since August when she protested an election law that banned her from running from [*sic*] public office. – Reuter	–5 –6

Figure 6: International news agency story as published in the *Evening Post*, Wellington, 20 January 1995 (reproduced by permission of Reuters)

event of this story. The earliest events are reported last of all, with the final sentence describing events from some six months previously which are the antecedents to the present occurrences.

In the body of the story, perceived *news value* overturns temporal sequence and imposes an order completely at odds with linear narrative. It moves backwards and forwards in time, picking out different points on each cycle or giving more detail on previously mentioned matters (S4 and S5). This violation of our expectations that narratives usually proceed in temporal succession is a distinctive feature of news stories – the inverted pyramid structure. Van Dijk has called this the instalment method (1988b: 43), by which an event is introduced then returned to in more detail two or more times. The radical discontinuity of time between sentences imparts a general lack of syntactic, semantic and discourse cohesion

within the news story, as we have seen in the figure 4 IRA story. The reverse-chronological structure has a direct pay-off (and in part doubtless an origin) in journalistic practices – stories are routinely cut from the bottom up to fit into available space. The important information must therefore come as early as possible, and the story should be capable of ending at any sentence. So, in the IRA story, at least the last two sentences could be cut without affecting the earlier part of the story (for more discussion of this question, see Bell, 1991).

Earlier Forms of News Telling

As news consumers we are so accustomed to this approach that we forget how deviant it is compared both with other narrative genres and with earlier norms of news reporting. Figure 7 shows a story from the *New Zealand Herald* of 11 June 1886. It reports the eruption of Mount Tarawera, a volcano located some 200 km to the south-east of Auckland, where the *Herald* is published. The eruption caused significant loss of life and reshaped an extensive area of the New Zealand landscape.

It is a typical disaster story which would run in any modern newspaper, but here it is narrated in absolute chronological order. Events are told from the viewpoint of the readers in Auckland – first hearing the sounds of the distant eruption and speculating on their cause, then eventually receiving the news of the real cause. Where the historical story begins at the beginning, the modern lead sentence would run something like this:

> 'Mount Tarawera erupted last night killing at least 30 people and sending hundreds more fleeing . . .'

Research on the development of modern news narrative style indicates that the inverted pyramid structure developed in American journalism at the end of the nineteenth century. Schudson (1982, 1989) found that until the 1880s, stories covering presidential State of the Union addresses did not summarize the key points at the beginning. However, by 1910 the lead as summary was standard.

> AT an early hour on Thursday morning a noise as of the firing of cannon was heard by many Auckland residents.
>
> From the continuousness of the firing, the loudness of the reports, and the apparent occasional sound resembling salvoes of artillery, many people both here and at Onehunga were under the impression that a man-of-war, probably the Russian Vestnik, had run ashore on the Manukau bar and that these were her signals of distress.
>
> Vivid flashes, as from the firing of guns, were also seen both at Onehunga and also from the cupola of the Herald Office, which served to almost confirm the impression that there had been a marine disaster. At about 8.30 a.m., however, it began to be circulated about town that a

catastrophe, far surpassing in horror even the most terrible of shipwrecks, had taken place.

The first news was, through the courtesy of Mr Furby, the officer in charge of the telegraph department, issued by us in an extra and consisted of the following message, sent from Rotorua, by Mr Dansey, the telegraphist there, who manfully and bravely "stuck to his instrument" in the face of the most dreadful danger:

"We have all passed a fearful night here. At 2.10 a.m. there was a heavy quake, then a fearful roar, which made everyone run out of their houses, and a grand, yet terrible, sight for those so near as we were, presented itself. Mount Tarawera suddenly became active, the volcano belching out fire and lava to a great height. A dense mass of ashes came pouring down here at 4 a.m., accompanied by a suffocating smell from the lower regions.

"Several families left their homes in their nightdresses with whatever they could seize in the hurry, and made for Tauranga. Others more lucky, got horses and left for Oxford."

Figure 7: News as chronological story: *New Zealand Herald*, 11 June 1886

News Time and News Comprehension

The discontinuous, non-chronological nature of the time structure of contemporary news stories invites the question of how well readers and hearers understand them. Introducing their study of narrative comprehension, Ohtsuka and Brewer (1992: 319) state: 'If the reader is to comprehend a narrative text, the reader must be able to derive the underlying event sequence from the given text sequence.' If this is strictly so, then it has dire consequences for the comprehensibility of news. The example analyses in this chapter show it takes considerable effort for the academic analyst – let alone the casual audience – to unravel the time structure.

Psychological research on the comprehension of narratives[1] has illuminated both the time structures of different kinds of stories, and the effects which different orderings have on audiences' comprehension. Ohtsuka and Brewer (1992) found that readers understood the canonical/chronological version of a story most easily. There was a significant drop in comprehension level for a second version of the same story which was presented in directly reverse chronological order, and for a third version which told some of the events using flashbacks. A final version contained 'flashforwards' which could not be immediately related to what had already been narrated, and here comprehension was little better than chance.

Relating these principles and findings to news stories, we can see that while the canonical/chronological pattern is not used in modern news, nor is the backwards pattern used in its pure form of telling an entire story from last event

Flashback appears to be the staple time structure of news stories, and this is abundantly evident in the stories examined in this chapter.

The findings to date on comprehension of news stories are equivocal on whether the non-linear time sequence of standard news writing is in fact harder to comprehend, or whether chronological order is easier. Lay readers clearly have some ability to reproduce news formats. Lutz and Wodak (1987) tested the form in which subjects retold news stories, asking them to write a lead sentence themselves. They found that most middle-class students reproduced a standard, reverse-chronology news format. But while some lower-class informants included much of the desired information, their retellings did not follow news style.

In another study, Duszak (1991) had readers reconstruct the randomized sentences of a news story. Most identified the lead sentence correctly, but there were two relevant tendencies in how they ordered sentences after the lead. Informants appeared to be avoiding the radical discontinuousness of news formats by grouping apparently cohesive sentences together. And they tended to reassemble events in a more chronological order than the original had, for instance putting background material earlier in the story rather than at the end. It seems that readers have a default strategy by which – in the absence of cues to the contrary – they re-impose chronological order on events in the discourse. Duszak rightly interprets this as a 'powerful drive' to retell events chronologically, clashing with readers' knowledge of the ordering promoted by news schemata.

More research is needed on the effects of time structure on news comprehension. The hypothesis that the non-canonical news format does adversely affect understanding is a reasonable one on the basis of comprehension research into other narrative genres, but the degree to which familiarity with news models may mitigate these problems is unclear.

Brewer hypothesizes that certain discourse genres are particularly intended for comprehension. In these, 'the order of events in the discourse will map the order of the underlying events' (Brewer 1985: 187) – that is, they will be written in chronological order. Among the genres supposedly designed for comprehension he explicitly and rightly includes news stories – with no comment on the fact that news stories virtually never follow the easily comprehensible canonical order. They consist of series of flashbacks, flashforwards and reverse tellings which, when they are used in films or novels, challenge the audience's powers of decoding.

So why do journalists write in an order which we know to be less easily comprehended, when one of their declared goals is reader comprehension? Ohtsuka and Brewer (1992: 331) ask the same question of non-chronological orderings in any kind of narrative: 'why don't authors always write texts in canonical form?' Their answer is that authors have purposes – and narratives have functions – other than just comprehension. They serve to entertain and persuade, for example. With news stories, however, the question is especially sharp, because comprehension by the audience is one of the main explicit aims of news writing. The answer lies in a marriage of journalistic values, journalistic practices and technological development, which is strong enough to overturn the drive to comprehensibility.

The values of media control the way in which news is presented. We can account for the way news stories are structured only with reference to the values by which one 'fact' is judged more newsworthy than another – and so more worth remembering and understanding. In particular the value of immediacy, as we have seen, is a powerful force in news discourse. The reason for this is the dominating role that time plays in the practice of news-work (Bell, 1995b). Time rules news-work in a way it does few other professions: the product must be finished by a set time or it is useless. Schlesinger's study of BBC newsroom practices rightly characterizes news-work as 'a stop-watch culture' (1987: 83). Newsrooms operate against the clock, measuring daily achievement by the ability to produce a required number of stories for the deadline. The drive to get the news first is embedded deep in the news ethos, and radically affects the structure of the news text – to the extent of motivating attempts to disguise the age of news which is less than fresh. These work practices both drive and are reinforced by technological development. From the invention of the telegraph, which gave rise to modern news coverage as we know it, to the presentation of live news as it happens through the satellite and the cable, innovation in technology has been aimed at reducing the time between the occurrence of a news event and its telling.

6 Conclusion: Application and Applicability

The detailed analysis of news stories presented in this chapter has told us a lot about the character of the stories – indications of how they were made, evidence of discrepancies and gaps, and manifestations of the news values behind them. There is considerable pay-off from a comparatively straightforward discourse structural analysis of this kind. It can open up a subtext of the news, for instance of implied linkages which may not stand up to scrutiny. It can lead us closer to 'what the story actually says happened'.

In the IRA story, for example, we have been able to infer a good deal about its production and potential reception as well as about the text itself. We have seen the joins between the different input texts that have gone to make this one story; the divergent local and international readerships at which these inputs were targeted; and the conflicting views held by journalist and copy-editor over what was really the story in these events. We have noted the unspecificness of much of what we have read, reflected in alternative possible discourse structures for the story, which make it impossible from this text alone to determine exactly what were the persons, places and events involved. We have seen how the routinely jumbled time structure and lack of cohesion between sentences has served to make some things unclear, and looked at some of the repercussions that may have for comprehension of news stories. We have been able to assess the validity of the headline, and the reliability of evaluations put forward in the story.

It is particularly salutary how our specification of events, persons and places changed as the analysis moved further down the story. The interpretation based only on the headline and lead was rather misleading. If this had been a single-sentence story of the kind analysed earlier in the chapter, the level of unclarity and ambiguity would have remained very high. Projecting this experience back on to the earlier examples, it seems likely that the interpretations I offered of their event and discourse structures would be proved quite mistaken if we had access to the full text of the stories from which they have been cut.

The system of analysis I presented in the Guide earlier covers most of what we might want to know about a story's discourse structure, but there are other questions we might ask in relation to it, such as:

- What vocabulary is used in the lead to claim news value for the story? What is the order of sentence constituents within the lead? What news values lie behind that order?
  Is there a conflict between the journalist's goals of brevity and clarity in the lead?
- What figures or similar 'hard facts' does the story contain? How does the story use these to buttress its news value?
- How much of the story consists of talk? What kind of talk – statement, accusation, reaction, announcement?
- What are the news values which have made this a published news story?

The analytical framework concentrated on the journalist's five Ws and an H. But it is significant that two of those did not figure explicitly – 'how' and particularly 'why'. 'How', of course, is in many ways represented as the detail of 'what', but 'why' is not overtly addressed in the IRA story – or in many others. It is no accident that Carey characterizes 'how' and 'why' as the 'dark continent' of journalism (Carey, 1987; cf. Bell, 1996). Secondly, while there is good insight to be gained from an understanding of a profession's own understanding of its work (Manoff and Schudson, 1987), it must not be forgotten that such categories should themselves be subjected to analysis and deconstruction.

The analytical work involved in this framework is not small. The demand is in fact a true reflection of the real complexity of texts such as news stories, which sometimes appear deceptively simple. In doing such work, it is essential to move systematically, picking off the analysis point by point.

Yet while we need to be selective in our analyses and know what is an appropriate point to cut off at, it is evident to me that many of the insights yielded come only near the end of detailed work following a pattern such as that outlined in the analysis Guide. Because the analyses are time-consuming if undertaken at all comprehensively (cf. van Dijk, 1991: 10), we need to complement full-scale work on a few texts with more piecemeal, specific analyses on larger samples. But the reward of such work is a better knowledge of what the stories of our time are saying, and an understanding of the way they may be produced and received.

Notes

This chapter is in large part the fruit of a fellowship I held in 1994 at the Centre for Language and Communication Research, University of Wales Cardiff. So also was the idea for the Cardiff Round Table as a whole and this publication of a range of approaches to media discourse. I am grateful to the Centre – and particularly to its Director, Nikolas Coupland – for support and warm hospitality on that and later occasions. During the fellowship, I taught a course on news language and discourse, and much of the present chapter grew from that material and experience. I work normally as a researcher and journalist rather than a teacher, and it was salutary how hard the students found it to understand and apply these analytical approaches. This was the main motivation behind the Round Table meeting and this collection. I am greatly indebted to co-editor Peter Garrett for the encouragement and insight he brought to my chapter and to the book as a whole.

1. In this section, I report at second hand the findings of other researchers on story 'comprehension' which are relevant to my concern with temporal order. This begs methodological and theoretical questions that are beyond my scope to address in this chapter – such as the relationship between recall and comprehension, and between written and oral channels, and the dynamic way in which audiences interpret meanings in everyday life. Compare Richardson's and Allan's chapters in *Approaches to Media Discourse* (1996).

Crossing Genders, Mixing Languages: The Linguistic Construction of Transgenderism in Tonga

Niko Besnier

1 Introduction

This chapter takes as point of departure three seemingly unrelated developments in social and cultural anthropology. The first concerns recent rethinking of anthropological approaches to gender as a social and cultural category. Heralded by feminist anthropologists in the last decades of the twentieth century, this shift is spurred on by the insistence that gender (and, by implication, all other social categories) is always embedded in a complex maze of other social divisions that criss-cross all social groups: social class, race and ethnicity, religious identity, age, sexuality, citizenship in its various manifestations, position in structures of production and consumption, and so on. On both large-scale dimensions and in microscopic fashion, all aspects of social identity and dimensions of social difference can potentially inform or even determine the meaning of gender, dislocating sameness where it is least expected, and potentially establishing connections between surprisingly distinct categories, persons, and entities. A corollary to the recognition of the inherently embedded nature of gender is the assertion that "all forms of patterned inequality merit analysis" (di Leonardo 1991: 31), and that such analysis is the *sine qua non* of an anthropological coming-to-terms with the meaning of gender.

The second development I am concerned with arose with the increasing malaise among anthropologists, also characteristic of the 1980s and 1990s, with the tacit equation of culture with place, and the continued assumption that social

Source: Janet Holmes and Miriam Meyerhoff (eds), *Handbook of Language and Gender*, 2003, pp. 279–301.

groups could simply be defined in terms of geographic co-presence. Appadurai (1996), among others, demonstrates that locality is a problematic category for an ever-increasing number of people, for various possible reasons: place (of origin, affective ties, residence, etc.) may not be a singular, well-defined entity, as is often the case of the migrant. Place of origin may be a site of violence and horror, which is best erased from memories and daily lives, as in the case of refugees from civil wars and genocidal situations (e.g. Daniel 1996; Malkki 1995). Alternatively, place can have shifting, context-bound characteristics that vary with persons and contexts (Gupta and Ferguson 1997; Lovell 1998). Consequently, as Marcus (1995) argues, the age-old pattern of anthropological fieldwork that objectified "the Other" in distant lands is giving way to a more dynamic, "multi-sited" pattern of research, in which the ethnography "follows" persons, objects, or metaphors as they travel across geographies and histories.

The third anthropological preoccupation I invoke is the effort to come to grips with the various forms and meanings of modernity. Modernity, the condition of experience associated with capitalism, industrialism, consumption, and other characteristics of life in "the West," has long occupied a privileged if backstaged place in anthropology and the social sciences. At its inception, anthropology was defined as the study of what modernity was not; even recently, much work in anthropology continued to tacitly assume an unproblematic contrast between modernity and traditionalism (Spencer 1996: 378–9). However, recent thinking has unsettled the facile dichotomy between tradition and modernity, demonstrating, for instance, that the two categories are mutually constitutive, and that forms of tradition and forms of modernity are commensurable in many contexts. Furthermore, neither tradition nor modernity is a unitary condition: there many forms of modernity (as illustrated by the "alternative modernity" of Japan, for example) and, as Comaroff and Comaroff point out, "[n]or should this surprise us. With hindsight, it is clear that the cultures of industrial capitalism have never existed in the singular, either in Europe or in the myriad transformations across the surface of the earth" (1993: xi).

In this chapter, I explore how these various strands of thinking can be tied together, and inform concerns of language and gender. I explore the role of language use in constructing gender in the context of an investigation of how other social and cultural categories define gender. For example, men and women in many societies have different interests (in the various senses of the term) in "tradition" and "modernity," in the maintenance of the status quo or the emergence of new social arrangements, and language behavior and ideologies are often constitutive of these differing investments. In this project, I take gender not as a given, but as potentially emerging out of conflict and negotiation between members of a society, conflict and negotiation in which language plays an important role.

The empirical basis of my discussion is an ethnographic examination of the lives of transgendered males in Tongan society. Like all larger societies of the Polynesian region (Besnier 1994), Tongan society counts in its ranks a substantial number of men who "act like women," a category that Tongans refer to variously as *fakaleitī*, *leitī*, or *fakafefine*. The first term is the most commonly heard at this moment in history; it is a lexical compound made up of the ubiquitous polysemic

prefix *faka-*, which in this context means "in the manner of"; *leitī* is borrowed from the English word "lady," which is only used to refer to transgendered persons (i.e. never to female "ladies"). Transgendered Tongans prefer the unprefixed version of the term to refer to themselves, arguing somewhat tongue-in-cheek that they are not *like* ladies but they *are* ladies (I explore additional reasons for the preference of the shorter word in Besnier 1997: 19–20). The last term, *fakafefine*, literally "in the manner of a woman," is slightly old-fashioned, but it is readily understood because its meaning is transparent from the sum of its parts.

In the discussion that follows, I first introduce Tongan society as a diaspora scattered widely in the Pacific Rim, whose center of gravity is an independent nation-state coterminous with a group of islands in the Southwestern Pacific, the Kingdom of Tonga. I briefly describe the sociocultural meaning of the two principal languages spoken by members of this diaspora, Tongan and English, a meaning which is undergoing rapid change as expatriate Tongans in New Zealand, Australia, and the United States increase in number and prominence. I then turn to the position of *fakaleitī* in Tongan society, which I show to be varied and full of inherent contradictions. I demonstrate that English has become a trademark of *fakaleitī* identity in the islands, as it encodes a cosmopolitanism and modernity which many *leitī* find useful to foreground in their daily lives. However, this trademark has a price, in that many *leitī* are not fluent in English and most do not have access to the material means of backing claims of cosmopolitanism with tangible tokens of it. In addition, mainstream society can utilize the claims associated with the use of English to dislocate *leitī* from the local context and further marginalize them.

2 Tongan Society as a Diaspora

The fieldwork on which this chapter is based was conducted principally in the capital of Tonga, Nuku'alofa. However, the Tongan diaspora figures prominently in all aspects of the economic, social, and cultural life of the island society, and its importance continues to increase, despite efforts from some quarters to contain and minimize it. As a nation-state and an island-based society, Tonga therefore cannot be considered independently of overseas Tongan communities. Altogether, about 150,000 persons claim Tongan descent, of whom about 97,500 reside in the archipelago, a loose clustering of 150 islands, 36 of which are permanently inhabited. Overseas Tongans live principally in Auckland, Sydney, the San Francisco Bay Area, urban Southern California, and Salt Lake City, but there are small groups of Tongans or single individuals just about everywhere in the world. The size, diversity, and importance of the diaspora is particularly striking in light of the fact that significant emigration only began in the 1970s.

Tongans are Polynesians, and their society has been one of the most stratified and politically centralized of the region since its early-nineteenth-century unification under the rule of a sacralized king. A British protectorate between 1900 and 1970, Tonga is today an independent state. State and society are both founded on a marriage between selected aspects of a purported tradition and selected

aspects of a version of modernity (Philips 2000: 235–6). For example, the State is "the only remaining Polynesian kingdom" and an upholder of Christianity, features that Tongans consider to be illustrative of timeless tradition, while also emphasizing the fact that Tonga is an economically forwardlooking entity, a symbol of modernity. However, different elements of society and the State may differ on key points as to which aspects of tradition and which aspects of modernity should be made relevant to Tonga: for example, parliamentary representation and the scope of the nobility's political power are topics of acrid debate, particularly since the emergence of a Tongan Pro-Democracy Movement in the 1980s (Campbell 1992: 218–22). Those in power view dissenting voices as signs of an undesirable modernity, often associating them with the diaspora.

Despite rapid increases in the Tongan populations of cities such as Auckland, the most important urban centre for Tongan society continues to be Nuku'alofa, the capital of the nation-state, inhabited by about 25,000 people, many of whom have moved there from rural areas of the country in the last few decades. Nuku'alofa is the prime destination of overseas Tongans' visits to the island kingdom, in part because its international airport is the most important point of entry into the country from Hawaii, New Zealand, Australia, and Fiji. It is the venue of most national celebrations, including ceremonies relating to kingship, government, and nationhood (e.g. coronations, important funerals, and yearly festivals of culture). Nuku'alofa is the focal point of both the rest of the nation and the diasporic dispersion. It serves as the point of convergence for most of the intensive flows of goods, money, and people that keep the diaspora together.

In the context of the rapidly increasing transnationalism of their society, many Tongans see the maintenance of a quality of "Tonganness," as well as the very definition of this quality, as areas of concern (Morton 1996; Small 1997). Tongans refer to this quality as *anga faka-Tonga*, "behavior in the fashion of Tonga," or, when speaking English, "the Tongan way," echoing comparable phrases used in neighboring societies. The quality is concretized most forcefully in high culture, including the performing arts, the manufacture and exchange of *koloa* "valuables" (tapa-cloth and mats), ceremonies affirming hierarchy and kinship, and of course language. However, Tongans often invoke *anga faka-Tonga* when referring to culture in the broader anthropological sense, particularly when the context calls for a contrast between locality and extralocality. For example, overseas Tongans and locally based but cosmopolitan Tongans lay claims on "Tonganness" that other Tongans sometimes challenge (Morton 1998). "Tonganness" is deeply tied to place, but in potentially conflicting ways.

3 Tongan and English

The tensions associated with the definition and maintenance of local identity and related dynamics are perhaps most clearly enacted in the competition between the two principal languages utilized in Tongan society, Tongan and English. Just about everyone in Tonga knows at least rudiments of English, which is a prominent language in schooling and even, in the case of a few schools, the

only language of instruction. However, Tongans vary widely in terms of their fluency in English and the degree to which they feel comfortable speaking and writing English. Both fluency and readiness to speak English (which are not necessarily coterminous, as I will illustrate presently) depend on an aggregate of factors closely linked to the structuring of social inequality in Tonga. First, English is a prestige language, as elsewhere in the Pacific where it is the main post-colonial cosmopolitan language: linked to a colonial past, it dominates contexts of employment, education, modernity, transnationalism, contacts with the external world, and new forms of socio-economic hegemony such as entrepreneurship. Elite Tongans of either rank or wealth are more likely than non-elite Tongans to have resided in English-speaking countries under favorable circumstances (pursuing their education or visiting, for example), and therefore generally have had more opportunities to become fluent speakers of English. They are also intimate with the privilege and cosmopolitanism that English indexes.

In contrast, most non-privileged Tongans are often reluctant to speak English, ostensibly, according to explanations offered, because they fear making linguistic errors. In practice, their reluctance is not so much a matter of defective grammatical competence, but of not having the social self-assurance to assert oneself credibly as a privileged, modern, and cosmopolitan person without fearing shame (*mā*) and exposing oneself to ridicule.[1] While many non-elite Tongans have resided overseas, they have invariably been employed in menial job contexts, in which communication with native speakers of English is confined to job-related topics (e.g. understanding directives). In Tongan communities in cities such as Auckland and the San Francisco Bay Area, the life of many less-than-privileged first-generation migrant Tongans continues to be predominantly Tongan-centered and Tongan-speaking. As is the case of many migrant communities, it is only the overseas-born generation that acquires fluency in the dominant language.

The association of English with privilege is not unmitigated, for at least two reasons. First, most Tongans exhibit a high degree of allegiance to their own language. It is not uncommon to hear Tongan being used as an everyday tool of resistance to the hegemony of English. For example, it is used widely in the workplace, however steeped this workplace may be in the English language and associated symbols. In Nuku'alofa streets, youngsters do not fail to crack loud jokes in Tongan at the expense of any foreigner (*Pālangi*) they pass, whom they assume not to understand the language. But the prestige of Tongan is also asserted in contexts where English is not a competing code, as in oratory, ceremonialism, and song-and-dance concerts, and thus it is not solely associated with resistance.[2]

Second, there are contexts in which people use English widely without access to the material resources to "justify" their code choice, and without any obvious fear of shame either. One example is the very popular Nuku'alofa flea market, where English is a common medium among sellers and often also customers. What is interesting, though, is that the flea market is also one of the most visible local sites of modernity and transnationalism, for several reasons. Most simplistically, the goods sold (principally second-hand clothing) are from overseas, and thus the market is a place where people go to buy the product of transnational

links. In addition, socially marginal groups and "local Others," that is, persons who are already marginalized because of their non-mainstream religious affiliation or lifestyle (e.g. Mormons, Charismatic Christians, entrepreneurs), are overrepresented among the sellers. Furthermore, the act of selling, particularly secondhand objects, flies in the face of the "traditional" order: in the "Tongan way," selling used items makes others suspect that the sellers are so poor that they are forced to sell their possessions, a state of substantial *mā* "shame." However, sellers whom I interviewed described with pride how they had overcome the strictures of traditionalism and become modern persons, a process that some attributed to their religious affiliations.[3] The prominence of English and the modernity that suffuse the flea market are thus not coincidental, and they indicate that Tongan and English are embroiled in potentially complex structures of competing prestige, along with the categories with which each language is associated, a theme which will figure prominently in the analysis that follows.

4 *Leitī* in Tongan Society

It is impossible to come up with a precise definition of who a *fakaleitī* is in Tongan society, for the same reasons that defining "man" or "woman" in any social context is neither feasible not fruitful. As for all social categories, one cannot isolate a set of necessary and sufficient conditions to determine who is a *fakaleitī* and who is not. Nevertheless, stereotypes abound, as they do wherever a marginalized minority is concerned in all social groupings. One can therefore utilize these stereotypes to provide a working definition of the category, bearing in mind at all times that they are stereotypes, and hence that they are prone to distortions, underlain with covert moral judgments, and subject to socio-political manipulation.

Mainstream Tongans stereotypically associate a *fakaleitī*'s presentation of self with a "feminine" comportment (e.g. emotional way of talking, an animated face, "swishy" walk). In domestic or rural settings, *leitī* do "women's" work (e.g. laundry washing, cooking, flower gardening, child-minding, caring for elderly parents) and don't do or don't like to do physically demanding work associated with men (e.g. subsistence gardening, wood chopping, construction). In urban contexts, they hold occupations that have feminine associations (e.g. seamstress, hairdresser, cook, "house-girl"), because they either cater to women or are commonly performed by women. *Fakaleitī* are commonly characterized as wearing women's clothes and make-up, although in practice most *leitī* wear either men's or gender-neutral clothes. Their leisures and interests are concerned with beauty, creativity, and femininity (e.g. talking and doing fashion, hairstyles, and decor). They play netball and definitely not rugby (but many, like men and in contrast to women, do get drunk, and often). Finally, "because" they are like women, as the local logic goes, *fakaleitī* have sexual relations with "straight" men, that is, with men who are not identified as *fakaleitī*. Most "straight" men engage them in frequent banter over their "true" gender identity and the possibility of sexual relations, often portraying *fakaleitī* as the sexual aggressor, a strategy designed in part to emphasize the out-of-control nature of *fakaleitī*'s sexuality (a theme

familiar to many sexually defined minorities around the world), and in part to invalidate their claim that they are "real women," since sexual aggression is a male trait.

What these stereotypes do not capture is that *leitī* identity is highly variable, considerably more complex, and criss-crossed by dynamics that reach far beyond the confines of narrow characterizations of gender and sexuality. An important theme that will not often arise under elicitation is the notable way in which *leitī* orient their lives toward aspects of modernity to an extent and in ways that other Tongans do not. While mainstream Tongans tacitly recognize, in their rapports with and attitudes toward *leitī*, that this orientation is part and parcel of who they are, they do not explicitly point to it as a characteristic marker of the identity. I will argue here that it is as central to understanding the meaning of the category as its gendering.

5 *Leitī* and English

It is here that language and language use begin to offer a particularly rich *entrée* into the intricacies of the problem. First of all, verbal behavior is one of the most consciously foregrounded features of *leitī* identity, yet also one of the vaguest. When asked, "How do you know when someone is a *fakaleitī*?," mainstream and *leitī* Tongans often reply, '*Oku te 'ilo'i 'i he le'o* "You know by the voice," where *le'o* "voice" also means, more generally, "way of speaking, speech mannerism." When pressed further, informants typically suggest that *leitī* speak with a high-pitched voice and at a fast tempo, and engage in dramatic emotional displays. However, attempts to determine this distinctiveness more precisely run into the same conceptual and analytic difficulties as characterizations of the linguistic characteristics of gender or sexual minorities elsewhere in the world (cf. Hall and O'Donovan 1996; Gaudio 1997; Ogawa and Smith 1997; and many others).

What is particularly striking but often left unmentioned by informants is the salience of English in *leitī*'s linguistic repertoire. The most immediate piece of evidence of this salience is the name of the category itself: a borrowing from English used exclusively to refer to transgendered males, the word *"fakaleitī"* in and of itself indexes the English language, its contexts of use, and its symbolic associations with modernity and cosmopolitanism, an indexicality that probably operates largely at a subconscious level.[4] This indexicality may be further reinforced by two factors: the original meaning and connotation of the English word "lady" (evoking sophistication, class, good breeding); and *leitī*'s own preference for the unsuffixed version of the term, which "denativizes" the term even further by stripping it of the Polynesian morpheme *faka-*. (Going one step further, *leitī* sometimes pronounce the term as if it were an English word, voicing the dental stop, diphthongizing the vowel cluster, and shifting the stress from the word-final long vowel onto the diphthong.)

The orientation to English that is part and parcel of *leitī* identity goes further. No matter how fluent or elementary their English proficiency may be, *leitī* pepper their conversations with one another and others with English. *Leitī*'s code-switching

can occur in any context, and can target a wide variety of linguistic units, from single words to large discourse chunks. The most frequent examples in my corpus, not surprisingly, are to be found in face-to-face interviews with me, since *leitī* see me primarily as a speaker of English, even though my Tongan is perfectly adequate, and perhaps more importantly as someone with whom they wish to establish a rapport for which the appropriate language is English. The following excerpt from a typical one-to-one interview illustrates the ubiquitous nature of borrowings and code-switched strings[5] (I = interviewee, N = Niko [myself]):

I: Ka koe'uhí, 'e ki'i- te nau *feel secure.*
N: Hm.
I: Pea mo e anga ko e fie nofo faka-Tongá, *you know, how our culture,* 'oku- 'oku *tight up* pē'a e *respect*
N: Hm.
I: ki he mātu'a mo e *sisters* mo e *brothers* mo e me'a.
N: Hm.
I: Ka ko e taimi ko ē 'oku nau- nau māvahe ai ko ē 'o nofo faka'apitanga, pehē
N: 'Io.
I: 'a e *camp.*
N: Hm.
I: Ko e fo'i- fai tahataha pē 'oku tu'u 'i he 'ulu, *that's all.*
N: Hm.
I: *They don't really care,* pe ma'u ha me'akai pe 'ikai.
N: Hm.
(Transcript 1993: 3, p. 6)

Translation
I: *And because, just- they will* feel secure.
N: *Hm.*
I: *And they have a desire to live in the Tongan way,* you know, how our culture, *the* respect *is quite* tight up
N: *Hm.*
I: *for the parents and the* sisters *and the* brothers *and so on.*
N: *Hm.*
I: *But when they move out and start living together as roommates in a house, it [becomes] like*
N: *Yes.*
I: *a* camp [i.e. an encampment, where norms of respectability are ignored].
N: *Hm.*
I: *Every- each does whatever goes through his head,* that's all [i.e. and nothing more].
N: *Hm.*
I: They don't really care *whether they even get food or not.*
N: *Hm.*

This excerpt, taken from an interview with a *leitī* who is relatively fluent in English, presents several interesting features. First, many words and phrases that the interviewee utters in English could equally have been uttered in Tongan, and in a couple of instances the Tongan equivalent may have been more felicitous. Second, some of the terms that my interviewee utters in English in fact refer to concepts that are highly specific to Tongan society and culture. Such is the

of "respect," a word that in Tongan English has the locally specific meaning of "avoidance behavior between cross-sex siblings and some inter-generational relations," which is much more succinctly denoted in Tongan by the widely used term *faka'apa'apa*. Such is also the case of the English kinship terms "brothers" and "sisters," which do not do a good job of capturing the kinship categories relevant to "respect," best understood in terms of crosssiblings (*tuonga'ane* "[woman's] brother", *tuofefine* "[man's] sister").

What is particularly interesting is that even *leitī* who do not have grammatical fluency in standard English nevertheless engage in code-switching with a frequency and poise that would rarely be witnessed among mainstream Tongans of comparable linguistic abilities. The following is an excerpt from an interview with a *leitī* who is much less fluent in English than the interviewee in the prior excerpt, despite years spent working in Australia. Nevertheless, English words and sentences abound in the interview:

I: Ne- 'Aositelelia, sai'aupito 'a 'Aositelelia ia ki ke kau leitī. **He ko e- *mastly*** ko e sio ki he- ki he-, *have you heard about the Mardi Gras,*
N: 'Io, 'Io.
I: 'Oku topu 'a 'Aositelelia hē,
N: Hm.
I: ( ) he nofo pehē.
N: Hm.
I: Ē? *Lesbian.*
N: Hm.
I: *And also the- ladies and the gay.*
N: Hm.
I: *( ) understand?*
N: Na'á ke fa'a kau ki ai?
I: *I only joins but I-* na'e kai- na'e 'ikai ke u **'alu au ki he ngaahi fale pehē.**
N: 'Io.
I: *I just went inside and watch them,*
N: Hm, hm.
I: Ē? *But I never do this one.*
(Transcript 2000: 2, p. 6)

Translation
I: *It was- Australia, Australia is very good to its transgendered people. Because it's-* mostly *if you look at the- at the-* have you heard about the Mardi Gras,
N: *Yes, yes.*
I: *Australia is top* [*topu*, a recent borrowing from English] *on that front,*
N: *Hm.*
I: ( ) *living like that.*
N: *Hm.*
I: *Right?* Lesbian.
N: *Hm.*
I: And also the- ladies and the gay.
N: *Hm.*
I: ( ) understand?
N: *Did you often partake in it?*
I: I only joins but I- *I didn't- I didn't go to that kind of houses* [presumably, gay bars].

N: *Yes.*
I: I just went inside and watch them,
N: *Hm, hm.*
I: *Hm?* But I never do this one.

In short, grammatical competence, concerns for efficiency of expression or the untranslatability of certain terms, and the fear of shaming are of little relevance to my interviewees' code choices. Rather, what is foregrounded in their code choices in interviews with me, as well as in face-to-face interaction with everyone else, is the indexical meaning of English and possibly the indexical meaning of the very act of code-switching (cf. Stroud 1992).

6 The Public Construction of *Leitī* Identity

With Kulick (1999: 615), I consider an analysis based on talk produced in the context of ethnographic interviews both limited and limiting (although not completely devoid of value, as long as the ethnographer places his or her own position under ethnographic scrutiny). What is of interest in the Tongan material is that the patterns of code choice I elicited during ethnographic interviews with my informants echo strikingly patterns of language use in other contexts, and thus are representative of patterns of wide social scope.[6]

Take, for example, public talk in the context of the annual beauty pageants that *leitī* have staged, with increasing aplomb since the early 1990s, in some of the most prominent venues in the country. These events are particularly interesting because, for many Tongans, they represent a context in which *fakaleitī* identity is most clearly elaborated. *Leitī* themselves and their non-*leitī* champions (principally members of a cadre of influential professional women *d'un certain âge*) see the pageant as a prime opportunity to present themselves in the best light and to seek control of their public image, and thus as a subtle but efficacious context for political affirmation. The Miss Galaxy beauty pageant is the most salient of these events, although it is only one of several comparable events held throughout the year. Like other important events in Tonga, the pageant has a high-ranking or otherwise prominent patron, who in recent years has been recruited from within the ranks of the royal family. Half of the jury of six or seven is composed of non-transgendered Tongan dignitaries (e.g. high-ranking army officers, intellectuals, and the winner of the mainstream Miss Heilala pageant for "real" women, which precedes the transgendered pageant), while the other half are "distinguished" Expatriates (i.e. temporary foreign residents of Tonga, such as businessmen, spouses of diplomats, and the occasional visiting anthropologist).

Sponsored by various businesses and organizations (e.g. hotels, hairdressing salons, rugby teams), contestants appear on stage in various costumes, ranging a gamut familiar from South Pacific pageants in general, which includes evening dress, *pule taha* "island wear" (ankle-length skirt and matching short-sleeved top, worn with a tasseled fiber belt), and "their own creations" (see Photograph 1). Each appearance is ostensibly designed to allow contestants to present themselves

as attractive and feminine persons, following familiar patterns of beauty pageants around the world. The core of the pageant consists of several judged events, including an individual talent display, a brief interview (of the what-would-you-do-to-save-the-world? type), and catwalk parades. Interspersed are entertainment routines, which may include a hula performance by the emcee, a rock-and-roll standard sung by a local talent, a dance routine performed by all contestants to a popular Tahitian or disco tune, and a short classical and torch-song concert by non-transgendered performers.

What I designate "extra-locality" pervades the entire atmosphere of the Miss Galaxy pageant. It is a feature of the pageant that organizers and contestants take great pains to elaborate, and that the audience expects of the show, although these expectations are always mitigated by the view that this extra-locality is fraudulent.

The most immediate and spectacular manifestation of extra-locality is the very name of the event. Both funny and poignant, "Miss Galaxy" lays a claim on as ambitiously cosmopolitan an image as can be imagined, and plays on hyperbole in the same fashion as some of the camp aspects of the pageant (e.g. the more extravagant costumes and performances), creating humor while attempting to retain control of this humor. But extra-locality also saturates other aspects of the pageant. For example, one of the events requires contestants to appear in "national" costume as representative of foreign "countries" (e.g. Miss Rarotonga, Miss Switzerland, Miss South America). Similarly, at the organizing stage, candidates provide their age, vital statistics, occupation, and personal aspirations, which one of the organizers enters on bio-data sheets.[7] Clearly, what participants in the pageant aim for in this emulation of international pageant practices is the

Photograph 1: The contestants at the end of the pageant posing around the newly elected Miss Galaxy 1997, the incumbent, and the emcee.

appearance of a glamor whose reference reaches beyond the confines of the local context. The extent to which participants are aware of the inspiration for these practices depends on their relative worldliness. While some *leitī* involved in the programming of the show have had the opportunity to watch televised international pageants, others must rely on second-hand reports of such events, what they can infer about them from watching the mainstream Miss Heilala pageant, and their imagination.

In addition to bearing the names of the countries they represent, Miss Galaxy contestants go by female-sounding stage names of their own choosing, and which they often use in everyday contexts. These stage names are often coinages that bear linguistic similarity to the person's original Tongan name (e.g. "Suzie" from Sosefo), and are either English names (e.g. Priscilla Pressland) or exotic-sounding names with no connotation other than their generic foreignness (e.g. Aisa De Lorenzo, Aodushi Kiroshoto), but never Tongan names. The extra-local flavor also pervades the stage decorations (in 1997, flower arrangements and rather unfortunate bouquets of phallic-shaped multicolored balloons), the background music (for the opening, a medley of triumphalist classical themes such as the William Tell Overture), and the singing and dancing. When events are explicitly designed to add local color (e.g. a *tau'olunga* performance, a popular Tongan tune sung by one of the organizers), they are bracketed entertainment routines designed to fill the time while contestants are getting changed back-stage, and often look like strained token gestures. When a contestant does decide to perform a Tongan dance for a judged event, it is generally a spoof.

Perhaps the most powerful index of extra-locality is language use. Throughout the pageant, the dominant language is English. When contestants first present themselves, for instance, they do so in English:[8]

> Aisa: ((*walks up to the mike*)) Good evening ladies and gentlemen. My name is Aisa De Lorenzo, I'm eighteen years of age, and I represent, ((*pauses, raises arms triumphantly*)) BLUE PACIFIC TAXIS! ((*walks down catwalk*)) (1997: Sony: 2 1:07:36–1:08:20)

Each contestant will have memorized and rehearsed her lines prior to the pageant, and will take utmost care to pronounce them correctly and loudly. This does not prevent occasional slip-ups, which the audience will immediately ridicule boisterously. The important point is that, for most contestants, speaking English before a large and distinguished audience of elite Tongans (many of whom are bilingual) and foreigners represents a serious challenge: many *leitī*, particularly pageant contestants, speak minimal English, as poverty and marginality have barred them from opportunities to learn the language. A significant number have not traveled overseas, and those who have resided in industrial countries have not done so under privileged conditions.

By centralizing the English language and its associations, *leitī* position themselves on the side of prestige and worldliness, and in opposition to the use of Tongan and its localized connotations. But their sociolinguistic behavior, both in and out of the pageant, adds further complexity. Indeed, despite the obvious

difficulties that *leitī* experience in speaking English during the pageant, many Tongans expect them to speak English more readily on a day-to-day basis than non-transgendered Tongan men, for a number of reasons. First, Tongans generally see *fakaleitī* as self-assured and brash creatures that know no shame (*ta'emā*).[9] While in actuality a significant percentage of *leitī* are self-effacing, the demeanor of other *leitī* underscores this stereotype. One illustration of this shamelessness is their very participation in a pageant that constitutes the prime locus of the formation and reinforcement of popular stereotypes of *fakaleitī*: contestants' behavior in the pageant can be moderately outrageous and is certainly viewed as exhibitionistic.

Second, stereotypes of *leitī* view them as oriented toward modernity, the West, transnationalism, and social change. Once again, the extent to which this stereotype reflects reality varies across individuals, but here as well it is certainly founded on undeniable (if partial) evidence. The uncompromisingly extra-local design of the pageant falls right in line with this expectation, both establishing and confirming the stereotypes held by audience members. Viewed in this light, the prominence of English in both public and private contexts is hardly surprising, since English is the language of extra-locality.

Finally, Tongans tend to view the use of English as having feminine undertones: as in many other societies in which a language of modernity competes with a code of traditionalism (e.g. Gal 1979), the former is associated with women's aspirations for upward mobility and emancipation from the strictures of traditionalism (compare Meyerhoff). When questioned on the matter, most Tongan men and women will state that women speak better English overall than men, and that this is due to the fact that girls study harder in school and that women are talkative "by nature." These familiar-sounding assertions bear witness to the fact that the gendering of language use is tacit and embodied in practice, rather than explicit and grounded in overt consciousness.

As a result of this gendering, men who speak "too much" English do so at the risk of compromising their masculinity in the eyes of society at large. This concerns *fakaleitī*, who willingly go to great lengths to dislocate themselves from their masculine attributes. Interestingly, it also concerns overseas-born Tongans: their awkwardness in performing Tongan maleness, including speaking Tongan as a preferred language, frequently brands them as *fakaleitī*-like, regardless of whether they present any identifiable sign of effeminacy in their comportment. The use of English thus has many associations in addition to extra-locality: it potentially indexes deficient Tonganness, deficient masculinity, femininity, and transgendered identity, traits which may or may not overlap but which are all readily equated to one another. Thus failure to perform Tonganness can easily become a sign of imperfect masculinity and vice versa, unless it is mollified by convincing mitigating factors, such as elite status or wealth.[10]

Patterns of language use in the Miss Galaxy pageant, as well as the overall non-local ambience to which they contribute, are not without irony. As discussed earlier, most contestants live in relative poverty. In tune with their under-privileged status, many *leitī* speak English poorly. Sustaining the level of extra-locality expected of them is therefore difficult for many contestants, who switch to Tongan

once they have delivered simple memorized lines. But English still remains dominant in the pageant: it is the language that the emcee uses to address the audience and, when he addresses the contestants, he does so first in English and then provides a Tongan translation, usually *sotto voce.* These communicative practices maintain English in the foreground, at the expense of Tongan.[11]

The difficulty contestants have in maintaining English as their working language during the pageant places them in an awkward position. For example, in the interview event, contestants are given the choice of answering in English or Tongan, and most choose the latter. In 1997, one contestant chose English, and the audience initially reacted with a loud murmur of temporary admiration for her courage. However, it took little time for her to stumble, as she searched for an English word while waving her hand campily, while the audience, satisfied with the expected proof of the fraudulence of her claim to cosmopolitanism, began hooting and ridiculing, forcing her to abort her brave attempt:

Emcee: What would you say about being a hairstylist, or- being- a working- what- what does it mean, like, to be working at Joy's Hair Styles? ((*sotto voce, summarizes the question in Tongan)) Ko e hā e me'a 'oku ke fai 'i he* hair salon?

Masha: ((*takes cordless mike*)) Well thank you very much. ((*audience laughs, then shouts with admiration and encouragement*)) If you want your hair to be curled, ((*beckons with her hand*)) come over. ((*audience explodes in laughter and whooping, Masha laughs and then becomes serious and requests silence with the hand*)) Uh, I like it very much, and uh-I enjoy working there, with uhmm- ((*pauses, word-searches, waves her hand, audience explodes in laughter, drowning the remainder of the answer*)) blowers, ((*unable to finish, mouths*)) (thank you). ((*hands mike back and returns to her position*))

(1997: Sony: 4 0:02:45–0:03:55)

Contestants thus are caught between a rock and a hard place: if they answer in English and make mistakes, they will be laughed at, and if they answer in

Photograph 2: Masha Entura searches for the English word she needs to answer her interview question.

Tongan, this very fact will be ridiculed as evidence that they are unable to carry through the artifice of extra-locality to its logical end. The ridicule that greets the choice of Tongan is congruent with many other aspects of mainstream Tongans' attitudes toward *fakaleitī*, both at the pageant and in day-to-day interactions. Mainstream Tongans indeed consider *fakaleitī* identity as essentially bogus: here are these men pretending to be women, and not just any women but cosmopolitan sophisticates, and yet they cannot even maintain their end of a simple conversation in English. At the pageant, it is not uncommon for drunken men or women to try to rip contestants' outfits and expose them as what they "really" are, namely persons with male physiologies. Nothing generates greater hilarity than contestants losing their bra in the middle of a performance. In day-to-day interactions between *fakaleitī* and mainstream Tongans, the latter often express mock annoyance at the "fraudulence" of *leitī* self-presentation and identity, while *leitī* argue back with "proofs" that they are "real women."

However, like all ideological linkages that disadvantage some and benefit others, the linkages I have described are not immune to contestation on the part of those whom they marginalize. This was powerfully illustrated by a minor humorous incident in the 1997 pageant, when one of the contestants, the quick-witted 'Āmini or Lady Amyland, sponsored by Joey's Unisex Hair Salon, turned the tables on the audience during the interview event (and, perhaps, on society at large, even if only for a fleeting moment). Before she has a chance to answer the emcee's question, Lady Amyland is heckled by a drunken *leitī* in the audience, who urges her to answer her interview question in English (*faka-Pālangi*). The heckling draws some laughter, since everyone knows that Lady Amyland's English is poor and that she would make a fool of herself if she tried. But 'Āmini's repartee wins the prize:

Emcee:	Miss Joey's Unisex Hair Salon! What do you have to say to promote Joey's Unisex Hair Salon? ((*lowers voice, translating into Tongan*)) *Ko e hā e me'a 'oku ke fai ke* promote *ai 'a e- ((rolls eyes, searches for Tongan word)) fakalakalaka ai 'a Joey's Unisex Hair Salon.*
'Ahi:	((*heckling from audience*)) *Faka-Pālangi, 'Āmini!*
Audience:	((*laughter*))
'Āmini:	Sorry excuse me, I'm a Tongan ( ) ((*rest of answer drowned by deafening laughter, vigorous applause, cat-calls*)) (1997: Sony: 4 0:05:42–0:06:26, see Photograph 3)

'Āmini answers the heckler by reaffirming her Tongan identity and therefore her duty and privilege to answer the question in Tongan, an unexpected move which the audience (and any Tongan viewer of the video recording) found extremely humorous, because the claim is embedded in a context in which everything is done to foreground non-locality.[12] What Lady Amyland is doing here is part of a wider tacit project on the part of at least some contestants to take greater charge of the pageant and its effect on the audience. This project consists in stripping the audience (and society at large) of its privilege to ridicule contestants, and to take control of the boundary between humor and seriousness.

Photograph 3: Lady Amyland savors the effect of her quick-minded repartee to a heckler.

But the project goes further, and its meaning becomes clear when viewed in light of the previous analysis. Note that Lady Amyland asserts her claim to Tongan identity not in Tongan, but in English; the covert message is that one can assert one's Tonganness while controlling the tools with which one does so, and while using tools that are not part of the sanctioned repertoire. In addition, the preface of her repartee ("Sorry excuse me") is an inside joke which non-*leitī* audience members are unlikely to make sense of, a reference to another *leitī*'s awkward attempt, a few years earlier, to speak English to a prospective *Pālangi* date. The overall effect of Lady Amyland's repartee contests the power of dominant forces to dictate what counts as markers of locality and what does not; asserts that the claim to be part of the "galaxy" does not necessarily deny one's local identity; and proclaims that being a *leitī* does mean giving up one's place in Tongan society.[13]

7 Conclusion: The Linguistic Constructions of Tongan Transgenderism

This chapter has investigated the linguistic behavior and ideologies of *fakaleitī* and mainstream Tongans, and the relationship of these various behaviors and ideologies in the constructions of identities, stereotypes, and life trajectories. I argued that, in a society that remains essentially monolingual, the presence of English is strongly felt, being associated with contexts where cosmopolitanism, modernity, and capitalism are foregrounded, elements of increasing importance to the very nature of Tongan society. Among the subgroups of Tongan society who are enthusiastic users of English, *fakaleitī* figure prominently, even though

most do not have access to the kind of resources which might justify, in the eyes of greater Tongan society, the implicit claim to prestige status that the choice of English entails: wealth, status in the traditional hierarchy, cosmopolitanism, and grammatical fluency in English.

Fakaleitī code-switch for complex and diverse reasons, and in this respect they do not differ from code-switchers in all other societies of the world. However, one of the most salient, although largely unarticulated, motivations for code-switching that this chapter has explored is the fact that the use of English represents for many *fakaleitī* a symbolic escape hatch out of social marginality (compare Meyerhoff, on women on Malo, Vanuatu). The claims embedded in their use of English and their code-switching serve as an idiom of resistance against the symbolic and material oppression that they experience as both transgendered persons and poor Tongans. However, this strategy is not without risk. Like all resistant action, these claims can be turned around and used against them to further marginalize them. *Leitī*'s language choices place them at risk of being perceived by non-transgendered Tongans as alienating themselves from a local context that offers both unpleasant but also potentially rewarding symbols and resources for everyone. Being generally poor, *leitī* are not in a good position to define for the rest of society what counts as "local," and the perception that they are alienating themselves from a pre-defined localness over which they have little control is potentially disadvantageous.

This chapter has attempted to explore the intersection of gender, modernity, and locality by focusing on the differences and conflicts in the subjectivities of members of one society. Reading dominant characterizations of modernity from sociology and cultural studies (e.g. Featherstone, Lash, and Robertson 1995; Jameson and Miyoshi 1998), we are led to expect that Tongans would experience tokens of modernity and globalization, for example, in a kind of Durkheimian (solidarity-enhancing) unison. What I have shown here is that they not only differ from one another in the way they experience these tokens and in what they do with them, but they also actively challenge each other's experiences of these tokens. Furthermore, they enlist these experiences to argue over the meaning of seemingly highly localized categories and dynamics, including gender.

In this chapter, in line with a substantial body of recent research, I have explored the potentially heterogeneous nature of gender as a social category, and have sought to unravel this heterogeneity in terms of the varied positions that members of the "same" gender can take *vis-à-vis* modernity and localness. I have also sought to distinguish between different meanings of modernity, from material to ideational manifestations of it. Finally, I have investigated the complex interplay of modernity with locality. The chapter has explored the role of language in creating and indexing these social and cultural dynamics. The discourse- and ethnography-based analysis I have developed here illustrates the complex role that categories other than gender play in defining gender. It also shows that the meaning and valuation of such categories as gender, modernity, and localness are objects of conflict and contradiction, both across subgroups of society and across contexts

Acknowledgments

I conducted fieldwork in 1994, 1995, 1997, and 1999–2000, grounding myself on a general understanding of Tongan society acquired during residence in a Tongan village in 1978–80. I thank many Tongan informants and friends for their help and devotion, and Janet Holmes and Miriam Meyerhoff for useful comments on an earlier version of this chapter. Financial support for fieldwork from the following sources is gratefully acknowledged: Marsden Fund of the Royal Society of New Zealand, Wenner Gren Foundation for Anthropological Research, Yale University Social Science Faculty Research Fund, and Victoria University of Wellington Faculty of Humanities and Social Sciences Research Fund. Portions of this chapter are reprinted from Besnier (2002) by permission of the American Anthropological Association, which is gratefully acknowledged.

Notes

1. The fact that, in Tonga as in many other parts of the Pacific, English is the language of choice when one is drunk lends further support to this analysis (compare Harvey 1991 on the role of Spanish in Quechua drunken conversation).
2. Tongan has a notable system of honorifics ("speech levels"), centered principally on the lexicon: certain words are used solely when addressing or speaking of members of the nobility or the royal family other than the sovereign, and others when addressing or speaking of the sovereign or God. These register variations are the subject of ideological elaboration, but in practice they concern a very restricted range of linguistic structures and their use is very flexible (Philips 1991). They are of no significant relevance to the materials presented here.
3. One interviewee, who belongs to a small Charismatic Christian sect, explicitly linked her "liberated" stance to the fact that she had accepted Jesus into her heart, which enables her to ignore tradition-based gossip and shaming. Because they reject the (often oppressive) structuring of mainstream Christian denominations, Charismatic Christians place themselves on the margin of a society where church-mediated and church-directed exchange is so determinative of social life. This is also true, to a lesser extent, of Mormons (Gordon 1990) and other people who have somehow extricated themselves from the duties of reciprocity and exchange, often at a cost to their social standing.
4. There is a substantial and evergrowing corpus of borrowings from English in the contemporary Tongan lexicon, many of which have been phonologically nativized (Schütz 1970). Some words were borrowed early in the history of contact (e.g. *taimi* "time", *siasi* "church"), and have lost all connotations of foreignness. More recent borrowings, while highly integrated in everyday linguistic usage, continue to subtly index the connotations of English as a medium of communication, as evidenced, for example, by cases where both a borrowing and a word of Polynesian origin have roughly the same meaning (e.g. *kiti* and *leka* "kid"). The borrowing of *"leitā"* probably dates back to the early decades of the twentieth century (Futa Helu, personal communication).
5. In the orthography in general use for Tongan, an apostrophe represents a glottal stop, a macron superscripted to a vowel represents gemination, and an acute accent above a word-final vowel indicates that stress shifts from the penultimate to the accented vowel to denote the definiteness and specificity of the noun phrase ending with the

6. Don Kulick extends his criticism to analyses that focus primarily on talk produced in other "on-stage" circumstances, for example, for media dissemination, or during performances of various kinds. The point is well taken, and falls in line with a long tradition in linguistic anthropology of emphasizing the importance of seeking an understanding of social dynamics by focusing on day-to-day interaction. However, one should also not forget that "public" discourse may also act as an important medium through which identities are created and negotiated, representations constructed and challenged.
7. Some of the information provided is fake or unrealistic, while other details are designed to be humorous. For example, contestants regularly claim "high-status" feminine occupations such as "nurse" and "public relations" (*sic*) to add glamor to their profile, as well as "future plans" to be "computer operator," "flying attendant" (*sic*), and "to be a good wife." The same practice of emulating international beauty contests is found in the pageants that transgendered persons stage in Jolo, Southern Philippines (Johnson 1997) and in urban South Africa (Reid 1999), both of which exhibit fascinating similarities to the Tongan material.
8. In the following discussion, I have not attempted to hide the identity of those concerned since my analysis is based on a public event. Extracts are identified by year of recording and video reference number.
9. A Tongan businessman told me that he had employed a *fakaleitī* to sell his products door-to-door precisely because *fakaleitī* worry little about shame, in addition to being gregarious and talkative. These traits are thus not necessarily seen as negative assets.
10. Many of the symbolic associations I describe here of course echo patterns found in many other societies. One is reminded of Willis's (1977) celebrated analysis of working-class masculinity among adolescents in English schools, Bourdieu's (1985) analysis of social class and "refinement" in France, particularly as it relates to gender, and Ortner's (1991) study of social class and gender in New Jersey, among many other relevant examples.
11. English, as with other tokens of modernity and cosmopolitanism, also occupies a prominent role in many other public events in Tonga, including the Miss Heilala beauty pageant for "real" women. However, in other events, these tokens are commonly on a par with Tongan and tokens of "Tonganness." In the Miss Heilala pageant, for example, the contestants' ability to perform tokens of Tonganness, including their linguistic skills, are scrutinized very closely. This scrutiny frequently places overseas-born contestants at a disadvantage, as discussed in Teilhet-Fisk (1996) and Besnier (2002).
12. The humor already began with the heckle itself, which is uttered in Tongan, despite the fact it urges the contestant to speak English, and which refers to the contestant by his everyday name, rather than her transgendered name.
13. I do not wish to imply that Lady Amyland's act of resistance was the result of a carefully engineered strategy on her part. For one thing, she was probably drunk, as many contestants are. However, we know from Scott (1985, 1990) that everyday acts of resistance need not be the outcome of calculated designs.

The Power and Politics of Genre

Vijay K. Bhatia

Introduction

All discourse forms, especially those used in institutionalized contexts, are socially negotiated. At the very heart of most frameworks for the analysis of discourse, especially as genre, is the belief that there is nothing like a universal form of discourse for structuring knowledge. There can only be a 'consensus or an agreement' (Bruffee, 1986: 777) among the members of specific disciplinary communities to express their concerns in specific discursive forms. Most institutionalized forms of discourse, therefore, are socially constructed, interpreted and used. Goodrich (1987) explains this institutionalization of discoursal practices in terms of 'social authorship' as against the more familiar subjective authorship.

> The right to a discourse is organized and restricted by a wide variety of means, to particular roles, statuses, professions and so on. Similarly the institutionalisation of discourse is limited in terms of its legitimate appropriation, and the restrictive situations of its reception – church, court, school, hustings and so on.

Foucault (1981) also sees *social authorship* of discourse in terms of two interrelated aspects. The first one, according to him, is:

> Who is speaking? Whom among the totality of speaking individuals, is accorded the right to use this sort of language? Who is qualified to do so? Who derives from it his own special quality, his prestige, and from whom, in return, does he receive if not the assurance, at least the presumption

Source: *World Englishes* vol. 16, no. 3, 1997, pp. 359–371.

> that what he says is true? What is the status of the individual who – alone – have the right, sanctioned by law or tradition, juridically defined or spontaneously accepted, to proffer such a discourse?

The second, he explains in terms of institutional sites from which the authorized speaker makes his discourse and from which the discourse derives its 'legitimate source and point of application.'

Pêcheux (1982) also stresses the importance of institutional forms in discourse when he says

> what can be and should be said – in the form of a speech, a sermon, a pamphlet, a report, a programme, etc.

Like other forms of discourse, genres are also socially constructed and are even more intimately controlled by social practices. Genres are the media through which members of professional or academic communities communicate with each other. They are, as Berkenkotter and Huckin (1995) point out,

> . . . intimately linked to a discipline's methodology, and they package information in ways that conform to a discipline's norms, values and ideology.

Myers (1995: 5) also points out,

> Disciplines are like cultures in that their members have shared, taken for granted beliefs; these beliefs can be mutually incomprehensible between cultures; these beliefs are encoded in a language; they are embodied in practices; new members are brought into culture through rituals.

The consensus is arrived at and negotiated through professional conversations and practices amongst the informed and practising members of a professional community. Interactions and conversations enable consensus, on the one hand, and have a regulatory or limiting effect on the other, as to what should or should not be admitted into a community's body of knowledge. Genres, in other words, are socially authorized through conventions, which, in turn, are embedded in the discursive practices of members of specific disciplinary cultures. These discursive practices, to a large extent, reflect not only conventions used by specific disciplinary communities, but also social conventions, including social changes, social institutions and social knowledge, all of which, in a way, could be seen as significantly contributing to what in genre theory is regarded as 'genre knowledge.' Genres, in whatever manner one may identify them, whether as *a typification of rhetorical action* (as in Miller (1984), and more recently, Berkenkotter and Huckin (1995)), as *a staged, goal oriented social process* (as in Martin (1993)), or as *shared communicative purposes* (as in Swales (1990) and Bhatia (1993)), are products of an understanding or a prior knowledge of generic conventions. These generic conventions are responsible for regulating generic constructs, giving them internal

ordering, which in discourse literature, for various reasons, has been given different names, some of which include discourse structuring, staging of discourse and generic structure potential (GSP).

Complexity of Generic Forms

Although generic forms are products of conventional knowledge embedded in disciplinary cultures, they are dynamic constructs. Typical realizations of these institutionalized forms are often characterized by their generic integrity, on the one hand, and their propensity for innovation, on the other (see Bhatia, 1993, 1995). These two aspects of genre may appear to be somewhat contradictory at first, but as we shall soon discover, these two characteristics are complementary to each other. In fact, it will not be inaccurate to suggest that one is, in a way, an essential prerequisite to the other. Generic integrity is the product of the conventional features of a specific generic construct. Although these conventions are embedded in the rhetorical context, they often constrain the use of linguistic resources (lexico-grammatical as well as discoursal), and are frequently invoked to arrive at a reasonable interpretation of the genre or even determine the choice of the genre to suit a particular context. Within generic boundaries, experienced users of genre often manage to exercise considerable freedom to manipulate generic conventions to respond to novel situations, to mix what Bhatia (1993) calls 'private intentions' with socially recognized communicative purposes, and even to produce new forms of discourse. Therefore the tension between conformity and creativity, so often made an issue of in applied discourse studies, is not necessarily real. As Dubrow (1982: 39) points out, 'a concern for generic traditions, far from precluding originality, often helps to produce it.' Similarly, Fowler (1982: 31) points out:

> Far from inhibiting the author, genres are a positive support. They offer room, as one might say, for him to write in – a habitation of mediated definiteness, a proportioned mental space; a literary matrix by to order his experience during composition . . . The writer is invited to match experience and form in a specific yet undetermined way. Accepting the invitation does not solve his problems of expression . . . But it gives him access to formal ideas as to how a variety of constituents might suitably be combined. Genre also offers a challenge by provoking a free spirit to transcend the limitations of previous examples.

In fact, a subtle exploitation of a certain aspect of generic construct is always seen as tactically superior and effective. It is almost like the advertiser's exploitation of the cliché *the shape of things to come* in the following opening headline of an advertisement for a car.

> The shape of things to come: Mitsubishi Cordia

Or, the use of the famous statement about the British colonial empire in the Lufthansa advertisement, *The sun never sets on Lufthansa territory* or in the following slogan for an

idea of waste of energy is lost unless it is associated with 'Don't be foolish.' The whole point about such associations is that they communicate best in the context of what is already familiar. In such contexts, words on their own carry no meanings; it is the experience which gives them the desired effect. Therefore, if one is not familiar with the original, the value of the novel expression is undermined. Just as the advertiser makes use of the well-known and the familiar in existing knowledge, a clever genre writer makes use of what is conventionally available to a discourse community to further his or her own subtle ends. The innovation, the creativity or the exploitation becomes effective only in the context of the already available and familiar. The main focus of this paper is on these two interrelated aspects of genre theory, i.e., the constraints on generic construction, a preknowledge of which gives power to insiders in specific discourse communities, and the exploitation of this power by experienced and expert members of such disciplinary cultures to achieve their 'private intentions' within 'socially recognized communicative purposes.'

Organizational Preferences and Generic Controls

The other interesting area of generic variation, although within a restricted range, one finds in organizational preferences. In the case of academic publications, we often come across what we commonly refer to as housestyles. Although every single journal claims to have its own style sheet, most of them can be characterized more by their overlap rather than variation.

Similarly, in the case of newspaper genres, especially the news reports and the editorials, we find an unmistakable 'generic identity' (Bhatia, 1993) in almost all of the exploits of these genres from various newspapers, although all of them have their own preferences in terms of style, stance and substance. Some may be more objective, while others more interpretative; some more socially responsible, while others more sensational. In spite of all these differences, most of them display common characteristics in terms of their use of generic resources, in terms of their structure, interpretation and communication of intentions. These somewhat different orientations to the events of the day do not make their stories very different in terms of their generic form.

Even in the case of business communities, we often find different organizations displaying their unique identities through their organizational preferences in the matters of their choice of generic forms, but the broad range of genres they tend to exploit to further their organizational objectives show remarkable similarities rather than differences. All these areas of generic use indicate that although their preferred generic forms show a subtle degree of variation for what could be seen as 'tactical advantage,' they never disregard some of the basic features of individual generic constructs, which give these genres their essential identities.

The Power of Genre

There is no better illustration of the saying 'knowledge is power' than the one in the case of generic power. Power to use, interpret, exploit and innovate novel

generic forms is the function of generic knowledge which is accessible only to the members of disciplinary communities.

How do these disciplinary communities maintain what we have called generic integrity in their discursive practices? Let us look at this phenomenon by looking at the academic community.

Maintaining Generic Integrity: Editorial Intervention

In some forms of academic discourse, especially the research articles, one can see generally two kinds of mechanism in place to ensure generic integrity: the peer review process, and editorial intervention. Both these mechanisms, though operating at different levels, are actively invoked to ensure that all accounts of new knowledge conform to the standards of institutionalized behaviour that is expected by a community of established peers in a specific discipline. Although individual judgements can vary within the membership of specific disciplinary communities, a high degree of consensus is often ensured by selecting like-minded scholars from within well-defined disciplinary boundaries. For example, if we survey a few journals which regularly publish articles on discourse analysis, we will find that although all of them publish articles on various aspects of discourse, they have a very different set of reviewers to certify accounts of knowledge claims for inclusion in the respective journals. If one encounters names like Cazden, Geertz, Goffman, Gumperz, Hymes, Milroy, Saville-Troike, Scollon, Tannen, and Zimmerman on the editorial committee of a journal, one could safely guess that they will be unlikely to accept articles outside a sociolinguistic orientation on discourse. Articles on other aspects of discourse are more likely to be discouraged and even rejected. If, on the other hand, one finds names like Ackerman, Bazerman, Berkenkotter, Comprone, Doheny-Farina, Huckin, Linda Flower, Miller, or Odell, one would expect them to welcome papers with a strong rhetorical orientation. Similarly, if one finds names like Carter, Christie, Halliday, Hasan, Kress, Martin and Rothery, one will come to the inevitable conclusion that the journal will favour a more systemic orientation to discourse.

After peer review, the second most important intervention comes from the editors, who enjoy all the power one can imagine to maintain the identity and integrity of the research article genre. Berkenkotter and Huckin (1995) document an in-depth and fascinating study of this kind of editorial control to maintain generic integrity. They point out that for the construction and dissemination of knowledge 'textual activity' is as important as the 'scientific activity.'

Generic Conventions as Authority: The Case of Citations and References

To us academics, the power of genre is nowhere better illustrated than in the publication of research articles. Swales in his research report *Aspects of Research Article Introductions* (1981) was the first one to point out the importance of the description of previous research on the rhetorical activity of knowledge dissemination as distinct from knowledge creation. In order to become acceptable to

the specialist community of fellow researchers, one must relate his or her knowledge claims to the accumulated knowledge of the discipline, without which his or her claims in the field are unlikely to find recognition through publication. In this context it is hardly surprising that literature review occupies an important place in the researcher's repertoire of skills in most academic disciplines. Referring to the importance of citation in scientific research activity, Amserdamska and Leydesdorff (1989: 451) point out,

> In a scientific article 'the new encounters the old' for the first time. This encounter has a double significance since articles not only justify the new by showing that the result is warranted by experiment or observation or previous theory, but also place and integrate innovations into the context of 'old' and accepted knowledge . . . References which appear in the text are the most explicit manner in which the arguments presented in the article are portrayed as linked to other texts, and thus also to particular body of knowledge.

Power to Innovate (Mixing and Embedding)

Although this pressure for the 'democratisation' (Fairclough, 1992) of discourse is becoming increasingly intense in some countries, especially in the USA, it is unlikely to make a significant dent in the so-called integrity of professional genres, at least not in the foreseeable future. However, one can see an increasing 'fragmentation of discursive norms and conventions' (Fairclough, 1992: 221), often leading to genre-mixing and embedding in institutionalized orders of discourse (see Bhatia, 1994, for a detailed discussion of this), on the one hand, and creation of new genres, on the other. To a large extent, these changes in discursive practices are making professional genres increasingly dynamic and complex.

The dynamic complexity of academic and professional communication is further increased by the role of multimedia, the explosion of information technology, the multi-disciplinary contexts of the world of work, the increasingly competitive professional environment, and above all, the overwhelmingly compulsive nature of promotional and advertising activities, so much so that our present-day world of work is being increasingly identified as a 'consumer culture' (Featherstone, 1991). The inevitable result of this is that many of the institutionalized genres, whether they are social, professional or academic, are seen as incorporating elements of promotion. Fairclough (1992: 207) rightly associates some of these changes with what he calls 'commodification' of institutional orders of discourse. Referring to such changes in discourse practices, he (1993: 141) points out,

> . . . there is an extensive restructuring of boundaries between orders of discourse and between discursive practices, for example, the genre of consumer advertising has been colonising professional and public service orders of discourse on a massive scale, generating many new hybrid [illegible]promotional genres . . .

As an instance of such a hybrid genre, Fairclough (1993) discusses the case of contemporary university prospectuses, where he highlights an increasing tendency towards marketization of the discursive practices of British universities. Bhatia (1995), in his discussion of genre-mixing in professional discourse, gives examples from several settings, where genre-mixing and embedding is becoming increasingly common. He also mentions several instances where one may find an increasing use of promotional strategies in genres which are traditionally considered non-promotional in intent, especially academic introductions, including book introductions, forewords, prefaces of various kinds, which are becoming increasingly difficult to distinguish from publishers' blurbs.

Shared Knowledge – Privileged Access/Insider Information

If generic conventions, on the one hand, give suitable expression to the communicative intentions of genre writers (who are members of a particular discourse community), on the other hand, they also match their intentions against their intended reader's expectations. This is possible only when all the participants share, not only the code, but also the knowledge of the genre, which includes the knowledge of its construction, interpretation and use. A necessary implication of this shared genre knowledge is that it is not routinely available to the outsiders, which creates a kind of social distance between the legitimate members of a discourse community and those who are considered outsiders. Although this creates conditions of homogeneity between the insiders, at the same time it also increases social distance between them and the outsiders, sometimes resulting in disastrous consequences for the one who does not have access to such shared knowledge. This shared knowledge could be in the form of linguistic resources used to construct a generic form, or it could be in the awareness of the rules of language use, some of which are socially learnt, as the ones associated with classroom discourse and academic genres, while other scan be legally enforced, such as the ones associated with courtroom procedures. Allen and Guy (1989), based on a personal communication from Worthington (1984: personal communication), report an excellent example of the lack of shared knowledge from the account of the courtroom interaction.

> An off-duty policeman in a store had shot and killed an intruder. Investigation had shown a set of burglar tools at the back of the store. The prosecutor was trying to show that there was no ground for presuming criminal intent, and that this was cold-blooded murder. The victim's wife was testifying for the prosecution. Here she is being cross-examined by the defense.
>
> Defense Lawyer: Could you tell the court and the jury **what your husband's** occupation was?
> *Wife:* He was a burglar.
>
> This supported the defense's contention of criminal intent, and secured acquittal for the policeman.

the specialist community of fellow researchers, one must relate his or her knowledge claims to the accumulated knowledge of the discipline, without which his or her claims in the field are unlikely to find recognition through publication. In this context it is hardly surprising that literature review occupies an important place in the researcher's repertoire of skills in most academic disciplines. Referring to the importance of citation in scientific research activity, Amserdamska and Leydesdorff (1989: 451) point out,

> In a scientific article 'the new encounters the old' for the first time. This encounter has a double significance since articles not only justify the new by showing that the result is warranted by experiment or observation or previous theory, but also place and integrate innovations into the context of 'old' and accepted knowledge . . . References which appear in the text are the most explicit manner in which the arguments presented in the article are portrayed as linked to other texts, and thus also to particular body of knowledge.

Power to Innovate (Mixing and Embedding)

Although this pressure for the 'democratisation' (Fairclough, 1992) of discourse is becoming increasingly intense in some countries, especially in the USA, it is unlikely to make a significant dent in the so-called integrity of professional genres, at least not in the foreseeable future. However, one can see an increasing 'fragmentation of discursive norms and conventions' (Fairclough, 1992: 221), often leading to genre-mixing and embedding in institutionalized orders of discourse (see Bhatia, 1994, for a detailed discussion of this), on the one hand, and creation of new genres, on the other. To a large extent, these changes in discursive practices are making professional genres increasingly dynamic and complex.

The dynamic complexity of academic and professional communication is further increased by the role of multimedia, the explosion of information technology, the multi-disciplinary contexts of the world of work, the increasingly competitive professional environment, and above all, the overwhelmingly compulsive nature of promotional and advertising activities, so much so that our present-day world of work is being increasingly identified as a 'consumer culture' (Featherstone, 1991). The inevitable result of this is that many of the institutionalized genres, whether they are social, professional or academic, are seen as incorporating elements of promotion. Fairclough (1992: 207) rightly associates some of these changes with what he calls 'commodification' of institutional orders of discourse. Referring to such changes in discourse practices, he (1993: 141) points out,

> . . . there is an extensive restructuring of boundaries between orders of discourse and between discursive practices, for example, the genre of consumer advertising has been colonising professional and public service orders of discourse on a massive scale, generating many new hybrid partly promotional genres . . .

As an instance of such a hybrid genre, Fairclough (1993) discusses the case of contemporary university prospectuses, where he highlights an increasing tendency towards marketization of the discursive practices of British universities. Bhatia (1995), in his discussion of genre-mixing in professional discourse, gives examples from several settings, where genre-mixing and embedding is becoming increasingly common. He also mentions several instances where one may find an increasing use of promotional strategies in genres which are traditionally considered non-promotional in intent, especially academic introductions, including book introductions, forewords, prefaces of various kinds, which are becoming increasingly difficult to distinguish from publishers' blurbs.

Shared Knowledge – Privileged Access/Insider Information

If generic conventions, on the one hand, give suitable expression to the communicative intentions of genre writers (who are members of a particular discourse community), on the other hand, they also match their intentions against their intended reader's expectations. This is possible only when all the participants share, not only the code, but also the knowledge of the genre, which includes the knowledge of its construction, interpretation and use. A necessary implication of this shared genre knowledge is that it is not routinely available to the outsiders, which creates a kind of social distance between the legitimate members of a discourse community and those who are considered outsiders. Although this creates conditions of homogeneity between the insiders, at the same time it also increases social distance between them and the outsiders, sometimes resulting in disastrous consequences for the one who does not have access to such shared knowledge. This shared knowledge could be in the form of linguistic resources used to construct a generic form, or it could be in the awareness of the rules of language use, some of which are socially learnt, as the ones associated with classroom discourse and academic genres, while other scan be legally enforced, such as the ones associated with courtroom procedures. Allen and Guy (1989), based on a personal communication from Worthington (1984: personal communication), report an excellent example of the lack of shared knowledge from the account of the courtroom interaction.

> An off-duty policeman in a store had shot and killed an intruder. Investigation had shown a set of burglar tools at the back of the store. The prosecutor was trying to show that there was no ground for presuming criminal intent, and that this was cold-blooded murder. The victim's wife was testifying for the prosecution. Here she is being cross-examined by the defense.
>
> Defense Lawyer: Could you tell the court and the jury what your husband's occupation was?
> Wife: He was a burglar.
>
> This supported the defense's contention of criminal intent, and secured acquittal for the policeman.

If only the wife had been slightly more familiar with the conventions of the courtroom examination, the task of the defence lawyer would not have become that easy.

Another example of the use of insider information to get access to information can be illustrated by the following headline from an advertisement for 'The Schroder Singapore Trust,' which reads,

> The Schroder Singapore Trust Has Grown Over 60% In 3 Years

The information being given here can be extremely misleading, except to those who are well aware of the discursive practices of the professional community of financial managers. Anybody trying to make sense of this statement should know that this 60 percent growth in three years on its face value could be misleading, to say the least. Although it carries the usual statutory disclaimer in the form of a note in small print saying, 'Past performance is not necessarily a guide to future performance, the price of units may fall as well as rise and cannot be guaranteed,' a lay person might still be led to think that his investment will probably get him close to a 60 percent return. The fact, on the other hand, could be that the unit value might have declined by 100 percent in the last one year or so, and may still be showing the downward trend at the time of the advertisement. There could be several other possible scenarios which will be accessible only to those with the inside knowledge of the way these genres function rather than to outsiders.

Maintaining Solidarity within a Professional Community

One of the most noticeable characteristics of any professional or academic discourse community is the availability and typical use of a range of appropriate genres, which their members think serve the goals of their community. The recurrent use of such discoursal forms create solidarity within its membership giving them their most powerful weapon to keep the outsiders at a safe distance. Hudson (1979: 1) rightly claims,

> If one wished to kill a profession, to remove its cohesion and its strength, the most effective way would be to forbid the use of its characteristic language.

In this context, it is hardly surprising that most of the attempts by the powerful reformist lobbies in many Western democracies to introduce plain English in legislative contexts are seen as imposition from outside and have been firmly rejected by the professional legal community.

The main purpose of legislation, as Bhatia (1993) points out, is to govern the behaviour of individuals and institutions in society through the use of rules and regulations. In order to keep control firmly in the hands of the legislature rather than the judiciary in a parliamentary democracy, statutory acts are written not only clearly, precisely and unambiguously but all-inclusively too. This rigour and

adequate specification of scope in legislation helps the legislature to control a totally subjective and idiosyncratic interpretation of the statute book.

All attempts to reform legislative language, including those by the plain English campaign (see Thomas, 1985; Eagleson, 1988; Kelly, 1988), have to a large extent met with very limited success, for the simple reason that they are seen as a transgression of the generic integrity of the whole tradition in the legislative process. Although the plain English movement has been quite effective in influencing the redrafting of general commercial and administrative documents, including insurance policies, residential leases, tax return forms, social benefit claim forms and other papers for better *accessibility* and *usability* by a larger section of society, when it comes to legislative provisions, it has not been able to soften the attitude of the parliamentary draftsmen significantly in many of the Commonwealth countries. The other argument for the preservation of these generic characteristics of legislative discourse is that the real legislative power in all parliamentary democracies must rest with the legislature and not with the judiciary. This is one of the most important reasons why clarity, precision, unambiguity and all-inclusiveness are so highly prized in British legislative discourse, which gives a relatively high degree of transparency to legislative intentions.

Power and Control in Legislative Context

Writing legislative discourse in terms of simple principles without adequate specification of the required scope, on the other hand, means giving wider powers to the judges and the courts to interpret the intentions of the legislature, which is not considered highly desirable in parliamentary democracies.

We find an excellent illustration of this point in the Basic Law drafted by the People's Republic of China. It is meant to be a mini-constitution for post-1997 Hong Kong based on the Sino-British Joint Declaration of 1978. It is written in the form of very simple principles and guidelines, a generic form, which can be seen as almost exactly the opposite of what we find in a typical legislative discourse from any of the countries of the Commonwealth. It is written in the form of basic principles on which there can hardly be any disagreement, lacking very significantly in details of all kinds. One of the important issues raised there is that of status of the laws previously in force in Hong Kong. Article 8 of the Basic Law states,

> The laws previously in force in Hong Kong, that is, the common law, rules of equity, ordinances, subordinate legislation and customary law shall be maintained, except for any that contravene this law, and subject to any amendment by the legislature of the Hong Kong special Administrative Region.

As one may see, like the other Articles of the Basic Law, this one too is expressed in terms of somewhat universal principles which are applicable to everything one could think of in the context of pre-existing legislative machinery. One may

be tempted to point out that there should be no serious problem in expressing legislation in terms of general principles. There are several legal systems which adopt such a strategy. The French legislative system is a good example of this. However, problems have occurred in this context, primarily because the transition of power has still some way to go. A number of issues are still unresolved and to make it worse, all this is happening in the context where two very different systems are in operation, the most elaborate and exhaustive legislative style used in the UK and their extremely diluted plain English versions captured in the Basic Law. Every time a new ordinance is considered or promulgated in Hong Kong, it becomes a matter of fresh negotiation between the two governments.

Obviously, this generic form of writing gives maximum power to the one who has the authority to interpret it. Since the Basic Law is meant to take effect only after July 1, 1997, after the territory is handed over to China, the eventual control over its interpretation will be concentrated in the hands of the future SAR government of the PRC. However, in the intervening period leading up to the hand-over, the interpretations of many of its sections have been disputed by both sides, for the simple reason that the genre in which it is written allows maximum power to interpret it to those who have the power to do it, which for the time being is shared by the two parties.

The power and politics of genre are the two sides of the same coin. In one context, it can be seen as a legitimate force often used to maintain solidarity within a disciplinary community, whereas on the other hand, it is used to keep outsiders at a respectable distance. On the one hand, it empowers some people. the insiders, while at the same time, it tends to silence others, especially the outsiders. That is what I meant by the power and politics of genre. We have seen the power of genre, let's turn to its politics now.

The Politics of Genre

Exploitation, Innovation and Manipulation of Generic Conventions

I have tried to present genre as a dynamic and clarificatory rather than a static or classificatory construct. I have also tried to maintain that it has a propensity for innovation, exploitation and manipulation. I would now like to take this argument further to discuss the nature of this exploitation or manipulation and constraints on such exploitation.

Genres are dynamic constructs, even though they are essentially seen as embedded in conventions associated with typical instances of language use in social, academic or professional settings. An understanding or a prior knowledge of conventions is considered essential for its identification, construction, interpretation, use and ultimate exploitation by members of specific professional communities to achieve socially recognized goals with some degree of pragmatic success.

The nature of genre manipulation is invariably realized within the broad limits of specific genres and is often very subtle. This can only be handled within the concept of genre because such liberties, innovations, creativities. exploit- [illegible] choose to call them, are invariably realized within

rather than outside the generic boundaries, whichever way one may draw them, in terms of recurrence of rhetorical situations (Miller, 1984), consistency of communicative purposes (Swales, 1990), existence and arrangement of obligatory structured elements (Halliday and Hasan, 1985) or a combination of these (Bhatia, 1993). The moment it becomes a free-for-all kind of activity, communication itself will become more of a problem. The reason is that the flouting of generic conventions leads to the opting out of the genre altogether and is noticed by the members of the concerned disciplinary community as being odd. Any attempt, therefore, to overlook, ignore or undermine the power of conventions at this stage can result in disastrous consequences.

Although a good understanding of genre knowledge is a prerequisite to any manipulation of generic resources, it is by no means sufficient to get such innovations and exploitations accepted in a disciplinary community. Kress (1987: 42) mentions two significant ways in which generic innovations are accepted, either they are backed by a stable social occasion or by authority.

> Unless . . . there is a change in the social structures – and in the kinds of social occasions in which texts are produced – the new generic forms are unlikely to succeed. That is why childish innovations fail; not because they do not constitute perfectly plausible solutions to particular textual/cognitive problems, but because they are supported neither by a stable social occasion, nor by 'authority.' This latter is of course the case where a writer of 'authority' creates a new generic form, which, seemingly because of the writer's authority alone, succeeds in establishing a new generic convention.

Gate-keeping Function of Discourse Communities

Berkenkotter and Huckin (1995: 102) in their study of gate-keeping at an academic convention, i.e., the study of abstracts submitted for the Conference on College Composition and Communication (CCCC), discuss an interesting instance of the power of generic control in well-defined contexts. On the basis of their analysis of the process of selection of papers for the CCCC convention, they claim that,

1. The high-rated abstracts all addressed topics of current *interest to active, experienced members of the rhetoric and composition community*; the low-rated abstracts often did not.
2. Almost all of the high-rated abstracts *clearly defined a problem*; the low-rated abstracts often did not.
3. The high-rated abstracts all *discussed this problem in a way that would be seen by experienced insiders as novel and therefore interesting*, whereas virtually none of the low-rated abstracts did.
4. The high-rated abstracts usually *projected more of an insider ethos* through the use of terminology, special topoi, and/or explicit or implicit references to the scholarly literature of the field than did the low-rated abstracts. [Emphasis added.]

They also point out that often 'the genre was shaped significantly by the interests of the program chair.' This is generally done through the theme statement issued when papers are invited for the convention. Depending upon the interests of the program chair or of the discourse community he/she represents, the emphasis can shift from one year to the other. Based on their study of CCCC abstracts for four years between 1988–92, they find two main levels of gate-keeping (1995: 115):

> (a) the external reviewers and (b) the program chair. We have observed many cases where the reviewers rated an abstract Excellent and yet it was not included in the program. Presumably, the chair disagreed with the reviewers' judgements. . . . In short, each convention bears the stamp of its principal gatekeeper.

They further point out that (1995: 115),

> In one particularly unfortunate case, a very interesting abstract was submitted to the Technical Communication area one year, where it received an Excellent rating from a reviewer and the program chair but was not included in the program (presumably because of a bad 'fit'). It was revised slightly and resubmitted the following year to the Discourse Analysis area. Again it received an Excellent rating, but again it was not included in the program. The author of this abstract probably never knew that she had written an outstanding abstract. All she would have been told was that her paper had been rejected for the program.

Another interesting case of such a gate-keeping encounter, though of a slightly different nature, between two different discourse groups was recently referred to by William Bright (1996). Giving his view of 30 years of American linguistics, he referred to the following extract from a letter written by Chomsky,

> . . . the level of rumour-mongering and of personal hostility . . . outright falsification so scandalous that they raise serious questions about the integrity of the field . . . I do not want to be associated with a journal . . . . which publishes flat lies . . . couched in rhetoric of a sort that might be appropriate to some criminal, but that one is surprised to find in a scholarly journal.

No wonder Chomsky never published in the journal, not because he was kept out but he decided to keep himself out. Gate-keeping can obviously work both ways.

Hegemony and World Englishes – Generic Variation and Control

Another important aspect of generic control raises the issue of hegemonic attitude to maintain generic standards, which in much of contemporary discourse and genre studies are dominated and even determined by essentially Western [illegible] dominant and widely

used global language for academic as well as professional purposes, it is no longer the sole property of any one community of people, be they English, American, Australian or any other. Like cricket, English has also become more universal not only in usage but also in its character. True to the reality of present-day variation in English, one needs to think in terms of world Englishes, rather than English as a single monolithic variety of English (for a detailed discussion and references see Kachru, 1986, 1994 and 1996). This variation in the use of English across the globe is getting increasing recognition in the sociolinguistic literature in the last decade or so; however, in some of the genres, especially used in the academia, the power to control and maintain generic standards can be, and often is, interpreted in terms of the dominant community, which undoubtedly happens to be a Western community. Anything which appears to be different from the norms set by the dominant community is viewed as deficient and in need of correction.

In some areas, genre writers have become increasingly sensitive to local knowledge and have started constructing, interpreting and using genres in forms which display such sensitivities, especially in the case of advertising and some other business genres, where it has become an established practice now to develop local teams to act alongside the expatriates in most of the multinational advertising companies. The reason for such sensitivities is also not difficult to understand. In the case of academic genres, especially in research publications, the politics is still controlled by those who have the power. Much of the academic discourse still fails to acknowledge the sources of variations, especially those of marginality and excluaion, giving the impression that there is, or should be, no variation in the way genres are constructed, interpreted and used.

Implications for Language Teaching and Learning

What are the implications of all this for language teaching? Applied genre analysis, unlike many other analytical frameworks, is neither static nor prescriptive. Potentially, it is dynamic and explanatory. It is for the language teacher to use it the way one would like to use it, for innovative exploitation of generic resources or for a limited exposure to standardized generic contexts. Although it is essential for the learner to be familiar with specific generic conventions associated with a particular professional setting, it is neither necessary nor desirable to restrict the experience of linguistic behaviour to just the conventionalized and standardized aspects of genre construction and use.

How can one bring in creativity in genre-based language teaching and learning? Since genre analysis gives a grounded description of linguistic behaviour in professional settings, it is possible to bring in a fair amount of creativity in language teaching by adjusting communicative purposes, the nature of participation in a particular communicative setting, the social and professional relationship between the participants taking part in a particular genre-construction exercise, and above all, by bringing in variability in the use of generic strategies to achieve the same communicative purposes.

There are two schools of thought, I should say. Those who believe in the explicit teaching of genres, especially the regularities of textual form and typifications, and others who see this as too constraining and advocate free expression. The truth, however, rests somewhere in the middle. All genres, primary as well as secondary, involve regularities and, hence, these regularities must be learnt by anyone who has even the slightest ambition of being part of any specialist disciplinary community. As Bakhtin (1986: 80) points out 'genres must be fully mastered to be used creatively.'

However, in order to make this happen, the first prerequisite is to have an awareness of the conventional knowledge that is situated within a specific disciplinary genre or a 'system of genres.'

Bazerman (1993: viii) attempts to resolve this tension between institutionalized expression and individual expression when he points out,

> . . . the individual learns to express the self against the compulsive society . . . We are not ourselves because we set ourselves apart from each other. We become ourselves as we realize ourselves in relation to each other. The social is everything we do with each other and what we become as we do it. We individuate by identifying ourselves on a social landscape, a landscape come to know as we interact with it. We discover and create ourselves and others by what we do with each other.

There are at least three things which stand out clearly from the foregoing discussion. First, language learners need to become aware of the conversations of the disciplinary community to which they aspire to be members of, which could be done through 'centripetal participation in the learning curriculum of the ambient community' (Lave and Wenger, 1991: 100). Second, acquisition of genre knowledge, which leads to an understanding of generic integrity, is necessary but not sufficient for any subsequent exploitation or manipulation of generic conventions. And, finally, genre knowledge should be best viewed as a resource to exploit generic conventions to respond to recurrent and not so recurrent rhetorical situations, rather than a blueprint for replication.

On the Complexity of Discourse Complexity: A Multidimensional Analysis

Douglas Biber

1. Introduction

There has been considerable interest within linguistics, psychology, and education concerning the linguistic characterization of discourse complexity. Although most of this research takes a comprehension perspective, addressing the question of what linguistic characteristics of a text make it more or less understandable or readable, there are also two major production perspectives on this issue: complexity differences in the language produced by different social groups, and complexity differences in the language produced in different situations. The present article focuses on the analysis of linguistic complexity across situations of use.

Much research on text comprehensibility has been motivated by an applied interest in the linguistic factors influencing the readability of a text (see e.g., Klare, 1984, for on overview), whereas other processing research has been theoretically motivated, analyzing the influence of more-or-less derivationally complex linguistic structures on performance. These two perspectives are combined in the recent collection of papers edited by Davison and Green (1988). Readability research has long recognized that lexical and structural factors make separate contributions to the overall complexity of a text; the recent papers by Frazier (1988) and Smith (1988) futher claim that there are different kinds of structural complexity involved in the syntactic processing of sentences.

Variation in discourse complexity across social groups is often assoctaied with the proposals of Bernstein (1962, 1970), who posited the existence of two competing "codes" – "restricted" and "elaborated" – and attempted to characterize the discourse of different social groups with respect to these codes (cf. the critique

Source: *Discourse Processes* vol. 15, 1992, pp. 133–163

by Dittmar, 1976). Studies analyzing the linguistic complexity of texts produced by different social groups have considered both structural and lexical features. For example, Poole (1973, p. 98) considers 19 "indices of code elaboration," including "indices of structural complexity" (such as the frequencies of subordinate clauses and relative clauses), "indices of language elaboration and modification" (such as the frequencies of total adjectives and adverbs), and "indices of verb complexity" (such as the frequency of passive verbs and preverb length). Van den Broeck (1977) focuses on five measures of complexity: mean length of T-unit (i.e., a main clause and all associated dependent clauses), a subordination index, a multiple embedding index, a passivization index, and the ratio of agentless passives to *by*-passives. Findings have not been consistent in this research area, and further research is required to investigate the kinds and degree of complexity differences across social groups.

The present article, however, approaches discourse complexity from the perspective of differences across situational varieties, or "registers," rather than taking a social or psycholinguistic perspective. This perspective adopts a product (rather than process) approach, focusing on the linguistic characteristics of texts produced under differing situational constraints and purposes. For example, many studies have claimed that written texts are more structurally complex than spoken texts because authors have more time for production in typical writing situations than speakers in typical speaking situations. Similarly, studies have claimed that speakers with informational purposes will produce more complex texts than speakers with personal purposes.

Although most studies focusing on speech and writing have reached the overall conclusions that writing is more complex, elaborated, and explicit than speech (e.g., DeVito, 1967; O'Donnell, 1974; Olson, 1977), some studies reach quite different conclusions; for example, Poole and Field (1976) and Halliday (1979) claim that speech is more structurally complex than writing. In part, these contradictory findings can be attributed to the failure to control for the kind of text being analyzed (cf. the critiques by Tannen, 1982, and Biber, 1986, 1988). However, they also reflect our incomplete understanding of the linguistic characteristics of discourse complexity. De Beaugrande and Dressler (1981, p. 45) make the general comment that it would be "wrong to imply that the production and reception of texts are well explored at this time. . . . The true complexity of the operations involved doubtless exceeds by several orders of magnitude the most complex models developed so far."[1]

In a series of recent studies (Biber 1986, 1988; Finegan & Biber, 1986), I analyze several linguistic correlates of discourse complexity within a multidimensional model of linguistic variation among English registers. Biber (1986) identifies three major "dimensions" of variation among spoken and written registers and finds that complexity features are associated with all three. Finegan and Biber (1986) further analyze the complexity features included in Biber (1986), showing that discourse complexity is at least a two-dimensional construct.

Biber (1988) uses an exploratory factor analysis to identify six basic dimensions of variation among registers in English. The study analyzes the distribution of 67 linguistic features across 481 texts taken from 23 spoken and written registers

(e.g., academic prose, press reportage, conversation, radio broadcasts). The dimensions have both linguistic and functional content. The linguistic content comprises a group of linguistic features (such as pronouns, hedges, present tense verbs) that co-occur with a markedly high frequency in texts. These co-occurrence pattens are identified quantitatively by the factor analysis. The functional content of a dimension is based on the assumption that linguistic co-occurrence reflects shared function; thus, each dimension is interpreted to characterize the situational, social, and cognitive functions most widely shared by the co-occurring linguistic features.

Although these dimensions represent a wide range of linguistic features and functions, they include many features associated with discourse complexity, and they confirm the finding that discourse complexity is a multidimensional construct that interacts in intricate ways with other functions. For example, different types of dependent clauses, which have traditionally been regarded as being among the most important indicators of discourse complexity, are found on all six of the dimensions. On the first dimension, causative subordination, sentence relatives, and WH clauses co-occur with interactive and involved features (as opposed to features marking informational integration); on the second dimension, present participial clauses co-occur with narrative features; on the third dimension, WH relative clauses function to mark an explicit and elaborated style of reference (as opposed to situated reference); on the fourth dimension, infinitives and conditional adverbial clauses co-occur with modals and suasive verbs marking an overtly persuasive and argumentative style; on the fifth dimension, past participial postnominal clauses and past participial adverbial clauses co-occur with passive constructions and conjuncts as markers of a technical, impersonal style; and on the sixth dimension, *that* complement clauses to verbs, *that* complement clauses to adjectives, and *that* relative clauses on object position co-occur with demonstratives, final prepositions, and existential *there*, reflecting an on-line informational focus. (These interpretations are based on the shared communicative functions of the co-occurring features on each dimension and analysis of the distribution of features across genres; a full discussion of the interpretations is given in Biber, 1988.)

The approach used in Biber (1988) might be labeled a macroscopic, exploratory approach. It is macroscopic in that it analyzes a broad range of linguistic features representing many grammatical classes and discourse functions, and it analyzes a broad range of the registers in English. A major advantage of a macroscopic approach is that it enables analysis of a discourse system relative to a variety of other interacting systems. Thus, Biber (1988) shows that the system of discourse complexity interacts in important ways with a number of other discourse systems, including interactiveness and personal involvement, informational focus, narrative focus, marking of reference, persuasive stance, and impersonal or technical style. The underlying assumption of this approach is that discourse systems are not autonomous; but rather that they represent a series of interlocking form/function sets that can only be fully understood by considering their relation to the whole range of varying linguistic features.

A macroscopic approach can be usefully complemented, though, by more detailed analyses of particular systems, because the functional interpretation of macroscopic co-occurrence patterns depends on prior analysis of the form/function associations within each system.[2] It is for this reason that the present study focuses exclusively on the system of discourse complexity.

The approach used in Biber (1988) is exploratory in that it does not test particular hypotheses concerning the dimensions; rather, the primary statistical procedure (exploratory factor analysis) identifies a set of co-occurrence patterns that fit the data, and the researcher then must interpret those patterns post-hoc. There are two potential problems with an exploratory approach: (a) the analysis can capitalize on chance co-occurrence patterns,[3] and (b) certain results can be difficult to interpret because they have little basis in prior research studies. Thus for some analyses a theory-based approach is preferable to an exploratory one, because it is more constrained, less likely to capitalize on chance variation, and directly interpretable. In a theory-based approach, multidimensional models are proposed on theoretical grounds, and statistical procedures (such as confirmatory factor analysis) are used to test the adequacy of each model and compare the relative strengths of competing models. In this case, only those models that have a solid theoretical grounding are tested, and the functional interpretation of the dimensions in a model is carried out before the statistical analyses.

The present study thus differs from the analysis in Biber (1988) in two respects: it focuses exclusively on linguistic features associated with discourse complexity, and it adopts a theory-based rather than exploratory approach. It builds directly on that previous study, however, by testing several of the associations among complexity features indicated there.

2. Overview of the Study

The present study analyzes the distribution of 33 linguistic markers of complexity across 23 spoken and written registers. If discourse complexity is a single, unified construct, and all kinds of texts are complex (or not) in the same way, then all 33 of these linguistic features should be distributed on a single dimension of variation. However, if these features instead comprise distinct co-occurence patterns. then a multidimensional account of discourse complexity is required. The exploratory analyses in Biber (1986, 1988) and Finegan and Biber (1986) indicate that this latter possibility is the case; that discourse complexity is a multidimensional construct. In the present analysis I statistically compare a unidimensional model with several multidimensional models hypothesized on theoretical grounds, using confirmatory factor analysis to determine the relative strengths of each competing model. The analysis confirms the earlier findings concerning the multidimensional nature of discourse complexity and identifies a particular five-dimensional model as the most adequate representation of the parameters of complexity in these data.

2.1 Texts Used in the Analysis

The texts used in the study are summarized in Table 1. These texts represent variation along several situational parameters relating to discourse complexity, including:

1. Opportunity for careful production and revision versus the demands of online production (e.g., an academic paper vs. academic lecture);
2. Topic and purpose (e.g., an academic paper with an informational purpose vs. a face-to-face conversation where the focus is on interpersonal concerns);
3. Opportunity for interaction and clarification; and
4. The possibility of direct reference to the physical and temporal situation.

Table 1: Distribution of texts across 23 registers

Register	No. of texts
Written – Registers 1–15 From the LOB Corpus	
1. Press reportage	44
2. Editorials	27
3. Press reviews	17
4. Religion	17
5. Skills and hobbies	14
6. Popular lore	14
7. Biographies	14
8. Official documents	14
9. Academic prose	80
10. General fiction	29
11. Mystery fiction	13
12. Science fiction	6
13. Adventure fiction	13
14. Romantic fiction	13
15. Humor	9
16. Personal letters	6
17. Professional letters	10
Spoken – From the London-Lund Corpus	
18. Face-to-face conversation	44
19. Telephone conversation	27
20. Public conversations, debates, and interviews	22
21. Broadcast	18
22. Spontaneous speeches	16
23. Planned speeches	14
Total	481
Approximate Number of Words	960,000

For example, regarding No. 3 and No. 4, referents must be clearly specified in written exposition, because reader and writer do not typically share space

and time, and they cannot easily interact; in contrast, referents can be less fully specified in face-to-face conversation, because both speaker and hearer can rely on a directly shared space and time, and hearers can directly request clarification.)

By analyzing the linguistic forms typically found in a number of different registers, associated with different production opportunities, communicative purposes, and interactional possibilities, it is possible to analyze the various types of discourse complexity from a textual perspective. The texts included in the present study include many combinations of these situational parameters, as illustrated by Table 2.

Table 2: Summary of some situational differences among selected registers used in the study

	Production	Purpose	Interaction
Academic prose, official docs., press editorials	Careful production and revision	Informational exposition	Minimal
Fiction	Careful	Aesthetic	Minimal
Speeches, interviews	On-line	Informational	Moderate
Letters	Moderately careful	Interpersonal and affective	Moderate
Conversations	On-line	Interpersonal and affective	Extensive

2.2 Linguistic Markers of Discourse Complexity

The present study focuses on 33 linguistic features that have been associated with discourse complexity. The occurrences of these features are counted in each text, and these counts are normalized to frequency per 1,000 words.[4] Table 3 lists the features in groups according to their primary discourse function and grammatical category. The first six features are actually associated with a reduced complexity; these features fall into three groups: structural reduction, less specified reference, and fragmented structure, representing reductions in structural elaboration, specificity, and integration. At the same time, these features reflect more difficult or complex tasks, because they are typically produced in demanding, on-line situations.

The remaining features in Table 3 directly represent increased discourse complexity. These fall into four major groups: integrated structure (features that enable a large amount of informational content to be packed into relatively few words), lexical specificity (features that reflect a careful word choice and words having relatively specific semantic content), passive constructions, and dependent clauses. The category of dependent clauses, which is the feature most frequently associated with structural complexity, actually comprises five subgroups: post-nominal modifying clauses, attitudinal clauses, complement clauses, adverbial clauses, and participial clauses. As noted in Table 3, these are not exclusive categories (e.g., certain participial clauses can also be considered passive construc-

Table 3: List of 33 surface features associated with linguistic complexity

I. Features Associated With Reduced Complexity
- A. Structural reduction
  - 1. *That* deletions
  - 2. Contractions
- B. Less specified reference
  - 3. Pro-verb *Do*
  - 4. Pronoun *It*
  - 5. Demonstrative pronouns
- C. Fragmented structure
  - 6. Clause coordination

II. Features Associated With Increased Complexity
- D. Integrated structure
  - 7. Nouns
  - 8. Prepositions
  - 9. Attributive adjectives
  - 10. Nominalizations
  - 11. Phrasal coordination
- E. Lexical specificity
  - 12. Word length
  - 13. Type/token ratio
- F. Passive constructions (cf. past participial constructions)
  - 14. Agentless passives
  - 15. *By*-passives
- G. Dependent clauses
  - G1. Structural elaboration of reference – postnominal modifiers (cf. participial postnominal clauses)
    - 16. WH relative clauses on subject position
    - 17. WH relative clauses on object position
    - 18. "Pied piping" relative clauses
    - 19. *That* relative clauses on object position
    - 20. *That* relative clauses on subject position
  - G2. Attitudinal clauses
    - 21. Sentence relatives
  - G3. Complement clauses
    - 22. WH clauses
    - 23. *That* complement clauses to verbs
    - 24. *That* complement clauses to adjectives
    - 25. Infinitives
  - G4. Adverbial clauses (cf. participial adverbial clauses)
    - 26. Conditional adverbial subordination
    - 27. Causative adverbial subordination
    - 28. Concessive adverbial subordination
    - 29. Other adverbial subordination
  - G5. Participial clauses
    - 30. Present participial postnominal clauses
    - 31. Past participial postnominal clauses
    - 32. Present participial adverbial clauses
    - 33. Past participial

All of the features in Table 3 are surface structure markers, and as such they are not fully representative of the linguistic correlates of discourse complexity. A complete model would include features representing cohesion, informational packaging (e.g., given vs. new information, topic, theme), and rhetorical organization. The present article is restricted to a comparison of models of discourse complexity as marked in the surface structure; but it shows that, even in this domain, discourse complexity is an extremely rich construct, comprising at least five separate dimensions.

2.3 Overview of Confirmatory Factor Analysis

The present investigation of discourse complexity is based on statistical comparisons among a series of confirmatory factor analyses.[5] In a confirmatory analysis, models are proposed on theoretical grounds, and competing models are evaluated in terms of their relative goodness of fit (see, e.g., Long, 1983).

This approach can be best described by contrasting it with a traditional exploratory factor analysis (such as in Biber, 1988). The goal of both techniques is to uncover underlying dimensions of variation, where each dimension, or "factor," is represented by a group of features that co-occur frequently in texts. An exploratory factor analysis identifies factors quantitatively in a way that accounts for the maximum amount of "shared variance" among features, where shared variance corresponds to a frequent co-occurrence of the features in texts. The resulting factors are interpreted on the assumption that features co-occur in texts because they share discourse functions. The theoretical analysis in this case is post hoc. That is, although theoretical considerations are important to an exploratory factor analysis in that they guide preliminary decisions concerning the texts and linguistic features to be included, the statistical analysis itself is not constrained by theory, and thus it can build on chance correlations among features as well as theoretically significant correlations.

In contrast, a confirmatory factor analysis can be motivated at all stages by theoretical considerations. Similar to exploratory factor analysis, these include, first of all, decisions concerning the texts and linguistic features to be analyzed. However, when using confirmatory techniques, the statistical analysis itself can be constrained by theoretical considerations to determine the number of factors, the particular features associated with each factor, and whether the factors are intercorrelated or not. The strength of this approach is that a number of competing models, each motivated on theoretical grounds, can be statistically compared to determine which best fits the data. Thus, when there is adequate background research to enable sound theoretical predictions, a confirmatory approach is preferable to an exploratory one.

The confirmatory factor analyses were computed using the LISREL VI statistical package (Jöreskog & Sörbom, 1984). The analyses are based on a correlation matrix of all linguistic features. For each particular model, the researcher specifies various theory-based restrictions, such as the number of factors and the particular features included on each factor; the LISREL statistical procedure then estimates the statistical parameters of that model, including the actual

"loadings" of the features on the factors and the intercorrelations among the factors. Factor loadings, which can range from −1.0 to +1.0, measure the strength of the association between a factor and a linguistic feature. If theoretical considerations predict that a feature is not associated with a given factor, then the researcher specifies the loading of that feature on that factor to be 0.0. Otherwise, LISREL estimates the magnitude of the loading.

In a later step, the estimated parameters are used to generate a matrix of *predicted* correlations among the linguistic features. The adequacy of each model can be evaluated by comparing the original correlation matrix to the predicted correlation matrix; if the two matrices are highly similar, then the proposed model is judged to be statistically adequate. This approach can also be used to compare the relative strengths of competing models – the model that produces the best predicted fit to the original correlation matrix is considered the strongest. A more detailed discussion of the statistics used to evaluate and compare statistical models is given in the Appendix, but the discussion in the following sections does not assume familiarity with those details.

2.4 Theoretical Models Indicated by the Exploratory Analysis in Biber (1988)

As noted in Section 1, many features associated with discourse complexity were included in the exploratory analysis of Biber (1988). The four models of discourse complexity tested in the present study are based on structural and functional criteria identified in this earlier analysis. (In addition, I test a one-dimensional model here because of its widespread adoption in previous research.)

The first model reflects a basic three-way distinction in the 1988 analysis, among complexity features marking reduced structure, elaborated structure (i.e., the various kinds of dependent clauses), and integrated structure. Although this model receives strong support from structural considerations, because it groups all dependent clauses on a single dimension, it is not well-supported functionally, because dependent clauses are distributed on all six speech/writing dimensions in the 1988 analysis. The earlier analysis does indicate, however, a fundamental distinction between referential elaboration (Dimension No. 3 in the 1988 analysis) and other types of elaboration. The second complexity model tested here thus distinguishes between referential elaboration and other kinds of "framing" elaboration (in addition to the dimensions of reduced structure and integrated structure).

The other two models are five-dimensional. The first of these separates passive constructions (both main clause and dependent clause) from the other four dimensions, based on the patterning of passive constructions as a separate dimension in the 1988 analysis (Dimension No. 5). Finally, a second five-dimensional model is tested that divides "framing" elaboration into two groups on structural grounds: adverbial clauses versus complement clauses. This division is indicated in part by the 1988 analysis (e.g., *that* clauses as verb complements and as adjective complements are two of the main features in Dimension No. 6), but it is based primarily on structural considerations.

It is possible to propose other models on structural grounds (e.g., distinguishing participial clauses from other types of dependent clauses). However

these additional models are not indicated in the exploratory 1988 analysis, and there is no other evidence that these groupings are functionally as well as structurally coherent; thus, they do not have sufficient theoretical basis for consideration here.[6]

Table 4 presents summary statistics for all five of the models analyzed in the present study. In the following sections, the relative strengths of each model will be discussed in turn.

Table 4: Goodness-of-fit statistics for five models of discourse complexity

Model M1. One dimension: Reduced versus elaborated and integrated structure

Chi-square M1	3435.0	($df = 495$)
Delta	.594	
GFI*	.632	

Chi-square difference M0 – M1 = 5036 ($df = 33$, $p < .001$)

Model M3. Three dimensions: Reduced structure/specificity, Elaborated structure, and Integrated structure

Chi-square M3	3163.4	($df = 492$)
Delta	.626	
GFI	.670	

Chi-square difference M1 – M3 = 272 ($df = 3$, $p < .001$)

Improvement in Delta M3 – M1 =.032 (3.2%)

Model M4. Four dimensions: Reduced structure/specificity, Structural elaboration of reference, Integrated structure, and "Framing" structural elaboration

Chi-square M4	3018.8	($df = 489$)
Delta	.644	
GFI	.691	

Chi-square difference M3 – M4 = 144 ($df = 3$, $p < .001$)

Improvement in Delta M4 – M3 =.018 (1.8%)

Model M5a. Five dimensions: (a) Reduced structure/specificity, (b) Structural elaboration of reference, (c) Integrated structure, (d) Adverbial structural elaboration (causative, conditional, concessive, and "other" adverbial clauses; present and past participial adverbial clauses; sentence relative clauses), and (e) Complement clauses (WH clauses, THAT clauses as complements to verbs and adjectives, infinitives)

Chi-square M5a	2989.4	($df = 485$)
Delta	.647	
GFI	.694	

Chi-square difference M4 – M5a = 29 ($df = 4$, $p < .001$)

Improvement in Delta M5a – M4 =.003 (0.3%)

(*Table 4 continued*)

(*Table 4 continued*)

Model M5b. Five dimensions: Reduced structure/specificity, Structural elaboration of reference, Integrated structure, "Framing" structural elaboration, and Passive constructions

Chi-square M5b 2600.3 ($df = 485$)

Delta .693
GFI .730

Chi-square difference M4 – M5b = 419 ($df = 4$, $p < .001$)
Improvement in Delta M5b – M4 = .049 (4.9%)

Chi-square difference M5a – M5b = 389 ($df = 1$, $p < .001$)
Improvement in Delta M5b – M5a = .046 (4.6%)

Chi-square difference M1 – M5b = 835 ($df = 10$, $p < .001$)
Improvement in Delta M5b – M1 = .099 (9.9%)

Correlations Among Factors:

	Reduced	Ref. Elab.	Integrated	Framing Elab.	Passives
Reduced	1.00	–	–	–	–
Ref. Elab.	–0.41	1.00	–	–	–
Integrated	–0.83	0.51	1.00	–	–
Framing Elab.	0.94	–0.22	–0.67	1.00	–
Passives	–0.69	0.39	0.79	–0.58	1.00

3. Models of Surface-Structure Discourse Complexity

3.1 A One-Dimensional Model: Reduced versus Elaborated Structure and Specificity

The first model to be considered is a one-dimensional (1-D) model of discourse complexity (model M1). The exploratory analysis in Biber (1988) does not provide theoretical support for this model, but because it is the model often assumed in research studies, it is considered here. According to this model, discourse complexity is a unitary construct, and thus all linguistic features associated with discourse complexity should load onto a single factor.

A summary of the goodness-of-fit of the 1-D model is presented in Table 4. The 1-D model is statistically significant in that it represents a significant improvement over the "null model," which is a model that specifies that there are no relationships among these linguistic features. (The chi-square difference score of 5036 shows this to be a significant model.) The model is also a theoretically meaningful one in that it accounts for a large portion of the observed correlations. This is indicated by the Delta coefficient value of .594, which shows that 59.4% of the relationships among these linguistic features is accounted for by the 1-D model. The 1-D model is thus a significant and theoretically meaningful one; the following sections show, however, that it is less adequate than multi-

3.2 A Three-Dimensional Model: Reduced Structure and Specificity, Elaborated Structure, and Integrated Structure

The first alternative model to the 1-D model tests whether the features marking structural elaboration and those marking informational integration should be considered as separate constructs. The 1-D model is based on the claim that these two groups of features represent a single underlying construct, discourse complexity, which is directly opposed to features marking reductions in structure, and specificity. The model tested in this section is based on the claim that integrated structure, elaborated structure, and reduced structure represent three separate constructs or dimensions. Features such as *that* deletions, contractions, and the pro-forms *do* and *it* are specified as representing the reduced structure dimension. Features such as nouns, prepositions, attributive adjectives, and nominalizations reflect a high informational focus and a relatively dense integration of information in a text; long words and diversified vocabulary (i.e., high type/token ratio) reflect a careful, precise word choice. Together, these features represent a dimension marking integrated structure. Finally, all forms of structural dependency, including relative clauses, complement clauses, and adverbial subordinate clauses, are specified as representing the elaborated structure dimension.

In one form of this model, we might hypothesize that these three dimensions are completely independent (or "orthogonal"); according to this hypothesis, structural reduction, integration, and elaboration are unrelated in their distributions and functions. It is possible to test this hypothesis by specifying the intercorrelations among the factors to be zero. The computed goodness-of-fit statistics for this model, however, show that it is less adequate than the 1-D model; the 3-D model with uncorrelated factors has a chi-square value of 4032.1, resulting in a Delta coefficient of .524 (52.4%), which represents a poorer fit than the 1-D model (which had a Delta coefficient of 59.4%).

A more plausible model is the 3-D model allowing intercorrelations among the factors, which represents the claim that integrated structure, elaborated structure, and reduced structure are separate but interrelated dimensions. The statistical summary of this model is given in Table 4 (Model M3). The chi-square value of 3163.4 ($df = 492$) represents a significant improvement over the 1-D model, and the Delta value of 62.6% represents a 3.2% increase over the 1-D model. The 3-D model with correlated factors thus provides a significantly better representation of the relationships among these linguistic features than the 1-D model.

3.3 A Four-Dimensional Model: Reduced Structure and Specificity, Structural Elaboration of Reference, Integrated Structure, and "Framing" Structural Elaboration

The dependent clauses included in this study can be divided into several different subclasses. The exploratory analysis in Biber (1988) indicated that one of the basic divisions among dependent clauses is between postnominal modifying

clauses, which specify and elaborate the identity of referents, and what I call here "framing" dependent clauses, which provide discourse frames of various types. Postnominal clauses include WH relative clauses, *that* relative clauses, and participial postnominal modifiers (clauses with "WHIZ-deletion"). All of these modify a noun head, specifying the reference of that noun or providing elaborating details about that noun. The framing clauses are less closely related structurally; they include sentence relatives, WH clauses, *that* complement clauses, infinitives, and various types of adverbial subordination. These can be considered "framing" in the sense that they either provide a discourse frame for a portion of text (as in the case of many types of adverbial subordination; see, e.g., Ford & Thompson, 1986; Thompson, 1983, 1985), or they provide an overt assessment of the speaker/writer's stance (in the case of sentence relatives, *that* complement clauses, and WH clauses; see Beaman, 1984; Quirk, Greenbaum, Leech, & Svartvik, 1985; Winter, 1982).

Model M4 in Table 4 presents the summary statistics for this four-dimensional model in which referential structural elaboration is separated from "framing" structural elaboration. The chi-square value of 3018.8 represents a statistically significant improvement over the 3-D model, and the Delta value of 64.4% represents a 1.8% improvement.

Consideration of the loadings for the features in this model (not presented in Table 4) shows that the Framing Factor is relatively diverse. Four features have strong loadings over .40: sentence relatives, WH clauses, conditional adverbial subordination, and causative adverbial subordination. However, the other features have relatively low loadings, some near zero (*that* complements, infinitives, and concessive adverbial subordination), indicating that this dimension is less well-defined than the others.

3.4 Five-Dimensional Models

It was noted previously that there are a number of ways that the dependent clauses included in the study can be subgrouped, and given that the "framing" elaboration dimension is relatively diverse, alternative models with theoretical support are worth further investigation. One of these other groupings, separating out complement clauses as a separate factor, is indicated in the 1988 exploratory analysis and is thus tested here. The summary of Model M5a in Table 4 shows, however, that this model represents a chi-square difference of only 29 over Model M4; this is a statistically significant improvement, but it corresponds to an improvement in Delta of only 0.3%. This model thus contributes little towards further understanding of dependent clauses.

A second five-dimensional model separates out passive constructions including agentless passives, *by*-passives, past participial postnominal clauses, and past participial adverbial clauses) as a separate factor. This model receives strong support from the 1988 analysis, in which passive constructions constituted the major features on one of the speech/writing dimensions. The summary of Model M5b in Table 4 shows that it provides the best fit of all models considered here. It represents a significant improvement over all other models

relatively strong improvement in Delta over other models – nearly a 5% improvement over the 4-D model, and nearly a 10% improvement over the 1-D model.

Table 4 also shows the intercorrelations among the factors in Model M5b. These intercorrelations are moderately high. For the Passive factor, they range from .79 (62.4%) to .39 (15.2%), whereas those for the Reference factor range from .51 (26%) to –.22 (only 4.8%). The Framing Elaboration factor shows an extremely high correlation of .94 (88%) with the Reduced factor, indicating an extremely strong positive relationship between structural reduction and a type of structural elaboration. That is, framing structural elaboration is strongly associated with these forms of reduced structure and specificity, indicating that these two groups of features are commonly used in the same communicative situations.[7]

The factor loadings for this last five-dimensional model (Model M5b), given in Table 5, indicate that the factors are relatively well-defined. On the Reduced Structure factor, all loadings are over .50; on the Integrated Structure factor, all loadings except one are over .50; and on the Passive factor, three of the four features have loadings over .70. In contrast, the Referential Elaboration factor shows some lower loadings, with *that* relative clauses having a loading near 0.0,[8] and the Framing Elaboration factor is the least coherent in the analysis, with five features having loadings below .20.

Overall, Model M5b accounts for 69.3% of the relationships among these linguistic markers of complexity (or 73% according to the GFI estimate). This leaves approximately 30% of the variance unaccounted for. In part, this remaining variance is due to the particular functions of individual features apart from their shared functions; and in part, this remaining variance could represent additional parameters of complexity not isolated here. In particular, the Framing Elaboration factor needs further investigation, to identify the salient subfactors represented there and additional linguistic features associated with those factors. Model M5b, though, accounts for a large amount of the shared variance among these linguistic features and thus provides a good first model of the dimensions of discourse complexity with respect to these surface structure features in English. In the following section, I consider the linguistic characteristics of different spoken and written registers with respect to these dimensions.

Table 5: Factor loadings for Model M5b, with five dimensions: reduced structure/specificity, structural elaboration of reference, integrated structure, "framing" structural elaboration, and passive constructions

	Reduced	Reference Elab.	Integration	Framing Elab.	Passive
1. *That* deletions	.83	.0	.0	.0	.0

33.	Past. part. adv. cls.	.0	.0	.0	.0	.42

4. The Discourse Complexity of Spoken and Written Registers

Two conclusions resulting from the model testing carried out in Section 3 are:

1. Discourse complexity is not a single, unified construct; rather, the results here indicate five separate but interrelated dimensions of complexity based on surface structure features, and consideration of linguistic features associated with information packaging, cohesion, and rhetorical organization will likely reveal additional dimensions.
2. Given this multidimensional nature of discourse complexity, a complete description of a text (or register) cannot focus exclusively on the degree of complexity; rather, the complexity of a text is described here within a five-dimensional space, so that texts are complex in different ways as well as to differing extents.

In the present section, I use this five-dimensional model to provide a preliminary description of the discourse complexity of spoken and written registers. To do this, a dimension score for each complexity dimension was computed for each text, by summing the frequencies of the linguistic features on that dimension. For example, the dimension score for the Reduced Structure factor is computed by summing the frequencies of *that*-deletions, contractions, pro-verb *do*, pronoun *it*, demonstrative pronouns, and clause coordination for each text. Before the dimension scores are computed, the individual frequency counts are standardized to a mean score of 0.0 and a standard deviation of 1.0, so that all counts have comparable scales.[9] The dimension scores are used for relative comparisons among texts (rather than for absolute characterizations). Individual texts can be compared directly in terms of their dimension scores, and registers can be compared in terms of their mean dimension scores.

Table 6 presents statistics from a General Linear Models procedure for each of the five dimension scores as predictors of the differences among 14 spoken and written registers. The F scores show that there are significant differences among the mean scores of these registers with respect to all five dimensions, and the r^2 scores show that all five dimensions are strong predictors of the register differences. Three of the dimensions – Reduced Structure, Integrated Structure, and Passive Constructions – are extremely strong predictors, having r^2 values ranging from 59.5% to 83.8%. The other two dimensions – Elaboration of Reference and Framing Elaboration – are weaker but still relatively strong predictors, with r^2 values of 36.6% and 32.1%.

Figures 1 to 5 present plots of the dimension scores of these 14 spoken and written registers. The figures can contribute to the interpretation of the factor analysis by identifying the situations associated with markedly high or low occurrence of each type of discourse complexity. That is, although the factors can be interpreted directly based on previous research, those interpretations can be extended by analysis of the distribution of each complexity type across texts.

From a quick overview of Figures 1 to 5, it is apparent that each of these five types of complexity is distributed differently among registers, confirming the claim that each dimension is responsive to different functional considerations. Figure 1 shows that the Reduced Structure Dimension is strongly associated

Table 6: Statistical significance and importance among the mean scores of 14 spoken and written registers with respect to the five complexity dimensions

Dimension	$F(13, 337)$	$p <$	r^2
Reduced structure	128.2	.0001	83.8%
Elaboration of reference	14.3	.0001	36.6%
Integrated structure	71.2	.0001	74.2%
Framing elaboration	11.8	.0001	32.1%
Passive constructions	36.4	.0001	59.5%

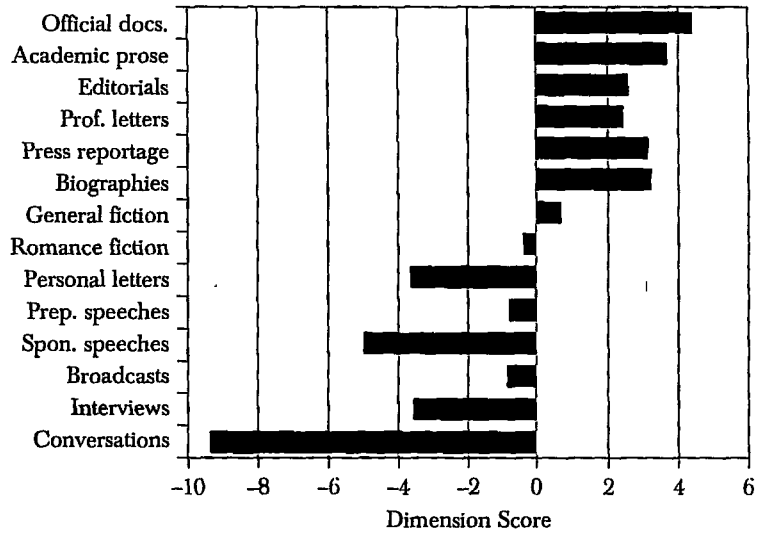

Figure 1: Inverse reduced structure dimension scores for 14 registers

with the mode distinction between speech and writing – all spoken registers have negative scores on this dimension, showing a greater than average frequency of reduced forms, whereas nearly all written registers have positive scores, reflecting a less-than-average frequency of reduced forms. (The poles of this dimension have been reversed, so that negative scores represent high frequencies of reduced features and positive scores represent a marked absence of reduced features.)

However, it would not be accurate to characterize this dimension as a simple distinction between speech and writing. First of all, two written registers have negative scores: a very small negative score in the case of romance fiction (cf. the small positive score for general fiction), and a large negative score in the case of personal letters. In addition, there is a considerable range of values among the negative scores of the spoken registers: from nearly −10 for face-to-face conversations, down to approximately −1 for prepared speeches and broadcasts.

In fact, the distribution of scores along this dimension might be better explained in terms of the interaction between purpose of communication and opportunity for careful production. Conversations are the least formal and least informational register included here, and thus they permit the most reduction in form. In addition, they are produced on-line without prior planning, making it relatively difficult to use fuller forms. Text Sample 1 illustrates reduced forms in a conversational text; these forms (marked in bold) include numerous contractions, as well as deletion of *that* in complement clauses (e.g., *I know <that> one can't . . .*), and frequent use of pronominal *it* and *that* (e.g., *that is a great deprivation*). (This text portion also illustrates the use of Framing Elaboration features, discussed later.)

Text Sample 1: Conversation

(Reduced Structure features are in boldface, Framing Elaboration features are capitalized and italicized, and <O> indicates deleted *that* in complement clauses.

A: **you're** rushing off # – –
B: I was thinking #
B: *THAT IF* I go # .
B: I might get into Sainsbury's *BEFORE* they **close #.**
B: our **housekeeper's** left # –
A: how absolutely awful
B: so . I mean <O> **that** is a – – a great de**privation #** –
A: well it is #
A: **isn't it** # – –
B: she's got a good office job # –
B: good money # –
B: but . I know <O> one can't suppose # –
A: just saying to mine this morning #
A: **I don't** know *WHAT* I'd do *IF* she left # –
A: she will of course #
A: *BECAUSE* she said *WHEN* she came # –
A: *THAT WHEN* the children are old enough #
A: she would get a driving job # .

Interviews and spontaneous speeches are similarly influenced by on-line production, but they have a much more informational purpose and thus show a less frequent use of reduced forms. Planned speeches are less influenced by the production circumstances due to the effect of prior planning, and so they show relatively few reduced forms. (Because there is considerable ellipsis of whole words and phrases in broadcasts, they are actually more reduced in form than their score of –1 indicates.)

The written registers are fairly uniform in their infrequent use of reduced forms, in line with their informational purposes and extensive opportunity for production. However, their scores do range along a continuum: official documents and academic prose with the largest positive scores, corresponding to their extreme informational focus and formality; biographies, press reportage, professional letters, and editorials with relatively large positive scores, corresponding to their relatively informational and formal purposes; general and romance fiction with scores near zero, reflecting their aesthetic purpose and their mixing of narrative with fictional dialogue; and finally, personal letters with a large negative score, reflecting their interpersonal purpose and a relative lack of planning and revision during production.

In contrast, the distribution of scores with respect to the Structural Elaboration of Reference Dimension, shown in Figure 2, appears to be completely unrelated to mode differences (between speech and writing) or to differences in production circumstances. Rather, this type of complexity seems to be strictly related to purpose: informational versus noninformational. Informational purposes require a frequent use of this type of elaboration, whether in speech (interviews,

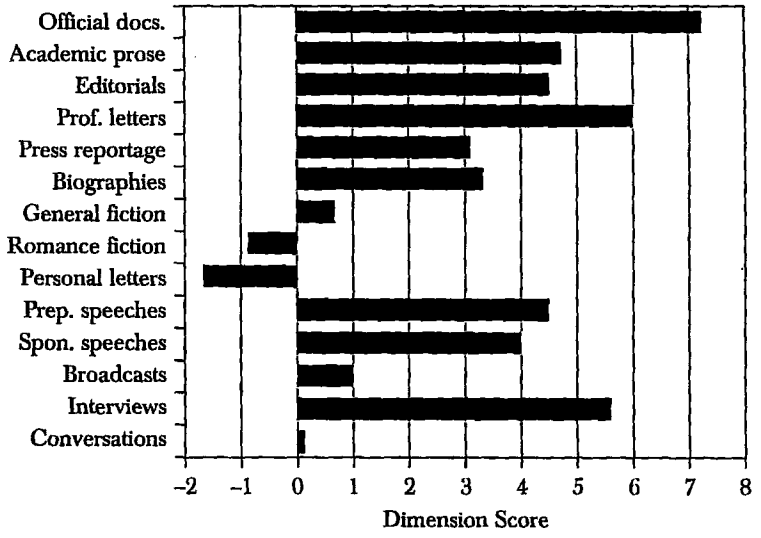

Figure 2: Referential elaboration dimension scores for 14 registers

spontancous speeches, prepared speeches) or in writing (official documents, academic prose, editorials, professional letters, press reportage, biographies). Non-informational purposes, on the other hand, show a markedly infrequent use of these forms, again, whether in speech (conversations and broadcasts) or in writing (fiction and personal letters). The frequent use of these features in informational registers is illustrated in Text Samples 2 and 3, taken from a (written) official document and a (spoken) interview.

Text Sample 2: Official Document

(Referential Elaboration Dimension features are in boldface, Integrated Structure Dimension features are italicized, and Passive Constructions are capitalized.)

Questions about marriage and children WERE again INCLUDED, as they had BEEN *at the 1911 and 1951 censuses* . . . . The *1961 census questions* related *to* all *women* who WERE or had BEEN MARRIED, and so repeated the *enquiry* MADE *fifteen years* earlier *NY the 1946 family census* CONDUCTED *on behalf of* the *royal commission on population.* The *questions about children* . . . extended *to* all *women* **who** WERE or had BEEN MARRIED.

Text Sample 3: Interview

(Referential Elaboration Dimension features are in boldface, and Framing Elaboration features are capitalized and italicized.)

Speaker A:
for instance *WHEN* we're looking #
at the legislative framework **within which**
marketing . operates # –
it will be fairly important #
to – – give # .

our – students # –
a full understanding #
of the – different legal systems # .
operating in different . countries # –
– **which** provide the environment for # –
exporting # – –
or importing indeed # –
SINCE a number of our students **who come from abroad # –**
may be engaged #
in importing . activities #
into their – . – native countries # – –
again #
WHEN one #
is looking at the way **in which** one –
the techniques # .
by which one – analyzes # .
markets #
behaviours #
and social situations # –
– we would – hope #
THAT our students would have **a full understanding** # –
of the cultural differences # –
which – will help them. . . .

Text Sample 2 illustrates the common use of relative clause constructions for referential specificity in official documents (e.g., *all women **who** were or had been married*). Relative constructions are used even more frequently in the portion of an interview given in Sample 3. In this case, these constructions are used both to specify the identity of referents and to provide elaborating details regarding a referent (illustrated in turn by the following two relative clauses: *the – different legal systems **operating** in different . countries # – – **which** provide the environment for # – exporting).*

The distribution of scores with respect to the Integrated Structure Dimension, given in Figure 3, depends on an interaction between communicative purpose and mode, distinguishing informational written registers from all other registers. Thus the informational written registers all show a frequent use of integrative features; these registers include the expository registers (press, official documents, and academic prose) as well as informational narrative (biographies) and informational written interaction (professional letters). The extremely dense use of these features in written informational registers is illustrated by Text Sample 2 (from an official document). These features include nouns, often in noun–noun (–noun) sequences (e.g., *census questions, family census*), attributive adjectives, and prepositional phrases (e.g., *on behalf of the royal commission on population*).

All other registers show an infrequent use of this type of complexity; these include all spoken registers, as well as fictional narrative and personal written interaction (personal letters). With regard to the spoken informational registers (e.g., speeches and interviews), production constraints apparently limit the extent to which information can be carefully integrated; and with respect to the

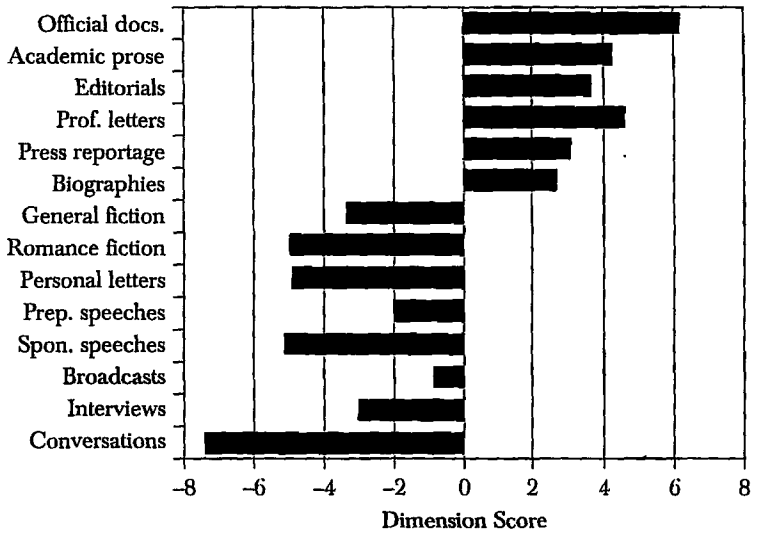

Figure 3: Integrated structure dimension scores for 14 registers

noninformational written registers (e.g., fiction and personal letters), the purpose does not require a dense integration of information.

The "Framing" Structural Elaboration Dimension (Figure 4) seems to be related primarily to communicative purpose, with little relation to mode or production differences. These features are relatively frequent in those registers that promote the expression of personal attitudes, justifications, and feelings: interviews, spontaneous speeches, conversations, professional letters, prepared speeches, and personal letters. They are much less frequent in those registers having informational, impersonal, "factual" purposes, such as press reportage, biographies, and academic prose; and they are markedly infrequent in official documents, which are typically direct statements of "fact" with no acknowledged author. These features are also markedly absent in broadcasts, which are radio reportage of events in progress (sports events, parades, etc.). These texts were recorded in the 1960s, preceding the current practice of interactive, personal reportage of events; these broadcasts are thus similar to official documents in being direct factual reportage with no acknowledged speaker and little personal commentary.

Text Sample 1 illustrates the use of framing elaboration in conversation, Sample 3 illustrates these features in an interview, and Sample 4 illustrates these features in a professional letter. These samples differ in mode and in informational purpose (conversations being spoken and noninformational, interviews being spoken but informational, professional letters being written and informational), but they share a focus on the expression of personal attitudes and opinions with justification for these positions. Several of the framing functions of these elaboration features are illustrated in these text samples. For example, WH clauses and conditional clauses are used to contrast various possible actions or points of

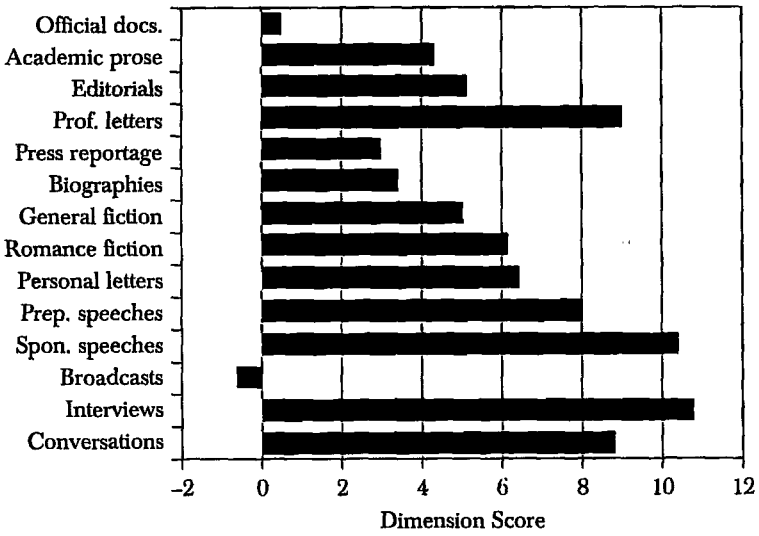

Figure 4: Framing elaboration dimension scores for 14 registers

view (e.g., *I was thinking THAT IF I go I might get into Sainsbury's before they close and I don't know what I'd do IF she left*, from the conversation sample; *for instance WHEN we're looking at the – legislative framework*, from the interview). Causative adverbial clauses are used to justify certain attitudes or opinions, as in the following example from the interview sample, where the speaker justifies a self-correction: *a full understanding of . . . legal systems <provides> the environment for exporting – – or importing indeed – SINCE a number of our students . . . may be engaged in importing activities.* Similarly in the professional letter sample, causative clauses are used to explain the opinion that: *any such drastic change would ultimately require the action of the board of directors BECAUSE if would involve a change in the constitution . . . and BECAUSE any such change would in turn require a vote. That* complement clauses are used to overtly frame an attitude or position relative to a "stance" verb or adjective[10] (e.g., *we would hope THAT our students would have a full understanding*, from the interview sample; and *I understand THAT certain XYZ populations are . . . impacted*, from the professional letter). Thus, although these elaboration features vary in their particular characteristic functions, they share general "framing" uses common in more personal, attitudinal registers.[11]

Text Sample 4: Professional Letter

(Framing Elaboration features are capitalized and italicized.)

. . . Any such drastic change would ultimately require the action of the board of directors *BECAUSE* it would involve a change in the constitution . . . and *BECAUSE* any such change would in turn require a vote . . . *IF* it is not possible *TO* add your concern this year, it would certainly be possible *TO* add it next year . . . Please understand *THAT WHILE* I am sympathetic to what you are trying to achieve, and *THAT WHILE* I understand *THAT* certain XYZ populations are . . . impacted . . . I am not at present entirely in sympathy . . .

Finally, the Passive Constructions Dimension, plotted in Figure 5, seems to reflect quite narrow functional considerations, being frequent only in written informational exposition (official documents, academic prose, and to a lesser extent press reportage and editorials). These features are markedly infrequent in all spoken registers, all narrative registers (fiction and biography), and all written interactional registers (personal and professional letters). Passive features differ from the Integrated features in that they are found only in written exposition rather than in all written informational registers (i.e., including biographies and professional letters). This dimension thus seems to be related specifically to an expository organization of information. Text Sample 2 illustrates the frequent use of passive constructions in official documents.

Thus, each of these complexity dimensions comprises a distinct set of linguistic features having particular grammatical and discourse functions; each dimension defines a unique set of relations among spoken and written registers; and each dimension is responsive to different aspects of the communicative situation, including mode, production circumstances, and purpose. As previously noted, these dimensions define a five-dimensional space of discourse complexity, and the complexity of particular registers can be analyzed within this space – with respect to both the types and extent of complexity.

Figures 6 and 7 plot the five-dimensional complexity profile of 11 registers: six written registers in Figure 6 and five spoken registers in Figure 7. These figures show that registers differ markedly in their complexity characterizations, and that no register is consistently complex with respect to all dimensions. Official documents and professional letters (on Figure 6) can be considered the two most consistently complex registers, but official documents are markedly noncomplex with respect to the Framing Elaboration Dimension, and professional letters are markedly noncomplex with respect to the Passives Dimension.

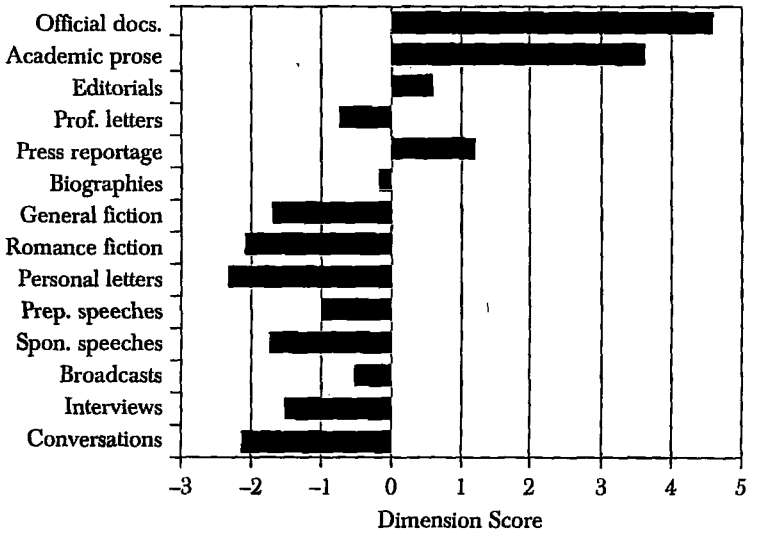

Figure 5: Passive constructions dimension scores for 14 registers

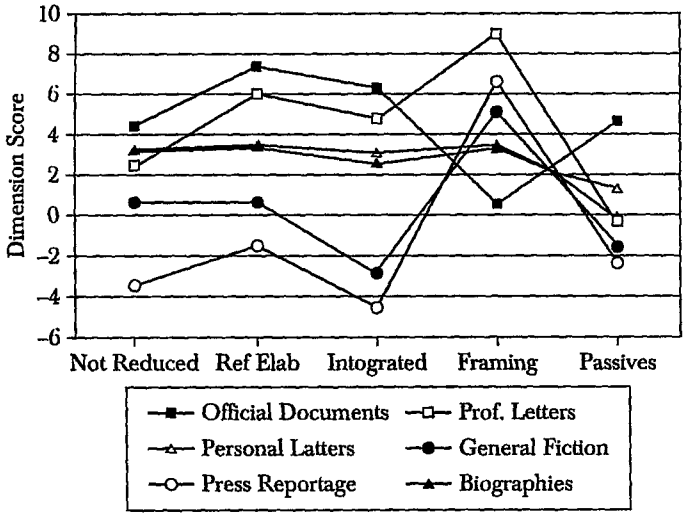

Figure 6: Complexity dimension scores for six written registers

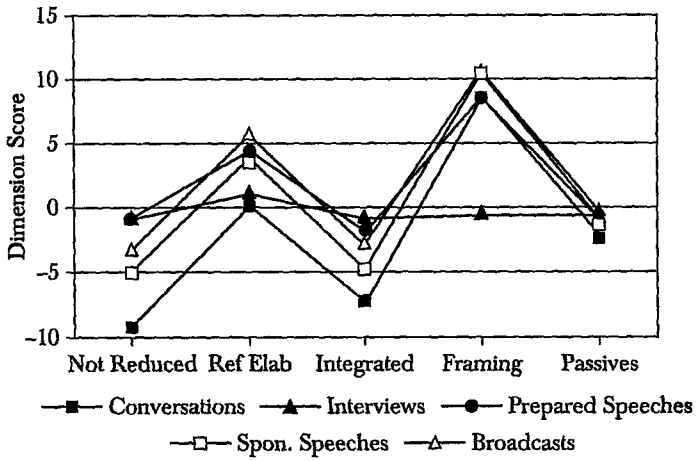

Figure 7: Complexity dimension scores for five spoken registers

In addition, comparison of Figures 6 and 7 indicates a fundamental distinction between the discourse complexities of written and spoken registers: Written registers differ widely among themselves in both the extent and kinds of discourse complexity, whereas spoken registers follow a single pattern with respect to their kinds of complexity, differing only with respect to extent. Thus, Figure 6 shows that written registers use much of the available complexity space defined by these five dimensions. Four basic profiles can be distinguished among the written registers:

1. Noncomplex with respect to the dimensions of Reduced Structure, Referential Elaboration, Integrated Structure, and Passives, but markedly complex

with respect to Framing Elaboration – this profile characterizes personal letters and general fiction, with the only difference between them being that fiction is unmarked (rather than markedly noncomplex) with respect to Reduced Structure and Referential Elaboration;

2. Moderately complex with respect to the first four dimensions (i.e., reduced structure, referential elaboration, integrated structure, and framing elaboration) and noncomplex with respect to the use of passive constructions – this profile characterizes press reportage and biographies, which are very similar to each other in their kinds and extent of complexity;
3. Moderately complex in avoiding reduced structures, highly complex with respect to referential elaboration, integrated structure, and framing elaboration, and noncomplex with respect to the use of passive constructions – this profile characterizes professional letters; and
4. Highly complex with respect to reduced structures (i.e., avoiding them), referential elaboration, integrated structure, and passive constructions, and markedly noncomplex with respect to the use of framing elaboration – this profile characterizes official documents.

In contrast, spoken registers follow a single complexity profile on Figure 7: noncomplex in permitting the use of reduced structures, moderately complex in the use of referential elaboration, noncomplex in the use of integrated structures, highly complex with respect to the use of framing elaboration, and noncomplex with respect to the use of passive constructions. (The only departure from this profile is shown by the broadcasts register, which is unmarked on all dimensions.)

These two figures thus indicate that there is a fundamental difference in discourse complexity associated with the production differences between speech and writing. Written production gives the addressor maximum freedom to manipulate the linguistic characteristics of a text in accordance with a number of situational parameters, including purpose, interactiveness, and degrees of personal involvement. In spoken production, though, the on-line production circumstances apparently restrict the kinds of discourse complexity possible. Thus, Figure 7 shows differences in the *extent* of complexity associated with situational parameters such as purpose and involvement, but only a single basic profile of the *kinds* of complexity associated with the spoken mode.

Overall, the complexity characterizations of registers differ in three respects: (a) the particular dimensions marked as complex or not for each register, (b) the extent to which a register is marked as complex on each dimension, and (c) the number of dimensions on which a register is marked as complex. Both the extent of complexity and the particular type of complexities for a given register are determined by the situational characteristics of that register. However, as previously shown, the exploitation of complexity features is apparently restricted by mode, so that written registers differ greatly among themselves in both the kinds and extents of discourse complexity, whereas spoken registers are mostly restricted to differences of extent.

5. Summary and Conclusion

On the basis of an analysis of many kinds of surface complexity features across many kinds of spoken and written texts, the present study has identified a five-dimensional model as the most adequate for these data, and it has described the complexity characteristics of spoken and written registers with respect to that model. The five dimensions reflect the influence of a number of situational parameters, including production circumstances, purpose, and involvement. None of the dimensions is associated with an absolute distinction between spoken and written texts; rather, mode interacts with other situational characteristics (such as an informational purpose) to determine the relations among registers with respect to these dimensions. However, when all five dimensions are considered together, they identify a fundamental distinction between written and spoken registers: Spoken registers are apparently limited in the kinds of complexity they can exploit, whereas written registers show much greater differences among themselves with respect to both their kinds and extents of discourse complexity.

The study raises several issues requiring further investigation. First of all, the study is based only on surface structure features of English. Inclusion of features relating to information packaging, cohesion, and rhetorical organization would enable fuller models (cf. Biber, in press). Second, some of the dimensions require further analysis even with respect to surface structure features. In particular, the "Framing" Elaboration Dimension should be analyzed further, to better understand the discourse functions underlying this dimension, and to identify any additional dimensions inadvertently collapsed with this one. Third, the situational interpretations in Section 4 are preliminary: more detailed analyses of these features in particular texts will enable a richer interpretation of the situational and functional correlates of each dimension. Finally, the analysis here is based only on the distribution of linguistic features in English texts; further research is required to uncover the dimensions of complexity in other Western and non-Western languages. The present analysis provides a new framework for the analysis of discourse complexity and identifies five important dimensions of complexity in English; additional research is needed to expand this analysis to other discourse systems and languages.

Author's Note

I Would like to thank E. Finegan, J. B. Carroll and an anonymous reviewer for *Discourse Processes* for their helpful criticisms on earlier drafts of this article.

Notes

1. Some previous register-based studies have proposed multiple parameters of variation that include complexity features on different parameters. Chafe (1982) proposes two

parameters (fragmentation versus integration, and involvement versus detachment) on functional grounds: Carroll (1960) and Marckworth and Baker (1974) use multivariate statistical techniques to analyze the parameters of variation among written registers.

2. For example, see the analysis of the "stance" System (including evidentiality and affect) in Biber and Finegan (1989).
3. As shown in Biber (1990), however, the dimensions resulting from the exploratory factor analysis of Biber (1988) do seem to be quite stable and reliable (in that they are replicable in various subsets of the text corpus).
4. The linguistic feature counts were carried out by computer programs, described in Biber (1988, especially Appendix II). The analyses in Biber (1990) indicate that the feature counts are highly reliable across text samples from within texts, and across texts within registers. Apart from extremely common features, such as nouns, verbs, and prepositional phrases, the features have positively skewed distributions. These distributions reflect the fact that these are functional/stylistic markers that occur relatively rarely (or not at all) in the majority of texts but with relatively high frequencies in particular registers. A visual inspection of scatterplots indicated that these features tend to have linear (rather than curvilinear) relationships with one another.
5. These analyses are undertaken within the general framework of covariance structure analysis, which provides a set of techniques for theory testing using correlational data (see, e.g., Hayduk, 1987).
6. The models tested here are thus based on theoretical considerations: a one-dimensional model commonly assumed in other studies, and four multidimensional models indicated by Biber (1988). Modification indices were not used in the analysis here. For each factor in each model, the functional/structural grouping of features indicated by previous research was specified as loading on that factor with "free" loadings (i.e., loadings that were estimated by LISREL), and all other features were fixed as having a loading of 0.0.
7. Correlations over .9 can be taken to indicate colinearity (Hayduk, 1987, p. 176), which is especially problematic in regression analyses (when two predictors are highly intercorrelated). Thus, the high correlation between the Reduced Structure Dimension and the Framing Elaboration Dimension indicates that these should not be used as separate predictors in a multiple-regression analysis; rather, a higher-order factor should be constructed out of the two. In the present study, though, I keep these two factors separate, because they are not used together as predictors in any analysis, and because they are clearly distinct in their structural (i.e., linguistic) characteristics.
8. This finding replicates the different distributions of WH relatives and *that* relatives found in Biber (1988). Ed Finegan (personal communication, 1990) has pointed out two functional differences between these relative clause types. First, whereas WH relative clauses can be either restrictive or nonrestrictive, *that* relative clauses are consistently restrictive. Second, there is an apparent tendency for *which* to be used in preference to *that* for plural (versus singular) antecedents. In addition, the use of *that* entails some loss of information relative to the more specific WH relative pronouns. The alternation between these forms in present-day English requires further empirical investigation.
9. For example, nouns have a mean frequency of 180.5 occurrences per 1,000 words (in the entire corpus) and nominalizations have a mean frequency of only 19.9 occurrences per 1,000 words. If these raw frequencies were used in computing the dimension score for the Integrated Structure factor, the frequency of nouns would carry much greater weight than nominalizations. Standardized scores put all frequencies on a single scale.

so that all features on a factor carry the same weigth in the dimension score. For example, if a text had 216 nouns and 34 nominalizations, it would have a standardized score of approximately 1.0 for both features, because the standard deviation for nouns is 35.6, and for nominalizations it is 14.4. That is,

for nouns: (216 – 180.5) / 35.6 = .997
and for nominalizations: (34 – 19.9) / 14.4 = .979.

Thus, this text is similarly marked for both nouns and nominalizations, having one standard deviation over the mean for both features, and the standardized scores reflect this fact.

10. Stance marking in English, including evidentiality and affect, is further discussed in Biber and Finegan (1989).
11. Given this interpretation, it is surprising that editorials, which are personal and opinionated, do not have a higher score on this dimension. Their intermediate characterization might be due to their relatively "protected" status. That is, because most readers of editorials cannot respond, there is less risk that editorial writers will lose face due to a direct challenge and, thus, the writers have a lesser need to overtly frame and justify opinions (in contrast to the directly interactional, and potentially confrontational, nature of letters. conversations interviews, and even speeches).

Appendix

The observed and predicted correlation matrices are compared using a chi-square goodness-of-fit statistic (generated by LISREL). A small chi-square value indicates that the predicted correlation matrix is not statistically different from the observed matrix, and that the model thus provides a very good fit to the data. In practice, however, the chi-square goodness-of-fit test does not by itself provide an adequate evaluation of a model, since the chi-square statistic is greatly influenced by sample size. Thus, practically any model based on a large sample will be rejected as inadequate ($\chi^2 < .05$, indicating that the predicted correlation matrix is significantly different from the observed matrix), although it is possible to find numerous statistically acceptable models based on very small samples. For this reason, Bentler and Bonett (1980) developed a technique for comparing the relative adequacy of various models, rather than focusing on outright rejection or acceptance of a model.

The Bentler and Bonett technique uses a "null model" (referred to here as MØ) as a baseline for evaluating the adequacy of particular models and the degree of improvement between models. In a factor analysis, the null model specifies that the observed variables are mutually independent; thus, the model has no common factors, the unique variances are equated with the variances of the observed variables, and all common factor loadings are set to zero. In the present analysis, the null model (MØ) has a chi-square value of 8471.3 for 528 degrees of freedom. Theoretically based models are evaluated positively to the extent that their chi-square goodness-of-fit statistic is significantly smaller than this chi-square value for the null model. In particular, if the difference in chi-square values between the null model and a theory-based model is significant, then that model represents a statistically significant improvement over the null model. (This is because the difference score between chi-square values also has a chi-square distribution.) For example, Table 4 shows that the factor analysis for a one-dimensional model of complexity (M1) represents a statistically significant improvement over the null model:

$$8471 \text{ (the M0 } \chi^2) - 3435 \text{ (the M1 } \chi^2) = 5036,$$

where the degrees of freedom is $528 - 495 = 33$. (This is significant at $p < .001$.)

The null model can also be used as a baseline to asses the theoretical importance of a given model, by determining the percentage of the observed correlations accounted for by the model. This is indicated by the Delta coefficient (Bentler & Bonett, 1980, p. 599), which represents the difference in chi-square values between the null model and a theory-based model as a proportion of the total chi-square value for the null model. For example, for the one-dimensional model of complexity (Table 4),

$$\Delta = (8471 - 3435) / 8471 = .594.$$

The Delta coefficient of .594 shows that 59.4% of the relationships among these linguistic features is accounted for by the 1-D model. The Goodness-of-Fit Index is a slightly more liberal measure of strength produced by LISREL (.632 in this case). Both of these coefficients indicate that the 1-D model is relatively strong and represents an important theoretical improvement over the null model.

The Dialogic Unconscious: Psychoanalysis, Discursive Psychology and the Nature of Repression

Michael Billig

This paper will discuss the possibility of making links between discursive psychology and psychoanalytic theory. At first sight, these two ways of understanding psychological phenomena seem utterly incompatible. Discursive psychology, which is being developed as a challenge to orthodox social psychology, discourages speculation about 'inner' processes (e.g. Antaki, 1994; Billig, 1997*a*; Edwards, 1991, 1994; Edwards & Potter, 1992, 1993; Harrê, 1995; Harrê & Gillett, 1994; Parker, 1992; Potter, 1996; Potter & Wetherell, 1987, 1995). Discursive psychology takes inspiration from the philosophical tradition of Wittgenstein's later philosophy and from the development of ethnomethodology and conversation analysis. These traditions of analysis stress the need to examine in detail the outward accomplishment of social life, showing how social order is reproduced through discursive interaction. Discursive psychology applies this project to psychological phenomena. It argues that phenomena, which traditional psychological theories have treated as 'inner processes', are, in fact, constituted through social, discursive activity. Accordingly, discursive psychologists argue that psychology should be based on the study of this outward activity rather than upon hypothetical, and essentially unobservable, inner states. In this respect, discursive psychology seems inimical with psychoanalytic theory, which presumes that hidden, unconscious motive-forces lie behind the surface of social life. Psychoanalytic theorists often treat outward social activity as a cipher for unobservable, inner motivational processes. The apparent incompatibility between the new discursive psychology and psychoanalysis might be expressed crudely: discursive psychologists turn the person inside out, converting inner mental life

Source: *British Journal of Social Psychology* vol. 36, 1997, pp. 139–159.

into outward social activity, while psychoanalysts move in the opposite theoretical direction by turning social life outside in.

It will be suggested that matters are not quite so simple, especially if one takes seriously the notion that conversational interaction is not only a mode of expression, but is also mode of repression. There is a case, it will be argued, for considering that there is a 'dialogic unconscious', which is constituted in dialogue and which functions as a form of repression. If the repressive aspect of conversation is considered, then discursive psychology and psychoanalytic theory may not be utterly incompatible, at least if theoretical adjustments are made on both sides.

In developing these themes, the present paper will attempt to argue within the basic assumptions of discursive psychology, especially the Wittgensteinian notion that psychological language stands in need of outward, rather than inner, criteria. It will be suggested that this position does not preclude psychoanalytic forms of explanation, but, under certain circumstances, encourages them. Nevertheless, to develop psychoanalytic themes based on the idea of a dialogic unconscious, it is necessary to expand the image of social interaction, which discursive psychology has inherited from conversation analysis and ethnomethodology. At present, conversation analysts have revealed in depth how everyday morality is routinely accomplished in conversational interaction. If the unconscious, as well as the conscious, is constituted in interaction, then the everyday interaction is not only reproducing moral norms, but it also reproduces immoral temptations, which are routinely resisted and repressed. To investigate these issues, it will be argued, it is necessary to examine the absences, rather than presences, in dialogue.

If this is done, then one should be able to investigate not only how everyday morality is accomplished within talk-in-interaction, as conversation analysts and ethnomethodologists have demonstrated; also it will be possible to see how repression is routinely accomplished. In so doing, discursive psychology will be attending to some of the traditional concerns of psychoanalysis. Most importantly, the basic psychoanalytic process of repression, whose routine operation even Freud considered to be mysterious, might be observed directly as it is constituted through social, discursive interaction.

Before discussing these themes, it is necessary to say a few words about the use of the terms 'psychoanalysis' and 'discourse analysis', for both terms cover a variety of different intellectual positions. In discussing psychoanalysis, the emphasis will be on the writings of Freud, rather than on later schools of thought. Of course, it should be possible to link the notion of a dialogic unconscious with concepts derived from other psychoanalytic schools. Indeed, this needs to be done, if the idea of a dialogic unconscious is to be fully developed. However, this initial paper concentrates upon Freud's writings. Not only have Freud's writings a unique historic and cultural significance, but arguably they still constitute the clearest presentation of psychoanalysis's central, enduring concepts.

Just as there are a variety of psychoanalytic schools, so very different approaches to the study of language are to be found under the broad heading of 'discourse analysis' (see, for example, the compendia edited by van Dijk, 1985, 1996). The type of discourse analysis to be explored in this paper is that which has been heavily influenced by conversation analysis, ethnomethod-

philosophy of Wittgenstein. This form of analysis concentrates on studying actual utterances in their particular contexts. In this respect, it differs substantially from Foucauldian and Lacanian approaches. Foucauldian studies tend to view discourses as cultural totalities, and they seek to identify these totalities rather than examine the ways in which people use utterances in specific circumstances. Foucault's notion of a 'discourse' is, to use Saussure's distinction, more *langue* than *parole* – concerned with the hypothetical total structure rather than particular usage. Similarly, Lacan, who takes seriously the link between language and the unconscious, operates with a somewhat abstract theory of language, which explicitly gives priority to *langue*, or the total linguistic structure, rather than to *parole* (see, for example, Lacan, 1979, pp. 20–21; for more details, see Billig, 1996, 1997*c*). By contrast, the present approach, in common with much discursive psychology, is firmly rooted in the study of the utterance and the particular, occasioned use of language. The present approach, therefore, differs from those psychologists who have been recently investigating the links between psychoanalysis and discourse in terms of Foucauldian and Lacanian ideas (see, *inter alia*, Burman & Parker, 1993; Henriques, Hollway, Urwin, Venn & Walkerdine, 1984; Hollway, 1989; Parker, 1990, 1992; Wilkinson & Kitzinger, 1995).[1]

In consequence, the notion of the dialogic unconscious, as outlined in the present paper, is neither Lacanian nor Foucauldian. It does not refer to a presumed 'fallen' structure of signification. Nor does it refer to utterances, which cannot be spoken because the speaker lacks the cultural and discursive resources for composing such an utterance. On the contrary, the dialogic unconscious comprises utterances which could well have been spoken, but which remain unspoken. These are utterances which in some sense have been dialogically repressed in particular conversational settings.

Discourse Analysis and the Unconscious

Discursive psychology has set itself the project of investigating how psychological states are constituted through discursive activity. This means paying attention to the use of psychological language in conversation. The point is not to treat psychological language (such as 'I feel happy' or 'my thoughts on this matter are . . .') as symptoms of inner processes. The analysis of psychological language, for discursive psychologists, is not a second-best strategy, as if the 'real' topics of psychology were internal, and thereby unobservable, phenomena. Quite the contrary, discursive psychologists assume that the traditional topics of psychology refer to phenomena which are outwardly observable. If one wishes to study 'feelings', psychologists should be paying attention to what people are doing when they claim to have feelings.

The principles behind this approach can be found in the later writings of Wittgenstein, who stressed that, because language is socially shared, there must be public criteria for the use of psychological words. If there were not such criteria, speakers would not be able to speak so readily of feelings, emotions or states of mind (see Shotter, 1993*a*,*b*, 1995, for discussions of Wittgenstein and

his contribution to discursive psychology). As Wittgenstein stated in *Philosophical Investigations*, 'an "inner process" stands in need of outward criteria' (1953, remark 580). He claimed that 'the characteristic mark of all "feelings that there is expression of them, i.e. facial expression, gestures' (1967, remark 513). The implications are profound. Psychologists should not search for the ghostly, unobservable essences, which are presumed to lie behind the use of feeling-words. They should be examining in detail the ways people make claims about psychological states and what they are doing when they make, or dispute, such psychological claims: they should be asking 'what is the purpose of this language, how is it being used?' (Wittgenstein, 1967, remark 716).

The techniques of conversation analysis and ethnomethodology enable discursive psychologists to answer such questions, for they permit analysts to investigate the microprocesses of speech acts in which psychological language is used. Analysts can study how, for example, claims to have particular emotions or psychological states are discursively accomplished. In this way, emotions and psychological claims are seen to be socially constituted and accomplished (Edwards, 1995*a*). For example, traditional psychologists assume that 'remembering' is something which takes place within the cognitive system of the isolated individual. By contrast, discursive psychologists treat remembering as a social and collective activity (Edwards & Potter, 1992; Middleton & Edwards, 1990; Potter & Edwards, 1990). They examine in detail the speech acts involved in making claims about remembering and forgetting, and they ask what such claims are accomplishing socially (e.g Billig & Edwards, 1994; Edwards & Middleton, 1986). Consequently, remembering, far from being treated as an unobservable, internal process, becomes a directly observable, social activity based upon speech acts.

Discursive psychology's stance of exploring observable social action, rather than searching for hidden, inner states, is reflected in the analysts' own theoretical language. Their concepts tend to emphasize action and activity, rather than inner process. Following the example of Harvey Sacks, the word 'do' features prominently in discursive analysis (Edwards, 1995*b*). 'Feelings' are activities which have to be 'done' (or accomplished socially and discursively). Discursive psychologists do not search for the feelings behind observable actions (or doings), but concentrate upon the doings, without which no one, including analysts, could talk of feelings.

It should be little surprise that an approach, which discourages phenomenological language as a tool of analysis, has little theoretical space for the vocabulary of psychoanalysis. If inner consciousness is not an explanatory concept, then there would appear to be even less reason to hypothesize an inner unconsciousness. The main texts of discursive or rhetorical psychology contain hardly a mention of the 'unconscious', 'repression' or Freud. Occasionally, and somewhat briefly, psychoanalysis is discussed, but typically in ways which discount its significance (see, for example, Gergen, 1994, p. 169; or Shotter, 1993*a*, pp. 138*f*; but see also Shotter, 1990, pp. 129*f*; for an argument that cognitive psychology has forgotten its Freudian heritage).

Discursive psychology, if it turned its attention to psychoanalysis, might easily treat psychoanalytic language as a topic of investigation, rather than as a theoretical resource for analysing other forms of discourse. This was a tactic which Volosinov/Bakhtin recommended years ago in his critique of Freudianism (Volosinov, 1994; see also Daelemans & Maranhao, 1990). Just as discursive analysts presently study how people use psychological language in everyday conversation, so they could examine how the language of unconscious motives is used in both lay and professional discourses. The distinction between the lay and the professional is not firm. As Moscovici (1976) has shown, psychoanalytic concepts are no longer confined to professional, psychoanalytic circles, but have been represented, and altered, in ordinary language. In this respect psychology, including psychoanalysis, has a wide cultural and political significance in contemporary Western society (Parker, 1994; Rose, 1990).

Discursive psychologists could specifically examine the current use of psychoanalytic concepts, thereby examining in discursive detail the phenomenon identified in broad outline by Moscovici. Such an examination of psychoanalytic discourse would not necessarily demand special methodological or theoretical treatment. Whether analysts were studying the language of consciousness or unconsciousness, the methodological techniques could be the same. The analysts would not themselves be using psychoanalytic concepts as analytic tools. They would see what is being 'done' with talk about 'hidden, unconscious motives'. They would not claim that 'hidden, unconscious motives' stand behind, or cause, this talk. For example, they would study how people talk about 'repression', but they would not assume that the talk itself was based upon repression. In this respect, such analyses would not be examining the repressive aspects of discourse; nor would they be probing the discursive aspects of repression, as understood by psychoanalysts.

Return of the Repressed Repression

Although the unconscious may be largely absent from the topics studied by discursive psychology, it is not to be easily eliminated. As psychoanalysts well understand, the repressed returns to haunt consciousness. Discursive psychologists, not to mention conversation analysts, might exclude the concept of repression from their theoretical vocabulary, but, occasionally, the repressed repression can be detected, lurking on the edges of analysis. Two examples can be briefly mentioned. Wetherell and Potter (1992), in their analysis of racist discourse, present an example of a 'benevolent racist', who disclaims being racist. This person, they suggest, fits Karen Horney's image of the individual resolving a neurotic conflict through fantasies about the ideal self (p. 54). Billig (1992), analysing how English families talk about the British Royal Family, at one point has recourse to the notion of projection (pp. 106–109; see also Billig, 1997*b*). Speakers are discussing whether the heir to the throne would be allowed to marry a non-white. The speakers disclaim their own racism, and they also deny

that the Royal Family, with whom they claimed to 'identify', is racist. Billig suggests that the 'racism' is projected onto others: the speakers oppose the idea of a non-white marrying the heir to the throne, but attribute this position to others – to 'the public' in general. The details of the analysis are not what matter for the moment, only the analyst's use of psychoanalytic terminology.

What, one might ask, are the analysts 'doing', when they use psychoanalytic terms? In both examples, analysts are considering the utterances of speakers, who are denying that they are racist, while expressing views which can easily be heard as racist. The analysts, in presenting this material, distance themselves from the respondents' denials of racism (see also van Dijk, 1992, 1993*a*). If the respondents disclaim any racist motives, the analyst, in using psychoanalytic terminology, alerts readers not to accept those disclaimers: the possibility of racist motives, unacknowledged by the holder of the motives, is left open. In this respect, as Parker (1992) has suggested, psychoanalytic concepts can be useful for a discursive psychology which has an acknowledged critical, political stance.

The analytic move of using psychoanalytic terminology does not represent an abandonment of the basic tenets of speech act theory, but is, in some respects, derived from them. The possibility of using psychoanalytic descriptions follows from the assumption that there are outward criteria for the use of psychological concepts. As Wittgenstein continually argued, because there are public criteria for the use of psychological language, we do not describe our own psychological states directly, whilst being forced to infer the states of others indirectly and with less certainty. On the contrary, as Wittgenstein wrote, 'every day we hear one man saying of another that he is in pain, is sad, is merry, etc. without a trace of doubt' (Wittgenstein, 1980, remark 138). Thus, we can legitimately claim confidence in our descriptions of another's psychological state. We may be confident, even if the other person disagrees with our assessment; in this case, we can argue that the other's description of themself conflicts with the outward criteria by which such descriptions must be made.

Wittgenstein, at one point, commented that 'it also happens that one says "I know that you felt like this then, even if you won't admit it now"' (1980, remark 138). In this sort of situation – where one person claims to know the feelings of another better than the person themself – the possibility of psychoanalytic explanations is raised. Such an explanation signals that the other's self-descriptions are unconvincing. Not only is a more convincing account of their motives offered, but also an account why the self-descriptions are unconvincing – why the person is unable to admit something about themself which is apparent to another and which should be, but is not, apparent to themself. In these circumstances, unconscious motives may be cited convincingly. Wittgenstein gives the example of someone who cannot explain why they suddenly climbed on a chair: 'Perhaps in such a case', he suggested, 'we should say that he acted with *unconscious* intention' (1988, remark no. 222). In another example, Wittgenstein wrote about someone, attempting to draw the picture of one individual but actually producing a portrait of another, being 'guided by forces in his unconscious' (1967, remark no. 262).

There are two points which can be noted about these usages of unconscious explanations. In the first place, such explanations depend upon

more 'normal' explanations. The psychoanalytic language game can never replace in its entirety the language games of ordinary psychological explanations, for they are to be used when the ordinary games appear to break down (Brearley, 1991; Cioffi, 1991; Hopkins, 1995). Second, the possibility for making explanations, which cite unconscious motivations, is not prohibited by the assumptions of speech act theory, on which discursive psychology is based. Indeed, the possibility follows from the Wittgensteinian assumption that emotions are social constructs and that it is not inevitable that the individual actor is privileged in producing more convincing self-descriptions than any outside observer can. Under some circumstances, others may doubt a person's self-ascriptions, or may wonder at the failure to produce any self-descriptions; then they may speculate why the person cannot admit to themself what appears apparent to outsiders. This sort of discursive move is to be expected in a society where psychoanalytic conceptions have passed into common sense (Moscovici, 1976). As is illustrated by the two examples taken from the analysis of speakers denying racism, discursive analysts can make the move too.

Conversation and Constraint

An important question needs to be addressed: if the discursive approach does not theoretically prohibit psychoanalytic speculations, at least in the way that it prohibits speculation about inner cognitive processes, then why are psychoanalytic notions so rarely employed? One might answer such a question historically, pointing out how psychology in general has repressed its psychoanalytic heritage (Parker, 1994; Shotter, 1990). In this respect, discursive psychology would merely be continuing a long established intellectual habit. On the other hand, one might attempt to answer more specifically by showing how discursive psychology's routine procedures of theory and methodology combine to inhibit discussion of the unconscious. It will be suggested that discursive psychology has adopted practices from conversation analysis, which tend to draw attention to the presences, rather than the absences, in discursive utterances. In particular, there are two principles of conversation analysis, which inform discursive psychology and which militate against psychoanalytic concerns with absences: (*a*) analysts should try to conduct their analyses from the participants' perspectives, as revealed in what the participants say; (*b*) analysts should use what participants say in order to reveal the structural organization of conversation.

(*a*) Conversation analysts, as well as ethnomethodologists, frequently claim that one of the strengths of their approach is that they focus 'on how participants themselves produce and interpret each other's actions' (Pomerantz, 1988, pp. 360–361). Conversation analysts do not seek to explain interaction in terms of sociological structures, which lie 'behind the backs of the participants' (Boden, 1994; Heritage, 1984). Instead, they observe how participants make sense of, and account for, the social world. In this respect, conversation analysis, to quote Deirdre Boden, assumes that 'human beings are knowledgeable agents in the production (and reproduction) of their lives and their history' (Boden, 1994, p. 13).

This assumption of knowledgeability forms the core of the ethnomethodological enterprise: 'By giving back to social agents their knowledgeability of their own social actions, it was then possible to sit back and observe the structuring quality of the world as it happens' (Boden, 1994, p. 74). In this way, ethnomethodologists, to quote Boden again, consider social order as 'a member's order than an analyst's construct' (p. 65).

The assumption of actors' knowledgeability is both a methodological facilitation and a restriction. On the one hand, analysts are bidden to take seriously what people actually say and do, rather than assume actors are simply re-enacting given roles within a hypothetical social structure. There is no doubt that this principle has productively concentrated attention on the fine detail of social life. On the other hand, the assumption is theoretically restricting in that the analyst is discouraged from taking a stance, which observers of others often do take and which is central to the whole project of psychoanalysis. This is the stance, which claims that 'members', or social actors, sometimes are unaware of the reasons for their actions and that their accounts, far from indicating knowledgeability, express a lack of knowledge and, indeed, repress self-knowledge. By assuming knowledgeability at the outset, the analyst cannot easily investigate how the repression of knowledgeability might be accomplished.

(*b*) The second principle aims to find within the utterances of social actors the structural organization of everyday life (Boden, 1994; Heritage, 1984). According to Buttny, much social interaction, such as adjacency pairings in conversation, has a 'normative organization' (1993, p. 39). Conversation analysts seek to discover this normative organization, which is presumed to lie within, and not behind, what participants say. This is why turn taking and sequential organization have been so central to conversation analysis. According to Boden (1994), 'turn taking and the sequenced structuring of action' lie 'at the heart' of social interaction (p. 53). The organizational pattern is presumed to be discoverable through understanding the sequential constraints on speakers. Drew (1995) claims that 'turns' in conversation are treated 'as the product of the *sequential organization* of talk' (p. 70). The organization is presumed to be present in the accounts which speakers themselves give. Thus, the analyst seeks to note conversational devices, which 'are *demonstrably or observably relevant* to the participants themselves' (Drew, 1995, p. 76; emphasis in original). By so doing, analysts hope to discover the 'stable and organized properties of conversational structures' (p. 76).

These structures are so normatively powerful, that they shape to a large extent what is said in conversational interaction. Drew (1995) claims that, according to the perspective of conversation analysis, participants' inner cognitive states are autonomous from their talk. What people say 'is not determined by, or the automatic product of, the processes of the mind'; instead, utterances in conversation 'are shaped most proximately by the sequential position in which the turn is produced' (Drew, 1995, p. 70). It is as if speakers find themselves inhabiting a normative structure which is more powerful than their individual feelings and to which they have to conform for interaction to proceed. This structure is present within the interaction and the analyst, therefore, seeks to examine [illegible]

among participants' actions to uncover the *sequential ordering* of accounting' (p. 59, emphasis in original). When analysts have located an instance of accounting, they should search for the conversational antecedents and consequences of these accounts. Most importantly, they should 'examine what *connects* these parts together as a coherent discursive practice of accounting' (p. 60, emphasis in original).

The upshot is that analysts tend not to search for absences in conversation, for the given conversation is to be seen as coherent in itself. It is presumed that participants are knowledgeable about the conversational structure, which is determining their 'conduct in talk-in-interaction' (Drew, 1995, p. 78). Similarly, it is presumed that this knowledge is expressed in the utterances themselves and, thus, the structure is knowable through these expressions. In consequence, the determination of particular utterances is to be understood in terms of other utterances! Again, the emphasis is upon the uttered presences of conversation. Analysts work with the text (or transcription) of the interaction, rather than using the text as a sign of something else, which is itself absent in the text, but which leaves traces. The meaning of a particular conversational turn is not to be sought in the inner states of mind of the speaker; nor is it to be sought in a hypothetical 'social structure'; it is to be found in the relations with the preceding interventions, and checked by the subsequent ones. What was, and what will be spoken, provide the means for understanding the function and meaning of what is said. In this respect, the analysts put themselves in the same position as the participants. What this means is that analysts search for the connections between utterances which are present in the conversation. What is absent from the conversation tends to be absent from the analysis.

Conversational Morality and its Flaws

By following the theoretical and methodological presuppositions of conversation analysis, researchers have provided an impressive corpus of knowledge about the intricate structures of contemporary conversations. They have demonstrated in detail the shared practices by which participants manage everyday interactions and, thereby, reproduce the normative structures which permit conversation to progress. For example, conversation analysts have claimed that there is a 'preference for agreement', which facilitates expressions of agreement and militates against expressions of outright disagreement (Bilmes, 1987; Pomerantz, 1984). There are ways of 'doing politeness', which hedge requests in indirectness, so that they are not heard as conversation-threatening commands (Brown & Levinson, 1987; McHoul, 1987). Conversationalists, in asking questions, offer possible answers and 'in so doing, they help to promote a friendly or cooperative atmosphere' (Pomerantz, 1988, p. 371). There is the structure of turn taking, which 'gives talk its rather syncopated and agreeably collaborative quality' (Boden, 1994, p. 71). Above all, there is politeness. As Chilton (1990) has written: 'Politeness formulations are universal and pervasive in everyday intercourse largely conventional and often benign. The preferred response is reciprocal politeness' (p. 222).

All this might be taken as suggesting that conversation analysis reveals little more than codes of etiquette. However, the theoretical importance of ethnomethodology and conversation analysis is that they demonstrate how social order is reproduced (Heritage, 1984). At root, the codes of conversation and politeness are codes of morality. Thus, Garfinkel (1967) claimed that ethnomethodology was revealing the accomplishment of 'practical morality'. In this respect, the micro-processes of conversational interaction reveal how everyday life is infused with moral concerns. Even the momentary pauses and fractional hesitations in routine conversations can be filled with moral import. For example, turn taking is not merely a structure which permits a conversation to proceed agreeably: it is a moral matter. As Boden (1994) suggests, by learning the routines of turn taking 'we take on that reciprocal moral code that guides human action' (p. 54).

If conversation analysis provides an investigation of practical morality, it also conveys an image of the nature of this morality. This is a morality which is seen to be routinely and successfully accomplished: it is not a morality which demands greater standards of ethics than can be practically realized. Often, but by no means always, a somewhat upbeat, positive rhetoric is used. Analysts, in quotations already presented, use terms such as 'benign', 'cooperative' and 'agreeable'. 'Members' are seen to 'collaborate', in order to 'accomplish' this morality; even the term 'member' suggests a belongingness. Because internal speculation is discouraged, the characteristics of the 'members' appear to be constituted through the talk-in-interaction. And this talk is seen to be a collaborative accomplishment, which is structured by the normative demands which are shared by the members. The result is that it is easy for 'members' to appear analytically as cooperative turn takers, who do not possess a clouded hinterland.

This positive image of social morality is very different from Freud's view. In the Freudian account, another, more dangerous, side of human nature is visible: immorality always lurks on the edge of overdemanding morality. For a Freudian, polite codes of civilized behaviour function to restrict impulses, which continually threaten social order. The more that the demands of politeness are heard to fill conversational spaces, the more the Freudian would suspect the repression of immoral impulses. The Freudian would not ask how the conversational structures of morality are accomplished, but what temptations these structures are trying to prevent. For example, if agreement is the socially preferred norm, then perhaps disagreement and disruption constitute a hidden temptation, whose delights must be repressed from consciousness.

Such questions tend not to be asked by conversation analysts, whose perspective to date has emphasized the achievement of conversational morality, rather than the repression of immorality. This can be illustrated by considering the conversational device of 'repair', which has been much studied by conversation analysts (e.g. Schegloff, Jefferson & Sachs, 1977; Pomerantz, 1984). Introducing a discussion of conversational repair, Nofsinger (1991) states that 'conversation, like other forms of human behaviour, is not perfect'. People can start to say the wrong things, or they can forget a word. According to Nofsinger, 'it is important for our understanding of each other that we fix these flaws before they lead to more serious and fundamental problems' (p. 124). Nofsinger

is taken from Pomerantz (1984; the same example is also analysed by Potter & Wetherell, 1995). One speaker suggests to another that the latter had not brought a great deal of fruit cake. The silence with which the remark is greeted leads the original speaker to 'back down' and reverse the original statement, suggesting that, after all, a little piece of cake can go a long way. The silence and the backing down indicated that the original statement was being heard as a possible criticism, which would disrupt the collaborative interaction. And so a repair was called for.

Much effort has been spent in detailing what Boden (1994, p. 75) calls the 'impressive range of repair', such as 'self-repair' versus 'other repair' etc. For present purposes, two points are worth noting. In the first place, repairs are seen to be necessary in order to rectify 'flaws', which threaten the structure of conversation. Second, the analytic attention is upon the repair rather than the so-called flaw. The flaws, which threaten the structure of conversation, cannot be explained by that structure. Analysts tend to demonstrate how and why the repair structure operates. Why the flaw should have arisen in the first place is typically left unexplained, even though flaws must occur as often, if not more often, then the repair work which follows them. Significantly, there is no technical terminology for describing how and why 'flaws' are 'accomplished'. The technical vocabulary is reserved for the repair work, which is seen as the accomplishment. Indeed, the very use of the word 'flaw', as used by Nofsinger, suggests that such utterances pose a threat to the conversational accomplishment.

Given the intricacy of speech, especially in relation to the codes of indirectness and mitigation by which politeness is routinely 'done', one can see the normative structures of conversation as highly constraining. Speakers are constrained to wait their turn, express demands indirectly, mitigate refusals and so on. In these ways, rudeness, or conversational immorality, is kept at bay. What is not asked – indeed, the standard ways of doing conversation analysis discourage the question – is why rudeness so frequently appears, or almost appears, before being quickly repaired. By contrast, the interruptions of social order – or, to use Freud's phrase, the 'parapraxes of everyday life' – have often constituted the starting point for psychoanalytic inquiry. The flaws indicate a hidden realm of desire, rather than chance accidents which happen because humans are not perfect beings. The moral codes constrain; their structures inhibit; but they do not totally dominate. Their intricacy of restraint can be read as a sign that the temptation to immorality stalks the practice of conversational morality, awaiting the opportunity to colonize vacated spaces.

Temptations of Rudeness and the Dialogic Unconscious

According to psychoanalytic theory what is prohibited beckons as temptation. If the forbidden were not tempting, there would be little need for complex moral codes. For temptation to be successfully curbed, it must not only be resisted but also denied. Social actors must chase the immoral desire from the conscious mind, lest the surface of everyday life be disrupted. All this is relevant to the practice of everyday morality, which can be witnessed in the course of even the

most casual conversations. This morality suggests a realm of discursive immorality: self-repairs, successfully accomplished, indicate a temptation resisted. This can be the temptation to act directly in ways which rudely throw off the complex restraints of discursive indirection.

One might stipulate that the possibility for 'doing politeness' depends upon the capability for 'doing rudeness' and, thus, that there is a permanent flaw in the apparently agreeable, cooperative structure. Developmentally, politeness and rudeness are linked. If politeness is routinely taught, as it must be for the skills of conversational turn taking to be acquired, then so must rudeness. Each time the adult says 'you must say *please* . . . don't speak when others are speaking . . . don't use that word – it's rude', the adult is telling the child what not to say, when speaking politely. In addition, the adult is telling the child about rudeness; in pointing out what must not be said the adult is equipping the child with dangerous, disruptive tools. Moreover, the parent, in instructing the child about these matters, tends to speak in direct ways which would not be classed as polite in adult company (Aronsson, 1991). In this way, the teaching of politeness, which is itself constituted through language, provides models of rudeness.

If all forbidden acts promise the possibility of pleasure, because they are forbidden, then rudeness and disagreement might be thought to haunt all those routine, banal enactments of discursive morality. Each conversational exchange, which successfully unfolds a normative structure without breakdown, might be said to express that structure of discursive politeness and to repress the corresponding one of rudeness. However, the notion of repression implies more than that something is hidden: it implies that what is hidden is desired as a source of pleasure. What evidence, one might ask, is there for supposing that rudeness (or politeness's repressed other) is a hidden, tempting pleasure? In Pomerantz's example of successful repair, one might ask why the first speaker broke the codes which prohibit direct criticism. Was the second speaker then tempted to challenge the first speaker, instead of remaining silent? Was the spontaneous self-repair a sign of temptation avoided? These questions are discouraged in conventional conversation analysis, whose theoretical vocabulary does not provide the words for describing a 'dialogical id' in battle with the 'conversational superego'.

Thomas Scheff (1990) has suggested that the fear of 'shame' holds social interaction in play. Should the normative structure be broken, an unrepaired conversational breakdown may ensue. The outcome is likely to be recognized as 'shameful' and the speaker feels shame, which, according to Scheff, 'is probably the most intensely painful of all feelings' (1990, p. 169). The speaker in Pomerantz's example corrects herself, lest she be heard as making an inappropriate criticism of her fellow conversationalist. Had she not done so, a scene – or conversational breakdown – might have ensued with all its attendant embarrassment and shame.

The use of psychoanalytic terminology is appropriate if there are reasons for thinking that what is shameful is also tempting. One might suggest that all social restrictions are accompanied by the desire – whether or not conscious, and whether or not constant or intermittent – to transcend the restriction. If this is so. then one should expect impoliteness to be an object of temptation and to represent a desired freedom. This temptation is both inhibited and created by

the fear of shame and by the routines of practice, which accomplish politeness. Moreover, these routines, by their very accomplishment, regularly succeed in driving the disruptive thought from the mind. Sometimes, the rude insult might just slip out, despite ourselves. And regularly, too, and again without conscious forethought, the words of repair will spontaneously slip out.

However tempting this line of argument, with its suggestion of dialogical id and superego, nevertheless it is necessary to offer some signs that the rudeness is a temptation, which must be routinely repressed. One criterion for the existence of unconscious desires is that they regularly, but unpredictably, leak into conscious awareness and into the flow of social activity. Freud, especially in *The Psychopathology of Everyday Life*, claimed that the 'parapraxes' of social life, such as lapses of memory, indicated the workings of repressed desires. However, the case of humour is particularly interesting. According to psychoanalytic theory, in humour the socially repressed is not only expressed but is enjoyed. Freud claimed that 'our enjoyment of the joke' indicates what is being repressed in more serious talk (*Jokes and their Relation to the Unconscious*, p. 138). Mulkay (1988) has argued that humorous discourse, by being marked off from 'normal' serious discourse, sustains 'one of the basic requisites of the serious mode: namely that disagreement should be avoided as far as possible' (p. 79). The point is not merely that humorous discourse expresses disagreement and impoliteness, but that the latter, which are repressed in normal discourse, can be enjoyed in the format of humour. Comic heroes are frequently figures who disrupt the patterns of restrictive politeness. From Diogenes of Sinope, living in his tub, through to Groucho Marx and John Cleese there is a common thread. Audiences find pleasure in the character who sweeps shame and the social rules aside. Sometimes, as with John Cleese's character of Basil Fawlty, the constraints of politeness are turned into weapons of rudeness: 'thank-you-so-much', he proclaims in a parody of politeness (see Brown & Levinson, 1987, pp. 229–230 for a discussion of the way that overpoliteness can become a means of insult).

It might seem curious that displays of rudeness, which ordinarily will be treated as unethical, are greeted with pleasure in the context of humour. Freud claimed that the pleasure of a tendentious joke expressed a repressed desire: 'To the human psyche all renunciation is exceedingly difficult, and so we find that tendentious jokes provide a means of undoing the renunciation and retrieving what was lost' (1991, p. 145). This is true of the urge to be impolite. According to Freud, 'the prevention of invective or of insulting rejoinders' occurs so commonly that 'tendentious jokes are especially favoured in order to make aggressiveness or criticism possible against persons in exalted positions who claim to exercise authority' (p. 149). The comic hero becomes a figure for identification, to be admired for doing precisely that which we would fear to do. Our laughter betrays the repressed wish for disinhibition, whilst, because the joke is 'only' a joke it confirms that inhibition. Peter Sloterdijk (1988), discussing Diogenes, who insulted Alexander the Great with impunity, talks of the 'dialectic of disinhibition' (p. 103). Inhibitions are released within the joke; pleasure is performed safely, especially if we, the inhibited, can enjoy vicariously the insults. The joker, recognized as such, reaffirms the boundary between normal and humorous discourse,

thereby strengthening the inhibition. Even Alexander the Great could join in the laughter at Diogenes. The disinhibition is localized, contained within the joke. Yet, the whole business of laughter and delight only makes sense if there is a wish which stretches beyond the moment of humour: otherwise why would the comic figure be greeted with delight rather than outrage?

For Freud, the forces of desire were universal and biologically based; as such they threatened the very nature of social order. Polite dialogue, thus, depended upon the sublimation of forces, which owed their origin to non-civilized, non-dialogical factors. The opposition between desire and civilization was, for instance, clearly expressed in later works such as *Civilization and its Discontents* and *The Future of an Illusion*. However, repression, and thereby the unconscious, must be formed in dialogue. Without moral requirements, which must be consciously expressible, there would be no reason to repress desires. One can go further. Language, which is necessary for the production of morality, is not merely a vehicle for transmitting moral prescriptions. Language constructs and requires its own morality of talk, and thereby its own repressed desires. In consequence, the location of desire outside the processes of dialogue and social order is not necessary. The temptations of impoliteness do not stand outside the dialogic process, but are constituted within it. The desires to be rude, to contradict, 'to speak one's mind', to have done with the constraints of politeness are formed within dialogue. Such desires cannot antedate, nor stand outside, the constrictions of politeness. In this respect, it makes sense to talk of the unconscious being dialogically constituted.

If the impulses for rudeness are formed in dialogue, then, so it may be argued, are their repression. Dialogue must create its own ways to push the temptations of rudeness aside from routine consciousness, and to permit the conscious aims of dialogue to continue. The person's sense of their own self will be involved, investing this repression with greater force than a social misdemeanour which can be lightly broken. In talking politely and agreeably – in doing consideration of others' feelings, through repair, indirection and a thousand other conversational devices – we are reproducing ourselves as tolerant, moral, polite selves. The intolerant, rude, hurtful possibilities (and desires) have to be routinely pushed aside from conscious awareness. The mere thought of being rude – of criticizing directly, snapping back, discarding the constraints of discursive etiquette – raises temptation in ways which should not even be thought of if interaction is to proceed routinely in its structured, reflexively monitored smoothness.

It might be said that the routine conversational intricacies, which are revealed by conversational analysts, depend upon a repression which is not routinely revealed. The pushing aside of temptation must be itself pushed aside, for, as Freud stressed, the process of repression is itself to be repressed. One might suggest that the theoretical stance of conversation analysis, as practised in the main, expresses this repression. Its image of the speaker, acting to agree, avoiding disruption, and sustaining the normative structures of dialogue, reflects the self-image of the caring, considerate, tolerant speaker with no further interior life. At the same time, residing within us is the capacity to hoot with pleasure at uncaring, inconsiderate and intolerant actions.

Dialogic Unconscious in Action

If the foregoing arguments are accepted, then it should be possible to analyse discourse, in order to examine the processes of repression in action. The dialogic unconscious will be constituted within talk, and the analyst, seeking to understand how repression is being discursively accomplished, will need to examine the absences of discourse. What is not said, but could easily have been, and, indeed, on occasions is almost said but then removed from the conversation, becomes of prime significance. Such analyses would extend the scope of conversation analysis, while remaining within discursive psychology's project to show how psychological phenomena are constituted within social activity. However, such analyses would not add a 'psychoanalytic dimension' in any simple way. The notion of the dialogic unconscious should leave neither discursive psychology nor psychoanalysis untouched.

In the first place, an analysis of the dialogic unconscious in discursive action lends itself to ideological analysis. The focus can be shifted from the individual to the social and to the construction of the unconscious. Repression, then, is not a universally static process, but something which is part of ideological and socio-historical currents (Frosh, 1989). Particular codes of politeness differ culturally and historically (Brown & Levinson, 1987; Katriel, 1986). So do the topics on which people are expected to converse and remain silent. Freud's patients found it difficult, even in the privacy of the psychoanalytic consulting-room, to talk of personal, sexual matters, which are now the common themes of television discussion shows (Carbaugh, 1988; Livingstone & Lunt, 1994). On the other hand, his patients would be unlikely to have been as troubled by some of the themes of 'race' as were the speakers studied by Wetherell & Potter (1993) and Billig (1992). The latter two examples illustrate the conditions of ideological analysis. Analysts not only have to stand back from what the particular speakers are saying; analysts also must attempt to distance themselves from, and reflect upon, the social conventions and ideological assumptions which enable such accounts to be given (Parker, 1992, 1994; van Dijk, 1993*b*).

The analyst of the dialogic unconscious needs to investigate how routines of talk can prevent the utterance of themes/accounts/questionings, which might seem reasonable to outsiders but which are collaboratively avoided by the particular speakers as a localized form of politeness. To the outsider, including the analyst, it can look as if there is a joint conspiracy to achieve a collective refusal of knowledgeability. If, as Boden (1994) suggests, rationality is localized, then the local rationality can also be seen as an irrationality, with its collaborative talk accomplishing discursive repression.

The traditional procedures of psychoanalysis are not, by themselves, suited for observing the repressions of the dialogic unconscious. In traditional psychoanalysis, one form of dialogue – the psychoanalytic conversation – is privileged as a means for discovering repressions which are presumed to have taken place elsewhere. As will be suggested, Freud was uncertain how repression was actually accomplished, being more concerned to show its incompleteness. What he did not take seriously was the possibility that conversations – including those between

the psychoanalyst and patient – repressed through their expression. As conversationalists talk about one set of topics, they are keeping others from discussion. How possible topics routinely remain undiscussed – and how possible questions remain unasked – requires the sort of microanalysis pioneered by conversation analysts, applied to discursive absences as well as presences.

As will be suggested, the analysis of discursive absences might provide clues about the operation of repression. In this respect, the notion of the dialogic unconscious might help to illuminate issues at the heart of psychoanalytic theory. After all, Freud himself believed that the idea of repression, rather than that of the unconscious, was the real discovery of psychoanalysis: he claimed that 'nothing like it had ever before been recognized in mental life' (1995*c*, p. 18). However, Freud was loth to conceive of repression in dialogic terms.

A brief example can be given of the sort of routine dialogic repression, which is overlooked in classic psychoanalytic theory. The example is taken from the famous 'Dora' case, presented in Freud's 'Fragment of an Analysis of a Case of Hysteria'. The 'Fragment' is a classic piece of psychoanalytic writing, notable for the detail of Freud's exposition and his imaginative interpretations (Marcus, 1986). In recent years, this case has become an object of intense reinterpretation. Feminist critics, in particular, have claimed that the case illustrates the dynamics of male power, which Freud overlooked and which, by his overlooking, he exemplified (for critiques of Freud in relation to Dora, see *inter alia*: Cixous & Clémont, 1986; Gallop, 1986; Gearhart, 1986; Irigaray, 1989; Jacobus, 1987; Lacan, 1986; Masson, 1990; Moi, 1986; Ramas, 1983; Rose, 1986). The background can be briefly given (for details of the historical situation of Dora herself, see Appignanesi & Forrester, 1993; Decker, 1991; Loewenberg, 1985; Rogow, 1978, 1979). Dora, as a young woman of 19, was brought to Freud for treatment by her wealthy, domineering father. She was suffering symptoms of hysteria and had recently threatened suicide. The life of Dora's family was intertwined with that of another family in a complex pattern of deceit. Dora's father was having a protracted affair with a young married woman, Frau K., although he denied this to his own family. To facilitate the affair, he encouraged increasing contact between the two families. Frau K. befriended Dora, often leaving her young children in Dora's care. Herr K. had been propositioning Dora since she was fourteen, on occasion grabbing her, trying to kiss her and, once, on holiday entering her bedroom while she slept. Dora told her father about K.'s advances, but he refused to believe her, claiming that she, in her hysteria, was engaging in sexual fantasies. This was one of the symptoms, which Dora's father hoped Freud would cure.

It was clear that Freud did not trust Dora's father, yet he followed the remit to restore Dora to psychological health. To this end, Freud sought to uncover repressed desires, which he assumed lay behind her hysterical symptoms. Dora was, according to Freud, really in love with Herr K., and her ready denials, when Freud put the idea to her, were further proof of the desire and its repression. Freud, after the analysis was terminated, came to the further conclusion that Dora also had erotic desires for Frau K., and that she also repressed these from conscious awareness.

Critics have claimed that Freud fell into the trap of pathologizing Dora, the victim of a pathological, patriarchal family. Freud's methodology was to use the psychoanalytic dialogue as a means of uncovering repressions, which were presumed to be individual and non-dialogic. His evidence for Dora's repressed wishes came from his interpretations of what Dora was telling him. In a later essay 'Repression', Freud specifically suggested that repression was '*individual* in its operation' (1995*b*, p. 572, emphasis in original). In searching for the individual aspects of repression, Freud's attention was directed towards Dora's individual inner life – to her dreams, fantasies, private thoughts and so on. He paid little attention to the conversations in which she would have routinely participated. One might argue that these conversations were crucial for the situation, in which Dora was caught. Moreover, if one takes the notion of the dialogic unconscious seriously, they might have provided models for the individual repression, in which Freud was interested.

According to the account which Freud presented, Herr K. sent Dora flowers every day for a whole year, whenever he was in the neighbourhood. He constantly bought her presents and spent 'all his spare time in her company' (1995*a*, p. 188). Freud adds an astounding, but unelaborated, remark: Herr K. pursued Dora 'without her parents noticing anything in his behaviour that was characteristic of love-making' (p. 188). How, one might ask, was this failure to notice achieved. It was, of course, a convenient failure for all concerned, except for Dora, the youngest and most vulnerable of the participants. What was said by Dora's parents when the flowers were delivered yet again, or when Herr K. arrived with another wrapped present for the adolescent? As he stood in the hallway, with all the conventional demeanour of a lover, what routines of greeting were developed? Did they make jokes about his being a suitor?

Here was a process of repression being socially produced in overt family activity, as all refused to draw the obvious conclusion or to ask the dangerous question. K.'s visits and flowers, by virtue of their frequency, must have taken on the character of a habit. If jokes were uttered, did these become family jokes, which by their familiarity repressed the truth they expressed? Or did a silence, filled by other words, become routine? One might predict that a pattern was established, so that the repression was reinforced through routine, especially dialogic routine. In short, one would want to know how the routines of greeting, as well as the routine ways of talking about the visits when the topic occurred in conversation, functioned to repress other, more obvious interpretations.

Similar discursive processes of avoidance can be seen in the two examples of racist discourse, discussed earlier. The denial of prejudice is not challenged. Speakers use conventional expressions, which polite white speakers are not expected to dispute: 'I'm not prejudiced but . . .' is rhetorically structured for agreement (Billig, 1991; Wetherell & Potter, 1992; van Dijk, 1992, 1993*a*). Questioning must be absent for the conversation to proceed without 'flaw'. For instance, the English families, talking about royalty, were collectively denying their own racism, while arguing for the impossibility of a non-white monarchy. A discursive projection was constructed: it was others – 'public opinion' or an amorphous 'them' – who would prevent any interracial marriage – not the Queen.

with whom the speakers were claiming to identify as the figure of nationhood. In this way, the speakers were distancing themselves from the racist practices, which they were tacitly supporting but attributing to others. Complex discursive strategies were used to maintain the position. Speakers avoided the word 'white', with its connotations of racial purity and, thereby, of racism (for details, see Billig, 1997*a*). The discursive balance was preserved by the avoidance of awkward questioning, as speakers collaborated to accomplish the collective projection.

If repression is dialogically and socially constructed then topics of repression will vary culturally and historically. The bourgeois citizenry of Freud's Vienna might have developed complex discursive codes to repress the topic of sexuality. However, the Viennese, whose elected mayor at the time of Freud's conversations with Dora was an openly racist demagogue, would be surprised, perhaps shocked, by today's inhibitions about 'race'. They would have difficulty adjusting to today's complex discursive codes of utterance and absence, by which racism gains entry to respectable homes with the demeanour of denial, rather like Herr K. being welcomed through the hallway with his bunch of flowers.

Dialogic Nature of Repression

Finally, some implications from the notion of the dialogic unconscious can be drawn in relation to Freudian ideas about the nature of repression. Necessarily these implications can only be outlined briefly. Discursive psychologists have suggested that public discourse often provides the model for individual functioning. For example, Billig (1996) proposed a rhetorical model of thinking, suggesting that internal debate is based upon public argumentation; children learn to think inwardly on the basis of their participation in the outward rhetoric of debate (see also Shotter, 1993*a*, *b*; Wertsch, 1991). The same approach can be applied to repression. Through participation in dialogue, which represses as it expresses, people acquire the skills of repression. These dialogic and social skills, when internalized, provide the basis for the sort of repression which Freud called individual in its operation.

Although Freud might have seen repression as the key concept of psychoanalysis, his writings are somewhat sketchy about describing the routine operation of repression. Routines are to be expected for, as Freud claimed, repression 'demands a persistent expenditure of force', for the repression of any particular thought is not 'an event which takes place once' (1995*b*, p. 572). When Freud attempted to describe how repression operates, he often lapsed into conceptual difficulty or mechanical metaphor (see Soyland, 1993, and Gellner, 1985, for discussion of Freud and metaphor). In 'The ego and the id', Freud envisaged the conscious part of the mind (the ego) repulsing unconscious forces from the id. Yet, the repulsion, accomplished by the ego, must itself be repressed. Thus, the ego must be unaware of itself and its accomplishments. Conceptually, therefore, the ego cannot be identified with consciousness for in some respects it 'behaves just like the unconscious' (1995*d*, p. 631). But how can consciousness be just like the unconscious, prelinguistic id? Freud recognized that there were conceptual

problems: 'We land ourselves in endless obscurities and difficulties if we keep to our habitual forms of expression (p. 631).'

Part of the problem lay in Freud's insistence that repression was, at root, a non-linguistic process, which was as mysterious as the non-verbal, instinctual id. There were, he admitted, linguistically constituted forms of repression, but these were more superficial, less basic forms. Freud, in his essay on 'Fetishism', specifically distinguished between repression proper (*Verdrängung*), which was non-linguistic, and disavowal (*Verleugnung*), which operated through language (Freud, 1977, pp. 352*ff*). Repression keeps affect away from consciousness, whereas disavowal is aimed at only the idea of the affect, rather than the affective forces themselves (see Laplanche & Pontalis, 1983, for further references to Freud's distinction). What is clear is that Freud believed that the basic process, by which the ego deflects the desires of the id, was the non-linguistic *Verdrängung*, rather than *Verleugnung*. And about the ways *Verdrängung* operated he could say little except by way of the mechanical metaphor.

It is possible to challenge the primacy of the non-linguistic forms of repression, while still keeping within the internal logic of Freudian theory. As Freud stressed, the necessity for repression only arises as a consequence of social morality. In 'On narcissism', he wrote that 'for the ego the formation of an ideal would be the conditioning factor of repression' (1995*e*, p. 558). Without a sense of conscience – and a punitive ideal to live up to – the ego would not need to censor desires. It can be argued that, from a developmental point of view, the notions of morality only arise within language: indeed, as conversation analysis suggests, talk-in-interaction forms the basis of routine, practical morality. If language-in-interaction creates moral imperatives, then it may also provide the means for their routine accomplishment. This would include the routines of dialogic repression.

Once the issues are put like this, then a step is made towards clearing some of the mysteries of repression. If repression is thought to be individual, unconscious and asocial, then the individual cannot learn (let alone be taught) how to repress. Something mysteriously innate, and non-cultural, must spontaneously occur, when cultural norms make their presence felt. On the other hand, if language-in-interaction itself depends upon repression, then in learning how to use language the child is learning lessons of repression. Polite talk will provide the models for individual repression, just as argumentation provides the models for internal deliberation (Billig, 1996). The child who learns the codes of discursive politeness, which are integral to learning to talk, learns how to change the subject, to avoid questioning ('it's rude to ask'), to turn threatening topics into humour, and so on. In learning these dialogic skills, the child is acquiring routines, which can be applied to their own individual mental life. Shockingly shameful thoughts may flash into consciousness; the individual knows how to change the subject, attribute thoughts to others, or tag them with humour. Above all, the person is acquiring routines of thought – or the buzz of internal chatter – which can keep the shocking waiting outside, pressing the bell and only gaining admission if it can appear, like Herr K., as a friendly, respectable guest.

If this line of argument is accepted, then the routine conversations in Dora's household were not irrelevant to her 'condition'. They, and other conversations,

provide the models for any self-disavowals enacted within the interior mental life. The theoretical implications are considerable. On the one hand, the notion of a dialogic unconscious serves to make the basic processes of repression appear less mysterious and more openly observable than is posited in Freudian thinking. On the other hand, the dialogic unconscious depicts ordinary conversations as more psychologically and ideologically charged than they typically appear to conversation analysts. In consequence, the idea of the dialogic unconscious opens the way to an unlikely combination of psychoanalytic and conversation analytic ideas in ways which could broaden and deepen the project of discursive psychology.

Acknowledgements

The author is grateful for the continuing support from members of the Discourse and Rhetoric Group at Loughborough University, and, in the present case, is particularly grateful to Derek Edwards and Jonathan Potter for their unrepressed, productive disagreement. The author also recognizes the helpful comments of Hélène Joffe, John Shotter, Teun van Dijk and the anonymous reviewers.

Notes

1. Hollway (1989), in an interesting and original investigation, uses psychoanalytic ideas to investigate dialogue. In certain respects her work parallels some of the present arguments. However, she does not use conversation analytic notions, which stress the occasioned character of discourse. She tends to use Lacanian ideas of signification which, from a conversation analytic point of view, do not tie in closely with the details of the utterances, which she studies.
2. There has been a tendency for conversation analysts to study agreement rather than disagreement, or to see disagreement as a disruption to the joint accomplishment of social life. However, more analysts are beginning to see the importance of argumentation in social life. To quote Schiffrin (1984), argument can be a 'form of sociability' (see also Billig, 1991, 1996; Grimshaw, 1990; Horowitz, 1996; Schiffrin, 1987; and see Gilbert & Mulkay, 1984, for analyses of argument in science). The effect of this stance on the theoretical vocabulary of conversation analysis remains to be seen. Already some analysts are counterposing the supposed 'preference for agreement' with an occasioned 'preference for disagreement' (Billig, 1991; Horowitz, 1996).

Investigating Narrative Inequality: African Asylum Seekers' Stories in Belgium

Jan Blommaert

1. Introduction

In a remarkable paper, Dell Hymes and Courtney Cazden investigated 'the possibility that one form of inequality of opportunity in our society has to do with rights to use narrative, with whose narratives are admitted to have cognitive function' (Hymes and Cazden, 1980: 126).[1] On the basis of observations on speaking rights in university classes they concluded that the use of particular ways of narrating focused upon the expression of emotions and personal experience and voiced in an 'anecdotal' mode was easily dismissed, while other narrative modes in which academic voicing and emotional detachment were more prominent were clearly privileged. Thus, 'contributions to class discussions based on narratives of personal experience did not get the floor' (1980: 127) and 'the truth of the matter would be that only the "anecdotes" of some would count' (1980: 131). The rights to use particular narrative modes are unevenly distributed, and this pattern of distribution disenfranchises those who have to rely on 'disqualified' narrative modes for conducting their business in society.

My aim in this article is to document and discuss autobiographical stories told by African asylum seekers in Belgium. I will try to highlight aspects of the structure and functions of narratives in an attempt to show how they represent crucial communicative resources for asylum seekers. Without recourse to the long and detailed narratives about home, escape and travelling, asylum seekers cannot make their motives and causes for seeking asylum fully understood. In highlighting these aspects, I display a concern for narrative–textual shape inspired by authors such as Hymes (1981, 1996, 1998) and Haviland (1996, 1997), as well as one for narrative–textual dynamics inspired by what has come to be

Source: *Discourse & Society* vol. 12, no. 4, 2001, pp. 413–449.

known as a 'natural histories of discourse' approach (Bauman and Briggs, 1990; Briggs, 1997; Gal and Woolard, 1995; Silverstein and Urban, 1996) emphasizing entextualization practices (de- and recontextualization practices) as crucial ingredients of 'interpreting' and 'understanding' text. These approaches to text will be set within a wider project that bears affinities to that of critical discourse analysis and can be summarized as investigating language-as-social-process in order to gain a more precise insight in power relations (see, e.g. Wodak, 1995).

The problem I wish to address through an analysis of these stories is that of narrative inequality in the context of asylum applications in Belgium. The asylum procedure involves a complex set of discursive practices and language ideologies that are, in practice, being used as criteria for 'truth', 'trustworthiness', 'coherence' and 'consistency'. Such discursive practices require access to communicative resources that are often far beyond the reach of African asylum seekers not only linguistically but also narratively and stylistically.

Like so many bureaucratic procedures, the asylum application procedure used to be 'blackboxed'. Hence, direct evidence of the official procedure interviews is not (yet) available,[2] and I have been forced to use the research tactic employed by, for example, Labov in his *Logic of Nonstandard English* (1970) (as well as, e.g. by Hymes reanalysing Labov's data in Hymes, 1996: chapter 8); I have also had to use 'second best' data and look at preconditions for talk in these data. The asylum seekers' narratives undoubtedly illustrate the way in which communicative resources are mobilized for 'making sense' of the asylum seekers' case; at the same time, they suggest at least the possibility of narrative inequality when measured against the norms and expectations inscribed in the discursive patterns of the asylum application procedure.

The lack of attention to the crucial functions of densely contextualized (and contextualizing) narratives is partly due to the particular treatment of text in bureaucratic procedures, particularly the shaping of textual trajectories in which 'original' stories are continuously reformed and reformulated. Hence it illustrates the fact 'that talk is often structured vis-à-vis mediated relationships it bears to objects and texts that are dispersed in time and space' (Briggs, 1997: 454–5) – in this case, vis-à-vis preconceived criteria of textuality and narrative appropriateness that are inscribed in practices of noting, summarizing and reading narratives, making 'files', interviewing and interrogating, translating and so forth (together with their products: specific texts formats and individual texts) within administrative procedures, themselves part of a huge text tradition such as that of Belgian law and bureaucracy. I argue that this process of (re)structuring talk into institutionally sanctioned text involves a dynamic of entextualization that is based on power asymmetries. This process also involves the problematic of the availability and accessibility of linguistic–communicative resources – an often overlooked 'context' of talk, but one that will be given prominence in this article (see also Blommaert, 2001).

Narrative inequality assumes a variety of shapes and has a multitude of dimensions. Three dimensions will be discussed in some detail here: (i) the accessibility and availability of linguistic–communicative resources; (ii) particular contextualization demands; and (iii) the ways in which texts are shifted through

the procedure. In my discussion, I focus on preconditions for discourse: the sort of 'material' for communication that asylum seekers have access to and what it means to be confronted with a bureaucratic system in which particular 'materials' are expected and required.

In the next section, I briefly provide some background on the situation of asylum seekers in Belgium and on the fieldwork project in which the data discussed here were gathered. In section 3, I turn to the issue of communicative resources and discuss some of the features of language competence observable in the talk of the asylum seekers. Section 4 presents a discussion of the particular type of sub-narrative that I call 'home narratives'. Home narratives are often long and sometimes anecdotal stories on the situation in the refugees' home societies, involving usually very detailed information on local events, the crisis from which refugees fled and so on. Home narratives are contextualizing accounts, and the particular contextualization trajectories they follow require close inspection. In section 5, I try to situate the home narratives in the discursive patterns that occur during the asylum application procedure.

2. Asylum Seekers in Belgium

The data discussed here were gathered during a fieldwork project in which more than 40 African asylum seekers were interviewed, most of them being illegal or in limbo, their asylum application either being undecided or having been rejected.[3] The interviews were open interviews in which asylum seekers were invited to tell the story of their escape, their reasons for escape, their experiences with the Belgian asylum procedure and with life as an asylum seeker in Belgium. The interviews were conducted in French, English and (in a small number of cases) Dutch. Dutch was the mother tongue of the interviewers; thus in most cases the interviewers and the interviewees had to rely on a language other than their native language to do the interview, and as a rule non-native varieties of those languages were being used.

The interviews were obviously very different from the ones taken in the official application procedure. The main difference was, however, not the open format of our interviews. The official interview also contains important 'open' slots. These open interview parts obviously offer a lot of material for detailed scrutiny and cross-questioning by the officials, and so become a threat rather than an opportunity for asylum seekers. Another shared feature between our interviews and the ones held in the procedure was the use of non-native languages as a lingua franca in the interview, implications of which will be discussed in section 3 of this article. The main difference was probably the key in which the interviews were put: ours were obviously inconsequential (though some subjects either suspected or hoped that the interview they did with us would have some benefit), and overall they were held in a friendly and sympathetic atmosphere.

In Belgium as elsewhere in Europe, asylum seeking has become a topic of heated political debate in recent years. The last decade has witnessed a rapid increase of asylum applications. This, combined with the increased complexity

of the cases – many asylum seekers do not offer a 'typical' motive for seeking asylum, as we shall see further – has led to bottlenecks in the administrations in charge of asylum regulations. In the past, it took years to reach a decision on some applications. In the meantime, applicants lived in the country in appalling conditions of poverty and marginalization (pushing them into the crudest systems of labour exploitation, including prostitution); often the administrative treatment was reduced to a very superficial inspection of the application in attempts to speed up the procedure and reduce the backlog of applications. The infrastructure for hosting asylum seekers rapidly (and chronically) proved to be grossly inadequate and violence became a constant ingredient of the treatment of asylum applicants by the police force. This flooding of the administrative apparatus went hand in hand with negative stereotyping of asylum and asylum seekers (Blommaert and Verschueren, 1998: chapter 8), associating asylum seekers with crime and qualifying most of them as 'adventurers' who sought asylum exclusively for economic purposes (in popular parlance: 'to take advantage of our generosity').

In September 1998, a young Nigerian woman called Sémira Adamu died during her forced repatriation. Her asylum application, based on the argument that she would be forced to marry an old and violent man in Nigeria, had been rejected. She was put on a plane for Togo and seated between two policemen; when she started to shout, the police officers put a small pillow over her mouth. Sémira Adamu went into a coma and died. Her violent death caused a public outcry both among asylum seekers and among the public at large. Asylum seekers came out of hiding and demonstrated, occupying churches and schools. A number of organizations were formed for the improvement of the living conditions and the chances of asylum for asylum seekers, and the government ordered a public inquiry into the procedures of repatriation of rejected applicants. For a brief period, asylum was a priority on the political agenda, and the negative stereotyping of asylum was transformed into a public image of victimhood. In the spring of 1999, the protests gradually faded and the issue of asylum seekers resumed its previous shape and course.

As shown later, the asylum procedure relies heavily on an investigation of applicants' stories. On their arrival in Belgium, they are interviewed about the causes and motives for fleeing their country and seeking asylum. The general format applied in this procedure is that of a criminal investigation. Well over 90 percent of the applications are turned down, often – as we shall see – on very doubtful grounds. Politically, the 'control' of immigration (i.e. the *reduction* of the number of effective immigrants) combined with a policy of 'humane repatriation' of rejected applicants is a generally accepted doctrine. The new phenomenon of massive asylum seeking is rarely seen as an issue in its own right, rather it is associated with the more general issue of immigration and immigrant policies in Belgium, and it is usually presented as a further complication of an already thorny issue of 'integration'/assimilation of foreigners into the local cultural, linguistic and social communities.

The discursive patterns by means of which these political categories are being constructed and situated in the larger fr[illegible]

society are beyond the scope of this article (see Blommaert, 1997; Blommaert and Verschueren, 1998); suffice it to state here that the issue of asylum seekers is obviously one in which rhetorical accomplishments and discursive constructions of reality are crucial. The politics of asylum in Belgium is a politics of representation in which discursively constructed and disseminated gross categories (e.g. 'political', hence 'legitimate' asylum seekers versus 'economic', hence 'illegitimate' asylum seekers) are crucial political instruments.

The historical situatedness of our data deserves some attention. The interviews we organized with asylum seekers were conducted between October/November 1998 and March/April 1999, i.e. during the brief period in which asylum seekers came out of hiding and were eager to tell their stories to all those interested, and during which there was some positive media and political attention for these stories. This accounts for the fact that we could collect data at all. During these few months, asylum seekers became visible and their stories became publicly accessible. Second, it explains the nature of their stories: they are apologetic and argumentative, using a discursive space shaped by the Sémira Adamu crisis, in which new views of asylum seeking, motives and experiences could be articulated. For a brief period, asylum seekers had a legitimate voice, and their case was taken up by many opinion makers and politicians.

3. Resources

One of the characteristics of the administrative world we live in is the unchallenged and apparently unchallengeable assumption that bureaucratic and administrative clients would have complete control over the medium and communicative skills in which bureaucratic and administrative procedures are being carried out. In Belgium (as undoubtedly elsewhere) administrative procedures require highly developed literacy skills as well as (some degree of) access to a standardized variety of a language (in Belgium: Dutch, French or German). It should be noted, in passing, that literacy requirements seem to increase in size and scope the lower one gets into society. People on low incomes often have to go through a mass of complex and very diverse paperwork in order to get social welfare benefits, privileged access to social housing, medical treatment or education. Thus, Jim Collins' comment that 'modern educational systems produce stratified literacies: elites are socialized to an interpretive relation to texts, and nonelites to a submissive relation to texts' (1995: 84) becomes pressingly relevant.

The first requirement, literacy, is taken for granted and is rooted in a sociocultural tradition in which generalized schooling provides (stratified patterns of) literacy to *all* Belgian citizens. Being literate is a sociocultural given in Belgium. The second requirement is more controversial and multilayered: the emphasis on standard varieties is rooted in political–linguistic struggles of the past, discussion of which would take us outside the scope of this article. Standard varieties of languages were used as emblems of national identity in many parts of the world; the outcome of the struggle in Belgium gave rise to a highly complex and politically very sensitive language legislation in which tolerance for other

speech varieties (nonstandard forms as well as foreign languages) is restricted. Thus, nonstandard varieties are allowed in the domain of orality and non-official language use; as soon as the bureaucratic and administrative arenas are being entered, the standard (written) variety of the language is imposed.

The fact is that the communicative requirements imposed on clients are conditioned by historically contingent phenomena such as the social distribution of communicative resources through, for instance, the education system, the mass media and so forth. In more than one way, the requirements thus presuppose membership of the society, or at least of social units with similar linguistic economies and communicative sociologies. Assumptions of choice in pragmatic theories (for instance in conversation analysis) are very often based on the implicit acceptance of such membership, and tend to obscure significant inequalities in the range of possible choices some people can control. Constraints on choice, anchored in inequality of speech repertoires, are certainly crucial features of our asylum seekers' data, and competence in the medium of narration is one issue. It makes a significant difference whether the narrator uses a language or language variety over which she or he has adequate control. Narrating in a second, third or other foreign language may considerably reduce the set of resources which speakers can select for structuring their story and thus for 'making their point'. As we shall see, this does not pre-empt the fact that they make their point; it does however influence the way in which interlocutors perceive their story and *get* the point.

In what follows, I first document some problems in language proficiency. After that, I turn to what I call 'ethnocoherence': patterns of coherence that can be discerned in such narratives, despite the sometimes considerable problems of language proficiency.

3.1 Problems of Language Proficiency

Let us now take a closer look at some examples from the corpus. They illustrate the difficulties experienced by many speakers in expressing themselves in French, English or Dutch. More often than not, stories are told in hesitant styles packed with self-corrections and mid-sentence changes of tactic, footing or topic, less than adequate lexical selection, problems in verb inflection (e.g. tense and aspect marking), problems in selecting adequate pronouns, and so on. At the same time, the stories that are being told are topically and structurally quite complex, as we shall see in the next section. The problems with language proficiency considerably complicate matters.

Extract 1 illustrates the types of stories which result from the use of 'broken' French coupled with a detailed and complex home narrative. The interviewee, a man from Angola, is explaining an episode of Angolan history to the interviewer.[4]

Extract 1

oui/l'autre président . . .(xxxxxx)/on l'a empoisonné/c'est le président Mobutu/ qui a mis le poison retardé/ il est parti au russe/ l'URSS/ pour traîter/ il a retourné/ il est mort/ mais on a abandonné son corps hein/oui/ {{*Question: c'était un président*

de MPLA?}} c'était le même mouvement MPLA/ dans le temps/ année septante-cinq/ quand il est mort on dit/ comme on ==il est marxisme/ on a pris on a choisi =on= on a fait faux testament/ cette testament c'était au temps du russe qui a fait ça/ comme toi tu =le= le président il est mort/ il a décidé Eduardo qui va me remplacer/ sans vote/ parce que il est toujours du même parti/ Eduardo il est d'origine angolais/ mais il est des Cap Verdiens/ parce que ce sont des anciens prisonniers/ et Portugais il a mis à l'île hein/ nous sommes à l'océan/ et on a mis une prison là-bas/ parce qu'il est venu pour commander l'indépendance/ c'était une petite ville =une petite= une petite village/ on a mis au pouvoir/ maintenant le président/ c'est on dit/ il dit que non/ tous les gens/ qui parlent Lingala/ les gens du Nord/ ce sont des gens plus malins/ plus intelligents/ par rapport au gens du Sud/ en Angola nous sommes quatre couleurs/ comme le Bré=le Brésil.

Translation:

yes/the other president . . .(xxxxxx)/they have poisoned him/ it's president Mobutu/ who put the delayed poison/ he has left to Russian/ the USSR/ to treat/ he gave back/ he died/ but they have left his corpse, right/ yes/ {{*Question: it was a president of the MPLA?*}}/ it was the same movement MPLA/ in those days/ year seventy-five/ when he died they say/ like they=he is Marxism/ they took they chose= they=they have made false testament/ those testament it was in the time of Russian that has made it/ since you you=the=the president is dead/ he decided Eduardo who is going to replace me/ without vote/ because he is always of the same party/ Eduardo he is of Angolan origin/ but he is of the Cape Verdians/ because they are former prisoners/ and Portuguese has put on the island, right/ we are at the ocean/ and they have put a prison over there/ because he had come to command the independence/ it was a small town= a small=a small village/ they have put to power/ now the president/ that is what they say/ he said that no/ all the people/ who speak Lingala/ the people from the north/ they are more clever people/ more intelligent/ in relation to the people from the south/ in Angola we are four colours/ like Bra=Brazil

As demonstrated in the next section, a tremendous amount of information is squeezed into narrative passages such as this one. The point I wish to make here is that the narrative structure and the salience of what the man tells us are overshadowed by the code in which he tells it: a variety of colloquial and informally acquired French in which grammatical, syntactic and lexical errors are frequent when measured against normative standard French. The sequence of events is not marked by the usual tense and aspect markers; nouns and adjectives are used as synonyms ("il est marxisme" instead of "il est marxiste"; "russe" instead of "Russie"); articles are deleted ("Portugais" instead of "le Portugais" or "les Portugais" and so on. The Angolan man is struggling with the code. Hence, contextually crucial and sensitive episodes such as the one in which he describes the change of power in his country (crucial and sensitive because they form the basis of the reasons why he escaped from his country) are narrated as:

Extract 2

dans le temps/ année septante-cinq/ quand il est mort on dit/ comme on ==il est marxisme/ on a pris on a choisi =on= on a fait faux testament/ cette testament c'était au temps du russe qui a fait ça/ comme toi tu =le= le président il est mort/ il

a décidé Eduardo qui va me remplacer/ sans vote/ parce que il est toujours du même parti/

Such ways of narrating crucial and sensitive matters are offered to interviewers who are also non-native speakers of French. But there are various sorts and degrees of 'non-nativeness', having to do with what sort of variety has been acquired by the speakers, through which types of channels and means (formal–informal learning, spoken and/or written, which genres). In this case, the interviewers were Belgian-Flemish highly literate university students with a more or less developed competence in 'schoolbook French', i.e. a variety of the standard language rarely used in practice. Students such as the group of interviewers in this project do not have much exposure to French, and they actively use it only on relatively rare occasions. So the interaction situation is one in which one party uses – and I adopt Fergusionian terminology for the moment – a very 'low' variety of French and another a very 'high' variety, while both parties have difficulties with the production of spoken French and none of them is 'fluent'. The passage in Extract 2 therefore appears very confusing, rambling and incomprehensible to the Belgian interviewer.[5]

The asylum seekers often acquire their varieties of European languages in informal circumstances: outside school, through exposure to specific varieties of speech, with dialect and/or jargon influences. This, as well as the effect it has on the interaction with the interviewers, can be seen in Extract 3 where the same Angolan man (P) explains the sort of currency used in Angola:

Extract 3

P: mais en Angola on mange les dollars/ nous avons les
Q: on mange?
P: oui on mange= =d=dollars/ au magasin on achète en **dollars / à cause de** (mon= au magasin on dit) c'est les magasins des français/ **Elf**

Translation:

P: but in Angola we eat dollars/ we have the
Q: we eat?
P: Yes we eat==d'dollars/ in the shop we buy in dollars/ because (sho= in the shop they say) it's the shop of the French/ Elf

The interviewer Q interrupts P with a request for clarification on the phrase "***on mange les dollars***". The phrase "***manger***" followed by the name of a currency is a colloquial Congolese French expression meaning 'to use a specific currency'. Interestingly, P does not recognize Q's request for clarification as referring to "***manger***" but understands it as a request to clarify why *dollars* are being used as currency in Angola. So his answer elaborates on the fact that the shops are owned by the French petrol company Elf.[6]

The next example illustrates how expressing sometimes even quite simple concepts or experiences can become highly problematic because of the limitations imposed by the code in which the story has been told. A woman from Angola tells her experiences in a detention centre for asylum seekers. She

tries to explain that there is a problem with *ventilation* in the centre; the whole fragment in Extract 4 is a struggle to find the right way to express 'ventilation'.

Extract 4

il y en a des familles qui vivent ici/ des enfants/ mais.. Il n'y a pas des choses de vapore==pour vaporiser des cigarettes/ parce que la cigarette là-bas ce n'est pas de==c'est de==de tabac/ les gens il va fumer du matin au soir/ il n'y a pas de fenètres pour sortir euh/ enlév==entrer le vent==il n'y a pas/ presque tout c'est fermé/ dans les toilettes c'est la même chose/ des fenètres ça n'ouvre pas

Translation:

there are families who live here/ children/ but... there are no things to vapore= to vaporize cigarettes/ because the cigarette there it is not the== it's = tobacco/ the people he smokes from morning till evening/ there are no windows to get out ehr/ take aw=get wind in=there are none/ almost everything is closed/ in the toilets it's the same/ the windows they don't open

Metapragmatic framing, speech act selection and other phenomena that belong to the sociocultural anchoring of language are also sources of communicative problems in our data. Often, the use of a common medium in interviews between native and non-native speakers triggers the assumption from the native speaker that the interlocutor not only shares the *linguistic* code, but also the *pragmatic and metapragmatic* codes. Giving metapragmatic instructions about the way in which the interview will be conducted (a common opening phase of research interviews) is one such locus of problems. The following fragment is taken from the start of an interview with R, a male refugee from the Ivory Coast. The tape starts running, and the interviewer B begins by giving some 'director's instructions' to R.

Extract 5

B: Ik denk dat het gemakkelijkst zou zijn als je begint/met hoe dat je naar hier bent gekomen ehr
R: =met vliegtuig
B: ja/waarom wa=waarom je naar hier gekomen bent/ehr/en hoe je hier geraakt bent/dat jij gewoon/ we gaa=we gaan niet veel vragen stellen/'t is wat/dat jij gewoon praat/wat praat
R: ja
B: zeggen watje..
R: =ja het is heel moeilijk om te zeggen (...)

Translation:

B: I think that it would be easiest if you start/with how you got here ehr
R: =by plane
B: yes/why wh=why you came here/ehr/and how you got here/that you just/ we won=we won't be asking many questions/it's what/that you just/talk a bit
R: yes
B: say what you..
R: =yes it's very hard to say (...)

B's intention is to provide some metapragmatic instructions for the interview. But mentioning one topic of inquiry "how you got here" in line (1) triggers a response from R ("by plane", line 2). R had interpreted line 1 as a question, not as part of a set of preliminary instructions. B repairs the mistake in line 3–4, R acknowledges this in line 5, and B hands the floor to R in line 6. Two problems can be identified with respect to R's misinterpretation of B's statement in line 1. First, the interview was in Dutch, B's mother tongue. Dutch, for R, is a new, foreign language which he masters admirably but not completely. The original utterance in line 1, spoken by B, was "*hoe dat je naar hier bent gekomen*" ("how-that-you-to-here-have-come"), in which the vernacular Dutch '*hoe*' ('how') is meant to stand for *the total set of circumstances* of R's coming to Belgium. It is not uncommon in varieties of Dutch to ask "how [Dutch *hoe*] did you get here" with the intention of learning the *reasons* for one's being there. But R, a non-native speaker of Dutch, only picks up the 'typical' *instrumental* meaning of 'hoe' ('how'), and answers that he came here "*met vliegtuig*" ("with-plane"). B's repair in line 3 consists of differentiating and specifying the precise semantic directions of his questions – 'how' as well as 'why'. So part of the mistake is based on differential competence in Dutch, more precisely, it is based on R's lack of familiarity with the semantic and pragmatic nuances of colloquial Dutch.

Second, there is also a mistake in *speech act interpretation.* R fails to pick up the *declarative* nature of B's utterance in line 1, and interprets it instead as a *question* to which he has to reply. In all likelihood, R interprets the circumspect formulation "I think that it would be easiest if you start/with how you got here" as an indirect, deferent question, rather than as the neutral declarative statement intended by B. Both problems have to do with the intercultural nature of the communicative event. The prima facie sharedness of the medium – R has an admirable knowledge of Dutch – can trigger an illusion that not only the lexical and grammatical aspects of the language but also the complete set of sociocultural, pragmatic and metapragmatic aspects are shared by the participants. This is not usually the case. In this fragment we see that differential competence in a language can be hardly noticeable, as it can lie in aspects of language that are less clearly visible than, for example, wrong lexical choices or grammatical (e.g. gender, article or inflectional) errors.

3.2 Ethnocoherence

The various difficulties with competence in the medium of the talk, reviewed so far, all suggest that stories are told in 'simple' varieties of languages. But this does not mean that such stories are 'simple', nor that narrators fail to bring about significant degrees of narrative structure or coherence in their stories. Even though the language may be simple and plain, and despite 'errors' in the language, stories can be narratively complex and display obvious patterns of coherence. But coherence seems to emerge in peculiar (*ethno*) ways, since speakers have no access to the full potential of grammar and syntax of the languages they have to use.

Let me illustrate this with an example from our data. The fragment is taken from the beginning of an interview with Habiba, a Somali woman. H is Habiba; A and B are interviewers.

Extract 6

H: I'm from *Somalia and my name is Habiba Mohammed and I=I have *five childrens and I coming here before the children are coming=when I was euh when I=I'm arrive in Belgium I was *alone\
A: ah\
H: yeah\in sake of the war=the war of Somalia\
A: uhuh\
H: And. I w=I'm. Twen=*thirty five years old\
A: uhuh\
H: and euh I was working in Somalia ICRC International red Cross
A: that's
H: ICRC *Red Cross\
A: ah OK OK jaja
B + H: [acknowledge]
H: and I was euh office assistant\
A: ja
H: yeah. So Somalia is starting war *nineteen ninety one
A: uhuh\
H: so until ninety one to ninety five I was in Somalia
A: uhuh\
H: and [baby starts crying] wa [laughs] and I have *four children at that time and euhm.. My husband comes from euh *north Somalia
A: uhuh
H: and I *south Somalia is fighting north at=at south is fighting\
A: uhuh
H: so my=my husband and my children have no. *safety for their lives
A: uhuh

Habiba clearly has difficulties speaking English. Her statements contain Dutch calques such as "in sake" (from Dutch "*in zake*", i.e. 'concerning', erratic plural marking ("childrens") and verb inflection ('and I coming here') and so on. But let us re-transcribe Habiba's narrative, deleting the interviewer's backchannelling interventions as well as the clarifying insertion sequence (on 'ICRC', two turns). These backchannelling interventions are important, because they support the structuring of Habiba's narrative; but by deleting them we arrive at a number of narrative statements:

Extract 7

1. I'm from *Somalia and my name is Habiba Mohammed and I=I have *five childrens and I coming here before the children are coming=when I was euh when I=I'm arrive in Belgium I was *alone\
2. yeah\in sake of the war=the war of Somalia\
3. and. I w=I'm. Twen=*thirty five years old\

4. and euh I was working in Somalia ICRC International red Cross
5. and I was euh office assistant\
6. So Somalia is starting war *nineteen ninety one
7. so until ninety one to ninety five I was in Somalia
8. and wa= and I have *four children at that time and euhm.. My husband comes from euh *north Somalia
9. and I *south Somalia is fighting north at=at south is fighting\
10. so my=my husband and my children have no. *safety for their lives

There is a considerable degree of narrative structure and coherence in this fragment, despite the 'broken' English in which it is made. First, Habiba brings new information in each of her statements. The statements do not overlap; each of them introduces a new element in the story. Also, there is a clear break in this sequence of narrative statements. Although each of the statements adds new information, Habiba marks a thematic break between statement 5 and 6. Statements 1–5 all refer to Habiba herself, they identify her (name, age, country of origin, profession); statements 6–10 are about '[the war in] Somalia' and provide background to the reasons why she came to Belgium. The break between both thematic parts is marked by cohesive devices: "and" in the first part, "so" (and "and") in the second. The use of these particles creates a complex pattern of information in the story:

Extract 8

PART I

1. I'm from *Somalia
2. **and** my name is Habiba Mohammed
3. **and** I=I have *five childrens
4. **and** I coming here before the children are coming
   {clarification} =when I was euh when I=I'm arrive in Belgium I was *alone\
   yeah\in sake of the war=the war of Somalia\
6. **and.** I w=I'm. Twen=*thirty five years old\
7. **and** euh I was working in Somalia ICRC International red Cross
8. **and** I was euh office assistant\

PART II

1. **So** Somalia is starting war *nineteen ninety one
2. **so** until ninety one to ninety five I was in Somalia
3. **and** wa= and I have *four children at that time
4. **and** euhm.. My husband comes from euh *north Somalia
5. **and** I *south Somalia is fighting north at=at south is fighting\
6. **so** my=my husband and my children have no. *safety for their lives

We can go a bit further. In part II, two levels can be distinguished. Not all the statements in part II are equally relevant. Statements 1, 2 and 6 are 'main' statements, setting important argumentative and narrative frames. Statement 1 introduces the general historical frame of the war in Somalia; statement 2 places Habiba in that historical frame, and statement 6 draws a general conclusion from this general sketch of Habiba's family's situation in the war. Statements 3, 4

and 5 elaborate on statement 2: they clarify and specify statement 2, Habiba (and her family) living in Somalia during the war years. Thus we arrive at the following structure for part II:

Extract 9

PART II

1. **So** Somalia is starting war *nineteen ninety one
2. **so** until ninety one to ninety five I was in Somalia
3. **and** wa= and I have *four children at that time
4. **and** euhm.. My husband comes from euh *north Somalia
5. **and** I *south Somalia is fighting north at=at south is fighting\
6. **so** my=my husband and my children have no. *safety for their lives

The main statements are marked by "so" the subordinate ones by "and". The structure is crystal clear, and Habiba accomplishes it by means of only two cohesive markers: "and" and "so".

The narrative patterns we find in stories such as that of Habiba not only contain a wealth of information, structured into patterns that reflect relevance and affect – Goffmanian footing – they often also contain intricate argumentative patterns in which theses are formulated, refuted, demonstrated by means of evidence and so on. Emphasis, logical or associative sequences, cause–effect relations, argument elaboration patterns are all marked by speakers. In order to make their point, speakers draw upon complex sets of related arguments, illustrations, conclusions, deductions and so forth.

Let us take a look at another example. The following fragment is taken from an interview with an Angolese couple P (husband) and D (wife); the Belgian interviewer is GM. The interview was in French. The following fragment occurs as part of an exchange on the role of the media in the Sémira Adamu case. The Angolese couple had been interviewed by local TV reporters, and GM asks whether they believe that this media exposure would have a beneficial effect on their asylum applications. The answer is negative: the authorities publicly claim that they would adopt a more flexible attitude towards asylum seekers; yet as soon as the latter present themselves to the authorities, the answer they get is that "they will have to follow the procedures". The Angolese woman elaborates this further:

Extract 10

1 4: à la télé on dit/*ooh noon/on peut pas donner tous lees personnes après cinq ans
2 les==on a fait euh dix ans/ les choses comme çà/ on va regarder les procédures /mais le
3 premier jour on dit à la télé /ooh noon /on va *donner les gens qu'on a fait cinq ans dans
4 notre pays/ parce qu'il y a eu des enfants qui étu=étudient ici depuis longtemps/ on a fait
5 *six ans==*cing ans et les enfants ils vont à l'école==c'est le bourgemestre de Bruxelles

6 qui a dit comme ça==
7 GM: ==hmm=
8 D: =ouais/ les enfants sont *integrés chez nous depuis longtemps==il part à l'école/mais
9 maintenant je pense qu'on va les donner les ==pour donner les enfants==là à ses parents/
10 *mais après quelques jours on a dit/OOH NOOON on va euh==suivre les procédures
11 [hits hands on legs] MAIS *COMMENT ON PEUT SUIVRE LES PROCEDURES?

20 they think that they give/ *aaahh all these people stay in our country/ but eh=*so long
21 they leaves to countries of the people to stay there/ in *Portugal there are Belgians=they have done something there

The Angolese woman tries to make a crucial point in understanding her condition and experiences as a refugee: the gap between what Belgians believe happens to refugees, and what really happens to them in Belgium. She makes this point in 'broken' French, part of the features of which do not appear in the English translation (e.g. ambiguous 3rd person "on", meaning "they" as well as "us" and impersonal "one"). However, more interesting is the elaborate argumentative structure of D's talk. Prompted by GM's suggestion that TV exposure would create a more favourable climate for asylum seekers to obtain their documents (i.e. to be 'regularized' and given legal residence permits) she argues that this is not the case. She describes what happened. First, largely in reported speech ("ooh noo", performance marked by lengthened vowels) she describes how the Mayor of Brussels declared on TV that people with children who go to school in Belgium and who have been in the country for a number of years would be regularized (lines 1–6). Next she describes how the Belgian authorities shifted their position a couple of days later, again using reported speech (line 10). She then states her own position: "but how can we follow the procedures?", and starts elaborating on that theme using an anecdote picked up from the newspaper. This then leads to a conclusion and a coda, in which the situation of asylum seekers in Belgium is compared to the freedom with which Belgians settle elsewhere in the world.

Despite her 'broken' French, D constructs a clear pattern of arguments, schematically represented as follows. Note also how the central motif of the argument, the issue of how to follow procedures, is marked by parallelisms (indicated by arrows ⇐):

Extract 11

1. Background
They will give the [documents] to the children to their parents
because they have been integrated here (says the Mayor of **Brussels**)

2. Point of departure:
[But] afterwards they say that we have to follow the procedures ⇐

3. Refutation

3.1. Core
But how can we follow the procedures? ⇐

3.2. Elaboration
1. Ever since I arrived here, I lived without documents
2. Anecdote: Report
yesterday we have read in the newspaper
A woman with no documents and 3/5 children
No documents for 7/6 years

Comment
And then they say that you have to follow the procedure ⇐
[BUT] you have thrown away that woman's documents
We don't know what procedure to follow ⇐

4. Conclusion and coda
That is the problem
The Belgians cannot give documents just like that [i.e. they *don't* give papers just like that, procedures must be followed, and this is problematic]
[BUT] Belgians believe that everyone just stays in their country
[WHILE] Belgians themselves can be found all over the world (Portugal)

We see a well-organized narrative pattern emerge over and beyond difficulties in handling the linguistic code. The core of the argument is clearly marked, and the refutation is accomplished by means of comparison of D's situation with that of someone else (the anecdote) and leads to a convincing point: staying in Belgium is not as simple as Belgians tend to believe it is; in fact, Belgians have an easier time when they decide to go and live abroad.

Stories told in 'simple' language are not necessarily 'simple' stories. But they may be stories that are open to all sorts of misinterpretation by interlocutors who, often, have a different (yet equally limited) competence in the medium in which the interview is done. It requires some effort to detect coherence in the stories told in 'broken' varieties of Dutch, English or French, because coherence and structure have to be sought at levels of linguistic structuring not easily penetrable to non-specialists and difficult to pick up while the story is told.[7] We will turn to such forms of structuring in section 4. But before that, we have to refer back to what we said at the beginning of this section: in our society, administrative procedures and the rights that are dependent of their 'correct' fulfilment require and assume the sharedness of linguistic and communicative resources. The fact of the matter is that these resources often lack from the repertoire of the asylum seekers interviewed by us. Consequently, issues of resources are crucial elements in the forms of narrative inequality investigated here. Inequalities

in speech repertoires condition narrative inequalities and thus inequalities in the allocation of social rights.

4. Home Narratives

4.1 A Contextual Account

One feature in many interviews is the way in which interviewees attempt to provide detailed contextual accounts of their lives, local circumstances, politics and conflicts in their home society formulated in the shape of sub-narratives of the larger narrative. We call such contextual accounts 'home narratives'. Often these narratives are triggered by an awareness that the story cannot be fully understood unless other people know some details about the society they come from, the particular events that caused their flight, and so on. Such exposés can be highly complicated. They can disturb an expected pattern of sequential event narrating ('first this, then that') and give a muddled impression (see Ochs and Capps, 1996, for a general survey of features of similar narratives). The details given by interviewees can also backfire: details are open to scrutiny and one inaccuracy, inconsistency or contradiction in the story can be enough to disqualify asylum seekers, as will be shown in section 5.

The following fragment is taken from an interview with R, a male refugee from the Ivory Coast. The interview was in Dutch. At one point, the interviewers (B and T) ask "What were the precise reasons why you came here?". What follows is a long contextualizing narrative, placed between two general framing statements which are given in bold.

Extract 12

35/36 down you can't vote/ and that's what they did/ yes we tried to find that list/ yes and make
37 another one
38 B, T: yes
39 R: but that was illegal
40 B: yes
41 R: if it/ yes/ then we are prosecuted/ **and so I had to escape/**

Almost 40 lines of monologue separate the question as to why R had to escape from the Ivory Coast and R's conclusion to the answer "And so I had to escape". In this monologue, he tries to capture some of the basic political mechanisms and problems of his home country: French neocolonialism (lines 2–7), monopartism and the difficult transition to multipartism (lines 10–15), political clientelism (lines 17–265), the opposition movement in the diaspora (lines 28–32), and the direct cause of his flight: protest against the manipulation of the elections (lines 32–41). This fragment is again followed by a very detailed account of the political and institutional customs of the Ivory Coast blended with accounts of events leading to R's flight.

4.2 Patterns and Structures

The man from the Ivory Coast starts by saying "for *everyone it is difficult to understand the politics of the Ivory Coast", indicating the need to provide such detailed information on life in the Ivory Coast: a precise understanding of why he escaped from his country would be impossible for people who hardly know anything about life and politics in his country (cf. "because/it is never discussed").

If we look a bit closer into the narrative structure of this fragment, we see the following patterns emerge. First, the narrative can be divided into episodes marked by particular narrative patterns:

Extract 13

1. for *everyone it is difficult to understand the politics of the Ivory Coast
   because ... it is never discussed
2. But over here we still have the French army
   ehr ehr our airport is a French army base
   and these people are there anyway
3. and we=we=we have no right to choose our=our own government
   yes these people are appointed by France
   but we are *not a colony anymore...
   since thirty-eight years we ehr have obtained our independence
   but until now our ministers have always been appointed by France...
   {reason} our country is in the center of West–Africa
   and that is a strategic position
4. {preceded by reply from B, T} yes/so...yes there is=we are not rich/ and..
5. okay..eight years ago we tried to create political par=parties and so
6. [louder] but the government itself has created *thirty-eight parties
   6.1. while this is the difficult thing to ehr get elected or to lead a country..
   If you are not a member of a party/ *then they=we obtained different ehr permission to create parties/
   and apart from that or on *top of that the government has created thirty eight parties/
   apart from the=*plus the thehh monopartism you see?
   6.2. yes the monopartism exists since sixty/ till ninety/ thirty years/
   6.3. and yes they have themselves created thirty=thirty-eight parties/
   6.4. the people who *don't work for the government/
   I mean/ in ehr..the=the private the private sector is very small/
   everyone already works for=for the government/
   and if.. yes the people who work for the government they are like ehr the prison/ they are like imprisoned/
   because you..you=you are always afraid of losing your job/
   -maybe in your family with your nephews and nieces and so maybe you are about one hundred people
   -and you are the only one who has a job
   that/ yes/ all these other people are/ they=they are poor and they all count on you /
   –then you have to keep your job
   -*if not *someone from your family will be bought to be used against you/
   yes things like that..small things like that/
7. and we...yes [sighs]
   yes there is our president of our party
   we also have=we also try to get organized here in Belgium in Holland in France/
   the=the large group is in France in Italy in Germany
   also in other countries..in Holland/
   the people from Holland will come here the day after tomorrow
   we have our/ yes large meeting in Brussels...

8. that's it...yes thehh reason was that
   8.1. in nine=ninety five/ we had to do an election/
   and in thirty four=ninety four a list of all the *inhabitants had to be made/
   8.2. but the people who did that
   when they came to you and they know that you are a=a member of the opposition/ then your name=ehr your name would not be written down/
   and if your name is not written down you can't vote/
   and that's what they did/
   8.3. yes we tried to find that list/
   yes and make another one
   8.4. but that was illegal
9. if it/ yes/ then we are prosecuted/
   and so I had to escape/

We can identify nine narrative episodes marked prosodically or by means of markers such as "but" or "and". The most complex episode is episode 6, subdivided into at least four sub-episodes. If we reorganize this narrative pattern so as to structure it into an argumentative 'answer'-pattern to the question, we see the following (paraphrases are given between accolades):

Extract 14

Why did you escape from the Ivory Coast?
Point of departure
1. For everyone it is difficult to understand the politics of the Ivory Coast

General reason: neocolonialism
2. We still have the French army
3. And we have no right to choose our own government
   {reasons:} we are in the centre of West–Africa
4. {that is why the French are there, because} we are not rich

Specific reason: membership of political opposition party
5. Eight years ago we tried to create political parties
6. {this is problematical, because} the government itself has created 38 parties
   {the government manipulates the democratization process: monopartyism plus 38 bogus parties}
   {iron grip of the régime on society} you are always afraid of losing your job
7. {our party also exists in Europe}
8. The {immediate} reason was {election fraud}
   {the régime tried to commit fraud in voter registration}
   {we tried to counterfeit our own voter registration list}
   but that was illegal

Conclusion
9. Then we are prosecuted and so I had to escape

This home narrative plays a crucial role in 'making sense' for the asylum seeker. The immediate cause of his problems is one issue, the wider context of neocolonialism and an oppressive one-party regime is another. This man broke the law

of the Ivory Coast in trying to counterfeit a voter registration list; but the justification for this act is the wider political context that makes clear that the Ivory Coast is not a democracy, that the laws are dictatorial, and that he and his friends broke that dictatorial law in their struggle for democracy. His asylum application in Belgium was jeopardized on grounds that he broke the law in his home country; his home narrative is an attempt to explain the justified nature of his asylum application. In sum: his home narrative is not a side-track, it is right on track.

4.3 Contextualizing Accounts

Let us go somewhat deeper into the explanatory and argumentative functions of these home narratives. R, in the fragment above, starts his monologue with a deep sigh and a reflection on the ignorance of Belgian people about the intricate realities of the politics of the Ivory Coast. In other interviews, we saw such home narratives framed in terms of absence of attention from the 'international public opinion' – 'everyone should know this' (a phenomenon also noted by Malkki, 1995 among Hutu refugees in Tanzania). In either case, the accurate contextualization of personal experiences in terms of local political, economic, social and cultural terms appears to be a crucial explanatory strategy for attaining understanding.

Text-structurally, home narratives are often framed by utterances situating them in relation to a particular argument or explanandum: preceded by framing statements such as "you must know that . . .", "you see, in my country . . .", "people here don't know that . . ." and so on, and followed by statements connecting the home narrative to a particular argument such as "that is why . . .", "and so . . .". So one of their functions is to provide a particular epistemic format: a metapragmatically framed 'aside' in which crucial referential and indexical 'fillings' are given of terms, concepts and features of the story.

This epistemic format is shaped by means of contextualizing discourses of time and place. The refugee experience is an experience of displacement (similar to the one described for native American groups by Collins, 1998) seen as crucial in understanding the work of identity of such groups in light of changing living conditions, political allegiances, economic practices and physical migrations. Stories from such groups thus display a complex interplay of physical space (e.g. place names), social space (e.g. sociocultural values or ethical codes associated to certain places) and narrative space (discursive articulations through indexical links in a narrative), in which migrant, minority or other social identities are being shaped (cf. Collins, 1998: ch. 6). Malkki (1995) demonstrated how physical displacement – part of the *condition humaine* of refugees – gives rise to forms of remembering that include spatial as well as temporal trajectories of leaving, being transported, settling, staying and returning, all of which become characteristic of the exile identity of the Hutu refugees she investigated (see also Maryns and Blommaert, 2001). In our data, too, displacement becomes a matter of identity, and (re)telling the story of escape and exile as well as the story of dealing with Belgian authorities gives rise to narratives that provide the core of [illegible] the autobiography of refugees takes the

shape of *trajectory* telling. Temporal and spatial elements are used in constructing 'refugeeness', as this identity relies on the fact of having left one place, travelled across parts of the globe and settled in another place. Surely, the increasing structuration of narratives into 'fully formed narratives' testifies to the gradual and discursive practice-based construction of such refugee identities.

In the home narrative in Extract 12, three places are articulated together with three time frames. Three different time frames are used to qualify features or events associated to either Belgium or the Ivory Coast: the present (incorporating the act of telling), the past and a timeless, permanent state of affairs. The timeless and the past frames are used to qualify the Ivory Coast; the present is used to qualify Belgium. We can summarize these in the following schema:

Time	Place
Present	HERE: Belgium • systemic observations: people don't understand politics in the Ivory Coast • political activism in exile
Past (i) Long (38 years) (ii) short (8 years, critical moment 1995)	THERE: Ivory Coast • monopartism, dictatorship • political activism, election incident
Timeless	THERE: Ivory Coast • systemic observations: neocolonialism, strategic location, poverty, clientelism

Richard Bauman (1986, quoted in Briggs, 1997) defines narrative as 'a representation of a segment of social life in such a way as to create a series of sequentially ordered events'. In the home narrative discussed here, the *temporal* sequence of events from past to present which would constitute a 'typical' narrative is 'broken' by a number of systemic observations with respect to the general political and social situation in the Ivory Coast, narrated in a factual timeless present tense. Thus, in response to the question "why did you escape from the Ivory Coast?", the man from the Ivory Coast presents us with a classic narrative in the sense of Bauman's definition, the chronological unfolding of events of which is, however, 'scrambled' temporally. We get a sequence of narrative episodes in which the time frame shifts between present, past and timeless states. If we place the narrative units identified and numbered in Extracts 13 and 14 above in a schema based on the three time frames (and keeping in mind the connection between time frames and places), the sequential-temporal ordering in the narrative appears in the table below (numbers refer to the episodes).

The starting point of the narrative is the here-and-now: an observation of the ignorance of the Belgians about the predicament of the people in the Ivory Coast, considerably complicating life for Ivory Coast refugees in Belgium. Next, a timeless time frame is introduced in which general contextualizing 'facts' are being offered, linguistically articulated in factual and declarative expressions without concrete temporal anchoring (episodes 2, 3, 4). Once this timeless, general context has been sketched, a more concrete and temporally sequential-

timeless contextualizing comment (6.1, 6.4) and once by an episode connecting the events in the Ivory Coast to the present in exile (7). The narrative concludes with a statement (9) that can both be seen as a closure of the sequential account of events and as an anchoring of the whole preceding story into the present situation of exile and asylum seeking in Belgium. It can, of course, also be seen as the point at which both aspects intersect and become one: the present situation of being a refugee.

Present (here)	Past (there)	Timeless (there)

	9> <9	

This pattern of temporal and spatial deixis is both a generic and an epistemic–argumentative matter. It is generic in the sense that it constitutes the genre of home narratives: nonlinear references to here/there and now/then/always make up the considerable complexity of such stories, the trajectory telling. It is at the same time epistemic–argumentative in the sense that it is directed at a hearer (and at overhearers) who needs to be instructed about these issues. This other-directedness of home narratives makes them fulfil the contextualizing functions they have in the story at large: they provide settings, scenes, referential domains and indexicalities that need to be adopted by the hearer.

In this move, there appears to be an acute awareness of the categories and interpretive resources of the hearer: the assumption used in telling home narratives is that (i) Belgian hearers *do not know* this; (ii) consequently their view of the situation in the home country is *wrong* and prejudges a correct interpretation of the causes and motives for the asylum application; and (iii) hence, the Belgian hearers *need to know* a series of things, so as to modify their categories and interpretive resources in treating the story of the asylum seeker. Home narratives are based upon a perception of *false or inaccurate contextualization* of situations and events in the countries of origin – wars, political conflicts, poverty – and are aimed at recontextualizing or 'recentering' them (Bauman and Briggs, 1990). The recentering is a process of localizing the conflicts, events and upheavals: instead of broad, abstract and impersonal ('decentered') categories of war, conflict, crisis, poverty and so on, concrete and highly personal, 'local' indexicalities are offered: 'this is not *the* war in Angola; this is *my* war in Angola'.

And the centering and localizing is performed by means of stories that blend personal chronological trajectories – autobiographies – with general framing statements on how life was and is over there and what people need to know in order to correctly understand the autobiographical narrative.

5. Narratives, Dense Contextualizations and the Asylum Procedure

5.1 Asylum Procedure and Narratives

We now move back to the comments we made at the outset of this article. In the Belgian asylum procedure, the asylum seekers' stories assume a central and critical role. The basis on which applications are being examined and sanctioned is the textual set of statements taken from the asylum seekers, in which they announce their desire to seek asylum in Belgium and provide reasons and motives for that desire. Inconsistencies in the stories are a major cause for refusing refugee status to asylum seekers. As will be shown later, inconsistencies, ranging from contradictions between two versions of the story over not remembering names, places or dates, and superficial or incomplete knowledge of things assumed to be known to people from one country (e.g. the name of the president, names of towns and cities, etc.) can all serve as cause for refusal. Strangely enough in a legal system backed by sophisticated high-tech and advanced forensic sciences, this kind of legal procedure relies heavily on narrative analysis.

This narrative analysis is, of course, performed in ways that can only be qualified as impressionistic. We have old and time-tested rules of evidence used to investigate statements made by people living in a highly literate environment, whose memories are supported by a (sometimes massive) literate 'archive' (diaries, notebooks, newspaper clippings, photographs, all kinds of small documentary souvenirs of events in one's life, see Radley, 1990), and whose statements are produced and interpreted in an interactional setting in which the interlocutors share the same linguistic resources and communicative skills (see the discussion in section 3 above). These rules of evidence stress textual consistency, linearity, logic, rationality and factuality; they require considerable attention to details; they rely on written language as the basic and most lasting format of declaring 'truth'; in short, they are highly culture- and society-specific and reflect local ideologies of language, literacy and communication. These rules of evidence are applied to statements made by people for whom few of these formats of language and communication can be taken for granted. Hence, what happens in the institutional processing of asylum seekers' stories is often a battle with unequal arms, and the confrontation of different narrative conventions creates a huge problem of justice and fairness.[8]

Attention to asylum seekers' storytelling conventions is scant. Yet their central position in the asylum procedure makes them into an important topic of research, both analytically and politically. The salience of looking at the way in which asylum seekers' stories are being told can perhaps be briefly illustrated with reference to the Sémira Adamu case. When her death was announced in the

media, one of the striking ingredients of many statements was the abundant reference to 'her story'. It was said that, indeed, forced marriage could be sufficient grounds for asylum, but that in her case 'her story did not fit'. The official verdict announcing the refusal of asylum argued:

> The story of the applicant is not precise on many counts. Thus, she could not specify the family name of a childhood friend with whom she stayed. She also failed to specify the date on which she was supposed to have escaped from Lagos. (My translation, Dutch original from *De Morgen*, 3 October 1998)

Other references to how Sémira Adamu interacted with people – again, matters of style – include a statement by the Catholic pastor of Brussels Airport, a man who met Sémira Adamu occasionally. To him as well, Sémira Adamu was not quite trustworthy:

> In the [asylum] Centre nobody believed her. I don't know the real story either. I rely on my intuition. Sometimes, when you asked her something, she just stood up and walked away. Or she started to sing. I once asked her why she had travelled so many thousands of kilometers to escape from a sixty-five year old man. 'Is Africa not big enough', I asked her. She didn't answer that question. (My translation, Dutch original from *De Morgen*, 3 October 1998)

Again, a lack of credibility seems to be tied up with the way in which Sémira Adamu communicated. Even sympathetic voices refer to peculiarities in communicative style. Lise Thiry, a former socialist senator who acted as foster parent for Sémira Adamu, qualified her as follows:

> Apart from that, Sémira sometimes seemed British rather than African to me. She didn't have the outspokenness and extroversion some of these [African] women have. (My translation, Dutch original from *De Morgen*, 3 October 1998)

Communicative style (including narrative style) is always a source for character assessment and character attribution. In a field as sensitive as asylum regulations, where officials' decisions may imply the difference between life or death, relative well-being or poverty, safety or danger, some attention to what actually happens in interaction may not just be desirable, but simply imperative.

5.2 Textual Trajectories

Let us begin with a brief survey of the interactional processes that constitute the core of the asylum application processes. A first observation is that in the totality of the procedure, direct interaction between asylum seekers and officials is restricted to a number of well defined occasions, viz. interviews on the asylum

seeker's story. Soon after their arrival in the country, asylum seekers are interviewed by officials, sometimes (but by no means always) assisted by interpreters. The topic of the interview is their motivation to seek asylum in Belgium: why did they leave their country, how, when? What reasons do they offer for assuming that their lives or life chances are endangered in their country of origin? Who are they, where do they come from? Who assisted them in their exodus? And so on. The story is noted by the official and has the status of an affidavit. From that moment onwards, it is the source and reference text for all other steps in the procedure. The asylum seeker is admitted in the country, and his or her application for asylum is being processed by the authorities. In the process, various other interviews can take place.

Apart from interviews, there are hardly any occasions in which asylum seekers themselves speak. Most of the communication on the case is written and legalistic and hence treated on behalf of the asylum seeker by lawyers, welfare workers or members of NGOs specialized in asylum affairs. So what we have is a handful of events during which the applicant directly produces oral narrative discourse. In between these moments we have tremendous text-production *on* that narrative resulting in written summaries, notes, translations, questions and replies written by lawyers or welfare workers, court rulings in which fragments of the narrative are being quoted and interpreted, and so on. It is an instance of the 'circulation of discourse' (Briggs, 1997: 538 ff.) that characterizes legal and forensic procedures as well as those of welfare work and bureaucracy (see Sarangi and Slembrouck, 1996). *These patterns of circulation are biased by inequalities in techniques of discourse representation; recontextualizations and re-entextualizations of the narratives in specific ('official' and authoritative) generic formats are usually privileged forms of discursive practice reserved to specific professional groups such as lawyers, administrators, 'experts' and bureaucrats.*

This textual complex, in which an oral 'original' narrative is the input for a long series of generically differentiated replications of that original is characterized by an ideology of 'fixed text' (Blommaert, 1997; Collins, 1996; Urban, 1996), in which the difference between the 'original' and its 'copies' are assumed to be minimal (hence in which it is assumed that every translation, summary, quotation, reading of the story is correct and accurate) because 'procedurally correct' text (i.e. text produced or collected according to standard procedures) is supposed to be a transparent, unambiguous set of signs. The story of the asylum seeker is remoulded, remodelled and re-narrated time and time again, and so becomes a *text trajectory* with various phases and instances of transformation. At the same time, the story is treated as a *singular* text, and responsibility for that text (and thus for all re-entextualizations in the text trajectory) is attributed to the asylum seeker. The asylum seeker is constructed as the responsible author for the whole intertextuality complex, despite the enormous differences in text-structure and text-modality, the genre and the code, the social spaces in which versions are being produced and used, and the power and authority attributed to different versions of the text. Commenting on similar phenomena, Briggs (1997: 540) observes that in such cases, the question seems to be 'one of a fundamental asymmetry in the power to determine how utterances can circulate between

contexts, epistemologies, and institutions, the way that narratives can be structured, and what sorts of legal effects can accrue to particular discursive relations'.

The result of this text trajectory is a *suggestion* of justice based on text-ideologies emphasizing the 'correct treatment' of the asylum seeker's narrative into notes, summaries, translations and so forth, but obscuring a variety of forms of appropriation of discourse and of shifting it into domains of authoritative re-entextualizations that are far beyond the control of the asylum seeker. So when the letter to Sémira Adamu speaks of 'the story of the applicant', what is referred to is the total textual trajectory of the narrative.

5.3 A Contest of Contexts

To illustrate this, let us have a look at two re-entextualizations of the story of an Angolese asylum seeker. The interview we did with him and his wife took four hours; the story of his situation in Angola and of his escape to Belgium took more than one hour, and well over 1500 lines of transcript. As always, it is a very complex story replete with home narratives bearing the characteristics discussed in the previous section. The man applied twice for asylum, and twice his application was rejected. These rejections were announced to the applicant in two official letters, partly standard and partly filled in with specific data on the application. In these documents, we find instances of re-entextualization of the man's story. I give fragments from the two texts of the letters (my translation, originals in Dutch and French, respectively):

Extract 15

"The concerned was interrogated on November 23, 1993 at the Commissariat-General [for Refugees and Stateless Persons], in the presence of [name], his attorney.

He claimed to be a 'political informant' of the MPLA. On October 18, 1992 however, he passed on information to UNITA. At the UNITA office, however, he met with Major [name], who works for the MPLA. Two days later, Major [name] had the concerned arrested. Fearing that the concerned would give the Major away at the trial, [name of the Major] helped the concerned to escape. The concerned fled to [locality] where a priest arranged for his departure from Angola. The concerned came, together with his wife [name and register number] and three children, through Zaïre and by plane, to Belgium. They arrived on May 19, 1993.

It has to be noted that the concerned remains very vague at certain points. Thus he is unable to provide details about the precise content of his job as 'political informant'. Furthermore the account of his escape lacks credibility. Thus it is unlikely that the concerned could steal military clothes and weapons without being noticed and that he could consequently climb over the prison wall.

It is also unlikely that the concerned and his wife could pass the passport control at Zaventem [i.e. Brussels Airport] bearing a passport lacking their names and their pictures.

Furthermore, the itinerary of the concerned is impossible to verify due to a lack of travel documents (the concerned sent back the passports).

The statements of the concerned contain contradictions when compared to his wife's account. Thus he declares that the passports which they received from the priest [name] were already completely in order at the time they left Angola. His wife claims that they still had to apply for visa in Zaïre."

Extract 16

"The concerned, of Angolese nationality, has declared being a member of UNITA ('Union Nationale pour l'Indépendance Totale de l'Angola'). He has forwarded a first application for asylum in Belgium on May 25, 1993. His application has been refused by the Commissariat-General on December 15, 1993. After an illegal stay in Belgium of three years, he has forwarded a second application for asylum on November 20, 1996, on the basis of some documents from Angola which he had received. In two faxes (of July 26, 1996 and September 4, 1996), one of his neighbors (calling himself '[name]') informed him that a certain '[name]', a friend of the concerned who was repatriated to Angola by the Belgian State, had been killed by soldiers. Prior to that, the latter had asked [name of the 'friend'] about the whereabouts of the concerned. From that moment onwards, the house of the concerned is supposed to be occupied [in French: *serait occupée*] by soldiers. In a letter of March 15, 1994, people are supposed to have already informed him [in French: *on lui aurait déjà communiqué*] that the priest named '[name]', who had helped him leave Angola, had disappeared. Apart from that, he has offered a communiqué from UNITA (of October 23, 1996) as well as his MPLA ('Mouvement Populaire pour la Libération de l'Angola') veteran's ID."

Let us now take a closer look at these two examples. They are genetically germane and are sequential; Extract 16 obviously adds to Extract 15. Three different types of discourse can be distinguished in the texts:

(a) reported elements from the asylum seekers' narrative in the shape of 'factual' summaries of the applicant's narrative
(b) procedural statements referring to the applicant's status, the administrative actions taken in his respect and by him, and the sorts of evidence offered
(c) explicit metapragmatic statements and comments on the applicant's narrative.

Let us first bring the statements belonging to the first category (reported elements) together from both texts:

Extract 17

-He claimed to be a 'political informant' of the MPLA. On October 18, 1992 however, he passed on information to UNITA. At the UNITA office, however, he met with Major [name], who works for the MPLA. Two days later, Major [name] had the concerned arrested. Fearing that the concerned would give the Major away at the trial, [name of the Major] helped the concerned to escape. The concerned fled to [locality] where a priest arranged for his departure from Angola. The concerned came, together with his wife [name and register number] and three children, through Zaïre and by plane, to Belgium. They arrived on May 19, 1993.
-In two faxes (of July 26, 1996 and September 4, 1996), one of his neighbors (calling himself '[name]') informed him that a certain '[name]', a friend of t

> concerned who was repatriated to Angola by the Belgian State, had been killed by soldiers. Prior to that, the latter had asked [name of the 'friend'] about the whereabouts of the concerned. From that moment onwards, the house of the concerned is supposed to be occupied [in French: *serait occupée*] by soldiers. In a letter of March 15, 1994, people are supposed to have already informed him [in French: *on lui aurait déjà communiqué*] that the priest named '[name]', who had helped him leave Angola, had disappeared.

Obviously, what we have here are extremely concise and highly selective 'summaries' of the story, organized chronologically and marked by tense-aspect markers in the verbs as well as by explicit chronological markers (e.g. "on October 18, 1992", "two days later", "July 26, 1996" and "September 4, 1996"). The account is not exclusively 'replicating' but contains significant amounts of evaluative modal qualifications (especially in Extract 16), indicating doubts about the factual truthfulness of parts of the narrative (e.g. the quotes surrounding the names mentioned by the applicant, the potentialist verbs "*serait occupée*", "*aurait communiqué*"). These summaries reflect the portions of the applicant's narrative deemed 'substantial' to his asylum application and qualified, in one discursive move, in terms of truthfulness and plausibility from the perspective of the procedure. Importantly, this selection of text portions involves text-rewriting and text-structuring practices, and shifts the epistemic centre from the asylum seeker to the administrator processing the application.

The second category (procedural statements) includes statements such as "The concerned was interrogated on November 23, 1993 at the Commissariat-General [for Refugees and Stateless Persons], in the presence of [name], his attorney" and "He has forwarded a first application for asylum in Belgium on May 25, 1993. His application has been refused by the Commissariat-General on December 15, 1993. After an illegal stay in Belgium of three years, he has forwarded a second application for asylum on November 20, 1996, on the basis of some documents from Angola which he had received". It also contains references to evidence offered: "two faxes", "a letter", "a communiqué from UNITA" and "his MPLA veteran's ID". This second category is broadly contextualizing much in the sense that home narratives contextualize the story of the applicant. References to the location of these facts and claims in the procedure re-centre the narrative: the facts and claims offered by the applicant have to 'fit' a procedural context, a context of sequences of activities, criteria of relevance, and criteria of 'testing' the truth of stories. The third category directly connects to this: here we find explicit expressions of doubt such as (explicit metapragmatic statements in italics):

Extract 18

> "It has to be noted that the concerned *remains very vague* at certain points. Thus he is *unable to provide details* about the precise content of his job as 'political informant'. Furthermore the account of his escape *lacks credibility*. Thus *it is unlikely* that the concerned could steal military clothes and weapons without being noticed and that he could consequently climb over the prison wall.

> *It is also unlikely* that the concerned and his wife could pass the passport control at Zaventem [i.e. Brussels Airport] bearing a passport lacking their names and their pictures.
> Furthermore, the itinerary of the concerned *is impossible to verify* due to a lack of travel documents (the concerned sent back the passports).
> The statements of the concerned *contain contradictions* when compared to his wife's account. Thus he declares that the passports which they received from the priest [name] were already completely in order at the time they left Angola. His wife claims that they still had to apply for visa in Zaïre."

The qualifications pertain to elements from the narrative not included in the 'summary' given elsewhere in the texts. The emphasis is on two things: general common-sense plausibility and documentary evidence. Certain arguments are qualified as unlikely on the basis of a general perception of what is possible and what is not (e.g. the unnoticed theft of military uniforms and weapons, the fact that another double-agent, the Major, would both arrest him and help him escape). There is no evidence offered of the *impossibility* of these facts, they just *seem* unlikely. Other elements revolve around the presence and absence of documentary evidence: the faxes, the letter, the veteran's ID, and "the itinerary of the concerned is impossible to verify due to a lack of travel documents (the concerned sent back the passports)".

The pattern of entextualization becomes clear now: what we have here is a complete refocalization of the narrative towards new deictic centres. The story of the applicant is relocated in another space and time-frame: that of the administrative procedure and its pace, that of its standard categories, criteria and textual formats (chronological-sequential and documentary). Whereas the home narratives were shown to have a localizing function – personalizing the story and anchoring it in particular spatial and temporal deictic frames – the highly modified versions of the story we find in the letters from the authorities show a completely different contextualization of the story: away from the local, away from the experiential, the affective, the emotional, the individual positioning of people in conflicts, towards generalizable categories and space-time frames. There is an official version of the conflict (e.g. the war in Angola), used not only in asylum procedures but also in international trade, development cooperation, foreign policy, and so on.[9] In that version, the experiential contextualizations of places, social roles, parties in the conflict and so forth, so prominent in home narratives, are replaced by a rather rigid pattern providing general categorizations (e.g. 'In country X, human rights are consistently violated', 'country Y is a democracy', 'in country Z there is a peace agreement between the warring parties, hence the situation has been stabilized' – the latter is the case for Angola) as well as more or less fixed attributes for roles in the conflict (the good, the bad, 'official' parties versus 'unofficial' parties, the State, the army, civil society etc.). There is a general recentering of the biography of the asylum seeker: the procedurally relevant biography of the applicant is that portion of his or her life that can be rewritten in the shape of a travelogue, starting with (an) event(s) that prompt his or her escape from the country of origin, the process of escape and travel itself

including details of time, duration, medium and itinerary, and his or her arrival in Belgium, all portions of which can be documented by means of place descriptions and time frames.

From this grid, deductive patterns of 'plausibility' and 'likelihood' are derived; whenever there is doubt, documentary evidence is required to remove the implausibility. In the extract given here, one of the crucial elements was the fact that the applicant had told how he had been arrested by an UNITA Major, who was in fact a double-agent just like him; that same Major had consequently helped him escape from prison. In terms of general plausibility within this contextual frame, it is 'unlikely' that the person who arrested the applicant would be the same as the one who organized his escape, the more since there was no documentary evidence supporting the Major's role as a double-agent. Similarly, the absence of documentary evidence of the itinerary of the applicant makes that crucial part of his story "impossible to verify" and hence unlikely or unreliable.

5.4 Noise and Inequality

The recontextualizing moves made through the text-trajectories are, as noted by Briggs above, connected to deep power differences: they involve differential control over contextualization procedures, and they involve differential access to skills used for reformulating, ordering, structuring discourse in such a way as to build a 'convincing' argument. The complex indexicalities of the stories as well as their general localizing-contextualizing functions basically do not fit well with the textual and narrative preoccupations of the asylum procedure. Hence, the particular format of narrating imposed during the procedure is sensed to incapacitate asylum seekers and prejudice their attempts at making sense of 'their' conflict – the basis of 'their' asylum application. A Congolese woman succinctly expresses the textual and contextual difficulties experienced during the interrogations that create the 'basic' version of the narrative:

Extract 19

> Mais ils sont trop durs là-bas parce que.. Tu peux raconter je sais pas/ tu peux raconter quelque chose.. Et la prochaine fois quand tu viens quand tu oublies un seul chose c'est fini tu as=tu es rejettée/ alors euh personne ne peut raconter deux fois la même hist=même histoire exactement/ il y a toujours de petits détails qu'on ne dit pas ou bien qu'on a=qu'on ajoute après/ mais eux ils ne tiennent pas compte de ça/ dés que tu ajoutes quelque chose ils disent ah la fois passée tu n'a pas dit ça alors c'est fini on te rejette/ il faut aussi comprendre les gens c'est. On=on n'arrive jamais à=à=à raconter une histoire de la même façon deux fois ça non

Translation:

> But they are too hard there because... You can tell I don't know what/ you can tell something.. And the next time when you come you forget just one thing it's over you are=you have been rejected/ well ehm nobody can tell twice the same sto=same story exactly/ there are always small details one doesn't say or else one a=one adds afterwards/ but they don't take that into account/ as soon as you add

> you/ one also has to understand the people it's... One=one never manages to=to=to tell a story the same way twice/ that no.

Combined with the problem of resources discussed in section 3, asylum seekers' stories appear to contain too much 'noise' to be easily inserted in the asylum procedure. They tell their story in non-native varieties of a language, sometimes to an interpreter who also has to use a non-native variety; this then is handed over to someone else, who translates and transforms it into an ordered and patterned written narrative, squeezed into the boxes of a standard form; consequently, this story is treated several times by still other people, who select from the story the parts that look 'truthful' and the ones that seem 'unlikely'. What is lost in the process is the narrative of place and time that is at the core of the stories: those parts of the story in which applicants bring international conflicts and phenomena such as war, famine, poverty into their own experiential space, relate personal motives to them, and offer this as arguments for obtaining asylum. As soon as this 'noise' has been cut off from the applicant's story, the chances of being understood, believed and supported are very slim.

This is why the densely contextualizing narratives discussed in the previous section become crucial and problematic in the asylum procedure. They are a necessary genre for asylum seekers, and at the same time an unmanageable (and a priori disqualified) genre in the procedure. They are salient because they are a realization of a genre that does not fit the genre. On the basis of what many asylum seekers can mobilize as linguistic and communicative resources, they are the upper limit of what they *can* do; and that does not correspond to what they *must* or *are supposed to* do.

6. Concluding Remarks

Social structure percolates in and is indexed by the narrative conventions, ideologies and codes of the asylum procedure. I hope to have demonstrated that there is at least a potential mismatch between resources and expectations which is at the heart of the power asymmetry that characterizes encounters between asylum seekers and the state; it locates asylum seekers in a position of conflict vis-à-vis the procedure. But both the power asymmetry and the conflict are socially and culturally invisible because of two reasons, both of which have to do with the pervasiveness of ideologies.

The first reason is the widely shared ideology that clients of administrative procedures in a democratic society such as Belgium have control over the basic linguistic–communicative resources needed to participate fully in the procedures and so to obtain justice and the benefits they are entitled to. Thus, the problem of narrativity in the asylum procedure can be represented as a rather superficial, technical problem and suggested remedies can range from training programmes for interpreters to more support for asylum seekers from 'experts' such as lawyers. The point I have tried to make in this article is that we are confronted with a fundamental problem of inequality in

shape who can talk when, in what ways, and with what effects' (Briggs, 1996: 13), not one that can be captured, as Briggs rightly points out in metaphors such as 'negotiation', 'difference', or 'variation' which all suggest some degree of equality and sharedness and a facility of choice for the inferior party.

The second reason why the power asymmetries and conflicts are invisible is their embeddedness in administrative procedures that are normalized for members of the autochthonous middle class, and that are imbued with great prestige as the symbolic custodians of a sociopolitical system qualified as just, egalitarian and democratic. Every political crisis caused by incidents with asylum seekers resulted in a reaffirmation of the faith in 'our justice' and led to a tightening and increase of the sophistication of the administrative procedure: more people would be hired, they would be better trained, the procedure would be accelerated, handwritten documents would be replaced by computerized standard forms. The administrative text-making machinery was never questioned; on the contrary, it was strengthened and enlarged. Thus the capacity to shift narratives from one context to another and from one authoritative entextualization to another was increased, and with it the power asymmetry with regard to the production, treatment, ordering, and making sense of narratives. This belief in the just, egalitarian and democratic nature of the state and state procedures reminds us of a remark made long ago by Perry Anderson (1976–7) in his celebrated commentary on Gramsci: the assumption of equality in the face of democratic procedures and state institutions such as the law is at the core of capitalist ideology because it obscures fundamental inequalities in society. The state is assumed to represent everyone and to render service to everyone in the same way; at the same time, administrative procedures of the state privilege elite literacies and narrativities and so shape and perpetuate deep social inequalities (a process complicated by the introduction of new technologies in bureaucracy).

Along with the concrete case I have argued here, I hope to have offered arguments for two more general theoretical points, both of which are inspired by Briggs's (1997) highly relevant discussion of narrative and inequality in institutional contexts. First, issues of resources deserve far more attention than they have received so far in the study of language in society. Assumptions of sharedness, as stated previously, seem to determine much of what goes on in the critical analysis of discourse in western societies, whereas the highly layered and hierarchical systems of literacy and communicative skills that dominate our societies seem to dictate a more attentive stance towards phenomena such as accents, differential competence, difficulties in writing and so on. Before people can embark on discursive work captured under labels such as 'conversation', 'exchange' or 'negotiation', conditions of 'sayability', 'expressibility' and 'mobilizability' of resources need to have been met (see the remarks in Briggs, 1997: 538–40). Every conception of 'context' in discourse should include such conditions, because they are a tremendous influence on what happens in discourse and on what happens with discourse. Resources are contexts.

Second, I share Briggs's concern for the circulation of discourse as a crucial ingredient of identity-forming social and political practices in our societies. 'Cases' (administrative, legal, welfare, medical, educational and probably far more) are

formed in the textual trajectories outlined in this article rather than in single instances of communication and single texts. We need to follow the process of text-making-as-social-and-political-process; it is here that people and subjects are constructed, cases are judged and individual lives are being influenced. As soon as we enter worlds in which talk and written text are seen as replicas of one another (and in which someone else's notes of what I said can be offered to me as 'my' story), we enter a world of differential power relations, which needs to be scrutinized in great detail. Michel Foucault's (1975) image of subjects being transformed into knowable objects of clinical observation by means of a multi-layered complex of discursive and material practices is looming large. The apparently small shifts our stories undergo as soon as they enter institutional textmaking systems are instances of such practices of Foucauldian *savoir* in which social issues become individual yet standardized 'cases'. The fact that we tend not to be aware of these processes – and even attribute considerable prestige to the system in which they develop – is a crucial and unavoidable topic for critical studies of language and society.

Acknowledgements

I am grateful to Dell Hymes, Ben Rampton, Monica Heller, Jim Collins, Jef Verschueren, Stef Slembrouck, Roxy Harris, Jürgen Jaspers, Jan-Ola Östman and Andreas Wagner for comments and suggestions. Katrijn Maryns contributed significantly to the final shape of the argument of this article, as did Chris Bulcaen, my most critical and most constructive reader. The second and fourth year students of the African Studies Program of the University of Ghent (1998–9) did an enormous amount of work collecting and shaping the data, and so I owe the greatest debt to them. A preliminary version of this article was circulated as 'Language, Power and Identity Working Paper no. 1' (see http://bank.rug.ac.be/lpi).

Notes

1. Hymes and Cazden's paper was originally published in 1978 in *Keystone Folklore* 22; it was reprinted as chapter 7 of Hymes (1980) and later reprinted again as chapter 5 of Hymes (1996). The paper is not really a joint product; individual sections are attributed to either Hymes or Cazden; for the purposes of this article, I consider it to be a collaborative writing product authored by Hymes and Cazden.
2. In late 2000, Katrijn Maryns obtained permission to record procedure interviews. Fieldwork is underway and genuine 'cases' will be available for research very soon. The first bits of data can be found in Maryns (2000) and Maryns and Blommaert (2000). On the basis of first fieldwork observations, nothing contradicts the patterns and mechanisms of discourse production and reception proposed in this paper.
3. The interviews were conducted by students of the 2nd and 4th year of African Studies at the Ghent University, as part of a course project supervised by the author. The length of the interviews varied from approximately half an hour to four hours. The interviews were recorded between November 1998 and April–May 1999, at the height of the so-called 'Sémira Adamu crisis'; see section 2.

4. I provide English translations, despite the fact that the 'broken' and hence very complicated forms of expressions can hardly be projected in another language in an equivalent way. I use a highly simplified set of transcription conventions in the presentation of the examples, namely:

*	stress on the following syllable
=	latching, rapid succession of turns, or self-correction
/	intonationally marked phrase or sentence end
...	pause
CAPS	high pitch, loud

5. Katrijn Maryns (2000) presents some samples of interviewer–interviewee interactions in the asylum procedure. In the data reported here, there are instances where the Belgian interviewer is wrong-footed by the interviewee for reasons that have to do with proficiency in French or English. Interestingly, interviewers then display a tendency to move into a cross-questioning tactic, insisting on details and accuracy.
6. This was, in fact, the second time that P used the expression "*manger* + currency" in the interview. The first time, Q did not pick it up as problematic. Note in passing how this phenomenon – a man from Angola using Congolese French colloquial expressions – offers us a glimpse of the migration history of the speaker. We can now suppose that the man, after having fled from Angola, has spent some time in the Congo before moving on to Europe. See Maryns (2000) for arguments and case analyses on the issue of identifying asylum seekers.
7. The emergence of structure in these narratives may be an effect of the repeated telling of the story, so that 'fully-formed narratives' are created. Dell Hymes, in correspondence about this analysis, remarks:

> It seems very likely that you have here what could in some cases be the early stages of 'fully formed' narratives of the sort I addressed in my own paper. That if those who tell them were in circumstances which led to them being told again and again, rehearsed, as it were, they might take on increasingly tight form ... It is extremely relevant to find ... that a contrast in initial elements, such as absence/presence of 'So' can be found to distinguish parts already at this stage. (See also Hymes, 1998.)

The point I wish to make in this part of the article is that such structuring not only occurs during very early phases of the narrative development of such stories, as Hymes points out, but that it also occurs despite a very restricted repertoire of linguistic resources.

8. Narrative inequalities based on differing narrative conventions and the differential distribution of communicative resources have been well documented with respect to courtroom discourse. I would like to mention just two cases. Marco Jacquemet (1992) emphasized the role of metapragmatic strategies in attorneys' courtroom tactics against Italian mafia-*pentiti*; the witnesses' communicative style was commented upon in attempts to discredit their credibility, and the normativity of 'correct' courtroom discourse was opposed to the *pentiti*'s use of the Neapolitan dialect. At a more general level, O'Barr and Conley (1996) distinguish between a professional and a lay ideology of law; the former can be characterized as 'rule-oriented', the latter as 'relational'. Both ideologies shape and make relevant differences in courtroom talk, and the failure to respect these differences by lay litigants 'may limit their access to justice' (O'Barr

and Conley, 1996: 118). For reasons explained earlier, the discussion in this section is conjectural.

9. In a letter about this case from the Department of Immigration of the Ministry of the Interior, it is for instance said that 'the situation in his country [i.e. Angola] cannot be considered to be exceptional so as to vindicate a regularization on the basis of art, 9§3'. There are no fixed criteria for judging local situations to be 'normal' or 'abnormal', decisions on this point being the privilege of the Minister of the Interior.

"You Gotta Know How to Tell a Story": Telling, Tales, and Tellers in American and Israeli Narrative Events at Dinner

Shoshana Blum-Kulka

Story-telling in ordinary talk between intimates is one of the most common enactments of narrative discourse. We tell stories to each other as a means of packaging experience in cognitively and affectively coherent ways (Labov & Fanshel 1977, Sacks 1974), or in the terms of Bruner 1990, as a way to test the borderlines between the exceptional and ordinary. Fisher 1987 considers the narrativization of experience a basic human need; the essential nature of human beings is captured by the metaphor of man as *homo narrans*. Extending Kenneth Burke's definition of man as a symbol-making and symbol-using animal, Fisher proposes an all-encompassing definition for the role of narratives (63):

> The idea of human beings as storytellers posits the generic form of all symbol composition. It holds that symbols are created and communicated ultimately as stories meant to give order to human experience and to induce others to dwell in them in order to establish ways of living in common, intellectual and spiritual communities in which there is confirmation for the story that constitutes one's life.[1]

Although the narrative use of language, as insisted by Hymes 1982, is a universal function, such use can be expected to vary culturally as do other ways of speaking. Indeed, oral narrative styles vary by culture for both adults and children, as shown both by work adopting a cross-cultural perspective e.g. Scollon & Scollon 1981, Tannen 1980) and by comparative studies in the context of language socialization (e.g. Heath 1983, Schieffelin & Ochs 1986). My goal here is to apply a culturally sensitive analysis to narratives old in the course of dinner-table conversations in middle- to upper-class Jewish-American and Israeli families.

To apply such an analysis, we need first to understand the nature of the narrative event in question.

Conversational story-telling can be looked at from a social-interactionalist position, as interaction, with a focus on how the narrative emerges in its context, and/or as discourse, with a focus on the textual end product abstractable from the context. The first approach is represented by work on conversational story-telling from the perspectives of both ethnomethodology (e.g. Jefferson 1978, Sacks 1974) and discourse analysis (Polanyi 1989, Schiffrin 1984, Tannen 1984); such work shows the manner in which the structure of oral narratives is conversationally accomplished. Particularly relevant here are studies focusing on narratives during family dinner-table conversations (Erickson 1982, 1988; Ochs et al. 1989; Ochs et al. 1992). A complementary, rich source of information on this dimension is provided by studies in folklore that highlight the poetic and social interactional assets of performance (Bauman 1986, Briggs 1988, Hymes 1981, Kirshenblatt-Gimblett 1975, Shuman 1986). By contrast, the discourse approach is best illustrated by Labov's influential work (Labov & Fanshel 1977, Labov & Waletzky 1967), which unveils the structural coherence of seemingly chaotic onversational renderings of personal experience.

The narrative-events examined-here, performed by both adults and children, function as crucial socializing contexts for family interaction in general, as claimed by Bernstein 1971. Hence a further perspective that needs to be added is cross-cultural variation in practices of narrative socialization, as suggested by cross-cultural and cross-ethnic studies of language socialization (Blum-Kulka & Snow 1992, Heath 1983, Miller et al. 1990, Schieffelin & Ochs 1986).

Yet none of these approaches on its own captures the unique nature of family narratives. We need an approach that accounts simultaneously for family story-telling as an event, a social action unfolding in real time, as well as (at the discourse level) a text about other events. The links and transitions between these two realms are provided by performer/tellers. Dinner-table narrative events are unique: they represent a three-way intersection of the act of narration, the textual content and form of the narrative, and the persons responsible. Taking all three dimensions together, narratives become *narrative events*.[2] Like other speech events, narrative events have their specific norms governing the scene, participation rights, message content, message form, and rules of interpretation (Hymes 1974:55–8). In narrative events, these features can be seen as subsumed under three dimensions of narrativity: telling (narration), tales (narratives), and tellers (narrators). In oral storytelling, the realm of telling is embedded (in an open-ended fashion) in the realm of conversation, and the realm of tales within that of telling, as depicted in Figure 1.[3]

Telling is the act of narrating in real time, the actual performance of a story before an audience. In the terms of Goffman (1981:144–5), telling is enacted by the role of the speaker as *Animator*, the one responsible for the sounds that make intelligible speech come into being. The central issue of performance in family narratives is a social-interactional one: who participates in whose stories, and how. To narrate "is to make a bid for power" (Toolan 1988:6); entering the telling mode in the family context raises the issues of narrative participation rights.

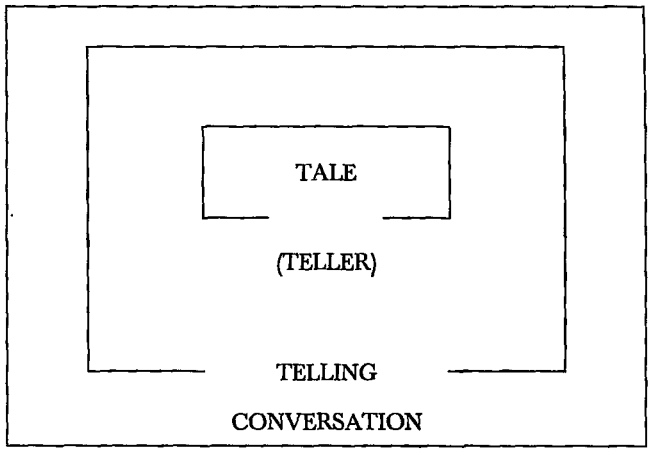

Figure 1: Dimensions of narrativity

Even when such rights are assumed by virtue of social role in the family, as with parents, they still need to be renegotiated conversationally on each specific occasion (Jefferson 1978, Polanyi 1989, Polss 1990). For children, both participation rights and modes of story entry remain goals to be achieved with some difficulty. The division of telling-space may vary by role in the family (children vs. adults) as well as by role and culture, as when children in one culture are granted story-telling rights over and beyond their rights in another. Cultures also may differ in the framing of transitions from the realm of conversation to the realm of telling, as well as in the importance of the telling with relation to the tales.

Tale is the stuff from which narratives are made. The term refers to the two dimensions of narrative captured in the poetics of narrative fiction by the distinction of *fabula* vs. *sjuzet* (in the Russian formalists' terms) or *story* vs. *narrative* (Rimmon-Keenan 1983). The *fabula* or the *story* of narratives "designates the narrated events, abstracted from their disposition in the text and reconstructed in their chronological order, together with the participants in these events" (Rimmon-Keenan, 3). In other words, in experience-based narratives, the *fabula* consists of the real-world building blocks used for the construction of the story. The *sjuzet*, on the other hand, relates to the way in which the story is shaped in the making: the "spoken or written discourse that undertakes the telling." In the actual discourse, events do not necessarily appear in chronological order, and content is filtered through some perspective, sometimes called a "focalizer" (Rimmon-Keenan, 74). It is the responsibility of the *Author* (Goffman 1981:144–5) to select the words in which the *fabula* is encoded in a way that is still retrievable for the audience. Cross-cultural variation in *fabula* choice may be expressed in spatio-temporal orientation of narrative plots (e.g. recent vs. not-recent past) or in the type of protagonists that are foregrounded (self vs. other). However, cultural attitudes to the preferred style of *sjuzet* may be expressed through critical comments to children about the way they are telling a story. As one father told his

son, who failed to give a convincing performance of a joke learned from the father, "You gotta know how to tell a story."

Tellers (performers) may or may not be the persons accountable for the story. This is the role called the *Principal* by Goffman (1981:144–5): the one committed to what the words say. In personal narratives, all three speaker roles (principal, author, and animator) can merge into one. In a personal narrative, it is the Principal who has actually experienced the events recounted and claims authorship for the narrative, acting also as Animator. But more generally, and especially when children are involved, the three speaker roles may be realized by different speakers. A mother who repeats to the father a story of personal experience, recounted to her earlier by her child, may act only as Animator (if she quotes verbatim); or she may take authorship rights, if she edits the child's version. In either case, the child remains the principal for the story. From a cross-cultural perspective, the relation of tellers to telling and tale raises issues of authorship vs. performance: How is authorship emically defined? Who, in each culture, is entitled to tell whose stories?

Background and Method

The database for the study consists of 264 narrative events that occurred during two dinner-table conversations with eight middle-class Jewish-American and eight Israeli families.[4] All Jewish-American families were residents of the Boston area; all Israeli families lived at the time in Jerusalem. The narrative events were examined as part of a larger project investigating the pragmatic socialization of children in the presence of a member of the research team who came from the same cultural background as the family. Following initial contacts by phone, the observer visited the home and got acquainted with the family prior to recordings. The same observer stayed with the family throughout the research period. The families were told that we were interested in comparing Israeli to American family dinners, and they were provided with details when interested. The observers were invited to join the families for dinner as a matter of course. Hence the situation in which we are comparing the groups is that of families interacting with a semi-official guest. As will be discussed later, interaction with the observer proceeded differently in the two groups, revealing a cultural difference in this mode of family self-presentation. All families participating in the project came originally from a European background (mainly from Russia and Poland) and hence share a Jewish Eastern-European heritage. The parent generations are native-born American or native-born Israeli. The American and Israeli families were matched for number and ages of children.

Segmentation and Coding

Narrative events were defined broadly as conversations that recapitulate past events. Since the perception of what constitutes a narrative may well differ from

children to adults, or across cultures, we deliberately avoided imposing further structural criteria on tales (e.g. number of events mentioned).[5] The segments extracted from full transcripts of the dinner conversations vary in length from brief exchanges, of a few seconds, to long elaborated happenings, of up to 10 minutes. Boundaries of the segments were decided textually, in agreement among three analysts, on the basis of transition markers signaling entrances and exits from the telling realm. Analysis of the texts proceeded by a set of quantifiable coding categories, designed to capture variation on each dimension of narrativity. The categories used and the findings from the coding are integrated into the discussion.

In the following I address the degree of cultural diversity between Jewish-Americans and Israelis in their attitudes toward telling, tales, and tellers in family narrative events. I argue that, considered from this threefold frame work, family narrative events of the two groups share certain features attributable to the speech event in which they are embedded. Yet the groups differ culturally in the structuring of each dimension of narrativity, and in the relative importance granted to each: Jewish-American narrative events foreground tellers and the act of telling, while Israeli narrative events prefer to focus on tales and tellers. The argument is developed as follows: the degree of cultural diversity is discussed, first, in terms of the division of narrative space between members of the family and styles of story initiation; second, in terms of the spatio-temporal orientation of tales, and the degree of conventionalization in the transformation of tales into telling; and third, in terms of the relationships between ownership of the tale and participation in the telling.

Issues of Telling

Gaining Access to Narrative-space: Children and Adults

Family dinner-table narratives tend to be jointly constructed affairs (Erickson 1988, Ochs et al. 1989). In our case, collaboration takes several forms: stories are co-narrated, constructed through question/answer sequences, or told with sporadic but meaningful contributions from an active audience. In all these, telling is shared by several members of the family, sometimes including the observer. Collaborative process is at work in both Israeli and American narrative events: in almost half of the narratives, more than four members participate. By contrast, less than 5% are performed by just one participant; see Figure 2. What these numbers mask, though, are cultural styles of participation; as will be shown, Israeli and Jewish-American families differ greatly in the way they draw lines of demarcation between *teller(s)* and *audience.*

Israeli and American families differ in their attitudes toward the division of telling-space, as well as in members' modes of participation in narrative events. Consider attitudes toward the division of telling-space between adults and children. In both groups, dinner time is perceived as a prime occasion for spotlighting children as narrators. To reveal attitudes toward children, we first divided

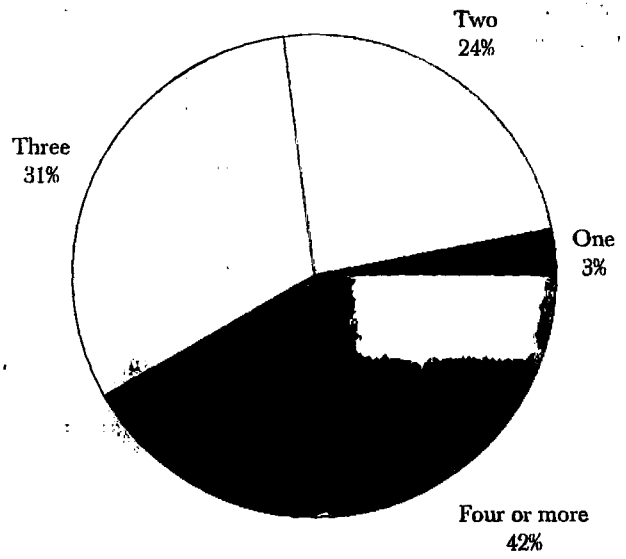

Figure 2: Number of participants in narrative events

narrative events in terms of identity of the predominant *mainteller*(s), as either *child* (or children) or *adult*(s); see Figure 3. In a further analysis, we identified the *initiator* of the narrative event by role in the family as *child, father, mother,* or *observer*; see Figure 4.

The degree to which children are considered conversational partners in adult company is noteworthy across the two cultures. In discussing determinants of cultural variability in conversation, Schieffelin & Eisenberg (1984: 382) note:

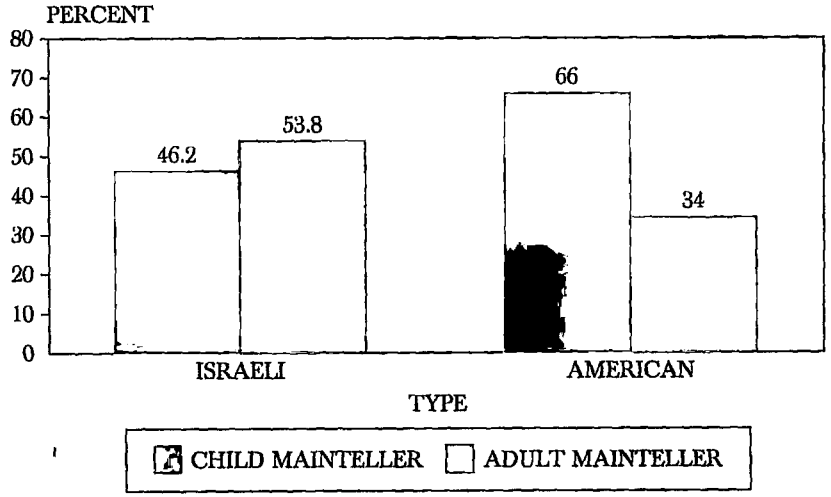

Figure 3: Maintellers: division of telling space

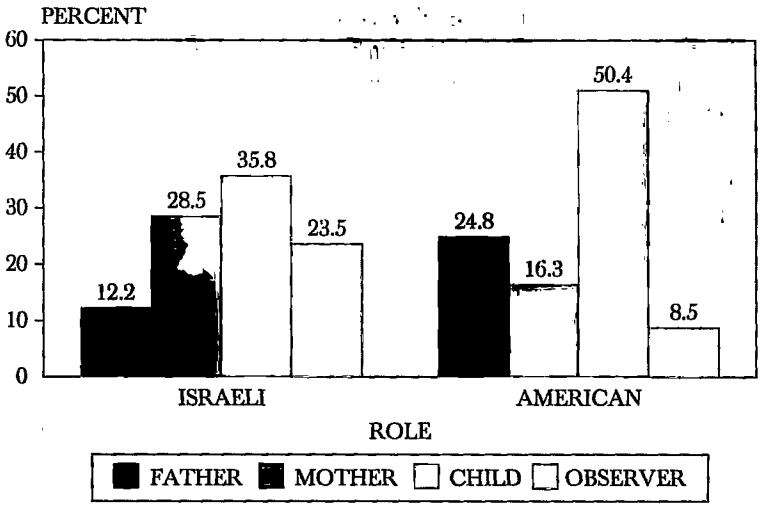

Figure 4: Narrative initiation

Cultures vary along a continuum ranging from societies in which children are not allowed or expected to talk to adults or strangers and/or are not thought of as co-conversationalists to those in which children are actively encouraged to talk to adults, who in turn support this interaction and try to understand it. In some societies adults think it is important to elicit speech from children, socializing them in terms of production and interaction skills (e.g., Kaluli in Papua New Guinea, white middle-class American); but in other cultures children are encouraged to be quiet and speak only when spoken to (e.g., rural Louisiana Blacks, Luo in Kenya).

We found that, across the two groups, children take up 42% of all narrative space (see Fig. 3). The case of the middle-class families studied here well exemplifies a cultural pattern which treats children as rightful co-conversationalists; in both the Jewish-American and Israeli families, children around the dinner table share, in the terms of Goffman (1981:131–2), an official status as *ratified* participants.[6] The pattern is most salient in the American families (see Fig. 3). American children act as maintellers in 66% of all narrative events, leaving the adults as maintellers of 34%. But the adults in the Israeli families take up a much higher proportion of narrative space, playing the dominant role in 54% of narrative events. In line with the overall attitude toward the division of narrative space between adults and children, American children are also more active story-initiators (by 15%) than Israeli children.

This difference points to a cultural distinction in modes of narrative socialization at dinner. Notions of tellability and cultural styles of telling are acquired by children both by engaging in the telling and by being exposed to stories told by others. The American families tend to emphasize socialization by allowing for the display of narrative practice; but in the Israeli families, children are given a higher chance to

This does not necessarily mean that Israeli children engage generally in less display of narrative than do American children; stories may be told by children at other points during the day, to siblings or one parent. But it does mean that dinner-table conversations, where both adults and children jointly participate, are perceived by the American families as an occasion to focus on the children as narrators; in the Israeli families, narrative space is divided between adults and children. From the children's point of view, different gains are involved in each practice. Being encouraged to tell stories may be important in developing confidence in performing rights and the skills of narration (Blum-Kulka & Snow 1992); however, acting as primary or even secondary audience to adult stories allows access to the experience of significant others, thereby expanding the bases for identification (Miller et al. 1990) and shaping cultural notions of tellability or *reportability* (cf. Hymes 1981).[7]

Narrative Initiation: Insiders and Outsiders, Women and Men

Adult roles also are differently distributed across the two groups, most notably in regard to the observer. Observers in the Israeli families initiate 15% more narrative events than do the observers in the American families (see Fig. 4). In other words, the observers in the Israeli families seem much more confident in their story-telling rights than their American counterparts. Or, as suggested by Deborah Tannen (personal communication), the Americans may have different ideas about their *obligations*, rather than their rights: with their scientific tradition of "objectivity" in social science, perhaps they feel it incumbent upon them not to participate any more than necessary. This result ties in with other observations on the relations between observers and families in the two groups.

In both groups, observers (with one exception) were invited to join the dinner table as a matter of course; but the nature of their interaction with the family differed in key, and consequently in rules of interaction. In terms of the continuum of formality proposed by Irvine 1979, the generally prevailing key of family discourse (because of intimacy among participants) is that of informality. Yet there are differences of degree between the two groups: Israelis seem to celebrate the outermost informal end of the continuum. Consequently, observers are drawn into the circle of conversation from the onset, and interact with all family members, not only in the role of familiar guests but rather as actual or potential friends. This is in line with the ethos of solidarity in Israeli culture, which tends to symbolically minimize social distance (Blum-Kulka et al. 1985, Katriel 1986). One of the privileges granted to friends is that of both self-directed and other-directed narrative initiation. Observers in the Israeli families accordingly share initiation almost equally with other members present.

Being a familiar guest at the American family's somewhat more formal dinner table does not bestow on the observer the privileges granted to friends; though partaking in the interaction, the observer does so cautiously, under the rules of interaction governing communication between nonintimates. Not being overtly active in narrative initiation is one way in which such caution is exercised.

Hence it is not surprising to find that observers in the American families are engaged in less than 10% of story initiations.

Another difference between Israelis and Americans is in the relative parts played by mothers vs. fathers in narrative initiation. In the Israeli families, mothers have twice as many initiations; in the American families, fathers play a slightly more active role. This finding is in line with general patterns of participation rates in dinner-table talk. Following the categories proposed by Bublitz 1988 for topical action, we have analyzed the proportional role of fathers vs. mothers as topic initiators throughout the entire conversation: out of 47 parent-introduced topics, Israeli mothers introduced 76.5%; but out of 67 parent-introduced topics in the American families, fathers introduced 66%.

One reason for these findings may be the American perception of the occasion as having formal overtones because of the presence of the observer. Though the serving of food is accomplished mostly by the mothers, the fathers in these families take it upon themselves to *entertain the guest*, e.g. to introduce topics and to use narratives to keep the conversation going. By contrast, in the Israeli families, the mothers seem to take charge of the event, both in instrumental terms (here too it is mostly the women who serve the food) and by keeping the conversation going.[8]

Styles of Narrative Initiation

The solidarity ethos of Israeli society, as manifested in attitudes toward the observer, finds further expression in styles of narrative-event initiation. Consider story entry. In an independent study of the same corpora, Polss 1990 has analyzed in detail the types of devices used by initiators and story recipients in the course of story-entry talk. Germane to the discussion of attitudes toward telling is her analysis of the types of devices used in responsive utterances. Following Tannen's distinction (1984, 1985, 1989) between *high-involvement* and *high-considerateness* conversational styles, Polss distinguishes between high-involvement and low-involvement narrative response strategies.

High-involvement responses focus on the tale and the teller; in Tannen's terms, they show active "participatory listenership" (1984:30). These include devices such as request for information, confirmation of information, and listener contribution to the narrative. Low-involvement responses focus on the telling; they signal message reception, thereby confirming the teller's success in aligning story-recipients. These include different types of *uptakers* (Edmondson & House 1981:62–3), e.g. neutral back-channeling responses (*mhmm, uhhuh, yeah, right, okay*, etc.) and emotively colored ones (*really?, good, for heaven's sake*).

Polss found interactive, high-involvement style more characteristic of story entry in Israel than in America: the proportion of high to low involvement styles is 82% to 18% in the Israeli narratives, compared to 69% to 31% in the American stories. Thus Israeli story-opening exhibits a higher emphasis on coparticipation and demonstration of personal involvement. Israeli coparticipants frequently interpret story-initiator information, showing their concern with tale and teller.

(1) Israeli family 7: The conversation takes place as the family is getting ready to sit down at the table. Present also are the daughter (16) and the two sons (12 and 10).[9]

1 Observer:	*etmol hayinu [//] hayiti ecel pnina ve + . . .*	Yesterday we were [//] I was at the home of Pnina and + . . .
2 Mother:	*ve-cvika?*	And Cvika?
Observer:	*ve-cvika ken.*	And Cvika, yes.
Mother:	*nu # ve-ex halax?*	So how did it go?
Observer:	*haya meod nexmad.*	It was very nice.
	[Story]	

The fast rate of speech, lack of interturn pauses, and dialogic unfolding of this story entry places it high on the involvement continuum. The story recipient's high engagement can further be seen by her use of what Tannen (1984:118) calls "cooperative promptings" at every turn (e.g., "So how did it go?"). Americans, by contrast, exhibit less relative focus on interpersonal involvement, devoting their efforts to floor-management tasks aimed at securing the telling.

(2) American family 2: The children are Martin (8m), Daniel (6m), and Tamara (4f). The conversation takes place in the middle of dinner.

Martin:	My best friend got about + . . .
	You see me and my best friend were studying *rockets-?*
Observer:	Uhhuh.
	[Story]

The shared features noted here are high degrees of collaboration and of inclusion of children in narrative events. Cultural diversity is revealed in attitudes toward tellers – the question of who participates – and in styles of story entry. This trend for cultural diversity of a gradient nature, against a background of shared orientations, is also noticeable in attitudes toward tales.

Transforming Tales to Telling

Cultural Variation in Spatio-Temporal Orientation of Tales

Where do tellers find the tales for constructing narratives at dinnertime? Certainly not in fiction; the vast majority of narratives in both groups (90%) are derived from real-life experience. In predominantly adult narratives, fictional topics do not exceed 4%.

In child-involved narratives, fiction does play a role (14%). Israeli children mention fictional characters from story books (Aladdin is one) and tell the contents of movies and books. American children talk about fictional characters from television: Sesame Street, Bugs Bunny, etc.

We have analyzed spatio-temporal framing by coding the two dimensions independently. First, since our definition of narratives included only stories of the past (see Ochs et al. 1989 for a different notion of temporal framing in family narratives), we distinguished narratives by temporal reference, including

today ("I finished my assignment today in um and . . ."), *recent past* ("I met an interesting man on the beach last week"; "Last night Debbie . . ."), or *distant past* ("that happened about five years ago.") Cases which were either timeless (such as jokes and fiction), or lacking in cues for reliable assignment to a "recent" or "distant" time frame, were excluded from this analysis, leaving a corpus of 195 clearly time-framed marked narrative events (out of 264). Second, we defined narrative spatial orientation as geared either toward the *home*, the *world of school and/or work*, or any other location in the *world*. For example, a narrative about how the substitute teacher behaved that day is considered a "today/school" narrative, a visit to the museum last week is a "recent-past/world" story, and a teenager's early childhood memory about a family pet is a "distant-past/home" story.

In terms of their spatio-temporal framing, family dinner narratives defy the expectations of literary critics. Toolan (1988:1–2) defines narratives as "a recounting of things spatio-temporally distant." This might be true for fictional narratives; but most family narratives are definitely not temporally, and only partially spatially, remote from tellers and audience. Considered together for both groups, the majority of temporally marked narratives (63%) concern events of the very recent past – today, yesterday, or last week – leaving 42% to focus on events from the distant past ($n = 195$); see "Past 1" and "Past 2" in Figure 5. In terms of location, half the narratives analyzed fall into the third group, being located in the world. A third concern school or work, with the rest (12%) being located in the homes; see Figure 6.

Within this general framework, however, we find cross-cultural preferences. The distribution by story time in Israeli and American narratives shows that story time is very different in the two groups (Fig. 5). The most striking difference is revealed in regard to the "today" frame: in the American families, almost half

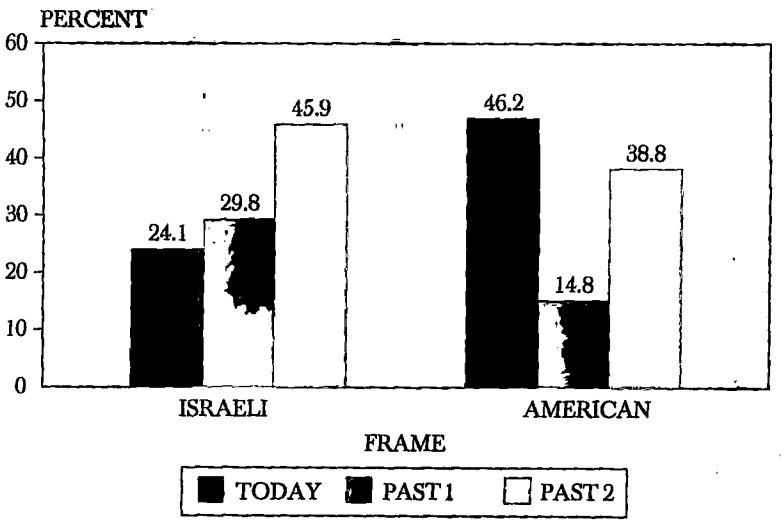

Figure 5: Temporal tale frames

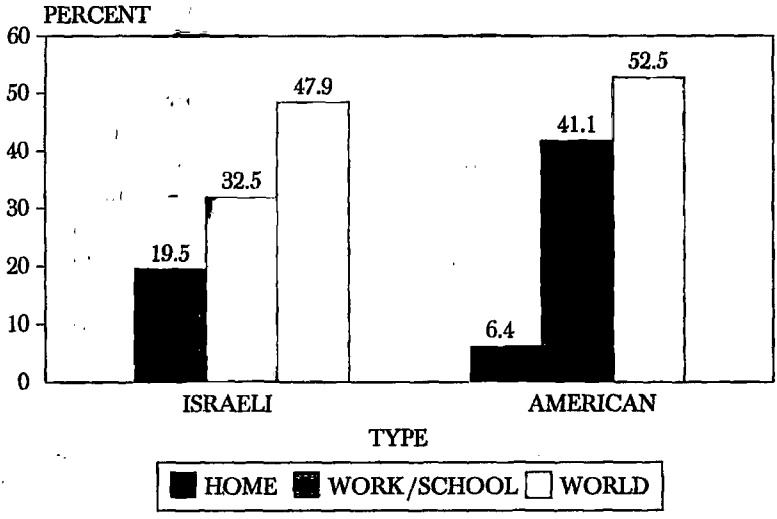

Figure 6: Spatial tale frames

the time-marked narratives focus on *today* (46%). Telling about the happenings of the day thus stands out as the most important single time frame for American narratives. By contrast, in Israeli narratives, "today" stories take up only one-quarter of narrative space (24%). For Israelis, the recent and nonrecent past are the preferred time frames, taking up over three-quarters of narrative space (76%). The difference lies in general preference for time frames, not in choice of topics within the frames chosen. For example, for both Americans and Israelis, stories of the distant past cover a rich variety of topics. These include a series of humorous anecdotes about house painters that the family employed over the years, the story of an exceptional shopping expedition, several camping and travel stories, and anecdotes from the children's earlier years.

Cultural preferences for the tale's spatial frame are revealed in the choices of home orientation vs. school or work orientation (see Fig. 6). For both groups, about half the narratives are world-oriented, concerning spatial frames such as museums, camping grounds, or shopping malls. But Israeli narratives are markedly more home-oriented than American. In a considerable proportion of Israeli narratives (20%), the locus of the tale is at the home; by contrast, home stories are quite rare (6%) in the American corpus. The Israeli home stories include stories about birthday celebrations, family pets, grandparents visiting, or specific incidents that link the world and the home, such as the story of a mother's anxiety on coming home and not finding her two (early teen) sons there when she expected them.

An interesting corollary to Israeli home orientation is provided by analysis of the types of protagonists foregrounded in family narratives (Figure 7). We have divided protagonists as *self*, *other*, or *us*. For both Israelis and Americans, attention is divided almost equally between stories that involve the self as protagonist and those concerning others. The prominence of the self as protagonist

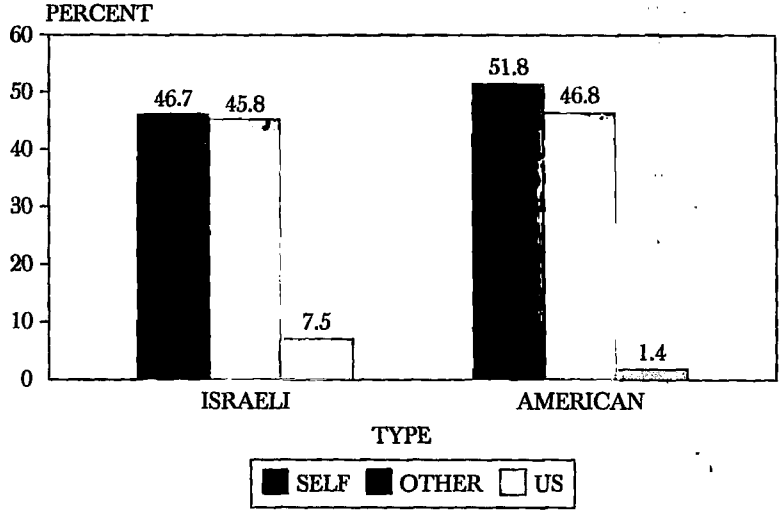

Figure 7: Tale protagonists

is not surprising, given that family dinners provide a unique opportunity for each member to use the narrative mode for raising issues of personal concern before a presumably supportive audience. Stories about others often involve the self too, e.g. the self as critical observer, as when the narrative concerns a teenager recounting an incident between the teacher and another student. The third category, "us stories," are quite rare in both groups; but they are more likely to appear in the Israeli narratives than the American. Furthermore, the nine Israeli "us narrative" events are rather long and elaborated happenings, lasting up to seven to eight minutes each, while the two American "us narrative" events are much shorter (3–4 minutes) and less elaborated.

We have seen that the groups differ culturally on the dimensions of spatio-temporality. For the Americans, the process of transformation from tales of today to the actual telling is enacted in a culturally specific, ritualistic way–that is unparalleled in the Israeli narrative events.

"Today" Rituals: Who will I Tell How My Day Goes?

In an imitation of domesticity, a call girl in an American movie from 1990 (*Pretty Woman*) greets her customer with "How was your day, dear?" But judging by our dinner-table conversations, this conventional query functions socially in much richer ways than merely a sign of wifely concern. Narratives about the day's happening figure in both Israeli and American dinner-table talk, but it is only in the American families that such narrative events take on the features of a proper interaction ritual (Goffman 1976). "Today" narratives seem to combine three ritualistic features: the recurrent nature of the activity type, and the role expectations that it entails; the formulaic, repetitive language of the opening phase; and the ritual constraints governing the type of conversational contribution expected.

As an activity type, "today" narratives resemble early childhood *formats of interaction*, which are "standardized . . . interaction patterns between adult and infant that contain demarcated roles and eventually become reversible" (J. Bruner 1983:120). Within the family context, the roles of demarcation cut across *insiders* and *outsiders*: thus the observer at the family dinner table has in this case no participation rights, never asks (and is not being asked) about other's or his/her own day. This is not surprising, given that "today" rituals, like early childhood interaction formats, are based on a very high level of shared assumptions of both a cognitive and an affective nature. Members of the family have basic cognitive scripts about each other's activities during the day, and they act on the assumption that deviations from such scripts (the stuff narratives are made of) are a matter of mutual interest and concern.

Theoretically, within the family circle, all members have reciprocal rights and duties to participate; but in practice, reciprocity is limited to spouses, since children either self-initiate participation or are invited by parents to do so, but as a rule fail to show the same initiative toward their parents.

Whereas childhood interaction formats act as a language acquisition support system (J. Bruner 1983), "today" narratives act as a critical socializing context for the acquisition of narrative skills. As the analysis of the texts will show, the ritual can be performed with varying degrees of success. The processes involved in causes of success or failure provide contexts of socialization in regard both to the choice of acceptable topics and to appropriate ways of telling.

The opening phase of "today" rituals is marked by clear discourse boundaries at the point of initiation. The stylistic features of the opening gambit are of a formulaic and repetitive nature, allowing for only a limited degree of lexical and syntactic variation.

Consider modes of initiation. Transition from any other topic to the "today" narrative is enacted either by an other-initiated formulaic question (some variation on *How was your day?*), or by a self-initiated *today* + *action verb* phrase ("I had lunch at the Parka today.").

(3) American family 6: The children are Andrew (10m), Jessica (8f), and Joshua (3m). This "today" story is the first, to be followed by several others at the same meal.

1	Father:	Jessie, how was your day?	←
2	Joshua:	Ooooh aaah	
3	Mother:	What was the best part of your day, Jessie?	←
4	Jessica:	After lunch.	
5	Joshua:	I get xxx	
6	Jessica:	xxx	
7	Father:	You were out playing in the rain.	
8	Jessica:	Uh-huh. [=! affirmative]	
9	Mother:	Do you have your templates, Jessie?	
10	Jessica:	xxx	
11	Father:	[=! talking to Andrew] Really? What happened after lunch? You left for the beach yesterday?	

The transition from the previous topic is often minimally marked by the use of a discourse marker (cf. Schiffrin 1987), e.g. *so*.

(4) American family 2: Present are also the children: Daniel (6m), Marvin (8m), and Tamara (3f).

1	Father:	So, Tamara, what did you do today?	←
2	Mother:	<xx help yourself> [>]	
3	Father:	<What'd you do today, Tamara? > [<]	
		End@	

(5) American family 7: The children are Aaron (9.5m) and Abigail (7f).

1	Mother:	So what did you accomplish today?	←
2	Father:	xxx	
3	Aaron:	Uh, uh.	
4	Father:	Yes	
5	Mother:	Yes [= laughing]	
6	Father:	Well #	
		[Story]	

The salience of the ritual becomes particularly evident through self-nomination. The right for telling your day is implicitly felt to be equally shared, as voiced by 4-year-old Sandra. With no preliminaries, Sandra at some point in the middle of the dinner turns to her mother and asks a question.

(6) American family 4: The children are Jordan (7.5m) and Sandra (4f). Sandra's initiation takes place half an hour into the dinner.

1	Sandra:	Mommy to who will I tell how my day goes?	←
2	Mother:	OK let's hear your day.	
3	Sandra:	Well # I xxx played puzzles xxx I made xxx [continued]	

Sandra's question shows that she is already aware of her rights for displaying her day, and moreover that she offers her day as a gift to be received. It is the duty of her family to appoint a receiver for the gift; and indeed, her mother acknowledges the gift, accepting it on behalf of all present (*Okay, let's hear your day*), thereby giving the signal for the ritual to begin. In other words, the ritual requirement in the case of self-nomination is for recipients to display positive acceptance – not only yielding the floor for the teller, as is the case in all narratives, but also paying homage to the specific offering made.

In other-initiated narratives, the opening gambit creates a slot that the recipient is expected to fill with a narrative of the *doings* and *accomplishments* of the day. In this way the ritual constraint that operates determines the type of contribution expected from both initiators and respondents. In ex. 4, the child is *probed to conform* to this *conversational demand* (cf. Dascal 1983:109), while in ex. 5 the adult provides the expected narrative. What distinguishes the family "today" ritual from similar rhetorical routines in other types of interaction (e.g., *How was your weekend?* at the office) is apparently the notion of accountability. In the family, a question like *How was your day?*, especially when addressed to children,

implicitly invites a narrative no less than does an explicit query about the day's happenings. In other contexts, of course, a narrative may be neither invited nor much wanted. It is through the notion of accountability that we can understand how somebody's day can be topicalized, objectified, distanced, and contemplated with care.

(7) American family 8: The children are Jared (11m) and Robin (9f). The mother's move follows a request from Robin to change the subject discussed previously.

1 Mother: I want to talk to Jared about his day, because he said it was so horrible. ←
2 Jared: It was not horrible, it was just boring. ←
3 Mother: Why was it boring Jared?
4 Jared: It was really [//] actually that's not quite true. This person who studies lungs came in for science +\
5 Mother: Lungs?
6 Jared: Yeah, and she said [//] she showed us some slides and brought in a plastic dog's lung
[continued]

As these examples show, both children and spouses are invited to participate in the ritual. But as noted, nomination rights are not quite equally distributed. We encountered only one instance where a child tries to nominate a parent, rather than vice versa.

(8) American family 7: The children are Aaron (9.5m) and Abigail (7f).

1 Andrew: What happened at work today Mother? ←
2 Mother: Well I bet you, one power trouble at work today.
3 Andrew: Oh really. [=! laughs]
4 Mother: [=! laughs] Oh God.
5 Abigail: You should drop your jobbie. ←
6 Mother: I know.
7 ?: Drop your jobbie.
End@

This example shows one way in which the ritual may fail: neither party (certainly not the mother) seems to consider the question as a serious attempt to initiate a "today" ritual. When no narrative comes forth, another child offers a personal comment (T5), which serves to change the topic. In the case of successful "today" narratives, the same slot often is filled by prompts to continue, worded in no less formulaic ways than initiations.

(9) American family 4: Sandra is 4; also present is Jordan (7.5m).

1 Father: So what else did you today Sandra? ←
2 Sandra: Um xx beads, puzzles and I played clock
[continued]

(10) American family 4.

1 Mother: What else did you do today, dear? ←
2 Father: That's all

Such constraints on initiation and participation rights, as well as on modes of telling, turn "today" narrative events into a clearly delimited speech events that impose specific rights and duties on all participants. For the gift of a *today story* to be well received, it must be a substantial gift. The first operating constraint is one of selection. Not all the day's happenings are worthy of telling: adults explicitly call upon nominated tellers to exercise criteria of interest in regard to the tale before launching into the telling; thus 8-year-old Jessica (T3 in ex. 3) is asked to tell *the best part of her day.* A long account of a soccer game by an 8-year-old boy is interrupted as follows.

(11) American family 4: Jordan is 7.5.
Father: Jordan, would you like to tell us something? Other than soccer, what happened today?

Child tellers are required to order the day's happenings by relevance (*Tell us the worst/best part of your day*; *What were the highlights of your day?*) prior to foregrounding one particular chain of events as a narrative topic. Children are also explicitly socialized in modes of telling. They are required, in the terms of Genette 1980, to turn *stories* into true *narratives.* An extreme example of this process is illustrated by the narrative event I refer to as "Everybody's Day."

(12) Everybody's day: American family 5: The family has three children: Dorothy (13f), Beatrice (10f) (also called Harriet), and Matthew (4m).

1 Father: So how was your day Harriet? <You're supposed +\ > [>]
2 Bea: <Daddy [=! offended]> [<].
3 Father: What?
4 Bea: Cut that out. [%com: Bea does not like to be called Harriet]
5 Father: You're supposed to say "Oh it was wonderful xxx"
6 Bea: Daddy [=! annoyed] no lozzie [unclear?] [/] <lozzie> [?][>] [=! laughs].
7 Father: <=! laughs> [<]
8 Mother: xx Why don't you tell us about your day now?
9 Matthew: My [//] your day.
10 Bea: Mine?
11 Matthew: xxx.
12 Father: Your first?
13 Matthew: And your tenth.
14 Father: Oh [=! laughs].
15 Matthew: Bea tell your day. ←
16 Bea: I woke up and I got dressed and xxx [=! speaks very softly].
17 Matthew: What?
18 Father: Speak up.
19 Bea: # um # I woke up and got dressed and went to xx xx
20 Father: You didn't bother to eat any of breakfast or lunch?
21 Bea: Nope.
22 Father: And I made you such nice french toast too.
23 Matthew: No then <my day!> [>].
24 Father: <Oh is it your turn now?> [<] ←
25 Matthew: After Bea comes me [=! laughter]# my day # washed and

26 Father: Matthew!
27 Matthew: Oh [=! laughs]
28 Father: You can do any of that # whatever it was.
29 Dorothy: Matthew now # can I go?
30 Matthew: No. First I wake up # then go to bed # then wake up <then go to bed # then I wake up # then go to bed> [>] [=! laughing].
31 Father: Oh [=! laughs] <you just lost your turn> [<]
32 Matthew: First I wake up # then +\
33 Bea: Matthew!
34 Father: No, stop.
35 Matthew: xxx.
36 Bea: Matthew you had a very <boring day> [>]. ←
37 Matthew: <Here go mommy> [<]
38 Father: First I wake up # then I go to nursery school
%com: [=! imitates the way Matthew speaks]
39 Mother: Listen to this family.
40 Mother: First I woke up and then had breakfast.
41 Matthew: Then you had nothing [=! laughs].
42 Mother: Then I had my shower.
43 Matthew: Then you had nothing [=! laughs].
44 Mother: Then I did the wash. I made the lasagne+ . . .
45 Dorothy: Now it's my turn Matthew. ←
46 Father: First I ate breakfast # then I got up.
47 Bea: Daddy [=! annoyed tone].
48 Mother: Oh [=! laughs].
49 Father: Then I didn't take a shower. Then I brushed my teeth # then I went outside # then I got dressed +\ ←
50 Bea: Daddy [=! shouting]!
51 Mother: Oh [=! laughs].
52 Father: Then I took my shoes off and put my pajamas back on # went to the basement # did some work # caught a pigeon # <made the pigeon for lunch> [>]
53 Matthew: <Oh [=! laughs]> [<]
54 Father: <Then I drove you all to> [<] [/] then I [/] then I went to # Woolworth's bought something that I had to return later in the day as usual because I always have to return everything I buy.
55 Bea: You can't buy things.
56 Father: um # then we went to the library.
57 Bea: And found nothing.
58 Father: And I went with a girl who found nothing. Then we went out <of the library +\> [>]
59 Bea: <Okay> [=! shouted]!
[Turns into a discussion about whose books are on whose library card]

"Everybody's day" displays the typical features of the "today" ritual in its insistence on equality in rights of participation (on turn-taking, see particularly T24, T25, T29, T45), on the repetition of the formulaic questions (T1, T8, T15), and on the type of sequential coherence built up from "your day" questions

responded to by action verb series. But it is a ritual gone sour, negative rather than positive in affective outcomes.

Several indicators in the discourse combine to show us what is going wrong, and thereby also reveal underlying norms for how it should have gone. First, there is a double message in the father's initiation: he uses the formulaic *How was your day?*, but prefixes it with an unusual term of address (which his daughter does not like), and follows it with a metacommunicative statement (*You're supposed to say . . .*). He thus sets a playful tone for the interaction, implying that it is not to be taken seriously. But the mother shifts the key back to a serious tone (T8), and the children spend a considerable amount of metacommunicative energy – in line with the general tendency of American family dinner talk to topicalize turn-taking (Blum-Kulka & Sheffer 1993) – arguing for their share in the family's "today" narrative space.

By shifting the argument constantly from the realm of telling, in which the issue at hand is a share in the "today" ritual, to the realm of conversation, in which the issue is floor management, the speakers indicate most clearly a dissatisfaction with the unfolding of the event. Thus, in T23, Matthew claims his share in the ritual of telling one's day; his utterance is an attempt to enter this specific telling realm. His father's response, *Oh, is it your turn now?*, switches back to the realm of conversation, thereby implicitly inviting talk for talk's sake rather than compliance with the demanding task (in terms of content) of telling one's day. In T24, the framing of the event shifts from the frame of telling one's days, in which it is meaningful to exchange and evaluate personally owned days, to the loosely defined frame "talk about the day," in which the focus is on having a share in the talk, rather than on telling one's own day. Subsequently, the realm of the tale is affected as well, yielding extremely poor "today" stories in terms of information.

The first child to speak on topic, Beatrice (T16–22), fails to provide an interesting narrative; she is interrupted by her younger brother, Matthew (T23), who is dismissed (T33–34) as having defied expectation for making a substantial contribution of any kind. While Beatrice still conforms to the rules, though not very successfully, Matthew steps out of the rules completely. Deliberately or not, his account actually parodizes both the requirement for informative substance (T25, T31) and relevance. His father dismisses him by moving from the realm of telling to the realm of conversation, negating a conversational turn that fails the "today" requirement (*You just lost your turn*); but Beatrice's evaluation of the tale (*Matthew you had a very boring day*) imply a critique of the teller as principal (T36). The mother's metacomment in T39 (*Listen to this family*) suggests an awareness that things have gone wrong; yet her own attempt at a change of *footing* (Goffman 1974:124–60) goes back to the earnest, but not good enough, report mode earlier initiated by her daughter (compare T16 to T40 and T44).

The event culminates with the father giving an echoed, free indirect speech, mocking imitation of Matthew's account (T38), only to go on (T46ff.) to offer a parodized version of a "today" report of his own. Framing the report as a parody of the real thing is indicated by an unlikely reversal of chronology (*First I ate breakfast then I got up*), followed by the negation of an event (*then I didn't ta-*

a shower). Audience response (T47, 48, 50, 53) wavers between clear annoyance, which in the case of the daughter may mean taking offense (see T47), and laughter, which seems to indicate in this case that both mother and son align with the father's choice of telling-frame.

The overall message of this failed narrative event relates to tales, telling, and tellers. In regard to the tale, it evokes the requirements of "today" tellability: to provide a significant contribution to the ritual, you have to select, order, and dramatize the events of the day. A failure to do so shifts the focus of the narrative event from the realm of telling back to the realm of conversation, and changes its key; these transformations result in the disintegration of the "today" ritual. Tellers, encompassing in this event both the role of animator and an accountable principle (Goffman 1981), are highly vulnerable to such transformations, finding themselves being challenged both on account of their tales (e.g. *boring day*) and their participation in the telling.

What is the overall function of the "today" rituals in the American families? In terms of discourse goals, they occupy a curious place between transactional and interactional speech (Brown & Yule 1983:1–2). The role of the ritualistic question *How was your X* can set off different types of speech events. In case it is completed in a two-move exchange, as might be the case among co-workers in an office situation, we have before us an interaction ritual (in Goffman's sense) that will tend to serve mainly phatic interactional goals, aimed predominantly at the maintenance of social relations, rather than the transmission of information. But in the family the same question sets off very different kinds of expectations. Here the transmission of (narratively filtered) information is not only tolerated, but actually required, and the interactional goal achievable is not just social harmony but rather "affective convergence" (Aston 1988:255). The ritualistic mode seems to satisfy this variety of expectations; it provides conventionalized ways for the show of reciprocal interest and affect in the family, while simultaneously serving as a socializing context for transmitting cultural notions of appropriate ways to transform tales into telling.

In contrast, the Israeli time-framed narratives exhibit only few of the features of the "today" ritual. We do find that the activity type is enacted, especially by parents asking their children about the activities of the day. As in the American families, such questions expect a response in the form of a narrative, rather than phatically. Failure to provide a narrative is responded to by further probing (see T4, 5, 8 in ex. 13).

(13) Israeli family 4: The family has two daughters, Ruti (12f) and Naomi (8f), and one son, Yaron (4m).

1	Mother:	*Yaron # tesaper lanu <ma asita ha-yom ba-gan> [>]*	Yaron, tell us what you <did in school todya> [>]
2	Ruti:	*<ma [//] ex haya ba-gan> [<]*	[What [//] how was school> [<]
3	Yaron:	*naim*	Pleasant.
4	Mother:	*naim? ma haya naim? tesaper lanu ex haya naim?*	Pleasant? What was pleasant? Tell us how it was pleasant. We played.

7	Yaron: *be-misxakim.*	With games.
8	Mother: *eze? ba-xuc? ba-xacer?* [continued]	Which? outside? in the yard? ←

But initiation of such narrative events varies with child and family. Transition to a narrative concerned with the day's happenings is initiated either by a variant of *What did you do in school (today)?*, as in ex. 13, or more typically, by a topically specific question, as in ex. 14.

(14) Israeli family 6, with twin girls aged 6: Lilax and Iris.

Father:	*lean halaxtem hayom be-shiur teva?*	Where did you go today during your "nature" lesson?
Lilax:	*la-giva hazoti she-pa'am she-avra halaxnu* [continued]	To this hill that we went to last time.

The time marker *today* tends to appear in stories told about children, rather than by children in response to "today" elicitations. An example is a story told mainly by a mother, with some participation from a child, about the adventure her 4-year-old daughter had at school when a rooster jumped on her; or a story, again told by a mother, about how 6-year-old Rami missed the bus to school. The need to mark narratives temporally tends to be reserved by Israelis for stories from the past. One device is the use of *pa'am*; literally *pa'am* means 'once'; and as in English, it figures in conventional story beginnings. Examples from the family narratives vary in topic, as seen in ex. 15–17.

(15) Israeli family 2: The children are Shlomit (12f), Riki (10f), and Mika (5f).

Father:	*hayiti pa'am be-shuk aravi ve-ani halaxti liknot kishuim vehayu sham* [continued]	I visited once an Arab market and I went to buy some zucchini and there were

(16) Israeli family 2.

Mika:	*ani roca lesaper bedixa. pa'am axat halax ish* [continued]	I want to tell a joke. Once a man went . . .

(17) Israeli family 1: Yoash is a guest, a friend of the family.

Yoash:	*shamati pa'am et ex korim la. hag-veret Milo* [continued]	I once heard, what's her name, Mrs. Milo

Other time-marking devices used include concrete specifications of time (*last week/yesterday/last year/about a month ago*), as well as sequential ordering of events relative to self (*the first time I went to the University*).

Talk about the day's activities lacks the ritual constraints on participation structure: we found no indication in the Israeli discourse of an expectation for all to participate, as in the American families. What seem to be missing are both the accountability requirement, in regard to the most recent time frame, and the

a shower). Audience response (T47, 48, 50, 53) wavers between clear annoyance, which in the case of the daughter may mean taking offense (see T47), and laughter, which seems to indicate in this case that both mother and son align with the father's choice of telling-frame.

The overall message of this failed narrative event relates to tales, telling, and tellers. In regard to the tale, it evokes the requirements of "today" tellability: to provide a significant contribution to the ritual, you have to select, order, and dramatize the events of the day. A failure to do so shifts the focus of the narrative event from the realm of telling back to the realm of conversation, and changes its key; these transformations result in the disintegration of the "today" ritual. Tellers, encompassing in this event both the role of animator and an accountable principle (Goffman 1981), are highly vulnerable to such transformations, finding themselves being challenged both on account of their tales (e.g. *boring day*) and their participation in the telling.

What is the overall function of the "today" rituals in the American families? In terms of discourse goals, they occupy a curious place between transactional and interactional speech (Brown & Yule 1983:1–2). The role of the ritualistic question *How was your X* can set off different types of speech events. In case it is completed in a two-move exchange, as might be the case among co-workers in an office situation, we have before us an interaction ritual (in Goffman's sense) that will tend to serve mainly phatic interactional goals, aimed predominantly at the maintenance of social relations, rather than the transmission of information. But in the family the same question sets off very different kinds of expectations. Here the transmission of (narratively filtered) information is not only tolerated, but actually required, and the interactional goal achievable is not just social harmony but rather "affective convergence" (Aston 1988:255). In contrast, the Israeli time-framed narratives exhibit only few of the features of the "today" ritual. We do find that the activity type is enacted, especially by parents asking their children about the activities of the day. As in the American families, such questions expect a response in the form of a narrative, rather than phatically. Failure to provide a narrative is responded to by further probing (see T4, 5, 8 in ex. 13).

(13) Israeli family 4: The family has two daughters, Ruti (12f) and Naomi (8f), and one son, Yaron (4m).

1	Mother:	*Yaron # tesaper lanu <ma asita ha-yom ba-gan>* [>]	Yaron, tell us what you <did in school todya> [>]
2	Ruti:	*<ma* [//] *ex haya ba-gan>* [<]	[What [//] how was school> [<]
3	Yaron:	*naim*	Pleasant.
4	Mother:	*naim? ma haya naim? tesaper lanu ex haya naim?*	Pleasant? What was pleasant? ← Tell us how it was pleasant.
5	Yaron:	*sixaknu*	We played.

7 Yaron:	*be-misxakim.*	With games.
8 Mother:	*eze? ba-xuc? ba-xacer?* [continued]	Which? outside? in the yard? ←

But initiation of such narrative events varies with child and family. Transition to a narrative concerned with the day's happenings is initiated either by a variant of *What did you do in school (today)?*, as in ex. 13, or more typically, by a topically specific question, as in ex. 14.

(14) Israeli family 6, with twin girls aged 6: Lilax and Iris.

Father:	*lean halaxtem hayom be-shiur teva?*	Where did you go today during your "nature" lesson?
Lilax:	*la-giva hazoti she-pa'am she-avra halaxnu* [continued]	To this hill that we went to last time.

The time marker *today* tends to appear in stories told about children, rather than by children in response to "today" elicitations. An example is a story told mainly by a mother, with some participation from a child, about the adventure her 4-year-old daughter had at school when a rooster jumped on her; or a story, again told by a mother, about how 6-year-old Rami missed the bus to school. The need to mark narratives temporally tends to be reserved by Israelis for stories from the past. One device is the use of *pa'am*; literally *pa'am* means 'once'; and as in English, it figures in conventional story beginnings. Examples from the family narratives vary in topic, as seen in ex. 15–17.

(15) Israeli family 2: The children are Shlomit (12f), Riki (10f), and Mika (5f).

Father:	*hayiti <u>pa'am</u> be-shuk aravi ve-ani halaxti liknot kishuim vehayu sham* [continued]	I visited once an Arab market and I went to buy some zucchini and there were

(16) Israeli family 2.

Mika:	*ani roca lesaper bedixa. <u>pa'am</u> axat halax ish* [continued]	I want to tell a joke. Once a man went . . .

(17) Israeli family 1: Yoash is a guest, a friend of the family.

Yoash:	*shamati <u>pa'am</u> et ex korim la. hagveret Milo* [continued]	I once heard, what's her name, Mrs. Milo

Other time-marking devices used include concrete specifications of time (*last week/yesterday/last year/about a month ago*), as well as sequential ordering of events relative to self (*the first time I went to the University*).

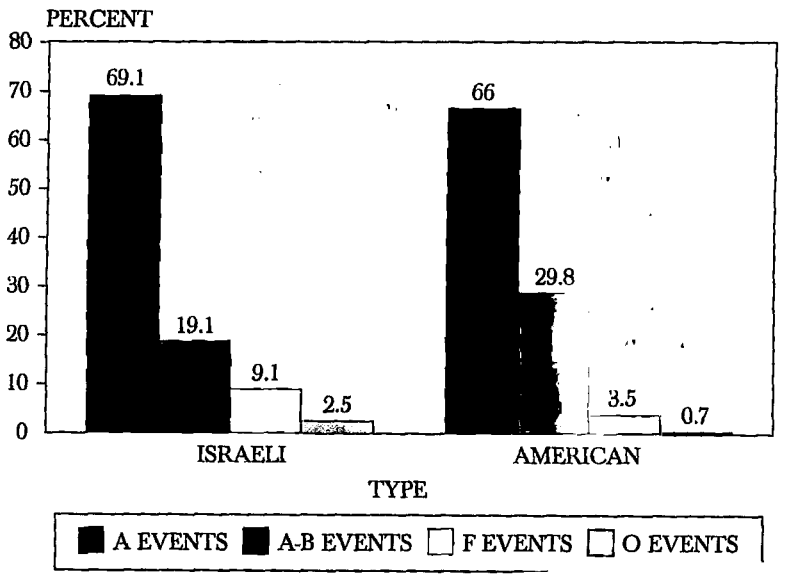
Talk about the day's activities lacks the ritual constraints on participation structure: we found no indication in the Israeli discourse of an expectation for all to participate, as in the American families. What seem to be missing are both the accountability requirement, in regard to the most recent time frame, and the expectation for a display of

The difference between the two groups in regard to "today" narratives reflects to some extent a wider cultural difference in the way verbal elements of social interaction are conventionalized. Relative to Israeli society, American social interaction seems much more governed by situationally conventionalized scripts (see Blum-Kulka 1992 for elaboration), which in turn pale by comparison with the degree of linguistic conventionalization observed for Japanese social behavior (Ide 1987). From this perspective, *How was your day*, apart from its broader cultural and familial functions, is yet one more instance of the rich repertoire of routinized interaction rituals in the United States.

Cultural Styles of Collaboration

Issues of Co-ownership vs. Co-performance

The degree of participation in the telling raises the issue of how access to the information contained in the tale, i.e. the *tale-ownership*, is related to the *entitlement* to tell the story (Shuman 1986:137–41). In other words, whose stories in the family are told by whom and to whom? In discussing narratives that call for audience response, Sacks (1978:261) notes that it is the "involvement in it [the story] that provides for the story's telling." Personal experience grants ownership, and shared experience grants joint ownership: "Parties who have experienced an event together are jointly in a position to describe it to someone else" (Goodwin 1981:159). As noted by Miller et al. (1990:298), "The conditions giving rise to joint ownership are more likely to occur in intimate relations than in non-intimate ones." Members of the family, being part of an intimate network, come to the dinner table with knowledge of both shared and unshared events. Although the conditions for claiming joint ownership may be met, the fact that several people are in a position to tell a story does not result necessarily in joint performance: Mothers regularly tell stories *about* children in the presence of the children (Miller et al. 1990), claiming sole performance rights on jointly *owned* stories. The reverse may be true as well; at least during the dinner-table conversations studied here, highly involved audience response to a story of personal experience (or knowledge) may turn the telling into a joint performance, implying a process-motivated claim to joint ownership. Hence ownership rights through access to the tale have no one-to-one correspondence to performance rights through access to the telling.



As the first step in exploring the interrelations between these two dimensions, I consider each independently, and then explore the culturally preferred intersections observed in the family narratives.

One way to approach story ownership is by considering access to the knowledge of the events recounted: is the narrated event (the fabula) known to the teller only, or is it shared by any other participants? Abstracting the nature of the narrated events from the verbal narratives by considering textual indicators, we follow Labov & Fanshel (1977:62–4) in distinguishing individually known *A-events* (known to teller only) from two-party shared *A-B events* (known to teller

and one other participant) and generally known *O-events*. Specific to the family scene is a fourth type of fabula, *F-events*, which are shared by all members of the family.[10] A breakdown of the data using these categories, as presented in Figure 8, suggests that Americans and Israelis only partially share attitudes regarding the degree of novelty expected from narratives around the dinner table.

In both groups, A-events dominate (66% and 69%). This is not surprising, given that dinner time provides a unique opportunity for all to share personal experiences with intimates. Family dinners with young children do not seem to occasion stories concerned with the state of the world; O-event narratives are almost absent from this speech event. For Americans, the next most frequent category following A-events is A-B events (30%). For the most part, these recount events experienced jointly by a child and one of the parents. For the American families, there is a marginal 3.5% of F-event stories. On the other hand, for the Israelis, F-event narratives prove a viable category, representing 9% of all stories told. It is interesting to note that, for Israelis, the percentage of F-event narratives in child-involved narratives rises to 15%, while in the equivalent set of American stories it drops to 2%.

Consider now modes of performance. We can distinguish three major modes of telling: *monologic*, *dialogic*, and *polyphonic*. Even though family narrative events are jointly constructed affairs, styles of collaborations vary from low to high participation by participants other than the primary narrator(s). At the dominantly single-voice end of the continuum, we find monologic narratives, in which one primary narrator remains in control of the floor throughout the event. The audience at such events responds indirectly, sustaining the telling but not involved in the tale. At the multivoiced, polyphonic end, we find narratives that defy the distinction of primary vs. secondary narrator(s), being constructed in close

collaboration between several participants. Between these two ends, we find dialogic narrations, constructed typically through a question/answer format.

A multiplicity of voices at the level of telling (in the polyphonic mode) can also transform relations between tellers. In the terms of Goffman (1974:127), the audience at such events is transformed into "fellow performers" who become "inhabitants of the same realm." For Tannen (1989:12), it is an issue of involvement: "an internal, even emotional connection individuals feel which binds them together to other people as well as to places, things, activities, ideas, memories and words. However, . . . [it is] not a given but an achievement in conversational interaction." In Tannen's analysis of a dinner conversation between friends (1984), she found this achievement of high involvement through conversational style to characterize the three Eastern-European Jewish speakers present.

Monologic narratives tend to be self-initiated, though they may follow a question from another participant. For example, in the Robbery Story analyzed by Polanyi (1989:66), the topic is put forward by a participant other than the storyteller, appealing to the appointed participant's expertise on the events to be narrated. Turning to the two women who got robbed, their friend asks: "I heard secondhand or whatever that you go robbed. – Yeah. – What happened?" Nor do tellers of monologic narratives necessarily have to claim experiential warrants for the tale – although, around the dinner table, tales do tend to be stories of personal experience. The distinctive feature of monologic narratives is the recognizability of a single narrator's voice.

In the dialogic mode, narration proceeds through a question/answer format, whether the story is self- or other-initiated. This is the mode that children use to tell stories from the very early stages of language acquisition (Ninio 1988, Sachs 1979). A well-documented subset of such stories is the joint evocation of shared events, in which the caretaker and the child jointly recount the story (Heath 1982, Snow 1991). But whether or not the events to be recounted are known to both adult and child, elicited narratives with young children tend to remain collaborative, with story contributions distributed between adult and child (Snow & Goldfield 1982).

Polyphonic narration is enacted in principle through both co-performance and co-ownership. Co-performance requires access to the tale, or at least shared access to its social context. This access takes into account an individual teller's *information state* (cf. Goffman 1974:133) as to "why events have happened as they have," as well as participant's familiarity with the underlying sociocultural scripts that make narratives "ring true with the stories they know to be true in their lives" (Fisher 1987:63). Co-ownership may be culturally interpreted as entitling all co-owners with story-telling rights (but not necessarily so; see Miller et al. 1990, Shuman 1986).[11] The outcome will be a jointly constructed narrative, where division lines between primary and secondary narrators are blurred. The issue of telling rights in such cases may vary culturally in regard to all participants, or only in regard to children. If children are included in the circle of right-holders, a child may feel licensed to contribute on topics felt relevant, whether the story is initiated by an adult or another child.

Israelis and Americans seem to differ in preferences for these three modes of performance. Quantitative analysis of a subsample of the narratives included here (Blum-Kulka & Snow 1992) shows that Americans prefer the monologic, display mode in 60% of the cases, with a preference for the dialogic mode in 29%. Israelis, by contrast, make use of all three styles, preferring both the dialogic (49%) and the polyphonic (30%) to the monologic (24%).[12]

But the cultural difference in regard to both ownership and performance rights is revealed mainly in the diverse ways the groups interpret the relationship between these two dimensions. Excluding dialogic, typically adult/child narration from this analysis, we can detect four types of interaction between access to the tale and participation in the telling. In the following I argue that the two groups differ in their preferences for these, as shown in Table 1.

Table 1: Styles of participation

	Mode	
Event-type	Polyphonic	Monologic
Shared	Israeli/American	American
Unshared	Israeli	Israeli/American

Among the four possible configurations between event type and mode of telling, Israeli and American narratives seem to share two: telling shared experiences collaboratively in the polyphonic mode, and allowing predominantly solo performances of personally known stories. However, the American families support monologic performances even when tales are known to more than one participant; and Israeli narration may unfold in a highly collaborative way, even in unshared tales.

The distribution among these four modes shows these preferences as representing a gradient phenomenon; see Figure 9. In both groups, shared experiences told collaboratively and single experiences told monologically constitute the bulk of narrative events (77% for Israelis, 84% for Americans). For Israelis, the third choice is to tell unshared events in a polyphonic mode (18%); for Americans, it is to tell shared events in the monologic mode (12%). In the following, I illustrate the way cultural styles are manifest within each of the two major modes of telling.

The Monologic Mode: Telling Shared and Unshared Events

A culturally shared and highly prevalent mode of telling (43% for both groups) is the dominantly monologic performance granted occasionally to sole tellers who recount (mostly but not exclusively) personal experience. In one such case, an Israeli woman describes in great detail the nightmarish dream she had about getting lost on one of the campuses of the Hebrew University in Jerusalem. In another instance, an American teen-age girl recounts a confrontation she had with a teacher in school. In the following example, the story offered by

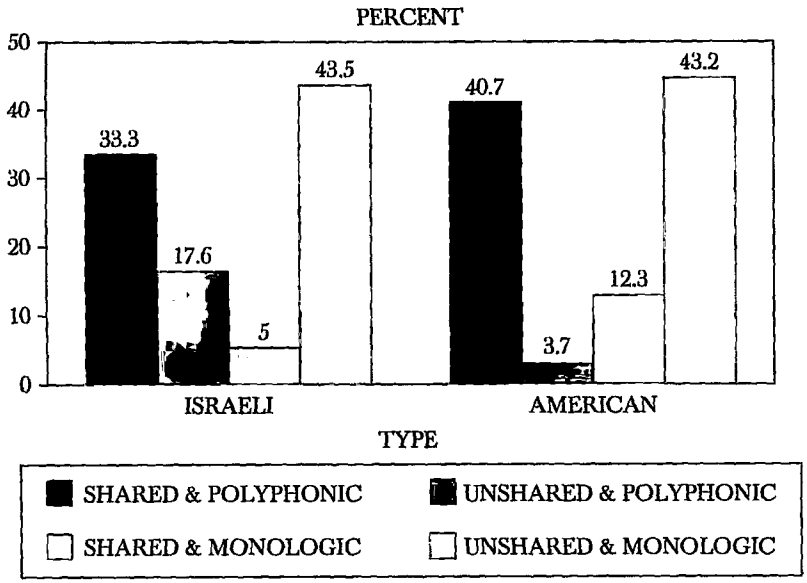


Figure 9: Ownership vs. performance in telling tales

observer terminates a series of stories concerning memories of food from childhood, all embedded in members' attitudes towards the religious practices of the parent and grandparent generations.

18) Israeli family 1: The children are Nadav (11m) and Jonathan (10m). The segment follows several exchanges concerning food and eating habits.

1	Observer:	*aval ha-ax sheli Avner haya noda be-bareranuto be-oxel. hu mamash hayu shlosha dvarim she-hu axal ve-zehu.*	But my brother Avner was well-known for his pickiness in food. There were actually three things he ate and that's it.
2	Mother:	*ma?*	What?
3	Observer:	*chips ve-stek ze haya ha-xx. ve-ani zoxeret she-od basar bishvil she-hu yoxal basar notnim lo. Sonya hayta notenet lo avatiax be-onat ha-avatixim xotexet lo she-yaani kaxa* + |	Chips and steak it was xx # And I remember that more meat so he'll eat meat they would give him. Sonya [%com: Sonya is the teller's stepmother] would serve him watermelon in season # would cut it so +\
4	Mother:	++ *lo yargish. bis me-ze ve-bis me-ha-hu.*	(that) he won't notice; a bite ← here and a bite there.
5	Observer:	*ve-kshe-hu higia le-cava hu na'asa gorme kaze oxel ve-mitanyen bemisadot. hayom shuv ani lo yoda'at ki hu dos yesh lahem kol mine isurim. aval ba-tkufa she-hu od haya*	And when he got to the army he became such a gourment, eating and interested in restaurants. Now again I don't know, since he became observant, they have all these

		xiloni hu na'asa axlan bilti ragil ve-hu amar "axshav ani mictaer al kol ha-shanim she-haya oxel kol kax tov <ve-ani> [>] ve-ani lo neheneti me-klum."	rules. But during the period while he was still nonobservant, he turned into a great eater and said, "Now I'm sorry for all these years when there was such good food and I, and and I didn't enjoy it at all."
6	Mother:	*<ken?> [<]*	<Yes?>
7	Nadav:	*ani af pa'am lo ectaer.*	I shall never regret it. ←
8	Observer:	*lo # kol ze ba lomar lax she-ata lo yaxol lada'at ma yihye be-od* +\ @ End	All this means that you can never know what will happen in another +\

The story of Avner, the non-eating child transformed into a gourmet adult-only to lose access (from the teller's point of view) to gourmet food, through newly acquired religious practices – is exceptionally rich in cultural themes, negotiating transitions between life cycles in the Israeli context (child/soldier/adult) and Jewish life styles (non-observant/observant); see Polanyi 1989 for analysis of cultural themes in American stories. For the purposes of the present analysis, the mode of telling is of interest. The example illustrates that, even in the monologic mode, when recounting unshared events, Israeli audience response goes beyond brief *uptakers* (Edmondson & House 1981). In T4, the evaluative detail added by the mother is her own logical inference, never mentioned by the main teller. The child's comment in T7 indicates how carefully he had been listening to the story; in the Israeli families, children typically act as active audience to all stories told, regardless of tellers (adults or children) and topic. In the American families, child participation in the role of active audience seems more restricted to child-related topics (Blum-Kulka & Snow 1992).

In the American families, monologic telling is not restricted to unshared events. In 12% of the American (non-dialogic) narrative events, a sole performer is granted telling rights for a tale; this happens in only 5% of the parallel cases in the Israeli families. Consider the following personal experience narratives told with the explicit purpose of entertaining.

(19) The bug: American family 3. The children **are Samuel (10m) Joshua (6m). Talk** on hikes precedes this segment.

1 Mother: Daniel loves that.
%com: [Daniel is her husband]
2 Samuel: Really?
3 Mother: I on the other hand [//] He loves to commune with nature. Me, I can take nature through a glass window.
4 Samuel: xxx
5 Mother: A glass window # with the bugs out # and anything that's more than four feet removing themselves from my presence I can't deal with them [=! laughs]. We had a bug once in the shower # and Samuel called me in on a Friday afternoon # wouldn't you know it # and he screams "Ma!" and there is this thing # if it wasn't two inches big # I thought it was the ←

most disgusting and somehow as disgusting as they are small # they get worse when they get larger # and there I was # it wasn't even afraid # it wasn't running # it was taking its time # it was sort of taking a little walk across the shower. I would at least appreciate it if they were afraid +/

6 Observer: But no. ←
7 Mother: +"But no, it sat there, very territorially, so I said "Get rid of it," he said "I'm not getting rid of it, you get rid of it," and of course Daniel was nowhere around.
8 Observer: Of course, right.
9 Mother: So we had to shpritz it to death. ←
10 Observer: Of course. ←
11 Mother: Oh, it was horrible, and the darn thing was so resilient it wouldn't die, you know I find that absolutely appalling +\
12 Observer: It wasn't xxx
13 Mother: That's right, well by the time we finish with them, they would be +. . . Cockroaches are going to inherit this earth one of these days.
14 Father: Well, you weren't using insecticide though.
15 Mother: I was using mildew spray xxx and that bug had the nerve to walk around in it yet # but finally it gave up # the ghost # and then we had to dispose of it. So I said "Go ahead # Samuel # dispose of it." He says "I'm not touching it # you touch it." So I took it out with thirty layers of tissue # so that I wouldn't even feel its shape and I picked it up and I threw it into the bathroom toilet.
16 Observer: She hasn't gotten over it. ←
17 Mother: I'm still thinking about it. I can see that bug # and I have visions of it rising up yet like a phoenix to haunt me. End@

The Bug Story is initiated by the mother, who remains the primary narrator for its duration. Though both father and older son (Samuel) are familiar with the events, audience response is limited to sustaining the act of telling through appropriate backchanneling and clarification comments (T6, T8, T10, T12, T16). The teller's comment on her relations with nature (*I can take nature through a glass window*, T3) serves as bridging talk to introduce her dramatic encounter with a spider in her bathroom on a Friday afternoon. She then manages to entertain her listeners by using several evaluative devices to highlight the turning points of her narratives (e.g. direct quotes, a shift to the use of the present tense; see T5, T7). Her efforts are fully appreciated – as can be seen by audience reactions in T6, T8, and T16. Finally, she concludes by providing a Labovian coda (Labov & Waletsky 1967:39); visions of the bug rising like a phoenix clearly link the past to the present.

The Bug Story shows that co-ownership of the tale does not necessarily entail equal rights for the telling. Narrative events can distinguish tellers from experiencers. In the Bug Story, the teller is the chief but not sole experiencer in the

events narrated; yet she is granted full telling rights, foregrounding her story-telling skills as individual performer.

The Polyphonic Mode: Telling Shared and Unshared Events

As listeners, we tend to expect collaboration in the telling when access to the tale is shared by several of the participants. Thus stories about a couple's trip abroad may be told to friends jointly, or in a monologic style, but with frequent interceptions from the other "knowing" participant. Shared ownership of the tale in the family may cut across generations, or create ownership affiliations between any group of members, either by true experience or by claimed familiarity with the events. Events that happen to parents jointly, prior to their children's birth, are one source for generationally defined ownership. In one case, the story of the parents' courtship is told in collaboration by both parents in response to a 10-year-old's question: *ex at ve-aba higatem le-ahava me-aruxat-erev pshuta?* 'How did you and Dad come to be in love from a simple dinner?'

The story of the parents' courtship is an example of the type of narrative which may be told again and again, because of its relevance to the history of the family. Memories from a shared past carry the potential to become part of the familial narrative repertoire, their telling triggered by the presence of a new audience. Our presence at the dinner table might have occasioned the retelling or construction of several such *family fables*. Consider the potential of the following recollection of a family reunion as a candidate of being or becoming a family fable.

(20) American family 7: Children are Aaron (9.5m) and Abigail (7f).

1	Father:	Yeah # anyway we had a big family reunion.	
2	Abigail:	What's a family reunion? [=softly]	
3	Mother:	That was all the members of the family [//] all relations.	
4	Father:	Well # you can't be more specific.	
5	Mother:	Not all.	
6	Abigail:	All the members of his side of the family.	←
7	Father:	Yes # it was all of my father's [//] my father and both of his sisters and all their children # and all the grandchildren.	
8	Aaron:	We were one of the grandchildren # right?	
9	Father:	Right.	←
10	Mother:	Um hm.	
11	Father:	So all these people were at this big reunion. And there wasn't enough room to sleep inside the house. So a lot of people bought # had or rented.	
12	Mother:	Rented. Nobody had # everybody rented.	
13	Father:	Yeah? Everybody rented RVs, which are these motor homes which you sleep in. And are not real comfortable.	
14	Mother:	And they're not real private.	
15	Father:	xx didn't seem to mind.	
16	Mother:	Well you just [//] you were so shy Abigail # you you wouldn't talk to anybody. And you just stayed inside the	←

RV and you never wanted to come out # see everybody. You just wanted to stay inside and read books and play with your toys.

17 Aaron: She could read then?

18 Mother: Well she had some books that she looked at the pictures # you know.

19 Aaron: Yeah.

20 Abigail: Picture book? Picture book?

21 Aaron: Pretended to read # pretended she was grown up.

22 Mother: Uh huh. And when anybody tried to talk to you # you'd run away and hide in the RV.

23 Father: Except for Pearson.

24 Abigail: Yeah in the RV I would go. ←

25 Father: You visited xxx P. He picked you up, xxx feet and sat you on his back xxx started asking you about the pictures.

26 Abigail: Huh

27 Father: You succumbed to his charms. xxx have [=! laughter] End@

The polyphonic mode of telling is particularly suitable for stories that have the family "us" as protagonist, and which are relevant in terms of contribution to the building of familial and individual identities. The Family Reunion story is not about self or other, but rather reflexively about "us," the family, and the way we were then. Its relevance stems from stressing family continuity: it seems to be saying "Here is something we did together, even if you children do not remember it all." Revealing several sides of Abigail's younger personality, the story is particularly relevant for the child protagonist: it provides her with a sense of the continuity of the self, combined with the opportunity to reflect on her younger self as compared with her current self. The suggested key for reflection is a humorous one; the child is invited to join the others in laughing at her own shyness then, and the attraction that broke it. The text contains indicators that the story has been told previously. Abigail's first contribution to the narrative (*all the members of his side of the family*, T6) suggests familiarity with the tale, or at least parts of it. A later remark (*yeah in the RV I would go*, T24) can be taken either as her recollection of the events, or as her acceptance of her parents' version. The story is thus on its way to becoming a family fable.

Telling is carried by both parents, with a shift in appointed audiences. The father seems to be talking first to the Observer; but the mother deliberately shifts perspective, appointing Abigail, the heroine of the story, as primary audience (*you were so shy Abigail*, T16). Aaron, the older brother, takes the role of the challenger, doubting his mother's version (*She could read then?*, T17) – and once reassured, insisting on his sister's limitations ([*She*] *pretended to read*, T21). The mother aligns with her son by picking up the 3rd person reference to Abigail (*Well she had some books*, T18); then, treating the exchange with Aaron as a "side-sequence" (Jefferson 1972), she shifts back to addressing Abigail directly. Thus, although in different narrative roles, eventually all family members collaborate in constructing a narrative that may well become part of the family's fable repertoire.

In the Israeli narratives, by contrast, sharing the tale is no prerequisite for participation in the telling. Even when the specific events are strictly of the A-event, "only teller knows" type, in the family they are told against the background of shared sociocultural scripts which in turn provide occasions for nonexperiencer participation. Israeli dinner-table participants seem to take full advantage of their familiarity with such scripts. In 18% of the (non-dialogic) Israeli narrative events, singular tales get a polyphonic telling. In the American families, we detected only three such examples (4%). In the following narrative, the fact that the story concerns an A-event does not prevent other members from taking an active part in the construction of the story.

(21) *Saving a watermelon*: Israeli family 4. The family has two daughters (Ruti, 11, and Naomi, 8) and one son (Yaron, 4). The story follows an account of a car accident the mother was involved in the same day.

1	Father:	*ani etmol* [/] *ani etmol hicalti avatiax.*	I yesterday [/] I saved a watermelon yesterday.
2	Observer:	Oh [=! laughs]	
3	Naomi:	*ex* [/] *ex?*	How? How?
4	Ruti:	*ex hu hicil?*	How did he save it?
5	Father:	*atem to ta'aminu. ani nasati li # hayiti ba-boker # ze haya etmol # ken # hayiti hare etmol ba-boker ba-bank <lifnei hacaharayim.>* [>]	You won't believe it. I was driving, in the morning, it happened yesterday, yes, I was at the bank yesterday before noon.
6	Mother:	*<avatiax al ha-sakin.>* [>]	Watermelon by the knife. [an expression used by watermelon vendors]
7	Father:	*lo ze lo al ha-sakin. mazal.*	No, it's not by the knife. Lucky.
8	Observer:	*ani mekava she-lo <sikanta et acmexa>* [>]	[=! laughs] I hope you didn't endanger yourself [=! laughs]
9	Father:	*<ve-ani nosea li>* [<] *me-ha-super be-giva hacarfatit # ma at mekava?*	And I'm driving from the supermarket on French Hill # what do you expect?
10	Observer:	*she-lo sikanta et xayexa* + \	That you didn't risk your life
11	Father:	*kimat.*	almost.
12	Mother:	*oy va-avoy li.*	[=! exclamation]
13	Father:	*be-super lemata le-kivun ha-ramzor ve-pitom ani roe holexet sham isha im ezo yalda ve-pitom ve-eze sakit matxila lehitgalgel ba-morad # ve-he-yalda roca laruc <le-sham ve-coraxat>* [>] *ve-ha-ima maxzika ota.*	Near the Super in the direction of the traffic lights, and suddenly I see a woman walking with a child (female) and suddenly a bag starts rolling down the slope, and the child wants to run there and is yelling and her mother is holding her.
14	Observer:	*<ha-yalda* xx [<]	The child.
15	Father:	*az ba-hatxala lo raiti ma ze aval ze hitgalgel be-merec.*	So at the beginning I didn't see what it was but it rolled with great vigor; everybody is laughing.
16	Ruti:	*avatiax dafuk.*	Shitty watermelon

17	**Father:**	*raiti* [/] *raiti she-lo keday la'acor et ze im ha-oto, maher acarti et ha-oto ve-racti ve-hiclaxti litfos et ha-avatiax she-hitgalgel be-tox sakit # ve-lo kara lo shum davar # bari ve-shalem hexzarti oto le-zro'ot ha-yalda.*	I saw that it's not worth stopping it with the car, so I stopped the car quickly and ran, and managed to catch the watermelon that was rolling in the bag, and it came to no harm, I returned it safe and sound into the arms of the little girl.
18	Ruti:	+> <*ha-yalda ha-mityapaxat*>. [>]	The sobbing child.
19	Mother:	<*acarta et ha-mexonit*>>]<] [/] *acarta et ha-me* + \	You stopped the car, you stopped the +\
20	Father:	*avarti oto. acarti et ha-mexonit* + \	I passed it. I stopped the car.
21	Mother:	*acarta ve-yaradta me-ha-mexonit ve-hicalta et ha-avatiax?*	You braked, got out of the car and saved the watermelon?
22	Father:	*natati la avatiax ve-hicalti et xaye ha-mishpaxa sham.*	I gave her a watermelon and saved the life of the family there.
23	Mother:	*ve-ma amru lexa ha-mishpaxa ha-zot?*	And what did they say to you, this family?
24	Observer:	Oh [=! laughs]	
25	Father:	*"toda raba be'emet toda ve-shuv toda."*	"Thank you very much really and thanks again."
26	Mother:	*be-amerika ish lo haya ose et ze.*	In the States nobody would have done it.
27	Father:	*be-amerika avatixim ze masoret lehacil.*	In the States there is a tradition to save watermelons.
28	Mother:	*ze rak ba-arec* <*mishehu yored me-ha-mexonit.*> [>]	It's only here that somebody would get out of the car.
29	Father:	<*ma at medaberetxx*> [< >] *dvarim kaele* + . . .	What are you saying, things like this . . .
30	Ruti:	<*be-amerika yesh* xx xx xx>[<].	You have in the States.
31	Father:	*hem meod adivim ba-dvarim ha-ele.*	They are very polite in these things.
32	Observer:	*aval avatiax, im ha-yalda hayta raca la-avatiax az haya yaxol lihyot nora mesukan.*	But a watermelon, if the child would have chased the watermelon things might have become very dangerous.
33	Father:	*lo. hayta sham beaya. zot omeret ha-ba'aya shel ha-isha hayta o ha-avatiax o ha-yalda.*	No. There was a problem. I mean the woman's problem was either the watermelon or the child.
34	Mother:	*ve-hi hexlita ha-yalda* <*be-shlav dey mukdam*> [>].	And she decided for the child quite early on.
35	Father:	<*hi hexlita ha-yalda*>[<] # *aval ha-yalda hexlita avatiax.* END@	She decided (for) the child, but the child decided (for) the watermelon.

This story is offered as a humorous counterpoint to the preceding narrative by the mother, recounting her near escape from a car accident. The father embeds the upcoming story in the ongoing conversation by repeating the verb *save*

(in the previous story, *saved from the incident*) in the new and unexpected context of *saving a watermelon.* Unlike the Bug Story, the watermelon incident is based on events known to the teller only. Yet, in the Israeli family, participants take an active part in the performance from the onset. The high level of involvement (Tannen 1984, 1989) can be glimpsed by just scanning the names of the participants making comments during the event (wife, Observer, both older children) and by noticing the high proportion of overlapped talk.

The nature of audience participation changes with different phases of the narrative event. The event is composed of three phases: the opening (T1–13), which provides the abstract and the general setting (time and place); the main body of narrative (T14–18); and the discussion of its point (T19–35); cf. Polanyi 1989. In the opening phase (T1–13), audience response takes the form of what Tannen (1984:118) calls "cooperative prompting": both children display interest (T3–T4), the wife debates jokingly the kind of watermelon in question (T6), and the observer expresses empathy for the teller experiencer (T8).

The teller presents the main events of the story – including setting, complication, and resolution in Labovian terms – in turns T13, T15, T17. Audience response at this stage is diminished, recipients confining themselves mainly to backchanneling.

But once the happy ending becomes evident, the audience takes on a highly active part both in embellishing the story and in debating its point. In T18, Ruti uses a phrase borrowed from the language of written Hebrew fairy tales ('the sobbing child'), which serves to dramatize the scene of the story's denouement. The child's sobbing is implied in an earlier statement by the teller ('she is yelling', T13), but is never mentioned again. This evaluation of the tale is offered because it coheres with the rest, not because the speaker has first-hand or vicarious proof for it being "true."

The point of the narrative emerges in collaboration among several participants. In response to his wife's clarification question (T21), the teller reformulates the point of the story as concerning 'the saving of a family' rather than 'saving a watermelon' (T22). In the side-sequence that follows, wife and husband disagree about the plausibility of the event taking place anywhere but in Israel. The mother's attempt to explain the narrative's coda, in terms of cross-cultural variability as regards norms of politeness (T26, T28), is rejected by both father and daughter (T29, T30, T31). Note that the girl shows her alignment with her father's position by cooperatively overlapping talk (Tannen 1984:118) that actually completes the father's utterance (T30).

In T32–T35, the three adults return to the issue of the point of the story. By rephrasing the "true" nature of the complication as a case of real danger (T32), the Observer reinforces the transformation of the narrative's point, from being an entertaining anecdote about "saving a watermelon" to being a serious story about saving lives. The discussion foregrounds the status of the narrative as a moral construct (cf. Fisher 1987), giving it meaning through negotiating the nature of the moral dilemma at hand. Husband and wife collaborate in underscoring this new angle, by shifting perspectives (T34–35) to the viewpoint of the

woman with the child, for whom the problem was one of protecting her child rather than the watermelon.

This example shows that Israeli participants do not feel restrained by non-access to actual experience to claim authorship for the story. Though the fabula of the watermelon is derived from the personal experience of the teller, the other participants in the event take a highly active part in the story's construction, especially in negotiating its macrolevel point. The process culminates in a joint agreement as to the point of the story; this agreement, as well as the high degree of participation throughout, reveal a preference for a multivoiced mode of performance in this group. But collaboration goes beyond performance: through the process of becoming *fellow performers* in the telling, participants claim joint ownership of the tale. In other words, in monologic unshared event narratives, ownership rights are reconfirmed through the telling; but in the process of a joint performance of an (initially) unshared event, ownership rights may be generated performatively through the very act of participation in the telling.

These examples show that the two groups differ in attitudes toward the relationship between ownership and performance. Israeli families reveal a flexibility in regard to both dimensions; they strive toward joint ownership for all narratives. This trend is manifested by the high degree of participation in the telling of both personal narratives and shared family events. By partaking in the construction of the story, members of the Israeli family use narrative authorship (Shuman 1986:174–8), to make claims for joint narrative ownership.

In the Jewish-American families, however, participation in the telling seems preconditioned by joint access to the tale. Thus the recollection of shared family memories (the Family Reunion story) is accomplished with the help of several family members. But, in contrast with the Israelis, story authorship is highly valued. Hence we note a trend to allow for the display of individual story-telling skills even in cases where the tale is known to more than one participant (the Bug Story). For these families, authorship through performance is used to assert and/or achieve individual ownership.

Conclusions

I have grounded my analysis of family narrative events in the threefold framework of telling, tales, and tellers. The distinction between the first two dimensions is certainly not my discovery. Under different guises, it concerns students of both narratology (e.g. Genette 1980, Rimmon-Keenan 1983) and folklore (e.g. Bauman 1986, Briggs 1988, Young 1987). My inclusion of tellers within the same paradigm is meant to emphasize the social constitutive nature of oral story-telling – and within it, the role of individual selves (e.g. in the presentation of self as protagonist and/or performer) in relation to the other two realms.

This model permits us to isolate the shared and unshared properties of Jewish-American and Israeli family narrative events. We have found similar patterns with respect to multiple participation, the prevalence of personal experience stories, and a respect for children's story-telling rights. These patterns probably

derive as much from a common Eastern-European oral story-telling tradition as from narrative practices prevalent in middle-class families in the Western world. As documented by Kirshenblatt-Gimblett (1974:283), oral story-telling has been a cultural focus in Jewish society from time immemorial; it was frequent and important in traditional Eastern-European communities, it was egalitarian (everybody could tell), and was not limited to specific speech events. By contrast, features like the dialogic nature of many oral narratives (Polanyi 1989) or the deliberate involvement of children in story-telling (McCabe & Peterson 1991) characterize White North American mainstream practices.

However, the two groups also differ in many respects. The differences show up both in the ways of construing each of the three narrativity dimensions independently, and in the interplay between them. Access to telling is less available to Israeli than American children, but is more available to Israeli than American observers. Spatio-temporal framing of tales in the American families locates stories outside the home, but close in time; Israeli families favor stories more distant in time, but located in the home. While most narratives in both groups recount individually known events with self as protagonist, Israeli families are more likely than Americans to recount family-shared events that center around the family ("us") as protagonist.

In the transitions between the realm of conversation and the realm of telling, American families search for clear demarcation lines, occasionally ritualized, as in the "today" stories. The high-involvement style of Israeli story entry tends to blur the boundaries between the two realms. Israeli narrative events often begin and end in a highly polyphonic mode; while the opening phase establishes shared access to the tale, the closing phase focuses on negotiating a shared interpretation of the story's meaning, seamlessly moving back to the realm of conversation.

The relations of the tellers to the tales and/or telling is also perceived in culturally distinct ways. Americans support tellers by attending to individual telling rights, but Israelis tend to support tellers by attending to the tale. Access to story ownership in the American families is asserted through familiarity with the tale, but in the Israeli families it is also achievable through participation in the telling. As a result, monologic modes of telling in the American families extend to shared events, while telling of unshared events is celebrated by Israelis in the polyphonic mode. The proposition unique to the Americans seems to be "Let me tell our story"; for Israelis, it is "Let us (all) tell your (singular) story."

Yet all these families share an Eastern-European background. As such, all could be expected to manifest in narratives the high-involvement conversational style found by Tannen 1984 to typify Jewish New Yorkers from the same background. Spolsky & Walters (1985:64) argue that this high-involvement style has an analogy in Eastern-European learning styles of the Yeshiva, where participatory listenership and rapid turn-shifting "mark the discussion of equals." Another analogy is provided by styles of worship in the synagogue: the Eastern-European temple is seemingly chaotic, compared to the Asian or Western European, yet this "chaos" is governed by underlying ideological principles, which allow for a higher involvement on the part of the individual worshiper.

Ideology is also a strong motivating factor in understanding Israeli conversational style. As elaborated by Katriel 1986, the Israeli style emerged against the background of a strong ideological opposition to all things associated with Eastern-European diaspora traditions, including ways of speaking. On many dimensions of language use, the Israeli style has indeed been shown to break away from traditional modes (e.g. Blum-Kulka 1992, Katriel 1986). But simultaneously it seems to show strong traces of cultural continuity. We first noted this trend in the prolific use of affective nicknames and endearments, which echo in their suffixes Yiddish and Slavic sound patterns (Blum-Kulka & Katriel 1991). The study of family narrative events provides a second example. Compared to the Jewish-Americans, the Israelis are more involved in all aspects of narrative discourse, sharing both tellings and tales.

From this comparative perspective, the impact of Eastern-European traditions is less noticeable in the narrative discourse of Jewish-American families. In their case, it is American culture which seems to have played the formative role. Thus the emphasis on individual rights and self-accomplishment, seen in attitudes toward the telling, could be expected from sociological accounts of American society (e.g. Bellah et al. 1985). The ways that Jewish-American narratives differ from Israeli narratives echo American ways of speaking, although they may well differ in style from narratives in other American speech communities.

Notes

An earlier version of this article was presented at the Boston University Child Language Conference, October 1989. The research reported was funded by Grant no. 87–00167/1 from the Israel American Binational Science Foundation (BSF).

I am indebted to Leslie Polss, Naomi Mazoz, Talya Miron-Shatz, and Sigal Ravina, who participated in coding and analyzing the data. Special thanks are due to the participants at the 1990 summer Dubrovnik Inter-University Graduate Seminar on Cross-Cultural Pragmatics – especially Guy Aston, Juliane House, Gabi Kasper, Tamar Katriel, Susan Paulston, Catherine Snow, and Elda Weizman – for many insightful comments on the family narratives. I also thank Deborah Tannen, who graciously identified herself as the reviewer for the manuscript. Her comments were extremely helpful.

1. Other approaches to narrative stress the *socioculturally* constitutive role of narrative practices (Bauman 1986, J. Bruner 1986, E. Bruner & Gorfain 1984). As formulated by Bauman (p. 113), "narrative . . . is not merely a reflection of culture, or the external character of social institutions, or the cognitive arena for sorting out the logic of cultural codes, but is constitutive of social life."
2. I borrow the term from Bauman 1986, who follows Roman Jakobson in distinguishing the narrative context of the situation, namely the narrative event, from the story-world evoked through the telling, namely the events narrated.
3. See Young 1987, especially chapters 1–2, for a philosophically attuned discussion of the phenomenological framework for the analysis of the different narrative realms involved (in her terms *storyworlds* and *talewords*).
4. The families were selected by the snowball technique: all adults had to be college-educated, professionally employed, and native-born Israelis or Americans. The full

sample includes three groups: native-born Israelis, native-born Jewish-Americans, and native-born Jewish-American immigrants to Israel. Three dinner conversations were recorded (twice by audio and once by video) for each family, within a period of two to three months; all families (including children) participated in an ethnographic interview following the recordings. For further details on the project see Blum-Kulka 1990, Blum-Kulka & Katriel 1991, Blum-Kulka & Sheffer 1993, Blum-Kulka & Snow 1992, Olshtain & Blum-Kulka 1989.

5. The common practice in studies of children's narrative development is to insist on two consequent and causally or temporally related events (Labov & Waletzky 1967) as a minimal requirement for a segment of text to be considered a narrative. On one occasion, we used this definition to allow for comparability across data sets collected under different conditions (Blum-Kulka & Snow 1992). But we found the definition inadequate for capturing the richness of conversational narratives at dinner. From a young child's perspective, recounting a single past event during one short speaking-turn (not an "extended turn," as in conversation-analytical accounts of story-telling) may very well count as "telling a story." Operational definitions of what constitutes a narrative need to accommodate the type of discourse in which the narrative is embedded, as well as variation in participants' emic perspectives.
6. Goffman (1981:131–2) distinguishes official, ratified participants vs. unofficial (unintentional) *eavesdroppers* and (intentional) *over hearers.*
7. I use "reportability" here in the sense of Hymes (1981:82): the knowledge that competent members of a culture or community have as to what behavior is reportable in that community.
8. An interesting issue, beyond the scope of this article, is the gender differences between the parents, noted at the family dinner table, as related to possible gender differences in speech in the two respective societies at large.
9. Transcription follows the CHILDES system (MacWhinney 1991:122–5) as follows: < > overlap; [>] overlap follows; [<] overlap precedes; # short pause; [/] retracing without correction; [//] retracing with correction; +\ interrupted utterance; + . . . trailing off; + quick uptake; +, self-completion; ++ other-completion; [=! text] paralinguistic material; [%com] contextual information. Punctuation marks are used to mark utterance terminators. Some deviations from CHILDES were introduced: the use of capitals and quotation marks for reported speech, to ease reading; and the segmentation of the text by turns (the relevant units here), rather than utterances. Participants are identified by role (for adults) and by name (for children). Age and sex of child are given in parentheses, in that order: Andrew (8m) = Andrew, aged 8 years, male. Conversational features (e.g. interruptions and overlaps) are marked approximately on English translations from Hebrew. Leftward arrows to the right of the transcript point to the passages being discussed.
10. Examples of textual indicators for event type would be: *A funny thing happened to me today* (A-event); *Remember the time I walked you to school?* (A-B event); *Remember our last camping?* (F-event); *I was surprised by the results of the election* (O-event).
11. As Shuman (1986:31) notes: "One must have information in order to talk about something. However, people with the information are not necessarily entitled to tell what they know."
12. Included in this analysis were all narrative events from one meal of 10 American (five middle-class and five working-class) families and five Israeli middle-class families ($n = 73$).

Dialogue and Confrontation in Venezuelan Political Interaction

Adriana Bolívar

Introduction

The beginning of Venezuela's democratic political system in the modern sense is often associated with two major events: the end of Marcos Pérez Jiménez's dictatorship on 23rd January 1958, and the signing of what is known as the Punto Fijo Pact, which established the rules of participation in the democratic game the same year.

Between 1959 and 1998 most of the changes were the responsibility of two major parties, *Social Democrats (AD)* and *Christian Democrats (COPEI)* which, every five years, participated in elections that brought either one or the other to power (Bolívar, 1992). After 1998 a new party was added to the picture, *Movimiento Quinta República* (Fifth Republic Movement – MVR). This is now the party that controls Venezuelan's social, political and cultural life within the framework of an extreme polarization that separates followers and adversaries of President Hugo Chávez and his government, which began in 1999, seven years after Chávez had led a military coup. The reasons for this division can be found in political and economic factors in Venezuela's history, notably the predominance given to presidential styles that favor authoritarianism (Caballero, 2003, 2004) and the transformation from a primarily rural country to an oil-producing one in the third decade of the twentieth century.

Chávez's gaining of power in 1999 can be understood as a reaction of Venezuelan people against the traditional parties that had governed during 40 years based on personal authority rather than on true dialogue and participation (Bolívar & Kohn, 1999a, 1999b; Bolívar, 1999c, 2001c), as well as a serious

Source: *AILA Review* vol. 18, 2005, pp. 3–17

economic and moral crisis caused by poor administration and corruption (see Bolívar & Kohn, 1999a; Bolívar, 2001a).

My aim in this paper is to focus on some moments during Chavez's government before and after 11th April 2002, which is considered by many as the most conflictive period of the last few years and which sparked further conflict and violence in the struggle for political and economic power. My interest is to find out how violence and confrontation intensify in the course of an interaction in which participants initiate, respond and close communicative cycles around issues and topics that feed group confrontation. Also, I want to find out how different groups of people evaluate verbal aggression individually from their own experience.

I shall argue that in order to critically describe and interpret confrontation in political discourse we have to focus on the participants in the interaction with a view to assigning responsibilities and evaluating effects. One way of doing this is to keep a detailed record of events identifying the macro-exchanges that emerge in the interaction (Bolívar, 2001a). We can say that what we examine is conversation or dialogue at a higher level, in the macro-social text that can be described on the autonomous plane that concerns the recording of experience, and on the interactive plane that accounts for the relation between participants (Sinclair, 1981; Bolívar, 1986, 1994b; Hunston, 2001). My claim is that although both planes are simultaneous, the choices of meaning depend on the interactive plane. I have to acknowledge the influence of the British School of Linguistics, particularly Firth (1951), Halliday (1967, 1968, 1970, 1985), Sinclair & Coulthard (1975) and Hoey (1979, 1983), as well as the influence of research done by critical discourse analysts, mainly those within the framework of Hallidayan Linguistics (Fowler et al., 1979; Fairclough, 1989, 1992a; and Wodak, 2001).

The analysis I present here takes the viewpoint of the linguist who tries to explain how meanings are constructed in everyday interaction, but who is aware that the interpretation and explanation will always be an approximation to what actually happens because "the knowledge obtained by research is partial, situated (i.e. specific to particular situations and periods rather than universally applicable) and relative (i.e. related to the researcher's world view and value system)" (Taylor, 2001:12).

I adopted the critical discourse perspective after my first analyses of political dialogue (Bolívar, 1992) when I realized that the semantic and pragmatic levels were not enough to understand the dynamics of political interaction, or to understand sufficiently the forces that shape its dynamics. Critical discourse analysis (CDA) follows general principles that give ample opportunity to explain meaning and society (see van Dijk, 1993; Fairclough & Wodak, 1997), allowing us also to face the twofold commitment we have as researchers and humans who want to live in a better world (Bolívar, 1997).

While there is no unique method in CDA, method itself is very important in order to legitimize research in the field. This is why CDA analysts take great care to define their central theoretical notions and methods/procedures (see Meyer, 2001:14), just as all discourse analysts should do (see Wetherell et al., 2001). The [illegible] are socio-cognitive.

discourse-historical, dispositive analysis and mediated discourse analysis (see Wodak & Meyer, 2001); and although all of them have made important contributions, I have adopted the label Interactional Analysis as more accurately reflecting my own approach.

Theoretical Framework

The Definition of Context

Meaning is constructed in social context, and this makes *context* the category at the highest level, as studies for over thirty years prove (Duranti & Goodwin, 1997). We have to distinguish between the global context and the context of situation. We take it that the global context can be studied at the historical and cultural level. The definition of context of situation in Firthian terms serves our purposes because it embraces all the elements needed to carry out an analysis of dialogue and confrontation in political discourse or any other discourse. So we take into account the following elements (Firth, 1951:43):

A. the relevant features of the participants: persons and personalities
   1. the verbal action of the participants
   2. the non-verbal actions of the participants
B. the relevant objects
C. the effects of verbal action.

These categories allow us to describe language events and their effects, which may be verbal or non-verbal. Verbal effects may materialize in the production of verbal texts, but non-verbal effects may express themselves in other languages such as body language, or actions such as stone throwing, clapping, blowing whistles, hitting pots and pans in demonstrations, laughing, the use of colors (for instance, white for AD, green for COPEI, red for MVR) and other symbols. The interactions can combine sequences of verbal and non-verbal action in the construction of meaning. In the study of political interaction the context has to take into account the global context of history and culture in order to interpret the meanings constructed today, and it has to examine particular moments in the present to see how they fit in the social text that is created.

Evaluation as the Central Notion

I start from the assumption that discourse is fundamentally about evaluation and that we must try to make the connection between the evaluating activity in the world and the evaluation in text. Evaluation is studied in language by examining how interpersonal meanings are constructed, and by the systems of mood and modality in grammar (Halliday, 1994). Initially I studied evaluation as motivation for intratextual change in newspaper editorials (Bolívar, 1986, 1994a, 1994b, 1996a), but later I extended the notion to other genres and to the description of intertextual patterns and the di[illegible]

(Bolívar, 1999c, 2001a, 2001b, 2003a). My aim as a discourse analyst has been to show how evaluation, defined initially as the type of information that concerns the expression of feelings and opinions, finds its place and function in text by negotiation which has its origin in the real world of phenomena where the purposes for the interaction are determined (Bolívar, 2001e:131).

I believe that to be able to give an account of texts we have to study them in the context of events in the world, as Firth argued many years ago:

> In linguistics as in any other social science, we start with man's active participation in the world we are theorizing about. And we are all participants in those activities which linguistics sets out to study. Speaking, and listening, writing and reading, are simply accepted as meaningful in human life in society. In brief, linguistics accepts speech and language texts as related to the living, and therefore to the meaning of life, and applies its theory and practice as far as it is able, to the statement of meaning in strictly linguistic terms- that is by employing the restricted language of linguistics set in its own theoretical framework (Firth 1957, in Palmer 1968:169).

It is on the basis of these arguments that I would claim that linguistic and discourse categories can be extended in order to understand social processes, since "Our schematic constructs must be judged with reference to their combined power in dealing with linguistic events in the social process" (Firth, 1951:42).

The implications for the study of evaluation in discourse, then, are that, in the same way that we can study *exchanges* in conversation or *triads* in written texts (see Bolívar, 1986, 1994a, 1994b, 2001a), we can identify communicative cycles at a higher level in the flow of social events where we are constantly evaluating the actions of others, our own discourse and the discourse of others. I assume that in democratic political confrontation, the major responsibility for the interaction lies with the leaders who have been legitimized by vote to exercise power. These leaders are constantly being evaluated in terms of what they say and do, or don't do, so it is more likely that they will perform the role of initiators and that they will close cycles with major evaluations regarding what is good or bad, positive or negative, desirable or undesirable for their people and their country.

Corpus and Procedures

For the purpose of studying political confrontation, the above-mentioned points imply that we must collect a corpus of written and spoken texts during the course of events; we have to identify the issues and topics, but focusing primarily on the actors/participants who introduce them. The aim is to see who initiates and responds to interactions and who closes cycles with the voice of the "primary knower" (Berry, 1975) so that we can discover the types of patterns that emerge in the interaction. In this way, we can describe interactions between participants in the spoken dialogue (speaker, hearer) and participants in written text (writer-reader), and make way for other voices or participants in the texts, as represented

by the participants/actors in the real world. Focusing on the participants in events is more than a methodological decision, it is one that affects the collection of the texts and the interpretation and explanation of the context of culture and situation. The description focuses first on the macro-exchanges in which political actors (or those who assume such a role) confront, and then on the effects this confrontation has on those who act as observers or participate in it as citizens.

In order to analyze the macro-exchanges that emerge at particular moments in the interaction we follow the steps summarized below:

- A particular problem/conflict is chosen in order to observe how participants introduce changes in the situation.
- The events are followed in a sequential order starting with those participants who initiate a topic or conflict. The texts are collected in the chronological order in which they are produced.
- Macro and micro-exchanges are collected. For example, micro-exchanges in conversation or in the news and the macro-exchanges that emerge later in the political interaction. These are given a function in the sequence as Initiation (I), Follow (F) or Closing (C). We must be aware that an Initiation of one exchange might also work as the Closing of a previous one.
- Actions and topics are traced in chronological order.
- The effects in language and actions are described, with attention to the accompanying use of symbols (flags, whistles, banners).
- The linguistic resources and discourse strategies are examined with emphasis on the interpersonal value (mood and modality, (im)politeness).

The Participants in the Confrontation

The main participant in the confrontation since 1998 has been Hugo Chávez because he started a new period in Venezuela's political history. Although from the outset his style was reminiscent in some ways of previous populist presidents like Betancourt (see Madriz, 2000) and Pérez in his second government (Bolívar, 2001c), there was a striking difference in terms of the high level of verbal aggression in Chavez's electoral campaign, with a slogan threatening 'to fry the heads of Adecos' in oil, which harked back to the Federal War in the middle of the nineteenth century. In this campaign he proposed radical change and a return to the values of the past to rescue the Republic. In the face of 'decay' and 'death', he proposed 'reconstruction' and 'rebirth' (Molero de Cabeza, 1999). He broke the rules of protocol from the very day he took office (2nd February, 1999) by modifying the oath pronounced by his predecessors: "I swear to God, to my Motherland, to my People, on this moribund Constitution, that I will encourage the necessary democratic transformations for the Republic to have a new Magna Carta suited to the new times. I swear it." (*Alocuciones presidenciales*, 1999, my translation) (see Bolívar, 2001c). The reference to this moribund constitution broke the pragmatic rules of quantity, quality and manner (Grice, 1975), but it emphasized the relevance of his promises in the electoral campaign. Since then, Venezuelans have witnessed many changes: a new Constitution [illegible]

Chavez term to six years and allows him to be reelected, a new name for the country, *República Bolivariana de Venezuela* (Bolivarian Republic of Venezuela), a National Assembly instead of a Congress, a new power structure that has added Moral Power and Citizens Power to the branches of government, and new laws, among them the recently approved Law of Social Responsibility of the Media. Also, there is a new internal composition of the Supreme Court of Justice (comprising predominantly government supporters), which gives Chávez more control of power than any other president before him.

From 1999, President Chávez and those close to him have privileged a threatening rhetoric and impoliteness (threats, insults, discrediting nicknames, war metaphors, accusations) which in many ways have contributed to create and reinforce polarization (see Montero, 2003; Bolívar, 2001b, 2002a, 2002b, 2005a, 2005b, and forthcoming); Bolívar et al., 2003). The results of a rhetorical analysis of 2,480 front pages of national newspapers between 1999 and 2002 (Montero, 2003) serve as evidence that the attitude of the opposition went first through a phase of perplexity and astonishment, to another of implicit or moderate protest that introduced *cacerolazos* (the noise made by banging pots and pans), and finally to one of explicit response with increasing verbal aggression against the President and criticism of the government (see Lozada, 2003).

At the end of 2001 insults were combined with actions in the streets: demonstrations, *cacerolazos* by the opposition, fireworks by Officialists (the name given to government followers) and physical attacks on Opposition demonstrators. The violence reached its climax on the 11th of April 2002 when more than a million demonstrators took the streets asking for Chavez's resignation. During this demonstration 19 people were shot dead by snipers. Venezuelans witnessed that and the reading of Chavez's resignation on television by General Lucas Rincón. Chávez was out of power for 48 hours, during which time Pedro Carmona Estanga was appointed president. In his brief government, Carmona Estanga decreed the dissolution of powers and rescued the country's name, changing it back to Venezuela. Apparently the military changed its mind, and Chávez was reinstalled. What actually happened in those 48 hours (12th and 13th of April) remains uncertain (see Lafuente & Meza, 2004). The confrontation continued in 2002, and is still present, with Chávez's followers defending their leader's revolution and his adversaries insisting on the loss of legitimacy of the government because the democracy was being forced into a revolution people did not vote for in 1998.

The opposition is now weakened by Chavez's success in the 2004 referendum that will keep him in office until 2006, despite all the accusations of fraud, his presumed contact with Colombian guerrillas and his alliance with Fidel Castro. The political confrontation has involved the participation of the media, the Catholic Church, the political parties that oppose him (from both right and left wings), the Confederation of Workers (CTV), the Confederation of Trade and Commerce, the National Oil Company, private schools and the universities. The verbal confrontation has even gone beyond the national borders to include President George Bush and some of his collaborators.

The Patterns of Interaction

We only have room to briefly cover some aspects of the confrontation with the media. We have identified several general patterns of interaction that, apparently, show how polarization and violence worked before and after 11th April 2002. The media were the target of the president from the beginnings of his term, especially in his radio and television program *Aló Presidente*, which lasts an average of five hours every Sunday. Indeed, in program number 100 on 17th March, 2002, Chávez claimed that the program was created because the media would not allow them to work (see Bolívar, 2003b, 2005a). For their part, newspapers and television channels have criticized Chávez harshly for his personalism and militarism (Bolívar, 2001c, 2001d, 2005b). In the confrontation with the media, two patterns were found, one that involves physical aggression before April 11th 2002, and another that shows how alignment against the government grew after this date.

Macro-exchange 1: between the President and journalists (from March 2000 to January 2001 – see Bolívar, 2001b).

Initiation: The president exhorts the military to fight for the truth and insults the media (he calls them "all-time deceivers" (*El Nacional*, 24 March, 2000, front page)).

Follow (1): Journalists respond with a demonstration demanding freedom of expression and verbal reaction, returning the insult by calling Chávez *gallina* (chicken) by way of a reminder of the failure of his attempted military coup in 1992 (*El Universal*, May 2, 2000, p. 1–10).

Follow (2): Chávez's followers insult the demonstrators ("You are enemies of the people, You only tell lies, Chavez tells the truth, Out with Journalists! Out!") and attack journalists physically ("Journalist Eugenio Martínez was hit in the face with the Sunday edition of *El Universal*. Most media vehicles were the target of stones and blows" – *El Universal*, 2000, front page).

Closing: Journalists accuse Chávez of provoking and repressing journalists and of putting their lives at risk (*El Nacional*, 5 May, 2000, D/2)

Macro-exchange 2: between humorists and the President (between 20th and 30th October, 2002)

Initiation: Humourist Pedro León Zapata criticizes Chavez' militarism in a caricature (*A mí la sociedad civil me gusta firme y a discreción* – I like Civil Society standing to attention and ready to obey orders – *El Nacional*, 20 October, 2000).

Follow (1): President Chávez responds on the same day from Margarita Island, late at night on a national broadcast, *Pedro León, ¿cuánto te pagan por eso?* (Pedro León: how much are they paying you for that?). It should be noted that Zapata's caricatures have been critical of all Venezuelan governments before Chavez.

Follow (2): Humorists from four widely read national newspapers publish caricatures making reference to Zapata's text and picture (e.g. a sword imitating Chavez's face). They all implicitly refer to militarism and condemn the President's insult.

Closing: Zapata publishes a new caricature using the same words pronounced by the President, ironically thanking him for the free promotion: *y hablando como los locos, Hugo Rafael: ¿cuánto te pagó Zapata por ese propagandón?* (And since we're talking nonsense, Hugo Rafael, how much did Zapata pay you for all this advertising? – *El Nacional*, 30 October 2000).

The National Union of Journalists publishes a communiqué that gathers all the caricatures in one text headed *Al Maestro con cariño. . .* (To Master Zapata with love . . . – *El Nacional*, 5 November 2000, D/7) in a gesture of solidarity by all Venezuelan journalists and artists.

In 2002, in the absence of the traditional parties that had been discredited by Chavez, the media took the lead as political actors and were largely responsible for organizing demonstrations against the government. This is evidenced by the way in which the private television channel *Globovisión* (Global Vision) was nicknamed *Plomo Visión* (Bullet Vision) by the President, and *Globoterror* (Global Terror) by his followers. *Venevisión*, another private channel, became *Venenovision* (Poisoned Vision). More than 200 journalists, several newspapers and television channels (29 in all) received some kind of aggression in 2002, from damage to equipment to bomb explosions (*El Nacional*, 3 January 2003 p. A/1–2).

Between December 2002 and February 2003, the country was involved in one of the longest strikes in its history, called by the Federation of Workers (CTV). The National Oil Industry condemned Chávez's attempts to politicize the industry and put it in the hands of a new Board of Directors integrated by government supporters. The Opposition condemned the increasing violence, Fidel Castro's influence on Venezuela's decisions, the failure of the government's social and economic programs and Chávez's reluctance to accept a recall referendum.

During the strike a new pattern emerged, which included verbal aggression as well as violence, and which involved the issue of cultural values. This was initiated by General Acosta Carles who, following orders given by the President. broke into the warehouses of *Coca Cola* and national brewery *Polar* in Carabobo State to confiscate the products with the intention of giving them to the people affected by the strike.

Macro-exchange 3: between the military (General Carles), the people, and the President (between 17th January 2002 and 11th February 2003)

In this macro-exchange two non-verbal actions were evaluated by Venezuelans: (a women demonstrators were beaten to the floor by the soldiers accompanying the general and by the General himself; (b) the General (G) belched in front of the television cameras when a woman journalist (J) from *Globovisión* tried to interview him. Burping in public is considered impolite in Venezuelan culture, so this generated evaluations from all sectors in society.

Initiation (the violence and a micro-exchange on television):

J: General, today was the deadline of 48 hours given by *Indecu* (the government's consumer protection body) to the company to. . .

G: (belches, holding a can of *Malta*, a soft drink) Excuse me, excuse me miss (belches again)

J: Isn't that rude?
G: No, no, you know it was instinctive, right? And it came out because this has a lot of gas, and it was hot, right?
J: Excuse me General, today was the deadline that Indecu had given the company to distribute the products . . .
G: . . . do you remember this baseball player who did that, he has a refreshment and he goes (belches)
J: This is a serious job and I am asking you a serious question, General . . . in relation to . . .

Follow (1):

The newspapers report the event and reject both the violence and the belching as grotesque. They also imply that the action was robbery rather than confiscation (*El Universal*, p.1 *El Nacional*, p. 2–4, 18, January, 2003).

Follow (2):

The General is accused of dishonoring the uniform and he is reminded of the military code of ethics (*El Universal*, 18, January, 2003, p.2–4).

Follow (3):

Demonstrators take to the streets to condemn the abuse of power, the violence and the belching. The main slogan reads *Ni un eructo más* (No more belches), which can be interpreted as the condemnation of sexism and *machismo* as well as violence and abuse of power (*El Universal*, 19 January, 2003 p. 1–2)

Follow (4):

National Guards demand the removal of General Carles (*El Nacional*, 21 January, 2003, p.1)

Follow (5):

Chavistas (Chavez's followers) attack demonstrators in El Tuy ("Chavist ambush", *El Nacional*, 21 January, 2003, p.1)

Follow (6):

A Zapata caricature makes fun of the cultural revolution (*El Nacional*, 22 January, 2003).

Follow (7):

Lawyers claim that Carles's visit to the *Coca Cola* and *Polar* premises was illegal. (El *Universal*, 22 January, 2003, p. 1–4).

Closing: President Chávez ratifies the General in his position during a demonstration organized by the government on 23rd January 2003, to celebrate the anniversary of the 1958 uprising. Chávez's followers sing *Carles Carles erúctales otra vez* (Carles, Carles, burp again), thus approving what the Opposition evaluated as grotesque. No apologies were made for the General's conduct.

On February 11th 2003 the general was decorated by the President for being a General and for his patriotic services during the strike (*El Nacional*, 11 February, 2003, p. A/3). A graffiti accompanied this decision: *Acosta Carles General del Pueblo* (The people's General).

The strategic use of the President's threatening language after terrorist attacks was highlighted by the media in headlines and editorials (*Verbobomba* – Bomb-verb. *Tal Cual*, 25 February 2003: *El lenguaje del Presidente*

violencia – The President's language commands and legitimizes violence, *El Nacional*, 2 March 2003, front page). These were tense and uncertain moments for all Venezuelans since both sides were accusing each other for the violent attacks.

The opposition nicknamed the General "General Belch", and insulted and harassed him in protest against his behavior. On 23rd January 2004 the General was appointed main speaker in the National Assembly on the occasion of the anniversary of the 1958 uprising, a Bolivarian School was named after him (number 3,200 in San Juan de Los Morros, 6th May 2004). Acosta Carles is now Governor of Carabobo, one of the most important states in Venezuela.

The Effects of Confrontation

The effects in the minds and self-esteem of Venezuelan citizens are worth reporting. In a study that involved 50 persons from my own university (students, colleagues and workers) who were asked to write down a list of the insults they recalled in exchanges between the Government and the Opposition (Bolívar, 2002a, 2003a), it was found that 263 different words had been evaluated as insulting. Women and men in this group (Group 1) tended to evaluate differently but they all agreed on a few words which indicated their perceived values and attitudes in terms of affect, judgment and appreciation (see Martin and Rose, 2003: 15). The insults attributed to the Opposition against the Government (in decreasing order of strength) were about: (a) moral judgment: 'assassins' (everybody), 'assassin' (Chávez), 'corrupt', 'thieves', 'liars', (b) appreciation of social value: 'shanty-towners' (*marginales*), 'scum', 'mobs', 'hordes', (c) appreciation of political value: 'communists', 'Bolivarians', 'dictator', 'Chavist'; (d) appreciation of mental and intellectual value: 'loony', 'nut', 'dumb' (all against Chávez); (d) appraising feeling: 'resentful' (*resentidos*).

As for insults attributed to the Government against the Opposition we found: (a) moral judgment: 'rotten in-groups' (*cúpulas podridas*, to refer to AD and COPEI), 'conspirators', 'fascist', 'traitors', 'liars', 'unpatriotic', 'corrupt', 'thieves'; (b) appreciation of political value: 'adecos' (AD people), 'anti-Chávez', *golpistas*, (involved in a coup d' êtat); (c) appreciation of social value: 'squalids' (*escuálidos*) and 'oligarchs' (to mean high class or privileged); and (d) appraisal of feeling: 'in anguish' (*afligidos*).

In another study, still in progress, to evaluate the insulting repertoire after the referendum, three more groups have been interviewed (100 persons): Group 2, from *Universidad Experimental Libertador* (UPEL-Maracay), Group 3 from the recently created *Universidad Bolivariana*, and Group 4, from *Universidad Central de Venezuela* in Caracas. It has been found that women and men remember a large number of oneword insults and a wide variety of complex expressions (721 in all). The most revealing point is that the words agreed upon by women and men in these three groups are fewer but consistently the same. Only three words are recalled by both women and men in their attributions to the Opposition against the Government: 'assassins', 'thieves' and 'communists', which indicate moral judgment and political appreciation. Four words stand out in the attributions

to the Government against the Opposition: 'squalids' (*escuálidos), golpistas*, 'oligarchs' and 'fascists', which indicate appreciation of social and political value.

Many new offensive expressions appeared after December 2004. Of these, the three groups agree on three words that are attributed to the Opposition against the Government: *malandros* (scoundrels), 'ignorant' and 'illiterate'. Other words mentioned, but without agreement among women and men, are: 'monkeys', 'blacks', 'Indians', 'gorillas', 'homosexuals', 'dirty' and 'revolutionaries', all expressing negative appreciation of the people who follow Chávez, who is referred to as a 'tyrant'. Two words are remembered by all the women and men in Groups 2 and 4 in their attributions to the Government against the Opposition: 'terrorists' and 'assassins'. In group 3, however, the attributions are different. What women and men recall is *plastas* (pieces of shit) and *pendejos* (schmuck).

When we examine the textual value of these words, we realize that most of those that women and men remember form part of a cohesive link with words introduced by the President (*escuálidos, oligarcas, fascistas, golpistas, plasta, pendejo*) (see Bolívar, 2003a for the use of *plasta*). Also, most words attributed to the Opposition have been used by Opposition leaders, the media and the people in demonstrations. What strikes our attention is that the group that might be closer to Chávez, because they study at the university created by the President, perceive more insults that lower their self-esteem (blacks, Indians, monkeys, ignorant). After December 2004, racism and sexism seem to have deepened as well as despise for the other – and a hatred that can only be harmful for everybody.

Conclusions

In 1999, before Chávez became President of Venezuela, we were concerned about the lack of dialogue and participation in our democracy (Bolívar & Kohn, 1999b, Bolívar, 2001d). Now the concern has become alarm because, in the political confrontation, violence and death have found a place. The analysis presented here has shown how, in ongoing interaction, actions and words are evaluated by the participants, and how meanings are created in the course of events where verbal and non-verbal actions combine. We have also seen that words have effects on people's minds and feelings because offensive words only serve to feed the confrontation and hate. Although I claim that, in discourse, initiations are important to identify those who start conflictive macro-exchanges, I believe that in everyday life, the responsibility rests on us all because, as citizens, we must preserve respect for the other and enrich cooperation and understanding. However, the major responsibility lies with those who have been legitimized in power by the vote, and who must not forget their commitment to govern for everybody, bearing in mind that in the long run cooperation and persuasion work better than stressing the differences, threatening, and using fear to reach political goals. Having seen how hate language works in practice it is mandatory to reinforce peace language for the sake of the country and all those involved in the confrontation.

Personal Web Pages and the Semiotic Construction of Academic Identities

Carmen Rosa Caldas-Coulthard

1. Introduction

Visual communication is central to the information society and to the practices of Late Modernity. Pictures, photos, illustrations are everywhere – they permeate our academic work, everyday lives, and activities. It is common nowadays to refer to brand images, corporate images, national images, and self-images. These are interwoven with our professional and personal identities, and they are signposts to lifestyles, cultures, and societies.

In his seminal book *Ways of Seeing*, John Berger (1972: 7) points out that:

> Seeing comes before words – the child looks and recognizes before it can speak. But there is also another sense in which seeing comes before words. It is seeing which established our place in the surrounding world. We explain that world with words, but words can never undo the fact that we are surrounded by it. The relation between what we see and what we know is never settled. The way we see things is affected by what we know or what we believe.
> To look is an act of choice.

Scollon & Scollon (2003b) suggest that humanity has undergone at least four 'ages' in its development: the *oral*, the *literate*, the *imagistic*, and currently, the *information* age. For them, oral societies were constructed through oral narratives; literate societies, through the standardisation of genres and documentation (essays, plans, forms, scripts, charts, tables, etc.); while the still-current imagistic

Source: C. R. Caldas-Coulthard and M. Toolan (eds) ...

society constructs itself through the moving picture – the camera, the analogue and the digital video. The information society, by contrast, is constructed through the digital pathway that makes its meaning through the combination of many semiotic resources. We take this for granted. Meaning-making is dependent on the interplay of different resources, and these surround us in our everyday life. New technologies, especially the Internet and the World Wide Web, are pushing forward, almost daily, new communication strategies and people interact through these new resources.

According to NUA (a resource for Internet statistics run by *INQUIRA*, NUA internet surveys – http://www/nua.com/surveys), an exact estimation of how many people are online throughout the world is not possible. However, they say, there are many surveys that use different measurement parameters and from observing many of the published surveys over the last two years, they claim that up to September 2002, approximately 605.6 million people had online access worldwide.

Just one year later, Global Reach (Global Internet Statistics by Language – www.glreach.com) gives us the following results:

Online Language Populations Total: 649 Million (March 2003)

Language	*Percentage*
Dutch	1.9
Russian	2.7
Portuguese	2.8
French	3.3
Italian	3.6
Korean	4.2
German	6.5
Spanish	8.1
Japanese	10.3
Chinese	11.9
English	35.2

The sheer numbers of people using virtual communication and the affordances of the new media are producing a visual revolution, in which everything from the structure of books to the layout of pages, distribution of images such as photographs, illustrations or digital backgrounds, and the use of typography and colour are brought to bear on conveying specific meanings. Representation, modality and multimodality therefore enter into the very constitution of things since an object's or idea's meaning is shaped by the very process of representing it by way of language or images or other semiotic resources.

Representation for Hall (1997: 61) is the process by which members of a culture use signs to produce meaning – 'things, objects, people or events do not have in themselves any fixed, final or true meaning. It is us, in society, who makes things mean, who signify'.

> Representation, as a cultural process, establishes individual and collective identities, and symbolic systems provide possible answers to the questions: who am I? what could I be? who do I want to be? (Woodward 1997: 14).

Modality is the concept used by communication specialists to talk about different modes or codes of communication – speaking, writing, using images, gestures, sounds, colour, drawings, etc. to communicate a specific message.

Multimodality (Kress & van Leeuwen 2001: 20), the concept used by semioticians and discourse analysts, on the other hand, is 'the use of several semiotic modes in the design of a semiotic product or event'. Modes are resources for making meaning. The same meaning, in any cultural domain, can be expressed in different semiotic modes – (music can encode action, images can encode emotion). We would miss out important aspects of a film without considering the role of music in the ongoing narrative, for example, or of a magazine without interpreting its pictures and illustrations. Therefore, for Kress and van Leeuwen, the particular ways that modes are combined (they may, for instance, reinforce or complement each other) will determined the ways we receive and interpret a message. The authors claim that all semiotic products and events are communicative since they undergo processes of articulation, interpretation, and ultimately, use and action.

An important point to make is that *all messages are multimodal* since all messages make use of multiple modes. Web pages are archetypal examples of multimodal messages. Web authors use many semiotic resources in their pages to communicate their identities – the language used, the photos, the colours,[1] the objects chosen and displayed, all signify symbolically different aspects of their identities.

Multimodal analysis therefore is crucial for understanding and interpreting the world. Our tendency so far as linguists, however, has been to privilege written and spoken texts above all other modes, and to consider objects, actions, and people as simply making up 'the environment in which the text comes to life', as Halliday (1978: 25) suggests.

The internet and the World Wide Web have changed our views dramatically. As Kress & van Leeuwen (2001) have pointed out, the desire for crossing boundaries inspired 20th-century semioticians to develop new theoretical frameworks that are applicable to all semiotic modes.

In this chapter, therefore, I will examine academics' personal Web pages in order to consider the multimodal discursive strategies used by Web page creators to present themselves in terms of:

1. the narrativisation of their lives;
2. the multimodal choices that help to create a particular identity.

I will also want to point out the implications of this kind of one-sided interaction for discourse analysis – the Web-page addresser sends a message not to an implied audience but to anybody out there in the world who happens to open her or his page. The strategies used to address an unspecified audience

My interest here is in looking specifically at how participants in this new genre recontextualise (Bernstein 1981), in the public sphere, a fictionalised representation of themselves. Through what seems to be a light and inconsequential 'message in a bottle' to the world, social activity is presented, evaluated, and possibly new norms of behaviour are being created.

2. Personal Web Pages – The Personal in the Public Sphere – Real or Fictional Story Telling?

On a day of internet surfing, I came across a page, http://www.cs.bham.ac.uk/~axs/#who, by one of the members of the University of Birmingham staff, a computational scientist named Aaron. At first sight, this was an academic page, giving the internet surfer information about the professor's career, his publications, courses given, etc. However, there was a link to family issues, which I pursued. This hyperlink seduced me in many ways, especially for the force of the narration. For many minutes, I followed attentively the story being told. This was the 'real', not fictional, story of a young man who died of cancer, Ben, retold by his father, the professor. I saw Ben's wedding photos, then the events of his illness, and finally, the events surrounding his death at 34 years of age.

Many different semiotic resources were posted on this Web page – photos of different occasions of the family life, a map of the cemetery where Ben was buried, the speech delivered by his young wife during his funeral, a poem read by a friend, etc. I was very touched by the telling, so much so that I wrote to Aaron, who then wrote back to me and sent my message to Ben's wife, who then wrote back to me. There has never been any face-to-face interaction with the participants of this virtual exchange. This experience prompted me to look more closely at the question of personalisation of the public space of the University. My data for this paper are therefore restricted to academic Web pages. especially those of the University of Birmingham – pages of teaching staff, postgraduate students, and some technicians.

Academic pages should be in principle public statements, but as Aaron's page demonstrates, academics tend to use the public site to include their private sphere in this kind of communication. Hence, my interest in investigating more the question of how the personal intrudes in the public world of academia and the multimodal resources used by 'webbers' to achieve their goals. (According to a new report from www.nua.com – Internet Surveys by Category. by January 2000, 19 million U. S. internet users, or 29 percent of the total number of users, have personalised Web pages, and 88 percent of users believe that personalisation is the best way for companies to learn about consumers.)

The University of Birmingham index of individual Web pages linked to departments listed, in April 2002, a total of 425 of which only 23 belonged to female academics. This seems surprising since I would expect that many more women were actively involved in communicating virtually. Unfortunately. this is not the case. Not surprisingly, scientists, especially engineers, produce the majority of pages. The arts academics tend to be much more parsimonious

Before I start examining some examples of Web pages, I want to consider briefly the question of computer mediation as communication and the question of recontextualisation.

3. Computer Mediation as Communication, Narration, and the Construction of Identities

Over the past ten years, as Rodney Jones (2002) has pointed out, many areas of investigation, especially in sociology, anthropology, linguistics, cultural and communication studies became interested in Computer-Mediated Communication (CMC). The internet and the World Wide Web are producing new forms of interaction, both in the business and personal spheres as well as new forms of social organisation. New discursive practices have therefore been developed. Jones points out that different professionals like linguists and communication scholars concentrate on linguistic features (registers and genres), sociologists and anthropologists are interested in the development of online 'communities and cultures', while psychologists focus on the cognitive aspects of computer-mediated communication. Jones continues (2002: 3) that although there are many perspectives on CMC,

> the kinds of data that are gathered to answer these varied questions are remarkably limited. Nearly all of the studies look for answers to their questions in the words typed on the screen. Data typically take the form of downloaded 'logs' of computer chat sessions or corpora of emails or Usenet postings, and analysis is generally confined to those words. Interactions are assumed to exist in a kind of virtual vacuum, identities are hardly ever linked to the lives of the people producing the words, and communities and cultures are generally seen to stop at the screen's edge.

The main problem with looking at computer-mediated communication in this way, he suggests, is that it ignores the importance of online behaviour as well as the importance of semiotic meanings.

Another problem with such studies, Jones (2002: 3) suggests, is that they tend to focus on the *mediational means* (Scollon 1998) 'at the expense of looking at the kinds of actions that are taken, leading them into a kind of technological determinism in which actions are interpreted only as "effects" of the media'. For mediational discourse analysts (Wertsch 1991; Scollon 1998, 2001; Scollon & Scollon 2003a, 2003b), the main focus of interest is on the complex and indirect connections between discourse and action – they propose the notion that social identities and practices are not only realised in texts since what goes on in social interaction is much more complex:

> A *mediated action* is defined as a social action taken with

> mediated actions, it being definitional that 'social' *means* socially mediated. The principal mediational means (or cultural tool) of interest is language or discourse, but the concept includes all objects in the material world including other social actors. Within MDA [Mediated Discourse Analysis] there is no action (agency) without some mediational means (i.e., the semiotic/material means of communicating the action) and there is no mediational means without a social actor (agency). (Scollon & Scollon 2003b: http://www. gutenbergdump.net, valid in April 2002[2])

If action is ignored in CMC then, researchers are examining culture *in the cultural tools* (Wertsch 1991) instead of examining culture through its relationships with action, agents, and tools.

The problem with the concentration purely on 'mediational means', as Jones (2002) demonstrates very well in his research on Chinese learners of English using *ICQ*, a chat and instant messaging software, is that often what is sought by users *of ICQ* and other interfaces of this type is not 'communication' at all, but rather 'connectivity', 'social presence', or 'play'. My computer conversations with Aaron exemplify this point. We were connected somehow.

In order to overcome these limitations, I want to propose, based on Jones' research, another way of approaching my Web pages, one which focuses not just on the texts people produce when they are sitting in front of their screens, but on the multimodal resources used to construct identities which the new media now make possible. These identities are inevitably connected to the world outside the computer screen.

By representing themselves in particular ways, a narrator 'gives off', to use Goffman's terms (1959), personal clues about the social role performances he or she is making and this representation indexes these invisible psychological or social cultural states.

Of this vast brave new world, I will concentrate on the question of how identities are presented through multimodal aspects. These are the questions:

- Are my webbers constructed as 'characters' or 'idealisations' differing from the actual person behind the keyboard? (For example, the 2003 case of an American GI who, pretending to be 19 years old, engaged through a chat room with a supposed 19-year-old English girl – he was 30 years old and she was 12 years old. He was then prosecuted for a criminal offence.)
- Alternatively, are they 'hybrid extensions' of their offline identities?

For the most part, I want to claim, online identities are not purely reflections of offline identities or complete reconstructions, but recontextualisations. convenient hybrids of both processes whose uses often have as much to do with what is happening in the offline social life of users as their online social life.

3.1. Webbers' Identities and the Question of Recontextualisation

The discourse of personal Web pages is a discourse about social practices which takes place outside the context of that practice and within the context of another

one – the virtual context. The process of including one social practice into another is a *recontextualisation*, or

> ...a sequence of communicative activities which make the social practices explicit to a greater or lesser degree. Social practices are things that people do, with greater or lesser degree of freedom, fixed by custom or prescription, or some mixture of these two. (van Leeuwen 1993: 30)

Texts and images are representations of given practices, not the practices themselves. As soon as one writes or speaks about any social practice, one is already recontextualising. The moment we recontextualise, we are transforming and creating other practices.

Web pages are recontextualisations that not only represent social practices, they also have to explain and legitimate – in other words, they have to make explicit the 'why' of their representations.

In the corporate world of today's universities, there is a pressure on academics to communicate values, to advertise and 'sell' themselves. They have to recontextualise their self-identities in order to do this.

Giddens (1991) says that in postmodern societies self-identity becomes a reflexive project – an effort that we constantly work and reflect on. We produce and revise a set of biographical stories – the telling of who we are, and how we came to be where we are now.

> Self-identity, then, is not a set of traits or observable characteristics. It is a person's own reflexive understanding of their biography. Self-identity has continuity – that is, it cannot easily be completely changed at will – but that continuity is only a product of the person's reflexive beliefs about their own biography. (Giddens 1991: 53)
>
> A person's identity is not to be found in behaviour, nor – important though this is – in the reactions of others, but in the capacity *to keep a particular narrative going*. The individual's biography, if she is to maintain regular interaction with others in the day-to-day world, cannot be wholly fictive. It must continually integrate events which occur in the external world, and sort them into the ongoing 'story' about the self. (Giddens 1991: 54)

For Giddens, then, the self is not something we are born with and it is not fixed. The self is reflexively made, constructed by the individual (Gauntlett 2002):

> What to do, how to act, whom to be?
>
> These are focal questions for everyone living in circumstances of late modernity – the ones which on some level or another, all of us answer, either discursively or through day-to-day social behaviour. (Giddens 1991: 70)

However, as Lemke (http://www-personal.umich.edu/~jaylemke) points out identity construction is also a verbal

beliefs, and values). People participate in activities through interactions and practices, and this participation, he argues,

> constitutes and shapes a) identity choice, b) identity display, and c) identity construction. Identity is thus a positioning of self or other in a system of meaning-relations and in a network of material practices, including a system of power relations..., and discourse in general serves to construct identity and positioning with respect to this system of meanings.

What webbers do when they create their personal pages is to choose a set of self-characteristics that are important for them (life moments and achievements, relations, places and moments) and construe a persona. From the multitude of identities that academic users have available to them, I will discuss next two main kinds of identity formation in virtual recontextualisations: narrators and characters.

3.2. Narrators as Extensions of Self and as Characters

For the psychologist Kohut (1971), according to Barry O'Connor (in www.selfpsychology.com), a sense of 'self' is

> a fundamental aspect of our life experience, and integrated with the totality of our life. It not only encompasses who and what 'I am', at critical stages of our growth, but in addition it is the totality of the inner workings of our true-self. One could say, that within the development experience of the human, which I would argue lasts our entire lives. There are certain 'way points' that need to be arrived at in terms of realizing 'self-potential'. Significant others are an essential aspect of our self development.
>
> This of course commences at the very earliest stages of our existence with the critical relationship with our mother, and with this the influence of our father on both mother and ourselves. This is further complicated in the modern environment with the diminishment of the nuclear family, and the re-designation of what comprises a family, with or without societal support.

The principal description of the 'self', in my data, follows the pure and minimal forms of identity representation:

- I exist.
- Here I am.
- My name is so and so.
- I come from such a place.
- This is my family.
- Personal Web Pages
- These are my things.
- These are my interests.

Consider these examples (given the space constraints, I will illustrate with only a few pages):

Welcome to the

Who Am I?
I am just a normal (?) British bloke who happens to be called Rob Branston, but I have nothing to do with the famous Branston Pickle. Now I have that sorted out and just on the off chance that the odd person is continuing to have a look, I will tell the rest of you a bit more about me. I am a 24-year-old Economist, researching for a PhD in Industrial Economics at the University of Birmingham in the UK. I am approximately 6 feet 4¼ inches tall (195cm to my metric orientated friends), have short brown hair and green/hazel coloured eyes. If you really want you can see some pictures of me, but I warn you that I am not at my finest!!

At the moment I am looking for a job, so I have been spending a great deal of my spare time working on a page containing an academic orientated CV and information about PhD. I have also made a more 'city' orientated CV as I am not sure what my future direction will be. If you like what you read, why not send me an email? I have also been spending a lot of time updating, expanding and enhancing the suite of pages I created for L'institute – Institute for Industrial Development Policy and the pages for *L'institute* – Ferrara Graduate School in Industrial Economics. As my friend Don Fazio says, I've got some work to do now, so we'll continue this chat a bit later ....

Webpage 1

How is Rob Branston construing his 'self'? The answer to the question 'Who am I' in this case, is linked, interdiscursively, with material goods of a given society – you need to be at least Anglo-Saxon, to recognise the illustration

(Branston pickle) and understand the semiotic value and pun of the naming approximation. Rob Branston then becomes

> just a **normal British** bloke who happens to be called Branston.

The representation of the pickle bottle is crucial for determining not only the self-identity (normal) but also the national one (British).

Some other examples from the data reaffirm **place of origin** as an important aspect of their identities. The webbers are 'outsiders' and need to assert their foreignness:

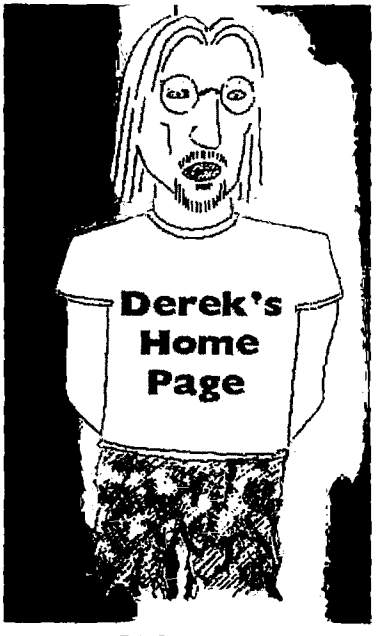
> I am a **Venezuelan** plant biologist.
>
> I **hail** from a **serene** town Kovilpatti the 'matchless town of matches' in Tamil Nadu.

Naming is a very important form of identification and webbers tend to make sure their names are foregrounded, like these examples:

> According to the Keirsey Temperament Sorter I've got a ENTP (Extraverted iNtuitive Thinking Perceiving) personality type – this means I'm an Inventor – who am I to argue?
>
> **I've an unusual surname – Pryke** and so I've set up a web page listing other Prykes on the net.
>
> **My name is Alberto** and I'm Italian. I'm an Aerospace Engineer and for the time being I'm working as Research Associate at the School of Electronic and Electrical Engineering of the University of Birmingham. If you are interested in knowing something more about me (for professional reasons only please, I'm the happy husband of a wonderful young lady...) you can download my Curriculum Vitae...
>
> One thing that **I would like to make clear is my surname,** is it Cirre or Cirre-Torres? Well, in Spain we use 2 surnames, the 1st is the surname of your father and the 2nd of your mother. When I came here, I wrote my 2 surnames linked by a hyphen, so my 1st surname is Cirre and the 2nd is Torres.

For some webbers the use of the language of 'affect' (Martin 2000) is a strategy used to identify their selves:

> I started writing this page during one lonely, homesick September night, between a Volterra integro-differential equation and a multi-domain boundary element approximation. Warmed only by a strong Italian coffee, with Elton John filling the dark of my room, I was dreaming my dreams of far planets and unknown realms, the depth of the ocean, the mystical power of ancient oriental traditions.



> This page is nothing but the pale shadow of my thoughts of that night, but if even only one among you will find in it a reason to look further into the sky and into himself, then this is one of the most important things I could ever do.

This kind of representation, in fact, reaffirms stereotypical constructions of Latin people – emotional, perhaps 'out of control' – the warm 'Italian coffee, the homesickness, the darkness of the room' construe the identity of the lonely student in a cold and foreign place.

Others identify themselves through humour generally using self-deprecation:

> Welcome to Derek's Home Page. I'm Derek Carter, and at present I'm a third year PhD student studying in the Department of Electronics and Electrical Engineering at The University of Birmingham. **Yes I'm yet another of those boring engineers**, and yes I do spend most of my time in front of computer terminals. My field of research is parallel heterogeneous computer architectures, sounds very impressive doesn't it!

This negative appraisal (Martin 2000) is legitimised through a cartoonesque representation of self:

Webpage 2

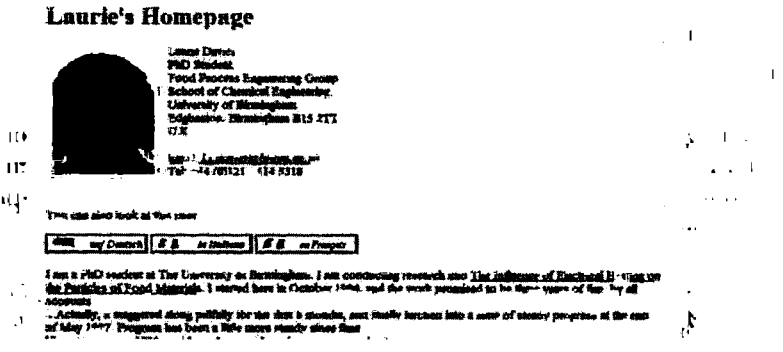
Kohut (1971) refers to *self-object experiences*, experiences (usually with other people) that nourish the self and which define the experience of the self and self-esteem.

Significant others, like family relations, are an essential aspect of our self-development. That is why so many family relations are presented in Web pages – the self of the webber is being represented through self-objects that reinforce her or his own performances.

Photographs showing the webber within the family context are therefore extremely common in my examples. Marriage photos or simple stills of family groups recontextualise the webber as not only a member of a group but also as *belonging* to a group. Not only parents, siblings, partners, but even pets are introduced as parts of the self, as the example below shows:

INFORMATION YOU REALLY WANTED TO KNOW ABOUT ME!!

This is us on our BIG Day!!



Hi! My name is Cathy Lowe, and up until 24th June 1995, I was known as Cathy Smart. I am 28 Years Old and married to Tony. We live in Birmingham and have done so for the last 5 years, well I say we, Tony has lived in Birmingham all his life, I moved all the way from Solihull (for my sins) in 1992. I am a very lazy individual, much to my husband's dismay, but I occasionally get off my backside to go Swimming and the odd Step Aerobics Class. I enjoy pottering around in the garden, especially since we had our Garden Pond re-built. I also enjoy reading, once I'm into a good book I'm oblivious to everything around me, even my husband!! We are both also Dog Lovers and up until a two years ago we had a BEAUTIFUL Alsatian called RADAR, unfortunately we had to have him put to sleep as he was very ill, he was only 8 years old.

Here he is

Webpage 3

Physical appearance and embodiment seem to be one of the other ways webbers recontextualise themselves – all my examples present either a photo or an illustration of 'self', especially of the 'face'. Laurie, below, shows us a sort of 'passport photo' of himself, but he self-evaluates his own appearance when he says, revealingly, at the end of the page: 'By the way, I have had a haircut'.

Webpage 4

What makes the 'self' a supposedly 'real self' in such situations is not necessarily contingent on the realm of 'facts' or 'personal information', but rather on the opportunities for users to create the 'real selves' they thought they 'should be' or 'could be', anchored in the semiotic representations chosen, either verbal or non-verbal.

What is interesting about participants' conception of their 'online' selves is that the complexity and multiplicity of these selves are seen as features that actually make them 'more real' rather than 'less real'. Computer-mediated interaction for these participants, because of the choices made, seems to be something which did not fragment their sense of their 'real selves', but expanded it.

We have to see then, as Jones suggests, cyberspace, not as the site of 'cyber society' (Jones 2002), but regard it more as what Scollon (1998) calls a *site of engagement*, a 'field' upon which multiple actions, identities, and communities can be enacted.

The second identity type of construction I want to concentrate on is character.

3.3. Character

Many of the concepts developed in narrative theory are not specific to language. I want to point out here that the way narrators construct characters (and consequently their life stories) is by the choice of how they recontextualise themselves, in particular spaces, in particular settings (like in a literary text). The spaces are created through the representation of locations and objects. The dimension of the 'activity' being engaged in (what participants are doing when recontextualised) is also very important – some characters are recontextualised as moving in spaces, others as static and in particular positions

By using especially the multimodal resource of photographs, narrators construct through their choices of how to present themselves, a particular version of the self, creating scenarios, spaces, and attributes. The visual landscape is part of this characterisation. By interpreting the way the narrators construe themselves via image, we recreate a narrative of their lives – what they do, where they do it, who they position themselves as in the social practices around them.

Photos are memorable – they represent a neat slice of time, not a flow. Susan Sontag (1999) suggests that photos furnish evidence, a more accurate relation to visible reality than other mimetic objects. Coleman (1998: 57) adds that

> Photographs however do not show how things look. What a photograph shows us is how a particular thing or person could be seen or could be made to look at a specific moment in a specific context, by a specific photographer employing specific tools.

Photos are the most plausible and straightforward representations of identity – part of our identity is an awareness of ourselves, as we would want others to see us. The very artificiality of the pose (smiling or not, looking at the camera or not) demonstrates the gap between the way we are and the way we would like to appear as Barthes (2000) suggests in his *Camera Lucida*. Certainly, the smiling face is an attempt not only to produce a positive evaluation from gazers, but also to interact with them.

However, albeit being faithful to the way we 'look', we have to remember that, as Kress & van Leeuwen (2001) point out, in some domains certain visuals are 'truer' than others. The authors call this the *coding orientation* and this has to do with modality. Modality, here, in the linguistic and semiotic sense, as Scollon & Scollon (2003b, www.gutenbergdump.net) explain, is the word that

> linguists and logicians use to talk about alternate realities. 'Irrealis' (not real) contrasts with 'realis' (real). *Ought* contrasts with *is, was, will be. Realis* is something 'real', 'definite', 'perceived by the person speaking'. *Irrealis* is 'imagined', 'unreal', 'indefinite', 'unknown' or 'unknowable'. The linguistic and logical point of the distinction between realis and irrealis is that there *is no external truth or reality* that is being referenced. It is the mode of representation which is telling us what the producer of the language or image wants us to believe.

Images can make the same distinctions in modality. They can represent a person, a thing, or a space according to a scale of 'it might look like this' to 'it looks like this'. This is done through choices of colour, hue, distance, focus, and vectors. However, a photograph tends to make us believe that what we see is *the reality* in this sense. Visual resources tend to be more 'realis' orientated than texts, which are more easily 'irrealis' orientated, as Scollon & Scollon suggest (2003b, www.gutenbergdump.net).

My argument here, when examining the photos used by webbers, is that in fact, although these photos purport to be 'realis' representations of self, what

authors do is to construct, through choices in modality, a 'characterisation' of the self in terms of the ways their identities are being displayed. The interesting point about the photographs below is that although these Web owners are academics and the photos are placed in academic Web pages, the visual/virtual landscapes chosen in a sense construe specific characters and the discourses that surround them – the discourse of action, the discourse of adventure. The

Mark's Tape Trade List

Webpage 6

modalities chosen, especially colour (in the original pages, blues, reds, greens), produce 'irrealis' effects. What we have here are therefore projections of ideal selves: the sportsman, the association with a particular musician, are facets of hybrid 'private' identities that also happen to be public (and academic). The examples below illustrate these points:

4. Recontextualisation of interaction

I want briefly to look now at recontextualisations of verbal interactions.

According to Jones (2002), the vast majority of people who engage in computer-mediated communication regard it as an extension (McLuhan 1994) of their 'real-life' social interactions rather than as separate from them. Therefore, Jones concludes, the effects of CMC are to 'ground them more firmly within their existing material communities and circumstances' (Jones 2002: 5). Several of the participants in his research, in fact, were quite adamant in rejecting the traditional dichotomy of 'actual' and 'virtual' reality, insisting that computer-mediated communication is as 'real' as anything else is ('as real as a telephone call').

Contrary to my initial belief that Web page messages were sent to unknown addressees, Web narrators in fact try to facilitate the exchange of information among colleagues and peers and the sense of social 'connectivity'. Narrators are therefore agents acting upon the world – they send messages to particular (not well-defined) people, hoping to influence them in some way or other.

When asked about the recipients of their Web pages, one of the writers I contacted replied:

> I don't have a clear idea, but I would include, in no significant order: colleagues in the school, research students and undergraduates in the school; colleagues in other universities around the world; potential collaborators in many places, several types, in several disciplines; potential research students, people who may be able to learn something from my research or contribute to it by commenting or criticising; journalists who contact me to find out about artificial intelligence or cognitive science; school teachers; school leavers exploring the school's web site and wanting to know what's here; people around the university interested in management issues; people who have heard me give presentations and would like to see the slides (usually extended versions); people who may be interested in a book I wrote in 1978, which went out of print and is now free of charge online....

This is the testimony of another webber:

> At first there was no audience, actually, but one has appeared for many of the things there...[T]he idea was to make a brief visual essay using photos we had to organize our own reflections about our pasts and see if

> that would help us find connections...I have told a few students about them (the different pages) as I try to introduce myself as broadly as possible to them thinking there's no way they could understand the academic slices of my life w/o knowing something of the rest. But I don't like to ramble on in a seminar about how I wrangled horses as a teenager, so if it's on the net I just say, 'go take a look' and get on with the subject. So I guess you could say that much of it, maybe most of it is this: I make little essays, highly personal, about things I or we think about or have done, put them on the net so our own kids and family and a few friends can see them.
>
> ...what's on my websites is the stuff that isn't in my formal academic vita but which is essential to understand what's in the vita.
>
> Incidentally, these pages are now found by search engines and visited by who knows who. I average about 60,000 visits a year.

This shows that the message is addressed to targets, and not virtual beings, out there in cyberspace. An interesting aspect of these interactions however, is their spoken conversational features. Most of the pages examined here have greetings, openings, closings, apologies, and the address to a 'you'. Consider for example:

- Hi, I am (name).... How are you my friends all over the world?
- Hello.
- Welcome!
- Hi, thanks for visiting this page!
- Want to know more about me? Well, then...come and browse through then....
- Hi, have you found something?
- Welcome everybody. I'm sorry it's taken such a long time, but here at last are the beginnings of my web page, with pictures showing highlights of the Big Day.
- Thank you for stumbling upon my humble website. I hope you find something of interest while you're here.
- Do not forget to come back. See you next time.
- Hope you're happy. Be nice to animals. And although this site hasn't got much, you never know.
- That's all, folks.

In Late Modernity, the need to communicate/talk (although through virtual media) continues to be part of people's lives, even if people are stuck in their houses in front of their computers. This is not very different from old times, when people use to visit each other and chat on verandas, at least in warm countries like my own.

One of the opening messages of Paul McIlvenny's page (http://ntpaul.sprog.auc.dk) summarises extremely well the interdependency between the interactants in this virtual communication:

You browse, therefore I am

Through pseudo-interactions webbers seem to continue traditions of diary or biography genres where people tell 'whoever is out there' about their personal experiences, their relationships. The informal aspect seems to diminish the distance between writer and reader – you are there, I do not know who you are. But somehow, like me and Aaron, *you browse and I exist.* That is why, I think, there are so many 'hi, hellos, goodbyes', opening and closings in virtual interactions. The material page is the mediational means for social action.

5. Final Remarks

The University of Birmingham has now managed to standardise Web pages to make them compatible with the corporate image of the University. A corporate team produced a set of guidelines so that webbers should maintain the same institutional 'image'. The photos should look the same, nothing that is 'personal' should be inserted into the pages. This is the discourse of the institution trying once again to standardise, paradoxically, presentations that have to do with people's lives and identities. By doing this, the institution tries once more to exert control over its members.

However, from the examples discussed above, it seems that new creative formats resist corporate discourses. Self-presentation has to do with what we are, whom we deal with, and the choices we make in life. People, as Lemke (2002) suggests, choose the ways they want to display themselves and construct their identities. Identity construction is a complex phenomenon and people project in public spaces, idealisations of what they 'think' they are. The multitude of formats, photographs, and colour choice point to the hybrid formation of identity. The online construction is an extension of the offline persona. And institutions cannot control these representations. There will always be a way out of the institutionalised corporate 'image'.

To conclude, I want to emphasise the importance of the study of multimodality in the new communicative genres. Web pages combine language, image, and graphics into a single integrated text's structure. They are therefore:

- **interdiscursive**: 'positioned within multiple, overlapping and even conflicting discourses' (Scollon & Scollon 2003b, www.gutenbergdump.net) – the discourses of the family, the institution, and emotion;
- **intertextual**: they have links with other mass media, especially with classical and modern narratives of all sorts – books, films, comic strips, paintings, among others;
- **dialogical**: a means through which different kinds of 'conversations' can be established.

Web pages are also *sites of engagement.* In some ways, as Deborah Tannen (2002, cited in Jones 2002: 9) points out, 'Asking linguists to pay less attention to texts

is like asking astronomers to stop looking up so much'. It is, however, only through breaking down the traditional hierarchical separation of different modes of representation and focusing more onto the *social actions*, *social identities*, and *social practices* that we will achieve a true understanding of the society we live in – and virtuality is here to stay. In the virtual world we live in, there is no more looking back.

Notes

1. All the Web pages used in this chapter were in colour. Unfortunately, the illustrations in this book can only be reproduced in black and white.
2. One of the essential features of Web pages is their ephemerality. The authors alter and delete items and even whole pages, as you will find if you attempt to follow this reference, Scollon & Scollon (2003b, www.gutenbergdump.net). This page no longer exists.

Role and Position of Scientific Voices: Reported Speech in the Media

Helena Calsamiglia and Carmen López Ferrero

1. Introduction

In recent years the presentation of scientific knowledge, understood as scientists having regular interaction – direct or mediated – with the general public, has had a significant place in the media, apparently seeking to fill the traditional gap that exists between scientific community and people in general. As Moirand (1997) states, the press has become, in specific topics of interest, the 'meeting point' for scientists with the average citizen. In fact, scientists, as a very specialized community of scholars and researchers, have throughout the 20th century been secluded in universities and research centres, enclosed as it were behind the walls of professional worlds, and lacking contact with the needs and requirements of the general public. The development of democracy and communication, in tandem with the increasing consciousness of the importance of science for the distribution of political power and a better quality of life through technology, have finally broken down these walls. This has been achieved through the generating of journalistic practices where scientists and science are represented and called upon to contribute to the formation of public opinion. This has been done not without distrust and misgiving on the part of scientists and experts but it can be said that nowadays the need for scientific culture is claimed as a social right. Nevertheless, bridging the two worlds, the world of the specialist and the world of lay people, remains a problem, not only from the cognitive perspective but also from the perspective of the representation of science and scientists outside their own domain.

Developments in discourse analysis have involved approaches to the use of language in different contexts. The one that deserves our attention is precisely

Source: *Discourse Studies* vol. 5, no. 2, 2003, pp. 147–173

the way in which progress in scientific knowledge reaches the general public in the age of information and communication. Scientific/academic use of language has been recognized as a specific register with its own norms, patterns and style, affecting not only terminology but ways of presentation and reasoning through particular discourse genres and procedures. No wonder, then, that the way a unit or a piece of knowledge is selected and transformed to be presented and explained to non-experts can be a very rich topic of research, since it demands rigorous recontextualization conveyed through discourse procedures affecting both global and local levels of text.

In this article we focus attention on the way in which scientific voices are referred to in the context of a particular case, involving a serious health and diet problem that has been threatening the basic needs of the population in industrialized countries in Europe. This is the case of the Bovine Spongiform Encephalopathy (BSE) outbreak – commonly known as 'mad cow disease' – which in the past 15 years has affected different countries, creating a state of public alarm and desorienting public opinion owing to the widespread consumption of meat among the population and the subsequent fear of transmission of the disease to humans.

We pursue our search at a time when, after a period of doubt and insecurity, the possibility of transmission to humans was openly stated in a session of the British Parliament, in March 1996. It is from this date on that the 'mad cows' affair explodes in the media, causing all kinds of diplomatic, commercial, political and social reactions. It has been a *fin-de-siècle* health crisis that has deeply worried and disturbed governments due to its consequences affecting a variety of social groups and agencies. Its importance can be gauged by the immediate attention which it received from sociologists and other analysts interested in this critical situation (see, for example, Daban and Grau, 1996; Porta, 1996; Donadieu, 1997; Jasanoff, 1997; Zander, 1997; Ratzan, 1998).

New episodes of the crisis have been again unfolding (2000–1). The disease's genesis has been re-explained in the press in detail, especially during the last months of 2000, when new 'mad cow' cases spread across several countries in Europe, mainly in France, Germany, Portugal and Spain. So the debate and the doubts still remain, with politicians and scientists in a state of alert as to how to solve a problem that has become of great relevance due to the complex texture of its consequences.

The aim of this article is to analyse the role of scientists as social agents – people with something to say and do in the case under study – as they are represented in the Spanish press. Our analysis takes journalism into account as the frame of communication (at the macro-level), an active domain of writing for a wide general public, with genres and conventions of its own; and, as the specific focus of analysis (the micro-level), citation as a form of *poliphony*, a concept taken from the theory of enunciation (Bajtin, 1979; see Voloshinov, 1929; Benveniste, 1971/1974; Ducrot, 1984). Within this framework, we identify reported speech not only through the way that grammar differentiates between direct and indirect style, but widening this view to include what in journalistic practices constitutes a *continuum* of reference to 'other' voices which pragmatic perspective has taken

into account (Reyes, 1993/1994) and in relation to journalistic practices (Waugh, 1995; Méndez, 1999a, 1999b). We consider both levels as a whole from a critical perspective that favours the view that citation means managing the words of others to convey and serve the purpose of the writer, giving a slant to what is said. This contrasts with other views, such as those presented in journalism training, arguing that citation not only makes the writer's discourse more objective and credible, but frees him/her from any responsibility.

2. Background Information: Brief History of the BSE Case

The aim of our study is scientists' reported speech in a corpus of news which reports the popularly known 'mad cow' disease, technically called *Bovine Spongiform Encephalopathy*. Although the period we analyse in the present article is the first eruption of this affair in the press in 1996, we emphasize the relevance of this scientific/social topic as a recurrent one in the media. But there are scientific topics that enjoy punctual or acute interest ('patrón de interés puntual o agudo', *Informe Quiral*, 1999: 74), meaning that they generate a great amount of news in a brief period of time. Such is the case of the beginning of the 'mad cows' affair, generating 75 news items in the period of March–April 1996 in the most widely read general Spanish newspapers.

In order to put the news in context, we need to refer to some key scientific data on Bovine Spongiform Encephalopathy as a degenerative pathology of the brain. The origins go back to an infection known as *scrapie*, identified in 1732 in sheep and goats. In 1920, the human disease *Creutzfeldt–Jakob* (*CJD*) is identified, with intriguing similarities to scrapie. In the 1970s, Stanley Prusiner, the 1997 Nobel Prize winner in Medicine, identified the agent which causes the disease. It is called *prion*, a special variant of a protein (healthy or diseased) found in all brains. The altered protein (prion) causes changes in the normal proteins, and it triggers a chain reaction which finally leads to the brain disease. In 1985, in Great Britain, Bovine Spongiform Encephalopathy (BSE) was described as a disease closely related to scrapie. Three years later, BSE was connected to the ingestion of animal feeds derived from meat and bones of infected sheep.

Political data are also relevant to understand the case. We will note the following events: in 1986 the British government officially declares BSE's existence. From then on, various action is taken by the government: organic animal feeds are forbidden, an expert report on BSE is demanded (finally published in 1989), animals are slaughtered. But people are persuaded by the government agencies not to worry about eating meat. There is widespread conviction that there is no connection at all between human and animal brain pathologies. At the same time, powerful economic interests emerge in the face of an uncertain but openly predicted possible crisis of enormous consequences. The British Government officials of different ministries are responsible for indecision and lack of transparency.

In 1990, a Committee appointed by the British Government is set up to monitor the incidence of the disease. It consists of experts in contact with a team of medical researchers in Edinburgh. On 20 March 1996 the British Health Secretary info—

Parliament that a variant of the human encephalopathy (Creutzfeldt–Jakob) could be related to BSE. The evidence is not clear but generates widespread bitter conflict between institutions, government, commercial organizations and the food industry, causing diplomatic relations to be broken off and alarming the average citizen. The focus of the crisis is Great Britain, but other countries in Europe are also under the threat of the disease and its transmission between species. This conflict is taken up by the media where scientific information is mixed with political statements, commercial reactions and citizens demanding clarification.

As regards scientific progress in brain pathologies, in spring 1996 there were some significant scientific advances which reached the mass media. But the scientific community was going at its own pace in the midst of the press storm. In fact, research on such a rare disease as Creutzfeldt–Jakob had been very sparse, only receiving a boost after the BSE outbreak in cattle. Nevertheless, 14 years after the bovine disease was first identified, ultimately causing 92 human victims – mainly in Great Britain – lack of scientific certainty and political dithering undermined European consumers' confidence.

During the period studied in this article, March and April 1996, two scientific articles were published; these were not generated by the sudden crisis and consequently they were not intended to provide a clear-cut response to people's concerns. The scientific information provided by these two articles was taken up in the news report in our corpus. The first article was a medical report produced by the Edinburgh team: 'A new variant of Creutzfeldt–Jakob disease in UK' by R.G. Will, J.W. Ironside et al., published in the medical magazine *The Lancet* on 6 April 1996. It contains no clear proof but considers that exposure to BSE is the most plausible cause for transmission of the disease across species. The second article referred to the ongoing resarch on the 'prion' protein, after Prusiner's findings in the 1970s. The article appeared on 25 April 1996, in the scientific magazine *Nature*, written by D.C. Krakauer, M. Pagel, T.R.F. Southwood and P.M. de A. Zanott, entitled 'Phylogenesis of prion protein'. The first article was leaked to the press by the governmental committee before publication in *The Lancet*. The second was the direct source of information appearing in the press.

The press presented the facts summarized here, their interest sparked off after the British parliamentary session in March 1996, mentioned above. The media brought into their discourse reported speech from different sources which supply reference points for the interpretation of the facts. This use of reported speech is the object of our study.

3. Broad Context of the Study: Discourse and Media

The approach that we take considers reported speech in the context in which it appears. The case under study has newspapers as its context or domain. Thus, in order to control the object of our study we can locate and define it in the light of what van Dijk (1988) and Charaudeau (1997) have proposed concerning different aspects of informative discourse in the press. To begin with, Charaudeau provides a general semiotic approach from the perspective of the *communicative contract*, as represented in Figure 1.

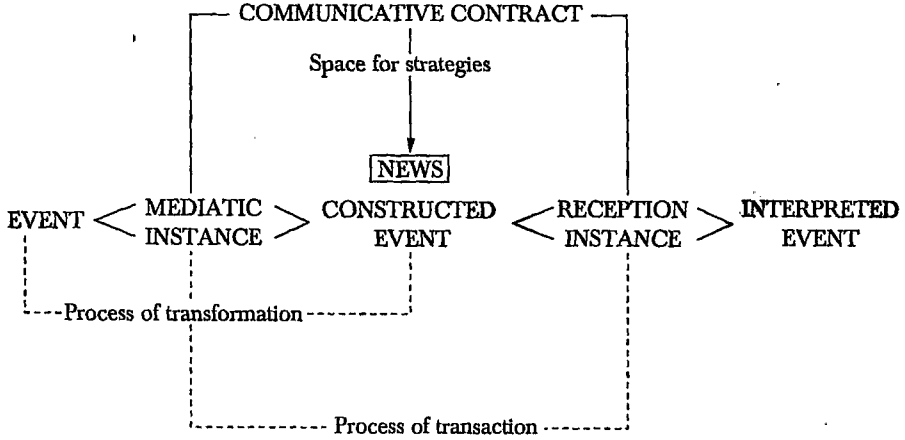

Figure 1: General semiotic approach (Charaudeau, 1997: 72)

The event in the media goes through a process of transformation that results in the *construction of the event* by its representation in words. So the process of transaction allows for strategies within the frame of the communicative contract.

The discourse modes of a media event are viewed as shown in Figure 2.

Given the discourse modes of the media event, schematized by Charaudeau, it is clear that the object of our study is the first phase, that of the *reported event*, where what is being said predominates over reference to fact.

If we rely on Van Dijk's schema for the superstructure of news in the press (Figure 3) we see that if the media story is made up of *situation* and *comments*, the situation in the 'mad cows' case is an oral episode that triggers a variety of comments (oral reactions) from different sources. As the first focus of attention is a statement by the British Health Minister and the subsequent debate in the

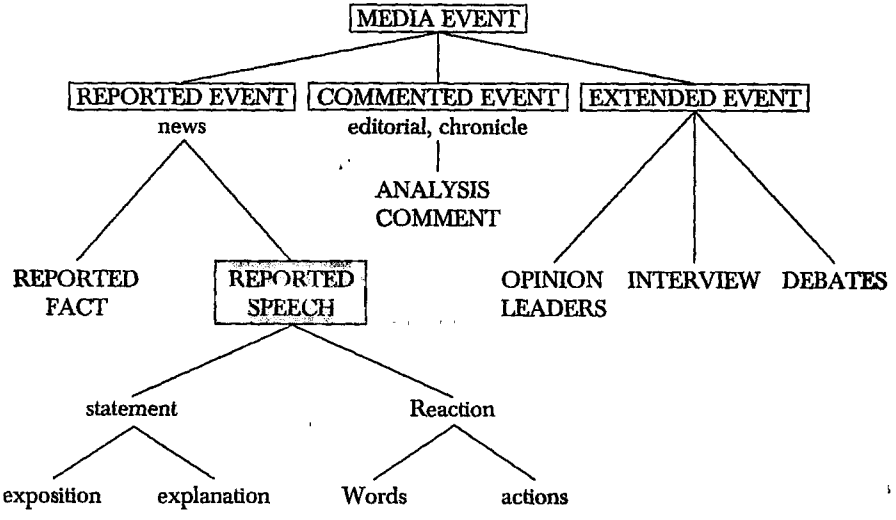

Figure 2: Discourse modes of a [illegible]

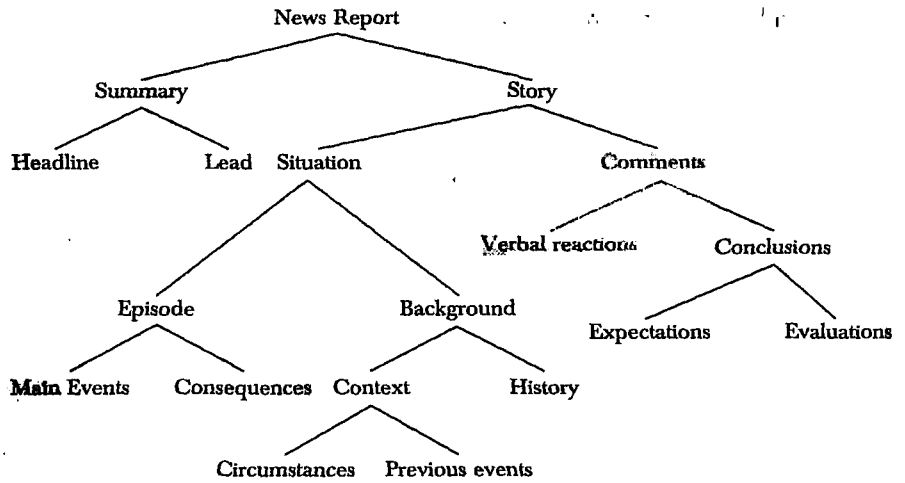

Figure 3: Hypothetical structure of a news schema (Van Dijk, 1988: 55)

House of Commons, it is a case where words become the core of information. This was the origin of the sensational treatment of the affair in the press.

At the microlevel, journalistic practices have established conventions on procedures of citation because of its constant presence in the news. In style books we consistently find instructions on the proper way to present citations. As an example:

> All alien words, statements or opinions transcribed literally in an informative text have to be signaled with quotation marks, without changing the sense or intention with which they were uttered. . . . The author will always be identified, through the proper name or any other characteristic that supports, justifies or gives authority to his/her words. The identification will be done at least once, in the begining, in the middle or at the end of the transcribed sentence. (Abc, 1993: 52; authors' translation)

Prescriptive guidelines for journalists stress the use of citation to give authority and legitimacy to what is said through the strict (literal) quotation of words spoken by others. It is one of the procedures by which to obtain credibility for the facts under comment as well as one of the means of certifying knowledge of what is being said. Literal quotation is intended to be objective knowledge, far removed from the subjectivity of the journalist.

4. Theoretical Framework

Different studies have been carried out in the past decade on specific aspects of reported speech from a variety of perspectives, on various domains and

languages: see, in particular, the compilation of articles by Lucy (1993) and Janssen and Van der Wurff (1996), including Haverkate's on reported speech in Spanish literary works. We have based our approach on the conception of the *énonciation* theory as initiated by the Soviet scholar Bajtin (1979), formulated by the French linguist Benveniste (1971/1974), developed by different representative authors such as Kerbrat-Orecchioni (1980), Authier-Revuz (1982), Ducrot (1984), Maingueneau (1987, 1991, 1993) and applied to journalism by Waugh (1995) and Méndez (1999a, 1999b). In its first formulation, the theory puts forward the existence of a Speaker that actualizes the virtual system of language (*énonciateur*) in relation to a Hearer (*énonciataire*), two axes from which choices of textual items are made and from which a particular variety of text (*énoncé(s)*) is derived. The two main characters of the communicative act (*énonciateur, énonciataire*) are present in the text through different kinds of lexical and deictic traces whose interpretation gives the key for a degree of personal and interpersonal implication. Most of the studies in this framework have focused on the emergence of *subject* (speaker/writer) in texts, making its basic assumption on the fact that the subject is built through the process of *énonciation*. Ducrot, following the line of the fundamental *heteroglossy* of language as it is claimed by Bajtin, breaks the assumption of a one-to-one relationship between Speaker and text. His hypothesis is that the Speaker can be unfolded in several *voices* (*polyphony*) and postulates making a distinction between (1) the text author or *empirical subject* (*pre*-discursive identity); (2) the construction of the *discourse subject* (a *voice* created in text); and (3) the triggering of *other voices* which contribute to the perspectives adopted by (2) to build a particular position.

In every situation of *énonciation* the author creates a voice taking a position, choosing a role according to the possible addressees. This position and role can be enriched and made precise by the inclusion of different other voices that (2) adopts to confirm or contrast the position taken. The discourse analyst is interested in (2) and (3), that is, in the particular way the author chooses to be concerned with the text (degree of incorporation, modality – *voice-building*) and in the variety of other voices that can be integrated into the discourse. One's own voice can be unfolded, as for example in the case of irony. Other voices can be included, either explicitly, through *citation*, or implicitly, through what is called *concealed citation*. The identification of the presence of various voices and the way they are called up in the text are one of the most challenging analytical problems: to find the *line* taken by the discourse subject in any text.

This theoretical framework allows us to consider quoting as a strategy of the writer not only to convey information but also to give an orientation to the text through the choices made in the linguistic constituents of the quoting procedure.

An integrated approach to a specific discourse procedure such as citation would appear to be very useful in accounting for the sense, direction and effects of the insertion of words from different sources into the main discourse of the journalist. We address the following questions: what is the role of scientific *voices* in cases where they are entitled to talk? Which are the forms of quoting? Is quoted speech a way of absolving journalists from responsibility or a means of orientating their position on the topic of reference? How is all this managed in a situation of

crisis? To give an answer to the questions that arise in the study of the use of this discourse procedure we combine different levels:

(a) the description of grammatical construction and markers of *explicit citation* (Girón Alconchel, 1989; Reyes, 1993; Maldonado, 1991, 1999);
(b) the function accorded by the theory of *énonciation* to reported speech as a form of *polyphony*;
(c) the interpretation accorded by *critical discourse analysis* to the representation and presentation of agents in reported speech (Caldas-Coulthard, 1994; Van Leeuwen, 1996).

From this perspective, the three levels contribute to a discoursive explanation that includes the written press context, the discourse functions accomplished and the linguistic units chosen. Grammars have defined explicit citation in terms of direct/indirect styles. Nevertheless, it is interesting to note, as observed by scholars like Méndez (1999a, b) who study quotations in the press, that the clear-cut differentiation between the two main styles is not entirely relevant for the journalistic domain since there are a number of different ways of using the words of others by combining traits of direct and indirect style – considered as the basic axis defining reported speech. The increasing presence of words from different sources when conflict is projected in news in the press gives rise to a variety of ways of formulating them. If the study of citation was based traditionally on its occurrence in literature, where free indirect speech is typically found, its use in other contexts (daily conversation or newspapers, for example) leads to the incorporation of other parameters in the identification of citation formulae.

Taking into account that we are dealing with written data, we can distinguish different styles:

- *direct citation*: there is a *fracture between the syntax* of D1[1] and D2 because it entails the maintenance of two different deictic centres (affecting tense, space and time adverbs and person-reference words), as a result of the two different enunciations being put in relation one to another; the two segments are connected through juxtaposition and they are signalled by graphic markers such as (:)
- *indirect citation*: there is only *one discourse*, D1, with a single deictic centre. a subordinate clause introduced by a conjunction, and the correspondent agreement of tenses.
- *integrated citation*: it has the form of indirect citation but with segments – of greater or lesser extension – signalled as being cited directly/literally with clear graphic or typographic marking, mainly with quotation marks or marked fonts (boldface or italics). This type of citation allows mixing syntactic traits of direct and indirect style, a phenomenon rejected by grammarians but frequently used by journalists.
- *inserted citation*: words of W2 are brought into the main discourse by means of markers such as '*según* X' or '*para* X', '*in the words of* X', '*according to* X' which have the function of assigning explicit words to a particular agent

> (literal or non-literal, depending on the use of graphic signs of quotation) without any communicative verb.

The narrative style of the news makes the appearance of direct speech rarer while the rest are very frequent, with a broad and loose acceptance of either one or two deictic centres.

Pragmatically speaking, the idea that is brought to the fore is that in any of the explicit occurrences of D2, in any of the forms referred to here, the possibility of obtaining strictly the same original sense through literality is seriously called into question. Even if the exact words are reproduced, they are extracted from the original context and are placed in a new context that can modify the sense. That is the conclusion drawn by Reyes (1993) and by Caldas-Coulthard (1994) and suggest we should question a maxim apparently accepted by the standards of journalism: that explicit quoting means fidelity to the text. As argued:

> Direct style is often opposed to indirect style, somewhat ingenuously, saying that it seeks to reproduce literally the cited words. It would be more exact to view it as a sort of dramatization of a previous expression, rather than a totally similar one. In other words, it is no more or less reliable than indirect speech: they are two different strategies to refer to previous speech. (Maingueneau, 1987: 60; authors' translation)

The question is put in another way: it is fidelity to the voice which is under consideration, so to speak, the original intention and purpose, the original partners of communication.

The presence of different voices evoked in a text leads us to consider the polyphonic character of news in journals (Ducrot, 1984; Authier-Revuz, 1982; Maingueneau, 1987). In that sense, the idea of *one text/one voice* is not at issue. Rather, different *voices* are assumed or directly evoked by the writer, who builds the representation of a world of reference through a combination of a variety of voices. The relative weight, frequency and value of the different voices will, by means of the observation of the empirical data, provide us with a profile of protagonism taken on by the social actors whose words are called upon in relation to the topic.

Finally, studies from a critical perspective of the ways social agents are presented (Caldas-Coulthard, 1994; Van Leeuwen, 1996) allow us to question the neutrality of the writer and pick out the argumentative trend that arises from the fact of choosing who is cited, how he/she is represented, what is cited and for what purpose.

5. Delimitation of the Linguistic-Discursive Object: Form and Function of Explicit Citation

Even if we are conscious that voices can also be integrated in more subtle ways, considered by various scholars as '*hétérogénéité constitutive*' (Authier-Revuz, [illegible]

as 'narrative mode of citation' (Charaudeau, 1997) or as 'echoes, hidden citations' (Reyes, 1994), in this article we are concerned with explicit citation. This kind of citation consists of the main text (D1) and the quoted text (D2). D1 is sequentially the point of departure from which the writer (W1) designs the development of his/her own discourse. Before inserting the cited voice (2), W1 introduces a preparatory *frame* (Girón Alconchel, 1989), which is formed by:

(a) The presentation of the *identity* of the cited voice. It involves the presentation of the agent, by such linguistic means as names, proper names, titles or honorifics, designation of status and public position, relational adjectives, etc. Any of the choices made are significant.
(b) The communicative verbs (*verba dicendi*) that W1 attribute to the voice of cited agents (W2).
(c) Other elements that are not necessary but possible: narratives, descriptions, modalities.

The frame is the *presentation* of W2 made by W1, where W1 is responsible for creating a new context for the cited words. That is why we focus on this precise portion of citation, the pre-citation, which plays the role of *interface* between D1 and D2.

For the study of the pre-citation segment we have drawn on the suggestions in the Van Leeuwen's schema (1996: 66) concerning different modes of inclusion of agents:

In the framework of Van Leeuwen's description, we have considered the five categories stressed by boldface font in Figure 4: (1) *genericization*; (2) *individualization*; (3) *collectivization*; (4) *aggregation*; and (5) *objectivization*. In our data,

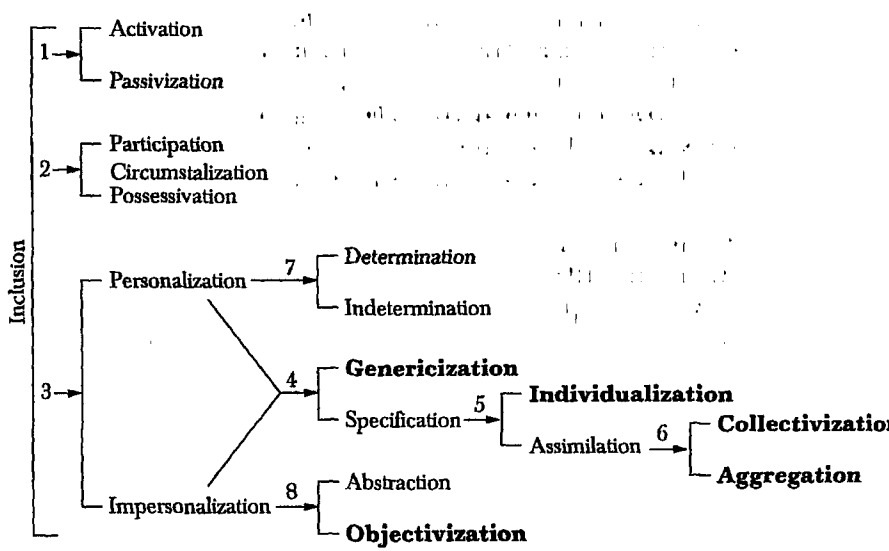

Figure 4: The representation of social actors in discourse: Inclusion system network (adapted from Van Leeuwen, 1996)

those are the most frequent forms of representation of members of the scientific community.

Van Leeuwen (1996: 46) considers an important factor in the presentation of social actors to be the choice between *generic* and *specific* reference: actors can be represented as 'classes' (*genericization*) or as 'specific' identifiable individuals (*specification*). The *specification* can be singular (*individualization*) or plural (*assimilation*). Examples of generic forms in our corpus are forms such as 'scientists', 'doctors' without a specific reference to a concrete group of experts.

The process of singular specification in the corpus is expressed by authority voices (individual scientists); as for assimilation, Van Leeuwen (1996: 49) distinguishes two major forms: *aggregation* and *collectivization. Aggregation* quantifies groups of participants, treating them as 'statistics' (example: 'a number of critics'), *collectivization* does not. In *collectivization*, social actors are presented as 'community', as a homogeneous, consensual group; this is the case, for example, of 'WHO experts' in our corpus.

Genericization, individualization, collectivization and *aggregation* are four personalized forms in the process of agent representation. On the contrary, *objectivization* is a form of *impersonalization*, also frequent in our corpus and realized by metonymical references, such as 'texts'.

The five forms considered can be *determined* or *undetermined.* Thus, we have considered the Van Leeuwen's distinction *determination/indetermination*:

> *Indetermination* occurs when social actors are represented as unspecified, 'anonymous' individuals or groups, *determination* when their identity is, one way or another, specified. Indetermination is typically realised by indefinite pronouns ('somebody', 'someone', 'some', 'some people') used in nominal function.... *Differentiation* explicitly differentiates an individual social actor or group of social actors from a similar actor or group, creating the difference between the 'self' and the 'other', or between 'us' and 'them'. (1996: 51–2)

As for the reporting verbs related to the agents, while it is necessary to accept the wide variety of 'verba dicendi' and the impossible task of classifying them,[2] it is also clear that they can confer a content-oriented trend or an evaluative trend. We find interesting suggestions in the way Thomas and Hawes (1994) and Hyland (2000) have indicated types of *content* or *evaluative* approaches channelled through the choice of verbs of communication (see Figure 5).

In content-oriented process, verbs related to findings (*observe, discover, notice, show*) or to procedures (*analyse, calculate, describe, assay, explore*) refer to research acts of science agents. Popularizing acts (*explain, describe, compare, define, exemplify*) are used to clarify and facilitate understanding of specialized concepts.

An evaluation verb 'allow[s] the writer to ascribe a view to the source author, reporting him or her as positive (*advocate, argue, hold, see*), neutral (*address, cite, comment, look at*), tentative (*allude to, believe, hypothesize, suggest*), or critical (*attack, condemn, object, refute*)' (Hyland, 2000: 28).

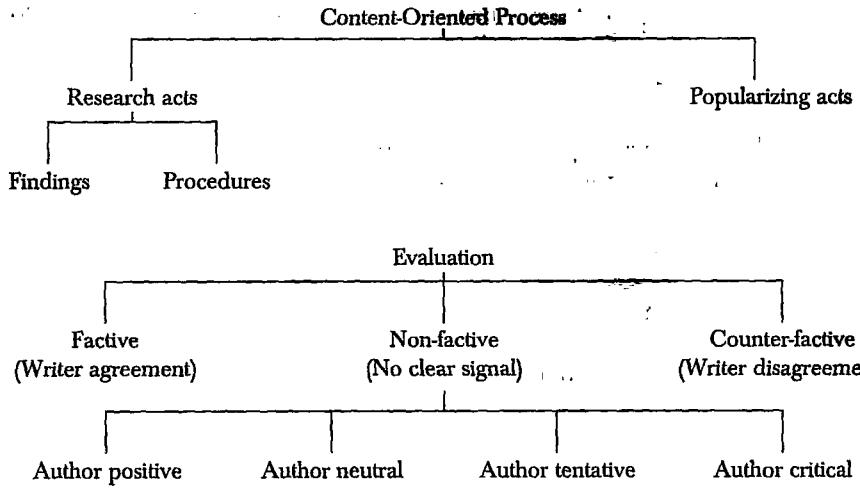

Figure 5: Critical analysis classification of reporting verbs

Through an accurate analysis of the framing of the quote we can indicate the interpretive cues that are given by the writer, because of the important role of choices in determining the argumentative orientation:

- choice of type of agent (conveying authority or credibility in a particular domain);
- choice of his/her representation in discourse (as an individual or a collective, determined or undetermined, personalized (author) or objectivized (text), etc.;
- choice of reporting verb (locating the agent in a position towards the topic).

In the case of 'mad cow' disease, types of agents that are called upon can tell us which are the sources that are presented as more relevant, those of the scientific community or those with political or civic-social standing. This is a sociological distribution that gives external configuration to the voice. But their representation is achieved by internal configuration through language use; the image of the agent is constructed and related through a specific reporting verb. Our claim is that close analysis of the pre-citation segment, the *frame* of the cited words, will give us important clues to the interpretation of the role and position of scientific voices.

6. Corpus and Data Treatment

We have based our study on a corpus of 75 news items from six different newspapers: *La Vanguardia, El País, El Mundo, El Periódico, ABC* and *Avui*. These are the most widely read general newspapers in Spain (*Avui* circulates in the Catalan-speaking area). The news items considered were published in March

and April 1996 (between 22 March and 27 April 1996, to be exact).[3] This corpus contains the 'reported speech' in the process of communication of news (Charaudeau, 1997).

The 75 news articles (D1) provided the 445 reporting structures (D2) that constitute the microlevel units analysed, both reported speech from non-scientific voices (349 statements) and from scientific voices (96 statements). We have focused the present study on the 96 scientific reporting structures, 21.57 percent of the reported speech in the corpus selected.

We compiled an extensive database to allow us to study quoted speech both from a quantitative and a qualitative point of view. Every citation has a corresponding register which details information on the macro-level of discourse (newspaper, press genre, press section, news author) as well as on the textual micro-level (identification of W2, form of citation, reporting speech choice, text of citation).

7. Analysis

After the delimitation of the object of our study and the presentation of the corpus, in the present section we proceed to study the role and position of scientific voices in the 'mad cows' affair as they are communicated via the Spanish press. First, we analyse the results of the study of the 'quoting frame' of scientific citations: representation of agents and choice of reporting verbs. Then we present a brief analysis centred on the contrast between scientific and non-scientific reported speech; this contrast allows us to obtain relevant data which helps to explain the role and position of scientific voices.

7.1 Analysis of Scientific Voices

We have divided our corpus into three chronological information 'peaks' or phases, given the concentration of the news around each peak, and the silence or 'pause' in between. Note that in phase 1 and phase 2, sources from scientific articles are not available, the source being governmental agencies that interpret the report issued by the scientists (see Section 2). Only in phase 3 is the information related to an article on the prion (from the microbiology field) which appeared in *Nature*.

The three phases, including the percentage of citations, are the following:

Phase 1: 22–24/3/1996 (44.30 percent)
Phase 2: 28–31/3/1996 (33.04 percent)
Phase 3:24–27/4/1996 (22.60 percent)

For every phase we will give some representative examples of the dominant scientific voice and of the associated reporting verbs, so that we are able to see

where there are modulations of the general stance detectable in the distribution of the different ways of representing scientific voices (Van Leeuwen, 1996).

Table 1 presents a summary of the process of representation and position of scientific voices in the different phases considered: we present the most frequent forms of representation of actors and the reporting verbs associated with each kind of representation.

Table 1: Forms of representation of identity and reporting verbs

Phase	Representation of identity	Reporting verbs
1) 22–24/3/1996	*a) Genericization* *b) Collectivization*	*a) Tentative* *b) Positive*
2) 28–31/3/1996	*a) Individualization* *b) Assimilation: collectivization and aggregation* *c) Objectivization*	*a) Research + markers* *b) Controversial: positive, tentative* *c) Positive, research*
3) 24–27/4/1996	*An only source represented as:* *a) Collectivization* *b) Objectivization* *c) Individualization*	*a) Research, tentative + markers* *b) Research* *c) Popularizing + markers*

We have characterized every phase by a title that shows the differences found between the communication of scientific knowledge in each case: from caution (*tentative* point of view) to assertiveness (*positive* perspective) in the first phase; diversification of the scientific voices and their representation (*individualization*, *assimilation* and *objectivization*) in the second phase; presence of a single source in the third phase, which is collectivized, individualized or objectivized.

7.2 First Phase: Caution versus Assertiveness

The systematic observation of citations in this first phase shows that social actors are represented by forms of *genericization* and *collectivization* (a form of *assimilation*). Scientists are presented as a *class* in *genericization* without a specific referent, as we can see in the following examples:[4]

(1) **Los científicos dicen** ahora que esos cuatro años fueron decisivos para que se saltara la barrera de las especies y se desarrollara una versión humana de la enfermedad. (*La Vanguardia*, 23/03/96)

(1) **Scientists** now **say** that those four years were decisive in the breaching of the species barrier and the development of a new human version of the disease. (*La Vanguardia*, 23/03/96)

(2) **Los médicos creen** saber distinguir estos últimos 'porque se producen en menores de 42 años, presentan una analítica diferente desde el punto de vista anatomopatológico y son de evolución más lenta, algo más de

(2) **Doctors believe** they can distinguish the latter 'because they occur in people less than 42 years old, are analytically different from an anatomo-pathological point of view, and are slower to develop, taking somewhat more than 20 months'. (*El País*, 23/03/96)

'Scientists' and 'doctors' are genericized, and so symbolically removed from the readers' world of immediate experience, treated as distant *class*. As we will see in 7.5, other types of voices, non-scientific voices such as politicians, are not genericized.

When the process of *genericization* is chosen, the scientific cited words in press are presented by a *tentative* verb, such as 'believe'. This type of reporting verb is one of the most frequent verbs used in our corpus, always associated with a *generic* or an *assimilate* voice, as Examples 1 and 2 shows, to express caution in front of a critical situation that relates both to social perception and to the limitations of scientific knowledge.

On the other hand, in this first phase, scientific voices are also reported as members of an international organization (World Health Organization, WHO), as a form of *collectivization*:

(3) Per la seva part, **experts de l'OMS van assegurar** ahir que no veuen justificació científica per prohibir la importació de carn de boví procedent de Gran Bretanya. (*Avui*, 23/03/96)
(3) For their part, **WHO experts** yesterday **assured** us they saw no scientific justification for prohibiting meat imports from Great Britain. (*Avui*, 23/03/96)

In Example 3 we can see that WHO experts are presented as a 'community', as an homogeneous, consensual group which have the responsibility of evaluating findings in science and its consequences for the general public. WHO experts are put under a process of *collectivization*. Their influence and political representation in society justify the reporting verbs chosen to present their speech: verbs associated with this collective are always *positive* ('assure'), a type of reporting verb which is never used in our data to introduce scientific class. The collective of WHO scientists is characterized by their assertiveness versus the caution showed by scientists in general.

As we have said, in the computation of reporting verbs, the verbs more frequently used in our corpus are *positive* ('assure'), *popularizing acts* ('explain'), *neutral* ('say', 'state') and *tentative* ('believe'). In this first phase – as in the other two – *positive* evaluation of facts is never in the generic voice of science. Assertiveness is always related to political representation.

All these observations are completed by the content of the quotations, which shows two distinct trends: the medical experts show 'caution' about their findings (Example 2) while the organization reveals 'assertiveness' in mitigating social alarm (Example 3). Knowledge of the context of these news items is crucial, because scientific information is channelled by governmental

in parliament. So, in this first phase, the dominant source is homogeneous and it is presented in agreement.

7.3 Second Phase: Diversification of Scientific Voices

In the second phase of the event, more voices are called upon to inform about 'mad cow' disease. Dominant scientific voices are reported in three different modes: *individualization*, *assimilation* and *objectivization*.

As for *individualization*, the linguistic form of presentation is through determination by use of name and surname, professional identity and institutional status and origin, as Example 4 shows:

(4) **Según afirma Stanley B. Prusiner, profesor de Neurología y bioquímico en la Universidad de California**, en el *Scientific American*, 'Es una teoría, pero puede que los cambios estructurales de la proteína alterada, el prión, sean también responsables de otras enfermedades degenerativas más comunes como el Alzheimer. Y esta posibilidad no debe ignorarse'. (*El Mundo*, 28/03/96)

(4) **According to Stanley B. Prusiner, a teacher of neurology and biochemistry at the University of California**, in the Scientific American, 'It's a theory, but it may be that structural changes in the altered protein, prion, might also be responsible for other degenerative diseases more common than Alzheimer. And that possibility should not be ignored.' (*El Mundo*, 28/03/96)

In this phase, as in the first one, it is noticeable that reporting verbs are distributed differently depending on the identity. Individual authorities are presented frequently with *markers* of reported discourse such as 'for', 'according to' ('para', 'según' in Example 4), contributing thus to the neutrality or distance established by the writer. Reporting verbs used to introduce authorities are above all *research* verbs – 'describe' ('describir'), 'conclude' ('concluir') – not very frequent in the corpus. Two examples of this kind of structures are the following 5 ('described') and 6 ('concludes'), with *individualized* voices ('Vincet Zigas' and 'Carleton Gadjusek' in Example 5, 'Jeffrey W. Almond' in Example 6):

(5) **Vincet Zigas, del Servicio de Salud Pública de Australia y Carleton Gadjusek, del Instituto Nacional de la Salud de EEUU, describieron** en 1957 cómo miembros de una tribu de Papúa Nueva Guinea sufrían una enfermedad mortal caracterizada, primero, por la pérdida de coordinación y, después, por demencia. (*El Mundo*, 28/03/96)

(5) **Vincet Zigas, of the Australia Public Health Service and Carlton Gadjusek of the National Health Institute of the United States, described** in 1957 how a tribe in Papua New Guinea suffered a lethal disease characterized firstly by loss of coordination and then by dementia. (*El Mundo*, 28/03/96)

(6) **El científico Jeffrey W. Almond concluye** en un artículo publicado en el *British Medical Journal*: 'Es obvio que la forma de presentación de la ECJ en Gran Bretaña, en comparación con otros países libres de la enfermedad de las "vacas locas", es una causa que debe ser estudiada'. (*El Mundo*, 28/03/96)

(6) **Scientist Jeffrey Almond concludes**, in an article published in the British Medical Journal that 'It is obvious that the form in which ECJ presents in Great Britain, in comparison with other countries free from "mad cows' disease", is a cause which should be studied.' (*El Mundo*, 28/03/96)

As far as *assimilation* is concerned, *collectives* are presented in a general determined or undetermined form and are now dispersed across different fields (neurology, veterinary, medicine, etc.), institutions (hospitals, health services, etc.) and countries (Great Britain, USA, Australia, etc.). It is not the case, then, of a generic scientific reference as it was during the first phase but of heterogenous *collectives* of scientists: in Example 7, 'Las autoridades sanitarias' and 'los propios médicos del hospital de Canterbury' have specific references:

(7) **Las autoridades sanitarias y los propios médicos del hospital de Canterbury, donde murió Anne Pearson, no han querido hacer comentario alguno sobre el caso, más allá de decir** que 'es imprudente especular sobre cómo la víctima contrajo el CJD, porque su caso está siendo todavía estudiado en un laboratorio de Edimburgo y no hay conclusiones definitivas'. (*La Vanguardia*, 30/03/96)

(7) **Health authorities and the doctors themselves at the Canterbury Hospital where Anne Pearson died did not wish to make any comment** concerning the case, **beyond saying** that 'It is unwise to speculate over how the victim contracted CJD, as her case is being studied at the Edinburgh laboratory and there are no definitive conclusions.' (*La Vanguardia*, 30/03/96)

Forms of *aggregation* are also frequent in this phase, showing the different points of view in the groups of scientists: in Example 8 the determiner 'some' ('Algunos') in front of 'others' ('Otros', 'Y otros') signals different groups of experts who did not agree on the scientific explanation of the phenomenon:

(8) **Algunos investigadores creen** que, además del prión, debe de haber otro agente infeccioso aún no identificado. **Otros** no **descartan** que aparezca un virus. **Y otros están seguros** de que la nueva enfermedad detectada en GB no es ECJ sino la propia EEB de las vacas. (*El Mundo*, 28/03/96)

(8) **Some researchers believe** that, in addition to prion, there must be some other unidentified agent of infection. **Others** do not **rule out** the possibility of a virus appearing. **And others are sure** that the new disease detected in GB is not ECJ, but none other than the EEB occurring in cows. (*El Mundo*, 28/03/96)

In this example, scientists are presented in *aggregation* in terms of Van Leeuween (1996), identified as groups that show disagreement in the evolution of science research. This disagreement is also reflected in a variety of verbs indicating scientific debate and different points of view: in Example 8 a *positive* expression 'are sure' is used next to a *tentative* verb such as 'believe'.

Finally, 'texts', a form of *objectivization*, are in this second phase a notable source for citation, being presented in a general determinate form or by the name of the publication, with no identification of authorship. Personal reference is lost through a metonymic reference (as 'Studies' in Example 9) that gives credibility to the written words – related to the accepted knowledge of the scientific community:

(9) **Los estudios han demostrado** que en ninguna de ellas [enfermedades neurodegenerativas], los leucocitos – el 'ejército' del sistema inmune – se infiltran en el cerebro. (*El Mundo*, 28/03/96)

(9) **Studies have demonstrated** that in none of them [neurodegenerative diseases] do leucocytes – the immune system's 'army' – infiltrate into the brain. (*El Mundo*, 28/03/96)

Citations of texts are presented with significant *research* verbs such as 'demonstrate' ('demostrar') in Example 9 or 'reveal' ('revelar').

As can be seen, in this second phase sources are heterogeneous, in their reference as well as in their mode of representation. Experts come from different fields: neurologists, biologists and microbiologists, veterinarians, etc. bringing about an expansion of information that complements the purely medical data. Journalists begin to quote research on microbiology, looking for a possible explanation of the causes of the infection, trying to confer credibility based on the results of studies.

7.4 Third Phase: A Scientific Move

This phase is typified by a particular instance of scientific communication as it appeares in the British journal *Nature*, about a month after the outbreak of diplomatic and economic conflict generated by the first wave of news. It represents progress made in scientific information.

We find different forms of representation of this source alone: first, as the text published in *Nature*, a form of *objectivization* exemplified in the following citation:

(10) **Un estudio que publica hoy la revista Nature demuestra** que la estructura genética de los priones de las vacas tiene un parecido muy significativo con los priones de los seres humanos. (*El Mundo*, 25/04/96)

(10) **A study published today in Nature magazine demonstrates** that the genetic structure of prions in cows is very significantly similar to prions in human beings. (*El Mundo*, 25/04/96)

Second, as the group of scientists who carried out the research, a mode of *collectivization* represented in Example 11:

(11) **Los científicos de Oxford, incluidos T.R.F. Southwood, antiguo miembro de la comisión asesora del Gobierno británico sobre la enfermedad de las vacas locas, han descubierto** que estas proteinas [priones] de vacas y personas comparten dos rasgos distintivos en su estructura que están ausentes en la proteína de oveja. (*El País*, 25/04/96)

(11) **Scientists at Oxford, including T.R.F. Southwood, former member of the British government advisory commission on mad cows' disease, have discovered** that these proteins [prions] in humans and cows share two distinctive traits in their structure that are absent in the sheep protein. (*El País*, 25/04/96)

And third, as the authorities on the matter, in the process of *individualization* expressed in Example 12:

(12) 'Las ovejas padecen una enfermedad similar desde hace doscientos años pero nunca se ha transmitido a las personas. La enfermedad de las vacas, en cambio, sí puede haberse transmitido. Si así es, debemos buscar una característica que tengamos en común con las vacas pero no con las ovejas. Y es precisamente lo que hemos encontrado', **explicó** ayer **David Krakauer, director de la investigación**, en entrevista telefónica. (*La Vanguardia*, 25/04/96)

(12) 'For the last two hundred years, sheep have suffered a similar disease that has never been passed on to humans. The disease in cows does, however, seem to have been passed on to humans. If this is so, we have to look for a characteristic we have in common with cows but not with sheep. And that's precisely what we have found', **explained David Krakauer, director of the investigation**, yesterday in a telephone interview. (*La Vanguardia*, 25/04/96)

As we see in the examples above, reporting *research* verbs are frequently used: 'demonstrates' ('demuestra' in Example 10), 'have discovered' ('han descubierto' in Example 11), associated with the collective of researchers and with texts. Also, *markers* such as 'for' ('según', 'para'), which show a neutral position, are employed to introduce the group of scientists, and not only to refer to an individual authority (as in the second phase). Finally, the *popularizing* verb 'to explain' ('explicar') is used in this third phase primarily in relation with authorities ('explained' in Example 12).

Nevertheless, when scientists are quoted as a generic group, *tentative* reporting verbs are also assigned, as in the previous phases:

(13) **Los científicos creen** que [los priones] pueden causar graves enfermedades neurológicas cuando pasan de una especie a otra e incluso cuando pasan de un individuo a otro dentro de la misma especie. (*La Vanguardia*, 25/04/96)

(13) **Scientists believe** that [prions] can cause serious neurobiological illnesses when they pass from one species to another and even when they are passed from one individual to another within the same species. (*La Vanguardia*, 25/04/96)

To sum up, in the third phase, the source is a scientific article on microbiology published in one of the most prestigious reference journals in science communication (*Nature*). We cannot find any significant discourse function in the way scientific voices are represented, by individualization, collectivization or objectivization, since all of them are present in the quote frame referring to the same source. The reporting verbs used are in the semantic domain of *research* ('demonstrate', 'discover', 'conclude') and *divulgence* ('explain'), following the patterns of science communication. Moreover, *markers* of neutrality are used frequently to introduce scientific discourse.

7.5 Contrasting Scientific and Non-Scientific Voices

As we have already mentioned, the proportion of speech reported from scientists in our selected corpus is only 21.57 percent of the total amount of reported speech; in other words, non-scientific voices are dominant. For this reason it is interesting to contrast the representation of scientific and non-scientific voices in order to note differences in the role and position of each kind of agent as featured in science communication.

In a previous study – reported in Calsamiglia and López Ferrero (2001), Calsamiglia and Cassany (2001) – the respective contributions of scientific and non-scientific voices in the information on 'mad cows' disease were examined. The present analysis confirms the results presented in the two articles, in which we studied use of quotation in the three first days of diffusion of the news in the Spanish newspapers.

Table 2 shows the distribution of scientific voices in the present corpus in relation to the representation of identity:

Table 2: Presence and identity of scientific voices (96 citations: 21.57 percent)

Genericization (16.66%)	Assimilation (25%)			Individualization (43.75%)			Objectivization (14.58%)
	–Determined	+Determined		–Determined	+Determined		
"Scientists" "Experts"		Gov	Res		Author	WHO	
16	1	14	9	1	29	12	14

Scientific voices are frequently put into a process of *genericization*, as a community without specific reference ('los científicos', 'los expertos', etc.). When there is a process of *assimilation* two specific groups are represented: government advisors (*Gov* in Table 2) and collectives of concrete researchers (*Res*), some of which publish their studies in *Nature*. As for *individualization*, this mode is presented through a scientific authority (*Author*) or a World Health Organization member (*WHO*).

In contrast, Table 3 shows the distribution of non-scientific voices in the corpus:

Table 3: Presence and identity of non-scientific voices (349 citations: 78.43 percent)

Assimilation (27.79%)				Individualization (70.20%)						Objectivization (2%)
–Determined	+Determined			–Determined	+Determined					
	Cou	Inst	Org		Cit	Mer	Org	Polit	Press	Spec	
12	17	41	27		5	12	60	134	24	10	7

Abbreviations used in Table 3 refer to the different forms of representations:

Forms of assimilation:
- *Cou: country* ('Suiza, Alemania, los alemanes, Reino Unido')
- *Inst: institution* ('el gobierno, la Administración española, las autoridades suizas, la UE')
- *Org: organization* ('la Organización Mundial de la Salud, el sector cárnico, las organizaciones agrarias, los sindicatos agrícolas')

Forms of individualization:
- *Cit: citizen* ('dos oficinistas, un quiosquero, un ingeniero cincuentón, un ama de casa')
- *Mer: merchant* ('un carnicero, un exportador de carne, el encargado del restaurante')
- *Org: organization* ('un portavoz de la OMS, el presidente del Sindicato Nacional de Ganaderos')
- *Polit: politician* ('el ministro de la presidencia en funciones, el líder de la oposición laborista')
- *Press: press* ('*Le Monde, The Daily Telegraph*, EFE, special correspondents')
- *Spec: specialist* ('sociólogo, antropólogo').

Forms of objectivization: ('informe, código penal')

As shown, non-scientific voices are represented mainly as individual voices (70.20 percent), politicians being the social agents most cited. The data tell us how, in this case, politicians are called upon to provide information even on science matters. As for the reporting verbs used, the press attributes a *positive* ('assure' in Example 14) and *interaction-oriented* position ('urge', 'call' in Examples 15 and 16) to social agents with a political function. In a critical situation, political

actors are the ones expected to be active on their speeches, decision making, recommendations. They are pushed to perfom symbolically, involving sometimes a risk to their public face:

(14) **Tony Blair, líder de la oposición laborista**, también **aseguró** que continuará comiendo carne de buey, aunque **acusó** al Gobierno de 'ocultar datos' a la opinión pública, y de 'resistirse a decir toda la verdad' para proteger los intereses de los ganaderos. (*La Vanguardia*, 22/3/96)

(14) **Tony Blair, leader of the Labour Opposition**, also **assured the House** that he would continue eating beef, although he accused the Government of 'hiding facts' from public opinion, and of 'refusing to tell the whole truth', to protect the farmers' interests. (*La Vanguardia*, 22/03/96)

(15) Precisamente ayer, **su presidente, Jacques Santer, reclamó** a John Major medidas urgentes para acotar la crisis y permitir que la UE pueda levantar el embargo – siquiera parcialmente – que pesa sobre el vacuno británico. (*El País*, 25/4/96)

(15) Precisely yesterday, **its president, Jacques Santer, urged** John Major to take urgent measures to bring the crisis to an end and allow the EU to lift the embargo (partially) imposed on British beef. (*La Vanguardia*, 25/04/96)

(16) Un sector predominante de la prensa comparte esta tendencia. **Sir Teddy Taylor, abanderado del euroescepticismo, pidió** ayer una prohibición total de vino y queso francés en el Reino Unido en venganza por el boicot francés contra la carne británica. (*ABC*, 23/3/96)

(16) A major part of the press shares this tendency. **Sir Teddy Taylor, avowed Eurosceptic, called** yesterday for a total ban on French wine and cheese in the United Kingdom, in revenge for the French boycott on British meat. (*ABC*, 23/03/96)

On the other hand, when we consider the generic and collective representation of scientific voices (40 citations) plus their objectivized representation as texts (14 citations), we observe that, unlike what we saw with non-scientific voices, the predominant source is not an individual: 'science' is represented by the scientific community as a group, or by texts. Therefore, the scientific community and texts are perceived by society as sufficient markers of authority. However, if we leave the 14 textual citations aside and focus on the 40 citations of personal scientific voices, the proportion of individualized (43.75 percent) and generic and assimilated (41.66 percent in total) citations are very close. A relevant feature is that both assimilated and individualized citations are presented in noun phrases (NPs) with determiner. In the case of individual voices, the determination is related to a personal social identity (name, status, etc.). In the case of generic and assimilated voices – 'scientist' ('los científicos'), 'experts' ('los expertos'), 'researchers' ('los investigadores'), etc. – there is generally just a simple determiner preceding a common noun, having either an anaphoric or generalizing function;

again the linguistic choice appeals to a 'common ground' representation of the role of scientific work.

As for the reporting verbs, we find scientific and non-scientific voices coincide in their use of *positive* and *neutral* verbs, such as 'say', 'state', 'assure' ('decir', 'afirmar', 'asegurar'). Nevertheless, there is a relevant difference in the use of specific verbs in each kind of source. As we have noticed, reporting verbs assigned to non-scientific voices can be described as *interaction-oriented*: 'claim', 'announce' ('reclamar', 'anunciar'), while those assigned to scientific voices are *content-oriented*: 'explain', 'believe', 'consider', 'show', 'emphasize' ('explicar', 'creer', 'considerar', 'señalar', 'destacar'), related to mental activities of knowledge, qualification and focalization. Some of them reflect a *tentative* position ('believe', 'consider'), others ('explain', 'show') are characteristic of *popularizing* discourse.

As a summary, in Table 4 we present the relevant contrasts in the forms of representation of identity and in the choice of reporting verbs to introduce scientific and non-scientific speech:

Table 4: Choice of representation of identity forms and reporting verbs

Voice	Representation of identity	Reporting verbs
Non-scientific	*Assimilation*	*Positive and neutral*
	Individualization	*Interaction oriented*
Scientific	*Genericization*	*Positive and neutral*
	Assimilation	*Content oriented: tentative and popularizing*
	Individualization	
	Objectivization	

8. Discussion

At the beginning of this article, we asked several research questions about the sense, direction and effects of the insertion of words from scientific sources into journalist discourse. Our aim has been to reveal the role of scientific voices on an issue where they are entitled to talk, and to explain the orientation of discourse depending on the forms of quotation, above all in a situation of crisis such as the 'mad cows' affair has been and still continues to be.

Another kind of question is related to the use that journalists make of citation: is quoted speech a way of abdicating the responsibility of journalists or a means of orientating their position on the topic of reference? As Moirand (2000) points out, journalists compensate for what she calls an 'insecurité discursive' by bringing to their discourse the very many voices involved in the problem. By doing so they dramatize the conflict. At all events, the amount of quoted material of non-scientific individuals, mainly politicians, in circulation indicates that responsibility is assigned to socio-political actors, even if the information has its origin in a report by a group of researchers.

Why are scientific voices so scarcely represented? Our proposed division of the journal articles studied into different stages may help to give an answer to this question. This procedure has been useful in allowing us to grasp the modi-
fications suffered by [illegible]

In our analysis, the first and second phases of the news story are just four days apart, while the third phase comes nearly a month later. The first phase is marked by the representation of scientists as a collective dependent on political directives (parliament, ministers, organizations). The scientific community is presented in the context of social life as a class that is expected to give quality information. The first problem arises: the demands of media information and the nature of scientific information collide. They reflect two ways of representing knowledge: science based on ongoing search, on the discussion of hypotheses, with no conclusive evidence; the media representation based on the idea that scientists are able to provide an account that will bring a quick solution to the problem.

The second phase is marked by diversification and individualization, while written studies are drawn upon also as a credible referent. A variety of experts and texts are called upon and, according to the state of knowledge, still not established or accepted, different points of view are reported. This is a legitimate position in the context of science, but again the problem arises when it is presented to a public that needs to make urgent decisions, adding to the confusion created in the first phase.

The third phase is marked by reference to a scientific source, the publication of a microbiology research article about the possible infectious agent of the disease. In this phase the standard way of communicating advances in science is respected. The progress in scientific information is presented and explained within its strict limits through the text and the group, only incidentally individualizing the research actors. But though it seems that some of the causes of the disease are beginning to be explained, in the context of social alarm and economical conflict, this cannot fulfil the more immediate and urgent needs of the general public.

As for the evaluative activity of journalists, it seems that the use of reported speech is a means of orientating their position on the topic of reference, as well as or even more than a way of abdicating their responsibility to inform objectively. Journalists seem to assume that they reflect public needs and fears as well as the loss of control that a health crisis situation generates. If the scientific role is not considered a decisive social role capable of mitigating social alarm on its own, journalists are not able to assign or recognize the limits of scientific knowledge and to present such limits as a worthy fact in itself. In the public context, the consequence is that this knowledge is a source of confusion rather than a contribution to an understanding of the problem.

9. Conclusion

In conclusion, we can say that the analysis of the 'quoting frame', in its canonical components of agent identity and reporting verbs, gives a representation of what the press considers relevant for that part of information which is based on words, not on facts. The most outstanding feature is that multiple voices are called upon to clarify a situation where decisions have to be taken at different levels. In actual fact, the 'mad cows' affair is an example of the propagation of ongoing research through political instance. The circulation of information generated in

a research context, once set in different contexts, may create the confusion that we have been able to describe in the analysis of the choice of reporting verbs, showing different attitudes, understanding and interests.

The study of the 'mad cows' case shows the differing pace of science and daily life as a gap that is manifested through the way the press, reacting consciously or unconsciously to a situation of crisis, gives rise to different voices. Scientific voices have a limited role in the press, much less weight than those of political actors. Individual scientific authorities (researchers) are presented in a lower position than scientists as a generic class or in a civic/administrative role. As for the communicative position, journalists attribute a *neutral* and *popularizing* stance to individual researchers and a *controversial* and *tentative* position to the scientist in general, both of these contrasting with the *positive, interaction-oriented* position attributed to the social agents with a political function.

The position assigned to scientists is a qualified one but not efficient enough, managing a kind of knowledge (a) that rests on *tentative* hypotheses and questions under *research* and (b) because the advances of science do not give rise to results with immediate answers to social needs. In fact, the two representations of knowledge show their contradictions when they are placed side by side: the scientific representation (science domain) and the social representation (society domain). A question remains unanswered: whether confidence in scientific work can be maintained in the media even if what is communicated is the limited state of scientific knowledge.

These conclusions should be contrasted with the analysis of the role and position of scientific voices in the new 'mad cows' episode which peaked at the turn of the century. Approximately five years after the first appearance of the story in the media, a new episode of the crisis has developed. Following this rich communicative event should provide ways of accounting for journalists' responsibility in representing science in social life and their contribution to a better public understanding of science.

Notes

This is the final version of a study carried out under the auspices of DGES project no. PB96–0292. 'Análisis discursivo de la divulgación científica: aspectos pragmáticos, textuales y retóricos' as part of the program of the Dirección General de Enseñanza Superior del Ministerio de Educación y Cultura (1997–2000) of the Spanish Government, and presented as a paper at the *VII International Pragmatics Conference* in Budapest (2000). A first version was originally presented as work in progress at the *I Simposio Internacional de Análisis del Discurso*, Madrid, 1998 (see Calsamiglia and López Ferrero, 2001, and Calsamiglia and Cassany, 2001).

1. D1 refers to main discourse by writer 1 (W1); D2, to quoted discourse by writer 2 (W2).
2. An exhaustive classification of reporting verbs has been proposed by Battaner et al. (2001): *assertive communicative* ('decir, comunicar, preguntar, asegurar, prometer, manifestar, admitir'), *communicative claim* ('asegurar, recalcar, insistir, reiterar, precisar, puntualizar'), *attention focus* ('observar, señalar, ver, reflejar, advertir, indicar, destacar').

positive evaluation ('alabar, elogiar, aprobar, dar importancia, destacar, subrayar. recalcar'), *negative evaluation* ('reprochar, desaprobar, criticar, acusar, lamentar, atacar, descartar'), *demanding* ('pedir, ordenar, mandar, prohibir, exigir, aconsejar, instar a, suplicar, reclamar, solicitar'), forms of *speech* ('susurrar, tartamudear, suspirar, gritar, exclamar, chillar, carcajearse, reírse, gruñir, murmurar, declamar, tararear, cantar, recitar'), *discourse markers* ('empezar, comenzar, añadir, seguir, acabar, terminar, continuar, concluir'), *discourse action description* ('comentar, desarrollar, considerar, plantear, proponer, tratar, sostener, confesar'), *interaction description* ('intervenir, responder'), *metalinguistic markers* ('narrar, citar'), *opinion verbs* ('opinar, juzgar, considerar, creer, dar su opinión, estar convencido de, calificar, sugerir, estimar'), *counterarguments* ('discutir, objetar, rectificar'), *analysis* ('analizar, distinguir, establecer, hacer una distinción'), *comparison* ('comparar, ejemplificar'), *thinking and observing* ('pensar, especular, sentir, ver, oír').

3. The analysis of citation in the three first days in those newspapers at the moment when it became known that BSE might be transmitted to humans has been studied in Calsamiglia and López Ferrero (2001).
4. In the examples, we stress in bold the linguistic structures (the pre-citations) analysed.

Relativity and Its Discontents: Language, Gender, and Pragmatics

Deborah Cameron

1. The "Social Constructionist Turn" in Language and Gender Research

The approach to language and gender that is probably most familiar to most people (including many scholars who are not specialists in the field) is one that focuses on identifying, describing, and explaining what are taken to be characteristic differences in the discourse styles of women and men. This research tradition (now sometimes referred to variously as "modernist," "essentialist," or "second wave," by contrast with the subsequent "postmodernist," "social constructionist," or "third wave" approaches I describe below[1]) is usually thought to have emerged in the mid 1970s, with Robin Lakoff's pioneering essay *Language and Woman's Place* (1975). Lakoff's account of male-female differences exemplified what came to be called the "dominance" current, which related the linguistic behaviour of men and women to their unequal social positioning. Later, an alternative "[cultural] difference" approach emerged, in which less emphasis was given to inequalities of power: rather, men and women (and, more especially, boys and girls) were seen as members of distinct (sub)cultures within which they acquired differing norms for everyday communication (Maltz and Borker 1982). Since the interactional socio-linguist Deborah Tannen popularized a version of this thesis in her best-selling book *You Just Don't Understand* (1990), a host of pop-psychology and self-help writers (notably John "Mars and Venus" Gray [1992]), have reinforced its status as folklinguistic common sense.

Yet most language and gender research today is informed neither by this view nor by the alternative "dominance" view. At the same time that Tannen's work

Source: *Intercultural Pragmatics* vol. 2, no. 3, 2005, pp. 321–334.

was prompting criticism from some of her colleagues (e.g., Freed 1992; Troemel-Ploetz 1991; Uchida 1992), many researchers were questioning some of the fundamental theoretical assumptions on which both "dominance" and "difference" approaches relied, suggesting that both were flawed by their "essentialist" view of gender. The popularity of Tannen's work on male-female misunderstanding, and of the reductive and stereotypical "Mars and Venus" accounts that followed, gave increased urgency to this questioning process. What emerged over the next few years was a new approach which, as I noted in passing above, has been given a number of labels, including "postmodernist" (Cameron, in press), "social constructionist" (Weatherall 2002), and "third wave" (Baxter 2003).

I have given a more detailed account of this shift and its implications elsewhere (Cameron, in press); the table below provides a brief summary of the key theoretical assumptions characteristic of the new approach and how these contrast with the assumptions made in earlier work.[2]

Within what I will henceforth follow the majority of commentators by calling the "social constructionist" paradigm (though with the terminological reservations

Table 1: Contrasting approaches to language and gender

"Modernist"/"second wave"/ "essentialist" approach	"Postmodernist"/"third wave"/ "social constructionist" approach
Views gender as a stable attribute of individuals, a part of their core identity that is normally acquired in the course of their early socialization. Language-using reflects or marks the speaker's (pre-existing) gender identity.	Views gender as ongoingly "performed" or constructed through engagement in particular local practices; gender is not something you "have" or "acquire" once and for all early in life but something you do continually. Language-using is part of "doing/performing" gender and thus is constitutive of gender.
Focuses on binary gender *difference*: presupposes the existence of two internally homogeneous groups, "men" and "women," and looks for generalizations about differences between them. Most studies deal with "mainstream" gendered subjects – often white, straight, middle-class, and monolingual.	Focuses on gender *diversity*: assumes that there are multiple masculinities and femininities, inflecting or inflected by other dimensions of social identity (e.g., class, ethnicity, generation); intra-group differences and inter-group similarities are as significant as differences between gender groups. Is also interested in "liminal" cases which challenge the binary logic of gender (e.g., transgendered or "queer" speakers).
Favours global generalizations and "big stories": linguistic gender differences are explained in terms of overarching social structures, e.g., male dominance or separate gendered subcultures.	Favours "looking locally" for explanations of gender-related patterns: masculinities and femininities are produced in specific contexts or "communities of practice," and it cannot be assumed that the same patterns will be found in all or most cases.

expressed in note 1), it is possible to distinguish several sub-currents. Some researchers, most of them socio-, applied or "critical" linguists, are influenced by either Judith Butler's formulation of gender as "performative" (Butler 1990) or the "communities of practice" model drawn from Lave and Wenger (1991) and most influentially disseminated to language and gender scholars through the work of Penelope Eckert and Sally McConnell-Ginet (1992, 1999) – or, in some cases, by both of these. Others espouse a form of social constructionism that is theoretically rooted in the ideas of Harold Garfinkel and Erving Goffman (and feminist elaborations thereof, such as Kessler and McKenna 1978; West and Zimmerman 1987), and their preferred approach to the analysis of discourse is conversation analysis (CA), originally an offshoot of Garfinkelian ethnomethodology. Many researchers in the latter group have a disciplinary affiliation to social psychology; some are adherents of "discursive psychology" (cf. Potter and Wetherell 1987) who combine CA methods with poststructuralist theoretical ideas about subjectivity, identity, and "discourse" in the Foucauldian sense (e.g., Edley and Wetherell 1997; Wetherell 1998).

2. Debates within Social Constructionism

Among social constructionist language and gender researchers, and especially the CA-oriented group, there has been vigorous debate during the past few years on the issue of "realism versus relativism" (e.g., Speer 2000). Much of this has turned on the methodological question of whether it is legitimate for analysts of discourse to make gender relevant in analysing data where the participants themselves do not orient to it explicitly as a concern (see e.g., Kitzinger 2000; Stokoe and Smithson 2001; Weatherall 2000, 2002). In "classical" CA (see e.g., Schegloff 1997, 1998) it is axiomatic that one does not go "beyond the data" nor impose analysts' categories in place of participants' own (a position that follows the logic of ethnomethodology, with its insistence on viewing social order as a local "members' accomplishment"). For many feminists, on the other hand, the "classical" approach is open to the criticism that it denies the relevance of gender differentiation/inequality as an overarching principle of social organization, and so prevents analysts from taking proper account of its effect on all social interaction.

This debate is sometimes presented as an argument between more and less radically constructionist positions. Gender "realists" hold that even if gender is diverse and locally variable in its actual forms, differentiation/inequality between women and men is nevertheless a "real" social fact that in some form can be assumed to have "global" relevance. Gender "relativists" deny this, arguing that gender is *radically* local: it is only "there" when participants in an interaction explicitly make it relevant, and an analytically satisfying account of their behaviour in that case should not need to import from outside the data more general or "global" assumptions about gender as a macro-social category. Some researchers who take this position would see the use of global assumptions about gender as covertly reintroducing a form of essentialism, and so vitiating the analysts' claim to be working within a social constructionist framework. Yet some of their

opponents would retort that the kind and degree of essentialism gender "realism" represents is a strategic necessity if discourse analysis is to serve feminist ends. The debate, then, is not only technical and methodological, a question of how to go about the practical business of analysing discourse data, but also political, a question of what feminist discourse analysis is or should be centrally about. For "realists," one key goal of feminist analysis is to show how unequal gender relations are (re)produced in various kinds of talk and text. "Relativists," while they do not necessarily reject that goal, tend to define a feminist analysis as one that eschews a priori assumptions about gender, seeking instead to reveal the constructed and contingent nature of gender categories themselves.

This debate may look quite different from the earlier "dominance versus difference" debate, but while there are indeed some significant differences, there are also similarities. In the "dominance versus difference" case, too, there was a dispute about the relationship of gender to power (whether it is legitimate for analysts to postulate that one always implicates the other), which was played out in arguments about analytic procedure. In her paper "The relativity of linguistic strategies," Deborah Tannen (1993) warned against what she regarded as the typical "dominance" analytic procedure of reading power relations off from the presence in discourse of particular linguistic forms or discourse strategies – for instance, equating the act of interrupting someone with asserting dominance over them. She argued that since the meaning of any form or strategy is contextually "relative," this way of proceeding analytically risks finding meanings in discourse that were not salient for the participants, and attributing to the participants intentions they did not have. (For example, someone who interrupted an interlocutor may have intended not to assert dominance over them but to signal solidarity and support for what they were saying.)

Though the argument is framed differently, there are surely resemblances between Tannen's concerns about "dominance" analysts imposing their own interpretation and/or political agenda on discourse data and the concerns of contemporary analysts favouring the "classical" CA approach. More generally, it seems feminist discourse analysts a decade on are still arguing about some of the same questions the "dominance versus difference" debate turned on, albeit within a different theoretical framework. Where, as analysts, should we look for the workings of gender in discourse? On what grounds is it legitimate to argue for the relevance of gender, and of power relations between gender groups, in analysing a particular piece of data? Though the answers proposed have changed, these questions have evidently not been resolved or transcended by the turn to social constructionism.

Among today's social constructionists, it is generally accepted that discourse strategies do have the property Tannen calls "relativity": the mapping from linguistic form to discourse function is typically many-to-many rather than one-to-one. But as I pointed out in a response to Tannen's 1993 article (Cameron 1998), accepting the postulate of relativity does not in itself resolve all disputes. Relativity, after all, is not only an issue for discourse analysts; it is also a practical problem for participants in discourse. If interaction is to go on in the ways we know it does, participants in any specific case must be able to

multiplicity of interpretations that might in principle be licensed by an utterance or turn-at-talk, and decide what, in that context, would constitute the "best" or most plausible interpretation. The question of how they do that – and how the process might be affected by gender and/or power differences – is not, I would argue, satisfactorily answered in either Tannen's account or the more "radical" social constructionist accounts that have succeeded it.

Tannen's argument was that recipients in practice resolve ambiguities by unconsciously invoking gender-specific assumptions about the function and proper conduct of social interaction. Men place utterances addressed to them in a "status" frame, whereas women place the same utterances in a "connection" frame: the result is often misunderstanding. Thus Tannen (1993) analyses a vignette in which two co-workers, a woman and a man, are walking between buildings on a cold day. The woman asks the man where his coat is (i.e., remarks on the fact that he is not wearing one), and the man responds, "thanks, mom." According to Tannen, the woman's remark was intended to convey friendly concern, but since the man placed it in a status-oriented frame, he took it as a put-down and responded by putting the woman down – "thanks, mom," addressed by an adult to someone other than their mother, implies that the addressee is inappropriately bossy and interfering, and is subordinating the other by treating them as a helpless or irresponsible child.

In the analytic framework favoured by those on the "relativist" side of the current debate, there is no place for the kind of global assumptions about gender (i.e., that men as a group seek status and women connection) that are invoked in Tannen's analysis of the "coat" vignette. However, the relevance of gender to this exchange would be acknowledged in a "classic" CA analysis making use of the "next turn proof procedure." It is a general principle in CA that a recipient's understanding of the prior turn will be displayed in the response they produce in their own next turn: the analyst can therefore warrant claims about what an utterance meant by looking to the next turn. In the "coat" case, the man's use of the gender-specific appellation "mom" is evidence that he takes gender to be relevant. If, on the other hand, he had said something like [sarcastically] "I appreciate your concern," it would still be possible for the analyst to assert that the man interpreted the woman's remark as inappropriate or uncalled for, but there would be nothing to warrant the further claim that this had anything to do with gender. So whereas in Tannen's approach gender is globally relevant, and by implication factors into every act of interpretation, in the CA approach its relevance is limited to just those cases where participants explicitly display their orientation to it by mentioning it.

This is where my own argument begins; for in my view, both these approaches are unsatisfactory: one does not sufficiently restrict the claims an analyst can make about the interpretive behaviour of participants in discourse, while the other, conversely, is too restrictive, suggesting that nothing can be relevant for analysis unless its relevance for the participants is overtly displayed in the words they actually utter. Between these extremes, I would suggest, is another possibility: making use of the insights of Gricean pragmatics (Grice 1975), and the elaboration of those ideas in relevance theory (Sperber and Wilson 1986).

3. A "Pragmatic Turn"?

Though there are some important differences between the Gricean model of communication and relevance theory (which limitations of space prevent me from pursuing here), the key insight these pragmatic approaches share is that meaning is *inferred* rather than *decoded*: derived not simply by processing the manifest content of an utterance or text, but by putting that together with propositions which are retrievable from context or from background knowledge in order to generate inferences about what is meant or intended. Rather than explicitly providing everything necessary for an adequate interpretation, utterances/texts will provide evidence that cues the hearer to look for other propositions (i.e., ones that are not explicitly encoded) that may be relevant for interpretation. There is, of course, no guarantee that the inferences generated by hearers will lead them to the precise meaning a speaker intended to communicate. (Meaning is, in that sense, "relative" or indeterminate.) But the inference-based account does imply that in the normal case the hearer will make the effort necessary to generate *a* meaning: s/he will not simply conclude that since all strategies are multifunctional and polysemous, what this speaker on this occasion means by X is undecidable.

Any inference-based account of meaning must immediately call into question the idea that something – for example, gender – has to be mentioned overtly in discourse to count as relevant for an analysis of what was meant or how it was interpreted. In an inferential account of communication it is assumed that conversationalists in their active efforts to make sense of discourse have far more to bring to bear on that discourse than what is explicitly and overtly encoded in it; furthermore, it is routinely expected that they *will* "go beyond the data" in this way. On that basis, it is possible to argue for the potential relevance of gender (or rather, of conversationalists' background knowledge and beliefs about gender) even in cases where gender is not explicitly at issue in discourse.

For example, the title of my article "Is there any ketchup, Vera?" (Cameron 1998) quotes an utterance which a friend of mine recalled her father addressing regularly to her mother at the family dinner table (the condiment varied – it might be mustard or pickle rather than ketchup – but the form remained constant). I chose to examine this particular case because it provided a counter-example to a claim made in the literature on male-female misunderstanding, that men have difficulty in understanding indirect requests. "Is there any ketchup?" was clearly issued (in this case by a man) and interpreted (by his wife Vera) as an indirect request, that is, both of them understood that the intention was not to request information about the availability or otherwise of ketchup, but to request (indirectly, since the utterance is linguistically coded as a request for information) that Vera go and get the ketchup. My friend also reported that whereas her father's use of this strategy invariably elicited the desired response (the action of getting ketchup), if she, the daughter, used the same strategy, her mother typically treated it as the request for information it appeared to be, responding with an utterance such as, "Yes, it's on the kitchen counter."

Here we might ask, is it plausible to suggest – as an analyst using the next turn proof procedure might be led to suggest – that Vera understands the same utterance as an indirect request when it comes from her husband, but as a request for information when it comes from her daughter? There is certainly a difference in her overt uptake of the utterance in the two cases, but it surely does not follow that Vera must believe the underlying communicative intention to be different. In a pragmatic framework her contrasting responses are most readily explained as a consequence of her deploying certain beliefs (which in this familial context she takes to be background knowledge for all parties present) about the nature of her obligations to other family members: specifically, that a husband who wants ketchup is entitled to have it fetched by his wife, whereas a daughter who wants ketchup is not entitled to the same service from her mother. In that case, beliefs about gender (more exactly, about the gendered roles of wife/mother, husband, and daughter) are relevant for the analysis of Vera's discourse, even though gender is not explicitly mentioned anywhere in the exchanges under discussion.

In my article, I made the more general suggestion that many cases of so-called "male-female misunderstanding" do not involve any misunderstanding (in the sense of failure to retrieve the speaker's intended meaning or some plausible "best guess" at it), but are rather instances of *conflict* between men and women who are either bringing to bear different background assumptions about their roles, rights and obligations, or strategically resisting what they infer to be the other's assumptions (as Vera is doing when she pretends not to hear her daughter's "is there any ketchup" as a request whose intended meaning is identical to her husband's when he utters the same formula). It is for this reason, I argued, that the alleged problem of male-female misunderstanding appears to be common in societies where the influence of feminism has made gender relations a matter of contestation, whereas it does not appear to prompt the same concern in societies where more extreme gender segregation and male dominance remain the unquestioned norm. If the root cause of the problem were what Tannen claimed – that males and females acquire their habitual ways of using language in separate and highly divergent subcultures – one would surely expect to find exactly the opposite.

The kind of conversational gender trouble Tannen struck such a chord by describing is in my view related, then, not to differences in men's and women's ways of communicating, but to the extent to which they diverge in their assumptions about gender itself. Vera and her husband understand one another perfectly and there is no conflict between them, because although their social roles are differentiated along conventional gender lines, they both accept this differentiation as appropriate: they do not disagree on what each is entitled to expect from the other and obligated to provide for the other. For many less traditional couples, this is more a matter of contention and the resulting conflicts are played out in discourse – among other things, through both real and strategic "misunderstandings."

The arguments just outlined (Cameron 1998) were developed in response to Tannen's "cultural difference" approach, but they seem to me no less pertinent

to the debates going on now among social constructionists. Arguably, even the strictest "relativists" covertly depend on mobilizing the kinds of background assumptions about gender I invoked in the above discussion of the "ketchup" example. Even where the relevance of gender is not disputed, because it is explicitly made relevant – as in the utterance of "thanks, mom" in Tannen's "coat" vignette – the analyst in effect has to "go beyond the data" in order to say anything about how or why gender is being made relevant. To understand why "thanks, mom" can be heard in this context as taking the prior turn to be inappropriate, judgmental, and unwelcome to the recipient, we need to access not merely the dictionary meaning of "mom" but a cluster of assumptions and beliefs about social roles and behaviours to which that appellation is likely to direct the hearer's attention, thus enabling her to *infer* that her previous utterance was unwelcome.

A conversation analyst might reply at this point that CA is simply not interested in what might be going on in conversationalists' minds – for instance, their intentions and their reasoning about others' intentions: what matters is to account for the observable orderliness of their conversational behaviour. As a microanalytic approach which looks at the organization of discourse turn by turn, CA's great strength is its ability to provide answers to the question "why that now?" or, in other words, give an account of what is being accomplished locally by the production of a particular turn at a particular moment in the unfolding interaction. But as a number of commentators have pointed out, there are clearly supra-local patterns in the way gender is enacted and talked about, which cannot be accounted for using a purely "local" analytic approach. To answer the question "why that now?" it is often necessary to presuppose an answer to the prior question "why that *ever*?"

For example, analysts have repeatedly found people doing extensive identity work in order to claim certain identities/attitudes relating to sex and gender while disclaiming others: they are at pains to establish themselves as gendered in ways that avoid the extremes of either sexism or militant feminism, and as heterosexual but not homophobic (Edley and Wetherell 1997; Speer 2002; Speer and Potter 2000). In their accounts of this behaviour, analysts implicitly make use, expect their readers to make use, and for that matter must suppose that participants themselves were making use, of such common-sense propositions as "a normal person is unambiguously either a woman or a man," "homosexual identities are stigmatized," and "being openly prejudiced against certain groups is socially disapproved behaviour." The fact that participants in talk recurrently take certain issues as requiring careful management makes sense only in relation to background assumptions like those just listed, which are "global" rather than "local" in the sense that they pre-exist the particular conversation being analysed. Strictly speaking, it is "going beyond the data" to invoke them: but if you do not invoke them, you are arguably missing an important dimension of participants' own behaviour – the use they routinely make of knowledge drawn from sources other than the ongoing interaction itself.

With regard to gender (and other socio-demographic variables such as class, age, and race/ethnicity), we ignore or downplay this dimension of participants' behaviour at our peril, since one kind of knowledge that people routinely [illegible]

to bear on inferring others' probable communicative intentions is their knowledge about the person and/or the type of person they are dealing with. Though the theoretical developments discussed above in connection with the social constructionist turn have led to a strong focus on the speaker's performance of gender, it should not be forgotten that gender is not only performed by speakers but also ascribed to them by the recipients of their discourse. As Weatherall (2000, 2002) has pointed out, there are few situations in which an interlocutor's gender is not manifested – visually, vocally, or both in the case of spoken interaction, and through the explicit naming of authors which is typical, though not invariable, in written texts – and also few situations where it is not regarded by most people as salient information. Whenever I speak, the information that I am a woman is available (conveyed by the pitch and timbre of my voice, as well as my bodily appearance in face-to-face contexts) to be used by my interlocutors in their interpretations; even if my discourse does not evidence any intention to make my gender relevant, interlocutors can always choose to treat it as such.

One manifestation of sexism as a "global" social force is the propensity to treat gender, particularly the gender of women as the marked and subordinated category, as omnirelevant, and, on that basis, to generate inferences which are not warranted by anything in an individual's actual behaviour, but are rather based on propositions about the social category that individual belongs to. Like many women working in highly traditional male-dominated institutions (in my case, Oxford University), I am made aware of this propensity on a daily basis. I pick up the phone and the person who is calling assumes I must be the professor's secretary rather than the professor. I enter a college or university building and the porter assumes I am a student rather than a member of the faculty. Sometimes, the gendered basis for the inference is indeed displayed in what the caller or the porter says (e.g., the porter addresses me as "my love," which he would not do to someone he knew to be a senior academic, nor to a male of any social/professional status); but even when my interlocutor's judgement of me is displayed through a gender non-specific kind of disrespect (e.g., "hey, where d'you think you're going?"), I know very well, from experience and observation of similar scenarios involving men and women over time, that I am being treated in this way because of the meaning my interlocutor attaches to my gender. Similarly, people of colour learn to identify certain kinds of disrespect as connected to their race/ethnicity, though in this case it is (nowadays) even less likely than in the gender case that the interlocutor will make explicit reference to category membership in performing the act of disrespect.

In these examples, there is a temporal or historical dimension: it is the repetition of the same pattern on many different occasions which leads the recipient of disrespectful behaviour to infer, perhaps on the basis of what might otherwise seem scanty or equivocal evidence, that gender or race/ethnicity must also be relevant on this particular occasion. The local instance, in other words, is interpreted in relation to a whole history of comparable instances, as part of a more "global" pattern. So another problem with "relativist" approaches which insist on confining analysis strictly to what can be observed in the local instance is that they downplay or even deny the relevance of participants' histories, and

the cumulative knowledge they have built up during those histories, to their behaviour at any given moment.

It is perhaps worth pointing out that Judith Butler's most famous statement about the socially constructed and performative nature of gender actually emphasizes repetition and temporality: "Gender is the *repeated* stylization of the body, a set of *repeated* acts within a highly rigid regulatory frame, which *congeal over time* to produce the appearance of substance, of a 'natural' kind of being [emphasis mine]" (Butler 1990: 33). The gender "realist" Margaret Wetherell somewhat similarly suggests that interpretative strategies "congeal over time": that rather than coming to every new utterance or exchange with no preconceptions, communicators make use of what she calls "interpretive repertoires ... culturally familiar and habitual line(s) of argument comprised of recognizable themes, commonplaces, and tropes" (Wetherell 1998: 400). She goes on to suggest that in declining to entertain such non-local constructs on the principle of not going beyond the data and not imposing analysts' concerns in place of participants' own, proponents of classical CA are, in fact, imposing their own very narrow concept of what is relevant for participants locally:

> It is the conversation analyst in selecting for analysis part of a conversation or continuing interaction who defines this relevance for the participant. In restricting the analyst's gaze to this fragment, previous conversations, even previous turns in the same conversation, become irrelevant for the analyst, but also by diktat for the participants. We do not seem to have escaped, therefore, from the imposition of theorists' categories and concerns. (Wetherell 1998: 402)

I agree with Wetherell's point here as far as it goes; but what I have been arguing in this discussion is that the problems she is pointing to might usefully be addressed by adopting an approach to the analysis of discourse that is informed by the insights of relevance theory. Though this theory is often thought of as an asocial, cognitivist approach, it is arguably capable of being applied to phenomena which are of interest to feminist and other "critical" discourse analysts: one could focus on the social and ideological propositions that conversationalists have access to, and that they use in making inferences. This approach might enable analysts to give more substance and detail to concepts like "interpretive repertoire" and to describe how in specific instances people mobilize particular interpretive repertoires. It might also enable analysts to ask questions about the social distribution of those repertoires and the assumptions associated with them (i.e., whether there are consequential social and cultural differences at the level of what people take to be "common knowledge" or in Wetherell's phrase "culturally familiar and habitual lines of argument"), without falling into the kind of cultural essentialism for which Tannen's version of interactional sociolinguistics has been criticized.

Perhaps the most important insight pragmatics has to offer to social constructionist feminist discourse analysis, though, is a general theoretical one:

that in "going beyond the data," or bringing "global" assumptions to bear on local instances, analysts need not be automatically thought of as imposing their own procedures in place of the participants'. In any inferential approach to communication, it is axiomatic that participants are using other information besides what is actually encoded in discourse to derive meaning from what is said. By seeking to model this process in a principled way, we might hope to arrive at a better understanding of – and perhaps a greater degree of consensus about – the relevance of gender for communicational behaviour.

Notes

1. There are problems with all these terminologies. The "second/third wave" distinction is somewhat obscure (it alludes to "second wave" feminism, i.e., the post-1968 liberation movement as opposed to the "first wave" nineteenth and early twentieth century suffragist movement, and posits a more recent "third-wave" feminism whose putative date of onset and distinctive characteristics are, however, disputed). The "essentialist/social constructionist" distinction is highly value-loaded ("essentialist" has become a smear-term rather than a descriptive label), and is also misleading inasmuch as all feminist theory since Simone de Beauvoir ("one is not born but becomes a woman") could aptly be described as "social constructionist": the whole concept of gender, as distinct from sex, is inherently social constructionist. "Modern/postmodern" is my own preferred terminology, but I concede it has the (considerable) disadvantage of invoking one of the most variable and contested terms in current theoretical discourse (i.e., "postmodern[ism]").
2. This table presents the two approaches in an "ideal-typical" form that has the effect of maximizing the degree of difference between them: it should be borne in mind, as always with such oppositions, that the reality is more complicated. It should also be noted that the shift from "second" to "third wave" assumptions is not a matter of simple chronology (that implication is another reason why the "wave" terminology is problematic). There was no historical moment before which everyone subscribed to the assumptions set out in the first column, and after which everyone subscribed to the assumptions set out in the second column. Rather there has been a shift in the overall balance between two historically overlapping tendencies, such that "third wave" assumptions are now dominant (which does not mean "second wave" assumptions have vanished altogether).

The Analysis of Discourse Flow

Wallace Chafe

Introduction

Language is a dynamic process. It is easy to forget that fact when one is working with language that has been frozen on paper or a computer screen, where it has been turned into something that can be examined as if it were a fixed object. So much of linguistic analysis has dealt with language in written form that there is a temptation to think of language itself as having the same static quality (cf. Linell 1982). But language in action is better captured with the metaphor of a flowing stream.

There are, in fact, two streams, one a stream of thoughts, the other of sounds. The two have very different qualities. It is instructive to compare the experience of listening to a familiar language with listening to a language one does not know. In the former case it is the thoughts, not the sounds, of which one is conscious, but in the latter case only the sounds. Sounds are easier for an analyst to deal with, simply because they are publicly observable. Thoughts are experienced within the mind, and for that reason are less tractable to objective research. On the other hand thoughts enjoy a priority over sounds in the sense that the organization and communication of thoughts is what language is all about. The sounds exist in the service of the thoughts, and follow wherever the thoughts may take them. It is the thoughts that drive language forward. A basic challenge for discourse analysis is to identify the forces that give direction to the flow of thoughts.

1 Topics

Important among these forces are what I will be calling *topics*. This word has been used in different ways, and I should make it clear that I am not using it to

Source: Deborah Schiffrin, Deborah Tannen and Heidi E. Hamilton (eds), *The Handbook*

apply to a constituent of a sentence, as when one speaks of a sentence having a "topic and comment" (e.g. Hockett 1958: 201), or of "topic-prominent" languages (Li and Thompson 1976), or of "topicalization" or "topic continuity" (e.g. Givón 1983). Rather, I am using it to refer to what is sometimes called a "discourse topic" (Brown and Yule 1983: 71), as in "the topic of this paragraph." A topic in this sense is a coherent aggregate of thoughts introduced by some participant in a conversation, developed either by that participant or another or by several participants jointly, and then either explicitly closed or allowed to peter out. Topics typically have clear beginnings, although that is not always the case (cf. Tannen 1984: 41–3), and their endings are sometimes well defined, sometimes not. As long as a topic remains open, participants in a conversation experience a drive to develop it. I began chapter 10 of Chafe (1994) with a quote from William James that nicely captures this drive:

> In all our voluntary thinking there is some topic or subject about which all the members of the thought revolve. Half the time this topic is a problem, a gap we cannot yet fill with a definite picture, word, or phrase, but which . . . influences us in an intensely active and determinate psychic way. Whatever may be the images and phrases that pass before us, we feel their relation to this aching gap. To fill it up is our thought's destiny. Some bring us nearer to that consummation. Some the gap negates as quite irrelevant. Each swims in a felt fringe of relations of which the aforesaid gap is the term. (James 1890, vol. 1: 259)

Sensitivity to the topic structure of talk may be a trait that varies with individuals. Casual observation suggests that people are constrained to varying degrees by the need to develop a topic fully before the conversation moves on to another, and that there is variable recognition of the social right to topic development. One wonders if such differences in conversational style can be traced to differences in the degree to which a person experiences James's aching gap and the need to fill it.

A first step in discourse analysis can be to listen to a recording of a conversation with the goal of identifying topics, segments of discourse during which one or more of the speakers talk about "the same thing." Topics are identifiable above all from their content, but there are likely to be phonetic cues as well: sometimes, though certainly not always, a longer-than-normal pause before a new topic is introduced; sometimes heightened pitch, loudness, acceleration, or a new voice quality at the outset; sometimes a tapering off in these same prosodic features at the end. One may find topics varying greatly in length. There may be occasional stretches of discourse during which there appears to be no topic at all. But most parts of most conversations lend themselves well to analysis into units of this kind.

There appears to be a basic level of topic-hood, with topics at that level typically included within more inclusive *supertopics*. The latter also have identifiable beginnings and endings, but they lack the internal structure that characterizes basic-level topics and do not generate the same drive for closure. James's ach-

Each time a basic-level topic is concluded, any participant in a conversation has the option of abandoning the current supertopic and, by introducing a new basic-level topic, introducing a new supertopic at the same time. With no internal structure of their own, supertopics can be abandoned whenever any included basic-level topic has been completed.

After a particular basic-level topic, or some sequence of them, has been chosen for further study, the next step can be to reduce the flow of language to some written form. The word *reduce* is appropriate. There is no way in which the richness of natural speech, with all its prosodic complexity, its accompanying gestures and shifts of gaze, and ultimately the entire physical, social, and cognitive context in which it took place – no way in which all these factors can be captured in any presently conceivable written form. Thus, any attempt to transcribe spoken language on paper inevitably leaves much out. The transcriber needs a system that is more or less adequate for the questions addressed, but needs always to keep in mind that any system only selects from the totality of observations that might be relevant (Du Bois et al. 1993; Chafe 1993, 1995).

It is useful in this process to identify a unit of transcription that reflects another level of organization. In addition to basic-level topics, language gives evidence of the organization of thoughts from moment to moment into a focus and a periphery: a limited area of fully active consciousness surrounded by a penumbra of ideas in a semiactive state. Each focus is expressed in sound with a brief prosodic phrase, typically one to two seconds long, whose properties include one or more of the following: a distinctive terminal intonation contour, an initial resetting of the pitch baseline, the presence of silence before and after, a change of tempo at the beginning or end, and boundary changes in voice quality such as whispering or creaky voice. Intonation units are a pervasive feature of natural speech. Not only do they provide a useful way of segmenting speech, they are profitably viewed as expressing constantly changing foci of consciousness, and hence their relevance to understanding the flow of thought (Chafe 1994: 53–81).

2 Topic Navigation

In this perspective a topic can be seen as a conceptual unit that is too large to be accommodated within the limited capacity of fully active consciousness. A topic as a whole can thus be present only in a semiactive state. Once a topic has been introduced, the more limited focus of active consciousness navigates through it, activating first one included idea and then another until the topic is judged to have been adequately covered and closure is judged appropriate. This navigation process is often guided by a *schema*, some familiar pattern that provides a path for a speaker to follow (e.g. Bartlett 1932; Chafe 1986). It may also be driven, alternatively or simultaneously, by the less predictable interaction between conversational participants (Chafe 1994: 120–36).

I will illustrate this process with an excerpt from a long conversation in the course of which three women, whose names will be given here as Kathy, Sally, and Chris, were discussing teaching practices in an elementary school classroom.

Kathy was an experienced teacher, Sally was a less experienced teacher, and Chris was a less involved onlooker. We can take up this conversation at a point where its forward movement was momentarily at a standstill. The previous topic had just been closed, and if the conversation was to continue someone had to choose and introduce a new topic. The preceding topics had fallen within the domain of a supertopic I will label Classroom Experiences.

The default option during such a lull in a conversation is for any of the participants to open a new basic-level topic that remains within the current supertopic, in this case to talk about another classroom experience. That choice would leave the supertopic Classroom Experiences open, a situation that can be represented with an open parenthesis. The introduction of a new basic-level topic would then create its own open parenthesis, included within the other. This situation can be represented as follows, where the supertopic is shown in italics:

(*Classroom Experiences* (Classroom Experience 1) (Classroom Experience 2) (Classroom Experience 3

There are two open parentheses that demand eventually to be closed.

An alternative would be for any of the participants in the conversation to introduce a basic-level topic that would close the current supertopic with Classroom Experience 2 and establish a new and different one. Imagine, for example, that someone began talking now about a movie she had just seen, introducing a new basic-level topic that would simultaneously open a new supertopic that could be labeled Current Movies. The effect would be:

(*Classroom Experiences* (Classroom Experience 1) (Classroom Experience 2)) (*Current Movies* (A movie just seen by X

As it happened, Sally chose the default option, opening another topic that remained within the Classroom Experiences supertopic. What she said was:[1]

(1) Sally (0.5) Whát I was gonna têll you about that rèally frústrates me is that,

No one but Sally knew where this topic would lead, and for the moment we can give it the label Something Frustrating. Later we will see how the flow of the conversation would make a different label appropriate.

The words *what I was gonna tell you about* suggest that Sally had planned to introduce this topic earlier. Examination of the larger context reveals that she had tried earlier to do just that. She was unsuccessful in that first attempt because Chris interrupted her with a different topic. What she said earlier was (numbered (0) because it lay outside the excerpt with which we will be principally concerned):

(0) Sally . . Méanwhile in the príncipal's òffice they're tèlling me,

Two other topics intervened before Sally returned to what she had [illegible] in (0), a topic that [illegible]

while the other topics were being developed. It was thus easily available to be reintroduced in (1), which was followed by a second intonation unit whose wording closely resembled that of (0), as we will see.

3 Navigation by Schema

We can now follow this conversation as it unfolded for those engaged in it. At the end we can view a transcript of the conversation as a whole, at the same time considering what, exactly, such a transcript represents. The Something Frustrating topic was at first developed by Sally as a monologue. There is a ubiquitous schema for narrative topic development whose maximum components can be listed as follows (cf. Chafe 1994: 120–36):

- summary
- initial state
- complication
- climax
- denouement
- final state
- coda.

Labov and Waletzky (1967) suggested a similar schema, but inexplicably omitted the climax. An opening summary may or may not be present. Closer to being obligatory is the presentation of an initial state that gives the topic a spatio-temporal and/or epistemic orientation. The complication section disturbs the initial state with events that lead to a climax, an unexpected event that constitutes the point of the topic, the reason for its telling. The denouement then provides a relaxation toward a final state in which new knowledge provided by the climax has been incorporated. There may or may not be a coda, a metacomment on the topic as a whole.

Sally's statement in (1) summarized the content of what would follow by saying that it would entail something frustrating. Not only did she open a new topic and assume the floor, but at the same time by using the word *frustrates* she foreshadowed its organization, creating an expectation that it would involve something desirable followed by an explanation of why that desirable outcome could not be realized. Deciding just how to proceed required additional mental processing time on Sally's part, an interval during which she uttered a prolonged hesitation sound, followed by 1.3 seconds of silence and then an audible breath before she continued:

(2) Sally (0.2) ũh=,
(3) (1.3) (breath) the (0.1) the péop . . the príncipal and stuff they sày to me,

In (3) she repeated, with only partially different words, her earlier attempt to introduce this topic, shown above as intonation unit (0). Early in (3) she decided

to mention the people who had given her advice. Her truncated *the peop* was an attempt at categorizing that idea, but she quickly found a better categorization and produced the interestingly hedged phrase *the principal and stuff*, followed by the quote-introducer *they say to me.*

Looking back at (1), we can see that Sally's consciousness was then operating in what I have called the *immediate mode* (Chafe 1994: 195–223). That is, Sally was talking about what was still frustrating her at the very time she was talking. With (3), however, she moved into the *displaced mode* by shifting to things that had been said to her at one or more times in the past, displaced from the here and now of this conversation. Furthermore, the choice of the *generic mode* (*they say to me*, without reference to any particular event) anticipated that the quote to follow would be generic as well. She was not talking about a particular act of advice-giving, but of events less locally specified. (The context makes it clear that she was not using the historical present here.)

Sally then began the quote, shifting her voice iconically to a higher pitch that lay noticeably above her normal range. The first element in the quote established an affective stance on the part of the principal and the others toward what they were telling her:

(4) Sally (0.9) (tsk) (breath) (begin higher pitch) óh wèll,

The alveolar click (*tsk*) as well as the prosody and wording *oh well* conveyed something of the lack of concern Sally had perceived in the advice: the principal and stuff felt that coping with the third-graders was no big deal.

The next focus established a frame for the recommended action: the idea that Sally should do something specific:

(5) Sally . . whát you dò with those thírd-gràders,

With this utterance Sally created a second level of displacement. Having begun in the immediate mode in (1) (experiencing her current frustration), she used (3) to shift into the displaced world in which she was given advice, and now with (5) she moved into the further displaced world of the recommended action, a more hypothetical world that might be realized at some future time. Thus the sequence of (1), (3), and (5) established a setting that was increasingly displaced from the immediacy of the present conversation:

what frustrates me	(immediate)
the principal and stuff say to me	(past and generic)
what you do with those third-graders	(future and generic)

With this orientation in place, Sally arrived at a point where she could begin expressing the advice that had been given her. Putting it all together and deciding how to express it took a little more time, some of which she filled with two intonation units that shed light on still other aspects of discourse flow:

(6) Sally you knòw,
(7) is you jùst like,

There are two problems that confront anyone engaged in talk. They are created by two kinds of *unconformity*, to borrow a term from geology, where it refers to a discontinuity in rock strata. I use it here to refer to disparate aspects of human experience that must somehow be brought into approximate (but only approximate) conformity if one is to interact with one's fellow humans. First, there is the inevitable unconformity between an individual's experiences – perceptions, actions, and evaluations that are either immediate, remembered, or imagined – and the limited resources a language provides for verbalizing them. Second, there is the unconformity that inevitably exists between one mind and another. There is, in short, both a *verbalization* problem and an *interaction* problem. The language people produce often gives indications that a speaker recognizes both, and (6) and (7) are examples.

So far as the verbalization problem is concerned, language cannot fully or adequately express an inner experience. The verbalization process allows a speaker to get a useful handle on the experience and share it to some degree with others, but the linguistic organization of ideas is not the same as the experience itself. The ubiquitous *like*, found here in (7), is one way a speaker can show recognition of the unconformity between ideas and their verbal expression – a small and passing way in which Sally showed her recognition that what she was about to say would be only a roughly satisfactory representation of what she was thinking.

So far as the interaction problem is concerned, one mind can never fully know what another mind is experiencing, and language can only imperfectly bridge the gap. Someone engaged in a conversation needs both to clothe an inner experience in language that will more or less adequately express it, and at the same time find language that will more or less satisfactorily take account of what is believed to be present in other minds, to the extent that that is possible. The equally ubiquitous *you know*, the sole content of (6), is one way a speaker can show recognition of the unconformity between his or her own mind and the mind of another, in this case signaling that what she was about to say was, to some degree at least, what her listeners might have expected and not something that would be totally surprising to them. (It can be noted that (6) and (7) were attributed to the people characterized as *the principal and stuff*, not to Sally herself, but of course there is no way to know whether they were anything the principal or anyone else had actually said.)

It was time now to move on to the complication section of the narrative schema, in this case the actions recommended by the principal and stuff:

(8) Sally (0.8) táke them=,
(9) and pút them=,
(10) you knòw with= òne of the smárter fòurth-gràders who's vèry [vér]bal and,

(11) Chris [Uh huh,]
(12) Sally (0.1) and wèll-behàved.
(13) (0.5) And you . . hàve them wòrk as a téam you know;
(14) so that the (0.4) (breath) fóurth-gràder can help the thírd-gràder.

At the end of (14) the prosody conveyed a definitive closure of this section. The climax then came with a bang, its impact heightened by the nearly two seconds of silence that preceded it as well as by the forceful wording:

(15) Sally (1.7) (loud) But . . that's búllshit.

The immediately following denouement served to justify this evaluation:

(16) Sally (0.1) Because,
(17) (0.5) thát just tèaches the thírd-gràder=,
(18) with the lèsser intélligence that,
(19) (0.9) that he's wórthless;
(20) . . you know that he càn't léarn [sùmpm on his ów=n.]

4 Navigation by Interaction

With (20), Sally completed her own development of the topic she had opened in (1). Can we say that the conversation had now returned to a state where it would have been appropriate for any of the participants to introduce a different topic, either staying within the Classroom Experiences supertopic or introducing a new supertopic? The question is whether (20) qualifies as a topic ending. We can only speculate on Sally's goal in opening her topic in the first place, but we might suppose that she was using (1)–(20) as a way of eliciting some reaction, perhaps sympathy and advice, from her interlocutors. In any case Kathy reacted in a way that may not have been what Sally was hoping for. What she said overlapped the end of (20):

(21) Kathy [Nó it's nót;
(22) nó it's] nót,
(23) you cán put them in tèams like thàt;

With these three intonation units Kathy succeeded in reorganizing the structure of the ongoing topic. Until now Sally's topic had been organized around the idea that teams do not work, the idea I labeled Something Frustrating. Kathy now introduced the idea that teams *do* work, thereby organizing the topic into a bipartite structure of thesis and antithesis: into the subtopics Teams Do Not Work and Teams Do Work. Thus, the topic we are studying could now be relabeled as Using Teams. But what followed took a path that no one could have anticipated.

Kathy began by justifying her statement in (23) by trying to modify Sally's conception of the make-up of the teams:

(24) Kathy but you dón't put óne with óne;
(25) you pút like twó fóurth-gràders with–

Before she finished (25), however, she decided that her intent would come across more clearly if she could establish the relative numbers of third- and fourth-graders in Sally's class. After nearly a second of silence she briefly thought in (26) of asking for raw numbers, but truncated that attempt also and quickly replaced it with a request for a ratio instead:

(26) Kathy (0.8) Hów many thírd-gràders d–
(27) What's the . . [1 rátio of thìrd- 1] [2 graders to fòurth-graders. 2]

In the middle of (27) there occurred one of those conversational moments when people talk at cross-purposes, a turbulence in the stream of interactive thought. Sally did not immediately hear Kathy's question about the ratio of third-graders to fourth-graders, and not only Sally but also Chris began to pursue directions of their own, overlapping most of (27):

(28) Sally [1 But they're nót 1]
(29) Chris [2 You mean so they dòn't feel sìngled 2] [3 óut or whát. 3]

But Sally quickly abandoned whatever she had begun in (28) and responded to Kathy's question in (27) with some precise information:

(30) Sally [3 Nów I have 3] like fíve thírd-gràders.
(31) I have like (0.3) twénty-two kíds.

These two statements elicited the first of the misunderstandings that drove the remainder of this topic. Sally's answer invited some hasty arithmetic that should have yielded the correct number of fourth-graders, but Kathy made an error:

(32) Kathy (0.2) Ókay,
(33) só you have fífteen fóurth-gràders and fíve thírd-gràders?

We can only speculate on why Kathy said *fifteen*, but the subsequent conversation suggests that she had been hoping for a whole number ratio like fifteen to five, so that each team could have contained three fourth-graders and one third-grader.

The question in (33) was a confirmative one, anticipating a positive answer, but of course Sally responded with a correction:

(34) Sally (0.6) Nó;
(35) (0.9) uh=nó.
(36) (0.1) I have like (0.2) séven (noise) fòurth-graders.
(37) (0.1) (sotto voce) And fíve thìrd-graders.

During (36) there was an extraneous background noise that masked the last syllable, *teen*, of the word *seventeen*, so that Kathy heard only *seven*. On the basis

of ordinary expectations regarding class size she responded with surprise, communicated especially by her prosody:

(38) Kathy You have twélve kíds?

Now it was Sally's turn to be surprised. Thinking she had just explained that the correct numbers were 17 fourth-graders and five third-graders, Kathy's question made no sense:

(39) Sally (0.5) Whát?

But Kathy could only repeat it:

(40) Kathy (0.1) You ónly have twélve kíds?

Sally repeated her previous answer, this time free of the noise:

(41) Sally (0.4) Nó.
(42) (0.3) Séventéen;

Kathy stood corrected:

(43) Kathy (0.2) Óh ókay,

Sally wanted to make certain that Kathy knew that 17 was not the total number in the class, but only the size of the subset on which she had focused:

(44) Sally fóurth-grà[ders,]

Amid all this confusion Kathy abandoned her plan to be precise about the numerical composition of the teams. If she had hoped to specify that each team would be composed of three fourth-graders and one third-grader, she now found it pointless to insist on such exactitude and fell back on a less precise recommendation:

(45) Kathy [so] thén what you dó is you sprínkle the fifth-gràders out évenly.
(46) (0.6) And you máke . . [the fóurth-gràders] (0.1) táke the responsibility for téaching them.

In (45) she made another error, saying *fifth-graders* instead of *third-graders*, probably because Kathy herself had taught a fifth–sixth-grade combination in which it was the fifth-graders who were the less advanced. Sally corrected her with a questioning intonation while Kathy was uttering *fourth-graders* in (46):

(47) Sally [Thírd-gràders?]

Kathy then went on to supplement what she had said in (46):

(48) Kathy And yóu engráin in them,
(49) that it's théir responsibìlity to hèlp those little kíds.

She added a coda that would drive home the success of the recommended procedure. Sandwiched between her final two intonation units was a protest by Sally, evidently to the effect that she herself had done the same:

(50) Kathy Thát's what Í did,
(51) Sally I háve been.
(52) Kathy [and it wórks.]

Even before Kathy finished (52), Chris overlapped with a question whose effect was to open a new, though closely related topic:

(53) Chris [But thén you]
(54) can you sáy it's a [pàrt of your] gráde?

There followed a lengthy discussion of whether and how one should grade the fourth-graders for their mentoring activities. The situation created by (54) was thus as follows:

(*Classroom Experiences* (Classroom Experience 1) (Classroom Experience 2) (Using Teams) (Assigning Grades

My intention with this extended example has been to illustrate how the stream of language is propelled forward by the opening of a topic and the creation of a drive for the topic's development until closure is judged appropriate. I have discussed a basic-level topic, ultimately called Using Teams, as an example of the highest level of topic-hood at which there is a coherent trajectory of development. Once open, a topic may be kept moving along a path provided by a schema, or by the interaction of separate minds engaged in the conversation, or by some combination of both. Interactive topic development may be driven by an interlocutor's desire to agree with or contradict something said by another, or to request needed information the other may possess. This example shows especially well how forward movement may be driven by momentary misunderstandings.

5 The Text

By stringing together all the intonation units that were introduced piecemeal above, one can produce a transcript of this entire segment of the conversation. This kind of object is often called a *text*, and it is the traditional object of discourse study:

1 **Sally** (0.5) Whát I was gonna téll you about that rèally frústrates me is that,
2 (0.2) ùh=,
3 (1.3) (breath) the (0.1) the péop . . the príncipal and stuff they sày to me,
4 (0.9) (tsk) (breath) (begin higher pitch) óh wèll,
5 . . whàt you dò with those thírd-gràders,
6 you knòw,

7		is you jùst like,
8		(0.8) táke them=,
9		and pút them=,
10		you knòw with= òne of the smárter fóurth-gràders who's **vèry [vér]bal** and,
11	Chris	[Uh huh,]
12	Sally	(0.1) and wèll-beháved.
13		(0.5) And you . . hàve them wòrk as a téam you know;
14		so that the (0.4) (breath) fóurth-gràder can help the **thírd-gráder.**
15		(1.7) But . . that's búllshit.
16		(0.1) Because,
17		(0.5) thát just tèaches the thírd-gràder=,
18		with the lèsser intélligence that,
19		(0.9) that hé's wórthless;
20		. . you know that he càn't léarn [sùmpm on **his** ów=n.]
21	Kathy	[Nó it's nót;
22		nó it's] nót,
23		you cán put them in tèams like thàt;
24		but you dón't put óne with óne;
25		you pút like twó fóurth-gràders with–
26		(0.8) Hów many thírd-gràders d–
27		What's the . . [1 rátio of thìrd- 1] [2 graders to fòurth-graders. 2]
28	Sally	[1 But they're nót 1]
29	Chris	[2 You mean so they dòn't feel sìngled 2] [3 óut or whát. 3]
30	Sally	[3 Nów I have 3] like fíve thírd-gràders.
31		I have like (0.3) twénty-two kíds.
32	Kathy	(0.2) Ókay,
33		só you have fífteen fóurth-gràders and fíve thírd-gràders?
34	Sally	(0.6) Nó;
35		(0.9) uh= nó.
36		(0.1) I have like (0.2) séven (noise) fòurth-graders.
37		(0.1) (sotto voce) And fíve thìrd-graders.
38	Kathy	You have twélve kíds?
39	Sally	(0.5) Whát?
40	Kathy	(0.1) You ónly have twélve kíds?
41	Sally	(0.4) Nó.
42		(0.3) Séventéen;
43	Kathy	(0.2) Óh ókay,
44	Sally	fóurth-grà[ders,]
45	Kathy	[so] thén what you dó is you sprínkle the fífth-gràders out évenly.
46		(0.6) And you máke . . [the fóurth-gràders] (0.1) táke the responsibílity for téaching them.
47	Sally	[Thírd-gràders?]
48	Kathy	And yóu engráin in them,
49		that it's théir responsibílity to hèlp **those little** kíds.
50		Thát's what Í did,
51	Sally	I háve been.
52	Kathy	[and it wórks.]
53	Chris	[But thén you]
54		can you sáy it's a [pàrt of your] gráde?

What kind of thing is this? Does it have any validity beyond being a visual representation of a concatenation of utterances that were produced in sequence as the conversation unfolded through time? One possibility, easily discardable, is that it represents something in the minds of one or more of the participants before these things were said. But of course no one could have planned the above, or have predicted that the conversation would proceed in this way. Is it, then, something that remained in the minds of the participants afterwards? Again the answer must be no, though perhaps this time not quite so unqualified a no. Although some of the ideas expressed here were probably retained in some form, varying from one participant to another, for at least a while, the details of how these thoughts were activated and verbalized during the conversation were surely quickly lost. The participants may have remembered for a time that they talked about using teams in the classroom, that Sally did not like the idea, that Kathy did like it, and so on. But the particular sequence of ideas and exactly how they were expressed was surely ephemeral.

It is worth noting that spontaneous conversations differ from "oral literature" in this respect. A person may remember a ritual or story or joke and repeat it later in another setting, though with language and content seldom if ever identical. But people do not repeat casual conversations in the same way. Someone might say, "That was a good conversation," but no one would be likely to exclaim, "Let's say the whole thing again tomorrow." If people do remark occasionally, "I think we've had this conversation before," they are hardly thinking of a verbatim repetition. It is worth reflecting on the fact that the collection and study of texts has in the past been slanted toward narratives and rituals whose value lies in something closer to (though seldom identical with) verbatim repetition. Discourse of that kind is more persistent in memory, and in that respect is a little more like written language. In other words, earlier discourse studies have tended to favor material that has been closer in nature to written text (Chafe 1981).

I do not mean to suggest that a text like the above has no use. What it gives us is a lasting record of evanescent happenings that we can examine visually at our leisure. As a kind of time machine, it is a resource that allows us as analysts to view all at once the dynamic processes by which a sequence of linguistic events was produced. It is a useful tool that can further our understanding of how minds and language proceed through time. By freezing temporal events it helps us identify the forces responsible for creating them. My point is that we should not be misled into interpreting this artificial aid to understanding as something that possesses a transcendent reality.

One may sometimes hear the view that participants in a conversation are engaged in the joint construction of a text. I suggest that it is better to think of a conversation as a uniquely human and extraordinarily important way by which separate minds are able to influence and be influenced by each other, managing to some extent, and always imperfectly, to bridge the gap between them, not by constructing any kind of lasting object but through a constant interplay of constantly changing ideas. The example that has been discussed here suggests a few of the ways in which that can happen.

Note

1. Conventions followed in this and the following transcriptions of speech include the following. The numbers in parentheses are measurements (to tenths of a second) of periods of silence. The acute and grave accents mark the nuclei of syllables with primary and secondary accents respectively. Periods show a decisively falling pitch contour, often accompanied by creaky voice, whereas semicolons show a less decisive fall. Commas show any other terminal contour, except that the high rising pitch associated with a yes-no question is shown by a question mark. The equals sign shows a prolongation of the preceding sound. Square brackets show overlapping speech, sometimes indexed with numbers when there might be ambiguity. That is, a segment enclosed in [1 . . . 1] overlaps with another segment indexed in the same way, etc.

Missing Links in Mainstream CDA: Modules, Blends and the Critical Instinct

Paul Chilton

1. The Critical Stance

Let us first attempt a crude map of the terrain. Critical approaches to text and talk in European scholarship over the past twenty years or so have indeed been interdisciplinary, but this observation has little significance unless one specifies the sources and tributaries. This introductory section is an admittedly partial attempt to sketch the landscape.[1]

'Critical Theory', associated with the Frankfurt School and especially with Jürgen Habermas provides one source in social theory. This source found itself channelled into a sociological variety which did not claim any technical connection with language studies or linguistics (notably, Stuart Hall, Birmingham Contemporary Studies). It was also drawn upon by scholars whose orientation was towards language use, though these scholars were somewhat eclectic in the social theory that they made use of (Fowler et al. 1979; Fairclough 1989; Wodak 1996; Wodak & Meyer 2001). A guiding theme was the notion that language can be used for self-interested ends by power groups.

A further source was the work of Michel Foucault, whose claims were not always viewed as consonant with those of the Habermasian tendency. Foucault's work has given rise to at least two tendencies. One tendency has its context in sociology, political science and to some extent in literary studies, and like Foucault himself, does not analyse language. This tendency has given rise to many studies, too numerous to list here (but cf. for example Shapiro 1984 for examples). Amongst writers in this vein it is common to find the assumption, or claim, that 'discourse' includes the non-linguistic as well as the linguistic. At this point an additional

Source: Ruth Wodak and Paul Chilton (eds), *A New Agenda in (Critical) Discourse Analysis*, 2005, pp. 19–51

influence needs to be mentioned, namely the post-modernist current that was a confluence of ideas from philosophy, literary studies and sociology (Barthes, Derrida, and others). This kind of work had no contact with formal linguistics but made assertions about the nature of meaning ('free floating signifiers'), epistemology and ontology, attacking alleged essentialism, promoting notions such as 'aporia'. This form of relativism provided for the possibility of indefinitely extended critique that runs the risk of being ethically and politically indiscriminate. It is not possible here to address it directly and will not be referred to again in this chapter.

To return to Foucault, the second Foucauldian influence is to be found among those whose declared preoccupation is, by contrast, with language as such (notably Fairclough 1989, 1992, 1995, 2003; to some extent Wodak 1996). Many of these authors would, however, accept that discourse, understood as language-use, is but one (if perhaps the most salient) manifestation of social action. The insistence that language is a form of social-action is probably the most important tenet amongst this group (see Fairclough & Wodak 1997:278–279 for a formulation). Those working in this tradition have often had some degree of formation in linguistics and have to a greater or lesser extent proceeded on the assumption that the nature of social action can be elucidated, even unmasked, by various kinds of linguistic analysis.

One can distinguish here several sub-tendencies among the linguistically oriented. Historically the first was Critical Linguistics ('the East Anglia school'), whose early work, drew on George Orwell for inspiration, Bakhtin and to a lesser extent Habermas and to an even lesser extent Foucault for its social theory. For its linguistic theory it drew at first on Chomsky's early versions of transformational grammar (Hodge & Kress 1993 [1979]). This choice was later replaced by Halliday's so-called systemic-functional grammar (Fairclough 1989: 13–14; Fowler 1996: 11).

The second language-oriented trend, chronologically speaking, is Critical Discourse Analysis, most commonly associated with Fairclough, Wodak and van Dijk (cf. van Dijk 1993; Fairclough 1995; Fairclough & Wodak 1997; Caldas-Coulthard & Coulthard 1996). Fairclough, in particular, is influenced by Foucault, especially in his use of the notions of 'order of discourse' and 'discourse formation'. Wodak's approach to the analysis of language in use ('discourse' is understood by all of these authors to be language) comes from various strands of sociolinguistics and ethnography (cf. Reisigl & Wodak 2001: Chapter 2). Van Dijk's work, emerging from relatively formal text linguistics (van Dijk 1977, 1980, 1998; van Dijk & Kintsch 1983), has always had a cognitive orientation, being concerned with mental schemas that represent the social and give rise to stereotypes, that in turn give rise to various ideologies, among which are exclusionary discourses, especially racism.[2] For many in this group of scholars (especially Fowler, Kress, Hodge, Thibault, van Leeuwen, Fairclough and others, but not van Dijk), Halliday's systemic-functional grammar has supposedly provided the toolkit for deconstructing the socially-constructed (thus linguistically constructed) machinery of power

Yet after twenty years of this form of scholarship, there remain serious problems in the entire endeavour. I will not attempt to deal with the postmodernist work that does not address issues of language per se, since this would take us too far afield philosophically. I will focus on CDA understood in a broad sense, occasionally including Fowlerian Critical Linguistics (Fairclough & Wodak 1997; Fowler 1996).

2. Claims and Aims of CDA

Among the serious problems that, to my mind, bedevil CDA, are the following.

1. CDA claims, sometimes implicitly, sometimes explicitly, that its practice provides demystifying and emancipatory effects (see for example, Fowler 1996: 55ff.; Wodak & Meyer 2001: 10; Weiss & Wodak 2003: 14f.). There is of course an argument about whether a supposedly scientific endeavour should allow itself social and political motivation in the first place. One may argue for objectivity here on the grounds that acknowledging one's interests is per se a form of scientific objectivity, an argument that may well be crucial for all social sciences. This is not, however, my main point. Rather, I want to pose the question whether CDA has any credible efficacy, on its own terms, as an instrument of social justice. And if not, or even if the answer to that question is just a bit in doubt, do we need it?

2. This question is connected to its methods and linguistic underpinning. CDA has tended to draw, as we have seen, on social theory of a particular type and on linguistics of a particular type. Despite some limited use of work in psychology and cognitive science (e.g. van Dijk 1991, 1993a, 1993b, 1998, 2004, forthcoming; van Dijk & Kintsch 1983; Wodak 1986; Reisigl & Wodak 2001), it appears to be fair to say that CDA has generally neglected developments in these fields. It has eschewed not only generative linguistics but also cognitive linguistics. (The latter at least does not figure in any seriously comprehended way in CDA literature.)

3. I have just questioned whether CDA has had genuine social effects. It is also questionable whether CDA has any theoretically interesting yield for the social sciences, and more especially for linguistics. With regard to the latter, apart from the early attempts by serious linguists working around Fowler, Kress and Hodge, CDA in its later manifestation has made, so far as one can see, no contribution to our scientific understanding of the language capacity in homo sapiens. This is strange in view of the CDA insistence that language plays such an enormous role in social and political life.

3. What is Missing from CDA

There is a common element underlying these three criticisms: CDA despite some interest in (mental) representations has by and large not paid any attention

to the human mind. There are two consequences of this observation, around which this paper is constructed. They are the following:

1. The lack of attention to mind is an important theoretical lack in its own terms. But there is worse.
2. It is possible that taking stock of recent research in the cognitive sciences leads us to the conclusion that we do not actually need CDA.

If there is anything in this argument, then we need to radically reassess what scholars are doing when they research into the relationship between the socio-political domain and the linguistic domain, and the paper concludes with some conclusions on the matter.

4. Why CDA Needs to Consider Mind

CDA has since its emergence been interdisciplinary, but selectively so. The aim of this section is to bring to the attention of CD Analysts the existence of a body of empirical research and speculative literature which they have tended to ignore. It is a body of work that has clear implications for a possible cognitive approach to the analysis of discourse in social and political contexts. There is a simple argument underlying the claim that CDA should attend to this cognitive dimension.[3] It starts with the central tenets of CDA itself (cf. Fairclough & Wodak 1997: 258–284). There are three such tenets:

1. discourse is social action (or 'social practice')
2. social action constructs social reality (objects, situations, identities, social relations...)
3. discourse is the use of language.

It follows that discourse constructs social reality. This must imply some sort of causal relation between language use and social action. There are a number of philosophical questions that seem to arise here, which we can only adumbrate. One is the following. It would appear to be the case that CDA is claiming that discourse stands in a causal relationship to social action (by which we might understand social relationships, group membership, the formation of social and political institutions and the like). But discourse is said to be social action, in which cause we seem to have discourse causing itself. Many discourse analysts, particularly those in the post-modernist tradition, would have little problem with this, since they are prepared to adopt the logical conclusion, namely that everything is discourse. CDA authors on the other hand are inclined to resolve the tension by using the term 'constitute' for cause: 'discourse is socially constitutive as well as socially shaped' (Fairclough & Wodak 1997: 258). So far as it goes, this is a useful concept that at least points to a complex dialectally causal relation. However, it is perhaps time to start probing its nature in more detail. To proceed beyond

that particular formula, one needs to notice that it is entirely stated with respect to a social domain that appears autonomous: social action *qua* discourse has effects on social discourse that is either (a) also discourse or (b) social action but not (linguistic) discourse.

The way out of the loop is to introduce the cognitive dimension (as van Dijk (e.g. 1980, 1998) has done, and does also in the present volume). The argument is straightforward. Discourse, that is to say language in use, is produced and interpreted by human individuals interacting with one another. Language can only be produced and interpreted by human brains (and vocal apparatus, etc.). If language is produced and interpreted in human brains, then it interacts on any account of language with other cognitive capacities (as well as motor systems). In particular, if language use (discourse) is, as the tenets of CDA assert, connected to the 'construction' of knowledge about social objects, identities, processes, etc., then that construction can only be taking place in the minds of (interacting) individuals.

This argument seems to indicate that if CDA is to be a research enterprise, which I take to mean an enterprise that enhances human understanding and knowledge, then what goes on inside people's heads must become a prime concern. There are many ways in which such a research goal might be pursued. In the present chapter I will merely suggest how some of the existing research in certain areas of contemporary cognitive science and psychology, particularly those varieties that take an evolutionary perspective, might be used to enrich and explore in new ways the sorts of social action and social construction that CDA has classically been preoccupied with.

Let us, then, consider the specific area of racism or xenophobia (not of course necessarily the same thing). CDA is good at showing how particular language users establish exclusionary attitudes and maybe practices by recurrently and selectively asserting certain attributes (i.e. social roles, behavioural characteristics, physical appearance, etc.) of social and ethnic groups (e.g. van Dijk 1991, 1993a, 1993b; Wodak 2000; Reisigl & Wodak 2001). In other words, CDA draws attention to the existence of stereotyped categorisations in daily talk, elite talk and texts. CDA also shows how language users categorise behaviour, actions and attributes – all of which may be observable facts – in ways that express attitudes towards such facts. For example, immigration, which denotationally refers to spatial movements of people in relation to political boundaries, is defined as 'invasion' or 'flood'. It is also good at identifying interactive verbal devices for the implication or presupposition of assertions about social and ethnic groups, and in pin-pointing mitigation devices such as 'apparent denial'. Underlying all these features that are found in text and talk referring to social and ethnic groups is the conceptual process of category formation. On the actual cognitive processes CDA seems to have little new to say, despite the fact that there is an abundant psychological and social psychological literature on the formation of concepts (but cf. summaries in van Dijk 1991, 1993a, 1998 and Reisigl & Wodak 2001). In general, CDA has done a fine descriptive job. Whether the description has altered public awareness significantly enough to achieve emancipatory effects is perhaps not the main point here, though it is obviously not irrelevant. The disturbing fact is that racism, xenophobia

and other kinds of exclusionary behaviour continue to appear. This suggests that we may need to delve deeper into *why* this kind of category formation is so persistent a factor in social behaviour, and *why* the language forms associated with it are so potent. These are difficult questions: I am not going to give the answers, but merely propose that anyone seriously interested in these issues needs to address such questions. This means taking an explanatory stance rather than a merely descriptive one and it also means, I am suggesting, taking account of ideas developed in cognitive and evolutionary psychology.

5. Some Aspects of Cognitive and Evolutionary Psychology Relevant to CDA

In this section I review some recent ideas emerging from cognitive science and cognitive psychology. Since an evolutionary perspective has proved a fruitful thinking device in these and other areas, and since it can provide an explanatory framework for expanding the discussion of issues that CDA is concerned with, I will bring that too into the picture. But I make no pretence of completeness in regard to this field.

5.1 Modularity of Mind

Chomsky postulated back in the 1960s that the human language faculty was an autonomous module of mind. In part, the claim was based on analogy with other human cognitive and perceptual abilities that were regarded on empirical grounds as modular, in particular vision and facial recognition. The notion of modularity was more extensively theorised by Fodor (1983), whose ideas have had a wide impact on psychology, theoretical and applied, on cognitive science and on philosophy. Fodor's theory corresponds roughly to Figure 1. For Fodor, the mind has two tiers: a collection of input modules that are autonomous and have a specific job to do (like the blades of a Swiss army knife) and a central processor that corresponds to what people generally think of as intelligence, creative thinking. The former are hard-wired, localised and provide input to the latter, which is not localised and is characterised by 'its non-encapsulation, its creativity, its holism and its passion for the analogical' (Fodor 1985: 4). The last point is worth noting and we shall return to it.

There is much controversy surrounding the two-tier proposal, but the most significant development of the modular concept has been its incorporation into evolutionary psychology, notably by Cosmides and Tooby (1992), who, in broad terms, argue that the mind of humans as we now know them has emerged not by chance or solely by the impact of particular social and physical environments but by the pressures of evolutionary selection. The mental modules evolved for purposes of survival, just like any other organ of the body. Rather than assuming the existence of some generalised intelligence and learning ability, the tendency is to regard the mind as consisting of many specialised modules, interacting among

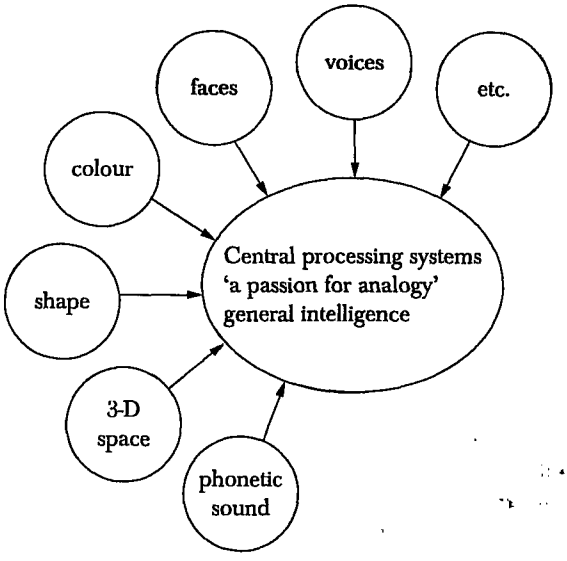

Figure 1: Information from perceptual organs to input systems (Modules) (Fodor)

one another. One type of evidence that is adduced is similar to the familiar Chomskyan argument for the innateness of language: that children develop very many kinds of specific knowledge very rapidly and on the basis of scant input. Cosmides and Tooby think there is a very large number of such modules:

> A face recognition module, a spatial relations module, a rigid objects mechanics module, a tool-use module, a fear module, a social exchange module, an emotion-perception, kin-oriented motivation, an effort allocation and recalibration module, a child care module, a social inference module, a friendship module, a semantic-inference module, a grammar acquisition module, a communication-pragmatics module, a theory of mind module, and so on... (1992: 113)

Amongst these modules, some of which are empirically attested, some rather more speculative, which should be of interest to researchers interested in the interaction of language and society? Clearly language is one of them, but we will focus on three other possibly modular areas.

5.2 Intuitive Psychology ('Theory of Mind')

Somewhat before Fodor, Humphrey had begun to propose a specific module of social intelligence combined with what is known as a 'theory of mind' module, which refers to what appears to be the innate ability of humans to guess and make pragmatic predictions about the intentions and likely future actions of their fellows (Humphrey 1976). The idea has been picked up and further investigated by Leslie (1991) and Baron-Cohen (2001) in normal and abnormal psychology, and by Whiten (Ed. 1991) in primatology. Essentially the

that humans have an evolved ability to look for the motives and plans of others, an ability that can clearly be used cooperatively or counter-cooperatively. In any event, applied to language behaviour, it suggests that humans naturally and automatically tend to look for interpretations of discourse acts in terms of what speakers are intending to convey and to do.

5.3 Machiavellian Intelligence

Similar claims to those outlined in the preceding paragraph have been made also for primates. Byrne and Whiten (1988) and Byrne (1995), for instance, have made empirical studies of chimpanzees that they believe demonstrate clearly that these creatures engage instinctively in social behaviour that display the following:

- the formation and observation of group and subgroup boundaries
- the formation of coalitions in competitive environments, signalled by, inter alia, grooming behaviour
- the formation and observance of dominance hierarchies
- the practice of tactical deception motivated by individual wants.

It is the latter, tactical deception, that has been dubbed 'machiavellian intelligence'. Its workings follow from the ability to read the intentions of others, and to recognise the ability of others to read one's own intentions, leading to the ability to mask one's intentions (Whiten 1991). If a distinct machiavellian module exists in apes, then, so the evolutionary argument goes, it must exist as a distinct ability also in their descendants, homo sapiens. In the case of language-using creatures, the ability to verbally mislead, deceive and to lie is clearly closely related. CDA researchers should not rush to dismiss the argument that humans have an evolved instinctive and specialised ability to exploit one another upon the basis of abilities developed for cooperative social survival purposes. And there is a further very good reason for CDA to look closely at these ideas. It will have been apparent from the preceding arguments that if an individual A has an innate ability to read the minds of B and use deception for his or her own ends, then conversely, B must have the same ability and could in principle use it to read the intention to deceive. This is a highly significant notion for CDA to which we return at the end of this chapter.

5.4 Intuitive Biology

We have looked at the claims for innate social and psychological modules. Other modules of mind have been researched that have to do with the human mind's relation to the non-social world. One of these is 'intuitive physics': human understanding of gravity, solidity, orientation, force, and so on appear to be hard-wired, that is, be present at birth as some sort of neurological template that enables the child to deal with the surrounding environment without having to learn it in the way that an empiricist psychology would suggest the human mental tabula rasa

has to learn about everything (Spelke 1991). More relevant to the concerns of this paper is 'intuitive biology', which works on the same general principles. What the innate biology module works on is living entities. The research in this field (cf. Atran 1990 and 1994; Kennedy 1992; Keil 1994) indicates that human children automatically make assumptions about the taxonomy of 'natural kinds'. For instance, they seem to take for granted the difference between animate and inanimate entities. Moreover, there is evidence that all human cultures share a basic framework for classifying the natural world (Atran 1990). These folk classifications are highly complex: a reasonable explanation, it is argued, is that there is a common genetic blueprint for it. An analogous argument is often made for the universal innateness of the language instinct. The evolutionary argument would be that human evolution needed to select for the ability to classify the living world because of the survival advantages conferred by such an ability.

One feature of the research on intuitive biology that is of interest to CDA is the claim that this module includes 'essentialism'. That is to say, humans seem intuitively impelled to attribute 'essences' to different kinds of things in their taxonomies of natural kinds. A predisposition to essentialism would provide an important explanatory framework for many social phenomena that interest CDA researchers, and we return to it later in this chapter.

6. Beyond Modules: Cognitive Fluidity

As was pointed out above, while the notion of modularity is widely accepted among psychologists and cognitive scientists, the precise form and significance of the modularity is controversial. Karmiloff-Smith (1992), for example, building on her earlier developmental work with Piaget, argues that modules are merely the basis for development that is subject to variable cultural shaping. But the interpretations of modularity that will concern us here are those of Mithen (1996) and those of Sperber (1994) and Cosmides and Tooby (2000).

Mithen, whose background is in archaeology, seeks an explanation for the apparent 'explosion' of human development that occurred between 60,000 and 30,000 years ago. Mithen's hypothesis is that the mind is indeed modular but does not, as in Fodor's account, have an independent general processor. Rather what happened at the critical moment in human evolution was that the autonomous modules began to intercommunicate: Mithen calls this the emergence of 'cognitive fluidity' (Mithen 1996).

Sperber also accepts the modular story, but accounts for human creativity by postulating (with plenty of evidence from language) a further module, the 'module of metarepresentation', an expanded version of the theory of mind module and closely tied to language and communication. What this module must be doing, in Sperber's view, is handling concepts of concepts and representations of representations. It will also be giving space to concepts from several otherwise encapsulated and non-communicating modules, and allowing recombinations and transformations of the concepts formed in the modules.

Mithen seizes on Fodor's comment about general intelligence having a 'passion for the analogical' and proposes that the mechanism by which the modular domains started to interconnect was metaphor. Specifically, he claims that language evolved in the first place for social purposes and was 'metaphorically extended' as it was 'invaded' by concepts coming from the major domains (Mithen 1996: 214). Along with Sperber he retains the metarepresentational module as a key feature of human intelligence, linked to communication, but sees it as an expanded form of social intelligence. This metarepresentational, communicational and social module takes in non-social concepts from other domains and can process them creatively, perhaps using metaphor or some other form of mental transformation.

What Mithen and Sperber do not do is tell us much about is the nature of these processes, particularly where language, which they regard as a key element, is concerned. This is where the work done in cognitive linguistics over the last few decades becomes signally relevant. In particular, there are well developed theories of metaphor and conceptual blending that could be linked with the Mithen-Sperber hypothesis. In Section 8 below we explore the possible application of some recent theorising in cognitive linguistics on conceptual blends (Fauconnier & Turner 2002).

7. The Point of All This for CDA

Why should the body of work in cognitive science and evolutionary psychology, of which I have sketched but a small fragment, be of interest to CDA? In brief the reasons are as follows.

i. Machiavellian intelligence is of course political behaviour, whether conceived as institutionalised politics or informal social movement politics or day-to-day interpersonal manoeuvring and manipulation. The work summarised above proposes that the basic framework for such behaviour is innate in humans, not primarily derived from socialisation, socioeconomic forces and the like, as proposed in the existing heavily socialised accounts of CDA. It is quite likely (as Mithen and Sperber seem to argue) that an innate social intelligence is in some way fundamental and operates in ways that may be innate. But this is very different from CDA's existing assumptions about the primacy of the social and the political. If the field is to take account of all relevant science, then it seems inevitable that it has to confront the question of how the human mind works when engaged in social and political action, which is largely, for humans, verbal action.

ii. Research on social intelligence has focused inter alia on the formation of social categories, specifically racial categories, and 'essentialism'. This is familiar territory for CDA practitioners. However, the literature outlined above is scarcely if ever drawn on in these studies. In Section 8 below, I introduce some more details that might suggest links of research building on the elements of a cognitive approach already found in CDA work on racism and ideology.

iii. We have seen that when a perspective is adopted that confronts the question of who we are as a species and what we are like, there arises the fundamental question of how we got to be so uniquely creative (often unpleasantly so by our own human values). We have seen the vague but recurrent suggestion in the literature, from Fodor to Mithen, that some metaphorical ability seems to be the explanation of how modular thought is integrated. What is lacking in the evolutionary-cognitive literature is a detailed theory of metaphor. It is also, as it happens, lacking in a lot of CDA work, where it is often simply treated as a 'persuasive' rhetorical device of some sort. However, cognitive linguistics (CL) has two closely related theories of cognitive activity corresponding to Mithen's 'cognitive fluidity'.[4] The CL theories on metaphor are those developed by Lakoff, Johnson and Turner (Lakoff & Johnson 1980; Lakoff 1987; Lakoff & Turner 1989; Lakoff & Johnson 1999) and explored empirically by, for example, Gibbs (1994), Boroditsky (1997) and Glucksberg (2000). The second relevant CL theory I am alluding to is conceptual blending developed by Fauconnier and Turner, which is of importance to CDA because it is specifically a theory of what conceptual activity goes on during discourse processing (Fauconnier & Turner 2002).

iv. CDA as an academic and pedagogical enterprise might not be necessary at all. This startling inference could be drawn from the claim – indeed the evidence – that humans have in any case an innate 'theory of mind' and a metarepresentational module. If individual humans are innately machiavellian, they are also innately able to counter one another's machinations. If language is crucial to this ability and associated activity, then they should have an innate ability not just to use language in machiavellian ways but to detect and counter one another's machiavellian use of language. I shall return to this argument, which is put forward by Sperber and others, towards the end of this paper. In the meantime, the question is, given the foregoing remarks: What is CDA for if people can do it anyway?

Having outlined some of the issues that CDA will have to confront if it is going to be genuinely interdisciplinary, I now move on to what this means for research into a specific area of social enquiry that that has been the traditional stamping ground of CDA. The area is racism. Section 8 summarises the work largely ignored by CDA accounts of this area. And Section 9 outlines a CL approach that explains how using cognitive linguistics can provide an account of what the human mind is doing when it does racist discourse. This approach is not entirely neglected in critical approaches to language use: see for instance Lakoff (1991, 1996, 2003), Chilton (1996a and 1996b), Chilton and Lakoff (1999), Rohrer (1995), Dirven (2001), Santa Ana (2002) and O'Halloran (2003).

8. A Cognitive Approach to Racism

Most discourse-oriented approaches to racism also make reference to cognitive issues or to the need for an explanatory framework or both. Van Dijk's approach, for instance, is broadly sociocognitive and is constructed around a standard

psychological model of memory, linking semantic memory to stable social constructs, episodic memory as a storehouse for previously encountered narratives, and working memory, in which context and ongoing discourse are processed (van Dijk 1984, 1991, 1993a, etc.). Reisigl and Wodak (2001: 10–14) review some social-psychological explanations, some psychoanalytic explanations and some cognitive psychology research into categorisation and stereotyping but do not incorporate them directly into their discourse analysis approach. No CDA work, so far as I am aware, draws on the evolutionary cognitive science research outlined in Section 5 of the present paper. Essentially, the explanation of racism that has been discussed in the cognitive science literature draws on the theory of mental modules and on the postulated existence of mechanisms of transfer between autonomous modules. It is worth considering it further because of its potential for linking cognition, language and social behaviour in an explanatory framework.

Mithen (1996: 224–225) argues that racism arise from a particular use of 'cognitive fluidity' acting on particular specialised mental modules, namely *technical intelligence* (tool making, manipulation of objects) and *social intelligence* (thinking about people, together with ingredients such as theory of mind that we have mentioned above). The general idea is pictured in Figure 2.

Mithen's notion is that the area above the line represents the modern (i.e. Pleistocene and post-Pleistocene) mind, while the area below the line represents the separate modules of the early human mind. A better interpretation might be to say that the area above the line stands for cognitive effects that can come about in the modern human mind under certain conditions (maybe the ones that CDA is or ought to be able to specify). Another element in Mithen's framework is that intuitive biology (the natural kinds module) accounts for human readiness to accept the existence of different social groups (and label them races, etc.). But it is cognitive fluidity that accounts for our readiness to treat some

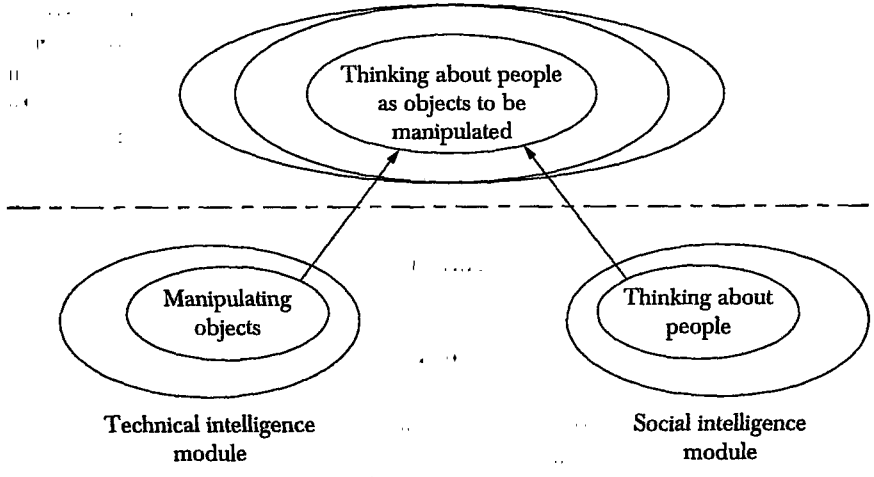

Figure 2: After Mithen (1996: 225)

groups as inferior. This can come about when the thinking-about-people module merges with the thinking-about-tools module. Or when the natural kinds module merges its humans and animals categories for certain groups of the former. What happens is that people can be thought of as either animals (thus inferior) or as objects (tools) or both.

A slightly different, though related account, comes from the work of Atran (1990, 1994), Boyer (1990), Gelman (1994) and Hirshfeld (1994). Gelman's position is that the idea of different human races comes from essentialist beliefs, which are part of the intuitive biology module. As Atran argued, intuitive biology predisposes humans to set up taxonomies of *living kinds* for animals (a schema obviously adaptive for hunter-gatherers in the relevant environment for early humans). Gelman and her colleagues (e.g. Gelman, Coley & Gottfried 1994) have done empirical developmental work with children, producing evidence that children spontaneously attribute 'essences' to living kinds. Their findings show that children consequently also take it for granted that living kinds have their own invisible internal workings, that these internal workings cause certain behaviours, that attributed essential characteristics inevitably develop or grow, and that the attributed identity is permanent, despite changes, because something 'inside' is regarded as fixed. So children and adults develop racial categories, assumed to have fixed essences, by *transfer* from the living kinds module to the people category in the social intelligence module. However, Hirschfeld's (1994) experiments suggest that children have an independent tendency to construct racial categories and thus that it is not a matter of merging elements from the essentialist natural taxonomy module with elements in the people module.

The latter position has serious implications. Does it mean there is a racist module, a domain-specific competence for racial classification'? If such a module included the assumption that some races were inferior to others, does this mean racism itself is innate? Sperber (1994) is worried by this implication and proposes an alternative story within the modular framework. In Sperber's view 'proper' domains evolve for survival under specific environmental conditions, but conditions may change, and the module can take on a different role. This would include the case where such a module interacts with components of a later culture (which could of course include linguistically mediated cognitive components). Consequently, for Sperber, a module can *develop* a cultural domain. The example Sperber gives is the following.

Let us assume, as seems plausible, that a zoological domain (i.e. biology module) evolved in early humans whose job was the conceptualisation of animals. Such a module would be adaptive for dealing with local fauna. Then suppose the fauna upon which the original module was based ceased to exist or be not visible (maybe the community moved to another location). It is likely, Sperber argues that the module remained active and could (perhaps, we may interject, in the way Mithen suggests) take input from culture (or as we may say, from discourse). Sperber's speculation is that any module of this kind might be biologically inherited in the modern human mind, but be a rather general *metatemplate.*

Further, he speculates, such metatemplates can be 'initialised' by cultural input. To quote Sperber directly:

> A cognitive module stimulates in every culture the production and distribution of a wide array of information that meets its input conditions. This information, being artifactually produced or organized by the people themselves, is from the start conceptualized and therefore belongs to conceptual domains that I propose to call the module's *cultural domain(s)*. (Sperber 1994: 55; Sperber's italics)

What happens then is that in the process of cultural transmission (one may want to call it 'discourse') causes a mimicking of the module's actual domain based on information coming from another domain. It follows that

> racial classification might result from an ad hoc template derived from the living-kinds metatemplate, through an initialisation triggered by a cultural input. (ibid.: 58)

As to the precise nature of this cultural trigger:

> the mere encounter with a nominal label used to designate a living thing is enough to tilt the child's categorization of that thing towards an essentialist construal. . . . It is quite possible that being presented with nominal labels for otherwise unidentified and undescribed humans is enough (given an appropriate context) to activate the initialisation of the ad hoc template. (Sperber 1994: 59)

This is of course reminiscent of what discourse analysts have long been saying. However, they have been saying it in a theoretical vacuum. What is crucial is that the point being made by Sperber in the last quotation is based on experimental work with children, and is also coherent with the theoretical cognitive evolutionary framework.

So where does this leave the suggestion of a domain-specific racism made by Hirschfeld? What Sperber says on this score, somewhat disturbingly, is this:

> There is, as Hirschfield suggested, a genetically specified *competence* [my italics] that determines racial classification without importing its models from another concrete domain. (Sperber 1994: 58)

However, and the point is extremely important, Sperber's approach seems to propose that this competence may itself be derived not from a competence that has racial classification as its proper domain at all but more indirectly from a different genetic modular competence:

> Racial classification may be a mere cultural domain, based on an underlying competence that does not have any proper domain. (ibid.)

His hypothesis (he stresses that it is only a hypothesis) is in fact that there is a higher level metatemplate whose job is to generate ad hoc templates for actual zoology and botany domains (living kinds). This metatemplate is 'initialised' for racial classification. The intitialisation of an ad hoc template for racial classification

> could well be the effect of parasitic, cultural input on the higher-level learning module, the function of which is to generate ad hoc templates for genuine living-kind domains such as zoology and botany. (ibid.)

The upshot in relation to the implications of Hirschfeld is that

> no racist disposition has been selected *for* [...] in humans. However, the dispositions that have been selected for make humans all too easily susceptible to racism given minimal, innocuous-looking cultural input. (ibid.; Sperber's italics)

Now if we ask what 'cultural input' might be, it is clear that in view of the genetic endowment for language and the fact that human culture depends critically on linguistic communication, the cultural input initialising racial classification must be talk and text, in other words discourse. We can sum all this up as in Figure 3.

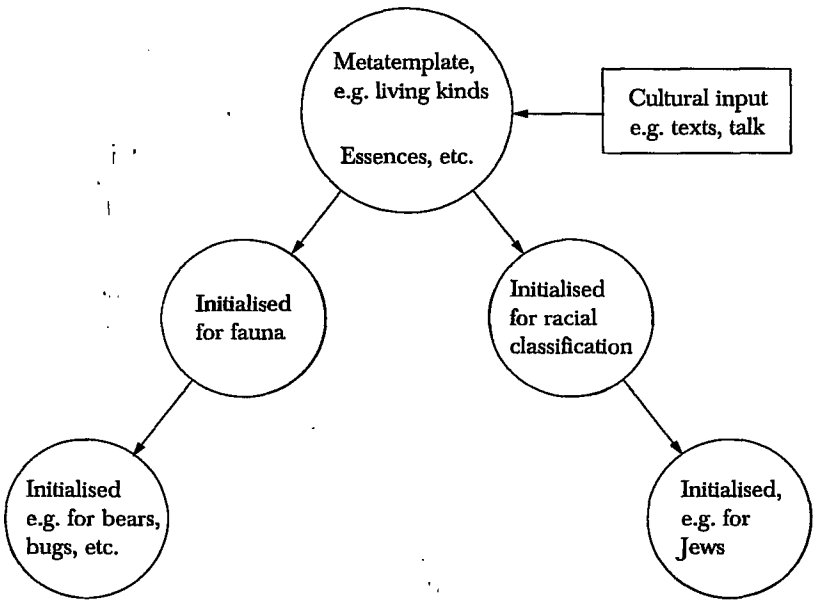

Figure 3: Sperber's initialisation-of-template theory of modules

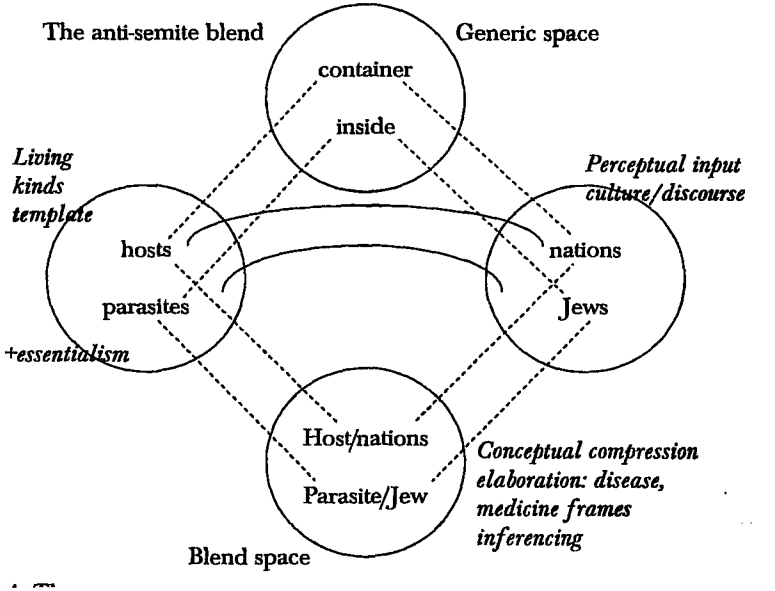
The value of this kind of approach lies in its potential explanatory power. That is to say, it offers an explanatory account of *how* what Sperber calls 'cultural input' and CDA practitioners may call 'discourse' has any effect in the human mind, *how* it takes hold and has the potential to spread from one mind to another. It also vindicates the work done in CDA, which in effect shows something of how the cultural input is achieved. The gap a Sperberian account fills is the explanation of why the discoursal input should have any effect and be so persistent in human societies. However, there is one area that neither the CDA account nor the Sperberian one tells us about in detail (though Sperber and the other cognitive psychologists and archaeologists certainly come close to it). This area concerns the actual workings of the mind that give rise to what Fodor calls 'passion for the analogical', what Mithen calls 'cognitive fluidity' and what Sperber variously calls 'cultural input', 'initialisation', 'the effect of parasitic information'. In the next section I show how one CL theory, namely blending theory, can give a more detailed account of these processes than is currently available either in the cognitive evolutionary literature we have been surveying or in the standard CDA literature.

9. Using Cognitive Models of Discourse

There are in fact rather few models of discourse that have a distinct cognitive flavour. The most sophisticated formal theory, which also claims a cognitive element, is DRT (Discourse Representation Theory: see for example Kamp & Reyle 1993 and for developments Asher & Lascarides 2003). Another related type of discourse analysis is Werth's (1999) 'text worlds' approach. However. while CDA cannot seriously claim to make a contribution to discourse analysis without taking account of these highly sophisticated models, I shall leave their further exploration to another occasion. For there is in fact another recent theoretical development which is equally indispensable and which happens to have a direct bearing on the matter of cognitive fluidity, and thus also by hypothesis. on the question of racial categorisation and racism as formulated by the researchers discussed in Section 8.

Fauconnier and Turner (2002) present a theory of cognitive blending developed in a series of earlier papers (e.g. Fauconnier & Turner 1996; Fauconnier 1997). Blending theory is an attempt to explain one of many tricks performed by the human mind, specifically in the processing of discourse. The starting point is the notion of 'mental space', which may be a structure called up from long-term memory or a structure on hold in working memory:



> Mental spaces are small conceptual packets constructed as we think and talk, for purposes of local understanding and action. They are interconnected, and can be modified as thought and discourse unfold.... In blending, structures from two input spaces is projected to a separate space, the 'blend'. The blend inherits partial structure from the input spaces, and has emergent structure of its own.

> ... input spaces under construction recruit structure from more stable, elaborate, and conventional conceptual structures that may have conventional structures of various sorts: shared frame roles, connections of identity or transformation or representation, metaphoric connections. These conventional connections are fully available to the work of blending. Blending may exploit, simultaneously, more than one kind of counterpart connection (e.g. frame-role connection and identity connection). through entrenchment, blending can influence conventional structures and their conventional connections. Blends themselves become conventional. (Fauconnier & Turner 1996: 116)

These summaries are almost sufficient as a framework for preliminary exposition. In addition, we need to note the characteristic diagrammatic notation developed by Fauconnier and Turner, used below in Figure 4. Its rationale is based in set theory and the mathematical notion of mapping from one domain to another. For present purposes all we need to note is that mappings place elements in different domains in correspondence with one another. An example will illustrate the kind of cognitive phenomenon that is at issue. Consider this kind of discourse, offered by Fauconnier and Turner:

> I claim that reason is a self-developing capacity. Kant disagrees with this on one point. He says it's innate, but I answer that that's begging the question, to which he counters, etc. etc. (ibid.)

This is a familiar academic genre. How it works is by using two mental spaces, one in which the contemporary speaker is making assertions and another in

which Kant is speaking. The two spaces are separate. But they do have something in common (the concepts of thinking, debating, writing) which is connected to both the first two spaces. It is called the 'generic' space. The blend occurs in a fourth mental space which brings together inputs from the modern philosopher space and inputs from the Kant space. The blend space can also draw on other cognitive frames: in this example, it appears to draw on the shared 'debate' frame. Once the blend has emerged, the mind can work in that space, elaborating it, drawing inferences from it, etc. The blended material can feed back into the two input spaces.

It should be already obvious that an explicitly worked out theory along these lines does much to fill in the notion of cognitive fluidity (as suggested also by Turner 2001), the transfer among basic mental modules, postulated by the evolutionary cognitive psychologists and archaeologists. In making that point, I am of course using blending. For I am merging the Fauconnier-Turner model with the modular model. In fact, the suggestion is that it is precisely the modules discussed that can (not always, but can) provide the input spaces in the blending system described above.

Blending crops up in all manner of discourse, however: jokes, poetry, oratory, advertising, ideology, to suggest a few examples. CDA researchers will be interested in ideology. The theory of blending, together with evolutionary cognitive science, could enable us to construct a general cognitive theory of ideology, which has been lacking in CDA.[5] What such a theory would give us, it should be noted, is not a means of combating directly those with whose ideologies we might disagree, but a means of deepening our understanding of what it could mean to give an explanation of how and perhaps why human minds produce such structures. Here we can do no more than sketch out how this task might be broached. Let us take a simple (because extreme) case, which many people in the world today (but not all) would categorically reject: antisemitic nazi propaganda, as found classically in Hitler's *Mein Kampf*.[6]

At the core of nazi antisemitic propaganda was a crucial cognitive blend that spread back into many aspects of discourse. As is well known, *Mein Kampf* uses, inter alia, the following argument:

> X is a parasite (virus, bacillus, etc.) in the body of Y
> bodies can be cured by expelling or destroying parasites
> doctors expel/destroy parasites, etc.
> Therefore, Y can be cured if doctors expel X from Y

What are the cognitive processes involved in an argument of this kind? Following blending theory we can see that we have (i) an input space or source domain, which includes the concept 'parasites'. Now 'parasites' is part of a pre-existing structured cognitive frame, which necessarily includes concepts such as 'host' organism. In fact, it looks uncommonly like what Atran, Sperber, Mithen and others regard as a module of mind that has to do with the taxonomy of living kinds, or naive zoology. Recall that this module, according to several accounts, incorporates essentialism: the ascription of inherent and constant properties of

'kinds'. We also have (ii) a second input space, a target domain, which here is a social group that has contingently become distinct in the culture where the discourse (and the formation of concepts in many minds in that culture) is taking place. Clearly, this space is largely formed by many complex inputs from social discourse, including the kinds of linguistic communication ('discourse') studied by van Dijk (1991, 1993a), Reisigl and Wodak (2001) and others, not to mention the large body of explanatory attempts by the Frankfurt School and studies of nazi language by, e.g. Ehlich (1989). In this instance the social group in question is Jews. It could also include other contingent social entities, say nation states, or geographical regions. It is highly relevant that larger groups can contain, or be conceived as containing, smaller groups. In addition, there is a cross domain mapping which establishes analogies between host-parasite and nation-subgroup (Jews).

In terms of mental spaces, we have (iii) a common (or 'generic') conceptual space. In this instance, the relevant one appears to be the image schema container-contained (on image schemas, and specifically, container, see Johnson 1987 and Johnson & Lakoff 1999 and on the importance of this schema in large-scale systems of political belief Chilton 1996a). Finally, we have (iv) the blend space, where the input spaces are merged. Here, and this is the crucial point, is where further inferencing and elaboration is effected. According to Fauconnier and Turner, it is in the blend space that a cognitive phenomenon that they term 'conceptual compression' occurs (Fauconnier & Turner 2002: 92–93). At the same time, elaboration is a kind of expansion, which in the case of *Mein Kampf*, and antisemitic discourse in general, recruits further cognitive frames,[7] specifically knowledge frames that structure basic knowledge about disease, healers, healing, and curative methods. Also recruited in ideological discourse of this type are cognitive frames centred on the body which draw on the container image schema. Figure 4 represents a simplified picture of the way the mind's 'cognitive fluidity' operates to creatively produce concepts about social groups.

Such models offer CDA detailed hypotheses about how discourse affects social cognition. Notice that they are dynamic, in the sense that they can enter into inference chains. In the present example, the blend 'nations are hosts, Jews are parasites' engages the cognitive frame of biology and disease. In turn, the disease frame permits inferences of the kind:

(i) If *a* is a parasite in *b*, *a* causes disease *c*
(ii) If *c* is a disease, *b* can be cured by *d* with *e* and/or by doing *f*
Where *d* is (say) a doctor, *e* for instance is a medicine that (*e*) kills *a*.
Therefore, to cure *b*, kill *a*.

Such inferences are not strictly logical nor empirical, but based on the blend of one domain with another. Simply labelling a group 'parasites' activates a blend, which in turn activates an inferential chain. The conclusion 'kill *a*' may or may not be implanted and result in real exterminations, pogroms and genocides.

This is a hypothesis about how discourse ('cultural input') can affect ('infect', if one wants to use the metaphor) human minds, and lead to acts by humans

against other humans. This link is missing from current CDA. The cognitive account tells you the mechanisms. What it does not do is tell you *why* such inferences should lead to certain historical events at a certain time and place. If you want answers to this particular *why*, there are several routes to pursue. One is CDA. which might be able to describe the characteristics of the 'cultural input' (the discourse) that might have activated the blends ('initialised the template' in Sperber's terminology discussed above), facilitated the inferences and promoted the conclusion. It might tell us about the social and political conditions that led to certain kinds of communication network that made such input possible or effective. Typically, with the partial exception of the 'discourse-historical approach' espoused by Wodak and colleagues, CDA does not take this latter step. but sticks at the level of verbal detail. To understand *why* particular cognitive effects arise and *why* they result in action at a certain time or place is not a question cognitive scientists or linguists address. It is not evident that CDA is equipped to address this question either, without massive collaboration from, at least, the disciplines of political economy and history.

The cognitive account outlined here attempts to fill in some of the missing links that are implicit, or ought to be implicit, in the CDA project – namely, exactly how (i.e. by what mechanisms) can human utterances conceivably lead to appalling human actions?

10. Passive Receptors or Critical Instinct? Do We Need CDA?

To sum up the argument so far, to understand discourse requires a cognitive perspective. We have reviewed some of the recent work in evolutionary psychology that appears to have considerable relevance for CDA. We have also reviewed one corner of cognitive linguistics, for the same reason. In Section 9, we have shown two things: one, how blending theory can add detail to some key claims in cognitive psychology and two, how a blend of blending theory and cognitive evolutionary psychology can add detail ('depth') to our understanding of ideology, a classic topic in CDA. In this final section we attempt to draw out some of the implications for CDA of taking this route. To accomplish this we can make further use of recent work in cognitive science. Two kinds of question will guide the discussion. First, does the evolutionary and cognitive perspective imply that the human mind is easily manipulated because of the effects due to innate modules and mechanisms like blending? Second, if CDA took into account the cognitive perspective we have outlined, what sort of research would CDA become and could it still claim emancipatory benefits?

The question of how easily or not the human mind can be tricked, deceived or manipulated through the use of language is a core empirical and theoretical question that CDA has never addressed as such. There are well-known psychological studies on such phenomena as 'groupthink' and on the framing of narratives but little detailed discussion of the very possibility of verbal manipulation or how or to what extent it might work in detail (but cf. Allott forthcoming; Chilton 2002; and Saussure forthcoming). Indeed, from Fowler and others on, in the

wake of Orwell's newspeak nightmare, there has simply tended to be an assumption that people are easily hoodwinked by powerful verbalisers. What follows is an attempt to open up this question to closer scrutiny.

We return to recent work in cognitive evolutionary psychology for clues and cues. As was noted earlier, Sperber has postulated a genetically evolved metarepresentation module which he regards as central to a number of characteristically human mental and other behaviours, including creativity and consciousness. Metarepresentation, according to this hypothesis is a second-order module with the ability to form concepts of concepts and mental representations of mental representations, one's own and those of others.

The evolutionary perspective prompts a form of argumentation that goes as follows. Why would homo sapiens have developed such an ability? Because, we may speculate, humans need to know what others are thinking (cf. 'theory of mind', 'machiavellian intelligence'). That is to say, such knowledge has survival value, because it is important to know what others inside and outside one's group are wanting, believing, intending, etc. Further, metarepresentation must be integral to human language/communication, for in processing a speaker's (S's) vocalisation the hearer (H) forms a mental representation of what S is (probably) representing in their own mind. Indeed, communication occurs when H recognises S's intention that H construct some mental representation corresponding with some representation in the mind of S. Comprehension is metarepresentation.

This line of argument has some possible implications for CDA, at least for that part of it that is concerned with strategic deception through language use. Humans may have innate mechanisms for communication and comprehension, but these precisely facilitate tactical deception, that is, machiavellian behaviour. It would make no sense to assume that some had a machiavellian module and some didn't (which doesn't mean that some do not use it and cultivate it more than others, as would be argued for any of the other postulated modules). But if everyone has it, it is also necessary to assume that all individuals have the ability to counter it in others.

The hypothesis is, then, that humans need to be able to detect intentions to engage in deceptive action. Since language use is also a form of action, we must ask whether humans are not also naturally endowed with the ability to detect deceptive language use. Cosmides (1989), on whom Sperber is drawing, regards some such ability as a specialised mental module which she calls the 'cheater detector'. Sperber elaborates on this in a fashion that should attract the attention of CDA:

> The human reliance on communication is so great, the risks of deception and manipulation so ubiquitous, that it is reasonable to speculate that all available cost-effective modes of defense are likely to have evolved.
> (Sperber 2000: 135)

Building on Cosmides, Sperber goes further than Cosmides in grouping together possible component modules of this innate ability. First, there is an in-built facility

for checking the reliability of the source of information, in line with the idea of 'source tagging' (Cosmides & Tooby 2000). The recursive syntax of human languages permits embedding of propositions as complements of reportative verbs. evidential and attitudinal verbs, facilitating the metarepresentation of sources (amongst other things).

Second, theory of mind supplies the ability to 'be sensitive to subtle signs of deceptive intent [and] read the relevant attitudinal and emotional signs' (Sperber 2000: 135). Third, Sperber proposes that there exists a 'consistency filter', by means of which the human mind is innately inclined to check the logical consistency of language input, on the one hand with respect to the internal logical consistency of a stretch of talk (or text), and on the other hand with respect to external consistency with what the receiver believes to be true and with alternative informational input.

Because a speaker S will recognise a hearer's intention to counter S's deceptive intents, Sperber argues that S will try to penetrate H's defences, resulting in 'a persuasion counter-persuasion arms race' (Sperber 2000: 136). This point is in one sense obvious, but it is important to stress the claim that the modular mental basis of such a spiral is an innate ability. Even more specifically, Sperber proposes that this ability will have evolved in such a say as to give rise to a further innate module, a 'logico-rhetorical' module. This is a 'persuader' module that seeks to penetrate H's cheater detector and source tagger. It can display authority and simulate consistency. Again, one must assume that this module too works both ways: that is, it works for S's goals but also for H's defences as a counter-persuader ability. This last point is rather interesting for CDA, since it postulates.

> ...the development of the ability to scrutinise these argumentative displays and to find fault with them. (Sperber 2000: 136)

In other words, humans may already have a critical instinct, even perhaps something like a module for CDA. Naturally, people may not use it. But, firstly, to say that people do not use it, makes a claim that needs substantiating. Do they not? The question is not simple, because recognising failure to deploy critical ability requires criteria that would certainly be highly disputable. Secondly, if people do not, or do not all, or do not all of the time, this would not demonstrate an innate critical potential does not exist. Thirdly, if the claim is that people have the critical potential but do not use it, then what we need to know is under which conditions is this the case? Historians, political scientists and other disciplines can do this job as well as, or better than CD analysts. One of CDA's claims seems to be that it is primarily something about the *discourse* (utterances) that hampers the use of the human critical potential and promotes nefarious notions. This claim has not been substantiated. Nor has CDA developed any detailed theory of how cognitive influence might occur as result of discourse input to a human brain. The cognitive theory outlined in this section is a very modest step in addressing this deficit in CDA.

11. Implications for CDA

Whether the proposals of Sperber, Cosmides and others are valid can of course only rest on further empirical and theoretical work. But sufficient work already exists for the claims to be worthy of consideration.

In this paper we have (a) argued that CDA cannot neglect the cognitive aspect of communication, (b) rapidly summarised some recent work in the field of evolutionary cognitive psychology, (c) rapidly summarised one recent approach in cognitive linguistics, and (d) applied a blend of (b) and (c) to one aspect of an extreme form of racist discourse. This review and application yields two main points. First, the combined cognitive framework can go beyond description and put forward suggestive explanatory stories. Second, the combined cognitive framework raises questions about the status and direction of CDA itself.

What then are the issues for the status and direction of CDA?

i. The combined framework of cognitive evolutionary psychology and CL yields insights into human nature and human societies that CDA itself has not provided. It may be that CDA, given its adopted methods and goals and the linguistic theories it has predominantly drawn on, may be incapable of going beyond description. I am thinking here primarily of the kinds of CDA which take their theoretical frames predominantly from social theory, without the incorporation of cognitive perspectives, and which also draw in rather limited ways on heavily socialised linguistic models. I exclude those less prominent currents that place cognition at the core and which do draw, to varying degrees, on psychology and on cognitive linguistics.

ii. Even if we accept only very tentatively the modular model of mind, and the particular modules for which there is evidence or at least plausible deductive arguments, the consequences for CDA as a socially oriented, possibly emancipatory enterprise, have to be re-examined. Put bluntly, if people have a natural ability to treat verbal input critically, in what sense can CDA either reveal in discourse what people can (by the hypothesis) already detect for themselves or educate them to detect it for themselves? There are obvious responses to this question. One might be that, granted a 'critical discourse' module, such a module still needs to be activated and developed. There are problems with such a move, however. One is that it places CDA in a position of responsibility and perhaps power, if an educating or developing role is granted to CDA practitioners. Another is the problem of knowing what sort of technical analysis CDA could conceivably provide that could give what is required for someone to develop their critical discourse module. Stock responses to CDA include the charge that it is stating the obvious and that no technical apparatus is needed anyway to point out what is not perhaps obvious. Such responses might be taken to suggest that people are indeed aware of the existence of their own critical faculties. Moreover, taking the point that technical apparatus is not needed, this means (a) that CDA has no core scientific programme of discovery or elaboration and then (b) also that its ability to bring strategic and tactical language use to awareness may be no greater than that possessed by the non-expert and that it is merely engaging in ordinary political language use.

iii. The last set of points could be taken to imply that the focal research question might be formulated as the question: What prevents people using their innate cheater-detecting logico-rhetorical modules to protect their own interests? I am suggesting that the answer is not that they cannot analyse the verbal input and need help in spotting, for example, nominalisations or agent-less passives, or intertextual cross-overs. Next to nothing is known about whether such things do really have any cognitive effects and thus social action effects. What is clear, however, is that under certain social, economic and political conditions people may not be able, or may not be willing, to respond critically. One can imagine many such conditions, but it is doubtful that any of them can be elucidated by purely linguistic or discourse-analytical means. For they would seem to have to do with economic forces or socio-political institutions that restrict freedom of expression and freedom of access to information, without which you cannot use your source-tagging abilities, your cheat detector, your consistency checker, etc. This is not to deny the central importance of linguistic communication, but it does cast doubt on whether technical or theoretical research or description in CDA has any special social role. In fact, if the preceding argument is correct – that it is institutional or economic restrictions on communicative freedom that is crucial, then what is needed is historical, social, economic and political analysis not the analysis of language itself. And, interestingly enough, it is Chomsky, whose linguistic models have no social or political critique, who has provided an analysis of the restrictions on expression and access in modern capitalist societies ('A propaganda model' in Herman & Chomsky 1988: 1–35).[8]

iv. The last paragraph argues that CDA's would-be theoretical and technical analyses of text and talk may have no direct bearing on social and political conditions. It may be that it could carry a pedagogical role, but in that case it may be doing no more than any politically aware person. If it does set research goals, within the normal understanding of research in the western scholarly and scientific tradition, then it may necessarily separate itself from social and political goals. The route that has been indicated in the bulk of the present paper goes in the direction of deductively elaborating empirical and theoretical research, and also exploring phenomena like racism from within that paradigm. What I have suggested about racism in Section 9 is of no obvious use in combating racism. If it has any value it is of a scientific kind, in so far as it sketches a hypothesis as to how certain conceptual structures take hold in the mind and spread.[9] There remain questions about the socio-economic and political conditions under which certain cognitive effects take hold of whole populations by way of verbal communications (and perhaps other systems), but these are not specifically linguistic matters on which language experts can pronounce. There remain, too, profound philosophical questions about volition, agency and ethical responsibility.

The upshot of these ruminations is that CDA may not be the field within which the most perplexing questions can be pursued that concern the nature of the human mind, of human language, of human language use and of human society.

Notes

1. I am most grateful to Patricia Chilton, Bill Downes, Ron Scollon and Ruth Wodak for critical discussion to do with ideas in this paper. This does not mean that they would agree with anything I say in it.
2. See below on cognitive science and cognitive linguistics in a socio-critical context. It is important also to mention the important work inspired by pragmatics produced by Verschueren, Blommaert, Bulcaen (Blommaert & Verschueren 1998; Blommaert & Bulcaen 1997), who have tended to keep their distance both from mainstream CDA and from Hallidayan linguistics (see Verschueren 2001). Downes (2002) points out that Hallidayan systemic-functional grammar fails to take account of inferencing and world knowledge in human language understanding. He also argues that CDA fails to resolve the tension between CDA's claim to reveal social functions of discourse and speakers' conscious intentions and rationalisations. These points are somewhat related to O'Halloran's (2003) arguments that the presence of items and structures in text is not necessarily related to the cognitions established by the reader/hearer on the basis of such text features, as well as to his general application of the distinction between low-effort shallow reading and high-effort interest-oriented reading of texts.
3. The more cognitively oriented linguists concerned with social issues do, I think, assume something like this argument; but these are not the authors typically associated with the central tendency of CDA.
4. The theories in cognitive linguistics referred to have developed quite independently of the theories of modularity discussed earlier.
5. Interestingly, such an approach takes us back to the origins of the term *idéologie* as used by Destutt de Tracy, *Eléments d'idéologie* (1817–1818).
6. Cf. Chilton, 'Manipulation, memes and metaphors: The case of *Mein Kampf*' in L. de Saussure, ed. (forthcoming).
7. The mechanisms by which 'recruiting' occurs are not specified by Fauconnier and Turner, but it seems likely that there is overlap between modular knowledge frames. For example, there is at least a culture-based naive medicine frame that intersects with the naive zoology module. Relevance principles may also apply.
8. It has been pointed out to me by Ruth Wodak that in certain highly structured social spheres, e.g. doctor-patient communication, educational institutions; discourse behaviour has been changed as a result of CDA-type activity. This may be correct. However, there is a risk in such claims of drawing CDA's own charge of the 'technologisation of discourse' (cf. Fairclough 1989, 1995, 2003).
9. 'Epidemiologically', Sperber would say (Sperber 1994); cf. also Dawkins on 'memes' (1999) and Chilton (forthcoming).

The Interpenetration of Communicative Contexts: Examples from Medical Encounters

Aaron V. Cicourel

Editors' Introduction

Aaron Cicourel is Professor of Cognitive Science and Sociology at the University of California, San Diego, where he is also employed by the Medical School. For over three decades, Cicourel has worked on the ways in which knowledge is accessed or manipulated in a variety of contexts, including courts (Cicourel 1968), educational settings (Cicourel and Kitsuse 1963), and medical settings (Cicourel 1980). His concern for the structuring of everyday experience through social interaction and his critique of hidden procedures within institutional settings puts his work close to two other contemporary influential figures in the analysis of everyday interaction, Erving Goffman and Harold Garfinkel. With the former, Cicourel shares the focus on situated interpretation – Goffman's famous leading question "What's going on here?" can be repeatedly heard through Cicourel's work – and with the latter he shares the concern for the participants' unconscious inferential processes or implicit principles that characterize everyday thinking. Cicourel's unique approach to sociology, which he termed "cognitive sociology" (Cicourel 1973), is an original blend of European scholarship on the mundane basis of scientific thinking – Husserl's thought as filtered through Schutz's work was particularly influential in Cicourel's early research – and contemporary development within cognitive science. His long-term association with the Center for Human Information Processing and his regular exchanges over the last several years with such scholars

Source: Alo Scandra Duranti and Charles Goodwin (eds), *Rethinking Context: Language*

as David Rumelhard, George Mandler, Michael Cole, and Roy D'Andrade has further informed his concern for the integration of traditional micro-sociology with current thinking within psychology and anthropology on the origin of contextspecific knowledge and memory.

In this chapter, Cicourel returns to one of the main concerns of his intellectual career, namely the question of the definition of context in the analysis of verbal interaction within institutional settings. Whereas formal grammarians and structuralist anthropologists are interested in the discovery of underlying, abstract, often unconscious structures and processes that give meaning to linguistic or ritual forms, Cicourel is interested in the hidden aspects of reasoning and information processing that characterize researchers as well as members of a given culture. "How do you know that?" is a question that Cicourel often asks his colleagues when they present the results of their research projects. The replies (or attempts to reply) he receives in these exchanges constitute for him the starting point for methodological and theoretical reflections on how knowledge is stored and retrieved and issues created or ignored out of a myriad of details which are often used but not talked about by analysts. Cicourel's ideal model of the relationship between language and context is one in which the participants, before the analysts, have simultaneous access to several levels of analysis, including the local organization of turn-taking and their internal syntactic structure, lexical choices and semantic networks, as well as the broader context of the institutional settings where the interaction takes place and within which talk acquires meaning for the participants *qua* social actors (see Corsaro 1985). He distinguishes between two senses of context, which he names "narrow" and "broad," and proposes their integration for the analysis of everyday talk. Methodology is one of Cicourel's main concerns. In particular, he stresses the importance of ethnographic fieldwork and the ways in which it can help situate a stretch of talk within its larger institutional context. In this chapter, his methodological concerns are integrated with a detailed analysis of particular verbal exchanges within a medical facility. By using a technique similar to what film critics call "slow disclosure" (Sharff 1982), Cicourel slowly uncovers further layers of information about the participants, their institutional roles, their previous exchanges, and their shared knowledge. In so doing, he is able to directly address the issue of how much contextual information should be made available in the study of spontaneous everyday interaction. In Cicourel's chapter, we are shown that even the use of initials in a transcript hides unspoken principles and selective strategies. Until we are told that IDA and MR stand for *Infectious Disease Attending* and *Medical Resident* respectively, we could take them to be conventional mnemonic devices void of social meaning. But labelling is important for participants (when they talk about each other) and researchers alike. What does it mean to give a transcript with names of speakers, with their occupational roles, or with initials? What do we evoke when we say that a certain conversation is between a doctor and a patient, or between A and B? On the other hand, how much information should be offered? Shouldn't we avoid the possibility of an infinite regress, whereby the

whereby only the information that the participants themselves make available in the talk should be evoked by the researcher. However, Cicourel points out some possible limitations of this program when applied without a critical attitude. The omission of apparent extratextual information can be problematic to the extent to which it obscures information that was at some point relevant to the researcher during the collection of analysis of the material under discussion. The ideal researcher in Cicourel's model of discourse analysis is thus one who does not hide his or her sources of information and research choices but makes them into a common resource to be shared with the readers in an attempt to unveil the hidden processes of the selection of information which guides participants and analysts alike in the course of their daily lives.

The interpenetration of communicative contexts: examples from medical encounters

1 Introduction

A researcher's decision to tape-record conversation or discourse creates a contextual frame that limits what is to be identified as relevant data, their organization, and the kinds of analysis and inferences to which these data will be subjected. Research on conversation and discourse varies considerably in the extent to which an investigator will describe the circumstances of taping a conversation and her or his involvement with those taped. Similar conditions exist in other types of research on social interaction. For example, in field research, a participant observer must be sensitive to the fact that elicitation procedures can force informants to become aware of issues or conditions about which they normally are not aware or may be aware of only in the local context of everyday settings. Silverstein (1981) notes that much if not most of what is of interest to researchers is beyond the informant's ability to articulate meanings in ways we would like or expect. The researcher's questions can create contextual frames that may not

laboratory experiments of social interaction where status and role relations are foci of attention. The investigator's and subjects' conceptions of status and role relations are contingent on implicit and formally defined notions of "context" created for the experimental occasion. We seldom know the extent to which simulated social relations reflect or are contrary to the kinds of experiences subjects have in their everyday encounters.

While many researchers will agree that talk and some notion of "context" shape each other as part of an emergent process that changes through time and space, not all students of language use will concede that ethnographic material, participant attributes, and patterns of social organization that are constitutive of talk need to be included in studies of the structure of conversation or discourse. For example, conversation analysts (Sacks, Schegloff, and Jefferson 1974; Schegloff, in press) prefer to focus on such things as sequential organization, and how that organization creates local contextual elements in conversation. The researcher's use of social categories in any analysis must be linked to participants' recognition of the categories as integral to the events being studied. This research attitude can result in a very formal type of analysis. Linguistic approaches to discourse analysis (Brown and Yule 1983) also minimize the role of ethnographic and organizational conditions that can also result in a formal analysis of utterance sequences. What remains unclear is the extent to which the decision to tape or use particular materials includes or excludes explicit and tacit knowledge about reported and unreported ethnographic conditions, participant attributes, and patterns of social organization that can selectively shape subsequent analysis. The researcher can exercise considerable discretion in what the reader will be shown or told about "context."

The content of conversation or discourse material can be made to appear rather transparent when we use brief, formal or informal exchanges among people we do not know, who interact in settings described in a limited way, or when we use casual, mundane everyday conversations among friends during informal exchanges. When the research analyst is working in her or his own society, and the reader is expected to be from the same society, it is especially convenient to use brief, formal or informal mundane conversations. The investigator's ability to comprehend these exchanges is assumed to be self-evident and is seldom if ever an aspect of the analysis. But if a fuller analysis of participants' conversation and ethnographic understandings about activities, objects, and ideas is desired, and that understanding presupposes prior social experience, and/or technical, scientific, or professional training, then other strategies besides a completely local analysis must be employed.

Verbal interaction is related to the task at hand. Language and other social practices are interdependent. Knowing something about the ethnographic setting, the perception of and characteristics attributed to others, and broader and local social organizational conditions becomes imperative for an understanding of linguistic and non-linguistic aspects of communicative events.

In the present chapter, I discuss several settings within a larger organizational

"context" includes an institutionalized framing of activities. In traditional social science theorizing, it is customary to speak of group-derived prescriptive norms that pressure and/or channel people with designated titles, presumed competencies, duties or responsibilities into certain physical spaces at certain times in order to engage in a finite number of specifiable activities. Within this institutionalized context or framing of activities, emergent processes of talk appear that create a more narrow view of "context" in the sense of locally organized and negotiated interaction.

The extent to which the investigator knows about the institutionalized and everyday events that participants and analysts categorize by the use of specific terms varies. For example, the analyst of particular settings may or may not be present when speech events are recorded. Within this more narrow sense of "context," therefore, the analysis of a tape and transcript may or may not begin with the investigator's direct experience with the ethnographic setting in which the speech events were recorded.

When the investigator knows little or nothing about the speech event and the event is rather short-lived and apparently not viewed as part of or influenced by existing institutionalized or bureaucratic activities, what gets identified as context can be more easily located in the talk said to be attended by the participants. The investigator can begin her or his analysis by examining the way the conversation is initiated, the way intonation and stress are used, the content of lexical items and phrases, the occurrence of pauses or hesitations, turn-taking moves, and the way topics are introduced, sustained, and altered or changed. The focus of attention can become the sequential organization of conversation material that presupposes that participants, investigator, and reader all share a common knowledge base that is largely tacit or unstated but which becomes partially articulated by the way the investigator begins to make claims about the categories to which the participants are said to be attending. The investigator and reader presumably can each examine the same data and make claims and counter-claims about the clarity and substance of the analysis.

The methodological strategy of using local talk as the source of information in the narrow sense of context can be self-serving by the way the researcher not only ignores prior and current organizational or institutional experiences of participants, but by the kinds of data that are presented for analysis. For many students of language and social interaction, therefore, the notion of context need not include references to the participants' and researcher's personal, kin, and organizational relationships and other aspects of complex or institutionalized settings. Casual, fleeting speech events, however, are often constrained and guided by normative institutionalized features that we associate with encounters in public places described in general but vivid terms by Goffman (1959, 1963, 1971) among others. These brief exchanges can also carry considerable cultural and interpersonal "baggage" for participants because of long-term social relationships unknown to or unattended by the investigator. The investigator who examines a speech event can therefore be forced to attend to its several senses of context

The present chapter is identified explicitly with the view that both a broad and local sense of context are needed for the study of language use. The focus on discourse in the pages that follow should not be construed as being relevant only to conversational material, but also applies to the study of single utterances. I examine a complex environmental setting in order to underscore the importance of context at different levels of analysis. The following pages begin with a conversation in which three people emerge as speakers. Subsequent sections provide the reader with a brief overview of the organizational settings and the ethnographic circumstances in which the data were obtained. After investigating additional speech events, I close the chapter by illustrating how both immediate and other aspects of context must be taken into account if we are to understand language and social interaction in everyday life. The focus of this chapter, therefore, differs from but also builds on conversation and discourse theorists concerned primarily with the structural features of conversation such as turn-taking, side sequences, topicalization, coherence, and related notions. It is important to locate the analysis of language and social interaction in a wide variety of social activities that are implicitly and explicitly known to the participants and investigator.

2 A Routine Conversation

The speech event presented in Example (1) can be viewed as a routine conversation between three unidentified people who will be identified below.

Example 1: A conversation between three physicians

1	PA:	(?) (low voice level) Is this the same **one** (**we?**)
2		(ya?) did yesterday?
3	IDA:	No. This is the eye lady.
4	PA:	(?)
5	IDA:	Cellulitis
6	PA:	Oh.
7	IDA:	With group A strep..in shock
8	PA:	In shock. (Slight rise in voice level) How about **that.**
9	IDA:	I[t?] was gonna be more interesting |if she didn't
10	MR:	|I'm(?)
11	IDA:	have bacteremia but (laughing and voice level
12		increasing) now she's had |bacteremia so
13	MR:	|There's a little, there's
14		little (voice level increases) problem with that
15		that I'll, will go into more as far
16	IDA:	Yeah.
17	MR:	how much shock she really |was in,
18	IDA:	|was in, right
19	MR:	compared to what [abrupt shift] she's a liver lady.
		[illegible] I don't know what her blood pressure sits

23	PA:	So she didn't have peripheral, evidence of shock
24		really?|Just a low blood pressure.
25	MR:	[No, she wasn't, she wasn't ever clamp, you
26		know
27	PA:	Uh huh
28	MR:	clamped down *or* flushed or anything
29	PA:	OK
30	MR:	I can..and, and she doesn't
31		[abrupt shift] one thing that argues
32		against a lot of neuropathy, you know, from diabetes, for
33		one, she's only had it for three years, but two, you know,
34		her neuro exam an' her an' her peripheral vascular exams,
35		is really normal, is normal sensory, good pulses distally,
36		and stuff, and I just have a hard time,
37	PA:	Yeah
38	MR:	there'd be a lot of sy-sympathetic, you know
39	PA:	Right
40	MR:	phone calls.
41	IDA:	Have they got sinus films on yer yet?

Each dot between words = one second. The solid vertical line indicates points of overlap in the exchange.

Telling the reader that three physicians are involved is an initial attempt at penetrating what is occurring in this encounter. Lines 1–12 strongly suggest that the participants are engaged in a discussion regarding the medical condition of some other party. The investigator's control over when and what material will be shown the reader can, therefore, vary considerably and can create different interpretive frames. Saying that three physicians (they also could be other health care providers) are talking implies that they are probably in a medical facility of some kind, but there is no indication of precisely what kind or part of a health care facility they are in. Nor can we be sure if the patient is nearby, is an inpatient or an outpatient. We know nothing about the physicians' gender or personal characteristics nor their specialities. Nor do we know if this information is relevant to the analysis.

The opening lines (1–8) of Example (1) do not mention the term "physicians" nor is there any indication in lines 1–3 that a "patient" is involved. Having identified the three participants as "physicians," we can also say that they are talking about a "patient" who has been dubbed the "eye lady," for some unstated reason, or a patient who is experiencing difficulty with her eye.

Although the content of lines 1–3 of Example (1) ("Is this the same one [we?] [ya?] did yesterday? No. This is the eye lady.") does not suggest a health care facility, physicians, and a patient with eye problems, the term "cellulitis" in line 5 might be recognizable enough to send us to a medical dictionary as we begin our analysis. Alternatively, we might seek help from informants or examine further sequences of conversation in the hope that other lexical items, phrases,

by IDA in line 7 ("group A strep..in shock"), which could refer to an infection. The comment or observation by PA in line 8 ("In shock. How about that.") could be interpreted as expressing interest in the categories supplied by IDA and perhaps mild surprise. The subsequent remarks by IDA in lines 9, 11 and 12 of Example (1) ("I[t?] was gonna be more interesting if she didn't have bacteremia but now she's had bacteremia so") suggest that PA and IDA are both familiar with the terms "cellulitis," "group A strep," "in shock," and "bacteremia."

The significance the analyst attributes to particular utterances or to their sequential order, and claims about the participants' perception and understanding of a speech event, are often the result of examining subsequent utterances (Sacks, Schegloff, and Jefferson 1974). If we do not invoke institutional and local socio-cultural details with which to identify the participants of conversation, the analysis of meaning is nearly impossible.

I will now abruptly shift my mode of analysis by telling the reader something about the participants in Example (1) and about how the data were obtained. The setting is generally known to the reader and investigator alike because of a commonsense understanding of categories such as "patient," "health care facility," "medical center," "hospital," and "medical school." Stating that the talk is in a medical setting does not tell the reader that there is medical talk taking place nor who is doing the talking and with what credentials. But claiming the participants in a given speech event are physicians talking about a particular (technical sense of) "patient" orients us to categories we associate with particular members of a medical setting and a basis for making claims about the use of these categories in their talk. The term "patient," for example, is used in at least two ways in this chapter.

For the reader of this chapter, the term "patient" probably implies a commonsense notion of someone who is not feeling well or is "sick." For the health care expert, however, the term "patient" can activate thoughts about someone with neurophysiological, biochemical, and psychopathological symptoms and conditions that are part of an extensive technical compositional semantics and clinical as well as mundane experiences. For the most part, the term "patient" will be used in the second sense just noted. Thus, even mundane terms such as "eye lady" (line 3, Example 1) and "she's a liver lady" (line 19, Example 1) imply an activation of technical knowledge and experiences that are part of complex socially organized activities.

3 The Research Setting and Types of Participants

The case material I present in this chapter represents a small portion of data from field research in two teaching hospitals. The material is part of routine institutionalized bureaucratic activities that are typically associated with health care delivery in Western countries. My observations and tape-recording of activities mostly involved physician–patient, physician–physician, or physician–

The medical settings observed are typical of teaching hospitals but are not necessarily representative of other clinic or hospital settings in which there is an absence of House Staff (interns, residents, and training fellows). The inclusion of House Staff adds hierarchical relationships and hence additional bureaucratic conditions that differentiate teaching from non-teaching hospitals. Additional details about organizational conditions, the influence of status and role relationships, and the expertise or background knowledge associated with such designations will be provided as the chapter unfolds.

The range of speech events in these settings can be diverse and can include a quick exchange of greetings, brief exchanges of gossip or rumors about patients, or staff, and discussion about the local baseball or football team's fortunes. There also can be brief and lengthy exchanges between physician and patient, technical discussions among physicians and between physicians and nurses or technicians, and somber or emotionally charged exchanges between family members and health care personnel. The exchanges can occur in a variety of settings such as the patient's room, in a clinic examining room, a hall or corridor, an empty elevator, the cafeteria, at the x-ray facility, the nurse's station, or a laboratory.

Over a period of months, I observed and then began to tape-record various clinical exchanges. These exchanges included outpatient clinics where patients may be seen initially or as a follow-up from prior visits or inpatient service. I also accompanied the resident or attending physician on ward rounds, or visits to the x-ray facility, to daily laboratory rounds, and to weekly grand or teaching rounds where cases of unusual interest are presented before attendings (one or more physicians qualified to supervise residents) from the county and residents from several hospitals.

The ethnographic activities alluded to above obviously provided many opportunities to express my ignorance about medicine and to ask questions of different experts. The field research was facilitated by my official connection with a school of medicine. Knowing some of my informants independently of the research setting because of committee activities in the School of Medicine made participation in the research setting easier and enabled me to ask many "dumb" questions as a non-medical specialist. But familiarity with the settings can also create problems. For example, my colleagues sometimes forgot that I am not a physician and spoke to me as if I were fully capable of understanding technical matters that were discussed. I often pretended to seem informed in order to not disturb the speech event, but later would have to ask for help.

My ethnographic experiences, consultations with people called "physicians," and occasional uses of a medical dictionary enable me to take a number of liberties in describing the material in Example (1). I can tell the reader that there is a female inpatient located in a medical teaching hospital with an eye problem as well as additional difficulties associated with the technical terms "group A strep" (line 7), "shock" (line 7) and "bacteremia" (line 11). I rely on the reader's commonsense understanding and my use of expert informants to claim that the physicians are talking about someone with an infection and perhaps something

Less transparent here is the remark by IDA (lines 9–12) that the case would have been more interesting if the patient did not have bacteremia.

4 Reexamining the Conversation in Example (1)

The exchange in Example (1) does not state that the three participants are attached to a health care facility of some kind nor is there any mention of a patient. The conversation begins in line 1 with the introduction of a topic ("Is this the same one . . .") and a reference to some object or someone that had something done to it the day before.

In Section 2 above, I alluded to the possible content of lines 1–7 of Example (1). An analyst might choose to ignore further discussion of content at this point and instead could focus on who speaks first and how someone responds, identifying turns, the selection of next speaker, topicalization, side sequences, adjacency pairs, registers used, topic and comment, deictic, anaphoric, metaphoric, and metanymic expressions, to mention some familiar aspects of the study of language in social interaction.

The opening question by PA ("Is this the same one [we?] [ya?] did yesterday?") in line 1, Example (1), can be seen as topicalizing an unidentified but particular type of object that other participants presumably recognize as fitting into a specific subset of a general category. We can subsequently categorize this object as a "patient" in the technical sense by assuming the participants are health care providers of some kind. The response by IDA in line 3, Example (1), rejects a particular subset of the unidentified hypothesized category but does allude to another subset by stating "This is the eye lady." In lines 5, 7, and 12 of Example (1), IDA seems to clarify the hypothesis about the category "patient" by describing particulars such as "cellulitis," "group A strep," "in shock," and "bacteremia."

The opening question by PA in line 1, Example (1), might also be loosely interpreted as one part of an adjacency pair (e.g. question–answer sequence) in which the second part consists of the "No" of line 3 by IDA. Perhaps this type of analysis might be stretched even more if we ignore the "No" of line 3 and the "Oh" of line 6 and say that the second part of the adjacency pair consists of fragments from lines 3, 5, 7, and possibly 12 of Example (1). To paraphrase the exchange, PA's question in line 1, "Is this the same one (we?) (ya?) did yesterday?" is answered by IDA in lines 3, 5, 7, and possibly 12 ("No. This is the eye lady," "Cellulitis," "With group A strep...in shock," and "now she's had bacteremia"). If we go beyond this loose illustration of sequential analysis, we can ask how much local context is the analyst required to construct in order to convince herself or himself and the reader that the interpretations being claimed are adequate for some sequence of text?

5 What Counts as Relevant Ethnographic Details?

to IDA when posing the question about the "same one" in line 1. The speech event can be further clarified by noting that PA refers to a Pathology Attendant who is the Chief of the Microbiology Laboratory, and IDA is the Infectious Disease Attending. MR is the infectious disease Medical Resident for the rotation period during which the event occurred.

The exchange reported in Example (1) occurred after MR and IDA had both interviewed the patient and had discussed the case. Their participation in the encounter reported in Example (1) had already been anticipated because of the expected earlier exchange. PA is the expert here and methodically examines a series of small slips of paper each morning at 11:00 a.m. in which new or additional information about a patient's cultures is noted. IDA is also an expert about microbiological aspects of each patient, particularly the clinical ramifications of the case. By addressing IDA, PA asks the responsible clinical expert about the case in order to contextualize the laboratory findings. There are other people in the corner of a large room (which is actually one part of the suite in which the microbiology labs are located). There often is a fourth-year medical student doing a month's rotation in infectious disease cases, a pathology resident who assists PA with laboratory details including the cultures for each patient, slides, and petrie dishes to be examined that morning, an infectious disease resident from pediatrics, and one or two teaching fellows.

In a teaching hospital, IDA may begin with a few comments on the case but normally turns it over to MR for the details. After this, PA first examines the slide or cultures and either directly describes the morphology of the organism(s) or invites the medical student or fellow or a resident to tell the group what organism(s) is/are involved. PA then invariably gives the group additional information about the nature of the organism, the kinds of disease and/or symptoms associated with the laboratory findings, and the patient's likely prognosis with different types of treatment.

The opening line of Example (1), therefore, assumes coherence by reference to a presumed activity done with thus far unidentified others the day before. As noted above, the unidentified others in the present case are the MR and IDA. The response by IDA in line 3 shifts the topic to someone called "the eye lady." The inaudible comment by PA in line 4 of Example (1) could have been a request for details about the case. IDA provides one detail ("cellulitis"). From my watching his facial expression and hearing the intonation of his voice ("Oh" in line 6), I infer that the term is of interest to PA. When IDA provides additional information about the patient, PA repeats the last phrase ("in shock") and with a slightly rising voice level seems to be expressing mild surprise ("How about that"). Then IDA, in lines 9, 11, and 12, refers to how much more interesting the case would have been if the patient had not had "bacteremia" ("I[t?] was gonna be more interesting if she didn't have bacteremia but now she's had bacteremia so"). MR, however, in lines 10 and 13–17 ("There's a little, there's little problem with that that I'll, will go into more as far how much shock she really was in") seems to be questioning the patient's "shock" and these doubts are related to the issue of bacteremia with or without shock.

IDA and MR when the two discussed the case and knew that there were doubts expressed (in two separate medical histories) by other physicians about the patient's "shock." MR's completion of his remark from line 17 (stated as "compared to what" in line 19) was followed by an abrupt shift in the topic. Presumably the patient's "shock" was to be contrasted with an unstated something else ("compared to what") when MR decided to abruptly shift the topic to the patient's liver ("she's a liver lady, you know"). So in addition to being "the eye lady" of line 3, the metaphor shifts to that of "liver lady." The reader's technical knowledge may be strained by the phrase "a liver lady." My participation in the setting tells me we have a patient with a current eye problem and a prior liver problem attributed to a history of alcohol abuse.

On the basis of previous conversations with informants, I can report that one clinical sign of shock is very low blood pressure. MR's remark in line 21 ("It may not be real high to start with") refers to the time of admission for the patient when her blood pressure was observed to be low but where no one (including the patient) was aware of her normal blood pressure. The inference of possible shock, therefore, can be problematic depending on the patient's normal blood pressure. IDA had contributed to MR's remarks through their previous conversations the day before, and the "Right" uttered twice by IDA in line 22 could signal agreement with the present observation by MR and/or IDA's prior contribution. After reading the transcript, however, IDA reported that the intent of saying "Right" twice was to hurry MR into expediting his delivery and remarks.

In lines 23–4, PA provides some clarification of the patient's alleged shock by his "declarative-interrogative" that the patient apparently "didn't have peripheral, evidence of shock really? Just a low blood pressure." Although appearing to be a question, PA's remarks are spoken authoritatively through the use of a somewhat "matter of fact" or "self-confident" intonation and the mildly assertive nature of the content. There is also the ethnographic element that he is the primary expert here and can be indirectly asserting this expertise by his remarks in lines 23–4.

MR's rambling remarks in lines 25–36 of Example (1) address several possible topics that presuppose background in clinical medicine. For an attending, MR's remarks can become the basis for an organizational assessment of the resident or novice in infectious diseases. As non-medical specialists, students of language use in social interaction, we can only superficially assess the import of the material in Example (1) unless we seek the help of informants and have access to the kind of ethnographic information provided thus far.

6 Expanding the Ethnographic Context

I have presented a partial description of the way the selection of different ethnographic or organizational settings and types of speech events or social interaction

technical matters that affect how patients are admitted into a medical setting, are diagnosed, and treated by different health care delivery personnel.

The present case involves a 48-year-old white female whose chief complaint was recorded in her admission history and physical examination as "swelling of the left eye." Additional details can be found in Cicourel (1987). Of interest here is her primary diagnosis of "periorbital cellulitis" or what was described as a "right-upper-lid abscess with periorbital cellulitis." My informants helped me translate this last phrase into an infected, swollen-shut left eye, that seemed highly inflamed to me, with purplish coloring of the skin around the eye that was apparently caused by blood seeping into the skin. The patient's left side of her face was swollen as well as her eye and ear. There was pus oozing out of the area of the eyelids.

I accompanied MR when he first went to the medical ward to see the patient. Before interviewing the patient, MR went to the nurse's station to review the patient's chart. As is often the case with infectious disease patients, an attending physician other than IDA usually will see a patient admitted to the medical service. In the present case, two attendings had interviewed the patient and had ordered laboratory tests before asking for an infectious disease consultation. The results of these tests were reported in the chart. MR's infectious-disease-oriented interview of the patient, therefore, was in part influenced by his having had access to the patient's medical chart. MR's questions, therefore, reflect aspects of these prior experiences.

In addition, this interview is influenced by his prior medical school training. The medical student's knowledge of infectious diseases can be traced to one or two courses (depending on the quarter of semester basis of the medical school) in microbiology. I attended some of the lectures in microbiology and also interviewed the director of the course, who is also PA in the conversation of Example (1). With the help of informants, it is possible to trace aspects of the basic science concepts and clinical medicine experience medical students are exposed to before they enter an intern or residency program. Knowing something about the physician's prior experiences in medical school and as a House Officer can provide the analyst and reader with possible aspects of the background knowledge tacitly or explicitly assumed or employed during a speech event. I do not have time to present all of the content of my interview with PA in his role as the microbiology course director, but instead will provide the reader with a few highlights that can be linked to the conversation in Example (1).

Trying to trace the kinds of basic and clinical science concepts that medical students and House Staff are exposed to before they attain the status of "attendings" is not meant to imply that such codifiable knowledge is the primary source of background necessary for the diagnostic reasoning and treatment directed at patients. In my work on medical communication and diagnostic reasoning, I have stressed the importance of tacit clinical experience and the everyday understanding of mundane social interaction as aspects of a world presumed to be known in common but not necessarily examined reflexively by participants in the medical or any other area of life (Cicourel 1982, 1986, 1987). I call the

codified knowledge (textbooks, detailed lectures, laboratory practices, apprentice-like experiences) into our understanding of bureaucratic and non-bureaucratic language use and social interaction. Inasmuch as sociolinguistics tends to address various kinds of everyday events in which the analyst can "pass" as an expert because of her or his background in language use and social interaction, the analysis of content is often viewed as fairly straightforward. By calling the reader's attention to the role of multiple ethnographic and/or organizational settings and informants, I underscore the complexity of the term "context" or "local" and more abstract senses of culture or social organization for understanding language use and social interaction.

According to the microbiology course director during an interview obtained early in my research and noted above, students should remember the following:

Example 2

"...what are the important bacteria, and, in terms of human disease, and what are their unique microbiologic characteristics...The streptococci can be differentiated into the hemolytic ones and the non-hemolytic ones and green ones. Those that are alpha-hemolytic make green colonies. And among the beta-hemolytic ones we have the group A strep, which is really the only accepted cause of bacterial pharyngitis...The streptococci are in chains, the pseudomonas and the enterobacteriaceae are gram negative rods, and they look a lot alike on the gram stain... And if you look at the streptococci for a minute, the group A strep, is able to cause sore throats primarily because of the M protein... ...what are the unique microbiologic characteristics that permit me to recognize this organism, let's say right out of the blood culture bottle like you've seen us do up there?....Did this patient have cellulitis, or lymphangitis? Yes. Well, then it's probably a group A strep...

The technical remarks by the pathologist made during the interview conducted before the completely independent laboratory conversation of Example (1) refer to the clinical consequences medical students are expected to remember from courses in microbiology. The references to "streptococci" (line 3), "beta-hemolytic ones" (line 6), and "group A strep" (line 7) in Example (2) are directly related to the "sore throats" of line 12 and are a significant aspect of the diagnostic reasoning employed in the present case. Notice the reference to "cellulitis" and its association with "group A strep" in lines 17–18. The pathologist's remarks provide clear evidence of prior training on the part of physicians that plays a role in job-related speech events. Such training may be important not only to participants, but also to the analyst's understanding of medical communication and semantic aspects of diagnostic reasoning in the case under review and in medical settings generally.

of a medical student's laboratory experiences with the microorganisms noted in Example (2). Without this background knowledge based on studying textbooks, listening to lectures, and working in a laboratory setting, it would be rather difficult for a participant to display her or his group membership in the conversation of Example (1). In the case of a medical resident, there will have been prior experiences as an intern in which aspects of the material in Example (1) will have been discussed.

Another source of background knowledge that can influence speech events in medical settings is the way that novice physicians are exposed to an initial lecture (also given to them as a written handout) when they begin their training. The following lines are from lecture notes developed by an infectious disease attending physician. I quote selectively from the written handout given to the House Staff.

Example 3

"I. Septicemia – microbial agents in the bloodstream...
B. One is led to the diagnosis of bloodstream
infection by a **sudden change** in clinical
state...
All sorts of organisms can cause hypotension, but,
in the absence of hypoxia (pneumonia) or heart
failure, gram-negative bacteremia with endotoxemia
is by far the most common cause of sustained
hypotension...
D. Other causes of infectious shock
3. Streptococcal shock (group A strep), often in
the absence of bacteremia, associated with soft
tissue infections (usually severe)..."

Of interest are references to "microbial agents in the bloodstream" (line 1), "the diagnosis of bloodstream infection by a **sudden change** in clinical state" (lines 2–4), and "organisms [that] can cause hypotension" such as "gram-negative bacteremia with endotoxemia" (lines 5–7). A sudden change in clinical state can be a drop in blood pressure (hypotension), which in turn can be linked to the release of bacteria or endotoxins in the bloodstream that can lead to shock. The most succinct remark can be found in lines 10–13 of Example (3) because it comes fairly close to the case described in Example (1). The patient was found to have group A strep and bacteremia as noted by IDA in Example (1). The case revealed bacteremia but MR claimed the patient may not have been in shock. The presence of shock was never confirmed. The remarks contained in Example (3) and given to House Staff at the two hospitals in which I conducted my research directly associate this background material to specific aspects of the exchange in Example (1).

I will close this section by quoting a brief excerpt from MR's original interview with the patient. The interview occurred prior to the speech event reported in

Example 4

1 I wanna take (?) your blood. (?) blood pressure (?)
2 (.....) (mumbling) A lot of people get, bacteria
3 in their blood, and ya get uh shock. [Low monotone
4 intonation] When your blood pressure goes down
5 because it means (?) the bacteria releases certain
6 toxins, depending on (?) area (?) [raised intonation]
7 Has your, blood pressure always run kind of on the low
8 side, ma'am?

Before MR and I entered the ward to see the patient, MR had reviewed the patient's chart and was aware of the two prior medical histories therein and hence was also aware of the suspected diagnosis of bacteremic shock. MR was also aware of many other medical facts and hypotheses about the patient's condition. MR's explanation (only partly shown here) to the patient about her medical problems (linking a drop in blood pressure to a prior release of "certain toxins") can be linked directly to the prior medical histories that existed in the patient's chart, the infectious disease attending's written handout, and the pathologist's description of what medical students should remember of their course work in microbiology. In turn, all of these matters, plus MR's interview with the patient, had an effect on the remarks by PA, IDA, and MR in Example (1).

7 Concluding Remarks

The chapter has presented a few of the large number of interpenetrating medical events that form the local context for language use and social interaction in any given encounter. I have sought to discuss the topic of local context in terms of those cultural and organizational constraints, normative expectations, and immediate conditions that surround local speech events as they unfold.

The notion of interpenetrating medical communicative contexts seeks to place the local mutual shaping of talk and context into a framework that incorporates structural and processual aspects of social organization and reasoning during social interaction. The medical setting I chose as the point of departure for the present chapter was the source of a conversation between three physicians. The material presented in Example (1) can be subjected to different types of interpretation, contingent on the analyst's orientation to language use and social interaction and the extent to which the notions of background and context are employed.

The local interaction in Example (1) is intended to call the reader's attention to outside organizational experiences or institutionally guided and constrained social interaction and/or speech events that are directly relevant to the way local exchanges are likely to occur. For example, the interaction described in Example (1) can be linked to the microbiological aspects of medical education (Example 2) and the lecture on Septicemia (Example 3) given to the House Staff at the beginning of the medical academic year. All social interaction and/or

The analyst's decision to describe the materials in Example (1) as an exchange between three health care delivery workers or professionals creates a cultural context for the analyst and reader and simultaneously calls attention to the use of social categories that hopefully can be attributed to participants' recognition of their relevance for the speech event being examined. The analyst's decision to focus on particular sociolinguistic notions (topicalization, turn-taking, speech act categories, coherence, types of deixis, frozen expressions, preferred sequences, etc.) rather than the interrelationship between discourse and culture or the interrelationship between discourse and linguistic theory can trigger different expectations on the part of the reader.

Telling the reader that the three participants in Example (1) are physicians, that the exchange took place in a hospital microbiology laboratory while they were discussing a patient with suspected bacteremic shock, and preparatory to examining the patient's blood cultures, creates a cultural context within which the analyst and reader can understand what transpires. Our understanding deepens when the physicians are identified as a pathology attending, an infectious disease attending, and an infectious disease medical resident. Not only are the expressive style and the content observed contingent on organizationally constrained status and role relationships that can influence who speaks first, whose views will be influential or will prevail *vis-à-vis* action to be taken, but the analyst's and reader's ability to comprehend the significance of broader and local sociocultural issues may require extensive consultation with medical experts.

The present case actually began with MR and the researcher going to the nurse's station of a university medical center medicine ward to examine the medical chart of a patient suspected of having bacteremic shock. MR was performing an organizational obligation of initiating a consultation requested of the Division of Infectious Diseases.

The material from the microbiology course presented above reflects information medical students are expected to know, and the excerpts from the lecture given to new House Staff reflect the kinds of training experiences a novice like an intern or resident physician is likely to possess when reading a patient's chart and then interviewing the patient.

By the time the case reached the microbiology laboratory rounds depicted in Example (1), the patient had also been interviewed by IDA: MR and IDA had discussed the case in some detail; IDA had interviewed the patient; and IDA had consulted the patient's chart, added to it, and had consulted two standard textbooks on microbiology.

The analysis of material in Example (1), the excerpts on the microbiology course (Example 2), the infectious disease attending's lecture notes for new House Staff (Example 3), and the fragment from MR's interview with the patient (Example 4) represent a small part of a complex set of interpenetrating contexts. In the present chapter, I have documented only minimally the way informants helped me understand organizational conditions, local speech events and social interaction, the meaning of complex concepts, and procedures from basic and clinical medical science and practical experiences. I have, however, ample

I have characterized as unavoidable aspects of organizational and local constraints and processes that are integral to rethinking "context."

A nagging issue that undoubtedly remains for many readers is the familiar one that an infinite regress can occur whereby the observer presumably must describe "everything" about a context. Such a demand is of course impossible to satisfy because no one could claim to have specified all of the local and larger sociocultural aspects of a context. Observers or analysts, like participants of speech events, must continually face practical circumstances that are an integral part of all research or everyday living. As researchers, we obviously privilege some aspects of a context while minimizing or ignoring other conditions. The observer is obligated to justify what has been included and what has been excluded according to stated theoretical goals, methodological strategies employed, and the consistency and convincingness of an argument or analysis. Meaning and understanding in everyday life are contingent on cognitive and linguistic activities, i.e., a knowledge of how to use language structures that we call metonyms, metaphors, and other imaginative constructions associated with particular lexical items, phrases or utterances, and personal experiences. Therefore, some specification of the environmental conditions in which these language practices emerge, are embedded, and evolve should guide the researcher's depiction of context. I have tried to indicate some of the conditions that can be identified in a medical setting to illustrate the way different senses of the term "context" can be pursued conceptually and empirically.

Acknowledgments

Parts of this chapter were initially presented at the Invited Session "Rethinking 'Context': Language as an Interactive Phenomenon, Part I" (Society for Linguistic Anthropology and General Anthropology Division), American Anthropological Association annual meeting, Philadelphia, PA, December 1986. A version of the paper appeared in the *Social Psychology Quarterly*. The present version has been expanded slightly and further revised. I am grateful to Charles Davis and Elizabeth Ziegler for their invaluable support and advice, and to Sandro Duranti, Charles Goodwin, Douglas Maynard, Hugh Mehan, James Wertsch, and two anonymous referees for their helpful substantive suggestions on earlier drafts. Douglas Maynard also provided very useful editorial suggestions.

Answers and Evasions

Steven E. Clayman

When Albert Gore was Bill Clinton's vice presidential running mate in 1992, Gore's position on abortion became the focus of controversy. As a legislator, Gore had opposed federal funding for most abortions, but now he was expressing support for it as part of Clinton's health care reform plan. In an aggressive interview conducted by Sam Donaldson, Gore received a barrage of tough questions exposing this apparent contradiction. He was momentarily rescued by a commercial break, at which point he was urged by his media advisor to sidestep questions of this sort: "Don't be afraid to turn their questions. If they ask you about [abortion], just say . . . 'I want to talk today about the new direction that Governor Clinton and I want to take the country.'"[1]

There is a widespread perception that politicians are frequently evasive under questioning from members of the news media, and this perception is not without merit (Bavelas et al. 1988; Bull 1994, 1998; Bull & Mayer 1993; Clayman 1993; Greatbatch 1986b; Harris 1991). The impetus to resist a line of questioning is understandable, given the adversarial character of contemporary journalism. In news interviews – as well as press conferences and other forms of interrogation – journalists are drawn to questions that are unflattering, incriminating, or otherwise hostile in character. If answered straightforwardly, these can inflict damage on a politician's policy objectives, career prospects, and personal reputation. When 1996 presidential candidate Bob Dole was questioned about the addictiveness of tobacco, his equivocal response was roundly attacked by the Clinton campaign and received weeks of unfavorable media coverage. On the other side of the Atlantic, a question about the Labour Party's opposition to nuclear weapons prompted party leader Neil Kinnock to give a cavalier response that was subsequently exploited by the Tories and helped ensure Thatcher's reelection in 1987. And it is not only politicians who face such dangers: no interviewee is immune. In response to a question about the absence of African Americans at the managerial

level in professional baseball, Al Campanis, vice president of the Los Angeles Dodgers, made some racially insensitive remarks which caused such an uproar that he was fired the next day. To avoid consequences like these, interviewees may be motivated to be less than forthcoming in the face of hostile questioning.

However, evasiveness has a downside. Answering questions is treated as a basic moral obligation, not only for public figures in journalistic interviews but also for interactional participants more generally (Schegloff 1968, Heritage 1984:245–53, Raymond 1998). But while interactants generally expect each other to be properly responsive to questions, the responsive conduct of politicians is perhaps more closely scrutinized, so that attempts to resist, sidestep, or evade can be costly in a variety of ways.

Interviewers themselves monitor for evasiveness, and such maneuvers can be met with probing follow-up questions and negative sanctions (Greatbatch 1986a). When Clinton administration Treasury secretary Robert Rubin sidestepped a difficult question about gasoline taxes and instead offered a rosy analysis of the overall economy, he was reprimanded for his slipperiness: "When we ask people like you a simple question . . . you do the light fantastic instead of giving us a direct answer." Sanctions like these, in addition to upping the ante for a genuine answer, also constitute the previous response as indeed evasive, thereby exposing and highlighting that quality for the broadcast audience. Interviewers have not always been quite so aggressive, but the impetus to monitor for and respond to evasiveness is now rooted in the adversarial culture of contemporary American journalism (Clayman and Heritage in press a). Journalist-interviewers gain professional status on the basis of aggressive questioning, and they pride themselves on the skill with which they can pursue and pin down recalcitrant interviewees.[2]

Monitoring by journalists can also extend beyond the occasion of the interview itself. Subsequent news stories about interviews and press conferences often contain excerpts (in the form of quotations and sound bites) that show public figures to be refusing to answer questions, or initially resisting questions, or answering only after being repeatedly pressed to do so (Clayman 1990). When Texas governor George W. Bush, early in his 2000 campaign for the presidency, gave less than forthcoming answers to questions about his cocaine use, there followed a virtual feeding frenzy of stories dissecting the ramifications of his evasiveness. A similar fate befell President Bill Clinton following his artful responses to questions about Monica Lewinsky. An act of evasion can thus become a newsworthy event in its own right, and a persistent source of unfavorable publicity.

Even when journalists allow such maneuvers to pass without comment, there may still be consequences for the broadcast audience and in public opinion. Insofar as a resistant response is noticed by audience members, they will seek to account for the breach of conduct via inferences that are apt to be unflattering or incriminating. Audience members may infer that the interviewee has some ulterior motive for avoiding the question, or that he or she has something to hide. American citizens may have a constitutionally protected right to remain silent in the face of police questioning, so that silence cannot be treated as incriminating in courts of law, but public figures have no such protection in the court of public

In a nutshell, then, interviewees face a dilemma. There are various pressures, both from journalists and from the audience, from within the interview and in subsequent media coverage, to "just answer the question." But when the question is adversarial, there are cross-cutting pressures to take precisely the opposite course of action. For those contemplating a resistant response, the problem is how to reap the benefits while minimizing the various costs associated with that risky course of action.

The management of interactional resistance, and the construction of answers more generally, is a neglected topic in studies of broadcast news interviews. Although there is lively interest in evasiveness as a phenomenon, prior research focuses mainly on distributional matters – on which politicians tend to sidestep questions disproportionately, and on the circumstances under which they do so (Bavelas et al. 1988, Harris 1991, Bull & Mayer 1993, Bull et al. 1996; Bull 1998). Less attention has been paid to more fundamental issues, such as what distinguishes an "evasion" from a genuine "answer," the elementary forms that resistance to a question can take, and how acts of resistance are managed through specific discursive practices (Greatbatch 1986b, Clayman 1993, Bull 1994, Clayman & Heritage in press b).

This article provides an overview of the dynamics of answering and resisting questions in broadcast news interviews. An exhaustive treatment of this complex subject is, of course, beyond the scope of a single essay. The present objective is to delineate some of the main issues involved and some of the main practices mobilized to manage responses that resist the agenda of a question. The primary database consists of more than 100 news interviews broadcast in the United States and England over the past two decades. A second and much smaller data set consists of journalistic questioning in other contexts, including U.S. presidential press conferences and campaign debates.

Conceptual Preliminaries

Evasiveness is an elusive phenomenon, and its analysis is fraught with conceptual pitfalls. The concept is, in the first instance, a familiar part of interactants' ordinary language for characterizing and sanctioning conduct, but it is also deployed by social scientists in technical analyses of such conduct. This raises numerous difficulties, including the question of the perspective from which evasiveness is to be assessed.

One approach treats the ANALYST'S PERSPECTIVE as primary. Here, the boundary between "answering" and "evading" is something that the analyst determines by formulating a clear-cut operational definition, which can then serve as a benchmark from which to assess particular responses. This approach can generate informative results (e.g., Harris 1991, Bull & Mayer 1993, Bull 1994), but it becomes problematic when the analyst's assessment diverges from that of the participants themselves. It is, after all, the participants' own understandings of

tradition that informs this essay, here the PARTICIPANTS' PERSPECTIVE is treated as of primary importance in the analysis of responses. Thus, every effort is made to ground analyses in the understandings and orientations of interviewers and interviewees as these become manifest in the interaction itself.

This ideal can be difficult to achieve in practice. One problem is that the participants may not necessarily agree on the import of a particular response. While an interviewer may treat a given response as improperly evasive, the interviewee who produced it may treat it as an essentially valid way of dealing with a difficult and perhaps flawed question. In this connection, the very terms used by the analyst to characterize responses can become problematic. "Evasion" connotes moral impropriety and thus may be seen as embodying a contestable perspective on the action under analysis.

A more fundamental difficulty is the fact the participants' understandings are not always transparent, and they may at times be designedly opaque. Consider that when an interviewee sidesteps a question, he or she may strive to conceal that fact in an effort to avoid various negative consequences that might otherwise follow (e.g. hostile follow-up questions, negative inferences). Correspondingly, even if the interviewer recognizes that the question has been sidestepped, he or she may decide to "let it pass" in the interest of moving the interview along. It is thus possible that an act of evasion may occur that is fully apparent to both participants, yet neither party registers that fact in any demonstrable way.

Accordingly, well-grounded analytic judgments must draw not only on resources internal to the particular instance under examination, but also on patterns of conduct that cut across numerous cases. Moreover, to maintain analytic clarity, I will adhere to the following terminological convention: I will reserve the term "evade/evasive" for actions that are treated as inadequately responsive by the interview participants; other terms – e.g. resist, sidestep, agenda-shift – will be used more broadly to encompass responses that depart from the agenda of the question, but which the participants may not necessarily treat as inadequate on that occasion.

Doing "Answering"

Any analysis of this subject must begin by considering the fundamental nature of ANSWERING as a type of social action. In the organization of interactional sequences, answers are responsive actions that become relevant only on the completion of a question, and questions in turn set an agenda of topics and tasks to be dealt with in subsequent talk (Heritage in press). Moreover, after a question has been produced, interactants monitor the ensuing talk to determine how it embodies an answer to the question (Schegloff 1968, 1972). What, then, constitutes an answer in this context? This may at first seem obvious: an answer is an action that addresses the agenda of topics and tasks posed by a previous question. What is less obvious is precisely how such responsiveness is displayed by interviewees (hereafter IEs) and recognizable by interviewers (hereafter IRs).

fact that there is no single primary indicator or marker of "answering" – unlike "questioning," which is typically marked by interrogative syntax. How, then, do IEs indicate that they are indeed being responsive to the question at hand? In other words, how do they ACCOMPLISH OR DO "ANSWERING"?

As a point of departure, consider that there are various paths or trajectories that answers may follow. Some answers take a ROUNDABOUT TRAJECTORY; they begin with a unit of talk which cannot in itself be construed as a possible answer, but which is part of a larger stretch of talk that can be seen in its entirety as answering. For instance, when a conservative politician is asked (ex. [1], lines 1–2) about the attractions of a new workfare proposal – which would require those receiving unemployment benefits to work for them – his initial remarks (lines 3–10) do not, by themselves, answer the question. Instead of talking about the advantages of workfare, he begins by attacking the current unemployment program as "ludicrous" (lines 3–7), and he then goes on to say that reducing benefits is not a viable solution (lines 7–10). Only after he has in effect ruled out these other courses of action, taking three full sentences to do so, does he speak directly to the issue of the advantages of workfare (lines 11–13).

(1) UK *BBC Today*: Social Security Cuts

1	IR:	. . . Mister Howell what are the attractions as you see them:
2		uh- of this workfare idea?
3	RH:	.hh Well (.) hh it seems to me to be ludicrous that we
4		are spending according to the government more than
5		eight billion pounds: in support of the unemploy:ed on
6		condition that they do nothing whatsoever .hhh to(r)
7		help society, .hh And I believe the time has come
8		when- when we've got to recognize: that (.) par::ing
9		down benefits is not the an:swer. That isn't how
10		savings can be made.
11		.hhh Savings ku- huge savings could be made: if ahm
12		(.) one the unemployed people were offered the right
13		to work and given an opportunity to work. . . .

Although the initial remarks could not by themselves stand as an answer, they are not irrelevant to the question at hand. Indeed, the initial assessment of alternatives to workfare is a relevant prelude to rendering a comparative assessment of workfare itself. Thus, considered holistically, this entire turn can be seen as occupied with the task of answering the question. And IRs generally treat such roundabout answers, once completed, as adequate.

However, IRs do not in the first instance encounter COMPLETED turns; they monitor and evaluate turns INCREMENTALLY, while they are unfolding. From that in-progress vantage point, the subsequent trajectory of a response may be decidedly uncertain. In the previous example, the IE could simply have attacked the alternatives without ever advancing an affirmative argument for workfare. To

This is a leap that IRs are not always willing to make. Thus, roundabout answers are initially vulnerable to being heard as evasive and are subject to countermeasures from the IR. Consider ex. (2), an excerpt from a 1985 interview with Pat Buchanan, shortly after he began serving as President Reagan's second-term director of communications. The IR rather delicately makes the point (lines 2–6) that other administration officials don't seem to like Buchanan very much and have leaked that view to the press, and he goes on to ask Buchanan (line 7) how that can happen. Buchanan responds (lines 9–11) by noting that *there was a lotta that in the first term*, and he begins to explain why. This could be the first component of a roundabout answer that will eventually deal with the current situation, but it could also be an effort by Buchanan to deflect the discussion away from himself. The IR takes the skeptical view, analyzing it as an incipient evasion; he interjects at line 12 (arrowed), pointing out that *you weren't in in the first term*, thereby treating Buchanan's turn-thus-far as irrelevant and unresponsive.

(2) US, 3 June 1985, *Nightline*: Patrick Buchanan

1	IR:	Continuing our: conversation now with Pat Buchanan.
2		Pat- uh:- (0.2) to put it as gently as I ca:n there're some
3		people: fairly high up in this administration who seem
4		to be able to contain their enthusiasm for you, .hhh
5		And every once in a while stories crop up in thuh press
6		that one can only assume come from some o'those folk. (0.2)
7		How does that sort of thing happen, in an administration.
8		(.)
9	PB:	tlk .hhh Well I think 'ere was a lotta that in the
10		first ter:m Ted, an' = uh: >I think one o'thuh reasons<
11		was you had-=
12	IR: →	= Well you weren't in in the first [term.
13	PB:	[Right, but you had
14		three chiefs of- (.) ehsta:ff virtually, you had Baker
15		(.) Deaver and Meese .hhh An' there was it seemed to me
16		from the outsi:de an awful lot of leaking on one er against
17		one er another, from secondary an' tertiary personnel .hhhhh
18		A:n' since Don Regan came in we've been goin' through a
19		bit of a transition, there was some o'that I think back
20		in April, .hhhh but since thuh transition's been complete
21		I haven't seen any of it an' we don't expect to see as
22		much in the:: uh .hhh in the second term . . .

It is possible that the design of the final question (line 7) unintentionally encourages Buchanan to begin his response as he does. Perhaps to soften what is plainly a face-threatening subject, the IR depersonalizes the question somewhat by asking how *that sort of thing can* happen, and this may license Buchanan's decision to talk initially about the larger history of Reagan administration leaks. But whatever may have prompted this initial response, and whatever direction Buchanan may

A more common type of trajectory establishes the "answering" character of the talk early on. This trajectory may be termed MINIMAL ANSWER PLUS ELABORATION; it begins with a first unit of talk in response that provides the information targeted by the question, albeit in a minimal way, followed by subsequent talk that clarifies and elaborates. For instance, a yes/no question can prompt an initial one-sentence expression of affirmation or negation before that answer is elaborated. An explicit "yes" or "no" may be included in the initial response, which is the normative way of answering a yes/no question (Raymond 1998). For example:

(3) US, 22 Feb. 1985, *Nightline*: South African State of Emergency

IR: tch .hh Are you willing (.) personally to renounce
the violence (.) in that country.
(0.6)
AB: → .hh Yes I will.
I mean I have said so on Saturday I was on a platform . . .

Similarly, a *wh*-type question (*how long* below) can prompt an initial one-sentence provision of the requested information (arrowed) prior to further elaboration:

(4) UK, *Newsnight*: China 2

IR: And how long how long will that take **and how long has**
he got to prove he can do it?
ZM: → .hhhh Ah:: (0.2) it ti-(0.2) maybe it take uh
→ one or two years (.) to to do that. (0.7)
And I think ah that . . .

Like a standard written paragraph, this trajectory of answering begins with an initial unit of talk that minimally fills the information gap targeted by the question, while subsequent talk furnishes details that clarify, support, or elaborate.

Furthermore, the initial remark's relevance to the question is often marked by various surface features of the remark's design. Perhaps the most obvious way of marking question-relevance is to incorporate some of the wording of the question into the initial response (Roth 1996, Schegloff 1998). The repetition may involve a single key word – **confrontation** in ex. (5):

(5) UK, *Newsnight*: Tienanmen Square Uprisings

IR Jonathan first (.) let me ask you:, uh what is the latest
situation are we any nearer: the actual (.) straight
→ **confrontation** between the troops and the students (.) **in**
the square.
JM: ⇒ Well I think we've already had this **confrontation.**
The: uh citizens of Peking .hhhh and of course . . .

A larger phrase may also be repeated, such as **side effects** in ex. (6):

(6) US, 8 Dec. 1985, *Face the Nation*: Cancer Treatment

IR: → .hhh Now tell us about uh = the **side effects**. .hhh Is it as toxic (.) a:s chemotherapy, < Is it as poisonous: an- (.) to the system and what=are the other
→ **side effects**.
SR: ⇒ The **side effects** could be quite seve:re, but they're
⇒ somewhat different than the kinds of **side effects** that one sees with- uh with chemotherapy, .hhh The major
⇒ **side effect** is a buildup of fluid in the body . . . .

An IE may go still further, incorporating the entire framework of the question into the initial response and thereby matching his response word for word to the question at hand:

(7) US, 13 March 1979, *World at One*: Mineworkers Strike

IR: → And what do you think the result of the ballot will be.
AS: ⇒ 1::: think that the result of the ballot will most probably be acceptance of the deal:, (.) but it could be: er closer than most people expect.

This latter mode of response can seem exaggerated or hypercorrect, and it may indicate an undercurrent of resistance or hostility to the question.[3] But the general import of repeating lexical items from the question remains much the same across these examples. Through this practice, IEs can propose that they are attending to the question in detail and are thus properly responsive to the issues that it raises.

Most of the practices examined thus far involve similarities in phrasing, but other practices for doing "answering" work quite differently. Certain INDEXICAL EXPRESSIONS, namely those involving ANAPHORIC REFERENCE, have meanings that are inextricably linked to the prior question. The simplest type involves the use of a pronoun that refers to the issue raised by the question, such as ***that*** in ex. (8) (arrowed):

(8) US, 22 July 1985, *MacNeil/Lehrer*: South Africa

IR: .hhhhh Reports today: are: of course that the violence has continued uh what have you heard tha- whether er not the state of emergency is in fact working.
(0.4)
HB: tch .hhhhh It is perhaps too soon:: to make
→ make a judgement on that . . . .

Here the IR asks whether the South African government's imposition of a state of emergency is working to stop the violence there. The IE's response – ***It is perhaps too soon to make a judgment on that*** – ends with a pronoun that acquires its meaning by referring to the matter raised by the previous question.

It is not only pronouns that have this back-referencing character. For example, certain verbs are also heavily context-dependent for their meaning, such as *was* in ex. (9) (arrowed):

(9) UK, 5 Nov. 1979, *ATV Today*: Innocent Man

Int:		.hh Were you surpris:ed when you: w- went to court,
		an- and indeed went down,
		(0.2)
TS:	→	hhhh .hhh I was mos- I- I certainly was,
		in fact I- I .hh all the way up to the- to the court. . .

In the context of the prior question (*Were you surprised*), the response (*I certainly was*) can readily be understood as meaning "was surprised."

Units of talk that are shorter than a sentence also tend to be parasitic on the question for their meaning. For example, the initial phrasal response below – *Child support offices* – can be understood in context as advancing a claim that "child support offices will be the judge of good cause."

(10) UK, *Today*: Child Support

IR:		.hh But who's going to be the judge of that, the judge
		of good cause:.
RH:	→	.hhhh Child support offices.
		Ahm in the local offices and in our regional centers
		.hh ah we'll look at each case very very carefully . . .

Finally, certain turn-initial discourse markers also refer to the previous question. Answers to *why*-type questions may be prefaced by *because*, which identifies what follows as an explanation fitted to the question. For example:

(11) US, 18 Sept. 1992, *MacNeil/Lehrer*: Perot

IR:		So why don't you go ahead and (.) say:
		I'm (.) a candidate for pr[esident?
RP:	→	[Because that's not (.)
		where the organization is now.
		Our organization (.) is to:tally focused on try:ing
		to get both parties to do the job. (0.7) That's why.

In all these cases, the sense of the initial remark is, by itself, indeterminate at least to some extent. Observers must refer to the question to disambiguate the remark, and in so doing its meaning is "filled in" in a way that is thoroughly question-relevant.

In analyzing these various practices for doing "answering," it may seem that we are expending a great deal of energy for a modest payoff. However, these practices are far more significant than the analysis thus far suggests. As we shall

see, not only do they figure in genuine efforts to answer the question; in addition, IEs can use them subversively in maneuvers that are substantively resistant.

Dimensions of Resistance

Resisting a question is, like answering, a complex phenomenon. We can begin to dissect this phenomenon by drawing a basic conceptual distinction between two dimensions or aspects of resistance.

The Negative Dimension

The NEGATIVE aspect is manifest to the degree that the IE's response falls short of an adequate answer to the question. In the strongest variation on this theme, the IE declines to provide any information at all that bears on the question. For example, when a member of the Labour Party is asked about his willingness to serve in a cabinet committed to unilateral nuclear disarmament, he flatly refuses to answer (arrowed):[4]

(12) UK, Greatbatch 1986b:451: Unilateral Nuclear Disarmament

IR: You wouldn't serve in a Cabinet committed to lu-
unilateral nuclear disarmament of Britian would you
Mister Shore?
PS: .hh What I do believe:: er: Mister Day (which)
→ I will not a:nswer that question, I'm not (.)
→ deliberately answering that question.
What I do believe is thi:s. I do actually genuinely believe
lo:ng believe: (d) .hhh that unilateral initiatives: (.) can
assist (.) multilateral disarmament . . . .

In a less extreme form of negative resistance, the IE provides an answer that is partial or incomplete. For instance, in the face of a two-part question, an IE may address one part while leaving the other unanswered. Thus, in a Nixon press conference[5] held during the Watergate period, a journalist first asks (beginning at arrow 1 in ex. [13]) whether Nixon is personally investigating charges that his campaign funds were mishandled, and he then asks (arrow 2) whether the charges will hurt his bid for reelection.

(13) US, 29 August 1972: Nixon Press Conference

JRN: 1 → Mr. President, are you personally investigating
the mishandling of some of your campaign funds,
2 → and do you agree with Secretary Connolly that
these charges are harmful to your reelection?
RN: Well, I commented upon this on other occasions,
and I will repeat my position now.

3 → With regard to the matter of the handling of campaign funds, we have a new law here in which technical violations have occurred and are occurring, apparently, on both sides. As far as we are concerned, we have in charge, in Secretary Stans, a man who is an honest man and one who is very meticulous – as I have learned from having him as my treasurer and finance chairman in two previous campaigns – in the handling of matters of this sort. Whatever technical violations have occurred, certainly he will correct them and will thoroughly comply with the law. He is conducting any investigation on this matter, and conducting it very, very thoroughly, because he doesn't want any evidence at all to be outstanding, indicating that we have not complied with the law.

Nixon targets only the first question for response (see arrow 3), and he never gets around to addressing the second question about political implications.

Another type of incomplete answer is a simple yes-or-no reply to a yes/no question. In the news interview context, IEs normally are expected to produce elaborated answers (Heritage & Greatbatch 1991), so that minimal yes-or-no responses (arrows 1 in ex. [14]) can be seen as inadequate. They indicate tacit resistance to the broader agenda of the question, and they regularly lead IRs to probe for further elaboration (arrows 2):

(14) US, *Meet the Press*, 24 Oct. 1993

IR: . . . .hh Madam Attorney General you've testified this week- u- in front of Congress abou:t .h violence and television. .hhh And said that if the TV industry didn't in effect clean itself up, clean its act up, .hhh there may be government intervention. Government regulation. (0.4) Thuh New York Ti:mes in an editorial said that (.) you embarked on a quote <dangerous embrace of censorship.> (0.3) Didju?

IE: 1 → No.

(0.2)

IR: 2 → .hhhh Wha:t kind of government intervention are you thinking about? Would you ban: programs like NYPD: Law and Order, would you [uh:

IE: 1 → [No.

(.)

IR: 2 → W- Wh:at are we talking about.

IE: We're talking about (.) asking the media to stop talking (.) about what it promises to do, and do it.

The Positive Dimension

Resistance has a positive dimension as well. This is manifest to the degree that an IE moves beyond the parameters of the question, saying and doing things that were not specifically called for. These departures vary greatly in magnitude and in kind. The most dramatic form of departure involves a substantial change of topic. For instance, following a question about nuclear waste disposal (lines 1–3 in ex. [15]), an expert not only refuses to answer (lines 5–6); she then goes on (lines 7–10) to refute allegations made much earlier in the program regarding the Three Mile Island accident and its health consequences. The issue of power plant accidents is rather far removed from that of routine waste disposal efforts.

(15) US, 6 June 1985, *Nightline*: Nuclear Waste

1	IR:	Continuing our conversation now with Doctor Rosalyn Yalow.
2		Doctor Yalow uh- ehh lemme put it in very simple terms.
3		If it's doable, if it is: easily disposable, why don't we.
4		(1.0)
5	RY:	Well frankly I cannot- (.) ANswer all these scientific
6		questions in one minute given to me. On the other
7		hand there was one horrible thing that happened tonight
8		that you have- .h in addition extended. .hh And that is
9		thuh NOtion that there is an increased incidence of
10		cancer associated with the Three Mile Island accident.

Here the IE veers sharply away from the topic of the question and toward a substantially different area of discussion.

Alternatively, a response may lie within the question's topical parameters but perform a task or action other than what was specifically requested by the question. Thus, in ex. (16), when Senator Bob Dole is asked whether he would support the reappointment of the Federal Reserve Board chairman (lines 1–3), Dole offers a generally favorable assessment of the chairman's past performance (line 4), but he does not specifically endorse his reappointment (presumably in deference to the political independence traditionally granted to the Fed). This evasive maneuver does not escape the notice of the IR, who presses again for an explicit endorsement (line 5):

(16) US, *This Week*: Senator Bob Dole (from Donaldson 1987)

1	IR:	Talking about money, what about Paul Volcker, whose term
2		is up next year? Would you like to see him reappointed
3		to the Fed?
4	BD:	I, I think he's been very effective.
5	IR:	Well, would you like to see him reappointed?

Here. the response is, broadly speaking, within the topical parameters of the question – it is "about" Paul Volcker – but it can be regarded as evasive nonetheless

The most subtle form of evasion is embodied in those responses that alter the terms of the question ever so slightly. Consider ex. (17), from an interview with the deputy secretary of defense, John Deutch, on the subject of Gulf War syndrome. Across this excerpt, the IR tries to get Deutch either to confirm or to deny reports that U.S. troops were exposed to chemical weapons during the Gulf War. However, Deutch will not be pinned down; although he repeatedly offers denials, all are in some way qualified.[6]

(17) US, 12 March 1995 60 *Minutes*: Gulf War Syndrome

1	JD:	hh Our most th:orough (0.2) and careful efforts to
2		determine (.) whether chemical agents were us:ed in
3		the Gulf, (.) .hh lead us to conclu:de that there was
4		no: (.) w:idespread use of chemicals against U.S. troops. =
5	IR:	=Was there any use. = Forget w [idespread. Was there any use.]
6	JD:	[I- I do not belie:ve]
7		I do not believe there was any: o:ffensive use of chemical
8		agents by: .hh uh- Iraqi: (0.2) uh military: (.) troops.
9		Ther [e was not-
10	IR:	[Was there any- any accidental use. Were our troops
11		exposed in any way:.
12		(0.4)
13	JD:	.hhh Uh- I do not believe that our troops were:
14		expo:sed in any widespread way to: u [h: chemical
15	IR:	[In any narrow
16		way. = In any way.
17	JD:	hh .hh The defense science board did an independent
18		study of this matter: .hh [and fou:nd in their judgement=
19	IR:	[(.)
20	JD:	=that there was no:: confirmation .hh of chemical:
21		(0.2) weapon (0.2) widespread use: in the Gulf.

The deputy secretary first denies that our troops were exposed to any ***widespread use*** of chemical weapons (lines 1–4). The IR seeks to disallow this qualifying adjective by asking about *any* use whatsoever (line 5), but the IE again qualifies his response but in a different way (6–8), this time denying only that there was ***offensive use***. When the IR tries to disallow that qualification (10–11), the IE switches back to his previous qualifying adjective, restricting his denial to *widespread* exposure (13–14). This maneuver is countered more aggressively by the IR, who interjects his next pursuit just after the qualifying adjective is introduced and before the IE has reached a possible completion point (14–15). He makes one last attempt to elicit a blanket denial, but the IE holds fast to his more cautious position (17–21). The deputy secretary's caution is not difficult to understand: any confirmation would presumably expose the government to numerous lawsuits, while a flat denial may be unsupportable and may even contradict current or future evidence. He manages to avoid both alternatives repeatedly, and in a rather subtle way. He presents himself as if he were being dutifully responsive,

UNIVERSITÄTSBIBLIOTHEK

Finally, even responses that do address the agenda of the question, but contain additional turn components that shift away from that agenda (as in exx. [18–20]), are treated as problematic in the news interview context (Greatbatch 1986b). This is a product of the distinctive turn-taking system that organizes news interview talk, which obligates IEs to restrict themselves to the action of answering IRs' questions (Greatbatch 1988, Heritage & Greatbatch 1991). Given this normative constraint on IEs' talk, any attempt to produce something other than an answer – even as a supplement to an otherwise responsive answer – may be regarded as an improper diversion from the agenda at hand.

By changing the topic of a question, the task that it poses, or the specific terms in which it is framed, IEs can loosen the strictures inherent in being on the receiving end of an interrogation. Any such maneuver is resistant in the affirmative sense and constitutes an effort to SHIFT THE AGENDA of the question.

Overt Practices

Given the various dimensions of resistance, how are such maneuvers actually managed by IEs? IEs deploy a wide range of discursive practices in such contexts, and these can be understood in terms of the way they reduce the risks associated with a resistant course of action.

One set of practices is used when IEs choose to be up front and explicit about what is taking place. The strategy of resisting a question OVERTLY has, from the IE's point of view, an obvious disadvantage: It renders the resistance conspicuous, and hence more likely to be noticed by the IR and the media audience. However, this disadvantage is offset by an equally important advantage: Having admitted the evasion, an IE can take steps to minimize the damage that it might otherwise cause. Three forms of damage control will be examined as they figure in efforts to shift away from the agenda of the question.

Deference to the IR

IEs often preface their agenda shifts with remarks that display some degree of DEFERENCE TO THE IR. Perhaps the greatest deference is conveyed when the IE actually REQUESTS PERMISSION FROM THE IR to shift the agenda.[7]

In ex. (18), for example, a China expert first answers a question about whether recent civil unrest will strengthen the position of reform-oriented officials in that country (lines 4–13), and he then goes on to talk about various other matters (16–25), including the generational shift in Chinese leadership and problems of corruption. However, he does not raise these other matters without first requesting (arrow 1) and receiving (arrow 2) permission from the IR to do so.

(18) UK, *Newsnight*: Civil Unrest in China

1 IR: Well what do you think do you think this strengthen:s

4	DH:			I think that (0.2) Jao Ze Young just as he was
5				responsible for bringing (.) China out of the turbulence
6				which followed the .hhh uh resignation of Hu Yao Bung as
7				General Secretary in=uh January nineteen eighty seven.
8				.Hhh just as he (.) brought China out of that turbulence
9				he will bring Chi:na out of this turbulence .hhh and I
10				think his stature has already been increased (.) by
11				recent events (.) .h and ah (.) I'll go out on a limb
12				and say: I think it's likely to be increased further
13				.hh by future events
14		1	→	but I would like to make two very quick points.=
15	IR:	2	→	=Very quickly if you would.
16	DH:			There's a genera:tional thing he:re. .Hhh U:um (0.4) ih
17				Deng Zhao Peng is going to be ei:ghty fi:ve on the twenty
18				second of August this yea:r. .Hh he joi:ned the
19				Communist Pa:rty (0.3) .h in nineteen twenty fou:r. .Hh
20				When Mister Baldwin had become prime minister for the
21				first time in this coun:try:. Just. .Hhh (0.3) Secondly
22				(0.3) corruption. .Hh A lot of (.) what is: (.) ca:lled
23				corruption .hh is in fact the by:produ:ct (0.1) of a
24				system of multiple pricing .hhh which I think is going to
25				have to be rela:xed.

A similar request appears in ex. (19), an excerpt from a debate interview concerning health care reform. The IE – a health insurance industry executive who opposes President Clinton's health care reform plan – is asked whether anti-reform TV ads disclose the fact that they were paid for by the insurance industry (lines 1–4). She answers this question in the affirmative (5–8), but she then goes on (arrow 1) to ask the IR for permission to comment on an issue raised earlier in the program by a reform proponent (*Ron*). When the IR grants permission (arrow 2), she proceeds to address this other issue (which has to do with whether the so-called Coalition for Health Insurance Choices is actually an association of insurance companies masquerading as a grass-roots public interest group).

(19) US, 21 Oct. 1993, *MacNeil/Lehrer*: Health Care Ad War

1	IR:			.hhh Well Miss Jenckes he raises an interesting question.=
2				Again just as a matter of stra:tegy your ad doesn't
3				say:: that it's sponsored by the heal:th (.)
4				in[surance companies]
5	LJ:			[Margaret that's abs]olutely incorrect. .hh Our a:ds
6				(.) whether they're on TV, .h our print a-advertisements.
7				that appear in newspapers .hh even radio spots indicate
8				that we have paid for it.=
9		1	→	Let me may- just make one
10				comm[ent in [terms of wha [t Ron: says.
11	IR:			[.hhh [wh- [ih-
12	IR:	2	→	Al[l right.]

15 you always start with like minded people. But whether . .
16 you're an agent or a broker, .hh you have legitimate
17 health care concerns youself. . ..

Requests for permission openly acknowledge that a shift of the agenda is in the works. In ex. (19), the IE specifically indicates (lines 9–10) that she wishes to respond not to the IR's question, but to a point made earlier by another IE. At the same time, however, such requests defer to the IR as the one who is properly in charge of the discussion agenda.

The IE may also offer what Greatbatch 1988 has termed a TOKEN REQUEST FOR PERMISSION to shift the agenda; this resembles an actual request but is not treated as requiring a response from the IR. Thus, in ex. (20). a discussion of newly proposed legislation to restrict access to abortion, an anti-abortion advocate answers a legalistic question about the wording of legislation, but she then goes on to argue that current law is too permissive. She prefaces this agenda shift with a request-like object, *can I also point out* (arrowed).

(20) UK, *Afternoon Plus*: Abortion

1 IR: Jill Knight may I ask you how far that's going to be put
2 into practice and [what- who: is going to deci:de what=
3 JK: ['Ye::s'
4 IR: =i[s serious and what [is a substantial-
5 JK: ['Ye:s' [.hh uh
6 JK: Well of course the doctor:: and u::h thuh-
7 [in other a:reas wh(h)ere medical- th'medical profession=
8 (): [( )
9 JK: =is practiced .hhh doctors've been quite capable of
10 deciding what's serious. (.) and what substantial means,
11 → .hhh And can I also point out, .hh that u::h
12 Professor Huntingford whom you had on .hh your
13 program in December:: .hh supporting the abortion act
14 .hhh u::h eh said (.) really (.) again quite recently
15 there's no do(h)ubt abo(h)ut it=we have got abortion on
16 ^request, .hhh and this is what parliament did NOT ask for . . .

Notice that the IR makes no attempt either to grant or to refuse permission, and the IE does not seem to expect a response. Indeed, she actively discourages a response by building her token request as an incomplete clausal unit (*can I also point out that* . . .), which projects further talk to come. Because they provide so little opportunity for response, token requests are somewhat less deferential than their full-fledged counterparts. Nevertheless, they do show the IE to be "going through the motions" of seeking permission, thereby continuing at least to acknowledge the principle that it is the IR who normally sets the agenda.

Whether they are "genuine" or "pro forma," requests for permission openly acknowledge the fact that an agenda shift is being contemplated. At the same time, however, these practices alleviate some of the interpersonal damage that

to the IR's control over the course of the discussion. Any effort to seek permission mitigates that threat by deferring to the IR and sustaining a sense in which the IR remains at least formally in charge.

Minimizing the Divergence

A second form of damage control involves downplaying the agenda shift by portraying it as insignificant, a minor digression from the agenda established by the question. Requests for permission often contain MINIMIZING CHARACTERIZATIONS, such as reference to "a very quick" or "just one" comment.

(21) UK, *Newsnight*: Civil Unrest in China
DH: But I would like to make *two* very quick points

(22) US, 21 Oct. 1993, *MacNeil/Lehrer*: Health Care Ad War
LJ: Let me may-just make one comment in terms of what Ron says . . .

In addition to temporal and numerical minimizers, the inclusion of the adverb "just" further downgrades what is about to be said, as in the preceding example and again in the following:

(23) UK, *Today*: Child Support
RH: Can I say just to (set) the context . . .

In each of these ways, the divergence is cast as a slight digression from the framework of the question.

Justifying the Shift

IEs may also strive to EXPLAIN AND JUSTIFY their efforts to divert the discussion. Justifications may be embedded within requests for permission. For example, in ex. (24), a discussion of the 1992 vice presidential debate, a Republican strategist first responds to a question about the performance of Ross Perot's vice presidential candidate, Admiral Stockdale, but he then shifts the agenda (lines 14–16) to defend George Bush's flip-flop on abortion, and he prefaces this shift with a token request for permission (arrowed):

(24) US, 13 Oct. 1992, *Nightline:* Presidential Debate

1	IR:	.hhhh Uh Bill Kristol, does: Stockdale's performance
2		tonigh:t take some of the air:: (.) out of the the
3		Pe[rot balloo]n:: just as it was getting bl:own up again.
4	WK:	[p H H Hhhh]
5		(0.6)
6	WK:	Uh:: I'm not sure about that Chris. I think the: ah:
7		two things were remember- we'll remember about Admirable
8		Stock- Admiral Stockdale tonight ah: are his: very strong

10 and his statement about the important of cah- 'portance
11 of character. .h to leadership. Both of those statements
12 will: (reboun:d) to the benefit of President Bush.
13 .hh Ah and on that last point
14 → if I could just speak to Molly's point: uh before the break,
15 uhm President Bush changed his mind about abortion an:d
16 said so. . . .

This token request contains justificatory elements, and these are embodied in how the requested action is characterized. Instead of asking generically to "say one more thing" or "make an additional point," this IE asks specifically to address *Molly's point before the break.* This way of characterizing what he wants to do is not technically necessary for the token request to be intelligible; it is a choice that provides an implicit rationale for the agenda shift. In the context of a debate interview involving partisan IEs, portraying the shift as a response to a point made earlier by an opposing IE tacitly justifies the shift on the grounds of fairness and the principle that partisan accusations should not be permitted to stand unanswered. In addition, the shift is characterized in relation to an impending commercial break, further justifying the maneuver by explaining why it is being launched at this particular point in time.

Justifications can also appear outside of permission requests, where they tend to be more explicit and elaborate. An example is highlighted in ex. (25). The IR asks whether corporate mergers are creating monopolistic entities, and the IE briefly addresses this issue, but he then raises other concerns about mergers. Before doing so, however, he justifies this shift (arrowed) on the basis that it will concern the most important problem with corporate mergers, one that has not yet been addressed in the interview.

(25) US, 5 June 1985, *Nightline*: Corporate Mergers

IR: .hhhh Senator Metzenbaum take me back to the- to that difference: that uh Mister Forbes made a moment ago, between monopolies and what we have today:, which it seems in- in some instances is moving .hh at least (0.2) gr:adually in the direction of a monopoly. is it not? (0.3)

HM: Well I think that some mergers (.) don't have any element of monopoly in them at a:ll. .hh (.) Uh for example General Motors buying Hughes Aircraft (I'm-) not at all certain that there's any monopoly (.) issues there. (0.5)
→ On the other hand I think the real concern tha h:asn't
→ been addressed (.) previously (.) in this program (0.7)
HAS to do with the fact that. . .
((parenthetical comment omitted))
. . . when you have a major merger of this kind, (0.2) of the KINd that we've been talking about on this program, (.hh) you haff to worry A does it eliminate (.) competition

secondly you have to be concerned as to the impact (.)
on the shareholders, (0.4) and third but certainly not
least of the three, (.) is the impact upon the community . . .

The rationales offered for agenda shifts tend, not surprisingly, to exclude naked self-interest as a motivating factor. Instead, such rationales fall into one of two basic categories. One argument, common in panel interviews involving partisan IEs, is based on an implicit principle of fairness and the need to respond to points raised by opposing IEs. Ex. (24) typifies this rationale, but other examples are commonplace:

(26) US, 3 Feb. 1992, *MacNeil/Lehrer*: Haitian Refugee Repatriation

BA: Ahm: let me just respond to a few things that (.)
Congressman Rangel said . . .

(27) US, 21 Oct. 1993, *MacNeil/Lehrer*: Health Care Ad War

LJ: Let me may- just make one comment in terms of what
Ron: says

Alternatively, unsolicited material may be justified on the basis that it has a significant bearing on the overarching subject at hand. This type of rationale is illustrated in ex. (25); other examples include the following:

(28) UK. *Today*: Child Support

RH: Can I say just to (set) the context. . .

(29) US, 5 May 1996, *This Week*: Gas Tax Repeal

RR: But I think there's really a- a mu:ch b:igger (0.4)
this is part of a much bigger picture . . .

In either case, the import of this practice remains much the same. Such accounts acknowledge the fact that a shift of the agenda is in progress, and they even grant that this constitutes a breach of interview etiquette. But by providing a justification grounded in principles of fairness or relevance to the discussion agenda. IEs present that breach in a favorable light.

The Special Case of Refusing to Answer

Justificatory accounts become particularly elaborate and strenuous when the IE overtly refuses to answer the question altogether. This follows from the fact that such refusals constitute a particularly strong breach of etiquette. It is one thing to make some effort to answer the question before proceeding to shift the agenda; it is quite another to decline to answer altogether (Greatbatch 1986b). Accordingly, justificatory accounts are crucial in this context.

Various rationales may be offered to account for a refusal to answer, but they [illegible] element in common: They deflect responsibility away from

is to claim that the information necessary to answer the question is unavailable. Thus, in ex. (30), when a medical researcher is asked whether a new cancer treatment may have other applications, he suggests that the information is not yet available because the relevant research has not yet been done:

(30) US, 8 Dec. 1985, *Face the Nation*: Cancer Treatment

IR: Uh two final questions. Doctor Rosenberg, d'you see this having application for other diseases, like multiple sclerosis or even A:IDS,
(0.4)
SR: We haven't yet begun: to explore that, although I think possibilities exist 'at need to be investigated 'n I think other:: scientists will be looking at those questions.

Notice that the IE does not merely assert that he DOESN'T KNOW the answer, which might taint his reputation as a medical expert. In general, DON'T KNOW accounts in news interviews usually contain some further explanation for the IE's lack of information. Indeed, when a simple don't know account is offered without any further explanation (arrow 1 in ex. [31]), it is pursued by the IR (arrow 2) in a way that strongly implies that the IE ought to know the answer in some form.

(31) US, 22 July 1985, *News Hour*: South Africa

IR: Who are these people.
(0.7)
HB: 1 → I do not know.=
IR: 2 → = You don't know the naych- I don't mean their names obviously but I mean what kind of peopl:e are falling-
[are falling- (0.4) into the category uh those =
HB: [I would ha-
IR: =thetch- need to be arrested.

Alternatively, the IE may suggest that he or she knows the answer but is unable to provide it under current circumstances. The temporal limitations of the broadcast interview are often cited – as in ex. (32), when a nuclear physicist asserts that she cannot answer *all these scientific questions in one minute given to me* (arrowed).

(32) US, 6 June 1985, *Nightline*: Nuclear Waste

IR: Continuing our conversation now with Doctor Rosalyn Yalow. Doctor Yalow uh- ehh lemme put it in very simple terms. If it's doable, if it is: easily disposable, why don't we.
(1.0)
RY: → Well frankly I cannot- (.) answer all these scientific questions in one minute given to me. . . .

An IE also may refuse to answer on the basis that the [illegible]

delicacies of official negotiations to deflect questions. In ex. (33), from a discussion of the federal budget, Senate majority leader Bob Dole is asked whether it will be necessary to cut social programs, raise taxes, or reduce defense spending in an effort to reduce the deficit, but Dole declines to answer (arrowed), arguing that to do so would be premature in advance of formal negotiations.

(33) US. 8 Dec. 1985, *Meet the Press*: Bob Dole

AH: You can't have it both ways either.>On this program< you have said that you don't think, .hhh that you'll eliminate thirty to fifty programs, [an'] Senator Packwood=
BD: [( )]
AH: =says ya have to, .hh Number two you say you hope you will not have a tax increase, [.hhhh And]=
BD: [But I do.]
AH: =number- and number three you say ya h:ope you can have a:l [m o s t] three percent on: .hhh on: on=
(): [( )]
AH: =defe:nse, .hh And yet you hafta cut fifty billion next year. Now which o'those three is gonna give Senator, (0.4)
BD: → I think that's going to happen sometime next year when
→ those of us:: uh in- leadership positions=set=down
→ with the President and make the hard choice. I don't
→ think I'd make it today: .hhhhh ih=in December of 1985.

Notice that this account, by proposing that TO ANSWER would be inappropriate, can also be taken to imply that THE QUESTION soliciting this answer was inappropriate, although this is an unstated implication of an account that remains focused primarily on the inappropriateness of answering.

Occasionally, however, an IE will go one step further by asserting outright that the question is improper and hence unworthy of an answer- in effect, deflecting the question by attacking it. In ex. (34), for example, when a Serbian spokesperson is asked if recent prisoners of war are being beaten (lines 1–2), he suggests that the line of questioning is unnecessarily provocative and biased (5–10):

(34) US, 15 July 1995, *NPR All Things Considered*: Serbia

1 IR: Are they being beaten? Or will you be: are you treating
2 them (u-) humanely according to inter[national conventions.
3 IE: [hhh!
4 (.)
5 IE: Well I mean your line of questioning really suggests that
6 we are the most awful creatures on earth. That we a:re
7 beating the prisoners, raping women, and so on and so forth.
8 .hh Please I think I have been very: uh: uh correct in my
9 answers, an' I would expect you to: .hh be more correct in
10 your line of question=because it's extremely provocative. . . .

By attacking the question in this way, the IE both justifies his failure to provide an answer and deflects the discussion away from the substance of the question and toward the manner in which it was raised.

It is rare for an IE to refuse a question flatly, without providing a rationale of some sort. When that does happen, it can come across as an extremely hostile gesture (arrowed in ex. [35]). Consider how a Labour politician flatly refuses a question concerning his willingness to serve in a cabinet committed to unilateral nuclear disarmament:

(35) UK, Greatbatch 1986b:451: Unilateral Nuclear Disarmament]

IR: You wouldn't serve in a Cabinet committed to lu-
unilateral nuclear disarmament of Britian would you
Mister Shore?
PS: .hh What I do believe:: er: Mister Day (which)
→ I will not a:nswer that question, I'm not (.)
→ deliberately answering that question.
What I do believe is thi:s. I do actually genuinely believe
lo:ng believe: (d) .hhh that unilateral initiatives: (.) can
assist (.) multilateral disarmament. . . .

Here the IE not only declines to offer a justification; he casts his refusal to answer as a deliberate, willful choice. This can be heard as a powerful – albeit implicit – attack on the legitimacy of the question (and, by implication, on the judgment of the IR. who asked it), which is treated as so transparently unworthy that its refusal requires no justification.

At the opposite extreme are refusal accounts that are nonhostile in character and inflict minimal damage to the interpersonal relationship between IR and IE. The most notably benign practice involves refusing to answer AS A MATTER OF GENERAL POLICY; IEs may assert, in effect, that they never answer questions of that sort. In ex. (36), for example, when Arthur Scargill is asked if he is planning to run for the presidency of the National Union of Mineworkers (lines 1–2), he refuses to say then and there, pointing out that he's been similarly unresponsive to *every other pressman over the past forty-eight hours* (3–5):

(36) UK. 13 March 1979, *World at One*: National Union of Mineworkers

1 IR: M:ister Scargill will you run for the presidency of the National
2 Union of Mineworkers.
3 AS: .hhh er Mister Day: I must give you the same answer that I've
4 been giving every other pressman over the past forty-eight
5 hours. .hhh If and when Mister Gormley officially (.) hands in
6 his resignation and that's by no means certain .hhhh cr during:
7 this year or at any time during the next three years .hh then I
8 will give (.) serious consideration to the matter . . .

Treasury Secretary Robert Rubin does something very similar when asked about the direction of future interest rates. He [illegible]

three-and-a-half-year-old policy of not commenting on the future course of the financial markets (lines 2–4):

(37) US, 5 May 1996, *ABC This Week with David Brinkley*: Robert Rubin

1 IR: But which way are they going now?=
2 RR: =>For three and a half years.< .hhh Sa:m. I have had for
3 three and a half years a policy of >not commenting on
4 what markets are gonna do. . . .

As a form of damage control, the general-policy account has advantages that extend beyond its justificatory import. By emphasizing that there is a principled rationale underlying the refusal, this type of account also has the effect of DEPERSONALIZING the refusal. It is presented not as an idiosyncratic response to a particular question from a particular IR, but as a general policy applied to all questions of that sort. This helps to ensure that the refusal will not be taken as an act of defiance against the IR per se. Furthermore, insofar as this practice implies that any further efforts to elicit an answer will prove fruitless, it also FINALIZES the refusal. It thereby inhibits follow-up questions and represents a strong bid to close down the entire line of inquiry.[8]

Covert Practices

Overt practices have their counterpart in strategies for resisting a question COVERTLY. Covert practices are used mainly in the context of positive resistance. or talk that departs from the agenda of the question. What makes them covert is that the IEs avoid any explicit acknowledgment of the fact that a shift is in progress, and they may also take steps to conceal that fact. For the IE, the obvious advantage of a surreptitious strategy is the possibility of "getting away with it"; if done with enough subtlety, it may escape the notice of the IR and many audience members. On the other hand, if the maneuver *is* noticed, it can be particularly costly for the IE. Those who sidestep questions while pretending to answer them risk being seen as devious and manipulative, and this is over and above the negative inferences generated by the resistance itself. Furthermore, such inferences cannot be forestalled via forms of "damage control," because the covert nature of the practice precludes any explicit remedial effort. IEs can, however. reduce the likelihood that the resistance will be noticed by taking steps to render it less conspicuous.

Subversive Word Repeats and Anaphoric Pronouns

Earlier we considered how a stretch of talk becomes recognizable as an "answer," and we described a variety of practices – including lexical repetitions and anaphoric pronouns – that are implicated in processes of doing "answering." However. sufficient for answering to occur

A recognizable answer can be constructed without any of these practices; conversely, when such practices are used, they provide no guarantee that a full-fledged answer has been given. Indeed, IEs can use these same practices subversively to provide a kind of surface camouflage for maneuvers that are substantively resistant.

A straightforward example of this sort appears in ex. (38), an interview with Arthur Scargill of Britain's National Union of Mineworkers. The interview took place just as the mineworkers were preparing to elect a new president, and Scargill was discussed as a likely candidate. In a question seeking to distinguish the candidates on the left, the IR (lines 1–2) asks Scargill to explain *the difference between your Marxism and Mr. McGahey's Communism.* Scargill launches his response (line 3) with a repeat of a key word from the question: *The difference is. . . .* By virtue of this literal repetition, he appears to be moving straightforwardly to answer the question:

(38) UK, 13 March 1979, *World at One*: Striking Mineworkers

1	IR:		.hhh cr <u>W</u>hat's the difference between <u>y</u>our Marxism **and**
2			Mister McGahey's Communism.
3	AS:	→	er The difference is that it's the <u>pr</u>ess that <u>c</u>onstantly
4			call me <u>Ma</u>:rxist when I do <u>not</u>, (.) and never <u>h</u>ave (.)
5			er er given that description of myself. . . .

But appearances can be deceiving: Scargill uses the word *difference* to mean something quite other than what it meant in the IR's original question. In that question, *the difference* refers to a distinction between two candidates, Scargill vs. McGahey, and their ideologies. In the response, *the difference* refers to a distinction between two interpretations – by the press vs. by Scargill – of Scargill's ideology in particular. This semantic shift in the meaning and reference of *the difference* is part and parcel of a more encompassing shift in the agenda. Scargill veers away from the question per se in order to counter a presupposition that was embedded within it – that he is in fact a Marxist. To be sure, this is a relatively mild divergence. in that Scargill does not change the subject so much as propose that the question is inapposite. Nevertheless, he does not, strictly speaking, answer the question in the way in which it was framed. And yet he presents himself as if he were being dutifully responsive. By repeating a key lexical item from the question (*What's the difference. . .* → *The difference is . . .*), he packages his response as if it were filling the information gap targeted by the question.

Like word repeats, anaphoric pronouns can be used subversively. Consider ex. (39), an exchange with a spokesperson for presidential candidate Ross Perot. The IR prefaces his question with a comment on the amount of money Perot is planning to spend on TV advertising during the final weeks of the campaign (lines 1–3), and he goes on to ask whether Perot is *actually gonna get out and meet with the voters . . .* (4–5). The IE begins to respond by saying *Let's talk about this* (6), using a pronoun that refers to the questioning turn and thus seeming to promise a bona fide answer.

(39) US, 15 Oct. 1992, *MacNeil/Lehrer*: Presidential Debate

1	IR:	.hh Mister Milfor:d ah r- your man Ross Perot is gonna
2		spen:d at lea::st ten milli:ion dollars .hh in TV advertising
3		>in the final two and a half weeks of this campaign.<
4		.hhh Is he actually gonna get out and- and meet with
5		voters, campai:gn like the other candidates?
6	CM:	Yeh. well l- let's: (.) talk about this: for a second.
7		Ah- the- the other two: (.) candidates recei:ve over
8		fifty five point two million dollars directly from the
9		taxpay:ers. .hh Mister Perot is spending his own money.
10		In addition to the fifty five million dollars that they
11		get from the federal government, .hh they get over a
12		hundred million dollars in so::ft money. The whole way
13		the (.) political process is financed is something we
14		objec:t to::, .hhhh I- I imagine he will spend ten
15		million dollars on media 'cause what we see is something
16		very extraordinary in Amer:ican politics. .hh Usually,
17		with the passage of ti:me independent candidates go
18		down: in the polls:. .hh Since we have entered the
19		race according to the polls, we've gone from seven to
20		fifteen percent. . . . And we think Perot is gonna win.
		.
		.((Some 20 lines of transcript omitted))
		.
21	IR:	. . . You: you gave a good answer.=You never answered my
22		question, how:ever. .hh >Part of thuh political process<
23		is for candidates actually to get out and mee:t with voters.
24		(0.3) >Is he gonna do tha:t?

Rather than answer the question about meeting with the voters, the IE responds instead to the prefatory comment, offering a lengthy justification for Perot's advertising expenditures (lines 6–14). He then goes on to comment on Perot's rise in the polls and his chances of winning (15–20). This shift is obscured by the initial back-referencing statement, but it is not exactly invisible. The IR pursues the matter (21–24), explicitly sanctioning Milford for having *never answered my question.*

Subversive word repeats and anaphoric pronouns also can be used in combination, as in ex. (40), from a British debate interview concerning a proposal to make abortions more difficult to obtain. The excerpt begins with the IR asking Jill Knight, an outspoken opponent of abortion, about one aspect of the legislation, which would shorten the time period for legal abortions. A key word in the question is *concern*; it is central to the final question (line 13), which asks about the IE's level of *concern* regarding the more restricted time frame, and it also appears in the preceding statement (12) and the earlier lead-in (3–4), both of which make reference to widespread public "concern" about the new restrictions:

(40) UK, *Afternoon Plus*: Abortion

3			same. (.) and indeed (.) have caused great deal of
4			concern. (0.4) But first you'll note .hhh is the
5			clause about (.) time limits h in which h abortions
6			can be .h legally=
7	(JK):		=*(yes)*=
8	IR:		=ha:d. And the time limit h (.) according to the
9			bill has now dropped .h from twenty eight weeks .h
10			(.) to twenty wee[ks.
11	(JK):		[Yes.=
12	IR:		=Now< a lot of people are very concerned about this.
13			[.hh How concerned are you.
14	(JK):		[*yeh*
15	JK:	→	.hhh Uh: (.) I think this is right. I think that um:
16			.hh again one's had a lot of e:uh conflicting
17			evidence on this but .hh what has come ou::t h an'
18		→	I think that .h the public have been concerned about
19		→	this. .hhh is that there have been th'most
20			distressing cases, .hhh of (.) live (.) kicking
21			babies who have been destroyed. .hh I've had nurses
22			come to me in great distress (0.2) about this .hh and
23			uh there was undoubtedly (0.1) throughout the whole
24		→	(ambit) of public opinion .hh very great concern .h
25			on this whole question. . . .

In her initial response, the IE appears to be moving to answer the question straightforwardly. Her first remark (*I think this is right*) refers to the IR's prior talk and seems to be expressing some form of confirmation or agreement. And when she begins to elaborate, she twice uses that same key word, *concern* (arrowed). However, this comes to mean something very different here than it did originally. She uses *concern* to mean "concern about late term abortions"; but in the original question it meant "concern about the more restricted time frame" and, by implication, the more restricted access to abortion that this entails. This semantic shift is intertwined with a more encompassing shift in the topical focus of the response vis-à-vis the original question.

It is useful to consider the ramifications of a more overt mode of resistance. The IE could have said something like "I'm not the least bit concerned about a shorter time frame; what worries me is the destruction of live and kicking babies!" But that would place her in direct disagreement with the viewpoint embedded in the question, and it would make her vulnerable to being seen as insensitive to the plight of those seeking abortion services. Her actual course of action obscures such implications. She presents herself as if she were straightforwardly answering, and agreeably expressing "concern," while surreptitiously veering away from the question in the way in which it has been framed. The cover for this maneuver is provided by the back-referencing confirmation and the lexical repetition, the latter serving as a kind of pivot between the question's agenda and the somewhat different direction pursued subsequently.

Operating on the Question

Agenda shifts can be obscured in other ways. Before "answering" a given question, an IE may first refer to, characterize, or paraphrase the question at hand. These various operations can modify the question in a way that both facilitates and conceals a shift of the agenda. Thus, not only can IEs adjust the surface form of a response to fit the question, they can also, in effect, adjust the question to fit the response that they intend to give.

To illustrate, consider ex. (41), an excerpt from an interview with a presidential candidate, Senator Gary Hart. The 1988 interview was prompted by media reports suggesting that Hart had an extramarital affair with a young woman named Donna Rice. At one point, he was asked specifically if he had an affair with Miss Rice (arrow 1). In the course of his answer, Hart reformulates the question (arrow 2), broadening it so that it is made to concern his marital fidelity over the past 29 years, including periods during which he and his wife were publicly known to have been separated. Upon completing this reformulation, he provides an "answer" (arrow 3), an admission of infidelity. But the parameters of his admission have been set not by the original question, but by the reformulation.

(41) US, *Nightline*: The Best of Nightline

IR:			Uh- (0.5) I told you::. (0.4) some days ago when we spo:ke, and I told our audience this evening that I would ask you both questions. I will ask you the first now: just before we tak a brea:k because I think I know what your answer's gonna be.=
	1	→	=Did you have an affair with Miss Rice?
GH:	2	→	. . . .hhhh Mister Koppel (1.1) if the question: (.) is in the twenty nine y:ear:s of my marriage, including two public separations have I been absolutely and totally faithful: to my wife .hhh
	3	→	I regret to say the answer is no: . . . .

The advantages of such a transformation should be obvious. It enables Hart to appear "forthcoming," but in response to a question that, by virtue of its generality, is much less pointed. His admission is thus less politically damaging than it might otherwise have been. In effect, Hart manages to "steer the question" in a more desirable direction. In this particular example, Hart seems to acknowledge the fact that the question has been modified. Notice that his reformulation is offered tentatively within an *if*-clause (*Mister Koppel, if the question is . . .*). This case is thus comparatively overt in the way in which it shifts the agenda.

Other question reformulations are asserted more forcefully, as if they were faithfully preserving the essence of the original question. Ex. (42) comes from the 1988 vice presidential debate; although not officially labeled a "news interview," this event was organizationally similar in having the candidates respond to questions from a panel of journalists. In the first question to Dan Quayle, a

critical of Bush's decision to choose Quayle as his running mate (lines 4–16); the journalist then asks Quayle why he hasn't made *a more substantial impression* on his own Republican colleagues (16–19). Quayle begins his response (21–24) by reformulating the question in terms of his general qualifications for the presidency:

(42) US. 5 Oct. 1988, Bentsen-Quayle Debate

1	JRN:		hhhh Senator you have been criticized as we all
2			know:: for your decision to stay out of the Vietnam
3			war::, (0.3) for your poor academic record, .hhhhhh
4			but mo:re troubling to so::me are some o'thuh
5			comments that've been made by people in your own
6			party, tch .hhh Just last week former Secretary
7			of State Hai::g. .hh said that your pi:ck. (0.2)
8			was thuh dumbest call George Bush could've
9			ma[:dc.
10	AUD:		[h-h-hhxhxhx [hxxXXXXXXXXXXXX=]
11	JRN:		[Your leader in the Senate]
12	AUD:		=XXXXXXXXXXXXXXXXXX[XXXXXXXxxxxxxx(5.8)]
13	JRN:		[Your leader in the Senate] Bob
14			Do:le said that a better qualified person could have
15			been chosen. .hhh Other Republicans have been far
16			more critical in private. .hhhh Why d'you think
17			that you have not made a more substantial
18			impression on some of these people who have been able
19			to observe you up clo:se.
20			(1.5)
21	DQ:	→	.hhhhhh The question goe::s (1.0) to whether
22			I'm qualified (1.1) to be vice president, (0.8)
23			.hhh and in the case of a:: (.) tragedy whether
24			I'm qualified to be president. (0.6) .hhhh (0.7)
25			Qualifications for:: (0.2) the office of vice
26			president 'r president (1.0) are not age alo:ne.
27			(1.5) you must look at accomplishments: (1.0)
28			and you must look at experience. . . .

This is a substantial transformation. On one level, it moves from subjective impressions of Quayle – which may be difficult to explain or refute – to his qualifications considered as an objective matter. There is also a change in the presuppositional loading of the question. The original question is presuppositionally negative: In both the preface and the wording of the question itself, it presumes that Quayle did not in fact make a good impression and asks why this was so. In contrast, the reformulated version is presumptively neutral (*whether I'm qualified*) and thus facilitates a more upbeat response. Despite the magnitude of this transformation, it is asserted affirmatively and without qualification (*The question goes to . . .*). Quayle thus proposes that his reformulation successfully

To appreciate the significance of this practice for managing an agenda shift, it might be useful to consider what the preceding exchange would look like without a reformulation:

(43) [Invented]

JRN: . . . Why do you think that you have not made a more substantial impression on some of these people who have been able to observe you up close?

DQ: Qualifications for the office of vice president or president are not age alone. You must look at accomplishments and you must look at experience.

When the "answer" is made to follow the question without any preparatory work, it is manifestly disjunctive. Against this backdrop, the importance of the reformulation is that it affiliates the matter-to-be-pursued with the matter-that-was-inquired-about, thereby minimizing the discrepancy between the two. In effect, the reformulation provides a version of the question that the subsequent response can be seen as "answering."

In ex. (42), the IE operates on the question as a whole object. But IEs also may operate on a component of the question – a phrase, a prefatory statement, or one part of a multi-part question. In ex. (44), from a Nixon press conference during the Watergate period, Nixon targets the first part of a two-part question for reformulation. The journalist first asks (beginning at arrow 1) whether Nixon is personally investigating charges that his campaign funds were mishandled, and he then asks (arrow 2) whether the charges will hurt his bid for reelection. After a prefatory remark, Nixon produces a reformulation (arrow 3) that highlights the first part of the question:

(44) US, 29 August 1972, Nixon Press Conference

JRN: 1 → Mr. President, are you personally investigating the mishandling of some of your campaign funds,

2 → and do you agree with Secretary Connolly that these charges are harmful to your re-election?

RN: Well, I commented upon this on other occasions, and I will repeat my position now.

3 → With regard to the matter of the handling of campaign funds, we have a new law here in which technical violations have occurred and are occurring, apparently, on both sides. As far as we are concerned, we have in charge, in Secretary Stans, a man who is an honest man and one who is very meticulous – as I have learned from having him as my treasurer and finance chairman in two previous campaigns – in the handling of matters of this sort. Whatever technical violations have occurred, certainly he will correct [illegible] will thoroughly comply with the law. He

> conducting it very, very thoroughly, because he doesn't want any evidence at all to be outstanding, indicating that we have not complied with the law.

This reformulation is subversive in two respects. First, it replaces a key term from the question that implied wrongdoing (*mishandling*) with a more favorable term (*handling*). Furthermore, the remainder of the response deals exclusively with the matter of the investigation; Nixon never gets around to the second part of the question, regarding the consequences for his reelection campaign. This omission may not have been accidental. Dealing with the investigation question enables Nixon to present himself as "doing something" about a scandal within his administration, and thus independent of the morally tainted forces which brought it about. In contrast, the issue of whether the scandal will hurt his campaign seems, at least from his standpoint, less advantageous.

Although this omission is clear in retrospect, it was not evident at the outset that some form of evasion was in progress. Nixon could have gone on to answer the second question. Indeed, it is standard practice for IEs, when "reaching back" to deal with something other than the last component of the questioning turn, to indicate as much by referring to or reformulating that aspect of the question (Clayman 1993). This is because IEs normally address the final component of the question (Sacks 1987); conversely, they take steps to warn listeners when an atypical response trajectory is in the offing. Thus, Nixon's operation was initially accountable as an effort to manage an atypical response trajectory rather than to avoid the second question.

There are still more subtle variations on the practice of operating on the question. In the cases examined thus far, the operation is exposed within a discrete unit of talk, but it also may be embedded within some other activity – assertions of agreement or disagreement, for example. Ex. (45) shows how, in the course of claiming to agree/disagree with some aspect of the question, an IE can embeddedly reformulate that question (arrowed):

(45) US. 22 July 1985, *MacNeil/Lehrer*: South Africa

1	JW:		But isn't this (.) d. declaration of the state of
2			emergency:: (.) an admission that the eh=South African
3			government's policies have not worked, an' in fact that
4			the um- United States (0.2) administration's policy of
5			constructive engagement (.) has not worked.
6	FW:	→	I do not agree with you .hhhh that the approach we have taken
7		→	(.) toward South Africa is- ay- is an incorrect approach.
8			.hhhhh We want (0.5) to see that s- system change. We wanta see
9			South Africa end apartheid. We wanta see basic rights established
10			for all South Africans. .hhhh We wanta see peace and stability
11			in that country, .hhh An' that's a PERfectly respectable goal.
12			Second. The way we have pursued it .hhh I also believe
13			.hhh is the most SENsible way: in dealing with a
14			dangerous situation

Here, the IE first asserts disagreement (*I do not agree with you*) and then characterizes the object of his disagreement (*that the approach we have taken. . .*) in a manner that transforms the terms of the question. The transformation is subtle yet advantageous for the IE, who was then a U.S State Department official during the Reagan administration and is here defending Reagan's policy of "constructive engagement." The original question asked (after some preliminary talk) whether the U.S. policy of constructive engagement *has not worked.* This is reformulated in the statement of disagreement as a question about whether U.S. policy *is an incorrect approach.* The latter version is very much easier for the IE to refute. It is difficult to argue with the original assertion that U.S. policy *has not worked,* since at the time of the interview apartheid remained intact. But one can assert the overall *correctness* of U.S. policy even in the face of its manifest failure to bring about an end to apartheid, and this is precisely what the IE does in his subsequent response.

Two Case Studies

Having analyzed various practices for managing resistance as they are employed across a wide range of interview circumstances, it is now time to apply these analytic resources to some singular cases. One objective of these case studies is to illustrate the power of the analytic apparatus developed thus far to elucidate just how particular noteworthy IEs are able to elude the grasp of an advancing line of questioning. Moreover, while a systematic analysis of audience reactions is beyond the scope of this paper, these case studies are suggestive of the impact that such practices can have on subsequent media commentary and on pubic opinion.

Dan Quayle and the Succession Question

During the 1988 U.S. presidential campaign, the two main vice presidential candidates, senators Lloyd Bentsen and Dan Quayle, squared off in a nationally televised debate. The format had the candidates responding to questions from a panel of four journalists, making it not unlike a multi-IR interview or small press conference. Opportunities to follow up and pursue evasive answers were more limited than in ordinary news interviews, because here each journalist could ask only one question at a time, and the order of questioners was predetermined. Nevertheless, processes of resistance and pursuit were both very much in play.

An extended tug-of-war developed around the issue of presidential succession. It began when Dan Quayle – a youthful senator and George Bush's running mate – was asked what he would do if the president died or became incapacitated for some reason. The purpose of this question was to test Quayle's readiness for assuming the presidency in an emergency: What would be his plan of action? Quayle sidestepped this issue when it was first raised, prompting several follow-

The first journalist to raise this question was Brit Hume of ABC News. Noting the apprehensions people might feel about Quayle being *a heartbeat away from the presidency* (ex. [46], lines 1–4), he asks Quayle to describe, in the event of his sudden succession to power, *the first steps that you'd take and why* (5–10):

(46) US, 5 Oct. 1988, Bentsen-Quayle Debate

1	JRN:		Senator I wan- I wanna take you back if I can
2			to the question Judy as:-asked you about some
3			o'the apprehensions people may feel about your
4			being a heartbeat away from the presidency. .hhhh
5			And let us assume if we can for the sake of this
6			question that you become vice president- an:d the
7			president is incapacitated for one reason or
8			another and you hafta take the reins of power.
9			.hhhh When that moment ca::me, w- what would be
10			thuh first steps that you'd take (0.2) and why::.
11			(3.2)
12	DQ:		.hh First I'd- first I'd say a prayer (1.1) tch for
13			myself (2.3) and for thuh country I'm about to
14			lead, (2.4) And then I would (1.1) assemble his
15			(1.1) people and talk (0.8) .hhh
16		→	And I think this question keeps going ba:ck to: (1.0)
17			the qualifications and what kind of (1.1) of vice
18			president 'n (0.7) in this hypothetical situation
19			(1.0) if I had to assume:: (0.8) thuh responsibilities
20			of: (0.3) president what I would be. (1.0) .hhh
21			And as I have said (1.2) tch age alo:ne. (0.3) .hh
22			although I can tell you h.h after the experience of:
23			these last few weeks 'n the campaign I've added
24			ten years to my a[ge,
25	AUD:		[x-x-x-x-x-x[-x (1.7)
26			[Age alone. (1.0)
27			is not (0.2) the only (0.5) qualification. .hhhh
28			You've got to look at ex:perience. (.) And you've
29			got to look at accomplishments. . . .

Quayle makes an initial stab at answering the question (lines 12–15), but it is rather half-hearted and insubstantial. He says only that he'd *say a prayer* and would *assemble his people and talk.* He then proceeds to reformulate the question (arrowed, lines 16–20), veering away from the issue of his plan of action for assuming the presidency in an emergency and toward the more general issue of his overall qualifications for the presidency. He then goes on to discuss his qualifications at length, ruling out age as a qualification and focusing on experience and accomplishments. In the end, talk about qualifications dominates his response, only the first part of which is reproduced here.

Although this shift is managed covertly and is obscured by the use of an initial question reformulation, Brit H[illegible]

In ex. (47), after a full round of questioning from the other panelists, Hume regains the floor and pointedly pursues the question (line 6). Before doing so, however, he carefully justifies this move by calling attention to the inadequacy of Quayle's previous response, summarizing it in a way that highlights its feebleness: *You said you'd say a prayer, and you said something about a meeting* (4–5). He then presses Quayle to elaborate (6). Notice that some audience members in the hall begin to laugh at this point (8), displaying appreciation of Hume's derisive commentary and aligning with him in his pursuit of an answer.

(47) US, 5 Oct. 1988, Bentsen-Quayle Debate

1	JRN:		Senator I wanna take you back to the question
2			that I asked you earlier about what would happen
3			if you were to: take over in an emergency and
4			what you would do first and why:: .hhhh You said you'd
5			say a prayer:: and you said something about a meeting,
6			(.) What would you do next.
7			(.)
8	AUD:		h-hhhhhhhhhhhhhhhhhhhhhhhhhhhhhh [hh-h- ((laughter))
9	DQ:		[I don't believe that
10			it's (0.6) proper for me:: to: .hh get into the specifies:
11			(0.5) of a hypothetical (.) situation like tha:t (1.2)
12		→	The situation is: (0.8) that if'(0.8) I was called upon
13			(0.7) to ser:ve (0.7) as the president (0.4) of this country,
14			or the responsibilities of the president of this country,
15			(1.0) would I be capable and qualified (0.2) to do that.
16			(0.5) .hh and I've tried (0.4) to list the qualifications.
17			(1.0) of twel:ve year:s in the United States Congress. . . .

But that answer remains elusive, as Quayle again sidesteps the question, although his method of doing so here is rather different. Given that his prior covert maneuver has been exposed by Hume's pursuit, Quayle now chooses a more overt mode of resistance. He explicitly justifies his failure to provide a more substantial answer by characterizing the focus of inquiry as *a hypothetical situation* and suggesting that it would be improper to answer in specifics (lines 9–11). He then shifts the agenda (12–15) in precisely the same direction as before – away from his plan of action and toward his overall qualifications for the presidency. Thus, while Quayle's resistance is now overt and on record, it is also justified and accounted for.

Unfortunately for Quayle, justificatory accounts do not necessarily bring the line of questioning to a halt; such accounts can be argued with and contested. This is what the very next questioner on the panel – Tom Brokaw of NBC News – does, relinquishing whatever question he had planned to asked in order to pursue the succession question yet again. In ex. (48), Brokaw begins with a disclaimer to the effect that that he doesn't mean to *beat this drum until it has no more sound left in it* (lines 1–2). He then takes issue with Quayle's account for not ans- [illegible] *it is after all the reason*

question but with a pointed assertion (12–16) that *surely you must have some plan in mind* for assuming the presidency in an emergency, since it has happened to *so many vice presidents* in recent years. By rejecting Quayle's previous account for not answering, and by pressing the issue in a more pointed way, Brokaw has increased the pressure for a genuine response.

(48) US, 5 Oct. 1988, Bentsen-Quayle Debate

1	JRN:		Senator Quayle I don't mean to beat this drum
2			until it has no more sound left in it but to
3			follow up on Brit Hume's question w:hen you said
4			that it was a hypothetical situation, .hhhh it is
5			Sir after: all: the reason that we're here tonight.
6			.hh [h because you are=
7	DQ:		[Mhm
8	JRN:		=[running [not just for vice president,]
9	AUD:		[x x [x-x-x-xxxxxx=]
10			=xxxxxxxxxxxxxxxxxxxxxx [xx-x-x-x-x (4.4)]
11	JRN:		[And if you cite the] experience
12			that you had in Congress, (0.2) surely you must have
13			some plan in mind about what you would do: if it fell
14			to you to become >president of the United States<
15			as it ha:s to so many vice presidents .hh just in
16			the last twenty five years er so.
17			(0.3)
18	DQ:		teh .hhh Lemme try to answer the question one more
19			ti:me. I think this is the fourth ti:me,
20			(1.0) [that I have had this question, .h [and I think=
21	JRN:		[(this is-) [Third time
22	DQ:		=that-.hh three times, (0.8) that I have had this
23			question, and I'll try to answer it again for you.
24			(0.3) as clearly as I can. (0.7) .hh Because
25		1 →	the question you're asking. (1.3) is what (.)
26			kind (.) of qualifications .hhhhhh does Dan Quayle
27			have to be president. (1.0) tch
28		2 →	What kind of qualifications do I have
29		3 →	and what would I do: (1.0) in this kind of a situation.
30			(0.4) what would I do in this situation, .hh I would (1.9)
31			make sure. (2.1) that the people in the cabinet, (0.9)
32			'n the people 'n the advisors to the President, (.) are
33			called in, (0.2) an I'll talk to 'em, (0.5) an I'll work
34			with 'em. . . .

After commenting on the number of times he's had this question (lines 19–22), Quayle promises to *try to answer it again for you as clearly as I can* (23–24). Quayle then does something that is very puzzling on its face. He launches into yet another question reformulation (beginning at arrow 1) that begins to reframe the issue once again as a matter of qualifications. However, in the course of this reformu-

which he subsequently elaborates (30–34). Why does Quayle start to veer away from the agenda of the question, only to return to it subsequently?

The solution to this puzzle lies at the nonvocal level. After Quayle launches into his reformulation (at line 3 in ex. [49]) and completes the focal word *qualifications* (4), Brokaw begins shaking his head (6), and he continues to do so until the reformulation reaches a first possible completion point. In this way, Brokaw nonvocally rejects Quayle's bid to shift the agenda.

(49) US, 5 Oct. 1988, Bentsen-Quayle Debate

1	DQ:	. . . and I'll try to answer it again for you.
2		(0.3) as clearly as I can. (0.7) .hh Because
3		the question you're asking. (1.3) is what (.)
4		kind (.) of qualifications
5		.hh [hhhh does Dan Quayle have to be president. (0.5)] (0.5)
6	JRN:	[((H e a d s h a k i n g))]
7	DQ:	tch What kind of qualifications do I have
8		and what would I do: (1.0) in this kind of a situa[tion. (0.4)]
9	JRN:	[((Nodding))]
10	DQ:	And what would I do in this situation, .hh I would (1.9)
11		make sure. (2.1) that the people in the cabinet, (0.9)
12		'n the people 'n the advisors to the President, (.) are
13		called in, (0.2) an I'll talk to 'em. . .

This rejection is consequential; Quayle subsequently abandons the incipient agenda shift and returns to the original agenda (lines 7–8). Brokaw nods approvingly (9), and Quayle proceeds to elaborate on his emergency plan. Thus, while Quayle initially steers the question in a different direction, Brokaw steers him right back.

However, Quayle's return to the original agenda is made to appear as if it is unrelated to what Brokaw has done. Notice that Quayle does not respond immediately to the headshakes; he continues to speak through the headshaking until the reformulation is possibly complete (line 5). He also places some distance between the completion of the headshakes and the start of his continuation, allowing one full second of silence to elapse, and then backtracking a bit when he continues (7). Furthermore, when he finally gets to the plan of action component of the reformulation, he links it to the previous component with *and*; it is thus introduced as a supplementary rather than a contrastive matter. By these various means, Quayle constructs his reformulation so that it can be seen as a single continuous action rather than an "about-face" in response to Brokaw's prompting. In other words, he presents himself as if he had been headed in this direction all along.

In the aftermath of this debate, most observers declared Lloyd Bentsen the decisive winner, and extensive media commentary focused on Quayle's performance and its shortcomings. A common criticism was that he came across as overly "rehearsed" or "programmed" in his remarks. This widespread impression

experience – as a favored response to various kinds of questions (see also ex. [42]). Moreover, he repeatedly uses the same basic practice – which we have termed "operating on the question" – to fit that favored response to the question at hand. This recurrent mode of resistance is first managed covertly, but it is subsequently exposed by persistent follow-up questions from the panel of journalists. at which point it becomes transparently manipulative. Here, then, patterns of response within the event are congruent with and thus appear to have been consequential for subsequent media commentary.

The Affairs of Bill Clinton

Perhaps more than for any other American president, Bill Clinton's conduct in answering questions – not only in news interviews and press conferences, but in courtroom depositions as well – has had clear effects on his political fortunes and public image. He is a notoriously skilled interrogatee, adept at turning questions to his advantage while appearing to be dutifully responsive. However, when these practices have been exposed as strategies of evasion, the negative repercussions have been substantial. The following analysis focuses on questions regarding the delicate subject of extramarital affairs.

Early in the 1992 presidential campaign, allegations surfaced about an extended affair between Clinton and Gennifer Flowers. These allegations emerged just as Clinton was breaking from the pack of Democratic candidates to become the front-runner in the primary campaign, placing his buoyant candidacy in serious jeopardy. In an effort to confront the issue and put it to rest, both Bill and Hillary Clinton appeared on the *60 Minutes* program. That interview has been called one of the great performances in American presidential politics, and it was widely credited with rescuing the Clinton candidacy.

Many factors undoubtedly contributed to this outcome, but at least part of the success can be attributed to the manner in which Governor Clinton dealt with the core questions concerning his relationship with Gennifer Flowers. Although he admits in a general way to having had "problems" and "difficulties" in his marriage. specific questions about the alleged affair with Flowers are met with what seem at first glance to be straightforward denials. However, on analysis it becomes apparent each response falls at least a hair's-breadth shy of a full-fledged denial. Within the framework developed in this article, Clinton's responses are covertly resistant and extremely subtle in the manner in which they elude the agenda of the question.

Consider the first question of this kind, in which the IR, Steve Kroft, raises Flowers's claim of a twelve-year affair with Clinton (lines 1–3):

(50) US, Jan. 1992 *60 Minutes*: The Clintons

1 IR: She's alleging (0.2) and has described in some detail in
2 thuh super market tabloid .hh what she calls a twelve
3 year affair with you.
4 (1.5)

Clinton responds to this allegation (line 5) with a simple assertion to the effect that it is false. This assertion is squarely on-topic, but it is nonetheless only minimally responsive. As demonstrated earlier, given that elaborated answers are the norm in the news-interview context, minimal one-sentence responses are tacitly resistant to the agenda of the question. In the present case, Clinton's unelaborated denial – *That allegation is false* – is not particularly informative about his relationship with Flowers. Is he denying any extramarital affair whatsoever? Or is he merely denying an affair that lasted twelve years? By responding minimally, Clinton is able to issue a denial in a way that avoids specificity regarding what, exactly, is being denied.

The IR notices the ambiguity in Clinton's denial, and he pursues the question in a way that seeks to resolve it (lines 1–4). He tries to pin Clinton down to an absolute denial, reformulating the prior response as *categorically denying that you ever had an affair with Gennifer Flowers*:

(51) US, Jan. 1992, *60 Minutes*: The Clintons

1	IR:	I'm assuming from your answer (0.4) that you're (.)
2		categorically denying (.) that=you ever had an affair.
3		(1.0)
4	IR:	with Gennifer Flowers.
5	BC:	.hh I said that before. (.)
6		.hh °uh° An' so has she.
7	HC:	(hmh hmh hmh)
8		(.)
9	BC:	hh=huh Wh(h)en £these st(h)ories came out£ (0.5)
10		she: an' thec other people invol:ved, (0.2) nh:
11		denied them, (.) An' denied them (.) repeatedly, (.)
12		An' she changed her story when she was paid.

Once again, Clinton seems at first to be cooperating with the agenda of the question by confirming this version of his denial. However, he avoids a straightforward "yes" or "that's right," asserting instead that he had already denied the affair on some prior occasion (line 5), an occasion which remains unspecified in his response. He then proceeds to talk at greater length about Flowers's own previous denials of the affair (6–11), and he suggests that the recent change in her story was motivated by the money she received from the tabloid that first published it (12). Thus, while he fosters the impression of having categorically denied an affair, on closer analysis it becomes apparent that he never quite does so in the here-and-now, on his own accord. He adopts an interactional footing in which he is merely relaying denials previously expressed by himself and others.

This interview went over well at the time, and Clinton would go on to win both the nomination and the election decisively. But his performance would eventually come back to haunt him. Early in 1998, when Clinton was called to give a deposition in the Paula Jones lawsuit, he admitted under questioning that he did indeed have an affair with Flowers. Shortly thereafter, the original

Around the same time, allegations about another affair surfaced, this time involving a young White House intern named Monica Lewinsky. Shortly thereafter, Clinton was questioned about the affair in an interview on *NewsHour*. Once again, what initially appear to be forthright denials of the affair are in fact covertly resistant. In this case, the specific mode of resistance is a subtle shift in the terms of the question, a shift involving the verbal tense in which it is expressed:

(52) US, 21 Jan. 1998, *NewsHour*: Clinton

1 IR: You had no sexual relationship with this [young wo [man.]
2 IE: [ml [Th-]
3 IE: There is not a sexual relationship. That is accurate.

The IR asks Clinton to confirm that he *had no sexual relationship with this young woman.* Clinton eventually issues a confirmation (*That is accurate*), but only after reformulating the issue from past to present tense (*There is not a sexual relationship*). This response does not necessarily rule out an affair that is over and done with, but to the casual listener it might seem that Clinton has denied an affair altogether. This type of tense shift would later become notorious when it was exposed as a strategy employed by Clinton in the Paula Jones deposition.

The Clinton case is a powerful illustration of the distinctive attractions and risks associated with a covert mode of resistance. Throughout these examples, Clinton never owns up to the fact that he is not answering the question fully or straightforwardly; the resistance remains unacknowledged and extremely subtle. This approach enabled Clinton to survive various difficult moments in his original presidential campaign and his tenure in office. But because some of these responses have been exposed as evasive through subsequent events, he has paid a price over the long term in the form of damage to his political and personal reputation. The indictment against him is not merely that he sidesteps questions – many politicians are guilty of that – but that he is deceitful about it. The so-called "Slick Willie" factor should stand as a cautionary note to public figures contemplating a covert mode of resistance.

Discussion

In this age of political cynicism coupled with anxiety about the decline of civility in public life, it is tempting to assume that virtual anomie now characterizes the domain of public discourse. Politicians, in such a world, would no longer be bound by traditional norms and could thus ignore with impunity the questions they receive in journalistic interviews and press conferences. The practices examined in this article, taken together, reveal a more complex state of affairs. Although it is true that resistant and evasive responses are commonplace, these are managed with considerable care. When resistance is done overtly, interviewees take steps to control the damage that may be caused thereby. When it is done covertly, there are corresponding efforts to conceal the resistance or at least

consequences that can follow from the breach of conduct embodied in an act of evasion, and they demonstrate that such an act continues to be regarded AS a breach by those involved.

On the other hand, by virtue of these practices, politicians and other public figures can indeed gain substantial "wiggle room" for pursuing their own agendas even under the most persistent interrogation. It is possible that such practices have evolved over time in relation to the changing culture of the journalistic profession. In both England and the United States, journalistic questioning has become less deferential and more adversarial since the 1950s (Clayman & Heritage in press a, b). This could prompt interviewees to become more resistant and/or to develop more sophisticated methods for dealing with difficult questions, just as they have developed other strategies for managing adversarial encounters with journalists (see Jones 1992). Alternatively, increasingly adversarial questioning could have precisely the opposite effect: Insofar as adversarialness includes a greater propensity to ask follow-up questions that pursue evasive responses (Clayman and Heritage in press a), it could encourage interviewees to adhere more closely to the question agenda. Whether there actually has been a systematic change in public figures' responsive conduct – in either the propensity toward resistance or in the practices for managing resistance – must await further research.

Finally, this analysis has methodological ramifications for efforts to quantify responsive conduct as a prelude to examining its distribution across individual politicians, journalistic environments, or historical time periods. It should be abundantly clear that responses cannot properly be dichotomized as either "answers" or "evasions," for between these black-and-white categories are numerous shades of gray comprised of varying modes and degrees of resistance (cf. Bull 1994). Moreover, these variations may have nontrivial consequences for how the public forms judgments about a politician's moral character. To take just one example, a skillfully managed covert approach could enable a politician to get through a hostile interrogation without any negative repercussions. Alternatively, as the case of Bill Clinton aptly demonstrates, if covert evasions are exposed by subsequent events, the politician may be seen in retrospect as devious and manipulative, and this outcome may be worse for the politician than if he or she had initially acted overtly with appropriate forms of damage control. Accordingly, quantitative and distributional studies would do well to pay much closer attention to the specific practices through which interviewees deal with questions.

Notes

Portions of this article were presented at the 1996 conference of the American Sociological Association. The author would like to thank John Heritage, Manny Schegloff, and the anonymous reviewers for their critical input.

1. This incident was discussed in a documentary film by Brian Springer entitled *Spin*.
2. This professional skill is often thematized in broadcast journalists' autobiographies

Mr. President! (Donaldson 1987). Both titles are common prefaces to hostile follow-up questions, and they evoke images of an aggressive interviewer doggedly pursuing his elusive prey.

3. This kind of full-form repetition, where the entire framework of the question is preserved in the initial response, appears disproportionately in certain environments. It is often found in exchanges that (i) are highly argumentative, or (ii) involve a response that ultimately departs from the agenda of the question. It may be that the practice of repeating the framework of the question, rather than accepting it and building on it, conveys a modicum of independence from the prior course of questioning, and is thus useful in resistant and hostile environments.
4. Notice that the IE refers to the IR by name ("Mister Day") as he launches his resistant response. It turns out that this is a highly recurrent practice across various forms of resistance. It appears to be related to the pragmatics of address term usage in interaction generally: Speakers often address their recipients by name when expressing deeply felt opinions and personal feelings (Clayman 1998), particularly when such opinions or feelings are oppositional in character.
5. Such multi-part questions are more common in press conferences than in news interviews.
6. This excerpt is from a taped interview segment on *60 Minutes*, and it appears to have been edited in such a way as to highlight and sharpen the tug-of-war between the IR and Deutch.
7. Similar requests for permission and token requests are used by IEs when speaking out of turn (Greatbatch 1988). Such practices generally serve to mitigate departures from the normative turn-taking arrangements in the news interview, and agenda shifts represent a specific type of departure that is mitigated in this way.
8. The array of refusal accounts discussed here may not be equally available to all IEs in all circumstances.

Author Identification, Idiolect, and Linguistic Uniqueness

Malcolm Coulthard

Introduction

It is now over thirty-five years since Jan Svartvik published *The Evans Statements: A Case for Forensic Linguistics* (1968), in which he demonstrated that incriminating parts of a set of four linked statements – purportedly dictated to police officers by Timothy Evans and incriminating him in the killing of his wife and baby daughter – had a grammatical style measurably different from that of uncontested parts of the statements. It was later discovered that both victims had actually been murdered by Evans' landlord, John Christie. This marked the birth of a new discipline – the linguistic investigation of authorship for forensic purposes. Little more happened for a quarter of a century, with the notable exception of work by Roger Shuy in the USA (1993, 1998), but during the past ten years, there has been a rapid growth in the frequency with which lawyers and courts in a number of countries have called upon the expertise of linguists in cases of disputed authorship. The texts examined range from questioned suicide notes, through anonymous letters, mobile phone text messages and contemporaneous police records of both interviews and confession statements, to the essays of students suspected of plagiarism.

Idiolect and Uniqueness of Encoding

The linguist approaches the problem of questioned authorship from the theoretical position that every native speaker has their own distinct and individual

version of the language they speak and write, their own *idiolect*, and the assumption that this *idiolect* will manifest itself through distinctive and idiosyncratic choices in texts (see Halliday *et al.* 1964: 75; Abercrombie 1969). Every speaker has a very large active vocabulary built up over many years, which will differ from the vocabularies others have similarly built up, not only in terms of actual items but also in preferences for selecting certain items rather than others. Thus, whereas in principle any speaker/writer can use any word at any time, speakers in fact tend to make typical and individuating co-selections of preferred words. This implies that it should be possible to devise a method of *linguistic fingerprinting* – in other words that the linguistic 'impressions' created by a given speaker/writer should be usable, just like a signature, to identify them. So far, however, practice is a long way behind theory and no one has even begun to speculate about how much and what kind of data would be needed to uniquely characterize an *idiolect*, nor how the data, once collected, would be analysed and stored; indeed work on the very much simpler task of identifying the linguistic characteristics or 'fingerprints' of whole *genres* is still in its infancy (Biber 1988, 1995; Stubbs 1996).

In reality, the concept of the linguistic fingerprint is an unhelpful, if not actually misleading metaphor, at least when used in the context of forensic investigations of authorship, because it leads us to imagine the creation of massive databanks consisting of representative linguistic samples (or summary analyses) of millions of idiolects, against which a given text could be matched and tested. In fact such an enterprise is, and for the foreseeable future will continue to be, impractical if not impossible. The value of the physical fingerprint is that every sample is both identical and exhaustive, that is, it contains all the necessary information for identification of an individual, whereas, by contrast, any linguistic sample, even a very large one, provides only very partial information about its creator's idiolect. This situation is compounded by the fact that many of the texts which the forensic linguist is asked to examine are very short indeed – most suicide notes and threatening letters, for example, are well under 200 words long and many consist of fewer than 100 words.

Nevertheless, the situation is not as bad as it might at first seem, because such texts are usually accompanied by information or clues which massively restrict the number of possible authors. Thus, the task of the linguistic detective is never one of identifying an author from millions of candidates on the basis of the linguistic evidence alone, but rather of selecting (or of course *de*selecting) one author from a very small number of candidates, usually fewer than a dozen and in many cases only two (Coulthard 1992, 1993, 1994a, 1994b, 1995, 1997; Eagleson, 1994).

An early and persuasive example of the forensic significance of idiolectal co-selection was the Unabomber case. Between 1978 and 1995, someone living in the USA, who referred to himself as FC, sent a series of bombs, on average once a year, through the post. At first there seemed to be no pattern, but after several years the FBI noticed that the victims seemed to be people working in Universities and Airlines and so named th[illegible]

Industrial Society and its Future, from someone claiming to be the Unabomber, along with an offer to stop sending bombs if the manuscript were published.[1]

In August 1995, the *Washington Post* published the manuscript as a supplement and three months later a man contacted the FBI with the observation that the document sounded as if it had been written by his brother, whom he had not seen for some ten years. He cited in particular the use of the phrase 'cool-headed logician' as being his brother's terminology, or in our terms an idiolectal preference, which he had noticed and remembered. The FBI traced and arrested the brother, who was living in a wooden cabin in Montana. They found a series of documents there and performed a linguistic analysis – one of the documents was a 300-word newspaper article on the same topic written a decade earlier. The FBI analysts claimed major linguistic similarities between the 35,000 and the 300 word documents: they shared a series of lexical and grammatical words and fixed phrases, which, the FBI argued, provided linguistic evidence of common authorship.

The defence contracted a linguist, who counter-argued that one could attach no significance to these shared items on the grounds that anyone can use any word at any time and therefore shared vocabulary can have no diagnostic significance. The linguist singled out twelve words and phrases for particular criticism, on the grounds that they were items that could be expected to occur in any text that was arguing a case – *at any rate; clearly; gotten; in practice; moreover; more or less; on the other hand; presumably; propaganda; thereabouts*; and words derived from the roots *argu* and propos**. The FBI searched the internet, which in those days was a fraction of the size it is today, but even so they discovered some 3 million documents which included one or more of the twelve items. However, when they narrowed the search to documents which included instances of all the twelve items they found a mere 69 and, on closer inspection, every single one of these documents proved to be an internet version of the 35,000-word manifesto. This was a massive rejection of the defence expert's view of text creation as purely open choice, as well as a powerful example of the idiolectal habit of co-selection and an illustration of the consequent forensic possibilities that idiolectal co-selection affords for authorship attribution. The first example will be taken from the area of plagiarism detection.

On Defining and Detecting Plagiarism

At its simplest, plagiarism, or more accurately the type of plagiarism we as linguists are competent to deal with, is the theft, or unacknowledged use, of text created by another. As my own university's website expresses it:

> Plagiarism is a form of cheating in which the student tries to pass off someone else's work as his or her own. . . . Typically, substantial passages are 'lifted' verbatim from a particular source without proper' attribution having been made

Any investigation of plagiarism is based consciously or unconsciously on a notion of *idiolect*. In other words it is expected that any two writers writing on the same topic, even if intending to express very similar meanings, will choose an overlapping, but by no means identical, set of lexico-grammatical items to do so. Indeed, and more importantly for some cases I will treat below, linguists from all persuasions subscribe to some version of the 'uniqueness of utterance' principle (Chomsky 1965; Halliday 1975) and so would expect that even the same person speaking/writing on the same topic on different occasions would make a different set of lexico-grammatical choices. It follows from this that, in any comparison of two texts, the more similar the set of items chosen, the greater the likelihood that one of the texts was derived, at least in part, from the other (or, of course, that both were derived from a third text), rather than being composed independently.

In most cases involving students there is little doubt about guilt, as these two examples of essay openings from Johnson (1997: 214) demonstrate – all items which student B 'shares' with student A are highlighted in bold:

> **A.** It is essential for all teachers to understand the history of Britain as a multi-racial, multi-cultural nation. Teachers, like anyone else, can be influenced by age old myths and beliefs. However, it is only by having an understanding of the past that we can begin to comprehend the present.
>
> **B.** In order for **teachers** to competently acknowledge the ethnic minority, **it is essential to understand the history of Britain as a multi-racial, multi-cultural nation. Teachers** are prone to believe popular **myths and beliefs; however, it is only by understanding** and appreciating **past** theories **that we can begin** to anticipate **the present.**

Even these short extracts provide enough evidence of shared items to question the originality of at least one of the essays, or both, of course, if a third text later proves to be the common source. When this level of sharing is also instanced in other parts of the same texts there is no room for doubt or dispute. The case of essay C, however, is not as clear-cut (items which C shares with one or both of essays A and B are highlighted):

> **C.** It is very important for us as educators to realise that **Britain as a nation** has become both **multi-racial** and **multi-cultural**. Clearly it is vital for **teachers** and associate teachers to ensure that **popular myths and** stereotypes held by the wider community do not **influence** their teaching. By examining British history this will assist our **understanding** and in that way be better equipped to deal with **the present** and the future.

Even though there is still quite a lot of shared lexical material here, it is evident that the largest identical sequences are a mere three running words long. Even so, one would still want to categorize this degree of lexical overlap, if instanced in other parts of the text, as unacknowledged, through more sophisticated bor-

Birmingham observation that 'Typically, *substantial* passages are "lifted"'. I will not discuss here the important question of whether a significant proportion of student written texts, which technically fall within the textual definition of plagiarism, are not the results of deliberate attempts to deceive at all, but rather a consequence of what is coming to be known as 'patchwriting', that is genuine but flawed attempts by students, who have somehow failed to acquire the academic rules for acknowledging textual borrowing, to incorporate the work of others into their own texts (see Pecorari 2002; Howard 1999).

Johnson's (1997) solution to the detection of this kind of student plagiarism or *collusion*, was to move away from using strings or sequences of items as diagnostic features and to focus instead on the percentage of shared individual lexical types and tokens as a better measure of derivativeness.[2] Intensive testing has shown that this measure of lexical overlap successfully separates those essays which share common vocabulary simply because they are writing on the same topic, from those which share much more vocabulary because one or more of them is derivative (see Woolls and Coulthard 1998). For example, in Johnson's study, whereas essays A, B, and C shared 72 different lexical types in their first 500 words, a set of three other essays from the same batch, whose authors had not colluded, shared only 13 lexical types, most of which were central to the topic under discussion. Further work (Woolls 2003) has shown that the most significant evidence is not the mere quantity of shared lexis, but rather the fact that, in the case of some shared items, both texts have both selected them and then only used them once. As such, 'once-only' items are, by definition, not central to the main concern of the text, otherwise they would have been used more frequently. The chances of two writers independently choosing several of the same words for single use are so remote as to be discountable.

If proof were needed of the distinctiveness and diagnostic power of words used once-only – *hapaxes* as they are technically labelled – it comes from successful internet searches in cases of suspected plagiarism. Experience confirms that the most economical method to use when checking the internet for suspected plagiarized text is to search using distinctive collocates whose individual items occur only once in the text in question. I will exemplify with the opening of a story written by an 11-year old girl:

The Soldiers (*all spellings as in the original*)

> Down in the country side an old couple husband and wife Brooklyn and Susan When in one afternoon they were having tea they heard a drumming sound that was coming from down the lane. Brooklyn asks,
> 'What is that glorious sound which so thrills the ear?' when Susan replied in her o sweat voice
> 'Only the scarlet soldiers, dear,'
> The soldiers are coming, The soldiers are coming. Brooklyn is confused he doesn't no what is happening.
> Mr and Mrs Waters were still having their afternoon tea when suddenly a bright light was shinning trough the window.

The first paragraph is unremarkable, but the second shifts dramatically, '*What is that glorious sound which so thrills the ear*?'. The story then moves back to the opening style, before shifting again to '*What is that bright light I see flashing so clear over the distance so brightly?;*'. It is hard to believe that the same author could write in both styles and raises the question of whether the other borrowed text(s) might be available on the internet.

If one takes as search terms three pairs of collocated *hapaxes* 'thrills – ear', 'flashing – clear' and 'distance – brightly' one again sees the distinctiveness of idiolectal co-selection; the single pairing 'flashing – clear' yields over half a million hits on Google, but the three pairings together a mere 360 hits, of which the first thirteen are all from W. H. Auden's poem 'O What is that sound'. The poem's first line reads 'O what is that sound which so thrills the ear' while the beginning of the second verse is 'O what is that light I see flashing so clear Over the distance brightly, brightly?'. If one adds a seventh word and looks for the phrase 'flashing so clear', all of the hits return Auden's poem.

Do People Repeat Themselves?

Whereas (occasional) identical strings in two texts which are supposed to have different authors can be indicative of 'borrowing' or theft, it is harder to argue the case when the texts are (supposedly) produced by the same author but on different occasions – even when there is no suggestion that the author had sight of the first text when s/he was producing the second. The example I want to use is from a famous English murder case, dating from 1978, where one piece of strongly contested evidence was a record of a police interview with a suspect.

In this case, four men were accused, and subsequently convicted, of killing a 13-year old newspaper delivery boy, Carl Bridgewater, solely on the basis of the confession of one of them, Patrick Molloy – there was no corroborating forensic evidence and Molloy retracted his confession, but to no avail. He admitted that he did actually say (most of) the words recorded in his confession, but insisted that he was being told what to say, while he was dictating the confession, by a policeman who was standing behind him. He also claimed that he had only made the confession after being physically and verbally abused for some considerable time.

The police, however, as support for the reliability of the confession, produced a contemporaneous handwritten written record of an interview which they claimed had taken place immediately before the confession and which contained substantially the same information expressed in the same language as the confession statement. Molloy denied that the interview had ever taken place – in his version of events he was being subjected to abuse at that time – and counterclaimed that the interview record had been made up later on the basis of the then pre-existing confession. As is evident from a cursory glance at the two extracts below taken, respectively, from the statement which Molloy admitted making and the interview record which he claimed was [illegible]

the basis of such similarities, that either one of the two documents was derived from the other or that both had been derived from a third. However, at the time of the original trial, no linguist was called to give evidence – in fact there were no forensic linguists practising in Britain at the time – so it was left to the lawyers to evaluate the linguistic significance of the interview and confession. As a result, the same phenomenon, massive identity in phrasing and lexical choice, was argued by the defence to be evidence of falsification, and by the prosecution to be evidence of the authenticity and reliability of both texts, on the grounds that here was an example of the accused recounting the same events, in essentially the same linguistic encoding, on two separate occasions.

Extract from Molloy's statement

(17) **I had been drinking and cannot remember the exact time I was there but whilst I was upstairs I heard someone downstairs say be careful someone is coming.** (18) **I hid for a while and** *after a while* **I heard** *a* **bang** *come from downstairs.* (19) **I knew that it was a gun being fired.** (20) **I went downstairs and the three of them were still in the room.** (21) **They all looked shocked and were shouting at each other.** (22) **I heard Jimmy say, 'It went off by accident'.** (23) **I looked and on the settee I saw the** *body of the boy.* (24) **He had been shot in the head.** (25) **I was appalled and felt sick.**

Extract from disputed interview with Molloy

P. How long were you in there Pat?
(18) **I had been drinking and cannot remember the exact time that I was there, but whilst I was upstairs I heard someone downstairs say 'be careful someone is coming'.**
P. Did you hide?
(19) Yes **I hid for a while** and then **I heard** the **bang** I have told you about.
P. Carry on Pat?
(19a) I ran out.
P. What were the others doing?
(20) **The three of them were still in the room.**
P. What were they doing?
(21) **They all looked shocked and were shouting at each other.**
P. Who said what?
(22) **I heard Jimmy say 'it went off by accident'.**
P. Pat, I know this is upsetting but you appreciate that we must get to the bottom of this. Did you *see the boy's body?*
(Molloy hesitated, looked at me intently, and after a pause said,)
(23) Yes sir, he was **on the settee.**
P. Did you see any injury to him?
(Molloy stared at me again and said)
(24) Yes sir, **he had been shot in the head.**
P. What happened then?
(25) **I was appalled and felt sick.**

this assertion depend on two commonly held mistaken beliefs: first, that people can and do say the same thing in the same words on different occasions and secondly, that people can remember and reproduce verbatim what they and others have said on some earlier occasion. The former belief can be demonstrated to be false either by recording a person attempting to recount the same set of events on two separate occasions, or by simply asking a witness to repeat word for word what s/he has just said. The second belief used to have some empirical support, at least for short stretches of speech (see Keenan *et al.* 1977 and Bates *et al.* 1980), but was seriously questioned by Hjelmquist (1984), who demonstrated that, even after only a short delay, people could remember at best 25 per cent of the gist and 5 per cent of the actual wording of what had been said in a five minute two-party conversation in which they had participated. Confirmatory evidence about the inability to remember even quite short single utterances verbatim was specially commissioned from Professor Brian Clifford and presented at the 2003 'Glasgow Ice Cream Wars' Appeal. This was used to challenge successfully the claim of police officers that they had independently remembered, some of them for over an hour, verbatim and identically, utterances made by the accused at the time of arrest. Clifford's experiment tested the ability to remember a short, 24-word utterance and found that most people were able to recall verbatim no more than 30 to 40 percent of what they had heard.[3]

By the time of the Bridgewater Appeal in 1997, it was possible to provide extra supporting evidence of two kinds. First, as a direct result of Johnson's (1997) work on plagiarism discussed above, which demonstrated the significance of vocabulary overlap, an analysis was done of the shared vocabulary in the two Molloy texts. It became evident that the highlighting in the two Molloy extracts presented above actually understates the similarities between the two texts – a closer examination revealed that there was in fact not one single word in Molloy's statement, neither lexical nor grammatical, which did not also occur in the interview record. I have only seen that degree of overlap on one other occasion, when two students had in fact submitted identical essays for assessment. Ironically, the computer analysis showed the degree of similarity to be only 97 percent – the 3 percent of different words made up of spelling errors produced by one of the two students.

In the Bridgewater case there also was secondary, supporting linguistic evidence, of a different kind, to support the claim that the interview record was both falsified and based on the statement. If we assume that the police officers had indeed, as Molloy claimed, set out to create a dialogue based on the monologue statement, they would have faced the major problem of what questions to invent in order to link forward and apparently elicit the pre-existing candidate answers which they had derived from the statement. In this scenario one would expect there to be occasions when a question did not fit successfully into the text into which it had been embedded – and indeed there are.

In a developing interview, a police question usually links backwards lexically, repeating word(s) from the previous answer. However, in creating a question to fit a pre-existing answer, there is always the danger that the

sequence – (21) 'They all looked shocked and were shouting at each other.' (22) 'I heard Jimmy say, "it went off by accident"' – which appears word for word in the interview record, except that the two sentences are separated by the inserted question 'Who said what?'. However, in this context the word 'said', although it is cataphorically unremarkable – *said* links with *say* – is anaphorically odd because the men have just been described as 'shouting'. One would therefore have expected an anaphorically cohesive follow-up question to be either 'What/Why were they *shouting*?' or 'Who was *shouting* (what)?'; one would certainly not predict 'who *said* what?'. The choice of 'said' is a most unexpected choice – except of course for someone who knows that the next utterance will be 'I heard Jimmy *say* . . .' – then it has an evident logic.

An example of a *grammatical* misfit is where the statement version 'on the settee I saw the **body** of the **boy. He** had . . .' is transformed into 'Q. Did you see **the boy's body**? Yes sir, **he** was on the settee'. The statement version correctly uses the pronoun 'He' because the referent is the 'boy' in 'the body of the boy'. but the reformulated version in the police interview, 'the boy's **body**', would be more likely to have elicited 'it' as a referent. We also find examples of process misfit: in the exchange reproduced below, the question 'what happened' requires a report of an action or an event, but in fact the response is a description of two states:

P. What **happened** then?
M. I **was appalled** and **felt sick.**

Had the reply been 'I vomited', it would, of course, have been cohesive. Similar process misfits are:

P. What were the others **doing**?
M. The three of them **were** still in the room.
P. What were they **doing**?
M. They all **looked shocked**

It is possible to continue in this vein, but I think these examples are sufficient to show that textual oddities like these support the claim, which was based on the identity of expression, that the interview record was created from the pre-existing statement. Sadly, it was not possible to test the acceptability and persuasiveness of these arguments in court, as the Crown conceded the appeal shortly before the due date, when compelling new evidence from document and handwriting analysts emerged to convince the judges of the unsafeness of the conviction.

The Evidential Value of Single Identical Strings

In the Bridgewater Four case there was a whole series of identical strings of words to support the claim that the interview record was derived from the

due to borrowing rather than identical encoding on two separate occasions, the claim of fabrication was supported by other linguistic evidence of a different and independent kind. The final questions I will address in this article are how much weight can one place on a single identical string and how significant is the length of a string when assessing its evidential significance? These questions go to the heart of current thinking about uniqueness in language production.

As Sinclair (1991) pointed out, there are two complementary assembly principles in the creation of utterances/sentences; one is the long accepted principle that sequences are generated word by word on an 'open choice' basis. When strings are created in this way, there is for each successive syntagmatic slot a large number of possible, grammatically acceptable, paradigmatic fillers and thus one can easily, if not effortlessly, generate memorable but meaningless sequences like 'colorless green ideas sleep furiously'. The other assembly principle proposed much more recently as a result of corpus work (Sinclair 1991), is the 'idiom principle', according to which pre-assembled chunks made up of frequent collocations and colligations are linked together to create larger units. In practice, both principles work side by side, which means that any given short string might be produced by either principle and therefore might be either an idiosyncratic combination or a frequently occurring fixed phrase. Nevertheless, the longer a sequence is, the more likely it is that at least some of its components have been created by the open choice principle and consequently, the less likely that the occurrence of this identical sequence in two different texts is a consequence of two speakers/writers coincidentally selecting the same chunk(s) by chance.

The data I will use for exemplificatory purposes come from the Appeal of Robert Brown in 2003. As in the Bridgewater Four case, here too there was a disputed statement and a disputed interview record; the difference was that Brown claimed that the statement was in reality a dialogue which had been represented as a monologue. He claimed that a police officer had asked questions to which Brown said he simply replied 'Yes' (Judge's Summing-up, p. 95 section E), and that, although the interview did occur, the record of it was made up afterwards – 'no police officer took any notes' (Judge's Summing-up, p. 93 section E).

Below are two sentences from the statement matched with items occurring in the (invented) interview record:

(i) Statement I asked her if I could carry her bags she said 'Yes'
Interview I asked her if I could carry her bags and she said 'yes'
(ii) Statement I picked something up like an ornament
Interview I picked something up like an ornament

In what follows I have used examples from Google, rather than from a corpus such as the Bank of English or the British National Corpus, on the grounds that Google is accessible to the layperson for whom the argument is designed. While the above utterances/sentences may not seem remarkable in themselves, neither of them occurs even once in the hundreds of millions of texts that Google searches

String	Instances
I picked	1,060,000
I picked something	780
I picked something up	362
I picked something up like	1
I picked something up like an	0
an ornament	73,700
like an ornament	896
something like an ornament	2
I asked	2,170,000
I asked her	284,000
I asked her if	86,000
I asked her if I	10,400
I asked her if I could	7,770
I asked her if I could carry	7
I asked her if I could carry her	4
I asked her if I could carry her bags	0
if I could	2,370,000
if I could carry	1,600

It is evident that 'if I could' and perhaps 'I asked her' have the characteristics of pre-assembled idioms, but even then their co-selection in sequence is rare, at 7,770 occurrences. The moment one adds a 7th word, 'carry', the odds against it occurring become enormous, with a Google search yielding only 7 instances. Indeed rarity scores like these begin to look like the probability scores DNA experts proudly present in court. However, unlike the DNA expert, the linguist expert has the disadvantage that everyone in the courtroom considers themselves to be a language expert and, among other things, 'knows' that they can remember what they and indeed others said in past conversations and feels confident that they can 'repeat' what was said verbatim at a later date. It will never be enough for the linguist to simply assert the uniqueness of encoding, it will need to be demonstrated in an accessible way.

An Attempt at Court Persuasion

When faced with the problem of having to convince the Appeal Court judges in open court in the *R vs. Robert Brown* Appeal, I prepared the following presentation, which I hoped would both interest and persuade the three judges of the evidentiary strength of the identical formulations discussed above. I should say that, as in the Bridgewater case, this was not the only linguistic evidence to support Brown's claims about the unreliability of the police records.

As a first step I used Google to find out something about other cases involving Lord Justice Rose, who was to preside. The first three citations for the words

> Guardian Unlimited | Special reports | Archer loses **appeal** bid
> ... was not present at today's hearing, had his application for permission to **appeal** against the conviction rejected within hours. **Lord Justice Rose**, sitting with ...
> (*www.guardian.co.uk/archer/article 0,2763,759829,00.html—30k*)

I accessed this citation, part of which is reproduced below as 'Guardian Extract', and from it selected the first phrase quoted from Lord Rose – 'For reasons we will give later in the day' – which I have highlighted in bold. Given the nature of Appeal Court judgments, which are often released after the decision has been announced, this seemed an unremarkable phrase and yet a Google search returned only 7 occurrences of the phrase – all of which, on closer examination, proved not only to be attributed to Lord Rose, but were all in fact different reportings of the same uttering at the end of the Archer appeal. Even reducing the phrase to the apparently less specific 6-word utterance 'For reasons we will give later' only produced two more examples, this time not uttered by Lord Rose. Thus, here was an example of the uniqueness of an apparently ordinary utterance by Lord Rose himself.

Guardian extract

> **Archer loses appeal bid** Lord Justice Rose, sitting with Mr Justice Colman and Mr Justice Stanley Burnton in London, told Archer's QC Nicholas Purnell: '**For reasons we will give later in the day** we are against you in relation to conviction.'
>
> At the start of the hearing Nicholas Purnell QC, outlining the grounds of appeal, said: 'The submission that we make on behalf of Lord Archer is that **the first and fundamental ground** which interconnects with all the other grounds of appeal was that the learned trial judge wrongly exercised his discretion not to sever the trial of Edward Francis.'
>
> Mr Purnell said the decision of the judge, Mr Justice Potts, not to sever the trial of Francis had an **'unbalancing effect on the equilibrium'** of the trial.
>
> Counsel argued that Mr Francis was 'in a position effectively as **a substitute prosecution witness** and a substitute prosecutor'.

I then took three shorter phrases quoted in the same article, this time from Nicholas Purnell, Lord Archer's QC, each of them seeming, at least to this lay reader, to be equally unremarkable phrases for a lawyer to utter, *the first and fundamental ground, unbalancing effect on the equilibrium*, and *a substitute prosecution witness*. For these phrases I found 7, 10 and 4 instances respectively, but again for every phrase all the instances were reports of the same single occasion of uttering by Mr Purnell.

Armed with these examples, taken from an audience-relevant text, I hoped to convince the judges that uniqueness of utterance was a demonstrable fact. Sadly, at a pre-trial case conference, the defence barrister who had chosen to call me as an expert witness smiled indulgently and described my intended presentation as *whimsical* and decided not to use it. Fortunately, my other linguistic

Author Identification in American Courts

While the analytical techniques and arguments and the derived opinions reported above would be and in some cases already have been accepted in British courts, the situation is less clear in the USA. In a recent article entitled 'The linguist on the witness stand: forensic linguistics in American courts', Tiersma and Solan (2002) noted that:

> although the [American] legal system has often welcomed linguistic expertise, there are a number of areas in which they are more hesitant to do so. One example is the use of linguistics to identify authors. (Tiersma and Solan 2002: 229)

Tiersma and Solan cited the rigorous demands of the American legal system's Daubert criteria, which, in their opinion, many authorship identification method fail to meet. The Daubert criteria were created in a Supreme Court ruling at th end of an appeal in the case of *Daubert vs. Merrell Dow Pharmaceuticals, Inc.* (50 U.S. 579 (1993)). Essentially the argument was over whether expert evidenc could be rejected on the grounds that the experts involved had not publishe their work. In their ruling the Supreme Court observed that 'the adjecti "scientific" implies a grounding in the methods and procedures of science' an then went on to propose four criteria with which to evaluate the 'scientific-ne of a method:

1 whether the theory offered has been tested;
2 whether it has been subjected to peer review and publication;
3 the known rate of error; and
4 whether the theory is generally accepted in the scientific commun (509 U.S. 593) quoted in Tiersma and Solan (2002).

There is an extensive and lucid discussion of the Daubert criteria as applied linguistic evidence in the article by Solan and Tiersma in this issue (pp. 448–

In one sense, Tiersma and Solan are raising purely American proble because in the British and Australian legal systems it is the expert rather t the method that is recognized, so these courts can and do allow opinion evid from anyone considered to have:

> specialised knowledge based on . . . training, study or experience [pro vided that the opinion is] wholly or substantially based on that knowledge (Evidence Act 1995 Sec 79)

However, knowing that their evidence would also satisfy the Daubert cri gives extra confidence to British linguist/experts and it is quite conceivable similar criteria might be introduced into British Courts at some point in

Northern Ireland, for example, has recently ruled that forensic phonetic evidence based solely on auditory analysis, that is with no acoustic support, is no longer permitted.

Although I await the views of lawyer-linguists Solan and Tiersma with interest if not with some trepidation, I would argue that the methods of author attribution discussed above do meet the four Daubert criteria:

1. Whether the Theory Offered has been Tested

Work by many people on a large number of cases has shown that there is no longer any dispute that the occurrence of shared identical items is conclusive evidence that two texts have not been independently created; what remains to be agreed is how few shared identical items are necessary to support a decision.

2. Whether [the Theory] has been Subjected to Peer Review and Publication

Publications like this one and those by Johnson (1997), Woolls and Coulthard (1998) and Woolls (2003) have been subjected to peer review, there have been many presentations on this kind of authorship assignment at international conferences and to peer audiences in universities worldwide. In addition, the Copycatch Gold collusion detection program is in use internationally in over 50 universities, including the British Open University.

3. The Known Rate of Error

This is perhaps the most difficult criterion – in cases of plagiarism it is traditional to err on the side of caution, and so I know of no cases of error. However, in this article, in the final section, I have taken the extreme position that a single and relatively short string can be conclusive evidence; this in itself is a challenge to the academic community to test the error rate and at the same time to fix an acceptable statistical equivalent for 'beyond reasonable doubt'.

4. Whether the Theory is Generally Accepted in the Scientific Community

There is no doubt that the basic tenets of idiolectal variation and the uniqueness of utterance are generally accepted across the whole linguistic community; the disagreements are over how far certainty of assignment depends on the amount and kind of shared vocabulary and on the length of individual sequences and their composition in terms of idiomatic and open choice items.

Conclusion

The evidence discussed above suggests that the concepts of idiolect and uniqueness of utterance are [illegible]

questions about authorship with a high degree of confidence. As demonstrated we can use the concepts to help us search when we suspect plagiarism and to categorize and classify when we already have texts of various kinds whose authorship is suspect or disputed. There are still many author identification problems where the methodology is less developed and reliable and where Solan and Tiersma's cautions are well-heeded, but the future for author identification is encouraging.

Notes

1. For an accessible version of events, from someone who wrote a report on the language of the manuscript, see Foster (2001). The full text of the Unabomber manuscript is available at: *http://www.panix.com/~clays/Una/.*
2. An automated version of this analytic method, produced by Woolls (2002), is now available as the computer program *Copycatch Gold.*

Bodies, Beaches and Burn-Times: 'Environmentalism' and Its Discursive Competitors

Nikolas Coupland and Justine Coupland

Linguistic Perspectives on the Natural Environment

While there is as yet no consensus on how the term 'ecolinguistics'[1] should be applied (cf. Alexander et al., 1993; Fairclough, 1993), it would be an appropriate term for a critical perspective which concentrated on the semantics of expressions used to represent the natural environment, environmental practices or policies (cf. Alexander, 1993; Michael, 1991). Alternatively, because language is the medium through which ecological knowledge is fabricated, developed, transmitted and understood, a form of ecolinguistic research needs to investigate how relevant knowledge is shared or confined – for example as between scientific and media texts, and between experts and non-experts. Are non-experts simply informed or actively 'de-skilled' (Giddens, 1991) in the mediation of environmental knowledge? Bell's work on the reporting and reception of climate change information [1989, 1991] gives an important lead, in this regard.

Rather differently from these approaches, we want to argue for a 'competing discourses' formulation for ecolinguistics in the present paper. When people seek, as activists, critics, theorists or green politicians, to change social priorities, values or practices relating to the global environment, we become aware of environmentalism as a site of struggle. These struggles are generally represented as rather concrete disputes over human actions (whether or how to recycle waste, or to drive diesel cars), or over political decisions with practical consequences (whether to build a new by-pass, burn orimulsion in a power station, or limit fishing). But to the extent that such struggles are founded on arguments between political priorities and value systems, established by different groups with varying degrees

of power and influence, and enacted rhetorically (in conversations or the media), it is appropriate to construe them as competing discourses (cf. Lee; 1992, Candlin and Maley, in press).

Discourse in this context is intended in the broadly Foucauldian sense of a particular, internally coherent set of values and orientations, which is held to be normative, persuasive or simply unexceptional within specific groups or movements, which guides practical action, but which is configured around and through a finite set of claims, statements or accounts, amounting to a stance or (partial) world-view. That is, following the broad priorities by many contributors to this journal, discourses are taken to be both ideological and textual, and basically amenable to forms of linguistic or rhetorical or semiotic analysis. 'Environmentalism' itself can therefore be construed as a discourse, or, more appropriately, as an interlinked and evolving set of discourses, established to counter pre-existing discourses.

We see this approach as being able to build quite directly upon the critical theoretic work of Beck (1995) and Giddens (1991), in their characterization of 'the [late-modern, contemporary] risk society' and of popular involvement with environmental risk in particular. Douglas and Wildavsky's (1982) social and specifically cultural perspective on risk similarly *requires* the empirical support of particular grounded analysis. A discourse analytic tradition can support Nelkin's claims about the viability of a linguistic perspective on risk and the need to expose 'the conflicting values that perpetuate disputes over risk' as a supplement to 'rational' and 'objective' approaches (Nelkin, 1985, p. 9). 'Human responses to risk', as Nelkin writes, 'are filled with contradictions' (p. 15), and in the environmental domain these are occasioned by the vast disjunction between the hugely global etiology of risk and the local circumstances of people's particular responses, and by the conflicts between ideologies of modernity/progress and conservatism/restraint.

According to Beck, individuals' responses to environmental risk are necessarily located within the constraining 'freedom' of consumer choice. Contemporary technology and 'progress' have killed off nature and sought to reconstruct it *within* the parameters of technology and consumerism. Therefore, 'the social "consumption" of nature renders invalid all those concepts and theories that conceive of nature as the counter-image of human activity and power, to which it must be subjugated' (1995: p. 38). Since there is a prevailing technicist confusion between nature and society (p. 47), individuals are largely restricted to making their responses to environmental hazards within the domain of consumerist activities, rather than engaging with natural problems and solutions directly. The complexities and contradictions of responding to acknowledged environmental problems should therefore be apparent in the relevant social discourses, and amenable to critical commentary.

An Empirical Approach

One set of

In this paper, we develop an account of how UK print media coverage of these issues sustains a series of contradictory moral, ideological and practical positions. Our intention is to show how imperatives and proscriptions that are articulated as key parts of 'environmental' discourses are systematically undermined by other formations, either within the same or across different texts. That is, we want to illustrate how a rather abstract, but still textually grounded, discourse analytic approach to 'the environment' can show where and how 'environmentalism' is constructed in UK print media, *and* how those same media offer us specific means of challenging or ignoring 'environmental' imperatives. (The attributive 'environmental' is part of the paper's problematic, and should be read as subject to qualification and doubt, whether or not we place it in inverted commas.)

We collected a sample of UK print media during 2 weeks in July 1994 (that is during the 'so-called British summer', where 'so-called' is so-called). The sample was not in any way pre-planned, except insofar as we consciously chose a 'high summer' period. We surveyed all national newspapers and the 23 most popular magazines (10 weeklies, three 2-weeklies and 10 monthlies), judged mainly by circulation statistics.[2] In the first scan of these data, we identified texts making any reference to any aspects of ozone depletion (but not 'ground-level ozone'), UVA and UVB problems, sun-tanning or burning, and protecting skin from sun exposure. The texts included newspaper and magazine reports and features of variable length and prominence, but also weather reports and product advertisements.

Ozone–Melanoma Discourse

As a starting point, we might identify a recurring 'environmental' discourse within these data. It is a discursive formation that is relatively recent, but seemingly much better established in the southern than in the northern hemisphere anglophone cultures.[3] Its key components might be represented as in Figure 1.

We refer to this configuration as 'ozone–melanoma' discourse. Note its progression, at least in how the keywords are arranged in Figure 1, from causes to effects and from problems to solutions. As summarized in the last line of the Figure, the discourse frames this particular environmental issue initially in scientific terms, moving from a scientific cause through an interpretation of health consequences (with 'health' still ingrained in a biomedical domain). But through the need that it asserts for us to be aware of and perhaps responsible for our own health, a moral dimension comes into play, leading to potential revision of self-presentational ideals – specifically in redefining the desirability of fair skin.

The media sample includes a strand of newspaper reports focusing on a particular, new scientific discovery, to the general effect that sun-protection creams may give poorer protection against skin cancer than was previously thought. Text 1 (*Daily Telegraph*, 7 July 1994) is one of these reports, and it articulates many of the key processes and propositions that we have taken to be criterial elements of ozone–melanoma discourse.

The report is located within the referential domain of academic science ('a senior scientist said'; 'professor of chemical pathology'; 'Tests in his laboratories';

Sun creams 'no barrier' to cancer

By Peter Pallot, Health Services Staff

SOME sun creams may not protect against skin cancer, a senior scientist said yesterday.

Manufacturers have concentrated on blocking "burning" ultraviolet radiation — UVB — and have largely overlooked another form of radiation, UVA, said Dr Joseph Lunec, professor of chemical pathology.

Tests in his laboratories at Leicester University showed UVA could damage genetic material within cells which may predispose to cancer, he said.

He had developed chemical markers which identified UVA damage to genetic material in skin cells cultured in the laboratory, he said. But the link had not been demonstrated in people.

His findings are to be presented to a conference in Venice in October and in Australia in November.

Cases of skin cancer have grown rapidly in Britain and now exceed 40,000 a year, although around 90 per cent are easily treated.

Prof Lunec added: "Companies are conducting only a little investigation into UVA and there should be more."

Sun creams are given sun protection factors according to how much protection they offer to UVB. But that was no guide to their effectiveness against UVA, he said.

There has been concern in the sun cream industry about UVA. Boots, the pharmacy chain, has introduced a UVA star rating system.

Prof Lunec declined to say which commercial brands he had used in tests, but he said: "Creams need to contain more anti-oxidant vitamins to offer adequate protection. The people currently producing creams are not fully aware of the effects of UVA.

"In Australia, where exposure to the sun is much greater than here in Britain, they are more concerned about this issue.

"We have been experiencing a spell of hot weather and all the people you see coming into work burned by the sun have been exposing themselves to potentially dangerous levels of UVA."

Last night Prof Gordon McVie, of the Cancer Research Campaign said manufacturers had concentrated on protecting against UVB because all research suggested that this, rather than UVA, was the one that did the damage.

If the science proved sound, it would be the first time that UVA had been implicated as a cancer agent he added.

OZONE DEPLETION
INCREASED HARMFUL UV RAY ACTION (UVA and UVB)
THREAT TO HEALTH AND LIFE

SKIN DAMAGE AND MELANOMA
DEATH RATES (INDIVIDUAL PAIN)
AWARENESS
BURNING VS TANNING
SKIN PROTECTION
CHEMICAL BARRIERS
EXPOSURE LIMITATION
SUN AVOIDANCE

SUN-BATHING IS NAIVE (OR CRASS OR GROTESQUE)

FAIR SKIN IS GOOD

SCIENCE – HEALTH – MORALITY – SELF-PRESENTATION

Figure 1: Key elements of ozone–melanoma discourse

relates a scientific discovery to a health problem affecting large numbers of people. and so to an epidemiological trend ('Cases of skin cancer have grown rapidly in Britain and now exceed 40,000 a year'), although there are reported to be differences between northern and southern hemispheres in these trends and associated risks ('In Australia, where exposure to the sun is much greater than here in Britain'). The threat to health is represented as a physical one ('could damage genetic material'). Therefore what is at issue is 'burning' not 'tanning' ('burned by the sun'). Limiting damage is repeatedly (in fact on four occasions) cast in terms of 'protection' by means of a physical and/or chemical 'barrier' (headline) of varying 'effectiveness'. The text is a prototype of an explicitly 'risk-formative' discourse. It references 'risk' and 'threat' directly. It also establishes a hazardous outcome. gives a probability index, and extrapolates to undesirable consequences/problems.

How, then, might a competing discourses perspective enrich the analysis of how such media texts are socially constituted – how they stand as textualized versions of cultural discourses, relative to other discourses realized by other texts (actual or potential)? Even to claim, as we have done implicitly, that texts like Text 1 articulate an 'environmental' discourse suggests that there are other discourses with which they have to compete. Are there discursive configurations already marshalled as competing discourses to oppose the implications of scientific-medical ozone–melanoma discourse?

First, there is a 'traditional' versus 'contemporary' opposition at work. The original articulation of the scientifically based statement of the ozone hole problem (about a decade ago) expressed a new phenomenon, a new threat, deriving from new technical discoveries. The local story that drives Text 1 is based in a report of findings from *new* research. The issue of being aware of the health consequences locates us – as readers and as the people potentially at risk from cancers – as more aware than we were in the past, or as more aware than 'trad-

[illegible] discourse reacts against older

then arise. What discourses articulate 'traditional' orientations to sun-exposure? Do they still have a currency, and if so, where? Also, are there competing contemporary discourses which similarly oppose ozone–melanoma discourse? Which, how and where? Relating to the first of these questions, our media sample suggests there is indeed a well-established, 'traditional' discourse of sun-exposure. Its key elements might be summarized as in Figure 2, and we might identify this configuration as a discourse of 'sun-is-fun'.

LEISURE IS FUN
SUN IS PART OF SUMMER LEISURE

LEISURE IS MARKED (relative to work)
SUN IS RARE (in Britain)
THE MORE SUN THE BETTER

SUMMER LEISURE IS BODY-BASED
BODY EXPOSURE IS SEXY AND FUN

Figure 2: Key elements of sun-is-fun discourse

Sun-is-Fun Discourse

The *Western Mail* (the self-styled 'national newspaper of Wales') of 12 July 1994 carries a story under the headline 'Doctors issue a roasting on the hottest day of the year' (Text 2). The text begins by characterizing the traditional British day at the beach ('bumper day for ice-cream sellers and deck-chair attendants, yesterday's hottest temperature of the year . . .') and embeds information about

Doctors issue a roasting on hottest day of year

By SIMON PERRY

WHILE IT was a bumper day for ice-cream sellers and deck-chair attendants, yesterday's hottest temperature of the year brought strong warnings from doctors on the dangers of skin cancer.

It took only 20 minutes for people in Wales to burn under the scorching sun.

A burn could be one step towards skin cancer and, with more hot weather forecast today, Health Promotion Wales warned vulnerable people not to go out unprotected in the fierce heat.

Temperatures soaring to 27.8°C (80°F) in Cardiff yesterday. Much of Gwent and southern Powys hit 26°C. The highest reading in Britain was at Lakenheath, Suffolk, where

Weather hits coffee prices — Page 2
Comment — Page 8

sun-lovers were treated to a 30°C (86°F) afternoon. Fair Isle, Shetland, recorded the coolest with just 12°C (54°F).

The top temperature just pipped the year's previous peak of 29.3°C (84°F) recorded at Heathrow Airport on June 24.

The "burn time" — or the average time a fair-skinned person could spend in the sun unprotected without burning — was 20 minutes in South-East Wales yesterday and just five minutes longer near western coasts.

Weathermen also sounded pollution warnings for high sulphur-dioxide levels in the north of England and high nitrogen-dioxide levels in London.

Today, Cardiff weathermen forecast that it will remain hot and sunny, but it will start to cool off tomorrow when temperatures are forecast to fall to 20-21°C (68-70°F), the monthly average.

burn-times and cancer dangers within the story ('brought strong warnings from doctors on the dangers of skin cancer'). The feature goes on to endorse sun-is-fun directly in places: Temperatures soaring to 27.6°C (80°F) in Cardiff yesterday. Much of Gwent and southern Powys hit 26°C. The highest reading in Britain was at Lakenheath, Suffolk, where sun-lovers were treated to a 30°C (86°F) afternoon.

Temperatures are reported to be 'soaring' (an ethereal metaphor) and the representation that they have been 'hitting' high numbers evokes an annual competition to achieve the highest recorded figure (cf. 'The top temperatures just pipped the year's previous peak'). The sun is a 'treat' for 'sun-lovers' who will rue the fact that 'it will start to cool off tomorrow'. The contexting of burn-time information ('20 minutes in South-East Wales yesterday') allows, and arguably encourages, readers to bracket the problem status of the health-risk, or at least builds in the availability of an alternative stance. Although the text clearly references 'burning', 'warnings' and 'dangers' of 'going out unprotected' much as Text 1 did, it also offers sun-is-rare as a mitigation of sun-as-risk, and offers sun-is-fun as a legitimation of body exposure.

This pattern of intermixing discourses is repeated in many different texts in the sample, for example Text 3 ('Fry Noon' from the *Sun* newspaper of 12 July 1994).

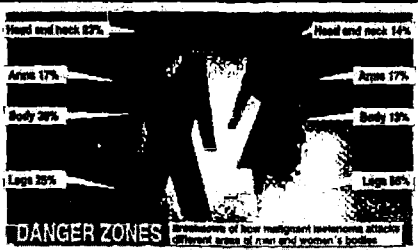
FRY NOON

You can get skin cancer in the local park as easily as on a Greek beach

By DAWN NEESON

BALMY Britain is putting Mediterranean hotspots in the shade, with temperatures today expected to top yesterday's 86°F

But it is also casting a shadow of death over thousands of sun worshippers in the form of skin cancer.



Over the last ten years there has been a 56 per cent rise in Britain's death rate from the disease.

Young

This year it will kill 1,800 Britons, compared with 743 in 1974—a rise of 142 per cent. The only cancer to kill more is of the lung but the sun is closing fast.

Women who tend to stay out in the sun longer, but number male victims three to two. And it is the only cancer where young victims outnumber the old.

Women tend to develop the cancer on their legs, as skirts offer less protection than trousers to men. Unlike

more on the torso. Around 3,500 people a year in Britain develop the lethal malignant melanoma and 36,000 the less serious but still dangerous non-melanoma skin cancer.

Rona MacKie, professor of dermatology at Glasgow University, says: "The message about protecting ourselves from the sun's rays is getting through, but people think it only applies when they go abroad.

"I'm astonished at the amount of people who sunbathe in Britain without using sun cream.

"Suggest they spend a hour on a Greek beach at midday without any and they'd quite rightly think you were mad. They don't seem to grasp that an hour in the local park at lunchtime can damage your skin in exactly the same way."

Part of the problem is the long time lag between when the skin is damaged and when cancer develops.

"It can take between ten and 20 years for the effects to be seen."

The Met Office now issues extra violet radiation warnings during summer weekends.

The amount of UVR, rating the ground, is highest between 11am and 3pm when the sun is high in the sky.

Even so, polls suggest that only a third of Britons have changed their sunbathing habits, with just five per cent of women saying they would prefer to be pale and healthy and a fifth still rushing to sunbathe at every opportunity.

If skin cancer is caught early the chances of a cure are good—more than 90 per cent of sufferers live more than five years.

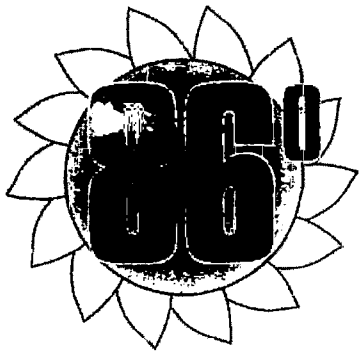
Freckles

Those most at risk are fair-skinned people, especially those with red hair and freckles—Scotland has seen one of the biggest rises in cases with 60 per cent more in the years.

The key symptom is a change to the skin surface. If a brown spot appears that was not there before, or if a mole gets darker, paler or changes shape, itches or bleeds, see a doctor immediately.

Dr John Hawk, consultant dermatologist at St Thomas's Hospital, London, says: "Some of you won't think it is glamorous to be brown, but to sunbathe to a tanned leather will be what is called

This is ostensibly another report about skin cancers, and the text again expresses the associated health-threat in terms closely reminiscent of the previous ones we have considered. But its opening lines project high temperatures as being, once again, good news ('Balmy Britain'), and in places the text glorifies them and marks them as achievements (expected to top yesterday's 86°F'). High temperatures in Britain are unusual, and it is newsworthy that Britain, for once, is outdoing the Mediterranean ('putting Mediterranean hotspots in the shade').



In Text 4, the *Daily Star*'s very similar lead-in to its story of the same day is: 'Stick the Med . . . Britain's real hot stuff'. But the implied competition is over more than temperature itself. In Text 4, heat is overtly constructed as desirable, since those 'under a cooling cloud' are 'some unlucky Scots'. Britain's being 'hot stuff' evokes a competition between European regions and races to be recognized as centres of sexual or at least sensual experience. The practice of bodily exposure to the sun is represented as 'basking', 'sweltering' and 'broiling', images which mix heat, moisture and passivity in ways that are as evocative of receptive sex as they are of some modes of cooking ('roasting').

As later examples suggest, the lexicons of tabloid sex and of summer heat (which itself is linked, of course, to bodily exposure) are entirely consonant with one another. The UK tabloid semi-nude is as likely to be characterized as 'sizzling' or as 'a scorcher' as is a hot summer's day. At the same time, the phenomenon is not purely tabloid. A headline from *The Times* (also of 12 July, not copied here) is: 'Britain to sweat for just one more day', and the feature goes on to comment that 'most of the country continues to bask in sunshine'.

Our argument this far, then, is that there is a recurrent ambiguity in many media texts' formulation of ozone–melanoma discourse, which, interspersed with reports of health-risks and warnings of skin damage, offer a 'traditional' means of resisting its evidentiality and its applicability to individuals, perhaps especially Brits. The *Sun*'s 'Fry Noon' piece (Text 3) itself reports the findings from 'polls' that 'just five percent of [British] women . . . [say] they would prefer to be pale and healthy and a fifth [are] still rushing to sunbathe at every opportunity'. (This is repeated almost verbatim in *The Times* Home News column of that day.) This gap between risk-information and day-to-day practice may be partly explained by the rhetorical alignment we find in some media texts *against their own* imprecations towards safer sun-use. A text such as Text 4 is therefore a self-subversive text, aligning against known eco-risks in the pursuit of hedonistic fulfilment and sensual sun-experience. As it suggests, 'Most human animals . . .' can persist with bodily exposure 'in the hope of getting a good, safe tan' [even] 'after the Government issued skin cancer alerts'. There are known risks, 'But at the moment hardly anyone cares . . . in the top sun spot of Europe!'.

The gendering of sun-is-fun discourse is implicit in the texts we have so far considered. But several other instances from the sample juxtapose verbal articulations of ozone – melanoma discourse with stereotypic visual images of young women in bathing suits. For example, the page 15 spread of The *Daily Express* (7 July 1994, not copied here) has the full-page headline 'Doctor's pin-up insult'.

FINE-O? TOO HOT FOR RHINO!

STICK the Med ... Britain's real hot stuff.

For the average 86°F heat which has us sweltering will last at least a day or two more And it could even hit **NINETY**, say weathermen

As yesterday's top temperature — the best for three years — reached 88° at Northolt, Middlesex. London was also warmer than the Mediterranean.

But while that was good news for almost everyone, the capital's zoo keepers put a damper on our sun fun by asking us to spare a thought for their **RHINOS.**

Cream

For black species favourites Rosie and Josh have had to be given rubdowns with moisturising cream to prevent their thick skins cracking in the heat!

Most human animals, though — apart from some unlucky Scots under a cooling cloud — were just applying lotion to their bodies in the hope of getting a good, safe tan after the Government issued skin cancer alerts.

Lakenheath in Suffolk, with 86°, was as broiling as Bombay and red-hotter than Rome, Nicosia, Istanbul and Barcelona.

Even rainy Manchester basked under clear skies and 79° . though further north the sun definitely didn't have its hat on as the mercury in the Fair Isles stopped at 54°.

But in the south, the 46-year-old July record of 93° could be under threat before the temperature drops later in the week

"It's been very warm but may get warmer still " a London Weather Centre spokesman confirmed.

The main problem may be the usual one — jams, with people heading for the coast in droves as they did yesterday

There were tailbacks on routes to Blackpool and Scarborough And a 10-mile one built up on the M25 in Essex

The extra exhaust fumes could also cause smog.

But at the moment hardly anyone cares in the top sun spot of Europe!

BAD SHOT KILLER

GOLFER Jeremy T. Brenno, 16, died when he slammed his club against a bench after a bad shot, and the broken shaft snapped back and pierced his heart, at Gloversville, New York

Breakfast toast

FIVE Daily Star library workers were toasting their success last night after scooping £10,000 in a radio show breakfast bonanza. Andy Williams entered himself and workmates John Gray, David Goddard, Pat Bridges and Martin Edwards in the Trebor Extra Strong Mintal Challenge on Virgin 1215's Russ and Jono's Breakfast Show They all had to tune in at the same time and then ring in to claim their prize.

Text 4: The *Daily Star*, 12 July 1994. © Express Newspapers plc.

the headline story, under the sub-head 'Women get a raw deal on the NHS [National Health Service], claims Minister'; and (rightmost) the story of high risks even with the use of suncreams, under the heading 'SUMMER SUN TANS HIDE CANCER RISK'. Physically dividing (or linking) these stories is an untitled image of a young woman wearing a swim-suit and jewellery, apparently in bright sunlight, in a submissive pose, her hands held up to her hair. The image lends itself as potential support for the 'pin-up' headline, since it can be seen as an instance of an actual 'pin-up' photograph. But it also visually contextualizes the verbal ozone–melanoma text to its right, again offering a subversive reading of that text. The image's stereotypic qualities conjure traditional, tabloid interpretations of female sexuality which are then proxemically forced into interaction with the right-panel's headline 'SUMMER SUN. . .'.

There are many such instances, including the *Daily Star*'s (11 July, p. 5) close-up of Kim Basinger, pouting, apparently in illustration of the headline 'Star Kim's lip cancer op agony'. The text contrasts two themes: on the one hand 'HOLLYWOOD superstar Kim Basinger', 'Beautiful blonde Kim' (and the photographic image); on the other hand, 'her agonising battle against cancer', 'painful laser surgery on tumours that appeared on her lips', 'the most painful experience of her life', 'It took three nurses to hold me down. They stuck a large needle under my lip', 'they lasered off the cancerous parts' (and the headline). As in previous instances, ozone–melanoma discourse is here in competition with traditional tabloid visual and verbal imagery of female sexuality. What is added in this case is an implicit element of moral chastisement, using the ozone–melanoma issue apparently to chastise those whose lifestyles are hedonistically linked to the sun. Kim is said to be 'allergic to the sun', to be 'married to movie hunk Alec Baldwin', and to have had a 'surfer ex-husband'. Here we get a fleeting glimpse of ozone–melanoma discourse as part of a shifting morality of anti-hedonism. Skin protection as part of (one form of) eco-awareness can be constructed as a new asceticism, aligned against the traditional hedonism of sun-is-fun.

On other occasions, however, 'sun-is-fun' gains unqualified approbation. *Today* newspaper's piece (12 July, p. 11, not copied), headed '86° Absolutely Sweltering', places its verbal text against a photo of forward-leaning Joanna Lumley, tanned and wearing a low-cut T-shirt: '. . . hottest day of the year – several degrees more sizzling than the Greek islands enjoyed . . . The best of British sunshine . . . In the South of France, Nice failed to top 80 fahrenheit . . . And, *Today's* weatherman Philip Eden warns: "Make the most of it. Things will cool down in most places by the weekend. The north is suffering already . . ."'

Overall, the sample suggests that the tabloid press construct sun usage primarily as a deserved reward, a treat. This is a pro-fun, anti-political correctness, and in its own terms even a libertarian discourse. Its stance is distinctively British working class (since 'the Med' has 'more than its fair share', and 'working people deserve their day out', etc.). Sun-use, through (predominantly female) body exposure, falls easily into the pattern of 'just a bit of fun' tabloid representations of leisure. It offers a ready counterposition to the serious, scientific, medical, rational discourse of the ozone–melanoma discourse.

Body-Culture Discourse

But contemporary discourses of the body, even in Britain, have in some ways transcended these tabloid representations. In late-modern societies, the body is semiotically too important, and has too much definitional potential, to function merely as a solar panel for hedonistic leisure. At the same time, it is too potent a signifier to be hidden from view, under the pressures of scientistic priorities. 'Laying out' is not what all late-moderns do, but body-culture more generally is one of their focal concerns. And body discourses refashion and undermine *both* pro- and *anti-* 'post-ozone' rhetoric to a significant extent.

Bodily exposure to the sun entails a bio-medical health-risk, but it also entails a risk to personal and social standing often referred to as 'premature ageing'. Social stereotypes of old age are in many respects based on physical (including physiological and physiognomic) images and definitions of ageing, but sagging flesh and wrinkles are undeniably also the hallmarks of (genuine) deep old age. Woodward's (1991) comments about the 'unwatchability' of old age, based on her observations of responses to fine art portrayals of elderly nudes, is apposite. The notion of 'gerontophobia' is also relevant here, encapsulating many people's experience of reticence and even revulsion when confronted by others', and no doubt the prospect of their own, ageing. There is a traditional (liberal humanist, and sometimes religious) discourse that works against attaching any significance to the body, and therefore to the ageing body ('beauty is only skin-deep . . . age cannot wither . . .'). But in late or high modernity the body has been imbued with remarkable symbolic status, to the extent that, for some, it is the single most potent signifier of selfhood.

Not only Giddens, but also Shilling (1993) and Featherstone (1991) are among those who have recently captured, at the level of social theory, the general characteristics of high modern body-culture. From their writings, we can derive the following elements of another putative discursive formation, which we can refer to as body-culture discourse (see Figure 3). In relation to ageing, it is very clear that body-culture discourse encodes an ageist, anti-elderly ideology. As Shilling writes, the body-as-symbol is par excellence the domain of the 'quintessentially modern individual who is young and never dies' (1993: 196). Consumer culture, in Featherstone's account, recycles ageist images, many of which centre on the youthful body: 'Certain themes, infinitely revisable, infinitely combinable, recur within advertising and consumer culture imagery: youth, beauty, energy, fitness, movement, freedom, romance, exotica, luxury, enjoyment, fun' (1991: 174).

The associated moral agenda is again largely a mass media imposition: 'Advertising, feature articles and advice columns in magazines and newspapers ask individuals to assume self-responsibility for the way they look. This becomes important not just in the first flush of adolescence and early adulthood, for notions of "natural" bodily deterioration and the bodily betrayals that accompany ageing become interpreted as signs of moral laxitude' (Featherstone, 1991: 178)

THE BODY EXPRESSES THE INDIVIDUAL
WE HAVE A MORAL CONTRACT WITH OUR BODIES
HEALTH IS EXTERNAL AS WELL AS INTERNAL
RECREATION IS WORK (THE NEW ASCETICISM)
THE BODY IS A COMMODITY AND A FORM OF CAPITAL
CONSUMERS CAN BE MODELS, BY BODY SHAPING AND COLOURING

BODY-CULTURE RESISTS/DENIES AGEING
BEAUTIFUL BODIES ARE YOUTHFUL BODIES
YOUTHFUL BODIES ARE HEALTHY BODIES
HEALTHY BODIES ARE (OFTEN) TANNED BODIES

Figure 3: Key elements of body-culture discourse

'create' ourselves, to an extent including physically, from all manner of role-models offered to us, particularly via the media.[4] In a consumer culture, we can command the belief (ultimately illusory, but highly seductive and involving) that we can transcend the lifespan and our own ageing (Featherstone, 1991: 177).

Against this background, discourses in the domain of sun, risk, health and tanning take on new meanings. Body consumerism and ageism can infiltrate and colonize both ozone–melanoma and sun-is-fun discourses. In late modernity, science-based and health-based rationales for limiting sunexposure can be supplanted by fear-of-ageing (gerontophobia), but to *the same* practical effect – that is, sun-avoidance. If (young) moderns do limit their sun-exposure, it may be under pressure from a wholly *nonenvironmental* discourse, which asserts attractiveness over health, personal and social priorities over responsiveness to scientific facts, and perceived youthfulness over actual longevity. Exposure to sun brings 'premature ageing', and ageing is what body-culture has been developed to resist.

But there is an internal dilemma. For body-culture to be enacted, bodies need to be seen. Similarly, bodies need to be 'displayed' and 'advertised' if they are to enter the relational market and realize their symbolic capital (Bourdieu, 1977). Investment in the body can only see a return if bodies are there to be traded in the open marketplace. In fact, there are few fully legitimate public display-sites for bodies other than beaches, and bodily disclosure as part of summer leisure therefore has a particular salience in late-modernity. Scantily clad bodies (especially female) may pour from the mass media, but people's desires to role-match, even to become the media images, are severely curtailed. From the consumerist standpoint, the fun element of sun may therefore be overridden by the sun's role as a facilitator for, a legitimizer of, bodily revelation. Sun declares the market place open.

Media texts in our sample again reflect the interpolation of bodyaesthetic, anti-ageing (and ageist) concerns into the ozone–melanoma and the traditional sun-is-fun discursive formations, either directly or indirectly. The frequent references to 'damaging your skin' (e.g. the 'Fry Noon' text, Text 2, earlier) implicate the risk of so-called 'premature ageing'. The 'Pinup' text that we referred to (from the *Daily Express*, 7 July 1994), like many others, suggests that even UVA rays 'cause ageing'. And yet, the suntanned body has a persistent semiotic

continues to be a population (and we have seen that, according to media reports and skin-cancer rates, it is a majority) who will forego the benefits of sun-avoidance, whatever their ideological bases.

One possible response is to reassert the hedonistic short-termism of sun-is-fun. As Shilling writes:

> Investment in the body also has its limitations. Indeed, in one sense, the effort expended by individuals on the body is doomed to failure. Bodies age and decay, and the inescapable reality of death appears particularly disturbing to modern people who are concerned with a self-identity which has at its centre the body. After all, what could signal to us more effectively the limitations of our concern with the young and fit, ideally feminine or masculine body than the brute facts of its thickening waistline, sagging flesh and inevitable death? (1993: 7)

Confronting the inevitability of physical decrement, we might shorten the time-span of our physicalized self-identities, and decide to live in rather locally relevant phases ('while I'm young enough to bare my body on the beach'). But this is a radical stance, and consumer culture is ready to step in with an ideological solution to a lived dilemma where it can be turned to economic advantage. It is under these circumstances that medical conglomerates and their advertisers have promoted the notion of 'healthy tanning'. Healthy tanning enacts the late-modern imperatives of ascetic body-culture, by-passing the dated hedonism of sun-is-fun, and pays lipservice to the scientific respectability and personal responsibility required in ozone–melanoma discourse. But above all it legitimizes body exposure to the sun and reinvents this practice as an entirely rational lifestyle choice. It is a classically commodified solution to an ideological dilemma, and it is hardly surprising, therefore, that the largest category of media text-types in our sample is advertisements selling anti-wrinkle, safe-tanning products.

Consider Text 5, page 28 of the July 1994 issue of *Prima* magazine (a magazine directed at young women), the beginning of a feature titled 'It's OK to tan'.

The text, like its title, is essentially a legitimation, cast as a new revelation ('everything has changed'). In fact, it offers an apparently new solution to an implied dilemma. It reasserts skin 'tanning' over skin 'burning', and glamorizes dark (or 'golden') skin. 'Risk' of skin 'damage' is still clearly referenced – in fact the twin risks of melanoma and visible ageing – but they are presented as familiar and controllable ('for the past decade we've been constantly warned', '. . . thoroughly drummed into us'). The magazine, and the technology it introduces to readers, offer the means of control. Sexual allure ('a fabulously sexy golden shade'; 'a glorious golden glow') is to be earned through an urgent ('vital') regimen of self-attention ('a properly achieved tan'; 'a sun-tan, carefully gained'; 'what you mustn't do is burn'). Sun use is reinstated as a legitimate late-modern practice, rescued from the drab asceticism of ozone–melanoma discourse which has been superseded (we are asked to believe) by a new asceticism of control *within* the

It's OK to tan

This summer it is definitely okay to tan – but what you mustn't do is burn. Your Prima tanning card will be vital on holiday, helping you to a fabulously sexy golden shade!

Yes, it's really true! Now you can have that glorious golden glow without putting your health and your skin at risk. For the past decade we've been constantly warned about the dangers of the sun's ultra-violet rays. The risks of increased wrinkling, ageing and, more importantly, skin cancer, have been thoroughly drummed into us. But now it would seem that everything has changed.

A properly achieved tan protects your skin

New research shows that a sun-tan, carefully gained using high-factor sunscreens, could actually protect your skin from any long term damage. Sunburn is the major culprit when it comes to skin damage; so if you can avoid it, then you

Retrospective

We began this analysis by identifying one strand of an 'environmental' discourse

exposing skin to the sun, linked to ozone depletion in the upper atmosphere. It would *not* be true to say that this scientific discourse is eclipsed by alternative formations. Many texts in the sample do refer to such risks, and build their own meanings in relation to a discourse of ozone–melanoma. To that extent, the textual data suggest the science-led discourse of risk appears to have received a reasonable exposure in the UK print media.

But the media sample also shows that there at least two different, alternative ideological and rhetorical formations which compete with this particular environmental discourse – what we called sun-is-fun and body-culture formations – often within the same media texts. If we look back at what we posited as the key elements of the 'environmental' discourse, we can in fact see how its competitors marshal themselves to *resist* its impact, both by *refutation* and by *colonization*. Sun-is-fun is essentially a refutation, a refusal to recognize one set of priorities and the imposition of an alternative set: it asserts leisure over science; the persistent rarity of sun (in Britain) over a perceived increase in environmental risk; hedonism over asceticism; a 'bit of fun' over serious scientific debate; the working person's priorities over political correctness; traditional values over new science.

In contrast, body-culture discourse largely *colonizes* environmentalism. It overlays the science of skin protection on top of the science of risk; it relocates risk within the individual's use of chemical treatments rather than in large-scale changes to the environment; it overlays the asceticism of self-protection on top of the asceticism of sun avoidance; consumerist solutions on top of natural solutions; individual responsibilities on top of community responsibilities; an apparently new science of safe tanning on top of the newness of ozone depletion science. But body-culture *also* colonizes sun-is-fun discourse. It technologizes leisure and makes 'work' out of 'laying out'; it reinvents 'laying out' as an identity project; it adds a narcissistic dimension to body exposure; it commodifies summer leisure as part of consumer culture.

Of the various opposing formations, therefore, it seems that the complex of body-culture priorities has the strongest potential to resist environmentalism, at least in the specific context of ozone layer depletion. The discourse processes we have examined in this analysis can in fact be seen as a coherent set of devices acting to promote what Giddens (1991) calls the sequestration of nature – late-modern societies' practice of obscuring the facts and imperatives of the natural environment through the distorting effects of mass-mediated institutions. The most profound potential interpretation is that Beck may similarly be correct in arguing that knowledge of environmental hazards does not, in itself, constitute an avenue for remediation – an escape route. Individual judgement about the environment, he suggests, is no longer anchored in individual experience (Beck, 1995: 52). The print media which establish environmental risks themselves lead us into commodified 'solutions' which fail to address the underlying environmental concern.

More generally, we hope to have established that the juxtaposition of 'language' or 'discourse' with 'the environment' is not inherently 'inappropriate' or

constructive for environmental research at a fundamental level. In this paper, we have adopted social semioticians' (or critical linguists') approach to context. Part of Hodge and Kress's (1988) thesis, for example, is that 'The site in which a text occurs typically contains instructions as to how it should be read and what meanings should be found in it' (p. 68). Context is therefore taken to incorporate sets of obligations and predispositions, which act as constraints not only on which messages should be conveyed and how they should be conveyed, but also on how messages should be interpreted. This feeds directly back into a community's dominant value systems and, ultimately, its social and political organization. This perspective has opened up the possibility of reading 'environmental' and other culturally specific values from media texts.

But it is a relatively small step to reconceptualize 'context' as including 'environment', even in the senses of 'natural' and 'global' environment. Ultimately, then, 'environment' is more than just another 'social issue' that can be addressed by linguistics. Linguistic theories of context may help us understand how the concept of 'the [natural] environment' has traditionally been interpreted, and how it may usefully be re-interpreted.

For example, the relationship between linguistic behaviour and context has traditionally been one of 'figure' to 'ground' (Goodwin and Duranti, 1992; Hanks, 1992). The analysis of language and communicative behaviour has traditionally entailed a focal concern with the structural and semantic properties of the behaviour itself (the figure), and an almost universal under-attentiveness to context (the ground). This abstracting of behaviour from context has appeared natural, for example because the structural analysis of language-as-code is analytically more secure than any form of structural analysis of context. *Human action more generally* seems similarly to offer itself for analysis independently of context, in that we can characterize our lived lives as a series of internally structured local activities – going to work, doing leisure, having relationships, etc. – each with their own event structure.

Yet a current consensus amongst context theorists is in challenging the appropriateness of the figure–ground relationship. Language, that is, can no longer be said to exist 'within' a context, from which it is theoretically independent: these are the 'increasingly more interactive and dialogically conceived notions' of context that Goodwin and Duranti refer to (1992: 1). Meaning derives from the interplay between language texts and context, taken to include other textualized meanings. This is Volosinov/Bakhtin's principle of 'dialogic' utterance and 'multiple voicing' (e.g. Bakhtin, 1981). Texts find their meanings in and in relation to the contextual meanings that comprise societies, cultures and ideologies, just as those contexts are continually being confirmed, challenged or refined in the generation and reception of new texts. It follows that language, and in fact all social action, is a complex of processes that, inescapably, dialogically implicates and actively valorizes the natural environment. Environmentalism, in any and all of its guises, must look to language for its constitutive core. As linguists, we

1. The published rationale for the symposium referenced as Alexander et al. (1993) was given as follows: 'Areas of work to be presented and discussed include questions such as: How are ecological problems articulated in texts? What do we learn about ecological problems through various texts? Which syntactic, semantic and pragmatic means are used in communication about ecological matters in different contexts? Which linguistic methods are appropriate for this kind of language research? Which theories of language are most adequate for investigation of the ecological problematic?' Many writers involved in those proceedings acknowledged Michael Halliday's seminal contribution to this developing field in his keynote address at AILA (The International Association of Applied Linguistics) 1990 (Halliday, 1990).
2. We are very grateful to Pam Perkins who collated and annotated the media print sample, and contributed important insights to our analyses. The sample was compiled under the guidance of Allan Bell, who has been involved in all aspects of this phase of the study. Chris Lane and Janet Holmes have also made important formative inputs into this work.
3. An explicit aim of our future work is to contrast northern and southern hemisphere mediated and lay discourses about the environment.
4. Giddens's position is: 'The reflexive project of the self, which consists in the sustaining of coherent, yet continuously revised, biographical narratives, takes place in the context of multiple choice as filtered through abstract systems. In modern social life, the notion of lifestyle takes on a particular significance. The more tradition loses its hold, and the more daily life is reconstituted in terms of the dialectical interplay of the local and the global, the more individuals are forced to negotiate lifestyle choices among a diversity of options' (1991: 5).

Figures of Speech: Figurative Expressions and the Management of Topic Transition in Conversation

Paul Drew and Elizabeth Holt

One feature of conversation that contributes to its colloquial character is that, from time to time, speakers use certain forms of idiomatic expressions which may be regarded as FIGURES OF SPEECH. The following fragment from a telephone conversation illustrates this kind of linguistic object, the use of which we shall examine in this article.

(1) [Field:X:(C):1:1:1:6]

	Lesley:	.hh He wz a (.).p a buyer for the hoh- i- the only horse hair fact'ry left in England.
	Mum:	Good gracious,
		(0.3)
	Lesley:	And he wz their buyer,
		(.)
	Mum:	Hm:::
	Lesley:	.t
	Mum:	Hm:.
→	Lesley:	So he had a good inni:ngs did [n't he.
	Mum:	[I should say so:

Just before this fragment, Lesley has told her mother about the death, at the age of 79, of a mutual acquaintance. Here, instead of describing this man's long and full life in some literal fashion, she chooses instead the figurative expression (arrowed turn) "he had a good innings" – an image derived from the game of cricket.

The matter of a speaker's selecting a figurative expression, in preference to a more literal way of saying or describing something, is particularly visible when the speaker changes what was going to be a literal or non-idiomatic form and replaces it with a figurative expression, as illustrated in the self-repairs (arrowed) in the following extracts.

(2) [US:20]

Vic: Dey took their business fuh three days en ney
→ came back en, took care a' her dey gi– .hh
→ showered her with, whatever kinda gifts they wanted.
(0.7)
Vic: In her mi:nd stuck the showering of gifts.

(3) [Field: 86A] (Lesley has called her husband, Skip, at work, to tell him that the police have been round to investigate the burglary of their home the previous night)

Lesley: An they said OH YOU'RE VERY PRECISE when I said what ti:me (.) I thought it was,
(0.2)
Lesley: BU' FORTunately I'd had a peep at the clo:ck .hh
(1.2)
Skip: Well I– I knew about what time it was I knew it was about
(1.1)
Skip: Ten– about uh (ten– say) between ten and twenty pa::st.
(0.2)
Skip: (Obviously knew)
Lesley: .hhh Well I said it was about three twenty one I
→ think because by the time we– (.) we– the penny
→ had dropped an' we got up again that was three twenty fi::ve,

In 2, it looks as though Vic had been going to say that, as a way of "taking care of her," they "give" her (gifts). However, he cuts off "gi–(ve)" and replaces it with the figurative "showered her with . . . gifts." In 3, Lesley alters what she had been going to say at "because by the time we–"; judging from the way she continues her turn, that projects either "by the time we realized . . ." or "by the time we got up again." In any case, she changes it to "by the time . . . the penny had dropped," thereby either replacing "realized" with "the penny had dropped" or inserting that expression into an otherwise non-idiomatic account. In each case, the speaker starts to produce a literal version of something, but then does a self-repair which substitutes that version (or possibly, in 3, adds to it) with a figurative description.

In such cases, a speaker's SELECTION of a figurative expression is particularly exposed in self-repairs involving the substitution of a figurative for a more literal description. But it is generally the case that the use of figurative expressions in conversation is a property of the DESIGN of turns at talk. As with any other feature or component of turn design – lexical, syntactic, intonational, or prosodic – a figurative expression may be selected as part of the way in which a turn at talk

sequential properties of turns that have the selection of a figurative expression as one of their design features.[1]

Parenthetically, we should note that we are taking a somewhat different direction of inquiry than that followed by most research in this field. Very broadly, research into the whole range of idiomatic language (including not only figurative expressions but also proverbs, oxymora, "syntactic idioms" etc.) has been directed toward uncovering the following:

(a) The grammatical characteristics of, and structures underlying, idiomatic constructions (Chafe 1968, Weinreich 1969, Fillmore et al. 1988, Abeille 1995, Nicholas 1995, Schenk 1995).
(b) The semantic interpretative competencies and cognitive processing involved in their comprehension (Bobrow& Bell 1973, Gibbs 1980, Estill&Kemper 1982, Gibbs 1987, Popiel & McRae 1988, Schraw et al. 1988, Schweigert & Moates 1988, Gibbs & Kearney 1994).[2]
(c) The connections between syntactic properties of idioms and their interpretation (e.g. Gibbs & Nayak 1989).

Across all these fields of research in linguistics and (psycho) linguistics, the data or test materials are almost invariably instances of idioms abstracted from any actual dialogic context (indeed, much of the research, especially in the area of idiom comprehension, is experimental). In short, it appears that there has been little systematic investigation into the use of idioms in naturally occurring dialog, at least, in English.[3]

By contrast, we are inquiring here into the interactional role that figurative expressions play when they are used in conversation. Figurative expressions are a feature of the design of turns at talk: They are selected as part of the way turns are constructed so as to "fit" with, or play a coherent interactional role in, the sequences in which those turns are produced. Thus the components of a turn's construction, at whatever level of linguistic production,[4] are connected with the activity that the turn is being designed to perform in the unfolding interactional sequence of which it is a part, and to the further development of which it contributes. That is, the most proximate context in which a turn is produced, and in which it is recognizably coherent, is its SEQUENTIAL context. Hence we treat figurative expressions as one of those linguistic components of turn design through which speakers manage, collaboratively, certain sequentially embedded activities. We explore here whether an account can be given of the occasions when speakers employ figurative expressions, in terms of their SEQUENTIAL DISTRIBUTION or ENVIRONMENTS. Therefore, rather than seeking any kind of "cognitive processing" account for speakers' selections of figurative expressions in speech, we can regard using figurative expressions as a systematic, socially organized practice for producing certain kinds of (verbal) conduct – as, indeed, are all components of the design of turns at talk. Just what that organized practice, and what activities figurative expressions may be employed to perform in conversation, is the focus of this inquiry.

By "figurative expressions" we mean those conventionalized complex units

that are phrasal (e.g. "stark naked," "by and large," "zero tolerance," "window of opportunity") or even lexical.[5] (For an overview, see the introduction to Everaert et al. 1995.) In common with these other idiomatic complex units, figures of speech are formulaic or relatively "fixed" in composition – syntactically, lexically, and sometimes intonationally.[6] Hence, like words, they may be learned separately as single units of the language (Fillmore et al. 1988; but for a different view, see Gibbs & Nayak 1989). Generally, they are semantically opaque; their meanings are not the same as, or cannot be found from, the meanings of their constituent words (Bolinger 1976, Weinreich 1969).[7] This creates the distinction between their literal and figurative meanings – a distinction which, of course, is the starting point of much of the research literature cited above on the recognition and comprehension of idioms. At any rate, the conveyed meanings of such expressions are not literal but metaphorical, as is illustrated by "had a good innings," "shower with gifts," and "the penny had dropped," in exx. 1, 2, and 3 respectively. The metaphorical character of figurative expressions is therefore another property that distinguishes them from some other routinized or relatively fixed expressions (including "automatic language," Van Lancker & Kempler 1987) which are part of the idiolect of a language.

Our primary data are a corpus of telephone calls recorded by a British family at intervals over a three-year period, consisting of approximately 15 hours of telephone conversations between family members, between members of the family and their friends, and occasionally with colleagues.[8] This corpus was supplemented by various other corpora of American and British telephone calls, amounting to about 20 hours of recorded and transcribed conversations (for the transcription conventions, see Atkinson & Heritage 1984). From these data a sample collection was made of approximately 200 instances of speakers using figurative expressions.

Figurative Expressions in Topic Termination Sequences

An initial and fundamental step toward identifying the patterns or organizations associated with a linguistic phenomenon is to see whether that phenomenon has any discernible distribution in talk. While the sense of, or basis for, "distributionalizing a phenomenon" can vary according to one's analytic perspective, here we mean determining whether the phenomenon has any regular or recurrent position in sequences of talk (following the sense of "distributionalize" used by Sacks 1992:2.422). When we adopted this analytic way of examining the collection of figurative expressions in our corpus, a very striking pattern emerged. In this pattern, following a turn in which a speaker produces a figurative expression, the co-participants briefly agree with one another, after which one or the other introduces a new topic of conversation.[9] Hence it appears that the use of a figurative expression is associated with topic termination and transition to a new/next topic.

To illustrate the principal features of this [illegible]

expression "had a good innings" – though now considering the turn in which that was produced in relation to more of the surrounding talk. Lesley and her mother had been talking, for some minutes before this extract, about the illnesses (and possibly "final" illnesses) of some elderly friends.

(4) [Field:X:(C):1:1:1:6]

1	Lesley:	I don't know'f you remember Missiz Milbeck th't
2		use to go to chu:rch.
3		(0.8)
4	Mum:	(Mi[ssiz)
5	Lesley:	[Uh: uh- he wz the vicar's ward'n anyway he
6		die:d suddenly this week .hhh and he wz still
7		wo:rking.
8		(0.3)
9	Mum:	([ )
10	Lesley:	[He was seventy ni:ne,
11		(0.3)
12	Mum:	My: wo:rd?
13		(0.2)
14	Lesley:	Y[e:s he: was um
15	Mum:	[(You've got s'm rea:l) workers down the:re,
16		heh
17	Lesley:	.hhh He wz a p– uh: Ye:s. Indee:d .hh He wz a
18		(0.2) .p a buyer for the hoh– i– the
19		only horse hair fact'ry left in England.
20	Mum:	Good gracious.
21		(0.3)
22	Lesley:	And he wz their buyer,
23		(.)
24	Mum:	Hm:::
25	Lesley:	.t
26	Mum:	Hm:.
27	Lesley:	So he had a good inni:ngs did[n't he.
28	Mum:	[I should say so:
29		Ye:s.
30		(0.2)
31	Mum:	Marvellous
32	Lesley:	.tk.hhhh Anyway we had a very good evening o:n
33		Saturda:y.
34		(.)
35	Mum:	Ye:s?
36	Lesley:	We went to North Cadbury: an' Gordon came too ...

The kind of topic transition with which the production of a figurative expression is associated in our corpus occurs in 4:27–33. In response to Lesley's producing a figurative version of this acquaintance's having lived a long and full life (4:27), Mum assents very positively to that assessment, "I should say so: Ye:s. (0.2) Marvellous" (4:28–31). After this, Lesley introduces what is evidently a quite

Before considering in more detail some of the features of that topic transition sequence, and the role within it of the use of a figurative expression, we present further instances of this pattern of topic transition. To highlight the pattern we are identifying, the turn in which one speaker produces a figurative expression is marked by arrow 1; the turn(s) in which the recipient briefly agrees or concurs with the idiomatic assessment (sometimes followed by the speaker who produced that assessment) is shown as arrow 2; and then the turn in which one or the other speaker introduces a new topic is shown as arrow 3.

(5) [Field:J86:1:4:6]

Gwen: You know it wz: so lovely an' everything[y know

2	→	Lesley:	Yes: that's ri:ght,=
2	→	Robbie:	=Ye[s.
3	→	Lesley:	[Yes. Ye[h .tch .hhhhhh. Wuh-
3	→	Robbie:	[Ok a y, W'ddiyou wanna talk t' me abou(h)[t
3	→	Lesley:	[Eh: WE:ll eh WHAT I RANG up about was . . . .

These cases illustrate clearly a sequential pattern in which a figurative expression is produced in a turn that results in the termination of a current topic. That termination is managed by the participants in a brief exchange of agreements, followed by a transition to a new/next topic. From this pattern it appears that figurative expressions are associated with an organization for closing a current topic of talk and moving on to a next topic. Several components of this organization for topic termination/transition will be examined here in closer detail: (i) the character of figurative expressions in this position as summaries of the current topic; (ii) the sequence through which topic transition is managed; and (iii) the ways in which speakers construct a next turn as introducing a "new" topic.

Figurative Expressions as Summaries

At the point where each of extracts 4–10 begins, a speaker is telling the co-participant about something: about the death of a mutual friend in 4, the home of friends who have just separated in 5, the troubled life of Robert Maxwell in 6, the car of a friend in 7, and so forth. The speakers are reporting empirical facts or details; and in each case, the one doing the reporting is the speaker who produces the turn in which a figurative expression is used. Thus, just before ex. 6, Steven and Lesley have been talking about the famous (perhaps infamous) British publisher Robert Maxwell, touching among other things on the rumor that he has a son who is so severely disabled that he lives permanently in hospital, and on Maxwell's risky business dealings (data not shown). Here, at the beginning of the extract, Steven tells Lesley about the death of Maxwell's parents when he was young. He then produces a figurative summary of these tragic circumstances and allegedly nefarious dealings: "so eez had quite a– checkered career already–." The character of this as a summary is perhaps particularly evident, in that this is designed as an upshot of the prior detailing, signaled by "so . . ." (see also 4:27).

In 9, Ann has been telling Jenny about her difficulties cleaning her double-glazed windows, concluding her account of these difficulties with "you can't wi:n really." In each case, the empirical detailing or reporting is brought to a conclusion with a figurative expression which somehow summarizes what the speaker has been reporting.

Used in this way, these figurative expressions serve as summary assessments of what has been reported – assessments being generic forms of summaries (Jefferson 1984:211). They are "assessments" in that these expressions convey a certain positive or negative value to be attached to the circumstances that the speaker has been describing, including optimism ("it'll iron itself out") or resignation ("you can't win"). In producing figurative assessments, speakers move away from, or step out of, their report of empirical details. In ex. 4, when Lesley uses the idiomatic assessment "he had a good innings," she is not now adding to the list of facts about the man that made his life, and death, notable. The figurative expressions do not themselves include further information about the person who died in 4, nor about the house of the friends who have separated in 5, Maxwell's early life in 6, the friend's car in 7, or the economic difficulties facing the P's industry in 8. In producing a figurative expression, the speakers are becoming empirically disengaged. They are not contributing further details but rather are assessing and summarizing the previously reported empirical information. Employing a figurative expression can be a device to summarize a topic, and thereby to draw it to a conclusion.

This disengagement from empirical details, managed through producing a figurative assessment, is highlighted by the way in which that assessment is not connected particularly or exclusively to its contiguously prior turn. Rather, the expression relates back over much of the prior talk/details, to assess aspects of the topic that have been talked about in earlier turns; indeed, the expression may refer back to and summarize or assess circumstances talked about over the whole of that topic. In ex. 4, when Lesley says that he "had a good innings," she is not merely summarizing the information in her immediately prior turns. The idiom plainly does not refer particularly to the immediately prior information that, when the friend died, he was a buyer for the only horse-hair factory in England. Instead, it refers back over the whole topic, including the details in each of Lesley's turns in the extract – that he was the vicar's warden, that he was still working when he died, and that he died aged 79. By connecting back beyond the adjacently prior turn/information, the expression "had a good innings" summarizes the information across the entire prior announcement/telling, and it thereby begins to detach the talk from an item-by-item sequential development of the topic.

Although the data are too extensive to explicate this in detail, this is also true of the other examples cited above. In ex. 5, Gwen and Lesley have been discussing the breakup of the marriage of people they know, in the course of which Gwen mentioned how lovely and full of character this couple's home was (see Gwen's first two turns). Again, "coming to the end of her tether" is a

we have already mentioned that Lesley and Steven were previously discussing Maxwell's business dealings and the rumor concerning his disabled son; hence, when Steven says that Maxwell has had "quite a – checkered career," he can be heard as referring back to and summarizing all those troubled circumstances, as well as the immediately prior information that both Maxwell's parents were killed by the Nazis. In 10, Robbie's figurative summary "take with a dollop of salt" refers back over much of the very lengthy prior topic, concerning her experiences teaching at a school at which Lesley has also taught. Thus a figurative summary can serve as a device to close down a topic by connecting back beyond the immediately prior turn or information, often to the beginning of the topic. A figurative expression has the property of being able to summarize and assess more than whatever is referred to in its contiguous prior turn; in this way it can detach the talk from the progressive development of a "next item" of information relevant to an ongoing topic.

There are, of course, other means besides figurative assessments by which a current topic can be brought to a close; e.g., repetition is commonly associated with terminating a topic. Moreover, there are other kinds of assessments besides figurative expressions with which a speaker can summarize the talk thus far. Hence the account we are developing here is not a general account for the termination of topics: That would require an exploration of the range of techniques by which speakers can summarize and disengage from what they have been talking about (cf. Maynard 1980, Button 1990). Our focus here is to account for a systematic position in which speakers recurrently employ figurative expressions – namely, that they do so in summarizing a topic, and thereby draw it to a close.

It is worth noticing, however, that figurative expressions may have a special place among the techniques available for summarizing and concluding a topic. First, it is striking that they are commonly, indeed overwhelmingly, employed by speakers to summarize what they themselves have been telling/reporting, rather than what the other, their co-participant, has been telling. They are, then, "self-summaries": summaries of one's own talk/topic, and not of the other's talk.[10] Furthermore, their use as generic assessments detached from empirical particulars may give them a certain "power" in summarizing and closing topics – e.g., in contrast to the use of repetitions or other forms of assessment, which are more closely tied to prior empirical details (Pomerantz 1984a). A glimpse of this can be seen in 4:17–27, where Lesley initially repeats one of the details concerning the friend's career. After Mum's initial response to the details of this man's employment, and a pause (4:20–21), Lesley repeats that "he wz their buyer" (4:22); following this, there is something of a hiatus – a slight pause – before Mum does repeated ruminative acknowledgements. In outline, it appears very much as though the topic termination is imminent before Lesley's figurative summary in 4:27. It seems that Lesley is looking for a way to close the topic, tries with a repetition that does not quite succeed (in repeating "Hm:::," Mum doesn't find a way to move out of that topic and onto a next), and then tries again with a "stronger" closing move by producing the figurative

they fail in an initial attempt at topic closure, in ex. 4 through repetition. This suggests that figurative expressions may have greater "power" in drawing topics to a conclusion than other closing techniques such as repetition or (non-figurative) assessments; this represents a rather different approach to the "vividness" (Chafe 1968) or "intensity" (Labov 1984) of idiomatic and figurative expressions.

The Topic Transition Sequence

We outlined in the previous section the properties that are associated with the summary status of figurative expressions, and which make them objects for concluding a topic. The key evidence for their terminal character, however, is that co-participants treat these figurative turns as terminal, as bringing the topics to an end. This is manifest in the brief turns that come after the figurative turn and before the introduction of the new topic. In these turns, the co-participants manifestly decline to develop the topic further. Consider, for example, the sequence in ex. 9, following Ann's figurative summary of the trouble she is having cleaning double-glazed windows.

(from 9)

Ann:	You can't wi:n really.
Jenny:	No::.
	(.)
Jenny:	Oh no.
	(0.2)
Ann:	No.
	(0.3)
Ann:	Have you been to school this morning.

The recipient's (Jenny's) response to the summary "You can't wi:n really" is to agree: "No::. (.) Oh no." Ann, in turn, does a token reciprocal agreement or confirmation, "No", after which she introduces a new topic. The recipient had the opportunity, in the slot after the figurative turn, to continue talking about the topic of Ann's difficulties cleaning windows; she could have developed or elaborated that topic in a variety of ways. Instead, she produces a near-minimal unelaborated agreement; in doing so, the recipient declines the opportunity to develop that topic any further. Her response is topically fitted, but it does not offer any further resources to talk more about that topic. Hence she begins the disengagement from and closure of the current topic.

When in response Ann produces a (nearly) identical token, she likewise declines to take the opportunity in that slot to say any more about the previous topic. She thereby accepts or confirms the prior move by Jenny to disengage from the current topic; as a result, they are now collaboratively moving toward the closure of that topic. That closure is finally sealed by Ann's introduction of

sequence through which co-participants collaboratively disengage from a current topic and move to a next. Two further illustrations of that sequence follow.

(from 6)

1	→	Steven:	He's had k– eez a Czechoslovakian Jew so[eez
		Lesley:	[Yes
1	→	Steven:	had quite a– checkered career already=
		Lesley:	=eh heh
2	→	Steven:	.hhhh [Yeah
2	→	Lesley:	[Ye:h.
			(0.2)
3	→	Lesley:	.hhh Alri:ght. Well I':ll get my husband then: to get in touch with the address. =

(from 10)

1	→	Robbie:	B't take this with a dollop 'v salt you kno::w I'm– I'm ba:sic'ly quite happy b't quite relieved it's the sheer organization 'n getting all, everything done in th' da:y.
2	→	Lesley:	Yes: that's ri:ght,=
2	→	Robbie:	=Ye[s.
3	→	Lesley:	[Yes. Ye [h .tch .hhhhhh Wuh–
3	→	Robbie:	[O k a y, W'ddiyou wanna talk t' me abou(h)t

In each of these fragments, the turn in which one speaker produces a figurative summary (arrow 1) is followed by reciprocal and nearly identical "agreements" by both speakers (arrow 2);[12] after this, one of them introduces a new topic (arrow 3). "Agreement" is meant broadly, to include topically fitted or appropriate responses such as the sympathy tokens ("Oh what a shame") with which Lesley responds and Gwen reciprocates in 5, and the sympathetic or affiliative manner in which M responds to P's report of her troubles in 8. Agreement, sympathy, or affiliation may describe the particular response by a recipient to the figurative summary in question; in any case, contiguity or alignment between the co-participants is expressed in some way (i.e. through the minimal character of the agreements, typically "Yes" or some such object) so as to foreclose further talk about that topic and to enable the speakers to move on to a next topic.

Thus the topic transition sequence associated with figurative summaries (which may apply more generally to topic transitions following other forms of topical summary/closure) exhibits a kind of standard form, which can be represented schematically as:

1	→	Speaker A:	Figurative summary
2	→	Speaker B:	Agreement (or other expression of contiguity)
3	→	Speaker A:	Agreement/confirmation
4	→	Speaker A/B:	Introduces next topic

This can be considered a "standard sequence" for topical closure and transition to a next topic, after a topical summary – the production of a figurative

elided – e.g., instead of producing a further agreement/confirmation token in response to recipient's agreement, speaker A (the one who produced the figurative summary) moves straight to the introduction of a new topic, as in ex. 8.

(from 8)
1 → P: .hhh But I *think* it'll iron itself out,
2 → M: I sure hope [so.
4 → P: [I'll see you Tuesday.

In other cases, speaker B (the recipient of the figurative summary) may produce a minimal agreement token and then open a new topic right away, without waiting for any further token from speaker A. In either case, the production of a figurative summary (arrow 1) is responded to by a minimal form of concurrence by the recipient (arrow 2), which is followed by the introduction of a new topic (arrow 4). This results in an attenuated form of the standard sequence, through the elision of step 3 in the schematic model above. This is evidence that the recipient's topically disengaged minimal concurrence with the prior speaker's production of the figurative summary is sufficient to give either speaker the opportunity to embark on a new topic.

The standard transition sequence that we have described represents the sequence in which co-participants collaborate to close one topic of conversation and begin a next topic. The significance of this sequence is that it reflects – or, more properly, is the product of – the fact that co-participants regularly and systematically orient to the summary and closing implications of the figurative expression in the prior turn. That orientation is displayed in the way that both speakers systematically withhold any further topical development or elaboration. By producing minimal agreements (or other contiguous actions), recipients display their recognition that the idiomatic turn is somehow sufficient to terminate that topic; their responses are therefore designed not to say any more about that topic, but rather to exit from it. Subsequently, speaker A collaborates in the closure, either through further minimal agreements (frequently repetitions of speaker B's response), or by eliding the sequence and going straight to a next topic. Speaker A thereby concurs with speaker B's understanding that the figurative turn was designed to conclude and terminate the prior topic.

Thus the standard topic transition sequence is evidence of a symmetry between speakers' production of figurative idioms and their interpretation by recipients – where "interpretation" refers not to what the expressions themselves "mean" (in the way that psycholinguists have investigated the "interpretation" of idioms), but to the conversational activity they perform (topical closing). This symmetry, or mutual orientation to the topically terminal implicativeness of a turn in which a figurative expression has been produced, is generally embedded in this topic transition sequence. It is particularly visible, however, in cases where the co-participants SIMULTANEOUSLY and INDEPENDENTLY move to step 4 of the sequence, the opening of a next topic. This happens in ex. 10. Recall that Robbie summarizes the difficulties she's been having at the school where she teaches, speaking figuratively: "B't take this with a dollop 'v salt you kno::w".[13] Lesley

are characteristic of the standard transition sequence, steps 2 and 3. After this, each of them simultaneously changes topic – at least, it appears that Lesley is about to, when she drops out in response to the overlapping, topically initial enquiry from Robbie. In her arrowed turn, Lesley does an emphatic inbreath (characteristic of some disjunctive next move), followed by what is clearly recognizable as the beginning of "What" ("Wuh–"), which is almost certainly the start of "What I called about was . . ." But her move to that next topic coincides with Robbie (in her arrowed turn) simultaneously enquiring: "Okay, W'ddiyou wanna talk t' me abou-(h)t" (which also begins with increased amplitude). Hence, Lesley and Robbie simultaneously perform the same action: moving to a new next topic. As it happens, they are probably also both orienting to the relevance of not just any new topic, but specifically the matter of why Lesley has telephoned (this occurs about 15 minutes into the call); i.e., it appears that Lesley was about to announce why she called, at the same time as Robbie asks why she called. At any rate, they are simultaneously treating this as a place where it is relevant to introduce a new topic.

The significance of their simultaneous move to a new topic is that it provides evidence for the shared intersubjective "reality" of this position (to post the production of a figurative idiom) as a point where it is appropriate to change topic. Instances in which both participants embark on the same action simultaneously (in overlap) serve as particularly strong evidence that an observable pattern is the product of a shared understanding (which, of course, need not be conscious) – in this context, that figurative expressions can be used to summarize and close down topics, and thereby to occasion a move to next topics. For this reason, we might regard the use of figurative expressions as an intersubjectively available practice or device for topic termination.

Topic Transition: Introducing a New Topic

Recall that we are describing the components of the sequence in which the use of a figurative expression results in the termination of that topic and the transition to a new topic. We have discussed how idioms can work to summarize the preceding talk/topic; and we have outlined the transition sequence in which participants collaboratively disengage themselves from a prior topic. The final component – the introduction of a next/new topic – is of central importance: It is only when participants move to a new topic that what has been an incipient transition sequence, until that point, becomes fully realized or ratified as a termination of the prior topic and a transition to a next topic.

We have been relying until now on an intuitive, but nonetheless robust, sense of how one participant or the other introduces a next or new topic. For example, in 10, the topic that Robbie draws to a conclusion with the figurative expression "with a dollop 'v salt" has been her teaching experiences. As we have seen, she then changes the subject by inquiring what Lesley has telephoned her about –

of a mutual acquaintance. When Lesley subsequently announces "Anyway we had a very good evening on Saturda:y," that is rather clearly a change of topic. In each of exx. 4–10, the change of topic is similarly "obvious."

The difficulties associated with defining what constitutes a topic, and with specifying analytically the various referential and other linguistic means (shared reference, propositional content, pro-terming, anaphora and deixis, lexical repetition etc.) through which topical connections and hence discourse cohesion are managed, are well enough known not to need recapitulation here (but cf. Li 1976, Schank 1977, Maynard 1980, Brown & Yule 1983 chap. 3, Levinson 1983: 312–16, Schegloff 1990). But note that one important respect in which the concept of topic may be difficult to apply to the analysis of natural discourse is the problem of identifying topical boundaries. Generally, one topic of conversation merges almost imperceptibly into the next, in a seamless "stepwise" progression (Jefferson 1984, Sacks 1992:2.291–302). Hence the precise points of topic shifts or changes, and how such shifts were managed, are often analytically opaque. Of course, if one cannot identify the boundaries of particular topics, then it is difficult to offer an account of the linguistic basis for topical coherence, either in principle or for actual topics.

The changes of topic that follow figurative summaries of the prior topic in exx. 4–10 are not, however, managed in a stepwise fashion. They are "obvious" changes, not only in the intuitive sense of their involving a dramatic change in reference or content, but more particularly because, in most cases, speakers mark that they are about to change the topic of conversation. They do so, generally, in the design of the prefatory (turn-initial) components/features of the turn in which they introduce the new topic (arrowed in the following fragments).

(from 4)
Mum: Marvellous.
→ Lesley: .tk.hhhh Anyway we had a very good evening on Saturda:y. ...

(from #6)
Steven: .hhhh [Yeah
Lesley: [Ye:h.
(0.2)
→ Lesley: .hhh Alri:ght. Well I':ll get my husband then: to get in touch with the address.

(from 10)
Lesley: Yes: that's ri:ght,=
Robbie: =Ye[s.
→ Lesley: [Yes. Ye[h .tch .hhhhhh Wuh–
→ Robbie: [O k a y, W'ddiyou wanna talk t' me abou(h)t

(11) [Field:88U:1:9:11] (Simplified)
Dana: I can't really say hey Mum I've got prob ['ms
Gordon: [hhh ehhh heh heh
Dana: She'd run [a mi:le.](0.3) [( )
Gordon: [hhYhhhehhhh]h[hesssss

Dana: There you go:.
(0.9)
→ Dana: We↑:ll- (0.4) uh::m,hh I(h) can't think 'v anything else u- rea::lly exciting to say?

When, for example, Lesley announces in 4 that she and her husband "had a very good evening on Saturda:y," she marks this as a change to a new topic by beginning her turn with an audible inbreath; she then produces a prefatory discontinuity marker "Anyway," the beginning of which is produced with increased amplitude or stress. Such prefatory components as "Anyway", "Alright" (6), "Well" (11), "Okay" (10), either alone or in combination ("But anyway" in 7, "Alright well" in 6), are disjunctive in that they work to disengage the forthcoming turn from being tied or connected to, or coherent with, its prior turn; i.e., such components are produced to disengage this next turn, topically, from its prior. Hence, by producing such components – often in conjunction with some combination of audible inbreaths and raised amplitude – the speakers in such cases signal that what they are about to say will be unconnected with what they have previously been discussing, and hence that they are about to introduce a new topic.

This is clear evidence that participants themselves treat what they are doing as disengaging from the prior topic, and as introducing a new and quite different topic. In most instances in our collection of topical transitions following the use of a figurative idiom, the introduction of the new topic is signaled by (some combination of) increased amplitude, raised pitch/amplitude, and self-editing or hesitancy (including inbreath) – and, most importantly, by those prefatory discontinuity markers that suspend the relevance of the prior topic. (That is, they instruct the co-participant not to try to look for any connection between what the two of them have just been speaking about, and what is about to be said.) Again, this serves as evidence that the production of a figurative expression, along with the sequence of brief agreements that a figurative turn generates, constitutes a shared practice for closing down a topic and moving on to a next topic: a practice to which participants mutually or intersubjectively orient in conversation.

Failure to Achieve Topical Closure

Some cases in our collection of figurative expressions did not run off in such a straightforward or tightly organized topic-termination/transition sequence. The topic being talked about did not end after, or in the close vicinity of, the production of a figurative summary. In particular, we have two types of cases in which a speaker's attempt to close a topic with a figurative expression did not result in closing that topic – instances that nevertheless relate to the topic termination pattern we have been describing. The first type involves instances where the expression itself happens to occasion further talk

Touched-off Topical Developments

Devices or practices in conversation do not work in an automatic or mechanistic fashion: The practices evident in conversational patterns are RESOURCES that enable speakers to engage, recurrently, in certain activities, using means by which those activities will be coherent, recognizable, and meaningful to co-participants. But the use of those resources DOES NOT DETERMINE the course of the interaction. At any point in an interaction, participants may orient to the possibilities that a conversational practice occasions; nevertheless, they are not obliged or constrained to follow the sequential track implicated in those possibilities. In short, they may choose to take a different direction – to suspend the sequential track implicated in an object and instead take a different track. So it is with figurative expressions and the topically terminal possibility their use occasions. In the first set of cases in which the use of a figurative summary does not result in topic termination and transition, it appears that one speaker finds something further connected to or touched off by the figurative expression – so that the talk moves along from it in a more "step-wise" fashion, characteristic of topical development in conversation.

(12) [Field:X(C):2:1:2:7]

	Joan:	We 'aven't even bought a Christmas tree–: we've dragged an old one down that Kenneth use to 'ave in iz bedroom.[.hh
	Lesley:	[ihYe[:s:.
	Joan:	[An o:ld (0.3) sorta make believe one. You[know, .hh[An' made do with=
	Lesley:	[Ye:s, [yes.
1 →	Joan:	=tha:t. We're 'affing to really (.) tighten our
1 →		(0.7) belts.
2 & 3 →	Lesley:	ihYes well (0.3) so are we:. Because uh (.) it seems to me everybody else seems t' be doing so we::ll . .((Continues about her husband's doing badly because "nobody's buying anything for agriculture"))

Prior to this extract, Joan has been telling Lesley about the financial difficulties her family faces because of her husband's reduced income, and the economies they are having to make as a consequence – economies which she details, then summarizes figuratively (arrow 1). Lesley responds to this figurative summary, first by doing a minimal acknowledgment (arrow 2), and then (arrow 3) by continuing and developing the topic of reduced income. She shifts from talking about Joan's husband's income to her own family's difficulties in this respect: "well (0.3) so are we:" (i.e., "having to tighten our belts"). Thus there is something of a topical shift (in reference or focus) following Joan's figurative summary, but not the kind of clear and marked topic change characteristic of the sequences

in which the figurative expression is PIVOTAL: It is used to summarize the topic-thus-far, but it serves to touch off further related matters (see also Jefferson 1984:203).[14]

In such instances, the figurative expression might have terminated the topic about which the participants had been speaking. Recipients produce minimal agreement tokens to these summaries, and at this point they are potentially disengaged from that topic. However, one of them then finds in the figurative turn the opportunity to continue somewhat "on topic." Hence the figurative expressions in such cases bring the participants to a point at which they COULD HAVE disengaged from a previous topic and introduced a new topic; however, they DECLINE to do so, pulling back from disengagement and opting instead to continue the topic (albeit in a stepwise move). This, then, is the first way in which the standard sequence for closure and change of topic is not realized, because one participant chooses to exploit the topical opportunities that happen to be touched off by the figurative expression.

Disagreement, Disaffiliation, and Multiple Figurative Idioms

The second type of case in which the production of a figurative summary does not result in topic termination and transition involves some manifest lack of accord, affiliation, or agreement between the participants. Recall that the standard sequence described above is characterized by agreement or a measure of accord between them. In exx. 1 and 4–11, the recipient of the turn in which a figurative expression has been produced (speaker B in the schematic model) concurs with speaker A's figurative summary assessment. These agreements may take quite minimal forms (e.g. "Yes"; or "No" where appropriate, as in 9, see Jefferson 1994); or they may consist of appropriate expressions of sympathy (ex. 5), affiliation (exx. 8 and 10), etc. Whatever form of agreement or accord is used by the recipient, that speaker is in effect not only agreeing to the prior speaker's summary assessment: He or she is also implicitly accepting or confirming the prior speaker's move to close down the previous topic, by declining to take the opportunity in that slot to add anything or say anything more substantive about the matter being discussed. In other words, substantive agreement to the prior speaker's assessment also conveys a kind of "procedural" agreement, to draw that topic to an end. The recipient, in producing in this slot a minimal agreement (etc.), simultaneously concurs both with the prior speaker's assessment and with his or her move to close that topic (through the figurative summary). In this fashion, topics can be closed with agreement between the participants, through the relatively brief sequence outlined schematically above.[15]

To begin with, there are cases that seem to be a variant of the "standard" topic transition sequence.

(13) [Heritage:1:6:5–6] (Talking about clipping Mrs H's dog's claws)
Mrs. H: En that's botherin' me yo [u know I=
Ilene: [Yes

	Ilene:	Well that's it because you've o:nly just got to cut the tips off.
	Mrs. H:	Mm::.
		(.)
	Ilene:	You know you– you musn't cut it very far down,
	Mrs. H:	Yes.
	Ilene:	You musn't cut it onto the bla:ck because it's li:ke cutting into our own quick.
	Mrs. H:	Yes of course it ti[s.
1 →	Ilene:	[En they'll scream blue murder if you d(h)o th(h)a(h)[t
2 →	Mrs. H:	[hih hih Y(h)eh ah Well I've given it up as a bad job anywa[y.
	Ilene:	[eh heh heh hih
4 →	Mrs. H:	You kno:w, .h But l:look ah I wz (0.2) I'm havin:g sti:ll a big pro:blem with my: sister's ba:ck . . .

Just prior to this extract, Mrs. H. has been explaining to Ilene – who evidently breeds dogs, and whom Mrs. H. treats as something of an expert – that she has been having difficulties clipping her dog's claws. She has asked Ilene if she can recommend a reliable vet in the neighborhood who would do it for her. In broad terms, the extract resembles earlier cases: Speaker A (Ilene) produces a figurative summary (arrow 1, "they'll scream blue murder"), in response to which Mrs H. produces a minimal agreement form (arrow 2) and subsequently opens a new topic (arrow 4) – which happens to be her primary reason for calling, to ask Ilene's son, a physiotherapist, to treat her sister's back.

But in one respect, at least, this differs from earlier cases. Mrs. H's response to Ilene's production of a figurative expression is not restricted to concurring with Ilene's prior turn. Instead, she continues by adding to her agreement – done with a slight chuckle, reciprocating the chuckling laughter in Ilene's prior turn – a figure of speech of her own: "Well I've given it up as a bad job anyway." Certainly this does not extend the termination sequence very far; nevertheless. it results in a termination sequence which is not quite so attenuated as the "standard" sequence described above.

There is perhaps some slight difference between the positions of the co-participants at this point; the difference just surfaces when Mrs. H says, "I've given it up as a bad job anyway." At the beginning of this extract, Ilene has been asked to recommend a vet who might clip the dog's claws, and she is warning about the dangers of trying to clip them oneself – a danger she graphically summarizes figuratively. However, it appears that Mrs. H is displaying that she does not need to be advised not to attempt to clip them herself: She has already decided it's too difficult for her. Hence she is asking Ilene to recommend a vet (data not shown), and this is made explicit in her figurative summary. To a degree, then, Mrs. H RESISTS the advice implicit in Ilene's warning. (On the sensitivities of giving and receiving advice, and resistance to advice more generally, see Jefferson & Lee 1992, Heritage & Sefi 1992.) When Mrs. H adds that she has "given it up as a bad job anyway," she conveys that the warning, and

This kind of case, in which the recipient responds to her co-participant's figurative summary with one of her own, is fairly benign, in the sense that the difference in the positions expressed figuratively is perhaps only incipient; the difference does not approach overt disagreement or conflict (in this respect, note both Mrs. H's initial minimal agreement and her reciprocal chuckling). Significantly, the co-participants then move successfully to open a new topic.

In other instances, however, the differences between participants become more manifest at the interactional surface of the talk. Although one speaker may attempt to close the topic by producing a figurative summary, this is not accepted by the recipient. The recipient withholds the kinds of minimal agreement associated with the standard topic transition sequence, with the result that the co-participants do not achieve a topic termination and transition to next topic. Instead, the topic becomes protracted until further attempts are made to get the other's agreement, often through additional figurative summaries.

(14) [SBL:3:1:3–4] (Talking about asking the committee of a women's organization, of which Marylou and Claire are members, about showing some giftware at an event)

1	Marylou:	Maybe we sh' do tha:t.
2	Claire:	Mm hmg AN' AN' EH– A:SK how many: MIGHT BE
3		inTRESTED duh come BEC'Z IF YEE DON'T HAVE
4		ENOUGH THET'S INTERESTED W'L THEN (.) fooey
5		ON IT YIH [KNOW.
6	Marylou:	[We:ll I don't think it's a matter 'v it
7		having t' be right no:w. I think it's something
8		thet will snowba:ll.
9		(0.7)
10	Marylou:	Yihkno: [w?
11	Claire	[Mm::[h m .
12	Marylou:	[I think it's somethin' thet (.)
13		'll haftih be worked up
14		(1.6)
15	Marylou:	W[hich is alright en it can be done at
16	Claire	[(Weh–)
17	Marylou:	any ti:me en [I don't care whether a: lot 'v 'm
18	Claire:	[M m h m ?
19	Marylou:	come 'r not because
20		(0.7)
21	Marylou:	uh: if they don't wan' to.
22		(0.7)
23	Marylou:	But the thing i:s ah: the more the better,
24		(0.3)
25	Marylou:	Bu [t they don't haftuh (place order) in the club =
26	Claire:	[WE:LL YOU KNOW EVERY O N E A' T H E
27	Marylou:	=they c ['n u–have their own frie:nd [s (and uh)
28	Claire:	[Mh [.hhh Ever' one
29		a' those o:fficers yih know darn well's gonna

For several minutes before this, they have been talking about Marylou's wanting to show some giftware, which people might purchase, at an event being organized by a women's committee; but she's not sure of the propriety of suggesting it to them. Claire, another member of the committee, has been encouraging Marylou to ask them if they'd like a showing. The extract begins at the point where Marylou concludes (14:1) that "maybe we should" ask the committee about showing the giftware, with which Claire agrees. In a general sense, Claire is affiliating with Marylou; she is encouraging Marylou to go ahead and ask (the committee) "how many might be interested to come" to a sale of the giftware, on the grounds that she can be sure it will sell well (14:26, 28–30). There is, however, a difference between them at another level. Claire agrees that Marylou should ask the committee, in order to judge the likely interest in such a sale – her point evidently being that if there is insufficient interest, then "fooey ON IT" (14:3–5), presumably conveying that that would be the end of it. Marylou does not assent to this position, taking instead the position: "We:ll I don't think it's a matter 'v it having t' be right no:w." (lines 6–7). The difference between them is that, for Claire, it would be useful to get an indication of whether there is sufficient interest; but Marylou's position is that she could broach it with the committee in the hope that interest will build over time.

Marylou summarizes her position figuratively in 14:7–8, "I think it's something thet will snowba:ll." This does not elicit from Claire any form of agreement/concurrence; instead there is a pause (14:9), following which Marylou further solicits Claire's agreement, in response to which Claire produces only the non-committal token "Mm::hm." (14:11)– which manifestly withholds agreement. (Cf. Pomerantz 1984a; and for a further account of the difference between various response tokens, including "Mm hm", and their interactional and sequential implicativeness, see Gardner 1997.) This absence or withholding of agreement on the part of Claire to Marylou's proposed figurative summary results in the continuation of the topic. Specifically, Marylou pursues her case for believing that it does not matter if few are interested to begin with, because it's something that will gather momentum; in the course of this, Claire continues to withhold agreement (in 14:14, 18, 20, and possibly 22). Then (14:23) Marylou attempts another idiomatic summary, "But the thing i:s ah: the more the better." (For an account of such formal idioms, employing a general syntactic pattern – here, "the X-er the Y-er" – see Fillmore et al. 1988.) In continuing to explain the case for her position, Marylou can be seen to be pursuing Claire' s agreement (Pomerantz 1984b), culminating in her producing a second idiomatic summary.[9] This also fails to elicit Claire's agreement, and the matter remains unresolved, at least in this extract.

Earlier we noted that, in the standard topic transition sequence, there is a conjunction between (a) the recipient's agreement or concurrence with the prior speaker's figurative summary assessment, and (b) the recipient's accepting the opportunity to terminate that topic and move to a next. Recipients' minimal agreements in response to the figurative summaries (sympathy tokens, etc.) conjoin those substantive and procedural agreements. Ex. 14 begins to illustrate

production of a figurative expression does not result in topical closure and transition. Quite simply, the ABSENCE of topic closure is associated with a difference or disaffiliation between speakers – in effect, with a form of incipient disagreement. Such disagreement is not overtly expressed; rather, it is implicit in the absence of agreement in the recipient's response to the figurative summary. The prior speaker (the one who produced that summary) treats that absence as a withholding of agreement by the recipient, as Marylou does in 14; this results in a continuation of the topic and a pursuit of some resolution, perhaps through subsequent attempts to secure agreement. At any rate, when the production of a figurative summary of a topic fails to lead to the termination of that topic and the transition to a next, then the failure and its attendant topic continuation are associated with a lack of accord, and perhaps with incipient disagreement, between the participants.

A final instance rather dramatically illustrates this association between (a) the failure of a figurative summary to achieve topic closure, and (b) disaffiliation between speakers. It appears, from what has been said immediately before this extract, that Ilene's son is interested in buying a house which Raybee is selling. The estate agents (realtors) acting on Raybee's behalf have claimed that they introduced Ilene' s son to the property, through their having sent him details of the house (the documents referred to here) – a claim Ilene disputes. What hangs on this is whether Ilene's son is free to negotiate a price directly with Raybee, or whether he should instead negotiate with the agents ("Moss and Company").

(15) [Heritage:OI:1:2–3]

1	Raybee:	Well as far as I'm con:cer:ned i:t's: that um I'll

44 Ilene: Uh::m anywa::y uh:m, (0.2) Now he re:ckons thez
45 been another offer put i:n,
46 Ilene: I don't know whethuh that's true or not.

At the point where this extract begins, Raybee informs Ilene that she (Raybee) "has to" accept her agents' version, that they did send the necessary details to Ilene's son. While recognizing that Raybee is constrained to do this (15:4–5), Ilene very directly contests the agents'version (lines 5–11). She then summarizes figuratively the position in which she finds herself: "like banging yer head against a brick wa:ll" (15:14, 17). There is plainly no expression of concurrence or agreement by Raybee, who instead continues (in overlap, 15:17-18) to set out her position (15:18–29), which she then summarizes as being "left between th' devil'n deep blue sea:" (15:32–33). Although Ilene's response to that is initially a minimal token of concurrence, "Yeah" (15:38), Raybee happens to complete her summary turn in a fashion which Ilene treats as an opportunity to continue discussing the dispute between her and Raybee's agents. Neither of the figurative expressions with which each summarizes her position elicits the other's agreement or concurrence, and hence neither results in topical closure. The lack of affiliation between participants is quite manifest in the way that neither accedes to or concurs with the other's figurative summary of her position.

Parenthetically, we can discern from this a rather different account for the phenomenon of multiple idioms from that provided particularly by writers in stylistics. Noting that idioms often occur in flurries, and true to their dismissal of idioms as belonging to the unoriginal and therefore degraded forms of language (e.g. Black 1972:169), they have explained the occurrence of multiple idioms as [illegible] speaker uses an idiom, this infects

such "contamination," we can see in these cases that multiple (figurative) idioms may instead be associated with the pursuit by each speaker of her position – one with which her co-participant is reluctant to agree or concur. Hence one or the other may subsequently produce another (alternative) figurative summary of her position, possibly in an attempt to close the topic with some minimal agreement between them.

Such instances as these in exx. 13–15 illustrate the other major type of cases in our corpus, in which the production of a figurative assessment does not result in disengagement from and closure of a topic, with the introduction of a new topic. This occurs when there is some conflict or non-alignment between participants, manifest in part through the recipient's unwillingness to agree to – or perhaps more aptly, in 14–15, to concede to – the prior speaker's figurative assessment.

Conclusion

We should make it clear what we have not meant to claim in this account of the association between speakers' use of figurative expressions and topic termination/transition in conversation. First, we do not suggest that this is a general account of where or why figurative expressions are used; this was simply the most striking and recurrent pattern or organization evident in our corpus. Undoubtedly, there are other organizations that may be discovered through further research, and that may reveal other discourse or pragmatic functions of figures of speech. Second, we are even further from offering a general account of the way that speakers in conversation close one topic and move on to a next. It is clear that there are other devices or methods that speakers can use to summarize and bring a topic to a close, including repetition and other summary objects (some of which have been discussed in the literature; cf. Maynard 1980, Jefferson 1984, and Button 1990). In neither of these respects, then, are we proposing general accounts, if "general" is taken to mean that this is the only way that figurative expressions are used in conversation, or the only way that participants manage topical closure in conversation. It is, however, a general account in a different sense: It is an account which cuts across the other kinds of discourse variables with which it is thought figurative idioms are associated (in the very sparse research literature that is relevant here), such as their uses in narratives and stories, in talking about third parties (rather than about self or co-participant, Strassler 1982), or in complaining (Drew & Holt 1988).

The "logic" of our investigation has been to treat a linguistic object, with whatever syntactic and other linguistic properties such objects may possess, as an interactional device. That is, the properties of figurative expressions, particularly their non-empirical or "general" applicability, are a resource for managing certain interactional tasks in conversation. One of those tasks has been identified here, namely summarizing and drawing a topic to a close. The sequential pattern associated with the occurrence of figurative expressions is the product of the kind of resource that figures of speech

the sequential distribution of a linguistic object (here, figurative expressions), along with its distribution in topic termination and transition sequences, gives us access to the interactional functions of that object, i.e. to the kinds of interactional "problems" for which participants need to have solutions, and the way that this object is fitted to managing that task. Focusing on the sequential distribution of a linguistic object helps us, then, to appreciate its social interactional function(s).

Important questions about language processing and the cognitive correlates of such processing may need to be addressed through experimental studies of, e.g., the speed of recognition of the literal or figurative meaning of certain idiomatic expressions. But there are equally important questions concerning why speakers of a natural language use figurative idioms at all. We have suggested that we should investigate WHERE they are used, to determine the orderliness of their being used FROM TIME TO TIME (recalling our opening sentence). From this orderliness we can detect the social functions (rather than cognitive aspects) of the use of figures of speech in interaction. Finally, we have shown, through certain details of the topic termination and transition sequence, that participants themselves orient to these properties and functions of figurative expressions, even in instances where the production of a figurative expression fails to result in topical closure.

Notes

We have presented versions of this paper, over several years, to conferences and groups in many countries. We wish to thank all those, too numerous to list here, who have commented on this research, and who have made suggestions, observations etc. that have helped us clarify and refine or analysis. We are particularly indebted to Auli Hakulinen and Joerg Bergmann for their incisive and helpful comments.

1. In some cases shown in this paper, the turn in which a figurative expression occurs consists just of that expression, in a single unit turn, as here in ex. 1. However, in other cases, a figurative expression occurs with other surrounding material, in a multi-unit turn.
2. A very significant subset of this research effort focuses on linguistic competence and the appropriate comprehension of idioms – or rather, on the "deficient processing of proverbs and related nonliteral expressions" (Van Lancker 1990), either by those whose competencies are not fully developed, especially children (Gibbs 1987), or by those who are impaired, such as aphasics and those with certain neurological abnormalities (Van Lancker & Kempler 1987, Van Lancker 1990, 1991).
3. There are some exceptions, notably Strassler 1982 and McCarthy 1998. These studies explore idioms in naturally occurring spoken English; however, their focus on the pragmatics of idiom usage concerns broader patterns of association or correlations of idiom usage, e.g. between idioms and talk about a third person, rather than about self (Strassler 1982:103). Nevertheless, some of McCarthy's findings (1998, ch. 4), particularly concerning the "shifting from the event line to the evaluation line . . .,

4. On grammar as a feature or property of turn design, and thereby sequentially bounded, see Ochs et al. 1996.
5. However, it should be noted that many seemingly "lexical" idioms have their origins in standardized collocations and are really quasi-lexical, e.g."pushover" (meaning "very easy").
6. But on issues concerning the modification or syntactic flexibility of idioms, see Green 1975 and Nicolas 1995. Ex. 10, below, illustrates the kind of lexical flexibility that some idioms may allow: Here a "dollop" of salt is a recognizable and orderly version of the standard idiom "take with a pinch (or grain) of salt" – orderly, in that "dollop" plainly conveys an upgraded sense of skepticism.
7. In this respect, the kind of expressions we are investigating probably correspond to those which Fillmore et al. (1988:504–5) call "decoding idioms".
8. We gratefully acknowledge the assistance of the Field family and their friends in allowing us to record their conversations; and of Gail Jefferson, who transcribed all these data.
9. By "new," we mean a next topic, different from that which has been concluded following the production of a figurative expression. Hence, speakers may return to a topic previously talked about in the conversation, e.g. in exx. 5–6. The point is, though, that they CHANGE topic.
10. This is only a broad generalization, which does not apply to all cases – particularly since, in many instances where co-participants have been talking about some third party, they may have contributed equally to the "tellings" that make up the topic. (Nevertheless, at the points where figurative expressions are used, the one who is the principal teller/speaker at that point tends to be the one who uses the figurative expression.)

    Furthermore, there may be a kind of bias operating here, in that many cases involve complaints or troubles of some kind (Drew & Holt 1988). Thus one participant may be telling the other about some complainable matter or trouble; and the interactional delicacies associated with closing the topic of a personal trouble suggest that resources to exit from the troubles-topic may be available to the troubles-teller, and not so easily available to the other person (Jefferson 1984).
11. It is also possible, in ex. 5, that Gwen makes an initial move toward closing when she produces a non-figurative assessment of how lovely the couple's home was (Gwen's first two turns in the extract).

(5) [Field:J86:1:4:6]

Gwen:	You know it wz: so lovely an' everything [y know
Lesley:	[nYe:s.
Gwen:	All character 'n (0.3) beautiful.
Lesley:	Ye:s.
	(0.7)
Gwen:	B't I suppose she must 'v come t' the end of 'er (.) tether 'n just walked out then.

The pause following Lesley's minimal agreement/acknowledgement suggests a slight hiatus, associated with the fact that her previous assessment was insufficient to close the topic. Again, her production of a figurative summary may be a move to bring about the topic closure that was attempted or imminent in the turns before.

12. Lesley initially responds in 6 with a low, brief chuckle, in which she seems to recognize

might otherwise have produced in her prior response slot. Her doing so simultaneously with Steven's "Yeah" indicates, of course, that it was independent of, and unprompted by, Steven's turn. (On the possible relations between puns and summaries/story endings, see Sacks 1992:2.419–30.)

13. The imperative mood here, "take this with a dollop 'v salt", suggests that Robbie is telling Lesley that she (Lesley) should not take all her (Robbie's) previous complaints too seriously – that she's not too disheartened by teaching at the school.

There are other idiomatic aspects of Robbie's summary turn, particularly her use of the idiomatic (but not, perhaps, figurative) "getting everything done in the day."

(from 10)
Robbie: B't take this with a dollop 'v salt you kno::w I'm– I'm ba:sic'ly quite happy b't quite relieved it's the sheer organization 'n getting all, everything done in th' da:y.
Lesley: Yes: that's ri:ght,=

Note that her self-repair – she began with "getting all," after which "all" appears to be replaced with "everything" – may be akin to the instances illustrated in exx. 2–4: self-repairs in which speakers begin with a non-idiomatic version, but subsequently change it to an idiomatic formulation.

14. This shift in the focus of the topic (again, not marked as a change to a new topic) exploits the opportunity afforded by the figurative expression to develop the topic in a stepwise fashion. We use "exploit" here to draw attention to the possibility that speakers may use (whether intentionally or deliberately is not in point here) the opportunities that figurative idioms afford, not only to summarize and exit from a prior topic, but also to lead them, in an apparently topically connected fashion, to a "next" topic, something they wish to talk about. In such cases, the figurative expression has a bivalent character, summarizing a prior topic and simultaneously pointing forward to another matter. A case in which the pivotal work of the figurative expression seems especially to result from the speaker exploiting its bivalent property is the following.

[NB:II:2:5] (Speakers have been talking about the assassination of Robert Kennedy a few days before, to which Nancy refers when she says "everybody is talking about it")
Nancy: Yeah it's been a rough week an everbuddy is (.) you know
(0.2)
Emma: Mm hm
Nancy ta:lking about it en everbuddy: course I: don't know whether it's that or just that we're js:t (.) completely bo:gging down at work,h .hhhhmh
(.)
Nancy: E [r whatta WIH: WITH ME: with my finals? hhhh
Emma: [Oh: well e v r y buddy's sa::d
Nancy: hhuh uh:[:
Emma: [Oh ho:w'd you do with yer finals.

Nancy manages what is really a two-stage idiomatic exit from the topic of the assassination. Initially, she summarizes it as having been a "rough week" (which is idiomatic, if not quite figurative). Then she offers, as a possible reason for it having

bo:gging down at work". (Note that the transition from her first reference to "everybody," through a next "everybody," and then to "we," seems to enable Nancy to disengage from talking about "the population at large/in the city," and to move to focus instead on her colleagues at work, "we".) The figurative "bogged down" at work is then pivotal, by allowing her the opportunity to suggest another factor that has contributed to its having been a rough week – a factor associated with another kind of "work", namely the finals examination she has taken for a course at a local university. This touches off (as it might well have been designed to do) an enquiry from Emma about how she has done in her finals. So this idiomatic utterance, and in particular the figurative "bogged down" at work, has been pivotal in the transition from talking about the assassination to talking about Nancy's course and the examination. In this way, the bivalent properties of figurative summaries may perhaps be exploited as a device for managing, rather smoothly, the move to a next topic (and perhaps even a particularly favored topic).

15. The matter of securing the other's agreement, affiliation, or sympathy may be of some interactional moment, since figurative idioms are used so recurrently in complaint sequences, where a complainant can have some interest in whether or not his/her recipient will affiliate with him/her (see Drew & Holt 1988).
16. Note that this last figurative expression conveys a position which perhaps draws closer to Claire's, since *the more the better* has elements of Claire's suggestion that going ahead with the show and sale might depend on a sufficient number of people being interested – while nevertheless allowing that the thing may "snowball."

Universal and Culture-Specific Properties of Greetings

Alessandro Duranti

There is widespread evidence that greetings are an important part of the communicative competence necessary for being a member of any speech community.[1] They are often one of the first verbal routines learned by children and certainly one of the first topics introduced in foreign language classes. They are also of great interest to analysts of social interaction, who see them as establishing the conditions for social encounters. It is not surprising, then, to find out that there is a considerable number of ethological, linguistic, sociological, and ethnographic studies of greetings. But despite the attention greetings have received in the social sciences, there is to date no generalizable definition of greetings and therefore no systematic way for deciding what qualifies as "greetings" in a particular speech community. Nonetheless, researchers have felt at ease identifying "greetings" in different languages and providing hypotheses about what greetings "do" for or to people. In this article, I suggest that this has been possible due to the widespread belief that greetings are verbal formulas with virtually no prepositional content (Searle 1969) or zero referential value (Youssouf et al. 1976). Students of greetings have argued that people are either not believed to "mean" whatever they say during greetings or they are seen as "lying" (see Sacks 1975). In fact, I will argue, these claims are not always tenable. As I will show, not all greetings are completely predictable and devoid of prepositional content. Before making such a claim, however, I must establish some independent criteria by which to determine whether a given expression or exchange should qualify as a "greeting." Short of such criteria, critics might always argue that the apparent counterexamples are not greetings at all.

In what follows I first briefly review the existing literature on greetings in a variety of fields and identify some of the factors that contributed to the common

belief that greetings are formulas with no prepositional content. Then I introduce six criteria for identifying greetings across languages and speech communities. Using these criteria, I go on to identify four types of verbal greetings in one community where I worked, in Western Samoa. In discussing the fourth Samoan greeting, the "Where are you going?" type, I will argue that it blatantly violates the common expectation of greetings as phatic, predictable exchanges, and I show that it functions as an information-seeking and action-control strategy. Finally, I examine a Samoan expression that has been translated as a greeting in English but seems problematic on the basis of ethnographic information, and I show that, as we would expect, it does not qualify for some of the criteria proposed in this article.

Previous Studies

The literature on greetings can be divided along several methodological and theoretical lines. In what follows, I will briefly review the contribution of human ethologists, ethnographers, conversation analysts, and speech act theorists.

In the ethological tradition, exemplified by Irenäus Eibl-Eibesfeldt's work, greetings are studied as a means to uncovering some of the evolutionary bases of human behavior. By comparing humans with other species and adult-adult interaction with mother-child interaction (Eibl-Eibesfeldt 1977), greetings are defined as rituals of appeasing and bonding that counteract potentially aggressive behavior during face-to-face encounters. The presupposition here is that humans and animals alike live in a permanent, phylogenetically encoded condition of potential aggression (or fear of aggression) and, were it not for such adaptive rituals as greetings, individuals would be tearing each other apart. Fear of aggression is also used by Kendon and Ferber (1973) to explain eye-gaze aversion during certain phases of human encounters – people look away just as primates and other animals do to avoid the threat of physical confrontation – and by Firth (1972) and others to interpret the common gesture of handshake across societies as a symbol of trust in the other. This line of research is characterized by two features: (i) a focus on nonverbal communication (for example, Eibl-Eibesfeldt's 1972 study of the eyebrow flash), which is often analyzed independently of the talk that accompanies it; (ii) the assumption of shared goals between humans and other species; and (iii) the assumption that the same type of greeting behavior will have the same origin, motivation, or explanation across situations. The focus on nonverbal communication has been important in counterbalancing the logocentric tendency of other studies of greetings (see below) and has revealed commonalities across cultures that would have been missed were researchers concentrating exclusively on verbal behavior. The second feature, namely, the assumption that humans and animals share similar goals, presents other kinds of problems. It might be easy to accept that all species share a concern for survival and safety, but it is less easy to [illegible]

others suggested that greetings in all societies are about continuity of relationships, but the representation, conceptualization, and perception of continuity by humans are likely to be much more complex than those found in other species, partly due to the use of human language (Leach 1972). Furthermore, without minimizing the aggressive potential of human psyche and human action, we must remember that there are other things in life besides fighting or avoiding fights. Hence, even if we accept that greeting behavior might have phylogenetically originated from avoidance behavior, we still must demonstrate that such an origin is relevant to the specific context in which a particular greeting is used.

A second set of studies of greetings is ethnographically oriented. These studies tend to be descriptive in nature, focusing on culture-specific aspects of greeting behaviors, but they also share an interest in a few potentially universal dimensions such as the sequential properties of greeting exchanges and the importance of status definition and manipulation. This is particularly true of two classic studies of African greetings: Esther Goody's (1972) comparison of greeting and begging among the Gonja and the Lodagaa – a stratified and an acephalous society respectively – and Judith Irvine's (1974) study of Wolof greetings.

Ethnographically oriented studies tend to highlight the importance of identity definition in greetings. Some of them also reveal the subtle ways in which greetings are connected to or part of the definition of the ongoing (or ensuing) activity. This is especially the case in Caton's (1986) and Milton's (1982) studies, which provide clear examples not only of the religious dimensions of greetings in some societies but also of how what is said during greetings both presupposes and entails a particular type of social encounter (see also Duranti 1992a).

The emphasis on the sequential nature of greeting exchanges is the most important contribution of the work of conversation analysts. Schegloff and Sacks's work on conversational openings and closings, for instance, shows that greetings should not be analyzed as isolated acts but as a series of pairs, adjacency pairs, whereby the uttering of the first part by one party calls for and at the same time defines the range of a possible "next turn" by a second party, the recipient (Sacks 1992; Schegloff 1968, 1986; Schegloff and Sacks 1973). Sacks's (1975) study of "How are you?" as a "greeting substitute" in English provides a stimulating description of the interactional implications of choosing to greet and choosing to answer in a particular way; we learn why answering "fine" has different consequences from answering "lousy," and hence we are provided with a sociological justification for lying. As I will show later, the extension of these insights into another language and a different speech community shows that it is not always as easy to determine what is a greeting "substitute." Nor is it always the case that routinized questions can be easily answered by lying.

Finally, greetings have been analyzed by speech act theorists, who focused on their function as acknowledgment of another person's presence. Searle (1969) and Searle and Vanderveken (1985) proposed to analyze English greetings as an example of the "expressive" type of speech act,[2] aimed at the "courteous indication of recognition" of the other party (Searle and Vanderveken 1985:216), and

in other research traditions, Searle (1969) and Searle and Vanderveken (1985) also assume that greetings have no prepositional content, while Bach and Harnish (1979:51–52) interpret the act of greeting as an expression of "pleasure at seeing (or meeting)" someone. The claim that greetings have no prepositional content – or almost zero referential value (Youssouf et al. 1976) – is at least as old as Malinowski's (1923:315–316) introduction of the notion of "phatic communion," a concept that was originally meant to recast speech as a mode of action, a form of social behavior that establishes or confirms social relations and does not necessarily communicate "new ideas." The problem with the characterization of greetings as "phatic," and hence merely aimed at establishing or maintaining "contact" (Jakobson 1960), is that it makes it difficult to account for differences across and within communities in what people say during greetings. Finally, the view of greeting as an act that displays pleasure might make sense in some contexts and especially in those situations where verbal greetings are accompanied by smiles and other nonverbal as well as verbal displays of positive affect (for example, the English "Nice to see you"), but it might not be generalizable beyond such cases.

The interest in the biological basis of greetings, their social functions, their sequential organization, and their illocutionary force have revealed a number of recurrent properties of greetings and have presented interesting hypotheses about the form and function of greetings. At the same time, the emphasis on the "social functions" of greetings has contributed to the trivialization of what people actually talk about during greetings. If the only or main goal of greeting is to acknowledge another person's presence, what is actually said during a greeting may be seen as socially insignificant. In this article I argue that this lack of consideration of the prepositional content of greetings presents considerable empirical problems, and I suggest that we need ethnographically grounded analyses of greeting expressions to solve such problems.

One of the problems in ignoring the content of verbal greetings is that it establishes loose connections between social functions and the talk used to achieve them. As a consequence, differences in what people say can be ignored and we end up supporting the view that "once you've seen a greeting, you've seen them all," a corollary of the more general principle "once you've seen a ritual, you've seen them all." (Hence, why bother with the study of different societies, given that all you need can be found in your own backyard?)

The context for understanding what people say during greetings is nothing more or nothing less than the culture that supports and is supported by the encounters in which greetings occur or that are constituted by them. The method by which such encounters need to be studied must then minimally include (1) ethnography,[4] (2) the recording of what is actually said, and (3) at least a working definition of the phenomenon that is being investigated. Too many of the existing studies of greetings are based either on observation, interviews, or field notes, without the support of film or electronic recording or on recordings without proper ethnographic work (see Duranti 1997, chap. 5).

The Universality of Greetings

The starting assumption in this study is that we must be open to all kinds of conventional openings in social encounters as potential cases of greetings. Although some speech communities have activity-specific items that are used only for greetings (the American English "hi!" and the Italian "ciao," for example[5]), the existing literature shows that many communities do not have such expressions, and what people say during greetings might be identical to what is being said during other kinds of speech activities, the English "how're you doing?" being an example of such a type. For this reason, to concentrate only on lexical items and phrases exclusively reserved for greetings (or, more generally, salutations) would be tantamount to admitting that many languages do not have greetings or have a much restricted set of types. The criteria provided below are offered as a solution to this problem.

Criteria for Identifying Greetings across Languages

Building on the studies mentioned above and a few others, it is possible to extract a set of six recurring features to be used as criteria for the identification of greetings in a speech community:

1. near-boundary occurrence;
2. establishment of a shared perceptual field;
3. adjacency pair format;
4. relative predictability of form and content;
5. implicit establishment of a spatio-temporal unit of interaction; and
6. identification of the interlocutor as a distinct being worth recognizing.

As it will become apparent in the following discussion, some of these features could be grouped into larger categories. For example, features 3, 4, and 6 cover what is actually said in greetings, whereas features 2, 5, and 6 are reformulations of what other authors have identified as potential functions of greetings. In addition, features 1 and 5 (and in some ways, 2) define the spatial and temporal organization of the exchange. Although future studies may prove the need to regroup or even eliminate some of the distinctions that I am proposing, for the purpose of this article I have chosen to keep the six criteria distinct to ensure a broader spectrum of potentially relevant cases. Finally, I should mention that although both verbal and nonverbal aspects of greeting behavior were taken into consideration in the choice of defining features, later on in the article, I will favor verbal over nonverbal aspects of greetings. This is simply due to my efforts in this case to draw attention to the importance of the specific verbal expressions used in greetings and is not meant to undermine the importance of gestures and motion in the analysis of social encounters, which I have addressed elsewhere (Duranti 1992) and intend to return to in the future.

Criterion 1: Near-Boundary Occurrence

Greetings are routinely expected to occur at the beginning of a social encounter, although they may not always be the very first words that are exchanged between parties. This first feature of greetings is related to their potential function as attention-getting devices and their ability to establish a shared field of interaction (see criteria 2 and 5). As defined here, greetings must then be distinguished from closing salutations or leave takings, despite the fact that in some cases the same expression might function as both opening and closing salutation.[6]

Criterion 2: Establishment of a Shared Perceptual Field

Greetings either immediately follow or are constitutive of the interactants' public recognition of each other's presence in the same perceptual field,[7] as shown by the fact that they are usually initiated after the parties involved have sighted each other (Duranti 1992a; Kendon and Ferber 1973). In some cases, making recognition visually available to the other party may constitute the greeting itself (viz., with a toss of the head, a nod, or an eyebrow flash); in other cases, visual recognition is followed by verbal recognition. There are differences, however, in the timing of the verbal exchange vis-à-vis other forms of mutual recognition or verbal interaction. In some cases, talk may be exchanged before the actual greeting takes place. This is the case, for instance, in the Samoan ceremonial greetings (see below), where participants may exchange jokes, questions, or a few brief remarks before starting to engage in what is seen as the official greeting. A possible hypothesis here is that the more formal – or the more institutionally oriented – the encounter, the more delayed the greeting, and that the more delayed the greeting, the more elaborate the language used. Thus we would expect brief and casual opening salutations to occur simultaneously with or at least very close to mutual sighting and long and elaborate greetings to occur after the parties have had a chance to previously recognize each other's presence in some way. One of the most extreme examples of this delayed greeting is the one described by Sherzer (1983) among the Kuna, where a visiting "chief" who has come to the "gathering house" is greeted after he and his entourage ("typically consisting of his wife, his 'spokesman,' and one of his 'policemen,'") have been taken to someone's house to bathe.

> Then they return to the "gathering house," where the visiting "chief" and one of the host village "chiefs," sitting beside one another in hammocks, perform *arkan kae* (literally handshake), the ritual greeting. [Sherzer 1983:91]

Such chanted greetings are quite extended, including a long sequence of verses that are regularly responded to by the other chief, who chants *teki* 'indeed'.

Observationally, this property of greetings is a good index of the function of the greeting and the type of context and participants involved. Immediate and short greetings tend to index an ordinary encounter, whereas delayed [illegible]

greetings tend to index something special in the occasion, the social status of the participants, their relationships, or any combination of these various aspects.

This idea of greetings as reciprocal recognitions could be an argument in favor of Bach and Harnish's (1979) classification of greetings as "acknowledgments." Greeting would be a response to finding oneself within someone's visual and/or auditory range – if such a person is a candidate for recognition. As we shall see, the view of greetings as acknowledgments does not imply the acceptance of Bach and Harnish's view of greeting as a universal expression of attitudes or feelings.

Criterion 3: Adjacency Pair Format

Although it is possible to speak of a "greeting" by one person, greetings are typically part of one or more sets of adjacency pairs (see Schegloff and Sacks 1973), that is, two-part sequences in which the first pair part by one party (A) invites, constrains, and creates the expectation for a particular type of reply by another party (B); see examples 1, 4, and 6 below. The adjacency pair structure makes sense if greetings are exchanges in which participants test each other's relationship (e.g., Are we still on talking terms? Are we still friends? Do I still recognize your authority? Do I still acknowledge my responsibility toward you?). The sequential format of the adjacency pair allows participants to engage in a joint activity that exhibits some evidence of mutual recognition and mutual understanding. The number, utterance type, and participant structure of these pairs vary both within and across communities (see Duranti 1992a:660–662).[8] For example, some African greetings are organized in several adjacency pairs (Irvine 1974).

If we take the adjacency pair format to be a defining feature of greetings, a one-pair-part greeting – not as uncommon as one might think – would be "defective" or in need of an explanation.

Criterion 4: Relative Predictability of Form and Content

Since what is said during a greeting or part of a greeting exchange is highly predictable compared to other kinds of interactions, researchers have often assumed that greetings have no propositional content and their denotational value (to be assessed in terms of truth) can be largely ignored. Whether people say "hi," "good morning," or "how are you?" has been seen as an index of properties of the context (for example, the relationship between the parties, the nature of the social encounter) rather than as a concern participants manifest toward gaining access to new information about their interlocutors. This aspect of greetings needs to be further qualified in at least three ways. First, it should be made clear that information is exchanged in human encounters regardless of whether there is talk. Even when there is no speech, there are usually plenty of semiotic resources in an encounter for participants to give out information about themselves and make inferences about others. Such semiotic resources are based on or include participants' mere physical presence, their gestures, posture, and movements,

information exchanged beyond the prepositional content of what is said. For example, prosodic and paralinguistic features are a rich source of cues for contextualization (Gumperz 1992). Finally, even common formulaic expressions can be informative. In fact, if we start from the assumption that what is said and done in any human encounter lives along a formulaic-creative continuum, greetings might simply be interactions that tend to fall toward the formulaic side. We cannot, however, in principle assume that, because greetings are formulaic, (i) they are always completely predictable, (ii) they have no information value, and (iii) participants have nothing invested in the propositional value of what is said. First, the fact of considering an exchange highly routinized does not make its content completely predictable or uninteresting for social analysis, a point well illustrated by Bourdieu's (1977) analysis of gift exchange and Schegloff's (1986) discussion of telephone openings. It is still important to ascertain how participants manage to achieve the expected or preferred outcome. Second, the occurrence of certain routine and highly predictable questions and answers during greetings does not imply that the parties involved do not exchange some new information. Third, whether or not the participants are interested in the information that is being exchanged should be an empirical question and not an unquestioned assumption.

Criterion 5: Implicit Establishment of a Spatiotemporal Unit of Interaction

The occurrence of greetings defines a unit of interaction. Sacks (1975) alluded to this feature of greetings by saying that they occur only once in an interaction and that they can constitute a "minimal proper conversation." More generally, greetings clearly enter into the definition of larger units of analysis such as a day at work, different parts of the day with family members, or even extended interactions over several months – for example, when done through electronic mail (Duranti 1986). That the "unit" is something more complex than a continuous stretch of time (e.g., a day) is shown by the fact that two people meeting in two different places during the same day may in fact exchange greetings again. An empirical investigation of when greetings are exchanged throughout a day by a given group of people who repeatedly come into each other's interactional space might provide important clues on how they conceptualize the different space-time zones in which they operate. It might also give us a sense of the relation between natural units (such as a day-night cycle) versus cultural units (such as a meeting).

Criterion 6: Identification of the Interlocutor as a Distinct Being Worth Recognizing

The occurrence of greetings and the ways in which they are carried out typically identify a particular class of people. Syntagmatically, a greeting item (e.g., English "hello," "hi," "hey, how're you doing," "what's up") might be accompanied by address terms or other context-dependent and context-creating signs that identify participants as belonging to social groups of various sorts. Paradigmatically, the very use of greetings (as opposed to their absence) identifies

public arenas. That this is more than a tautology may be shown in various ways, including Sacks's (1975) arguments that in English the people we greet with the (substitute) greeting "how are you?" constitute a class he called "proper conversationalists." Even in those societies in which apparently *any* two people entering the same perceptual field would be expected to exchange greetings, distinctions are in fact made. Thus, for instance, among the Tuareg, according to Youssouf et al. (1976:801), once two people are seen progressing toward one another, the parties *must* meet, and once they have met, they must greet each other. Such moral imperatives, however, must be understood against the background of a social world in which avoiding greeting would be interpreted as a potentially threatening situation:

> The desert people have a history of intertribal warfare and intratribal feuds. If the Targi meets another, or others, in [the desert], the identification of the other – as early as possible – is critically important. For, once another person is sighted on a intersecting trajectory, there is no turning aside . . . for that can be interpreted as a sign of either fear or potential treachery and ambush, which invites countermeasures. [Youssouf et al. 1976:801]

This means that, implicitly, the use of greetings can distinguish between Us and Them, insiders and outsiders, friends and foes, valuable and nonvaluable interactants. For example, in many societies children and servants are not greeted. The absence of greetings then marks these individuals not only as nonproper conversationalists or strangers but also as not worth the attention implied by the use of greetings.

An Empirical Case Study

Any proposal for universal criteria needs empirical investigations to support it. In the rest of this article, I will offer a brief discussion of Samoan greetings as a way of assessing and refining some of the claims made so far. In particular, I will be concerned with two main issues: (i) the relationship between universal features and culture-specific instantiations of such features, and (ii) the distinction between verbal expressions that are greetings and those that, although they might look like potential candidates, are not greetings.

It should be understood that what follows is not an exhaustive study of Samoan greetings. Such a study would require a project expressively designed with the goal of collecting all types of greetings used in Samoan communities; in fact, as far as I know, such a comprehensive project has never been attempted for any speech community. Although the data discussed here are drawn from a range of interactions originally recorded for other purposes, they do contain a considerable number of exchanges that qualify as greetings according to the above mentioned criteria. Furthermore, in using Samoan data, I have the advantage

Four Types of Samoan Greetings

On the basis of the criteria mentioned above, I examined audio- and videotaped data collected in a Western Samoan community during three periods for a total of a year and a half of fieldwork.[10] I identified four types of exchanges that can qualify as "greetings": (1) *tālofa* greetings; (2) ceremonial greetings; (3) *mālō* greetings; and (4) "where are you going?" greetings.[11] The analysis presented here is also based on my own observation of and participation in hundreds if not thousands of Samoan greeting exchanges.

Before discussing these four types of greetings, I need to mention a few basic facts about the community where I worked; more detailed information on this community may be found in Duranti 1981 and 1994 and in Ochs 1988. (For a more comprehensive ethnography of Samoan social life, see Shore 1982.)

Despite modernization and a considerable amount of syncretism in religious and political practices, members of the Western Samoan community where I carried out research still hang on to traditional Polynesian values of family relations and mutual dependence. Their society is still divided between titled individuals *(matai)* and untilled ones *(taulele'a)*, and the matai are distinguished according to status (chiefs, orators) and rank (high chief, lower-ranking chiefs). Having a title usually comes with rights over land and its products and the duty to participate in decision-making processes such as the political meetings called *fono* (see Duranti 1994). Status and rank distinctions are pervasive in everyday and ceremonial life in a Samoan village. The language marks such distinctions in a number of ways, the most obvious of which is a special lexicon called *'upu fa'aaloalo* 'respectful words' used in addressing people of high status and in talking about them in certain contexts (see Duranti 1992b; Milner 1961; Shore 1982). Such words are part of some of the greeting exchanges that I will discuss below.

None of the greetings I discuss qualifies as the most "basic" or unmarked greeting item or exchange in Samoan society. As I will show below, the greeting that is the highest on the "formulaic" end of the formulaic-creative continuum, and hence with the least prepositional content, "tālofa," is the rarest in everyday life and hence is an unlikely candidate for the role of the most basic type or the one the other greetings are substituting for.

The Tālofa Greeting

This greeting can be used in a number of settings, including open and closed areas (for example, either outside or inside a house), whenever two people become visibly and acoustically accessible to each other. Unlike the other Samoan greetings I will discuss below, the tālofa greeting is at times accompanied by handshaking, a gesture likely borrowed from past Western visitors and colonial authorities. In fact, this is a greeting that is today most commonly used with foreigners. Contrary to what was described by Margaret Mead (1928:14), people from the same village today rarely greet each other with "tālofa" (see Holmes 1987:112),[12] which is reserved for people who have not seen each other for a long time.

hour-long audiotape of an "inspection committee" *(asiasinga)* going around the village and meeting dozens of people, I found three examples of "tālofa." All three examples involve only one member of the inspection committee (Chief S, the highest ranking chief of the group) who initiates the greeting. In one case, "tālofa" was exchanged with a group of chiefs from another village waiting for the bus. Although I have no information on the people who were greeted with "tālofa" in the other two cases, the interaction is not incompatible with the hypothesis that the parties involved had not seen each other for a while or are not very familiar with one another.[13]

Like the expressions used in the other Samoan greetings, *tālofa* may occur by itself or may be accompanied by an address term, either a name or a title, for example, "tālofa ali'i!", or "greetings sir(s)!" Here is an example that shows the adjacency pair format of the greeting and its rather simple AB structure:

(1) *[Inspection, December 1978: While standing outside, the committee members have been interacting with a woman who is inside the house, when Chief S directly addresses another woman from the same family, Kelesia.]*

Chief S:	tālofa Kelesia!
	Hello Kelesia!
	(0.2)
Kelesia:	tālofa!
	Hello!
Chief S:	*((chuckles))* hehe.

Tālofa is homophonous with and probably derived from the expression *tālofū* or *tālofae* – usually pronounced /kaalofa/ and /kaalofae/, respectively[14] (see the appendix) – used to display empathy for someone who is judged to be suffering or under any form of distress (see also Ochs 1988:173). This other use of the expression *tālofa* is found in the following excerpt from the same transcript, where a member of the inspection committee invites the others to feel sorry for the old woman Litia, who got up at dawn in order to clean her lawn in time for the committee's inspection. As shown by the following comment by Chief S, Tūla'i's sympathy is not shared by everyone else. In the next turn, Chief S proposes, albeit with some hesitation, to fine Litia.

(2) *[Inspection: The orator Tūla'i sees the old woman Litia, here pronounced/Likia/, cutting the grass.]*[15]

1	Tūla'i:	kālofa sē ia Likia- 'ua uso pō e-
		empathy Voc Emp Litia Perf rise night Comp
		Hey, feel sorry for Litia. (She) got up at dawn to –
2	Chief S:	'ae- 'ae- 'ae- 'ae kakau nga / / sala
		but but but but ought to fined.
		But, but, but, but she should be fined.
3	Litia:	e sēsē mātou i le faimea taeao.
		Pres wrong we:incl-pl in Art do-thing morning
		We shouldn't be doing things in the morning.

This example shows that it is not the occurrence of a particular expression that

pair part of a greeting exchange with Kelesia, in (2) the orator Tūla'i uses *tālofa* as an attempt to draw sympathy for the old woman Litia (pronounced /Likia/ in line 1) but not to greet her. In fact, the ensuing interaction with Litia does not contain a greeting. In an apparent response to the men's comments, Litia's first turn in line 3 is a negative assessment of her being up and running early in the morning, which could be interpreted as veiled apology.

In his Samoan-English dictionary, G.B. Milner (1966) suggests that *tālofa* is a compound made out of the words *tā* 'strike' and *alofa* 'love, have compassion'. *Ta* could also be the first-person singular, positive-affect pronoun. In this case the long /aa/ (spelled *ā*) would be accounted for by the combination of two consecutive /a/: *ta* + *alofa* → /taalofa/, originally meaning "(poor) me feels sorry". Although *tālofa* as a greeting does not have the same meaning of *tālofa* as an expression of empathy and therefore looks like a good candidate for a word with very little or no prepositional content, specialized for greetings, its rarity in everyday life makes it an unlikely candidate as the unmarked greeting in a Samoan speech community.

The Mālō Greeting

In my data, this greeting is most commonly used when one party (A) arrives at a site where the other party (B) already is. It has the structure given in (3).

(3) *Mālō-greeting:*

A: mālō (+ intensifier) (+ address + title or name)
B: mālō (+ intensifier) (+ address + title or name)

The word *mālō* has several meanings in Samoan. Its use as an opening salutation is closely related to its use as a compliment or encouragement to people who are working or have just finished doing something (see below).[16] An example of the mālō greeting is provided in (4), from an audiorecording of the "Inspection" tape mentioned above:

(4) *[Inspection: The committee members, including Afoa, a chief, and Tūla'i, an orator, arrive at the orator Taipī's family compound and see Taipī's wife Si'ilima.]*

1	Afoa:	mālō Si'ilima! *Congratulations/hello Si'ilima!*
2		(0.5)
3	Si'ilima:	mālō! *Congratulations/hello!*
4		(0.5)
5	Afoa:	'ua lelei mea 'uma! *Everything is fine!*
6	Tūla'i:	[māngaia – (0.3) māngaia le- (0.5) le fangua: – *Nice – the land looks nice –* [17]
7		

8 (2.5)
9 Tūla'i: fea le koeainga?
Where (is) the old man? [...]

Here, line 1 contains the first pair part, and line 3 contains the second pair part. In this case, the structure of the exchange is:

(5)

A: mālō + Name (first pair part)
B: mālō (second pair part)

In other cases, we might find more complex turns not only with names but also with titles and intensifiers (e.g., *lava* 'much, indeed').

(6) *[Inspection]*

Tūla'i: mālō ali'i Faikaumakau! (mālō + address + title)
Congratulations, Mr. Faitaumatau!

Faitaumatau: mālō lava. (mālō + intensifier)
Much congratulations.

In most cases, the exchange is initiated by the arriving party. This makes sense if we interpret this use of *mālō* as a greeting as an extension of the use of *mālō* as an expression of congratulation to someone who is engaged in a task or has just successfully completed one. In the latter case, called the "*mālō* exchange" in Duranti and Ochs (1986), the first *mālō* recognizes one party's work or activity and the second *mālō* recognizes the role played by the supporter(s) (*tāpua'i*). The second *mālō* in this case is usually followed by the adverb (intensifier) *fo'i* 'quite, also', which further underscores the reciprocity of the exchange. Differently from the greeting *mālō*, the complimenting *mālō* typically occurs in the middle of an interaction; hence it does not conform to the first two criteria described above (near-boundary occurrence and establishment of a shared perceptual field). But when the complimenting *mālō* does occur at the beginning of an encounter, it can function as both a compliment and a greeting. An example of this use of *mālō* is provided in excerpt (7), where the woman Amelia surprises the inspecting committee (see the "repair" particle '*oi* in Chief Afoa's response) by initiating the interaction with a congratulating "mālō." This *mālō* is followed by the display of the reason for her congratulations, namely, their "inspecting" or "visiting." (*le asiasi* is the nominalization of the predicate *asiasi* 'visit, inspect'.[18])

(7) *[Inspection]*

Amelia: mālō ā le asiasi!
congratulations Emp Art visit
Congratulations indeed (for) the inspecting!
Tūla'i: 'oi! // mālō!

Chief Afoa:	mālō fo'i.
	Congratulations also (to you).
Tūla'i:	'ua 'ou iloa::-
	I realize that –
Amelia:	pulengu'u ma oukou kōfā i le komiki!
	mayor and you-all honorable (orators) in the committee
	(To the) mayor and you honorable (orators) in the committee!
Tūla'i:	mālō // lava iā ke 'oe le kingā!
	congratulations Emph to you the mother
	Congratulations indeed to you, the mother (of the family)!
	[. . .]

In this case, the exchange is enacted as a series of reciprocal compliments, as shown by the syntax of the last utterance by Tūla'i: "*mālō* indeed to you, the mother (of the family)!", but it also works as a greeting. This is predictable given that it conforms to the six criteria introduced earlier and no other greeting with Amelia follows.

In 1978, I was told by a Samoan instructor who had taught Peace Corps volunteers not to use *mālō* as a greeting. He, like other adult Samoans with whom I spoke, considered the use of *mālō* as a greeting a relatively recent and degenerate extension of the use of *mālō* as a compliment. (This view is supported by the fact that *mālō* is not mentioned as a greeting in any of the earlier ethnographic accounts.)

How can we explain the extension of the *mālō* from one context to the other? In the *mālō* greeting, the party who is about to enter another's living space calls out to the other by starting an exchange of mutual support and recognition. Since the other is likely to be busy doing something or to have just finished doing something, *mālō* is an extension of the one used in those contexts in which one party is more explicitly seen as "doing something" and the other as "supporting the other party's efforts." When the mālō exchange is started by the person who is stationary (e.g., inside a house), it could be seen as an extension of a congratulatory act to the newcomer for having made it to the present location, overcoming whatever obstacles he encountered or could have encountered.

In its ambiguous state between a congratulating act and a greeting act, this Samoan greeting shares certain similarities with the English "How are you?" discussed by Sacks (1975) and others. In both cases, we have a greeting item that is not exclusively used for greeting and in fact is imported, as it were, into the greeting exchange from other uses and contexts. In both cases, we have a relative or incomplete ritualization of the term so that it can be still taken "literally." There still is, in other words, some of the force of the mālō compliment in the mālō greeting. At the same time, differently from the English "How are you?", we cannot define the mālō greeting as a "greeting substitute" because there is no other obvious candidate for the same types of situations.

Ceremonial Greetings

Ceremonial greetings

a head nurse) arrives at what is either foreseen or framed as an official visit or public event. As discussed in Duranti (1992a), ceremonial greetings (CGs) only take place after the newly arrived party goes to sit down in the "front region" of the house. CGs are the most complex among the four types of Samoan greetings discussed here. They are made of two main parts, a first pair part, the "welcoming," and a second pair part, the "response."

(8)

A: [WELCOMING]
B: [RESPONSE]

Each of these two parts may, in turn, be **divided in two major subcomponents**, a predicate and an address.

(9)

WELCOMING	RESPONSE
a. Welcoming predicate	a. Responding predicate
b. Address	b. Address

The welcoming predicates recognize the arrival of the new party and welcome him or her into the house. They are the same predicates that in different contexts function as verbs of motion meaning "arrive, come." A list of some such verbs is given in Table 1, with information relative to the specific social status indexed by each term. Whereas *maliu* and *sosopo* are said to (and imply that the addressee is) an orator (*tulāfale*), the verb *afio* is used with (and implies that the addressee is) a chief (*ali'i*). The deictic particle *mai*, which accompanies all of them, expresses an action toward the speaker or, more precisely, toward the deictic center (see Platt 1982), which in all the cases discussed here is the totality of the shared space already occupied by the welcoming party and defined according to the physical shape of the house (see Duranti 1992a).

Table 1: Welcoming predicates used during ceremonial greetings (CGs)

Samoan term	English translation	Social index
maliu mai	'welcome'	<orator>
sosopo mai	'welcome'	<orator>
afio mai	'welcome'	<chief>
susū mai	'welcome'	<chief or orator>[a]

[a] This particular verb is used with the holders of titles descending from the high chief Malietoa and can be used with either a chief or an orator. It is also the most commonly used term for high status individuals who are not matai, e.g. pastors, school teachers, doctors, government officials. It is thus often used as an "unmarked" term when one is not sure of the social identity of the addressee or when one knows that the addressee has a title but wishes to treat him or her with deference. In my living experience

The responding predicate exhibits less variation and is often omitted. The address is the most complex part and the one that allows for more variation. It can also be repeated when the speaker differentiates among the addressees:

(10) Address:

a. Address form
b. Generic title
c. Name (specific) title
d. Ceremonial attributes (taken from *fa'alupenga*[19])

The address may have up to these four parts. The address form (see Table 2) shows distinctions similar to the ones found in the welcoming predicates. Some of the forms are in fact nominalizations of those predicates. The distinction between what I call a generic title and a name title is found only in some cases. In the village of Falefā, where I conducted my research, there were two orator title names (Iuli and Moe'ono) that also had a generic title, Matua, which I have elsewhere translated as "senior orators" (Duranti 1981, 1994).

Table 2: Address forms according to status

Samoan term	English translation	Social index
lau tōfā	'your honor/highness'	<orator>
lau afionga	'your honor/highness'	<chief>
lau susunga	'your honor/highness'	<chief or orator>

Any of the following combinations were commonly used during CGs and other formal exchanges in addressing the people holding the Iuli or Moe'ono title:

- an address form (*lau tōfā* '*your honor*')
- address form + generic title
  (*lau tōfā* + *le Matua* 'your honor + the senior orator')[20]
- address form + generic title + name title
  (*lau tōfā* + *le Matua* + *Iuli* 'your honor + the senior orator + Iuli' or *lau tōfā* + *le Matua* + *Moe'ono* 'your honor + the senior orator + Moe'ono').

If a person has a *matai* title, the name given at birth (called *ingoa taule'ale'a* 'unfilled name') will not be used in the CG. Only those who do not have a *matai* title – such as pastors, some government officials, and foreigners – might be greeted with the address form followed by the birth name. For example, a pastor whose untitled name is Mareko would be addressed as "lau susunga Mareko" (your honorable Mareko). In this case, the proper name replaces the "name title." If a person does not have a *matai* title and does not hold a religious or administrative office and his name is not known to the welcoming

related; this is a convention used with untitled people when they perform ceremonial roles on behalf of their family, village, or religious congregation.) Other times, an ad hoc "title" is created on the spot based on whatever information about the newcomer is contextually available. For example, people who did not know me personally often referred to me as "the guest from abroad" *(le mālō mai i fafo)*. If they saw me filming, I became "the cameraman": *le ali'i pu'e ata*, lit. 'the (gentle)man (who) takes pictures'.

The adjacency pair structure of the CGs is hard to perceive at first, and these greetings are particularly hard to transcribe because they are typically performed by several people at once and never in unison. This means that the speech of the different participants typically overlaps and interlocks, producing a nonchanted fugue (Duranti 1997b). Here is an example from a meeting of the village council *(fono)*. One of the two senior orators in the village, Moe'ono, has just arrived and gone to sit in the front part of the house. The orator Falefā, who is the village "mayor" *(pulenu'u)* and whose house is being used for the meeting, initiates the greeting and is followed by a few other members of the council. (I have here slightly simplified the transcript for expository reasons.)

(11) *[Monday Fono, August 1988; ceremonial greeting of senior orator Moe'ono]*

Falefā:	ia'. māliu mai lau kōfā i le Makua
	Well. Welcome your highness, the senior orator.
Malaga:	lau kōfā i le Makua
	Your highness, the senior orator.
?:	lau kōfā i le Makua
	Your highness, the senior orator
	(2.0)
Moe'ono:	ia'. ('e'e ka'ia) le kākou ngu'u
	Well. ((I) submit to) our village
??:	[(lau kōfā le Ma:kua)
	(*Your highness, the senior orator*)
	(7.0)
Moe'ono:	mamalu i le- (1.0) susunga a le ali'i pulengu'u ngei
	dignity of the – (1.0) highness of Mr. Mayor here
	(7.0)

This exchange seems to qualify easily as a greeting, according to the six criteria established above. Like other exchanges I have either witnessed or recor this one occurs a little after the newcomer, Moe'ono, has arrived to the h (criterion 1) (but see more on this later). It also defines a shared perceptual fi as defined by the welcoming predicate with its deictic particle *mai* (criterio The greeting is sequentially organized as an adjacency pair (criterion 3). expressions used in greeting are predictable but not completely so (criterio The exchange establishes the ensuing interaction as a formal one in which pu identities will be evoked, in this case, a formal meeting of the village co orator (criterion 6). So

For example, before the CG shown in (11) above, one of the people in the house uses a *mālō* with Moe'ono – although no audible response can be heard – and a few minutes later, Moe'ono himself exchanges *mālō* with an orator who has just come in and has already been greeted with a CG. My hypothesis is that these other greetings or greetinglike exchanges are between different social personae and that they are performing a different kind of work. The CG recognizes the party's positional identity that is judged relevant to the forthcoming activity, typically a formal type of exchange (e.g., a political or business meeting, a ceremonial exchange), and is done between an individual as a representative of a group and a collectivity (the people already in the house).[21] The *mālō* greeting, on the other hand, although it may be addressed to collectivities,[22] usually is a preliminary to short and relatively informal exchanges. Its use projects a sense of immediacy and is a prelude to some business that can be easily dealt with, without even entering the house. Example (12) below reproduces some of the verbal interaction preceding the CG illustrated in (11). Senior orator Moe'ono and the orator Talaitau have arrived at the same time, but only Moe'ono goes to sit in the front region of the house; this transcript starts a few seconds before the one in (6) above and shows that the notion of "acknowledgment" or "recognition" proposed by speech act theorists as the illuctionary force of greetings must be qualified. We need to specify what is being acknowledged. Physical presence? Status? Social role in the ensuing interaction? For example, when we enlarge the context of the CG in (1), we find out that both Moe'ono's physical presence and his status have already been recognized before the CG is produced. After Moe'ono's remark about the presence of the videocamera in lines 5 and 6, the orator Manu'a provides a justification for the presence of the videocamera (lines 13–15), which starts with a formulaic apology (starting with the expression "vaku . . .") indexing Moe'ono's higher rank. Manu'a might be apologizing for a number of things, including his speaking at all to such a high-status person before proper greetings have been exchanged, his speaking about such nondignified matters as videotaping, or his (and the other matai's) failure to ask for Moe'ono's approval before allowing the camera to be used.[23]

(12) [*Monday Meeting, August 1988*]

1	Moe'ono:	(he) sole!
		(Hey) brother!
2	?:	((to a woman outside)) (ai) **sunga!**
		(?) *Woman!*
3	?:	(??)
4	Manu'a:	e- mālō lava!
		Tns- congratulation Emph
		Is – hello, hello!
		|
5	Moe'ono:	māngaia ali'i le- lea ke va'ai aku **ali'i**
		Nice sir, the – that I see sir(s),
		e fai le pu'enga aka ali'i (o le –)

7	Talaitau:	(?sē) *(?Hey)*
8		oi. oi sole! *Uh-oh, brother!*
9	Moe'ono:	[o le kākou fongo ali'i *of our meeting sirs*
10	Talaitau:	ai 'o le ā le mea lea nga ili ai le pū a le pulenu'u. *Maybe that's why the horn of the mayor was blown.* [
11	Manu'a:	(leai fa'afekai) *(No thanks.)*
12		(0.7)
13		'e vaku lau kōfā le Makua, *With due respect, your highness the senior orator,*
14		(2.0)
15		'o si koe – 'o si koe'inga e sau e pu'e – se aka o (le –) *The dear old ma – the dear old man (who) comes to film (the –)*
16		(1.0)
17	?Moe'ono:	((Sigh)) haaaa! *Haaaa!*
18	Manu'a:	o:: –
19	?:	(??lea)
20		(3.0)
21	??:	(??fangu?)
22	?:	(leai!) *(No!)*
23	??:	(???) [
24	Moe'ono:	e lelei kele le ali'i 'o Falefā *Mr. Falefā is very good*
25	Falefā:	ia'. māliu mai lau kōfā i le Makua *Well. Welcome your highness, the senior orator.*

If acknowledgments of physical presence, status, and rank have already been done, the CG, which is started by the orator and mayor Falefā in line 25, must do something more. I suggest that the CG allows the people present to *collectively* recognize Moe'ono's presence *as* the senior orator, someone who has specific rights and duties within the forthcoming event, the meeting of the fono. Conversely, the CG gives Moe'ono the opportunity to recognize the presence and hence future role played by the rest of the assembly. *It is as social actors engaged or about to be engaged in a particular (and to some extent predictable) type of interaction that participants' presence is recognized by means of a CG.*

It is, of course, possible to argue that CGs are not *real* greetings and a distinction should be made between "greetings" and "welcomings," with the CGs being an example of the latter. The translation of the predicates used in the first pair part would support this hypothesis. My experience in this community,

individuals who meet in a closed area, which is likely to be the site for further activities also involving or indexing their positional roles. This position is supported by a number of observations.

In Western Samoa, I heard high-ranking persons who met on the road, for example, while inside a car, apologize for the improper way in which they find themselves in each other's presence. The expression used is "leanga tātou feiloa'i i le auala" ([too] bad [that] we meet on the road). This expression was explained to me by a person who had just used it to imply that meeting on the road is not the proper way for high-ranking people to come together. In other words, the implication is "we should have met elsewhere." Where? For instance, at someone's house. If such a meeting had taken place, ceremonial greetings would have been exchanged (as well as food and perhaps gifts). This, to me, indicates that for high-ranking Samoans ceremonial greetings are part of what makes an encounter proper or canonical.

The formality or ritualistic nature of the CGs is not a reason for not considering them greetings. For one thing, such formality is quite common in everyday encounters. As documented by Bradd Shore, Margaret Mead, and other ethnographers, Samoans are used to rapidly shifting, within the same setting, from an apparently casual exchange to a much more eloquent one, in which fancy epithets and metaphors are used and individuals get addressed with longer names, inside of longer turns at talk. In other words, CGs are much more routine than we might think and, in fact, statistically much more common than the tālofa greeting. In Western Samoa, whenever I went to visit persons of high status, if I entered their house and sat on the floor in the "front region" (see Duranti 1992a, 1994), I would be greeted with a CG. No matter how hard I tried at times to avoid the CG by acting informally and engaging my hosts in conversation, I was rarely able to avoid it. After a few seconds of my arrival, someone would clear his or her voice and start a CG with the usual shifting activity marker *ia'* 'well, so'. Only kids or young, untitled folks may enter and leave a house without being the target of CGs. Part of this sharp social asymmetry is still at work in the Samoan community in Los Angeles, where young and untitled members of the families I visited are never introduced to me and do not expect to participate in the greeting rituals that in American society often include the youngest children in the family.

The "Where Are You Going?" Greeting

When two parties, at least one of whom is ostensibly going somewhere, cross one another's visual field of perception and are close enough for their voices to be heard by one another (the volume of the parties' voices being adjusted proportionally to the physical distance between them), they may engage in what I will call the "where are you going?" greeting:[24]

(13) Scheme of "Where are you going?" greeting

1 A: Hi!

This goal may be either a place or a task.

First, we must recognize that the adjacency pair in the scheme in (13) conforms to the criteria introduced earlier for greetings. It is typically used when party B is seen moving along the road or a nearby path by party A, who is stationary (e.g., inside a house, in front of a store), but it can also be found in cases in which A and B pass each other on the road. Under these circumstances, the initiator usually stops to address the other (moving party), who may or not also stop to respond. (This is different from the Mehinaku greeting discussed in Gregor 1977.)

The greeting may continue with a leave-taking exchange of the following kind:

(14) Leave-taking after "where are you going" greeting
3 A: Then go.
4 B: I/we go.

The existence of "where are you going?" greetings in Samoa and other societies (see Firth 1972; Gregor 1977; Hanks 1990) suggests that we cannot easily extend to other speech communities Searle's analysis of English greetings as an expressive type of speech act (see above). As may be gathered by an examination of its content, the "where are you going?" greeting is more than an expression of a psychological state. It is an attempt to sanction the reciprocal recognition of one another's presence with some specific requests of information that may or may not receive satisfactory response. Although they are highly predictable and conventional, "where are you going?" greetings force participants to deal with a wide range of issues including an individual's or group's right to have access to information about a person's whereabouts, culture-specific expectations about the ethics of venturing into public space, the force of questioning as a form of social control and hence the possibility of withholding information as a form of resistance to public scrutiny and moral judgment (Keenan 1976). As in the neighboring language of Tokelau (Hoëm 1993:143, 1995:29), Samoan speakers who greet with the "where are you going?" question feel that they have the right to an answer, and the question itself is a form of social control. With the last part of the exchange, shown in (14), the questioner formally grants the other party permission to go. The speech act analysis proposed for English greetings, then, cannot be easily extended to these greetings, given that to initiate a "where are you going?" greeting is definitely more than (or different from) a "courteous indication of recognition" (Searle and Vanderveken 1985:216) or a conventional expression of pleasure at the sight of someone (Bach and Harnish 1979:51–52). To ask "where are you going?" is a request for an account, which may include the reasons for being away from one's home, on someone else's territory, or on a potentially dangerous path. To answer such a greeting may imply that one commits oneself not only to the truthfulness of one's assertion but also to the appropriateness of one's actions. It is not by accident, then, that in some cases speakers might try to be as evasive as possible. Samoans, for instance, often reply to the "where are you going?" greeting question with the vague 'to do an errand' (fai le fe'au). Even when they give what appear to be more specific

and "I'm going to Apia," speakers are still holding on to their right to release only a minimum amount of information – with bragging being an obvious exception ("I'm going down to the store to buy a five pound can of corn beef for Alesana!"). Just as in the Malagasy situation discussed by Elinor Ochs Keenan (1976), the tendency in these encounters is to violate Grice's (1975) cooperative principle and not to be too informative.

The violation of this principle, however, does not have the same implications discussed by Sacks (1975) regarding the American passing-by greeting "How are you?". In the American case, the common assumption is that the party who asks the question as a greeting is not really interested in an accurate or truthful answer. It is this lack of interest that justifies what Sacks sees as a social justification for "lying." People are expected to provide a positive assessment (fine, good, okay) regardless of how they are actually doing or feeling at the moment. In the Samoan case, instead, questioners would like to know as much as possible about the other's whereabouts, and the vagueness in the answer is an attempt by the responding party to resist the information-seeking force of the greeting. Furthermore, the consequences of one's answer are also different. Whereas in the American English greeting substitute "How are you?", as argued by Sacks, a lie is a preferred answer regardless of its truth value, in the case of the Samoan "Where are you going?" greeting, vagueness is conventionally accepted, but violation of truth is potentially problematic if later detected.

That the Samoan "Where are you going" greeting is, at least in part, about rights and duties, expectations, and possible violations is shown by the fact that, when questioned by someone with higher authority, Samoan speakers might be expected to give more specific answers. Likewise, they might display their uneasiness about a situation in which they have been placed, uneasiness about the very fact of being visible and hence vulnerable to public questioning by someone with authority. This is indeed the case in (15) below. In this example, the inspection committee encounters a group of young men on the road. One of the members of the committee, the orator Tūla'i, recognizes a young man from his extended family and addresses him:

(15) *[Inspection]*

A	1	Tūla'i:	fea (a)li('i) a alu iai le kou – kengi 'i ukā? *Where (sir) are you going inland with your pals?*
B	2	Young man:	sē vange afionga ali'i ma kulāfale mākou ke ō aku 'i ukā *With your permission, honorable chiefs and orators, we are going inland*
	3		e – (0.8) e kapenga mai le – (0.2) suūvai – (0.2) o le Aso Sā. *to – (0.8) prepare the – (0.2) food (0.2) for Sunday.*
A	4	Tūla'i:	ia' ōloa ('ā) *Okay, go then,*
B	5	Other man:	(mākou) ō. *(We) go.*

the social organization achieved by it. First, the content displays a noticeable status asymmetry between A and B (which is represented by more than one speaker). Despite the relatively polite questioning by orator Tūla'i (the address form "ali'i" he uses does not have the gender and age selectional restrictions as the English "sir" or the Spanish "señor" but does convey some consideration for the person addressed),[25] there is no question that in lines 2 and 3 the young speaker does his best to show appreciation of the specific statuses represented by the members of the inspection committee, since the respectful term /afionga ali'i/ refers to the chiefs in the committee and the term /kulaafale/ refers to the orators. These terms are in contrast with the casual, almost "slang" word /kengi/, a borrowing from the English *gang*, used by the orator Tūla'i in referring to the young man's group. Furthermore, the young man also indicates through his opening remark /vange/, an apologetic expression for an unbecoming (past or future) act (corresponding to the /vaku/ we saw earlier in [13], line 13) that anything he might do or say to such a distinguished audience is likely going to be inappropriate. In fact, even his group's presence in front of the committee may be seen as an inappropriate interference in the chiefs' and orators' actions, or at least in their interactional space. There are some remnants here of possible avoidance relations with people of high *mana* that have been characterized as typical of ancient Polynesia (Valeri 1985).

Despite the conventionality of the exchange, what is said and how it is said is extremely important. The illocutionary point or goal of the greeting is not just "a courteous indication of recognition, with the presupposition that the speaker has just encountered the hearer" (Searle and Vanderveken 1985:215). Although recognition is certainly involved, the exchange plays out a set of social relations and cultural expectations about where parties should be at a particular time of the day and what they should be doing then, all expressed through an actual exchange of information about the parties' whereabouts. It is the higher status party, that is, the orator Tūla'i in this case, who asks the question. The only thing the young men can do is answer as quickly and as politely as possible and hope for a quick and uneventful exchange. In this interpretive frame, the final granting of permission to go ("ia' ō loa") is also ambiguous between a formulaic closure (corresponding to the English "See you" or "Good-bye") and a meaningful sanction of the young men's goals and destination by a man of higher authority.

Expressions That Are Not Greetings

Given my claim that the six criteria introduced above should allow researchers to identify greetings across languages and communities, it is important to establish whether the same criteria can allow us to exclude words and exchanges that are *not* greetings. A good candidate for such a test is the Samoan term *tulouna* or *tulounga*.[26] In Augustine Krämer's (1902–03) extensive ethnography of Samoan history and social life, *tulounga* was translated to the German *gegrüsst*, the past participle of the verb *grüssen* 'greet'. The English version of the German text

the English *greeted*. Here is an example from Krämer's book; (16) shows the original, and (17), the English translation.[27] The passage is taken from the beginning part of the *fa'alupenga* (ceremonial address of the village of Falefā, which is the site of the exchanges analyzed in this article).

(16)

Tulounga a 'oe le faleatua	Gegrüsst du das Haus von Atua
tulounga a 'oe le 'a'ai o Fonotī	gegrüsst die Stadt des Fonotī
	[Krämer 1902:277]

(17)

Tulounga a 'oe le faleatua	Greeted you, the house of Atua
tulounga a 'oe le 'a'ai o Fonotī	greeted Fonotī's city
	[Krämer 1994:360]

The translation of *tulounga* with "greeted" at the beginning of each phrase achieves the goal of mirroring the word order of Samoan (verb first). But the translation is problematic first of all on empirical grounds, given that *tulounga* is not used in any of the ceremonial greetings I described above. For example, *tulounga* is never mentioned in the ceremonial greetings despite the fact that they are quite formal and, as we saw above, include sections of the ceremonial address (*fa'alupenga*) of the village, the context in which *tulouna* appears in Krämer's text. Instead, I found *tulounga* (pronounced /kuloungа/; see the appendix) in the first speech given during the meetings of the fono. In this context, as I suggested in Duranti 1981, it makes sense to translate it to "acknowledgment" or "recognition":[28]

(18) *[April 7, 1979: first speech of the meeting, by orator Loa]*

Loa: ia'.
Well,
(2.0)
kuloungа ia (1.0) a le aofia ma le fongo,
recognition indeed . . . of the assembly and the council,
(3.0)
kuloungа le vilingia ma – kuloungа le saukia,
recognition (of) the suffering and – recognition (of) the early arrival,
(2.0)
kuloungа Moamoa 'o kua o Lalongafu'afu'a
recognition (of) Moamoa,[29] *the back of Lalongafu'afu'a*[30]
[. . .]

The translation of *tulouna* (*or tulounga*) with *recognition* (one might even consider the term *apology*, given its obvious relation to the expression "tulou!" [excuse (me)][31]) is consistent with the description provided in Milner's dictionary:

Expression used before mentioning

established order, and apologizes for any offence he might inadvertently give when speaking before the distinguished assembly. (N.B. This expression is used repeatedly in uttering the ceremonial style and address of a social group or village *[fa'alupenga]*). [1966:286–287]

When we match *tulounga* against the six criteria provided above, we find that it matches only two or perhaps three of the criteria for identifying greetings:

(i) It is part of a relatively predictable part of a speech (criterion 4).
(ii) It contributes in part to the establishment of a spatiotemporal unit of interaction (to the extent to which it contributes to clarifying the type of encounter in which it occurs) (criterion 5).
(iii) It identifies the interlocutors as distinct and yet related beings (criterion 6).

But *tulounga* does not qualify according to the three remaining criteria:

(a) It does not occur close to an interactional boundary (criterion 1). Instead, it is used in the middle of a speech.
(b) It does not establish a shared perceptual field (criterion 2). Such a field has already been established by a number of other expressions and rituals.
(c) It is not in the form of an adjacency pair (criterion 3). There is no immediate or obvious response to the particular section of the speech in which the speaker uses *tulounga*.

Conclusions

The analysis of greetings presented here shows that semantic analysis must be integrated with ethnographic information if we want to provide an adequate pragmatic analysis of speech activities within and across speech communities. Whatever greetings accomplish, they do it by virtue of the participants' ability to match routine expressions with particular sociohistorical circumstances. To say that greetings are constituted by formulaic expressions only tells half of the story. The other half is how such formulaic expressions may be adapted to, and at the same time help establish, new contexts.

I have argued that we cannot compare greetings across speech communities unless we come up with a universal definition of what constitutes a greeting exchange. After proposing such a universal definition consisting of six criteria, I have shown that the tendency to see greetings as devoid of propositional content or expressing "phatic communion" is too limiting and, in fact, inaccurate. Greetings are, indeed, toward the formulaic end of the formulaic-creative continuum that runs across the full range of communicative acts through which humans manage

My analysis of four different types of Samoan greetings offers an empirical corroboration of the six criteria and proposes some new hypotheses about the work that is done during greetings in human encounters. In particular, I have shown the following:

1. The notion of "greeting substitute" used for English greetings such as "How are you?" may not be extendable to other speech communities. I showed that in Samoan, since no particular greeting can be identified as the most basic or unmarked one, there is no sense in claiming that any of the expressions used in greetings are "greeting substitutes."

2. In certain types of greetings, most noticeably ceremonial ones, recognition has already taken place before greetings are exchanged. This means that "acknowledgment" of another's presence per se cannot be the function of greeting, unless we redefine the notion of "acknowledgment" to make it more culture- and context-specific. For example, physical recognition might have taken place (i.e., participants might be signaling that they have sighted one another), but context-specific social recognition might still be needed; that is, participants need to be acknowledged for what they represent or embody in a particular situation or course of action. The act of greeting, in other words, does not necessarily imply that the speaker has *just* encountered the hearer, as proposed by Searle and Vanderveken (1985:216), but that the encounter is taking place *under particular sociohistorical conditions* and the parties are relating to one another *as particular types of social personae.* This is the case across a number of greetings. It undermines the possibility of cross-culturally extending speech act theorists' analysis of English greetings as an "expressive" type of speech act aimed at the "courteous indication of recognition" of the other party (Searle and Vanderveken 1985:216).

3. Contrary to what is assumed by most existing studies of greetings, greetings are not necessarily devoid of prepositional content; they can be used to gather information about a person's identity or whereabouts. The Samoan "Where are you going?" greeting, for example, is seeking information about the addressee and, unlike what is argued by Sacks (1975) about the English "How are you?", in answering the Samoan greeting, a lie is not the "preferred" answer, or at least not preferred by the one who asks the question. The questioner would rather find out as much as possible about the other party's whereabouts. For this reason, the "Where are you going?" greeting can also work as a form of social control and therefore be quite the opposite of Bach and Harnish's (1979:51–52) view of the act of greeting (in English only?) as an expression of "pleasure at seeing (or meeting)" someone.

Notes

1. Although the absence of greetings or their relatively rare occurrence in certain societies has been mentioned at times – the classic example being American Indian groups such as the Western Apache studied by Basso (1972), who are said to prefer

speech communities do have verbal expressions that conform to the criteria I define in this article, although their use and frequency may vary both across and within communities. (See Hymes's comments about North American Indians in Youssouf et al. 1976:817 fn. 6.)

2. Although Searle and Vanderveken claim to be discussing the English verb *greet*, as shown by the following quote, they in fact treat *greet* and *hello* as part of the same class:

> "Greet" is only marginally an illocutionary act since it has no prepositional content. When one greets someone [but usually one does not greet by using the verb *greet!* A.D.], for example, by saying "Hello," one indicates recognition in a courteous fashion. So we might define greeting as a courteous indication of recognition, with the presupposition that the speaker has just encountered the hearer. [1985:215–216]

3. Austin defined behabitives as "reactions to other people's behaviour and fortunes and . . . attitudes and expressions of attitudes to someone else's past conduct or imminent conduct" (1962:159).
4. By *ethnography* I mean here the study of human action within a particular community through participant-observation of spontaneous encounters for the purpose of gaining an understanding of the participants' perspective on what is going on in such encounters. For a review of ethnographic methods applied to the study of verbal interaction, see Duranti (1997a: ch. 4).
5. Italians use *ciao* for both opening and closing salutations.
6. This statement is ambiguous. It should be understood as meaning either one of the following scenarios: (i) in a given speech community, the same verbal expression may be used in both greeting (viz. opening saluation) and leave-taking; or (ii) a greeting item can exhaust the encounter and in that sense function as both an opening and closing expression. An example of the first situation is the word *ciao* as used in Italy. An example of the second situation is the English question "How're you doing?" when it is not followed by an answer.
7. The use of the notion of *perceptual field* allows for the inclusion of visual and auditory access. The issue of technologies that allow for nonreal time communication (writing in general) is left out of the present discussion. (But see Duranti 1986 for a brief discussion of greetings in electronic mail.)
8. Philips (1972:377) used the notion *participant structure* in referring to structural arrangements of interaction. For the related notion of "participation framework," see Goffman 1981:226 and M. H. Goodwin 1990.
9. I am avoiding here the term *Samoan society*, given the existence of many communities around the world where Samoan is regularly spoken, including two independent countries, Western Samoa and American Samoa, each of which with different kinds of language policies and language practices, including different levels of bilingualism.
10. July 1978–July 1979, March–May 1981, August 1988.
11. As I said earlier, these four types of greetings do not exhaust the typology of Samoan greetings. There is at least one more possible candidate, the informal" 'ua 'e sau?" (Have you come?), said to someone who has just come into the house. (For a similar greeting in Tikopia, see Firth 1972.) The lack of personal experience with this greeting and the absence of examples of this greeting in my data have prevented me from including it in the discussion. One of the reviewers also suggested the expression *uā* as an abbreviation of the same greeting.

13. The laughter that follows excerpt (1) could be interpreted as an index of the awkwardness of the exchange under the present circumstances.
14. Although I have no quantitative data at this moment to support such a statement, I must mention that the greeting *tālofa* is one of the few Samoan terms that can be pronounced with the initial /t/ even in the "bad speech" pronunciation (see the appendix); in other words, it does not necessarily change to /kālofa/ even in those contexts in which all other /t/ sounds disappear. This feature of *tālofa* might be related to its common use with foreigners.
15. For abbreviations used in interlinear glosses, see the appendix.
16. This meaning makes the Samoan *mālō* related to the homophonous Tongan term *mālō*, meaning "(to be) laudable, worthy of thanks or praise" as well as "thank you" (Churchward 1959:325), and to the Hawaiian *mahalo* 'thanks, gratitude, to thank' (Pukui and Elbert 1986:218).
17. Given the different word order of English and Samoan, it is impossible to adequately reproduce here the pauses in the English translation. Samoans say "is nice the land" rather than "the land is nice." This explains why many examples of repairs are in the predicate phrase.
18. Samoan distinguishes in this case between *le asiasi* 'the inspecting/visiting' and *asiasinga* 'the visit/inspection' or the 'visiting/inspecting party'.
19. What I call "ceremonial attributes" here are parts of the *fa'alupenga* 'ceremonial style of address' for people of high status or their entire community. (There is a *fa'alupenga* of the entire country.) They include metaphorical expressions that identify particular titles and their connections to ancestors, places, and important events in Samoan history. See Duranti 1981, 1994; Mead 1930; and Shore 1982. Krämer 1902–03 (and 1994) contains all the *fa'alupenga* as known at the time of his study.
20. Syntactically, the name of the title may be simply juxtaposed next to the addressed term, as in (iii) above, or be linked to it with an oblique preposition (e.g. *'i/i* or *'iā/iā*), as in "lau kōfā i le Makua" (literally, "your honor from the senior orator"). The word *kōfā* also means "opinion (of a chief)." Orators are expected to present the position of their chief.
21. It is also possible to have CGs exchanged between two groups, for example, when two or more individuals arrive simultaneously. In these cases, however, the individuals, especially when their number is low, are each addressed within the same extended CG (Duranti 1997b).
22. Here is an example of a response by an individual to all the members of the inspection committee:

Tūla'i:	mālō (Timi)! // (?)
Timi:	mālō (1.0) afionga i ali'i – ma failāunga!
	(3.0)
	'ua lē faia lou lima inga 'ua 'ē ka'oko!
Tūla'i:	*You haven't done your hand [i.e., played cards] since you've been operated on [i.e., you've gotten a tattoo]!*

23. This third hypothesis makes this exchange similar to another one that took place a decade earlier, when another matai spoke on my behalf to explain to the Moe'ono of those days – the father of the person holding the Moe'ono title in this interaction – what I was writing on my notebook (see Duranti 1992b:91–92).
24. Given its context of use, this type of exchange is the most difficult to catch on tape unless the

greetings was made after returning from the field, although I witnessed and participated in hundreds if not thousands of these exchanges, I have very few clear and reliable "where are you going" greetings in my corpus. Despite this limitation, however, I think that some hypotheses may be made about their organization and in particular about the importance of their propositional content.

25. The term *ali'i*, which historically comes from the Polynesian term for "chief" (Proto-Polynesian *aliki*), maintains in Samoan this meaning for the higher-ranking *matai*. In (15), instead, it is used as a separate address form. It may also be used like a title in English and other Indo-European languages: for example, before a first name (*ali'i Alesana* 'Mr. Alesana') and as a descriptor (*le ali'i lea* 'this gentleman/fellow'). In contemporary Samoa, the term does not have restrictions in terms of age, gender, or animacy. Thus *ali'i* may be used with a young child, a woman (e.g. *ali'i Elenoa* 'Ms. Elinor"), or even an object (*le ali'i lea* can mean 'that person" or 'that thing"). Such a variety of uses makes it difficult to provide a translation of its use in the first line of (15), but it is clear that it should be understood as showing some form of respect, however minimum, of the addressee's social persona. It contrasts, for instance, with the informal address terms *sole* (for male recipients) and *sunga* (for female recipients), which may be translated with English terms such as *lad, brother, or man* and *lassie, sister*, or *girl*, respectively.
26. The alternative spelling and pronunciation is probably due to hypercorrection resulted from the sociolinguistic variation between *n* ([n]) and *ng* ([ŋ]) (see Duranti 1990; Duranti and Ochs 1986; Hovdhaugen 1986; Shore 1982).
27. To make it consistent with my transcription conventions (see the appendix), I have changed Krämer's spelling of *tuloga* to *tulounga*.
28. The English *acknowledgment* parallels the way in which *tulounga* is sometimes used by Samoan speakers, who seem to treat it as a nominalization as well. For example, in example (18), the first *tulounga* is followed by a genitive phrase "a le aofia ma le fongo" (of the assembly and the council).
29. Moamoa is the name of the *malae* 'ceremonial green' of the village of Falefā.
30. Lalogafu'afu'a is the name of the malae of the village of Lufilufi, the capital of the subdistrict of Anoama'a where Falefā is located. The spatial metaphor "the back of" is meant to convey the idea that the people of Falefā are expected to support and protect the people of Lufilufi.
31. "Tulou!" (Excuse me!) is commonly used to excuse oneself for inappropriately entering the interactional space occupied by people of high status (Duranti 1981).

Appendix

Transcription Conventions

All Samoan examples are taken from transcripts of spontaneous interactions recorded by the author in Western Samoa at different times between 1978 and 1988. In the transcripts presented in the article, I adopt the conventions introduced by Gail Jefferson for conversation analysis (see Sacks et al. 1974), with a few modifications.

[*Inspection*]	A name in brackets before the text of an example refers to the name of the transcript.
Tūla'i:	Speakers' names (or general descriptors) are separated from their utterances by colons.
?:	A question mark instead of a name indicates that no good guess could be made as to the identity of the speaker.
??:	Repeated question marks indicate additional unidentified speakers.
?Tūla'i:	A question mark before the name of the speaker stands for a probable, but not safe, guess.
(2.5)	Numbers between parentheses indicate length of pauses in seconds and tenths of seconds.
[	A square bracket between turns indicates the point at which overlap by another speaker starts.
=	The equal signs indicate that two utterances are latched immediately to one another with no pause.
=[	The equal signs before a square bracket between turns signals that the utterance above and the one below are both latched to the prior one.
(I can't do)	Talk between parentheses represents the best guess of a stretch of talk which was difficult to hear.

approximately the length of the blank spaces between parentheses.

(( )) Material between double parentheses provides extralinguistic information.

[. . .] An ellipsis between square brackets indicate that parts of the original transcript or example have been omitted or that the transcript starts or ends in the middle of further talk.

// Parallel slashes are an alternative symbol indicating point of overlap.

o:: Colons, single or double, indicate lengthening of the sound they follow.

Abbreviations in Interlinear Glosses

Art = article; Comp = complementizer; Emp = emphatic particle; incl = inclusive; Perf = perfective aspect marker; pl = plural (as opposed to singular or dual); Pres = present tense; Voc = vocative particle.

"Good Speech" and "Bad Speech"

Samoan has two phonological registers, called by Samoans *tautala lelei* 'good speech' and *tautala leanga* 'bad speech'. "Good speech" is strongly associated with Christianity, written language (e.g., the Bible), and Western education (Duranti and Ochs 1986; Ochs 1988; Shore 1982). It is thus required of children and adults most of the time in the schools and during church services and most church-related activities. "Bad speech" is used in everyday encounters in the homes, at the store, or on the road and is also characteristic of most formal contexts in which traditional speechmaking is used, including the ceremonial greetings discussed in this article. There is also a considerable amount of shifting between these two registers (Duranti 1990; Ochs 1985, 1988). All the examples reproduced here are given with the pronunciation originally used by the speakers, which is usually "bad speech." When discussing words or phrases in the text of the article, I have usually used "good speech," unless I am referring to words actually used by people, in which case I put them between obliques to frame them as different from traditional orthography, e.g. /lau kōfā/ and /fongo/ instead of *lau tōfā* and *fono*, respectively. This means that the same word may be found in two different versions: for example, the expression *tulounga* is /kulounga/ in the transcript of a speech in a fono in which it was used. I followed standard Samoan orthography, with one exception: I substituted for the letter *g*, which traditionally stands for a velar nasal ([ŋ]), *ng*, which is more reader-friendly for non-Polynesianists. The inverted apostrophe (ʻ) stands for a glottal stop ([ʔ]).

Moaning, Whinging and Laughing: The Subjective Side of Complaints

Derek Edwards

Introduction: The Subjective Side of Complaining

Complaining deals not only with the complaint's object, the thing being complained about, but also its subject, the complainer (or 'complainant'). Let us call this the *subjective side* of complaining, the way that a complaint may index the speaker/complainer. Complainers may display or manage a range of speakerindexical characteristics that we can gloss as attitude, stance, investment, jocularity, and so on. A complaint can be done in ways that enhance its objectivity and seriousness, and its chances of being taken seriously. On the other hand, rather than simply reporting factual and complainable matters, a complainer may (also, or instead) be heard as moaning, whinging, ranting, biased, prone to complaining, paranoid, invested, over-reacting, over-sensitive, or whatever other vernacular category might apply. The present study explores this 'subjective side' of complaining, not as an analytically discernible characteristic of speakers, but as a performed, managed, interactionally produced and interaction-sensitive feature of how complaints are done. Of course, not only complaints, but discourse of all kinds, are available for evaluative inferences about the speaker: 'our accounts may themselves be evaluated ... in terms of the propriety or fairness or justice or accuracy with which we have reported some (external) events, or our motives in doing so' (Drew, 1998: 295–6). Sacks (1992) also drew special attention to the speaker-indexical properties of compliments and complaints, particularly with regard to 'safe' and 'unsafe' ones.[1]

Some studies distinguish between *direct* and *indirect* complaints. Direct complaints are made against the talk's current recipient (e.g. Dersley and Wootton, 2000); indirect complaints are made about someone or something

else (e.g. Drew, 1998). The present study focuses on indirect complaints. This focus is dictated partly by what is available in the materials used for the study, but also by the need to restrict the scope and complexity of the analysis. We should also note that the direct/indirect dichotomy is not always straightforward. For example, Sacks (1992) observed how complaining about a restaurant to one's fellow diners may implicate the one who brought you there, requiring some delicacy in how it is done. Similarly, there are settings such as family therapy and neighbourhood complaints mediation (Stokoe, 2003), in which complainees (those against whom complaints are made) may be present but not directly addressed.

Various studies of everyday talk have focused on how some object is made a 'legitimate complainable' (Pomerantz, 1986). *Objectification* of a complaint is one way (in fact, a variety of ways) of handling the subjective side; the more a complaint can be built as a factual description of its object, the less available it is to be heard as stemming from the speaker's disposition to see, feel, or interpret things negatively. Members' objectification methods include 'script formulations' (Edwards, 1994) in which specific events are offered as instances of generalized, recurrent patterns; extreme case formulations (Edwards, 2000a; Pomerantz, 1986); independent corroboration by other victims and witnesses (Edwards and Potter, 1992); graphic narrative description (Geertz, 1988; Potter, 1996; Wooffitt, 1992); verbatim quotations with 'active voicing' (Wooffitt, 1992); invocation of category-based knowledge entitlements (Potter, 1996; Whalen and Zimmerman, 1990); uses of factual presupposition;[2] and joint production of the complaint itself. The latter, joint production, is a notable feature of indirect complaints where the complaint's recipient affiliates with, and may join in with, the complaint's production. There are examples of joint production in the data used in this article.

The analytical focus of this study, however, is on ways in which a complaint's subjectivity is actively managed. A subjective stance of some sort is typically a performed feature of the complaint's production and receipt. While drawing heavily on the principles and methods of conversation analysis, it is also a particular feature of discursive psychology to explore the close, mutually implicative nature of subject–object relations, as a managed feature of discourse of various kinds. In the case of complaints, this is a matter of how talk constructs the object of a complaint in combination with the dispositions and mental states (in commonsense terms) of the complainer, in ways that handle the indexical and interactional features of complaining.

Identifying Complaints

In order to collect samples for analysis, it was necessary to start with at least a loose, to-be-refined notion of the phenomenon, in this case, 'complaints'. Speech acts such as questions, requests, and commands are types that once seemed relatively straightforward to define in terms of grammar and felicity conditions (Austin, 1962; Searle, 1969). Yet even for those types, problems of 'indirectness', [illegible] turn-taking and indexicality, have hugely

Levinson, 1979, 1983; Schegloff, 1988). 'Complaints' elude formal definition, and remain a largely normative and vernacular, rather than technical, category.[3] That is to say, characterizing something as a *complaint* or an *accusation* is properly understood as part of the phenomenon, part of the practices in which people themselves may use words to construct the nature of things. In conversation-analytic terms, complaints may start to be technically specifiable, if they turn out to occur in bounded sequences with clear beginnings, endings, and interactional characteristics. Although some complaints are indeed clearly bounded (Drew, 1998), others are not so well marked (Dersley and Wootton, 2000; and this applies to several examples used for the present study). Let us explore, then, the vernacular sense of *complaint*.

The word *complain* overlaps and contrasts with a range of relevant alternatives such as *criticize*, *(be)moan*, *accuse*, and *denigrate*. But it is a feature of complaining, as an actual conversational activity (rather than a topic for conceptual analysis), that the word itself is seldom used. The same stretch of talk might also be glossed as criticism or accusation, troubles-telling, or merely story-telling or factual reportage, which are potentially relevant alternatives for speakers when characterizing their activities. Speakers may even work against the notion that what they are doing is complaining, rather than simply reporting some observations. For example, callers to helplines for reporting child abuse often express their 'concerns' (Potter and Hepburn, 2003), where any suspicion that they may have a personal grievance with their neighbours might threaten the factual objectivity of what they are reporting, and question for whose sake they are reporting it. Given that a complaint involves some kind of *grievance*, this immediately makes relevant something that a speaker may work to minimize, which is any kind of motivated, or dispositional, basis for what they are saying. This makes complaints particularly interesting when examining the management of subjective investment in descriptive discourse.

We start, then, from the notion that 'complaining' is a defeasible vernacular category with normative, oriented-to properties and consequences. There is a set of participant roles: a *complainer*, an *object* or complainee (if the object is a person), and a complaint *recipient*, who will also be the object/complainee in cases of direct complaints. Various kinds of 'footing' (Goffman, 1979) are possible, where a speaker may offer a complaint on someone else's behalf, or as a relay or 'animator' of another person's complaint. Complaints are also inherently *negative*, just as criticisms are, and take the form of morally implicative stories and descriptions of people and places. The complainee's *agency* is normatively invoked, such that someone can be held culpable or negligent. Complainers may 'work up' a complainee's agency, through how their actions are described and sequentially narrated. For example, 'overdetermined descriptions of actions' (Drew, 1998: 318)[4] can suggest deliberateness, and thereby enhance the actor's culpability. A complaint also includes a *grievance* (or infringement, or transgression), which is something that 'criticism' need not include; or, to put it another way, something that makes criticism start to sound like complaint. Typically,

The following analysis focuses on ways in which indirect complaints handle or manage the complainer's subjectivity, including their disposition to complain, and their current 'attitude' to the complaint's object. It is worth emphasizing at this point that 'subjectivity' is not simply a threat to a complaint being taken as serious and factual. It may do that, but it may also enhance factuality and seriousness, and be oriented-to in that way by recipients, by signalling how aggrieved, long-suffering, and non-disposed to complaining, the complainer may be.[5]

Materials and Method

The main materials used for this study were the extensive set of mundane domestic telephone conversations collected by Elizabeth Holt and transcribed by Gail Jefferson using the conventions developed for conversation analysis; special thanks to Gail Jefferson for the considerable time and expertise involved in transcription. These materials are supplemented, for one specific analytic feature, by examples from the specialized setting of neighbourhood complaint mediation, collected by Elizabeth Stokoe. The use of conversation-analytic transcription enables a focus on precisely how complaints are delivered and taken up in talk-in-interaction. Extracts are selected not only as clear or representative examples of a phenomenon, but also on the basis that they generally contain several of the phenomena under analysis, which makes for a more economical use of multiple data sequences.

The procedure was to work through the audiotapes and transcripts, collecting candidate examples of complaints. Examples were excluded that seemed to be criticism or accusation without complaint; in other words, those that lacked a sense of grievance. This collection was then further reduced to those which displayed the range of 'subjectivity-managing' features that became the focus of close analysis. The analysis itself applies the basic principles of conversation analysis, with a view to discursive psychology's central concern with how psychological characteristics (in this case, the subjective side of complaining) are handled as part of talk's performance of social actions.

Analysis

The analysis outlines four ways in which a speaker/complainer's subjectivity is displayed and managed. Although the four may occur together, there is no claim or requirement that they are always present whenever a complaint is made. Rather, they are to be understood as optional members' methods; that is to say, recurrent and systematic ways in which the (potential) subjectivity of a complaint may be handled, and where, on each occasion, there is some interaction-oriented work being done through their use:

1 *Announcements.* Before elaborating a complaint, speakers may formulate

which also provides for how the complaint recipient might appropriately respond to it.

2. *Laughter.* Laughter may display 'attitude' and provides for receipt.
3. *Displacement.* Complaints may be directed at a common-sensically lesser or less obvious object, sometimes comical in its choice and description.
4. *Lexical descriptions.* Words alternative to *complain*, such as *moan* or *whinge*, characterize a complaint's subjective basis, and may be used to counter and undermine its factual grounds or seriousness.

Analysis 1: Announcements

A recurrent feature of complaints is that the complainer signals not only that a complaint is coming, but also their stance or reaction on the matter. By formulating how they are affected, whether at the time of the offence or now at the time of reporting it, the complainer provides the essential *grievance* component of complaining, signals its seriousness and current relevance (given that it is usually a past event), and also attends to the recipient's task of how to hear and respond:

(1) Holt:M88:1:5:22

1	Rob:	→	↑Well ↓and the <u>o</u>ther thing I wz disgusted b- I'm
2			↓sorry you're getting'n <u>ea</u>rful'v this you couldn't'v:
3			phoned't a better ↑<u>ti</u>:me,hheh ↑he [h
4	Les:		[.hh ↑<u>Oh</u> that's
5			alri:ght,
6	Rob:		Well the ↑other thing ↓I've (.) found very strange
7			is ↑there weren't any <u>dic</u>tionaries in the classroom
8	Les:		.t.k.<u>hhh</u> [h
9	Rob:		[<u>Not</u> actua [l
10	Les:		[↑<u>No</u> children's dih- e-w'l not
11			many children's dictionaries,hh
12	Rob:		W'l, they ↑<u>ha</u>ve those little (.) b<u>oo</u>klety ↓things

Extract 1 is several minutes (22 pages of transcript) into a phone call between Robbie and Lesley, two schoolteachers who are sharing stories and complaints about various other staff at their school. The announcement is in line 1: 'the <u>o</u>ther thing I wz disgusted b(y)', and the complaint proper is in line 7, the absence of dictionaries. The use of the extreme case formulation (ECF) 'weren't any' helps mark it as a complaint (Pomerantz, 1986).

The extract contains features that display the interaction-orientation of the upcoming complaint and its announcement. Robbie cuts off the announcement (line 1) to insert an apology to Lesley (lines 1–3) for what is clearly to be a further complaint in a series. The description "n <u>ea</u>rful'v this' implies that Lesley may be tired of hearing them. Lesley's '↑<u>Oh</u> that's airi:ght,' grants Robbie permission to continue, although there is no expression of enthusiasm, and no obvious uptake of Robbie's irony and laughter ('you couldn't'v: phoned't a better ↑<u>ti</u>:me,

of complaining. Following Lesley's less than enthusiastic receipt of a projected additional complaint, Robbie downgrades her subjectivity announcement from 'disgusted by' (line 1) to 'found very strange' (line 6), still prior to delivering the complaint. Further recipience problems and downgrades are then done on the complaint itself, with Robbie shifting from the extreme 'weren't any dictionaries' to the softened 'not actual' and 'not many' (lines 9–12; cf. Edwards, 2000a, on the interactionally occasioned uses of ECF softeners).

The details of extract 1, therefore, show the participants' sensitivity, during the announcement and production of a complaint, to the complaint's projected and ongoing receipt. The complainer's subjectivity and stance are a feature of that. Note that the first object repaired is not the complaint itself, but the nature and strength of Robbie's feelings about it. Faced with a possibly non-affiliative receipt, Robbie downgrades the grievance (from 'disgusting' to 'strange'), and jokes at her own reporting of it (lines 2–3), prior to making the complaint proper.

Extract 2, from a phone conversation between Lesley and Joyce, is the start of a complaint sequence that we return to later, in extract 6:

(2) **Holt:C85:4:2**

1	Les:	→	°Oh:.° .hh **Yi-m-You ↓know I-I-I'm broiling about**
2			**something hhhheh** [**heh .hhhh**
3	Joy:		[**Wha::t.**
4	Les:		**Well that sa↓:le. (0.2) at- at (.) the vicarage.**
5			(0.6)
6	Joy:		Oh ↓ye[:s,
7	Les:		[.t
8			(0.6)
9	Les:		**u (.) ih Your friend 'n mi:ne wz the:re**

Lesley's expression 'I'm broiling about something' again serves as an announcement of an upcoming complaint. As Drew (1998) notes with regard to this sequence, it formulates the complainer's sense of grievance, which is a canonical component of complaints:

> Reporting in this way their emotional response – their sense of grievance – enables complainants to characterize how far the other's behavior has caused offense. In this respect it may be noted that these expressions of indignation are formed as first person assessments, for example, as 'I was so angry,' 'w'l tha tee:d me o::ff,' rather than as generalized assessments (in the form 'it was so ...'). (Drew, 1998: 311)

But note also the way Lesley delivers her announcement. The term *broiling* metaphorically signals a particularly strong reaction to an event that turns out to be a person saying to her at a vicarage jumble sale,[6] somewhat teasingly, 'hhello Lesley, (.) ↑still trying to buy something f'nothing'. Without detailing the whole story sequence, extract (2) contains, already in the announcement

Combined with the metaphor 'broiling', this is hearable as Lesley announcing an upcoming complaint whose possibly ironic, even comical features, and her proposal not to be taking it too seriously, are projected in how the announcement is delivered. Lesley's announcement, through its combination of a strong metaphor and laughter, manages to provide a sense of Lesley being truly aggrieved, while not making too much of it. Again all of this is accomplished, or at least projected, along with the further ironic remark 'Your friend 'n mi:ne' (line 9), prior to the complaint itself being told.

Extract (3) is the beginning of Lesley's relaying to Gwen, a complaint made by a third party, Jean-Claude, who has written a letter to Lesley. The complaint itself is examined in extract 10; here we are looking at Lesley's initial announcement of it:

(3) Holt:J86:1:4:1

1	Les:		We:ll. We ↑got a ↑letter t'da:y, an' ih- (.) it wz
2			very: Jean Clau↓:de you kn[ow.=how'e]goe:s,
3	Gwe:		[Y e : : s?]
4			(0.2)
5	Les:	→	.hhh An' (.) an' really it made us lau:gh, [but- it=
6	Gwe:		[hhh!
7	Les:	→	=wz very ↓sa↓:d.
			(0.2)
8	Les:		[Eh:m]
9	Gwe:		[Oh::]:?
10			(1.4)
11	Les:		eHe says that his mother's left his ↓fa ↑ther,

Lines 1–7 contain the announcement, in which Lesley signals various subjective takes on the yet-to-be-recounted complaint. For her own part, as the complaint's relayer or 'animator' (Goffman, 1979), it is something both humorous and sad (lines 5–7), where Lesley's prime response is probably the humour of it. There are several bases for claiming humour as primary: (1) it comes first, in line 5, with 'it wz very ↓sa↓:d' offered second, where it works as a corrective (introduced by 'but') to any impression that she might be making light of someone's distress, or indulging in *Schadenfreude*; (2) it is a first person assessment (cf. Drew, 1998: 311), characterizing Lesley's actual reaction, in contrast to the generalized assessment 'it wz very ↓sa↓:d'; (3) Lesley has already prefaced Jean-Claude's complaint as dispositional, as a recognizable kind of thing that he does, and therefore as perhaps not too serious[7] – 'it wz very: Jean Clau↓:de you know.=how'e goe:s' (lines 1–2).

The upcoming complaint is not in fact the content of line 11, that Jean-Claude's mother has left, but develops in extract 10 in ways that we shall explore with regard to displacement and humour. The point here, as with extracts 1 and 2, is the quite detailed subjectivity-managing work done by Lesley in how she announces the complaint, prior to relating it. An expression of sympathy and

go on to share a laugh on the basis that they are not being heartless. This echoes other studies of phenomena such as the role of 'weak agreement' in producing and projecting disagreements (Pomerantz, 1984); the work done by 'show concessions' (Antaki and Wetherell, 1999); and Sacks's remarks on how complaints themselves are recognizable through, rather than despite, their being accompanied by contrastive appreciations of the complaint-object (Sacks, 1992: vol. 1, 359).

Extracts (4) and (5) are further examples of announcements that formulate the speaker's subjectivity; in these cases the speaker is also the complainant:

(4) Holt:X(C):2:1:9:1

1	Moi:		(...) Les I just wanted a' ↓sa:y .hhhhheh:m::: .t I'm
2			sorry about what I hea::rd abou:t (.) an' I'm not being
3			nosey is there anything I c'n do: or (.) can I help in
4			any wa[y o: :]r would you] rather not]talk about it.]
5	Les:		[↓eh::] h e h heh↑]What about]the ↑bu::rglar]
6			(0.2)
7	Moi:		.t ↓Ye:s
8			(.)
9	Les:		↑Uhhh! .hh (.) ↓No:::. It's very kind of you: .h
10		→	↑No:::. .hh In fact (.) ↑we ↓thought it wz killingly
11			funny really,

(5) Holt:88U:1:4:5

1	Dana:	(...) an' I wz going abs'utely crazy I mean I wz
2		sat there .hh leaping up'n do:wn
3		(0.9)

In extract 4, Lesley's '↑we ↓thought it wz killingly funny really' precedes her account of a recent burglary at her house. In this case, rather than simply announcing the story, it prefaces it by correcting Moira's assumption that it might be a delicate or painful matter to talk about (lines 1–4). On the contrary, Lesley laughs off any sense of seriousness and delicacy (line 5), and goes on to formulate the whole thing as 'killingly funny'. Again, the initial focus for both Moira and Lesley is on feelings and attitude, rather than the event itself. Extract 5 is Dana's preface to a rather jocular complaint about having been kept waiting for a lift home by someone who kept ignoring all signals that Dana wanted to leave.

One thing to note in these examples is that subjectivity formulations, and their use within story and complaint announcements, can be used to enhance, as well as to undermine, the factuality or seriousness of the event concerned. The extremity of 'going abs'utely crazy' and of 'leaping up'n do:wn', lend themselves both to the seriousness of anything that might cause such reactions, but also to a potential for jocularity, or indeed both (Edwards, 2000a). It is a matter of specific lexical choices, and how they are used, indexically and sequentially, on any occasion of telling. We have seen that formulating a reaction or grievance

occasioned by events, can enhance a complaint's credibility. An important function of complaint announcements is to signal to the recipient what kind of stance or attitude is being adopted and proposed.

Analysis 2: Laughter

Laughter occurs in some of the extracts we have already examined: see extract 1, line 3, extract 2, line 2, and extract 4, line 5. This is in addition to reports such as 'really it made us lau:gh' (extract 3), and '↑we ↓thought it wz killingly funny really.' (extract 4). Laughter occurs at various junctures: in announcements of upcoming complaints, in the course of complaining and narrating complaints, and in complaint receipts. The unexpected prevalence of laughter in the complaint sequences collected for this study is probably related to their being indirect complaints, and ones that often concern past circumstances. In any case, detailed studies of laughter in conversational interaction (e.g. Glenn, 1995; Haakana, 2001; Jefferson et al., 1987) have revealed various kinds of 'serious' business being performed, including participant alignment and misalignment. Accordingly, rather than interpreting the laughter that accompanies complaints in terms of people simply finding their troubles amusing, we explore the recipient-designed work it does in managing stance, 'take', or attitude. In particular, laughter can signal that a complainable item, even when serious, is not something that the complainer is disposed to moan about, indulge in, or make heavy weather of (Jefferson, 1984).

Extract 6 continues a few turns after the end of extract 2, in which Lesley announced (with laughter) her upcoming complaint about an incident at a vicarage jumble sale. In extract 6 she relates the incident:

(6) Holt:C85:4:3

1	Les:		AND uh ↑we were looking rou-nd the ↓sta:lls 'n
2			poking about 'n he came up t'me 'n he said Oh:
3			hhello Lesley, (.) ↑still trying to buy something
4			f 'nothing,
5	():		.tch!
6	Joy:		.hh[hahhhhhh!
7	Les:		[↑ .hhohhh!
8			(0.8)
9	Joy:		Oo[: : :]: L e s l e y]
10	Les:	→	[↑Oo:.]ehh heh ↑heh]
11			(0.2)
12	Joy:		↓I:s [n ' t] [↓he
13	Les:		[↑What]do ↑y[ou ↑sa↓:y.
14			(0.3)
15	Joy:		↓Oh isn't he ↓drea:dful.
16	Les:		°eYe-:-:s:°
17			(0.6)

19 Joy: Wh<u>a</u>t'n <u>a</u>w::f'l m<u>a</u>::[:::n
20 Les: → [ehh heh-heh-↑h<u>e</u>h
21 Joy: <u>Oh</u>:: honestly, ↓ <u>I</u> cannot stand the m<u>a</u>n it's j<u>u</u>st
22 (no [:)
23 Les: [<u>I</u> thought well I'm g<u>o</u>n' tell J<u>o</u>yce that,
24 → ehh[h<u>e</u>h [heh-heh he-e].<u>uh</u>: ↑.e [h .eh↑ .hhhhh
25 Joy: [( ) [<u>0 h : : : :</u>.] I [d<u>o</u> think he's
26 dr<u>e</u>adful
27 Les: .tch O<u>h</u>: dea-r
28 Joy: <u>Oh</u>:he r[eally <u>i</u>] :s,
29 Les: [↑<u>He</u> dra-]ih-h<u>e</u> (.) took the w<u>i</u>n' out'v my
30 → sails c'mpl<u>e</u>tel(h)y

The analytic focus here is not the complaint itself (see Drew, 1998, on this sequence), but how Lesley manages her sense of grievance, and her attitude as complainant. Although Lesley does plenty of laughing (lines 10, 20, 24, 30), Joyce notably does not, but continues to receive the complaint as serious (cf. Jefferson, 1984, on the withholding of affiliative laughter in troubles-telling receipts). Yet Joyce does not sound misaligned; it is as if she is taking it seriously on Lesley's behalf, while Lesley herself, as the aggrieved complainant, provides all the complainable materials that Joyce needs (lines 1–4), while making light of it. It remains a clearly identifiable complaint, but one told as an almost delightfully painful story, rather than something serious with real damage done.

It is worth considering what it is that Lesley may be managing here. The offence itself, rather than being a clear insult, can easily be heard as an ironic remark, teasing or poking fun at her. In that case, for Lesley to be simply offended could display her as having no sense of humour, or as over-sensitive. That the man was teasing, rather than doing serious character assassination, seems warranted by Lesley's expressed difficulty in knowing how to respond ('↑ What do ↑ <u>you</u> ↑<u>sa</u>↓:y' line 13; and 'h<u>e</u> (.) took the w<u>i</u>n' out'v my sails c'mpl<u>e</u>tel(h)y' lines 29–30). Some ambiguity of intent is always part of a good tease, and can present problems for recipients (Drew, 1987). Lesley's mixture of complaint and laughter conveys a sense of being wrong-footed by the man, and unsure of how best to evaluate the episode, and therefore what stance to take on it both at the time and now in the telling. Whether the man was poking harmless fun at her, or slandering her, or both, is probably what makes him so 'dreadful', which is Joyce's response in line 15 immediately following not the reported incident itself, notably, but Lesley's '↑What do ↑<u>you</u> ↑sa↓ :y.'

Extract 7 is a report of a complaint that is now, so to speak, ancient history:

(7) Holt:88U:2:4:25

1 Car: (...) I said well (.) <u>Ron</u>ald said he 'ad mell<u>o</u>wed which
2 'ee <u>had</u> I m<u>e</u>an .t.hhh It was r<u>a</u>ther- h<u>i</u>s b'aviour wz
3 <u>rath</u>er different from: wh<u>e</u>n 'ee met me in the office
4 after m<u>y</u> f<u>a</u>:ther'd died'n said ↑<u>Oh:</u> they tell me y<u>ou</u>r
5 f<u>a</u>:ther h<u>a</u>s died 'n I nearly said sh'd 'ee've asked

6 → your p(h)erm(h)issio(h)o[n
7 Ski: → [Oowehhhh hhah ha:h uh-:
8 .uh:: .uh .hfhhhh

Carrie is telling Skip about a man who once made an insensitive remark to her, following the death of her father. Her laughter is in line 6. The complaint itself is no longer a live issue; the offender has reportedly 'mellowed' (line 1), which Carrie herself confirms ('which ee' had' – lines 1–2). She reproduces the complaint in the form of a re-enacted, actively voiced dialogue (lines 4–6; cf. Lesley in extract 6). Note the precise placement of her laughter, not inside the complaint-object, which is what the man said to her, but rather inside her own ironic response: 'I nearly, said sh'd 'ee've asked your p(h)erm(h)issio(h)on'. Carrie is rehearsing her reaction to the man's insensitivity. The insensitivity complaint remains hearable, but Carrie also manages, in its telling, to display that she is not making heavy weather of it.

A particular feature of Carrie's story is that her jocular, ironic reply did not actually happen; it is reported as something she 'nearly, said' (line 5). This device, of nearly having said something, whatever its basis in fact or memory, enables what may be a current stance or attitude to be back-dated to the original events, as (in this case) an ironic rather than painful reaction to a piece of insensitivity. In the telling, and in the precise manner of its formulation and laughed-through delivery, Carrie conveys a recipient-designed stance upon the event as speaker/complainer. Skip's nonverbal response (lines 7–8) receives it just as Carrie offers it, as a somewhat shocking (his initial news-receipt 'oowehhhh'), but also laughable story (the immediately subsequent laughter particles 'hhah ha:h').

Jefferson remarks on a pervasive asymmetry of laughter in troubles-tellings (a phenomenon that overlaps somewhat with indirect complaints), where troubles-tellers may laugh, but recipients withhold laughter:

> ... a laughing troubles-teller is doing a recognizable sort of job. He is exhibiting that, although there is this trouble, it is not getting the better of him; he is managing; he is in good spirits and in a position to take the trouble lightly. He is exhibiting what we might call 'troubles-resistance'. But this does not mean that ... a recipient is invited to join in the merriment, to also find the thing laughable ... In troubles-talk, it appears to be a recipient's job to be taking the trouble seriously; to exhibit what we might call 'troubles-receptiveness'. (1984: 351)

One useful thing that this subjectivity-work (displaying 'good spirits', etc.) accomplishes, is enabling a complaint story to be told without placing the current recipient in the awkward position of hearing 'an earful' of troubles (see Robbie's apology in extract 1), and perhaps being expected to offer advice or help (see Moira's opening in extract 4, where both sensitivity and possible assistance are invoked). Indirect complaints, being delivered to an uninvolved complainee, require some kind of management of the

relevance – indeed, of the complainee's uninvolvement. Various risks may arise if not forestalled, such as the complainee hearing the complainer's grievance as here-and-now rather than there-and-then; or the complaint as somewhat 'direct' or implicative of them (cf. Sacks, 1992: vol. 2: 297). Laughter can manage recipiency by marking the speaker as not-here-in-this-telling worried/upset/angry, and so on, but rather, that those 'feelings' are a proper part of the (elsewhere) offence, and yet still felt, and even re-animated in the telling.[8]

Analysis 3: Displacement

Ironic delivery of complaints can be accomplished in various ways including laughter, the use of excessive and extreme versions of events (Edwards, 2000a), and a caricatured tone of voice best appreciated by listening to the audiotape. The device examined here, however, is the use of a 'displaced' complaint object. That is to say, where there is an obvious and serious object for complaint, such as being burgled or losing one's parents through marital separation, the speaker may complain instead about what might be considered, normatively, to be secondary or incidental details. Displaced complaints resemble 'buffer topics' in troubles-tellings, these being topics 'biased towards nonserious treatment' that can provide 'a time out for pleasantries' (Jefferson, 1984: 351ff.). Buffer topics may be relevant or not to the trouble itself, and Jefferson focuses on their relevance in laughter sequences where, unlike with troubles proper, recipients will do affiliative laughter. Displaced complaints include some buffer topics of that kind, but are nevertheless objects of complaint.

Extract 8 continues Lesley's report to Moira about the burglary (see extract 4) that Moira has tentatively and sensitively inquired about, and that Lesley has prefaced as 'killingly funny really'. Extract 8 begins at a point in the story after Lesley's husband had got out of bed to investigate a noise downstairs, and discovered evidence of a break-in:

(8) Holt:X(C)2:1:9:3

1	Les:		(...) u-we:ll what I did ↓ have agains' this bu:rglar
2		→	.hh was he: his ↑ muddy fee:t.hh
3			(0.3)
4	Moi:		khh! (.) h[a ho hu-uh]
5	Les:		[You know: ↑ a]ll over the cushion[::s eh-]
6	Moi:		[You:r]
7			ti:dy mi:n:d. O[h : : :]dear
8	Les:		[We:ll h]heh! .hh You ↑ should see ↑ the
9			↑window ↓s:ea:t.h

Rather than objecting to the obvious offence, indeed crime, of being burgled, what Lesley complains about is the muddy footprints the man left. Burglary is something familiarly characterized as a traumatic personal violation, and Moira had oriented to that in broaching the topic very delicately in her initial inquiry

as 'displaced' is signalled in Lesley's contrastive expression, 'what I did have agains' this bu:rglar ... ' (line 1), which contrasts it to what one might expect to be complainable, the crime itself. In fact, nothing appeared to have been stolen, and the muddy footprints were apparently the only effective damage. But again, the irony not only orients to that displaced, downgraded object (muddy feet rather than break-in and possible theft), but also displays Lesley's above-it-all coping attitude, produced in contrast to Moira's initial projection of it all as a very sensitive matter.

Moira's expression 'you:r ti:dy mi:n:d' (lines 6–7) subjectivizes Lesley's complaint, in line with Lesley's ironic production (Lesley responds in line 8 with another laughter token 'We:ll hheh!'). At the same time, Moira acknowledges that for *someone such as Lesley*, muddy footprints are a serious enough matter ('Oh::: dear', line 7). Through displacement, uptakes and laughter particles, Lesley and Moira manage to share a notion of a burglary that did some damage, but that Lesley is well on top of, and able to laugh about. The nature of the break-in and its consequences, the offence and grievance, is tied up with the management of subjective attitude to the event and its telling.

In extract 9 Lesley responds to a later inquiry about the burglary, from Arthur:

(9) **Holt:X(C)2:2:2:2**

1	Art:		(...) How how've you settled in now after thē: (p)
2			visitor.
3			(0.2)
4	Les:		.hhh Oh: (.) eh hheh he .hh Well- (0.2) .h (.) I
5		→	↑mus' say this finger ↓print stuff makes a me:ss but
6	Art:		Oh:.
7	Les:		An' I can' get the mud off the cushion: but a ↑part
8			f'm that we're alri:gh[t?
9	Art:		[What a ↓nuisance.
10			(0.2)
11	Les:		Ye: [s.
12	Art:		[(Fancy) galloping all over the cushion this is
13			ridiculous isn't

The displaced complaint on this occasion is the fingerprint dust left by the police (line 5), followed again by the muddy cushion (line 7). The notion of displacement is normatively relevant again, in that the obvious object for complaint would expectably be the burglar and the break-in, rather than the police doing their normal investigative work. Note how Arthur makes his inquiry (lines 1–2). He does not broach the topic with as much delicacy as Moira in extract 4, but still his inquiry is into how Lesley might be coping with the experience ('how've you settled in now'). He also uses the euphemistic category 'thē: (p) visitor', rather than, say, 'the burglar', where the pronunciation 'thē:', with the long vowel, displays an orientation to the category *visitor* as somewhat 'thoughtfully' selected

These details are the context for the fingerprint complaint, whose *displaced* status is somewhat marked in how Lesley delivers it, preceding it by 'well' and 'I ↑mus' say', which offer it as a contrast to what might be expected from her.[9] Rather than reporting how she is coping with the experience of having been burgled, Lesley offers a complaint about the mess left by the police. Arthur receives that in line 6 as news ('Oh:.'), and takes Lesley's complaints seriously (line 9). The sequence continues in mildly ironic manner, with Arthur appreciating the point of Lesley's complaint, while nevertheless formulating it in an upgraded, metaphorical, and rather comical manner as 'galloping all over the cushion' (line 12). Similarly, Arthur's description 'ridiculous' (line 13), in line with the gently ironic tenor of this sequence, connotes laughing at something and not just condemning it (which a term such as *awful*, or *disgraceful*, would do). Through citing displaced objects of complaint, then, Lesley has again managed to convey the genuinely complainable nature of those things, but also their ironic status and, with that, how well she is coping with the more obvious experience of having been burgled, that Arthur (like Moira in extract 4) had delicately inquired about.

Extract 10 starts a few lines after the end of extract 3, where Lesley has announced to Gwen the laughable but also 'very ↓sa↓:d' content of a letter from Jean-Claude, in which 'He says that his mother's left his ↓fa↑ther' (extract 3, line 11). Jean-Claude's complaints about it are reproduced here by Lesley, accompanied by laughter from both her and Gwen:

(10) Holt:J86:1:4:2

1	Les:	.hh An' he s- Oh:-: it's such a sad letter really he
2		writes um: .tch .hhhh (0.3) oh I haf to buy my own
3		stea:ks 'n[£cook th'm£ ehh ↑heh [h
4	Gwe:	[.hhh [aah-ah-[ah-ah-[ah
5	Les:	[.hhh [An'
6		my father wakes me up every mo:rning an' he snores
7		all ni:ght
8	Gwe:	Oh↑:[↓:.
9	Les:	[And uh eh- (0.3) e-he wants me as a sla:ve an'
10		I've got to cook .hhh an' clean for him: an' .hhh (.)
11		do the washing an' £look£ a:f[ter the shee [ps.hh
12	Gwe:	[h h : : : : [ha-ha-ah-
13		ah-ah-ah-ah.hhhehhh ↑I:t looks as though the fa:ther
14		stayed in the ↑house the ↓:[n.
15	Les:	[.h ↑Yes m:Madam ↓Duval's
16		gone off to Rouen.

The section omitted between extracts 3 and 10 deals with how the parental separation was not unexpected, and Lesley and Gwen discuss the topic more sympathetically later in the call. Our focus here is on how Lesley recounts Jean-Claude's complaint about his father. There are various indications of irony and

'smile voice' (marked by the £ signs) manner of Lesley's delivery in lines 3 and 11, performed inside the description of the mundane household chores and services that Jean-Claude is now complaining about having to do. There is the standardly comic 'snores all ni:ght' (lines 6–7), which is also extrematized, at least in Lesley's reproduction of it ('all ni:ght'; cf. 'every mo:rning' and 'wants me as a sla:ve'), and the comical French spelling error 'sheeps' (line 11), faithfully reproduced by Lesley, and laughingly received by Gwen. What makes all of this a laughing matter is not only its enactment as funny, but *displacement*. Jean-Claude's reported complaints are not about the trauma or sadness of his parents' separation, family break-up, his father's distress, or his missing his mother, but rather his father's snoring, and his having to do the household chores.

As we also noted for extract 3, Lesley's remark in extract 10, line 1, 'it's such a sad letter really', is echoed in other remarks throughout a long sequence, in which she displays sympathy and concern as well as jocularity. Lesley works at ensuring that her jocular treatment of the letter does not index her as laughing heartlessly at Jean-Claude's expense. This is discursive psychology in action, a speaker's display and management of subjectivity and attitude in talk. In keeping with discursive psychology's general approach to such matters (Edwards and Potter, 2005), there is no implication here that Lesley or anyone else is expressing 'actual' or 'underlying' states of mind. Rather, these notions of investment, irony, attitude, etc. indicate participants' practices and concerns, performed and oriented-to in how they talk.

Analysis 4: Lexical Descriptions

When speakers formulate the kinds of speech acts done in complaining, the word *complain* is not the only option. An ad hoc selection of related alternatives might include *blame, accuse, criticize, slander, slag off, castigate, denigrate, censure* and *condemn*. We have noted that some of these alternatives, such as *accuse* and *criticize*, while applicable to lots of actions that could also be called complaints, do not require the sense of transgression and grievance that *complain* possesses. But there is a further indefinitely extendable set of alternatives that not only include a sense of grievance, but also add an element of subjectivity and investment on the part of the complainer. These include *moan, grumble, go on* and *on, gripe, carp, grouse, nag, bellyache* and *whinge*.

The word *whinge*, for example, reflects the major indexical danger of complaining, that it is an action that may rebound upon and index the complainer. It is used not only to characterize the complainer, but to counter the complaint. Take the celebrated Australian expression *whinging Pom*, generally applied to British visitors who complain about the climate, the dangers of insect or snake bite, being unlucky at cricket, or whatever other standard misfortunes may afflict them. The expression implies complaining for some flimsy, insufficient reason, and negatively rather than constructively solution-oriented.[10] Additionally, the category *Pom* calls up an MCD[11] for the whinger, such that the act of whinging

not in its object, but in the complainer. As a corollary, the person who applies the category 'whinging Pom' is reflexively displayed as 'true blue Aussie', not prone to whinging, and whose analysis of the circumstances being whinged at would be more favourable, or more constructive. The relevance of that reflexivity comes into its own where complaints are being countered and discounted.

The relevant term that features most often, in the conversational data used for this study, is *moan*. In extract 11 Lesley is talking to her mother ('Mum') about Lesley's mother-in-law 'Nan' (named elsewhere), whom she has been characterizing as a hypochondriac who prefers to stay in bed and have other people (including Lesley herself) do her shopping, cooking and housework. That is what mum is responding to in line 1, with the strongly dispositional formulation, 'y'won't cure'er ↓now love it's too late':

(11) Holt:1:1:12

1	Mum:		Ah well- (0.2) y'won't cure'er ↓now love it's too late
2	Les:		No an'she wz ever so na:sty tuh Mark when'ee ca:lled
3			I [as'week]
4	Mum:		[Was she]:?
5	Les:		Oh: ↓yes.
6			(0.8)
7	Les:		He came: back r:ea::lly: sh:aky

15	Les:	→	.hh She wz moaning on about m-me:: an:' (.) m:oaning
16			on about him'n [ohh
17	Mum:		[(well) she's got a ba:d meh- uh long
18			mem'ry. abou:t (0.2) that sort'v thing (...)

In the context of complaining about Nan, Lesley dismisses Nan's reciprocal complaints as 'moaning on' (line 15). The phrase 'moaning *on*' portrays Nan's moaning as repetitive and prolonged. In addition to the category *moaning on*, the grounds for complaints/moans about Lesley herself are also undermined by the long time since Lesley's transgression happened (emphatically '↑SIX YEARS AGO this was'), and the downgraded, vague, almost forgotten nature of it as a one-off ('once', line 13) rudeness towards 'MISSI:Z uhm:: someb'ddy or other' (lines 12–13). Along with these other details, the description MOANING ON, like *Whinging Pom*, manages both to characterize the complainer as disposed to complain, and to dismiss the complaint as poorly grounded, and negative. Line 1 is also interesting from the perspective of 'moaning' being unconstructive (see again note 10); Mum's remark 'y'won't cure'er ↓now love' projects Lesley's [illegible]-solution-oriented, rather than the kind

Mum's uptake about Nan's 'long mem'ry' (lines 17–18) picks up Lesley's sense of Nan as dispositionally *prone to* complain about a range of things ('that sort'v thing', line 18). In fact, Nan's dispositions, as the explanation of why she complains, are already strongly formulated in line 1. So we have here a jointly produced portrait of Nan, in which Nan's complaints about Lesley are grounded not in their object, Lesley, but in the subjectivity of the complainant, Nan herself. Examining how complaints are countered throws into sharp relief the features of complaining that speakers/complainers attend to when mounting a complaint. Terms such as *moan* and *whinge*, along with 'scripted' descriptions of the complainant's recurrent *moaning on*, shift the cause of the complaint from its object to the dispositions of he or she who complains.

There are formulations of the act of complaining that, rather than pointing to the complainer as moaner or whinger, characterize it in benign terms. Extract 12 provides brief examples in which, relevantly, Robbie is doing self-characterization, in the context of a jointly produced, strongly affiliated complaint sequence:

(12) Holt:M88:1:5:42

Rob: Well thanks ↑ever so much f 'r listen↓ing to me an' letting me get it off my↓chest.

And shortly afterwards:

Rob: perhaps have another chat again an' sort'v (release) a little stea-:-:m↑.hhh heh heh (heh)

The idiomatic metaphors of releasing steam, and getting things off your chest, manage to convey subjectivity without bias. They formulate benign motives for talking, being expressions that imply doing something that has to be done, in the sense that steam pressure builds up and requires releasing (see Lakoff, 1987, on anger metaphors), and that burdens that weigh down on one's chest need to be removed. Such motives for complaining stand in stark contrast to others such as spite, rancour, or Nan's propensity to moan about nothing.

Given the usefulness of terms such as *moan* and *whinge* in countering complaints, I close this section with examples from a special setting where complaint-countering is prevalent: neighbourhood dispute mediation.[12] Recall first, Lesley's use of *moan* in extract 11:

15 Les: → .hh She wz moaning on about m-me:: an:' (.) m:oaning
16 on about him'n[ohh

We noted that the expression *moaning on* implies something extended and repetitive, and how that starts to index the complainer rather than the object/complainee. This is further conveyed by the repetition of the verb with two object complements 'about m-me::' and 'about him', where the complaint's specific object is unclear – moaning about what in particular? What had anybody done? There is an implied lack of discrimination, a sense of repetitive attacks

complaining for no good reason. Terms such as *moaning* and *whinging* lend themselves to essentially intransitive uses, as actions directed at no clear object or cause but, rather, informing us about the complainer. Although they *can* take clear objects, they are often used intransitively (with no object, as in 'whinging Pom'), or else with objects that are very unspecific. Here are three examples of *moan*, taken from two different neighbourhood mediation sessions:

(13) Med-1:5

1	Ann:		(...) but I shouldn'ave t'[do that 'n my own house,=
2	Med:		[°mm°
3	Ann:		=sh[ouldn'ave t'sit with my telly as low as it'll=
4	Med:		[°mm°
5	Ann:		=go cuz she's sayin' th't she cn hear m'telly, ↑I **'EAR**
6		→	'ER ↓telly I 'ear (0.6)[it's ↑just ev'ryday thi:ngs
7	Med:		[°mm°
8	Ann:	→	she['s moaning about.
9	Med:		[°mm

(14) Med-1:5

1	Ann:		so every time I come ou:t I fee:l (0.5) like when
2			she goes t'peg the[washing ↓out] o:r (.) the other
3	Med:		[°mm: hm,°]
4	Ann:		day it rai:ned, (.) I wouldn't go o:ut becuz (.) I
5			>thought'w'l< if I go out she prob'ly gonna start
6		→	moa:nin' abo[ut somethin' ↑else.
7	Med:		[°mm°

(15) Med-5:30

1	Mac:		U::UHH (.) an' then I: (.) said (0.2) u::h >som'ing
2			about< I like t'do: (0.5) a bit o'garden:'n he said
3			I:don't ↑mind if you ↓do a bit of gardening,
4			(.)
5	Mac:	→	he wz (.) ↓moaning about som'ing else I can't
6			↓remembe:r,

In extract 13, Anne is countering a neighbour's complaint about various kinds of household noise, including that from her television set. The object of the verb *moan*, however, is '↑just ev'ryday thi:ngs' (line 6). The television noise is being used as an instance of the category 'everyday things', and Anne nicely formulates it as both routine and reciprocal: 'she en hear m'telly, ↑ I 'EAR 'ER ↓telly' (lines 5–6). The sense is conveyed, therefore, of a neighbour who is disposed to complain about non-complainables (in the same sequence Anne also mentions complaints about footsteps on the stairs).

Extracts 14 and 15 contain the same vague moan-object: 'moa:nin' about somethin' ↑else' (extract 14, line 6), and '↓moaning about som'ing else I can't [illegible]' (extract 15, lines 5–6). 'Something else' is a nicely chosen

adds to that sense. Again, the impression is of an essentially *intransitive* kind of moaning, an activity done by, and indexical of, the complainer, rather than something caused by a specifically complainable event or circumstance. The phrase 'start moa:nin' (extract 14, lines 5–6) works in the same way as 'moaning on', implying a sustained activity being embarked upon, given whatever pretext, by the complainer. Through the choice and application of lexical descriptions, then, speakers can characterize the activity of complaining in ways that either support or undermine its causation, constructiveness, and legitimacy. Much of the everyday work done in countering complaints works up their subjective, irrational, dispositional causation.

Discussion

The idea that making a complaint may require the management of speaker-indexical matters such as motive, disposition, or subjective investment, was raised by Harvey Sacks with regard to direct complaints, in a consideration of what next turns might do.

> ... if you say 'You interrupted me' and I say 'You're always complaining', then the next move might turn on a discussion, not of my interruption, but of your complaining ... And if you don't want your complaining to be the topic, then you may have to avoid making things which are formulatable as 'complaints'. And in that regard, if somebody does something routinely which is capable of being complained about, and you complain about it each time, you're in a good position to be treated as complaining. (Sacks, 1992: vol. 1, 637–8)

Sacks pointed to two features that we have also focused on here: the speaker-indexical dangers of complaining, and the way in which recurrent actions work in practical reasoning as a basis for ascribing dispositions ('you complain about it each time, you're in a good position to be treated as complaining': see Edwards, 1995).

Sacks's idea that 'complaining' might therefore be something to avoid being characterized as doing, raises the issue of the analytical status, and formal identifiability, of the speech category 'complaint'. Complaining will sometimes be overt and obvious, but it is also likely to be a subtle business in which speaker/complainers work against the indexical category of dispositional moaner, while providing object-descriptions that permit the complainable nature of those objects to be heard and taken up by recipients. It is a feature of the ironic and jocular delivery of complaints examined in this study, and of the choice of displaced objects, that speaker/complainers manage to accomplish some 'serious' complaining within an ironic delivery. The tendency of recipients to acknowledge the seriousness of an ironically delivered complaint, even when laughing along with it, may be in recognition of the

and displacement bring off. There is a tendency in making complaints, as with invitation refusals and 'dispreferred' actions[13] generally, to project oneself as doing it reluctantly, or only through necessity.

One feature of *indirect* complaints is that they are often performed at some distance from the offence itself. They are often reports of past events, past complainables. This gives rise to a kind of duality between the situation pertaining when the offence took place, and the current situation of talking about it, in which the initial complaint has to be re-animated. Subjectivity announcements, and the detailed activity of complaining, attend to this notion of what kind of grievance it is/was, how the complainer is now dealing with it, and how the current complaint-recipient should hear it as relevant to them, here and now. Past complainables seem to be routinely done ironically, whether humorously or as something now coped and dealt with. This is reminiscent of a thousand holiday, family and peer group disaster stories, everyday 'war stories' in which all kinds of things that went wrong get to be the stuff of tall tales, funny stories, and accounts of triumphing over adversity and seeing the funny side of it all. There is a surprising frequency in the data used for this study, of some kind of ironic take being done. The laughter and irony are probably there, not because people find their misfortunes all that funny, but rather, as recipient-designed management of attitude, coping, and (as Sacks anticipated) general avoidance of being seen as a complainer.

Irony and humour, in enacting a complaint, are members' methods for displaying and managing the speaker/complainer's stance or attitude, such that the complaint recipient is not placed in the potentially awkward position of having to work out how to respond. But humour is also done as *part of* the act of complaining, not merely as a contrast to it, nor to suggest that the complaint is weak or unfounded. It can even be part of getting a complaint taken seriously, precisely by signalling that the complainer is not disposed to make too much of it. This may be a basis for serious uptakes of humorous deliveries, where the humour is not taken to be inviting the hearer to laugh, nor showing that it is nothing serious. Rather, it is doing what Sacks suggested might be necessary, avoiding finding yourself 'in a good position to be treated as complaining'.

Institutional relevancies come into play. In the neighbourhood mediation data, which figured briefly in the final section of the analysis, complaining is not only frequent, and of endemic relevance to the setting, but there is also an orientation to the setting, to the need for mediation or police action (cf. Meehan, 1989), and to the role of mediator as a questioning, sympathetic, but non-partisan complaint recipient. A complaint in such a setting also has to be made severe enough to be worth resorting to that kind of setting, requiring those kinds of resources. This is reminiscent of couple counselling, in which couples work up the extremity and intractability of their mutual complaints during initial troubles-telling (Edwards, 2000b), in response to the question of what brings them there. In the mundane telephone calls, that provided the bulk of materials for this study, a complaint can be something much more casual and underplayed, and not at all the kind of thing requiring or orienting to formal mediation procedures.

they are the site for complaints to have to be broached, worked up, and performed 'from scratch', where there is no institutional or pre-established relevancy or requirement for it, or for its severity or seriousness. As Drew notes, 'we do not complain to just anyone: we choose who to complain to and what kinds of complaints might appropriately be made to which kinds of recipients' (1998: 323–4). That kind of situated, recipient orientation remains a topic in need of investigation.

The phenomenon of 'displacement' may be a way of avoiding talking about personal feelings on sensitive matters, such as how Lesley or Jean-Claude felt, how hurt they are, how vulnerable it feels to have someone break into (or walk out of) your home like that. Recall that Lesley's 'muddy cushions' complaint (extracts 4 and 8) was preceded by a delicate inquiry by Moira, into something Moira did not name, and that Lesley would perhaps 'rather not talk about'. Psychological explanations might be offered for avoiding sensitive and painful matters, including the Freudian, psychodynamic possibility, where the term 'displacement' is also used, of some kind of avoidance or repression of deep, painful feelings. However plausible such explanations may be, the discursive-psychological analysis offered here is different, in three ways: (1) we are examining it as interaction; (2) it makes sense in interactional terms; and (3) the psychology is presumptive, and may be a case of providing a psychodynamic or mentalistic explanation for something whose nature is to be found in the observable dynamics of social interaction (Billig, 1999; Edwards and Potter, 1992; Wooffitt, 1992). It is not so much a matter of disproving psychodynamic explanations as obviating them, or at least of analysing social interaction in its own performative, occasioned, and sequentially organized terms.

The major focus of this study has been the subjective side of complaints as a performed and managed feature of how they are made. In making and reporting complaints, speakers display some kind of stance or attitude, both to the complaint-object and to the current action of telling. Complainers work to objectify complaints (Pomerantz, 1986), and also use displays and formulations of emotional investment, or ironic stance, in ways that may either enhance or distract from a complaint's seriousness and consequentiality. It is not only a matter of softening complaints by playing them down or laughing through them, nor a matter of choosing between irony and seriousness. Rather, it is a matter of how complaining is effectively done, in which speaker-indexical features, and potential recipient uptakes, have to be managed.

Notes

1. 'Safe' compliments and complaints are those that have no negative implications for other people present, who might be characterizable under the same membership category used for the compliment/complaint.
2. Edwards (1997, 1999) examines the uses of presupposed and 'given' information in factual rhetoric; Sacks notes specifically with regard to complaints that 'a possibly

3. Identifying something as a complaint may depend on contextual features of the talk: 'routinely a piece of praise plus "but" plus something else, tells you that the something else is a "complaint," where it isn't obvious, often, that it is a complaint. That is to say, isolated, it wouldn't be a complaint' (Sacks, 1992: 359).
4. 'Overdetermined' descriptions are those where instead of, say, 'I had a drink', the speaker reports that she 'took the drink and drank out of it' (Drew, 1998: 318).
5. Drew (1998: 311) also notes that 'reporting ... their emotional response – their sense of grievance – enables complainants to characterize how far the other's behavior has caused offense.' This echoes discussions of the everyday rhetoric of emotion talk, where emotional reactions may be opposed to rational judgements, making an emotion-driven report unreliable; but they can also be used to signal the spontaneity and genuineness of whatever version of events they are attached to (Edwards, 1997, 1999).
6. A jumble sale is an informal, occasional, usually charitable sale of cheap bric-a-brac that people donate to raise cash for some kind of community project.
7. Characterizing a complaint as expectable from the complainant, i.e. as dispositional, can be a way of undermining its factual basis or seriousness. See Edwards (1995, 1997) on the relations between 'script formulations' and dispositional characterizations of actors, and the relation of that to factual reporting.
8. The specific placing of the laughter may signal sensitivity to this then-versus-now 'risk' of indirect complaints. Examples include: 'I thought well I'm gon' tell Joyce that, ehhheh heh-heh he-e.uh: ↑.eh.eh ↑.hhhhh' (extract 6); 'I nearly said sh'd 'ee've asked your p(h)erm(h)issio(h)on' (extract 7); and 'you couldn't'v: phoned't a better ↑ti:me,hheh ↑heh' (extract 1).
9. Something you 'must say' contrasts with something you might *want* to say. Lesley is complaining about fingerprint dust left by the police. She is complaining while implying reluctance to do so, or an orientation to the delicacy of doing so. Again, this is a small token of subjectivity or 'attitude' management, of managing speaker-indexical implications of saying something.
10. One feature that can make a complaint a candidate 'moan' is the absence of orientation to constructive next actions or solutions. Meehan notes, in a study of telephone calls to the police, how 'complaints' (in the sense of reported disturbances, offences, etc.) are normatively oriented to subsequent police action: 'they will try to formulate events in police-worthy form' (1989: 117).
11. Membership Categorization Device: see, for example, Hester and Eglin (1997), Sacks (1992).
12. Thanks to Elizabeth Stokoe for making some neighbourhood mediation data available. Some of the discussion in this article, on the nature of complaints and what they are designed to manage, was helped by examining a wide range of materials that it is impossible to include within the scope of a single article.
13. 'Dispreferred actions' in conversation analysis are actions such as refusing invitations and declining offers, where speakers orient in various systematic ways to the normative expectation that such things will be accepted (Atkinson and Heritage, 1984).

Trial Discourse and Judicial Decision-Making: Constraining the Boundaries of Gendered Identities

Susan Ehrlich

Introduction

Recent formulations of the relationship between language and gender, following Butler (1990), have emphasized the performative aspect of gender. Under this account, language is one important means by which gender – an ongoing social process – is enacted or constituted; gender is something individuals *do* – in part through linguistic choices – as opposed to something individuals *are* or *have* (West and Zimmerman, 1987). While the theorizing of gender as 'performative' has encouraged language and gender researchers to focus on the agency and creativity of social actors in the constitution of gender, to my mind there has been less emphasis placed on another aspect of Butler's framework – the 'rigid regulatory frame' (Butler, 1990) within which gendered identities are produced – that is, the limits and constraints on speakers' agency in constructing such identities. This emphasis on the 'performative' aspect of Butler's work, rather than on her discussions of the regulatory norms that define and police normative constructions of gender, may arise because, as Cameron (1997) suggests, philosophical accounts of Butler's 'rigid regulatory frame' often remain very abstract. For Cameron (1997: 31), too often in feminist philosophical discussions, 'gender . . . floats free of the social contexts and activities in which it will always be . . . embedded,' obscuring the fact that the routine enactment of gender is often, perhaps always, subject to what she calls the 'institutional coerciveness' of social situations. In other words, cultural norms (i.e. Butler's rigid regulatory frame) make certain performances of gender seem appropriate

and intelligible; in Butler's (p. 49) words, they 'congeal over time to produce the appearance . . . of a natural kind of being.' These same cultural norms render other performances of gender inappropriate and unintelligible and at times subject to social and physical penalties and sanctions (e.g. homophobia, gay-bashing, the 'fixing' of intersexed infants).

By examining data from a public institution, a Canadian sexual assault trial, I demonstrate how culturally dominant notions of male and female sexuality can impose constraints on the formation of participants' gendered identities. Moreover, I show how the gendered identities ascribed and assigned to individuals can depart from the identities individuals intend to claim or adopt.

Significant to an investigation of 'talk' in trial contexts is the fact that interpretations and understandings of the talk are discernable not only in the talk's local discourse (i.e. in the trial), but also in the non-local assessments and judgments of non-speaking recipients (i.e. juries and/or judges). Thus, while the Crown attorney (i.e. the lawyer representing the state) in the sexual assault trial 'talk' described later represented the complainant as *resisting* her perpetrator of sexual assault to the extent possible, judges at both the trial level and the appeal level represented the complainant as *participating* in consensual sex with the accused.[1] Put somewhat differently, the gendered sense-making framework, or *discourse*, that the judges imposed on the events in question departed quite dramatically from the gendered sense-making framework, or discourse, invoked by the Crown attorney in her questioning of the complainant. Through her questioning of the complainant, the Crown attorney allowed a feminist understanding of sexual violence to emerge: one that acknowledged the unequal power dynamics that can shape and restrict women's behavior in the face of men's sexual violence. Yet such an understanding of the complainant's behavior failed to find its way into the judicial decisions of the trial judge or the appeal judge. Indeed, the fact that it was not recognized in these judicial decisions is illustrative, I suggest, of the way that dominant, androcentric discourses (i.e. Butler's rigid regulatory frame) can render certain performances of gender as unintelligible and incoherent. Thus, this chapter considers the notion of 'the female voice' to the extent that it demonstrates the way a feminist perspective, when manifest in a public context, can be distorted or rendered invisible by the androcentric discourses that often dominate in these contexts.

The Participant Structure of Trial Discourse

In describing trial practices, Hale and Gibbons (1999: 203) make a useful distinction between 'two intersecting planes of reality' in the courtroom: the reality of the courtroom itself – what they call the 'courtroom reality' – and the reality that comprises the events under investigation in the courtroom – what they call the 'external reality.' In the court's representation of this 'external reality,' visual images (e.g. photographs, diagrams) and physical entities (e.g. weapons, clothing) are

is . . . through testimonial evidence which consists of descriptions of the events by witnesses – versions of the second reality presented through language.' That is, within the context of legal adjudication processes, language is the primary means by which witnesses and lawyers convey information about the events that are the subject of a court's deliberations. And, while much of the courtroom language representing this 'external reality' ostensibly occurs between lawyers and witnesses – that is, it is dyadic – the participant structure of the speech event of the trial is in fact more complex than this. Given that the primary target of courtroom interactions between lawyers and witnesses is a third-party, overhearing recipient – a judge and/or jury – trial talk is more accurately characterized as multi-party (Drew, 1985; Cotterill, 2003). One way of conceptualizing this multi-party structure is by appealing to Goffman's (1981) notion of the 'gathering.' According to Goffman (1981: 136), 'interactional facts' have to be considered in relation to 'the full physical arena in which persons present are in sight and sound of one another' – what Goffman labeled a 'gathering.' Put somewhat differently, Goffman (1981) argued that the two-person, face-to-face, speaker–hearer model is too crude a construct to account for significant aspects of talk-in-interaction given that speakers will alter how they speak and/or what they say 'by virtue of conducting their talk in visual and aural range of non-participants' (Goffman, 1981: 136). These 'non-participants,' according to Goffman, can include unratified recipients such as bystanders or eavesdroppers as well as ratified recipients. Within the courtroom context, judges and juries constitute ratified recipients, and for Levinson (1988), who elaborates on Goffman's framework, they are the 'indirect target' of trial talk.

For my purposes here, what is important is Goffman's recognition that participants who are not actively and directly participating in an interaction may nonetheless influence many of its properties. While Goffman talks explicitly about how speakers may alter their linguistic identities under the influence of unratified indirect recipients of talk (e.g. bystanders), in this paper I am interested in how ratified indirect recipients of talk, that is judges in trial contexts, may influence and control the (gendered) meanings and interpretations assigned to speakers' linguistic identities. I shall argue that, in order to understand the complexity of gendered identities and, in particular, the way they can be constrained by cultural norms (i.e. Butler's rigid regulatory frame), we need to be attentive to the work of indirect recipients within an interaction or, in Goffman's (1981: 136) words, to 'the full physical arena in which persons present are in sight and sound of one another.'

Data

The data analyzed here come from a Canadian criminal trial involving sexual assault: Her Majesty the Queen v. Ewanchuk, 1995. The case involved a sexual assault that took place during a job interview between the accused (also referred to as the defendant) and the complainant (also referred to as the plaintiff)

The accused was a carpenter and wished to hire individuals who would sell his work for him. While the complainant suggested that her job interview be held in a mall, the accused expressed a preference for more privacy and proposed instead that the interview take place in his van. The interview was conducted in a polite, business-like fashion, according to the complainant's testimony. During the interview the complainant left the door of the van open because she was hesitant about discussing the job offer in his vehicle. After the job interview, the accused invited the complainant to see some of his work in his trailer (i.e. caravan) which was attached to the van. Again, according to the complainant's testimony, she purposely left the trailer door open out of fear of being alone with the accused in a confined space, but the accused ignored her efforts and closed and locked the door. The accused initiated a number of incidents with the complainant that involved sexual touching, with each incident becoming progressively more intimate than the previous. The complainant said that she complied with many of his requests out of fear that any resistance would prompt the accused to become more violent. However, when his touching progressed to the complainant's breast, she used her elbows to push him away and said 'no.' The accused resumed his sexual touching and began to massage the complainant's inner thigh and pelvic area, at which point the complainant again said 'no.' The accused resumed his advances by grinding his pelvis into hers, touching her vaginal area and placing his penis on the complainant's pelvic area under her shorts. He stopped after the complainant said 'no' a third time. After these incidents, the accused opened the door of the trailer at the complainant's request and the complainant left the trailer. She later charged the accused with sexual assault.

The trial judge acquitted the accused of sexual assault relying on the defense of 'implied consent' and the Alberta Court of Appeal upheld this acquittal. The Supreme Court of Canada overturned this acquittal and entered a conviction of sexual assault for the accused. In what follows, I analyze data from the 1995 trial, the 1995 decision of the trial judge and the 1998 decision of the Alberta Court of Appeal. In particular, I contrast two sets of data from this case: excerpts from direct recipients' talk, that is question–answer sequences between the Crown attorney and the complainant, *and* excerpts from indirect recipients' discourse, that is the judges' decisions. Specifically, looking beyond the face-to-face aspects of communication to the discourse of indirect recipients allows us to consider the regulatory norms – that is, Butler's rigid regulatory frame – and the constraints they can impose on identities.

Question–Answer Sequences in Trial Discourse

Like other types of institutional discourse, courtroom discourse has been the subject of much research over the past two decades – research that, among other things, has highlighted its asymmetrical character. As others have noted about courtroom discourse (e.g. Atkinson and Drew, 1979; Walker, 1987; Conley and

the right to initiate and allocate turns by asking questions of witnesses but the reverse is not true. And, such differential participation rights, it has been argued, bestows considerable conversational power and control upon the participant who is sanctioned to ask questions (Hutchby and Wooffitt, 1998). For example, in discussing doctor–patient interaction, Drew and Heritage (1992) note that the question–answer pattern that characterizes most such interactions not only allows doctors to gather information from patients, but can also result in doctors directing and controlling talk: introducing topics, changing topics, and selectively formulating and reformulating the terms in which patients' problems are expressed. Similar claims have been made about lawyers in their role as questioners in the courtroom. However, given the *adversarial* nature of courtroom discourse within the Anglo-American common law system and the *legally sanctioned* power of lawyers to ask questions, lawyers may exercise even more conversational control than doctors in their respective institutional settings.

Adversarial dispute resolution, of which trials are a notable example, requires that two parties come together formally, usually with representation (e.g. lawyers), to present their (probably different) versions of the dispute to a third party (e.g. judge, jury, tribunal) who hears the evidence, applies the appropriate laws or regulations, and determines the guilt or innocence of the parties. Lawyers have as their task, then, convincing the adjudicating body that their (i.e. their client's) version of events is the most credible, or in Capps' and Ochs' (1995) terms, 'the official story.' Apart from making opening and closing arguments, however, lawyers do not themselves testify. Thus, through the posing of questions, lawyers must elicit from witnesses testimony that will build a credible version of events in support of their own clients' interests in addition to testimony that will challenge, weaken, and/or cast doubt on the opposing parties' version of events. Atkinson and Drew (1979: 70) note that while trial discourse is conducted predominantly through a series of question–answer sequences, other actions are accomplished in the form of such questions and answers. For example, questions may be designed to accuse witnesses, to challenge or undermine the truth of what they are saying, or, in direct examination, to presuppose the truth and adequacy of what they are saying.

Direct Examination of the Complainant

In contrast to the adversarial, combative nature of cross-examination, direct examination, that is the questioning of one's own witness, has been characterized by both legal practitioners and scholars as supportive and cooperative (e.g. Woodbury, 1984; Barry, 1991; Maley, 1994). According to Cotterill (2003: 129), direct examination 'represents an initial, dominant narrative statement, which is then responded to, challenged and sometimes subverted in cross-examination questioning.' Because the emphasis in direct examination is on developing new information, open-ended questions tend to be more frequent in direct examination. Moreover, Woodbury (1984: 211) suggests that open-ended questions have a strategic function

third-party recipients (e.g. judge and/or jury) that lawyers are trusting of their witnesses. Indeed, Harris (2001: 68) argues that lawyers must exercise a high degree of control over *all* witnesses, but that the strategies required to do this differ depending on whether the witness is 'friendly' or 'hostile.'

Because the varying versions of events that emerge in trial discourse are determined to a large extent by the questions that lawyers ask of witnesses (e.g. their controlling of witnesses' topics, their selective reformulations of witnesses' prior answers, etc.), Cotterill (2003: 149) argues that courtroom narratives are best characterized as 'dual-authored texts,' 'with the emphasis on the voice of the lawyer as the primary and authoritative teller.' Due to the 'dual-authored' nature of courtroom narratives, in what follows I analyze question–answer sequences between the Crown attorney and the complainant using the analytic framework of Conversation Analysis, broadly conceived. Conversation Analysis is fundamentally concerned with the sequential analysis of utterances, that is 'how utterances are designed to tie with, or 'fit' to, prior utterances and how an utterance has significant implications for what kinds of utterances should come next' (Wooffitt, 2001: 54). I adopt this approach to question-answer sequences in the direct examination of the complainant because the nature of the questions asked by the Crown attorney has significant implications for what kinds of utterances come next, specifically the kind of testimony the complainant produces and the kind of discursive identity she projects.

In the direct examination of the complainant in the Ewanchuk case, the Crown attorney typically began by asking a broad Wh-question (e.g. 'What happened then?'), that is a Wh-question that allowed the complainant to construct an extended narrative. In response to this broad Wh-question, the complainant would provide an answer that described an event or a series of events. Immediately following such an answer, the lawyer would ask a more narrow Wh-question, that is a Why-question that attempted to elicit more specific information: the plaintiff's motivation for performing a particular action that she had described. For example, in (1) below, the Crown attorney begins by asking a broad Wh-question about the events that transpired once the plaintiff reached the defendant's van. The plaintiff's answer is followed by a more narrow Wh-question – a Why-question inquiring about the plaintiff's motivation for suggesting that she and the defendant talk inside the mall, as opposed to in his van. What emerges in the answer to the Why-question is the complainant's desire to talk to the defendant in a public place.[2]

Q: Was he inside the van or trailer when you first got there?
A: I believe he was inside the van, but – he might have stepped out to meet me.
Q: What happened once you got there?
A: I asked him if we could go inside the mall, have a cup of coffee and talk about whatever.
→ Q: Why did you want to go inside the mall to talk?
A: Because it was – it was a public place. I mean, we could go in and sit down

According to Woodbury (1984: 211), the narrow Wh-questions that follow broad Wh-questions in direct examination serve a narrative function. Since it is important that lawyers and witnesses co-construct 'a coherent and maximally detailed account' for the sake of third-party recipients, Woodbury maintains that narrow Wh-questions allow witnesses to elaborate on details that contribute to the coherence of the narrative. But, what is it that determines the *kind* of details that will make a narrative cohere? Why, for example, does the Crown attorney in the Ewanchuk case follow up her broad Wh-questions with Why-questions that probe the plaintiff's reasons for performing certain actions in the series of events under question?

It is my contention that the narratives elicited from the complainant through the Crown attorney's questions cohered as feminist narratives. That is, the Crown attorney allowed a feminist understanding of sexual violence to emerge in the complainant's testimony. In particular, it became clear through the question–answer sequences of the Crown attorney and the complainant that the threat of men's sexual violence can create an asymmetrical power relationship between men and women which, in turn, can shape and restrict women's efforts to resist their perpetrators. Consider examples (1)-(5) below which all come from the direct examination of the complainant (I have repeated example (1) below), and all contain a Why-question from the Crown attorney that asks why the complainant has performed a particular action. The answers elicited by these questions (italicized below) reveal the strategic nature of the complainant's actions; that is, the particular actions the Crown attorney asks about are represented by the complainant as ways she attempted to discourage the accused's sexual advances.

Example 1

Q: Was he inside the van or trailer when you first got there?
A: I believe he was inside the van, but – he might have stepped out to meet me.
Q: What happened once you got there?
A: I asked him if we could go inside the mall, have a cup of coffee and talk about whatever.
→ Q: Why did you want to go inside the mall to talk?
A: *Because it was – it was a public place. I mean, we could go in and sit down somewhere and talk.*

Example 2

Q: What happened then?
A: He said, Why don't we just talk inside the van here. And he sat into his driver's seat, and I opened the door, and I left the door open of the passenger seat and I sat down there.
→ Q: And why did you leave the door open?
A: *Because I was still very hesitant about talking to* ***him.***

Example 3

A: He went around to – no, first, he said, Okay, I'd like to pull the van into the shade. It was a hot day, and there was cars that were parked under the shade for an shade of a tree, I believe, and he got out, and he went and he stepped inside, and he said, Come on up and look. So I stepped up inside, took about two steps in, I didn't, like, walk around in it. And then he went to the door, closed it, and locked it.
(some intervening turns)
Q: Had you expected him to lock the door?
A: Not at all. I left the door completely wide open when I walked in there for a reason.
→ Q: And what was that reason?
A: *Because I felt that this was a situation that I shouldn't be in, that I – with anybody to be alone in a trailer with any guy with the door closed.*

Example 4
Q: Did you talk about other things while you were sitting in front of the van?
A: Yes. He asked – we talked a little bit more on a personal level.
Q: What do you mean by that?
A: I believe I told him that I was living on my own. Well, not totally on my own. There was about three other people living there and that I had a boyfriend.
→ Q: Why would you tell him those things?
A: *Because I felt that he should know because I just – I felt – I felt that he might feel a little more threatened if I had said that.*

Example 5
Q: What happened after you talked about your personalities?
A: We were still mentioning a lot of personal things. Like I was still mentioning that I had a boyfriend. I believe I said his name.
Q: What was his name?
A: His name was Allan.
(some intervening turns)
→ Q Why were you mentioning your boyfriend Allan?
A: *Because, like I said, I felt like if he ever – if – it might prevent him from going beyond any more touching.*

In example (1), when asked why she suggested going inside the mall, the complainant explains that it was a *public* place. (Presumably, sexual advances are less likely to occur in public places.) In examples (2) and (3), when asked why she left the doors open to the front of the van and the trailer, respectively, the complainant explains that she was 'hesitant' about talking to the accused alone 'with the door closed.' In examples (4) and (5), when asked why she was mentioning her boyfriend, Allan, the complainant explains that she wanted the accused to feel 'threatened' and that she wanted to 'prevent him from going beyond any more touching.' Clearly, what the Crown attorney succeeds in eliciting in asking these particular Why-questions is a sense that the complainant is not passive, but rather is actively attempting to create circumstances that will discourage the accused's sexual advances.

Examples (6)–(9) are somewhat different from (1)–(5), as the Crown attorney does not ask questions about actions intended to discourage and/or prevent the accused's sexual advances, but rather asks about actions that could be construed as preambles to consensual sex.

Example 6

Q: Did he say anything when he locked the door?
A: He didn't say anything about the door being locked, but he asked me to sit down. And he sat down cross-legged.
Q: What did you sit on?
A: Just the floor of the trailer.
→ Q: Now, why did you sit down when he asked you to sit down?
A: *Because I figured I was in this trailer, the door was locked, he was not much more than this stand is away from me here, probably only a couple of feet away from me. I felt that I was in a situation now where I just better do what I was told.*

Example 7

Q: And what happened then?
A: He told me that he felt very tense and that he would like to have a massage, and he then leaned up against me with his back towards me and told me to rub his shoulders and I did that.
Q: And up to the time he told you he was tense and wanted a massage, had the two of you talked about you giving him a massage?
A: I believe all he had said right before that is that he liked to have them, and he was tense feeling and that was all.
Q: Had you ever offered to give him a massage?
A: No.
Q: Did you want to give him a massage?
A: No.
(some intervening turns)
→ Q: If you didn't want to give him a massage at that point in time, why did you touch his shoulders?
A: *I was afraid that if I put up any more of a struggle that it would only egg him on even more, and his touching would be more forced.*

Example 8

Q: And what happened then?
A: Then he asked me to turn around the other way to face him, and he said he would like to touch my feet or he would like to massage my feet, so I did. And he was just touching my feet.
Q: Did you want him to massage your feet?
A: No.
→ Q: Why did you turn around?
A: *Because I guess I was afraid. I was frozen. I just did what he told me to do.*
Q: Did he ever ask you if you would like him to massage his feet – your feet?
A: No, he just said, Turn around I'm going to.
Q: What happened after you turned around?
A: He was massaging my feet, but he didn't stay there. He was moving up my

again, and then he'd move back up again, and *I just sat there, and I didn't – I didn't do anything. I didn't say anything. I knew something was going to happen, and I didn't want to fight. I didn't want to struggle. I didn't want to scream, because I felt that that would just egg him on more.*

Example 9

Q: And what happened when he reached to hug you?

A: He just did, and I, at this time, I was trying really hard not to cry. I had been wiping my eyes when he was on top of me when he couldn't see me, and I just . . . . I just responded by just lightly putting my arm on him when he hugged me because I was afraid that he would think I was really scared, and that I would leave there telling people.

→ Q: And why were you worried about him thinking that?

A: *Because I didn't think that he would stop there, that it would get worse, and it would be more brutal.*

Put somewhat differently, in examples (6)–(9), the Crown attorney asks why the complainant complies with the accused's requests: in (6), why she sits down when asked; in (7), why she begins to massage the accused when asked; in (8), why she turns around to face the accused when he asks to massage her feet; and, in (9), why her fear of the accused leads her to reciprocate his hug. In response to these questions, the complainant says a variety of things: that she was afraid; that she felt she should do what she was told; that she feared if she did not comply with the accused's requests or if she put up a struggle that she would 'egg him on even more,' 'his touching would be more forced,' and 'it would be more brutal.' Indeed, such responses reflect strategies that many victims of sexual violence employ to prevent more prolonged and extreme instances of violence. As researchers on violence against women have asserted, submitting to coerced sex or physical abuse can be 'a strategic mode of action undertaken in preservation of self' (Lempert, 1996: 281). That is, if physical resistance on the part of victims can escalate and intensify violence, as some research shows (e.g. Dobash and Dobash, 1992) and many women (are instructed to) believe, then submission to coerced sex is undoubtedly the best strategy for survival. Significant about the Crown attorney's questioning in (6)–(9) is the fact that her questions allow the complainant's actions to be revealed as strategies of resistance, rather than as precursors to consensual sex. In fact, all of the Crown's why-questions highlighted in examples (1)–(9) function to elicit responses that emphasize the complainant's active deployment of strategies meant to discourage and resist the accused's escalating sexual violence.[3] Put another way, the complainant's actions were contextualized within a framework, or discourse, that acknowledged the potential structural inequalities that characterize male–female sexual relations and the effects of such inequalities on women's strategies of resistance. We will see in the next section that, by contrast, the trial judge and the appeal judge contextualized the complainant's actions within an alternative framework or discourse – one that erased the unequal power dynamics of male–female sexual relations and, concomitantly, construed coerced sex as consensual sex.

Judges' Discourse

As stated in a previous section, the trial judge's decision to acquit the accused in this case was appealed to the Alberta Court of Appeal, where the acquittal was upheld, and then to the Supreme Court of Canada, where the acquittal was overturned. In this section, I discuss both the decision of the trial judge and the Alberta Court of Appeal judge, including the defense both judges invoked in acquitting the accused – 'the defense of implied consent.'

The first noteworthy aspect of both of these decisions, given that the Crown attorney and the complainant depicted the complainant as attempting to discourage and resist the accused, was the consistent representation of sexual relations between the accused and the complainant as consensual sex. Consider the following excerpt from the trial judge's decision, at a point when the judge is describing the 'facts' of the case:

Example 10

B [the complainant] told A [the accused] that she was an open, friendly and affectionate person; and that she often liked to touch people. A told B that he was an open, friendly and affectionate person; and that he often liked to touch people. A and B talked. They touched each other. They hugged. They were sitting on the floor of the trailer and they were lying on the floor of the trailer. A told B that he would like a body massage, and B gave A a body massage. For the body massage, A sat in front of B so that B could massage A's back. They later exchanged places so that A could give B a body massage. B later lay on her back, and A gave B a foot massage. After the foot massage, A massaged B's bare legs and he massaged her bare inner thighs. During this period of two and one half hours, A did three things which B did not like. When A was giving B a body massage, his hands got close to B's breasts. B said "No", and A immediately stopped. When B and A were lying on the floor, A rubbed his pelvic area against B's pelvic area. B said "No", and A immediately stopped. Later on A took his soft penis out of his shorts and placed it on the outside of B's clothes in her pelvic area. B said "No", and A immediately stopped. During all of the two and one half hours that A and B were together, she never told A that she wanted to leave. When B finally told A that she wanted to leave, she and A simply walked out of the trailer.

(from Reasons for Judgment (Moore, J., C.Q.B.A.), November 10, 1995)

These same 'facts' are confirmed by the Alberta Court of Appeal judge in his support of the trial judge's 'doubts about consent.'

Example 11

Yet, if review of the evidence that supports the trial judge's doubts about consent [illegible]

> said to be criminally assaultive were preceded by *an exchange of consensual body massages, partially on the floor of the trailer, hugs and assurances of trust and restraint*. . . . Beyond that (and somewhat inconsistent with an appellate profile of Ewanchuk as a relentless sexual predator) every advance he made to her stopped when she spoke against it.
>
> (from Reasons for Judgment of the Honourable Mr. Justice McClung, February 12, 1998)

In general, these descriptions of what transpired between the accused and the complainant – with the exception of the descriptions of the three times that the complainant said 'no' – emphasize the consensual, mutual and reciprocal nature of their sexual relations. Indeed, the appeal judge states quite explicitly that the hugs and the body massages were reciprocal (i.e. 'an exchange') and 'consensual' (in italics above). Particularly striking is the fact that both judges represent as consensual and reciprocal events that the Crown attorney and the complainant depicted as coerced sex. That is, on many occasions – and this is exemplified in examples (6)–(9) – the complainant said she complied with the accused's wishes out of fear that his violence would otherwise escalate. Yet, the judges represent these events as ones that the complainant engaged in without coercion. For example, in line 5 of example (10), the trial judge states that the complainant and the accused hugged each other in a reciprocal way (i.e. 'They hugged') whereas in example (9) the complainant says that she responded to the accused's hug out of fear, that is 'because [she] was afraid that he would think [she] was really scared' which in turn would lead to even greater brutality. Likewise, in lines 7–8 of (10), the judge states simply that the complainant gave the accused a body massage in response to his request (i.e. 'A told B that he would like a body massage, and B gave A a body massage'); yet in example (7) the complainant says that she agreed to massage the accused only because she 'was afraid that if [she] put up any more of a struggle that it would only egg him on even more and his touching would be more forced.' Finally, we see that in lines 11–12 of (10), the judge states the accused massaged the complainant's bare legs and inner thighs, as if this were a consensual act (i.e. 'After the foot massage, A massaged B's bare legs and he massaged her bare inner thighs'); but in example (8) the complainant says that she complied with the accused's massages because she did not want to 'egg him on more.' In sum, despite the fact that the complainant conveyed in her direct testimony that she had little choice but to comply with the accused's sexual advances, the judges' decisions failed to qualify or modify the sexual advances in such a way. Indeed, there is a sense in both decisions that the complainant's consent was freely given. By contrast, it is noteworthy that in the decision of the Supreme Court of Canada, there are many descriptions of the 'facts' that acknowledge the coerced nature of the sexual contact between the accused and the complainant, for example 'At some point the accused said that he was feeling tense and asked the complainant to give him a massage. The complainant complied, massaging the accused's shoulders for a few minutes.' 'The complainant did not want the accused to touch her in this way, but said nothing as she was afraid that any resistance

In previous work on the language of Canadian sexual assault trial judgments, Coates, Bavelas, and Gibson (1994) noted that judges recognized resistance on the part of complainants only when it took the form of persistent physical struggle. Coates *et al.* (1994: 195) elaborate: 'The language of appropriate resistance seemed to us to be drawn from male–male combat between equals, where continued fighting is appropriate, rather than from asymmetrical situations . . . where physical resistance would lead to little chance of success and a high probability of further harm.' While the excerpts from the judges' decisions do not seem to deem physical struggle as the only appropriate form of resistance, they do seem to require that resistance at least take the form of verbal refusal. For example, based on lines 14–19 of example (10), it seems that verbal refusals are the only indicators or signals that the trial judge recognizes as resistance on the part of the complainant. That is, although the Crown attorney is successful in eliciting testimony (for example, (1)–(9)) that depicts the complainant as attempting to discourage and resist the accused in a variety of ways – including submitting to coerced sex, the trial judge appears to only perceive her resistance on the three occasions that she said 'no' to the accused.

The Defense of Implied Consent

Under Canadian criminal law, an accused will be found guilty of sexual assault if the Crown attorney proves beyond a reasonable doubt that the complainant did not (or could not) consent to the acts. As stated earlier, the trial judge did not find the accused guilty of sexual assault, but rather acquitted the accused, relying on the defense of 'implied consent.' The Alberta Court of Appeal upheld this acquittal and the defense. For both of these judges, then, the complainant was considered to have *implied* consent; moreover, the Alberta Court of Appeal judge defined implied consent as 'consent by conduct.' One of the questions that arises from these judgements concerns the kind of 'conduct' that these judges deemed as signaling consent. Both the trial judge and the Court of Appeal judge found that the complainant was a 'credible witness' (from the trial judge, Moore) and that she was genuinely afraid of the accused: 'Certainly the complainant was afraid of Ewanchuk as the trial judge found' (from the Court of Appeal judge, McClung). However, both judges also commented in their decisions that she did not communicate her fear to the accused. Consider the follow excerpt from the trial judge's decision:

Example 12

All of B's [the complainant's] thoughts, emotions and speculations were very real for her. However, she successfully kept all her thoughts, emotions, and speculations deep within herself. She did not communicate most of her thoughts, emotions and speculations . . . . Like a good actor, she projected an outer image that did not reflect her inner self. B did not communicate to A by words, gestures, or facial expressions *that she was 'frozen' by a fear of force.* B did not communicate that *she was frozen to the spot,* and that fear prevented her from getting up off the floor and walking out of

The picture that emerges from this description of the complainant is that she was 'frozen to the spot' and 'that she was "frozen" by a fear of force' (italicized above), yet she kept her emotions and feelings hidden from the accused. And, on the basis of this type of 'conduct,' the trial judge acquitted the accused, suggesting that the complainant's conduct *implied* consent. Given that the accused would have to draw inferences in order to understand the complainant as 'implying' consent, one wonders what kind of cultural background knowledge these inferences would rely upon. In other words, what kind of cultural assumptions might give rise to the inference that concealing emotions and being frozen to the spot conveys consent? What becomes clear from questions such as these is the ideological nature of the cultural assumptions that the accused is understood to rely upon in drawing such an inference. That is, by ruling that a woman who is emotionless and frozen to the spot is *implying* consent, the judges are invoking assumptions about women's lack of agency and passivity in the course of 'normal' heterosexual sex. As Cameron and Kulick (2003: 36) remark about such societal assumptions, 'the denial of sexual agency to women means that saying "yes" to sex (or initiating it) is disapproved of. Nice girls should demur coyly in order to demonstrate that they are not sluts or nymphomaniacs, but this is a ritual, formulaic gesture and men should not be deterred.' Clearly, the accused in Her Majesty the Queen v. Ewanchuk was not deterred by the complainant's emotionless and frozen demeanor (indeed, not even by her three verbal refusals); and, such behavior was authorized by the trial judge and the Alberta Court of Appeal judge presumably because of the weight of cultural beliefs that equate a woman's sexual passivity with consent.

Conclusion

Recent approaches to language and gender, while emphasizing the agency and creativity of speakers in constructing gendered identities, have paid less attention to the normative discourses (i.e. Butler's rigid regulatory frame) that police and regulate the intelligibility of such identities. In this paper, I have suggested, following Goffman (1981), that a full understanding of identity construction requires looking beyond the face-to-face aspects of interaction to what Goffman calls the 'gathering.' Put somewhat differently, I have used a sexual assault trial to demonstrate how participants who are not directly and actively involved in an interaction can nonetheless influence the meanings and understandings that are assigned to that interaction. More specifically, I have attempted to show how the identity *imposed* upon the complainant in this sexual assault case – as a participant in consensual sex – departed quite dramatically from her identity – as a victim of coerced sex – as it was co-constructed in her direct testimony.

Capps and Ochs (1995: 21) argue that adjudicators in legal cases never determine the truth of a case; rather, 'on the basis of divergent versions of events, jury members [and adjudicators] construct a narrative that is plausible and

are undoubtedly many factors contributing to the determination of an 'official story,' I am suggesting here that a crucial determining factor, especially in the context of a sexual assault trial, is the intelligibility – or lack thereof – of participants' 'performances' of gender. Indeed, in the judicial decisions analyzed so far, the version of events endorsed by the trial judge and the Court of Appeal judge relied upon a very particular understanding of gender and sexuality – one that viewed women's verbal refusals as necessary to resistance and equated women's lack of physical responsiveness with consent. As demonstrated before, the Crown attorney and complainant invoked an alternative, feminist sense-making framework in this trial – one that viewed submission to coerced sex as a way for the complainant to resist more extreme and prolonged instances of violence. Yet, this alternative way of assigning meaning to the events in question did not seem to resonate with the sense-making frameworks of the trial judge and the Alberta Court of Appeal judge. McConnell-Ginet (1988, 1989) has argued that counter-hegemonic viewpoints or discourses may encounter difficulty functioning as background knowledge in linguistic exchanges that do not take place among familiars (McConnell-Ginet, 1988: 92). In other words, because the Crown attorney's discursive strategy involved a feminist understanding of sexual assault, it had difficulty surviving as a contextualizing framework within a public institution, such as a trial. Rather, this trial – or at least crucial and defining aspects of it – relied on dominant, androcentric background assumptions (i.e. Butler's rigid regulatory frame) to inform and constrain its interpretation of events.

I thank Judith Baxter for valuable comments on a previous version of this paper. The research for this article was funded, in part, by a Regular Research Grant from the Social Sciences and Humanities Research Council of Canada, grant #410–2000–1330.

Notes

1. Within the Canadian criminal justice system, Crown attorneys represent the state and complainants assume the role of witnesses for the state. That is, complainants are not *directly* represented by Crown attorneys.
2. The arrows within the transcripts point to narrow Wh-questions asked by the Crown attorney.
3. In previous work on the language of sexual assault trials (Ehrlich, 2001), I have argued that defense lawyers strategically invoke the 'utmost resistance standard' in trial discourse as a way of undermining the credibility of complainants. Until the 1950s and 1960s in the United States, the statutory requirement of utmost resistance was a necessary criterion for the crime of rape (Estrich, 1987); that is, if a woman did not resist a man's sexual advances to the utmost then the rape was said not to have occurred. While the 'utmost resistance standard' is no longer encoded in legal statutes in the United States or Canada, the adjudication of sexual assault cases often [illegible]

it is possible that the Crown attorney's questioning of the complainant in the Ewanchuk case anticipated, and was designed to counteract, such a strategy on the part of Ewanchuk's lawyer.

The Occasioning and Structure of Conversational Stories

Susan M. Ervin-Tripp and Aylin Küntay[1]

1. Orientation

What do we mean by a story? Recent usage has turned almost everything, even the non-verbal, into a narrative.[2] For example, Ochs and Capps (1996) have a remarkably inclusive definition of narratives of personal experience as "verbalized, visualized, and/or embodied framings of a sequence of actual and possible life events." The absence of a common guiding framework has led to the blossoming of criteria used by different narrative researchers for identifying their respective units of study. When one looks for personal experience stories in natural conversations, the most striking fact is that they are not always clearly recognizable by traditional narrative-internal criteria such as the presence of a protagonist and events creating conflict, reference to events in the past, presence of a climactic complicating action, or closure of the storyline with a resolution. Further, the onset of conversational stories does not always clearly demarcate the narrative segment from the preceding talk. Some stories are explicitly introduced into the ongoing conversation with a preface like "do you remember when ..." or "did I tell you about ...," or are elicited by instructions to tell a story. But in children's talk or talk between adults, there are many marginal cases.

Our focus is on identifying a conversational story and how it is occasioned. Given that the story is part of discourse and the storyteller a participant in an interaction, some of the structural organization of the story is directed to its function in a particular conversation. "Narrators linguistically shape their tellings to accommodate circumstances such as the setting as well as the knowledge, stance, and status of those in their midst" (Ochs and Capps 1996). We intend to examine how the embedding contexts of telling alter the internal structure and

features of conversational narratives, attending to some issues raised by Jefferson in her classic study of the conversational embedding of stories (1978).

2. Narrative Genre vs. Narrative Production

Now that we have the video and audio technology to look at conversational sequences, we have the possibility of two different levels of analysis in the study of talk. One level is the live interaction, negotiated on the spot in dialogue or through listener response. Another level is that of talk about talk using genre and speech act vocabulary, that is, classification by speakers and listeners or even by coders, and reference during talk to something said before or about to be said: "she told a story about ...", "he told me to ...", "he asked me to ..." This is what Hymes referred to in his development of an ethnography of communication (1972) or what is sometimes called metapragmatics. This level includes our category and prototype system for talk. There is a similar distinction in the study of speech acts like requests. What happens in real-time circumstances can differ from what is retrospectively recognized, remembered, reported, or judged, and therefore from what enters into speech act theories – the recollection of speech acts in tranquillity (Ervin-Tripp, Strage, Lampert and Bell 1987).

There are thus two forms we could call a story. One is the social genre that has prototypes and ideal forms and provides a model for what we expect when we ask "Tell me that story about when ..." The genre is talked about and has a cultural existence in member instruction and evaluation. The second is whatever happens when people talk about the past, the future, or recurrent events or practices in ordinary conversation. When we look at conversational events in a transcript, we do not know how much notions of prototypic genres affected performance, or even whether the speaker considered what was said to be a story. Very little work has addressed the relation between talk about talk and the interactional events such talk refers to. One exception is the work of Bauman (1993), who examined a speaker's "metanarrational comments" and "disclaimers of performance on the grounds of insufficient knowledge" (p. 188) as an indicator of the speaker's construction of genre conventions. However, although Bauman emphasized the relevance of such metapragmatic comments to the analysis of the features of narratives that embed them, he did not attempt to relate speakers' notions of prototypic narratives to what gets said in ongoing talk. It seems obvious that interactional events as remembered have some bearing on talk about talk. But do the prototypes and genre classifications have any effect on ongoing talk? When we cannot interview the tellers we have to make inferences from the narrative features, evaluations, and changes under conditions of evaluative monitoring.

Some theoretical approaches[3] view narrative genre as a "dynamic expressive resource, in which the conventional expectations and associations that attach to generically marked stylistic features are available for further combination and recombination in the production of

genre or norm and narrative as a spontaneous, often ambiguous conversational event – may converge or diverge from one another, depending on the occasioning conditions which influence narrative features.

3. Standard Narrative

The standard characterization of personal narratives in social science research grew out of the Labov and Waletzky analysis (1967). Labov's first elicited stories carne from his "danger of death" sociolinguistic survey question, which was designed to produce style shifts toward the vernacular variety of the speakers, in the heat of emotional recall. Eventually more than 600 American east coast adolescents and adults were posed the standard question "were you ever in a situation where you thought you were in serious danger of getting killed?" As a result, Labov elicited stories of near-death experiences that got rendered in fully formed narrative structures, upon which Labov and Waletzky later built their theory. They proposed that it is only spontaneous accounts of past personal experience, "not the products of expert storytellers that have been re-told many times" (p. 12), which could provide a window on the most fundamental forms of narrative structure. However, the methodology they used in order to obtain narratives is not appropriate for either spontaneous or first-time narratives. On the contrary, danger of death stories are likely to be retold, to be seen as attention-grabbing and entertaining to listeners, and to be thought appropriate for prototypic performance occasions. A human protagonist is at the center, and usually there is some kind of conflict and suspense even in brief telling. Thus, what Labov and Waletzky pursued in personal experience narratives, that is, first telling of thematically dramatic experiences, involves a contradiction in terms; the inherent ever-present conversational relevance of such stories makes them amenable to repetition and stabilizes their structures. In spite of the specificity of the so-called "invariant structural units that are represented by a variety of superficial forms" (p. 1) to this very limited genre of danger of death stories, the internal features that Labov and Waletzky (1967) found have been taken as fundamental in most narrative research since. Labov (1972) defined narrative as "one method of recapitulating past experience by matching a verbal sequence of clauses to a sequence of events which (it is inferred) actually occurred.... We can define a minimal narrative as a sequence of two clauses which are temporally ordered.... There is temporal juncture between the two clauses, and a minimal narrative is defined as one containing a single temporal juncture" (pp. 360–361). The narrative clauses, he pointed out, had to be coordinate, not subordinate or conditional, as are clauses used in representations of practices or recurrent events, or in backgrounding of information. The Labov and Waletzky narrative can be taken as typical of a certain culturally defined type of narrative that optimally occurs under elicitation.

Peterson and McCabe, beginning their study of narrative development in

in McCabe, In press). Their strategy for collecting narratives is to have a familiar interviewer engage the child subject in a conversation. During those informal conversations, the experimenters use what they call a conversational map, a series of short, deliberately unevaluated narratives about things that supposedly happened to themselves and could possibly have happened to the child (e.g., getting a bee sting). Such a methodology carries considerable ecological validity lince it is the naturally occurring conversation, at least from the perspective of the child participants in the study, that occasions the topics of narration. However, adults could push their agenda of obtaining data quite strongly in such elicitation contexts, sometimes not giving children enough chance to select or expand on their own favorite topics. As a result, it becomes difficult to strip off the effects of heavy narrative scaffolding from the outcome structure.

The elicitation method, which is employed most commonly to obtain comparable narratives from different subjects in developmental studies, folklore, and sociolinguistic interviews, demonstrates that stories are cultural constructs. If we are asked for stories, we know what is meant, and we are able to identify good stories and good story-tellers. Most research on narratives has relied on elicited stories or prefaced stories, those most likely to be identified by both speakers and audiences as fitting the cultural prototype.[4]

4. A Boundary Case

As opposed to elicited stories, stories occasioned in the conversational situation often do not exhibit many of the prototypical narrative genre cues that are thought to be embedded in the structure of a story. The example below illustrates a marginal case of classification that occurs in conversation when stories are spontaneous, not elicited. After the Loma Prieta earthquake, a student taped a conversation that included two brothers and other student friends. He had received an assignment to tape and analyze about an hour of naturally occurring interaction.

(1) Earthquake story[5]
Albert and Ned are two brothers. **Olga is Ned's friend,** Cynthia her roommate. All are college students.

53 Al: you know that-
54 that *nice *glass *china ***display case in our** *dining room?
55 Ned: =in the *dining room=
56 Cyn: =o-o-oh=
57 Al: **trashed/
58 Cyn: =forget id=
59 Ned: =*absolutely= trashed/
60 Al: whole thing a=bsolutely..yeah =
61 Ned: =*every *single bit= **of *glass and**
62 * pottery in th-
63 Olga: and *

65 Al: crystal
66 Ned: *everything ..*trashed/
67 Cyn: =o-o-oh my go-o-o-d=
68 Al: =oh a er *antiques *genuine= *antiques
69 Ned: =and the *amount of *money= we have lost
70 is going to be **astronomical/
(UCDisclab:QUAKE)

Features. This example does not meet the usual criteria of narrative. There is (a) no animate protagonist, (b) no sequence of events, (c) no temporal juncture, (d) no temporal connectives, (e) no conflict. Why does this seem to people who hear it to be a story? There is the introduction of the "protagonist," a piece of furniture, by a "common ground" preface (53). There has already been an event in time, an earthquake, so the story is about an implicit temporal sequence, an earthquake followed by the outcomes of the earthquake. Most important, the rhythm of the telling, the alternation between ellipsis and expansion, the lexical and syntactic repetitions, the evaluation by the listeners (56, 67) and by the tellers (68–70) and the probing by participants (63) is appropriate to the excitement of a dramatic story, so it seems to listeners to be a story.

Context of telling. Example (1) occurred in a spontaneous conversation, in a series of *rounds* about different facets of the earthquake experience. To have restated the obvious, to have given a temporal, causal sequence such as "we were in the classroom and suddenly it shook" would have made no sense because everyone present already had experienced the beginning. The highly salient experience of the earthquake established the common ground for the round participants to reveal their individual observations in the immediate aftermath of the shared disaster.

Stories of disasters recently experienced by everyone in the room probably have these common properties – they often occur in rounds, and they are both semantically and syntactically elliptical, building on common knowledge and conversational sequences leading up to the story. As told later when the common knowledge is forgotten, or to audiences who don't share the same history, the stories must be reshaped to provide both orientation and temporal sequences to fill in what is not shared.[6] In fact, when Luebs (1992) interviewed 14 people two months after the Loma Prieta quake, the speakers provided extensive orientation and full-fledged narrative structures. Moreover, since the narratives were not part of naturalistic conversation, but were elicited by the researcher, most of them included codas, that is, verbal or nonverbal ways of showing that a narrative is over. Luebs' data confirm that elicited narratives move closer to the prototype.

4.1. Databases for Study

Adult data. The UC Disclab adult data consist of 180 transcripts collected in a variety of contexts, but primarily from informal natural groups taped in natural [illegible] students[7] in California, with 500 fines of transcription archived using

American school data. We created a non-task waiting room context for best friends of seven and ten to tape natural sociable conversation in a California public school, where the children were varied ethnically and some were bilingual. These ten dyads and triads are in the UCDisclab archive.

Family data. The Ervin-Tripp family data consist of 38 transcripts from 8 multi-child California families with at least one child 3 years old. Some families were videotaped over a period of 18 months in their homes. We observed meals or child free play with siblings and a visiting peer, with the goal of differentiating the social marking features in children's speech with peers, siblings, and adults.

Turkish preschool data. We obtained child–adult conversations at preschool sites[8] in Istanbul, Turkey. Both of the preschools had 3-to-5-year-olds, providing around 40 children from whom we taped different kinds of elicited and spontaneous extended discourse. The informal preschool system provided multiple settings such as classroom environments, various organized and spontaneous play groups, and casual chats to search out the early deployment of narrative skills. For the examples included in this paper, we analyzed around 60 hours of audiotaped talk.

4.2. Locating Narratives in Transcripts

To identify candidate instances of narrative segments, we employed several methods: computerized search for specific linguistic markers such as temporal connectives, reading over the datasets for larger-level indicators of narrative such as reference to irrealis events or past events, prefaces by narrators, prompting by audiences, or audience evaluations. No single method is adequate by itself for identifying all the segments of talk that are of interest. This problem brings us back to the definitional problem we discussed in the beginning of the paper. If we have to determine what constitutes stories, we are probably better off in considering the narrative genre as a continuous cline, consisting of many subgenres, each of which may need differential research treatment. Since there currently exists no single model that includes criteria encompassing all the range of oral narrative forms, we need to approach the problem employing different tools.

Once we identified narratives, the next step was to look back at the antecedent context to find how the narratives were situated, and how they were occasioned by what was said before. We were surprised at how often this context changed the interpretation of the narrative.

5. Observed Features and Contexts of Conversational Narratives

We found that using judges to identify proto-narratives in the family transcripts produced a wide variety of short descriptive [illegible]

temporal junctures in the family and the adult data, we found projections of future events, fantasies, descriptions of regularities, reports of conversations, and reports of events that have occurred – including dreams. It was important in the case of young children to use a linguistic criterion for choosing text materials, so as not to impose categories that are not in the system of the child. If we used temporal connectives as a search criterion – such as *when, while, after, before,* and *and then* – we found that they first appeared in child speech in commands and in planning for future coordinated action, rather than in experience or fantasy narratives (Ervin-Tripp and Bocaz 1989). In other words, planning displays some narrative qualities in child usage. The temporal clause in such sequences defines the relation between two activities of a single actor or between two actors' activities.

"I'm going to make a garbage can when I'm all through with the train lid." (3.0)[9]

Temporal clauses occurred both in reference to *simultaneous events* such as "you listen while I read" (3.3), and to *successive events,* as in "can I have your worm when you get finished" (3.1).

Young children describe sequences of actions in elaborate future plans, including directorial planning of complex dramatic play with coordinated scenarios that are temporally detailed. There is especially rich past and future reference whether the child plays the director planning the actions, or an actor undertaking the script. Outside of dramatic play, young children talk less often about the past than adults do. Among the narrative-like sequences we found were generic descriptions of scripted events, describing what happens on a regular basis, or if you do something, what results.

The following dramatic play enactment illustrates an occasioning of talk about the past. The actor playing the patient is preparing a command to operate on her leg, but describes a personal experience in the past to account for the injury. We see from other child texts (see 3 below) that injuries are usually asked about and are explained by a story of what happened. The child inserts this common type of topic sequence into dramatic play.

(2) Doctor–patient play of 4–5 year olds

1	Kit:	pretend there's something wrong with my leg. my leg-
2		let's pretend that I tell you that my leg's–um-
3		let's pretend I tell you– first, you operate on it.
4		um, but before you operate on it,
5		let me tell you something, okay nurse?
6	Jill:	um, 'kay.
7	Kit:	um, when I was walking down the street,
8		I saw this piece of glass and I picked it up,
9		then I didn't see too well, then it goes way up to here.
10		see now. it's–now it's over there.
11		can you–can you operate on it, nurse?
12	Andy:	I can.

This segment begins in the directorial voice (1–3) which switches without any marking into enactment in the patient's voice (5). Kit starts with a request for the floor (4,5) which Jill acknowledges (6), and Kit then begins the story with a subordinate backgrounding clause (7) establishing the place of the event and the protagonist's activity at the time of an action (8) by the protagonist, reported by a telic verb. Gestures showed the injury (9,10). There is a sequence of narrative events (9). The story provides the explanation of an injury needing repair in the dramatic medical scenario planned at the beginning (1–3), so it is an inserted elaboration before the medical scenario unfolds (11).

We made similar form-based searches in our extensive database of adult materials, looking for markers of temporal juncture[10] as a way to locate story sequences. We found relatively few extended stories. Those referring to the past often were brief, as in the examples to follow. They were stimulated by the sight of objects, pictures, people or television. While the children relied often on the setting as a source for talk, in the adults, we found more stories that continued prior talk, either in story rounds, or in stories to support or challenge conversational claims. There were scripts, that is stories about customary events, and stories that reported dialogue only. The focus of much of the students' social talk was on character, on the implications of events rather than on the events themselves, and on daily problems that they could not solve. In the last type of interaction, the discussions of problems, we can expect some of the kinds of sequencing that Jefferson (1988) has reported for troubles talk.

Unlike Labov and Waletzky's narrators, our tellers of spontaneous stories did not take a long time to build to a high point. It was rare that stories involved drama or suspense. The character anecdotes usually presented a brief event, and the problem situations began with a single event to initiate a topic, with interchanges about alternative outcomes. These stories in young adults are analogous to the stories Ochs, Smith and Taylor (1989) have found in American families, which propose problems and alternative outcomes. These speakers did not seize the floor for a long performance of a story with suspense.

5.1. Elicited/Prefaced Narratives

It is elicited or prefaced stories that best demonstrate that the structure of stories is strongly related to the circumstances of their telling. They are likely to fit some paradigm of a good story, since the prototype is evoked for tellers. The elicitation signals that the respondent has to undertake a performance. The preface signals that the teller is willing to identify what is to be read as a story. They are, in some sense, accountable to the public standards for a story.

While adults may preface or volunteer stories to entertain, in many of the examples we found there was questioning from the audience to prompt the teller, and to give the teller the floor. But a question can focus a reply on a narrow issue rather than on a full story, thus altering the temporal ordering in the [illegible] relation[illegible]

(3) Broken foot elicitation
Melody is 4;7, Lisa is 2. Dave and Georgette are researchers in the home of the children making a videotape. There is an overlapping hosting conversation by the father which interweaves the two sets of speakers.

4 Dav: OK. in the course of the next months,
5 we hope to be out here a few more times.
6 Geo: what happened to your foot, Lisa? Fa: =would= you like any-
7 Mel: =um= [to G] she, she =cut it= thing to eat or drink?
8 in the wheel. D: =not me= [to Fa]
9 she cut. Fa: =Georgette do you?=
10 =when.when=, =when the= G: =no thank you=
11 friend was next door, then, then
12: then, then, then, then she was pushing her on the bike,
13 and it got caught in the spoke or the wheel.
14 G: oh boy
15 M: and she broke a bone.
16 G: oh boy.
17 L: a bone. (Melody) I broke this
18 : =(it go slip) = [to G] Fa: =what kind of= sandwich would
19 : (the bone slipped) you like to eat, Melody?
20 M: Uh, *um* what kind do you have?

(Ervin-Tripp Family Transcripts: Fleursll)

The focus of Melody's reply was specifically selected by a narrow "what happened to your foot?" question, which prompts Melody first to a summary (7) and then backwards in time to the circumstances that brought this result (10–13). As a story, it gets audience reaction (14,16). The disruption of the real time temporal order in the story results from the specificity of the eliciting question.

Most children observed in the Turkish nursery schools by Aylin Küntay did not produce stories for other children, who gave them no prompts. It was adults who often supported children's elicited stories with prompts to get started and to continue. In the following example, Emre has been talking to the adult researcher (Ad) about a children's entertainment center that he visited over the weekend:

(4) Alligator game prompting [Translated from Turkish] (Age: 4;11)

1. Emre: there is a Scoreboard, shows our score
2. > Ad: is that so? how did you – did you make a lot of points?
3. Emre: (I) did
4. *but* once I won a lot of things
5. that alligator-shooting game did not give us
6. because some part of it was broken
7. > Ad: is that so? what happened?
8. Emre: got broken
9. we had won a lot of shillings
10. at that time it got broken
11. Ad: my gosh!

14. those people who control Piramit – they fixed that
15. and *then* we got all that shilling.
(Aylin Küntay: Eryavuz preschool)

This story has a classic construction with a high point and resolution, but the temporal marking appears to be affected by the adult prompting. The adult question (2) takes the child from a description to a specific event. In answering the question, the child begins by a short reply to the question, yet the *but* signals a newsworthy issue or violation of expectation (4), even as the story is beginning, marked with *once*. The story then begins. The resolution does not immediately follow the complicating action, but the adult question interrupts the flow (7). At this point the child repeats and moves back in time to recapitulate the sequence of winning before the equipment broke, even using a pluperfect affix to mark anteriority before the time evoked by the question, and then points out the problem resolution with a *but then* marker. While *eliciting* seems to bring out prototypic stories, *prompting* can alter the temporal sequence by its focusing effect.

5.2. Rounds of Stories

In many conversational settings, stories implicitly invite related stories from other participants. Goffman (1974) states that "an illustrative story by one participant provides a ticket another participant can use to allow the matching of that experience with a story from his repertoire" (p. 510). Adults, in their interactions characterized by a series of stories, pick out some features from previous stories and work them into their ongoing story without bothering to frame each story anew (Ryave 1978), much as speakers in sequential self-introductions use the same frame repeatedly. Umiker-Sebeok (1979), analyzing preschool children's narratives produced spontaneously within natural conversation with other children, found that the most common response to a narrative was similar narrative. At age three, response narratives in Umiker-Sebeok's data did not seem to advance the conversation "as a conjoint elaboration of a conversational topic" (p. 107), but appeared as "dangling narratives" that generally concerned the same general topic.

In the following Turkish preschool example, Can initiates the series of narrative contributions by establishing the theme to be visits to the doctor's office. Single statement initiations that do not go beyond minimal event representations are very common in this younger age. The children await the teacher's interested reaction before building upon their original one-line narratives. In this particular example, the teacher demonstrates interest by saying "is that so, dear?" (2), setting up the topic of visits to the doctor as interesting for all the children.

(5) Visits to the doctor
Beril (4;0) is one of the two girls in a seven student class. Osman is 4;0. Can is 3;7. It is breakfast time, and all of the children are sitting around a table, with their Teacher (Teach) and the researcher (Res) present.

3	Beril:	my mother took me to the doctor, too
4	Can:	shall I say what (*he/she*) said
5	Can:	(*he/she*) said let him eat waffles a bit later
6	Teach:	said let him not eat too much waffles, right?
7	Can:	said let him bite in teeny-weeny bites with his teeth
8		and then also pickles..
9	Teach:	did you get a shot Can?
10		no:
11	Can:	*(1)* don't really like
12	Teach:	let him eat little
13		little by little
14		let him not eat much
15		xxx wouid you like biscuits? {to Res}
16	Res:	no, thanks
17	Beril:	Teacher, the doctor told me don't eat anything
18	Teach:	the doctor?
19		but if we don't eat we can't grow
20	Beril:	no *(he/she)* said have breakfast but
21		don't eat those that your mother brings
22	Teach:	is that so?
23	Osman:	my mother did not take me to the doctor's
24	Teach:	because you aren't sick, right?
25		don't get sick, ideally

(Aylin Küntay: Ubaruz preschool)

Beril, after replicating Can's one-liner in line (3), follows on Can's subtopic about his doctor's nutritional advice. Aside from demonstrating thematic continuity, Beril's story features formal similarities to Can's, such as employing quoted speech of a doctor. Osman then contributes (23) by reporting non-occurrence of the topical event in his life. In Turkish children's rounds like the above, second narrators frequently claimed to have exactly the same experience as first narrators, down to the same details.

Since the overarching motivation for rounds of Turkish children in classroom settings seems to be to gain the teacher's interest, they usually try to top other children's stories with their own versions. If an initiation story attracts the attention of the teacher, other children select out of the thematic possibilities of the original story to construct their own. Usually, some of the thematic content gets replicated in the following stories. As Cortazzi (1993) suggests, usually "later narratives are highly pre-specified, showing marked parallels of topic, theme, character of events with preceding narratives" (p. 32–33).

Rounds allow for the ellipsis of presupposed information or allusion to information from earlier stories. The highly elliptical Earthquake narrative (1) occurred in a series of rounds with successively changed protagonists. Students began by telling where they were when the earthquake happened, and what they and people around them did. They added second-hand stories about what other

hierarchy. After a discussion about the behavior of their dogs, Cynthia said that nothing of hers fell down, turning the topic to inanimate objects, including the immediate cues in the room in which the taping occurred.

(6) Earthquake round

1 Cyn: ==yeah our room our room looks like nothing happened at all,
2 Dom: ==I was I was worried about this [pointing at empty beer
3 bottles on shelves] i-i-it's like coming home to find a big
4 pile of lads, [lads refers to empty bottles]
5 Ned: this is the first this is the first indication
6 that this was something
7 because the last one that happened was like a six
8 [referring to Richter scale] in Los Gatos and I was sitting

16 Ned: and then Al and I come back and we are just all *oh my
17 =*god there it is tilted nearly fallen off just hanging=
18 Al: =yeah.. instant hand up supporting them because they are just-=

The three who were present here co-produce a description of the state of the beer bottles. At this point Dom continues a round of reports on each person's room, including non-effects.

34 Al: nothing happened in my room.
35 Cyn: ==things were moved.
36 Ned: [to A] yeah funny thing Al=your room is a m-=
37 Geo: =you couldn't tell=
38 if something happened to your room.

There is an acceleration (39) as Ned emphasizes the extent of damage in their house, summarized by Al (43). At this point the two brothers overlap in two dramatic descriptions, Al with exaggerated generalization (43), Ned with emphatic prosody in (44).

39 Ned: oh my mum and dad cannot get to Pete's room
40 to see what it's like..= they ca*n't= get to George's
41 Al: =yeah=
42 Ned .all the book-=
43 Al =*natural *disasters= just do *not* stop *happening at *our house.
44 Ned ==*all the *bookcases *everything *fucking c-
45 our *house is **chaos.
46 Al ==yeah.
47 Ned it's *chaos.. =the bookcases=
48 Olga: =the bookcases = came off = the wall?=
49 At: [to O] =Olga =
50 Ned: ==the bookcases all fell down= *books *everywhere *fumiture=
51 Al: =you know =
52 Ned: *moved=

supports the generalization by describing the bookcases. But it is Albert who gets to the worst case of all, the shelving containing the antique crystal, and the brothers produce a duet narrative.

53 Al: you know that-
54 that.*nice *glass *china *display case in our *dining room?
55 Ned: =in the *dining room =
56 Cyn: =o-o-oh= =
57 Al: **trashed.
58 Cyn: =forget it.=
59 Ned: = *absolutely= trashed.
60 Al: whole thing a =bsolutely..yeah =
61 Ned: = *every * single bit= of *glass and
62 *pottery in th-
63 Olga: and *crystal?
64 Ned: * all the crystal..*trashed.
65 Al: crystal
66 Ned: *everything ..*trashed.
67 Cyn: =o-o-oh my go-o-o-d=
68 Al: =oh a er * antiques *genuine= *antiques
69 Ned: =and the * amount of * moneys we have lost
70 is going to be **astronomical.
(UCDisclab:QUAKE)

The round thus began with what happened to items on shelves in each of the participant's campus rooms, moving from a vivid local example in the immediate environment, through another male's room to the most extreme case personally known, the parental home of Albert and Ned. At this point what triggers the dining room narrative is the two strong generalizations in (43,45). To illustrate the generalization, Ned and Albert move emphatically through a coordinated but elliptical description, with considerable rhythmic emphasis. The line length is shorter, with stronger stress and more focus on predicated descriptors, compared to the beer bottle description where more action is mentioned and there are human participants. The final evaluation by Ned, in a longer, syntactically complex sentence, changes the rhythm to summarize the major outcome.

Rounds can also lead to conventionalized story-telling, since they can provide occasions to be given the floor and to produce a tale that can use prior models as scaffolding and the obligation of mutual appreciation as support.[11] In the following example, women at a Senior Center were discussing what they thought of changes in clothing fashions, and moved into the topic of making graduation dresses. The following is an excellent example of the frequent feature in all-female groups of women telling real-life narratives of their own embarrassing experiences to create amusement.

(7) Making grade school graduation dresses
Setting: Senior Center

Ann told a story about how hard it was to finish in time, which ended with an evaluation.

14 Ann: I remember I was so traumatized with that dress [laughs)

After general laughter, Bev started her own story on a similar theme.

16 Bev: what did *I pick but an Indian *linen..

Bev's story quickly moves into a problem. Her laughter (31) suggests that she already had the intention of making a humorous report on her solution. Deb's laugh (33) collaborates in the key.

29 Bev: and I uh if you did not leave enough yeah?
30 for your seams you know and then
31 uh, I had [laugh] all but one sleeve for puffed sleeves?
32 and one was not gonna be as full as the other one so-o
33 Deb: [laugh]
34 Bev: my grandmother used to bring a lot of things from overse-
35 you know, from uh, Europe, she used to travel a lot, my
36 dad's mother? and she had some beautiful ribbon
37 so I used it for the sash I remember it was an orchid.
38 sash, and uh, that- that dress did up, but uh,
39 what was I to do about the sleeves.
40 so I walked crooked up the stage.
41 All: [laugh]
(UCDisclab: WCON1)

Here, Bev reports a situation which for a young girl would be a painful dilemma, the lack of fabric for making the dress sleeves symmetrical for a major public event. Her story about the sash (34–40) sustains the suspense; *"but what was I to do about the sleeves?"* and takes the listeners explicitly to her problem of a crooked dress. Then she states the punch fine, the embarrassing solution of walking crookedly (40). This story is typical of women's humorous narratives about themselves (Ervin-Tripp and Lampert 1992). We can surmise that Bev knew at the start that she would present a problem narrative with a witty outcome. This is a prototypic narrative.

Adult round participants use prior models as scaffolding, with the possible aim of developing mutual appreciation as similar events. Kirschenblatt-Gimblett (1979) studies "story-dominated conversations" of Eastern European Jewish adults finds "in these story-dominated events, there is a preoccupation with narratives as things in themselves. For this reason, and because the narratives are preformulated and relatively self-contained (they can be understood without reference to any preceding conversation or narration), there is a tendency for story-dominated events to be organized like beads on a string" (p. 291).

In sum, rounds are a type of a speech context that

be cycles of jokes, cycles of humorous personal narratives, cycles of stories of one's room in an earthquake. If rounds provide a mutually cooperative audience that allows floor to the speaker, there is the possibility of elaborating a performance in terms of the cultural norms. Rounds can thus involve continuity of genre, continuities of latent topic, continuities of key, emulation of form, and presupposition or ellipsis.

5.3. Environmentally Cued Narratives

More common than rounds in our conversational data are story triggers in the local environment. Here, unlike rounds, there are no models provided in the preceding conversation. There is considerable variability of structure.

(7) Bird burials

1 Ellen: don't look...there's a dead bird.
(20 turns)
21 Ellen: a-a-aw let's bury it.
22 Dina: =let's= not [laugh]
23 Bill: =I - I= don't think so! some cat will probly =get it =
24 Ellen: =my dad= always
25 did it for us
26 =[laugh] =we'd put it in a shoebox and bury it.
27 Dina: =[laugh]= how sweet.
28 Bill: a-aw
29 Ellen: then we'd make crosses out of popsicle sticks.
33 Dina: that's cute though...that's really nice.
34 Ellen: we'd have a funeral for it and everything.
we'd say a prayer [laugh] and bury the thing.
(UCDisclab: LCON2)

This is an example of the reminder report, which describes scripts rather than presenting a conflict with a resolution. There is a serial connective *then*, but the use of *would* marks this as a description of customary practice. There is, however, audience evaluation (27, 33) in this case, as if this were a narrative.

Children's conversations often include reference to what is in their immediate environment, since their activities tend to build on available resources for play. The following is an example of environment-cued fantasy of ten-year-olds in California. The imaginary characters and the disruption of order are characteristic of boys' stories as early as four (Nicolopoulou, Scales and Weintraub 1994).

(8) Microphone story

Two ten-year-old boys alone in a testing room eating lunch notice the microphones strung from the overhead light.

1 Sam: what's this for?
2 Jer: it's a microphone
3 [S & J start to sing into microphones]

Singing or other stage performances are frequent reactions to microphones at this age. At this point, Sam begins to build up a scene of disorder.

4 Sam: [laughing] I was screaming!
5 [laughing] (hey..I'll be acting like this)
6 hey Jeremy Jeremy Jeremy I'm gonna be laughing in this
7 and the light falls down [laugh]
8 what would you do if the light fell?

The past tense (4) marks irrealis and a possible story beginning. In (5–6) the tense is moved to the future and in (8) to the conditional, setting the stage for more fantasy. In (8) we see the imaginary disruption of order, which creates a problem to be solved by the fantasy narrative.

9 Jer: I'll be under the table
10 Sam: [laugh] no.. and you did it!
11 Jer: I'd be outta this class [laugh]

(5)
12 Sam: it'll hit you on your head! [laugh]
13 Jer: you know what I'd do,
14 I'd be Superman and catch it.
15 be Superman and get squashed like a pancake.
16 Sam: I'll be Flash and get the fuck out.
(UCDisclab: GFIVE3)

In this sequence, Sam changes his position from challenger (10, 12) to capping with a character shift (16). Besides being fantastic responses to an environmental stimulus, these stories show how posing alternative outcomes can be part of collaboration in competitive bouts of story-telling.

5.4. Narratives Presenting Problems

As opposed to stories that resolve the complicating situations they set up during being told, some narratives invite audience participation in a possible problem-solving process by formulating problematic situations or protagonist behavior. Ochs, Smith, and Taylor (1989), who studied what they call "detective stories" during dinnertime talk, noticed that such problem-solving narratives can be characterized by interactive negotiation of the incomplete resolution.

The two most frequent contexts for temporal series in young adults' talk in the data are personal characterizations and problem situations. The problem situations are presented with potential endings, which participants co-construct. These differ somewhat from "troubles talk" (Jefferson 1988) when they refer not to chronic problems but one-time events.

A Taiwanese engineering student is conversing with two Asian-American women about the topic of [illegible]

(9) Asian women

Hel: you know...I was talking with a friend about
that asian caucasian dating thing...
and my complaint to { [p] to my friend}
is that that is that asian guys just don't ask
=y' know?.
Min: = yeah = they're not as (xxx) as (xx)
Hel: do you agree?
Yuan: totally agree
Hel: so then if that's true then how come when you guys
get like mad at at *us
if we go out with caucasian people
then you guys don't ask..
you guys don't get off your butts
(I)*answer me
Yuan: it's becau:se..
Hel: (I) you expect us to wait
Yuan: ==*ri:ght
Hel: ="yeah =
Yuan: *ri::ght
Hel: no, seriously
Yuan: (4) hm I don't know I don't what to say
Hel: ==yeah..i don't know either

This segment poses a problem of tension between Asian men and women, in which Helen presents a challenge to Yuan in the *you guys* form (12,13) and pressures him (14) to answer the challenge, then herself providing the answer (16). In the conversation, Asian males are accused of causing the problem about which they are angry (10) both by their behavior (12, 13) and by their unrealistic expectations (16). The topic of male anger triggers a description from Min in which the theme is Asian male anger. The story is basically in the form of a long quotation.

Min: ==did you guys see in the Daily Cal
about stuff..about the vandalism in Dwinelle
I actually like saw it..but um..there's this..
there's this like group of people who call themselves
the (1) Asian Male something or other they like
wrote like all over spray painted or marked =all over=
Yuan: =o:h AMU?=
Min: ==*yea AMU..they like wrote kill whitey and then like
in the girls' bathroom downstairs they're like like y'know
basically just slamming on asian woman
for dating caucasian men
like stay within your own kind..stay within your own group..
know what I mean? and it was just
Min: scrawled *all over the stalls and the walls was writing
Yuan: hm-mm

Helen's evaluation (39) explicitly refocuses the topic again on anger, and triggers a story from Yuan which begins with the response marker *well* (*40*), suggesting he intends the listeners to find a continuity from the topic to his story.

40 Yuan: well, I just met a caucasian guy yesterday
41 and we were just talking right?
42 and he he he speaks a little bit of Chinese
43 and he got a job uh got a job with a company like
44 uh doing tradings and stuff
45 and he was just telling me
46 yeah...you know...some Asian women...man
47 some Chinese women you just take them and
...[clarification of bam – bang]
48 bang them...you know
49 like (2) have sex with them
50 yeah bang them...and then yeah so y'know
51 I'm just going to work here a couple of years
52 and then go back to Thailand and get a wife
53 you know what am I supposed to response-
54 to response to that?
55 Hel: you can bop him
56 Yuan: all I can say is you know
57 MM: tell him you're pissed
58 Yuan: all I can say is being in this world
59 there's somebody who like to hit other people
60 and there's somebody who like to get hit...you know
61 so (1) what can you say?
62 Hel: did you hit him?
63 Yuan: no
64 Hel: why not?
65 Yuan: cause whoever the girl that wants to go out with
66 him, that's her problem...that's not my problem.
(UCDisclab: ASDAT)

This story picks up the racial anger theme, identifying the speaker with the anger of the graffiti writer implicitly by an example of what could produce that anger, white men's disrespect for Asian women. The story here has a structure of a prototypic narrative involving a conflict, but the conflict is unresolved. The narrator evidently did not show his anger to the Caucasian antagonist, and was left feeling dissatisfied. The businessman's statement (46–49) is presented without comment. There is a possible narrative transition marker *then* (50) but no overt reply is reported, and the action shifts to interior reflection. Yuan describes information about his own plans (51–52) implying a conflict with the stance of the businessman.[12] He leaves the story with a question about what he should have done (61). In the context of the graffiti topic, the two women have no hesitation in assuming Yuan's anger, and provide an answer to his question (55–57). It is not [illegible]

prompted (64–66). The story has two unusual features: the failure to report the ending, which had to be prompted, and the solicitation by the teller of alternative outcomes. These mark the story as a problem situation.

5.5. Narratives As Performances

Every narrative, insofar as it attempts to get some point(s) across, has an evaluative aspect. However, only some narratives receive a very animated and dramatic enactment so that a performance aspect is attributed to them (e.g., Bauman 1986; Hymes 1972). In such cases, the teller foregrounds the evaluative component of the story, with less emphasis placed on the events comprising the story. Cortazzi (1993), in contrasting performance narratives with interview narratives, asserts that performance becomes highlighted if the topic is appropriate to the audience, and if participants have reciprocal relationships and shared norms for evaluation. Schiffrin (1981) talks about one feature, that is, usage of historical present tense, that "makes the past more vivid by bringing past events into the moment of speaking..." (p. 58). Among some of the other common features that are employed as tools for highlighting the evaluated point of the story are constructed speech and animated intonation (Tannen 1989).

The following segment coming from two sisters sitting in a cafe demonstrates how constructed speech can be used to constitute a story. Sara is a topic change; she is involved in Mimi's job hunt. Bringing her up brings up also talk about her personality, first a descriptor from Mimi "standoffish" and then a carefully staged mocking mimicry, which Lina launched (9) before Mimi's comment about weirdness (10) suggesting it is an independent but perhaps corroborating expression. The mimicry is a "story", in the form of a dialogue. But it is only a fragment, with no event sequence.

(10) Sisters in a cafe talking about a job search

5 Lina: xxso you decided to call Sara?
6 Mimi: yeah. it's weird cause she's kinda..I don't know
7 don't you think that she's kinda standoff-
8 she's kinda-
9 Lina: she left this message
10 Mimi: her and Jill are both kinda weird I think
11 Lina: =she always goes she goes=
12 Mimi: =they're =
13 Lina: [slow whiny] "I'm calling for Mi-i-mi-i"
14 Mimi: she's- she =calls me Mi-i-mi-i =
15 Lina: =did you hear her message?.
16 Mimi: yeah.
17 Lina: she goes [slow whiny] "I'm calling for Mi-i-mi-i.
18 um if you want you can work at the video store.
19 um tell her to cali me, bye Mi-i-mi-i" [laughs]

(UCDisclab: SISTRS)

that Lina gets the floor for a full quotation mimicking Sara's voice, a production she appears to be planning by line 11. As a conversational tactic this example corroborates and illustrates the points made by Mimi, but the urgency of her production, and her overlaps while accelerating till she gets the floor suggest another feature, a goal of achieving a good performance, in this case of a witty mimicry. Also, as obvious from the content of the conversation, not much of what the story conveys is new information. The only conversational purpose of the story appears to be to display a shared assessment of a third person in a vivid way.

In the Turkish child database, totally "spontaneous" narratives by a child were not very common. Teachers, at times explicitly, disallowed children to tell stories outside of the time allotted for story-telling. When interviewed, a teacher reported that she really did not like it when Hasan, who told story (11) broke into his "quite fantastical and irrelevant" stories in the middle of "serious" group activities. But even without encouragement, children occasionally told some stories that were not precipitated by any remark, question, or topic in the preceding conversation. What seemed to trigger such narratives was probably the tellability attributed to the events by the storytellers. The content tends to be not banal, but out-of-the-ordinary events lending themselves to highly theatrical performances that attempt to build and uphold some suspense in the audience. Labov (1972) proposes that eventfulness is an intrinsic aspect of events and is expressed by evaluative devices: "evaluative devices say to us: this was terrifying, dangerous, weird, wild, crazy; or, amusing, hilarious, wonderful; more generally, that it was strange, uncommon, or unusual – that is, worth repeating. It was not ordinary, plain, humdrum, everyday or run-of-the-mill" (p. 371). Children also tended to repeat such narratives, and consolidated highly elaborate structures through repetition. As Goffman (1974) aptly writes "effective performance requires first hearings, not first tellings" (p. 508). The following narrative is from a 4-year-old boy replaying a particularly dramatic reported near-death experience of a (nonexistent) sibling.[13]

(11) Brain-washing

During a gymnastic session at the preschool, a four-year old boy spontaneously launched into a dramatic story about his non-existent younger brother. When Hasan was asked to retell the story the second telling was very like the first.

1 **Res:** **tell** ***(it)*** again.
2 Hasan: my sibling opened medicine/medicine box – took (it)? [self-correction]
3 was able to open (it)?
4 broke that lid?
5 ate them up
6 ate all all all (*of them*) up?
7 **Res:** a-ah! [=expressing surprise]
8 eee? [=so then?]
9 Hasan: ate them?

12 Res: then?
13 Hasan: then (*we*) took (*him*) to doctors
14 Res: what did (*they*) do at the doctor's?
15 Hasan: what's this? {re: taperecorder}
16 Res: this – (*we*) will listen (*to it*) later
17 Hasan: are you) going to listen (*to it*)*?*
18 Res: uh-huhu
19 what did (*they*) do later at the doctor's?
20 Hasan: doctors ehh.. ee tube – (*they*) inserted a tube towards
21 (*his/her*) belly
22 Res: hmmh
23 Hasan: and after that e eh.. (*his/her*) stomach – e (they) cleansed
24 (*his/her*) brain.
25 Res: Uuuuh! [=expressing astonishment]
26 Hasan: yes!
27 Res: is (*he/she*) fine now?
28 Hasan: ee if (*they*) hadn't washed (*his/her*) brain,
29 he/she would have died {postposed pronoun}
30 Res: god forbid!
31 now (*he/she is*) fine, that means
32 Hasan: (they) washed (*his/her*) brain
33 after that (*he/she*) got well
34 and never took medicine without permission again.
(Aylin Küntay: Eryavuz Preschool)

From the perspective of the 4-year-old boy, the events are so impressive that he seems to be carrying them around in a story-package that waits to be opened up in every appropriate occasion. The exigency of conveying the story gets reflected in the animated tone of voice he uses to tell the story. In turn, such enthusiasm may have led to the development of a full-fledged narrative structure. The temporal sequencing of the orienting events into a personally evaluated complicating action (1–11), the building up of suspense through an extended resolution (20–26), which also receives an evaluation by the presentation of a counterfactual event (28–29)[14] and the usage of a narrative-ending coda to return to the present time (34) depict all the essential elements of a Labovian story structure.

Not all the out-of-the-blue stories exhibited the Labovian elements in a very straightforward fashion. For example, first-person fight stories, while constituting a major portion of the boys' spontaneous tellings, never attained structural complication. There seem to be two main reasons for this: (1) young narrators do not necessarily take on the task of using the sequential unfolding events strategically to create suspense, and (2) the action structure of fight stories that reinforce a self-aggrandizing story is so predominant in the minds of the speakers that they do not go beyond elaborating on the manner of their participation in a fight.

5.6. Tactical Narratives

of the tactical use of narratives was Goodwin's (1990:243ff.) instance of a story told in the midst of a dispute to humiliate the opponent. Support may be in the form of a description, or of a single vignette, as in example (10). Structurally, such narratives are often highly abbreviated, containing only enough information to support the position. Also, they may begin in the middle of a sequence. Example (13) contains a narrative but it does not conform to Labov's criterion of temporal iconicity.

Below is an example of a tactical narrative from the Turkish child database. In a context of a long conversation, Emre has been telling the adult researcher about some horror movies. The adult states (1) a generalizing conclusion that he does not get scared of anything if he can watch such violent movies, a statement Emre challenges by a story. Here the child provides a continuous narration demonstrating an instance of a personal history narrative brought in to support a reply that runs counter to the assumption behind the question. The result is an elaborate narrative with extensive presentation of emotional reaction.

(12) Scary films (Age: 4;11)

1	Ad:	so you don't get scared of anything?
2	Emre:	get scared-
3		for example I get scared of *sey* chow do you say
4		in the cartoon very good-
5		at first there was a very ugly man
6		I didn't get scared of him
7		but then he got uglier in the film
8		I didn't watch it
9		and then I left the TV without turning it off
10		since I got so much frightened
11		my mother was in the kitchen
12		I immediately ran to the kitchen

(Aylin Küntay: Eryavuz Preschool)

The narrative is introduced clearly as an example (3) of the generalization (1) and is constructed as a contrast between a stimulus and non-response (5–6) in agreement with the adult's assumption, and a contrasting *(but then–)* stimulus and fear responses (7–9) in disagreement with her generalization. The next line (9) *and then* escalates to a more vivid example of fear. He provides explanations (10, 11) in the form both of motivational evaluations and place information before the climax and marks the ultimate challenge to the adult's generalization by illustrating his flight (12) as occurring *immediately.* The evaluation (10) can also be seen as a reply to (1) tying the example back to its prompt. Thus the narrative foliows a direct reply, is marked as an example, and is punctuated with recurrent challenges to the stimulating question. It never loses its marking as a reply.

In the following example, the conversational topic had begun with questioning of Ann about her plans to become a feminist therapist, which she illustrates with a quotation narrative, which is the second-hand story of a friend. In the

Her point relating this story to her career goals never was completed, because Cathy interrupted with a specific narrative.

(13) Temper

8	Cath:	=*wo-o-h =
9		you wanna hear about *harassment from a *guy
10		(like) *right after we *saw you,
11		this guy grabbed my *butt, on my way to dinner, on the sidewalk//
12	An:	*o::h =my *go:::d =
13	Iris:	=oh my *go:::d=
14	Cath:	==**no:: it was kind of funny though.
15		I- you- you know I
16		=knew him from the **party = the night be*fore.
17	Tere:	=you **knew who he **was, right/.
18	Cath:	*but.. and he's nice looking
19		and he's a nice guy/
20		but it was just kind of { [fast] *weird
21		because I didn't recognize him at first}
22		I *had to turn around and like,..
23		*actually it took me about a *block to even make the
24		connection/

In this report, Cathy identified her story as an example of the general topic introduced by Ann, supporting Ann's point. She uses a preface (9) to take the floor, identifies the location of the event (10) and moves directly to the high point. The audience reaction (12, 13) confirms the appropriateness of the story and gives her warrant for holding the floor later to speculate about her own reactions. The orientation, evaluation, and her resulting behavior all follow. The audience even collaborates and confirms (17). This story presented a problem appropriate to the topical context, and was followed by a round of harassment stories.

64	Cath:	==(well you know what *maybe)
65		it's kind of *cool sometimes
66		if you're in the right frame of mind.
67		I **really have to be in the right frame of mind,...
68		**drunk. { [laugh] ( )}
69		*no, I *really-I *do have to be in
70		=the right frame of mind. *Simon was just =
71	Tere:	=guys do it to me all the *ti:me,.. I mean guys I *know=
72	Cath:	lucky I didn't *backhand him for that...
73		that's *all I have to *say about it..
74		it was there- I mean if it had been,..
75		if *that had been say like mid*week last week when I was
76		really up*set about stuff,..
77		*I would've turned around and- and...
78		**nailed the guy,.. I swear to god
79		I would've *hi[illegible]

81 Cath: ==**anybody who fucks with me that way last week I
82 would've killed.

Cathy shifts the topic from harrassment to mood in contrasting situations, a shift not followed by the other women (71). She then creates hypotheticals about her willingness to retaliate when in a bad mood (77–79), building to an extreme (82). Her anger about the unresolved event even leads to an ambivalent reply to Teresa's teasing (93), which may have been based on a misinterpretation of Cathy's laugh (92, 95).[15]

91 Cath: I have a *temper *anyway but
92 [laugh] I *really have a temper wh=en (a guy) =
93 Tere: ={ [high] **do you=
94 **really?}
95 Cath: [laugh] **Terry that was not even funny,..
96 *yeah it was but... *it wasn't. <3>
97 *well, yeah.

Next Cathy produces a story, but it is not built up temporally as a narrative; rather, Cathy presents the high point (100) that provides proof of her claims to a fiery character (99).

99 Cath: *you= guys wanna see me in one of my bad moods,
100 *Iris saw me sh- throw my shoe through my window.
101 Iris: [laugh] oh *yea::h I {[laugh] remember that.}
102 Cath: *I don't remember what I was ma:d about,
103 I *broke my window with my shoe.
104 Tere: **go:d,
105 Iris: **I remember what you were mad about....
106 you were *gonna uh- urn..
107 you had been waiting all *day to ga- go out,..
108 your mom said she was gonna be back in the *morning,..
109 = and she didn't come back,=
110 Cath: =**....h and left = me without a *car.
111 Iris: ==yeah....
112 Cath: *that was when I was sharing a car with my *mo:m.
113 that was like my-,..
114 *that was a while ago....
115 that was like my *junior year in high school
116 or something
(UCDisclabCAFE1)

What turns out to be a story about a temper tantrum was not presented as a narrative. Cathy, whose conversational focus is on her own personality and capacities, says she remembers only her own burst of temper and its outcome, not what caused it. It is left to her friend Iris to go back in time (105) and construct the content f[illegible]

to a high-point, and the resolution and coda that one sees in a full narrative. Rather, a speaker seizes a piece of a past sequence for her local conversational needs and gives a fragment of the event sequence.

6. Conclusions

When we see data from other societies, we recognize that there are conditions where long, well structured, personal experience narratives are heard frequently. Alves (1995), for example, found that even Portuguese village children speaking to other children can tell such stories spontaneously, because, he says, such tellings are encouraged and modeled. Americans ask "have you heard this before?" as if retelling to the same audience is undesirable, thus ruling out the repeated rehearsal that elaborates the descriptive, dramatic or humorous features of stories. Ochs, Smith and Taylor (1989) have recorded families in which long personal narratives are not modeled and parents do not report their personal experiences as narratives, instead treating children's reports of the past as problem situations.

Audience participation norms are culturally variable, as we have seen from Watson-Gegeo and Boggs (1977) and others. In our data there is some evidence of occasional backchannel encouragement. Among the questions to be considered in cultural information are these: Can a story be retold or must we ask if it is new? Under what conditions is retelling authorized, and how? Does the storyteller have to demand the floor by prefacing or do listeners recognize and orient to cues of upcoming narratives? Are there occasions and people that can be expected to produce elaborated stories? Many of these cultural factors have their effect through altering the very performance conditions which we have proposed affect the prototypical structure in narratives.

There are also *production conditions* that facilitate longer and more elaborated stories. Among them are:

(a) The opportunity to rehearse and reshape a story. Stories that are retold already have a basis in form, and a reteller has the knowledge of how the first occasion was evaluated by the audience. Even a story that is someone else's gives the teller this advantage.
(b) Stories are likely to be less elliptical where less shared knowledge can be presupposed, and orientation must be supplied. Stories across generations are like this.
(c) On the other hand, shared experience can be motivating of shared interest, as we see in the stories shared by family members or veterans. Prompts, collaboration, and evaluations from an audience indicate attentiveness and willingness to hear a long story, leading the speaker to turn what could have started as a tactical move into a performance.
(d) Elicited, prefaced or audience-prompted stories can be seen by tellers [illegible] aesthetic standard involving the cultural

tellers' most shaped, retold, and dramatic experiences. If the speaker is free to choose a rehearsed and reshaped story, there is likely to be more plot build-up than in conversationally occasioned novel accounts.

(e) Stories that are told in response to narrow questions, or to make particular conversational points, are more likely to select a time in the narrative to begin which does not entail a build-up or elaboration. The telling may include just the high point, or just constructed speech, or just a description. Stories that are told to illustrate a problem can lack resolutions, and alternative outcomes may be solicited from or volunteered by the participaing group.

In sum, the presence and absence of the features of the prototypical story can be systematically related to the conversational circumstances.

Notes

1. The second author's dissertation concerns both spontaneous and elicited narratives of children in two Turkish preschools.
2. Throughout this paper, the terms "narrative" and "story" will be used interchangeably. However, the distinction between narrative and story is a valid one, which is central in some accounts. For example, Rimmon-Kenan (1983) has a three-way distinction between "story", "text", and "narration", where story refers to a series of of logically and chronologically related events, and **narration** is the manner of talking about these event sequences. The origin of the story/narrative bifurcation comes from the Russian formalists' split between fabula and *sjuzhet* (Propp 1968) and gets disseminated into other researchers' work (for example, Chatman's (1978) distinction between story and discourse). Such accounts strive to isolate a paradigmatic core from actual narrative versions, by moving away froin the surface language phenomena towards a deeper structure. Since our main concern in this particular study is only the actual use of language in extended discourse, the distinction will not be honored in the writing.
3. For example, the rhetorical approach (for e.g., Abrahams 1968, 1976, Bauman 1986, 1992; Ben Amos 1976; Hymes 1971), which grew out of the folkloric tradition as a challenge to structuralist approaches, regards stories not as highly confined and named entities in a given culture, but as parts of situated face-to-face communicative events and interactional sense-making situations.
4. In fact different prototypes appear when one compares elicited stories from people of different cultural backgrounds. For example, Minami and McCabe (1991), Michaels (1981), and Rodino *et al.* (1991) have compared elicited stories from different cultural sources, and have shown contrasts in children's story organization in terms of high points, the degree of focus on events or on people's characteristics, and audience encouragement of elaboration or brevity of presentation. So even if we are talking about the prototypic story, we need to identify what features and structural components are commonly highlighted or ellipted in a given culture.
5. Transcriptions are based on Gumperz and Berenz (1993); *is stress; = overlaps= ==latched response; ... pauses; () seconds of pause; { } feature boundaries; / falling terminal juncture.

7. These data were obtained by assignments to students, so they are biased to ages 18–30 with a few exceptions involving families or senior centers.
8. Eryavuz Center and Ubaruz Center will be used as pseudonyms for the two preschools. Although social class is not one of the factors that is explored systematically in the study, an attempt was made to include children representative of families of different socio-educational backgrounds. Almost all of the children in Eryavuz Center carne from higher-middle to upper-class families. Ubaruz Center catered to the children of the staff of a major university, and therefore included children of all backgrounds, mostly lower-middle class and middle-class.
9. Ages are given after quotations in the case of child speakers.
10. Looking only for marked sequences leads to the omission of stories like the earthquake event.
11. The kind of structural elaborations found by Nicolopoulou (1996) when children have audience support in preschool narratives-for-drama suggest that many other manipulations of audience relations to story-telling could alter structural complexity.
12. Linda Young (1994) has described an Asian communication pattern in which background information is presented first, often without further explanation, relying on inference.
13. A later interview with Hasan's father revealed that Hasan didn't have any brothers or sisters. However, the father reported that their neighbor's son, to whom Hasan may be referring as a sibling, had been hospitalized recently for swallowing some headache pills.
14. Such usage of postposed third-person pronouns is very rare in Turkish. In this context, it signifies some ambivalent attitude or emotion on the part of the narrator towards the protagonist – empathy mixed with disapproval and antagonism.
15. Laughter is common in women's self-critical and revealing speech (Ervin-Tripp and Lampert 1992).

Discourse, Social Theory, and Social Research: The Discourse of Welfare Reform

Norman Fairclough

1. Sociolinguistic Theory

The Editorial of the first issue of this journal committed it to promoting the 'building of sociolinguistic theory', arguing that on the one hand sociolinguistics has often been only 'weakly social' in failing to connect with social theory, and on the other hand language-oriented traditions in social science have 'shunned the technical resources that linguistics and semantics offer' (Bell et al. 1997). I agree with Coupland's more recent claim (Coupland 1998) that there is a profound interest in language in recent social theory. This constitutes a so-far undeveloped potential for socially enriching sociolinguistics. At the same time, there is a pervasive failure amongst social theorists to operationalize their theorisations of language in ways of showing specifically how language figures in social life within social research. This is partly a matter of theory stopping short – theoretical frameworks and concepts which centre language within social life are not pushed in the direction of theorisations of language itself. So I agree with Coupland that sociolinguistics can advance social theory – though I see this not as a simple addon, but as a transdisciplinary relationship wherein the logic of one theory is put to work within another (Dubiel 1985; Fairclough 1997; Halliday 1993). Whereas I agree also with Coupland that a single integrated sociolinguistic theory is both implausible and undesirable, I would want to add that integrated *theorizing* is crucial: much recent social theory is committed to overcoming the unproductive divisions between 'macro' and 'micro' theories or 'structure' and 'action' theories by centering its theorising on the dialectic of structure and action (Archer 1995; Bhaskar 1986; Bourdieu & Wacquant 1992; Giddens 1990), and I believe sociolinguistics should follow the same route.

2. The Place of Sociolinguistics in Social Research on Modernity

The interest in language in recent social theory is substantially attributable to understandings of modernity which in one way or other centre upon language or imply an enhanced role for language in modern social life as compared with pre-modern social life. The turn to language in recent social theory references a turn to language in recent social life. But different theoretical categories are used to reference similar perceptions of social change within modern society: for some theorists it's a 'turn to language' (or semiosis), for others a 'cultural turn', or an 'ideological turn', or 'a knowledge turn'. These are of course not simply different terms for the same thing, because the theoretical differences are sometimes substantive, but they do nevertheless constitute different takes on broadly the same sorts of social change. Part of the difficulty of the category of 'discourse' is that it slides between these different theorisations.

The turn to language is evident in various narratives of modernity which centre on language, e.g. the influential narrative of modernity as time-space compression and latterly 'globalisation' (Giddens 1990; Harvey 1989, 1996). Social systems are contrasted in terms of their properties of temporal and spatial distantiation, the extent to which social relations are 'stretched' in time and space. Whereas social relations in pre-modern societies were centred upon people being co-present, modern society has involved a progressive 'stretching' of social relations, so that in contemporary ('late modern') society there is a compression of time and space to the point where relations of power can be instantaneously enacted on a global scale – e.g. massive shifts of capital can destabilise governments in a matter of days. Time–space compression disembeds persons and practices from particular local contexts, and undercuts traditions – it entails a process of 'detraditionalisation' and a corresponding enhancement of the reflexivity of social life, understood as living social life on the basis of knowledge about social life. People live in ways which are mediated by discourses which construct work, family, gender (femininity, masculinity), sexuality and so forth in particular ways, which emanate from experts attached to social systems and organisations, and which come to them through the mass media (print, radio, television, the internet). If the 'texts' of early modern society were printed, it is this multisemiotic discourse that constitutes the 'texts' of late modern society. We might say that contemporary social life is 'textually-mediated' – we live our practices and our identities through such texts. This implies a more central role for discourse, for language and other forms of semiosis, in contemporary social life in comparison with earlier social life.[1] There are other narratives of modernity which centre discourse in different ways (for instance, Habermas's version of critical theory, post-structuralist and post-modernist theories of Foucault, Lyotard and Baudrillard, the post-Marxism of Laclau and Mouffe, and the feminist theories of Butler, Fraser and Haraway).

In addition to such 'grand narratives', the dialogue with social theory needs to include more middle-range and local social theory which opens up empirical work on specific fields, such as the theories of Bourdieu (1988, 1991) and Bernstein

theorisation of discourse. If we develop the categories of CDA in a transdisciplinary way through internalizing the logic of these theories, we can operationalize this theorisation in ways of analysing discourse (Chouliaraki and Fairclough 1999).

If theories of modernity ascribe in one way or another a central place to language, they tend not to specify how it does the social work that is ascribed to it. What is missing is a theoretical specification of the social power of language which could be operationalized as ways of showing in detail within particular social research projects how language and other forms of semiosis perform the social magic which they are credited with. Smith's work is a case in point. It is immensely valuable in producing a feminist sociological account of the social effectivity of texts in contemporary social life, without specifying how texts have these effects. This is where discourse analysis (and more broadly sociolinguistics) can contribute to developing social theory. But this should not be conceived of as simply adding existing theorisations of language onto existing social theories. It is rather a matter of each internalising the theoretical logic of the other, and allowing it to work within its own theorising. It is a matter for instance of doing discourse analysis and developing the theoretical categories of discourse analysis in a way which tries to work with Smith's concept of textually-mediated social life, and of doing sociological analysis and developing sociological categories in a way which tries to work with discourse analytical concepts such as 'interdiscursivity' (Fairclough 1992). In short, developing one theory in dialogue with another, being open to having one theory transformed through internalising the logic of another.

What I shall specifically do in this paper is explore how discourse and text analytical categories might be developed through internalising certain social theoretical logics. The social theoretical logics I shall discuss relate to the theorisation of: (a) social practices (Althusser and Balibar 1970; Mouzelis 1990); (b) different and competing practices (for Bernstein, 'coding modalities') within a given field (Bernstein 1990, 1996); (c) processes of classification in social practices as processes of differentiation and dedifferentiation ('equivalence' in Laclau and Mouffe's terms, 1985). Let me emphasize that my aim is not to produce a finished retheorisation, but to explore what it means to work in a transdisciplinary way.

3. New Labour

I shall give the theoretical concerns of the paper a particular focus by referring to a discourse analytical study I am currently working on, on the political discourse of the 'New Labour' Government in Britain (Fairclough 2000). I shall refer in particular to New Labour's 'reform' of social welfare.

The Labour Party won the general election of May 1997 in the U.K. under the leadership of Tony Blair with a substantial majority after eighteen years of Conservative Party government. Under Blair's leadership, Labour came to the conclusion that its

'Clause 4' of the Party's constitution, amounting to acceptance of capitalism in its new 'global', 'neo-liberal', form. Referring to the Party as 'New' Labour was also seen as important in convincing the electorate that Labour really had changed. This went along with a shift in the focus of the Party's appeal towards 'middle England', the relatively prosperous middle class and upper working class many of whom had supported the Conservatives. Although such matters of interpretation are inherently controversial, the Labour Party is widely perceived as becoming a party of the centre rather than the centre-left.

The repositioning of 'New' Labour has involved significant changes in British politics and government. It represents itself as initiating a 'new polities', a politics of the 'Third Way', which transcends the division in British politics between the ('old') left and the ('new') right. There is a new political discourse which combines elements from Thatcherite Conservative discourse with elements of communitarian and social democratic discourses (a favourite way of summing this up is 'enterprise as well as fairness' – 'enterprise' is a Thatcherite word, 'fairness' is 'New' Labour's preferred alternative to the social democratic 'equality'). There is an attempt to 'reinvent' (or 'modernize') government, involving new forms of 'partnership' between the Government, business, and the voluntary sector. And there is a change in political style which is most obvious in the leadership style of Tony Blair. What is open to question is whether the 'new politics' of 'New' Labour constitutes a new form of social democracy (Giddens 1998), or is a neo-liberal politics which is essentially a continuation of the Thatcherite 'new right' (Marxism Today 1998).

Given that political and governmental processes are substantively linguistic processes, there is a clear general rationale for using the resources of language and discourse analysis in researching politics and government. However, the case is even stronger for New Labour, not only because there has been an unprecedented focus on questions of language both within the Government itself and among those who have commented on it, but also because the 'reinvention' of government (Perri 6 1997, 1998) seems to entail a relative 'turn to discourse' in the way government is conducted. In particular, a move towards a more 'networked' form of governing involving what New Labour calls 'partnerships' with for instance business and the voluntary sector means that government becomes more 'dispersed' among agencies whose activities cannot be directly overlooked from the centre (though the shift towards such networking is in tension with New Labour's taste for strong central control). The emphasis consequently shifts to government interventions to change 'cultures' ('cultural governance'). For example, the Government is intent on introducing 'customer-focused services' in welfare and public services, treating the public as customers and consumers. Changing the 'culture' of government agencies in that direction is very much a matter of changing the language, getting staff to adopt and internalize a new language (e.g. renaming claimants as 'customers'). At the same time, the Government is giving unprecedented attention to how its policies and actions are represented in the media, to putting an advantageous media 'spin' on everything

4. Texts and Social Practices

My objective in this section is to work with the logic of a theory of social practice in order to specify theoretical categories for the social analysis of texts (text, texture, genre, discourse, style, intertextuality, order of discourse), and to show how the theoretical framework which emerges from this can be used in a textually-oriented political analysis of New Labour.

4.1 Social Practices

The analysis of social practices constitutes a theoretically coherent and methodologically effective focus for social scientific research (Archer 1995; Bhaskar 1986; Bourdieu and Wacquant 1992; Chouliaraki and Fairclough 1999). The great strength of the concept of practice is that it allows analysis of social structures to be brought into connection with analysis of social (inter) action – see further below.

All social practices involve forms of work, identification, that is the construction of social identities, and representations of the social world (this is a reworking of Mouzelis 1990 – see also Chouliaraki and Fairclough 1999). All social practices are practices of production – work. In claiming that all social practices are work, the aim is not economic reductionism, but on the contrary to insist that people collaboratively produce their social lives in all domains of life, so that economic production is only one special form of social production. All social practices can be characterized in terms of the materials they work on, and the means of production available (techniques, methods, theories), and the social relations within which they produce (Althusser and Balibar 1970: 41). Furthermore, all practices involve identification, the construction of social identities – every practice is associated with particular 'positions' for people (Bhaskar 1986 refers to the 'positions-and-practices system') in terms of which their identities and social relations are specified. However, there are different 'performances' in these positions depending on the social (class, gender, ethnicity, etc.) memberships and life histories of those who occupy them (Archer 1995), and different identities attach to different performances. Finally, people also produce representations of the social world, including representations of themselves and their productive activities – people never simply act, their representations of their actions and domains of action are an inherent part of action, action is reflexive. Different representations tend to be produced from different positions.

4.2 Texts – The Dialectics of Discourse

A social practice as a practice of production brings together different elements of life into a specific local relationship – types of activity, spatial and temporal locations, material resources, persons with particular experiences, knowledges and wants, semiotic resources including language. We can roughly [illegible] four main

I understand 'text' in a broad sense, including spoken as well as written language, and combinations of language with other forms of semiosis including gesture and visual images. In that these diverse elements are brought together to constitute a practice, we can call them 'moments' of that practice (Harvey 1996). A focus of analysis is on processes of 'articulation' (Laclau and Mouffe 1985) – on how elements are brought together as moments within practices, which may achieve stabilization as relative permanencies, but may also be disarticulated. In being articulated together within a practice, elements are transformed. The moments of a practice are in a dialectical relationship – each moment 'internalizes' the others without being reducible to any of them (Harvey 1996). It is in this sense that text *is* physical activity, *is* power, *is* knowledge and desire, etc., yet at the same time something different from all of them. Each of the four categories of element contributes its own distinctive generative powers to the production of social life, though the generative powers of each works through the mediation of the generative powers of the others. From this 'critical realist' perspective (Archer 1995; Bhaskar 1986; Collier 1994) it is relevant to ask, what is the distinctive generative power of text? (See below.) The question of how texts figure in social practices, how in specific terms they are dialectically related to other moments, has to be answered empirically practice by practice, and for each of the three major aspects of practices distinguished above (work, identification, representation).

What is the distinctive generative power of text? What in Hasan's terms is the 'semologic' (Hasan 1999)? It is the power to socially produce, i.e. to work, in its textual moment; the power to produce texts. I shall refer to this as 'texturing', adapting the term 'texture' from Systemic Functional Linguistics (Halliday and Hasan 1976). So the production of social life in social practices is partly the production of texts. The creativity of texturing as a mode of social production consists in generating new meanings through generating new combinations of elements of semiotic systems (including new 'wordings'). Any difference of wording entails a difference of meaning, though the nature of that difference is a matter for social negotiation and renegotiation as wordings are repeated in shifting contexts (Derrida 1978; Hasan 1999). Is the generative power of text attributable purely to properties of language and other semiotic systems? Language and other semiotic systems are open systems with an unlimited capacity to make meaning through generating syntagmatic and paradigmatic connections. Yet there is also a social structuring of semiotic diversity – the social order of discourse (see below) – which limits the generative capacity of language and other semiotic systems by limiting the combinatorial possibilities of genres and discourses. What I am suggesting is that there is a double structuring of the semiotic, the structuring of semiotic systems and the structuring of orders of discourse, and that the specification of the generative power of text needs to be in terms of both.

4.3 Genres, Styles and Discourses

[illegible] of genre, discourse and

For any particular practice, the question of genre is the question of how texts figure (in relation to other moments) within work, the production of social life, and therefore within the social interaction that constitutes work. Different genres are different means of production of a specifically textual sort, different resources for texturing. Social production, i.e. work, both produces social life and reproduces social life; it is simultaneously creative and conservative. Our theorization of genre must capture that; Bakhtin's (1986) theory of genre is indispensable in its subtle combination of the relative fixities of genres and their openness to new articulations.

The question of styles is the question of how text figures (in relation to other moments) in the identification of people involved in the practice (the construction of identities for them, and differences between them). Different styles attach to different identities.

The question of discourses is the question of how texts figure (in relation to other moments) in how people represent the world, including themselves and their productive activities. Different discourses are different ways of representing associated with different positions. They constitute different visions of for instance the field of government and the wider conjuncture of social fields it is a part of, and different classification (or *di*-visions) of that social world.

4.4 Field, Order of Discourse, Intertextuality

There is one further important characteristic of social practices – they are organised into networks. Networks are more or less stable, more or less fluid. Networks articulate together different forms of work (social relations), different identifications, and different representations, corresponding to the different practices they combine. Practices are networked together within particular areas of social life which have a relative internal coherence and are relatively demarcated from others (for instance, politics, or education). Following Bourdieu I shall call these 'fields' (Bourdieu and Wacquant 1992). Both the internal organisation of fields, and the way social life is divided between fields, are open to change. The social relations of fields are relations of power and struggle, in which the external boundaries and internal structure of the field are stakes.

Since social practices are always networked within fields, analysis of the textual moment is always concerned with specifying how different genres, different discourses, and different styles are articulated together in particular sorts of relationships. We can use the term 'order of discourse' (Fairclough 1992) to talk about fields as relative permanences specifically in terms of these articulations within the moment of text. The term 'intertextuality' (or 'inter-discursivity', Fairclough 1992) can be used on the other hand to talk about shifting articulations of genres, discourses and styles in specific texts.

4.5 Structure and Action

Men (sic) make their

> and inherited circumstances with which they are directly confronted. (Marx 1973)

A preoccupation in recent social theory has been how to overcome the unproductive divide between theories of structure and theories of action, though the quotation from Marx above symbolizes a long tradition of dialectical thinking about structure/action. Theorisations and analyses oriented only to structure are incomplete because structure as well as being the precondition for action is the outcome of action, is transformed in action. This is what Bhaskar (after Giddens) calls the 'duality of structure' (Bhaskar 1986). Theorisations and analyses oriented only to action are incomplete, because action not only produces social life, it also reproduces structures which are its precondition. This is what Bhaskar calls the 'duality of praxis'. Social science should include theories and analyses of both structure and action, and of their interconnection. Social analysis based upon social practices and positions constitutes a theoretically coherent and methodologically effective focus for social research precisely because it allows structure and action to be brought into connection (Bhaskar 1986). On the structural side, positions within practices are pre-given 'slots' in which people have to act, and the position-practice system has a relative durability over time. But, on the action side, although positions are defined abstractly for collective actors, they are occupied by individuals who belong to diverse categories of social agent (working class, middle class; women, men; black, white; and so forth), and who have an individual sense of self (Archer 1995). The dynamics of the social and individual relations played out in practices transcend and transform the position-practice system.[2]

Analysis of the textual moment of social practices mediates between the perspective of action, that is the specificity of the particular text, its specific forms of intertextuality, and the perspective of structure i.e. the order of discourse. The order of discourse is seen as both a precondition for and constraint on textual action, texturing as a mode of work, and an effect of textual action, both reproduced and transformed through textual action. The categories of genre, style and discourse are understood in a way which facilitates movement between the perspectives of structure and action. They are categories both of the order of discourse and of the text. Genres, styles and discourses are on the one hand relatively permanent elements of orders of discourse, and on the other hand instantaneously and shiftingly constituted in specific texts in ways which may to a greater or lesser degree reproduce or transform the permanences of orders of discourse. Those who favour neatness may regard this tension within the categories as simply confusing, but it is essential to a dialectical movement between the perspectives of structure and action in the analysis of texts and discourse.

4.6 New Labour, Government and Text

The field of government can be seen from the perspective of this paper as a network of social practices, which changes over time and varies from place to

and place, one needs to look at how exactly practices are networked together. Part of that exercise is looking at the textual moment of the field, at how different genres, discourses and styles are articulated together within its order of discourse. Some changes in practices and orders of discourse can be identified with specific governments, others are longer-term. Although the specific network of practices under New Labour is distinctive, some of its features are longer-term and apparent for instance in the Conservative governments which preceded it.

The 'reinvention of government' (Perri 6 1997, 1998) under New Labour involves shifts in the field of government. We can think of this as shifts between the field of government and other related fields which transform the field of government itself – the 'inside' of government is transformed through transformations in its relationship to the 'outside'. This involves shifts in the relationship between the fields of government, politics, media, market research, business, voluntary work, and so forth. Shifts in these relationships are internalized as a new conjuncture of practices constituting the field of government itself (the field of government selectively 'takes in', recontextualizes (Bernstein 1990, 1996), practices of politics, media, market research and so forth). For instance, the state becomes 'managerial', incorporating business management practices into government (Clarke and Newman 1997). This applies also for the textual moment: government under New Labour is a new order of discourse, a new articulation of genres, discourses and styles.

Althusser and Balibar (1970) characterize practices of production in terms of the sort of 'effects' they produce. The work of government produces social effects (new social practices and conjunctures of practices) through producing political effects (groupings and alliances of people around/behind desired social effects). Part of the analysis of a particular form of government is specifying the genres of government, the textual means of governing and producing the effects of government.

New Labour has meant changes in the genres of government, including changes in which genres are articulated together and how they are articulated together – for instance, 'focus group' discussion has been incorporated into the array of genres, and articulated with more mainstream genres through the mediation of research reports and press releases which 'translate' focus group discussions into forms which can be incorporated into for instance official documents. Or again, media genres such as the press release or newspaper feature article have taken on a more prominent role among the genres of government and come in a sense to dominate mainstream governmental genres (Franklin 1998). At the same time, the adoption of more 'managerial' practices in government means that mainstream genres such as consultation documents (so-called 'Green Papers') have also changed (see below). In broad terms, New Labour has accentuated the longer-term shift towards achieving the effects of government through managerial rather than political means. This means that, in terms of the textual moment, the political discourse of New Labour is a promotional discourse, which avoids and excludes political dialogue.

field. New Labour has had a radical impact on political discourse through the discourse of the 'Third Way', which has appropriated much of the Conservative discourse of Thatcherism (and is in that sense 'post-Thatcherite', Driver and Martell 1998) which it has combined into a new mix with elements of communitarian and social democratic discourses, leaving the Conservative Party floundering in search of a distinctive political discourse of its own.

A third part of the analysis is specifying the distribution of political styles, and how they figure in the constitution of identities and differences. These include the identities of parties, tendencies and individuals. New Labour has (especially through the person of Tony Blair) achieved a dominant political style, a textual construction of an identity which is effective in conveying its mix of values (youthfulness, compassion, toughness, etc.) and capturing the cultural mood. (I am writing in the northern hemisphere spring of 1999 – this might of course change.)

5. New Labour Welfare 'Reform': The Textual Moment

I focus now on analysis of the textual moment of a specific aspect of New Labour in government, the 'reform' of social welfare. I shall pursue the theme of working in a transdisciplinary way by drawing upon other theoretical logics in addition to the theorisation of social practice – specifically, Bernstein's sociological theory of the field of pedagogy (1990, 1996), and Laclau and Mouffe's theorisation of hegemonic struggle (1985).

5.1 'Reform' of Social Welfare

One of the major commitments of the 'New' Labour government is the 'reform' of the welfare state. I use scare quotes for 'reform' to indicate that it is a contentious representation of what the Government is doing – for instance in the words of an *Observer* editorial (14 February 1999) an 'anodyne' term which represents as 'neutral, technological and essentially benign' what can otherwise be represented as 'the salami slicing of welfare benefits' and 'the rebasing of the welfare state around means-testing rather than universalism and income redistribution'. The Government argues that 'reform' is necessary because the system is increasingly expensive yet ineffective in relieving poverty and 'tackling' social exclusion, and encourages a 'dependence' on welfare amongst people who could work. Welfare state reform in Britain is in many ways analogous to reforms underway elsewhere – the U.S. shift from welfare to 'workfare' for instance is widely recognised as having been a model for New Labour, and there are similar attempts at reform in other E.U. countries. But international 'neo-liberal' tendencies to reduce welfare provision do not preclude national specificity: Clarke and Newman argue (1997, 1998) that the post-war British welfare state was part of specific social and organisational 'settlements' which have been 'unsettled' by radical social

Welfare reform is a major process which is likely to extend over several years. I shall focus on just one point in that process, the publication of the so-called 'Green Paper' on welfare reform. A Green Paper in the British system is a consultative document in which the Government sets out options and its own position and solicits public discussion. It is a preliminary to legislation. The welfare Green Paper (entitled 'New Ambitions for Our Country: A New Contract for Welfare') was published in March 1998. This particular point in the reform process itself involves a network of practices, and in its textual moment a network of genres, discourses and styles.

5.2 Generic Chaining

The production of effects within the field of government depends upon the constituent practices articulated together (networked) within it being 'chained' together in particular ways. For instance, there are two practices whose positioning in these chains seems to be regarded by commentators as distinctive for government under New Labour. The first is 'experiments in democracy' (Giddens 1998) such as using focus groups and citizens' juries (e.g. the 'People's Panel'). One view of the function of such experiments is in testing reactions to government initiatives as part of a wider strategy for managing consent. The strategic location of these legitimizing exercises in the chaining of practices is important. So too is the location of enhanced forms of media management which have been critically referred to as 'government by media "spin"' (Franklin 1998), which can be seen as part of the shift towards 'cultural governance' (which entails a preoccupation with representations and the control of representations). One feature of New Labour noted by commentators such as Franklin is that every move by government appears to come with a prepared media strategy, implying a chain structure punctuated by media-oriented practices.

One aspect of texturing as work (social production) in a textual mode is the arrangement of genres in what we can call 'generic chains' as part of the chaining of practices, i.e. the regular sequential ordering of different genres. We find generic chains of the following general form in the welfare reform process: . . . . speech – (media reports) – document <press release> – (media reports) – speech <press release> . . . That is, a document such as the Green Paper on welfare reform is likely to be prepared for and followed up by speeches on the part of important ministers, but each of these (like the document itself) comes with its own press release (systematically incorporating a media 'spin' – see below on this term), and each subsequent move in the chain is responsive to media reactions to earlier moves. Practices such as focus groups may be inserted into such chains through research reports which also come with press releases attached. On occasion press conferences will also figure in such chains.

The press release for the Green Paper on welfare reform is reproduced in Appendix 1. I shall begin the analysis of it here, but go into more detail in section 5.6. This is a 'boundary' genre which links the fields of [illegible]

(administrative) genre or rather sub-genre (i.e. occurring as part of other genres) – a set of background notes. The latter also hybridizes the former: the date and reference number between the headline and lead paragraph. The 'report' is also a resource for producing reports, and the latter part of it consists of important elements of that resource – key principles of the Green Paper, key quotes from Field and Blair. It is in a sense an official summary, but a summary which selects and orders what it summarizes with a partly promotional intent. In this respect too the 'report' hybridizes media and governmental genres. It is a sort of 'transitional' genre. In sum, the hybridity of the press release as a genre arises from its positioning in generic chains.

The process of summarizing is crucially important not only in press releases but throughout the practices of government. The Green Paper itself includes its own internal summaries – the first chapter is a summary of the whole document, there is a summary of the main points in the last chapter, the Prime Minister's Foreword incorporates his summary, the press release constitutes a summary oriented to media uptake, and the document is then summarized over and over again in speeches. It is through summarizing that media 'spin' is added. By media 'spin' I mean a particular representation of an event or series of events (including a speech or a document) designed to manage the way they are perceived by the public. Differences in summaries are also significant in the negotiation and contestation of political differences within the Government as well as between the Government and other parties and interested groups and organisations. Summarizing is a form of representation and is linked to the question of discourses – the different summaries referred to above involve differences in discourses.

5.3 Recontextualization

Summarizing can also be seen as an aspect of what Bernstein calls 'recontextualization' (1990, 1996). Every practice (and every network of social practices – every field) recontextualizes other social practices according to principles which are specific to that practice/field, which derive from the particular form of social production (work) associated with that practice/field. For instance, the press release is a practice which here recontextualizes according to its own particular logic two other practices: a press conference held by Frank Field to launch the Green paper, and the documentary practice of the Green Paper itself (also Blair's Foreword as a distinct genre or perhaps sub-genre within that practice). Practices in being recontextualized are so to speak uprooted, torn from their own social circumstances, and they appear in the recontextualized form of discourses.[3]

The concept of recontextualization draws attention to the link between production (work) and representation: the way other practices are represented depends on the work that is going on, as well as different positions occupied by people who are involved in the work. Using the concept of recontextualization to think about the textual moment draws attention to links between genres (ways [illegible] and discourses (textual representations). It points [illegible] ongoing

link between analysis of genres and analysis of discourses (and indeed analysis of styles). But in order to move in this direction we need to look elsewhere for a perspective and categories which will allow us to operationalize a processual view of representation. I suggest we can find them in the political theory of Laclau and Mouffe (1985). But further categories of Bernstein's are needed to make that connection: the categories of 'framing' and 'classification'. Thinking with these categories is a way of socially enriching the text-analytical categories of 'genre' and 'discourse'.

5.4 Genre and Framing

'Framing' in Bernstein's theory is a matter of control – in the terms I have been using, the control and regulation of work, i.e. of social production, and therefore of the action and interaction which constitute work. Framing according to Bernstein is either 'strong' (where control is one-sided) or 'weak' (where control is shared). I want to suggest, following Chouliaraki (1998), that it is productive to think of genres as devices for framing, i.e. as means for controlling work in a textual mode. Framing is a matter of both properties of individual genres and the chaining of genres. In the case of welfare reform, the chaining of genres constitutes a strong 'framing' of its process of production, i.e. one facet of the powerful one-sided control and management of the process of achieving political consent by the Government. I shall focus in this section on one chapter of the Green Paper itself (chapter 3, 'The importance of work'), returning to the press release in 5.6. Readers will find the first 14 paragraphs of the chapter (there are 40 in all) in Appendix 2.

The Green Paper consists of a (signed) Preface by the Prime Minister Tony Blair, followed by a Summary of the whole document, Chapter 1 which sets out the case for welfare reform, Chapter 2 which identifies four 'ages' of welfare, and eight 'key principles' of welfare reform which constitute the topics of chapters 3–10. Chapter 11 is about the longer-term future of welfare, and there is an Appendix on the evolution of social security.

I have already suggested that the political effects of government in the production of consent are sought by New Labour not through political dialogue but through management and promotion despite representations of the welfare reform process (e.g. 'It is vital that reform is informed by a full debate on the proposed framework', Summary chapter para 31). The framing of this promotional practice of governance is strong, that is the Government tightly and unilaterally controls the process. Referring specifically to the Green Paper, it is characterized by a strongly framed promotional genre.

Each of the central chapters (3–10) is structured as follows: a chapter title ('The importance of work' in the case of chapter 3) below which there is a coloured box containing one of the eight 'principles' of the proposed welfare reform. In this case 'Principle 1': *The new welfare state should help and encourage people of working age to work where they are capable of doing so.* There is then an unheaded introductory section f[illegible]

taking up the bulk of the chapter (paragraphs 6–40) setting out proposed future welfare practices; and under the heading 'Measures for Success' a short list of criteria against which the success of the proposed reforms will be judged (end of paragraph 40). Each of the chapters tells readers what the case is for welfare reform but above all what the Government has done, is doing and intends or aims to do in the way of welfare reform.

In these accounts, welfare reform is represented as a managerial process of problem-solving, finding solutions to obstacles in the way of the objectives formulated in the eight 'principles', with the problem-solver represented as virtually exclusively the Government itself. Specifically in this chapter: work is the means of averting poverty and welfare dependency, but there are obstacles to people working, so the Government will take certain steps to facilitate work. This argumentative structure is repeated in places within the central 'Policy Direction' part of the chapter, though its focus is heavily on the 'solutions' (the predominant type of clause has an actional process with the Government as agent – what the Government has done, is doing, or will do). Representing welfare reform as managerial problem-solving and structuring these central chapters of the document in terms of problem-solving is part of what makes the genre promotional: the Government's policies are sold as merely technical solutions to an agreed problem.

Although in the nature of things there are many unanswered questions at this consultative stage in the reform process, no questions are asked:[4] the grammatical mood is declarative. The potential for questions is indicated by their marginal presence at the end of the Summary chapter where the reform process is constructed as debate:

> it is also vital that reform is informed by full debate on the proposed framework. We are consulting widely on the content of this Green Paper and we want your views. For instance, how can we best deliver on our guiding principles? Are there ways in which the policy direction can be improved? Are our tracking measurements for success right?

Statements are categorical assertions – again, although in the nature of things there are uncertainties about what has happened or what is the case and hesitations about what should be done, there are no 'maybes' here. The Government is constructed as in full and solitary control. The simulation of certainty and being in control are part of the representation of welfare reform as problem-solving and part of the promotional rhetoric of the document.

Moreover, there is a slippage between the process of consultation over proposed welfare reform and the process of implementation, between consultation document, planning document, and publicity document. This is evident in the use of coloured boxes (eight in all) in the chapter. These boxes contain bullet points or in one case numbered points, with or without headings. Such boxes are widely used in planning documents. The clearest example of this sort of use [illegible] of the chapter, the 'Success Measures': there is no discussion of

were itself a planning instrument in the implementation of welfare reform. Such boxes are also widely used in publicity. The document oscillates between describing the proposed welfare reform, and publicizing it, as it might publicize particular schemes to claimants in implementing the welfare reform. Welfare reform is not simply represented as problem-solving in the document (which would be a matter of what discourse is drawn upon), it is enacted as problem-solving – there is an ambivalence of genre.

These boxes figure as a structuring device: they mark and signal to readers careful authorial planning of and tight control over the text and texturing. They are a resource for strong framing, strong unilateral control by the writer (the Government) over the texturing. For instance the box in paragraph 5 lists in their sequential order the main sections of the 'Policy Direction' part of the chapter which takes up 35 of its 40 paragraphs. The boxes also figure as a pedagogical device, directing the reader to the main points and the main structures of the projected new world of welfare. These are 'reader-friendly' but also thereby reader-directive features, which construct the social relations of the document as asymmetrical relations not only between the one who tells and the one who is told but also more specifically between teacher and learner, with strong classification (insulation) between the two subject positions (see 5.5). The many section headings work in a similar way.

There is an oscillation between informing and persuading ('telling' and 'selling') throughout the document – correspondingly between the social relations of 'telling' constructed in the pedagogical way referred to above, and the social relations of 'selling' (relations between the one who sells (persuades) and the one who potentially buys (accepts)). Take paragraphs 5–7 as an example. One aspect of this oscillation is the shift between third person ('the Government', para 5, the first and third sentences of para 6, the second sentence of para 7) and first person ('we', the second sentence of para 6 – notice the explicit commitment to changing culture, 'cultural governance', the first sentence of para 7). This oscillation between 'the Government' and 'we' occurs throughout the document in the 'solutions' part of the problem-solution structure. Notice that 'we' is open to an ambivalence which is an aspect of the promotional character of the genre – for instance, is the 'we' of 'our ambition' in para 6 the Government, or the Labour Party? and more generally, is the Green Paper government report or party 'propaganda'? Another aspect of the oscillation between informing and persuading is the shift in explicitness of evaluation. The two sentences with first person are also the two most explicitly evaluative – the first including the noun 'ambition' which has a marked positive evaluation in contrast with 'aim' (which occurs here twice as a verb), and 'nothing less than'; the second including several words/expressions which are positively (first two) or negatively (second two) evaluative in this context: 'comprehensive', 'break the mould', 'old', 'passive'.

5.5 Discourse and Classification

I referred earlier to different discourses constituting different visions (...

are framing in its textual mode, i.e. forms of control, discourses are classification in its textual mode, i.e. forms of power. Discourses are forms of what Bourdieu calls 'symbolic violence' (Bourdieu 1991). Discourses classify people, things, places, events etc. – and indeed other discourses. The central question is what sort of boundaries and 'insulations' (Bernstein 1990) are set up between discourses. The recontextualization of practices as I said earlier transforms them into discourses, and imposes upon them classifications and divisions, variably according to different positions in the recontextualing practice. Classification may be strong or weak (Bernstein 1990) – entities may be sharply or loosely divided, strongly or weakly insulated from each other.

The Green Paper selectively recontextualizes social practices to constitute a discourse of social welfare, a vision of the world of welfare. The first division, classification, is between what is included and what is excluded – the analysis of discourses has to attend to absences as well as presences. For instance, the population of the world of welfare in this discourse of social welfare is a sparse one, consisting essentially of the Government and welfare claimants. Welfare staff figure in a very few instances, and a claimant organisation ('lone parent organisations') only once in this chapter – claimant and campaign organisations are rare in the document as a whole. On the other hand, welfare professionals such as doctors are simply absent.

The second division is amongst the entities (persons, things, events, discourses, etc.) which are included. This 'internal' classification is strong – in the case of persons included within the world of welfare, the Government and welfare claimants are strongly divided, insulated from each other. Overwhelmingly, the agent in actional processes is the Government – 'the Government', 'we', or a Government initiative such as one of the 'New Deals'. Overwhelmingly, claimants figure as Goals or Beneficiaries in actional processes. The Government acts, claimants are acted upon. Welfare staff rarely act, welfare professionals never, and claimants generally only where their actions are initiated/managed by the Government (e.g. in paragraph 9: *It aims to help young unemployed people . . . to find jobs*). The dominance of the Government over the process of welfare reform enacted in the strong framing is in a sense repeated in the strong classification, the exclusive agency of the Government in the represented world of welfare.

Claimants (and staff) do however figure if only marginally in another participant role: as agents in verbal processes and experiencers in mental processes, mainly in paragraph 14. There is also a scatter of other examples elsewhere in the chapter where claimants are subjects of mental process verbs (e.g. 'the vast majority of single parents want to work', 'some people feel forced to give up their job'). These can be seen as recontextualizations of what people say in other practices; they take the form of reports of particular things people have said or thought (i.e. they are 'reported speech' and 'reported thought'). In the reporting of speech, the practice that is being recontextualized is sometimes explicitly identified, and sometimes not. Here it is not, but it is evident that the practice is market research (opinion polls, surveys, perhaps focus groups) – that [illegible] in terms of what claimants (and staff) say or think.

of single parents want to work': not only is the practice where these 'wants' were expressed unspecified, so also is who precisely expressed them (possible alternative: 'in a poll of single parent opinion, the vast majority of those asked said they wanted to work'). The Government speaks for these people. Part of the classification which divides the Government from claimants is that the latter do not act (without Government management) but do react (verbally, mentally), though both the ways in which they react and how reactions are represented are controlled by Government (van Leeuwen 1995). One might say that this 'reinvented' form of government includes market research as a technology for legitimizing the Government speaking for the public. Apart from these examples, what others (including relevant others such as welfare professionals, claimant groups) say is not reported. The Green Paper is monological, univocal, dominated by the voice of the Government and excluding other voices.

The Government's welfare reform policy is summed up as 'welfare to work', getting people off welfare and into work, so the practice of work is heavily but again very selectively recontextualized. A key issue is what is seen as included within the practice of work – what 'work' is. Work is overwhelmingly constructed in the document as 'jobs' in the traditional sense – relatively stable and regular work providing enough to live on. The fact that an increasing proportion of work is casual, part-time, and poorly paid, is not focused in the document. Nor is the question of whether for example, women's work in households counts as 'work'. Recent debate over what should count as 'work' does not figure – whether e.g. governments should deliberately stimulate the 'third' (e.g. voluntary) sector and legitimize it as 'work' (Giddens 1998). This is an aspect of the first division, between what is included and what is excluded: these other discourses of work are not explicitly included, though they do have an implicit presence.

For the most part, the word 'work' is used without modification to mean 'jobs' in the sense above. However, there is a shift to the expression 'paid work' twice in the document, once in para 1 of chapter 3. Why this shift? It is significant that it occurs here, at the beginning of the chapter dealing centrally with work. The shift is informationally backgrounded – 'paid work' in sentence 3 is the unmarked theme and is thus constructed as simply a repetition of 'work' in sentence 1. There is no explicit contrast between paid and other sorts of work. Nevertheless, the shift does implicitly signal a contrast – the specification of 'work' as 'paid work' is an implicit acknowledgement that there are other understandings (and discourses) of work. There is also a trace of an alternative discourse of 'work' later in the chapter in paragraph 9 which is the only such case in the document. A list of 'opportunities' for young unemployed people includes: 'work with an employer who will receive a job subsidy', 'work with a voluntary sector organisation', and 'work on the Environmental Taskforce'. Only the first is a 'job' in the usual sense. On the other hand, when the document refers to what parents do in caring for children, it does not refer to that activity as 'work'. As with reported speech so with discourses, an important variable is whether they are attributed (to voices) and located (in practices). What we have here is a covert recontextualization of what people say about work in other practices (—at

The Green Paper is cut off from debates over the nature and future of work, through strong classification which is manifested in the exclusion of relevant other voices, and in the dominance of one discourse of work over an alternative which is only covert. Yet one might think that these debates are crucial for a policy which depends entirely on moving people from welfare into work, given that the number of 'jobs' in the traditional sense is shrinking. Without some fundamental rethinking of the nature of work, the policy looks at best incoherent, at worst dishonest.

By contrast with the representation of work, there is a diversity of discourses in the representation of the social relations of welfare within the document, and that diversity is evident to a degree in the introductory section of this chapter, specifically in paragraph 5, which includes the following representations of the practices of the new world of welfare: 'promote work', 'help people move from welfare to work' (and in Principle 1, 'help and encourage people to work'), 'develop flexible . . . services', 'responsibilities and rights are fairly matched'. The construction of the social relations of welfare as 'helping' relations has been central to the British welfare state, but 'helping' is mainly focused in this document on getting people off welfare and into work. 'Promoting' and 'developing flexible . . . services' by contrast belong to a managerial discourse, and the former connotes cultural intervention. There is also legal/contractual discourse in 'responsibilities and rights'. But the main feature of the construction of the social relations of welfare is the mixture of bureaucratic/professional welfare discourse ('helping' etc.) and managerial/cultural ('promoting' etc.), with the latter predominant. An example of the latter is in paragraph 21 of chapter 3: 'personalised', 'flexible' services are 'delivered', through a single 'gateway' for 'customers' by 'personal advisers' who develop 'tailor-made action plans' for individuals. There is a new discourse here which 'relexicalizes' (Fowler, Hodge, Kress and Trew 1979) welfare services. Cultural effects can be achieved in so far as the Government can win acceptance for such shifts in discourse and the new identities and values they entail. In so far as this document represents (as it is claimed to) a 'third way' between traditional social democracy and neo-liberalism, it would seem to lie in this discoursal diversity in the recontextualisation of (the social relations of) the new world of welfare – a point at which the classification and division between subjects is relatively open.

5.6 Equivalence and Difference

If we use Bernstein's categories of framing and classification to think about genre and discourse, we can analyse the Green Paper as simultaneously regulating the work and social relations of government, and representing the world of welfare (producing a vision of that world through division). But we still need a way of showing how regulation and representation are bound together in the process of texturing; that is, we still need a way of analysing representation processually. Classifications are not simply imposed through the generic framing of interaction

We can draw upon the political theory of Laclau and Mouffe (1985) to find a way of theorizing and operationalizing this perspective. They theorize the political process (and 'hegemony') in terms of the simultaneous working of two different 'logics', a logic of 'difference' which creates differences and divisions, and a logic of 'equivalence' which subverts existing differences and divisions. I want to suggest first that this can usefully be seen as a general characterization of social processes of classification: people in all social practices are continuously dividing and combining – producing (also reproducing) and subverting divisions and differences. Social practice, as Laclau and Mouffe suggest, is an ongoing work of articulation and disarticulation. My second suggestion is that this can be applied specifically to the textual moment of social practices. Elements (words, phrases, etc.) are constantly being combined and divided in texts; prior combinations and separations are constantly being subverted. The point that texts are constantly combining some elements and dividing others is a rather obvious one. But what I am suggesting is that we see these processes as part of the textual moment of the social process of classification, and that by doing so we can see the integration of that textual process with the textual work of controlling and regulating social relations and interactions. That is, we can see the integration of discourses with genres.

It is easier within the limits of an article to show this process in a short text than in a long one, so I shall refer again to the Green Paper press release (Appendix 1). The press release is a recontextualization of a press conference given by Frank Field and of the Green Paper itself including the Prime Minister's foreword. It is a recontextualization which is shaped by the genre of the press release, the work it is doing (the effects it is trying to produce) and the way the work is regulated and controlled.

As I said in 5.2, the press release is a combination of two genres, 'report' and background notes. I am only concerned here with the former. The headline and lead (which I take to include the first three paragraphs – i.e. sections separated by spaces) give a summary of the Green Paper and press conference which is elaborated in the rest of the 'report'. The logic of the report genre is an additive and elaborative one favouring repetition and expansion. The 'report' is also a promotion, and the summary in the headline and lead also incorporates a particular 'spin' which needs to be subsequently sustained and developed. The direct reproduction of the eight 'principles' which constitute the Green Paper's self-summary falls outside these reporting and promotional logics – the press release is also a sort of official summary which is expected to give the 'complete picture'.

Turning to discourse and classification, the headline and lead selectively focus certain aspects of the vision of the 'reformed' world of welfare in the Green Paper: the reform as a 'contract', 'promoting opportunity instead of dependence', 'work for those who can, security for those who can't'. This selective focus constitutes the 'spin'. There is actually internal evidence of differences of position and focus between Field and Blair (Field takes a more ethical stance towards welfare reform, Blair sees it more in terms of

the eight principles with the rest of the report. For instance the construction of welfare as a 'contract' is not included in the principles, and is not prominent in the Green Paper until chapter 11, which deals with the long-term future rather than the immediate reform. The section selected from Blair's foreword is the last four paragraphs which are the only ones in which he refers to the new welfare 'contract'. This focus is therefore a significant one, and it had an effect on media coverage of the Green Paper – several national newspapers for instance reproduced a table in chapter 11 summarizing the vision of a 'new welfare contract' for 2020!

Let me come to division and combination – the logics of difference and equivalence. The second paragraph of the lead incorporates two divisions taken from the Green Paper – 'opportunity instead of dependence', and 'work for those who can, and security for those who can't'. The latter is a double division: the division between those who work and those who can't is mapped onto the division between 'work' and 'security', restricting by implication the social security offered by the welfare system to those who are unable to work. These divisions condense important features of the New Labour welfare 'reform': an acceptance of the New Right construction of welfare as morally objectionable in promoting 'welfare dependency', the commitment to 'equality of opportunity' as an alternative to 'welfare dependency', shifting the focus of welfare towards getting people off welfare and into work (which gives the division between those who can work and those who can't primacy over the division between those who have work and those who haven't).

These divisions are repeated and elaborated in the quotations from Field. The first paragraph of those quotations contains in addition to a repetition of 'work for those who can; security for those who cannot' a division between 'a cycle of dependency and insecurity' and 'an ethic of work and savings'. Although the various elements put together here can be found in the Green Paper, this particular division is Field's, it is 'spin' as creative elaboration, a process of representational work. It is combination as well as division: 'dependency' combined with 'insecurity', 'work' with 'savings'. The division is again a double one – 'dependency and insecurity' as against 'work and savings', but also 'cycle' as against 'ethic'. The latter seems somewhat incoherent. Field's specific position and difference from others within New Labour is evident both in the foregrounding of the ethical aspect of welfare 'reform' – which is present in the Green Paper, but marginal – and more subtly in the rewording of 'dependence' as 'dependency', which is a more direct evocation of the New Right theories of 'welfare dependency' referred to above and again foregrounds the moral dimension. The two instances of 'genuine' in the third and fourth paragraphs of the Field quotation also accentuate the moral dimension, and also show that division can be covert – 'those in genuine need' are covertly set off from those not in genuine need (those whose claimed needs are not genuine). The moral division between the deserving and undeserving poor is echoed here.

At the same time, the division between those who can and those who cannot

who cannot work', and 'those of working age' and 'those in genuine need who can't work'. The former hybridizes two divisions, 'can/cannot' and 'want to/don't want to', formulating the shift in New Labour thinking from seeing work as an option for the disabled to expecting those who are able to work to do so. The latter generalizes the category of those who can work to those of working age – the message is that if you are of working age you work unless you are too severely disabled to do so, a message which is underscored by the combination of 'work' and 'welfare' which subverts the division between them – 'work is the best form of welfare'.

Summing up the quotation from Field, the vision of welfare which is summarized in the divisions of paragraph two of the lead is further worked up through the divisions and combinations of the quoted material. This is a localized instance of how the politics of New Labour, the 'Third Way', is constantly in process as its elements are worked (textured) together in texts – in this case for instance in a way which foregrounds ethical and moral aspects of welfare 'reform'. The process of working up the discourse takes place according to the logic of the genre, involving in this case a movement from summarizing gist in the headlines and lead, to repetition and elaboration in the rest of the 'report'. The genre is of course a relatively simple one, and the interplay between discourse/classification/division and genre/interaction/regulation is much more complex for instance in the Green Paper itself.

Differences of position and perspective between Field and other New Labour leaders which are well known and can be extensively documented elsewhere are also evident here. The ethical focus is Field's rather than Blair's – which does not mean that it is absent from Blair's political discourse, just that it is not worked into the same salience. Conversely, it is the Blair quotations which elaborate the construction of welfare as a 'contract' – though again it is also part of Field's political discourse. In the first paragraph of the Blair quotation there is a three-way division which sets the 'third way' against 'dismantling welfare' and 'keeping it unreformed', and constructs the former as a 'new contract between citizen and state', and in terms of a marked form of combination which is pervasive in New Labour discourse – the 'but also' relation.

I use this term for combinations which can be paraphrased with 'x but also y' (or 'not only x, y'). The example here is: 'we keep a welfare state from which we all benefit, but on terms which are fair and clear' (or: 'but we also make the terms fair and clear'). Other instances of the 'but also' relation are: '. . . the vast majority of us benefit . . . But we all contribute . . .', 'We benefit but we pay', 'fair not just for the existing generation, but fair between generations'. The pervasiveness of the 'but also' relation in New Labour is a part of the politics of the 'Third Way' – the 'Third Way' is all about transcending divisions, reconciling what had been seen as unreconcilable, combining themes from the 'old' left and 'new right'. There is a very prominent New Labour 'but also' relation which is alluded to here and most directly formulated in the lead as 'reciprocal duties between government and the individual' but interestingly not formulated in its usual form – 'rights and responsibilities'. Rather, the [illegible]

of the 'Third Way'. Also, by combining universality ('we all benefit') with the everyday concept of 'fairness', and constructing the contract as a 'fair deal', Blair connects the 'reform' with everyday values and criticisms of the existing system (in terms of 'unfair' abuses of it). This everyday and one might say populist construction stands in contrast with the austere, theoretical, and moral construction of the lead: 'reciprocal duties between government and the individual' – one might see this as part of a difference in style between Field and Blair.

6. Conclusion

In addressing the question of sociolinguistic theory which I raised in the opening section, I have drawn upon several social theories in a transdisciplinary way, using them to think theoretically about language within the operational context of research on the political discourse of New Labour, trying to enhance the capacity of the particular area of sociolinguistics I have been concerned with (discourse analysis) to advance social theory in the direction of language. There are gains, I am suggesting, both for the sociolinguist and for the social theorist.

The gains for the sociolinguist from thinking with theories of social practice are more explicit and coherent specifications of how the semiotic (language, discourse in the abstract sense, text) figures as an element of the social. What I have specifically argued is that there is a textual moment in any social practice, and that the textual moment has three facets for which we can use the categories of genre, discourse (as a count noun), and style. The category of intertextuality can be specified as the textual aspect of the articulatory character of social practice. Other categories such as dialect and register could also be grounded and differentiated in theorisations of social practice. I argued that theories of practice can be enhanced with theories of fields as networks of practices whose textual aspect is orders of discourse. I also argued that a socially-grounded theorisation of texts as processes involving the interplay of genre and discourse (as a count noun) could be developed through thinking with the categories of recontextualization, classification and framing, and the logics of difference and equivalence. What this gives is a way of specifying the process of texturing as work – the production of social life in its textual moment. My concern has been to discuss a particular way of working, in a transdisciplinary mode, and again this could be pushed in different directions, for instance towards the concern of many sociolinguists with linguistic constructions of identity.

The gains for the social theorist are in pushing social theory in the direction of language so that social research flows into language research rather than stopping (as so often) on the threshold of language.[5] These gains come from the incorporation of social theories into theorisations and eventually analyses of language so that the latter become more fruitful for social theorists to think, theorize and analyze with. The key issue is textual analysis, and the place of textual analysis in social research. The concept of 'texturing' claims that there is always a textual moment to the work, the production of social life, in any soc-

analysis. The challenge for sociolinguists is to develop forms of textual analysis (including of course interactional analysis) which are socially compelling, and I am suggesting that the way to do this is by drawing social thought into our theorisation and analysis of texts.

Notes

1. Thinking in policy terms, the recent emphasis on the 'learning age', the need (especially the economic need) for 'lifelong learning', can be construed as a recognition of this (Department of Education 1998).
2. With respect to the social dynamics, Bourdieu (Bourdieu and Wacquant 1992) gives a different account, in terms of the dual inscription of the social in places/institutions (fields and their positions) and in bodies (and habitus), and tensions between position and habitus as a source of transformation.
3. They appear in an 'imaginary' form according to Bernstein, and it is the transformation from real to imaginary that is the space in which the play of ideology takes place. I do not develop the point here, but this strikes me as an interesting basis for thinking about discourse and text ideologically. See Chouliaraki and Fairclough (1999).
4. The Green Paper on learning (Department of Education and Employment 1998) makes an interesting contrast in this respect, and shows what is possible. Questions are directed to the reader throughout the document, and gathered together over four pages in the final chapter.
5. Let me give one example of social theory stopping on the threshold of language, where the rubicon of text analysis really needs to be crossed. According to Bernstein (1990, 1996), although the symbolic violence of classification imposes 'voices' on subjects which limit their 'messages' in social interaction, 'message' can subvert 'voice' – what is repressed in classification can re-emerge in social interaction. There is, in other words, a voice-message dialectic. Bernstein does not acknowledge the need for text analysis in formulating this important position, yet it is through close analysis of texturing, of textual processes, that this dialectic can be shown in practice (Chouliaraki and Fairclough 1999).

Appendix 1: Frank Field Launches New Contract for Welfare

Date: 26 March 1988
Ref: 98/077

Frank Field, Minister for Welfare Reform, today unveiled the Government's Green Paper on Welfare Reform "New Ambitions for Our Country – A New Contract for Welfare".

Mr Field said the Government's programme for welfare reform would promote opportunity instead of dependence, and would be based on work for those who can, and security for those who can't.

The Green Paper, for the first time, sets out a series of success measures to be achieved over the next 10–20 years. It presents a new welfare contract, based on reciprocal duties between government and the individual.

The Green Paper sets out eight key principles guiding welfare reform:

* The new welfare state should help and encourage people of working age to work where they are capable of doing so.
* The public and private sectors should work in partnership to ensure that wherever possible, people are insured against foreseeable risks, and make provision for their retirement.
* The new welfare state should provide public services of high quality to the whole community, as well as cash benefits.
* Those who are disabled should get the support they need to lead a fulfilling life with dignity.
* The system should support families and children as well as tackling the scourge of child poverty.
* There should be specific action to tackle social exclusion and help those in poverty.
* The system should encourage openness and honesty and the gateways to benefit should be clear and enforceable.
* The system of delivering modern welfare should be flexible, efficient and easy for people to use.

Mr Field said:

"This Green Paper has a central aim: work for those who can; security for those who cannot. We want to replace a cycle of dependency and insecurity with an ethic for work and savings.

"The document builds on the £3.5 billion New Deal for the young and long term unemployed and the Budget that made work pay, raised Child Benefit and put quality childcare within reach of all families. At the same time we are modernising and putting money into schools and hospitals and will soon have the first ever national minim wage to help the low paid.

"The arguments for reform are clear, society has changed and the state has not kept pace with it. As such, spending on Social Security has doubled yet more people live in poverty and insecurity.

"The Green Paper offers pensioners a decent income in retirement and a new beginning for disabled people. Those disabled people who want to work will get help to do so, while those who cannot work will get genuine support.

"Work is the best form of Welfare. To those of working age we offer greater help to get into work, and a modern system to provide help for those in genuine need who can't work."

In a foreword to the Green Paper, the Prime Minister said:

"We must return to first principles and ask what we want the welfare state to achieve. This is the question this Green paper seeks to answer. In essence, it describes a third way: not dismantling welfare, leaving it simply as a low-grade safety net for the destitute; nor keeping it unreformed and under performing; but reforming on the basis of a new contract between citizen and state, where we keep a welfare state from which we all benefit, but on terms that are fair and clear.

"There is a very simple reason why we need such a contract more than ever today. The welfare state we have is one from which the vast majority of us benefit through a state pension or Child Benefit or use of the NHS. The welfare state isn't just about a few benefits paid to the most needy.

"But we all contribute through taxes and charges. We benefit but we pay. It is a contract between us as citizens. As such, it needs to be a fair deal, within a system that is clearer, more relevant for the modern world, efficiently run and where costs are manageable. One that is fair not just for the existing generation, but fair between the generations.

"That is the fundamental reason for reform. It will take time. Frank Field has started the process in this Green Paper. Now that the process is underway, we want all the nation to be part of it. There will be consultation and time for discussion at every stage. Our objective is to build a genuine national consensus behind change. The welfare state belongs to us all. It is part of our inheritance. We must now all work together to re-build it for the new century that awaits."

Notes to Editors

1. The Green paper *New ambitions for our country: A New Contract for Welfare* is available from Stationery Office bookshops. It is also available in Braille, audio cassette and in Welsh (Cmd 3805, price £11.50).

2. A summary version of the Green paper has also been produced and is available free of charge from the following address:
Welfare Reform
Freepost (HA4441)
Hayes
UB3 1BR
Tel: 0181 867 3201
Fax: 0181 867 3264
The lines are open Monday to Friday from 9am–5pm

3. **Consultation**
Feedback on the content of the Green Paper should be addressed to:

7th Floor, The Adelphi
1–11 John Adam Street
London WC2 6HT

Appendix 2: Excerpt from 'Green Paper' on Welfare Reform

Chapter Three

The importance of work

Principle One

The new welfare state should help and encourage people of working age to work where they are capable of doing so.

1. The Government's aim is to rebuild the welfare state around work. The skills and energies of the workforce are the UK's biggest economic asset. And for both individuals and families, paid work is the most secure means of averting poverty and dependence except, of course, for those who are retired or so sick or disabled, or so heavily engaged in caring activities, that they cannot realistically support themselves.
2. For many people the absence of paid work is a guarantee of a life on low income. One of the reasons children make up a higher proportion of those at the bottom of the income distribution is that a growing number of parents, especially lone parents, are out of work. Paid work also allows people to save for their retirement.
3. For too long, governments have abandoned people to a life on benefits. Far too many individuals and families are penalised, or gain too little, if they move from benefit to work.
4. **Chapter One** described how work has changed over the last 50 years. The rewards for skills have grown, widening the wage gap. Some people reap the rewards of fairly paid work, while others are either stuck on benefit or switching between benefit dependency and short-term, low-skilled jobs. There has also been a shift in balance from full-time manual jobs to part-time and service-sector posts. In households with two working adults, the loss of a job for one can mean that the other would be better off giving up work too.
5. The Government aims to promote work by:

   - **helping people move from welfare to work through the New Deals and Employment Zones;**
   - **developing flexible personalised services to help people into work;**
   - **lowering the barriers to work for those who can and want to work;**
   - **making work pay, by reforming the tax and benefit system, including a Working Families Tax Credit, reforming National Insurance and income tax, and intro-ducing the national minimum wage; and**
   - **ensuring that responsibilities and rights are fairly matched.**

■ POLICY DIRECTION

Welfare to Work – The New Deals

6. The Government's biggest investment since taking office has been in a large-scale **welfare to work** programme. Our ambition is nothing less than a change of culture among benefit claimants, employers and public servants – with rights and responsibilities on all sides. Those making the shift from welfare into work will be provided with positive assistance, not just a benefit payment.

7. Our comprehensive welfare to work programme aims to break the mould of the old, passive benefit system. It is centred on the five aspects of the New Deal for:

   - **young unemployed people;**
   - **long-term unemployed people;**
   - **lone parents;**
   - **people with a disability or long-term illness; and**
   - **partners of the unemployed.**

8. Alongside these national programmes, we are also piloting targeted help for areas of high long-term unemployment through the new Employment Zones.

Young unemployed people

9. For young people, entering the labour market is a critical rite of passage to adulthood. One of the factors causing social exclusion is an unacceptably high level of youth unemployment. The **New Deal for Young People** is a radical step forward because it emphasises quality, choice and above all meeting the needs of individuals. It will address all the barriers to work that young people face, including homelessness and drug dependency. It aims to help young unemployed people, aged 18 to 24, to find jobs and remain in employment. In the Budget, the Chancellor also announced that partners of young unemployed people who have no children would be included in the New Deal, and given access to the same opportunities for work.

The New Deal for Young People

- **Is being piloted in 12 pathfinder areas.**
- **Will go nationwide in April 1998.**
- **Is an investment of £2.6 billion.**
- **Will offer participants, aged 18 to 24, four opportunities:**
  - **work with an employer who will receive a job subsidy of up to £60 a week;**
  - **full-time education or training;**
  - **work with a voluntary sector organisation; or**
  - **work on the Environmental Taskforce.**

All these options involve training.

- **Support will also be given to those young people who see self-employment as the best route out of benefit dependency.**
- **Includes a special £750 grant to employers to provide their New Deal employees with training towards a recognised qualification.**
- **For those who do not wish to take up offers of help there will be no 'fifth option' of simply remaining on benefit.**

10. Every young person who receives Jobseeker's Allowance (JSA) for six months without securing work will enter the New Deal Gateway – an exercise in promoting job-readiness and providing a tailor-made package of help. People with particular disadvantages may enter earlier. For those with adequate skills and appropriate work experience – the 'job-ready' – the immediate focus will be on securing an unsubsidised job. For those young people less equipped to enter the job market, the Gateway will provide careers advice and guidance, assessment of training needs, work trails with employers

Long-term unemployed people

11. For those who lack skills and become unemployed, the risks of remaining out of work for a long period are high. So prevention is better than cure. The Government's plans for lifelong learning, described in **Chapter Five**, are designed to raise skills in the adult population and promote employability, so that people find it easier to get and keep jobs.
12. There is already a sizeable group of long-term unemployed people who may need additional help to overcome barriers to work. Employers are often sceptical of the job-readiness of a person who has been out of the labour market for long periods. And, over time, skills, confidence and health can deteriorate. The New Deal for the Long-Term Unemployed represents the first serious attack on the waste of talents and resources represented by long-term unemployment.

The New Deal for the Long-Term Unemployed

- **Due to start in June 1998.**
- **Initial investment of £350 million.**
- **For those aged over 25 who have been out of work for more than two years.**
- **Substantial job subsidy of £75 a week for employers for six months.**
- **Changes to benefit rules to improve access to full-time education or training. Additional pilots are due to start in November 1998:**
  - **Pilots of an intensive approach for 70,000 people, providing individualised advice, counselling and help, which may include training and work experience, at a cost of £100 million.**
  - **Special assistance tailored to the needs of those aged over 50.**

Lone Parents

13. The twin challenges of raising children alone and holding down a job are considerable. The vast majority of single parents want to work, to gain a decent wage and a foothold on the ladder out of poverty. But the old welfare system did little to help, simply handing out benefits rather than offering active support in finding and securing work, training or childcare. **The New Deal for Lone Parents** will provide a more active service.

The New Deal for Lone Parents

- **Piloted in eight areas since July 1997, offering help to 40,000 lone parent households.**
- **Available nationwide to lone parents making a new or repeat claim for Income Support from April 1998.**
- **Available to all lone parents on Income Support from October 1998.**
- **The service is aimed at lone parents whose youngest child is at school, but is also available to those with pre-school children.**

14. There will be a full, independent evaluation of the first phase of the New Deal for Lone Parents, available in autumn 1999. Early indications are encouraging. Lone parent organisations, employers and lone parents themselves have all welcomed this New Deal, and the staff responsible for delivering the [illegible]

26

Coherence in Text vs. Coherence in Mind

T. Givón

1. Introduction

Most linguists and experimental psychologists derive their understanding of text coherence, such as it is, almost exclusively from the study of well-edited written text,[1] and the behavior of text comprehenders. Both traditional tilts are of course understandable. Coherence is much easier to demonstrate *prime facie* in a well written text, where repeated cycles of careful editing have produced maximally-consistent global structures. Coherence is also much easier to investigate experimentally by manipulating, controlling and recording the behavior of text comprehenders. One must recognize, however, that the price of methodological convenience in both disciplines may be rather steep. The phenomenon of text coherence as a natural cognitive process may be distorted beyond recognition; so that one winds up studying artifacts of either text editing or experimental design, and often of both.

The aim of this paper is to introduce a measure of realism into the discussion of discourse coherence, by reminding us all of the incredible complexity that a serious empirical study of coherence must entail, and how such complexity can only be studied by combining the methodological resources of several disciplines. My approach may be characterized by the following theses:

(a) **Single vs. multiple strands**: Text coherence is a complex, composite meta-phenomenon, involving multiple strands. While each of the strands may be discussed or manipulated independently, coherence is fundamentally an epi-phenomenon.

(b) **Product vs. the process**: Coherence is fundamentally *not* an objective property of the produced text. Rather, that text is a by-product of the

mental processes of discourse production and discourse comprehension, which are the real loci of coherence.

(c) **Single vs. multiple perspectives**: Text coherence is fundamentally a collaborative process, involving two minds attempting to achieve, simultaneously, many goals. Some of those goals may be in conflict, and the collaboration between the two interlocutors toward resolving such conflicts and achieving their respective goals is a matter of degree.

(d) **Production vs. comprehension**: One must index one's study of the mental processes of text coherence separately to discourse production and discourse comprehension.

(e) **Written vs. oral discourse**: Fundamentally, the production of spontaneous oral communication is the most revealing medium where a realistic study of text coherence should be located.

(f) **Knowledge-driven vs. grammar-driven processes**: Human discourse production and comprehension involve two distinct processing channels: one older, slower and vocabulary-driven; the other younger, faster, and grammar-driven.

(g) **Local vs. global coherence**: In both processing channels, both local and global aspects of coherence are involved.

Of these seven, I will focus more narrowly on (a), (f) and (g). Thesis (b) remains the underlying methodological *leitmotif* of the study. The other three – (c), (d) and (e) – will be either taken for granted or be supported primarily by cited references.

I will begin by recapitulating some of what text-sensitive linguists know from studying the external artifact – the recorded or written text. How to extrapolate from the product text to the mental processes involved in text production and text comprehension remains a key methodological issue.

2. Coherence and Grounding

2.1. Coherence Strands in the External Text

From a methodological, heuristic perspective, coherence may be defined as an observable property of the external, recorded text:

(1) **Coherence as continuity**:
"Coherence is the **continuity** or **recurrence** of some element(s) across a span (or spans) of text".

Of the many elements that can recur across text, six more visible, concrete elements are the easiest to track; and their coherence is thus the easiest to measure. They are:

(a) referents

(c) aspectuality
(d) modality/mood
(e) location
(f) action/script

In processing the first five elements of coherence – (a), (b), (c), (d), (e) – grammar is massively involved, a subject we shall return to in considerable detail further below. The use of grammar as an instrument of discourse coherence has salutary consequences for both the text analyst and the text comprehender. For the text analyst, tracking recurrent elements through the text is facilitated by their predictable association with grammar. One needs to only study then the distribution of grammar in text; and this is a clear methodological windfall. For the text comprehender, overt grammatical signals – syntactic constructions, morphology, intonation – cue the text processor, they guide it/him/her in the construction of a coherent mental representation of the text; and this is a vital cognitive boost.

2.2. Coherence as a Mental Entity

A number of separate issues must be considered if one is to treat coherence not only as a methodologically-useful observable artifact of the external text, but also as a cognitive phenomenon in the mind that produces and comprehends the text. First, there are cognitive operations that must occur in both text production and text comprehension. These operations do not of themselves constitute text coherence. Rather, they impose or guarantee whatever coherence we find in the external text.

Second, there are at least two mental text-traces that one must consider. And each of the two stands, at least potentially, in some isomorphic relation to the external text:

(a) working memory buffer ('immediate recall')
(b) episodic memory ('longer-term recall')

While I intend to confine most of my remarks to the latter, perhaps a few words could be said about the former.

2.2.1. The Working Memory Buffer

It is fairly well established that the working memory buffer for text is severely limited, perhaps retaining no more than 2–5 clauses at a time, or roughly 8–20 seconds of verbatim text (Gernsbacher, 1985; Squire, 1987; Carpenter and Just, 1988; Just and Carpenter, 1992; *inter alia*). By 'verbatim' one means not only the vocabulary but also the surface grammatical form of utterances. During the short time-span of the buffer, whatever portion of the 'external' speech signal that is at all to survive in longer-term memory must be translated rapidly, into

essential for both the text producer and text comprehender, although their mental episodic representation need not be identical.

Surface information of grammatical cues probably does not survive beyond the working memory buffer, and thus most likely does not reach episodic memory. One may consider the grammatical signals associated with natural language clause as the mental processing instructions[2] that guide the speech comprehender toward constructing a coherent, structured mental representation of the text. Put another way, grammatical signals are part of the transfer mechanism used for placing the clausal information at some coherent – connected, grounded – location in episodic memory. They are thus responsible for at least some of the connectivity – or coherence – of the mentally represented text.

2.2.2. Episodic Memory

Unavoidable metaphorical usages such as 'mental trace', 'mental storage', 'mental model' or 'mental representation' need not conjure up an image of binding isomorphism between the external text and its episodic mental representation. Nor should these metaphors imply any particular stability of that representation over time. Both of these issues remain wide open, and are probably a matter of degree. In describing the sub-cortical hippocampus-based (medial temporal lobe) neurological mechanisms that supports at least the early phases of episodic memory, Squire and Zola-Morgan (1991) observe:

> "...This system is fast, has limited capacity, and performs a crucial function at the time of learning in establishing long-term declarative memory. Its role continues after learning during a *lengthy period of reorganization and consolidation* whereby memories stored in neocortex [the hippocampus is sub-cortical; TG] eventually become independent of the medial temporal memory system. This process, by which the burden of long-term (permanent) memory storage is gradually assumed by [the] neocortex, assures that the medial temporal lobe system is always available for the acquisition of new information..." (p. 1385; emphases added; TG; see also Squire, 1987)

Not only is the information in episodic memory malleable during a protracted period of "reorganization and consolidation", but retrieval of this information for reflection or speech production, even from the more permanent neocortical storage, is heavily dependent on the context within which it is accessed or 'reproduced'.[3] The flexibility and context-dependence of longer-term episodic recall are indeed well documented (cf. Loftus, 1980).

However little we know about the real details of text representation in episodic memory, either hippocampal or neocortical, I will take it for granted that text is represented at least in part as a **network of connected nodes**. This network structure displays at least two well [illegible]

(2) **Mental text structure:**

a. **Hierarchy:**
Episodic text representation has at least some depth of hierarchical organization, so that nodes ('chunks') are connected both 'upward' and 'downward' to other hierarchically adjacent nodes – clauses to their governing chains, chains to their governing paragraph, etc.[5]

b. **Sequentiality:**
Episodic text representation displays at least some sequential chaining at each hierarchic level, so that nodes are connected to both preceding and following sequentially-adjacent nodes – a clause to a preceding and following clause, a chain to a preceding and following chain, etc.

Both the degree of hierarchic depth and the length of sequential chains remain wide-open empirical issues. It is easy to demonstrate that both vary enormously from one external text to the next.[6] And there is no reason to assume that they do not vary even more extensively from one mental text representation to the next. Further, other – 'idiosyncratic' – connections, neither hierarchic nor sequential, probably also exist between nodes in the network.

I will be concerned here primarily with use of episodic representation *during* the on-line processing of incoming discourse. For this use, the longer-term neocortical episodic representation of the text is probably irrelevant. It is the early and extremely flexible episodic representation in the hippocampus-based system that concerns me most here.

2.3. Coherence as Grounding

2.3.1. Preamble

If one accepts the assumption that mentally-represented text has some sequential-hierarchic network structure, one can see why coherent episodic representation is the chief guarantor of fast on-line access to episodic information during both text production and text comprehension. The guarantee of on-line access to individual nodes in the network of mental text lies in their **connectivity** or **grounding** to other nodes in the network. From the perspective of the text receiver ('hearer'), connectivity allows for coherent storage. From the perspective of the text producer ('speaker'), connectivity makes it possible to produce a text that the hearer can comprehend. Following Gernsbacher (1990), I will assume then that text comprehension is synonymous with the construction of a **structured mental representation** of the text. That is:

(3) **Coherence as grounding:**

a. In order to guarantee fast on-line access to nodes in the mental representation of text, nodes must be **grounded** at least to some degree. That is, a node must be **connected** to either some sequentially adjacent, hierarchically adjacent, or non-adjacent node(s) within the mental text-structure.

b. The more connections a node has – the more grounded it is – the more

The grounding of information nodes in the mentally-represented text, especially during on-line text comprehension, involves two main directions – anaphoric ('backward') and cataphoric ('anticipatory'). Anaphoric grounding has been studied much more extensively. It involves connecting incoming new information chunks to some existing mental representation – either of the text or of other mental entities. The second, cataphoric grounding, has been studied in much less detail. It involves the opening of pending connections in yet-to-be completed structure, in anticipation of text that is in the process of being constructed (Gernsbacher, 1990). Somewhat paradoxically, incoming text-nodes are grounded cataphorically to text-nodes that have not yet been processed, although some may have already been stored in the immediate recall buffer. In the space below I will briefly flesh out the notions of anaphoric and cataphoric grounding.

2.3.2. Cataphoric ('Anticipatory') Grounding

Traditionally, cataphoric grounding has been discussed almost exclusively in terms of **indefinite reference,**[7] and then mostly in terms of the *absence* of anaphoric grounding. A more careful study reveals that cataphoric grounding is a much more extensive grammar-cued phenomenon, involving referential, temporal and thematic coherence.

In the grammar of **referential coherence,** referent NPs are identified as either those that will be important, topical, and thus persistent in the subsequent discourse, or those that will be unimportant, non-topical, and thus non-persistent. Topical referents are most commonly given special grammatical marking, while non-topical ones are left unmarked. As an example of this grammar-cued contrast, consider the use, in spoken American English, of the indefinite articles 'a(n)' and 'this' in the introduction of new indefinite NPs into the discourse. A typical example of this contrast can be seen in the following Dear Abby letter (Wright and Givón, 1987):[8]

(4) **The indefinite articles *a(n)* vs. *this*:**

"Dear Abby: There's *this guy* I've been going **with** for near three years. Well, the problem is that **he** hits me. **He** started last year. **He** has done it only four or five times, but each time **it** was worse than before. Every time **he** hits me it was because **he** thought I was flirting (I wasn't). Last time **he** accused me of coming on to *a friend* of **his**. First **he** called me a lot of dirty names, then **he** punched my face so bad **it** left me with a black eye and black-and-blue bruises over half of my face. It was very noticeable, so I told my folks that the car I was riding in stopped suddenly and my face hit the windshield.

Abby, **he**'s 19 and I'm 17, and already I feel like *an old married lady* who lets her husband push her around. I haven't spoken to **him** since this happened. **He** keeps bugging me to give **him** one more chance. I think I've given **him** enough chances. Should I keep avoiding **him** or what?

Black and Blue".

The new referent marked by 'this' recurs as the

The cataphoric persistence of 'a'-marked vs. 'this'-marked indefinite referents in the oral English has been studied in narratives produced by 8–12-year old native speakers of American English. The results are summarized in (5).

(5) **Mean topic persistence (TP) of the indefinite 'a'-marked and 'this'-marked subjects and objects in spoken English**; (expressed as number of times the same referent recurred in the sub-sequent 10 clauses; Wright and Givón, 1987)

grammatical coding	mean TP value	N
'this'-subject	6.95	28 (65%)
'this'-object	2.40	15
total 'this'		43
'a'-subject	1.54	13
'a'-object	0.56	94 (88%)
total 'a':		107

There is a clear interaction between grammatical subjecthood and the indefinite article 'this': 65% of 'this'-marked NPs appeared as subjects, while 88% of 'a(n)'-marked NPs occurred as non-subjects. Indeed the contrast of grammatical roles – subject vs. direct object vs. others – is one of the most important cataphoric grammatical signal for both indefinite and definite NPs. To illustrate this, consider the cross-language comparison of topic persistence of referents given in Table (6). The survey represents distributions in 5 unrelated languages. The **topic persistence** of subject and object NPs in active-transitive clauses is expressed as their recurrence in the following 10 clauses of text. The results are expressed as the contrast in frequency between low-persistence referents – those that recur only 0–1–2 times (0–2) in the following 10 clauses, and high-persistence referents – those that recur more than twice (>2).

(6) **Cataphoric persistence of subjects and objects of transitive clauses in Sahaptin, Panare, Bella-Coola, Korean and Spanish**[9]

	number of occurrences in the following 10 clauses					
	0–2		>2		total	
language	N	%	N	%	N	%
Sahaptin						
subj	9	19.6%	37	**80.4%**	46	100.0%
obj	21	**61.8%**	13	38.4%	34	100.0%
Panare						
subj	9	31.0%	20	**69.0%**	29	100.0%
obj	19	**65.5%**	10	34.5%	29	100.0%

(*Continued*)

(*Continued*)

	number of occurrences in the following 10 clauses					
	0–2		>2		total	
language	N	%	N	%	N	%
Bella Coola						
subj	27	21.4%	99	**78.6%**	126	100.0%
obj	82	**65.1%**	44	34.9%	126	100.0%
Korean						
subj	53	35.3%	97	**64.7%**	150	100.0%
obj	106	**72.0%**	44	28.0%	150	100.0%
Spanish						
subj	19	19.0%	81	**81.0%**	100	100.0%
obj	70	**70.0%**	30	30.0%	100	100.0%

Other grammatical devices may also be used for the cataphoric grounding of topical indefinite referents. A common one is restrictive relative clauses in combination with the indefinite article:

(7) a. A man **with no shoes on** came into the office and...
b. A woman **who spoke no English** then stepped forward and...
c. Someone **who's very anxious to meet you** is coming over tonight...
d. A guy **I haven't seen in years** has just called me and...

In addition to tagging the newly-introduced NP as an important topic in the subsequent discourse, the information in the REL-clause makes the referent salient, grounded to the current location in the discourse. So that the referent can now be attached at a **relevant** location in the mental representation of the incoming text.

2.3.3 Anaphoric Grounding

2.3.3.1. Preamble: Definite Reference

Speakers code a referent as definite when they assume that it is **identifiable** or **accessible** to the hearer. By 'accessible' one means that it is represented in – and can be retrieved from – some pre-existing mental structure in the hearer's mind. When speakers re-introduces a referent in such a context, they ground it by various grammatical devices. Such grounding serves to establish a **mental connection** between the referent's occurrence in the current text-location and its previous anaphoric trace in some extant mental structure. Grammar-guided anaphoric devices most commonly ground re-introduced referents into three types of mental structures:

(8) **Mental structures for anaphoric grounding:**
(a) Model of 'I'

We will take up these three types of anaphoric grounding in order.

2.3.3.2. Grounding to the Speech Situation
Grounding referents – or other coherence elements – to the current speech-situation is achieved by indicating their spatial or temporal relation to the two participants in the discourse – speaker and hearer. This involves well-known **proximity** and **orientation** devices such as:[10]

(9) a. **The interlocutors:**
'I', 'you', 'we', 'y'all'
b. **Other referents:**
'this one', that one', 'that one over there'
c. **Location:**
'here', 'there', 'way over there'
d. **Time:**
'now', 'then', 'long ago, 'in the future' 'today', 'yesterday', 'tomorrow' 'this week', 'last week', 'next week'

2.3.3.3. Grounding to Generic-Lexical Knowledge
Culturally shared, generic-lexical knowledge is represented mentally in the permanent semantic memory. Referents may be grounded to this mental structure in two distinct ways. First, some referents are globally accessible because they are uniquely identifiable to all members of the relevant speech community ('culture', 'sub-culture', 'village', 'family') at all times. Some examples of such referents are:

(10) **Globally-accessible generic definites**

referent	**relevant social unit**
a. **The sun** came out.	all humans
b. **The president** has resigned.	a nation-state
c. They went to **the cemetery.**	a community
d. **The river** is frozen over.	a community
e. Call **the sheriff!**	a county
f. **The Gods** are angry.	a religion
g. **Daddy** is home!	a family

Generic access to definite referents is frequently intermixed with episodic text-based access, yielding a hybrid system of double grounding. A double-grounded referent is accessible partly through an anaphoric connection to its episodic trace in the episodic representation of the current text, and partly through connection(s) to generic-lexical knowledge. This hybrid type of grounding is often referred to as **framed-based** or **script-based** reference (Anderson, Garrod & Sanford, 1983; Yekovich and Walker, 1986; Walker and Yekovich, 1987). Typical examples are:

(11) **Double-grounded frame-based reference:**
a. My boy missed **school** today,
he was late for **the bus**.
b. He showed us this gorgeous **house**,
but **the living room** was too small.
c. She went into a **restaurant**
and asked **the waiter** for **the menu**.

The definite referent 'the bus' in (11a) receives its anaphoric grounding from two separate sources – the antecedent referent 'school' in the preceding text, plus generic-lexical knowledge of the frame 'school' and its sub-component 'bus'. Similarly in (11b), the definite referent 'the living room' receives its anaphoric grounding in part from the antecedent referent 'this gorgeous house' in the preceding text, and in part from generic-lexical knowledge of the frame 'house' and its sub-component 'living room'. Likewise in (11c), both definite referents 'the waiter' and 'the menu' receive their grounding in part from the antecedent referent 'a restaurant' in the preceding text, and in part from generic-lexical knowledge of the frame 'restaurant' and its sub-components 'waiter' and 'menu'.

Frame-based referential access is often accomplished through conventional knowledge of whole-part, possessor-possessed relations:

(12) **Whole-part, possessor-possessed frame-based access:**
a. She grabbed **the fish** and chopped off **its head**.
b. **John** just got a job working for **his father**.
c. **The house** was a mess, **the roof** leaked.
d. **She**'s upset. **Her kids** keep flunking highschool.
e. **The table** is missing **one of its legs**.
f. **My wife** called and said...
g. **Your house** is on fire.

In (12f, g), the anaphoric antecedent is not accessible from the current text itself, but rather from the speech situation, i.e. the identity of the speaker and hearer. But the use of frame-based knowledge to affect full grounding of the definite referent is of the same type.

2.3.3.4. Grounding into the Current Text

By far, the bulk of the grammar of anaphoric grounding involves access to anaphoric traces in the episodic mental model of the current text. Out of this vast array, one can separate several clusters of devices that seem to specialize in cuing access to rough locations – or configurations – in the mental text structure. One can illustrate the use of such devices by citing their characteristic anaphoric gap – or **referential distance** (RD). This purely heuristic measure records the gap – in number of clauses backward – between the referent's current text-location and its last previous occurrence.

(13) **Comparison of mean referential distance (RD) values and degree of categorial distribution for common anaphoric devices** (from Givón, ed. 1983a; 1983b; 1984b; Sun and Givón, 1985)

construction	mean RD (# of clauses)	degree of clustering around the mean
a. zero anaphora	1.0	100% at mean
b. unstressed PRO	1.0	95% at mean
c. stressed PRO	2.5	90% between 2–3
d. Y-movement	2.5	90% between 2–3
e. DEF noun	7.0	25% at 1.0 35% scattered 5.0–19 40% at 20+
f. DEF-Noun with modifier(s)	10.0	55% scattered 5.0–19.0 45% at >20
g. L-dislocated DEF-N	15.0	60% at >20 (25% at 4–9) (13% at 10–19)

One must emphasize that referential distance is primarily a heuristic measure of convenience. Distance by itself is not necessarily of great cognitive significance. Rather, distance tends to coincide with some mental entities – both structures and operations. The main division in (13) is probably between devices that signal maximal continuity (13a, b) and those that signal discontinuity (13c-g):

maximal continuity	===>	zero anaphora, unstressed pronoun
discontinuity	===>	stressed pronoun, full lexical noun

As an example of how this major distinction is deployed in text, consider the following passage of fiction. Of the referents that play any significant role in the narrative,[11] continuous ones are bold-faced, and discontinuous ones are italicized:[12]

(14) "...**He** circled it wearily as a wolf, **[Ø]** studying it from all angles, and when finally **he** stopped within a dozen feet of *the dead man*, **he** knew much of what had happened at this place.

The dead man had ridden a freshly shod horse into the playa from the north, and when **[Ø]** shot **he** had tumbled from the saddle and *the horse* had galloped away. *Several riders* on unshod ponies had then approached the body and *one* had dismounted to **[Ø]** collect the weapons..."

Cognitively, the maximal-continuity anaphoric devices signal the default choice of **continued activation** of the current topical referent. From the perspective

under the same thematic chain-node. The topical referent is the node label of the thematic chain.

Discontinuous anaphoric devices, on the other hand, signal the **terminated activation** of the current topical referent, and activation of another topic for which there exists an anaphoric mental trace. Among such devices, the short-distance devices (13c, d) tend to signal the activation of another referent without terminating the current chain. An example of such a use of a stressed pronoun can be seen at the end of (14) and its continuation:

(15) "... *Several riders* on unshod ponies had then approached the body and *one* had dismounted to [Ø] collect the weapons.
The clothing had not been stripped off, nor was *the body* mutilated..."

The full indefinite NP 'several riders' in (15) terminates the activation of the preceding chain *and* its topical referent ('the dead man'), and opens a new chain, becoming its topical referent. The stressed pronoun 'one' then singles out one member of this group briefly, but this is done without terminating the thematic chain. The chain is then terminated, returning implicitly to the earlier topic 'the dead man'. This is done indirectly by double-grounding the frame-based reference, via 'the clothing' and 'the body'.

As an example of the use of the other short-distance discontinuous referent device, Y-movement ('contrastive topicalization' (13d)), consider:

(16) "...After buying a copy of *The Racing Times* at a Manhattan newsstand, Ed Piesman, a dentist and an avid horse-racing fan, said he preferred the new paper to the venerable *Daily Racing Form* because "the columnists are much better" and some of the statistics "are much much better". *But* the news dealer who sold him the paper said people like Dr. Piesman are few. **"The Racing Time, I sell two a day**, maybe five when there is a big race", said Ashok Patel, whose stand at 72nd Street and Broadway is adjacent to an off-track betting parlor. **"The Daily Racing Form, I sell 40 or 50 a day"**..."[13]

Two topical referents persist throughout the paragraph, 'The Racing Time' and 'Daily Racing Form'. When they are switched for contrast, the object-fronting Y-movement construction is used – without terminating the paragraph.[14]

Several long-distance anaphoric devices are characterized by the following conflation of functions:

(a) Like other full-NP definites, they are topic-switching devices, deactivating the current topic/node.
(b) Their anaphoric topic is re-activated after a long gap of absence (i.e. of cognitive de-activation).
(c) The mental trace of the re-activated topic in the episodic memory is found in another chain, across at least one chain boundary, but often across a paragraph boundary.

As illustration of a long-distance anaphoric device, consider the use of L-dislocation (13g) in informal spoken American English:[15]

(17) H: ...Well my dad was born in Sherman, that's close to where [...] is. He was born in Sherman in 1881, and he died in '75. Yeah. And ah, so, ah of course, **my great grandfather, they came in there**, I think, y'know, part of them from Tennessee and part of them from Illinois. And I don't really know much about that far back, Tom. **But my grand-dad, he was a hard-shelled Baptist preacher**, and he just, y'know, farmed and ranched.
T: In Texas?
H: Yeah, yeah.
T: So he was already in Texas?
H: They must've come there when he was small, y'know, 'cause he spent...
T: Your great grandfather moved and your grandfather was really raised in Texas.
H: Yeah, yeah. In other words, about three generations of us... were in Texas...
T: In Texas...
H: And of course we eh, **my dad, all he ever did was farm and ranch**...

Some grammatical devices are better described as theme switching or **paragraph-initial** devices. Rather than coding the re-activated topic, they signal the beginning of a new thematic paragraph. Consider, for example, the use of fronted adverbials in:[16]

(18) "...Their trail when they left Wells' body lay in the direction he himself was taking, and that meant the waterhole was off-limit for Shalako unless he wished to *fight* them for it, and no man in his right mind started a *fight* with Apaches.
When the time for *fighting* came, the man Shalako *fought* with a cold fury that had an utter impersonal quality about it. He *fought* to win, *fought* with deadly efficiency, with no nonsense about him, yet he did not *fight* needlessly.
Despite his weariness and that of the horse, he began backtracking. Peter Wells was not likely to be alone, so his presence indicated a camp nearby, and a camp meant water. Yet Shalako puzzled over his presence there at such a time..."

Both new paragraphs in (18) are introduced by pre-posed ADV-clauses. In both, thematic discontinuity overrides referential continuity, so that in spite of the continuing main participant ('Shalako', 'he'), a new thematic paragraph is initiated.[17]

2.4. The Extreme Bounds of Coherence

It is possible, at least for those who interpret coherence as an objective property of the external text, to view coherence as akin to 'grammaticality' in the Chomskian sense – a text either has it or doesn't have it. Within the framework of network-like mental text structure I am proposing, it is more useful to view text coherence as a matter of degree. One could then set up the theoretical extreme upper and lower bounds of coherence, then see how various kinds of text stack up vis-a-vis

A useful description of the extreme bounds of coherence can be extrapolated from Wittgenstein's (1918) discussion of tautology and contradiction in logic. The upper bounds of coherence is logical **tautology**, as in:

(19) John came home, John came home...

In 'text' (19), all nodes in the second clause – subject, verb, locative – cohere maximally with corresponding nodes in the preceding clause. The second clause is thus maximally grounded, and the text maximally coherent – but also maximally redundant.

One type of lower bounds of coherence is the logical sense of **contradiction**:

(20) John came home, John didn't come home...

In 'text' (20), all nodes in the two clauses seem to cohere maximally – except for the crucial modal node of truth value, which thus makes the two clauses logically incompatible as members of the same text.[18] The more common cognitive, pragmatic sense of incoherence involves the absence of recurrent element(s) across the text, as in:

(21) John went to Italy, the cow jumped over the fence...

Most coherent – interpretable – texts fall somewhere in the middle between the two extremes of total redundancy and utter incoherence. In moving across adjacent clauses, one encounters some recurring and some non-recurring elements.[19] But neither the amount of new (=disjointed) information nor the amount of old (= connecting) information in a single clause is totally unconstrained. The constraint on the amount of new information in the clause may be given as (Givón, 1975; Pawley and Syder, 1983; Chafe, 1986, 1987a):

(22) **constraint on new information**:
"Clauses in natural text tend to have only one chunk
(usually a word) of new information per clause".

If one accepts the clause as the incremental unit of processing new textual information (Givón, 1984a, ch. 7; Chafe, 1986, 1987a, 1987b), then (22) can be viewed as a constraint on the amount of new information that can be added to mentally-represented text during a single processing increment.

The second constraint, at the other end of the scale, governs the amount of old information in the clause, and may be given as (Givón, 1984a, ch.7; Givón, 1990a, ch. 20; Chafe, 1987a):

(23) **constraint on old information**:
"Clauses in natural text tend to have **at least one chunk**
(usually a word) of old information per [illegible]"

The most common element of old (=connecting) information in the clause is its main topic, most often the subject; the vast majority of clauses in natural text have subjects; and the vast majority of subjects are definite – i.e. connecting information.

There are good reasons to suspect that principle (23) represents the **minimal grounding requirement** for coherent interpretation of the clause, rather than an optimal level. The number of grounding connection in an average clause is probably larger, and referential coherence is only one grounding connection in the clause.[20]

If multiple grounding of a clause is indeed the norm, then this norm can be cast as a principle of grounding, coherence and mental access:[21]

(24) **Multiple grounding, coherence and mental access:**
"The more grounding connections the clause has, the more mentally accessible it is, and thus the more coherent it is relative to the text in which it is embedded".

3. Knowledge-driven vs. Grammar-cued Coherence

3.1. Preamble

In a recent review, Walter Kintsch (in this volume) has suggested that two parallel processing channels are active simultaneously during text comprehension. One, the "strong method", is driven by domain-specific knowledge contained in the **lexical information** (nouns, verbs, adjectives, adverbs) in the clause. The other, the "weak method", is driven by the **grammatical information** in the clause. Kintsch contrasts the two channels as follows:

> "...We have finally found a use for syntax in a psychological processing model. It provides the comprehender with a "weak" but general method for comprehension, to be complemented by the "strong" knowledge-based and domain-specific methods. As in problem solving, weak and strong methods have their respective advantages and uses, and the complete comprehender would not forego either..." (Kintsch, in this volume, p. 158)

Perhaps a more apt characterization of the contrast between grammar-driven and knowledge-driven text comprehension is that of "rough-grained" vs. "fine-grained". One may illustrate the relation between the two processing modes with an analogy from transportation. Suppose you are heading toward a particular house on a particular street in a particular neighborhood of a distant city. You travel first on the freeway – fast, efficiently, with relatively little conscious attention – until you reach the city, your rough-grained destination. Now you must exit

attending carefully to traffic signals and street names, until – slowly, laboriously – you reach your fine-grained destination.

3.2. Grammar as an Automated Discourse-processing Mode

One must note that text comprehension – the construction of a coherent mental representation of the current text – need not rely on grammar cues at all. It is well established that there exist two modes of discourse processing in human language – the **pre-grammatical** and the **grammatical**. The pre-grammatical mode is both ontogenetically and phylogenetically prior (Givón, 1979a, ch. 5; 1989, ch. 7; 1990b; Blumstein and Milberg, 1983; Lieberman, 1984; Schnitzer, 1989; Bickerton, 1990). In Table (25), the two processing modes are compared in terms of their structural, functional and cognitive properties.

(25) **Pre-grammatical vs. grammatical discourse processing**

properties	**grammatical mode**	**pre-grammatical mode**
STRUCTURAL:		
a. **grammatical morphology**	abundant	absent
b. **syntactic constructions**	complex/ embedded	simple/ conjoined
c. **use of word-order:**	grammatical (subj/obj)	pragmatic (topic/comment)
d. **Pauses:**	fluent	halting
FUNCTIONAL:		
e. **processing speed:**	fast	slow
f. **Mental effort:**	effortless	laborious
g. **Error rate:**	lower	higher
h. **context dependence:**	lower	higher
COGNITIVE:		
i. **Processing mode:**	automated	attended
j. **acquisition:**	late	early
k. **evolution:**	late	early

The slow, analytic pre-grammatical mode of discourse processing is heavily vocabulary driven. This tallies with the fact that vocabulary is acquired before grammar, in both first and second language acquisition. Thus, pre-grammatical children, adult **pidgin** speaker and **agrammatical** aphasics comprehend and produce coherent connected discourse, albeit at slower speeds and higher error rates than those characteristic of grammatical language. A- coherent pre-gram-

(26) [anticipating a trip]
In atnga. Sit dawn. tan ki.
in airplane sit down turn key
'(We'll go) in the airplane, sit down, turn the key,
Vruum vruum! Tan tu da rayt. Atnga!
vr. vr. turn to the right airplane
And vroom vroom! (We'll) turn to the right. Airplane (flies)!'

As an example of coherent adult second-language pidgin, consider:[23]

(27) "...oh me?...oh me over there...
nineteen-twenty over there say come...
store me stop begin open... me sixty year...
little more sixty year... now me ninety...
nah ehm... little more... this man ninety-two...
yeah, this month over... me Hawaii come-*desu*...
nineteen seven come... me number first here...
me-*wa* tell... you sabe gurumeru?...
you no sabe gurumeru?...
yeah this place come...
this place been two-four-five year...
stop, ey... then me go home... Japan...
by-n-by... little boy... come...
by-n-by he been come here... ey...
by-n-by come...
by-n-by me before Hui-Hui stop...
Hui-Hui this... eh... he... this a...
Manuel... you sabe-*ka*..."

As an example of coherent narrative produced by an agrammatic aphasia patient, consider (Menn, 1990, p. 165):

(28) "...I had stroke... blood pressure... low pressure...
period... Ah... pass out... Uh... Rosa and I, and...
friends... of mine... uh... uh... shore... uh drink,
talk, pass out..."
"...Hahnemann Hospital... uh, uh I... uh uh wife, Rosa...
uh... take... uh... love... ladies... uh Ocean uh Hospital
and transfer Hahnemann Hospital ambulance... uh...
half'n hour... uh... uh it's... uh... motion, motion...
uh... bad... patient... I uh... flat on the back...
um... it's... uh... shaved, shaved... nurse, shaved me...
uh... shaved me, nurse... [sigh]... wheel chair... uh...
Hahnemann Hospital... a week, a week... uh... then uh...
strength... uh... mood... uh... up... uh... legs and
arms, left side uh... weak... and... Moss Hospital...
two week... no, two months..."

lexical words in the clause. These lexical clues do not disappear in the presence of grammar, in fluent adult speakers. Rather, as Kintsch (in this volume) suggests, vocabulary-guided inferences remains a **parallel processing channel** alongside grammar-cued inferences.

4. Local vs. Global Coherence

Much of the experimental psycholinguistic work on text coherence has in fact centered on vocabulary-driven global processes, i.e. Kintsch's domain-specific general knowledge inferences. This is especially conspicuous in the work on causal inference (Trabasso and van den Broek, 1985; Trabasso and Sperry, 1985; Fletcher and Bloom, 1988;), as well as in earlier discourse-oriented work (Rummelhart, 1975; Johnson-Laird, 1980; van Dijk and Kintsch, 1983; Morrow, Greenspan and Bowers, 1987; Glenberg *et al*, 1987). The same focus on knowledge-driven global coherence is apparent in the "story grammar" paradigm (Mandler, 1978; 1982; Mandler and Johnson, 1977; Johnson and Mandler, 1980; Stein, 1982; Stein and Glen, 1979), or its near equivalent "story schema" (Schank and Abelson, 1977; Wilensky, 1980, 1982; De Beaugrande, 1982).

In a recent review, McKoon and Ratcliff (1992) refer to vocabulary-driven global inferences as "elaborative inferences", "instrumental inferences" or "inferences from situation models". They characterize this global approach to text coherence as follows:

> "...It is widely believed that readers automatically construct inferences to build a *relatively complete* mental model of the situation described by the text ..." (1992, pp. 17–18)

In outlining their **minimalist, localistic** alternative, McKoon and Radcliff suggest that vocabulary-driven global inferences are somehow "not automatically encoded" during text comprehension, and do not depend on the immediate recall buffer. In this, global inferences presumably contrast with local inferences, which are "automatically encoded" during text comprehension and depend on the immediate recall buffer. Whatever the ultimate status of this distinction, it is worth noting that the sense of "automatic encoding" used by McKoon and Ratcliff (1992) could not be the same one we used earlier in referring to grammar as an "automated discourse-processing mode". To begin with, the experimental text-frames used by McKoon and Radcliff have little to do with grammar-driven inferences. Rather, they contrast local vs. global vocabulary-driven inferences. Further, many processes subsumed under lexical access, whether under **spreading activation** (Collins and Quillian, 1969, 1972; Rips, Shoben and Smith, 1973; Smith *et al.*, 1974; Collins and Loftus, 1975; Glass and Holyoak, 1975; Smith, 1978; *inter alia*) or under **multiple activation** (Swinney, 1979) are said to involve considerable automatic

In the remaining portions of this paper, I will outline and illustrate how both vocabulary-cued and grammar-cued text processing involve *both* local and global aspects of coherence. Further, I will suggest that flexible, opportunistic, negotiated aspects of coherence (cf. C. Goodwin, 1986, 1988, 1992, in press; Coates, 1987) may pertain to *both* its local and global structure. If my analysis turns out to be correct, then we must conclude from it that:

(a) Discourse has both local and global coherence structure.
(b) Grammar must have evolved as a mechanism for speeding up the processing of both local and global aspects of text coherence.
(c) Vocabulary-cued – Kintsch's "knowledge-driven" – text processing remains a parallel channel of text processing.

When grammar-cued processes can get us there faster, lexical knowledge may be merely redundant. But beyond a certain point, vocabulary-guided processing is indispensible for fine-grained text comprehension. Further, in a number of well-known instances the use of grammatical and lexical information is intertwined. Finally, quite often the very same grammatical device clues a mixture of local and global coherence.

5. Mechanisms of Coherence

5.1. Preamble

We return now to deal with two central issues in the study of text coherence as a mental process – vocabulary-guided vs. grammar-cued coherence, and local vs. global coherence. The evidence that I will survey will be primarily of the kind that text-oriented ('functional') grammarians consider as their stock-in-trade: the distribution of grammatical and lexical information in well-defined environments in the recorded "external" text. The methodological slant of such work is relatively explicit: Specific text environments are interpreted as **communicative tasks**. And specific grammatical devices that coincide with such environments are interpreted as the **automated signals** that trigger the **cognitive mechanisms** that perform these tasks. It is obvious that the connection between text environments, communicative tasks, grammatical signals and cognitive mechanisms is at the moment largely inferential. But the claims I make are explicit, and thus open to further empirical testing. What I intend to demonstrate here are three interlocking sets of facts:

(a) All major coherence strands involve both vocabulary-guided and grammar-cued processes.
(b) All major coherence strands display both local and global coherence processes.
[illegible] coherence involve both

5.2. Spatial Coherence

5.2.1. Vocabulary-guided Spatial Coherence

It is relatively easy to show vocabulary-guided spatial coherence in text, and further, that such spatial coherence could be both local and global in scope. Consider:

(29) a. **More local:**
They left the **living room** and went **directly** into the **kitchen.**
b. **More global:**
In **Los Angeles,** they found a big mess and fired the manager. In **Chicago** the following week, things were looking much better.

As is typical of vocabulary-guided inferences, frame-based information plays an important role in identifying the spatial coherence as more local in one case, more global in another. Thus, the knowledge that a kitchen tends to be adjacent to the living room (29a) is implicit in the cultural frame "typical American home". Likewise, the knowledge that Los Angeles is geographically non-adjacent to Chicago (29b) comes with the cultural frame "U.S. geography".

The status of spatial prepositions in English is problematic, in the sense that they may be considered either grammatical or lexical-semantic. But regardless of their status, some prepositions cue local and some less-local spatial configurations. Thus, for example, 'in(side)', 'at', 'on(top of)', 'under', 'near (by)', 'in front of' and 'behind' tend to code more local spatial relations, where the figure is relatively close to its spatial ground. On the other hand, 'far (from)', 'away (from)', 'out(side) (of)', 'to(ward)' and 'from' tend to code more global spatial relations, where the figure is more remote from its spatial ground.

Note that some verbs incorporate spatial-orientation features in their lexical meaning. Thus:

(30) a. So he **came** to the house and...
(▷ I was there; he came **toward** me)
b. So he **went** to the house and...
(▷ I was not there; he went **away** from me)

5.2.2. Grammar-cued Spatial Coherence

Situation-based spatial reference is obviously confined to the immediate speech situation. Even so, it can be both more local and more global:

(31) a. Give me **this** book. Now **that** one you can keep.
b. You sit **right here,** and you **here** and you **here.** Now everybody else please sit **way over there.**

Similarly, text-based spatial

(32) a. He came to **the house** and stayed **there** for a week.
b. He kept out of **the office** but stayed **nearby**.
c. He went up **the hill**, and **that's where** he found the body.
d. They went further down, and **right there** they found...

More-global grammar-cued spatial reference may be seen in:

(33) a. This is all for **the Gulf desert**. Now **elsewhere** this Tuesday evening...
b. So he camped **at the fort**. But the rest of them moved **further away** and...
c. All was quiet in **Transylvania**. But **other** countries were not quite as lucky.

Quite often, spatial coherence is established by a mix of vocabulary-guided and grammar-cued means. And this mix may involve more-local or more-global spatial reference:

(34) a. **Local mixed-cues spatial coherence:**
He left **his cubicle** and stepped **into** the **lounge right across the hall** and...
b. **Less local mixed-cues spatial coherence:**
He left **his cubicle** and **left** the **building**. On the **other side** of the **street** he hailed a cab and...

In (34a), the location nouns 'cubicle', 'lounge' and 'hall' furnish part of the spatial coherence information, guided by the relevant frame-based knowledge of "office". But the grammatical cues 'into', 'right' and 'across' further reinforce the more local spatial interpretation. In (34b), the location nouns 'cubicle', 'building', 'side', 'street', together with 'cab' and the verbs 'left' and 'hail', furnish part of the spatial coherence information, again guided by frame-based inferences. But the grammatical cue 'other' reinforces the more global spatial interpretation.

Note, further, that at particular locations in discourse – typically at the opening of a discourse, a chapter or an episode – the whole spatial framework for an impending text is laid out in some detail. An example of such spatial orientation ('scene setting') at a story-initial context can be seen in (35) below, the second paragraph of a novel:[24]

(35) "...Seven days of [Ø] riding the ghost trails **up out of Sonora, down from the Sierra Madre, through Apache country**, keeping **off the sky lines** and watching the beckoning fingers of the talking smoke..." (p. 1)

In signalling spatial coherence in (35), a mixed array of lexical and grammatical means are employed.

Spatial re-orientation often takes place at paragraph-initial environments. One of the most common device there is a **pre-posed adverbial** with an

(36) a. ...Meanwhile **back on the ranch**, the crew is busy with fall roundup...
b. ...**At all other locations**, the AP reports, order order has been **restored**...
c. ...Finally, **at the house where they found the body**,
the missing gun all of a sudden turns up...

In each case, grammatical and lexical signals are combined. In each case, the fronted adverbial performs at least two communicative functions: It signals the termination of the preceding thematic paragraph and the initiation of another. And it affects spatial re-orientation. In each case, the spatial re-orientation contains specific global coherence clues, ones that refer backwards – anaphorically – to spatial information in the preceding paragraph or even further back. In (36a), this is implicit in both 'back' and 'the ranch'. In (36b), it is implicit in 'other'. In (36c), it is implicit in the restrictive REL-clause 'where they found the body', which refers back to an event assumed to be already accessible in episodic memory.

5.3. Temporal Coherence

5.3.1. Vocabulary-guided Temporal Coherence

Vocabulary-guided temporal coherence is most often intermixed with grammatical signals, such as prepositions. The coherence may be strictly local, as in:

(37) a. On **Tuesday** she was late, on **Wednesday** she was late again, and on **Thursday** she didn't show up at all.
b. You go to work in the **morning**, at **noon** you take a short lunch break, and in the **afternoon** you...
c. They started calling him at **five** and they kept till **six** and he finally showed up at **seven**.

When vocabulary-guided temporal coherence is less local, the simultaneous use of grammatical devices such as pre-posed adverbials is almost obligatory, as a paragraph-initial or chain-initial device:

(38) a. ...So they made a deal and signed the papers.
The following **Tuesday**, at **eight** in the **morning**, the guy calls and says...
b. ...So he went to sleep. **Two hours later**, she...
c. ...And so things went on this way the whole winter.
Next **spring**, a new chief was appointed...

Again, implicitly or explicitly, anaphoric connections are made by the temporal adverb, tapping into information accessible in episodic memory. The anaphoric clues are partly embedded in the lexical time-word – 'Tuesday', 'eight', 'morning', 'hour', 'spring'. Often, the clues involve modifiers

5.3.2. Grammar-cued Temporal Coherence

5.3.2.1. Tense-Aspect and Temporal Coherence

Most non-pidgin languages code at least two major distinctions of temporal coherence through their tense-aspect-modality system. These distinctions contrast three tense-aspectual markers:

(a) preterit ('perfective', 'past')
(b) progressive ('durative')
(c) perfect ('anterior')

The **preterit** aspect codes the more common temporal *norm* of discourse, whereby events are recounted in the same sequential-temporal order in which they occurred (Hopper, 1979). These sequential events are, further, temporally adjacent, so that the temporal coherence relation between them is strictly local.

The in-sequence norm can be then contrasted with two counter-norms. The **progressive** aspect codes events that are simultaneous with other events. Such events are by definition non-sequential, but due to their extreme temporal adjacency their temporal coherence is by definition rather local. The contrast between the preterit-sequential and progressive-simultaneous aspects is illustrated in:

(39) a. **Sequential (preterit-past):**
After she came home, he **cooked** dinner,
and they ate and went to bed.
b. **Simultaneous (progressive-past):**
When she came home, he **was cooking** dinner.
Then they ate and went to bed.

A more natural example from written narrative also illustrates the much higher text-frequency of the in-sequence preterit norm:[26]

(40) "...Within the mouth of the draw he *drew* reins again. With his first glance he *recognized* the body for what it was, but only when he *was* quite sure that he *was* alone *did* he approach it. He *circled* it as wearily as a wolf, **studying** it from all angles, and when he finally *stopped*, within a dozen feet of the dead man, he *knew* much of..."

The **perfect** aspect codes counter-sequence events, more specifically events that occur earlier but are placed later in the verbal depiction. Consider the contrast between (41c) and (42c) below:

(41) **Sequential preterit-past:**
a. She came back into the room,
b. looked around,
c. **spotted** the buffet

(42) **Perfect past:**
a. She came back into the room
b. and looked around.
c. She **had spotted** the buffet beforehand.
d. She went to get a sandwich...

The difference between the sequential preterit and the counter-sequential perfect in (41) and (42) below may be given diagrammatically as:

(43) a. **Actual order of events:**
...A, B, C, D...
b. **Order of narration in the preterit past:**
...A, B, C, D...
c. **Order of narration with the perfect:**
...A, C, **B**, D...

A more natural illustration of the contrast between the sequential preterit and the counter-sequence perfect in narrative can be seen in:[27]

(44) "...He *circled* it wearily as a wolf, studying it from all angles, and when finally he *stopped* within a dozen feet of the dead man, he *knew* much of what **had** happened at this place.
The dead man **had** ridden a freshly shod horse into the playa from the north, and when shot he **had** tumbled from the saddle and the horse **had** galloped away. Several riders on unshod ponies **had** then approached the body and one **had** dismounted to collect the weapons..."

Table (45) summarizes the frequency distribution of the major tense-aspects in two English texts.

(45) **The distribution of tense-aspect-modality in low-brow fiction and academic text in English**[28]

	academic		fiction	
category	N	%	N	%
past (sequential)	2	2	74	56
irrealis	18	20	8	6
habitual (sequential)	62	70	/	/
progressive	/	/	43	32
perfect	7	8	8	6
total:	89	100	133	100

In the fiction text, most sequential events were coded by the preterit-past, but the presence of dialogue provided for a relatively large portion of non-
coded events. In the aca-

5.3.2.2. Temporal Adverbial Connectors

Another grammatical sub-system used in the coding of temporal coherence are adverbial connectors. These can be as small as single-word conjunctions, such as '(and) then', 'later', 'afterwards', 'soon', 'earlier (on)' and others. Most of these connectors have an implicit anaphoric temporal reference, some more local, some more global. The latter tend to be associated with more major thematic transition. Thus compare:

(46) a. He had a quick dinner **and then** got up and left.
b. He ate dinner, **then** slept, **then** got up and left.
c. He ate dinner. **Later (on)** he got up and left.
d. He ate a good dinner. **Afterwards** he slept for 8 hours.
e. They ate dinner. **Soon** the dishes were cleared and...
f. He ate dinner. **Earlier on** he had slept for 8 hours.

Almost all the temporal connectors in (46) are sequential. The lone exception is the counter-sequential 'earlier (on)' (46f), which is further amplified by the perfect aspect.

5.3.3.3. Temporal Adverbial Clauses

The last grammar-cued device used extensively in establishing temporal coherence in discourse are temporal ADV-clauses. The temporal sub-ordinator of such clauses provides the specific cataphoric temporal relation between the adverbial and main clause. This relation is in one sense local, since it pertain to the very next clause:

(47) **Temporal links of adverbial clauses:**
a. **Precedence:**
Before she came, he left.
b. **Subsequence:**
After she came, he left.
c. **Simultaneity:**
While she was working, he left.
d. **Point coincidence:**
As she was coming, he saw her.
e. **Terminal boundary:**
Till she left, he worked steadily.
f. **Initial boundary:**
(Ever) since she came, he's been ignoring her.
g. **Intermediacy:**
Between her starting the project and
her quitting in a huff, nobody slept.

But the temporal relation could be more remote, and thus in a sense also more global:

(48) **Way before** she came, he left

Pre-posed ADV-clauses tend to be used as **coherence bridges** at the onset of a new thematic clause-chain or paragraph. Their more global, anaphoric coherence strands are not cued by the adverbial subordinator itself. Rather, they are signalled by a combination of grammatical and lexical cues inside the adverbial clause. This is especially true in presupposed ADV-clauses, i.e. those that have a past or perfect tense-aspect:

(49) a. After **he said that**, she decided...
b. Having **told us this incredible a tale of woes**, he...
c. During **her next visit**, the Queen said...
d. In the **last attempt to assassinate him**, they tried...
e. When **they finished telling her about it**, she said...
f. After **what she told him** finally sank in, he got up...

5.4. Thematic Coherence

Thematic coherence is most likely an epi-phenomenon. It may be an additive consequence of all the more concrete strands of coherence falling together, but is unlikely to be the mere sum of its various parts. In this section I will illustrate one aspect of thematic coherence that is primarily vocabulary-guided, and a number of aspects that are heavily grammar-cued. Each one turns out to involve both local and global aspects of coherence.

5.4.1. Vocabulary-guided Action Coherence

By action coherence I refer here to culturally-shared, conventional, generic knowledge of **sequential action schemata** ('scripts', 'routines'). Both thematically and syntactically, such sequences display maximally-tight coherence – typically with continuing reference, location, temporality, aspectuality, modality and perspective:

(50) a. She opened the fridge, took out the milk carton,
poured herself a glass and drank.
b. He put on his pajamas, got in bed,
turned off the light and went to sleep.
c. They shot the deer, skinned it,
quartered the carcass and hung it to cure.

In each case in (50), reversing any local sequential order will disrupt the thematic coherence. Respectively:

(51) a. *She opened the fridge, poured herself a glass of milk,
took out the milk carton and drank.
b. *He put on his pajamas, got into bed,
went to sleep and turned off the lights.
c. *They skinned the deer, shot it,
quartered the carcass and hung it to cure.

inherently incoherent about pouring oneself a glass before taking the milk-carton out of the fridge. One can transfer liquids from one container to another inside a fridge. It is only in the more global context of the routine "going for a glass of milk" that the order is incoherent. Similarly in (51b), there's nothing inherently incoherent about going to sleep (but not falling asleep, or waking up later) and then turning the lights off. It is only in the more global context of the routine "going to bed at night" that the order becomes incoherent. And similarly in (51c), there is nothing physically impossible about skinning an animal and then shooting it. It is only in the more global context of the habituated routine "hunting game animals" that such an order becomes incoherent.

5.4.2. Grammar-cued Thematic Coherence

As noted earlier, human discourse is multi-propositional, with clauses making up chains, which in turn make up paragraphs (etc.).[29] One of the grammatical sub-systems that helps cue this hierarchic organization of discourse combines conjunctions, intonation and pauses – which in the written language are mimicked as punctuation – [30]) and paragraph indentation. These devices are inherently cataphoric: The grammatical cue is placed between the two clauses, signalling the degree of thematic continuity of the *next* clause.[31]

Given the strong correlation between thematic and referential continuity, consider now the results of one study of low-brow English fiction text, where referential continuity across various grammatically-cued inter-clausal transitions was recorded (Table 52).

(52) **Referential continuity across adjacent clauses separated by *zero*, comma, period and paragraph indentation; with 'and' and 'then' in written English** (Hayashi, 1989)

conjunction type	**% subject switch (DS) across the conjunction**
and	15%
, *and*	70%
. *And*	81%
and then	16%
, *and then*	36%
. *and then*	100%
, then	50%
. Then	56%
. PARAG+Then	100%
comma (alone)	10%
period (alone)	72%

An equally strong association exists between conjunctions that are themat-

that are thematically disruptive or contrastive ('while', 'but', 'though', 'yet') and referential discontinuity. Table (53) summarized the results of one distributional study.

(53) **Referential continuity across adjacent clauses separated by various conjunctions in written English** (Hayashi, 1989)

conjunction	% subject switch (DS) across the conjunction
and (all punctuations)	29%
, *while*	77%
but (all punctuations)	85%
, *though*	100%
. *Yet*	100%

The conjunctions that signal tighter thematic continuity presumably cue more local coherence, while those that signal greater thematic disruption cue more global coherence – since they are typically found at chain or paragraph boundaries.

5.5. Referential Coherence

5.5.1. Grammar vs. Lexicon, Local vs. Global

The largest portion of the grammar of discourse coherence in most languages is connected, in one way or another, with the grammar of referential coherence. The following list of grammatical devices is by no means exhaustive:

(54) **Main sub-systems in the grammar of referential coherence:**
Without lexical information
(a) zeros, agreement, pronouns
(b) same-subject (SS) cataphoric morphology
Combined with lexical information
(c) different subject (DS) cataphoric morphology
(d) determiners, articles, numerals
(e) grammatical case-roles (subject, direct object)
(f) role-changing constructions (passive, inverse, antipassive, dative-shift)
(g) existential-presentative constructions
(h) restrictive modifiers (relative clauses, adjectives)
(i) word-order devices (L/R-dislocation, Y-movement, cleft)

Among these devices, the major dichotomy is between those that signal **continued activation** of the current topical referent, and those that signal its **terminated activation**. Statistically, this dichotomy overlaps to a large extent (but not absolutely) with the dichot-

absolutely) with the split between local referential coherence (continuity) vs. global referential coherence (discontinuity).

The dichotomy between grammatical devices that signal continued reference vs. those that signal disrupted reference also coincides, in the main, with the dichotomy between purely grammatical referential devices (54a, b), and those that combine grammar-cuing with lexical information (54c-i). The most obvious source of lexical information in the latter group is the lexical noun itself. Compare:

(55) **Grammar without lexical cuing (continuing reference):**
- a. **Zero:**
  ...The woman came in and **[Ø]** stopped...
- b. **Anaphoric pronoun:**
  ...The woman came in and stopped.
  Then **she** moved again...

(56) **Grammar combined with lexical cuing (terminated reference):**
- a. **Indefinite noun (modified by an adjective):**
  ...The woman came in and stopped.
  There was a tall man sitting there...
- b. **Demonstrative plus noun:**
  ...The woman came in and stopped.
  "There's something wrong with **this room**"
  she thought...
- c. **Definite noun:**
  ...They went in together. The woman stopped,
  But **the man** kept going...
- d. **Definite noun (modified by a REL-clause):**
  ...The woman came in and stopped. She saw
  the man who had questioned her earlier sitting there...
- e. **Word-order device (L-dislocation):**
  ...The woman came in and stopped. She was finally home.
  But **the man, he** never came back...
- f. **Grammatical role and voice change (passive):**
  ...The woman came in and braced herself for a long wait.
  The man was still being searched, so it seemed...

Combining lexical cues with grammatical ones is indispensible when reference is terminated (56). Even when the next topical referent to be activated has an accessible antecedent in some extant mental representation, a search for that antecedent must be instituted. Purely grammatical information cannot be conclusive, as it was in signaling continuing reference (55). Thus, the grammatical device "full NP" *per se* (56) could only signal discontinuing reference. Other grammatical devices signal **definiteness**, i.e. accessibility of the co-referent in some existing mental model (56b, c, d, e, f). Other grammatical devices yet may narrow the search down to episodic memory (56c, d, e, f). Other yet may point the search more finely beyond the current thematic chain (56d, e.f). But [illegible] antecedent can occur without full specification

Above and beyond the head noun, other lexical clues for referential identification may be furnished by **restrictive modifiers.** Thus in (56d) above, the specific vocabulary items in the REL-clause "who questioned her earlier" guide the more fine-grained search for coreference, under the assumption that the proposition "A man questioned the woman" is still accessible in the hearer's episodic memory.

5.5.2. Text Frequency, Markedness and Cognitive Default

In this section I briefly review the frequency distribution of zeros and anaphoric pronouns vs. full NPs in coherent discourse. Two facts are conspicuous about the two continuing reference grammatical devices. Functionally, they mark a continuing referent, one that was also topical in the preceding clause. Structurally, they display zero lexical expression of that referent. The distribution of zero/pronouns vs. full NPs in natural text reveal that referential continuity is the more frequent norm, and discontinuity is the exception. Consider first the distribution of zero/pronouns vs. full definite nouns in Ute, English, and two English-based pidgins.

(57) **Text frequency of clauses with anaphoric subject pronouns (incl. zero) vs. full subject nouns in spoken Ute, spoken English and two spoken Pidgins**[32]

	ZERO/PRONOUN		DEF-NOUNS		TOTAL	
	N	%	N	%	N	%
Ute	288	**93.5**	20	6.5	308	100.0
English	540	**74.4**	185	25.6	725	100.0
Spanglish pidgin	109	**68.9**	54	31.1	163	100.0
Filipinglish pidgin	132	**73.3**	48	26.7	180	100.0

When the sample of full NPs includes indefinite nouns, the predominance of zero/pronouns is a little less pronounced. As illustration, consider the frequency distribution in Sacapultec Mayan (DuBois, 1987)[33].

(58) **The distribution of grammatical subjects, objects and 'others' in the zero-pronoun and full-NP categories in Zacapultec** (from DuBois, 1987)

	NP type					
	zero/pronoun		**full-NP**		**total**	
grammatical type	N	%	N	%	N	%
transitive SUBJ	169	**93.9**	11	6.1	180	100.0
intransitive SUBJ	136	**51.9**	126	48.1	262	100.0
all subjects	305	**60.9**	197			

What Table (58) reveals is the predominance of referential continuity – **93.9%** continuous referents – in the *transitive subject* category. Such subject are semantically almost entirely **human agents.** Intransitive subjects, in contrast, more commonly introduce new – discontinuous – participants into the discourse, and are also less likely to be human agents. The level of continuous reference there drops to around **50%**, and matches the level found in direct objects. The 'other' categories, indirect objects of various types, are almost categorially non-*continuous*, with only **13%** zero/pronouns.

The predominance of the subject-coded participant in coherent text can also be show by the following distribution in spoken English narrative.

(59) **Number of participant-referents per clause in spontaneous oral English narrative**[34]

# of participants per clause	N	%
1 (SUBJ only)	39	38.6
2 (SUBJ & OBJ)	54	53.4
3 (SUBJ, OBJ, OTH)	8	8.0
>3	/	/
total:	101	100.0

The distribution of total NPs in the various grammatical roles in the text in (59) can be now computed as:[35]

(60) **Frequency distribution of various grammatical NP roles in spontaneous oral English narrative**

NP role	#	%
SUBJ	101	59.0
OBJ	62	36.0
OTHERS	8	5.0
total:	171	100.0

The grammatical subject, the clause's *primary topic*, codes the event participant that is the most continuous – both anaphorically and cataphorically. NPs occupying this pivotal grammatical role constitute 60% of all referents in text. Direct objects, the clause's *secondary topics*, constitute the bulk of the rest (36%). Non-topical "others" make up a negligeable residue (5%).

The conclusions that one may draw from the various distributions presented above are as follows:

(a) The grammatical cues that signal referential continuity are the most frequent referent-coding devices in text.
(b) Zero lexical marking of referents is a concomitant of the referent's

(c) Zero lexical marking is thus the default choice in the grammar of referential coherence, the unmarked case.
(d) There is a strong association between the high-continuity grammatical device and grammatical subjecthood.
(e) Even with the less-continuous direct objects (and subjects of intransitive clauses) thrown in, the ratio of all topical referents per clause approximates 1 topic per clause.

These conclusions beg for a comprehensive hypothesis about the cognitive role of topical referents in the representation and retrieval of text in episodic memory.

6. The Grammar of Referential Coherence as Processing Cues

6.1. Preliminaries

In this section I sketch out more explicitly the cognitive interpretation of the grammar of referential coherence, an interpretation that has been implicit in the preceding discussion. I will take it for granted that the clause is the minimal unit for accruing new language-coded information into episodic memory. And further, that a clause in connected discourse always has one topical referent (most commonly its grammatical subject). The function of the clausal topical referent may be now given as the hypothesis:

(61) **Function of the clause's topical referent:**
  (a) Adjacent clause-nodes that belong to the same equitopic chain in mentally represented text are attached under their governing **chain-node**.
  (b) The clausal topic serves as the **node label** or **filing address** for the clause, insuring that it gets attached under its rightful chain-node.
  (c) As long as the incoming information is filed under the same chain-node, the same topic remains **activated**.
  (d) In order to discontinue one clause-chain and initiate another, the currently-active topic must be **de-activated**, and a new one **activated**.
  (e) Only one chain-node at a time can be activated, insuring unambiguous addressing of incoming new information.

The significance of using nominal referents – rather then other coherence strands such as locations, times, actions or abstract themes – as the chain-node labels lies in the conflation of four factors that are not wholly independent of each other:

(a) Nominal referents are perceptually-cognitively salient.
(b) Nominal reference is acquired early in ontogeny.
(c) Nominal reference evolved early in phylogeny.
(d) Nominal referents code culturally central entities.

individuated, spatially compact; and in particular:
(i) **The prototype subject-agent:**
human, active, conscious, willful.
(ii) **The prototype object-patient:**
concrete, inanimate, compact, manipulable, usable.

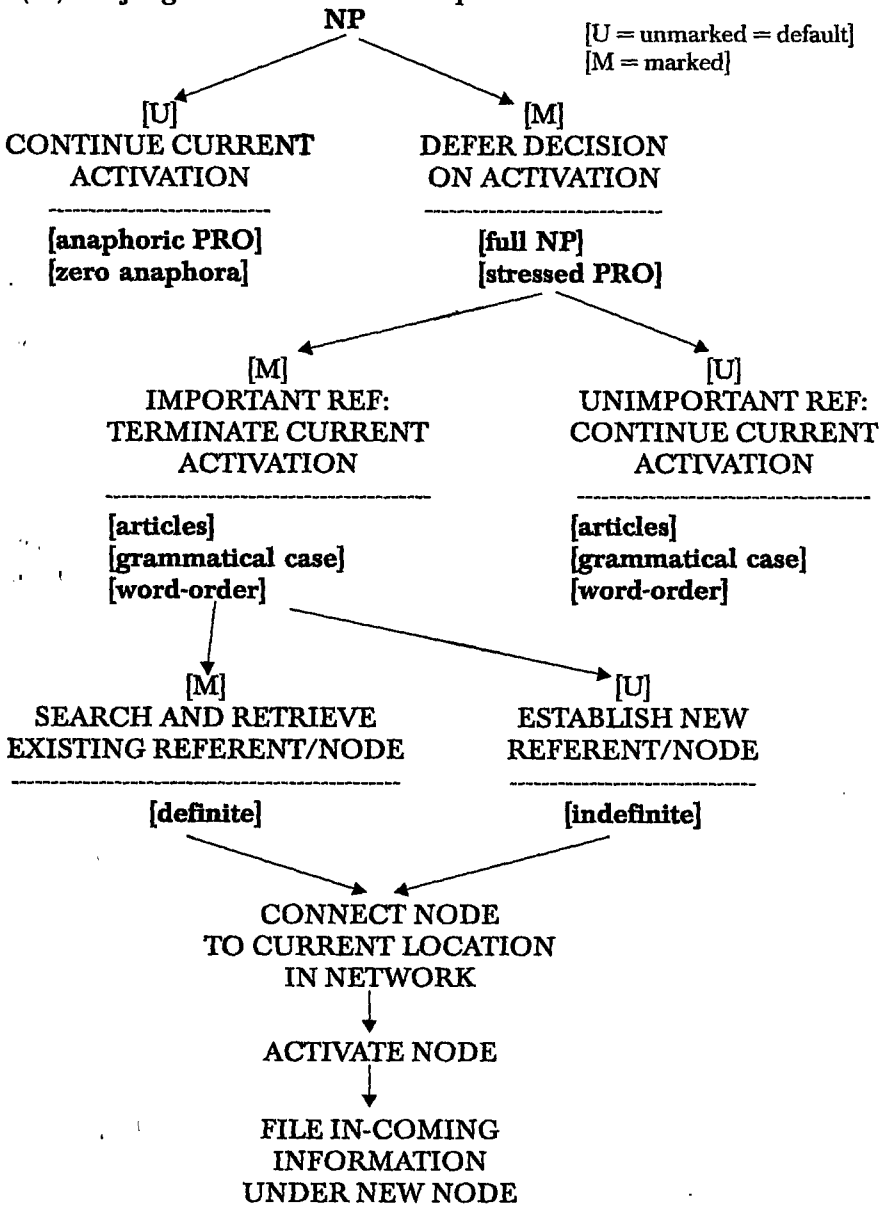
6.2. Cognitive Model

6.2.1. General Operations

I will assume that the grammar of referential coherence, in so far as it involves the episodic mental model of the current text, cues two main mental operations:

(a) **Attentional activation operations (cataphoric):**
Opening (activation) or closing (de-activation) text-nodes for attaching incoming new information.
(b) **Search & retrieval operations (anaphoric):**
Searching in the episodic text representation for the anaphoric grounding of referents. of 0 39/coher.92

By activating a topical referent, one activates the text-node labeled by the referent. Three possible operations are subsumed under 'attentional activation'.



(62) **Main attentional instructions:**
a. continue activation of the currently active topic/node
b. terminate activation of the currently active topic/node
c. activation of a currently inactive topic/node, by either:
(i) activating a new referent (indefinite)
(ii) re-activate an existing referent (definite)

Memory search and retrieval operations apply only in the case of (62c-ii) – when a currently inactive definite referent is re-activated. The re-activation of a definite referent requires searching for its anaphoric antecedence in some relevant mental structure (speech-situation model, lexical knowledge model, episodic text model). A precondition for re-activating a definite referent is that its anaphoric antecedence be accessible. In other words, a definite referent can only be re-activated if its current text-location is grounded to its antecedent text-location in the episodic mental model of the current text.

The main grammar-cued mental operations relevant to referent activation are summarized in (63) as a series of ordered, binary choices. For each binary choice, one option is assumed to be the **unmarked** ('default') case. This is the more frequent choice in natural text, the one that is cognitively less costly. The other option is the **marked** case, the less frequent choice in natural text, the one that is cognitively more costly.

The [illegible] operations outlined in (63) are to be interpreted the set

(63) **Major grammar-cued mental operations for referential coherence**

(64) **Major grammar-cued mental operations for referential coherence**

(a) if **ZERO/PRO** ⇒ continue current activation (keep filing incoming information under same node)

(b) if **FULL NP** ⇒ (i) defer activation de[illegible]

(ii) continue current activation (keep filing incoming new information in the current active node).

(d) if **IMPORTANT** ⇒ then
de-activate the current active node. then

(e) if **INDEF** ⇒ (i) do not search for antecedence;
(ii) initiate a new text-node;
(iii) activate the new referent/node;
(iv) attach the new referent/node to the current text-location;
(v) file incoming new information under the new node;

(f) if **DEF** ⇒ determine the source of definiteness among the three disjunctive options:
(i) Speech situation mental model
(ii) Generic-lexical mental model
(iii) Episodic text mental model;
then

(g) (i) search for antecedent in appropriate mental model;
(ii) ground the antecedent to its co-referent in the current text location;
(iii) initiate a new text-node, labeled by the grounded topical referent;
(iv) activate the new referent/node;
(v) attach the new referent/node to its current text-location;
(vi) file incoming new information under new node;

6.3. Some General Principles

The cognitive model outlined above, of grammar-cued attentional activation of text-storage nodes, abides by a number of general principles. The first one involves the relationship between a topical referent and the text-node of which it is the activating label:

(65) **Node activation via referent-activation:**
"A text-node in episodic memory is activated, and thus is open for storage of in-coming new information, when its topical referent, or node-label, is activated".

The second principle identifies the activation of text-nodes as a limited capacity mental process, a property one would expect of any attentional sub-system:[37]

(66) **One-node-at-a-time constraint:**
"Only one text-node is open – activated – at any given time".

Principle (66) probably applies at any given hierarchic level within the mental text structure. So that only one chain-node at a time is open for attaching clause-nodes; only one paragraph-node at a time is open for attaching chain-

The next principle relates the grounding of referents that serve as node-labels – both indefinite (new) and definite (old) referents – upon their activation:

(67) **Grounding as condition for activation:**
"A node – and thus the referent-label that activates it for text-storage – must be grounded before it can be activated for text-storage.
a. A new (indefinite) referent is grounded only to its current text location in the episodic structure still under construction.
b. An old (definite) referent is attached to its current location in the episodic text structure; but it must also be grounded to some other location in some preexisting mental structure".

The grounding of a referent-node to its current text location is by definition a local operation. The second type of grounding, applying only to definite NPs, involves more global connections between non-adjacent location in the current text-structure, or between two different structures.

7. Discussion

7.1. Local vs. Global Coherence

I think both the experimental work on text processing and the grammar-in-discourse studies by linguists strongly suggest that coherence involves both local and global processes. This seems to be as true of vocabulary-guided ('knowledge-based') processes as it is of all major grammar-cued processes. Pitting the two types of coherence against each other as mutually exclusive alternatives is not a viable approach.

7.2. Vocabulary-guided vs. Grammar-cued Coherence

The hybrid model of language processing and text coherence suggested by Kintsch (in this volume) is probably the right approach to pursue. Information about the coherence structure of text is thus processed through two parallel channels:

(a) Knowledge-based inferences, supported by the lexical vocabulary of the clause.
(b) Grammar-cued inferences, supported by the syntactic structure, grammatical morphology and intonational cues of the clause.

If the clause is indeed the basic processing unit for language-coded information, then both processing channels aim at the very same cognitive task:

(68) **Main on-line task in text processing:**
"Determine where and how to attach the new information in the [illegible]

The vocabulary-guided channel relies on the automatic activation of lexical meanings. That activation is always there, since it is necessary for understanding the propositional information of the clause, regardless where and how that information is stored in episodic representation. Text production and comprehension can proceed by relying exclusively on this channel, as is the case in early child language, second language pidgin, and agrammatic aphasia. The vocabulary-guided channel is also a slow, context-dependent and error-prone.[38] Nonetheless, it is a fine-grained processing channel. It guides the processor to exact, final mental destinations, and it is attuned to fine shades and gradations of meaning and context.

The grammar-cued channel is a later ontogenetic addition to the arsenal language processing, and probably also a later phylogenetic addition. It is a rough-grained processing route, moving the bulk at high speed and lower error rates in a relatively context-free fashion.[39] But it very seldom gets the processor to exact, final mental destinations. To reach those, the grammar-cued channel must be disengaged, and processing must rely on the ever-present, automatically activated, vocabulary-coded "knowledge-based" channel.

The only discourse context where lexical information seems clearly superfluous, for establishing text coherence, is the *default* context of continued current activation. This is the context where lexical information is consistently "deleted" from the clause. But this is also the context where grammatical clues are dispensed with, and where one most consistently finds:

(a) zero-coded NPs
(b) reduced (non-finite) verbal morphology
(c) zero-coded thematic conjunctions.

This paucity of signal in both processing channel is possible because the default mental task of continued current activation requires no further operation. The task in unambiguous – attach incoming clausal information to the same, currently-activated text-node. Constraint (66) – "one node at a time" – insures that this most frequent processing task is both cognitively least ambiguous. That such a task is also linguistically the least marked, i.e. requires minimal coding, is only to be expected.[40]

The traditional notion that zeros and pronouns "create ambiguity" is, from a cognitive perspective, an exact upside-down rendition of the facts. It is only in the least ambiguous processing tasks that one can safely resort to zeros and pronouns, because their lexical identity is unambiguously activated.

7.3. Why is Anaphoric Grounding So Necessary?

One of the most striking features of text coherence is the seemingly absolute anaphoric grounding requirement (67): Currently-topical referents that have antecedence in mentally represented prior text must be grounded to that antecedence. This requirement creates coherence connections that are often distant and in that sense global. And these distant connections cut across the hierarchic

(69) **The anaphoric grounding constraint:**
"When an important topic is re-introduced into the discourse, access to the information filed under its antecedent text-location must be assured".

But why such a rigid constraint? The answer is, I think, fairly obvious. If a referent is an important topic, its topicality and relevance must be justified upon activation in its current text location. As we have seen, this type of justification is systematically furnished for indefinite referents upon their first introduction into the discourse. They are cataphorically grounded by such information. But the information that justifies the importance and relevance of a definite referent with prior text antecedence has already been furnished at least once – at its prior text location. Obligatory anaphoric grounding makes that information available again – at the referent's current text location. This dispenses with the need to re-assemble the information again and again from scratch.

Anaphoric connections between a referent's current and prior text locations are time-saving devices in the processing of coherent discourse. They make it possible to tap into information that has already been assembled and stored in episodic text – when it again becomes relevant.

7.4. Grammar, Episodic Storage and Working Memory: The Thematic Flexibility of Episodic Representation

In their most recent review of the cognitive status of the working memory buffer, Just and Carpenter (1992) describe it as a **limited capacity** mechanism, in terms of both storage and processing. These two aspects of the buffer are thus in competition for a limited amount of "activation". While not explicitly stated in the review, the most likely limited capacity here is probably some species of attention.

The recall capacity for surface linguistic form, and thus for grammatical clues associated with the clause, is severely limited (Gernsbacher, 1985; Carpenter and Just, 1988, 1992; *inter alia*). These limits are somewhere in the range of 2–5 clauses, or 8–20 seconds,[41] a "moving buffer" beyond which grammatical form is not preserved.

Within the 8–20 second time-span of working memory, the grammatical information associated with the clause must be translated into the clause's location and manner-of-attachment in episodic mental representation. The clause's grammatical clues may thus be considered a **translation mechanism**; they insure the coherent encoding of incoming information in episodic memory. The limited buffer capacity suggests that, with grammar, such translation occurs within the range of 8–20 seconds, and that grammatical cues are unnecessary beyond that point. But couldn't they still be useful?

There are at least two good reasons why grammatical clues are probably not stored in episodic memory. The first reason is evolutionary: The grammar-free storage of episodic text develops in the child long before grammar; it is supported by the same hippocampus neurology in prehuman pre-
and it had

other words, the mechanism for coherent episodic mental representation has *always* been grammar-free.

There is a more compelling reason why the original grammatical information coming with each clause should not be preserved in episodic memory: It may actually be communicatively harmful to preserve such information. Grammar is a translation mechanism that helps contextualize clausal information in its *current* communicative context: current speech situation, current goals, current perspective, current text, current thematic structure. But once stored, the information is always – by definition – retrieved and re-used in *another* communicative context. This is true in the case of later retrieval and re-telling on another occasion (cf. Loftus, 1980; Squire, 1987; Squire and Zola-Morgan, 1991; Slobin, 1987; *inter alia*). But it is equally true about repeated access and retrieval during the on-line processing of the same current text.

The speech-situation context shifts constantly, as does the thematic context, even during the "same current text". This is particularly clear when one notes the shifting, flexible, negotiable nature of coherence in oral face-to-face communication (cf. C. Goodwin 1982, 1986, 1988, 1992, in this volume; Coates 1987, *inter alia*). A simple-minded example will illustrate how unstable the grammatical form is across consecutive, adjacent turns that have 'the same' propositional reference. The grammatical signals associated with three core proposition in (70) below – "Guy want see Bill", "Bill want John..." and "John ask guy..." – are bold-faced:

(70) JOHN: **There-s a guy here who want-s to see you.**
BILL: **Why do-es he want to see me?**
JOHN: **You want me to ask him?**
BILL: **Yeah, why do-nt you ask him.**

Retrieving propositional information from episodic memory together with the grammatical clues that were originally attached to it would render the information rather confusing, since those grammatical clues are incompatible with the proposition's current communicative context. The sharp decay of grammatical signals beyond the short-term buffer is thus not a loss, but rather a vital communicative necessity.

Notes

I am indebted to Bruce Britton, Wally Chafe, Marcelo Dascal, Morti Gernsbacher, Chuck Goodwin, Walter Kintsch, Jean Mandler, Tony Sanford and Dan Slobin for helpful comments on earlier versions of this work. The final product reflects my own views.

1. Among linguists, the perspective of well-edited, written, narratives text is implicit in much of the early work on coherence (cf. Longacre, 1971, 1976; Halliday and Hasan, 1976; Grimes, 1975; *inter alia*).
2. This approach to grammar as an automated discourse processing mode follows Givón

vocabulary-guided clues are responsible for a considerable portion of text coherence, especially in pre-grammatical communication (early child discourse, second language pidgin, agrammatic aphasic speech).

3. Dan Slobin (in personal communication) has noted that speakers and hearers bring a different contexts – goals, frames, relevance considerations – into verbal interaction. The mental text-trace that survives in episodic memory is heavily dependent on these varying contexts.
4. See e.g. van Dijk and Kintsch (1983); Gernsbacher (1990); *inter alia*. One may argue that there is a at least a partial one-way conditional relation between the two, so that:

   "if hierarchic, then sequential"
   (but not necessarily vice versa)

   The 'chunking' process that produce hierarchic representation – apparently in any modality and at any level – of sequential information beyond a certain length, is well documented (cf. Chase and Simon, 1973; Chase and Ericsson, 1981, 1982; Ericsson, Chase and Faloon, 1980; Ericsson, 1985). So that to all intent and purpose, for sequences beyond a certain minimal length of 3–4 items, one may interpret the relation between hierarchy and sequence as a *bi-conditional*.
5. See Carpenter and Just (1988) for a review of the role of chunking, i.e. the creation of hierarchic structure for long term storage (cf. Chase and Ericsson, 1981, 1982; Ericsson, Chase and Faloon, 1980; Ericsson, 1985).
6. Some texts are 'flat' or 'shallow', other have 'deeper' hierarchical structures. Some node-sequences (at whatever hierarchic level) are long, others are short.
7. Similar devices also exist in most languages to distinguish definite NPs that are slated to be more important ('persistent', 'topical') in the subsequent discourse from those that are slated to be unimportant ('non-persistent', 'non-topical').
8. The indefinite (unstressed) 'this' is not used in formal or written English. The letter cited here was written by a teenager using the informal oral style.
9. The data were taken from: Sahaptin (Sahaptian) oral narrative, Rude (1992); Surinam Carib (Carib) oral narrative, Gildea (1992); Bella-Coola (Salish) oral narrative, Forrest (1992); Korean written narrative, Kim (1992); Spanish written newspaper prose, Hidalgo (1992). See also Givón (ed. 1994).
10. The grammar of deixis is much more extensive, and may involve the tense-aspect modality system and other verbal inflections, as well as other grammatical sub-systems.
11. Several full-NP referents are thematically incidental or unimportant, and were not boldfaced. Thematic importance ('topicality') tends to correlate statistically with "playing the subject role in a clause".

13. The New York Times, Daily Business Section, June 3, 1991, p. C1.
14. For a discussion of various contrastive topicalizing devices, see Givón (1990a, ch. 16).
15. From the conversation of a retired New Mexico rancher, recorded ca. 1978 (see Givón, 1983a).
16. From L'Amour (1962, p. 8). For more details about the use of pre-posed ADV-clauses as thematic-discontinuity devices see Thompson (1985), Ramsay (1987), or Givón (1990a, ch. 19).
17. A somewhat similar situation was studied experimentally by Tomlin (1987).
18. The cognitive notion "same text" is akin to the logician's "same meta-level" (Russell's (1919) "same type") or the text linguist's "same universe of discourse".
19. When two adjacent clauses are disjointed in a set

20. See further below. Even when the clause contains only two main elements – an old-information subject and a new-information verb – chances are the verb carries tense-aspect-modality markers that signal other (temporal, thematic) grounding connections.
21. There may be time costs for processing each grounding connection, and some upper limit per clause. A clause can presumably be over-grounded, with confusion arising as to which direction of connectivity is more weighted, more relevant, or stronger. Marcelo Dascal (in personal communication) notes that one implication of constraints (23) and (24), taken together, may be that the ideal clause-size is two chunks, one new information, the other old (grounding) information. The issue is fundamentally not one of logic but rather of cognition, and must be resolved empirically.
22. Recorded by L.C. Givón, 5–20–81 (cf. Givón (1990b).
23. Hawaii Japanese-English Pidgin; from transcripts supplied by D. Bickerton; see also Bickerton and Givón (1976).
24. L'Amour (1962, p. 1).
25. The use of pre-posed adverbials to signal the opening of a new paragraph has been discussed earlier above.
26. From L'Amour (1962, p. 7).
27. L'Amour (1962, p. 7).
28. The fiction text was L'Amour (1962, pp. 83–85). The academic non-fiction text was Haiman (1985, pp. 21–23).
29. For the relation between clauses, chains and paragraphs, see Grimes (1975), Longacre (1971, 1976), Chafe (1986, 1987, 1988), Givón (1990a, ch. 19; 1991).
30. For the use of punctuation, intonation and grammar in signalling thematic continuity, see Chafe (1988); Givón (1990a, ch. 19; 1991). For cognitive aspects of pausing, see Eisler-Goldman (1968).
31. We have already noted how the grammar of reference, tense-aspect-modality and adverbials collaborates in signalling inter-clausal, inter-chain and inter-paragraph coherence. In other languages, the grammar of clause-chaining and paragraphing involves other devices, such as verb serialization, cataphoric switch-reference morphology, and more vs. less finite verb morphology – thus also tense-aspect-modality. See again Givón (1990a, ch.19).
32. After Givón (1983b; 1984b).
33. Excluded from DuBois' original Table 2 are NPs occupying the role of *possessor*. These are not grammatical arguments of the clause, but rather modifiers within the noun phrase. Similar figures have also been reported for Modern Hebrew (Smith, in press).
34. Life-story of a retired New Mexico rancher; first two typed pages of transcript; see Givón (1983a). The count excluded single NPs coming under their own separate intonation contour (see discussion in Chafe, 1988). All eight 3-participant clauses had one time-adverb, which strictly speaking is not a clausal participant, but was counted as one here.
35. A similar computation can be done with the Sacapultec distribution in Table (58).
36. The model presented below follows, in the main, the one presented in Givón (1990a, ch. 20) and Givón (1992).
37. See Posner and Snyder (1974); Schneider and Shiffrin (1977). Since grammatical cues seem to be to quite an extent a sub-conscious, automated system (rapidly decaying; immediate-recall dependent; not preserved episodic memory), the attentional sub-system involved here is probably a more modal-specific species of *covert attention* (Inhoff *et al*, 1989; Posner & Petersen, 1990; Nissen and Bulleme, 1986).

39. Grammar-cued processing is not, strictly speaking, wholely context free. Rather, the relevant notion of "context to be scanned" is reduced in grammar-cued processing to scanning for fewer, more conventionalized, more discrete structural clues of syntax, morphology and intonation.
40. For the relation between informational predictability (or frequency) and code quantity see Zipf (1935), Givón (ed. 1983b, 1985) or Haiman (1985).
41. Approximating from Swinney's (1979) figure of 250 msecs per lexical word, and an average of 4 words per clause in fluent spoken language.
