About the General Editors

Bertrand Badie is Director of Graduate Studies in International Relations and Professor of Political Science and International Relations in Sciences Po, Paris. He is also a research fellow at the Center for International Studies and Research (Centre d'études et de recherches internationales [CERI], Paris). He is currently working on international systems, diplomacy, multilateralism, and the sociology of international relations, after a long period devoted to research on the sociology of the state. He has been a visiting professor in many European, Asian, and African universities. He started his academic career at Université of Paris 1 Panthéon-Sorbonne (1974–1982), followed by a stint at Clermont-Ferrand University (1982–1990). He has served as Director of Sciences Po University Press (1994–2003), a member of the International Political Science Association (IPSA) Executive Committee (2003–2009), and Vice President of IPSA (2006–2009). He has published about 20 books—translated into 15 languages—including *The Sociology of the State* (1983), with Pierre Birnbaum; *The Imported State* (2000); *Les Deux Etats* (The Two States; 1987); *La Fin des Territoires* (The End of Territories; 1995); *Un Monde sans souveraineté* (A World Without Sovereignty; 1999); *La Diplomatie des Droits de l'Homme* (The Diplomacy of Human Rights; 2002); *L'Impuissance de la Puissance* (The Impotence of Power; 2004); *Le Diplomate et l'Intrus* (The Diplomat and the Intruders; 2008); and *La Diplomatie de Connivence* (The Diplomacy of Collusion; 2011). He earned his Ph.D. in political science at Sciences Po (1975) and also holds master's degrees in law (1972), in contemporary history (1977), and in oriental studies (1975). He is "Agrégé en science politique" (1982). He also holds an honorary Ph.D. from FUCaM (Facultés Universitaires Catholiques de Mons), in Mons, Belgium.

Dirk Berg-Schlosser is Professor Emeritus at Philipps-University, Marburg, Germany, where he has also been Director of the Institute of Political Science and Dean of the Faculty of Social Sciences and Philosophy. He has conducted research and taught at the universities of Munich, Aachen, Augsburg, and Eichstaett (Germany); Nairobi (Kenya); Stellenbosch (South Africa); Sciences Po (Paris); and California at Berkeley. He was chairman of the Research Committee on "Democratization in Comparative Perspective" of the International Political Science Association (IPSA) (1988–2000). He has served as Chair of the European Consortium for Political Research (ECPR) (2003–2006) and as Vice-President of IPSA (2006–2009). He is currently director of the IPSA Summer Schools on Research Methods at the University of São Paulo and Stellenbosch University. His major research interests include empirical democratic theory, development studies, political culture, comparative politics, and comparative methodology. He is author and coauthor of more than 20 books and about 200 articles in major international journals and chapters in edited volumes. His major books in English include *Tradition and Change in Kenya* (1984); *Political Stability and Development* (1991), with Rainer Siegler; *Conditions of Democracy in Europe, 1919–39: Systematic Case Studies* (2000), with Jeremy Mitchell; *Authoritarianism and Democracy in Europe, 1919–39: Comparative Analyses* (2002), with Jeremy Mitchell; *Poverty and Democracy* (2003), with Norbert Kersting; and *Democratization: The State of the Art* (2007). He is a member of the board of six major international journals and coeditor of book series with Oxford University Press and Campus. He has been the organizer and chair of numerous national and international panels, workshops, symposia, and conferences. He has served as referee for numerous national and international funding organizations.

He is currently a member of the Prize Committee of the Johan-Skytte Prize and a fellow at the Stellenbosch Institute for Advanced Study (STIAS). He obtained his first doctorate (Dr. oec. publ.) in economics at the University of Munich, a second advanced degree (Dr. phil. habil.) in political science at the University of Augsburg, and a Ph.D. in political science from the University of California at Berkeley.

Leonardo Morlino is Professor of Political Science in the School of Government and Director of the Research Centre on Democracies and Democratizations at Libera Università Internazionale degli Studi Sociali (LUISS) Guido Carli, in Rome. In 2004, he was awarded the Jean Monnet Chair in European Studies by the European Commission. He is currently President of the International Political Science Association (IPSA) (2009–2012). He has been a visiting professor or fellow at Yale University, Stanford University, Nuffield College (Oxford, UK), Institut d'Etudes Politiques (Paris), Hoover Institution, Center for Advanced Research in Social Sciences (Madrid, Spain), and St. Anthony's College, Oxford. His main research interests include the methodology of comparison, the processes of democratization, and the role of parties, interest groups, and civil society in contemporary European democracies. Since 2003, he has been actively involved in research on the promotion of democracy and rule of law in the new neighbors of the European Union and on the qualities of democracy in Europe and Latin America. He has mainly contributed to theory on regime change and democratizations, with specific attention to the so-called theory of anchoring, the quality of democracy and its empirical analysis. He has published more than 30 books and about 200 chapters in books and articles in journals in Italian, French, English, Spanish, German, Hungarian, and Japanese—mainly on the methodology of comparison, authoritarianisms, the European Union, democratic theory, and democratization processes. His main books as author include *Changes for Democracy: Actors, Structures, Processes* (2011); *Democrazie e Democratizzazioni* (Democracy and Democratization, 2003); *Democracy Between Consolidation and Crisis: Parties, Groups, and Citizens in Southern Europe* (1998); and *Como Cambian los regimenes politicos* (How Political Regimes Change, 1985). Books that he has coedited and/or coauthored include *Democratization and the European Union: Comparing Central and Eastern European Post-Communist Countries* (2010); *International Actors, Democratization and the Rule of Law: Anchoring Democracy?* (2008); *Partiti e caso italiano* (Parties and the Italian Case; 2006); *Europeizzazione e rappresentanza territoriale: Il caso italiano* (Europeanization and Territorial Representation: The Italian Case; 2006), *Party Change in Southern Europe* (2007); and *Assessing the Quality of Democracy* (2005). Some of his most recent articles in journals include "Are There Hybrid Regimes? Or Are They Just an Optical Illusion?" in *European Political Science Review* (2009); "Europeanization and Territorial Representation in Italy" (coauthor) in *West European Politics* (2006); "Anchors, Anchoring and Democratic Change" in *Comparative Political Studies* (2005); "What Is a 'Good' Democracy?" in *Democratization* (2004); "'Good' and 'Bad' Democracies: How to Conduct Research Into the Quality of Democracy" in *Communist Studies and Transition Politics* (2004); "Consolidation Démocratique: La Théorie de l'Ancrage" (Democratic Consolidation: The Theory of Anchorage) in *Revue Internationale de Politique Comparée* (2001); and "Architectures constitutionelles et politiques democratiques en Europe de l'Est" (Architectures Constitutional and Democratic Policies in Eastern Europe) in *Revue Française de Science Politique* (2000). Some of his most recent chapters in books include "Political Parties" in *Democratization* (2009); "What Changes in South European Parties: A Comparative Introduction" in *Party Change in Southern Europe* (2007); "Introduction" to *Assessing the Quality of Democracy: Theory and Empirical Analysis* (2005); "Problematizing the Links Between Authoritarian Legacies and 'Good' Democracy" (coauthor) in *Democracy and Authoritarian Legacies in Southern Europe and Latin America* (2004); "The Three Phases of Italian Parties" in *Political Parties and Democracy* (2001); "Democracy, Southern European Style?" (coauthor) in *Parties, Politics, and Democracy in the New Southern Europe* (2001); and "Constitutional Design and Problems of Implementation in Southern and Eastern Europe" in *Democratic Consolidations in Eastern Europe* (2001).

Preface

Politics has always been a key dimension of human life. Politics affects everyone, just as the weather does, and since the time of the Greek classics, humankind has attempted to come to grips with its empirical and normative implications. Politics and political science have changed over time and have been even more deeply transformed during the past decades in every part of an ever-smaller world. Empirical research and theoretical reflections on politics and its multiple connections with all other aspects of human life have developed enormously during the second half of the past century and now cover virtually all parts of the world, with their growing interdependence. These studies concern, for example, basic issues such as war and peace, prosperity, welfare, and a sustainable environment, as well as issues of freedom, justice, gender, and democracy under changing cultural perspectives.

At this point, one feels the need for an exhaustive overview of the empirical findings and the reflections on politics. The *International Encyclopedia of Political Science* caters to that need in many different kinds of readers, including undergraduate or graduate students who like to be informed effectively and quickly on their field of study; scholars who seek information on the relevant empirical findings in their area of specialization or in related fields; and lay readers, who may not have a formal background in political science but are attracted to, and interested in, politics. Thus, the encyclopedia can serve both the diffusion of knowledge about politics and the further development of the field.

The encyclopedia is the result of collaborative work by leading international scholars from all over the world. This team ensured the widest possible coverage of key areas, both regionally and globally. In this sense, this is the first truly international encyclopedia of its kind. It aims to give a comprehensive picture of all aspects of political life, recognizing the theoretical and cultural pluralism of the approaches and including findings from all parts of the world. The eight volumes of the encyclopedia cover every field of politics, from political theory and methodology to political sociology, comparative politics, public policies, and international relations.

The entries are arranged in alphabetical order, and a list of entries by subject area appears in the front of each volume. The entries are organized in three major categories, according to their substantive relevance, of roughly 1,800, 3,600, and 8,000 words. In addition, longer entries of 12,000 words cover the major subdisciplines and the state of the art in each field. The encyclopedia contains a detailed index as well as extensive bibliographical references. Thus, it can provide an essential and authoritative guide to the state of political science at the beginning of the 21st century for decades to come. It will be an invaluable resource for a global readership, including researchers, students, and policymakers.

The editors wish to acknowledge the invaluable assistance and advice of many colleagues and friends, including the members of the Executive Committee of the International Political Science Association (IPSA) and its presidents during this period, Max Kaase and Lourdes Sola. Bertrand Badie wishes to thank Sciences Po, Paris, and particularly Delphine Placidi, who assisted him in the first steps of the work. Dirk Berg-Schlosser gladly acknowledges the assistance from Diana Mai and Joris-Johann Krapp at the Institute of Political Science, Philipps-University, Marburg, Germany, in the initial phases of the project. Leonardo Morlino would

like to warmly thank Dr. Claudius Wagemann for his invaluable help in the starting phase of the encyclopedia.

Introduction to Political Science

> *Cet ouvrage produira sûrement avec le temps une révolution dans les esprits, et j'espère que les tyrans, les oppresseurs, les fanatiques et les intolérants n'y gagneront pas. Nous aurons servi l'humanité.* [Over time, this work will surely produce an intellectual revolution, and I hope that the tyrants, oppressors, fanatics, and those without tolerance will not benefit from it. We will have served humanity.]
>
> —Letter from Diderot to Sophie Volland, September 26, 1762

Political science, paradoxically, is both a very old and relatively recent discipline. Its origins go back to antiquity in classic European or Asian thought as far as recorded history goes. As an independent and respected academic field, however, it came into being in most countries only after World War II. This is due in part to the fact that its subject matter had been addressed by neighboring disciplines like philosophy, history, and public law, but also because it requires, more than others, a "breathing space" of freedom of thought and expression that is not voluntarily granted by most authoritarian regimes and that has developed worldwide only with decolonization and recent waves of democratization.

This introduction surveys the discipline of political science, beginning with an analysis of politics itself. Two important definitions of politics are discussed in detail here. First, politics can be viewed as a means, either for maintaining social harmony or for achieving a supreme good, as in some religious conceptions of the state. Second, politics has been understood as an instrument by which a central institution or a legitimate authority exercises power. The next section of the introduction examines the epistemological foundations of the discipline of political science. The third section traces the growth of political science during the 20th century and examines its evolving relationships to other social sciences and to other fields, most notably law and philosophy. The final section of the introduction describes more recent developments and perspectives in political science, as it has become a dynamic discipline with its own identity and with participation from political scientists around the globe.

Politics

Politics as a Special Sphere

The concept of politics carries different meanings. It can be considered to be an *art* (scholars are "studying politics"); an *activity* (one can "play politics" in one's office, in one's club, even in one's family); a *profession* (some "go into politics"); or a *function* ("local politics," "national politics"). Most political scientists consider the first meanings as derived from the last one, even as metaphoric, while some others have a wider and more abstract conception that is broader than that of function. Politics also has been understood as both to polity, which refers to an organization (a state, a regime and its constitution) and to policy, which refers to a system of political decisions and specific subfields (like health, education, foreign relations) through organizations act to carry out their functions. In a comprehensive perspective, politics is thus considered to be linked to a function, a system, an action, and a behavior.

All of them are, however, connected to a special dimension of the history of humankind. Even if some scholars object that some societies ignored politics (Clastres, 1975), most anthropologists consider politics as a constant of the human condition. In the first part of this entry, this constant will be grasped in its various definitions, and then it will be inserted into the general social order. The following sections examine definitions of this constant as a function and as an instrument.

Politics as a Function

Politics can be conceived as a contribution to the social adventure, as a function of the social order, or, quite differently, as a distinctive instrument, a special way of action. The first approach is more classic and deeply rooted in the various philosophical traditions that were elaborated around the world, while the second one is modern, related to the rise of positivist theory in the social sciences. In this section, we consider two ways in which politics can be seen as a function.

Politics as a Function: Promoting Social Harmony or Supreme Good?

Many philosophers have located politics in the art of coexistence. If human beings are selfish by nature, as they are often conceived, but must live and grow up together, to create peaceful coexistence is obviously one of the main functions of the polis. As such, politics should be considered as the permanent invention of the polis (city), as the construction of each social unit that aims to keep people together on a permanent basis. This point was already made by Plato, who considered politics as the art of organizing social harmony. We also find it in other traditions. Islam conceives of politics as a weakly differentiated function that aims to overcome tribal fragmentation through the principle of unity (*tawhid*). As such, *tawhid* will be achieved through the absolute Unity of God, and so politics cannot be entirely accomplished without religion: Politics cannot be conceived as a differentiated structure, but it is obviously a social function. The same principle can be found in Hindu writings. The *Arthasastra* (3rd century BC) and the *Manusmriti* (2nd century BC) were written during periods of decay and so-called evil, which implied starvation, violence, and chaos, while the *Mahabarata* covered a much longer period (from 1st millennium BCE to the 5th century BCE). Here, politics is presented as an absolute requisite for keeping peace and order, even if the tradition oscillates between divine invention in politics (*Manusmriti*) and its contractual origin (*Mahabarata*). In its turn, the Buddhist vision stresses the entropy of the world that leads to inequality, sexual division, property, and thus to conflicts and lack of safety. The orientation of this reform of Hinduism prompts human beings to choose a king as a guarantor of the social order. Similarly, Confucius pointed out that men need a ruler for preventing disorder, disturbance, and confusion.

This first function, promoting social harmony, obviously shaped political philosophy to a large extent up to the present day. Social contract theory clearly emanated from this postulate, in the Islamic tradition (*mithaq, bay'a*) as well as during the European Enlightenment. The *Arthasastra* anticipated Thomas Hobbes's vision of the state of nature, when it described the lack of politics as resulting in evil and vices, or when it mentioned the fable of the big fish that will eat the small one (*Matsyanyaya*). The functional dimension of politics, as the art of coexistence and "maintaining harmony," can, therefore, be considered as really transcultural and common to the humanity's different histories. Here, we can probably locate the roots of a pluralist vision of politics, as this first definition paves the way for a plural conception of the city (polis) where people do not necessarily share the same interests, the same beliefs, or the same ethnic characteristics. Quite the opposite, in this perspective, diversity is the real raison d'être of politics.

However, politics also claims a second function, which is more demanding and sophisticated. Some philosophers and thinkers are going further, beyond the invention of the city, pointing to another purpose: Politics is supposed to lead to the path of righteousness, to promote virtue, and to enable humans to achieve the Supreme Good. Thus, Aristotle conceived of politics as referring to welfare and virtue. The city must be constructed as the *good city*: Political science is elevated then to something much more demanding, namely, the "science of the good politics" or the "science of good government." This vision can be found in Islam through the commitment to divine law (*sharia*); when taken to its extreme, this conception even becomes a way of challenging power holders and leads to a political inversion in which protest is a more important political activity even than governing. In the same way, the *Arthasastra* describes politics as promoting peace and prosperity, while Buddhism produces an ethic of human behavior. Confucianism also gives the central role to the virtue that humans naturally possesses, but that is achieved through the ruler and his norms.

These two functions of politics convey the two faces of political theory, one of which is positivist, the other normative. If politics is only the science of the city, it is first of all a *behavioralist* science. If it is the science of the Supreme Good, its *normative* orientation is dominant. This tension has partly been overcome by an instrumentalist approach to politics, according to which the distinguishing nature of politics has to be found in the *instruments* used for running the city instead of its ultimate goals.

Politics as an Instrument: The Science of Power?

Power—in Max Weber's sense as the ability to achieve your interests even against someone else's will, that is, as coercion—is understood here as the first instrument through which politics operates. All major thinkers claim that the city cannot exist without power, no matter how it is structured. There is thus a long tradition of connecting power and politics, in which political science is assigned to study how power is formed, structured, and shared (Lasswell & Kaplan, 1950). However, the *science of politics* and a *science of power* are not synonymous: Is every kind of power necessarily political, for example, in a firm or a club? In a broader sense, some authors state that politics can be played in an office or inside a family, but this expression is merely a metaphor when conceived in a micro-social order. Conversely, if we consider power as the essence of politics, we have to opt for a wide definition of power that includes ideology, social control, and even social structures, and thus deviates from a vision of power as purely coercive.

For this reason, politics is commonly defined as a specific kind of power; either it is held by a central institution, such as a state, a government, a ruling class, or it is used by a power holder who is considered to be legitimate. The first perspective approaches politics as the science of the state and implies that traditional and weakly institutionalized societies lack the centralized power that is necessary for politics to exist. The second promotes the concept of legitimate authority as the real essence of politics and suggests that in this sense politics is more evident in democracies than in than authoritarian or totalitarian systems.

Some visions also link power and norms. Pushing the Aristotelian definition further, they define politics as the set of norms that lead to the City of Good—either the City of God or the City of the Philosopher. This radical conception is to be found in several traditions: that of Augustine, rather than Thomas Aquinas, in the Christian culture; Puritanism with the Reformation and Calvinism; radical Islam in the perspective of Ibn Taimyya. This conception, however, runs the risk of drifting into totalitarianism or at the very least depreciating the political debate, as it make any kind of political choice impossible.

The connection with *territory* is also frequently used as an instrumental approach to politics. The Greek tradition paved the way when Aristotle stressed the difference between politics, *ethnos,* and *oîkos* (household). If politics is conceived as the coexistence of diverse peoples, it denies that there is such a thing as "natural territory" and implies a socially constructed territory as its required arena. That is why Max Weber makes territory a key element of his definition of politics. For Weber, a community has a political quality only if its rules are granted inside a given territory: this territorial invention hardly fits nomadic societies or even a number of traditional ones (Evans-Pritchard, 1940). But even if it gets close to a state vision of politics, it emphasizes the role of pluralism and diversity inside the political order. In a more extensive conception of the spatial dimension of politics, public and private spheres are opposed: the former is seen as the natural background of political debate, while the latter is conceived as a resistance against political power and its penetrations (Habermas, 1975). We also find again the possible opposition between religious and secular spheres (other-worldly/this-worldly), and even the disenchantment with the world as one of the possible sources of politics.

After going through all these definitions, the criterion of social coexistence seems to be the most extensive one, and probably the least questionable. If politics is everywhere around the world considered more or less as managing social harmony, it can clearly be conceived as the opposite of some other classical spheres of social action (politics vs. social life, military, administration, etc.). As such, it is part of the general social arena, as an ordinary social fact, but a very specific one.

Politics in the Social Division of Labor

Here we face a contradiction that is shaping a serious debate among political scientists. If the conception of politics as an ordinary social fact tends to prevail, political science merges with political sociology (see below). In the opposite version, the latter would be defined as a part of political science, sometimes with ambiguous borderlines. The vagueness and the mobility of the borderline stem from different factors: the diversity of the great theories in the social sciences, which do not reflect the same visions of politics and which are torn between power and integration; the historical and cultural background of politics, which is shaping different kinds of lineages; and the present impact of globalization, which is probably fueling a new definition of politics that is increasingly detached from concepts of ethnicity and territoriality.

Two Traditions: Power Versus Integration

Max Weber is obviously considered as a "founding father" by both sociologists and political scientists. He clearly promoted a political vision of sociology when he developed his two major concepts of *Macht* (power as coercion) and *Herrschaft* (power as authority). Both of them can be found in the very first steps of his sociology where he defines power as the ability of one actor in a social relationship to modify the behavior of another, through pressure, force, or other forms of domination. From a Hobbesian perspective, power plays the major role in structuring social relationships, while the social actors strive to give meaning to this asymmetrical relationship in order to make it just and acceptable, thus establishing the legitimacy of those with power.

In modern society, the state plays an important role and politics has an exceptional status, as it is theoretically conceived as the main basis of social order. This conception is also strongly rooted in the Marxist vision, where the state is considered the instrument by which the ruling class maintains its domination, as the bourgeoisie does in the capitalist mode of production. Carl Schmitt also starts from a Weberian presupposition in linking politics to enmity. By contrast, in a Durkheimian vision, integration is substituted for power as the key concept. Politics is conceived neither as an instrument of domination nor as a way of producing social order; rather, it is a function by which the social system is performing its integration. Obviously, this function implies institutions and then a political sphere, including state and government, but it is considerably more diffuse and appears to be produced by the social community and its collective consciousness. From this perspective, a political society is made up of social groups coming together under the same authority. Such an authority derives from the social community and the collective consciousness; it is constituted by rules, norms, and collective beliefs, which are assimilated through socialization processes. As such, politics is closely related to social integration and is supposed to strengthen it further. That is why there is a strong correlation between a growing division of labor, from the increasing political functions, and their differentiation from the social structures. "The greater the development of society, the greater the development of the state" (Durkheim, 1975, 3, p. 170). Durkheim contrasted "mechanical solidarity" arising because of perceived similarities among people (e.g., in work or education) from "organic solidarity" arising when people are doing different things but see themselves as part of an interdependent web of cooperative associations. This Durkheimian vision is to be found later in the functionalist and systemic concepts of political science as elaborated by Talcott Parsons, David Easton, Gabriel Almond and others, but also in the socio-historical traditions, which attempted to link the invention of politics to the sociology of social changes, as in the work of Charles Tilly or Stein Rokkan. It is also congruent with the social psychological paradigm, which tries to capture politics through its social roots, such as socialization, mobilization, and behavioral analysis.

By contrast, state and power are the real sources of a Weberian political science. Politics is no longer a function of the division of labor, but has definitely its own determinants. Quite the opposite, social history is considering the transformations in the mode of government and more precisely the mode of domination. Power is thus conceived as an explanatory variable of the transformation of societies and political orders. Such a vision is common among those approaches of political science that are centered on power politics, the role of the state, or the nature of political regimes or that are focusing on political institutions and the conditions of their legitimization.

The Diversified Lineages of Politics

Politics is thus approached in different ways, but is also intrinsically plural. During the 1970s, when globalization began to shape the world and when decolonization was completed, both history and anthropology incorporated the perspective of politics with respect to plurality. This perspective on plurality also challenged the mono-dimensional vision that had been promoted by developmentalism a decade earlier. In anthropology, Geertz (1973) pointed out that politics covered several meanings that are changing along historical lines and according to specific cultures. These meanings are socially constructed as human actors encounter different kinds of events, challenges, or goals and as they are rooted or embedded in different sorts of economic and social structures. Politics is understood as achieving the will of God and his law in Islam, while it aims to manage the human city in this world according to the Roman Christian culture. The first conception was fueled by Muhammad's *hijra* when the Prophet left Mecca because of opposition to his teaching and went to Medina to build up the City of God. The second conception was shaped by the Roman experience of religion, which survived during the centuries of the Empire and had again to survive when the latter collapsed during the fifth century. In this dramatic contrast, politics does not cover the same meaning, as it is differentiated from the public sphere and oriented toward individuals in the Roman tradition, while it was more globally constructed in the Muslim tradition. In both cultures, this diversification continued; as Geertz mentions, politics does not have the same meaning in Indonesia and in Morocco, two Muslim societies that experienced greatly different histories.

For that reason, politics can be properly defined only when the definition includes the meaning that the social actors usually give to it. This cultural background implies a huge empirical investigation, which is all the more difficult since the observer tends to view things through his or her own concepts, which are obviously culturally oriented. The risk, therefore, is high to consider as universal a cultural vision of politics, which shapes the paradigm of empirical political science. Translations can be particularly misleading and even fanciful. For instance, the Arabic word *dawla* is often translated as "state," whereas their meanings are hardly equivalent. It is quite impossible to convey, through translation, the deep cultural gap that really implies two competing visions of politics. The only way of going ahead is to deepen the anthropological and the linguistic investigations in order to identify distinctive features of each conceptualization of politics, following the "thick description method" recommended by Geertz. But is there any end to this "individualization" of politics? To be operative, research must postulate a minimal universality of its own concepts and contain the risks of "culturalism": It has to keep the connection with history and anthropology while remaining in a universalist framework.

A Politics of Globalization

This dilemma is revived and even stimulated by the globalization of the world. In the new global order, politics is no longer limited or contained by the territoriality principle. It becomes reinvented beyond the classical coexistence of sovereign cities. Politics cannot be conceived as a simple addition of social contracts, as it was in the Westphalian paradigm. This challenge is first posed to the "realist" theory of international relations, questioning the absolute opposition between "inside" and "outside," or "domestic politics" and "international politics." The latter is no longer confined to the dialogue of sovereigns and has destroyed the traditional categories and criteria of politics. After all, is there a "global covenant," as Robert Jackson (2000) argues, that totally reshapes the construction of politics?

The hypothesis that competition among nation-states can be understood as parallel to that within nation-states supported the extension of the concept of politics to the international sphere. The idea of power politics was projected into the international arena in order to stress that international politics referred to the classical grammar: States, like political actors, were competing according to their own interests and were primarily concerned with their ability to dominate other states, or, at least, to contain the power of the others. Morgenthau (1948) defined *international politics* as the "struggle for power," *power* as "the control over the minds and actions of other men," and *political power* as "the mutual relations of control among the holders of public authority and between the latter and the people at large" (p. 27).

Although this conception is clearly rooted in a Weberian approach to politics, it does not belong only to the past. But it neither covers nor exhausts all the political issues at stake in the new configuration of the international arena. First of all, as sovereignty is fading, the proliferation of transnational actors no longer restricts international politics to a juxtaposition of territorial nation-states. Second, power and coercion are losing their efficiency as influence and social relationships are getting more and more performance oriented. Third, globalization and the growing international social community are shaping common goods, creating a kind of community of humankind; human beings are then creating "a political dialogue that can bridge their differences . . . without having to suppress them or obliterate them" (Jackson, 2000, p. 16). We are here rediscovering Aristotle when he claimed that men need each other for their own survival.

Nevertheless, no one would assert as yet the complete achievement of an international society or an international community. International politics remains an unstable combination of references to power politics and to international social integration: It then confronts the vision of politics as coexistence among diversity. It goes back to the idea of harmony, but without a completed contract, to the hypothesis of a global city without a central government, to the assertion of common norms without binding measures. This combination is at the core of the English School of international relations that refers to the "anarchical society." But it is also close to the French vision of an international solidarity. In the end, politics gets closer and closer to a functional vision of managing social diversity in order to make it compatible with the need for survival.

Epistemological Building Blocks of Political Science

Some major building blocks of political science can be identified that help characterize some common elements in existing approaches, but also, and perhaps more important, enable us to locate these positions and their *differences* more precisely with regard to the major epistemological foundations. The first of these building blocks concerns the *multidimensionality* of our subject matter; the second, its *plastic* and malleable character and the resulting *self-referential* problems; the third refers to a *systems* perspective of politics; and the fourth to the *linkages* between different levels (micro-, meso-, macro-) of political (and more generally social) analysis.

Multi-Dimensionality

The most basic distinctions of our discipline, which distinguish it in some important respects from the "natural" sciences, concern the dimensions of its subject matter. As in nature, there are certain hard "objects" such as political institutions and social structures, which can be identified and which are "tangible" and observable in certain ways. In addition, however, there is a "subjective" dimension in which such objects are perceived by individuals and groups and translated into concrete actions. Such perceptions themselves are shaped by a number of psychological, social, or other factors. This distinction is commonly accepted and runs through the history of philosophy from antiquity to the present day and concerns all sciences of humankind, including medicine. There, distinctions between body and mind (or consciousness) and the subsequent divisions into subdisciplines such as anatomy and psychology are commonplace. Similarly, the fact that there are possible interactions between these dimensions is well accepted, even though in medicine some of these psychosomatic relationships are still not well researched. The third dimension, the "normative" one that concerns ethical judgments of "good" or "bad" actions and behavior, is more problematic. In medicine, again, some ethical norms have been generally accepted since the time of Hippocrates, but debates continue about, for example, when exactly human life begins or ends, and what the respective theological or philosophical justifications are for such positions. In philosophy, this "three-dimensionality" of human existence has also been elaborated by Immanuel Kant, for example, in his *Critique of Pure Reason* (1787/1956, p. 748 ff.).

A graphical representation of these dimensions can be rendered in the following Figure 1 (where the dotted line represents a "holistic" position):

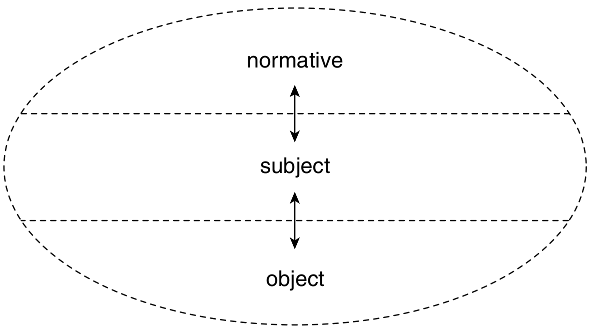

Figure 1 Dimensions of Human Existence

Source: Dirk Berg-Schlosser.

The crux of the matter really concerns problems of distinguishing such dimensions and their interactions not only analytically but also in actual practice, and controversies about normative, ontologically based justifications and their respective epistemological and methodological consequences persist. Here, we cannot go into these debates in any detail, but we find it useful to locate the major emphases of the current meta-theoretical positions in political science with the help of such distinctions. Thus, the major ontological approaches have their basis in the normative dimension ranging from Plato to Eric Voegelin or Leo Strauss, but also concern attempts in linguistic analysis (e.g., Lorenzen, 1978), or communications theory (Habermas, 1981). This also applies to non-Western traditions such as Confucian (Shin, 1999), Indian (Madan, 1992), or sub-Saharan African (Mbiti, 1969) ones.

Sharply opposed to such foundations of political theory are critical-dialectical or historical-materialist positions in the tradition of Karl Marx and his followers. There, the object dimension of the modes of production and re-production of human existence is the basic one from which the others are derived. Thus, the objective social existence determines the subjective consciousness and the political and normative superstructures. On this position, the teleological theory of history of Marx and his followers from the early beginning until the classless society and its peaceful end is based as well.

The third major meta-theoretical position, a behavioral or behavioralist one, takes the subjective dimension as its starting point, expressing a position of methodological or phenomenological individualism (for the use of these terms, see Goodin & Tilly, 2006, p. 10ff.). Then subjective perceptions and subsequent actions of human beings are what really matters. These shape social and political life. This position has been most influential in election studies, for example, but also concerning some aspects of political culture research. In a somewhat broader perception, both subjective and objective dimensions and their interactions are considered by empirical-analytical approaches, but, from a positivistic point of view, no normative judgments can be made on this basis. Long-lasting controversies concerning this position go back to Max Weber and his followers but are also reflected in more recent debates between Karl Popper and Jürgen Habermas, for example (see Adorno et al., 1969).

These basic meta-theoretical positions and their variations remain incompatible. Similarly, whether these dimensions can in actual fact be separated or, by necessity, always go together from a holistic perspective remains controversial. The latter position, in contrast to Kant, is, for example, represented by G. W. F. Hegel, but also by Marx and some of his followers (e.g., Lukács, 1967). In the same way, epistemological positions based on religion, including Buddhism and Confucianism, perceive these dimensions in a holistic manner. From a more pragmatic perspective, it seems that the fundamentalist debates about such matters have subsided in the last few decades and most political or social scientists just agree to disagree about such basic ontological or religious positions and their respective justifications. Nevertheless, Figure 1 may help better locate such positions and to put some conceptual order into these controversies.

The Plastic Matter of Political Science

As a result of the change from Newtonian physics with its deterministic relationships to quantum theory and probabilistic relations in nuclear physics, Popper (1972) has coined the metaphor of "clouds and clocks." Clocks represent Isaac Newton's deterministic world, as in astronomy, for example, where the movements of stars and planets or the next solar eclipse can be predicted (or retro-dicted) with clocklike precision. Clouds, by contrast, constitute a very elusive substance, the structures and regularities of which cannot easily be grasped over a somewhat longer period even today by the most advanced computers of meteorologists and their satellite-based data. Between these two extremes, however, which should be perceived as the opposite poles of a continuum rather than mutually exclusive positions, there is a plastic matter that is malleable in the course of time and that is neither perfectly determined nor subject to pure chance.

In an important essay, Gabriel Almond and Stephen Genco (1977) have transferred this concept to the social sciences and politics. They state that

> the implication of these complexities of human and social reality is that the explanatory strategy of the hard sciences has only a limited application to the social sciences. . . . Thus, a simple search for regularities and lawful relationships among variables—a strategy that has led to tremendous success in the physical sciences—will not explain social outcomes, but only some of the *conditions* affecting those outcomes. (p. 493, emphasis added)

The deductive subsumption of individual events under "covering laws" in Carl Hempel's (1965) sense, according to which claims about individual events can be derived deductively from premises that include a scientific law, thus is not possible for the most part. In addition, factors of human *choice* and action plus, possibly, some elements of pure chance in certain conjunctures also have to be considered.

As a consequence, we have to be more modest in our claims about the precision of causal relationships, the generalizability of regularities, and the universality of theories. At best, therefore, only theories located more precisely in time and space—what Robert K. Merton called "medium-range theories"—seem to be possible for most practical purposes. Such a view also corresponds with a position already expressed by Aristotle, who located politics in an intermediate sphere between the necessary, where strict science can be applied, and the realm of pure chance, which is not accessible for scientific explanations.

Such distinctions are illustrated in Figure 2:

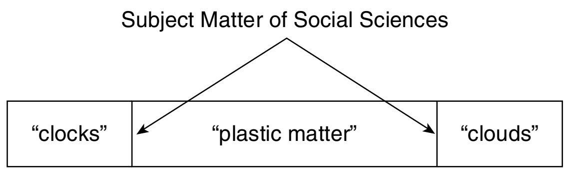

Figure 2 Degree of Determination of Theories

Source: Dirk Berg-Schlosser.

Again, the full implications of such a perspective cannot be discussed here, but this figure should be helpful, once more, to locate some of the "harder" and some of the "softer" approaches in our discipline along this spectrum. On the whole, we would agree with Almond and Genco's conclusion that

> the essence of political science . . . is the analysis of choice in the context of constraints. That would place the search for regularities, the search for solutions to problems, and the evaluation of these problems on the same level. They would all be parts of a common effort to confront man's political fate with rigor, with the necessary objectivity, and with an inescapable sense of identification with the subject matter which the political scientist studies. (p. 522)

The last point also leads to the next *differentia specifica* of the social sciences as compared to the naturalist sciences and their distinct epistemology.

Self-Referential Aspects

This sense of identification also can be seen in different ways. First of all, it means that as human and social beings we are inevitably part of the subject matter we are studying. Even if we attempt to detach ourselves as much as possible from the object under consideration some subjective influences on our perception remain. These can be analyzed by psychology, the sociology of knowledge to discern our (conscious or unconscious) "interests" in such matters, and so on, but some individual "coloring" of our lenses seems inevitable. Therefore, a certain "hermeneutic circle," which should be made conscious and explicit in the interactions with others, remains (Moses & Knutsen, 2007, Chapter 7).

However, this limitation can, again in contrast to naturalist perceptions of science, be turned to one's advantage. As human beings we can empathize with each other and can intersubjectively, if not objectively, understand and interpret the meaning of each other's thoughts and actions. This is even more the case when we are trained as social scientists in a common methodology and scientific language. This latter point also distinguishes the perception, level of information, and theoretical interpretation of a political scientist from the "man (or woman) in the street" talking politics, in the same way that a meteorologist has a different knowledge of what is happening in the atmosphere compared to the daily small talk about the weather. Nevertheless, such inevitable subjectivity, which is also historically and culturally conditioned, opens the way to more pluralist interpretations and meanings. Constructivist approaches, as contrasted to naturalist ones, can dig deeper in certain ways into this subjectivity and the plurality of meanings (cf., e.g., Foucault, 1970).

Two more points concerning our identification with the subject matter and our self-referential position within it must be mentioned. Being part of the substance, we can also, consciously or unconsciously, act upon it. Thus, self-fulfilling or self-defeating prophecies become possible as feedbacks between the interpretation or even just personal opinion of an important actor or social scientist whose authority in a certain sphere has become acknowledged in the matter he is dealing with. This frequently occurs when some "analysts" give their opinion on probable developments of the stock exchange or currency rates and many people follow suit. This also applies to electoral predictions with respective bandwagon and underdog effects.

Finally, being part of our world and being able, to some extent, to act on it, also raises the question of social and political responsibility. This brings us back to the normative side of politics with which we inevitably have to deal, self-consciously and being aware of possible consequences. In this respect, too, a recent constructivist turn in the theory of international politics, in a somewhat more specific sense of the term, has led to the broader discussion and possible acceptance of more universal norms.

A Systems Perspective

Within this multidimensional, malleable, and dynamic universe more specific *political* elements can be identified. One difficulty in this respect, again, lies in the contrasting meta-theoretical positions and their perspectives on politics (see the first section above). In a more abstract way, politics can also be conceived as the regulating mechanism in large-scale modern societies. Easton (1965) thus defines politics as "the authoritative allocation of values" in society and the forces shaping these procedures. In this process, different elements interact in a systemic way regulating conflicts. This mechanism can be conceived like a thermostat with the respective inputs and outputs connected by an effective feedback procedure in a cybernetic sense (see also Deutsch, 1963). Such relationships can be illustrated in a simplified system model (see Figure 3).

This system model should not, however, be equated with systems theory in a more demanding sense (e.g., Luhmann, 1984). Thus, such systems need not necessarily be in equilibrium and they may also explode or implode as, in fact, they did in Communist Eastern Europe.

Nevertheless, such a model is again helpful to locate the major subdivisions of politics (and political science), which also constitute the major subsections of this encyclopedia and, in fact, many political science departments or national associations. The bottom square includes, in a broader sense, the fields of political sociology and, when this is treated separately, political economy. The square on the left-hand side represents political sociology in a narrower sense of the term (organized interest groups, political parties, etc.). The top square reflects the institutional side (involving a possible separation of powers, etc.) but also questions of governance often including the realm of public policies and public administration on the right-hand side. All this is embedded in the international system concerning interactions with the outside

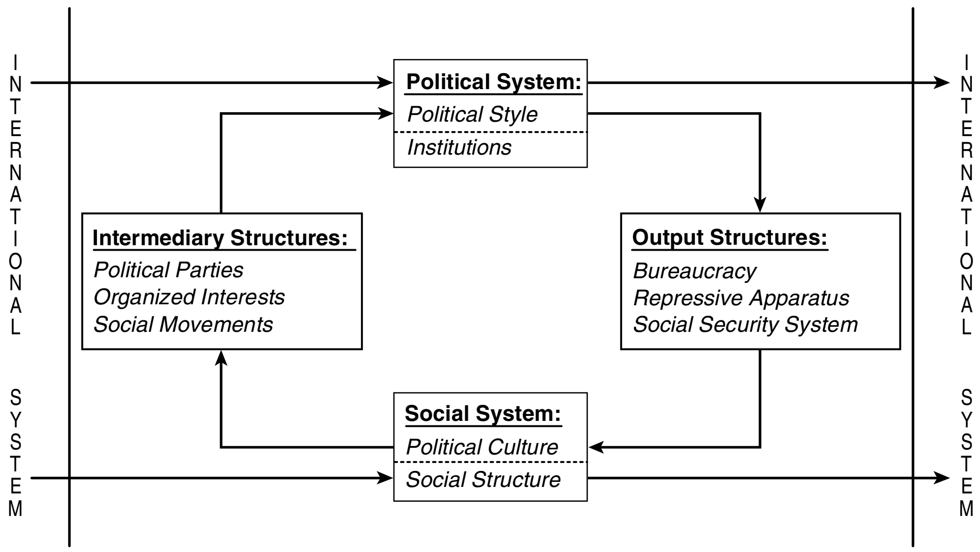

Figure 3 Simplified System Model

Source: Dirk Berg-Schlosser.

world both of state and society as the field of international politics and, in a more limited sense, international political economy. The arrows of such interactions can go in both directions. The systematic comparison of such systems or some subfields is the realm of comparative government. Overall theoretical (and philosophical) implications are the concern of political theory, and the respective methods and analytic techniques applied constitute the subfield of political methodology.

Linkages Between Levels of Analysis

A final building block to be considered here concerns the links between macro-aspects of entire political systems and their relationship with the micro-world of individual citizens and the meso-level of organisations in between. For this purpose, what has been dubbed "Coleman's bathtub" (Coleman, 1990, p. 8) is most helpful. Here, a given objective (structural) situation at the macro-level (on the upper-left-hand side in Figure 4) can be linked to the micro-level of individual subjective perceptions and values, which are then translated into concrete actions, possibly aggregated on the meso-level, and then leading to the outcome on the macro-level to be explained (upper-right-hand side). This relationship is illustrated in Figure 4.

It is important to note at this place that we do *not* imply for the individual actors, as is done for example in economics and rational choice theory, a specific logic of selection, as, for example, maximizing a person's material well-being. Such very restrictive assumptions of "homo oeconomicus" or even "homo sociologicus" (Dahrendorf, 1977) only rarely apply in political science, where usually a much wider range of choices exists, even if some of which may appear as "irrational" to others (for example, strongly felt ethnic or religious identities).

The purpose here, again, rather lies in the possibility to *locate* various approaches and their respective assumptions in such a scheme and to show the plurality of concepts that can be integrated here, but keeping them in a coherent relationship. Hartmut Esser (1993, p. 23 ff.), for example, has extended possible assumptions at the micro-level to include "restricted, resourceful, evaluating, expecting, maximing men" (RREEMM) or women, and even further assumptions about conflicting "identifying" (with some collective entities) or "individualizing" attitudes (RREEIIMM) or similar ones may be added. For the logic of the situation also framing procedures play a role where individual perceptions are shaped by the social milieus of one's childhood and later environment (see also D'Andrade, 1995). The point here is to

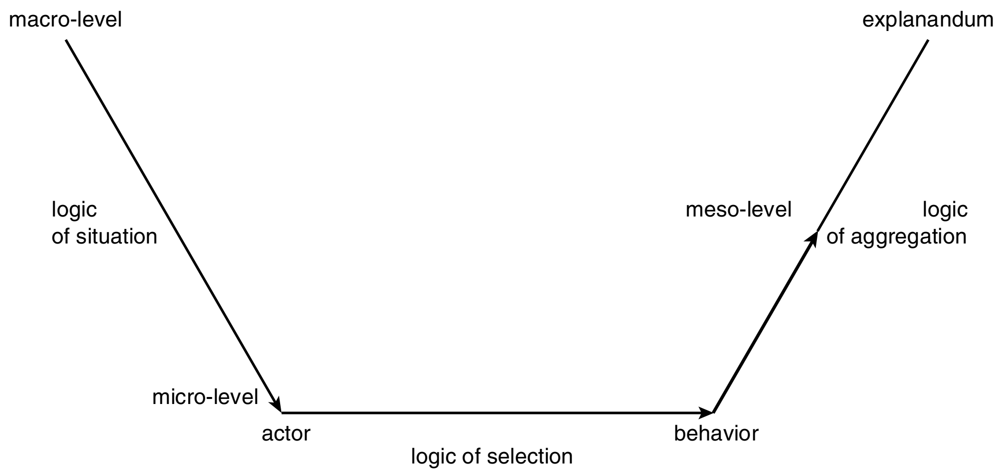

Figure 4 Linking Levels of Analysis

Sources: Adapted from Coleman (1990) and Esser (1993, p. 98).

show that in this way given historical and traditional constraints at the macro-level terms can be meaningfully linked to individual and, at the aggregated level, collective political action. Which particular historical, cultural, or other factors condition these choices in any given situation can be left open at this place, leaving room, again, for a plurality of cultural and theoretical perspectives.

The Need for a Reflective Pluralism

As this overview has shown, there are some basic building blocks, which can be usefully employed in a variety of ways for locating different epistemological positions and historical-cultural traditions in political science and similar fields. In this way, it at least becomes clearer where (and perhaps also why) certain contending positions actually differ. We do not intend to "harmonize" these positions. They all have, to varying degrees, their respective strengths and weaknesses, and no coherent, well-integrated theoretical building is constructed here with these blocks. That may even not be desirable, leaving some room to agree to disagree about some basic issues and perspectives. What is desirable instead is to elevate our consciousness and our way to deal with such controversies to a level of reflective pluralism, where not just anything goes, but where contending epistemologies and approaches can be brought into a fruitful interdisciplinary, intercultural, and, possibly even, meta-theoretical dialogue.

As already mentioned, political science has always been characterized by a diversity of contending meta-theoretical positions, paradigms, and approaches. In Europe, in the last century various strands of normative-ontological, Marxist, and empirical-analytical persuasions have been at the forefront (for such and similar terms see, e.g., Easton, Gunnell, & Graziano, 1991; Quermonne, 1996). For several decades in the United States, "behavioralist" positions and, more recently, "rational" and "public choice" approaches have dominated (cf. the influential volumes by King, Keohane, & Verba, 1994, and Brady & Collier, 2004). In other parts of the world, different theological, philosophical, and epistemological traditions have influenced the (more recent) emergence of political science there. Altogether, thus a great variety of contending positions, which have been summarized as "naturalist," "constructivist," and "realist," can be observed (Moses & Knutsen, 2007).

Relations With Other Social Sciences

Pluralism and different traditions in political science also emerge when we change perspective and focus more precisely on its relationships with other social sciences. This section explores three sources of political science as it differentiated itself from other disciplines.

Evolution of Political Science

When looking at the period after World War II, the basic difference in the traditions of different countries and areas of the world is between a plural form (political sciences) that is more common in Europe and encompasses the singular (political science). Conversely, in the tradition of United States the singular form (political science) includes the plural (political sciences). In the singular, there is a pluralist political science where empirical analysis is dominant, but also other perspectives (law, history, philosophy) are present. However, be it plural or singular, during the last decades empirical political science has increasingly differentiated itself from sociology, and above all from political sociology, public law, political philosophy, and contemporary history. Actually, in these developments we can see differences among disciplines or, more precisely, among specific groups of scholars in specific countries, but also overlapping and mutual influences with ever stronger interactions among scholars who are able to cross borders from Europe to North and South America, and to Africa and Asia, with a strong British tradition still present in Australia.

When we trace the original development of empirical political science, we can see that in a large number of European and American countries, political science is the result of empirical developments in public law. Consequently, the first difference concerns the difference between the perspective of law, which deals with "what ought to be"—with norms and the institutions that seek to embody them, and that of political science as transformed by behavioralism into an empirical social science, which is focused on "what is"—on the reality and on the explanations of it.

In Europe as well as in North and South America, there are other strong traditions that make contemporary history a parent of the new, post–World War II empirical political science. Here, despite all its ambiguities, the criterion of differentiation is between historical idiographic research, focused on the analysis of specific unique events, and a political science characterized by epistemological and methodological assumptions of other social sciences such as economics, sociology, and psychology, at least in terms of expectations of empirical findings (nomothetic) with a more general scope (regularities, patterns, laws). Social history and historical sociology as in the works of Reinhard Bendix, Barrington Moore, Stein Rokkan, Charles Tilly, and others have also greatly contributed to our understanding of long-term political processes at the macro-level. In this respect historical studies and political analysis can nicely supplement each other, as in the adage "Political science without history has no root, history without political science bears no fruit."

Within the European and North American traditions, sociology is the third parent of the new empirical science. Here, in addition to the common epistemology and possibly methodology of research, the overlapping of the contents, when political sociology is considered, makes the differentiation more difficult. Such a criterion was set up by two famous sociologists of the 1950s, Bendix and Seymour Lipset, when they stated that political science starts from the state and analyzes how it influences society, whereas political sociology starts from the society and analyzes how it influences the state (Bendix & Lipset, 1957, p. 87). In other words, the independent variables of a sociologist are the dependent variables of a political scientist: The arrows of explanation are going in opposite directions. Such a distinction sounds artificial and unrealistic when the inner logic of research is taken into account—if we decide in advance what is/are the independent variable/s, how can we stop when no salient results come out and declare that from now on one becomes a sociologist or economist or else? Nevertheless, for years such a distinction was the rule of thumb used to stress the difference between political sociology and political science. However, such a rule was responding more to the necessities of differentiation between academic communities than to the needs of developments in empirical research. It must also be noted that political sociology can be understood in both a broad and a narrow sense. In the former, it covers the broad social-structural and political-cultural bases of politics and their long-term developments over time at the macro level. In the latter, the intermediate and input structures of politics like interest groups, parties, social movements and other aspects of civil society are dealt with. These, undoubtedly, belong more to the realm of political science proper and have continued to flourish. In the former sense, closer to historical sociology, a certain slackening can be observed. This is due to the fact that the consideration of long-term social-structural developments had rigidified to some extent in the 1970s and 1980s in variants of orthodox Marxism, or the political element had largely disappeared in the analysis of finer social distinctions in Pierre Bourdieu's sense.

Last but not least, the development of differences between political philosophy and political science should be recalled. Again, there is much overlapping of contents, but epistemology and methods are different and easy to distinguish. As recalled by Giovanni Sartori (1984) with regard to the "language watershed," first of all, the language is different: The words and the related empirical concepts of political science are operationalized, that is, translated into indicators and, when possible, in measures, whereas the language of political philosophy is not necessarily so; it usually adopts meta-observed concepts, that is, concepts that are not empirically translated.

As discussed in the next section, this apparently simple differentiation covers possible commonalities, but leaves unsolved how the two different disciplinary perspectives deal with normative issues. Norberto Bobbio (1971, pp. 367, 370) made a relevant contribution in this direction when he emphasized that political philosophy focuses mainly on

- the search for the best government;
- the search for the foundations of the state or the justification of political obligations;
- the search for the 'nature' of politics or of 'politicness'; and
- the analysis of political language.

All four topics have an ethical, normative content, which is a characterizing feature of each political philosophical activity. At the same time, Bobbio recalls that an empirical analysis of political phenomena that are the objects of political science should satisfy three conditions:

- the principle of empirical control as the main criterion of validity;
- explanation as the main goal; and
- *Wertfreiheit,* or freedom from values, as the main virtue of a political scientist.

As noted in the discussion of epistemology above, the key element is in differentiating the speculative, ethically bound activity of a philosopher from the empirical analysis, even of phenomena that are influenced by the values of the actors.

The Influences of Other Disciplines

The obvious conclusion of the previous subsection is that there are different ways of analyzing political phenomena that correspond to different traditions and come from different cultural influences. Moreover, the discussion of those differences may help in developing a negative identity of political science. This is the very first meaning of the actual pluralism we have in this domain of knowledge: Pluralism only means that politics can be legitimately studied in different ways and with different goals that belong, at least, also to law, history, sociology, and economics. Pluralism in this sense challenges the autonomy of political science and even, in a radical version, has led to a denial that it constitutes a specific science. This view, however, no longer corresponds to the internal differentiation of the discipline, its specific achievements, and its more general institutionalization as an academic field. In addition, a second sort of pluralism inside political science proper reveals the overlapping and the influences of other disciplines in empirical political science. In this vein, when again considering the period starting after World War II, a main hypothesis can be proposed: Political science is influenced by the discipline or the other social science that in the immediately previous years has developed new salient knowledge. This is so for sociology, as can be seen in the analysis of Lipset and Bendix and other important authors since the end of World War II, who developed the work of classic sociologists, from Weber and Durkheim to Parsons and others. This is so for the influence of general systems theory, coming from cybernetics, and translated meaningfully into the analysis of political systems so that since the mid-1950s, it has become a major approach in political science. The same applies to the influence of functionalism, born with the developments of anthropology, and to rational choice or more specifically game theory, coming from economics and becoming more and more influential with several adaptations since the end of the 1950s. This is so, finally, for cognitive psychology that became very important in economics and at the same time in political science with the development of new ways of studying electoral behavior.

Moreover, when we consider more closely some of the subsectors of political science we can see more specific influences. For example, in the field of international relations, we can see the influence of international law. The public policies sector of political science has been influenced by sociology, economics, and constitutional and administrative law. Sociology has shaped the development of research on political communication. The influence of history can be seen in the selection of specific topics in comparative politics. Thus, we see that political science not only embodies a highly developed pluralism of the two kinds mentioned above, but also requires the integration of knowledge from other disciplines. Political scientists therefore also need an educational background that enables them to draw on these interdisciplinary sources of the field.

Recent Developments and Perspectives

As the International Political Science Association notes on its website,

> it is hard today for political scientists of 2011 to imagine the very different status their discipline in the world under reconstruction of 1949. In place of the familiar, well-structured web of national associations we know today, there were associations only in the United States (founded in 1903), Canada (1913), Finland (1935), India (1938), China (1932), and Japan (1948). (http://www.ipsa.org/history/prologue)

Founders of the International Political Science Association met in 1948 to plan for a new international organization that would establish dialogue among political scientists throughout the world. Taking into account the views of political science as variously defined in different countries, they identified four fields as constituting the discipline, acknowledging "the influence of the philosophers with 'political theory,' the jurists with 'government,' the internationalists with 'international relations,' and the fledgling behaviorist school of American political science with 'parties, groups and political opinion.'" Today IPSA serves as the primary international organization in the field, with individual and institutional members as well as affiliations with national political science memberships across the globe.

With respect to the ways that pluralism and interdisciplinary developments have taken place in political science, the North American influence has been paramount. The so-called Americanization affected all of Europe as well as other areas of the world where native scholars, educated in North American universities, went back to conduct research and to teach, bringing a new empirical conception of the discipline that significantly contributed to create new communities of political scientists (Favre, 1985). Moreover, American foundations and research centers gave support for research in Europe, Latin America, Asia, and Africa. While there are differences in political science as it exists today on different continents in this domain of knowledge—and actually also in most other scientific research domains—the North American universities, as well as the American research centers and the scholars associated with them, had a great influence that can be compared only to the intellectual German influence during the 50 years between the end of the 19th century and the first 3 decades of the 20th century. Thus, at the end of the 1960s, Mackenzie (1969, p. 59) suggested that in this period 90% of political scientists worked in North America, and Klaus von Beyme noted that the Department of Political Science at the University of California, Berkeley had more professors in this field than all German universities combined. Moreover, in those years and earlier in the 1950s in all European countries and in Japan, the American influence had been very strong in all social sciences, with some exceptions such as anthropology, which had a specific French presence. Forty years later, 70% of all political scientists are almost equally present in North America and Western Europe and the other

30% are spread throughout the rest of world, again with a relatively strong presence in Japan.

To better understand the development of the discipline all over the world with its specific contents, approaches, and methods, we should note that the American influence has been supplemented by the great increase of faculty members in all universities of the world since the 1960s. During this period, especially in Europe, there was the so-called transition from elite universities to mass universities; that is, there was a significant growth in the number of university students, which required the recruitment of a large number of new faculty members in all disciplines, political science included. This growth of the discipline allowed the creation of academic groups who absorbed and translated the American influence in different ways. Without that internal growth, there would not have been even the possibility of such a widespread influence.

This penetrating influence had a different impact in the various countries also in connection with their respective traditions. More precisely, on the one hand, the influence of the way empirical research is developed through quantitative statistical analysis and qualitative research is general and fairly homogeneously widespread; on the other hand, some approaches that have a stronger correspondence or congruence in the European and Japanese traditions, such as the different neo-institutionalist approaches, have had more success than other approaches, such as the rational choice approach. That latter has become very strong in North American political science, where it has its roots in economics, but it has remained much weaker among political scientists in other areas of the world. By its very nature, political science in other regions of the world also has been more specifically historical and comparative rather than just focusing (mostly) on a single case, the United States. Moreover, the legal traditions of several European countries especially influenced research in the subfield of public policies. At the same time, traditions in political philosophy and contemporary history maintained some influence on research that was predominantly qualitative rather than quantitative. Finally, and more specifically in Europe, research funding from the European Union led to the development of a number of works focused on topics related to the Union.

In the most recent developments, the impact of a more continuous and effective communication among scholars through different modalities, such as domestic and international collective associations, research networks, and initiatives of private and public institutions, affected the discipline as a whole mainly in three directions. The first one is a growing trend toward blurring national differences and a consequent convergence between North America, or between North and South America, and Europe. The second is an increased blurring of subdisciplinary divides. This is so especially between comparative politics and international relations, traditionally two separate fields in the past. Such a trend is particularly evident in the European studies. Third, research in political science more and more focuses on relevant, contemporary realities rather than confining itself to an ivory tower, which made it distant and largely irrelevant and, consequently, created that "tragedy of political science" Ricci singled out years ago (1987). Contemporary political science thus has developed into a multi-faceted, well-established discipline that is concerned with the pressing problems of our times and provides sound empirical analyses and meaningful orientation in the ever more integrated and complex world of the 21st century.

A

ACCOUNTABILITY

Accountability has become a key concept in both public administration and democratic theory. Its meaning is contested, but the general definition "obligation to answer for the performance of duties" would fit most versions. In this sense, accountability is a relationship between two parties—the person or organization answering or being held to account (the accountor or agent) and the person or organization to whom the account is owed (the account holder or principal). Analysis of accountability therefore begins with the double question: *Who* is accountable *to whom*? Accountability obligations depend on the terms of the relationship and on its institutional context, leading to two more key questions: (1) *For what* is the accountor accountable and (2) *how*? This entry covers the following topics: defining accountability, typologies of accountability, mechanisms of public sector accountability, democratic accountability, accountability in international relations, single versus multiple accountability, accountability in networks, and accountability and the new public management (NPM).

Though the English word *accountability* has a respectable historical pedigree (the *Oxford English Dictionary* records its use from the late 18th century), its prominence in political science dates only from the 1980s, before which time the cognate term *responsibility* was preferred. (Indeed, linguistic equivalents of "responsibility" are still dominant in other European languages that lack a direct parallel for "accountability.") The rapid rise of "accountability" can be traced to its adoption by public choice theory, particularly principal–agent theory, and by management theory, which in turn greatly influenced democratic theory and public administration. However, the relative lack of intellectual history and of cross-disciplinary seminal texts has meant that academic analysis of accountability has proceeded in a haphazard, fragmented, and repetitive fashion. Different subdisciplines, including comparative politics, international relations, deliberative democracy, constitutional law, and public management (further subdivided into U.S. and European versions) have each been developing their own parallel theories of accountability, with little cross-fertilization or sense of common purpose.

Defining Accountability

Though the core sense of accountability, the obligation of the accountor to answer for the performance of duties, is uncontroversial, disagreement occurs over what should be added to that core. Most analyses also include the capacity of the account holder to impose sanctions or other remedies on the accountor as a necessary complement to full accountability. However, some versions confine accountability to the initial informing and discussing stages, omitting the requirement for any rectification. In effect, they equate accountability with *transparency*, another popular term with which accountability is frequently linked. Certainly, in complex modern systems of public accountability, some accountability mechanisms, such as parliamentary inquiry or media investigation, can provide transparency but lack the capacity for imposing sanctions, leaving that function to other agencies such as courts or the executive. But transparency on its own, with no prospect of correction or other adverse consequences, falls short of full accountability.

In its core sense, accountability, like accounting itself, is essentially retrospective or *ex post*, in that it is concerned with information and explanation about past actions of the accountor. Discussion about future actions is, therefore, not, strictly speaking, an exercise in accountability. However, in a continuing relationship between principal and agent, *ex post* can easily overlap with *ex ante*, as in election campaigns when incumbent representatives not only defend their past actions but also outline their future plans. Indeed, some theorists have wanted to distinguish two types or aspects of accountability, *ex post* (retrospective) and *ex ante* (prospective) accountability, while others have included all communication between political leaders and the public as part of an ongoing accountability dialogue. Such usage, while understandable because of the obligations of democratic governments to engage in continuing discussion with their citizens, extends accountability beyond its normal focus of answering for past actions. Similarly, government consultation with stakeholders about future policy certainly helps keep politicians and bureaucrats in touch with relevant sections of public opinion, but it does not necessarily imply accountability in the strict sense of accounting for previous decisions.

Accountability is also sometimes taken beyond its retrospective core when it is equated with institutional devices for limiting or constraining power. For instance, constitutional checks and balances, such as federalism and the separation of powers, are sometimes described as mechanisms of accountability because they limit the legal power of governments and prevent them from abusing the rights of citizen. Such constraints may certainly involve accountability mechanisms, for instance, when a government oversteps its legal powers and is called to account by the courts. However, constitutional laws and regulations themselves are essentially prospective in focus, seeking to limit and control future actions of governments. The mere fact that laws and regulation constrain the power of governments need not in itself imply that they are instruments of accountability.

Significant disagreement also surrounds how far accountability is to be distinguished from other, closely related concepts, namely, responsibility and responsiveness. "Responsibility" and "accountability" share parallel conceptual histories, both originating in the notion of answering ("responding," "giving an account to") to someone. "Accountability," as the obligation to answer for the performance of duties, generally implies a relationship between two or more parties, in which one party is subject to external scrutiny from others. "Responsibility," on the other hand, typically refers to the internal deliberations and actions of a single person or organization.

This division of conceptual labor is by no means universally observed. "Responsibility" sometimes includes answering to others as well as making individual choices, as, for instance, in the classic British conventions of "responsible government" and "ministerial responsibility." Indeed, before the rise of the term *accountability*, *responsibility* regularly covered both external and internal aspects (as its equivalents still do in other European languages).

The popularity of "accountability" has seen it extended in a similar fashion, but in the opposite direction, to include not only external scrutiny but also the internal capacity for considered and conscientious action usually described as acting "responsibly." For instance, where members of caring professions, such as social workers and health professionals, have a strong vocational commitment to serving the interests of the community, this concern is sometimes identified as in itself constituting accountability to the community, regardless of whether members of the community actually have any rights of scrutiny or complaint. Similarly, members of the nonprofit charitable sector commonly see themselves as accountable to the recipients of charity even though they are not, strictly speaking, answerable to them. Particularly where professional standards or values are publicly articulated, voluntary adherence to such standards can be seen as a form of accountability without any requirement to report externally or without external any mechanism for others to demand compliance. The accountability has become internalized, as though the conscientious professional is in an imaginary dialogue with his or her clients and answering to them.

The question of whether an internalized sense of service should be accepted as a form of accountability recalls the perennial debate over the relative merits of professional discretion compared with external scrutiny as a means of securing public service in the public interest. The issue was classically discussed by Carl Friedrich and Herman Finer in the 1940s as a debate over two contrasting types of responsibility but is now typically described as a clash between two types of accountability. Conceptual clarity might be better served if accountability were reserved for external scrutiny and rectification, recasting the Friedrich–Finer debate as being between the respective merits of (internal) responsibility and (external) accountability. However, the emotive pull of "accountability," like that of "democracy," makes supporters of professional discretion unwilling to accept what would amount to an accountability deficit. Instead, they prefer to see themselves as embracing a special form of accountability.

Similar extensions beyond the core meaning of accountability derive from the connection between accountability and responsiveness. Accountability, as the obligation to answer to external scrutiny, derives its main justification from its contribution to responsiveness, understood as the readiness of institutions and officials to respond to the needs and interests of those whom they serve. In public administration, for instance, responsiveness, the alignment between official action and public preferences, is the goal to which the accountability of governments is a key means. However, accountability procedures of external scrutiny, such as review and audit, are not the only mechanisms for making governments responsive. For instance, changing the organizational culture of a public agency toward a greater client focus and concern for service quality can make the agency more responsive to the public but need not involve additional accountability procedures of scrutiny or inquiry. Yet many in such an agency would typically claim that it had become both more responsive and more accountable, in effect identifying accountability with responsiveness.

The link between accountability and responsiveness also arises with market mechanisms. Markets are unquestionably instruments of responsiveness. They find their main rationale in their capacity to align the provision of goods and services with the preferences of consumers and citizens. But are they therefore instruments of accountability? According to a strict understanding, organizations operating in a market, particularly private companies, are accountable primarily to their owners and shareholders, not to their customers. They may be accountable to individual consumers who have purchased goods or services, and they may also be publicly accountable in the sense of being liable to scrutiny for complying with any relevant law and regulations. But overall responsiveness to consumer preferences comes from the consumers' capacity to choose between alternative suppliers in a competitive market. Suppliers adjust to consumer demand not because of any complaints or scrutiny from potential customers, who have no such rights against a supplier, but because they will go out of business if they have no customers.

Markets are thus primarily "exit" mechanisms for securing responsiveness. Dissatisfied customers vote with their feet. Accountability, on the other hand, as normally understood, is a "voice" mechanism, allowing dissatisfied members of the public to complain and to seek information and rectification from an organization. In this case, markets do not count as accountability mechanisms. Nonetheless, because competitive markets have the capacity to force service providers to take note of consumer preferences and, in some sense, to "answer" to expressed demand, to describe them as instruments of accountability can have a certain plausibility.

In the same way, organizations that respond to peer or public opinion through concern for their corporate reputations are sometimes said to be exhibiting "reputational" accountability. Again, there is no direct connection or dialogue between the supposed "accountor" and the "account holder," no right of the public or the organization's peers to call the organization to account, and no formal obligation of the accountor to accept sanctions or redirections from others. Again, however, the emotive force of the term *accountability* leads sympathetic observers to classify such responsiveness as instances of accountability. Moreover, in modern democratic societies, reputational effects are often the result of media publicity and scrutiny. There are good grounds for seeing the media as agents of accountability, holding public figures and organizations up to scrutiny, even though the media may have no formal rights to demand information or to impose sanctions. As with transparency in general, however, such accountability without rectification is inchoate and incomplete.

Accountability is thus a chameleon-like concept that readily takes on new, additional senses from the different contexts in which it is used. Because external scrutiny and sanctions, the core of accountability, are so central to checking abuses of power and to the processes of representative democracy, the term itself is easily extended to other mechanisms and processes that secure the same overall objectives, including legal and regulatory constraints, market competition, and public service professionalism and commitment to the public interest. These extensions and variations have been driven by the emotive power of the term combined with the lack of widely recognized academic authorities on the topic. To expect agreement on a single concept of accountability is unrealistic. But, at least, analysts of accountability could become more aware of the well-established variations in usage and more willing to place their own versions within that larger conceptual context.

Typologies of Accountability

Most analyses of accountability divide it into different types, though, as with the definition of accountability, there is no agreement on a typology or even on the meaning of some of the labels. Some typologies are based on distinctions in the subject matter of accountability (*for what*), for instance, between accountability for contestable outcomes ("political") or for agreed tasks ("managerial") and accountability for different types of activity, such as finances, processes, and performance. Other typologies focus more on the institutions and mechanisms of accountability, for instance, "political," "legal," "bureaucratic," and "professional."

Several classifications are built on distinctions in the direction of accountability, such as "vertical," which can include "upward" accountability within a structured hierarchy as well as downward to citizens and customers, and "horizontal" and "outward," which refers to accountability to institutions or individual of roughly equal status. A "360-degree" accountability implies accountability in all directions: upward, outward, and horizontal. "Internal" versus "external" accountability can refer to the difference in *to whom* an organization is accountable, internal referring to those who exercise clear ownership or delegation rights while "external" refers to those who have no such rights but are nevertheless affected.

Typologies tend to be context dependent. For instance, writers on developmental politics and democratization have employed the contrast between "horizontal" and "vertical" accountability to stress the importance of having executive governments accountable (horizontally) to other coequal institutions, such as courts, legislatures, and auditors. Horizontal accountability has become equated with the rule of law and constitutional government, seen as prerequisites for successful representative democracy. In international politics, on the other hand, types of accountability identified in one influential study (hierarchical, supervisory, fiscal, legal, market, peer, and reputational) reflect the political realities of international relations and the absence of some of the more robust accountability mechanisms, such as elections and legal sanctions, available within nation-states.

In the public administration literature, the structure of accountability typologies tends to follow constitutional structure, with a sharp division between the approach in the United States and that in the parliamentary systems of the United Kingdom (UK); other Westminster systems such as Canada, Australia, and New Zealand; and Western Europe. In the United States, the separation of powers, along with federalism, makes bureaucrats independently accountable to a range of institutions, including the president, Congress, and the courts, forcing them to juggle between competing accountability demands. Analyses of accountability tend to stress the discretionary role of bureaucrats and the varied types of accountability forum—hierarchical, political, legal, and professional—in which they operate.

In parliamentary systems, by contrast, bureaucratic accountability centers on the hierarchical chain of accountability through ministers to parliament and the public, associated with the traditional conventions of ministerial responsibility and described variously as "parliamentary" or "political." To this have been added other, supplementary types, such as "legal," "judicial" (to cover accountability through courts and tribunals), or "managerial," referring specifically to the output-focused accountability emphasized in the NPM.

Not only do different typologies contain different sets and combinations of individual types of accountability but particular individual types also vary in meaning between different typologies. Political accountability, for instance, is sometimes confined to politicians and to processes involving politicians while at other times it refers, more broadly, to contestable outcomes involving non-elected officials as well as elected politicians. Legal and judicial accountability typically imply the processes of courts and the legal system. But they vary as to whether they are confined to the judicial branch of government or also include quasi-judicial tribunals or other executive-based institutions such as ombudsmen and freedom of information rules. Legal accountability has also been defined even more broadly to cover external monitoring for compliance with legally established rules, which therefore implies that legislatures scrutinizing compliance with their own legislation are engaging in legal accountability.

Finally, professional accountability also has no settled meaning. Sometimes it refers to the accountability that members of an expert profession owe to each other (peer accountability). For example, some professionals, such as doctors and lawyers, can be held to account by disciplinary bodies drawn from the profession itself. Less formally, members of a profession, including public servants, may be monitored and called to account through shared networks and collegial relationships. However, professional accountability has also been applied to the independent exercise of ethical norms of a particular profession, which have been internalized through socialization into the profession. In this case, professional accountability is being identified as a sense of professional responsibility, quite detached from any external scrutiny.

Mechanisms of Public Sector Accountability

The complex accountability structures surrounding modern governments involve a wide range of institutional mechanisms, which vary according to the section of government on which they focus (*who*?), the type of issue that they investigate (*for what*?), and the procedures they follow (*how*?).

Elections

In a representative democracy, the basic accountability mechanism is the general election at which incumbent executive leaders present themselves to the voters and seek a renewal of their mandate to govern. Elections compel elected politicians to explain and justify their actions and give the citizens the opportunity to listen and impose a verdict. Elections legitimize the control exercised by political leaders over the executive bureaucracy and thus underpin the accountability of agency heads to ministers and of junior officials to their superiors through the hierarchical chain of command. Though elections may be held at infrequent intervals, their indirect influence on government accountability is immense, through the threat of future of retribution imposed on unpopular governments.

Elections may be powerful but they are also blunt. Their effectiveness as accountability instruments can be compromised by their forward-looking function of selecting an incoming government. Voters may be deflected from sanctioning an unpopular government by the perception that the alternative leadership is even less palatable. Accountability is also denied where incumbent leaders do not stand for reelection (most notably in the case of second-term United States presidents). Moreover, because elections require a general judgment over a whole regime and its overall program, they do not allow for more fine-grained accountability on particular issues or decisions. Electioneering is dominated by general slogans and misleading rhetoric and does not offer much scope for accurate information or serious discussion.

Elections therefore need to be supplemented by a range of other accountability mechanisms and should not be seen as the sole instruments of democratic accountability, as is the tendency in theories of democracy built around the single act of voting and electoral choice. Conversely, regimes that lack elections, though undemocratic, may still offer citizens opportunities to hold their governments to account, for instance, through legal processes or complaints procedures.

Legislative Scrutiny

Between elections, the major institution of accountability is the legislature. Though primarily defined in terms of their lawmaking functions, modern legislatures have ceded much of their legislative initiative and discretion to the executive branch, especially in parliamentary democracies where the main legislative chamber is typically under the control of the ruling party. In compensation, legislatures have increasingly emphasized their accountability role as the main forum where the executive is required to answer to the public.

Legislatures hold executives to account through a variety of avenues. One is the requirement for regular reporting on executive activities. All government agencies and statutory officials are obliged to report periodically (usually annually) to the legislature on their general performance. Information provided to the legislature thereby enters the public realm and is available for general debate and discussion.

Legislatures also have the right to question members of the executive and subject them to public scrutiny. In Westminster-based democracies, conventions of ministerial responsibility require ministers to answer to parliament for the conduct of their departments, to provide information about decisions, and, where necessary, to impose remedies. Similar conventions exist in most parliamentary democracies where ministers are accountable to parliament. Ministerial responsibility has been a topic of perennial controversy, mainly because of a widespread but erroneous belief that it requires ministers to take personal responsibility for the actions of subordinates and resign when major mistakes are discovered to have been made within their departments. Such "sacrificial" resignation is rarely, if ever, undertaken and the doctrine of "vicarious" responsibility on which it is based (that ministers are personally responsible for the acts of subordinates) does not accord with practice. When ministers resign, they do so because of personal faults of their own making, such as misleading parliament or engaging in improper or corrupt conduct, and the decision is usually politically determined in terms of minimizing damage to the government's popularity.

Ministerial resignation is a side issue in assessing the role of ministers' responsibility in government accountability. Much more important, and the basis of the effectiveness of ministerial responsibility as an accountability mechanism, are the obligations it imposes on ministers to answer to the public on matters of public concern, either in parliament or directly through the media. Though ministers are not required to take personal responsibility for all actions of their subordinates, they must provide information and justification when asked. Refusal to respond publicly, which is common among leaders of private organizations, is politically unacceptable for elected politicians. At the same time, however, while avoiding outright deceit (which remains a strong ground for forced resignation), ministers can readily prevaricate and avoid disclosure of embarrassing information. Moreover, their monopoly of the right of public response can carry the corollary that departmental officials remain out of the public eye, which can shield them from legitimate public scrutiny.

To circumvent the problem of bureaucratic anonymity, legislatures also question public officials directly, usually through a system of legislative committees. The practice of committee scrutiny is most highly developed in the U.S. Congress, which, through the separation of powers, is an active partner in shaping government policy and has a legitimate interest in overseeing the whole conduct of government business. In parliamentary systems, the scope of questioning is somewhat more confined, exempting appointed officials from answering on issues of government policy, out of deference to the democratic mandate of the elected leaders. Even so, restricting questions to administrative matters for which officials are more immediately responsible still allows considerable opportunity for holding the bureaucracy to account.

Courts

All governments are subject to legal accountability through the courts because courts determine whether the government has acted within the law. The operation and effect of this power vary with a country's legal and constitutional structure. One contrast is between Anglo-American countries, where cases involving the government are heard in the same courts as civil cases, and some European countries, notably France, where a completely separate court structure is reserved for cases involving the state. Another contrast concerns the scope of judicial review. Where the constitution, as in the United States, defines and limits the powers of both Congress and the president, the courts become a forum for holding the government generally accountable across a wide range of substantial policy issues. On the other hand, in parliamentary democracies such as the UK, where few constitutional limits are placed on legislative power, opportunities for challenging policies through the courts are much more limited.

Most legal cases involving the government are brought by individual citizens and deal with particular decisions affecting them that have been made by government agencies. It is open to the court to rule whether a decision was taken within the powers legally conferred on the government agency; whether the citizen received natural justice, in terms of fair procedure and due process; and whether the decision itself was reasonable. Whether courts can decide on the actual substance and merits of a decision varies according to the provisions of the individual legal system. Some systems make use of quasi-judicial tribunals, which operate like courts though with a generally more relaxed approach to procedure and which, being technically part of the executive branch, are empowered to amend executive decisions.

Legal accountability, like litigation generally, suffers from being slow and expensive and is beyond the reach of most people for most issues. However, its availability as a last resort is crucial to the public's capacity to hold governments to account. Like the rule of law itself, of which it is a key element, accountability through an independent and honest judiciary is the foundation of all public accountability.

Auditors and Other Monitoring Agencies

Governments are overseen and investigated by a range of special-purpose accountability agencies. Of these agencies, the most long-standing are the offices of government auditors (variously described as "auditors general" and/or "comptrollers general"). Their traditional function has been the monitoring of government finances on behalf of the legislature to see whether public revenue and expenditure have been managed according to legislative authorization and according to standards of public probity and propriety. The historic function of "regularity auditing" for financial compliance has more recently been supplemented by "performance" ("value for money," "efficiency," "comprehensive") auditing that extends to assessing the efficiency and effectiveness of government programs. Performance audits usually take a program's objectives as given and then examine whether these objectives have been achieved and at what cost. In performance auditing, as distinct from regularity auditing, auditors typically lack any powers of sanction or rectification and can simply recommend changes and improvement.

In general, government auditors have proved essential in maintaining financial integrity in governments. Conversely, the absence of effective audit is a key indicator of weak and corrupt government systems. They have also been very successful in exposing bureaucratic waste and inefficiency. Even though they cannot mandate any remedies, the authority of their recommendations and the adverse publicity attached to the exposure of serious waste and inefficiency are often sufficient to prompt governments to follow their recommendations voluntarily.

Besides auditors, other investigating bodies include government inspectors and ombudsmen. Inspectors are officials established within particular government departments and agencies with the function of improving efficiency and effectiveness. Inspectors have been employed to monitor school and prison systems as well as government departments in areas such as taxation, defense, and security where bureaucratic performance is a matter of particular concern. The position of ombudsman, first introduced in Scandinavia, has been adopted worldwide as an avenue of complaint for individual citizens seeking redress in connection with particular decisions. Ombudsmen usually have the power to investigate and recommend but not to impose remedies. In spite of this limitation, however, they have proved an effective accountability mechanism midway between individual complaint and full legal proceedings.

Recent decades have witnessed an "audit explosion" as governments and government agencies become subject to increasing supervision by regulatory agencies. With the transfer of responsibility for providing public goods and services away from government departments under political direction to various forms of arm's-length providers, regulation has tended to replace political and bureaucratic direction as the means of making public service providers publicly accountable. A plethora of regulatory agencies now monitor different areas of public service provision, such as health and education, or different aspects of government activity, such as occupational health and safety or human rights. While most regulatory bodies are public bodies, some are privately established but have been granted legal powers—for instance, some consumers' associations and animal protection societies. Other private monitoring bodies have no legal mandate but operate more informally as observers and critics of government activities. These include a number of private international watchdogs, such as Greenpeace and Amnesty International and the financial ratings agencies, Standard and Poor's and Moody's, which have a great impact on economic policy because of the impact of their ratings decisions.

Freedom of Information and the Media

The public availability of information held by governments may be only the initial stage of a full accountability process and needs to be followed up by discussion and then, if necessary, by rectification. However, once such information is released into the public realm it can readily be used to spark a political reaction and force governments into remedies. Public access to government information is therefore an essential component of government accountability and is provided by a number of channels.

One such channel is the right of the general citizen to seek access to information, both personal information held about them as individual citizens and general information about government policy. Rights of freedom of information are found in most established democracies, with the United States having led the way and the UK being a reluctant latecomer. Certain exemptions usually apply, on grounds such as national security, cabinet confidentiality, commercial confidentiality, and protection of legal proceedings. Financial charges can also be imposed, especially on matters of general interest, with the result that information is generally sought by well-resourced journalists or by organized groups with political interests rather than by individual citizens.

The various media outlets, both print and electronic, also help spread information and stimulate debate. In part, their function is strictly intermediary, relaying to a wider public news items and arguments supplied by others. However, they also play an independent role in instigating inquiries and conducting investigations. Though, for the most part, privately owned and not formally part of the machinery of government, the media are essential to effective accountability in large-scale modern states. Indeed, a free press, along with elections and an independent judiciary, has been acknowledged as one of the key institutions in securing an accountable government.

Intra-Organizational Accountability

In addition to being externally accountable, government agencies, like all organizations, also exhibit internal structures of accountability whereby different members or sections are accountable to others within the organization. Indeed, from the perspective of individual officials, organizational accountability upward through the chain of bureaucratic command is often the most immediate and salient form of accountability in their daily activities. To assist in reinforcing upward accountability, organizations often impose their own in-house versions of independent scrutiny, such as internal audit or inspection, which mirrors and anticipates the financial monitoring of external auditors and inspectors.

Accountability of individual officials to their superiors is an essential element in the overall democratic accountability of executive government. If elected leaders are to be accountable for the actions of bureaucrats, then they must be able to rely on their bureaucrats' willingness to take direction and answer for their actions. Accountability upward is thus a corollary of control downward. Conversely, any slippage in control from above is typically reflected in lack of accountability upward.

Weakness in upward accountability may be symptomatic of the well-known propensity of bureaucrats to pursue their own policy agendas and apply their own judgment against the wishes of their superiors. It may also come from contrary accountability pressures. "Bottom-up" views of administration legitimate the direct accountability of street-level bureaucrats to their clients among the public and undermine the authority of organizational superiors. From this perspective, accountability through the "top-down" chain of bureaucratic command becomes an unwelcome constraint to be managed rather than a mandate to be respected. Bottom-up versions of accountability can claim their own democratic legitimacy through answerability directly to the members of the public rather than indirectly through the public's elected representatives.

Systems of Democratic Accountability

Democratic accountability can be viewed from various perspectives, from that of the citizen wishing to hold his or her government to account, from that of the elected politicians responding to the voters, or from that of the government official answering to political masters and to the public. Depending on one's position and interests, different accountability mechanisms claim the most attention. Politicians are focused primarily on elections and the media, whereas public servants are more concerned with accountability to superiors in the hierarchy. Citizens in strife with government agencies will be looking to grievance procedures and ombudsmen. In all cases, the structure of available accountability mechanisms appears complex and untidy, incapable of being reduced to tidy diagrams or flowcharts without oversimplification. Structures of accountability are inherently pluralistic and are better described as "webs," or possibly "systems," to indicate their complexity and fluidity.

The various accountability agencies and processes in webs of democratic accountability exhibit widely different functions. Some accountability processes, such as elections, focus on overall performance of government, while others, such as financial audit, concentrate on details of administration. Politicians and the media home in on politically controversial and sensational issues. Auditors and inspectors, by contrast, tend to deliberately steer clear of political controversy and instead concentrate on more humdrum areas of administration, which may appear dull but are often the site of major inefficiencies.

Some agencies, such as courts, exercise the full range of accountability functions, including information, discussion, and rectification, while others, such as the media, are limited to the transparency functions of information and discussion. It is for this reason that democratic accountability cannot be accurately represented by a chain of principal–agent relationships, given such relationships always imply the principal's right to impose sanctions. Standard structures of democratic accountability certainly involve account holders with the power to impose remedies and sanctions. This power may be located with a number of different actors. The basic right of rectification lies with citizens as voters who have the capacity to remove their elected representatives. But other public officers and institutions can also compel compliance on those accountable to them. Elected political leaders can direct their departments and agency heads in relation to their subordinates. Courts and tribunals can issue binding decisions.

However, not all agencies of accountability possess the power of rectification. Indeed, many of the most effective accountability agencies, including legislative committees, auditors, ombudsmen, and the media, can only investigate and recommend. Their effectiveness depends on their capacity to exert pressure on account holders with rectificatory powers, particularly executive leaders, to impose remedies in response to adverse publicity, backed by the ultimate electoral sanction. Democratic accountability can thus operate as an interlocking system with some institutions specializing in information and investigation while others are relied on for rectification. While there may be grounds for identifying elections as the defining accountability mechanism in representative democracies, they are far from being the only such mechanism.

A key factor in any web of accountability is whether each accountability agency charged with holding the government to account is itself publicly accountable for performing its accountability functions. Legislators, judges, auditors, ombudsmen, regulators, and so on need to be subjected to scrutiny themselves to prevent them from becoming lax or corrupt. Most officials in such scrutinizing positions are granted a degree of statutory autonomy to help them maintain an independent stance against the executive power that they must call to account. At the same time, however, this independence is itself open to abuse. Transparency, media scrutiny, and the ultimate power of arraignment and dismissal are essential buttresses of professional integrity. The guardians must be guarded.

Accountability in International Relations

Most analysis of government accountability has taken place within the context of nation-states, where the defining element of legal and political sovereignty provides a framework of effective sanctions to support other accountability mechanisms and where elections provide the people with the ultimate sanction. In the international sphere, however, the absence of effective sovereign power and elections raises the specter of an accountability vacuum. How can international organizations such as the United Nations (UN) or the World Bank be held accountable for serving the interests of the international community if that community is not capable of enforcing sanctions on them?

In practice, accountability in the international sphere, though weaker than in many nation-states, is far from nonexistent. In some areas such as trade policy and criminal behavior, international law can offer effective remedies backed up by the coercive power of nation-states. International organizations are subject to accountability mechanisms, such as audit, review, and media scrutiny, as well as being answerable to the national governments that underwrite them. The UN bureaucracy, though often incompetent and corrupt, can be exposed to detailed investigation, as over its handling of the Oil-for-Food Programme, and can be pressured to institute reforms. Rectification tends to be ineffective, because of the apathy and disunity among leading members of the Security Council, the body to which the bureaucracy is accountable. But, with more determination from member states, the accountability deficit could be significantly reduced. As it stands, the accountability deficit in the UN bureaucracy is probably no greater than that found in the national bureaucracies of most of the member states themselves.

The inherent contrast between accountability in nation-states and in the international arena should therefore not be overstated. Both are pluralistic in structure and involve a range of accountability mechanisms, many of which, such as the media and NGO (nongovernmental organization) watchdogs, operate at both levels. The significant lack of effective legal and political sanctions at the international level must be conceded. But so too must the potential for improved international accountability short of a united system of world government.

Single Versus Multiple Accountability

Should the duties of public accountability, whether for government as a whole or for particular government agencies, be concentrated in a single person or dispersed among a number of different people? The main argument for concentration lies in the value of having a designated person, usually the leader or agency head, who is obliged to take collective responsibility and to answer to the public, particularly in times of crisis or government failure. Where responsibility and accountability are dispersed between members of a group or between different agencies, officials and politicians can easily shift the blame to others, with the result that no one accepts an obligation to answer to the public. A single point of accountability, by contrast, makes buck passing much more difficult.

On the other hand, multiple avenue of accountability can provide the public with greater opportunities for extracting information from government and for holding government officials up to scrutiny. A leader exercising sole powers of accountability, while less open to buck passing, is better able to resist embarrassing inquiry into the actions of subordinates and to cover up mistakes. In practice, most collective actions involve the responsibility of many individuals ("the problem of many hands"), and the attempt to hold only one person responsible and accountable obscures the reality of how bureaucracies operate.

In general, multiple avenues of accountability appear superior for the initial stages of accountability, for revealing information, and for encouraging the scrutiny of government. Single points of accountability, however, are more effective for taking charge and imposing remedies. The differing U.S. and UK constitutions illustrate the contrast. The United States, with its separation of powers and multiple points of authority, provides a very open and transparent system of government but one where solutions are hard to impose. The United Kingdom, on the other hand, concentrates power in the prime minister and cabinet under tight conventions of ministerial responsibility, which have preserved executive secrecy but allowed effective rectification when problems come to light. A similar contrast can be found in the accountability of federal systems compared with that of unitary systems. Federations provide more avenues for inquiry but lack a single point of responsibility and are prone to blame shifting.

These dilemmas remain intractable. The best solution is to try to combine multiple avenues for scrutiny with a single authority for rectification, thus drawing on the virtues of each approach. Indeed, pluralistic democratic systems of accountability can be viewed in this light. Ideally, they combine many different, complementary mechanisms of scrutiny with a few clear points of unambiguous control and direction.

Accountability in Networks

"Networks" are an increasingly important feature of modern government posing particular problems of accountability. Networks may be understood as structures of collective action and decision making in which formally independent groups or individuals cooperate for shared purposes. They are commonly contrasted both with hierarchies, where the members are linked by formal control structures and in superior–subordinate relationships, and with markets, where self-interested parties are linked through formal agreements and contracts. Network members share the formal independence of market players while cooperating in shared values and objectives over a substantial period of time.

The concept of network has come to prominence in the analysis of modern systems of *governance* (to use a closely associated term) for various reasons. First, it signifies in part the long-standing aspects of all political systems, particularly the more informal cross-institutional relationships, which tended to be overlooked in more traditional institutional analysis and which now appear worthy of much more careful study. For instance, relationships between different levels of government, central and local, federal and state, have always relied heavily on informal partnerships and negotiation. Second, government systems are making more use of arms-length institutions, such as executive agencies and private organizations, for the delivery of public services. Relations between the purchasing government and the provider organizations are neither hierarchical nor market based but instead depend more on network characteristics of partnerships, trust, and agreed values.

Networks cause accountability problems because responsibility for collective action is shared between a number of different parties, giving rise to the classic buck passing associated with multiple accountability. Within the network itself, admittedly, relationships of trust and common interest may lead to mutual accountability and responsiveness. But for outsiders wishing to hold the network to account for its actions, the blurring of responsibility is problematic. Particularly when mistakes are made, interested members of the public are often unable to gain satisfactory answers because the various members of the network can shift the blame to each other.

Outsourcing of public services to stand-alone agencies has been bedeviled by accountability difficulties as politicians blame providers for performance failures and providers respond that the government has given them insufficient resources. The accountability deficit often increases if the providers are in the private sector and not accustomed to the level of public scrutiny applied to the public sector. Commercial contractors plead commercial confidentiality as a reason for concealing their internal operations and are often exempt from investigation by legislative committees or ombudsmen. Nonprofit organizations rely heavily on the conscientiousness of their staff, many of whom are volunteers, and are particularly reluctant to face demands for information and rectification.

Accountability and the New Public Management

The international public sector reform movement of the 1980s and 1990s, known as "the new public management," though primarily aimed at improving public sector efficiency and effectiveness, also included an accountability agenda. The movement's main assumption was that the public sector was less efficient than the commercial private sector and needed to move closer to private sector management methods. With respect to accountability, the most serious deficiency of the public sector compared with the commercial private sector is perceived to be its lack of clear objectives. Private companies have a clear and quantifiable "bottom line," the maximizing of shareholder value, which provides a clear focus for the performance and accountability of managers. Government agencies, by contrast, often have little sense of their objectives and lack clear criteria for judging the performance of officials and their agencies and for holding them to account.

Another deficiency noted in public sector accountability is bureaucrats' comparative lack of concern for serving the members of the public with whom they have direct dealings. In contrast to those offering goods and services for sale in a competitive market—who must focus on their customers' preferences—bureaucrats can exploit their monopoly position and remain largely unaccountable to the members of the public they are supposed to serve.

In other respects, however, the public sector is seen as laboring under excessive accountability burdens. For instance, lack of accountability for results is typically balanced by much more accountability for following set procedures than is found in the private sector. This accountability for process encourages red tape and discourages managerial initiative. At the same time, the managerial efficiency of public sector managers is also stifled by the constant threat of interference in their decisions by their political masters who are themselves responding to the accountability demands of the general public. Because political leaders can be held publicly accountable for any action taken by their departmental officials, the first imperative on all loyal bureaucrats is to save their masters from political embarrassment, even if organizational efficiency is compromised thereby.

The managerial accountability agenda of the NPM reformers therefore includes a number of interlocking strategies. First, objectives are to be clarified, and managers are to be held accountable in terms of achieving measurable outputs. Second, political accountability through elected political leaders is to be confined to the setting of broad objectives and outcomes, leaving responsibility and accountability for outputs with arms-length managers who are quarantined from day-to-day political interference and are accountable to independent regulators rather than to politicians. Third, service providers are to be made more directly accountable to individual citizens, viewed as clients or customers.

The reform agenda has had considerable impact on systems of bureaucratic accountability. Most government agencies now report performance in terms of objectives, including outcomes and outputs, and much effort has been directed toward designing performance measures, particularly in service agencies and in public health and education. The widespread decoupling of service provision from direct political control, through executive agencies and outsourcing, has raised the accountability profile of many agency heads and nongovernment service providers, while removing some internal organizational matters from, public scrutiny. The "audit explosion," signified by the creation of new monitoring and regulatory bodies, reflects the move away from political accountability to independent regulation. Moves toward greater client focus, including the service charter initiatives, pioneered in the UK, have done much to reorient frontline bureaucrats toward a more user-friendly service culture.

At the same time, however, traditional public sector accountability practices have proved much more resistant to change than the reformers had hoped, largely because of entrenched public expectations about accountability. The managerialist injunction to restrict the politicians' accountability for general objectives and to delegate accountability for implementation to agency heads and managers has proved politically unworkable. Members of the public and the media will not readily accept what they see as unjustifiable blame shifting from leaders to subordinates or contractors. Leaders become inevitably drawn into discussion of administrative details: making bureaucrats, correspondingly, remain highly sensitive to political direction. Private contractors become similarly adept at anticipating political pressures if they want their contracts renewed. Hopes that public servants would be less process driven have not been fulfilled. In particular, the continuing role of courts and quasi-judicial tribunals in reviewing administrative decisions has maintained a strong demand for due process. The public sector continues to be held to higher procedural standards through the principles of natural justice, which are jealously protected by the courts.

Accountability, Electoral

Electoral accountability is best interpreted as a three-phase process and a feedback. Political actors looking for election will first try to take into account the preferences of the voters. If elected, they will then keep into account what they have heard and learned during the electoral campaign. Returning to the voters, they will give an account of their behavior and their performance. Even those representatives who do not run again will retain some electoral accountability, because none of them would want to ruin the electoral chances of his or her party and successor.

Electoral accountability lies at the heart of all processes of democratic representation. It is a complex, multilayered phenomenon entailing three quite distinct, though interrelated, phases and several individual and collective actors. It is significantly affected and, in some ways, shaped by the electoral system and, more generally, by the institutional arrangements.

Accountability During the Electoral Campaign

Electoral accountability begins when a relationship is established between the voters and their potential representatives, candidates, and parties. During the electoral campaign, the candidates and the parties have an interest in getting to know what the voters need and want, which preferences and values they have, and which ideals they would promote. In this phase, accountability manifests itself as the most conscious effort by candidates and parties to learn, that is, to *take into account* what the voters communicate to them. Obviously, there are two limits to this process. First, the voters may not have a very precise idea about their preferences and interests and may not know exactly how to communicate them to the candidates and the parties. Second, the candidates and the parties may discount the preferences and the values of some or several groups of voters or may be unable to introduce them into their predisposed programmatic package and, to a much lesser extent, to their ideological views. On the whole, however, an effort will certainly be made by them to take into account what they have heard and have come to know.

Usually, a difference is drawn between a proportional electoral system used in relatively large constituencies with no possibility of casting a preference vote and plurality-majority electoral systems applied in single-member constituencies. Understandably, in the first case, much or most of the electoral accountability depends on the ability and the willingness of the political parties to take into account what they have heard during the electoral campaign, and much of the electoral accountability will then be projected to the national level. When plurality-majority systems operate in single-member constituencies, individual candidates are the protagonists of electoral accountability (Bruce Cain, John Ferejohn, & Morris Fiorina, 1987). It is up to them to interact with the voters, to learn as well as to explain, to take into account what they have been communicated by the voters, and also to carry that knowledge into the representative assembly. The candidates' ability to learn about the preferences of the voters and to shape them may make a difference in the outcome of the electoral processes and, possibly, in the type of politics and policies proposed and later implemented by their party or governmental coalition.

Accountability in the Implementation of Policies

Electoral accountability does not end with the holding of the elections and their outcomes. Once installed inside the representative assembly at any level of the political system, elected representatives and their parties must try to translate their proposals into policies. Again, there is a difference in the approach taken by representatives elected through a proportional system in large constituencies, even more so when there is no preference vote, and representatives elected in single-member constituencies through a plurality-majority electoral system. In the first case, party leaders will decide which policies to implement, usually claiming to have received a mandate and remaining somewhat indifferent to positions articulated by their individual representatives. Party leaders will *keep into account* what they believe has been the response of the voters to their overall programmatic offer. As to representatives elected in single-member constituencies, no doubt quite a number of them will certainly support their party's policies. However, not a small number of those elected representatives will indeed attempt to introduce into the political discourse and the policy debate what they have learned from the/their voters. In addition to some general preferences and interests expressed by their voters and largely compatible with their party's program/manifesto, elected representatives will seriously attempt to keep into account specific preferences and interests concerning their single-member constituencies and their voters, or all of them. Indeed, the working of a specific representative assembly will be significantly affected by the degree of political discretionality and electoral power of its individual members, especially those elected in single-member constituencies (Heinz Eulau, 1986).

Accountability and Reelection

Neither political debates nor electoral accountability comes to an end in a representative assembly. All party leaders and elected representatives, governmental office holders, and oppositionists are fully aware that public opinion has its (more or less open and informed) eyes on them, that it scrutinizes their behavior, its conformity to the promises and the programs, and its consequences. One way or another, all the protagonists, voters included, know perfectly well that in democratic regimes the voters will periodically pass judgment on the policies that they have approved or opposed and on their behavior while in office. Hence, when the time comes for new elections, elected representatives and party leaders cannot escape from performing another task fully belonging to accountability. They will have to explain to the voters what they have done, not done, or poorly done. They will be obliged to *give an account* of their performance in their roles. It is of decisive importance that elected representatives and party leaders accept full responsibility for their performance or lack of it. Indeed, often, but inadequately, electoral accountability is considered mechanically limited only to this specific phase: reward (reelection) and punishment (defeat). No doubt, depending on the strength and the independence of the mass media and on the degree of vibrancy and robustness of civil society, the politicians in office aiming at reacquiring their positions will be held accountable. Technically, the process through which representatives and party leaders launch their reelection bid is called feedback. It introduces old and new issues, renewing the circuit of accountability that depends on what was done and has to be reformed, and what was set aside but must be taken again into account.

Seen from this perspective—that is, focused on the activities, the perceptions, the performance of parties as well as individual representatives—electoral accountability is a never-ending game. However, it is true that from time to time individual representatives do voluntarily retire. It is also true that in some political systems for some political offices, there are term limits that oblige those office holders to exit from politics. One may conjecture that "lame duck" politicians will feel less inclined to take electoral accountability into account in their behavior. They will not be asked by the voters to explain their behavior. Hence, at least in theory, they will run few risks if and when they behave in an irresponsible way. What is missing in all the statements concerning the potential irresponsibility of office holders who are not constrained by the imperatives of reelection is the relationship between those representatives and their corresponding parties. Though there is no specific research on the motivations of the outgoing representatives or on the ability of party leaders to enforce on them the "ethics" of accountability, it does not seem farfetched to suggest that something of the kind is and always has been at work in most cases. That is, practically no outgoing representative has deliberately chosen to behave in an indifferent manner—more precisely, not caring at all about the relationship between his or her promises and his or her behavior, thus negatively affecting the chances of election of his or her party's candidates.

Accountability in Proportional Versus Majoritarian Electoral Systems

A larger issue looms with regard to electoral accountability, though to be more precise, perhaps one ought to speak of political representation. Though the comparative study by G. Bingham Powell (2000) is excellent, unfortunately it does not tackle the various processes, phases, and interpretations of electoral accountability. Rather, it refers to what kind of representation is overall provided by proportional systems (in which a party's share of seats is determined by its share of votes) versus majoritarian electoral systems (in which a candidate must win a plurality or an absolute majority of votes to be elected). Assemblies elected through proportional electoral systems and coalition governments may provide for the representation of a wider spectrum of opinions, interests, and preferences. Using the terminology above, they have the possibility of taking into account a greater number of opinions, interests, and preferences in the first phase of the electoral process. Statically, they may almost come to "mirror" them. Not much is learned, however, when it comes to the phase in which those opinions, interests, and preferences will have to be kept into account. The representatives of the various parties and their leaders will attempt to have their way, and the ensuing bargaining process does not at all guarantee better accountability, in terms of transparent and responsible processes of decision making. Also, when returning to the voters to give them an account of what has been done or not done, it is likely that the politics of *buck passing* will defeat the politics of personal and party accountability. It is also likely that some representatives and several party leaders might enact the politics of *outbidding* if they believe that they will not be asked to take on governing duties.

On the contrary, in single-member constituencies and in one-party governments, one can legitimately hypothesize that two likely processes will be at work. All representatives elected in single-member constituencies will feel the need to avoid relying exclusively on their "initial" voters. Some of those voters will inevitably be dissatisfied with the performance of their specific representative. Thus, the representative will attempt to increase the number of his or her voters by taking into account a larger set of preferences and by keeping them into account in his or her representational and governing activities in order to be reelected. A similar process will take place where there is single-party government. In their governing activities, all one-party governments are bound to lose some of their initial supporters. Hence, party leaders will launch their representational net beyond the initial borders of their electoral consensus. By so doing, they will attempt to take into account more interests, more preferences, and more opinions than simply those of the people who had voted their party into office. The process of widening the perimeter of their support seems much more difficult for representatives elected on party lines and for multiparty governments. Each party representative will have to toe the party line lest he or she jeopardizes his or her reselection. Hence, they will all stick to a static interpretation of their accountability: taking and keeping into account exclusively what was learned and promised through party channels. No party belonging to the governmental coalition will be likely to afford looking for additional outside support lest the political jealousy and envy of the other parties making up the governmental coalition lead to its breakup.

All these, admittedly, though indispensably, hypothetical, considerations are not necessarily meant to prove that majoritarian electoral systems applied in single-member constituencies are absolutely preferable to proportional electoral systems from the point of view of accountability, not the reverse. What they suggest is that no final conclusion concerning the superiority of proportional systems in terms of accountability seems justified. Only empirical research done countrywide and based on different electoral systems will offer sufficient and satisfactory material to understand and assess the quantity and quality of electoral accountability.

Accountability, Interinstitutional

Interinstitutional accountability is a form of horizontal accountability in which the different institutions provide a check on one another's behavior. The legislature is supposed to check the actions of the executive branch of government. The judiciary, especially constitutional courts, oversees the behavior of governing and representative institutions. Independent authorities—that is, all those agencies with power of oversight on specifically relevant aspects, such as central banks, regulatory agencies, and ombudspersons, or those authorities who oversee the regulation of media and communication or of competition—indirectly check the government and can be controlled by it in their actual working. Party government remains the best "mechanism" for interinstitutional accountability when party appointees and party representatives are accountable horizontally to their leaders and vertically to the voters.

This entry first discusses the definition of interinstitutional accountability and its evolution in Europe and the United States. It then considers ways in which such accountability has been expanded in recent decades to include the roles of institutions such as central banks, regulatory agencies, and ombudspersons.

The Nature of Interinstitutional Accountability

Institutions may be accountable vertically and horizontally. *Vertical* accountability, that is, electoral accountability, exists when institutions are exposed to the control of the voters and the citizens. Technically, the voters and the citizens are the principals and the institutions are the agents.

The citizen/voters delegate some representatives in institutions such as government and parliament to perform some tasks. They retain the capacity and the power to reward or punish a government and/or a parliament/congress. In this situation, vertical accountability is said to be at work. This type of accountability is the hallmark of democratic regimes. Where vertical accountability does not exist, there is no democracy, though, of course, a democratic regime requires and provides much more than just "vertical accountability." On the other hand, *horizontal* accountability is a relationship established among institutions: the executive, the legislative (parliament or congress), the bureaucracy, the military organization, the judiciary, and independent authorities. It occurs when the various institutions in different ways are in a position to control the activities of another specific institution. This type of control can be reciprocal and balanced, one-sided and skewed, formal and informal, accompanied by predefined sanctions, or largely symbolic.

Notwithstanding their often very significant differences, all these relationships can be legitimately assigned to the area of what is called "interinstitutional accountability." In a way, horizontal-interinstitutional accountability is a much more complex relationship to be studied, first of all, because it is not dyadic (voters–leaders) and may entail the activities of more than two institutions. Second, not only is it less transparent than any electoral process, but it is also less streamlined. Interinstitutional accountability is also made more complicated by the sheer fact that it is the product of a fair amount of reciprocal interaction and mutual influence. For this reason, its full understanding requires a profound knowledge of the dynamics of the entire political-institutional system. Finally, the study of horizontal-interinstitutional accountability is also more likely to be influenced by the values of the scholars, who may prefer the stability to the instability of the policy process and the concentration of political decision-making power to its diffusion, or, more rarely, vice versa. In different periods of time, some of these preferences, and values, advocated and shared by scholars and power holders, have been translated into concrete institutional arrangements. Indeed, a short exploration of selected constitutional outcomes is a good introduction to the analysis of interinstitutional accountability.

According to Aristotle, mixed regimes are the preferred form of government. If one political actor prevails over all the others, it results in tyranny. If few actors prevail over all the others, the regime is an oligarchy. When many actors have unbridled power, the regime runs the risk of degenerating into what Aristotle called democracy, the positive definition of a well-functioning and balanced regime being *politeia*. When power is highly concentrated in the hands of just one, a few, or many actors, it is impossible to control the exercise of that power and to impose accountability on the power holders. On the contrary, when it became possible to allocate power to different institutions, through the appearance, for instance, of constitutional monarchies, the seeds of interinstitutional accountability were sown.

Evolution of Interinstitutional Accountability

Most scholars would concur that the famous book by Charles-Louis de Secondat, Baron de La Brède et de Montesquieu, *De l'esprit des lois* (1748), represents the first attempt to suggest the division of institutional power, though not yet the creation of mechanisms capable of producing interinstitutional accountability. At the time, the problem to be solved was how to take away from the king the power to legislate and the power to adjudicate and give them to two specialized institutions: parliament and the judiciary. In practice, the king retained some legislative and judicial powers, but the very existence of two institutions enjoying most of those powers meant the first appearance of some relatively simple tripartite interinstitutional accountability. The separation of institutional powers created a situation in which different institutions were in a position to control each other, giving birth to the circuit of accountability among the three most important institutions.

The next, highly significant and quite deliberate, attempt to construct a web of interinstitutional accountability—the drafting of the Constitution of the Republic of the United States of America—constituted a response to practical problems more than a full-blown theoretical formulation. In all likelihood, James Madison and Alexander Hamilton thought that they were going to substantially imitate the institutional edifice existing in Great Britain. But they were also aware of the need to decisively innovate and improve on it. Montesquieu had fundamentally aimed at subtracting the legislative and the judicial power from the executive power (the king). The three powers could then act autonomously and independently, giving birth to a situation of positive institutional pluralism. However, neither autonomy nor independence was in itself leading to interinstitutional accountability. On the contrary, in Montesquieu's view, the institutional *separation* of the three "powers" was positive in itself. It was on the other side of the English Channel that a somewhat different interinstitutional formula made its appearance: "the king in parliament," meaning a close relationship and some reciprocal accountability between the chief executive and the representative assembly. The king could prevent parliament from passing undesired laws, and in its turn, parliament could oppose bills and, above all, taxes desired by the king. The product of a prolonged and even bloody confrontation, this apparently healthy situation represented a most prominent instance of "checks and balances."

At the time the U.S. Founding Fathers were drafting, defending, and promoting their constitutional package, Madison and Hamilton shared the view that in the English case one could find some separation of the institutions combined with some interaction among them. Both of them, but especially Madison, argued that the separation of the institutions was a good formula to prevent the accumulation and concentration of power in one specific institution. Though Hamilton wanted more power to be given to the presidency, in the end Congress, being more representative of the American people, received more and more important powers. And the U.S. political system parted forever from the institutional architecture of the British constitutional monarchy.

Great Britain

The development of the political and institutional dynamics of Britain led to the *fusion of powers*, the secret of the English Constitution's efficiency, according to Walter Bagehot (1867). That is, the relationship between the English cabinet and parliament is clearly skewed in favor of the prime minister, who obtains and retains his or her office because he or she is the leader of the parliamentary party that owns the absolute majority of seats. As Max Weber correctly wrote, the English prime minister is "the dictator of the parliamentary battle field." Hence, the separation does not run neatly between the prime minister with the cabinet and the parliament, between 10 Downing Street and Westminster, but between the prime minister together with his or her parliamentary majority and the opposition led by its shadow government. In a way, Winston Churchill was wrong: It is not parliament that is fully sovereign and omnipotent, but the parliamentary majority led by its prime minister. As a consequence, the English cabinet is accountable not to parliament as such but above all to its own parliamentary majority. The relationship of accountability does not occur between, on one side, government and, on the other, parliament, but between the governmental majority and the opposition. Still, under some exceptional circumstances, when party discipline breaks down, parliament may and will revive the circuit of interinstitutional accountability with Her Majesty's government. A similar situation holds in those parliamentary democracies that have imported the British model, for example, Australia, Canada, and, until 1993, New Zealand, plus some former British colonies in the Caribbean and Africa. In all these cases, an effective two-party system seems to be the necessary condition for interinstitutional accountability following the English style.

United States

Notwithstanding the oscillations between congressional government and the Imperial presidency, the definition that best characterizes the functioning of the U.S. political system was formulated by Richard Neustadt (1960): "separate institutions sharing powers." This widely accepted interpretation depicts a reality that is quite different from, one might even say almost the opposite of, the English institutional arrangement. In the United States, the executive and the legislative powers, the president and Congress, are the product of distinct electoral processes. The president does not have the power to dissolve Congress, while Congress cannot dismiss the president except through the very extraordinary procedure of impeachment, which, incidentally, does represent an extreme instance of interinstitutional accountability. Congress and the president are obliged to live and work together lest a paralysis of the political system follows. They are both endowed with quite powerful instruments to check their respective activities and behavior that, in some exceptional instances, for example, when they disagree on the federal budget, may lead to decision-making paralysis or a stalemate.

Including the judiciary, especially, the Supreme Court, in the overall framework, the situation of "separate institutions sharing powers" is complete. The president holds the power to appoint the justices (as well as several other federal judges), but the Senate retains the power to reject those appointments ("advice and consent"). The Senate has even the power to block the appointment of all the secretaries nominated by the president. In both instances, interinstitutional accountability may also be at work in a rather subtle way: deterrence and anticipated reactions. Fearing the opposition of the Senate, the president will avoid nominating someone who is likely to be rejected. On its part, the Senate will refrain from challenging the president on all nominations. Once appointed, the Supreme Court justices will hold office for life, which allows them to behave with absolute freedom, not being subject to any kind of retaliation. In a way, their accountability stops, but they are in a position to impose a lot of accountability both on Congress and on the president. The members of the European constitutional courts are not appointed for life but for fixed terms. Many of them have a career of their own after their experience in the constitutional court. It is not rare for them, as in the case of Italy, to position themselves, in some cases at the expense of interinstitutional accountability, to obtain other offices.

As to the interinstitutional accountability occurring between the U.S. president and Congress, though Congress enjoys the power to initiate legislation, it is exposed to presidential vetoes, which are often threatened and applied and which, for want of a three-fifth majority, are rarely overridden. A president's agenda can generally be achieved only in those infrequent cases in which the president's party has majorities in both branches of Congress that are solid and disciplined. Even the formation of the presidential team of secretaries, the so-called administration, needs the approval of—that is, confirmation by—the Senate. All these complex processes justify Neustadt's definition and evaluation. Indeed, U.S. institutions, though separate, share powers and compete for the exercise of those powers, making space for many opportunities of interinstitutional accountability. This is even truer when the president's party does not have a majority in one or both branches of Congress. A *divided government* may entail not just more interinstitutional accountability but also political and institutional confusion, stalemate in decision making, and pork barrel policies. It is not at all farfetched to hypothesize that confusion in the interinstitutional accountability process will negatively affect the possibility of vertical accountability as well. A number of principals (the citizen-voters) will find it difficult to identify which agents (the president or the members of Congress) to punish or reward. At this point, a classic institutional problem emerges: How much are we willing to sacrifice in terms of decision-making efficacy in order to obtain and maintain democratic control?

France

The quite different institutional arrangement of the Fifth French Republic, and more generally of semipresidential systems, entails different consequences in terms of interinstitutional accountability. In the French case, interinstitutional accountability is a more complicated phenomenon because it depends also on the changing allocation of political power between the president and the Assemblée Nationale (and, eventually, the leader of its parliamentary majority). Reacting against the institutional weakness of the Fourth Republic, Charles De Gaulle favored the concentration of much power in the hands of the president and the president's government. Semipresidentialism was meant to give more, and, in a way, "shielded" power to the chief executive, in order to endow the chief executive with a lot of (popular) legitimacy, certainly not to establish a circuit of interinstitutional accountability. De Gaulle never envisaged the likelihood of *cohabitation*, that is, of a president having to live with a party of the opposite political alignment that has the parliamentary majority and a prime minister who belongs to that party. Cohabitation introduces a significant amount of interinstitutional accountability, though at a price. Unlike the U.S. president (and all chief executives in presidential systems), the French president has the option of dissolving parliament in the hope that the voters will return the majority he or she likes. The president can dissolve parliament only after it has been in office for at least a year. However, no president can risk tarnishing his or her image by having the party with the opposite political alignment repeatedly returned by the voters. Hence, the network of interinstitutional accountability is enriched by the "interference" or the calling of the voters into the picture rather than by staying within the limits of interinstitutional relationships. A prime minister who belongs to a political alignment opposed to the president will avoid deliberately challenging the president, because such a move would risk the early dissolution of a parliament in which the prime minister's party is in the majority. This potential for the dissolution of parliament thus obliges both the president and the prime minister to behave accountably and, on the whole, predictably. Though both may engage in *buck passing*, the citizen-voters are in a position to evaluate specific responsibilities and to punish either the president for exaggeratedly interfering or the prime minister and his or her majority for their (lack of) performance. Finally, there is another important structure enforcing some interinstitutional accountability: the Constitutional Council, which can be activated by just 10% of the members of the Assemblée Nationale to challenge the bills approved by the majority.

Germany

All parliamentary governments are built on more or less complex and explicit webs of interinstitutional accountability. All governments must have and maintain a relationship of confidence with parliament, otherwise they will be replaced more or less smoothly. The German constructive vote of no confidence represents a specific mechanism of this type of accountability. A parliament that is unable to support its government or unwilling to enact its policies can be dissolved either by the head of the government or by the head of the state following a request by the head of the government.

German constitution makers also wanted to prevent the concentration of power. The semifederal system, based on the autonomy of the *Länder*, was the answer, especially strengthened by the many and important legislative and representative powers given to the second chamber: the *Bundesrat*. Though not involved in the procedure of voting confidence in the chancellor and withdrawing it, the Bundesrat is an important actor in the circuit of interinstitutional accountability. It has significant powers in all legislation concerning even marginally the policies considered in the domain of the Länder. Its power to prevent the passing of legislation approved by the *Bundestag* compels this assembly to be accountable. More generally, all types of federalism and all forms of political and administrative decentralization translate themselves into some interinstitutional accountability between the federal government and local governments.

Emerging Roles of Other Agents of Accountability

When speaking of interinstitutional accountability one must consider another, relatively recent phenomenon that identifies other authorities and agencies that can be instruments of accountability, such as central banks, regulatory agencies, and ombudspersons.

First, many countries have granted full independence to their central banks. The U.S. Federal Reserve has enjoyed such independence for some time, while the British Central Bank acquired it in 1997. With several other countries following suit, this trend means that one can find many instances in which interinstitutional accountability between the treasury and the central banks is at work.

Second, several countries have created independent authorities and agencies charged with tasks once performed by the executive or, at least, supposed to be in its domain or that of the legislature. In the second case, these agencies may complement legislative oversight. Examples are agencies that address areas such as consumer protection, food and drug safety, communications, and privacy issues raised by the news media; enforce regulations intended to ensure a competitive market; and oversee evolving energy technologies. In many cases, those agencies and authorities, whose chairs and boards are appointed either by government or by parliament, report directly to parliament.

Finally, in many countries and even in the European Union (EU) there is an ombudsperson who deals with the complaints of the citizens against their state and its bureaucracy as well as the very decisions of the institutions of the EU itself. Also, within the EU, interinstitutional accountability is present in its complex circuit going from the European Council to the European Commission to the European Parliament, but it also plays a role in the relationships between the institutions of the EU and the member states.

It is unclear whether the proliferation of authorities and agencies has actually improved the working and quality of interinstitutional accountability. When dealing with complex processes whose components, antecedents, and consequences are not and cannot be crystal clear, no attempt at evaluation is bound to be satisfactory. One may want to point to the perils of too dense and wide a network of interinstitutional accountability. The first peril has certainly to do with the (im)precise definition of the spheres of action of several institutions. In too many instances, tensions and conflicts may appear between the executive and the legislative, between the federal government and local governments, or, quite often, between the executive and the judiciary. It will then be the constitutional court that decides where the respective spheres of action begin and, above all, end. But there will always remain a gray area. Some institutional actors will try to take advantage of this gray area and engage in the politics of buck passing, that is, attempting to put the blame for what is done, not done, or poorly done on other institutions. In addition to tensions and conflicts, confusion will follow. The perils of interinstitutional accountability will affect the democratic framework itself. Though by definition the citizens are not directly involved in this kind of accountability, still they are more or less informed spectators who can look at what goes on and who can form their own opinion. Not being directly in the position to provide rewards or punishments, they are likely to reach a negative judgment on all the institutions involved in this exercise of political and bureaucratic buck passing. If and when all the institutions are considered equally responsible for the conflict and for the confusion, some political apathy or even alienation cannot be written off.

Technically, the mass media are not considered to be fully a component of the network of interinstitutional accountability. Nevertheless, they are often called the fourth power. But are they accountable to other institutions? Leaving aside their somewhat peculiar accountability to their readers and public opinion at large, at the most the mass media are accountable to the law, hence indirectly to the judiciary. They do play a political role that most certainly affects the way interinstitutional accountability is performed and evaluated, but the mass media themselves are external to that circuit.

Conclusion

In sum, there is a vibrant paradox in all discussions of interinstitutional accountability. Most scholars have maintained that this kind of accountability is quite positive for the working of democratic regimes. It seems to be less positive for the power of the people. Political power should not be concentrated but distributed among several institutions and shared by them. Checks and balances must be devised in such a way as to put a limit on the exercise of power by all institutions. Some activities are so important that they have to be controlled by special bodies: independent authorities and agencies. Recently, doubts have been raised concerning not only the effectiveness of interinstitutional accountability but also, inevitably, whether a dense network of interinstitutional accountability may in practice conspicuously trim all the occurrences of political accountability in which the citizens are the principals. When accountability escapes evaluation by the citizens because some policy areas are insulated and not exposed to their control, the quality of democracy may significantly suffer. Some nostalgia has made its appearance for the period and the situations in which the *party government* and a partisan opposition faced each other in a visible and transparent competition decided by the voters. There is more than a kernel of truth in the statement that such competition in contexts in which governing parties do not delegate power to outside agencies and authorities does provide for better accountability. When the parties in government are many, the voters will still encounter problems in their attempt to punish and reward their "agents." But most of the time it will be clear that parties and their leaders are accountable for the positive and negative functioning of the governing, representative, and bureaucratic institutions.

The extension of instances of interinstitutional accountability may have been fueled and nourished by distrust toward parties and party politicians. It may have had as a goal the containment and the reduction of party power. But in many cases, politicians seem to have reacquired their power working within and through the institutions, thus avoiding electoral accountability. When necessary, party leaders have learned to practice and implement a shrewd politics of appointments of loyal, even subservient, collaborators, in all nongovernmental bodies and agencies, guiding them to enact unpopular policies. The proliferation of institutions endowed with some decision-making power in technical areas or with the power to check the activities of other institutions has seemed to some a democratic conquest, to others an expropriation of the voters. Most of the time, it is still party politicians who control the exercise of political power by and within the institutions, while it is appointed technocrats and career bureaucrats who come to bear the brunt of the blame in the interinstitutional web of accountability. Not all that glitters is gold (democratic) in the circuit of interinstitutional accountability.

ADMINISTRATION

Governments in many Western countries decided in the 1980s that traditional administration was no longer up to the task of modern government. They looked to the private sector to define a new management approach. Management introduces a new vocabulary, mindset, and culture to government bureaucracies. The purpose is to force the hand of bureaucrats to become more dynamic and better managers. A debate has raged in the political science and public administration literature on the merits of the new public management (NPM) in relation to traditional public administration for the past 25 years. A number of politicians in the 1980s decided that the machinery of government was in an urgent need of repair. The old ways were no longer up to the task, and they packaged a series of reform measures that in time would become known as NPM. Proponents of NPM deliberately set high standards with goals to "reinvent government," "get government right," and designate those that would "steer" government from those that would be doing the "rowing."

The word *management* in NPM implies a decisiveness, a bias for action, and a dynamic mindset. Traditional public administration, meanwhile, conjures up images of rules, regulations, and lethargic decision-making processes. Presidents and prime ministers who came to power in the 1980s concluded that the problem was with bureaucracy, not political institutions. They accused bureaucracy of being bloated, expensive, unresponsive, a creation of routine deliberately resistant to change, and essentially incapable of dealing with new challenges.

It is one thing to diagnose the patient, but it is quite another to come up with the remedy. Initially, at least, political leaders were left to try this or that to see what would work with varying degrees of success. In time, a new approach, anchored in private sector management practices, began to take shape and a label was attached to it—NPM.

The goal was nothing short of introducing a new culture in government departments and agencies. The old culture was found wanting on many fronts. It attached too much importance to due process, prudence, probity, and centrally prescribed administrative rules and regulations. It also encouraged senior civil servants to focus on policy issues rather than on management. The old culture, associated with traditional public administration, was considered not only outdated but also counterproductive. Public administration became synonymous with the old culture.

NPM would introduce a new vocabulary, a new way of thinking, and a new culture. It would also give rise to a proliferation of management techniques to force government operations to become more efficient. The purpose was to force the hand of senior government officials to become better managers and to learn to make tough management decisions. Taken at face value, the political rhetoric that accompanied the arrival of NPM to government meant setting the civil service at its own throat.

The Canadian government published a report (see Table 1) designed to contrast the old culture (public administration) with the new culture (NPM).

NPM holds important advantages for politicians. In forcing the hand of senior civil servants to become better managers, politicians would gain the upper hand in shaping policy initiatives. The thinking was that civil servants had too much influence on policy at the expense of politicians. The message from politicians to senior civil servants could not be clearer under NPM—you worry about managing government operations better, and we will worry about setting policy priorities.

Table 1 Old Culture (Traditional Public Administration) Versus New Culture (New Public Management)

Old Culture	*New Culture*
Controlling	Empowering
Rigid	Flexible
Suspicious	Trusting
Administrative	Managerial
Secret	Open
Power based	Task based
Input/process oriented	Results oriented
Preprogrammed and repetitive	Capable of purposeful action
Risk averse	Willing to take intelligent risks
Mandatory	Optional
Communicating poorly	Communicating well
Centralized	Decentralized
Uniform	Diverse
Stifling creativity	Encouraging innovation
Reactive	Proactive

How then would civil servants become better managers? NPM encompasses a number of broad strategies to promote cultural change in government: decentralization of decision making, empowerment, a reduction on controls on managers, more flexible organizational structures, upgrading the skills of government managers, and a stronger sense of service to the public. Government departments and agencies were also encouraged to launch review exercises to identify "useless" red tape and "delayer" management levels.

In time, NPM became the fashion in much of the Western world. Margaret Thatcher in the United Kingdom (UK) showed the way with numerous measures designed to overhaul government operations. She cut the size of the civil service (from 733,000 strong to 569,000), restructured government operations by creating executive agencies and gave them a narrow mandate to deliver public services, privatized state corporations, delegated more authority to frontline managers, and overhauled the government's financial management system. This and other private sector management–inspired measures gave life to NPM in the UK. Before long, Australia, New Zealand, the United States, and Canada, among others, also introduced numerous NPM-type measures with varying degrees of success. Countries that did not pursue NPM with any enthusiasm, such as France, were regarded as being out of step with modern management strategies.

The contrast between the old (public administration) and the new (NPM) is striking and instructive. However, it probably came as a surprise for retired civil servants to discover that their culture was "rigid" and gave rise to "suspicious" and "secretive" behavior, which in turn served to "stifle creativity," which led them to "communicate poorly."

Old cultures die hard, if they die at all. NPM has met some successes but also failures. Graham Allison (1987) went to the heart of the matter when he wrote,

> The perception that government performance lags behind private business performance is

> correct. But the notion that there is any significant body of private management practices and skills that can be transferred directly to public management tasks in a way that produces significant improvements is wrong. (p. 525)

The sharp differences between the public and private sectors make it difficult for a number of NPM measures. The public sector does not have a clear bottom line and has legislative requirements of reviewing the work of government managers. Indeed, public sector managers depend on political bodies both for their authority and for their budgets, and they are subject to far greater public scrutiny of their actions. They are directly accountable to their political masters, and no matter what form of government organization is in place it can only enjoy legitimacy through the political process. Although it can take various forms, governments must have an accountability process to make the exercise of power responsible. This speaks of the merits of traditional public administration.

Traditional public administration has shortcomings, but it is directly tied to national political institutions and their accountability requirements. Hierarchy, command and control, and centrally prescribed rules and regulations enable political leaders to reach down to all departments and agencies and determine who did what and why things went wrong.

NPM had to compensate somehow for its call to empower managers, to flatten organizations, and to import numerous private sector management practices to government. An emphasis on measuring performance became another defining characteristic of NPM. Nothing is left in government that is not up for measurement from the performance of senior civil servants to program activities in all sectors whether economic or social. The thinking is that establishing performance standards will provide for more effective accountability and also enable both politicians and citizens to see how well civil servants and programs perform.

The demand for information to fuel performance measurement and evaluation initiatives by central agency and senior departmental officials has increased substantially in recent years throughout the Western world. It seems that everything in government now needs to be measured to have any standing in the expenditure budget process. This squares with NPM's emphasis on outputs, on good management, and on evaluating how well individual civil servants and programs perform. This too is in contrast to traditional public administration with its emphasis on controlling input costs and holding civil servants accountable for their administrative decisions.

Proponents of traditional public administration insist that politics and the public sector do not lend themselves to big answers. Public administration operates in a political environment that is always on the lookout for "errors" and that exhibits an extremely low tolerance for mistakes. The attention of the national media and political opponents are sufficient to explain why civil servants are cautious and why they strive to operate in an error-free environment. One would have to let the imagination run wild to visualize a headline in the media applauding the fine work of "empowered" civil servants. Supporters of traditional public administration insist that it is unwise to think that one can import private sector management strategies to government. They point out that in business it does not much matter if you get it wrong 10% of the time as long as you turn a profit at the end of the year. In government, it does not much matter if you get it right 90% of the time because the focus will be on the 10% of the time you get it wrong.

In the end, the debate that truly matters between the two camps centers on accountability. Both sides insist that their approach holds greater merit in ensuring that politicians and civil servants are accountable for policies and the delivery of government programs. For politicians and civil servants, both approaches have strengths and drawbacks—traditional public administration provides more stability and predictability while NPM provides greater flexibility and a capacity to measure the performance of both senior civil servants and programs.

Administration Theory

There is no single theory of public administration. Rather, public administration theory contains a complex of statements regarding what administration is, the meaning of *public*, who creates public administration, what the goals of public administration are, and how public administration should fulfill its tasks. Therefore, administration theories have always been and continue to be interdisciplinary, influenced by concepts from history, law, sociology, political science, management, and even psychology. Public administration theory also applies to a distinction between an academic discipline and a profession and contains approaches from organization theory, politics, governance, and law. This entry provides an overview of the development of administrative theories for the public sector and also examines some contemporary challenges in this area. It begins with early theories that sought to distinguish between politics, which dealt with the choice of the values underlying public policy as articulated through the political process, and administration, which implemented those policies in an efficient way similar to the way that businesses operate. It then considers the impact of theories of scientific management on the development of administrative theory. Last, it examines more recent thought that sees the influence of values on administrative decisions and proposes that the distinction between politics and administration is not as clear as it has been considered in the past.

Development of Administrative Theories

The European tradition of public administrative theory was based on Max Weber's conception of bureaucracy as a formal-legal institution responsible for implementing public law. This model was an ideal type that represented the highest form of rational-legal development for the state. Furthermore, it was designed to ensure equal treatment of clients through formal rules and through careful maintenance of files. While bureaucracy is generally a negative term in ordinary usage, its original intentions were more positive. In particular, the bureaucracy concept includes

1. division of labor and division of authorities,
2. hierarchy of administrative bodies, and
3. career system as the basis for the organization.

Public administration in the European tradition has been based on law, with the emphasis on the legal foundations of all public actions. Furthermore, executing public duties defined by law is incorporated into constitutional formula of executive authorities (in countries that have a written constitution), among legislative and judicature. As David Rosenbloom and Robert Kravchuk (2005) note, negatively defining administration emphasizes the autonomy of administrative agencies from legislative and judicature, also indicating that administrative actions affect rights and duties of private subjects. A legal approach to public administration, defined by lawyers, brings out the legal limits of administration and its executive nature; however, as some scientists rightfully state, public administration cannot consist solely of executing legal acts—similarly, it cannot be simple execution of policies, created without its involvement.

The American tradition in public administration has been based more on the work of Woodrow

Wilson and his concern with the relationship between administration and politics. Wilson's famous essay, titled *The Study of Administration* (1887), concentrated on organization and methods of activity of administrative agencies, particularly emphasizing how administrative tasks could be performed to achieve the highest possible efficiency. Wilson also clearly distinguished spheres of politics and administration and initiated the so-called politico-administrative dichotomy. He argued that what distinguishes politics from administration is that administration executes the will of the state as identified through the political process. Numerous scholars such as Frank J. Goodnow, William F. Willoughby, and Leonard White built on Wilson's work to form the beginning of modern administrative theory.

Following Wilson's so-called classic contribution, public administration authorities attempted to develop basic principles of public administration. The classic doctrine assumed that democracy and efficient administration were compatible and that the implementation activities of government could be analyzed scientifically. The early theorists of management have emphasized that organization and control can be recognized almost as synonyms, because almost at the same time the other trend of public administration patterns named scientific management was developing.

Wilson was interested in management science, and Frederick W. Taylor, recognized as the father of management science, began research that resulted in *The Principles of Scientific Management* (1911). The assumption of this work was that there is a single best way to achieve any assigned aim, whereas management science was supposed to help achieve the increase of efficiency by inventing the fastest, the most efficient, and the least "tiresome" production methods. This emphasis on management led to an identification of administrative science with bureaucratic forms of organization. The essential scopes of interests of academics and practitioners in the area of public administration have become division of work, the scope of control, hierarchy of organization, the chain of official internal instructions, the reporting system, departmentalization, development of standards, politics, and activity procedures.

The French engineer Henri Fayol was another significant influence on administrative theory and scientific management. Fayol studied company management seeking to enhance efficiency. According to his theory, administration is recognized as the social science ruled by similar rules to natural sciences. Fayol analyzed administration in terms of the functions of industrial organizations, which he classified as planning, organizing, commanding, coordinating, and controlling. Fayol was a rationalist who understood management of both private sector (companies) and public sector (e.g., public administration) organizations to be exactly the same thing. These rules, which he identified for the private sector, apply to the public one as well.

Classical administrative theory was developed further during the 1930s. This period particularly emphasized the inside aspects of public administration: management methods and problems, structures and activities of organizations, budget procedures, and staff problems. Luther Gulick's approach was contained in an abbreviation—POSDCORB, which management should meet as follows:

Planning—planning, elaborating the direction and methods of planned actions

Organizing—creating formal structure of power, division into organizational units, which cooperate for an assigned aim

Staffing—locating, improving, and developing staff

Directing—ordering, decision-making process, and handling instructions

COordinating—combining separate parts of the same action

Reporting—informing all actors in the process of accomplishing a plan

Budgeting—financial planning, accountancy control

The classical theory was challenged through decision-making approaches, notably those associated with Herbert Simon and bounded rationality. His 1947 book, *Administrative Behavior*, served as the foundation for the development of the so-called Carnegie School that emphasized the limits on rationality and the organizational basis of decisions. This school then served as the foundation for the rebirth of institutional analysis in political science and public administration.

Simon declared that making administrative decisions lies at the heart of public administration, emphasizing the feasibility of using scientific methods to study public administration; he argued that logical positivism was the right approach in terms of creating administrative policies. He sought to develop a social scientific approach to administration rather than the principles associated with the then conventional wisdom of "principles of administration." Simon disapproved Gulick's approach and his POSDCORB, claiming it to be inappropriate for many situations that civil servants face. He created the idea of limited rationality in the decision making, recognizing that people are rational in making decisions, but only to a certain extent. Simon acknowledged that decisions made by civil servants are rational in their view, but at the same time he pointed to many alternative variants that lead to achieving the most rational decision. According to Simon, the new paradigm for the study of public administration means that there should exist two trends in the discipline, harmonizing and mutually, intellectually stimulating:

1. One trend concentrated on progress of pure administrative science, strongly based on fundamentals of social psychology to understand decision making more effectively.
2. Another, more representative trend, aimed at creating guidelines of public policies that could guide decisions, albeit without the understanding of decision-making theory implied in the first principle.

Robert A. Dahl (1947), one of the most important early behaviorists of political science, analyzed "state of the art" of administrative science. According to him, administrative science should

1. recognize the complexity of human behavior,
2. relate to the problems of values eligible in administrative situations, and
3. consider the connections between public administration and surrounding environment.

Critics of Simon's fundamentals of public administration and political-administrative dichotomy were also supported by another scientist, Dwight Waldo, who defined public administration from the perspective of the surrounding environment, emphasizing the importance of comparative administration. From Waldo's point of view, public administration should be a branch of political science.

The more political approach to public administration has led to the conclusion that public administration is not only accountable to elected public officials (members of parliament and executive authorities) but also responds to their needs, in other words, being an instrument in politicians' hands. The importance of public administration from this perspective is stressed by the fact that it has the discretional authority. B. Guy Peters considers public administration to have a broader scope than a typical bureaucracy (in terms of random organization of administrative character) and emphasizes that it is an integral part of decisive processes of executive authorities.

Contemporary Challenges

Public administration today tends to equate public administration and governance. Etymologically, the term *governance* derives from the Greek word *kubernân* (piloting, steering) and was used by Plato to describe the creation of systems of rules. The Greek source gave birth to the Latin *gubernare*, with a similar meaning (piloting, making rules, steering). Governing, as we make a reference to it here, is close to the term of *managing* (leading), conducted by governments and their administration. Governing in this approach is connected to the new forms of actions of public administration, which are difficult to classify strictly as executing the law. For example, the World Bank created a definition of "governance" meaning the traditions and institutions by which authority is exercised for the common good. This approach, portraying "different" governing (with regard to traditional administration), is close to the new public management (NPM) conception and forms the base for further analysis of public administration and making new trends, such as new public service (NPS).

The NPM has been a recent and pervasive counterpoise to the emphasis on law in most continental (and Latin American) administrative systems. This approach to public administration emphasizes the economic foundations of governing and argues that public and private management are essentially the same. Therefore, this theory of administration in the public sector separates politics and administration even more than in the traditional Wilsonian and Weberian formulations. The NPM approach represents a recent theory for public administration, but as its influence wanes at the beginning of the 21st century, there is as yet no clear replacement. That said, the political and managerial weaknesses inherent in NPM have produced a number of important reactions in practice, if not in theory.

ADVOCACY

Advocacy is a kind of political action addressed to a governing body with the aim of influencing public policy outputs. Though advocacy is often equated with lobbying, it is in fact an umbrella term for organized activism related to a particular set of issues. Lobbying, meanwhile, is the practice of influencing a governing body through direct communication with legislators. Advocacy groups strive to change public policy according to their interests without seeking political mandates. The definition emphasizes the existence of some kind of organization, ranging from loosely coupled networks to highly formalized nonmembership organizations. It includes social movements, voluntary associations, or membership groups as well as institutions such as corporations, universities, cities, or foundations. This entry discusses the major actors, targets, and strategies, and their respective impacts.

Actors

The increase in the number of advocacy groups is one of the most striking and still ongoing trends in Western societies. The number of citizens willing to join an interest group has increased over many decades. In the United States, which has been in the vanguard, this so-called advocacy explosion started around 1960. Whereas between 1920 and 1960 the number of interest groups represented in Washington merely doubled, it quadrupled within the following 20 years. Similarly, at the end of the 1980s, the number of interest groups represented at the European Union (EU) in Brussels was 10 times higher than it was at the beginning of the 1970s, and it quadrupled between 1985 and 1991. The rapid growth in number was accompanied by a structural change with respect to the scope, intensity, and shape of advocacy. Today, advocacy is more diverse and much more professional than it was a few decades ago, including an increase in staff acting as in-house lobbyists, a growth of different kinds of lobbying firms performing surrogate representation, and the development of more and more forms of direct and indirect lobbying.

In the first half of the 20th century, the universe of advocacy groups in the Western world was dominated by trade, professional, and labor organizations. For example, before 1950 in the United States, these three types of groups accounted for over three quarters of all organized interests active in politics. Beginning in the 1960s, however, we can find a significant decline in the rate of unionization, first of all in the United States, and, since the 1980s, also in most Western European countries. Although the number of the other types of established groups continued to increase even in the second half of the century, their share of the group universe declined due to an even more rapid growth of various types of organizations from the nonprofit sector concerned with health, social welfare, culture, education, public affairs, consumers, senior citizens, taxpayers, civil rights, women's rights, human rights, the environment, religion, and other areas. Many of these groups originated in the social movements of the 1960s and 1970s, which mobilized their constituencies to turn the public's attention to new interests and new political problems. Parts of these movements turned into associations that would allow the groups to maintain their capacity to advocate even in times of declining mobilization.

The change in the composition of the group universe was paralleled by a process of differentiation in the mode of organization. The advocacy explosion resulted not only from a rise in the number of voluntary associations but also—and perhaps even more—from the fact that more and more institutions, such as corporations, governmental entities, universities, hospitals, and think tanks, have begun to act as interest groups. Many advocacy groups thus no longer represent the aggregate interests of individual group members but are lobbying on behalf of corporate actors, which do not have any members at all. Today, we find a highly differentiated pattern of advocacy in almost all Western countries consisting of a great variety of types of organizations, including broad-based membership groups such as labor unions, professional groups, and citizen groups, as well as institutions and groups with corporate members, such as trade associations and complex umbrella associations.

The different developments in the group universe were induced by several factors. First of all, the rapid social and economic changes in Western countries have created rising numbers of potential members and an overall growth in organizational resources. As people have become more educated, more articulate, and wealthier, and as knowledge and information have become more widespread, new interests have emerged, and traditional ones have been redefined. Accelerated by advanced communication technologies, the translation of interests into formal group organizations became a cumulative process, stimulating other constituencies to organize or to amplify political activities. Recently, another determinant of the expansion of the advocacy group system has come to the fore: government activity. Whenever government activity is expanded to new issues or existing government bodies gain new jurisdictions, new groups will form or existing ones will focus their activities on these new political areas. In spite of these driving forces, advocacy growth may slow down or reach a limit in the future, as it will become increasingly difficult for organizers to find interests not yet politically represented by any group or to mobilize for advocacy in view of scarce resources.

Levels and Targets

The targets of advocacy differ depending on the institutional settings and the decision-making procedures of the political system. Specific structures such as the separation of powers or the formal and informal rules of policy making are critical to advocacy groups' decisions as to whom to lobby and where to try to gain access. Whereas in centralized systems advocacy will be focused on actors and institutions of the central authority, multilevel or federated systems show a much more differentiated pattern of advocacy. For example, despite Germany being a federal state, advocacy groups in Germany focus on the federal level, particularly on the ministries and on leading parliamentarians, such as the chairs of committees, due to the strong and centralized party system. In contrast, the American federal system, even at the local level with its more than 80,000 governments, forms a significant political target since legislators are heavily dependent on the financial and political support of local coalitions. Finally, in the highly differentiated multilevel system of the EU, advocacy groups find many points of access and several veto points, offering a variety of opportunities to exert influence on policy outcomes.

The choice of political targets also depends on the character and type of the advocacy group. While traditional interest groups are apt to focus their activities on the national level, nongovernmental organizations (NGOs), most of them representing the interests of disadvantaged groups, focus on the international level, where their concerns have a better chance of being accepted than at the national level. Thus, Eurogroups tend to be experts in multilevel strategies, acting at the European as well as on the respective national levels, depending on which of the two is most critical for the decision-making process in which they engage. Legislators and governing boards, however, not only are passive targets of advocacy groups, but they often have an impact on group structures and resources as well. The most common instrument is the financial support given to groups, which otherwise would not be able to organize. Such support is intended to create countervailing forces to the powerful interest groups that tend to dominate the political process or to help form coalitions of advocacy groups that will improve the legislators' chances of getting reelected or foster their political plans.

Social change and changes in technology, institutional settings, and decision-making procedures will often prompt advocacy groups to address new targets and different levels of the political system. As the European Parliament has gained increasing power and responsibilities, it has increasingly become a target of lobbying activity. Similarly, globalization and denationalization have created new opportunity structures for social movement organizations and NGOs. Relying on new communication technologies, they have developed transnational ties and coordination mechanisms that enable them to organize protest on the international level and to develop countervailing power to the policies of international institutions such as the World Trade Organization or the International Monetary Fund. But these processes of adaptation may fail if the characteristics of the advocacy groups do not correspond to the institutional context in which a group wishes to act. For instance, the lack of a genuine European public sphere and the specific decision-making style of the European institutions involve high transaction costs for the mobilization of mass protest in Brussels. Therefore, the activities of social movements have remained predominantly national up to now.

Strategies and Tactics

To begin with, advocacy includes many activities that seem to have little to do with lobbying at all, such as gathering information, monitoring the political process, and conducting research. Nevertheless, today we find a great variety of tactics and strategies applied by advocacy groups and lobbyists to make decision makers willing to produce policy outputs consistent with their interests. The single group, however, has to decide which tools to apply and which not, since resources are limited. As a rule, advocacy is focused on a small number of subjects. Lobbyists spend most of their time on only a few critical issues, whereas they spend little time on many others.

For a long time, scholars have agreed that one should distinguish between inside strategies (based on personal contacts between lobbyists and policymakers) and outside strategies (public relations and grassroots contacts). This distinction has been useful for finding correlations between group characteristics or other factors and the selection of tools and for describing shifts in the strategic orientations of advocacy groups. There is a lot of evidence demonstrating that citizen groups will prefer outside strategies while established groups, mainly business, rely heavily on direct lobbying. Recently, however, the overall picture has become more multifaceted. While business groups tend to apply multivoice strategies that give them the chance to be present wherever a channel of influence opens up, social movements and citizen groups have also tried to apply inside strategies. Considering the growing variety of strategies and tactics, the distinction between inside and outside strategies seems to become obsolete and should be replaced by a more differentiated typology as suggested by Jeffrey Berry, who identifies four different advocacy group strategies, namely,

1. litigation and administrative intervention,
2. confrontation (protest, whistle-blowing, public relations, etc.),
3. information (making personal representations to government, releasing research results), and
4. constituency influence.

One of the major factors that has accounted for an expansion of lobbying activities is advocacy explosion. The rise of countervailing power has strengthened competition between new and established groups, forcing the latter to spend more on lobbying and to expand their action repertory. Furthermore, technological innovation in information processing has created new opportunities for lobbyists to gain access to policymakers and to apply new forms of lobbying, particularly those that address the general public, such as media- or issue-based campaigns. These trends have made it necessary for advocacy groups to acquire new skills and more professional knowledge, required to apply the new tools in an efficient and effective way. The rising demand for advocacy advice, in turn, is the main reason why direct representation by in-house lobbyists has increasingly been supplemented by surrogate representation through lobbying firms. Acting in the name of advocacy groups, such firms can help manage the problems posed by new developments in politics and communication technology. Lobbying firms are common primarily in the United States, where they account for about 20% of all lobbyists present in the capital and where they form a special sector with different types of businesses. In the past 2 decades, we have also seen a rapid growth of lobbying firms in the EU. The increasing scope and density of EU regulations have created a rapidly rising demand for professional advice on how to effectively lobby the European institutions.

Structures

Advocacy not only involves unilateral political activities by single groups or their agents but usually results in more or less intensive and stable relationships with other groups and with the groups' counterparts in the legislative and executive branches of government. These relationships come about if advocacy groups have at their disposal certain resources—be it power based on the control of their membership or information that their counterparts are interested in—and, in turn, if other groups or policymakers can offer them valuable information or give them the opportunity to get directly involved in the formulation and implementation of policies. One basic element of the structure of advocacy is thus an exchange relation between private and state actors. In a given policy sector, all the actors that are connected in this way form a specific policy network characterized by the number and type of its members, its stability, and its structure. Basic elements of a political system, such as the characteristics of government and the mode of interest group participation in decision making, form a framework that promotes the development of certain types of networks and helps them persist. By contrast, as competition between groups has increased, the established actors have been forced to open up policy networks and to integrate new advocacy groups in the policy-making process.

Since decision making in contemporary politics is a very complex process, the scope and density of policy networks vary to a considerable extent, making it an empirical question how stable the relationships between actors are and how power resources are distributed. Most scholars distinguish between several types of networks that can be arranged in a continuum ranging from very open to rather closed patterns of interaction. Whereas in the American context scholars tend to distinguish between "iron triangles" or subgovernments at the one extreme and issue networks at the other, the European debate on policy networks is shaped by the opposition of corporatism and pluralism. In spite of these differences in terminology, descriptions of the two extreme types are similar. While the former is characterized by highly restricted participation, stability of interactions, and centralized decision making, the main features of the latter are decentralization, a high level of conflict, dynamism, and broad participation.

The academic discourse on pluralism and corporatism is characterized by a typical asymmetry. As Grant Jordan stated, pluralism is ultimately no more than an antitheory, which is marked by what it excludes rather than by what it establishes. First of all, it describes a complex and confusing configuration of political actors that is open for new advocacy groups and where power is widely dispersed. Its core element is open competition between advocacy groups for political influence, which prevents any single group from dominating the political process. Since pluralism involves a great variety of single acts of exchange between private groups and legislators, the results of political decision making are highly unpredictable. In the corporatist pattern, however, a small number of advocacy groups have considerable resources at their disposal, in particular technical information on the implementation process that makes them essential partners of the legislators, with whom they work in close coordination. Corporatist arrangements consist of stable sets of actors in which the privileged advocacy groups get the chance to considerably influence policy outcomes in return for their cooperation in the implementation of a policy. As less resourceful societal actors are excluded, corporatism tends to subdivide the group universe into insiders and outsiders.

Whether corporatist arrangements have a chance to develop depends on the institutional, political, and social context. In political systems with a strong central state and encompassing umbrella organizations, as in several European countries, policy processes have been dominated for decades by interelite relations often based, as in Germany, on the public status of the major private actors. By contrast, in the United States, the fragmentation of economic interest groups and the division of American government has prevented corporatist patterns from developing. Since labor unions have always been weak, there was no strong stimulus for business organizations to develop powerful peak associations. So competition between groups of labor and capital has remained high and discouraged single groups from becoming privileged partners of the legislators. Besides, the American political system offers little opportunity to channel advocacy group activities in a way that would favor the development of corporatist arrangements. Federalism, the separation of powers, the fragmentation of power within both Congress and the executive, and the lack of a strong system of party discipline are factors that favor pluralist rather than corporatist patterns of interest intermediation.

Impact

In the modern world of politics, the political activity of advocacy groups is only one of a multiplicity of factors having an impact on public policy decisions. Therefore, methodological approaches that attempt to isolate this factor from the institutional and situational context in which it is embedded have produced unsatisfactory results. Research on advocacy group influence came up with better results when it stopped asking whether or to what extent advocacy groups are powerful at all and instead turned to the less fundamental question of under which circumstances they have an impact on policy outcomes. Today we are able to identify the structural and situational factors that help explain why advocacy is successful in some cases but in others has no impact at all. The five determinants are as follows:

1. group-related characteristics such as size and type of membership; resource endowment, particularly with regard to money; and the tactical and strategic repertory;
2. the features of the group universe, that is, the number of groups in a policy sector and the degree of cooperation and conflict;
3. legislators' demand for group resources such as information and political support;
4. the institutional framework as a channel for the distribution of opportunities to gain access to decision makers or to gain legal privileges; and
5. issue characteristics, such as policy type, degree of technicality, and public salience.

At first, it seems reasonable to assume that, other factors being equal, advocacy groups that are well endowed with different resources will be more influential than groups that are less endowed. The former will be able to employ more staff and pursue more multifaceted tactics and strategies than the latter. Furthermore, it is often suggested that an imbalance of influence is due to the unequal distribution of money. Indeed, there are many examples of rich groups, particularly corporations and trade associations, gaining easier access to decision makers, being present at more levels of government, and supplying decision makers with more valuable expertise than poorer groups are able to do. But there are only few academic studies that would confirm the assumption that political outcomes are skewed toward the interests of the advocacy groups that spend the most on lobbying. Money has only a limited effect, since there are other resources, such as public support, a large number of members, or political credibility, that may outweigh material affluence and, still more important, that cannot be bought on the political market. Moreover, recent research results suggest that group-related factors, such as money and membership and also tactics and strategies, all in all may have only a limited impact on political outcomes.

Keeping the other factors in mind, these findings do not come as a surprise. First of all, in a competitive group universe most attempts by advocacy groups to exert influence evoke counteracting activities by rival groups. For example, a sector such as business is, in most cases, unable to act as a unit for it is divided by too many conflicting interests. Furthermore, the advocacy explosion has intensified competition by creating more and more countervailing pressures. Second, advocacy success is determined by the behavior of legislators. Whereas legislators are often considered as passive targets, in fact they are active players shaping their relationship with advocacy groups according to their interests. Whether a decision maker is influenced by a certain group depends on his or her political goals, strategies, and demand for resources. Third, in any political system, institutions form a screen that is beneficial to some advocacy groups and discriminates against others. Generally, institutional mechanisms may preclude advocacy groups from converting resources into power. If the structures and strategies of a group do not match up with the political institutions, as is the case with social movements on the EU level, even resourceful groups may remain politically ineffective. Fourth, the likelihood of an advocate prevailing in a political conflict also depends on the issue at stake, that is, on the constellation of actors interested in the issue and their positions on the subject. The more groups that are involved in the issue and the higher the level of conflict, the more interests legislators have to take into account. So big issues have an adverse effect on lobbying success.

As a result, the impact of advocacy is limited, depending on factors such as the scope of the policy network, the level of conflict, the number of allies and opponents, and so on. Since every policy process is characterized by a specific, if not unique, constellation of structural and situational elements, the effect of group tactics and strategies is highly uncertain. Provided that the combination of factors in a certain policy arena is constantly changing, as is often the case, the results of public policy decisions are highly unpredictable, making it extremely unlikely for single groups to dominate the political process over time. But we will also find political contexts with a smaller number of actors and more stable patterns of participation where policy outcomes are less indeterminate. Advocacy groups that are formally included in policy-making processes, that deal with an issue that does not attract the interest of the media, and that act in a political niche where countervailing pressures are low will have a much better chance to influence policy outcomes than groups that act under largely varying conditions. As structural and situational factors can be considered as variables, the level of uncertainty is a variable too, featuring different contexts that are sometimes favorable to some groups and sometimes to others.

Advocacy Coalition Framework

The advocacy coalition framework (ACF) was originally designed by Paul Sabatier and Hank Jenkins-Smith in the late 1980s to explain the political behavior of actors in the policy process.

The ACF provides researchers a theoretical lens for organizing actors into coalitions by offering a set of hypotheses for explaining coalition structure and behavior, the role of science and technology in the policy process, and the factors conducive to learning and policy change. For more than 2 decades, the ACF has been applied in Europe, Canada, the United States, and developing countries to a range of topics including health policy, environmental/energy policy, economic policy, disaster policy, and education policy.

Sabatier and Jenkins-Smith created the ACF in response to what they saw as three shortcomings in the policy process literature. The first was their interpretation of the stages heuristic as both an inadequate causal theory and an inaccurate portrayal of the policy process. The second was a lack of progress to resolve the debate about top-down and bottom-up approaches to implementation research and a need for system-based theories of policy making. The third was the apparent lack of theory about the role of scientific and technical information in the policy process. In response, the ACF was created as a system-based model, integrating most of the policy stages, incorporating the best aspects of the top-down and bottom-up approaches to implementation, and creating hypotheses that involve the role of scientific and technical information in learning and policy change. This entry provides a broad overview of the assumptions, concepts, and hypotheses in the ACF and ends with directions for future research.

Foundation

The structural underpinnings that the ACF begins with are a set of assumptions involving a central role for scientific and technical information in policy processes, a time perspective of 10 years or more to understand policy change, and the assignment of policy subsystems as the primary unit of analysis. Policy subsystems are subunits of political systems, focused on a topical area and involving specialized actors. The ACF guides researchers to study a broad set of subsystem actors including officials from all levels of government, nongovernment actors, consultants, scientists, and members of the media. For these subsystem actors, the ACF assumes a mental model based on limited abilities to process stimuli, a tendency to remember losses more than gains, and a need to rely on beliefs as the principal heuristic to simplify, filter, and sometimes distort stimuli.

The ACF assumes that actors are politically driven by their beliefs and that their policies and programs are best thought of as translations of those beliefs. A three-tiered model of a belief system for its actors is depicted. Within the belief-systems model, the broadest, most rigid, and predominately normative are *deep core beliefs*, such as liberal and conservative beliefs or the relative concern for the welfare of present versus future generations. Of moderate scope and spanning the substantive and geographic breadth of a policy subsystem are *policy core beliefs*. Policy core beliefs are rigid but are more adaptive in response to new experiences and information than deep core beliefs. The most substantively and geographically narrow and the most empirical are *secondary beliefs*. Compared with deep core and policy core beliefs, secondary beliefs are more likely to change.

At the heart of the ACF is the coalition concept. Coalitions consist of actors with shared policy core beliefs who engage in nontrivial degree of coordination, ranging from developing joint plans to sharing information. The goal of a coalition is the attainment of policy objectives, meaning the protection or change in government policies. The behavior of a coalition toward the achievement of their policy objectives varies considerably and depends on their resources and on the resources of their opponents, all of which is constrained by external subsystem affairs. Common coalition strategies include (a) maintaining a long-term perspective and involvement in a policy subsystem, (b) seeking to maintain membership and mobilizing new members, (c) attempting to shape policies indirectly through public opinion campaigns and through supporting scientific and technical information that reinforces their beliefs, and (d) attempting to shape policies directly by shopping their ideas to venues controlled by actors with authority to change policies, such as the courts, executives, agencies, and legislatures. The behavior of coalitions is fundamentally connected to the level of conflict in the policy subsystem. In some subsystems, rivals are not actively present, and a dominant coalition maintains a monopoly over policy affairs. In more adversarial subsystems, coalitions behave caustically toward their rivals, limiting learning between coalitions. In more collaborative subsystems, coalitions cooperate, share information, and engage in cross-coalition learning.

While coalition members share policy core beliefs and coordinate their behavior, not all coalition members need to be directly tied to their allies. Some members are principal members, who remain active within the coalition for extended periods of time and are well connected with most allies. Principal members anchor the coalition by bearing the cost of coordination and by maintaining connections with—and hence the involvement of—more auxiliary members, whose involvement tends to be more temporally sporadic.

A flow diagram of the ACF is shown in Figure 1. On the right is a policy subsystem, within which coalitions strive to attain their policy objectives through various strategies. Subsystems operate within a broader political environment defined by relatively stable parameters and external events along with long-term coalition opportunity structures and short-term constraints and resources of subsystem actors.

To ease the application across political systems, the flow diagram in Figure 1 depicts three sets of variables as important long-term opportunity structures. The first is the degree of consensus needed for major policy change, which shapes coalition strategies in reaching agreements. The second is the degree of openness of political systems. For example, federalism and checks and balances in the United States create decentralized processes with many venues and encourage entry participation whereas corporatist systems are less open and more centralized and restrict participation. The third is overlapping societal cleavages.

Paths to Major Policy Change

An explanatory focus of the ACF is to help understand and explain major policy change. Four paths to major policy change have been posited. The first is shocks that occur external to a subsystem, including broad changes in socioeconomic conditions, public opinion, governing coalitions, and other subsystems. Among the factors linking an external shock to major policy change are shifting coalition resources and changing beliefs among coalition actors.

The second path to policy change is shocks within a policy subsystem. An example might include a catastrophic fire in a forest management policy subsystem. The ACF distinguishes between external shocks and internal shocks because the latter are predicted to underscore the failures in current subsystem practices and possibly weakening a dominant coalition.

The third path to policy change is policy-oriented learning. Policy-oriented learning involves relatively enduring changes in beliefs and strategies resulting from experience and/or new information as related to the attainment, and possibly the modifications, of policy objectives. As coalition members learn over time, they may develop new ways to overcome a rival coalition or refine their policy objectives, both of which may lead to major changes in subsystem policies. Since belief systems are rigid and resistant to change, policy-oriented learning primarily shapes secondary beliefs or secondary aspects of the policy subsystem over extended periods of time.

The fourth path to policy change occurs through negotiated agreements among competing coalitions. Probably, the most important condition enabling coalitions to negotiate is a hurting stalemate, which occurs when members of rival coalitions view the status quo as unacceptable and perceive no other venues to achieve their policy objectives other than direct negotiations. Additional conditions enabling negotiated agreements include effective leadership, consensus-based decision rules, diverse funding, duration of process and commitment of members, a focus on empirical issues, an emphasis on building trust, and lack of alternative venues.

Hypotheses

Sabatier and Jenkins-Smith provide a dozen hypotheses on topics ranging from belief and policy change to coalition stability. The five most frequently tested hypotheses are the following:

1. Significant perturbations external to the subsystem (e.g., changes in socioeconomic conditions, public opinion, systemwide governing coalitions, or policy outputs from other subsystems) are a *necessary*, *but not sufficient*, cause of change in the *policy core* attributes of a governmental program.
2. On major controversies within a policy subsystem when policy core beliefs are in dispute, the lineup of allies and opponents tends to be rather stable over periods of a decade or so.
3. Policy-oriented learning across belief systems is most likely when there is an intermediate level of informed conflict between the two coalitions. This requires that (a) each has the technical resources to engage in such a debate and (b) the conflict be between secondary aspects of one belief system and core elements of the other or, alternatively, between important secondary aspects of the two belief systems.
4. Policy-oriented learning across belief systems is most likely when there exists a forum that is (a) prestigious enough to force professionals from different coalitions to participate and (b) dominated by professional norms.
5. The policy core attributes of a governmental program in a specific jurisdiction will not be significantly revised as long as the subsystem advocacy coalition that instituted the program remains in power within that jurisdiction—except when the change is imposed by a hierarchically superior jurisdiction.

Further Development and Applications

The scope of the ACF continues to diversify in topics and theoretical focus. Areas ripe for future research include (a) explaining coalition structure and behavior, especially factors explaining defection and stability of members and choice of political strategy; (b) developing a theory of policy subsystem interdependencies; (c) explaining the effects of scientific and technical information on learning within and between coalitions; and

(d) investigating how biased assimilation shapes coalition behavior.

Advocacy Networks, Transnational

Transnational advocacy networks (TANs) are forms of collective action that cross national borders and are made up of collaborative connections among a myriad of actors who engage in joint initiatives on the basis of common goals and shared values. These networks seek to change states' and/or international organizations' policies and/or public opinion, at both a domestic and an international scale. TANs form around areas of specific issues, but these vary considerably, ranging from human rights, environmental protection, poverty, gender equality, and labor rights to networks that seek to change the agendas and policies of international organizations such as the World Bank or the International Monetary Fund. Their initiatives usually have a limited life span. Its promoters do not seek to build long-term coalitions; rather, TANs emerge and die as new issues come to the fore or as their demands gain attention.

The concept of TANs thus describes a different form of organized collective action from the more institutionalized international nongovernmental organizations or global social movements. Although some kind of internal division of labor and communication structure is in place, TANs most often do not have headquarters or paid staff. Furthermore, rules for affiliation tend to be loose. However, the internal functioning of TANs varies considerably, and it changes through time and across issue areas.

The literature on TANs is quite recent. It flourished in the 1990s, as part of a broader effort to understand the roles of nonstate actors in international relations. Ever since the publication of the pioneering analyses on transnational relations, around the end of the 1960s and the beginning of the 1970s, its study has gained increased prominence. What began as an attempt to incorporate the study of nonstate actors—at the time, mainly multinational corporations—into the research agenda of international relations scholars has become a vast literature that takes into consideration an increasingly heterogeneous set of actors and phenomena. The literature on TANs has contributed to moving the debate from the question of whether nonstate actors are relevant in international relations to understanding how they are relevant and how to evaluate their impacts.

Studies about TANs are often multidisciplinary. More specifically, this is a literature that has stimulated a fruitful dialogue between international relations and social movement theories. Although most authors will deny the existence of a simple causal link between globalization and transnational collective action, the constitution of international regimes and the augmented power of international organizations provide a common political background for TANs. These are understood best by considering the contributions made by international relations theorists. In turn, many of the challenges that social movements face at the domestic level, in terms of coalition building, for example, are also present in the international arena. Most important, social movement theorists help in identifying the mechanisms by which actors are able (or unable) to overcome their differences and construct common purpose.

Studies about TANs also seek to go beyond local–global dichotomies. Thus, rather than speak of the emergence or existence of a "global civil society," scholars refer to a plurality of TANs springing up intermittently across a wide-ranging set of issues. These networks are made up of various combinations in terms of participants' national origins and the pathways to transnationality chosen by them. While many actors remain rooted at the local or national scale, others may be part of global social movements or international nongovernmental organizations.

At least two issues remain as key challenges for the TAN literature. First, it is not always clear as to how to set the boundaries of TANs, that is, how to identify participants and differentiate among actors, given the internal asymmetry of power relations. Second, although there has been a concerted effort to evaluate the impacts of these collective action forms, we still know little about their longer term effects.

Relationships Among Actors in TANs

TANs are sponsored by a wide variety of actors located in different social positions and geographical locations, so much so that it is often hard to draw their boundaries. There is no consensus in the literature on this topic. For some scholars, TANs are not necessarily limited to nonstate agents but may include sympathetic government officials as well as international organization officials. Among nonstate actors, these may include nongovernmental organizations (NGOs), grassroots organizations, foundations, business organizations, the media, churches, and various other types of associations as well as individuals. For other authors, it is best to define TANs, more restrictively, as including only domestic and international nonstate actors, and among these mostly NGOs and social movements. A clearer definition of the boundaries of TANs remains an open challenge.

Whether the definition of participants is more or less restricted, in both cases, there is evidence that actors have very different approaches in terms of targets chosen and strategies used. As sets of interconnected nodes, networks cannot be aprioristically defined as formed by horizontal or homogeneous ties. Nevertheless, this use of the concept of "networks" has been common among activists and scholars alike. It has helped emphasize the novelty of these forms of collaboration with respect to more hierarchical and centralized initiatives of the past. However, recent scholarly efforts have focused on trying to specify better the embeddedness of networks in power relations as spaces of negotiation (and contention) affected by asymmetrical relations among participants. These efforts have led to a more detailed analysis about the internal functioning of TANs, which focus, for example, on questions of accountability, transparency, and decision-making processes. Asymmetries may follow North–South lines, but this is only one possible aspect. Other sources of tension within TANs refer to different political cultures (among countries and also among sectoral domains) and different visions in terms of tactics, both of which can be found within and across the South and the North.

Impacts of TANs

To understand under what domestic and international circumstances do TANs succeed or fail to achieve their goals, a long series of case studies and comparisons among them have been undertaken. Scholars have focused on the abilities of networks not only to influence political actors and policies at the domestic and international scales but also to bring about shifts in public opinion on given issues. Research has been done on campaigns oriented toward particular political problems (e.g., debt relief, use of land mines) and policy domains (e.g., the environment, trade negotiations, gender equality). While there are numerous case studies showing that TANs did have a positive impact, this is often not the case. Independent variables that explain these different outcomes in the literature include characteristics of the networks themselves (e.g., the strength of local grassroots members or the density of ties), characteristics of the issue chosen (e.g., its resonance with existing norms), characteristics of the target (e.g., the vulnerability of states to leverage politics or the access of activists to the state), and the strategies of the networks (e.g., their capacity to generate reliable information quickly).

Margaret Keck and Kathryn Sikkink pioneered the efforts to understand the impacts of TANs in their 1998 book, *Activists Beyond Borders: Advocacy Networks in International Politics*, in which they propose the "boomerang pattern" as a common and effective tactic used by TANs to enhance their influence. Most especially in cases of closure of the domestic political system, nonstate actors seek allies in other countries (or are sought by them) to apply pressure on other states and/or international organizations. These, in turn, will be able to use their leverage on the original target and thus help bring about the change demanded by domestic activists. Examples of the successful throwing of "boomerangs" include the well-known case of the Brazilian rubber tappers who, in the 1980s, allied with U.S. environmental NGOs to pressure the U.S. Congress to use its leverage on the World Bank. The World Bank, in turn, helped bring about changes in the projects they helped sponsor in the Amazon region and thus bring about changes in the Brazilian state's policies vis-à-vis environmental protection and the rubber tappers.

Special emphasis has been given by TAN scholars to impacts that are not easily measurable, such as the effects of transnational activism on international norms. This is certainly true in the case of scholars who adhere to a constructivist theoretical approach to the study of transnationalism. The argument is that TANs do contribute to change by shifting the norm structure of global governance. Norms, understood broadly as shared expectations held by actors about what is their appropriate behavior, are affected by the actions of TANs in at least two important ways: (1) as references by which TANs hold states and other actors accountable and (2) by the creation of new norms or the initiation of norm shifting. Either by upholding existing norms or by proposing new ones, TANs have an impact on how people in general think about the world.

Notwithstanding various successful examples of norm and policy shifting, evidence of the impacts of the campaigns launched by TANs is mixed and remains an important topic for future research. More specifically, longer term studies are needed to understand whether these changes are sustained through time.

African Political Thought

The expression "African political thought" can be considered a prima facie misunderstanding in that it oversimplifies the pluralism of thoughts that has always existed in Africa. Deep divergences characterize the African ideological landscape. While Jomo Kenyatta, the Kenyan political thinker who was the first prime minister of Kenya and its president from 1964 to 1978, positioned precolonial Africa as the reference for the rebuilding of independent Africa; Léopold Sédar Senghor, president of Senegal from 1960 to 1980, idealized the encounter between Africa and Europe as the starting point of any modernity in Africa. In the same way, the call for the immediate building of a United States of Africa was contradicted by the advocacy of a step-by-step process of regional integration.

Pluralism of political thoughts is not the lone obstacle besetting the emergence of a unified school; alongside it, there is also the issue of pluralism in meaning. As the matter of fact, the notion of "African political thought" is influenced by several dialectics, including those between the African continent and the diaspora, between North Africa and sub-Saharan Africa, and between tradition and modernity. This entry first examines each of these dialectics. It then describes the substance of African political thought through two main categories: (1) "againstism" and (2) "renaissance."

Dialectics Influencing African Political Thought

The African Continent and the Black Diaspora

The first dialectic is that between the African continent and the Black diaspora. For instance, without reference to the Jamaican thinker Marcus Garvey or the American thinker William Edward Burghardt Du Bois, it is impossible to understand the genealogy of Pan-Africanism; the Pan-Africanism that constitutes the main paradigm of African political thought is initially a Diaspora idea. As strongly contesting colonization and neocolonialism, African radicalism has been elaborated mainly by the French citizen of Martinique Frantz Fanon. The relationship between these icons of African political thought and the African continent is linked to the color of their skin. African political thought is to some extent a Black political thought. It therefore appears that the idea of African political thought is linked to that of Black political thought. The debate among the diaspora in the United States, in the Americas, and in the modern world has never been considered by the continental African thinkers as foreign to their concern. Senghor and Kwame Nkrumah were always in conversation with Black American thinkers such as Du Bois and Martin Luther King Jr.

The Relationship Between Sub-Saharan Africa and North Africa

The second dialectic is that between sub-Saharan Africa and North Africa. This one concerns the racial divide between "Blacks" and "Arabs." Africa is not a continent with ethnic or racial homogeneity. The impact of this on African political thought is the cohabitation of "Pan-Africanism" and "Pan-Arabism" in the continent. Even if Pan-Africanism is unification's ideology, some of its authors restricted Pan-Africanism to "Black Africa." The Afrocentric Senegalese thinker Cheik Anta Diop established the cultural foundations of a Black African federal state. In practical terms, this idea was reformulated by President Mobutu Sese Seko of Zaire as a replacement of the Organisation of African Unity by a league of Black people and states. Seko's proposal was clearly directed against the Arabs of the continent, who were accused of being oriented more toward Middle East through the Arab League. At the same time that Nkrumah of Ghana was advocating Pan-Africanism from Cape Town to Cairo, Gamal Nasser of Egypt was defending Pan-Arabism from Rabbat to Damascus. The dialectic of the African attachment to the continent and their attraction to what is going on in Asia indicates the variable geometry of Pan-Africanism. It is worth noting that whereas Pan-Africanism and blackness are intertwined, the interaction between Pan-Arabism and Pan-Africanism is still apprehended under the prism of antagonism, instead of complementarities. The presence of Arabs in Northern Africa and the role played by Arab states such as Egypt, Algeria, and Morocco in the liberation of the continent seem to contradict the ongoing misconception of Africa as a Black continent. At this stage, South Africa's episteme of representing an African rainbow identity is a revolution. Despite the influence of African radicalism that structured the African National Congress, post-apartheid South Africa, under the leadership of Nelson Mandela, transcends racial cleavages: To be an African becomes a cosmopolitan idea that can accommodate Indians, Whites, and Blacks. It is the advent of a postracial African that was envisaged by Mandela's thought.

Tradition and Modernity

The third dialectic that operates in the realm of African political thought is that between tradition and modernity. Traditional African political thought is perceived as political thought based on what is authentic to Africa through a precolonial reference (Basil Davidson, 1998; Jomo Kenyatta, 1938). Modern African political thought is political thought generated by the colonial and postcolonial eras. From this artificial dichotomy, tradition-generated political thought is given the label of authentic African political thought. At the same time, modern political thought is stigmatized for being Westernized. This is a false opposition, because tradition and modernity are relative notions and represent intertwined realties. The search for an authentic African political thought is an impediment to the understanding of the dynamics of Africa's ideological landscape. Instead of initiating a futile debate on the criteria of authenticity, it is better to note what works as an African political thought, be it modern or traditional, Afrocentrist or influenced by "Western" ideologies.

African Political Thought as "Againstism"

Modern African political thought is to be understood through the mediation of the relation with the "intimate enemy," that is, the Western world made up of colonial powers. That is why African political thought focuses on accusation. In this regard, the radical discourse dominates the ideological landscape. The Western world is presented as the enemy on the basis of the experiences of slavery and colonialism. These two experiences are seen as part of the same trend of African humiliation in the modern world. If one agrees with Carl Schmitt that the designation of the enemy is the starting point of politics, then African thought is political and unified when African thinkers define a common enemy as in the following examples:

In the 1930s, Kenyatta accused the "Europeans" of having destroyed the human dignity of the African, denigrated his culture and religion, and stolen his land (Kenyatta, 1938). This discourse on colonization as a brutalization process is shared by the main radical thinkers.

Nkrumah's opposition to the Western world concerned its colonial and postcolonial faces. In his analysis of the European domination of Africa, Nkrumah (1961) asserts,

> The white man arrogated to himself the right to rule and to be obeyed by the non white . . . Under this cloak, the Europeans robbed the continent of vast riches and inflicted unimaginable suffering of the African people. (p. xi)

Despite the independence of African states, Nkrumah identified neocolonialism as "the last stage of imperialism." Neocolonialism is the continuity of other forms of Western domination:

> In place of colonialism . . . we have today neo-colonialism. . . . The essence of neo-colonialism is that the State which is subject to it is, in theory, independent. . . . In reality its economic system and thus its political policy is directed from outside. (Nkrumah, 1965, p. 30)

Amilcar Cabral's (1970) denunciation of colonialism is based on the fact that the Western colonial powers had taken "up arms to destroy or at least to paralyze (the) cultural life (of Africans)": Foreign domination can be maintained "only by the permanent, organized repression of the cultural life of the people concerned." Colonization and neocolonialism are explained as negations of the history and culture of African peoples.

Fanon, in his writings, formulated an absolute clash between Africa and Europe: Colonialism is presented as "fundamentally unforgivable" (Fanon, 2006, p. 118) and Europe as having proceeded with cynicism and violence against Africa.

These categories and representations with their Marxist background have exercised a real ideological hegemony in Africa and still do so today. In the intellectual domain, the conservative trend of African political thought constituted a minority. The denunciation of Europe is common to both radical and conservative African political thought. Disunity appears at the level of the relationship with the colonial power: When a conservative African political thinker such as Senghor forgives the former colonial power and regards it as a friend and partner, radical thinkers envisage struggle. The synthesis of this historic cleavage has been made in postcolonial South Africa through the "truth and reconciliation" process under which a radical liberation movement, African National Congress, accepted to cooperate with apartheid elites.

African Political Thought as a Renaissance Political Thought

African political thought is dominated by the idea of renaissance. It is a normative political thought generated by the traumatism of slavery, colonialism, and underdevelopment. These historical events constitute the implicit or explicit background of African political thought.

The renaissance from the colonial or neocolonial domination is to be obtained through struggle for national liberation. It is a cultural struggle. The liberation movement defends the culture of the people (Cabral, 1970). The struggle is also a military one implying the use of revolutionary violence (Fanon, 2002).

The renaissance following the colonial divide of Africa and its underdevelopment is to be made through the creation of United States of Africa. Despite its practical failure, this ideal still dominates African political thought (Nkrumah, 1963).

The renaissance is a terrain in which several national ideologies situated between Marxism and liberalism, such as "African socialism" or "communal liberalism" flourished.

The renaissance political thought is also a thought of liberty and equality. Under the condemnation of colonialism, apartheid, and authoritarianism, what are at stake are liberty and equality (Mandela, 1995). African political thought then appears in its universality. However, as elsewhere, African political thought is also made up of exclusion of the other. The light of renaissance is contradicted by the darkness of discourses full of hate. Ethnic exclusion and genocide in Africa have always been justified "ideologically."

Agencies

In this entry, the concept of "agencies" is defined, and a short review of its history and relevance for public administration practice is provided. Finally, some key issues that have emerged from the evergrowing literature on this topic will be discussed.

Definition

Agencies are the organizational emanation of administrative decentralization in the public sector by which large monolithic core departmental bureaucracies are "unbundled" into smaller executive organizations that operate at a distance from the center of government. There are many descriptions of the administrative species "agency" in the international literature, such as "nondepartmental public bodies," "quangos," "nonmajoritarian institutions," "quasi-autonomous public bodies," and "arm's-length agencies," only to name some. For reasons of clarity, the term *agency* will be used throughout this entry. There is, however, a variation in the interpretation of the concept "agency" in different countries. Some argue that what an agency is, and what functions it does, may vary considerably across national cultures, legal systems, and political systems.

Although the definition of an agency, or the way in which "agencies" are conceptualized, may differ from country to country, there are some common features by which agencies can be characterized:

> First, in most cases, agencies are public law bodies. This means that they are subject to at least some public law procedures.
>
> Second, agencies have some capacity for autonomous decision making with respect to their internal management and/or policies.
>
> Third, agencies are structurally disaggregated from the center of the governmental apparatus (core ministry). This means that in most cases, agencies are not directly subordinate hierarchically to the oversight authorities, such as the central administration of government or the minister.
>
> Still, fourth, agencies are formally under at least some control of ministers and governmental departments, as there often is a (larger or smaller) degree of political responsibility for what the agency does.
>
> Fifth, in most cases, agencies are (at least partly) staffed with civil servants and (at least partly) financed by the state budget.

In the literature, the distinction is made between internally autonomous agencies and externally autonomous agencies. Internally autonomous agencies have a quasi-autonomous status within the central governmental department. These agencies are often labeled as "ministerial agencies," as they do not have a legal personality of their own (they are part of the legal person of the government, the ministry, or the department). This implies that the hierarchical relationship with the minister remains unchanged and that the minister remains responsible for the organization. Internally autonomous agencies do have extended managerial flexibilities, however, compared with the core governmental organizations (from which their "autonomous" status is derived). Examples of internally autonomized agencies are the Next Steps Agencies (United Kingdom [UK]), the *Agentschappen* (the Netherlands), or many federal agencies in the United States. Externally autonomous agencies are often labeled as "nonministerial agencies" because of their own legal personality and the fact that they are structurally detached from the core of the governmental apparatus. In most cases, the legal personality implies that agencies are controlled and steered by an intermediary body (like a board of governors). The existence of a board implies that the ministerial responsibility toward the agency decreases and often is only political in nature. Examples of externally autonomous agencies are the so-called nondepartmental public bodies (UK), the *zelfstandige bestuursorganen* (ZBOs; the Netherlands), or the independent administrative institutions (Japan).

Historical, Theoretical, and Empirical Context

Agencies: Not Something New at All

With the rise of new public management (NPM) as one of the dominant administrative doctrines of the past decades, many countries began reorganizing their administrative apparatus. One particular reform that could be observed in many countries was the so-called unbundling of the traditional large monolithic bureaucracies. For example, in the UK under Margaret Thatcher, the Next Steps Program dissolved the central bureaucracy in dozens of smaller executive agencies that were responsible for the implementation of public policies. This example was followed by similar initiatives in other countries such as the Netherlands or, more recently, Belgium (Flanders). However, this kind of public sector reform can be observed not only in the heartland of NPM (including many English-speaking countries) and in the broader Western world but also elsewhere. Agencification programs in developing countries (e.g., Tanzania, Jamaica), in East Asian countries (e.g., Thailand), and in Central and Eastern European countries (e.g., Latvia) have been documented extensively in the literature. Notwithstanding the fact that the 1980s and the 1990s were characterized in many countries by the establishment of many arm's-length agencies, the existence of agency-type administrative entities is not new at all. For example, for centuries the central government in Sweden has consisted of a small core bureaucracy, responsible for policy making, and many executive agencies at arm's length, responsible for implementing policies. As a second example, in the 1970s (so before NPM came into its heyday), Hong Kong's central government was unbundled into a lot of small arm's-length executive agencies. Also, the federal government of the United States has a long tradition of working with agency-like public organizations that are structurally disaggregated from the core of government.

Why Agencies?

The popularity of the agency-like administrative species in many governmental reforms is the result of the normative NPM-driven belief that this type of public organization is better suited to deliver public services in an efficient and effective way. As such, establishing agencies was considered by many governments as part of the solution in search of an answer to the crisis of the state in the 1970s and 1980s. Agencies are presumed, according to NPM advocates, to be better performers than traditional bureaucratic organizations because (a) they operate closer to the citizen/client and hence are more responsive to the client's need, (b) they are more flexible because of their high levels of managerial discretion, and (c) their (quasi-) independent status encourages them to behave more efficiently. The theoretical justification behind this—often normative—point of view can be found in rational economic theories such as property rights theory and principal–agent theory. Agencies, according to these lines of reasoning, are assumed to operate more efficiently and effectively compared with core departmental bureaucracies, because their autonomous status enables them to make their own managerial choices. The fact that agencies have the discretionary power to handle to a certain extent their own resources (personnel, finance, etc.) creates an incentive to use these resources efficiently and effectively ("let the manager manage"). On the other hand, the enlarged discretionary managerial competences on behalf of the agencies create a need to control these agencies by their principals, that is, the political and administrative oversight authorities ("make the manager manage").

In sum, according to NPM advocates, the creation of agencies is something rational, underpinned by rational-economic theories, as agencies are presumed (due to their quasi-autonomous status) to be better deliverers of public services than large, core-departmental bureaucracies. Recently, however, some scholars have argued that the agency phenomenon is more than an answer in the search for better public service delivery. These scholars argue that the agency phenomenon is a trend, a practice that is copied. There is a growing body of literature that shows that the creation of agencies, as part of public sector reform processes, is not always a rational decision. In many countries, the creation of agencies on a large scale is the result of processes of mimetic, normative, or even coercive isomorphism. In the past decades, public sector reforms that included some kind of "agencification" were considered as a best practice. Governments often tend to copy best practices from each other. Beside that many international institutions (e.g., World Bank, International Monetary Fund [IMF], and Organisation for Economic Co-operation and Development [OECD]) and multinational consulting firms have been very active in promoting NPM-like public sector reforms, including agencification programs.

Diversity

Despite the often argued fact that one is "converging" toward the agency form all over the world, which is also true to a certain extent, one should recognize that the agency form may not be that homogeneous as one might sometimes think. It can be argued that although the numerous similarities among these organizations have been created all over the world, there is also a great deal of variation, mainly due to differences in national cultures, legal systems, and political systems. The variation occurs along a number of dimensions, such as their governance structure and their relation with ministerial authorities, their degree of autonomy, and the variety of tasks they perform. In some models, agencies are organizations that are more or less directly linked to the core of government (central ministries). In English-speaking countries, such as the UK, the chief executive of the agency is responsible for an administrative oversight (a ministerial department) rather than a corporate body such as a board. This implies that the hierarchical bonds between agency and oversight are much stronger compared with the Scandinavian model, for example. In the United States, the typical agency is a public law legal person of its own, but it is still subordinate to the department within which it is located. Besides such agencies, established by a congressional act, there are also agencies that are established by and within a department. In other models, though the bonds of agencies with ministries may be weak, yet they have strong autonomy and independence. In Scandinavian countries (e.g., Sweden), agencies are responsible for implementing policies that are issued by small ministries responsible for policy formulation, although the agencies are also active in policy making themselves through their own corporate body, which has a lot of autonomy vis-à-vis the political and administrative oversight authorities. Also, in some cases, private organizations performing public tasks are considered as agencies. Governments may move some functions out of their control (e.g., through privatization), but they are still ultimately responsible for providing basic services to the public (e.g., the privatization and breakup of British Rail).

Key Issues

Roles and Functions

Agencies typically implement policies. They are, in most cases, responsible for delivering public services and public goods, such as public transport, public infrastructure, public security, and so on. This means that the role of agencies can be observed in virtually all policy fields or areas for which government is responsible. The observation that many agencies deliver public goods and services is in line with some NPM-like doctrines that advocate a so-called primacy of politics. According to such doctrines, politicians are democratically legitimized to decide on (the content and scope of) policy, while the main role of administrative actors (e.g., agencies) is to implement these policies. This strict dichotomy between policy (politicians) and operations (administrative actors) should be nuanced on at least two points. First, in reality, we can often observe in many countries that agencies have a large role to play in regulatory policy. In the policy domains of many countries, it is agencies that are the responsible actors to regulate the market in important policy fields such as energy supply, telecommunications, and postal services. These “regulatory agencies” have thus a strong policy element in their task and role (setting standards and norms, controlling market players, [helping in] defining the regulatory framework in the policy field, etc.). Second, recent research shows that agencies that are mainly involved in implementing policies (delivering public goods and services) often have a large role to play in policy making too.

Key Variables: Autonomy and Control

Agencies are generally characterized by two key variables: (1) their autonomy vis-à-vis the political and administrative oversight authorities and (2) the way in, and the extent to, which they are steered and controlled by these oversight authorities.

Autonomy

Autonomy of agencies refers to the discretion these agencies have to make decisions of their own or the extent to which the agency can decide itself about issues it finds important. In this sense, making an agency more autonomous involves the shifting of decision-making competences from external actors (e.g., the oversight authorities) to the agency itself. The level of organizational autonomy of agencies (or the extent to which the agency can make decisions of its own) is determined by the scope and the extent of these decision-making competences. Two different scopes can be discerned. First, agencies may have decision-making competences that are delegated to them from the oversight authorities concerning the choice and use of inputs or organizational resources. This is the *managerial autonomy* of agencies. An agency can have managerial autonomy with respect to several types of organizational inputs, resources such as financial resources and human resources, or other production factors such as logistics, organization, and housing and infrastructure. The second scope of organizational autonomy refers to decision-making competences of the agency in policy issues or the *policy autonomy* of the agency. The extent to which an agency enjoys policy autonomy will depend on the extent to which the agency is steered by its oversight authorities on processes, outputs, or effects. Having policy autonomy means that the agency can make decisions about the choice of policy instruments, the outputs that should be delivered by the policy, and the desirable societal effects of the policy. According to NPM-like doctrines, the ideal-typical agency has a lot of managerial autonomy, to fulfill the promise of "let the managers manage" and to ensure that the first part of the equation (more managerial competences = better organizational performance) is guaranteed. Policy autonomy, however, is low in an ideal-typical agency. As already suggested above, according to NPM, agencies are mostly expected to implement policies, not to design them (the exception may be regulatory agencies, cf. supra). In reality, however, many agencies that primarily implement policies also have a large influence in designing and evaluating policy. This may not be surprising given the fact that many agencies, as day-to-day policy-implementing actors in the policy field, are experts in their field and have a clear vision on what is happening in the policy field. A final issue concerning the autonomy of agencies is the difference between formal (legal) and real (empirical) autonomy. Formal or legal autonomy is the level of autonomy the agencies enjoy according to the laws, executive decisions, and decrees that deal with the establishment of these agencies. In these (legal) documents, it is formally described to what extent and under what circumstances agencies enjoy their own decision-making competences. In reality, however, many agencies enjoy more or less autonomy than is formally described. Research has shown that this may be due to the (political) salience of the task that the agency performs. In a politically sensitive policy field, agencies may be scrutinized more intensely by politicians compared with agencies in a politically less salient policy field.

Control

The other side of the coin is the extent to, and the way in, which agencies are controlled by their oversight authorities (which may be political—e.g., ministers—or administrative—e.g., ministries). The ways in which agencies are controlled/steered by the oversight authorities can be very diverse. First, agencies may be controlled *ex ante* ("before the facts"). *Ex ante* control is the formulation of rules and standards that give direction to the actor so that the desired output (from the viewpoint of the oversight authority) will be achieved. Oversight authorities thus control the agency beforehand. They can do so by setting general or detailed rules that constrain the autonomy of the agency in using the inputs. In this sense, *ex ante* controls take the form of authoritative mandates, rules, or regulations that specify what the agency can do. Or the oversight authority can control the agency by taking the major decisions itself or by making the decisions of the agency subject to approval by the oversight authorities (e.g., nullification rights or vetoes). Second, *ex post* control or results control is in essence checking whether the intended organizational goals have been achieved by the agency (and whether there is a need for corrective future actions). Result control involves the setting of the desired organizational results (norms), checking whether or not the organizational results meet this norm, and eventually the adaptation or continuation of the organizational practice. The intention of these "after-the-fact controls" is to motivate the agency to perform well and to make good decisions. As such, agencies are made responsible for the consequences of their decisions ("let the managers manage"). Some argue that result control can be regarded as a cycle that consists of interrelated subsystems: a planning system (setting organizational goals and norms for the agency), a monitoring system (to measure the organizational results *ex post*), and an evaluation and feedback system. The past decades, alongside the rise of the NPM, a shift toward contractualization in the controlling of agencies by their oversight authorities can be observed. In many instances, newly established agencies have performance contracts or management contracts with their oversight authorities in which the rights and duties of both parties are agreed on. Generally, the commitment of the agency is to deliver goods and services, on behalf of the oversight authorities, with a high level of efficiency, quality, and customer friendliness. Indicators are developed to be able to measure the results achieved by the agencies. The commitment of the oversight authorities generally has to do with ensuring that the agency has the necessary means (financial, personnel, infrastructural) to be able to achieve good results. Also agencies that have existed for a longer time often see their control regime shifting from *ex ante* control on inputs to *ex post* control on results and have to agree on performance or management contracts with their oversight authorities too.

Accountability and Performance

Earlier in this entry, a rather normative justification for the trend toward agencification in the public sector was discussed. NPM advocates often argue that smaller, single-task executive agencies are better vehicles to deliver effective and efficient public services and have better chances to behave innovatively and in a customer-friendly way compared with large monolithic bureaucratic organizations. The practice of performance contracts, it is often argued, also enables one to really assess whether or not agencies are performing well. However, it is not certain whether the promise of better performance has been fulfilled. Scientific evidence is at least inconclusive. One question is what "performance" is. In a public sector context, performance is a broader concept than just (economical) efficiency. No doubt that in many agencies, financial efficiency may have increased due to, among others, a better focus on the job. But other values that are of importance in a public sector context such as equal treatment and impartiality in service delivery are much harder to grasp in indicators, hence to measure for performance. The point is that increased efficiency does not always have to result automatically in increased performance on other aspects of the job that the agencies perform. Second, it is—from a methodological point of view—extremely difficult to compare performance of agencies with performance of other governmental organizations (e.g., bureaucracies). This is due to, among others, the scarcity of public functions/tasks that are in reality performed by organizations of different types in the same country (the exceptions are schools, public and private). Or the lack of null measurement of the performance of the function before it was shifted to a new organizational form (e.g., postal services before and after privatization). In sum, most commentators agree that some economical gains may be observed with agencies but that it does not necessarily imply that gains can be observed in other aspects of performance such as democracy, quality, and impartiality (which are important too, especially in the public sector).

This brings us to a final key issue to be discussed here. Performance of an organization also has to do with the accountability of that organization toward its key stakeholders. The issue of accountability is an important one because one has to be aware that in the search for the economic gains of working with agencies (efficiency; this is why they are created), there is also consideration of the possible political or societal costs because of the lack of control of these arm's-length agencies. In the case of agencies, the key stakeholders are the oversight authorities, the citizens who receive public services and goods of the agency, and ultimately, the general public or the society as a whole. Agencies are put at arm's length of the government, which makes control of the agency by government (the oversight authority) more difficult. Some authors therefore argue that the so-called vertical or upward accountability (toward the oversight authorities) may be weakened. In turn, it can be argued that agencies develop mechanisms of so-called horizontal or downward accountability, which is directed to the citizen/client of the agency (e.g., customer surveys, reporting on results, ombudspersons). Whether or not downward accountability can replace upward accountability remains a point of debate. Other observers argue that vertical accountability is large, given the fact that many agencies are subject to a multitude of control practice (nullification rights, performance contracts, audits, parliamentary hearings, etc.). In such cases, lack of accountability seems to be a lesser problem.

Agenda Setting

For any decisions to be made in the political system, an issue must be placed on the active agenda of government. In political science, agenda setting is an important topic for the analysis of collective outcomes, in particular for the evaluation of their democratic nature. Agenda setting concerns the strategic choice or selection of policy alternatives from a set of all possible outcomes on which individual, corporate, and collective actors finally decide. This entry discusses two alternative conceptions of agenda setting. One focuses more on the politics of getting an issue to the agenda. The other body of literature focuses on the impact of agendas on the outcomes of the process and on the power of agenda setters in determining outcomes. These two bodies of literature are complementary and together provide a full understanding of the role of agendas in shaping policy choices.

The Politics of Agenda Setting

In recent years, agenda-setting theory has also become a prominent approach in political communication research, which describes the transfer of important topics to the public sector for resolution, as discussed extensively by Frank Baumgartner and Bryan Jones. This portion of the literature discussing agenda setting considers the political and social mechanisms through which problems are identified and then politicized. This literature reflects the strong political role of agendas in making policy.

The agenda-setting literature also has pointed to the varieties of different agendas that exist in the public sector and the manner in which issues are moved on and off these agendas. The systemic agenda represents all those issues that are deemed appropriate for the public sector to take into account, whether or not they are being actively considered. The institutional agendas are those that are being acted on, or at least actively considered, at any point of time. Furthermore, there are important political considerations concerning which institutions constitute the foci for the political activity around any issue. Some political systems, for example, federal systems and those with active court systems, provide would-be agenda setters greater opportunities than do those with fewer points of access.

For an issue to become public policy, it must pass through several different institutions. In most democratic systems, issues must go through the legislature, and often committees within the legislature, although the source of the idea may have been the bureaucracy or the political executive, or perhaps interest groups. Then the issue, once acted on, will have to go to the bureaucracy for implementation and then perhaps to the courts for adjudication. These movements may occur as a normal part of political life but generally require some forms of political impetus for them to occur.

The agenda-setting literature has also focused on the roles of policy entrepreneurs in the process of making policy. Issues do not move on and off agendas on their own but require individual actors who foster their development and their adoption. These entrepreneurs have to be prepared when "windows of opportunity" open that permit issues that might otherwise be excluded to come to the active political agenda.

Analytic Models of Agenda Setting and Agenda Control

The second approach to agendas and agenda setting has focused on the influence that agendas and the manipulation of agendas have on the outcomes of deliberative processes. Traditionally, agendas and agenda formation have played a prominent role since the 20th century in analytical political science, which investigates the power of agenda setters in the collective decision-making process. For democratic governance, agenda-setting power can undermine the democratic process when the agenda setter has dictatorial power in manipulating the aggregation of individual preferences to collective outcomes. According to the social choice and legislative analysis literatures, a major precondition for this threat of dictatorial agenda-setting power is the instability of collective outcomes under specific democratic voting rules, which may allow an agenda setter to manipulate (or hinder from manipulating) them. Irrespective of the instability of collective outcomes, bargaining theories and logrolling approaches also emphasize the importance of agenda setting when it creates a bargaining advantage for the first mover. In other words, actors who can make the first moves in bargaining are often the ones who are able to shape the final outcomes of the process.

According to Donald Schön and Martin Rein (1994), a more optimistic interpretation comes from the deliberative literature, which stresses the framing of problems to find (stable) solutions. According to John Dryzek and Christian List (2003), deliberation has been argued to assist in aggregating individual preferences by subdividing or ordering issues in a way that induces stability of outcomes. The discussions involved in deliberative decision making enable the participants to reach solutions that are stable and reflect the underlying preferences of those participants.

According to Kenneth Joseph Arrow (1951), most theoretical work on agenda-setting power originates in social choice theory that focuses on the (in)stability of collective outcomes in democratic systems, which results from the aggregation of actors' individual preferences under specific democratic voting rules. With regard to the paradox of voting, Duncan Black (1948) and others, such as William Riker, have found that collective outcomes result from the interaction preferences of the actors involved in decision making and the structure of the agenda, that is, how policy alternatives are ordered in the collective decision-making process of democracies. This has important implications for the democratic nature of collective outcomes and the power of the agenda setter who controls the decision-making process and the voting sequence of the actors involved. Under majority rule, this power is restricted only when a median voter guarantees the stability of collective outcomes in the aggregation of actors' individual preferences.

In many decision-making situations, however, the median voter hardly exists. The existence of a median voter requires that actors with single-peaked preferences vote sincerely on an ordered single dimension. Put differently, the existence of a median voter is unlikely when preferences are not single peaked, when more than one dimension exists, or when actors vote strategically. From these restrictive conditions, under which alone the median voter theorem holds, early studies such as Black (1948) show that an agenda setter is able to achieve any outcome under majority rule. This insight on the dictatorial power of agenda setters applies more generally to all minimally democratic voting rules. Another insight from research on the (in)stability of collective outcomes is that—in policy spaces with more than one dimension—outcomes are almost always influenced by the characteristics of the decision-making processes. When instability of the collective outcome is common among the participants, democratic governance is highly threatened by dictatorial agenda setting.

This skeptical view on democratic governance has stimulated further discussion and research on the power of the agenda setters in collective decision making. More specifically, the crucial question has turned toward the extent to which an agenda setter can select and perhaps manipulate the decision-making process and, if so, what implications follow from this manipulation for collective outcomes. Some of the most influential developments in this vein of research come from studies of decision making in democratic legislatures. In these analyses, the focus is on who is able to draft and to amend legislative proposals that are finally adopted by the floor. On the most general level, this literature distinguishes between different legislative procedures by the level of institutional restrictions that define the power relationship between an agenda setter and the floor. More precisely, they find that two provisions often restrict the power of the agenda setter in democratic legislatures, the competitive right to initiate proposals and the amendment right on the floor of the legislature. In many democratic legislatures, every (individual, collective, or corporate) legislator has the right to draft a proposal, which can be adopted by the floor under either closed or open rule, the latter allowing for making amendments.

With regard to the findings in social choice theory, the power of the agenda setter is highest in legislatures without the competitive right of initiative, henceforth referred to as operating under closed rule. Under this condition, the agenda setter has complete control over drafting legislative proposals, and generally, there are limited options for amendment. The sole right of initiative is particularly decisive when the agenda setter can "keep the gate closed," that is, he or she can also ignore requests for drafting proposals or possibly for amendments. However, in some legislatures, the right of initiative is indeed in the hands of a single institutional actor to increase accountability for taking legislative action. For example, in the European Union (EU), the European Commission has the exclusive right to initiate legislation. However, scholars debate whether the Commission is capable of keeping the gates of initiative closed when the member states or the European parliaments request the European Commission to take legislative action. But regardless of the answer to this debate, the provision of an exclusive right of initiative suggests that there is a trade-off between the accountability for the decision and the level of agenda-setting power, which is sometimes minimized by distributing agenda-setting power across specialized committees. Kenneth Shepsle and Barry Weingast (1984) show that specialized committees can influence the outcome on the floor by drafting proposals. Hence, the competitive right to initiate proposals may open the gates for alternative proposals and thus reduce not only agenda-setting power but also accountability for taking action.

Another institutional provision to reduce agenda-setting power concerns the amendment right on the floor of the legislature. Under closed rules, the floor can only adopt or reject a proposal, while under open rules, it can amend the proposals. Therefore, the fundamental question is whether making amendments is subject to (additional) restrictions coming from internal legislative rules. For example, the proposals of the European Commission can formally be amended by the European Council and sometimes by the European Parliament in the following stages of the legislative process, which would suggest a lower agenda-setting power for the European Commission. However, since making amendments requires an absolute majority in the Council, and sometimes the additional bicameral consent of the European Parliament, the European Commission can exploit these higher voting hurdles in a way that makes amendments unlikely. To the extent that the European Commission is able to exploit this (bicameral) restriction, the agenda setter remains de facto powerful and can shape the final outcome.

In powerful, transformative legislatures, such as the U.S. Congress, the floor retains a substantial capacity to amend proposals coming from an agenda setter or from committees that have been preparing the legislation for consideration by the plenary body. These processes tend to minimize the powers of agenda setters and make the decision-making process less predictable than if there were greater control exercised through some agenda setter. That said, such an open-rule system may have more positive democratic effects than the more constrained agenda-setting processes.

Another feature of the amendment process is that legislators often face the problem of selecting among several amendments. As Björn Rasch (2000) notes, theoretically, a large number of voting procedures exist for selecting among several amendments, but legislatures conventionally use two procedures: the successive procedure and the elimination procedure. In the successive procedure, legislators vote successively on each amendment and decide whether or not it should be adopted. If an amendment is adopted, the process ends; if it is rejected, the legislators vote on the next amendment in the specified order. In the elimination procedure, the legislators pairwisely compare and vote on amendments. The rejected amendment is dropped, and the remaining is matched against the next amendment for a vote, and so on. Under both procedures, legislators can make amendments, but the sequence of voting (and the control thereof) can highly influence the collective outcome. As under closed rule, an agenda setter can manipulate the collective outcome by determining the voting sequence when legislators vote sincerely. In general, amendments that are introduced late on the agenda have a higher probability of adoption. However, when legislators vote strategically and anticipate the outcome, the reverse is also possible.

Although this research commonly finds that agenda setters remain powerful actors in democratic legislatures, some additional insights into the collective instability of outcomes in legislatures warrant greater empirical attention. Theoretically, the agenda setter can produce any collective outcome when legislators vote sincerely, but the scope of manipulation is often restricted when extreme outcomes are much more difficult to achieve. A major reason for this difficulty is that the voting sequence usually becomes very long and complicated when collective outcomes hardly match with the preferences of the legislative majority. In practice, as Rasch (2000) notes, such complicated sequences are hardly observed in legislatures. Another argument against the importance of the instability of collective outcomes and the resulting dictatorial power of the agenda setter criticizes the different level of behavioral assumptions that are made for the agenda setter and the legislators, that is, when the former is assumed to behave strategically while the latter is expected to vote sincerely. When the same behavioral assumption is made and legislators also behave strategically, they can anticipate an outcome from the decision-making process, which means that agenda manipulation becomes much more difficult. Under these conditions, collective outcomes are located in the uncovered set, which generally corresponds to the preferences of legislators more closely.

According to Rasch (2000), in most (democratic) legislatures the structure of the agenda and the sequence of voting are not controlled by a single actor. The responsibility for formulating the agenda is often delegated to the government of the day or to the speaker, but proposals can usually be amended by the parliament or the floor. Hence, when agenda formation is de facto made under open rules, the power of the agenda setter shrinks, and the set of feasible outcomes is restricted to the uncovered set. Given that result, most empirical research suggests that democratic institutions are designed in a way that restricts the power of the agenda setter. For example, the rules can make it possible for legislators to gather more information on their preferences in the decision-making process and thereby induce more stability by providing information. As with the deliberative processes mentioned above, the involvement of more potential decision makers can produce more stable outcomes than more hierarchically determined outcomes in legislatures.

A highly effective (but rarely observed) method of agenda setting in legislatures is to employ procedures in which the intensity of individual preferences is expressed by the number of votes assigned to an alternative (e.g., border count voting). Another way to restrict the power of the agenda setter would be the application of "backward-moving" instead of "forward-moving" agendas. In forward-moving agendas, legislators first take a vote between the status quo and a single alternative, while backward-moving agendas reverse this sequence and place the vote on the status quo on the final stage. As described by Shepsle and Weingast (1984), this procedure for establishing agendas usually limits the ability of the agenda setter to manipulate the outcome of the decision-making process vis-à-vis the status quo. Hence, empirical analyses rarely support the skeptical view on the democratic nature of legislatures when the dictatorial power of the agenda setter is only derived from an inherent instability of outcomes: Cases in which such manipulations have been observed are exceptionally rare in the real world.

Another way to study agenda setting under open rules is described by bargaining theories. In this approach, the implications of open rules often follow the idea that legislators make alternating offers to each other and decide whether they should accept a proposal for a final vote on the floor or whether they should attempt to amend it. In this bargaining process, the legislators are commonly assumed to behave strategically and to make proposals that they believe are acceptable to others involved in the process. They still would, however, only make proposals that would maximize their own benefit. A key feature of these bargaining models is that they assume that time is costly; that is, the benefits from reaching an early agreement are higher than those derived from reaching the same decision later. Hence, whenever an actor drafts a new proposal, the benefit is assumed to be lower than that derived from adopting the proposal of the earlier round, and so on. As a consequence, actors do not waste their time in infinite sequences of offers and counteroffers. This assumption is often sufficient to identify a solution from the agenda-setting process; that is, when no actor has an incentive to amend a proposal, then some generally acceptable solution has been reached. This assumption about the process implies, however, that actors can benefit from making early proposals in decision-making situations. For the same reason, this also favors patient actors, who can better afford to make counterproposals in the long run. As David Baron and John Ferejohn (1989) note, under majority rule, first movers have an additional advantage in shaping their agenda because their proposal can affect the winning coalition that results from the negotiations. Irrespective of the instability of collective outcomes, bargaining theories also support the view on the importance of agenda setting in collective decision making. Apart from institutional features, these theories demonstrate that actor-specific characteristics, such as the impatience of legislators, have an important impact on which proposals come to a vote and who shapes the final outcome in the negotiations.

These insights into agenda setting are derived from fixed policy spaces, while another line of research addresses the question on how issue linkage or package dealing can change the decision-making process and collective outcomes. According to Elmer Schattschneider (1960), from a strategic perspective, actors may seek to (de-)emphasize particular issues in order to maximize their influence on collective outcomes. With regard to agenda setting, this maximization strategy can comprise several means: First, an agenda setter may bring issues to a vote on which he or she has a winning position, creating a "bandwagon" effect. Another strategy might be to introduce new issues into a policy space that others do not sufficiently address. Hence, issues may strategically be added or removed from the agenda by the agenda setter to reshuffle majorities in collective decisions. Following this idea, issues become prominent when the agenda setter is interested in their awareness.

Conclusion

These analyses of the literature on agendas suggest that analytical political science and political communication research can come together for a future common research agenda. The communication literature emphasizes the role of entrepreneurs and their contribution in shaping agendas. The analytic perspective adds an even more strategic sense and examines how the agenda setter can manipulate the political process to produce desired policy outcomes. These two perspectives are largely complementary but too infrequently are brought together in a more comprehensive analysis of the setting and manipulation of political agendas.

Aggregate Data Analysis

Aggregate data are quantified attributes of collectivities that either relate to the body of interest as a whole (e.g., the level of democracy for countries) or have been aggregated on the basis of the properties of individual members of the collective. Aggregate data could also be negative, that is, *not individual data*, meaning that aggregate data refer to bigger entities (e.g., nations, regions, or companies) than individual data do (e.g., voters, workers, or inhabitants of some geographic area). The process of aggregation can be performed by calculating sums or various means (e.g., geometric or arithmetic mean) of the frequency distribution of individual cases. Aggregate data are predominantly secondary data; that is, researchers do not usually collect such data on their own. Another distinction refers to macro- versus microdata, with aggregate data always referring to quantities on a higher meso- or macrolevel. In this entry, types and sources of such data, major problems of reliability and comparability, and the possible applications of aggregate data are discussed.

Kinds of Aggregate Data

There are three types of aggregate data:

1. data relating to a collective as a whole (e.g., population or democracy indices, number of veto players or other characteristics of political systems);
2. aggregated individual data (e.g., the Gini Index for measuring income disparities, or the unemployment rate), which can be subdivided into two types:
   a. census data, where every single case of the whole population is measured (complete inventory count)
   b. data from samples, which should fit the context of the research question and be as representative as possible; and
3. event data, which give a frequency of events within a given period, mostly gathered from media sources (event data have become important sources for analysis, especially in international conflict research).

Basic Problems With Aggregate Data

There are some basic problems in comparative studies using aggregate data that have to be taken seriously. The first problem is *whole-nation bias*, which results from ignoring subnational variation; loss of information and reduced complexity are the consequences. Second, aggregate data are often measured in monetary units (e.g., for expenditure, import or trade volumes). For reasons of comparability between countries, the different currencies are most often translated into dollars or euros, which poses the problem of finding an adequate exchange rate for standardizing to the dollar or euro. One such standardization uses purchasing power parities, which may be misleading. Another alternative for comparing aggregated data is to standardize using a percentage of a national product measure. The choice and correct measurement of such indicators (e.g., gross domestic product [GDP] or gross national product [GNP]) are difficult and problematic; official data do not account for huge differences such as those concerning black markets or forms of subsistence income.

Intercountry comparability is also undermined by the use of different bases of calculation and a dissimilar inclusiveness of the indicators. An example makes this clear: The military budget is not identical with the budget of the Ministry of Defense. There may be a number of military expenditures (e.g., for the suppression of terrorism) that fall under the authority of other departments, such as the Ministry of the Interior. Another complication is the fact that the allocation of funds for such expenditure may vary from one country to another. The varying levels of quality in collecting data among countries can serve as a source of heteroskedasticity (i.e., a nonconstant variance where one expects a constant variance in the data). Therefore, different methods of data collection (e.g., estimation instead of more exact measurement) lead to less reliable data and, in the end, to poorer estimations in regression analysis.

Depending on which institution supplies the data (e.g., the Organisation for Economic Co-operation and Development [OECD] or the International Monetary Fund [IMF] for public finance data), huge differences for measures of the same variables are often seen. Also, revisions over time can lead to serious distortions. OECD data, especially GDP, are revised every 5 years. Apart from comparisons between countries, the comparisons between different points in time within one country can be flawed as well; for example, if statistical offices change their systems of data acquisition and calculation, poor intertemporal comparability can result. Another problem regards event data that mostly depend on media sources; in such cases, selective media coverage can lead to overrepresentation of events in countries with a highly developed media infrastructure.

A different problem in interpreting aggregate data is known as the *ecological fallacy*. It occurs when inferences drawn about individuals are based solely on data at a higher level of aggregation. For example, when analyzing referenda on European integration, it turns out that rich countries—in terms of GDP—tend to vote less in favor of Europe. By contrast, Eurobarometer statistics show that in most countries individuals with higher incomes tend to vote more pro-Europe than do those with lower income. The ecological fallacy would be to falsely conclude from the strong correlation at the highly aggregated level a correlation at the individual level.

Reasons for the Use of Aggregate Data

So why should political scientists, despite all these basic problems, still be interested in aggregate data? The answer begins on a basic level of theoretical scientific principles with a paraphrase of the well-known Kantian claim that concepts without data are empty, while percepts without concepts are blind. Data without theory also are *blind*, but theory equally needs data, because standing on its own it would be *empty*. Generally speaking, social researchers need to have access to data in order to test and develop hypotheses derived from models and theory. Both deductive and inductive approaches need data. Aggregated data should be used in particular (a) when the theory is already formulated at the macrolevel and (b) when the use of primary and individual data would be problematic in terms of availability, comparability, usability, and cost.

Time series of aggregate data are also a strong resource for detecting causal mechanisms. For example, a detailed analysis of the historical evolution of democracies, such as Samuel Huntington's "waves of democracy," would have been impossible without measurements of democracies such as those made in the Polity IV database. Another advantage of aggregated data is the possibility of making predictions on the macrolevel, for example, for economic, demographic, or political developments.

Furthermore, reasons for the use of aggregate data arise from the fact that they are especially suited for the use of statistical methods (from simple descriptive statistics to the most sophisticated methods of analysis) allowing for efficient comparisons of large spatial and social units of analysis. With the use of statistics, political scientists are also able to test reliability and to replicate other analyses quite easily.

Sources of Aggregate Data

The availability of aggregate data is important when it comes to the analysis of historical data. One such aggregate data analysis, generally considered the first, was a study of suicide rates in different countries by Émile Durkheim. Durkheim came to the conclusion that suicide is more common in predominantly Protestant countries than in Catholic ones. Max Weber was another early user of aggregated data, using information provided by the national statistical offices, which were established in the late 18th century (1796 in Sweden, 1797 in Norway, 1800 in France, 1829 in Austria). National statistical offices today are still one of the major sources for aggregate data. Other data suppliers are international organizations (e.g., UNSTAT, Eurostat, the World Bank, the IMF), which collect and prepare national data for international comparisons. One of the most comprehensive archives for international comparisons, especially for the developed countries, is hosted by the OECD. Its data archives developed rapidly (in part, due to advances in computer and Internet technology) and provide new research possibilities in terms of quantity, quality, and access to data. The steady increase in data availability gives researchers the opportunity to tackle new scientific problems and, by using data collected at different points in time, to employ longitudinal research designs. National social science data archives such as the Inter-University Consortium for Political and Social Research (ICPSR) in the United States, the UK Data Archive hosted by the University of Essex, and the "Zentralarchiv" at the University of Cologne, Germany, provide access to specific social science data, often international as well as national data. There are also special data archives serving particular purposes, such as the Luxembourg Income Studies (LIS), which provide comparable income data.

Although easy to use, these data archives bear some potential risks as well. The first risk is empiricism, or as Jan-Eric Lane (1990) put it, there is the "constant hazard that data considerations govern the conduct of comparative inquiry instead of theoretical considerations" (p. 191). Data archives are often constructed without an underlying social science theory, obstructing a sensible selection of information, which in the end could result in a boundless gathering of data that are inapplicable or unusable. This problem of too much, perhaps irrelevant, data stored in archives can be explained as most archives have some bias toward certain types of data that are readily stored; furthermore, relevant information that is more difficult to measure is thus underrepresented. Other less serious problems of data archives that can nevertheless result in a lot of time-consuming work for the social scientist are the contextual problem and the processing problem. The first concerns the fact that data in most archives have been assembled only for certain types of research problems and thus may not be suitable for other research questions—one often has to at least reassemble the data in a way appropriate for testing one's hypotheses. The latter refers to the myriad possibilities of data storage and formatting, frequently impeding the simple use of data with the statistical package of choice.

In addition to data archives, printed sources can be used to construct a data set: The classical way is to take handbooks with either thematic or regional foci. Examples of the first kind are Dieter Nohlen's compendia of elections in the world, the electoral almanac of Thomas Mackie and Richard Rose, or the *Political Data Handbook* by Jan-Erik Lane, David McKay, and Kenneth Newton. Furthermore, the revolution in information technology has cleared the way for new possibilities to gather data, so that the Internet has become the most important data source for scholars around the world. The quantity of online resources is enormous, but from an academic point of view the quality, especially in terms of the validity of the data, is mixed. Many privately run websites do not meet scientific standards.

Analyses That Can Be Done With Aggregate Data

Existing data sets can be used either for replicating former studies (for which these data sets have once been made) or for running further analyses. In a metastudy on the use of data sets in comparative politics, Andreas Schedler and Cas Mudde found that the data sets used in articles published in six of the leading English-speaking journals of political science between 1989 and 2007 show some striking characteristics:

1. Nearly half of all observed studies using data sets are single case studies and only a minority (24.5%) are large-*N* studies with more than 20 countries in the sample. Large-*N* studies, however, are becoming more and more common. In 1989, only one of the 30 studies had more than 20 cases; in 2007, these were already 41.4%.
2. Depending on data availability, most studies center on the Western world and only on a small subsample of all the thematic fields comparative politics has to offer; thus, it is a small world, the world of comparative political statistics.
3. In accordance with these findings, it is not surprising that the well-known global political data sets, such as Freedom House, Correlates of War, or Minorities at Risk, are not used as frequently as expected; rather it is the class of country-specific data sets that is most often applied.

The last important finding of their study is that only a very small minority of researchers are able to perform their analyses without modifying an existing data set. Most scientists have to modify, update, or refine existing data sets to fit their research questions. For a considerable number of studies (38.7%), comparative scholars had to completely construct new data sets on their own.

In general, each aggregate data analysis starts with a simple description of the data. This task can be performed by using either tables or graphical means such as bar charts or box plots. For some simple comparisons, this level of analysis may be sufficient, but most researchers have more specific research questions that they want to address via aggregate data. Let us assume that a political scientist is searching for the causes of government termination in parliamentary democracies; that is, the dependent variable is the time in office. The theory states that in addition to other factors, the polarization of the parliament, the economic environment, as well as the time already spent in office should play a significant role in early terminations. The first step of the analysis would be to select a sample of cases. For this research question, a most similar case's design seems appropriate, resulting in a selection of all countries having a sufficiently long record as a parliamentary democracy (say, 20 years) and having all necessary information for testing the theory available. This leaves us most likely with the OECD countries and thus quite a small number of cases (approximately $N = 20$)—that is, if we consider each country as one case. Doing so, we could compare the mean government duration of the countries with the means of the explanatory variables, for example, via bivariate cross-section regressions. The results would nevertheless not be very strong because the relationship between the independent variables and the dependent variable is likely more complex than a simple bivariate relation and the independent variables are probably intercorrelated. Therefore, it makes sense to test the theory with multivariate regression methods.

Here, a problem arises that is quite common in social science. On the one hand, there is a small N, and on the other, there are very complex models, consisting of many possible explanatory variables. This constellation generates a severe problem for statistical analyses, as the degrees of freedom are in these circumstances mostly not sufficient for a sound estimation of statistical models. There are two ways to handle this problem: (1) decrease the number of independent variables or (2) increase N. One way to minimize the explanatory variables is to construct indices. In our example, the economic environment measured by the two variables, *inflation* and *unemployment rate*, could also be covered by a combination of both, called the *misery index*. Decreasing the number of independent variables can be done only in special circumstances; in most instances, researchers will have to exclude certain explanatory variables from their models. The other possibility is to increase the number of cases. This task is generally quite difficult. A potential alternative is to not only look at the national level but also include subnational entities, when this is appropriate. In our example of government duration, this could be possible in some federal states, but the independent economic variables being defined on the national level undermine a meaningful comparison. Another possibility, which has become quite popular during the past few decades, has been the use of pooled time-series cross-section analysis. The pooling of yearly data into a matrix generates more cases (more precise observations) for the analysis. This procedure nonetheless raises new problems such as autocorrelation, which violates the assumption of random distribution of cases that is required by the standard ordinary least squares (OLS) regression. Pooled analyses, therefore, have to be used—if at all—in an extremely careful manner. When all these procedures do not result in a satisfactory cases to independent variables ratio, qualitative comparative analysis (QCA), a technique using Boolean algebra, could be applied. Fortunately, in our example, it is easier to maximize N, because every government can be regarded as a single case, and the data do not have to be aggregated further. Thus, it is possible to run multivariate regressions on a sample of all governments. However, the best methodological choice is probably not a regression but an event history model, which takes, apart from the other independent variables, elapsed time as a relevant factor into account.

Alienation

Political alienation was introduced in political and social thought in the 19th century. From the beginning, the concept was broadly, ambiguously, and inconsistently used by scholars, mainly because of its ideological connotations and purposes. In Hegel's and Marx's analyses of civic and capitalist society, alienation meant a state or a process of human disconnectedness. According to Claude S. Fischer, "alienation is the state in which the actor fails to perceive a positive interdependence between himself and social relationships or other objectifications" (1974, p. 18). According to Melvin Seeman, the most important elements of this conceptualization are the following:

1. Alienation refers to a kind of "discrepancy"—something that is only implicitly entailed in the definition before.
2. The individual himself or herself or his or her social environment functions as a target or a source of alienation.
3. Alienation can be regarded as a state or as a process.
4. It can be considered as a social situation/relationship, an individual mental state, a social circumstance, or a sentiment.

These aspects are discussed below.

In contemporary social science, alienation was restated as an essential part of the critique of advanced capitalism by authors like Erich Fromm, Herbert Marcuse, and Alain Touraine. Alienation, understood as an objective state or process, refers to a lack of socioeconomic resources, an underprivileged social status, an inferior position in a power relation, a lack of autonomy in labor relationships, or the degradation of objective life conditions. As a subjective feeling, it has several different meanings, such as a perceived loss of something considered valuable, a sense of inferiority, feelings of frustration, isolation, anomie, lack of control of one's own life conditions, or a perception of being manipulated by powerful others or by social structures. Drafted like this, the concept found its way in various scientific disciplines such as philosophy, psychiatry, psychology, sociology, and political science. Manifold social and psychic/attitudinal states and processes were subsumed under the heading of alienation, ranging from physical or mental illness to specific attitudes toward politics, such as political distrust or feelings of belonging to a discriminated social group (class, ethnicity, etc.). In modern political science, alienation was used more narrowly and referred to negative or critical political attitudes often leading to deviant political behavior. The topics that have been most prominent in empirical political research on alienation are analyses of various dimensions of the concept and its measurement and analyses of the impact of feelings of alienation on individuals' political behavior, particularly political apathy and participation in protest activities.

Other than the view of *alienation* as a general, diffuse disposition, the term was used as a multidimensional concept in empirical research. In this regard, Seeman was the leading scholar proposing a distinction of the subsequent six different dimensions of alienation, which were primarily understood as mental states:

1. *Powerlessness* refers to an individual's perception of low self-esteem or inferiority in political life or to a sense of low control of one's

own life conditions and the political circumstances one lives in. People feeling politically powerless think that they do not have any opportunity to make their voices heard in political life and to influence the conduct of public affairs. Some scholars distinguish between personal and political powerlessness, with the first set of attitudes describing the (lack of) ability to master one's own life and the second set referring to the perceived (lack of) capacity to exert some degree of influence on politics. The feeling of powerlessness comes quite close to the sense of political (in)efficacy or subjective (in)competence, which are much more familiar concepts in political science. It was often measured by using the ANES (American National Election Studies) standard items on political efficacy. The I-E (Internal-External Locus of Control) Scale developed by Rotter is the most common alternative measure.

2. *Meaninglessness* has to do with the individuals' sense of being able to comprehend political events, situations, and decisions and with the individuals' assessment of the impact of politics on their own lives. In short, people suffering from meaninglessness are cognitively disconnected from social and political life. This attitude resembles to a certain degree the cognitive component of powerlessness and thus is often interpreted as a facet of political (in)efficacy.

3. *Normlessness* as the third subdimension of alienation is largely synonymous to anomie and signifies the expectation that only the use of socially unapproved means will lead to the achievement of given goals. This expectation is due to the perception that social norms regulating individual and collective behavior do not perform their function any longer. Hence, political leaders do not react in a calculable and responsive way to citizens' demands. Those citizens who are well aware of this situation will rely on illegal or illegitimate forms of political behavior. In the practice of empirical research, normlessness is often equated to distrust and measured by the ANES standard items on trust in government. Alternative scales such as Dean's scale of normlessness and McClosky and Schaar's scale of anomie were also used in empirical research.

4. *Self-estrangement* seen as a failure of self-realization is the classical master theme of philosophical work on alienation and originated in the Marxian analysis of working conditions and relations. Accordingly, a lack of intrinsic fulfillment in work or an incapability of controlling one's working conditions is regarded as the core element of self-estrangement. In widening this narrow conceptualization, some scholars proposed regarding self-estrangement as an individual's engagement in activities that are not appreciated as intrinsically rewarding or are considered inauthentic. In empirical political science research, this dimension is not particularly important.

5. *Cultural estrangement* overlaps to a certain degree with normlessness and self-estrangement. It means the individual's rejection of commonly held values in society, while normlessness is seen as a rejection of more specific social norms. Again, the concept does not play a major role in empirical research, despite the important role attributed to value consensus as a source of social and political integration.

6. *Social isolation*, as the sixth subdimension of alienation, was originally seen as a lack of social relationships rather than as a mental state. In practice, however, both aspects cannot really be separated from each other. Lack or loss of social ties does not become a serious problem for individuals unless it will be perceived and assessed. Thus, social isolation signifies not only a whole set of behaviors and attitudes, a sense of being excluded or lonely, a lack of identity, a feeling of being rejected or discriminated as a member of a particular social group but also deviating behavior and lack of integration into social networks. Social isolation is used as an explanatory concept in some community studies, but it is clearly less influential in empirical research than powerlessness and normlessness.

Empirical social science research on alienation reached a point of culmination in the late 1960s and early 1970s when it was mainly embedded in two specific research contexts. The first one was the theory of mass society, which was a fashionable idea to many social scientists in that period. The second impetus came from empirical research on political protest activities and movements, which used the notions of alienation, cynicism, and subjective deprivation as the main explanatory concepts. The approach to alienation in analyses of mass society was far broader than in empirical research on political protest. As outlined by Seeman, the general research question of the former referred to the relationship of social change to political alienation, while the latter focused on various forms of behavior induced by feelings of alienation. An integration of these three sets of variables (structure, attitude, behavior) was largely missing in empirical research on alienation. An overview of the assumed links between the respective variables is outlined in Table 1.

Even if we agree to the idea of an impact of social change (particularly rapid and deep social changes) on the individual's perception of society and his or her own place in it as well as to the view of alienation as a source of deviant behavior, the specific hypotheses implied in Seeman's scheme are far from being conclusive. Political research focused on a smaller set of behaviors as well as attitudes. A first line of empirical research evolved in analyses of participation in civil rights protest movements and thus can be interpreted as an extension of classical studies of the behavioral impact of deprivation. Other research focused on the observation of an increase of political protest in affluent societies and on political protest as a means of privileged groups. The underlying assumption was that objective deprivation is not the only determinant of protest, even violent protest; negative feelings toward the political environment may also be a prominent source of protest activities. Two dimensions of alienation, powerlessness and normlessness, became particularly prominent in empirical research. According to the efficacy-distrust hypothesis, lack of powerlessness (efficacy) is a necessary condition for any type of political activity, since the powerless will generally abstain from participation irrespective of its specific form. Whether the powerful or efficacious will use protest or conventional means of exerting influence will depend on the presence or absence of normlessness (distrust). While the combination of efficacy and distrust leads to (illegal) protest, the efficacious and trusting use conventional forms of political participation such as voting, becoming active in parties, and so on. However, the empirical evidence on the efficacy-distrust hypothesis is not convincing, as is the case for the impact of alienation in general.

In assessing the state of research on political alienation, Seeman came to a rather pessimistic conclusion that still holds true today. According to him, research was often characterized by ideological convictions rather than by conceptual clarity and imbalanced by dealing mainly with powerlessness, normlessness, and social isolation and by neglecting the other components. The theoretical underpinnings of empirical research on political alienation have remained weak so far, the constructs have been used in an inconsistent manner, the measures were poor, and the empirical findings contradictory.

ALLIANCES

Alliances are among the most studied aspects of international cooperation and play important roles in most broad theories of international relations, particularly theories of war and peace. They are an important component of the security policies of most states in the international system today. This entry first defines and describes alliances, then discusses the motivations of states to form alliances and the effects of alliances on international outcomes.

An alliance is a formal agreement among independent states in the international system to cooperate militarily in the event of militarized conflict with outside parties. Alliances are distinguished from informal alignments by their codification in a written document; while states that share interests and tend to coordinate behavior may be termed *aligned*, only states that have made an international legal commitment to assist one another are *allied*. Alliances are distinguished from protectorates, unilateral guarantees, and colonial relationships by their joint commitments; all member states retain sovereignty and independence but commit to adjust their policies to meet allied goals. Commitments need not be symmetrical, but all alliance members must make some cooperative commitment. Finally, alliances involve promises of assistance in the event of military conflict with outside parties. Thus, they are distinguishable from other forms of military cooperation such as arms sales agreements and intelligence-sharing agreements.

Formation and Provisions of Alliances

Most alliances are formed through treaties. The specific promises made in these treaties can vary significantly. Some alliances commit the signatories to assist one another in the event a member state is attacked; these are often referred to as defense pacts. An example of a defense pact is the North Atlantic Treaty Organization (NATO). Other alliances provide for states to assist one another in accomplishing offensive goals, usually in addition to defensive promises. The Pact of Steel, signed by Germany and Italy in 1939, is an example of this sort of alliance. Many alliances, however, fall short of guaranteeing active participation in conflicts that may arise and instead commit the member states to remain neutral and provide no support for the adversary of an ally in the event the ally becomes involved in conflict or commit the members to consult in the event of threat and make every attempt to produce a coordinated response, without any specificity about what that coordinated response might be. The Molotov-Ribbentrop Pact (also known as the Nazi-Soviet Nonaggression Pact) signed in 1939 is an example of a neutrality pact, and the Treaty of Good Neighborly Friendship and Cooperation signed by Russia and China in 2001 is an example of a consultation pact (also known as an entente).

In many cases, alliance treaties also specify the conditions under which the obligations come into force. Rather than applying to any military conflict, an alliance may, for instance, apply only to conflicts with specific adversaries, in specific locations, or in conjunction with a specific dispute. The NATO treaty, for instance, specifies that it applies only to the home territories of members and does not commit members to defend their allies' colonial possessions. Defense pacts signed by France with both Poland and Czechoslovakia at Locarno, Switzerland, in 1925 commit the states to assist one another only in the event of unprovoked attack by Germany. And some treaties (for instance, the Convention of London signed by France, the United Kingdom, and Italy during the Crimean War) are limited to a specific ongoing conflict, committing the states to work together only through the conclusion of the current war.

Alliances also vary in the level of peacetime investment and coordination they require. While some alliance treaties only require action in the event conflict emerges, others provide for the development of organizations and military integration during peacetime, for one state to place troops on the territory of an ally during peacetime, and/or for shared development of defense and foreign policy. In addition, alliances vary in size and length of term. Some alliances are bilateral agreements, while others are large multilateral entities. Some alliances are formed for temporary purposes, for instance, for the duration of an ongoing war; whereas others are designed to last for long periods of time, for instance, 20 years, with provisions allowing for renewal.

Purposes of Alliances

So why do states form alliances? The most basic reason is that by joining their military forces with those of other states, they become stronger fighting forces. Given that the international system is anarchic, all bargaining among states takes place in the shadow of the use of force. States that can muster more military force can retain their security and compel concessions from others. States maintain their security by deterring threats against them, and successful deterrence requires convincing potential adversaries that pursuing gains at a state's expense through the use of force would be unsuccessful and/or prohibitively costly due to the state's ability to wage a successful war. Similarly, states can receive concessions from other states by convincing those states that resisting demands will be unsuccessful and/or prohibitively costly due to the superior military power of the challenging state or coalition. In the event that deterrence or compellence fails, and states find themselves at war, they are more likely to win the war with allied support than without.

Alternatively, states may use alliances to reduce their individual defense burdens. To the extent that economies of scale exist in the provision of defense, states might find it more efficient to combine their defense preparations with other states rather than bear the full burden of defense provisions on their own. For instance, many states found it more efficient to rely on the U.S. or the (former) USSR nuclear umbrellas during the Cold War rather than to develop their own nuclear weapons programs. Similarly, states may have different comparative advantages in defense (e.g., land power vs. sea power) and benefit from combining their efforts.

Interestingly, however, many alliances are formed between strong states and weaker states. Since weaker states usually cannot offer much increased military power to strong states (with the exception of a few weak states that occupy strategically important geographic locations), one might reasonably ask why strong states would see benefit in allying with weaker states. Two explanations (which are probably both accurate) have been proposed. One is that strong states have a self-interest in the security of some weaker states due to factors such as valuable economic relationships or rivalries with other major powers and are willing to bear the costs of defending those states. The other is that weaker states are willing to offer stronger states other advantages—for instance, foreign policy control, use of their territory and resources, or compliance on particular issues of interest to stronger states—in return for an alliance.

Implementation and Impacts of Alliances

Yet given that there is no institution to provide external enforcement of contracts in the international system, one might wonder why states believe that alliances will be reliable. How can state leaders be assured that their allies will not abandon them in the event of attack? In fact, this is a significant concern and almost assuredly prevents some potentially beneficial alliances from occurring; states should be reluctant to depend too heavily on other states to guarantee their security and when deciding to form alliances must consider the incentives that their allies will have for fulfilling their alliance commitments in the event of conflict. That being said, many allies do have incentive to work with their partners due to shared interests, and the formalization of cooperation in an alliance treaty enhances the probability of future joint action. Forming and institutionalizing an alliance are costly. Not only do states have to negotiate the agreement, they then have to implement military coordination clauses and coordinate their foreign policies to make the alliance credible. In addition, violating a previous commitment can have negative repercussions for the international reputation of a state and the domestic reputation of a leader. Thus, many scholars believe that states that invest in forming alliances have increased incentive to fulfill them in the event that alliances are invoked.

So how do alliances affect outcomes in the international system? The strongest effects of alliances are on the probability that militarized disputes occur and the probability that wars expand. Alliances affect the probability that states challenge the current status quo and make threats involving the use of military force. States with allies are less likely to find themselves challenged because potential adversaries understand that to compel compliance would involve facing a joint military effort involving the target and its allies. On the other hand, states that have allies committed to help them may be more willing to challenge the status quo and threaten the use of force in the expectation that their targets will concede their demands.

Yet, while defensive alliances may deter the initiation of disputes, when deterrence fails, states with allies may be more willing to resist a challenger's demands and take the dispute to war. If this happens, the war is unlikely to remain a bilateral affair. Alliances tend to diffuse wars beyond their initial participants and create larger, more severe conflicts. Because defensive alliances both deter disputes and make it more likely that failures of deterrence result in particularly large and severe wars, it is not easily apparent whether alliances have an overall dampening effect on international conflict.

Many scholars claim, however, that alliances have spillover effects on other kinds of international cooperation. Some argue, for instance, that allies tend to trade more with one another, that allies are more likely to settle disputes among themselves peacefully, and that institutions initially formed to support alliances become useful for a wide range of other cooperative activities as well. A large number of alliance treaties include specific provisions for nonmilitary cooperation in addition to military cooperation. Thus, alliances may have an indirect pacifying effect as well.

In conclusion, scholars today have considerable agreement on a definition for alliances, on how alliances can be distinguished from other relationships, and on the varying reasons why states form alliances. Research continues in an attempt to specify more precisely the full range of effects of alliances on international outcomes.

Analysis of Variance

Analysis of variance (ANOVA) is a method for decomposing variance in a measured outcome into variance that can be explained, such as by a regression model or an experimental treatment assignment, and variance that cannot be explained, which is often attributable to random error. Using this decomposition into component sums of squares, certain test statistics can be calculated that can be used to describe the data or even justify model selection. Lab experiments have become increasingly popular in political science, and ANOVA is a useful tool for analyzing such experiments. In recent years, there have been a number of laboratory experiments on the effects of campaigning and media advertising. Nicolas Valentino, Vincent Hutchings, and Ismail White (2002), Diana Mutz and Byron Reeves (2005), and Ted Brader (2005) have all performed lab experiments that aim to determine the effect that campaigning and advertising in media have on voters views and decisions. All three experiments employ an ANOVA to control for observable characteristics, interactions between treatment regimes, and significance of the relative effectiveness of treatments. This entry discusses ANOVA and its applications in greater detail.

In the familiar regression context, the "sum of squares" (*SS*) can be decomposed as follows. Assuming that Y_i is individual *i*'s outcome, $\bar{Y}$ is the mean of the outcomes, $\hat{Y}_i$ is individual *i*'s fitted value based on the ordinary least squares (OLS) estimates, and e_i is the resulting residual,

$$\sum_{i=1}^{N} (Y_i - \bar{Y})^2 = \sum_{i=1}^{N} (\hat{Y}_i - \bar{Y})^2 + \sum_{i=1}^{N} (e_i^2),$$

where

$$SS_{\text{total}} = \sum_{i=1}^{N} (Y_i - \bar{Y})^2$$

is the total sum of squares,

$$SS_{\text{regression}} = \sum_{i=1}^{N} (\hat{Y}_i - \bar{Y})^2$$

refers to the variance explained by the regression, and

$$SS_{\text{error}} = \sum_{i=1}^{N} (e_i^2)$$

is the variance due to the error term, also known as the unexplained variance. Commonly, we would write this decomposition as

$$SS_{\text{total}} = SS_{\text{regression}} + SS_{\text{error}}.$$

The equations above show how the total variance in the observations can be decomposed into variance that can be explained by the regression equation and variance that can be attributed to the random error term in the regression model.

ANOVA is not restricted to use with regression models. The concept of decomposing variance can be applied to other models of data, such as an experimental model. The following is the decomposition of a one-way layout experimental design in which an experimenter randomly assigns observations to one of *I* treatment assignments. Each treatment assignment has *J* observations assigned to it. In the case of a randomized controlled trial with only one treatment regime and *N* subjects randomly assigned to treatment with half a probability, this would mean that $I = 2$, one treated group and one control group, where each group has size *J*. In this framework, the variance decomposition would be as follows:

$$\sum_{i=1}^{I} \sum_{j=1}^{J} (Y_{ij} - \bar{Y})^2 - \sum_{j=1}^{J} \sum_{i=1}^{I} (\bar{Y}_{ij} - \bar{Y})^2 + \sum_{i=1}^{I} \sum_{j=1}^{J} (Y_{ij} - \bar{Y}_i)^2,$$

where

$$\bar{Y}_i = \frac{1}{J} \sum_{j=1}^{J} Y_{ij}$$

is defined as the average response under the *I*th treatment and

$$\bar{Y} = \frac{1}{IJ} \sum_{i=1}^{I} \sum_{j=1}^{J} Y_{ij}$$

is defined as the overall average of all observations, regardless of treatment assignment. Commonly, this sum of squares expression is written as

$$SS_{\text{total}} = SS_{\text{between}} + SS_{\text{within}},$$

where SS_{between} refers to the part of the variance that can be attributed to the different treatment assignments and SS_{within} refers to the variance that can be described by the random error within a treatment assignment. From this, we can see that SS_{between} and $SS_{\text{regression}}$, from the regression framework, both refer to the explained variance. SS_{within} and SS_{error} both refer to the unexplained variance.

Typically an ANOVA table is constructed to describe the variance decomposition. In the regression context, where *p* is defined as the number of independent regressors and *n* is the number of observations, the ANOVA table typically looks like this:

Source	*df*	*SS*	*MS*	*F*
Regression	P	$SS_{\text{regression}}$	$SS_{\text{regression}}/p$	$\dfrac{SS_{\text{regression}}/p}{SS_{\text{total}}/n-1}$
Error	$n-p-1$	SS_{error}	$SS_{\text{error}}/n-p-1$	
Total	$n-1$	SS_{total}		

This table gives us an idea as to how to break down our analysis. The column *df* refers to the degrees of freedom. In the regression framework, the degrees of freedom for the regression is the number of parameters in the regression equation. The degrees of freedom for SS_{error} is $n - p - 1$. The column *MS* refers to the mean squared error, which is defined as *SS/df* for each row in the table. If we were in the experimental one-way layout design, then the first row would refer to the between variance, and the number of treatments less one, that is, $(I - 1)$ for I treatments. The degrees of freedom for error is defined as the number of treatments times the number of trials in each treatment less one, or $I(J - 1)$ for J trials in each treatment.

The above table also contains a column called F, which refers to the F-test. The F-test is a way of using ANOVA to determine if all the regressors in a regression equation are jointly zero. In a one-way experimental analysis, the F-test determines if the means of the treatment groups are significantly different. If we have more than one treatment and one control group, then the F-test is applied to see if any treatments are significantly different from zero. The null for an F-test is that all coefficients in our model are jointly, not statistically, distinguishable from zero. The F-test is defined as follows:

$$F = \frac{SS_{\text{regression}}/p}{SS_{\text{error}}/n-p-1}.$$

Using the ANOVA table, we can also determine the R^2 value of our treatment or model. We define R^2 as follows:

$$R^2 = \frac{SS_{\text{regression}}}{SS_{\text{total}}} - 1 - \frac{SS_{\text{error}}}{SS_{\text{total}}}.$$

The R^2 refers to how much of the variance is explained by the model. A high R^2 value means that much of the variation is explained by the model, implying that the model fits the data well and that little of the variance is explained by the random error term. In the experimental framework, a high R^2 value means that much of the variation is explained by the treatment assignment, and little of the variance is due to random error within those treatment assignments.

Model Selection and Analysis of Variance

ANOVA is generally used with linear regression to assess model selection. When selecting the best model, we seek to strike a balance between goodness of fit and parsimony. If two models fit the data equally well, the model selected should include only those explanatory variables that explain a significant degree of the variance in the response variable. The question is how to distinguish between important and trivial variables in a way that is systematic. ANOVA is one method for identifying the parameters of interest. It is important to stress that ANOVA makes all the assumptions made by normal linear regression. Furthermore, in general applications of ANOVA, all the explanatory variables must be mutually orthogonal, although in some limited cases this orthogonality is not necessary to make a reasonable justification for model choice. To determine which covariates are important for the regression model, ANOVA can be run multiple times in succession to determine if adding an additional covariate contributes any more to the explained variance.

Consider two normal linear models:

$$y = \alpha + \beta_1 x_1 + \beta_2 x_2 + \varepsilon, \quad (1)$$

$$y = \alpha + \beta_1 x_1 + \varepsilon, \quad (2)$$

where x_1 and x_2 are explanatory variables, α is the intercept, and β_1 and β_2 are the parameters of interest. The second is obviously a simpler version of the first. We can think of Model 2 as the version of Model 1, in which β_2 is restricted to zero. For this reason, we often refer to Model 1 as the unrestricted model and Model 2 as the restricted model. The question is which model is better. If the restricted model fits the data equally well, then adding complexity does not improve the accuracy of the estimation significantly and the simpler (restricted) model is preferable.

In model selection, ANOVA analyzes the degree to which residual variance changes with the addition of explanatory variables to the basic model. Note that the vector of residuals for the restricted model (where $\beta_2 = 0$) can be broken into two components:

$$\begin{gathered} y - \hat{y}_1 = \{y - \hat{y}_2\} + \{\hat{y}_2 - \hat{y}_1\} \\ \hat{y}_1 = \hat{\alpha} + \hat{\beta}_1 x_1 \qquad \hat{y}_1 = \hat{\alpha} + \hat{\beta}_1 x_1 + \hat{\beta}_2 x_2 \end{gathered}.$$

Thus, the vector of residuals for the restricted model consists of a vector of the residuals for the unrestricted model plus the residual difference between the two models. By construction of OLS, the vectors $(y - \hat{y}_2)$ and $(\hat{y}_2 - \hat{y}_1)$ are orthogonal, and Pythagoras's theorem implies that the sum of squares for the restricted model is just the sum of squares for the unrestricted model plus the difference in the sum of squares for the two models, or equivalently,

$$SS_{\beta_1} = SS_{\beta_1,\beta_2} + \{SS_{\beta_1} - SS_{\beta_1,\beta_2}\}.$$

While adding complexity reduces the amount of unexplained variance in the residuals, it also reduces the degrees of freedom. This trade-off motivates the principal of parsimony in model selection. Under the assumptions of OLS, SS_{β_1} and SS_{β_1,β_2} are mutually independent and have a chi-square distribution. The F-test is therefore the appropriate test to determine whether the degree to which inclusion of each additional explanatory variable in the model improves the precision of estimation. In this case, the F-test would look as follows:

$$F = \frac{\{SS_{\beta_1} - SS_{\beta_1,\beta_2}\}/p - q}{SS_{\beta_1,\beta_2}/(p - q - 1)},$$

where p and q represent the number of parameters in the unrestricted and restricted model, respectively (excluding the intercept). Under the null hypothesis, the unrestricted model does not provide a significantly better fit than the restricted model; reject the null hypothesis if the F calculated from the data is greater than the critical value of the F distribution with $(p - q, n - p)$ degrees of freedom. The models, their sum of squares, mean square, and F-test can be displayed in an ANOVA table:

Fitted Model	*df*	ΔSS	*MS*	*F*
$\hat{y}_1 = \hat{\alpha}$	1	$SS_{\text{error}} - SS_{\hat{\alpha}}$	$\frac{SS_{\text{error}} - SS_{\hat{\alpha}}}{n - (n-1)}$	$\frac{SS_{\text{error}} - SS_{\hat{\alpha}}}{SS_{\hat{\alpha}}/(n-1)}$
$\hat{y}_1 - \hat{\alpha} + \hat{\beta}_1 x_1$	2	$SS_{\hat{\alpha}} - SS_{\hat{\beta}_1}$	$\frac{SS_{\hat{\alpha}} - SS_{\hat{\beta}_1}}{n - 1 - (n-2)}$	$\frac{SS_{\hat{\alpha}} - SS_{\hat{\beta}_1}}{SS_{\hat{\beta}_1}/(n-2)}$
$\hat{y}_1 = \hat{\alpha} + \hat{\beta}_1 x_1 + \hat{\beta}_2 x_2$	3	$SS_{\hat{\beta}_1} - SS_{\hat{\beta}_1,\hat{\beta}_2}$	$\frac{SS_{\hat{\beta}_1} - SS_{\hat{\beta}_1,\hat{\beta}_2}}{n - 2 - (n-3)}$	$\frac{SS_{\hat{\beta}_1} - SS_{\hat{\beta}_1,\hat{\beta}_2}}{SS_{\hat{\beta}_1,\hat{\beta}_2}/(n-3)}$
Total	4	SS_{error}	$SS_{\text{error}}/(n-3)$	

Often the results of an ANOVA table are used to justify the inclusion of each individual variable in the model. As the model expands from p to $p + 1$ explanatory variables, the F-test evaluates the hypothesis that the parameters $\beta_{p+1} = 0$, given the assumptions of the model are satisfied. If the explanatory variables that constitute the design matrix are all mutually orthogonal and we have the correct model, then the ANOVA results can be used to determine whether the inclusion of x_{p+1} significantly increases the fitness of the model. Without orthogonality, however, we do not know if the order in which the variables are added matters. As successive variables are added from the model, only the variance of the part of the variable that is orthogonal to the previously included variables in the model is removed from the variance of the error.

This entry has discussed the definition of ANOVA and how it is often applied to regression and experimental data. ANOVA is a decomposition of variance into component parts. There is variance that is attributable to a model, such as a regression model or an experimental treatment, and variance that is attributable to random error. ANOVA is often used to construct an ANOVA table, which succinctly presents the variance decomposition. This method can also be used to justify regression model selection where the goal is to find parsimony between fit and degrees of freedom. ANOVA can be used to determine how much extra variance a marginal explanatory variable explains while also weighing the loss of a degree of freedom. It is important to note, however, that the order in which variables are added to a model is important in these tests unless the variables are orthogonal to one another. The decomposition of variance using the analysis of variance is a powerful tool for describing data and the fit of a model.

Analytic Narratives: Applications

Often derided by colleagues for "possessing an *N* of 1," those who focus on case studies—Germany between the wars, France during the revolution, or Kasumpa village (see below)—nonetheless aspire to be social scientists. While their commitment to fieldwork, archival research, and qualitative methods runs deep, so too does their commitment to science. Analytic narratives offer a means for reconciling this apparent contradiction. Avner Greif, Margaret Levi, Jean-Lauran Rosenthal, Barry Weingast, and Robert Bates formulated the approach while focusing on historical cases. This entry illustrates the approach by reviewing its use in a study of Kasumpa village in the Luapula Valley of Zambia.

In this essay, "fieldwork" is defined as immersion in the lives of people who remain resident in their own social setting, while observing and recording their behavior and discussing with them their actions and the values and beliefs that shape it. This also includes, of course, knowledge of the local language. "Science" refers to the attempt to derive valid explanations, which implies two things: An explanation is valid if it follows logically from its premises, and it is valid insofar as it withstands efforts to refute it through the systematic collection and analysis of data. The best test of logical validity is formalization; that of empirical validity is the use of rigorous methods.

Taken together, these clarifications highlight a key feature of the agenda that underlies this method: the treatment of qualitative research, formal theory, and empirical methods as complementary rather than rival approaches to social research.

Illustration

Rural Responses to Industrialization: A Study of Village Zambia by Bates reports on a study of Kasumpa village, a settlement in the Luapula Valley that borders Zambia and Congo and forms a portion of the hinterland of the great mining centers of those two countries. The author of this study notes how, in the initial stages of his fieldwork, he sought to discern the values held by the residents of the village, their perception of the alternatives available to them, and the beliefs that shaped their behavior. The residents of Kasumpa village, he learned, quite rightly viewed themselves as poor and the mining towns as prosperous. Economic life revolved around the export of produce and labor to the mining towns; political life centered on efforts to persuade the government to generate money and jobs by investing in projects in the region. The residents sought to use the markets for produce and labor to gain access to the wealth of the mining towns, and they used political protest to levy a portion of it for themselves.

Based on these insights, the author then turned to theory. In expositing this work, this essay focuses on his treatment of migration, a subject long central to research in the region. The dominant theory of the time, developed by John Harris and Michael Todaro, viewed migration as a decision made by individuals as an effort to maximize their expected incomes. Several implications flowed from that formulation, and the author randomly selected 100 or so out of around 1,000 villagers to test them. If the theory were correct, more men than women would migrate to seek work in town, because there were more jobs for men in the mines, and the probability of securing a job was therefore greater for males than for females. The likelihood of departure from the village should be higher for working-age men: They were more likely to secure jobs than youths were and could amortize the costs of job searches better than old men could. In addition, according to this theory, when people left, they should journey to towns where others had settled before them, thus lowering the costs of job searches and increasing the return from migrating. The demographic structure of the village should therefore be distorted, with a gap where working-age men could normally be expected and a disproportionate number of females and old people of both sexes. An implication for politics also followed: While the migrants might choose to "exit" as a way of escaping poverty, those who remained should "give voice," pressuring the government to render fishing and maize growing more profitable. Phrased another way, while migrants might employ the market for labor as an alternative to political action, those who remained in the village should treat the market for commodities as a complement to it.

The data lend support to each implication, with young men flocking to the nearest mines, women and older men tending to remain behind, and fishermen and farmers dominating the local party branch and employing their positions to lobby the government for loans to farmers and investments in the local fisheries. However, while collecting the data, the researcher gained a deeper understanding of the migration decision—one that suggested that, in fact, the expected income model was wrong. Migration, it became clear, involved not only those who chose to migrate but also those they left behind and, in particular, their elder kin. Nor was migration the outcome of a choice made at one point of time; rather, it was a portion of an intertemporal sequence of moves in which the older generation paid for the costs of the movement of younger, working-age males from the village to town. Not only did they pay for transport and advance funds for sustenance during the initial period of job search, but they also paid for the costs of education so that the youths might better compete for jobs in town. It was made clear that they did this in the expectation of later receiving remittances from the young, thus assuring them of financial support in old age. In effect, rather than acting as individual agents, the residents of Kasumpa village acted as members of families and organized the relationship between generations so as to invest in the formation of human capital. By responding thus to the opportunities offered by the market for labor, they sought to extract income from the towns.

Stepping back for a moment, note the sequence and the interplay between different research methods. First, there was immersion and the gathering of qualitative information, then the formulation of theory. Next, the theory was tested, using survey methods and engaging further in "soaking and poking"—conversations about the relationships between parents and children, discussions about family life in the United States and Luapula Valley, and gossip about why X could live in comfort ("great kids") whereas Y lived in poverty ("the way he neglected his children, no wonder"). Then came the realization that the theory was wrong. The resultant crisis then restarted the cycle but not at a random starting point. Rather, because the failure took place within the context of a theory, it highlighted key features that had been missed the first time around.

It was clear that the decision to migrate did not result from a comparison between rural and urban wage rates, made by individuals who sought to maximize expected incomes, as the Harris-Todaro model might suggest. Rather, it resulted from the strategies used by members of families who sought to invest by forming human capital. Indeed, data from the surveys confirmed that the flow of finances between generations yielded a reasonable rate of return, for plausible rates of discount. But, the researcher realized, if this revised vision of the behavior of migrants was correct, then there was a *lot* he did not understand: According to the current theory, what was being observed, in fact, should not exist. Less dramatically, it suggested that the arrangement was highly vulnerable and that its persistence suggested that additional factors, not yet described, must be at play.

The theoretical difficulty came from two features of the behavior of the families. The first was that it involved an exchange; the second was that the exchange took place over time. The elders expended resources on the young at one point in time in the expectation that the young would later repay. But the preferences of the young should vary over time: They should be initially willing to pay but reluctant to do so when the bill came due later. Given this variation in preferences, the elders, anticipating the later actions of the youths, should not be willing to invest in the first place. The (implicit) contract was therefore vulnerable to the problem of "time consistency." And yet the elders were observed investing in junior kin.

Highlighting the anomalous nature of the finding was that local conditions reinforced the strength of the temptations facing the young. There was a long lag between the time when the elders bestowed resources on them and when they could be expected to remit money from town; the distance between the village and the town was great as well, making it easy for the young to dissimulate, claiming that the loss of a job, illness, or unforeseen expenses in town made it impossible to fulfill their obligations to village kin. The elders were of course aware of the impact of time and distance on the ability of the young to elude their obligations. And yet the elders continued to use their families in order to invest. The author of the study was thus driven by the failure of his theory to engage once again in the lives of the people of Kasumpa and to seek out what was being missed—accounting for their conduct, which otherwise appeared so rational.

Once again, theory had failed. However, once again, the failure proved generative, for it forced a search for features of village life that had been overlooked thus far. One feature was that the young hoped to return to the villages and depended on their families when seeking to do so. To retire in the village, a worker would need land on which to build a house and plant a garden. To secure that land, he would need to be *kumwesu*—that is, "one of us." To establish his bona fides, he would have to rely on his family in the village to testify to his roots there; to his participation in its affairs, as by returning for weddings and funerals; and to his continued support of the welfare of its citizens, as by remitting funds from town. Thus, the ability of the young to fulfill their plans rested on the willingness of their family to confirm that they had fulfilled their obligations to their elder kin.

Theory had therefore failed, or at least been exposed as inconsistent with the known data, and its failure had motivated a renewed pursuit of qualitative data—one focused on a search for features of reality that would fill gaps in the argument. Phrased differently, in the interplay between theory and qualitative research that characterizes the generation of analytic narratives, formal theory—which is often viewed as a deductive method—is instead used inductively.

Thus far, more emphasis has been given to fieldwork and theory than to the use of empirical methods. Recall, however, their use when testing the implications derived from the comparative statics of the expected income theory of migration. As illustrated in *Rural Responses to Industrialization*, they play an additional role as well: They are used to rule out alternative explanations.

Returning to the contributions of the elders to the young, someone might offer an alternative explanation: The elders could be viewed as altruistic rather than self-interested. Their payments to the young could be treated as gifts made out of affection. Given that both accounts are consistent with what has been observed, researchers, when marshalling empirical methods to choose between the two accounts, need to bring them to bear on data drawn from outside of the original sample. To gather such data, the author shifted his attention to the plateaus that lay above the valley. Because of the tsetse flies, the villagers in Luapula could not raise livestock; because the plateaus were free of tsetse flies, those who lived there could. There, the elders invested in cattle. Because cattle reproduce, herds grow over time, and as the urban centers grow, so does the demand for meat. All else being equal, cattle herds therefore increase in value, enabling their owners to recruit clients, bargain for brides, and bid for favors. If the elders were motivated by self-interest, then, rather than investing in their children, they would invest in their cattle; if they were motivated by affection, they would invest in junior kin. The evidence showed clearly that they invested in their herds. They stinted on the payment of school fees, so the level of education remained low. The rate of migration of cattle-keeping peoples remained low as well. Gathering empirical data from out of the original sample thus lend credence to the researcher's interpretation of the behavior of the villagers. Had affection dominated self-interest, then the flow of resources between generations on the plateau would have resembled that in the valley. Clearly, it did not. The analysis of theoretically relevant data, collected outside of the original sample, thus dispensed with an alternative interpretation, leaving the original intact.

Conclusion

The end product of this research was a "village study." But it was also a study that was the product of repeated efforts at falsification. When ideas were rendered coherent, then data were gathered to test them; when reflection exposed weaknesses in interpretation, then additional field research filled in the gap. The resultant study was not "large *N*." Nor was it axiomatic and deductive. But, as it was shaped by theory and statistical methods, the study "scaled up." It confirmed that villagers in the middle of Africa were rational and self-interested in their pursuit of wealth and their use of power, a controversial claim at the time and one still contested by cultural anthropologists. As in the treatment of the behavior of the villagers on the plateau, it supported those who contest the premise of cultural conservatism among cattle-keeping peoples. It helped redefine the understanding of how migration takes place and how rural people react to urban opportunities. And, along with the contributions of others, it helped alter the manner in which political scientists approach the study of agrarian politics.

There are some in political science who champion the "deep reading" of texts and "immersion" in rich, qualitative data. Others label themselves as formal theorists and generate rigorous proofs. And still others consider themselves to be methodologists and specialize on the development and use of systematic empirical methods. Those who develop analytic narratives view these approaches as complementary. The first yields *Verstehen* or comprehension; the second generates conviction, demonstrating that the explanation is logically consistent; and the third determines whether it is compelling—that is, it can be demonstrated convincingly to others. By combining these approaches, those who seek to produce analytic narratives "do science" even while focusing on unique events or particular settings.

Analytic Narratives: The Method

An analytic narrative is a methodological proposal to bridge rational choice modeling with more traditional narrative explanations of phenomena in the social sciences. Typically, the methodology combines models from game theory with historical narrative. The analytic narrative project, however, does not represent a methodological breakthrough in itself. Rather, the project makes explicit the methodology that numerous scholars have adopted when combining historical and comparative research with rational choice models. Influenced by the work of Douglass C. North, the analytic narrative project started off with a commitment to understand institutional formation and change. In their book *Analytic Narratives* (1998), Robert Bates, Avner Greif, Margaret Levi, Jean-Lauran Rosenthal, and Barry Weingast offer the first systematic outline of the key elements of the methodology, and they do so by exploring institutional change in a wide range of places and times. The authors' intent, as well as that of the majority of analytic narrativists, is to investigate enduring questions of political economy, such as political order, political and economic governance, and intra- or interstate relations.

Moreover, a distinguishing feature of the analytic narrative project is that it underscores the importance of the institutional context within which historical events occur. Understanding the institutional context helps account for how and why certain events may happen. The importance afforded to the historical and institutional detail is in fact what sets analytic narrativists apart from most rational choice scholars. Both deduce their hypotheses from the assumptions of rational choice and the logic of game theory. Rational choice scholars, however, start off from a general model and then test their hypothesis with appropriate data, while analytic narrativists formulate and refine the model itself in interplay with the context-specific institutional elements of the historical narrative. A major objective of analytic narratives, shared certainly with social science research, is to successfully identify the causal factors that explain a particular historical phenomenon—that is, to determine how some combination of causes brought it about. The notion of "mechanism" is commonly used. This entry discusses the conditions under which analytic narratives are most successful in providing explanations for historical phenomena. It first examines the distinctive roles of formal theory and context-specific evidence in developing a conjecture and ascribing causality. Second, it explores the behavioral assumptions underlying strategic game theory and their implications for analytic narratives.

Theoretical Model Versus Narrative

The construction of an analytic narrative proceeds, roughly, as follows. First, the scholar acquires in-depth knowledge about the historical phenomenon of interest; that is, a detailed account of the context and the historical process, based on studying the past through primary sources or reading the already existing historical accounts. A detailed account is essential to isolate the relevant strategic elements in the interaction: the key actors, their goals, and the rules that structure their behavior. These elements can then be formalized in a model. The formulation of the model—generally a game theory model—specifies the choices, constraints, and trade-offs the actors face in the phenomenon in question. The model is supplemented with a narrative that provides a rich explanation of the meaning actors attach to their actions, circumstances, and surroundings: the significance of the local culture. The outcomes predicted by the theoretical analysis are then confronted with the narrative; the narrative serves to assess the predictions and arbitrate among possible explanations in instances of observational equivalence. Further refinement of the model, and collection of more historical detail, can result from additional iterations between the analytics and the history. Analytic narratives stand on a careful balance between context-specific detail and rigorous analytic techniques. An analytic narrative, however, is problem driven, not theory driven. Thus, the explanation of a particular event is what motivates each study. Nonetheless, even if driven by a particular case, analytic narratives are informed by theoretical modeling. The exercise of formalization, by isolating the relevant strategic elements in an interaction, helps identify the key actors and the combination of causes that can explain the strategic situation in question.

A major reason for applying models to narratives is to attain logically consistent explanations; thus, the predictions of the model must follow deductively. However, it must be pointed out that the model does not need to do the bulk of the explanation. The theory highlights the issues to be explored and the general considerations and evidence that need to be examined, while the knowledge of the historical context is used to develop a conjecture regarding the relevant institution. The theory provides categories and a framework in terms of which the conjecture about the causal mechanism is formulated. The model, thus, *constrains* but does not determine the conjecture.

The conjecture is then evaluated, refined, or even overhauled through the interactive use of a context-specific model and the historical narrative. This empirical method thereby recognizes and takes advantage of the context specificity and historical contingency of institutional analysis. A successful explanation requires a well-confirmed causal claim about why and how a certain outcome obtained—this can be done even if it is primarily the narrative rather than the model that accounts for the explanation. The explanation that the model points to should also survive competition with other explanations. These can be existing explanations that the author may be contesting or other potential explanations that could account for the historical facts. The proposed explanation must be confronted with these other explanations and shown to be superior.

Analytic narratives, by providing a detailed account of the context and the historical process, acknowledge the uniqueness of situations that take place in particular moments and at specific places. At the same time, analytic narratives seek to identify causal mechanisms that are generalizable to other situations, inasmuch as they explain a social phenomenon by identifying how some combination of causes brought it about. Analytic narratives seek to capture the uniqueness of the situation under investigation by means of the narrative while using the model to capture the general features of the type of phenomena under which this situation falls. The use of rational choice in analytic narratives, by carefully identifying the causal mechanisms, makes possible the application of the logic of one setting to another.

Explanations that can account for different phenomena using few arguments—that is, generalizable explanations—are of course desirable. Generalizability, however, is not a requirement of explanation, since a causal mechanism may be unique to a phenomenon. Thus, for an analytic narrative to provide a successful explanation, it is not necessary that the causal mechanism be generalizable. It suffices that the events the model identifies as causes and effects actually take place. If a generalizable statement of the mechanism identified by an analytic narrative is available, this is of course a plus. In short, for analytic narratives to offer successful explanations, the formalization at the heart of the narrative must correctly identify some of the causes, effects, and enabling conditions in question. This does not require that the causal mechanism be generalizable. What is required is that the events the model identifies as causes and effects actually take place and that the statement of causal mechanism survives competition with other explanations.

Behavioral Assumptions

The reliance of analytic narratives on explicit formal theorizing compels scholars to take a systematic approach and to reveal the reasoning and assumptions behind their explanations. However, by emphasizing certain aspects of reality, this reliance on models, and specifically game theory models, highlights certain scope conditions for which the analytic narrative project is better suited. The scope conditions refer to the situations in which game theory is the best tool to explain human behavior. In terms of the historical phenomena of interest and the types of questions addressed, analytic narratives are a better tool when causal explanation is found in strategic interactions. They theorize strategic interaction and not the structural conditions under which the interaction takes place. Macrolevel structural factors are taken as exogenous during modeling interactions, which implies that changes in such factors need to be incorporated as moves by "nature" and are not treated in an analytic fashion. This emphasis on strategic interaction, however, is not a weakness of analytic narratives as much as a necessity given their focus on microlevel historical data.

The analytical framework of classical game theory rests on seemingly unrealistic assumptions about the cognition, information, and rationality of the parts in the interaction. What are the costs of these assumptions? Analytic narratives emphasize the importance of the institutional context in which situations take place. This institutional context can, in fact, provide the analytic narrativist with what Greif calls the "socially articulated and disseminated rules" that provide individuals with the cognitive, coordinative, and informational abilities that the theory assumes. Thus, the specificity of the institutional context can in many cases justify the behavioral assumptions (Greif, 2006, chap. 5).

The fact, however, that game theory may not be useful in certain conditions does not imply that analytic narratives must be abandoned. They can theorize by means of other forms of game theory that rely on different behavioral assumptions—for instance, evolutionary game theory and behavioral game theory. Uncertainty about the possible alternatives and complexity of the situation can lead to biases from the predicted game theoretic behavior. In these situations, the scholar needs to evaluate whether the theory should be modified to incorporate uncertainty or the pertinent behavioral assumptions by making use of behavioral or evolutionary game theoretic models. The usefulness of analytic narratives requires an awareness of the types of situations in which game theory is best applicable and that can benefit most from the methodology.

Analytic narratives, therefore, recognize and take advantage of the context specificity and historical contingency of institutional analysis. At the same time, they rely on explicit formal theorizing that compels scholars to take a systematic approach and reveal the reasoning and assumptions behind their explanations. This empirical methodology allows deduction and induction to complement each other and to be complemented by a context-specific analysis.

ANARCHISM

Etymologically, the term *anarchism* derives from two ancient Greek words: αν, meaning "absence of," and Αρχή, meaning "authority," "government," "ruler," or "war chief." Anarchism thus carries a negative charge: the negation of authority, the absence of rulers. *Anarchism* is opposed to all forms of hierarchy, including the state, capitalism, religious institutions, patriarchy, and racism. Yet the term also conveys a positive political project of justice, liberty, equality, and solidarity. According to the basic principles of anarchism, genuine freedom, equality, and solidarity are logical and political impossibilities in a system or a regime where some rule and others are ruled. All political regimes except anarchy are oppressive and tyrannical, even those claiming to embody the nation or the sovereign people. That is why anarchism can be seen as the ultimate revolutionary ideology and social movement. From the perspective of all elitist ideologies, including liberalism, anarchism is fundamentally flawed because, the argument goes, human beings cannot find satisfaction unless they are under the authority of rulers, be they warlords, priests, nobles, property owners, or elected representatives.

As a political ideology or philosophy, anarchism involves three elements: (1) a positive ideal (anarchy), (2) a critical discourse (opposition to hierarchies and oppression), and (3) the means to achieve this ideal (evolution or revolution, nonviolence or violence, mass movement, or affinity groups). In some cases, it may also involve an ontological conception of human nature. By and large, anarchism adopts a neutral sociological outlook posited on a binary human nature with a positive and a negative pole. The positive pole is the ability to live with others in a spirit of equality and solidarity, while the negative pole is the selfish drive for domination. As demonstrated by Peter Kropotkin and Élisée Reclus, it is the social structure that determines which pole prevails. If the structure is hierarchical, then people in a position of authority will become self-indulgent and arrogant and abuse their authority. Only a social environment where no one is in a position to exert power over others can ensure that people's goodness will prevail.

This entry describes the evolution of anarchism from its early roots to its development during the "anarchist century" from the mid-19th century to 1939. It also examines the resurgence of anarchism in the latter part of the 20th century, influenced by postmaterialist thought.

Historical Development of Anarchism

Some commentators assert that anarchism as a political ideology or philosophy has existed since the dawn of humanity and can be found, at least to a degree, in Taoism, stoicism, the works of Zeno, and the concrete experiences of communities on every continent that practiced egalitarianism (among adult males, at any rate). Kropotkin's book *Mutual Aid* is instructive in this connection. Others consider anarchism as belonging essentially to European modernity, with its forerunners emerging in religious social uprisings (the Anabaptists), the English Revolution (the diggers), and the French Revolution (the *enragés*). William Godwin (1756–1836) is generally regarded as the first true anarchist philosopher (*Enquiry Concerning Political Justice*, 1793). The Frenchmen Anselme Bellegarrigue, editor of *L'anarchie—Journal de L'ordre* (of which only two issues appeared, in 1850), and Pierre-Joseph Proudhon were among the first to call themselves "anarchists." They were followed by Mikhail Bakunin (1814–1876), Louise Michel (1830–1905), Voltairine de Cleyre (1866–1912), Peter Kropotkin (1842–1921), Élisée Reclus (1830–1905), Emma Goldman (1869–1940), and Errico Malatesta (1853–1932).

In its early days, anarchism attracted several prestigious fellow travelers, such as the painters Gustave Courbet and Camille Pissarro, the playwright Henrik Ibsen, the literary critic Herbert Read, and the philosophers Emmanuel Mounier and Bertrand Russell. Some famous anarchists, like the geographers Kropotkin and Reclus, were eminent scientists. Contemporary scholars identified with anarchism include Allan Antliff (art history), Normand Baillargeon (education science), Harold Barclay (anthropology), Susan Brown (political philosophy), John Clark (philosophy), David Colson (sociology), Ronald Creagh (sociology), Uri Gordon (social ecology), David Graeber (anthropology), John Holloway (political philosophy), Ruth Kinna (political science), and Robert Wolff (political philosophy).

There is an anarchist studies network linked with the Political Science Association in Britain and a number of scholarly anarchist journals, such as *Anarchist Studies*, *Réfractions*, and *Social Anarchism*. Yet it is in the nature of anarchism to expect intellectual and political activities to go hand in hand (*praxism*), and any division of labor between theorists or scholars and activists is viewed with suspicion. Bakunin held that anarchism acknowledges that some people may be more talented or skilled in a specific area, including theorization. However, there must be no monopoly of expertise. To be free, the people dealing with any expert should have the following: first, access to other experts in the same field; second, the right to ignore the advice of experts; and, finally, the opportunity to become experts themselves through education and practice. In other words, while expertise may confer influence on its possessor, it should be available to all and not be used to wield power over others. Anarchist ideas are for the most part expressed and disseminated anonymously in self-published independent journals, zines, and websites (see Infoshop) or in the publications of anarchist groups and organizations (e.g., Fédération Anarchiste and Alternative Libertaire in France, Anarchist Black Cross and Northeastern Federation of Anarchist-Communists in the United States, Class War in Great Britain, and Union Communiste Libertaire au Québec in Canada). Individual artists, like the composer John Cage, or trends, such as the punk movement (e.g., Bérurier Noir, Crass), are also identified with anarchism.

Central Elements of Anarchism

The Classical Age of Anarchism

From a historical perspective, there are two distinct moments of anarchism as a social and political movement. First, the classical age of anarchism—or the "anarchist century"—began with the first texts of Proudhon (who in 1840 famously stated, "Property is theft") and ended with the defeat of the Spanish Revolution in 1939. The period was characterized primarily by the working-class's expression and experience of anarchism, although some activists were already concerned with issues such as women's emancipation (abortion, birth control), free love and bi- or homosexuality, war and peace, racism and anticolonialism, free education, and vegetarianism. This epoch encompasses the Paris Commune of 1871, the Industrial Workers of the World in the United States, the Makhnovist rebellion during the Russian civil war, and the Spanish Revolution (1936–1939). During this time, anarchism was influential in Central and Latin America, especially in Argentina from the late 1800s through the 1920s. Of note is the year 1919, particularly the "bloody week," when about 1,000 people were killed and 50,000 arrested during a strike, including many anarchists. In Chile, anarchist organizations boasted 50,000 members in 1910 out of a total population of 3 million. In Mexico, anarchism was known through popular figures such as Ricardo Flores Magon (1874–1922), while in Cuba there were tens of thousands of activists in the 1920s. Anarchist activists and propagandists were very often at the forefront of social struggles and strike movements, such as the campaign for the 8-hour working day. In other parts of the world, anarchism was limited to small groups, active only for short periods of time but nevertheless subjected on occasion to bloody repression. Examples include the Philippines anticolonialist movement around 1900 as well as the Japanese anarchist and antiwar activist Osugi Sakae (1885–1923) and the anarcha-feminist Itô Noe (1895–1923).

The classical age of anarchism is still widely associated with illegalism (social banditism) and terrorism ("propaganda by deeds"). Around 1900, terrorists assassinated several heads of state (French President Sadi Carnot, 1897; William McKinley, president of the United States, 1901; Russian Prime Minister Pyotr Stolypin, 1911; Spanish Prime Minister José Canalejas, 1919; King George I of Greece, 1913), property owners, and military officers, very often in response to the bloody repression of the workers' movement. But at no time did so-called anarchist violence even come close to the level of violence (imprisonment, torture, death penalty, mass murders, etc.) perpetrated against anarchists by agents of the state, private paramilitary units and death squads, nationalist and fascist militias, and authoritarian Marxist militants. Anarchists were targeted by special repressive laws in almost all Western states in the closing decade of the 19th century. Thousands were killed by their former allies in Russia (Leninists) and Spain (Stalinists), and they were among the first political prisoners to enter the Nazi concentration camps in Germany. Violent repression, in conjunction with the heightened popularity and power of authoritarian Marxists following the 1917 Russian Revolution and the Red Army resistance and victory against the Nazi armies in 1941 to 1945, accounts for anarchism's declining influence within the progressive and revolutionary movements during the first half of the 20th century.

Postmaterialism and the Revival of Anarchism

The second moment of anarchism relates to the so-called postmaterialist context of the 1960s.

With spectacular events such as May 1968 in Paris, anarchism experienced a revival, although authoritarian Marxists (Leninists, Maoists, Trotskists, Guevarists, etc.) remained very influential among radicals. The anarchist resurgence was also connected with environmentalism, feminism, and pacifism, which embodied anarchism not only by advocating the abolition of capitalism, patriarchy, and the state but also by organizing their militant activities with neither formal leaders nor hierarchy, through a strictly egalitarian, participative, and deliberative decision-making process.

The contemporary resurgence of anarchism as a major tendency among radical progressive forces came with the collapse of the Soviet empire, the intellectual crisis of Marxism, and a series of events at the turn of the 21st century that signaled the rise of the so-called antiglobalization movement and resulted in part from anarchist mobilization: the World Social Forum in Porto Alegre, Brazil (2001) and the mass protests in Seattle, Washington, in 1999; Washington, D.C., and Prague, Czech Republic, in 2000; and Québec, Canada, and Genoa, Italy, in 2001. Many commentators saw this as a "new anarchism," characterized by (a) the innovative tactics of direct action, (b) the horizontal structure of militant organizations, and (c) the inclusion of pluralist concerns. The direct action tactics were exemplified by the Black Blocs, a street tactic originating in the German *Autonomen* movement of the 1980s; Reclaim the Streets in the United Kingdom; and carnivalesque actions such as the Pink Blocs or the Clandestine Insurgent Rebel Clown Army. The horizontal structures were inherited from the previous generation of radical ecologists, feminists, and pacifists. Finally, the pluralist concerns, emphasizing cultural and sexual diversity, were clearly due to the influence of the feminist and gay and lesbian movements, although some anarchists were still based in the labor movement or were actively involved in labor issues and anticapitalist mobilizations. In principle, the neo-anarchists (or "postanarchists"—Hakim Bey, Lewis Call, Todd May, and Saul Newman) regard as equally important the need to oppose the state, war, capitalism and neoliberalism, racism, sexism and heteronormativity, ageism, and specism. This opposition must furthermore take place globally as well as locally and in everyday life. Indigenous movements of resistance, such as the 1994 Zapatista insurrection in Chiapas, Mexico, are viewed as stimulating examples of anarchism in practice, mainly because they are self-organized through participative and deliberative popular assemblies (the Mohawk scholar Taiaiake Alfred has coined the term *anarcho-indigenism*).

Currents in Anarchist Thought

Historically, there have been several anarchist currents, each with its particular position on what is primary (the individual or the community, liberty or equality), its priorities (the emancipation of workers or women, the environment), and its organizational structure (mass movements, unions or communes, affinity groups). Very often, they have collaborated in solidarity, at times they have engaged in intense debates, and sometimes they have clashed.

Individual(ist) Anarchism

Individualist anarchism, according to Max Stirner, 1806–1856; Lysander Spooner, 1808–1887; and Benjamin Tucker, 1854–1939, emphasizes liberty and autonomy and denies that there is something other than individuals to which an individual must submit (e.g., nation/motherland, class/proletariat). However, such anarchists are as a rule deeply concerned by the exploitation of the working class and the oppression of women and may very well take part in social struggles, but through affinity groups rather than mass movements. They generally believe that free association can be beneficial for the individual's happiness and interests, and through the years they have been involved in rural or urban communes and in squats. However, membership in an association must be totally voluntary, with the freedom to join or leave at any time.

Libertarianism and *anarcho-capitalism* are sometimes used as synonyms of individual anarchism, although the latter is in fact a kind of radical liberalism, advocating free market capitalism for property owners and wageworkers, under the protection of either a state whose function is strictly limited to the enforcement of law and order or, in the absence of a state, of private security agencies. These views imply that property owners are in a position of authority and power over their employees, an idea inconsistent with individual as well as collective anarchism. *Proprietarian* is the term coined by Murray Bookchin to describe libertarianism.

Like Marxism, anarchism views capitalism as an exploitative system, protected by the state, which also exploits workers to sustain itself. This said, anarchism offers a variety of economic proposals for abolishing capitalism and reorganizing the production of goods and services.

Collectivist Anarchism

Proudhon proposed mutualism (from the Mutualists, a 19th-century secret society of weavers in Lyon, France). He suggested that just as the hive belongs to all bees, the means of production and exchange must be collective. However, each member of the collective—a free association—should share to some degree in the worst tasks. This job rotation would provide everyone with a better knowledge and understanding of the whole working process. Higher functionaries, such as architects and engineers, would be assigned through election, but decisions and working rules would be made collectively through a participative deliberative process. The exchange value would be assessed and then converted into tickets of hours of work under the supervision of a People's Bank, which would also offer interest-free credit. Consequently, there is no need for a violent revolution; workers need only organize among themselves to be free.

Some anarchists have identified serious issues arising from Proudhon's economic proposal: Should the evaluation of hours of works take into account job intensity and risk, required training and skills, and the worker's social responsibilities (such as dependents)? Moreover, this remains a very individualistic model of work organization, which draws on a bygone tradition of craftsmanship that values the artisan's self-reliance and personal pride. Finally, according to some, Proudhon is not a true anarchist, because he devotes considerable energy to demonstrating the physical, intellectual, moral, and political superiority of men over women, as evidenced by the more than 500 pages of blatant misogyny and antifeminism in his *De la Justice dans la Révolution et l'Église* (1860).

Anarcho-Syndicalist Anarchism

Anarcho-syndicalists, identified with Rudolf Rocker (1873–1958), see labor unions (*syndicats* in French) as the spearhead of social emancipation and revolution and the seed of the future anarchist society. Property owners—the bourgeoisie—and the state create nothing; they are mere parasites of workers' productive activity. Hence, if workers unite and stop working for their exploiters, the system will collapse and revolution will ensue. The general strike is therefore the main instrument for the realization of anarchy. Thereafter, global production will be structured according to "industrial groups" in each sector of production and integrated in an "economic federation." However, collective decision making would remain a bottom-up process centered on the general assembly of every place of work. Economic production based on human needs will ensure that all receive the goods and services they require.

Anarcho-Communism

With anarcho-communism, identified with Peter Kropotkin and Alexander Berkman (1870–1936), among others, the state becomes the direct target of a revolutionary mass movement. Although anarcho-communism often stresses the importance of the workers' movement, it is more open than many other anarchist trends to peasants, women, and the *lumpenproletariat*. Adopting a geographical perspective, anarcho-communism regards the urban or rural commune as the center of the new society. After the revolution, the communes may join in a federation, although the decision-making function will be situated at the local level, in keeping with a bottom-up process. In the absence of exploiters, such as the bourgeoisie and state agents, production output will necessarily surpass society's needs. Anarchy will therefore lead to a situation of abundance where all will receive whatever goods and services they need and want.

Working Inside Versus Outside the Political System

"Libertarian municipalism" is a contemporary version of anarchism, primarily developed in the 1980s by Janet Biehl and Murray Bookchin. Libertarian municipalism lays special emphasis on ecological issues, contending that these could be dealt with more effectively at the local level but only if municipal institutions were deliberative and participative. Bookchin even suggests that anarchists get involved in municipal politics, a view that has been criticized by other anarchists as obviously inconsistent with the antistate anarchist principle.

Bookchin is not the only self-proclaimed anarchist calling for some sort of involvement in official politics. Authors and activists like Colin Ward and Paul Goodman, or Philippe Corcuff, in France, who coined the term *libertarian social democracy*, argue that some anarchism in the official system is better than no anarchism at all. They advocate reforms with regard to issues, laws and regulations concerning individual freedom, free education, free sexuality, and so on. According to Noam Chomsky, it is the duty of today's anarchists to support the state and its welfare programs against neoliberalism and capitalism, or what he calls "private tyrannies." Chomsky is even in favor of voting for the Democratic Party in the United States, though he admits that mass social movements are still necessary to push the political elite in the right direction.

Others argue that it is possible to have anarchy here and now but outside the official system. For instance, the green anarchist Clark advocates "microcommunities." In today's network of squats, for instance, activists who align themselves with anarchism take over unoccupied buildings or land and try to live outside capitalism as much as possible, offering free meals and rooms to travelers and traveling to participate in campaigns of solidarity with immigrants or with antiwar and anticapitalist movements.

Feminism and Anarchism

The distinctions between various forms of anarchism are not as schematic in reality as what is generally presented in books, articles, and encyclopedias. Other strands of anarchism do not fit perfectly within the classical economic and political framework. Anarcha-feminism—for instance, is a feminist version of anarchism, devoted to fighting patriarchy both in society at large and within the Marxist and anarchist networks, where misogynistic and antifeminist attitudes are not uncommon (witness the term *manarchy*, recently coined by U.S. activists to describe inequalities among anarchist men and women). In the 19th century, authors and militants like Goldman and de Cleyre denounced the "sex slavery" of marriage and promoted free love. In the 1930s, the anarcha-feminist autonomous association *Mujeres Libres* boasted some 30,000 members in Spain and was an active force during the Revolution. It focused on education for girls and women, combat training for women, medical help for wounded fighters, and the emancipation of prostitutes through psychological and material support and the assassination of certain pimps. From the 1960s onward, Peggy Kornegger and Susan Brown, among others, highlighted the similarities between anarchism and feminism, arguing that, to be consistent, anarchists should be feminists (although some feminists, such as the liberal or Marxist statist feminists, may not be anarchists, i.e., opposing all forms of hierarchy and inequality). "Third-wave" feminism, with its emphasis on individual sexual choice and *queer* identities, is sometimes identified with anarchism. Nevertheless, the anarcha-feminist Claire Snyder warns "choice feminists" that under patriarchy, women's sexual life may not be totally free from the external control of men or from "internal tyrants," the name given by Goldman to the socialization—internal fears and false beliefs—that undermines women's freedom of will and choice. Finally, with regard to economic production, the anarchist and feminist Carol Ehrlich notes that it is not only the bourgeoisie as a class that exploits wageworkers but also men who exploit women's work, which is often undertaken with no monetary compensation.

Anarchism in the 21st Century

Today, a large number of principles closely linked to anarchism for the past 150 years have become, for many people, ordinary moral and political liberalism: the 8-hour working day; education for all, boys and girls alike; women's freedom of choice with regard to matters such as contraception and abortion; freedom in sexuality and love, including bi- and homosexual rights and the right to divorce or to cohabit without marrying; freedom of consciousness with respect to religion and state dogma; and freedom to refuse military service. While not self-identifying with anarchism, several influential contemporary scholars, especially in France and Italy, have adopted an anarchist approach in their work on state power (Giorgi Agamben), political representation (Michel Foucault, Jean-François Lyotard), micropolitics and resistance (Gilles Deleuze), and the reorganization of production and resistance based on egalitarian principles (Michael Hardt and Antonio Negri). Others, such as Donatella della Porta, are investigating new social movements that practice "direct democracy," which in fact amounts to studying anarchism in action.

This implicitly or explicitly anarchist activism within the "movement for global justice" is the target of state repression, even though anarchism does not represent a significant threat to social, political, and economic liberalism, as might have been the case at the turn of the 20th century. Thus, there were legitimate grounds for former British Prime Minister Tony Blair's jibe about the summit-hopping "anarchist traveling circus." Nevertheless, anarchism provides the most vocal and radical left-wing criticism of liberalism. During the 2001 G8 (Group of Eight) Summit in Genoa, after violent clashes between police officers and protesters—one of whom was shot dead at point-blank range—Canadian Prime Minister Jean Chrétien warned about the "anarchists who want to destroy democracy." In Greece and Italy, anarchist networks have been targeted by the police in recent years: Many have been arrested, and in Greece, one person was killed in 2008. The Federal Bureau of Investigation and Scotland Yard have also been preoccupied since the late 1990s with anarchists reputedly training for terrorist actions (which never occurred). Even certain political scientists, such as Tim Dunne of Exeter University, claim that anarchist activists and Al Qaeda militants are very similar in nature. In sum, anarchism said goodbye to the 20th century much as it had welcomed it—that is, cast in the role of a potential "terrorist" threat, the number one internal public enemy.

Anarchy

Anarchy is the absence of government or, more generally, political authority over and between the units of a political system. As an analytic concept, the term does not imply a lack of political order or the presence of chaos and thus differs from informal and colloquial use. The term also differs from *anarchism*, a normative and possibly utopian position that advocates minimizing the scope of political authority to maximize the domain of individual autonomy.

The condition of anarchy is widely understood to describe the modern international system in which states are the units of analysis, each is fully sovereign, and all are formally equal. It is this condition of anarchy, in turn, that separates international relations from other domains of politics and renders it, for many analysts, a distinct field of inquiry with different rules and patterns of interaction. Although other political arenas may also be anarchic, such as legislatures where vote trading between members cannot be legally enforced, the analytic concept has not been widely applied beyond the realm of international relations and, in a few cases, failed states.

Consequences of Anarchy

For most scholars of international relations, anarchy requires that all states must rely only on their own resources and abilities—a practice described as the principle of self-help. Lacking any authority that states can appeal to for protection, aid, or binding adjudication, each state must ultimately depend on its own efforts and wisdom. This further implies that any agreement made between states must be self-enforcing or in the interests of the parties to carry out if and when actually called on to do so.

Although the assumption that the international system is anarchic is widely shared, the meaning and consequences of this assumption are still vigorously debated. For realists, anarchy produces a zero-sum, competitive struggle between states. For political realists, anarchy did not feature prominently and was more a passive background condition; Hans Morgenthau—for instance, rooted the drive for power in the innate character of political man, not in the nature of the international system. For Neorealists (sometimes called structural realists), however, anarchy is one of the defining features of international structure with significant causal effects.

Even within neorealism, there are two prominent schools. For defensive realists, anarchy requires only that states seek security, although they may also pursue expansion, glory, or power for other reasons. Given that some states may possess aggressive tendencies, however, all states must be ever vigilant and prepared to defend themselves. Uncertainty over the motives of other states and problems of credible commitment, in turn, sometimes leads to bargaining failures and war. Offensive realists believe anarchy is such a challenging condition that states must pursue power at all times. Since states are always insecure, the fear that others will exploit them forces states to pursue all means necessary to impose their will on others. Also, as power is always zero sum, anything that gives an advantage to one state must create a disadvantage for at least one other. In this view, anarchy implies that international politics are a perpetual and intense struggle for domination.

Neoliberal institutionalists see anarchy as a condition that can be mitigated, if not fully resolved, by voluntarily negotiated institutions between states. Unlike in neorealism, anarchy does not define the goals that states seek but, rather, merely permits dilemmas of collaboration and coordination to arise that thwart cooperation between utility-maximizing states. These dilemmas, in turn, can be overcome in part by institutions that provide information or make commitments more credible. In a form of self-organizing order, states can avoid some of the harsher implications of anarchy by building institutions without necessarily subordinating themselves to any central authority.

Finally, constructivists see anarchy as an open-ended condition filled by the social purposes of states, which are themselves constructed of socially appropriate and interpreted roles and norms that vary over time and space. Thus, within the condition of anarchy, states may represent themselves and others in ways that produce a Hobbesian world depicted by realism, a Lockean world that reflects important elements of neoliberal institutionalism in its focus on natural rights, or a Kantian world of greater peace and cooperation than imagined by either of the alternatives. In all of these different socially constructed world orders, there is a potential for systemic transformation that is excluded by neorealism or neoliberal institutionalism.

Critiques of Anarchy

Although subject to continuing controversy, all three perspectives share a common focus on anarchy even while they debate its meaning and implications. Increasingly, scholars are criticizing the very concept of anarchy and the role it has played in the development of international relations theory. Too numerous to describe in detail here, many of the specific critiques can be grouped into two larger themes. First, the common notion of anarchy is derived from an overly narrow formal-legal conception of authority. Alternative conceptions of authority open up the possibility of many different kinds of authority existing at the same time within the international system. Second, sovereignty is not indivisible, as commonly averred, but is a bundle of different authorities that can be disaggregated in ways that do not necessarily coincide with traditional nation-states. Divisible sovereignty permits a patchwork of sometimes overlapping, competing, or complementary authorities to exist simultaneously. Taken together, these critical themes suggest that many forms of global governance that have been ruled out by the common assumption of anarchy may have actually existed in the past and may yet expand in the future.

In formal-legal conceptions of authority, the person (or unit) in authority has the right to issue and enforce certain commands over a set of subordinates because of the lawful position or office that he or she holds. Authority does not inhere in the individual (or individual unit) but in the person as an officer who is duly appointed or elected through some lawful procedure. Elected by a majority of the Electoral College, for instance, a person becomes the president of the United States; by established rules of rotation, a country collectively holds the presidency of the Council of the European Union (EU). Applied to international relations, since there is no lawful authority or procedure above states, no state or other unit can be authorized to govern over other states. As a result, the system and relations between states within that system must be anarchic.

Formal-legal authority, however, is simply one possible source of authority. The German sociologist Max Weber, closely identified with this formal-legal conception, also posited that legitimacy and authority could derive from charisma, tradition, or religious belief as well. Others argue that legitimacy and, hence, authority can arise from psychological principles of fairness and justice, socially constructed norms, or a negotiated social contact between ruler and ruled. These other sources of legitimacy at least open the possibility of authority by states, international organizations, nongovernmental organizations (NGOs), and other units over other similar units. While debate continues over who has authority over whom for what, a growing body of critical research suggests that international relations are not entirely anarchic but better described as a variegated system of multiple units in authority drawn from multiple sources of authority.

In turn, sovereignty has been traditionally conceived as indivisible or culminating in a single apex within each territorially distinct entity. Sovereignty was once vested in a king, emperor, or "sovereign." Today, sovereignty typically resides in the "people" and has itself evolved over time to include most citizens of a country. But in either case, there is assumed to be within each society a single, ultimate authority that cannot, even in part, be subordinate to any other actor. This assumption is codified in the notion of Westphalian or juridical sovereignty embodied in the United Nations Charter; today, states need not actually control their territory, as in the past, but only need to be recognized as sovereign by other sovereigns to be accorded that status.

Yet there is an increasing awareness that states have never fit this idealized vision of Westphalian sovereignty. Indeed, even historically, sovereignty appears better described as a set of authorities that are disaggregated across units within a state, long recognized as federalism, or, more important, across states and third parties. This disaggregation is not only exemplified by multilevel governance in the contemporary EU but also reflected in numerous international restraints on the freedom of action of states, including rights of protection or guarantee (e.g., the United States and the Federated States of Micronesia), rights of economic and financial control (the United States and the Dominican Republic from 1904 to 1941), rights of servitude (the United States and Japan, under various status of forces agreements), and rights of intervention (the United States and Panama, under the neutrality treaty of 1977).

Combined with multiple forms of authority, the possibility of multiple sites of authority suggest that patterns of global governance are likely to be more varied, complicated, and dynamic than once assumed. Transnational nonstate groups exercise authority over their members, whether they be religious orders, labor unions, or other collective bodies. NGOs earn authority over firms and even states in standard-setting boards and international creditor cartels and regulate behavior through monitoring and certification procedures. States exert authority over one another in spheres of influence, protectorates, or informal empires. International organizations possess authority as well, including the World Trade Organization and its dispute settlement procedures over trade, for instance, and the United Nations and the International Atomic Energy Agency over nuclear facilities and programs.

The assumption of anarchy, critics charge, blinds scholars of international relations to this variegated system of global governance. The critique of anarchy and the expansion of global governance implies three essential challenges for the future: (1) Analysts must map the forms of global governance, identify where current authority is inadequate or itself unregulated (as in the so-called democratic deficit in the EU), and propose reforms to improve human welfare; (2) policymakers must accept and navigate between these multiple forms of authority while harnessing them to their national purposes, when appropriate; and (3) global citizens must work to ensure that global authorities act in the general interest.

Anomia

Anomia is a noun that comes from the Greek *a* (negative prefix) and *nomos* (law), meaning absence of norms. The original meaning of anomia in the frame of the classical Greek polity defined a condition of being against or outside the law or a situation where current laws were not applied, resulting in a state of illegitimacy or lawlessness. In its modern usage, the meaning of anomia has a much broader scope, although it is a rather recent concept in the history of social thought. In much of the literature, particularly in the English-speaking world, the French spelling *anomie* is also extensively used. This entry discusses the use of the term in modern sociology, the widening of its scope, and its present-day relevance.

Anomia in Durkheim's Thought

In the social sciences, anomia has been a key concept in the development of modern empirical sociology. It is normally associated with the work of Émile Durkheim (1858–1919), the French sociologist who introduced the concept in his early sociological masterpieces, *The Division of Labor* (1893) and *Suicide* (1897). In his sociological perspective, anomia was no longer related to the rule of law; thus, it lost its original legal content and was instead defined as the absence of norms (legal rules just being one class of social norms). One of the major tenets of Durkheimian sociology is that a theoretical explanation of social agency must be given in terms of social causal factors and not on the basis of psychological conditions. In fact, one can say that the major contribution of Durkheim to the foundation of modern sociology has been the possibility of grounding the explanation of social action on purely social variables. In the famous Durkheimian formula, presented in Chapter 5 of *Rules of Sociological Method* (1895), social facts must be explained by other antecedent social facts. In relation to anomia, this thesis implies that the absence of norms is not a subjective psychological condition of the agent but an objective feature of the social structure or, in strictly Durkheimian terms, of the *collective life*.

The first references to anomia by Durkheim appear in *The Division of Labor*, his doctoral thesis at the University of Bordeaux. In this early work, referring to the social causes of the division of labor as a phenomenon typical of modern industrial society, Durkheim elaborates on the "abnormal" forms of this phenomenon, one of these forms being the "anomic division of labor."

In his ensuing famous essay *Suicide*, in which Durkheim put forward a plausible sociological explanation of the apparently purely psychological phenomenon of disposing of one's own life, he characterized a type of suicide that he called "anomic." This type occurs in the case of major social crises (e.g., an economic crash)—that is, structural phenomena that invalidate previous regulations to such a degree that some agents are incapable of coping with the radical ambiguity of the ensuing state of normlessness, and thus they take their own life in a supreme act of "anomic suicide." The common factor of both the anomic division of labor and the anomic suicide is the dissolution of social integration, the underlying social phenomenon that is manifested in the absence of norms. The reformist stance of Durkheim vis-à-vis the major political and social issues of his time is a reflection on how it were possible to confront trends toward anomic forms of social life in a secularized and functionally differentiated modern society.

In one of his most politically oriented works, *Leçons de Sociologie* (1950), published in English as *Professional Ethics and Civic Morals* (1957), Durkheim analyzes the relationships between an individual and the sphere of public regulation. In his view, the institutionalization of individual rights is the role of the State; thus, the latter has not been created to guarantee that individuals are able to exercise their natural rights; rather, the State creates and organizes those fundamental rights, and it makes them a reality. Political anomia is then a condition where public regulations have reached a point of extreme weakness, close to the absence of rules, and, therefore, individual rights cannot be exercised. In political terms, however, anomia is not anarchy. The latter refers to a lack of leadership, hierarchy, and command, whereas anomia implies a weakening of rules, structures, and organizations. Clearly, the Durkheimian concept of political anomia necessarily implies a radical weakening of public regulations. In short, anomia, in all of its possible specific manifestations, can be understood as a societal consequence of rapid and deep social change, and it is in this sense that anomia is a concept that runs in parallel with the notion of social crisis. According to Durkheim, without clear rules individuals cannot find their place in society. Such a state tends to occur in periods of social disruption (such as rapid economic growth or economic depression), bringing about greater anomia and, concurrently, higher rates of suicide, crime, and deviance.

Anomia and Social Change

Social change may generate anomia either in the whole of society or in some parts of it, so it must be stressed that, in a given society, social groups may be differentially affected by anomia. As recent events in the world economy illustrate, economic crises brought about by business cycles have differential impacts on groups according to their location in the social pyramid. Both sudden downward mobility, which is normally associated with economic depression, and the rapid onset of material prosperity, leading to quick upward mobility, tend to upset previous networks in which lifestyles are embedded, in each case increasing the chance of anomia. Talcott Parsons, in the early 1940s, discussing the social aspects of fascism, contends that an increase in anomia may be an outcome of almost any social changes that upset previous routines of life or symbolic associations, all of which imply instability of expectations. In Parsons's strain theory approach, social ambiguity as well as conflicting role expectations may lead to increased anomia, and this, in turn, may create a sort of anxiety-generated pattern of anomic action in areas such as reactionary voting behavior. In expanding the use of the concept of anomia to diverse areas of social interaction, Edward Tiryakian has made an elaboration of the notion of sexual anomia as an heuristic tool in approaching features of contemporary society that involve transformations in sexual relations and sexual identity that presuppose deregulations in modern sexual relations.

Anomia and Deviant Behavior in Merton's Theory

A distinction in the normative sphere between regulation of goals and regulation of means, introduced by Robert K. Merton, has become a key dimension in current anomia-related theories that tend to focus on "anomic" deviant behavior. A clear example of this shift in focus is the way in which the *Columbia Encyclopedia* (6th ed.) defines anomia: "a social condition characterized by instability, the breakdown of social norms, institutional disorganization, and a divorce between socially valid goals and available means for achieving them." Although Merton, when referring to socially accepted goals (values) and means (instruments for achieving those values), has in mind the overall universal striving for success in the American value system, his theory is a general proposition. In Mertonian terms, in any given society, there is a range of culturally accepted values (goals) and a corresponding set of normatively approved means of securing these goals, but the structure of economic resources in that society enables only certain privileged groups and classes to succeed.

Disparity between goals and means is, according to Merton, the main cause of anomia. Merton identified five possible reactions to the different relationships between goals and means. The first and most common reaction is *conformity*, which presupposes a nonanomic relationship of appropriate means to reach the socially accepted goals. All of the other four possible reactions are more or less anomic. The second possible reaction is *innovation*, which implies adherence to goals and rejection of socially accepted means. The third possible reaction is r*itualism*, based on adherence to means but rejection of socially accepted goals. In the fourth reaction, *retreatism*, both the goals and the means are rejected. Finally, the fifth and final possible reaction is *rebellion,* when both goals and means are ambiguously dealt with. In conditions of anomia (maladjustment between goals and means), underprivileged, deprived individuals will turn to various forms of individual deviance that are dependent on alternative means to reach the same desired ends. In other words, anomia occurs as the disjunction of means and goals that differ according to the profile of the social opportunity structure. Merton was then able to propose a theory of anomia embedded in social stratification and the class structure, and it is in this sense that his theory transcends the specificity of the American case and becomes a general theory of anomia. An interesting example of a Merton-inspired research of anomic behavior in a non-Western cultural context is the study conducted in 2006 by Parviz Piran, concerning the reactions of Iranian youth to anomic conditions created by the rapid and extensive change in the economic, political, and cultural fabric of their society.

Anomia in Contemporary Political Economy

The concept of anomia is also present in the field of contemporary political economy in the work of analysts who are advancing a theory of "institutional anomia" that basically states that in the present globalized context, as economic institutions gain dominance in shaping society, noneconomic institutions are weakened and forced to accommodate the market, thus feeding a condition of high institutional anomia that is conducive to higher violent crime rates. To the extent that increased anomia tends to erode and dissolve social networks in which social action is embedded, there is also a clear connection of this concept with the notion of social capital that is basically the outcome of associative networking. Contemporary research on the sources and the uses of social capital by different social actors in promoting their own advancement, which is a strong field in policy-oriented studies, is an interesting area for further applications of the general theory of anomia.

In short, the concept of anomia has provided quite a fertile intellectual ground for the development of the modern disciplines of the social sciences.

APATHY

Apathy looks at first like a very broad, even vague concept. It plays, however, a very important and critical role in political analysis, particularly in the analysis of the decline in voting turnout and civic engagement and more generally in the study of participation and civic involvement of citizens. The concept is derived from a long, intellectual, interdisciplinary tradition. It was first proposed in philosophy but has been extensively used in cultural psychology, anthropology, sociology, and political science. The concept also has intellectual connections with other concepts or notions coming from the sociological and political philosophical traditions such as alienation and anomie. In a typical use of the apathy concept, theories of mass society have explained, in the wake of World War II, that modernization and urbanization have been responsible for detaching individuals from their primary groups (community, family, early socialization groups), generating withdrawal from the public sphere and lack of interest and motivation in public affairs. This entry discusses the history and recent criticisms of this concept.

The more recent perspective on political apathy started in the 1950s and 1960s, in particular with the publication of the book *Civic Culture* by Gabriel Almond and Sidney Verba (1963). One of the issues of Almond's and Verba's political culture approach is that the stability of democracy and democratic institutions depends on a "civic culture," a mixture of participatory, subject, and parochial orientations toward politics. The important point here is that this civic culture seems to allow many citizens to be apathetic about politics. Many critics of the book took this to be a kind of justification for apathy.

Since the 1960s, the political sociology perspective on apathy is mainly linked to the question of political mobilization and political participation. In a very challenging study of the relationship between social class and voting in the mid-1980s in the Netherlands, Leo B. Van Snippenburg and Peer Scheepers recalled that a positive correlation between social protest and income inequalities at least implicitly referred to the thesis of Verelendung (pauperization) that originated from Karl Marx's work. They also recall that this thesis states that under (relatively) deteriorating socioeconomic conditions, the deprived will turn to social protest and revolt. The thesis was later criticized, emphasizing that history has regularly shown the contrary: Revolt emerges under circumstances of relative social deprivation and is more likely to happen in middle-class or privileged groups rather than in deprived ones. According to these alternative views, instead of revolting against the system that generates inequalities, a form of "collective apathy" often manifests itself in deprived groups (Marie Jahoda, Paul Lazarsfeld, & Hans Zeisel, 1971). This doubt and criticism of the pauperization thesis was strongly formulated in studies by a very influential group of social scientists in the 1930s and the 1940s, the so-called Frankfurt School, in particular their study of the "authoritarian personality" (Theodor Adorno, Else Frenkel-Brunswik, Daniel Levinson, & Nevitt Sanford, 1950). In this study, it was observed that during the economic depression of the 1930s, the workers and have-nots in Germany did not revolt. They instead remained outside the political scene and were apathetic. Parts of the middle class, by contrast, actively engaged in politics, as did the cultural and economic elites. In light of these facts, the Frankfurt School criticized the Marxian notion concerning the direct effects of pauperization on political radicalism. The Frankfurt School introduced an original hypothesis by putting "personality" as an intermediate variable between social characteristics and political consciousness, between class and ideology. In their view, belonging to a deprived group does not lead to active political behavior but encourages the development of an authoritarian personality (i.e., subordination to authority, conformity to rigid social norms, rejection of those not sharing these norms). Instead, authoritarian personalities show deference to authorities and remain outside the political field.

More recent interpretations came from other studies completing the traditional authoritarian personality theories through a hypothesis proposed by Leo Festinger (1957) in *Theory of Cognitive Dissonance*: Awareness of the low likelihood of benefiting from an "achievement society" generates a mental state of anomie, social isolation, lack of confidence in the system, and apathetic behavior. Socioeconomic frustration and status anxiety thus mediate the correlation between class, authoritarian values, and anomie. From this tradition, it can be concluded that modern societies generate apathy in different ways but especially by creating gaps between aspirations, values, and realities. This body of literature has an obvious relationship with another intellectual tradition, which is known as the relative deprivation or relative frustration hypothesis. This hypothesis states that, despite the socioeconomic deprivation and social inequalities experienced by the popular classes during the periods of economic stagnation, there was no political protest. To explain this paradox, political sociology frequently makes reference to a Tocqueville effect. Alexis de Tocqueville proposed a theory of rising expectations that may offer some clues to the paradox of apathy and mobilization (those who normally would have interest to mobilize are not doing so). According to this theory, it is not deprivation but the obstruction of favorable prospects and rising expectations that encourage social protest and radical political behavior. As remarked by Van Snippenburg and Eisinga Scheepers (1991), citizens experiencing such frustrations "become morally indignant, sometimes socially envious, and they easily turn to political protest and radicalism as a consequence" (p. 45). This Tocqueville effect has been used to explain political protest when social groups experience significant discrepancies between their raising expectations, the realities of their occupational chances, and the possibilities for participating in political decision making.

More recently, the concept of apathy has been rejuvenated and updated by a set of notions proposed in the context of empirical studies on legitimacy and political support. Political apathy has been mentioned in the explanation of the apparent lack of political support and political trust in contemporary democracies. This also used to be the case with the concept of democratic deficit that was first proposed in the context of European Union (EU) integration and its legitimacy. Since the beginning of the 1990s, a significant body of literature has investigated the democratic gap in EU institutions. This democratic deficit is supposed to explain the lack of interest, motivation, and civic engagement of European citizens in the process of EU decision making. The idea of a democratic deficit or democratic disenchantment is also related to a set of phenomena identified as the emergence of critical citizens (Pippa Norris, 1999). According to Norris, critical citizens aspire to democracy and consider it as their ideal form of government, but at the same time they are deeply skeptical when evaluating how democracy works in their own country.

Different explanations have been proposed for such phenomena and are not fully integrated even if going in a common direction. Since the mid-1990s, for instance, many commentators pointed out that if contemporary democracies were not facing a system crisis, at least they were facing a syndrome of disenchantment and democratic malaise: Citizens in many industrial societies had become disengaged from public space. It is worth noting that the theory of critical citizens is perfectly compatible with the portrait of apathetic citizens or skeptical, even angry or cynical citizens rather than with the image of apathetic citizens expecting public services but not supporting the democratic system actively. The set of explanations coming from this literature about the democratic gap in contemporary societies claims that this phenomenon arises from some combination of growing public expectations, negative news, lack of public trust, and failing government performance. Complementary explanations have been proposed, such as social capital theory focusing on a decline of civic engagement and social trust (Robert Putnam, 1993) or postmaterialist theories (Ronald Inglehart, 1997), emphasizing the changing value orientations linked to processes of individualization. Indeed, the World Values Surveys document in a large set of countries that individualization processes detach citizens from the public sphere. But the postmaterialist revolution also shows the capacity of educated citizens to be the changing force of a cultural revolution in many societies, education playing a crucial role in the cognitive mobilization processes underlying such value changes.

A challenging view about apathetic citizens has been proposed by Pierre Rosanvallon, a French historian engaged in research on the intellectual roots of contemporary democracy. In the context of lamentations about the low turnout in European elections and the apathy of citizens regarding EU issues, Rosanvallon contradicted the myth of a passive citizen. His main argument was that the phenomenon of abstention reflects a mutation of, and not just a decline in, the public sphere. According to him, the decline in voter turnout has often been accompanied by other democratic activities. Rosanvallon substitutes the view on democratic fatigue in contemporary societies (a view that too many elections weaken the "democratic appetite" of citizen) with a distinction between three facets of democracy: (1) *expression* of citizens in making judgments on the rulers and their actions; (2) *involvement*, which encompasses all means by which citizens get together to produce a common world; and (3) *intervention*, which consists of all forms of collective action.

According to Rosanvallon, the characteristic elections should be superimposed on these different forms of civic life. In other words, voting is the most condensed form of democracy and the most organized and visible. Rosanvallon observes that although lower participation in elections has undoubtedly eroded the democratic expression, involvement and intervention have been strengthened. As an example, Rosanvallon reports the following data on the French case: In terms of involvement, participation has not declined. The French are now more likely to have signed petitions (68% in 2000 compared with 53% in 1990). They have also taken part in more events and demonstrations to make their voices heard. In other words, citizens' apathy does have some empirical foundations, but it is a multifaceted and multidimensional phenomenon. Depending on the definition, the available empirical indicators can change significantly the views about a supposedly apathetic citizenry.

Area Studies

Area studies is the generic term for multidisciplinary social research that focuses on specific geographic regions or culturally defined areas. The largest scholarly communities in this respect are loosely defined as Asian, African, Latin American or Middle Eastern studies, together with a variety of subfields (Southeast Asian studies, Caribbean studies, etc.). Political science plays a major role in area studies programs, which typically also draw on disciplines such as history, sociology, ethnology, geography, linguistics, literature, and cultural studies. In political science, the presence of area studies is strongest in comparative politics, but they are also incorporated in international relations (IR) and other fields. This entry first describes the origins of area studies, from early colonial studies to the development and institutionalization of area studies in the Cold

War era. It then outlines the not always easy relation between area studies and the discipline of political science, highlighting key achievements as well as remaining problems. The final section turns to the current research frontier, which is marked by a new impetus for comparative area studies and by transnational perspectives that question, among other things, established concepts of space or area.

The Origins of Area Studies

Today's area studies can be seen as having their origins in the colonial expansion of European powers and the accompanying academic efforts to better understand those "foreign" or "native" societies that demonstrated a variety of languages, cultures, and social organizations hitherto unknown. In this sense, area studies emerged as a "child of empire," often driven by commercial and political interests or the perceived "civilizing mission" of the colonial powers. At the same time, the study of ancient civilizations, ethnic codes, social hierarchies, or foreign languages was part of the much broader process of the extension of Western science across the globe. While from the mid-18th century, European capitals began to display the treasures and arts of "exotic" civilizations as much as of ancient civilizations in public museums, the 19th century saw the establishment of colonial studies in European universities. In the United States, interdisciplinary centers for area studies first emerged after World War I, and they received a strong impulse after World War II, parallel to the U.S. rise as a global power. A better understanding of societies in Asia, Africa, the Middle East, and Latin America was seen as urgent in the context of the Cold War rivalry between competing superpowers looking for local clients and supporters, particularly in the Third World. (A similar, security-driven incentive to promote the study of foreign cultures was again seen after the terrorist attacks of September 11, 2001.)

The work of German geographer Alexander von Humboldt (1769–1859) was a forerunner of area studies. Von Humboldt was also one of the founding fathers of multidisciplinarity, which then ranged from social to natural sciences. At a later stage, a critical strand of area studies emerged that openly condemned colonial practices. This branch emphasized respect for other cultures, challenged the supposed universality of the Western worldview and the "Eurocentrism" inherent in theories claiming general validity, and advocated mutual learning instead of unilaterally copying Western social or political models.

A common legacy of all strands of area studies, however, is that they almost always refer to "other" areas. There are no "German studies" in Germany or "U.S. studies" in the United States. Until today, area studies have focused predominantly on the non–Organisation for Economic Co-operation and Development (OECD) world. A remarkable trend, however, has been the emergence and expansion of "European studies" in the wake of the growing importance of the European Union.

Area Studies and Political Science: An Ongoing Debate

The relationship between area studies and the discipline of political science has not always been an easy one. Particularly in the United States, the eclectic use of changing paradigms by area specialists has been criticized. Single-case studies have been attacked by scholars interested in generalization. At times, area specialists have been expected to simply deliver the raw data for universal theories. Conversely, area specialists have accused generalists of superficiality, claiming that an in-depth knowledge of the particular language, culture, and social context is needed to produce adequate analyses of cases that do not conform to the OECD "standard model"—on the empirical realities of which most political science theory has been generated.

Contemporary political science has developed most strongly in the post–World War II period and in the transatlantic North. This explains why the bulk of existing theories and methods have a clear "transatlantic" or "OECD bias." Democracy, elections, state and administration, security, and so on are conceptualized in mainstream political science using idealized blueprints of Western societies. It cannot be denied that these concepts have been highly influential in other world regions as well and have been internalized by many scholars, elites, and citizens from Argentina to Zimbabwe. However, they are also frequently contested and compete with other organizing principles of society. The trajectories toward modernity have in fact varied enormously around the globe, with religion, family bonds, or industrialization playing divergent roles in different world regions. The exclusive reliance on "imported" models without local adaptation, so area studies scholars have argued, produces systematic errors in the comprehension of how "other" political systems function. In a more and more globalized world and for advocates of a practice-oriented approach in the subdiscipline of IR, it has become essential to understand the motivations and capabilities of actors in the most remote places of the globe in order to appropriately analyze security and economic challenges for their own societies.

Nonetheless, a balanced view of the strengths and weaknesses of the approaches of both mainstream political science and area studies has led to a more fertile relationship and compromises between "nomothetic" and "idiographic" worldviews. Some of the most prolific strands of research in political science have been strongly influenced by area specialists; for instance, the understandings of corporatism as well as of transitions to democracy in the 1980s were largely developed by Latin American studies scholars, before their concepts "traveled" to explain European and other cases. More recently, the topic of the consolidation and reform of "hybrid regimes" has been studied in Africa and South East or Central Asia, and much of the study of persistent authoritarian rule draws heavily on the scholarship of area specialists of the Middle East and Asia. Similarly, studies of clientelism or nationalism, informal politics or political culture, and development models or revolution would not be possible without the insights of area specialists. Some scholars go so far as to call "area studies" a misnomer, stating that area-focused scholarship by political scientists should be understood as an integral component of comparative politics.

The "Orientalism" Debate and the Demarcation of the "Areas" Studied

Criticism of area studies has also been raised from within the regions under scrutiny, most prominently in the "orientalism" debate kicked off by the 1978 publication of Edward Said's influential critique of Western constructions of the "Orient." Area studies, according to this critique, expressed an imperialist and condescending worldview regarding the "other"; thus, the object of research had to be redefined, and a complete overhaul of the production of academic research on non-Western societies was necessary. Postcolonial studies emerged from this line of thought as a competing paradigm of research that sharply criticized mainstream Western academic approaches as being part of an international system of domination in continuity with the colonial past. While strongest in literary theory and cultural studies, postcolonialist approaches also concern social and political science.

A different line of critique has come from scholars in countries of the global South, who consider themselves political scientists, just like any North American or European scholar studying his or her own country, but find their research on Brazilian parties, South African trade unions, or Indian class structure labeled as area studies rather than being accepted as political science on an equal footing with similar research in the OECD world.

A particular concern in area studies is the exact territorial demarcation of the "areas" under investigation—all the more so given the recent emphasis on transnational and transregional interrelationships. Is it appropriate that African studies more often than not deal exclusively with the Africa south of the Sahara? Put differently, is North Africa part of both African and Arab studies? What implications does the choice between "Arab world" and "Muslim world"—with an emphasis on ethnicity rather than religion—have for the understanding of the region? Does it make sense to group Southeast Asian, Central Asian, and South Asian studies together under the label of Asian studies? While Latin American studies encompass a region with a largely shared historical and cultural legacy, some recent initiatives have shifted to a more hemispheric approach under the label of American studies, which includes Canada and the United States.

Intellectual debates on these matters abound, but the persistence of the existing classifications is a sign that they continue to provide a basis for the production of meaning. Recent research has in fact argued that "regional context" is one crucial variable in many quantitative research designs, and in IR, the concepts of a "world of regions" and an emerging regional architecture in world politics have become an important focus of scholarly attention, implicitly strengthening the key assumptions underlying the concept of area studies.

Comparative Area Studies

A distinct and new approach is "comparative area studies." In addition to intraregional and interregional forms of comparison, the long-marginalized field of cross-regional comparisons has emerged as part of the agenda, for example the comparison of social security systems in Venezuela and India or of party systems in Tanzania and Indonesia. The case for comparative area studies is twofold: First, given that the emphasis on regional expertise has been their raison d'être, the different branches of area studies have developed largely separated from each other over decades. The ability of concepts "to travel" from one regional context to another has yet to be investigated in an appropriate way. While, for instance, the analysis of the paradox of concomitant democratization and the persistence of neo-patrimonial rule was pioneered in the African context, its general usefulness can be tested on Latin American and Asian cases. Such cross-area analysis allows the detection of area specificities as much as commonalities. A more general theory may emerge more easily from such a research design than from single-area approaches.

The second line of argument for comparative area studies holds that cross-regional small-*N* comparisons are particularly well suited to perform a mediating role between area-focused scholarship and the general theoretical and methodological debates in political science. While there will be few scholars with equally profound expertise in distant world regions, the demanding prerequisites for conducting such cross-area research can be systematically fulfilled through collaborative projects between scholars with different regional expertise but shared research interests. Area studies are not limited to a particular set of methods or schools but employ the wide array of methods used in the disciplines involved. Typically, however, case studies and paired and small-*N* comparisons have been dominant, and—given area scholars' emphasis on profound knowledge of the area under investigation—qualitative approaches have traditionally been stronger than quantitative studies.

Finally, the dynamic development and increasing self-assertion of scholarship from the regions that are the topic of area studies have led to growing sensitivity toward ethical considerations voiced in "the South." Area specialists in Northern countries are constantly pressed by their colleagues from Africa, Asia, Latin America, or the Middle East to share their privileged access to libraries, data, and funding. One element of a more collaborative approach is, for example, the open-access movement to publish social science findings free of charge on the Internet for readers worldwide. This may eventually narrow the gap in the access to relevant current literature between the "Harvards" and the "Have-nots."

Arms Race

An arms race may be defined as a pattern of competitive acquisition of military capability between two or more countries. The term *arms race* is often used quite loosely to refer to any military buildup or spending increases by a group of countries. This definition requires that there be a *competitive* nature to this buildup, often reflecting an adversarial relationship. The arms race concept is also used fruitfully in other fields, especially evolutionary biology; however, this entry deals only with military arms races.

Examples of Arms Races

One example of an arms race is the "Dreadnought" arms race between Germany and Britain prior to World War I. In the early 20th century, Germany as a rising power sought to challenge the United Kingdom's traditional naval dominance. In 1906, Britain launched a new, more advanced warship, HMS *Dreadnought*, triggering a naval arms race. Between 1909 and the outbreak of World War I in 1914, Britain launched a further 19 "dreadnoughts" and a further nine battle cruisers, while Germany launched 13 dreadnoughts and five battle cruisers. This arms race is often cited as one of the causes of World War I.

The Cold War nuclear arms race between the United States and the Soviet Union is another example of a 20th-century arms race. The United States' use of nuclear weapons to end World War II led to a determined effort by the Soviet Union to acquire these weapons, leading to a long-running nuclear arms race between the two superpowers. The Soviet Union conducted its first nuclear test in 1949. At the end of 1956, the United States had 2,123 strategic warheads to the Soviet Union's 84. These numbers increased rapidly over the subsequent 30 years. The U.S. arsenal peaked in 1987 at 13,002 warheads, the Soviet Union 2 years later at 11,320 (figures from Stockholm International Peace Research Institute). The end of the Cold War effectively ended this arms race.

Arms races may involve a more general competitive acquisition of military capability. This is often measured by military expenditure, although the link between military expenditure and capability is often quite weak. Such more general arms races are often observed among countries engaged in enduring rivalries, which may sometimes appear to follow each other's military spending levels, especially during periods of heightened tension. Examples of such arms races include India–Pakistan, Israel–Arab states, Greece–Turkey, and, since 1991, Armenia–Azerbaijan.

Consequences of Arms Races

Arms races are frequently regarded as negative occurrences in both economic and security terms.

Large-scale arms acquisitions require considerable economic resources. If two countries spend large sums of money just to cancel out each other's efforts, the expenditure might well be seen as wasted. There is, however, considerable debate surrounding the economic effect of military spending. Some argue that it provides benefits through technological spin-offs, job creation, and infrastructure development; others argue that it displaces more productive forms of investment, while its final output is not itself productive. Certainly, countries that must import arms will see more negative economic effects of an arms race, and arms imports are a major contributor to Third World debt. Even for arms-producing countries, excessive military expenditure is likely eventually to have negative economic consequences. The Soviet Union's economic difficulties were certainly exacerbated by the very high proportion of the gross domestic product devoted to the arms race.

The question of whether arms races contribute to the outbreak of war is also the subject of considerable debate. An arms race may heighten fear and hostility on the part of the countries involved, but whether this contributes to war is hard to gauge. Some empirical studies do find that arms races are associated with an increased likelihood of war; however, it is not possible to say whether the arms race was itself a cause of war or merely a symptom of existing tensions.

One may also consider the gains for a country that "wins" an arms race in the sense of gaining a decisive military advantage. Arguably, the collapse of the Soviet Union, which left the United States as the sole global superpower, was partly due to the cost of attempting to keep up with the United States.

Modeling Arms Races

There is an extensive literature modeling arms races theoretically and empirically. These include game-theoretic models based on the "prisoners' dilemma" (PD), dynamic mathematical models based on the Richardson model, and economic models frequently based on a "utility-maximizing" framework. There is overlap between these categories.

Prisoners' Dilemma Models

The famous PD game is frequently applied to arms races between two countries. It is assumed that each country has a choice between a high or low level of arms. Each country's most preferred outcome is assumed to be where they choose high arms and their rivals low, gaining a clear military advantage. Their least preferred outcome is the reverse. However, the second best outcome for each is where both choose low; if no advantage is gained, it is assumed to be cheaper and more secure to avoid the arms race.

Each player's "dominant strategy" is to choose high arms, as whichever choice the rival has made, they do better by choosing high than low. This outcome illustrates the Nash equilibrium (named after John Nash), in which each player has chosen the optimal strategy in a noncooperative situation or zero-sum game, given the other player's strategy. The Nash equilibrium outcome of the game is therefore that both choose high. It is an equilibrium because neither player would change their own choice, given the choice of the rival. However, this arms race outcome is worse for both players than if both had chosen low arms. The logic of their rivalry traps them in a mutually disadvantageous situation.

However, the picture may not necessarily be so bleak, as in reality the "game" is not played once and for all but is an ongoing series of decisions, which can be modeled by the "iterated prisoners' dilemma" (IPD), where the PD game is played repeatedly by the same players. This opens the possibility for cooperation to emerge through reward and punishment strategies such as "tit for tat"—start by choosing low arms but then match the strategy chosen by the other player in the previous round. Experiments have shown this to be a highly successful strategy in IPD games.

While greatly simplifying real-world situations, the PD may be a useful metaphor to capture the essential dilemma facing countries engaged in an enduring rivalry.

The Richardson Model and Its Elaborations

In his seminal work *Arms and Insecurity*, Lewis Fry Richardson proposed a model (which he applied to the *Dreadnought* race) of an arms race between two countries where each country sets its military expenditure (or arms acquisition) level in each period based on its own and its rival's level in the previous period in an "action–reaction" pattern. This is modeled by the following equations:

$$M1_t = -a1M1_{t-1} + b1\mathrm{M}2_{t-1} + g1,$$

$$M2_t = -a2M2_{t-1} + b2M1_{t-1} + g2.$$

Here, $M1_t$ and $M2_t$ refer to the military spending levels of Countries 1 and 2 in years t and $t - 1$, respectively. The coefficients $a1$ and $a2$ (assumed to be positive) are "fatigue" coefficients, representing the difficulty of maintaining high levels of military spending. The coefficients $b1$ and $b2$, also positive, are "reaction" coefficients, measuring the tendency for each country to respond to the military spending of their rival, while $g1$ and $g2$ are autonomous "grievance" or "ambition" terms, representing each country's desire for military capability apart from the rivalry. Depending on the relative size of the fatigue and reaction coefficients, the arms race can either reach a stable equilibrium or spiral out of control.

The basic Richardson model has been extensively developed by other authors, both theoretically and empirically. Developments include taking into account the stock of weapons of each country as well as the rate of spending, introducing explicit economic criteria, and modeling the strategic dynamics of the relationship. Richardson models can easily be applied to empirical military spending data, using regression analysis to estimate the parameters of the equation for a pair of countries. The key question is whether the reaction terms $b1$ and $b2$ are significantly greater than zero—if so, an "action–reaction" or Richardsonian arms race is said to exist. A wide variety of theoretical models and statistical techniques starting from the Richardson framework have been applied to various pairs of countries.

Economic Models

A third approach is to assume that countries' military expenditure decisions are the outcome of an economic resource allocation process whereby the government seeks to achieve a set of economic, political, and security objectives by allocating spending between military and civil sectors. Neoclassical rational choice models are most frequently employed, but others are also used. When two rival countries are considered, each country's level of security is assumed to depend on both its own level and its rivals' level of military spending. Each country makes its decision taking into account the likely response of the other. The resulting models are similar to certain elaborations of the Richardson model: While one starts from the arms race and builds in economic allocation issues, the other starts with the allocation problem and builds in the rivalry.

Weaknesses of Richardsonian Models

While the Richardson model has proved extraordinarily fruitful in generating scholarly analysis of arms races, the Richardson approach has a rather poor empirical record in demonstrating the existence of actual arms races. Some, though not all, studies of India and Pakistan have found evidence of a Richardsonian arms race, but few other enduring rivalries have produced such empirical results and none consistently.

A problem of the Richardson model is that it assumes that the parameters of the relationship (the values of a, b, and g) remain constant, whereas in reality they may change over time depending on the changing relationship between the countries. A second is that it is most applicable to pairs of countries where the rivalry is the overwhelming factor for each country's security, which is relatively rare.

One suggestion is that the changing levels of tension or hostility between countries may be a better way of explaining their military spending decisions than the Richardson action–reaction framework—or perhaps a combination of levels of hostility with the rival's military spending. This would suggest that arms races are characterized more by short bursts of rapidly increasing spending during periods of high tension than by long-term, stable relationships between their levels of spending.

Attitude Consistency

Three types of attitude consistency can be distinguished: (1) consistency among the various components of an attitude, (2) consistency between different attitudes, and (3) consistency between attitudes and behavior. This entry addresses the relevant conceptualizations, measurements, and explanations.

Intra-Attitudinal Consistency

An attitude is said to be consistent when all elements elicit similar evaluative judgments. Intra-attitudinal inconsistency arises when some of these elements are positive in nature, while others are negative. Within the cognitive component, accessible beliefs may conflict, cognitions and affects may also conflict, and the various affects may differ, simultaneously. Intra-attitude consistency can be examined by comparing how respondents feel, how they think, and what their summary evaluation is. The many studies that showed low correlations and consistency between the cognitive, affective, and conative (behavioral) components have raised doubts about the early theorists' multicomponent view of attitudes. Martin Fishbein and Icek Ajzen restricted the term *attitude* to a person's evaluation and drew a clear distinction between cognitions, attitudes, behavioral intentions, and behaviors. From their point of view, an attitude is a person's general feeling of favorableness or unfavorableness and an index of the degree to which a person likes or dislikes an object. This one-component view of attitude opened the way to the development of more sophisticated explanatory models in which the summary evaluation is at the core of an attitude, while behavior or the intention thereto is an effect, and cognition (knowledge and beliefs) and affect (general moods and specific emotions) are origins of the attitude. The affects underlying attitudes are more easily accessible in memory than the cognitions, and they tend to predominate among ambivalent respondents with different evaluative-cognitive and evaluative-affective consistencies. Individuals differ in their tendency to base their attitudes on cognition or affect, as Geoffrey Haddock and Mark Zanna have shown. Consistent attitudes were found to be stronger, more predictive of subsequent intentions and behavior, more resistant to persuasive communication and change, and thus more stable than inconsistent attitudes. Inconsistent attitudes seem to result in more information processing and knowledge acquisition.

Interattitudinal Consistency

Attitudes toward the same object and attitudes toward different objects are said to be consistent when they do not contradict each other. Interattitudinal consistency with respect to the same object (dual-attitude model) is empirically examined by the extent to which a respondent's explicit and implicit or habitual attitudes are related to one another. Interattitudinal consistency with respect to different objects is empirically examined by the extent to which these attitudes are related to one another and/or the level of correspondence between the respondent's attitudes and his or her ideological self-identification (e.g., consistent liberal or conservative attitudes), left–right self-placement, and respondent's value system and/or the number of issues on which a respondent adopts his or her (liberal or conservative) party's position. Interattitudinal consistency is considered desirable from the point of view of "correct" voting in representative democracies, requiring citizens to make well-founded voting decisions. Scholars vary in their views on the level of interattitudinal consistency. Philip Converse was one of the first who showed that the political attitudes that many people have are not consistent and referred to this aspect of public opinion as "nonattitudes." However, the evidence presented by Max Kaase and Kenneth Newton, using Eurobarometer data, suggests that public opinion (in Western Europe) is relatively internally consistent (at both the aggregate and the individual levels). Mass opinion about the welfare state and the scope of government is structured into relatively few attitude publics. Mass attitudes about spending on government services and attitudes toward policy issues cluster into three groupings of related issues (welfare, security, and quality of life). There is also a match between saying that a particular issue has high priority as a public service and expressing a willingness to pay taxes for it. Finally, the statistical associations with left–right orientation and party identification are usually stronger than with any of the social, economic, and demographic variables. However, this left–right factor generally explains only a small proportion of the variance in issue positions. A factor that can also help us understand the structure of political attitudes is values; there is now a substantial amount of evidence that values are a major source of structure for political attitudes, according to Stanley Feldman.

Explanations of Attitude Consistency

Consistency and inconsistency have both interpersonal and intrapersonal sources. Political socialization theory, represented by, among others, David

Easton, Kent Jennings, Richard Niemi, Judith Torney, and Russell Farnen, emphasizes interpersonal and contextual factors and the level of consistency or inconsistency of the cognitive and affective messages that people receive from the various socialization agencies (including political leaders, mass media, friends and colleagues, religious institutions, school, family) in particular. The scale runs from very high message consistency in totalitarian regimes and autocracies, via moderate consistency in representative democracies with weak elite polarization, to very low consistency in democracies with strong elite polarization.

Various intrapersonal factors have been identified. Individuals differ in their chronic tendency to engage in evaluative responding (which can be measured by a set of items developed by Blair Jarvis and Richard Petty). People also differ in their attempts to reduce or avoid the tension that they experience when they become aware of contradictions. To avoid the anticipated tension, people prefer exposure to consonant media and messages (e.g., Fritz Heider's balance theory and Leon Festinger's cognitive dissonance theory). The level of political knowledge is another important variable. In general, the mean level is very low but the variance is very high. The higher the level of political knowledge, the more tightly structured or "constrained" the individual's system of attitudes, as Converse has shown. A few theoretical frameworks have been developed as attempts to explain the organization of political and social attitudes. Converse's "ideological constraint theory" holds that individual attitudes become consistent thanks to deduction from higher order orientations such as ideology. People differ in attitude consistency because they differ in the use of ideological schemas. Howard Lavine and Cynthia Thomsen have developed the "shared-consequences model" to understand the psychological mechanisms through which structural organization and consistency between attitudes develop. The core of the model is the strength of the perceived implicational relationship between a pair of attitude objects. Perceiving two policies, for example, legalized abortion and capital punishment, as instrumentally influencing a similar set of consequences, for example, the attainment of similar sets of value-related goals, constitutes a strong implicational relationship between them, which, in turn, creates consistency pressures. Consistency, then, is the psychological agreement between the valences of a pair of attitudes and the valence of the implicational relationship perceived to exist between them. The development of interattitudinal organization may proceed through a series of distinct stages: Interattitudinal connections may initially be derived from affective associations that issues have in common, next to self- and group-interest considerations, then from values, and finally from ideology.

Attitude–Behavior Consistency

Attitudes are studied primarily because of their expected effects on behavior. It is expected that the more favorable an individual's attitude toward some object, the more likely the individual will be to perform any given positive behavior and the less likely he or she will be to perform any negative behavior with respect to the object. In Allan Wicker's analysis of 45 studies, however, only a small minority of studies showed a strong or modest positive relationship between attitude and behavior. Hans Benninghaus's analysis of 57 studies supported Wicker's findings. Inconsistency between attitude and behavior is higher if the attitude object is not related to one's self-interest, if intra-attitude inconsistency is high, and if one's attitude conflicts with the subjective norm or the perception of how relevant others think one should behave.

In an attempt to improve the attitude–behavior link, the conceptualizations and operationalizations of the two key concepts have been reconsidered. Fishbein and Ajzen introduced the conceptual restriction of attitudes to a person's evaluation or feeling of favorableness or unfavorableness. With respect to behavior, distinctions were introduced, for instance, between behavioral categories and single actions, isolated individual behavior and behavior in the presence of others, and behaviors under much or little volitional control. In subsequent behavior-explanatory theories, attitude is still an independent variable, though not the one and only, the most important, or the most immediate variable. In Fishbein and Ajzen's "theory of reasoned action," which presents a causal chain to predict behavior, the immediate determinant of behavior is the individual's intention to perform the behavior in question. Attitudes toward the behavior and the "subjective norm" are the two determinants of the individual's behavioral intention. Thus, behavioral and normative beliefs are the antecedents of attitude and subjective norm and, as a result, ultimately determine intention and behavior. This reflects a cognitive approach to explaining attitudes and a rational view on human behavior. One of the main comments on the reasoned-action theory was that this theory is only applicable to purely volitional behavior. Ajzen's "theory of planned behavior" extends the theory of reasoned action by adding the perception of control over behavior. Perceived behavioral control is also cognitive and rational since it is the individual's set of beliefs about the presence or absence of requisite resources and opportunities. New meta-analyses by, among others, Min-Sun Kim and John Hunter and Christopher Armitage and Mark Conner, showed stronger attitude–behavior relationships and a relatively strong predictive power of the theory of planned behavior. Many studies have demonstrated the applicability of the theory in various content domains, including the political. In Marco Perugini and Mark Conner's "model of goal-directed behavior," the basic variables of the planned behavior theory were added, together with three other key variables: desire/motivation, emotions, and habit.

In general, affective variables are gaining in importance in theory and research aiming at explaining the consistency between attitudes and behavior. Promising political science theories, building on new insights from political neuroscience, are George Marcus's "affective intelligence theory," Milton Lodge and Charles Taber's "theory of motivated political reasoning," and Richard Lau and David Redlawsk's "model of motivated reasoning."

ATTITUDES, POLITICAL

Individuals hold attitudes—and eventually change them—in relation to a wide diversity of topics. They eventually establish connections between one topic and another. Thus, for example, for some individuals, attitudes toward a political topic may be based on attitudes toward other subjects not related to politics. The idea that political attitudes constitute, or should constitute, a separate field has two main roots. One is the tradition connecting the sphere of politics with the kind of well-articulated sets of ideas frequently called "ideologies"; the other is the normative tradition postulating that human beings should approach the realm of politics in a way that is different from how they normally approach other spheres of life, basically by putting aside impulses, affects, and passions. We hear and record opinions, but no one can hear or see attitudes. Attitudes lie within individuals' minds; therefore, they are nonobservable, or latent, properties. To speak about "attitudes," we need to build, analytically, the aspects of reality the existence of which we postulate. The concept of attitude as it is employed in various political contexts and the factors shaping them are discussed as follows.

Definition and Measurement

A critical problem, as ancient as the notion of "attitudes" itself, is how to measure them. Being, by definition, unobservable aspects of reality, any attempt to measure them is based on assumptions. The first and best known attempts to measure attitudes employed projective tools, scales, attitudinal indices, and mathematical models allowing inferences about latent structures through manifest observations and data. All of these tools are based on the principle of a stimulus (a question) and a response (a verbal answer) that elicits some unobservable mental state. The idea that attitudes can be measured by recording manifest verbal expressions from which they can be inferred had a significant impact on the development of the techniques of quantitative survey analysis. This concept provided a logic, a methodological and an empirical support for the field of opinion research.

Let us think of voting. How do we account for the particular decision each voter makes at the ballot box? Is this act something determined from outside himself or herself, such as his or her class position, or is it derived from some kind of "objective interest"? Is it a random impulse? Or is it a consequence of the multiple messages an individual is exposed to in a communication process called an electoral campaign? Or is it to a great extent the result of media and public relations manipulation? Or is it the result of influences and pressures generated in the social groups the person belongs to—family, the neighborhood, friends, colleagues, and peer groups? Is the vote the product of political convictions and ideas of an individual and his or her ability to match those ideas with the ones the candidates communicate? Or is it just the result of preferences on any of the attributes, or issues, the voter sees in a candidate?

However, political convictions or preferences cannot be directly observed. They can only be inferred from what a particular voter says. This nonobservable, latent, level is called *attitude*: the propensity to produce certain behavioral responses relating to specific subjects, once the individual has been exposed to a stimulus. To the extent that such attitudes determine opinions and behavior, the individual is an autonomous actor rather than a passive object moved by causes external to him or her.

Attitudes or *predispositions*, as they are frequently called, vary from one individual to another. For some individuals, "ideas," in the sense of a set of articulated beliefs, matter; to others, tastes are more important. For some individuals, particular issues are more relevant than general concepts; for others, moral values are more important than particular preferences. So, some people may vote because of the positions of candidates or parties on specific issues, whereas others may vote with regard to more general public policies. Some individuals prefer a candidate just because they like or trust him or her, or they base their choices on the perceived honesty of the candidate irrespective of his or her standing on public policy issues.

The idea that there are voters who make their decisions in an erratic, random way has not been alien to the social sciences. Frequently, this idea implies the assumption that individuals are strongly dependent on mass media, leaders, or material incentives, so they are not really autonomous actors. In any case, *attitudes* are important factors accounting for individual behavior and thought. They constitute a term in an equation intended to describe why autonomous persons do the things they do, other terms being *information* coming to the individual from society and *pressures and influences* from the near environment.

The standard representation of attitudes postulates the existence of levels of generality and stability in the judgments people are able to formulate about themselves and the external world. A higher degree of generality means that an idea refers not to a single or particular subject but to a wider set of topics; a higher degree of stability means that ideas sustained through time resist the impact of new information the individual is continually exposed to. In these assumed hierarchies of judgments each individual holds in his or her mind, there are, on one extreme of the continuum, the more general and stable ones—values, values, ideologies; on the other pole, judgments refer to particular issues—opinions; and in the middle are judgments that are less general and stable than the first ones but not as occasional or particular as the latter—attitudes. The expression *belief system* is sometimes used to refer to the relationship between the different attitudes a person can hold in a stable manner.

The term *attitude* denotes an individual's propensity to think and to form opinions in a stable way when he or she refers to a specific topic. "Attitude" also refers to a propensity in the individual to mobilize certain mental contents, stable points of view, every time he or she formulates specific judgments, utters opinions, or decides on certain conducts.

Citizens do have predispositions toward public affairs, governments, and elections. These vary among individuals. For example, some individuals hold conservative points of view, others hold liberal ones; some are nationalist, others universalist; some favor a certain public policy, others do not.

Some dimensions of predispositions are thought of as if they were a given, by a sort of necessity, in each individual. Thus, it is frequently assumed that individuals are always either liberal or conservative, either left wing or right wing. Empirical evidence in many countries does not support such assumptions. Sometimes, the evidence instead suggests that there are individuals who to some extent may be both liberal and conservative, depending on the issues that are considered. In some countries, people define themselves as oriented to the left, right, or center; in other countries, these concepts are not relevant for many people.

Attitude Formation

How these predispositions are formed is a matter of debate among social scientists. Predispositions may result from genetic factors, socialization, learning, or many other influences. Two main traditions have developed within the social sciences. One places emphasis on *interests*: Alexis de Tocqueville said that people's opinions change with their fortunes. The other focuses on *membership groups* each individual takes part in: Émile Durkheim talked of "likenesses of consciences" in contrast to the effects of the division of labor. The idea that each social position must correspond to a particular set of attitudes is deeply rooted in social theory; it frequently receives empirical support, but the explanation to account for that correlation is far from being consensual.

The theory of attitudes postulates an inferred, nonobservable relationship between a given attitudinal dimension, which is by definition unobservable, and a manifest, observable one. We can conceive of that relationship as a probabilistic one, in the sense that there is no perfect link between the real position of a person on the attitudinal dimension and his or her manifest answer to a particular question at a given time. An individual can be at a certain latent state in the dimension of "nationalism," but that position does not determine a single answer the individual would produce to a given question aimed to elicit that attitude. A student who knows the content of a given topic very well is supposed to answer all the questions in an exam correctly, but sometimes he or she fails to do so.

We speak, for example, about attitudes toward the government. We could conceive of these attitudes as ranging from a very favorable attitude to a very unfavorable one. To measure that attitude in a particular individual at a given time, we may ask him or her: "What do you think about the performance of the present government?" and we possibly offer him a limited set of options: "very well," "fairly well," "about average," "fairly bad," or "very bad" or 5, 4, 3, 2, 1, where 5 is a *very favorable* and 1 a *very unfavorable* evaluation. The relation is probabilistic, because, even if the individual usually is in favor of the current government, some days he or she will not necessarily give the same answer, assuming we ask the same question in different ways and that he or she does not remember the previous answers. Moreover, different researchers can construct the scale in different ways: Some offer five options, as in the example, while others offer four or seven choices. The answers generate a variable that is statistically dependent on the latent one, but that variable could also be dependent on many other variables, most of them probably unknown to us.

Critics of this method of measuring attitudes may argue that all the other factors that may influence a response, including the more occasional or situational ones, could reduce the relationship between the latent dimension and the manifest one to zero, making the measurement irrelevant and not valid to measure what it intends to measure. The supporters of the method think that the range of variation between these two levels of reality is far more restricted and that there is no better way to approach attitudes—at least in a quantifiable way.

It is commonly accepted that political attitudes help the analyst explain and predict political preferences and behavior. There is a great deal of research examining the effects of electoral campaigns, political communication, and messages delivered by political leaders on voters' attitudes. While there are no universal generalizations supported by empirical research, some firm trends can be established. For example, a voter's level of education and the quantity of information an individual may acquire facilitate a higher propensity to change; membership groups also have an effect, but this effect tends to become weaker the more complex societies are. Political parties in democratic systems used to have a strong influence on voters, but this influence is becoming weaker as the number of citizens who feel independent from parties is increasing. The role of ideology in the propensity of individuals to become exposed to certain kinds of messages and to be receptive to them is also a matter of discussion. The influence of the print media is also a matter of widely divergent points of view—that is, whether the media influence public attitudes or whether they adapt themselves to the prevailing attitudes of their publics.

We know that many citizens today hold stable political predispositions and do not change them easily. They derive their opinions and particular political decisions from those predispositions. However, they do not link their predispositions to particular opinions and decisions in a strongly linear way. Rather, they afford a certain degree of variability in the opinions they form at every moment—including the voting decision. So, different persons eventually may make the same voting decision for different reasons, while persons with similar attitudes may eventually arrive at different voting decisions. Electoral campaigns are sources of intense stimuli, concentrated within a short period of time, which voters cannot easily resist. During a campaign, political advertising, press information, and the messages of the candidate and other leaders are able to produce some variability in particular voting behaviors even while voters' attitudes may remain relatively stable. Sometimes, those intense messages are able to modify attitudes as well.

Some citizens decide their vote by taking into account both their own attitudes and the ones they attribute to the candidates and then matching them. But there are others who tend to take into account "tactical" considerations, such as defining their vote against a candidate rather than in support of another or to voting for the presumptive loser in order to prevent the winner from obtaining a landslide. To make that kind of decision, electoral polls may influence some voters.

The principle that political behavior, and specifically voting behavior, must be related to what citizens have in their minds is at the root of democratic theory. Quite often, mass democracy is judged negatively precisely on the assumption that voters lack the capacity to make consistent judgments anchored in adequate information. Thus, the ancient problem of the relationship between attitudes and behavior is central in the realm of politics—be it formulated in these terms or not. Even if attitudes, in whatever way they have been formed, tend to be stable and do not vary at random, they are susceptible to change. One important question is whether human beings are able to modify their attitudes in an autonomous way—that is, by thinking and reasoning themselves—or whether they change their attitudes under the influence of messages from the outside world.

Attitude Change

We are far from a theoretical consensus on how attitudes can change. While one theoretical perspective postulates that better informed, more consistent persons are more stable in their attitudes, another theoretical perspective proposes that they are more susceptible to nuances and variations in particular opinions. Recent research tends to give support to the view that particular opinions may vary, to some extent, independently from well-established attitudes. Individuals have many different ideas in their minds; so, they may hold different attitudes, some of them more firmly rooted than others. The assumption that more general judgments are more stable in the mind of individuals does not imply that specific opinions and decisions may vary to a greater extent. That does not necessarily mean that citizens are inconsistent but, rather, that they are flexible.

When an individual receives information from outside, he can dismiss it or accept it; in the latter case, he can process it and record it, totally or partially, in his memory. The new information may have different effects on already existing attitudes: It can modify some of them, it can be conserved without modifying previous attitudes (sometimes even if it produces some inconsistencies), or it can be rejected. The effect of a new piece of information on previous attitudes can also be sometimes delayed: The new information has been taken into account, but the mind works on it slowly. So there can be a lag between the moment a stimulus is produced and the moment an effective change of attitude takes place. It is possible that those effects are more intense on some attitudes held by an individual than on others; therefore, as each individual holds a collection of interrelated attitudes rather than many separate ones, it is possible that some attitudes change while others do not, thus producing different patterns of consistency or inconsistency over time.

Let us take the example of electoral campaigns. Some voters do not change their attitudes under the effect of a campaign while others do; but to some voters, the effect comes with a lag. So, the transition from one attitudinal property to another could be nil, immediate, or deferred—that is, some persons may adopt a new behavior or a new opinion after a period of time. This leads to the notion of a *probability of transition* from one attitudinal state to another as a function of a new stimulus or new information received. Much of public opinion research focuses on these effects, frequently analyzing them by means of statistical association coefficients and contingency tables.

In summary, attitudes may change as the result of changes in the social position of persons or of changes in the sociocultural context or because of the effect of communication—press media, advertising, electoral campaigns, leaders' messages.

To account for variations in voting behavior, it is useful to transpose the electoral market to any situation where individuals must make a choice between different options. In those situations, there are factors that condition the individual's own perspective and there are factors that are under the control of external sources. When the individual who has to make a choice is exposed to political communication, he or she may or may not be motivated by well-reasoned political purposes. There is no rule about why and how individuals process their own motivations and the information they receive from outside.

A model of the effects that lead to voting decisions in each individual citizen may take into account three forces: (1) the initial position of each individual, (2) the various forces that push him or her toward a change in one direction, and (3) the various forces that push him or her in the opposite direction. The balance of those three types of forces determines whether the person will finally vote for the candidate he or she would vote for if the campaign did not exist and other factors remain the same or whether he or she changes his or her voting decision. Political campaigns are dynamic factors moving against the other factors that keep the system stable.

Generally speaking, attitudes are at the base of the demand side; they help citizens form expectations and respond to what they are offered. Traditionally, political studies have given more emphasis to the supply side: articulated ideologies and widely shared systems of ideas, political parties, leadership, mass media. More recently, the focus has gradually shifted to the demand side; there has been increased interest in understanding individual predispositions and attitudes and the individual sources of opinions and behavior. Market research, motivational research, opinion research, and communications research have been the engines of the approaches centered on the demand side.

Audit Society

The concept of "audit society" refers primarily to a logic at work in regulatory and managerial processes and to tendencies, rather than to an epochal state or condition. In this context, an audit refers to a systematic assessment of institutional performance against agreed criteria and standards. The processes used to conduct such audits reflect the transformation of audit and evaluation practices into normative principles of organizational control with a wide reach. This transformation is in turn a function of what political scientists have called the "regulatory state," meaning in part a state with an operating philosophy of acting "at a distance" on policy domains, via instruments such as accounting and audit. Below, the role of the "audit society" idea as a critical resource is developed, followed by a number of methodological issues and concerns related to its potential application.

The idea of "audit society" provided an organizing motif for criticisms of the public service reforms in the United Kingdom (UK) and elsewhere during the 1980s and 1990s, known collectively as the "new" public management. While the original formulation of the idea relied largely on a synthesis of secondary empirical evidence, it has provided the platform for substantive studies on health workers, teachers, the police, social workers, and psychoanalysts, to name but a few. The working practices of these groups have been targeted by reforms, and they have found their professional lifeworlds transformed to a greater or lesser extent by precise demands for accountability. The critical reaction that enlists the idea of "audit society" has focused on defending the importance of professional judgment, demonstrating the decline of trust and the rise of anxiety, and analyzing the unintended consequence of auditable targets, which damage the very service quality the reforms have been intended to improve.

The auditing process is used in a variety of ways in academia, ranging from performance assessment to evaluating the effectiveness of research grants. The wide-ranging appeal of the "audit society" motif does not necessarily mean that it has been applied consistently across fields. It has often been taken as a given, supplying only a pretext for empirical analysis. In the academy, there are also variations in disciplinary sensitivities. For example, the specific methodological commitments of anthropology make it particularly vulnerable to the shorter timescales of the audit process and to the reductive nature of performance measurement. Marilyn Strathern and others have been highly critical of audit and related forms of performance measurement as they have emerged in universities in the UK. By contrast, economics, which has to a large extent internalized evaluation mechanisms as part of its own "professionalization," has been relatively silent on auditing as a specific mechanism of control and oversight.

If the concept of audit society is to be taken seriously as more than metaphor, it raises a number of serious issues for scholars. First, among these issues is the much debated boundary between audit and evaluation. Audit can be narrowly defined in the shadow of financial auditing largely as an exercise in compliance verification. From this point of view, it addresses the following question: Does this organization comply with some preestablished set of rules for the quality of its accounting? Even allowing for interpretation and discretion in the application of such rules, audit is fundamentally concerned with conformity with them. Interesting questions then concern the rules of performance themselves: How have they evolved and how are they implemented?

Evaluation, it is argued, is quite different from audit. It is an investigation of the impact of public service programs for change, assessing whether such programs succeed or fail in their own terms, and what unintended consequences they may have created. Whereas audit produces a kind of yes/no answer to compliance issues, evaluation often produces questions and ambiguity. Yet this ideal-typical distinction hides a dynamic by which the audit model expands its influence and affects evaluation in subtle forms. It is easy to see why audit is attractive to policymakers seeking simple measures of performance, and this attraction is grounded in a deeper logic that finds its purest expression in the idea of financial audit but also transcends that practice and is at work in evaluation practices as they are broadly understood. The power and impact of this logic in different institutional settings is an empirical question, but it is a logic that aspires to transform the evaluated domain according to its own operational values of visibility and traceability (the accountant's idea of the "audit trail") in the representation of organizational and individual performance.

Another criticism of the "audit society" idea is that it is a case of mistaken causality; the real driver of an "audit explosion" in the UK was in fact the heightened concern with performance improvement across a range of public services. While this is a very reasonable point to make—supported by the observed production of information that is never audited or checked in the strict sense—the concern with performance has been simultaneously a concern with the production of visible and auditable traces of performance. The logic of audit that requires individuals and organizations to be transparent and comparable plays a constitutive role in shaping conceptions of relevant performance and is at the very heart of what Michael Moran calls the attack on "club government" in the UK.

This means that "audit society" is only partly an argument about the rise of auditors, although data on increases in headcount for oversight activity are suggestive. It is more a claim about a change process that is governed by an audit logic, which in turn shapes the design of performance representations. This emphasis on process raises an important question for the scholarly understanding of "audit society" and for the attention given to the analysis of auditors as compared with those who they audit, respectively. Empirical indicators for the audit explosion can be found in the growth of audit institutions and expansion of their remit and scope. However, the less visible and more profound aspect of "audit society," which preoccupies many studies outside political science, concerns the manifest impact of the audit on professional service providers and the process by which the logic of audit is *internalized* by them.

This psychological and behavioral level of analysis reveals the conflicts and the range of strategies that individuals use to cope with new auditized demands for performance reporting. In turn, it suggests that the real "action" of the audit society happens at the level of the construction of "auditees," who are not docile subjects in Michel Foucault's sense and may put up considerable resistance to new measures of what they do but nevertheless operate in the shadow of a logic that values precision and traceability in the representation of performance. The strong form of "audit society" analysis goes further to suggest that performance representation in many different fields is shaped by this logic, with highly dysfunctional consequences.

Another methodological concern about "audit society" is that it is a case of selection on the dependent variable, a consequence of which is the failure to recognize the UK-specific nature of the phenomenon. While there is some truth in this, the argument also reveals differences between research sensitivities within and outside political science. Finding new and puzzling phenomena whose character and logic demand analysis is necessarily a precursor to the exploration of the kind of dependency and causality that provide insight into cross-sectional variation of the phenomena. In short, it is always the "dependent" variables that strike us first, generate puzzles, and provide the "value relevance" for research into their independent causes. We do not think much about this question when the dependent variable is well formed, for example, security prices in liquid capital markets, but when it is not, the investigation is more like a "depth hermeneutic" that is explicative and inductive in its movement from phenomena to their underlying logics. The audit society thesis is more than a mistaken focus on a well-formed dependent variable.

That said, cross-national variations in audit society tendencies are indeed significant, depending themselves on how fiscal and service performance issues are problematized and the sources of expertise available in different national settings and fields. The distinctive cultural position of accountants in UK society has influenced the way reform agendas have been shaped, and there is also considerable cross-sectional variation. So audit as an institutional logic with its own dynamic must compete with many others, and its hegemony in any setting is at best highly contingent.

The "audit society" idea has had wide cross-disciplinary impact because of its role in providing a label for the challenges faced by many different professional groups. However, to suggest that an audit logic has dysfunctional side effects is hardly a new one in social science. Analyses of failed dreams of mastery are well-known to political scientists and historians. The rise of audit and its underlying logic is only the latest version of this dream, and the effects, intended and unintended, are not particularly surprising. Behavioral economists have explored the "hidden costs of control" and the paradoxes of transparency. Bruno Frey and Reto Jegen have provided analyses of the "crowding" of intrinsic motivation by extrinsic efforts at control. This work overlaps with the "audit society" arguments and provides the potential for a more formal expansion of their insights.

Finally, it was suggested above that the rise of audit is closely associated with neoliberal reform agendas and the rise of the regulatory state in developed economies. And yet "audit society" is an intriguing concept precisely because it escapes easy alignment with such labels. The logic of audit embodies values of visibility and transparency that may enable greater democratic participation in service evaluation but may equally support centralist aspirations by states. Audit has been associated with a Soviet-style centralism in UK public policy, and performance audit in the Chinese context is an expression of socialist ideals. The malleability of audit and evaluation in different cultural contexts, and the capacity of their underlying logics to appear in quite different value systems, means that there is still some way to go in order to understand the complex social and organizational dynamics indentified under by the idea of "audit society." Not least among these complex dynamics is the apparent invulnerability of audit to its own failure.

AUDITING

If accountability is the hallmark of democratic governance, public auditing is a means to achieve it. Auditing is a form of oversight, or examination from some point external to the system or individual in question. Technically, auditing is a form of verification by an independent body, which compares actual transactions with standard practices. Because it evaluates the relationship of what *is* against what *ought to be*, auditing is a normative operation. Public auditing is the traditional instrument to hold actors entrusted with managing public funds accountable by providing information to supervising agents, elected officials, and (sometimes) constituents about compliance with or deviations from accepted standards. Although accountability as a general aim of auditing is undisputed, unavoidable tensions with other principles of good governance arise, such as the exercise of informed discretion by elected decision makers or individual privacy rights when the corset of control is taken to an extreme.

The media, interest groups, private overseers (e.g., credit-rating agencies), international organizations, public audit institutions, and the general public increasing see modern government as an object of scrutiny. At the same time, government regulates society and delivers services through myriad national, international, nonprofit, and private organizations, making control a highly complex issue. The question is: Who oversees whom for what purpose, under whose authority, with what kind of legitimacy, and how?

The balance of autonomy and control is a classic topic for students of government. It touches on issues such as responsibility, trust, functional differentiation, authorization of execution, assurance, and accountability. At its center stands the question of how public organizations can be task efficient and accountable at the same time.

This entry is divided into four sections: The historical traditions of auditing are traced in the first section, the second one introduces different institutional arrangements of auditing, the third one sketches the main arguments of the audit explosion discourse, and the final one illustrates the politics of auditing.

Tracing the Historical Traditions of Auditing

Auditing is one of the oldest and most eminent of state functions, and early forms preceded the rise of the modern democratic state. The Latin word *auditus* means "a hearing." In ancient Rome, the organization of a "hearing of accounts" was a way in which one official would read out his accounts to another who would compare the figures. This form of oral verification was intended to prevent officials in charge of funds from misusing them. Governors of ancient civilizations, for example, Sumer, Egypt, Phoenicia, Greece, and Rome, appointed trustworthy clerks to find and punish employees for embezzlements and to protect public assets. Early Chinese writings from the 12th-century BCE illustrate an advanced understanding of the role of auditing, describing methods and practices of good economic management and the necessity of securing an independent and high-level status for the auditor. One of the earliest records of public sector financial management in India is the *Arthashastra* written by Kautilya, who was a Brahmin minister under Chandragupta Maurya, the founder of the Mauryan Empire, about 2,300 years ago. Kautilya developed bookkeeping rules to record and classify economic data, emphasized the critical role of independent periodic audits, and proposed the establishment of two important but separate offices—the treasurer and the comptroller-auditor.

The origin of public auditing lies therefore in the review of financial transaction. The concept is closely related to the development of private sector accounting techniques in 16th-century Venice, but some supreme audit institutions date their origin back to the 13th and 14th centuries. The National Audit Office in the UK sees its origin in the early 14th century, the French *Cour des Comptes* cites 1318 as the year of its inception, professional forms of supervision and control of resources in Mexico date back to the Aztec Empire. These audit institutions were not independent of the ruler or crown and were designed to control the financial conduct of the crown servants. Their aim was to protect the interests, property, and wealth of a ruler at a time when the state was still considered private property. In concert with trends of the 18th and 19th centuries—the diminishing role of family and personal loyalty, the increasing division of labor in economy and state (functional differentiation), the emergence of big government, new ideas about responsible behavior of public servants—audit institutions changed in scope, quality, and quantity.

As parliament gained power to grant the financial means to execute public tasks, the need arose to oversee the respective administrations or institutions using the financial resources. The objective was to ensure that the regularity and probity of the expenditures was in accordance with the defined aims of parliament. The state budget was and is the prerequisite for this form of formal legal rationality. Its verification rests on checking receipts against authorized state budget expenditures and vice versa.

The clearest transformation was from internal to external auditing and with it the emergence of independent audit institutions, often considered to be the extended arm of the parliament via the executive government. Over time, they gained a constitutional status in many countries, which secured their statutory and operational independence from executive interference. In many countries, however, especially those under authoritarian rule, this was the exception rather than the rule. In the former German Democratic Republic, an independent audit system did not exist to execute the directives of the Ministry of Finance, which made the Central Committee of the Communist Party a political tool to oversee the completion of economic plans in a state-directed economy. The attribute of constitutionally secured independence of the auditor from those holding and executing power (relational distance), for example, cabinet, bureaucracy, parliament, and the auditor's role in ensuring good governance have become, as many see it, the key to the auditor's legitimacy in democracies. The many authoritarian regimes that lack an autonomous body of oversight in effect allow the instrumentalization of spending for partisan purposes. The *Mexico Declaration on SAI Independence* of the International Organization of Supreme Audit Institutions advocates principles of good auditing and tries to establish common standards of auditing among its global member organizations. It specifies organizational, functional, and financial independence as the core prerequisite to accomplishing tasks objectively, effectively, and without external interference.

The state audit evolved from a rather crude tool to prevent chaos and ruin in public finance to an advanced instrument for safeguarding responsive, accountable, open, regular, and efficient government. *Compliance auditing* (verification of accounts, legality of expenditures, the organization's adherence to regulatory guidelines) and *financial auditing* (the overseeing of public accounts, assessing accuracy and fairness of an organization's financial statements) were the primary purposes of auditing; *performance auditing* (examination of how government programs operate and how well they achieve the defined objectives) came somewhat later, gaining an important place in the auditing realm with the new public management reforms. The latter is often referred to as *value-for-money auditing*, or evaluating the efficiency, effectiveness, and economy of programs and policies. Such a focus is supposed to give way to comparisons with performance criteria of best practices from the private sector. Its critics claim that performance auditing has contributed to an overstretched meaning of auditing: For example, conceptual boundaries with forms of evaluation have started to blur.

Auditing as an Institutional Arrangement

Internal versus external auditing is the most basic differentiation of types of auditing. It refers to the organizational status of the auditing entity relative to the one it audits. *Internal* means that the auditor is part of the organization and the organization's employee; *external* refers to an external oversight body or person operating independently of the entity being audited. Because internal auditors are part of the organization under scrutiny, they work for the benefit of the management of the organization under examination and their insights remain mostly disclosed only within the management. In contrast, external auditors review financial transactions and/or statements and serve third parties, for example, parliament, president, who need reliable financial information about those entrusted with the management of public funds.

Models of Auditing: State, Private, and People's

The audit of public sector organizations staffed with civil servants differs. The most general classification is based on the question of who conducts the audit. Here we can distinguish between state, private, and people's auditing. *State auditing* can be divided into three subgroups according to government level:

1. supreme audit institutions (e.g., the British National Audit Office) examine the affairs of federal government departments;
2. second- or third-level audit institutions (which can be fully independent of other government levels) exist in states, provinces, and municipalities of federal systems to audit their own government entities; and
3. internal auditing bodies operate within any governmental department or agency.

Professional accounting firms charged with *private auditing* conduct special-purpose audits (such as reviewing public enterprise accounts) and have increased in number and scope in recent decades along with the growth of government-owned business corporations in the public sector. The third audit model, *people's auditing*, was exercised in the former Soviet Union by the *Narodnyi Control* (Soviet People's Control) as part of a combination of professional auditors with millions of volunteers as so-called people's inspectors who conducted examinations and inspections in their spare time. This system was meant to educate the masses and be a training ground in the transformation of the country into a communist society. According to the communist ideology, the professional state apparatus would eventually wither away and the ordinary people would take over.

Organization of Auditing: Court or Administrative System

State (supreme) audit institutions can be classified into two broad groups according to their organization: the *cameral* or *court system* and the *administrative* or *monocratic system.*

The Cameral System

In the cameral system, the audit institution is headed by a group of auditors whose independence is ensured by their judicial status and who examine governmental accounts as well as the uses of public funds. To this ideal-type model belong most of the Roman law–based countries, such as not only the Corte dei Conti in Italy, the French Cour des Comptes, and the Tribunal de Cuentas in Spain but also the European Court of Auditors, the German Bundesrechnungshof, the Dutch Algemene Rekenkamer, and the Auditoría General de la Nación of Argentina in Latin America. In Italy, France, and Spain, the auditor often acts as an administrative tribunal with quasi-judicial powers in administrative matters, whereas the variant of this collegiate system in Sweden, the Netherlands, and Germany is without jurisdictional authority. The strong legalistic foundation in both variants of the "cameral system" privileges legal and financial compliance over performance auditing. Though in principle a collegiate model in which everyone enjoys the same rights and duties, the institution is commonly headed by a kind of *primus inter pares*. As a "first among equals," he or she can exert, as in the German case, considerable influence by selecting the heads of sections and tailoring the areas of operation. Despite these far-reaching organizational competencies, the head of the institution cannot interfere with actual matters of auditing or the content of inspectors' decisions.

The Administrative or Monocratic System

In the United Kingdom (UK), Canada, and most of the former British Empire dominions and colonies, as well as countries such as Mexico, Chile, and Colombia, the state audit institution is organized under the administrative or monocratic system, which is similar to a hierarchically structured government department—that is, headed by a single person called the comptroller or auditor general and acting as an auxiliary institution to the legislature, although charged with ample autonomy. The head of the institution enjoys an independent status, but the institution itself functions according to hierarchical principles of lines of command. Under this system, controls are intended to correct rather than penalize. Supreme audit institutions in these countries focus more on *ex post* auditing, rather than *ex ante* control, and emphasize financial and performance auditing over compliance control.

Interrelating With Others: Parliamentary-Led or Executive-Led Auditing

Audit institutions are embedded in political environments, which is exhibited by the way they interrelate with other actors. Though they all enjoy statutory independence, differences arise with regard to instrumental institutions: the one to which they report, the one that appoints the head of the Supreme Audit Institution, and the one that assigns the annual budget. Despite their statutory independence and regulations to protect that status, auditors are dependent on, for example, national legislative bodies or governmental budget support—forms of leverage that can be used to compromise the auditor's independence.

In Argentina, Canada, Germany, the United States, Israel, Mexico, and the UK, the parliament or a special committee appoints the Auditor General, acts as supervisor, and decides on the annual budget. This system has been labeled *parliamentary led,* as the auditor is considered the extended arm of the legislator. In an *executive-led* system such as France (also Ecuador), the "Premier Président" and other magistrates of the Cour de Compte are appointed by a decree from the President of the Republic. Appropriations are officially related to the Prime Minister but have special authorization by Parliament. Reports are directed to the president and legislative branch of government. China also has an executive-led arrangement: The auditor reports to the Premier of the State Council (the head of the Chinese government) and the ministry of finance controls the budget. Sweden's Riksrevisionen, which until 2000 was similar to the executive-led model, now carries out its state audit functions under the auspices of Parliament.

Auditing as a "Neurosis"

Balancing independence with control is a classic topic in public sector research. The new public management (NPM) hype sparked an increased interest in performance auditing, primarily understood as an assessment of efficiency goals and other indicators of economic success with a corresponding system of controlling and reporting. At its center stands the question of how public organizations can be task efficient and accountable while being relatively free of bureaucratic impediment.

In the past 2 decades, almost every local government and many national administrations in OECD countries have implemented some kind of NPM reform. This "wave of modernization" has in many cases changed the way governments and local authorities operate and eventually also the audit regime. Although the NPM doctrine does not prescribe a well-defined list of reform steps, the stereotypical tool box includes privatization, deregulation, outsourcing, service delivery competition, semiautonomous service centers, and—particularly in central and federal government reform—executive agencies, performance standards and measures, increased consumer power, and employment of professional managers and noncareer personnel. Auditing bodies, it is claimed, respond to NPM-type reforms by institutional, procedural, and cultural acclimation. Increasing coproduction of public goods and services by public, private, and nonprofit organizations seems to pose additional challenges to systems of public auditing that are supposed to counter centrifugal tendencies of decentralized agencies and public enterprises.

The conceptual overstretching of auditing is often associated with a debate on the rise of the so-called audit society. An increasing public and academic concern about unethical behavior of public officials, an evaluation-obsessed political and social context, and the observation that modern Western societies would evolve into low-trust societies led observers to conclude that the "audit society" is a way of dealing with this type of neurosis. This diagnosis had its origin in Michael Power's description of a society obsessed with overseeing almost every domain of public activity and the paradoxical effect that it does *not* lead to an increase in trust in government. This audit mentality is very often decoupled from its real effects on public sector accountability and has become an end in itself. Auditing is not seen as a rational reaction to the well-defined problem of accountability; rather, the very concept creates, constitutes, and shapes the public perception for which it is a solution. Therefore, by "audit explosion," Power refers to the growth of audit and related monitoring practices associated with public management reform processes. As a multifaceted concept, the explosion is not only an increment of auditing activities in quantitative terms but also a shift in qualitative perspective, mainly toward the so-called value-for-money audit and other internal control systems. It also means that oversight bodies offshoot into many different fields such as health care and education. The concept of an audit society has been criticized for being too narrowly attributed to the UK or other English-speaking countries, such as Australia or New Zealand, meaning that it does not sufficiently capture the reality of developments in other countries, for example, the United States or Germany.

The Politics of Auditing

Audit institutions do not commonly have the power to set rules or sanction the deviant behavior of auditees. In principle, they lack the capacity to exert direct hierarchical control. This is not undisputed, as the Audit Office of Finland, the Office of the Comptroller General of Chile, and the Court of Audit in Spain are endowed with competencies to prosecute. The Italian Corte dei Conti and the French Cour de Compte also enjoy quasi-judicial powers in administrative matters. Despite these examples, the foundation of their authority in general, however, rests on their constitutionally guaranteed independence from political interference, their professional expertise, the skill to informally cooperate with auditees in order to improve processes, and the ability to ally themselves with like-minded organizations (such as the public accounts committee in parliament) to exercise indirect control. Providing information to other institutions about a specific body's financial management is the dominant way of exerting influence. The naming and shaming of deviant behavior through the publication of examination results must be seen as *ultimo ratio*. On one hand, publicizing mismanagement is a powerful lever; on the other, it politicizes their alleged independence as the auditor is drawn into the struggle between political competitors. For this reason, the evaluation of government policies by auditors is a critical matter.

Auditing is per se political in nature. It operates in the nexus of politics and policies. The tension between politicization and institutional independence is permanently felt in the arena of political competition for several reasons. First, the broad legal mandate with the discretion to look into almost any government activity and its potential to unveil, for example, untoward spending practices unwittingly makes the auditor a player within the political game. Second, the nature of the auditing workforce—empowered, well positioned in government, specifically skilled—impels political parties to strategically place favorites. Third, an independent producer of creditable and presumably apolitical information is a highly desirable partner in political arguments. Auditing as a political power or blaming tool is most evident when it is used to detect and deter deviant behavior, such as capitalistic tendencies in communist countries, or to achieve certain policy or partisan objectives. The claim of avoiding policy issues and focusing on the operation of the apparatus is therefore understandable, albeit next to impossible, especially in the context of issues framed not objectively but within the perceptions of political actors.

The principle of the auditors' independence is definitely a necessary condition for a well-functioning system. Other conditions are more general traits of the political system, such the audit courts' dependence on the democratic culture of a country, the respect for democratic institutions, the belief in a division of powers, and respectful behavior among those holding power. The main challenge in the development of auditing in modern states is therefore the acceptance of the complementarities of the auditor's role by relative political actors and the positive use of its potential to improve government operations, ensure good public records, and increase public trust.

AUTHORITARIAN REGIMES

Until the early 1960s, there was a fundamental dichotomy in political science between democratic and totalitarian regimes. Authoritarian regimes were often treated as a type of totalitarian regime. However, with the collapse (Germany) and the subsequent transformation (in the former USSR) of totalitarian regimes after World War II and in the 1950s, authoritarian regimes have become the dominant form of nondemocratic government.

This entry provides a general definition of authoritarian regime as well as exploring subtypes. Among the many subtypes of authoritarian regimes, the currently most widespread one is the "electoral authoritarian" regime that combines a facade of multiparty elections with a variety of authoritarian controls that, in effect, deprive such elections of any democratic significance. Therefore, this entry, while briefly discussing other subtypes of authoritarian regimes, will particularly focus on electoral authoritarianism. Because such regimes are the dominant regime type in the Middle East and North Africa, a special emphasis will be put on this region.

A Theory of Authoritarian Regimes

Juan J. Linz developed the first full-fledged theory of authoritarian regimes, as distinct from both democracies and totalitarian regimes, as well as from many other types of other nondemocratic regimes (traditional autocracies, sultanistic regimes, semiconstitutional monarchies, oligarchic democracies). As early as 1964, Linz defined authoritarian regimes on the basis of three main characteristics: (1) limited pluralism, (2) the presence of a mentality rather than an ideology, and (3) the absence or low level of political mobilization. He developed and refined his theory in his later work (especially *Totalitarian and Authoritarian Regimes*, 2000). More recently, such regimes have started to attract greater scholarly attention for several reasons. First, the emergence of military–bureaucratic authoritarian regimes in much of Latin America and elsewhere as a new type of authoritarianism required more detailed research into their dynamics. Second, after the global resurgence of democracy or the "third wave of democratization" in the 1980s and the 1990s, there emerged a still newer type of authoritarianism generally called "electoral authoritarianism." This type lies in the gray area between liberal democracies and "closed" authoritarian regimes, an area that they share with "electoral democracies." Hence, in this entry, while all subtypes of authoritarian regimes will be discussed, the emphasis will be on these intermediary types.

Limited Pluralism

Starting with the three-dimensional scheme of Linz, limited pluralism contrasts with the almost unlimited pluralism of liberal democracies and the almost total absence of pluralism in totalitarian regimes. The degree of limited pluralism varies among different subtypes of authoritarian regimes. They may exclude only political opposition groups or may exclude certain types of civil society institutions as well. Such exclusion may be based on legal regulations or de facto restrictions. As this observation indicates, the degree of limited pluralism is a critical variable in distinguishing the subtypes of authoritarian regimes, as will be spelled out below.

Mentality Versus Ideology

A second defining element of authoritarian regimes is the presence of a "mentality" rather than an "ideology." In Linz's view, in contrast to the more rigid, systematic, rationally developed, utopian, and comprehensive nature of ideologies, mentalities are less systematic and more amorphous ways of thinking and feeling, more emotional than rational. Although the distinction is not clear-cut and there is a large gray area in between, "mentalities," as recalled by the German sociologist Theodore Geiger, are, actually, more or less ambiguously developed values, such as fatherland, nation, order, hierarchy, tradition, race, ethnicity, and others. The key political characteristic of them is that, precisely because they are ambiguous and intellectually underdeveloped, creating broader political coalitions around them to build the bases of regime legitimacy is much easier than with precise, developed ideologies (Linz, 2000).

Lack of Political Mobilization

The third element is the absence of extensive political mobilization, again a crucial difference with totalitarian regimes, even though authoritarian regimes may also have followed mobilizational policies at some point of their development. Actually, this variable is closely related to the second one, since in the absence of an ideology, it is difficult to pursue effective mobilizational policies and to attract the young, students, and intellectuals.

Borderline Cases

Admittedly, in terms of all three criteria, the borderline separating authoritarian regimes from other types of nondemocratic regimes on the one hand and from pseudodemocracies or semidemocracies on the other is a rather blurred one. Thus, an authoritarian regime that allows a fairly large area of limited pluralism in nonpolitical fields and even tolerates and attempts to co-opt some of its political opponents, maintains a fairly flexible mentality that leaves room for different interpretations, and shows little interest in mobilizing the masses in a certain ideological direction may be said to approach a pseudodemocracy, while there may be cases where it is difficult to distinguish authoritarianism from totalitarianism. Hence, this large gray area poses a number of difficult borderline problems, and it requires an effort to distinguish subtypes of authoritarian regimes. Such difficulties of classification are further aggravated by the fact that many regimes combine elements from different types and stress different elements in different phases of their history. Authoritarian regimes are often complex systems combining elements of contradictory models in uneasy coexistence.

Subtypes of Authoritarian Regimes

Linz distinguished the following subtypes of authoritarian regimes using his two criteria of the degree of limited pluralism and the apathy mobilization axis:

- bureaucratic-military authoritarian regimes,
- organic statism,
- mobilizational authoritarian regimes in postdemocratic societies,
- postindependence, mobilizational authoritarian regimes,
- racial and ethnic democracies, and
- posttotalitarian authoritarian regimes.

Although space limitations do not allow for a detailed analysis of each of these subtypes, it will be useful to discuss whether this typology is as meaningful today, many decades after Linz's masterful essay.

Certainly, the collapse of the Soviet type of totalitarianism has made the fundamental distinction between totalitarian and authoritarian regimes much less meaningful at least for practical purposes. Probably the only Soviet-type totalitarian regime today is that of North Korea. Linz classifies China and Cuba as posttotalitarian. Certain former Soviet republics of Central Asia seem to combine posttotalitarian and sultanistic elements. On the other hand, Central and Eastern European countries that were part of the former Soviet bloc seem to have made a successful transition to democracy, while some of the former Soviet republics (Russia, Belarus, Ukraine, Moldova, Transcaucasian republics, Kyrgyzstan) are still experiencing serious problems of democratic consolidation, probably because of their much longer totalitarian past and difficulties associated with the problem of "stateness."

Another interesting borderline case between authoritarianism and totalitarianism is Iran, where an almost totalitarian interpretation of a religious ideology is combined with elements of limited pluralism. Under the Islamist regime, Islam has been transformed into a political ideology with a totalitarian bent, and the limited pluralism is allowed only among political groups loyal to the Islamic revolution. Furthermore, the electoral and legislative processes are under the firm control of tutelary institutions such as the Supreme Leader (appointed by the Assembly of Experts composed of theologians), the Council of Guardians with veto powers over all laws and all candidates seeking elective office, and the Expediency Council added to the Constitution in 1990 as the final arbiter in cases of disagreement between the Majlis (parliament) and the Council of Guardians, all inspired by Khomeini's doctrine of "the supremacy of the Islamic jurisprudent" (*Velayet-e Faqih*). These tutelary institutions effectively blocked the moderate reform attempts of President Mohammad Khatami (elected twice in 1997 and 2001, himself a cleric loyal to the Islamic Revolution), even though he had the support of the Majlis elected in 2000 and dominated by the reformists. Thus, Iran's limited pluralism appears very limited indeed.

The momentous socioeconomic and political changes in the past 3 or 4 decades, at the top of which stands "the third wave of democratization," made some of Linz's subtypes less relevant today than they used to be. Thus, with the transition to democracy in the South African Republic, the leading example of so-called racial or ethnic democracies disappeared. With the demise of totalitarianism, defective and pretotalitarian regimes are no longer a contemporary category. With the successful transition to democracy in former Soviet bloc countries of Central and Eastern Europe, posttotalitarianism is limited to a few countries such as China and Cuba, as was alluded to above. Mobilizational authoritarian regimes in postdemocratic societies also seem to be a category of mainly historical significance. Such regimes emerged in the past in countries with some democratic experience and a degree of political mobilization. Therefore, the authoritarian regimes had to use a mass organizational party and other mass organizations in order to exclude the defeated social force from political participation. However, with the worldwide preeminence of democratic ideology at present, it seems exceedingly difficult to establish such a regime in a country with some prior experience in democratic politics and mass mobilization.

Similar observations can be made about the subtype called "organic statism" by Linz. Such regimes attempt to combine the Catholic corporativist social doctrine with fascist elements but are distinct from fascist-totalitarian regimes. In these regimes, often described as coorporatism or organic democracy, a variety of social groups or institutions that are created or licensed by the state are allowed to participate in some degree in the political process. Linz admits, however, that this model, popular in the 1930s, lost its attraction for a number of reasons. Probably, the most important reason was the disengagement of the Catholic Church from its commitment to essentially undemocratic organic theories of society. A number of "populist regimes" that emerged especially in Latin America in the 1930s and later, such as those of Getulio Vargas in Brazil and Juan Peron in Argentina, interestingly, combined elements of corporatism with those of "electoral authoritarianism" to be discussed later. These regimes displayed a strong developmentalist, nationalist, statist, and elitist character. With the failure of their import substitution–based development strategy and the emergence of the currently dominant free market economy, however, such regimes seem to have lost their appeal.

Finally, the usefulness of another subtype called "tutelary democracies" by Edward Shils is also open to doubt. Recent research has suggested, for example, that Kemalist Turkey, usually presented as the prototype of such regimes, in fact bore closer resemblance to corporatist or organic statist authoritarian regimes. Indeed, it is difficult to conceive of an "enlightened" leader or a group of leaders dedicated to "educate" their people in democratic values and prepared to lose power as the ultimate outcome of the democratization process.

The remaining subtypes of authoritarian regimes with some contemporary relevance seem to be the military–bureaucratic authoritarian regimes and the postindependence mobilizational single-party regimes. The latter are normally associated with a war or struggle of independence from colonial rule. Countries in Black Africa and the Maghreb provide examples of this type. Linz observes that these regimes emerged in countries of low economic development where the colonial rulers had not allowed the growth of an indigenous professional or bureaucratic middle class but destroyed or weakened traditional precolonial authorities. Thus, the new nationalist leadership, mostly trained abroad, successfully mobilized the grievances of the native population against the foreign rulers. As expected, the desire for independence obscured the importance of other cleavages. After a short period of experience with democratic constitutions inherited or inspired by their former colonial rulers, most of these regimes were transformed into single-party regimes, the most notable examples of which were Algeria, Tunisia, Ghana, Ivory Coast, Senegal, and Tanzania. The single-party regimes claimed to represent the entire nation and defined their chief mission as nation building. However, their mobilizational and ideological components decayed rapidly. The role of the mass mobilizational single-party regime lost its preeminence. Consequently, they moved in the direction of either military–bureaucratic or organic statist regimes. This process can be compared with "detotalitarianization by decay," namely, the loss of the revolutionary ideological élan and of the mobilizational capability of the regime, which also explains the sudden collapse of the Soviet Union probably better than anything else.

Turkey was one of the earliest examples of single-party regimes and, as such, attracted the attention of a great number of Western scholars, including Maurice Duverger. The Republican People's Party (RPP) was founded by Kemal Atatürk, the leader of the War of Independence (1919–1922) in 1923, and it consolidated its monopoly in 1925 by outlawing the only opposition party, the Progressive Republican Party. It maintained such monopoly until the end of the World War II, when the party leadership allowed the formation of an opposition party, the Democratic Party and lost power to it in the first free election of 1950. The RPP (and its ancestor, the Society of Defense of Rights for Anatolia and Rumelia) was successful in achieving a significant degree of popular mobilization during the War of Independence, appealing to and co-opting Muslim religious orders, Kurdish tribes, radical republicans, and loyal monarchists, and so on. After the victory, however, the RPP was quickly transformed into an "exclusionary" single party, in the words of Samuel Huntington. It showed little interest in mass mobilization and concentrated its efforts on nation building and secularizing the state and society by top-down authoritarian methods, almost a "mission impossible" in a deeply divided, pluralistic, and devoutly religious society.

The military–bureaucratic authoritarian regimes emerged as probably the most widespread type of authoritarianism in the 1960s, especially in Latin America but also elsewhere. Guillermo O'Donnell and others have argued that the emergence of such regimes as a new type of authoritarian rule in Latin America was linked to the failure of import substitution–based industrialization (ISI). The early phases of this industrialization strategy gave rise to populist coalitions that brought together national industrialists, urban professionals, and the emerging urban working class. Both components of the populist coalition benefited from this expansionist policy: Import-substituting industrialists were heavily protected against foreign competition by import quotas, tariffs, and foreign exchange regulations; the urban working class, in turn, obtained employment opportunities, union rights, welfare benefits, and relatively higher wages because the growth of the domestic market was supposed to further stimulate the ISI.

The early, easy phase of the ISI, however, was soon exhausted. Once the limits of growth of domestic markets had been reached, the inefficient, internationally noncompetitive national industries failed to produce the necessary foreign exchange earnings. Thus, ISI-based economies faced severe problems, such as balance-of-payment deficits, foreign exchange shortages, low or negative growth rates, inflation, and unemployment. The economic crisis, in turn, led to the radicalization of the popular sector (the industrial working class) and to increased political polarization. This created fears among the urban middle classes of a Cuban-style radical leftist revolution. With the support of this middle class, the military took over in many important countries of Latin America such as Brazil, Argentina, Chile, and Uruguay and established what is known as the bureaucratic–military authoritarian regimes. The fact that these regimes emerged in the most highly developed countries of Latin America lends support to O'Donnell's economy-based explanation.

Such regimes differ from earlier types of military regimes in Latin America (*poder moderador*) in that the latter were of relatively short duration and intended to solve a particular constitutional crisis, while the former were of much longer duration and attempted to change the economic structure in a more free market, export-oriented direction. To accomplish this objective, they tried to demobilize the already activated popular sector by severely restricting its political participation opportunities. In this effort, they also enlisted the help of a large group of experts, technocrats, and managers with problem-solving capabilities. Hence, these regimes are often called "military–technocratic–bureaucratic authoritarian regimes" to distinguish them from the more bureaucratic–military–oligarchic authoritarian regimes of interwar Eastern Europe.

Although the bureaucratic authoritarian regimes have been analyzed mostly within the Latin American context, the applicability of this model is not limited to that continent. In fact, the National Security Council (NSC) regime in Turkey (1980–1983) bears strong resemblances to its Latin American counterparts. It also followed a period of deep economic crisis as a result of the failure of an ISI strategy, accompanied by intense political polarization, radicalization of the working class, and the increasing fears of the middle classes. Like its Latin American counterparts, the NSC regime pursued policies aimed at shifting the basis of the economy from an ISI to an export promotion model, while trying to demobilize the working class and depoliticize the society at large.

Parallel to the "global resurgence of democracy," pure and simple military regimes have virtually disappeared, except perhaps for a transitional period. As Larry Diamond observes, the interventionist armies today try to either legitimize their rule by running for president in contested but manipulated elections or carve out for themselves a large autonomous sphere in the form of tutelary powers and reserved domains behind a veil of civilian, multiparty rule.

Electoral Authoritarianism

While some of the subtypes in Linz's original typology have lost their contemporary relevance, new borderline problems have arisen as a result of the rise of democratic ideology as the almost unrivaled source of legitimacy. Many otherwise quite authoritarian regimes have been obliged to accept at least some outward trappings of democratic regimes. As a result, while in the past, the boundary between authoritarian and totalitarian regimes was not very clear, as opposed to the relatively well-defined boundary between nondemocratic and democratic systems, today the reverse seems to be true. Indeed, there seems to be a large gray area between authoritarian regimes and certain types of democracies variously called "electoral democracies," "semidemocracies," "pseudodemocracies," and so on. A newly coined term, *electoral authoritarianism*, suggests the difficulty of arriving at a neat classification. Electoral or competitive authoritarian regimes are not among the subtypes in Linz's original typology, for understandable reasons. As Diamond argues, this type of hybrid regime is very much a product of the contemporary world. The worldwide trend toward democracy has forced many authoritarian regimes to mimic some forms of electoral competition. Andreas Schedler argues, in the same vein, that on the bases of 2001 data, out of 151 countries in the "developing world," 36 (23.8%) are liberal democracies, 32 (21.2%) are electoral democracies, 58 (38.4%) are electoral authoritarian regimes, and 25 (16.5%) are closed authoritarian regimes. Thus, electoral authoritarian regimes make up more than two thirds of all autocracies.

The breadth of this gray area between liberal democracies and full-scale (closed) authoritarian regimes may necessitate the search for further subdivisions within this category. Thus, Schedler distinguishes between electoral democracies and electoral authoritarianism, while Diamond, in a more nuanced distinction, divides it into four subtypes as electoral democracies, ambiguous regimes, competitive authoritarian regimes, and hegemonic electoral authoritarian regimes. Both authors agree that the boundaries between these regime types are "blurry" or "foggy" and that it is difficult to fit elusive realities into ideal types. The distinction between liberal and electoral democracies is based on variables other than electoral competitiveness, since both conduct reasonably free and competitive elections as a minimum condition for democracy. Electoral democracies fail to institutionalize the other vital dimensions of liberal democracies, such as the rule of law, political accountability, full protection of civil and political rights, and so on. Another feature distinguishing electoral democracies from liberal democracies may be the presence of tutelary powers and reserved domains in some of them outside the purview of elected officials, most often in favor of the military but also sometimes in favor of clerical leaders as in the case of Iran. Turkey, where free and fair elections have been regularly held since 1950, but the military have enjoyed significant tutelary powers and reserved domains since its intervention in 1960, and even more so after its intervention in 1980, is a good example of such cases.

On the other hand, the difference between electoral democracies and electoral authoritarian regimes centers on the fairness and competitiveness of the electoral process. The criteria for free and fair elections are well known and need not be repeated here. However, as Schedler puts it, historically, elections have been an instrument of authoritarian control as well as a means of democratic governance. And at present, there are many regimes where multiparty elections are regularly held, but many basic democratic norms are systematically violated. Therefore, they should be classified as authoritarian regimes. Indeed, the authoritarian use of elections is nothing new, as attested by an old but influential book, *Elections Without Choice* (1978), edited by Guy Hermet, Richard Rose, and Alain Rouquié, providing earlier examples of such regimes. As Schedler rightly observes, "the menu of manipulation" available to authoritarian rulers is quite rich and varied, ranging from banning parties and disqualifying candidates to repressive policies against dissenters during election campaigns, fraud and intimidation, informal disenfranchisement, unequal use of state resources, adoption of favorable redistributive rules, and so on. Certainly, one can further subdivide the electoral authoritarianism category into competitive authoritarian and hegemonic authoritarian subtypes, as did Diamond, depending on their degree of competitiveness. In his view, competitive authoritarian regimes are defined by the presence of a significant parliamentary opposition, whereas in the hegemonic subtype, elections are largely an authoritarian facade: The ruling or dominant party wins almost all the seats. Similarly, in hegemonic electoral authoritarian regimes, the president is elected with a great majority of the popular vote. Diamond admits, however, the difficulty of distinguishing between the two types. At any rate, the difference seems to be one of degree rather than of kind. No doubt, they both firmly belong to the authoritarian type, but both differ from full-fledged or "closed" authoritarian regimes.

The blurry borderline between electoral democracies and electoral authoritarian regimes poses difficult methodological problems. As Schedler rightly argues, under conditions of electoral manipulation, official election figures do not faithfully reflect the actual distribution of citizen preferences. However, it is difficult to observe electoral manipulations, since these are usually "undercover activities," constituting "an impenetrable black box." Nevertheless, available information on the state of political rights in general may give us clues about the extent of electoral manipulation. Thus, unequal access to state resources or mass media, restrictions on freedom of expression and association, bans on political party activities, adoption of electoral rules favorable to the governing party, gerrymandering, and so on may provide reasonably reliable indicators to recognize an electoral authoritarian regime. Observations by international election observers, if available, may provide another source of information.

As was pointed out above, electoral authoritarian regimes constitute the largest group of countries in the developing world. Certainly, the rise of this type is closely associated with the global resurgence of democracy. With the collapse of Soviet-type totalitarianism, democracy has become the only legitimate form of government in the eyes of a much greater portion of the world's population. As a result of a favorable international climate, active promotion and encouragement of democratic change by major Western powers, the desire to gain international respectability, and domestic pressures associated with rising levels of socioeconomic development, some forms of authoritarianism have become less sustainable. Thus, most hybrid regimes today are quite deliberately *pseudodemocratic*, dreaming, in Schedler's words, of reaping the fruits of electoral legitimacy without running the risks of democratic uncertainty. They mimic democratic institutions not only in the electoral field but also by creating mimic constitutional courts and adopting other outward trappings of a system based on the rule of law. Conceivably, such institutions create potential areas of dissidence and conflict, even if they remain far from ensuring democratic accountability. Nevertheless, the concept of electoral authoritarianism centers on the electoral area, as its name indicates.

Thus, electoral authoritarian regimes combine two contradictory dynamics in uneasy coexistence. On the one hand, as Schedler points out, by permitting multiparty, competitive elections, they recognize the principle of democratic legitimacy instead of other sources of legitimacy (such as revolutionary, transcendental, communitarian, charismatic, or substantive). On the other hand, they subvert it in practice using various instruments of authoritarian manipulation. As opposed to democratic regimes in which the rules of electoral game are accepted and respected by all parties, in electoral authoritarian regimes, competition is not only "within rules" but also, and more important, "over rules." On the other hand, as opposed to closed authoritarian regimes, the rulers have to find a balance between "electoral persuasion" and "electoral manipulation."

This mixture of contradictory elements makes the future of electoral authoritarian regimes highly uncertain and unpredictable. Again, as Schedler points out, the game of authoritarian elections may lead to a process of gradual democratization as in Mexico and Senegal. It may lead to democracy through the sudden collapse of authoritarianism as in Peru and Serbia. It may also end up in an authoritarian regression. Or such regimes may survive for an extended period, through various successful survival strategies of the rulers.

At the other end of the democracy–autocracy continuum, "closed authoritarianism" seems to be the relatively smaller category, but a stable one. Thus, during the past 10 years, such a nonfree regime went from 25% of all states (48 in total; *Freedom in the World 2000–2001*) to 24% (47 in total; *Freedom in the World 2009*). They may combine some elements of "sultanistic regimes," considered a separate type by Linz. He has argued that the exceedingly personalistic and arbitrary nature of such regimes distinguishes them from the more institutionalized and predictable behavior of the authoritarian regimes. In sultanistic regimes, the ruler exercises his power unrestrained by legal rules or ideological commitments. Public bureaucracy becomes the personal entourage and servants of the ruler. Classic examples of sultanistic regimes are the Trujillo regime in the Dominican Republic, the Batista regime in Cuba, the Somoza regime in Nicaragua, the Duvalier regime in Haiti, the Pahlavi regime in Iran, and the Marcos regime in the Philippines. More recent examples may include the Ceauşescu regime in Romania, the Saddam Hussein regime in Iraq, and the North Korean regime.

If we look at the regional distribution of authoritarian regimes, we see its highest incidence in the Middle East and the North Africa and its lowest in Eastern Europe, with sub-Saharan Africa in between. According to Schedler's figures (as of early 2006), 11 sub-Saharan African countries (Burkina Faso, Cameroon, Chad, Ethiopia, Gabon, Gambia, Guinea, Mauritania, Tanzania, Togo, and Zambia) are in the electoral authoritarian category. According to his figures based on 2001 data, 52.6% of the Middle Eastern and North African regimes are electoral authoritarian regimes and 42.1% belong to closed authoritarianism category. Israel is the only liberal democracy in his classification, with Turkey included in the electoral authoritarian category. In contrast, 57.9% of Eastern European states are liberal democracies, 15.8% electoral democracies, 26.3% electoral authoritarian regimes; no Eastern European regime is in the closed authoritarianism category. The success of the Eastern European cases can be explained by the geographical and cultural proximity of Western democracies and many forms of international influences, including the European Union conditionality. The Middle East and North Africa, on the other hand, stand as the major geographical region of the world least affected by the third wave of democratization, a fact that requires a detailed explanation.

Islam and Democracy

One explanation for the limited democratization in the Middle East and North Africa, based on the alleged inherent incompatibility between democracy and Islam, the dominant religion of the region, must be treated with utmost care. It has been argued by Orientalists, for example, that many notions associated with Western democracy, such as the notions of popular sovereignty, representation, elections, secular laws, an independent judiciary, and a civil society composed of a multitude of autonomous groups, are alien to the Muslim political tradition. Such statements abound in the Orientalist literature and have deeply influenced the Western conceptions of Islam, so much so that Huntington argued that the West's problem is not Islamic fundamentalism but Islam. It is beyond the scope of this entry to discuss the philosophical, historical, and empirical flaws of this argument. Suffice it to say that Islam, like any other major religion, is not a monolith and that it has given rise to different interpretations and practices at different times and in different places. Likewise, historically speaking, it has been compatible with different forms of government.

Looked at from a purely empirical point of view, what is claimed to be "Muslim exceptionalism" seems more like "Arab exceptionalism." Thus, Alfred Stepan convincingly argues that Islam is sometimes misleadingly equated with Arab culture. He observes that, while there are no democracies in the Islamic countries of the Arab world, about half of all the world's Muslims live in democracies, near-democracies, or intermittent democracies. He then analyzes the cases of Indonesia, Bangladesh, Pakistan, and Turkey as examples of such hybrid regimes. Vali Nasr describes the same cases (plus Malaysia) as examples of the "rise of Muslim democracy," which he compares with the early stages of Christian democratic parties in Europe. He states that, unlike hard-line Islamists, Muslim democrats have a pragmatic perspective and seek to build governing coalitions within a democratic arena whose bounds they respect.

Turkey, with its militantly secular constitutional and legal system and its more than 60 years of (albeit interrupted) democratic experience, is perhaps the leading example in this category. However, the extensive tutelary powers enjoyed by the military, and its less than desirable record on political rights (judged by the ease and frequency of party closures), allow us to classify it only as an electoral democracy. Thus, according to the *Freedom in the World 2009* report, it is an electoral democracy in the "partly free" category with a rating of 3 for both political rights and civil liberties, on a scale of 1 to 7, with 7 being the lowest score. According to the same survey, the major non-Arab, Muslim-majority countries have the following ratings (the first figure refers to the countries' score on political rights and the second on civil liberties): Albania (3 and 3), Bangladesh (4 and 4), Bosnia-Herzegovina (4 and 3), Indonesia (2 and 3), Malaysia (4 and 4), Pakistan (4 and 5), Senegal (3 and 3), and Turkey (3 and 3). Of these, Indonesia is placed in the "free" category and the rest in the "partly free" category, and all are rated, except for Malaysia and Pakistan, as "electoral democracies."

Although the Freedom House's threefold classification of "free," "partly free," and "not free" categories are not identical to Schedler's fourfold (liberal democracy, electoral democracy, electoral authoritarianism, and closed authoritarianism) or Diamond's sixfold (liberal democracy, electoral democracy, ambiguous regimes, competitive authoritarian, hegemonic electoral authoritarian, and politically closed authoritarian) typologies, there is, no doubt, a large area of overlap. Thus, liberal democracy clearly corresponds to the "free" category, while closed authoritarianism corresponds to "not free." On the other hand, Freedom House's partly free category includes both electoral democracies and electoral authoritarian regimes (or the four intermediate regime types in Diamond's still finer typology), and the borderline between the two may not always be clear. It may be said as a rule of thumb, however, that countries with a Freedom House score of 3 or 4 may be considered electoral democracies, while those with a score of 5 or 6 belong to the electoral authoritarian category.

Among the non-Arab, Muslim-majority countries, the former Soviet states occupy a special place in that they are all in the "not free" or "closed authoritarian" category, with the exception of Kyrgyzstan, which is rated partly free by the Freedom House (with scores of 5 and 4). Thus, Azerbaijan, Kazakhstan, and Tajikistan have scores of 6 and 5, while Turkmenistan and Uzbekistan are at the authoritarian end of the continuum with scores of 7 and 7. This can be explained by their strong totalitarian legacy. Iran (discussed above) and Afghanistan are the other two special cases.

Authoritarianism in the Arab World

The situation is not at all encouraging in the Arab core of the Middle East and North Africa. In 2000, among 16 countries, 10 (Algeria, Egypt, Iraq, Libya, Oman, Qatar, Saudi Arabia, Syria, Tunisia, and the United Arab Emirates)—or 12 (if we include two border states Mauritania and Sudan that have an Arab majority)—were in the "not free" category and only 6 (Bahrain, Jordan, Kuwait, Lebanon, Morocco, and Yemen) in the "partly free" category. During the decade, Bahrain, Jordan, and Yemen came into the "not free" category, and consequently, in 2009, Freedom House scores for the remaining partly free Arab countries were as follows: Kuwait (4 and 4), Lebanon (5 and 3), and Morocco (5 and 4). Even more interesting, Stepan observes that, while the 16 Arab countries are "underachievers" in electoral competitiveness (relative to what one would expect from their levels of gross domestic product per capita), the 31 Muslim-majority but non-Arab countries are "overachievers."

To explain "Arab exceptionalism" requires no less an effort than explaining the much more debatable "Muslim exceptionalism." It does not seem convincing to attribute the Arab democracy gap to certain inherent characteristics of the Arab political culture. Therefore, one should look for political, rather than ethnic or religious, particularities of the region to explain such exceptionalism. But exactly what kind of "political" particularities? Indeed, authoritarianism in the Arab world has given rise to an extensive literature. Although it is not possible to give the subject a full treatment here, the most common explanations can be summarized as follows.

One such explanation is related to the historical conditions under which Arab states emerged. As Stepan correctly states, many contemporary Arab states have relatively new and arbitrary boundaries cut out of the Ottoman Empire and were afterward occupied and colonized by European powers. Compounding this problem of state identity is the widespread appeal of pan-Arabism in many parts of the region, based on a common language and common religion. Against this background, it is remarkable that the new Arab territorial states have shown a high degree of resilience and durability. Egypt, with its strong sense of identity and tradition of statehood going back to several millennia, may be considered an exceptional case. Another related factor is the impact of the colonial or semicolonial experience in the political culture of Arab states, where independence from foreign rule was the dominant objective overshadowing concerns such as democracy and human rights.

A second explanation centers on the concept of "rentier state." Many Arab countries are rich in oil and natural gas reserves. The vast income deriving from these sources enabled the ruling elites to buy or co-opt some elements of the potential opposition as well as satisfy the basic material needs of a large majority of the population. This has had a retarding effect on the emergence of an independent bourgeoisie that is the driving force for democratization in Muslim as well as other countries. As Nasr says, Muslim democracy needs the bourgeoisie, and the bourgeoisie needs Muslim democracy. Nevertheless, the rentier state hypothesis cannot explain the prevalence of authoritarianism in oil-poor Arab states.

A third argument, perhaps the most convincing one, provides a cyclical explanation. Thus, the repressive policies of Arab authoritarian rulers against all opposition groups, secular and Islamist alike, and their refusal to even partially liberalize the system radicalize the opposition. The chief beneficiary of this process is the Islamist opposition, much stronger, more broadly based, and better organized than secular opposition groups. This, in turn, increases the perception of threat (real, exaggerated, or manipulated) on the part of the ruling groups and is used to justify even more repressive policies. This fear, although highly exaggerated and manipulated, is also vivid within the Turkish state elites (particularly the military and the judiciary), and it constitutes one of the most formidable roadblocks on the way to further democratization.

The feeling of an Islamist threat also leads to a paradoxical situation in that liberal or secular opposition groups that should normally have been on the side of democratic reforms also support repressive policies against the Islamist opposition. As Daniel Brumberg argues, the alliance between potential democrats and the authoritarian states in the Middle East is the reverse of the political reform process in Eastern Europe. In the latter cases, the not too democratic elites nonetheless found democratic procedures useful for dealing with the opponents of the regime, thereby leading to a "democracy without democrats." In the Middle East, by contrast, fear of Islamist victories has produced "autocracy with democrats," as potential democrats now actively support or at least tolerate autocrats as a lesser evil than an Islamist regime. A similar process is under way in Turkey in the ostensibly "social democratic" and militantly secularist RPP's (Cumhuriyet Halk Partisi) support for the military's harsh attitudes and manipulative maneuvers against the governing Justice and Development Party (Adalet ve Kalkınma Partisi; AKP), even though the latter can in no way be considered an Islamist or even a post-Islamist party.

The dilemma of the authoritarian rulers in the Middle East explains the zigzagged course of liberalization policies. It has been observed that periods of relative liberalization have often been followed by those of deliberalization. Although in some Arab countries, such as Jordan, Morocco, Algeria, Kuwait, and Egypt, controlled or semicompetitive elections have taken place, and moderate advances have been made in areas such as the freedom of the press, association, and assembly, none of these regimes has advanced beyond the level of electoral (or competitive) authoritarianism. Many studies of these cases are rather optimistic, probably reflecting the democratizing bias of their authors.

And yet it seems a fruitful line of inquiry to distinguish between the relatively more successful and less successful of these cases. Thus, Brumberg distinguishes between what he calls "dissonant" states and "harmonic" states. The dissonant states leave some room for competitive or *dissonant* politics. The examples are Morocco, Egypt, Jordan, Kuwait, and Lebanon. That such regimes, however autocratic, recognize and do not attempt to destroy societal pluralism creates an arena for competition and negotiation. The "harmonic" states, on the other hand, in their attempt to impose an often artificial unity through repression and cooptation, leave little room for negotiation and compromise and create a deadly game of "winner takes all." These are the states based on an ideology (be it Islam, Arab socialism, or Kemalism) and a strong sense of mission that attempt to mold the society according to their image of the "good society." John Waterbury characterizes such states as "ends-oriented" states, arguing that since the mission is considered sacred, debates over ends or means are seen as subversive or blasphemous.

The dissonant Arab states and those in the non-Arab parts of the Muslim world permitted a degree of electoral competition that, in turn, helped moderate the Islamist groups and integrate them into the political system. Turkey is the leading example of this process, where the earlier Islamist parties were transformed into a moderate, center-right, conservative democratic party (the AKP). Other examples include Bangladesh, Indonesia, Malaysia, and Pakistan. Similar processes are under way in Morocco, Jordan, Kuwait, and Lebanon. As Nasr observes, competitive elections push religious parties toward pragmatism and make other parties more sensitive to Islamic values in a game to win the middle. Electoral competition may eventually lead to a situation of "democracy without democrats," and this surely is much more preferable to that of "autocracy with democrats."

Conclusion

The early optimism and enthusiasm about the global resurgence of democracy have been replaced by a sense of greater realism. It is clear that authoritarian regimes, in one variety or other, have shown greater resilience and staying power than originally anticipated, using a skillful mixture of coercion, co-optation, divide-and-rule tactics, and selective democratic openings. However, just as the prospects for sustaining full-scale (or closed) authoritarian regimes in an age of democratization are not good, so are the prospects for electoral (or competitive) authoritarian regimes. The uneasy mixture of democratic and authoritarian elements creates an inherent source of instability, with the possibility of going in the direction of either electoral democracies or less competitive hegemonic authoritarian regimes.

AUTONOMY, ADMINISTRATIVE

Within democratic systems, public organizations carry out a large number of functions, ranging from provision of education, health, and national security and regulation of financial markets to ensuring equal treatment for all. These bodies perform these functions because delegation is imperative: Elected politicians lack the time, expertise, and resources both to enact and implement laws and to delegate these tasks to public organizations. To perform their tasks, these bodies need a certain level of autonomy from democratic oversight. The laws they implement often contain goals, such as "national security" and "social welfare," that need further specification before they can be attained. Also, several different approaches and policy instruments to complex social problems may exist, and the choice of approach or policy instrument requires experience and knowledge of these social problems. Public organizations are staffed by civil servants with such experience and knowledge, but they need some level of autonomy to analyze social problems and to choose the best possible course of action for addressing these. Administrative autonomy revolves around a delicate balance. On the one hand, if public organizations lack administrative autonomy, they run the danger of being micromanaged by politicians. On the other hand, if there is too much administrative autonomy, politicians and voters run the risk of having created public organizations that are nonresponsive to democratic preferences.

Administrative autonomy is therefore a core concept in the study of public administration. At its heart lie democratic-theoretical questions concerning the relationship between voters, politicians, and civil servants as well as rational-instrumental issues concerning the management and design of effective and efficient public policies. As a theoretical concept, administrative autonomy represents an abstract social construct. Under this lemma, the background of the concept of administrative autonomy within the field of public administration is discussed first. Next, the various attributes and dimensions of the concept of administrative autonomy are described. Finally, an overview of theories of administrative autonomy is provided.

The Concept of Autonomy in the Study of Public Administration

In the field of public administration, the concept of administrative autonomy has been enjoying the close attention of many scholars for more than several decades (see, e.g., Daniel Carpenter, 2001; Peter Clark & James Wilson, 1961; Anthony Downs, 1967; Philip Selznick, 1957). Administrative autonomy is considered a sine qua non for nothing less than the "survival" of a public organization. To survive competition with other public organizations over scarce resources, the attaining of a substantial degree of administrative autonomy is seen as a critical goal: "Autonomy gives an organization a reasonably stable claim to resources and thus places it in a more favorable position from which to compete for those resources" (Clark & Wilson, 1961, p. 158). Administrative autonomy as the lifeblood of successful public organizations is still a vivid argument in contemporary public administration scholarship. In his study of the modernization of the American bureaucracy during the late 19th and early 20th centuries, Carpenter (2001) ascribes the success of various agencies, among them the U.S. Postal Service and the U.S. Food and Drug Administration, to their leaderships' capabilities to forge autonomy for their organization.

During the 1990s, we witnessed a renewed interest in the concept of administrative autonomy. Three developments were important drivers of this interest. First, starting in the late 1980s and the beginning of the 1990s, by setting up "quasi-nongovernmental organizations," that is, quangos, governments worldwide embarked on the path of restyling their central governmental apparatus according to one of the core prescriptions of the new public management (NPM) paradigm. In traditional Western parliamentary systems, governments were confronted with trade-offs between giving autonomy to parts of their integrated central administrative apparatuses and to retain control over the newly created autonomous bodies.

The second driver of the renewed attention for the concept of autonomy is the wide diffusion and creation of independent regulatory authorities (IRAs). The intellectual foundations for the creation of IRAs stem from the same source as that of NPM described above. The financial and economic reforms of the 1980s and 1990s resulted in the liberalization of markets and the breaking down of public monopolies. Deregulation led to reregulation as contracts and property rights within these newly created markets needed public supervision. Legislatures entrusted the protection of property rights and the enforcement of contracts on these new markets to independent regulatory agencies. Their autonomy from government is considered a necessary condition for guaranteeing the credible commitment of the government to not renege on the liberalization of these markets. Consequently, the creation of IRAs brought immediately to the fore the question of who controlled these highly autonomous bodies.

The third and final driver is the emergence of neo-economic theories within public administration and political science. Neo-economic theories entered the fields of political science and public administration through the latter's adaptations from economic and legal approaches to contract theories. Neo-economic theories first made school within American political science. The warm reception of the principal–agency framework is partly the result of the decades-old American interest in Congress's capability to control the bureaucracy. Principal–agency and transaction costs theories introduced a new conceptual tool kit into public administration and concepts such as "contract," "information asymmetry," "monitoring," and "costs" started to dominate our talk and thinking about politics and administration. Neo-economic theories soon crossed the Atlantic and assumed a prominent place within European studies on regulation, Europeanization, and quangocratization. This resulted in the growing attention on the concept of administrative autonomy.

The study of administrative autonomy is colored by sociological and neo-economy–inspired political science theories. Whereas sociological theories treat administrative autonomy as an important asset of public organizations to successfully function within their own environment, economic-political science theories consider the autonomy of public organizations as a potential liability. We will see that these perspectives constitute the basic view within two of the three main sets of theories of administrative autonomy.

The Anatomy of Administrative Autonomy

Administrative autonomy is an abstract concept that is not directly observable. In this section, we will present two dimensions of administrative autonomy that are commonly used in studies of this concept.

De Facto and De Jure Autonomy

The first distinction is between formal or de jure autonomy and actual or de facto autonomy of public organizations. De jure autonomy refers to the formal-legal prescriptions concerning the relationship between politicians and public organizations. The laws that created the body (or the laws and regulations that delegate specific tasks to public organizations) state how a political principal and its administrative agent should interact in *theory*. As such, these laws spell out the rules of the game that should be obeyed when these actors interact with each other. To a certain extent, the de facto or actual autonomy of a public organization is reflected by its formal autonomy. A public organization that is not part of a ministerial department, for example, will have more formal administrative autonomy than a unit of a ministerial department.

However, the correlation between de jure and de facto administrative autonomy is not always strong. George Krause and James Douglas (2005), for example, found that it was not the formal administrative autonomy of three different U.S. economic agencies that affected the outputs of their economic forecasts but the reputation of the economic professionals who worked within these agencies. Martino Maggetti (2007) found that a higher level of formal administrative autonomy is not a sufficient nor necessary condition for higher levels of de facto autonomy. These findings point at the existence of a discrepancy between rules and competences on paper and rules and competences in practice. In the words of Kutsal Yesilkagit (2004),

> Rules, procedures, and competences may seem clear on paper as they inform all actors about the formal intentions of the designers. However, [after the body is created] public organizations leadership can interpret the rules in a different way than politicians had in mind when they designed the rules. (p. 535)

Dimensions of Autonomy

Koen Verhoest, Guy B. Peters, Geer Bouckaert, and Bram Vermeulen (2004) distinguish between seven organizational domains and related dimensions of autonomy. The first dimension is *managerial* autonomy and refers to the extent in which managers may decide on the allocation of the input (e.g., budget) and resources (e.g., personnel) of public organizations without prior approval from a supervisory body (i.e., a minister). Second, *policy* autonomy designates the discretionary space within which managers of public organizations can decide on the quantities of the goods their organizations produce, choose from among the policy instruments they have to their avail, and arrange the internal procedures within their organizations. Managerial and policy autonomy hence correspond to the discretionary authority of public managers: a space within which managers enjoy some leeway to manage their organizations as they see fit.

External stakeholder may actively limit the discretionary space of the management of public organizations. Administrative autonomy is then a function of the exemption from constraints on the actual use of decision-making competencies that external stakeholders—that is, the ministers—grant these organizations. In democratic systems, central governments always retain certain powers to fine-tune the amount of decision-making competences of public organizations. This fine-tuning may take place through the adjustment of an organization's structural autonomy, legal autonomy, interventional autonomy, and financial autonomy. *Structural* autonomy is the extent to which the head of public organizations is exempted from direct supervision of elected officials—that is, the minister. If the head of a public organization reports to a governing board and not directly to the minister, then the structural autonomy of public organizations may be considered as high. The *financial* autonomy of a public organization is high when it is entitled to draw its own financial resources from the revenues of the services the organization delivers; it is low when the revenues of the organization come from the departmental budget. With regard to the *legal* dimension of autonomy, Verhoest et al. take the legal basis of the public organization as the measuring rod. If a public organization lacks legal personality or it is established by a statutory instrument instead of a statute, the position of the public organization vis-à-vis the legislature or the cabinet will be weak, as the latter can change the legal status of the public organization with lesser (legislative) costs than when public organizations was founded on primary law or a statute. Finally, *interventional* autonomy is the extent to which a public organization is exempt from *ex post* reporting, evaluation, and audit requirements. Table 1 gives a brief schematic overview of the dimensions of autonomy and the substances to which autonomy and/or exemptions refer.

Theories of Administrative Autonomy

Until now we have discussed the background and various attributes of the concept of autonomy. Here we will focus on the factors that affect levels of administrative autonomy. In research as well as in practice, we are primarily interested in why some public organizations have more administrative autonomy than others and what these organizations (can) do with their autonomy in public life. Overlooking academic research on administrative autonomy over the past decades suggests that there exist three sets of theories of administrative autonomy: (1) *external-control* theories, (2) *internal-administrative* theories, and (3) *dynamic-adaptive* theories.

Table 1 Dimensions of Autonomy

Type of Autonomy	*Autonomy Dimensions*	*Substance of Autonomy*
Level of decision-making competencies (discretionary powers)	Managerial autonomy	Decisions on inputs and allocation of resources
	Policy autonomy	Decisions on policy instruments, production of goods
Exemptions from constraints on decision-making competencies	Structural autonomy	Exemptions from direct hierarchical supervision
	Legal autonomy	Legal basis of public organization
	Financial autonomy	Source of agency funding
	Interventional autonomy	Exemption from *ex post* controls

The study of organisational autonomy: A conceptual overview. *Public Administration and Development, 24*(2), 101–118; Christensen, J. G. (2001). Bureaucratic autonomy as a political asset. In B. G. Peters & J. Pierre (Eds.), *Politicians, bureaucrats and administrative reform* (pp. 119–131). London: Routledge.

External-Control Theories of Administrative Autonomy

External-control theories of administrative autonomy claim that the administrative autonomy of a public organization is a function of the level of pressures exerted on the organization by political stakeholders in the environment of the public organization. The theories that are grouped under this heading have in common that they apply a (version of) principal–agency theory of political control. They assert that the degree of administrative autonomy of public organization depends on the instruments and resources that political principals, such as Congress or the president (in U.S. studies) and parliaments or cabinets and ministers (in studies on parliamentary systems), have to control the actions and outputs of public organizations. These instruments are usually divided between *ex ante* controls, such as agency design, administrative procedures, and *ex post* controls, such as audits, reporting requirements, and (threats of) budgetary cuts.

External control is not limited to political principals. Next to formal political actors, interest groups too may act as principals of public organizations. Interest groups are key players in the politics of delegation and administrative design, as they, perhaps more than elected politicians, care about the control regime of public organizations as these organizations are essential to the policy process and the distribution of public services to their members. Political control is therefore not an

> issue . . . of congressional dominance or presidential control, but rather of shared authority and the ability to influence policy in one direction or another, a process whereby interest groups' ability to access and shape policy both directly and indirectly is evident and must not be overlooked. (Scott Furlong, 1998, p. 61)

In other words, political control is a form of "joint custody" of president, congress, interest groups, and the courts, and administrative autonomy is the resultant of the strategies pursued by multiple interacting actors.

Internal-Administrative Theories of Administrative Autonomy

In contrast to external control theories, internal-administrative theories of administrative autonomy put public organizations and their interests, capacities, identity, and mission central to their explanatory models. The main thesis of this line of research is that the administrative autonomy of public organizations is a function of the organization's capabilities to forge its own autonomy from its direct environment. Whereas we could say that in the former perspective, the organization is considered as a passive taker of the discretion that its environment grants to itself, in this perspective, public organizations are considered as active seekers or forgers of autonomy (Carpenter, 2001).

As suggested by Wilson (1989, pp. 188–192), two sets of internal-administrative factors are deemed crucial for achieving autonomy. One is "political legitimacy" (Carpenter, 2001)—that is, the belief and reputation that agencies can deliver the services that are "worthwhile to some group with influence over sufficient resources to keep it alive" (Downs, 1967, p. 7). Agencies should "impress those politicians who control the budget that its function generate political support" (p. 7) from which politicians can benefit in terms of their reelection or strengthening of their party political base. Second, administrative autonomy requires the "organizational capacities" to deliver the benefits to their supporters: It must have the staff with the right skills and dedication to fulfill the organization's ultimate goal of securing a stable and strong autonomous position within the public space. In line with this, Selznick (1957) saw carefully designed recruitment instruments as a prerequisite for autonomy. The leadership of an organization, if it wanted to pass the initial survival threshold and maneuver through critical periods ahead, had to carefully select, first, the "social base," that is, those segments of "the [organization's] environment to which operations will be oriented" (Selznick, 1957, p. 104).

Dynamic-Adaptive Theories of Administrative Autonomy

The third set of theories of administrative autonomy commonly claims that the administrative autonomy of public organizations is a function of a complex pattern of interactions between public organizations and its (political) environment. The interactions consist of a mix of stimuli or signals and responses that traverse from various venues in the environment to a public organization as well as from agencies to the political actors in the environment. "[C]ausality" between control and autonomy "does not just flow from each democratic institution towards the administrative organization as assumed in many conceptualizations of political control theories, but . . . also flows from agency to political principals" (Krause, 1996, p. 1089).

According to Dan Wood and Richard Waterman, stimuli are discrete events (e.g., a crisis, the election of a new president), event progressions (e.g., yearly budgetary appropriations, congressional oversight hearings), and tonal stimuli (i.e., changes in the tone of political–bureaucratic relationships), and the responses are a function of the agencies' technological, rational, and political assets. Unanticipated behavior, a function of the general uncertainty in any policy environment, also influences autonomy. Policies are made in ambiguity; agencies do not only often poorly anticipate possible events, but they are also often not capable of making sense of the stimuli that reach them, causing public organizations to display unanticipated response behavior.

Conclusion

Administrative autonomy is a core concept in the study of public organizations. As the concept stands, it is studied in close relation to democratic-theoretical notions such as legitimacy, public accountability, and democratic control. In the preceding sections, we have discussed the various attributes of this concept and theories of administrative autonomy. We have seen that research on this topic is substantive. However, there are still aspects of administrative autonomy that have not yet been fully studied. Here, three lines of research that are worthy to be explored by future research are discussed.

In the studies discussed above, administrative autonomy is treated as the dependent variable. However, from a democratic perspective, the degree of administrative autonomy of public organizations is particularly important for the extent it enables or restrains public organizations in their operation. Public organizations that are more or less autonomous provide public services and regulate affairs across a variety of societal domains and may deeply affect the lives of citizens. So one line of research that deserves to be further elaborated is on the relationship between administrative autonomy and performance or policy impact. The study of administrative autonomy may be connected to existing studies on bureaucratic responsiveness. These studies examine the impact interest groups have on decision-making processes of public organizations but leave the relationship with administrative autonomy somewhat unexplored.

Second, an underexamined aspect of administrative autonomy is of a more normative nature, namely, the discussion from which stakeholders and public organizations *should* function autonomously. Public organizations are created to implement democratically chosen public policies. So, autonomy from government will never be absolute, as public organizations have been entrusted with the implementation of collectively agreed-on public policies. Furthermore, public organizations also interact with and are responsive to a number of nongovernmental organizations. So, public organizations will not be entirely autonomous from nongovernmental stakeholders as well. The focus within existing research has predominantly been on the varying degrees of autonomy from governmental and nongovernmental stakeholders, without questions regarding the desirability of varying degrees of autonomy from different stakeholders.

Finally, the globalization of the economy and technological developments increasingly blur the lines between the international order and domestic administration. We move toward a postnational bureaucracy that is hallmarked by the emergence of dense international networks of civil servants. Administrative autonomy becomes situated into a new context as the environment of public organizations becomes more and more transnational. The consequences of globalization of the executive branch force on us new ways of thinking about the relationship between politics and administration. Here, too, administrative autonomy will be a core concept.

AUTONOMY, SUBNATIONAL

The concept of autonomy is polysemous in scientific literature and can be used in very different contexts. When used with the word *subnational*, the concept refers to the degree of autonomy in governments below the level of central government, with the exception of local governments. Examples include the Canadian provinces, the U.S. states, the Spanish autonomous communities, the regions and communities in Belgium, the German and Austrian *Länder,* and the French departments and regions. Autonomy refers to the degree of decisional autonomy, sovereignty or self-government within a nation-state, enjoyed by these subnational governments.

This entry first discusses subnational autonomy and the structure of the state. Second, it describes the power, resources, and influence of subnational governments. Regionalization is discussed in the third section, the fourth section deals with multilevel governance and subnational autonomy, and the final one examines minority nationalism and subnational autonomy

Subnational Autonomy and the Structure of the State

Because nation-states vary in their structure, subnational governments also differ from country to country. In many cases, vast differences are found within a single country. This diversity results in a strong asymmetry between subnational governments in terms of their autonomy. The autonomy of subnational governments is based on several factors, including the institutional setting of a nation-state and the constitutional powers devoted to a subnational government. The more a country is constitutionally decentralized, the greater is the extent to which subnational governments have legislative powers and thus autonomy.

In unitary states such as Denmark or Israel, subnational governments have little or no autonomy. A unitary state is a state governed as one single unit in which the central government is the decision center. Subnational and local governments exercise only the power that the central governments choose to delegate.

In the case of a devolved or decentralized state, subnational governments have more autonomy. A decentralized state is generally a former unitary state such as France. The authority and responsibility for some public functions have been transferred from the central government to the regional government. A devolved state is a centralized state such as the United Kingdom (UK), where subnational governments have a degree of autonomous power devolved from the central government. A devolved government cannot challenge the constitutionality of central government's law. The power given by the central government can be revoked or reduced. For example, the Northern Ireland Assembly has been suspended many times by London since its creation. In theory, decentralized and devolved states are different, but in practice, the differences are very thin.

A federal state is a type of sovereign state in which sovereignty is constitutionally divided between a central government and the subnational governments (e.g., the Canadian provinces or the German *Länder*). To qualify as a federation, a minimum requirement is that the constitutional powers of the subnational governments cannot be changed unilaterally by the central government. In federal systems such as Germany, Canada, the United States, or Belgium, subnational governments have considerable autonomy. In Canada, for example, provinces are constitutionally responsible for health care, education, culture, and municipalities. They can also act on economic development, justice, environment, and so on. In Belgium, the autonomy of communities and regions goes even further. Since 1993, Belgium has been, according to the first article of its Constitution, "a federal state composed of communities and regions." The constitutional revision of 1993 permits the regions and communities to become real international actors. This includes the power of representation and power to sign treaties with sovereign states. Since the revision of the Constitution in 1993, the organization of Belgium's international relations is fundamentally adapted to the federal state structure. The autonomy of the Belgian substate actors, with regard to external policy, is unique in the world. Its exceptional nature arises from the recognized constitutional principle of *in foro interno, in foro externo*. On top of that, there is an *absence of hierarchy* between different levels of administration (see Table 1).

Subnational Governments Power, Resources, and Influence

The autonomy of subnational governments is also related to the resources that these actors can mobilize. Some subnational governments such as those

Table 1 Typology of Democracies and Cases in Relation to the Autonomy of Subnational Governments

Unitary States	*Decentralized and Devolved States*	*Federal States*
Denmark	France	Belgium
Finland	Netherlands	Canada
Greece	Portugal	Germany
Ireland	Great Britain	United States
Sweden	Spain	Austria
Israel	Italy	India

in Quebec, Catalonia, Flanders, California, or Bavaria possess more resources than many sovereign states. Let us compare subnational governments with the 192 members of the United Nations. In terms of population, 40 states have a population of less that 1 million and around 13 have between 1 million and 2 million. In the United States alone, 43 states have a population greater than 1 million, and 36 have a population of more than 2 million, according to U.S. Census Bureau data for 2008.

In 2008, according to the World Bank, nominal 2008 gross domestic product (GDP) estimates for 191 nation-states and territories, California would rank among the top 10 in the world. The top 11 American states would rank among the first 25 in the world, the top 26 in the United States are among the top 50 globally, and all 50 states are among the top 86 nation-states. The state of California could even be a member of the G8 (Group of 8; or the G20 [Group of 20]) since its GDP is greater than those of Canada and Spain. The annual budget of California exceeds that of Mexico and numerous sovereign states. Thus, subnational governments are among the most important economic actors in the world.

Regionalization

Since World War II, authority has shifted away from the central state to international organizations, such as the European Union or the World Trade Organization, and to regions and municipal governments. Regionalization represents a transformation of regional authority where the nation-state creates or reinforces the mesogovernment level between the central state and the local level. If Canada and the United States have been federations for years, in Europe regionalization has gone hand in hand with European integration.

After World War II, only Germany, Switzerland, and Austria were considered decentralized federal states. Since the 1950s, of the 27 countries that are now part of the European Union, including Belgium, Spain, Italy, the UK, and France, 19 have seen the rise of a stronger and deeper regional or subnational government. These governments now handle a wide variety of policy responsibilities. Since 1950, new regional governments have been created in 14 countries of the European Union (EU). Eighteen regions in 7 countries, excluding the Belgian regions and communities and the Spanish autonomous communities, have also been given a special autonomous or different status. In 1950, only 5 countries had directly elected regional assemblies covering the countries as a whole; by 2010, 16 countries had such assemblies. Only 2 countries in Europe with a population of more than 2.5 million, Sweden and Bulgaria, have not followed this trend. In Sweden, decentralization reinforced the role of municipal governments instead.

These meso or regional governments are a fairly new thing in many countries with diverse political history and constitutional setting. These new regional governments are reshaping politics, the distribution of power between the central government and the subnational units, and accountability.

According to some researchers, the driving force behind the rise of these regional governments is related, in part, to globalization. According to some scholars, the nation-state today is too small for the big problems of the world and too big for the small ones. In this context, regional governments are better placed to deliver important public goods.

Other scholars identify the rise of regions with the decline of the authority of the nation-states. In Europe, European integration has reinforced regionalization and decentralization. European integration has noticeably weakened the centralized uniform states with the introduction of the principle of subsidiarity in the Treaty of Maastricht of 1992.

There are also more technical reasons for regionalization or decentralization. For some scholars, the virtues of centralization and decentralization differ from one policy area to the other. The advantage of centralization is obvious: economies of scales and, in theory, greater equality between the citizens of one country. The virtues of decentralization are different. Some scholars suggest that regionalization and decentralization increase the efficiency of public policy. The fundamental principle of public goods analysis is that a jurisdiction should encompass those who are positively or negatively affected by a specific policy. Because the public goods differ, the scale at which they are most efficient also differs. Some policies, such as urbanism or fire protection, are best handled at the local level. Some policies, such as education or hospitals, are best handled at the regional level, and others such as national transportation, infrastructure, trade, and national security are better handled at the national level.

Some believe that political participation is better and more effective if the decision center is closer to voters. Decentralized governments are closer to the citizens and therefore have better knowledge about what they want and need. Regionalization thus contributes to better democracy because it multiplies opportunities for citizens to influence governments.

According to some researchers, regionalization and decentralization are drivers for better democracy. Elected officials in democratic states may shift decision making away from the central state if it can lead to more efficient decision making and can attract more votes. By contrast, authoritarian states tend to centralize the decision-making process. At best, authoritarian regimes will deconcentrate powers in local outposts so that they can provide more reliable information about local politics and implement more effective central policy. This fact explains why the democratization of southern, central, and eastern Europe went hand in hand with decentralization and subnational autonomy. The so-called third wave of democracy generated more decentralization. Regionalization and decentralization could thus, in theory, lead to more effective public administration and better democracy.

Finally, some specialists think that decentralization comes primarily from the public finance crisis. Regional governments are, in theory, more in phase with the real needs of the population and thus allocate resources more effectively. With the crisis of the public debt in numerous countries, decentralization is a way for the central state to transfer some responsibility to regions in order to reduce the pressure on public finance at the central level.

Multilevel Governance

With regionalization and decentralization, the responsibilities of substate governments have expanded considerably. Subnational governments have more power concerning economic development, education, health care, environment, public transport, and so on. Each of these public policy domains requires coordination among governments at diverse levels. Because no government is an island, increased globalization and internationalization have reinforced the need to coordinate local, regional, national, and international policies as the responsibilities of subnational governments expand.

The rise of regional government and subnational autonomy has a big impact on multilevel governance. Decisions taken at one level of government affect the decisions of the other level of government. Most policy thus require some form of coordination among international, European, national, regional, and local governments. We know that, for example, according to a United Nations estimate, between 50% and 70% of all adaptation and mitigation measures against climate change will call for implementation by the regions or subnational governments

The concept of multilevel governance was created within the framework of the EU to explain the relation between the various levels of government in EU policy making. Multilevel governance means that there are multiple actors from various level of government interacting to negotiate and implement public policy coming from the EU. The multilevel governance approach illuminates the interdependence between the local, regional, national, and international levels of authority.

At first, multilevel governance was developed for the study of the EU. Now, however, it is applied in various situations because virtually all government activities today are affected by the competence of at least one intergovernmental organization, and frequently many more. In this way, in the context of international organizations and international conferences, themes are dealt with that relate to education, public health, cultural diversity, the environment, business subsidies, the treatment accorded to investors, the removal of nontariff barriers, barriers to agriculture, to services, and so on. This phenomenon is magnified in Europe by the process of European integration and in North America by the North American Free Trade Agreement. Likewise, enlarging the scope of international issues means that all government departments have activities that are internationalized. This situation makes it harder for a country's ministry of foreign affairs to centralize the decision-making process.

In this context, subnational governments have become more aware that their political autonomy and their sovereignty—or, in other words, their ability to formulate and implement policy—are subject to negotiation in multilateral fora. Thus, since the 1960s, there has been a noticeable increase in the number of subnational governments that are interested and participate actively in international affairs.

In the United States, for instance, only 4 states had representative offices in other countries in 1970 versus 41 states with 245 representative offices in 34 countries in 2008. In Germany, the *Länder* have set up some 130 representative offices since 1970, of which 21 are located in the United States. In 2009, Quebec, one of the pioneers in the field, had some 28 representative offices around the world. In Spain, the autonomous region of Catalonia operates some 50 representative offices abroad, and in 2010 the Flemish government has more than 100 political, economic, and economic representations abroad. This phenomenon is also evident in Japan and many other countries.

When considered from the perspective of theories of federalism and international affairs, the two conceptions conflict: the centralizing school and the school devoted to multilevel governance. From the perspective of the centralizing approach, some scholars believe that a monopoly of foreign affairs is a "minimum power" of all central governments. In his landmark study, Kenneth Clinton Wheare highlighted the negative consequences of unbundling central control over foreign affairs for the national interest and for the functioning of the international system. To some scholars, international relations are at the heart of federal regimes. Centralization of the foreign affairs power is a requirement of international law because a centralized political system is a necessary condition for states to be able to play the role they are assigned in international law and practice. In essence, without the existence of a central government that has a plenary authority on its territory in relation to foreign affairs and the ability to participate in international relations and to enforce international obligations in the domestic order, interstate relations can only be seriously compromised. If the power of codecision is granted regarding treaty making, there would be a risk of paralyzing a state's foreign affairs. Every player would have a veto, resulting in harm to the state's image in the international arena.

Supporters of the concept of multilevel governance take a different view. According to some scholars, diplomacy or foreign policy cannot be considered a monopoly of the central government. Substate government will always have an important role, even if it is only for the purposes of implementing international agreements concluded by the central government. In addition, giving a monopoly over foreign affairs to central governments in federal regimes puts at risk the distribution of powers between the different orders of government for the benefit of central authorities. There are many examples of federal regime that must operate with important constitutional limitations on their powers in foreign affairs.

Foreign policy should be thought of as a complex system where different actors within the federal regime structure work with each other. Those who favor a multilevel governance approach thus maintain that "obligations of cooperation" exist between central governments and substate actors. To implement a coherent foreign policy, it is important to consult substate actors and, indeed, give them an important role by means of intergovernmental mechanisms, so that they can participate actively in the country's treaty-making process. According to this view, regional integration, multilateralism, and globalization have thus rendered centralist theses obsolete. The requirements of cooperation between the different orders of government are more and more important, and it is for this reason that one notices a considerable increase in executive federalism or intergovernmental relations in respect of the conclusion of international treaties in federal regimes.

Subnational Autonomy and Minority Nationalism

In multinational states, such as Canada, Spain, or Belgium, decentralization and subnational autonomy are also seen by many scholars as a way to reduce the likelihood of secession or political conflicts. Decentralization is a way to accommodate substate nationalist movements such as those in Catalonia, Flanders, or Quebec. The federalization or decentralization of multinational states is seen as a way to prevent the breakup of a country while permitting political and cultural autonomy of minority nations.

Many scholars have argued that some measure of autonomy or form of self-government will satisfy the majority of people within a minority nation. In practice, that would mean that a minority nation would, to some extent, govern itself while also participating in the nation-state institutions. Federalization of nation-states does not guarantee the end of the national question in multinational countries. The recent experience of Belgium with the Flemish movement, that of Scotland, or even those of Catalonia and Quebec confirm that political conflicts will remain, but it is hard to see any form of successful accommodation in multinational countries that does not include some elements of federalism and subnational autonomy.

Some researchers have reservations about granting subnational autonomy to accommodate minority nationalism. One problem is that federalism tends to accentuate the differences between the majority and the minority nation within a nation-state. The creation of an autonomous subnational government at the regional level gives the minority nation new tools to formulate new demands for more autonomy, which is seen as a never-ending story. Granting some form of self-government for minority nations tends to heighten and politicize the minority nation's self-consciousness and to facilitate the rise of a self-conscious intelligentsia. In the end, federalization is seen as a last-resort solution that risks fueling, rather than appeasing, minority nationalism. The territorialization of minority nations also risks reducing the cross-cutting interactions between the majority nation and the minority one. Giving some form of self-government to a minority nation holds the potential to polarize politics at the national level. It is thus very difficult or even impossible to create a national consensus on national issues.

B

Balance of Power

The balance of power is, arguably, the most central theoretical concept in the study of international relations, yet it is also one of the most controversial concepts in the field. It is a significant concept because it underpins how theorists of a realist predisposition think about international relations, and realism is one of the most widely acknowledged general theories in the discipline. The concept is also controversial because realism, in general, and the balance of power, in particular, have always been fundamentally challenged by other schools of thought. Advocates of the balance of power argue that it helps account for the most fundamental features of international relations and, in particular, the survival and stability of any system of independent states. Critics, by contrast, attack the concept by insisting that it is either incoherent, thereby promoting a spurious understanding of international relations, or dangerous, because it promotes policies that can lead to international tensions and often war. This entry first examines the balance of power metaphor and describes its historical development. It then discusses the roles the concept has in contemporary thought, especially in the work of Hans J. Morgenthau and Kenneth N. Waltz.

The controversy that surrounds the balance of power is not a recent phenomenon. It can be traced back for several centuries, although there is no authoritative genealogy of the concept. Debates about the balance of power became a regular feature of the theory and practice of international relations in Europe from the 16th century onward. The balance of power is generally regarded as an essentially Eurocentric concept, although this assessment remains somewhat speculative because so little is known about the theory underpinning how other international societies have operated.

While the balance of power is generally regarded as a concept that is quintessentially related to international relations, it is also a concept that is regularly used across the social sciences as well as in general parlance. However, outside international relations, the balance of power is not seen to be particularly controversial. The term is employed ubiquitously because it acts as a metaphor that effectively transforms our conventional understanding of power. Unadorned, power is generally treated as an attribute that enables an agent possessing power to regulate the activities of other actors. In the literature on power, this usage is often referred to as a behavioral or agential conception of power. The balance of power metaphor transforms this conventional meaning into a structural or systemic conception of power.

When treated as a metaphor, the balance of power has been associated with a wide array of images, from a chandelier to the arch of a bridge. The image that most frequently springs to mind is a set of scales. From the perspective of international relations, the scales can be viewed as a system in which the weights that are placed on the pans of the scales are equated with the power capabilities of the states that operate within the system. What the metaphor demonstrates is that if the weight/power is increased in one pan, then the weight/power on the other pan is automatically affected. It follows that power must be treated as a relative rather than an absolute phenomenon. But the metaphor can also indicate that if there is a disproportionately heavy weight placed in one pan of the scales, then it is possible to establish an effective counterbalance by placing a number of lighter weights on the other pan. The even distribution of power that is then formed is often represented as the definition of a balance of power.

If the metaphor is brought into focus, however, it is clear that this very specific meaning should be subsumed under a much broader conception that associates the balance of power with a system in which power is a structural attribute. Such a system is, in effect, constituted by the distribution of power that forms within the boundaries of the system. So in a multipolar system, for example, there are several main poles of power, whereas in a bipolar system there are two main poles of power, and in a unipolar system there is only one main pole of power. This structural conception of power has attracted the attention of many historians, theorists, and practitioners from the past and the present who have wanted to understand international relations, and it has led them to presuppose that the behavior of states is or at any rate should be significantly influenced by the structure or balance of power that helps constitute the international system.

In general usage, by contrast, the same kind of assumption is not made. If a wife goes out to work and earns an independent income, it can be argued that the balance of power within the marriage will shift as a consequence. Or, in a multiparty system, if two opposition parties ally, then the balance of power within the political arena will alter. In both cases, the metaphor brings the structure of the system into focus. But there is no presumption that a change in the balance of power will necessarily strengthen or weaken the system. The metaphor simply highlights the change in the distribution of power. But in international relations, there is a long-standing political myth that states will respond to changes in the distribution of power in a way that ensures that international stability is restored. But the veracity of this myth has also long been challenged, and a significant countermyth has arisen asserting that the preoccupation with the distribution of power in international relations is a major source of conflict and disorder. This controversy about the balance of power has been carried forward into the contemporary discipline and accounts for the very distinctive role that the concept plays in international relations.

Historical Development of the Idea

Despite its putative importance, we still do not have a very developed understanding of how the ideas associated with the balance of power have evolved across time. Nevertheless, it is generally accepted that the contemporary conception of the balance of power can be traced back to the Italian city-state system and that the key ideas relating to the concept began to take shape in the 15th century. By the start of the 16th century, Francesco Guicciardini (1483–1540), a practicing diplomat and an acquaintance of Niccolò Machiavelli, was able to call on these ideas when he came to write *The History of Italy*. He wrote this history in response to the French invasion of Italy in 1494; his aim was to trace what he viewed as the tragic loss of independence by the Italian city-states in the first decades of the 16th century. He shows how these states failed to respond adequately to external pressures until eventually most of them were absorbed by the Hapsburg Empire. The book provides the first case study of states failing to follow the logic of a balance of power system and, as a consequence, succumbing to hegemony.

Guicciardini's use of balancing metaphors is restricted to the start of the book where he examines relations among the city-states in the final decades of the 15th century. The focus is on Venice, Naples, Florence, Milan, and Rome, and he acknowledges that relations among these city-states were characterized by suspicion and jealousy. But he also notes that Venice was by far the most powerful state in the system and, moreover, that it had hegemonic ambitions. But the logic of this situation as depicted by Guicciardini is that it preserved a balance of power system because, by forming an alliance, the other city-states were able to counterbalance Venetian power and thereby preserve the independence of all the city-states. Guicciardini, however, also acknowledged that rivalry among the less powerful states could potentially threaten the overall stability of the system.

But this stability was preserved, according to Guicciardini, because the ruler of Florence, Lorenzo de' Medici, recognized the importance of maintaining peace among the less powerful states and preserving the alliance against Venice. As a consequence, he was willing to operate as a balancer within the system. In other words, Guicciardini argues that Lorenzo had to constantly shift his own position in relation to the other states in the system in order to ensure that the overall balance was sustained.

What began to destabilize the system at the end of the 15th century was an emerging tendency by the city-states to invite outside states to help settle disputes among the city-states. The problem with this tactic, as Guicciardini saw it, was that states such as France outweighed the combined strength of all the Italian city-states. Nevertheless, when the Milanese concluded that Florence and Naples were forming an alliance against them, they called on France for assistance. But this move had the effect of destroying the Italian balance of power system and Guicciardini resorted to medical metaphors to characterize the subsequent developments. Eschewing the balance of power metaphor, he argued that external intervention was a medicine with effects that were far worse than the original disease.

The History of Italy was translated into other European languages, and the ideas associated with the balance of power were rapidly diffused across Europe during the 16th century. By the end of the century, therefore, the balance of power was viewed as a Europe-wide phenomenon. But during this period, the meaning of the balance of power was also extended beyond the idea of shifting alliances in a competitive or adversarial system. For millennia, there has been a metaphorical link between scales and justice, and during the 16th century, there was a growing tendency to discuss the balance of power in terms of a just equilibrium. In other words, the balance of power began to be associated with the establishment of a distribution of power that was not only regarded as stable but also fair. Initially it was argued that the balancer state must have this capacity to establish the link between stability and justice. But, over time, a stable and just balance of power was seen to arise from a general agreement among the great powers in Europe, and so the concept began to be viewed as a product of great power cooperation and mutual association. By the start of the 18th century, Europe-wide peace agreements such as the Treaty of Utrecht in 1713 began to make reference to a just equilibrium in their formal provisions. At this juncture, therefore, the balance of power was seen to provide the constitutional basis for what was called the Republic of Europe. As a consequence, it then became possible to extend the idea of the balance of power back to the idea developed by Greek and Roman theorists of a mixed or balanced constitution. But the relationship between these sets of ideas has yet to be teased out in any detail.

By the 18th century, however, there was also growing resistance to the idea that the balance of power could be treated as either some kind of a natural or a man-made law that could promote peace and stability. On the contrary, the balance of power was seen to be irrevocably tied to a system where war was endemic. By the 19th century, critics such as the British radicals Richard Cobden and John Bright were going further and arguing that the balance of power was an utterly meaningless concept. From their perspective, only by moving beyond the balance of power thinking was it possible to promote a peaceful world. The battle between advocates and critics of the balance of power persisted throughout the 20th century and, almost inevitably, when the study of international relations developed as a formal academic discipline during the present era, the balance of power immediately became one of its central but also deeply contentious concepts.

Contemporary Study of the Balance of Power

It is not difficult to demonstrate that the balance of power occupies a central position in the contemporary study of international relations because the concept lies at the heart of two of the very most influential theoretical texts published since the end of World War II. The first, Hans J. Morgenthau's *Politics Among Nations*, published initially in 1948, epitomizes classical realism and the second, Kenneth N. Waltz's *Theory of International Politics*, published in 1979, spearheaded what is now known as neorealism or structural realism. Despite the fact that these texts are still enormously influential, both texts and, in particular, their use of the balance of power have come under continuous criticism ever since they were published. It is certainly not the case, therefore, that either realism or the balance of power has ever occupied a hegemonic position in the field. Instead, it is more appropriate to see them as occupying the central ground but at the same time being engaged in a constant debate with critics coming at them from a number of very different directions.

As a classical realist, Morgenthau was well aware that he was working in the context of a long-standing tradition of European thought that embraced the concept of the balance of power, and he recognized the need to take into account both its adversarial and its associational dimensions. From his perspective, the American Constitution and other similar domestic arrangements provided the most effective examples of a functioning balance of power system, and it followed that, in an international context, the balance of power could work at best only imperfectly. For Morgenthau, the golden age for the balance of power was the era of dynastic international politics in the 18th century when states were governed by an international aristocracy that formed a distinctive international society. Under these circumstances, it was possible to achieve a just equilibrium by means of largely consensual and Europe-wide peace agreements. But even when these agreements broke down, Morgenthau argued that the uncertainties associated with any attempt to calculate the prevailing balance of power generated restraint on the part of the rival dynasties and encouraged them to operate on the basis of the established dynastic rules of the game. At the same time, however, he readily acknowledged that the world had moved a very long way from these conditions. In the aftermath of World War II, what he saw were two ideologically driven behemoths operating in the absence of any international society. The United States and the Soviet Union were restrained only by the crudest kind of balance of power, and he feared for the future of the world. Morgenthau argued that only if the two sides adopted the tools of classical diplomacy was there any hope that humans would survive.

Waltz approached the balance of power from a very different direction, and he reached a very different set of conclusions from those of Morgenthau. He was writing in the context of a detente that marked a period of relaxation in the Cold War tensions between the United States and the Soviet Union; however, his aim was to establish a general theory of international relations that would transcend historical difference and help reveal the essential differences between domestic and international politics and explain why the structure of the international system has proved so enduring.

In the first instance, therefore, Waltz argues that all political systems can be categorized under one of two headings: hierarchy or anarchy. In a hierarchical political system, actors are functionally differentiated and power is distributed on a vertical plane, so that actors can exercise power over subordinate actors in the hierarchy but will themselves be subject to the power of actors that occupy a superior position in the hierarchy. Having made the distinction, however, Waltz focuses his attention almost exclusively on anarchic political systems where actors are seen to operate on a horizontal plane. In other words, these actors do not consider that they are operating in a hierarchy or in a functionally differentiated system. They view themselves as independent and autonomous actors operating on the basis of self-help and so they are primarily concerned, in the first instance, with maintaining their independence and autonomy. To be able to do this, they must, from the start, establish how power is structured in the system. This requires them to identify the dominant actors in the system—those actors that possess a disproportionate amount of the overall power in the system. Cutting through complexity, Waltz distinguishes between bipolar and multipolar systems. Then, contrary to Morgenthau, he aims to show theoretically why multipolar systems are prone to generate an unstable balance of power, whereas bipolar systems are prone to generate a stable balance of power.

Focusing first on multipolar systems, Waltz argues that if the balance of power begins to move against any of the dominant states in such a system, they will be pushed to respond by either internal or external balancing. Internal balancing requires the actor to enhance its power position by domestic means. The most obvious mechanisms are either to expand existing military resources or to seek technological improvements. But Waltz also acknowledges that in a self-help or anarchic political system, there will be a tendency for any action that gives an actor a potential or future power advantage to be emulated by the other dominant actors in the system. As a consequence, he argues that in an anarchy there will be a tendency for actors to take the form of like units.

In a multipolar system, however, Waltz argues that when the balance of power shifts, there is the alternative strategy of external balancing. In other words, states can form alliances with each other to enhance their security. But Waltz is very well aware that alliances are an inherently unstable feature of any anarchic system. The literature on alliances reveals that an alliance generates at least two contradictory fears. On the one hand, there is the fear of entrapment, as the result of being drawn by an ally into an unnecessary or dangerous conflict. But, on the other hand, there is also the fear of abandonment. Such problems are endemic in a multipolar system. The problem persists even in the face of a rising hegemon when, rather than forming an overwhelming alliance, states will often choose to pass the buck and, at least in the first instance, leave it to other states to confront the hegemon.

Because of these sorts of uncertainties, it becomes extraordinarily difficult in an anarchic system to identify the nature of the balance of power at any point in time. Nevertheless, despite these uncertainties, Waltz argues that there is sufficient flexibility in the system to ensure that any potential hegemonic state will eventually be met by an effective counterbalancing alliance. But, by the same token, Waltz insists that it is very much easier to identify the state of the balance of power in a bipolar system: There are no alliances to complicate the assessment, and the two dominant states simply have to monitor each other's activities. As a consequence, not only are there fewer sources of instability, but it is also easier for the two dominant states to reach mutual agreement and thereby to move from an adversarial balance of power through to an associational balance of power, although Waltz does not use this terminology.

Waltz has proved to be extremely influential because he articulated a balance of power theory in such unequivocal terms, and it has encouraged other theorists to either revise or reject the theory. Offensive realists argue that dominant states aim to maximize their power position, and they characterize Waltz's approach as defensive realism because of the assumption that dominant states only aim to preserve their independence. They dismiss the idea of an associative balance of power and are much more willing to entertain the possibility of hegemonic success. In the same vein, theorists working from a world-historical perspective insist that anarchic systems transform into hierarchical or at least unipolar systems on a very regular basis. This poses a very significant problem for Waltz and for the balance of power theory more generally. But a more immediate problem for Waltz is the persistence of unipolarity in the post–Cold War world. Waltz insisted after the demise of the Soviet Union that unipolarity is a very unstable structure and that it would rapidly give way to multipolarity. But realist critics argue that there are few signs that any states are willing to compete with the United States in the military arena and that in any event Waltz's own Neorealist logic can be used to show why unipolarity is a very stable structure. It is unlikely that these debates are going to be easily resolved, and, as a consequence, the balance of power will continue to provide a theoretical focal point for theorists and practitioners in the future.

Bargaining

Bargaining is an everyday activity that pervades all social life and, arguably, is the most important mode by which political decisions are made. It summarizes all social activities in which individuals or corporate actors have a common interest in working together but disagree on how they should cooperate. Bargaining is therefore a voluntary process through which negotiators try to distribute among themselves a mutual benefit. In politics, the mixture between cooperation and conflict that characterizes bargaining situations becomes apparent at all levels of decision making. An example of a recurrent, difficult bargaining process is the distribution of the taxed income of a polity between competing interest groups who advance contradicting claims to bolster their demand for a large share. Below, major game theoretical solutions to bargaining problems and their possible applications in political science are discussed.

In the simplest political bargaining problem, two negotiators disagree over how to divide a pie worth one unit of a fictitious currency (eurodollar). Any outcome in the "bargaining zone," which is delimited by the minimal individual payoffs the actors expect, can result from the negotiations. Trivially, no bargain is feasible if the minimal expectations do not overlap or, in other words, if the set containing the possible outcomes is empty. If the minimal expectation—technically often called the "reservation price"—of one player is zero, an extreme solution in which one side cashes in 1 eurodollar while the other side leaves the negotiation table empty-handed can occur, since the unlucky negotiator is assumed to be indifferent to the lack of a reward and the failure of negotiations. The "fair solution," in the absence of any power imbalance or neediness of a negotiator, is a 50:50 deal that splits the eurodollar into equal shares.

In many bargaining situations, actors demand a disproportional division of the spoils. The other negotiators then have to judge whether a credible claim that negotiations would fail without a concession from the other side supports the request. If they reject this demand, bargaining stops or is interrupted. Another suboptimal outcome materializes when negotiators accept a disproportional division and fail to call the bluff by the other side that the negotiations would break down if no concession were granted. The fate of a claim depends on the ability of the negotiators to communicate credibly that their claims are sincere. This creates in return an incentive to bolster the credibility of a specific position through strategic moves.

Social scientists who try to understand bargaining belong to either one of two camps. The first approach stems largely from social psychology and is, by and large, empirical. It tries to assess the importance of cognitive failures and other psychological features based on the performance of individual negotiators. In political science, the strategic theory of bargaining, as it was developed by Francis Edgeworth, Arthur Bowley, Frederik Zeuthen, and John Nash, is more influential as it takes into account that negotiation outcomes result from the interaction of at least two forward-looking actors. Technically, the strategic theory of bargaining is based on game theory. Its applications pertain to any subfield within political science and cover a wide variety of issues, ranging from the analysis of interstate war to delegation problems in public bureaucracies.

Bargaining games are answers to what is known as the "bargaining problem": Is it possible to predict the equilibrium outcome of a social negotiation in which all participating actors expect an individual gain? It took the genius of Nobel Prize winner John F. Nash to predict a unique equilibrium—that is, a single point—to the bargaining problem. In the Nash bargaining solution (NBS), this outcome represents the maximal product of the differences between the utility a negotiator attaches to his or her share x and the utility of the reservation price q.

By way of illustration, imagine a bilateral bargain in which the reservation price of two equally skilful negotiators is 0 so that actor i receives x and its counterpart j receives $1 - x = y$. We obtain the equilibrium prediction through the maximization of the Nash product $x(1 - x)$. Setting the differenced equation to zero ($1 - 2x = 0$), $x = 1/2$ and $y = 1/2$ result. A power-free bargain situation entices, in other words, a fair division.

As bargaining power has many facets, it can enter the calculus of the social outcome in various ways. One possibility is to equate power with capabilities c_i that enter as an exponential weight the utility function of the individual actor, where the sum of the capabilities add up to 1 within a society. Hence, if negotiator i is twice as powerful as counterpart j, the maximization problem in the bilateral case reduces to $x^2(1 - x)$. Differentiating $x^2 - x^3$ and setting the result to zero, we receive $2x - 3x^2 = 0$. If we disregard the outcome $x = 0$, actor i's share amounts to 2/3.

A further aspect of power at the center of the strategic theory of bargaining stems from the attractiveness of a so-called outside option. This outcome is equivalent to what an individual negotiator could reach if the negotiations fail or if they are stalled for some time. Another Nobel Prize winner, Thomas Schelling, made this point through the counterintuitive "paradox of weakness," according to which the less flexible negotiator possesses a bargaining advantage. Generally, the presence of an attractive outside option helps negotiators in their attempt to commit themselves credibly to a more beneficial bargaining position. Robert D. Putnam has used this insight in his "two-level games" metaphor, which stands for negotiations between governments that have to care about domestic pivot players. In such negotiations, governments who face a strong, isolationist opposition and a supramajoritarian ratification hurdle back home can convince a more cooperation-minded negotiation partner that only a minimal agreement is feasible. The commitment of such constrained governments is more credible precisely because they cannot get an agreement ratified that does not find the support of certain sections of the opposition. A treaty that is too close to the bargaining position of the foreign government is consequently doomed to fail in the negotiations or at the ratification stage.

The "Schelling conjecture" that the seemingly weak is in real life the strong actor can be illustrated within the NBS framework through the assumption that one of the actors can be committed to a disagreement point of 0.5 in the bargain over a pie of unit size. This credible claim lets the "zone of agreement" shrink and alters the maximization problem to $(x - 0.5)(1 - x)$, which leads after differentiation to a division of $x = 0.75$ and $y = 0.25$.

Criticisms of the NBS deal with its static nature, its axiomatic foundations, and its reliance on cooperative game theory. The first objection answers to the observation that most (but not all) negotiations consist of lengthy haggling. The second and the third of the perceived problems respond to the general criteria (axioms) that a bargaining solution has, in Nash's view, to fulfill in order to qualify as a socially rational outcome of a negotiation. His model, in particular, assumes in line with cooperative game theory that the negotiators agree on certain rules of the game and do not try to outsmart each other through unilateral moves.

A response to these objections is the development of noncooperative bargaining models that are dynamic and include relevant one-sided actions. Noncooperative bargaining models also often study the impact of information deficits on the bargaining outcomes. The most prominent analytical framework that assumes, in its most basic form, fully informed actors is the Ståhl-Rubinstein bargaining model. This sequential game introduces a strict bargaining *protocol* (a term standing for the order in which the actors are allowed to move) where the right to make an offer moves back and forth between two players. One version of this analytical framework assumes that actors discount the future with the factor δ_i ($0 < \delta_i \leq 1$). Hence, the longer the bargaining goes on, the less attractive it becomes. The model predicts again a unique outcome that is largely driven by the size of the discount parameters and hence by the patience of the negotiators. In general, the more patient an actor is, the larger is the share of the pie that she or he can bring home. If the intervals between the negotiation rounds converge toward zero, the Ståhl-Rubinstein bargaining model coincides with NBS.

The Ståhl-Rubinstein framework of analysis has been extended to negotiations among n actors. To make sensible equilibrium predictions in such a context, some additional assumptions about the bargaining protocol and the feasibility of certain strategies are necessary. The Baron-Ferejohn model of legislative bargaining, for instance, assumes that one member of parliament is randomly recognized as an agenda setter who can make equilibrium proposals to a majority of other legislators.

Generalizations of Schelling's insight that credible commitments are a key prerequisite to bargaining success incorporate models in which some negotiators are assumed to be imperfectly informed. Such "asymmetric information" pertains in the bargaining context most often to the credibility of a negotiator's claim that an outside option is more attractive than the proposal made by the badly informed negotiator. The better informed side tries in such a situation to improve the credibility of its claim through what is called "costly signals"; this is why such bargaining games belong to the category of "signaling games." In an interstate crisis, for instance, a costly signal can consist of a public warning or the mobilization of the troops. Signaling games have been successfully developed to understand conventional and nuclear deterrence; crisis behavior of this sort belongs to what is known as tacit bargaining, where actors use nonverbal means of communication to bolster their claims for a specific division of the spoils. The disadvantage of limited-information models, as games with asymmetric information are also called, is the plethora of possible equilibrium solutions. Oddly, this oversupply of predictions can only be trimmed down at the cost of asking the model agents to behave even more rationally.

The empirical evidence in favor of the equilibrium predictions that can be derived from bargaining models is mixed. In comparison with other decision-making modes such as voting or delegation, bargaining models predict outcomes more accurately. However, the extreme 100/0 division that some bargaining games suggest as a rational strategy hardly finds any support. Both laboratory and field experiments have shown that privileged negotiators often propose fair divisions against their own self-interest. The theoretical merit of these findings remains, however, controversial, although some powerful causal mechanisms that account for such seemingly irrational behavior have been proposed.

Behavioralism

The behavioral approach may be characterized as an attempt to conduct political science according to the example of the natural sciences—that is to describe, explain, and predict political phenomena as exactly as possible. It is the goal of behavioralism to gain scientifically valid—that is, methodically secured—generalizations on its subject. This method is not unique to the field of the social sciences; this application of the natural sciences to political science must be interpreted as being a part of a greater movement of which—despite great changes—all social sciences have become a part. From this point of view, behavioralism is a phenomenon of general social scientific empiricism that has found and still finds many supporters particularly in the United States. This entry reviews the beginnings of behavioralism and its evolution in the mid-20th century as a movement that reshaped the discipline of political science. It traces its emphasis on explanation, prediction, verifiability, and quantitative research and its growing influence in academic institutions as well as professional organizations. The entry concludes with a discussion of the goals and methodological assumptions that characterize the behavioral approach in political science.

Origins of Behavioralism

Although behavioralism as a trend began primarily after World War II, there are important predecessors in the context of American political science that paved its way. Beginning in the 1920s, the Chicago School and the New Science of Politics movement urged a greater use of empirical research to establish a scientific identity to the discipline. Charles E. Merriam, a leading figure in political science during those years, and Harold D. Lasswell, with his decades of work in the interdisciplinary area of policy studies, were key figures in those times; without their work, political science may well have taken a different course. Early behavioralist considerations developed in the 1920s as a reaction to the then predominant institutionalist approach, which was called "institutional realism," "realistic institutionalism," or simply "realism." The realist approach focuses on the analysis of the *actual* relations (in contrast to relations as legally defined) between different government institutions, political parties, and interest groups. In general, the traditional political-scientific analysis of political institutions aimed less at the development of theories than at finding facts. A strict distinction between factual claims and value judgments was an exception rather than the rule.

Originally, behavioralism was a protest movement due to dissatisfaction with traditional political science. The latter—in contrast to its neighboring sciences of sociology and economics—was accused of being characterized neither by cumulative research nor by reasonable scientific communication or even scientific cooperation. This flaw, it was stated, was among others due to political scientists having no common language, no common issues, and no agreement on methods. This was explained by the lack of comprehensive, generally accepted models or terminology schemes of the political process by which research was guided (David Easton, 1969).

This protest was initiated primarily by younger scientists who came from very different intellectual approaches and who were initially rather isolated, since they worked in different fields of political science. Protest was nourished by the experience of increased cooperation between political scientists and government institutions following the New Deal and, most of all, during World War II, when contact with representatives of the other social sciences had also increased. One result of this increased interaction between political scientists and politicians was the painful insight that there was an almost insurmountable difference between what was needed for political advice and what political science could offer. This difference between theory and praxis was not as strong in the neighboring disciplines, particularly psychology and economics, and, to a lesser extent, in sociology. In any case, government institutions were much less interested in advice from political scientists than from economists, psychologists, and sociologists, whose theoretical orientation and methodological basis were generally held in higher esteem than that of political scientists. In this context, the inability of traditional political science to predict events was particularly criticized.

The inability of traditional political science to predict and explain the rise of fascism in Europe was another reason for the dissatisfaction of behavioral-oriented young scientists. But fascism, particularly national socialism, also influenced the rise of behavioralism in another way: in the subliminal reorientation of the philosophy of science in American social sciences, influenced by emigrated European researchers. The popularization of Max Weber by Talcott Parsons and the publication of some of Weber's science-theoretical essays by Hans Gerth and C. Wright Mills (1946) were significant because they left out some of the pragmatist philosophical traditions. With many later behavioralists, the pragmatic philosophy, stating that value statements can be validated by practice, which was then predominant in the United States, was replaced by Weber's position that value statements cannot be proven by empirical means.

Another reason for the rise of behavioralism seems to be the changed international situation after 1945 and particularly the leading political role played by the United States in the postwar period. Increasing international interdependence, decolonization, and finally the Cold War confronted the political-scientific disciplines of international politics and comparative politics with tasks that could not be solved using traditional concepts such as diplomatic history, international law, and the comparison of institutions. Dissatisfaction with traditional political science was strongly supported by the exemplary effect of some social-psychological and sociological publications such as *The People's Choice* (1944), *The American Soldier* (1949), and *The Authoritarian Personality* (1950), where the empirical methods of random sampling, the questionnaire, and attitude analysis or panel analysis were employed and techniques of statistical evaluation were used to answer scientific questions. These methods previously seemed to have been reserved for economics and psychological diagnostics. These studies somehow served as signposts for a successful political-scientific behavioral research as it was imagined by early behavioralists.

It was predominantly the younger political scientists who in the early 1950s became fierce critics of the realist approach, most of all Easton. In several programmatic publications, reaching back as far as the early 1950s, he criticized the theoretical deficit of realist research, the lack of methodological reflection and terminological clarity, the absence of modern methods of data collection and analysis, and the one-sided emphasis on institutional aspects.

Realigning the Discipline of Political Science

In the beginning, the supporters of behavioralism were a small, scattered group of lonely fighters who were not bound together by any kind of organization and who felt connected to each other only by their way of understanding science. They met at seminars and in the context of conventions of the American Political Science Association (APSA) to discuss new methods of empirical research in politics. It was their goal to readjust the entire discipline of political science according to the criteria of behavioralism, not simply to add another subdiscipline. It is not surprising that such a demand for a fundamental readjustment of political science was strictly opposed by many established political scientists who met the new methods and theoretical perspectives with a lack of appreciation and even reacted with open dislike. As Dwight Waldo (1975) and Jürgen W. Falter (2001) have described, this resulted in the first phase of the so-called behavioralism controversy.

Behavioralism has been characterized by its interpreters and proponents as a "movement," as a "mood," a "conviction," and a "protest," as well as a "revolution" and a "renaissance." Easton distinguished between an intellectual trend and an academic movement; the former, he stated, had many more supporters than the latter. However, he said that it was difficult to identify both the supporters of the movement and the practitioners of the intellectual trend, because membership criteria were vague and the borders of the behavioralist conviction were unclear. In particular, he stated that it was almost impossible to distinguish "true" members of the movement, fellow travelers, and occasional sympathizers from each other.

Easton argued that behavioralism did not show any formal organization as a movement. Although there had been short-term plans in this direction, efforts to bring the movement together had not been very fruitful. On the other hand, there had always been a feeling of being loosely connected and an agreement on basic assumptions and scientific ideals, as well as lively mutual communication. Also, certain spokespeople of the movement had always been accepted by the scientific community. The success of behavioralism, he stated, was due not only to its effective leaders, its capable supporters, and the exemplary effect of important publications but also to a number of favorable conditions. In addition to the funding policies of the great foundations, the significance of the fact that the Social Science Research Council and its committees provided the behavioral movement with organizational vehicles for the development of American political science cannot be overemphasized.

Growing Institutional Influence

In the 1950s and the early 1960s, the increase in numbers of supporters of the behavioral approach seemed unstoppable. It experienced early, important success, as Harold D. Lasswell, perhaps the most important intellectual pioneer of behavioralism, was elected president of the APSA in 1955–1956. His successor, V. O. Key Jr., who was president in 1957–1958, was a behavioralist as well. Under their presidencies, for the first time, the APSA established a special team dealing with questions of political behavior. The number of behavioral-oriented teams at APSA meetings grew considerably until 1960. The rise of behavioralism became manifest in a dramatic rise of research papers after 1960. Soon there was no longer any subfield of political science without behavioral-oriented studies, although naturally the extent to which behavioral thought penetrated the various subfields varied greatly. The focus of research was the analysis of decision-making processes and patterns of behavior. The individual served as a basis for collecting data, and the individual actor, the group, the institution, or even the political system in its entirety, was the subject on which statements were made. The core concepts of behavioral research took shape mainly in the work by Herbert Simon on political decision making, Heinz Eulau on roles, David Truman on interest groups, David Easton on the political system, Harold Lasswell and Abraham Kaplan on the concept of power, and others. Political-scientific research now focused on theoretical concepts rather than on the analysis of everyday politics as the realists had preferred.

From about 1960 on, a number of important research papers based on the model of behavioralism were published, among them *The American Voter* by Angus Campbell and Philip E. Converse (1960), *The Civic Culture* by Gabriel Almond and Sidney Verba (1963), and Karl Wolfgang Deutsch's *The Nerves of Government* (published in German in 1963). In addition to studies on elections developed at Columbia University and the University of Michigan (*Voting* and *The Voter Decides*), several programmatic and empirical studies were published that were targeted at fundamentally restructuring the subfields of comparative politics and international relations. After 1956, the profile of the *American Political Science Review* also changed drastically, indicating a gradual change in the discipline. Clearly, the quantitative element was gaining ground. Now, almost all American universities appointed behavioralists to their departments of political science, which triggered off a kind of chain reaction, further supporting the spread of the behavioral conviction. Studies written in the spirit of behavioralism started to dominate the appearance of the most important scientific magazines in the United States. With just a few exceptions, for a number of years after 1964, almost all APSA presidents came from the behavioral movement or were at least related to it. In the course of only 1½ decades, behavioralism had succeeded in fundamentally changing political science in the United States.

In the course of the second phase of the struggle of the behavioral research program, following the students' revolt of the 1960s, a strongly application-oriented dimension was added to behavioral political science. In this, policy studies tried to combine a strictly scientific way of proceeding with practical relevance in order to provide political advice. Although it has often been declared dead, the behavioral research program is still alive, and contemporary scientists working quantitatively and empirically would call themselves behavioralists.

There has always been a fundamental difference between empirical and theoretical behavioralism. Both were based on the same philosophy of science—that is, logical empiricism. However, they deal with different questions and use different theoretical analysis units. Whereas a great part of empirical research earlier referred to and still refers to explaining individual behavior, theory-oriented behavioralism was mainly interested in the political system. Both kinds of behavioralism turned against philosophically normative, purely institutionalist, or social criticism–oriented approaches of political science. As Falter (1982) notes, a bitter behavioralist struggle in American political science resulted, from which, however, the behavioral research discipline survived relatively unscathed.

Goals and Methodological Assumptions

In this section, the 10 most important goals and methodological assumptions of behavioralism are summarized and commented on. This catalog of behavioral principles tries to comprehensively explain the common core of the various behavioral trends in the context of political science, as far as it is possible to bring the variety of approaches together.

The Need for Theory

The goal of behavioralist political science is not merely to describe political processes but also to explain and predict them. In this context, theory is seen as guiding the selection of research topics and the description and integration of empirical findings.

Looking for Regularities

According to the behavioral basic assumption, one must reach back to law statements in order to be able to explain and predict political processes. One pragmatic precondition for the search for regularities is the assumption that social and political processes are subject to such laws. However, with its search for laws, behavioralism does not restrict itself to empirical generalizations but tries to go as far as possible to theoretical statements. This makes it different from the classical and radical behaviorism of John Watson and B. F. Skinner with which—erroneously—it is often equated. This, at first, only a verbal equation, which, however, is often supposed to disqualify behavioralism as being "positivist" and thus out-of-date, blurs important, fundamental differences between the two trends. Behavioralism, which indeed is also an analysis of behavior using empirical and quantifying methods, goes far beyond the purely descriptive recording and generalization of behavior. Psychological behavioralism, being a theory-guided empiricism, (a) looks primarily for explanations and not for empirical generalizations and (b) includes intervening variables moderating between stimulation and reaction, for example, cognitive consciousness processes, in the form of theoretical constructions, in its analysis. Thus, in contrast to purely empirical generalizations, the theoretical statements of behavioralism deal not only with processes that could be directly observed but also with dispositional factors such as personality traits and attitudes that by empirical means can only be described indirectly—that is, with the help of indicators. These latent dimensions, which cannot be directly observed, are described with the help of theoretical concepts—that is, by so-called constructs. An example of such a theoretical construct is the concept of identification with a political party. Theoretical constructs are connected by definitions and lawlike statements. These theoretical concepts are connected to the observation level by so-called correspondence rules, which make the empirical evaluation of a theory possible. According to the behavioral opinion, all theoretical concepts must be operationalized (or rather be operationalizable).

Striving for Verifiability and Objectivity

It is typical for science, in the behavioral sense, that all statements must be verifiable. From the empirical point of view, statements are verifiable only if they either immediately refer to observable facts or can at least be based on statements formulated in the observational language. In contrast to the analytical philosophy of science, which only demands that statements must be (at least indirectly) observable or that they can be falsified, behavioralism still follows the verification principle of neo-positivism. For it, sentences that cannot be verified must be excluded from the scientific canon. To meet the criterion of verifiability, the measurements of the empirical researcher must be as objective as possible—that is, independent of the individual scientist. Objective research results are characterized by the possibility of their being repeated by other scientists under the same circumstances. To be verifiable, the applied research tools must provide reliable measured values. A measurement tool is reliable if it produces the same results in the case of repeated measurement of the same events, with a certain leeway for mistakes that must be as small as possible. This way, however, one does not know if a reliable measurement tool, for example, a scale, really measures that what is supposed to be measured. For this reason, measurements must not only be formally reliable but also topically valid. In this context, the formal exactness of measurement is a necessary but not sufficient condition for the topical exactness of measurement. To guarantee the verifiability or more generally the meaningfulness of its results, empirical research must also argue in a way that is without logical contradictions, that explicitly defines its terms and uses them consistently, and that excludes all concepts from the scientific language that do not refer to empirical facts.

Elaborated Research Techniques

Empirical social research employs a number of tools for data collection and data evaluation. These include various methods of attitude measurement, techniques such as the interview, the methods of quantitative topical analysis, and standardized observation schemes. Among the most important research techniques of empirical political science are various random sample procedures. Statistical methods of evaluation include regression analysis, variance and covariance analysis, as well as factor and path analysis, among others. It is the goal of the statistical methods of evaluation to cope with extensive amounts of data, to determine connections between analyzed variables, and to determine the degree of safety by which the measured connections can be accepted. In this context, the use of constantly improved, refined research techniques is not an end in itself but a means to meet the previously described quality criteria of research.

The Trend Toward Quantification

Inevitably, the demand that measurement results must be as exact as possible results in the attempt to make data collection and data evaluation as precise and standardized as possible. In this way, the tendency toward verifiability and comparability of statements is increased. According to its own statement, the call for quantification is not meant as a dogmatic demand but as a useful goal to strive for where it is reasonable for the object. Other goals, such as the theoretical and practical relevance of research results, are not supposed to retreat. Often—and sometimes with justification—the opponents of behavioralism object that its most important characteristic is its quest for maximum quantification while often losing focus on the subject under analysis.

Focusing on Individual Behavior

According to the behavioral point of view, all statements must be referred to as observable behavior. On rare occasions, the behavioral concept of behavior also refers to small groups. However, the behavioral concept of behavior is very comprehensive and includes both acts of behavior in the stricter sense and the expression of attitudes, intended behavior, or values as they are collected by using questionnaires or scales. If at the beginning of the behavioral movement, its spokespeople assumed that empirical and theoretical analysis units could be made to coincide—that is, the levels of observation and statement match—soon this behavioral-psychological remnant was abandoned. Political science deals also with groups, associations, and institutions that cannot be excluded from the field of political science just to meet a methodological demand. Otherwise, behavioral political science would actually have been reduced to the social psychology of the political behavior of individuals, as is often claimed by its critics.

Inductivism

Another typical feature of behavioral research activity is its inductive way of proceeding. Usually, research happens by observing empirical regularities—for example, that Catholics on the European continent vote for conservative parties more often than Protestants do. These empirical regularities are conceptually expressed by way of law statements. Also, theoretical constructions are definitely used—for example, that of the dogmatic personality. According to the behavioral point of view, these theoretical constructions, which are employed to explain and predict political behavior, must always be directly operationalized, which, however, is not at all necessary according to the point of view of the analytical philosophy of science. Thus, they stay comparatively close to the empirical surface, which might be one of the reasons why behavioralist theses are comparatively less fruitful, which, however, in this respect is hardly different from the theories of its neighboring sciences of sociology and social psychology. What exist in rich quantities are empirical single results and culture-specific generalizations, which, however, are comparatively unconnected.

Value Relativism

The behavioral position and the philosophy of science share the opinion that it is not possible to give reasons for value judgments with the help of empirical methods alone. Only cognitive statements can be empirically verified—that is, statements on the world as it is or, rather, as it appears to the scientist, but not statements on what the world should be like or how the scientist would like it to be. Thus, according to the behavioral opinion, value judgments are not capable of truth: They cannot be inferred from statements on facts. According to Arnold Brecht, between *is* and *ought* there is a gap that cannot logically be bridged and that makes it impossible for the scientist to present value judgments as a result of his or her research. Value positions that are included into empirical statements will distort the results of research. Thus, the individual scientist must try to neutralize his or her value tendencies and prejudices. This is why empirical science follows the ideal of impartiality in this sense, although it is in some way like the "Blue Flower" for scientists—a goal that they will never fully achieve. Even according to behavioral opinion, the individual will always be somewhat a prisoner of his or her value preferences.

Giving up on empirically reasoned value judgments does not rule out that values might be empirically analyzed as dependent or independent variables. Furthermore, according to Immanuel Kant, empirical political science is capable of analyzing systems of value preferences in respect of their consequences as well as of showing inconsistencies and incompatibilities, of researching the conditions for their realization, and of giving technological recommendations in the form of hypothetical imperatives.

Orientation Toward Basic Knowledge

The use of scientific insights for the realization of societal goals is possible only if there is a sufficient amount of basic knowledge. But even today this is not the case with most subfields of political science. Even after approximately 60 years of behavioral-oriented research, sufficiently confirmed theories are rather an exception. On the other hand, application-oriented research contributes little to the growth of scientific basic knowledge. To be able to make sound predictions, according to the behavioral program, there must be knowledge of behavioral regularities as well as theories using general terms, among others. The technological application of scientific insights depends on the existence of a knowledge stock that must be worked out by way of basic scientific orientation. That is why (at least originally) behavioralism supports a program of "true science," although as a consequence of Easton's postbehavioral revolution we observe that, in this respect, points of view are not so strict anymore. Today, many younger researchers, who nevertheless are definitely connected to behavioralism in respect of their research techniques, try to combine theoretical and practical relevance, most of all in the field of policy studies.

Integration and Interdisciplinarity

For its efforts to work out a secured and growing knowledge stock, political science must reach back to the concepts, procedures, and results of other social sciences. According to the behavioral opinion, politics include only one field of the social; personality traits in the widest sense may be as significant for political behavior as social or economic facts. It is necessary to reach back to data collection and evaluation techniques of other social sciences because there are only a few empirical methods developed by political science itself. Almost all the research techniques used by it are takeovers or modifications of sociological, social-psychological, economic, or individual-psychological methods and give reason to the demand for an interdisciplinary approach and the integration of research results.

The Lasting Influence of Behavioralism

Even if few political scientists today consider themselves behavioralists in the stricter sense, it is a fact that at first American political science and later international political science have been characterized and penetrated by behavioralism to such an extent that in Thomas Kuhn's sense—with a grain of salt—we may speak of a scientific turnaround whose heuristic possibilities do not seem to be exhausted at all even after 60 years. It is an achievement of the behavioral revolt that today empirical-quantitative studies are a matter of course. As for the methodical-statistical refinement of analysis, for a long time empirical political science has been acting at the same level as its neighboring disciplines. The bitter quarrels between doctrines from the 1950s to the 1970s have been replaced by a peaceful coexistence of many approaches and theoretical positions. In so far, Robert Dahl proved to have almost prophetic qualities when he subtitled a 1961 article with an early obituary for behavioralism, "Epitaph for a Monument to a Successful Protest."

BELIEFS

Political beliefs can be defined as individual psychological orientations toward objects of a cognitive nature in the political world (e.g., polities, institutions, actors) that consist of the perceived likelihood of a given attribute being attached to them. Therefore, a political belief has three basic components: an object, an attribute, and the perceived subjective probability that the object and the attribute go together. However, as with other concepts such as values or attitudes, political beliefs are hard to define properly, having been subject to different and even contradictory uses. Furthermore, any survey of the literature will show how political beliefs are measured in different and often imprecise ways. It is, thus, a concept still "open" to full discussion, or, as Imre Lakatos would have put it, it is a concept still in the "morphological phase." Therefore, this entry first reviews the main uses and definitions of the concept found in the literature to appropriately frame the definition advanced above. This concept of beliefs is then discussed in the wider context of belief systems.

Conceptual Problems

Generally, one can think of political beliefs as individual orientations toward politics, related to other similar concepts such as political values and political attitudes. But the terminological jungle that comes along with these concepts makes it very hard to make sense of such a definition; as William J. McGuire has stated, we find ourselves with a set of names in search of a distinction rather than with a distinction in search of a terminology, making the situation rather complicated and blurry. An often implicit assumption is that these concepts (beliefs, values, and attitudes) can be placed on an underlying continuum ranging from the most basic or abstract to the most specific. The most abstract ones would therefore be the filters through which citizens form their more specific orientations. However, this continuum is often defined by the opposition between attitudes and values. Values are commonly placed on the top of the scale, at the highest level of generality or abstraction, and attitudes are conceptualized as being more specific. But the place of political beliefs within this framework is not so clear. A review of the uses of the concept shows that there is deep controversy over how to locate political beliefs within this context. Indeed, on one hand are scholars who quasi automatically equate political beliefs with values and use both terms almost interchangeably, such as Stanley Feldman, who treats "core" beliefs as roughly equivalent to political values. On the other extreme, there are many scholars who consider beliefs as the more specific components of attitudes. In this latter framework, attitudes are conceptualized as summary evaluations made of opinions and beliefs, and therefore, beliefs would be placed at a lower level of generality or abstraction.

This controversy often passes unnoticed because most scholars simply do not pay attention to the definitional issue. Nevertheless, the extremely divergent uses of the concept must lead us to conclude that the placement of the concept in a latent (undefined) scale is not the appropriate path to follow if we aim at analytical precision. There is no clear consensus on where to place beliefs in such a scale and, therefore, its usefulness is extremely limited. We thus turn our attention to other attempts that are more analytically oriented.

These contributions are to be found especially in the field of social psychology. Martin Fishbein and Icek Ajzen advanced perhaps the clearest definition of *beliefs*: They define the term as the perceived likelihood, or the subjective probability, that an object has a specific attribute or characteristic associated with it. Therefore, political beliefs would be presented only by statements of the following nature: "The government is efficient," "The government is responsive," "The judiciary system is fair," or "Health care is free for all," and so on. These are cognitive thoughts and ideas that subjectively link specific attributes to political objects. Additionally, as stated by Oskar Niedermayer and Bettina Westle, beliefs can differ in strength, certainty, and subjective relevance or salience. Thus, they should be measured on a single dimension of subjective probability of an object–attribute relationship (i.e., how likely or certain it is that object *X* has the attribute *Y*), commonly through the degree of agreement or support to a given statement that must be both object and attribute specific.

This conceptual framework allows for a clearer conceptualization of the term, and it lays the ground for a distinction between beliefs and attitudes. Beliefs are primarily of a cognitive nature, while attitudes are evaluative. As Lester Milbrath states, beliefs are cognitions with a feeling of credulity attached to them. In other words, a belief contains a cognitive component of an object (it has to be known for the belief to exist) linked to "credible (believable) or incredible (unbelievable)" features of that specific object. In this sense, beliefs are distinct from values and attitudes, since the latter imply the attachment of a feeling of valence (like/dislike) to the cognition rather than to credulity. (In Milbrath's scheme, both beliefs and attitudes have a cognitive dimension since one can only believe or evaluate known objects.) Both feelings, Milbrath insists, are interrelated (i.e., we tend to believe what we like), but at the same time, they are different (we can believe things that we dislike and vice versa). In any case, the argument is the same: Beliefs are based on the perceived probability that an object has a given feature associated with it. An implication of this conceptualization is that beliefs can often be falsified with external, objective criteria, while this is not the case for attitudes and values.

However, as Stuart Oskamp notes, this way of conceptualizing beliefs and attitudes raises the problem of the status of the so-called evaluative beliefs that combine the perceived likelihood of having a given attribute on one hand, and an evaluation on the other (e.g., "The government is inefficient," "The authorities are responsive," or "The political system is democratic"). This is so because the attributes being believed or disbelieved have a clear and widely shared positive or negative implication. Even if these statements are syntactically nonevaluative, since they refer to the likelihood of an attribute being attached to an object, semantically they are clearly evaluative orientations. This ambivalence makes evaluative beliefs almost indistinguishable from attitudes. Evaluative beliefs might be considered as an intermediate category, but what they reveal is indeed a continuum that ranges from the most objective (and falsifiable) beliefs to the most evaluative ones.

The inability to distinguish beliefs from attitudes in this kind of literature points again to a serious flaw in conceptualization. As noted above, any meaningful definition of beliefs must, at least, allow us to separate them from political attitudes. Scholars using this theoretical framework try to resolve this problem by going back to the same kind of scale of generality or abstraction: Attitudes are considered to be generalized and enduring evaluations of an object, while beliefs are singular and specific statements (evaluative or not) that refer to particular characteristics of the object. Therefore, most scholars of this framework consider that a person's attitude toward an object can be thought of as a summary of his or her evaluative beliefs. For example, the overall evaluation of the political system would be an attitude, while the evaluation of each of its specific features (responsiveness, efficacy, transparency, etc.) would, within this framework, be thought of as a belief.

There is an additional empirical problem in this conceptualization: Cognitive beliefs are the foundations for evaluative attitudes and, therefore, we must expect a close empirical relationship among them. However, this relationship is not present in many instances. Scholars justify this lack of empirical evidence by saying that cognitive orientations and evaluative attitudes may not be empirically related. However, attitudes made up of summary evaluations must show—at least partially—*some* congruence with the set of beliefs that produces such general evaluations. Without such an empirical congruence, therefore, we should not think of those attitudes as summarizing a set of beliefs.

Ideology and Political Beliefs: The Belief-Systems Debate

Despite the relevance of the preceding definitional discussion, we must acknowledge that the core debate in political science on political beliefs has basically revolved around the concept of belief systems—their nature, structure, and internal consistency. This debate was originated by Philip Converse's seminal work *The Nature of Belief Systems in Mass Publics*. The following section briefly reviews the concept and the terms of the debate, which has been both conceptual and empirical.

The key concept is political belief systems. In Converse's framework, belief systems are coherent structures of "attitudes and ideas" whose components are logically organized. The internal coherence of belief systems stems from political ideology—mainly in terms of left-right ideology. Ideology, therefore, consists of an overarching set of integrated principles about politics and the social world from which specific beliefs are deductively derived. This concept was meant to overcome the limits of the term *ideology*, since its multiple (and often contradictory) uses and its normative overtones made it of limited utility for research. How do belief systems acquire their structure and eventually their internal coherence? Converse's perspective, which has its foundation in physics, implicitly assumes randomness to be, somehow, the natural condition of things. This underlying assumption implies that whenever we find a given structure in citizens' political beliefs, we must look for an external force, which, in his framework, is called a "constraint."

What are these external forces, or constraints? Converse discusses two types of constraints: the social and the psychological. However, his focus, and the focus of the literature following him, has been disproportionately placed on the first one. A social constraint for the political belief system comes from the dominant role of political elites, who "package" attitudes and beliefs in coherent structures for consumption by the public, as expressed by Stanley Feldman. These packages are often referred to as "political ideology." The psychological constraints are based on the role of superior convictions concerning humans and society that bind together more specific orientations, such as attitudes and beliefs. In other words, Converse is referring to what has otherwise been called "values" or, in Stanley Feldman's terminology, "core beliefs." Therefore, the ideological structure of mass belief systems (in terms of left-right opposition) might be thought of as a "social" or elite-driven constraint, while the alternative perspective of values and core beliefs, or even non-political normative judgments, may fall under an alternative psychological constraint.

The actual structure (or lack of structure) of citizen belief systems, as well as its main determinants, has also been the subject of an enduring controversy. The empirical findings to test this theory have displayed very little consistency across time and across issues or beliefs. Only a reduced segment of the publics (the so-called ideologues) shows a coherent pattern of beliefs congruent with the basic left-right ideological scheme. This low interitem congruence and overtime stability may signify a limited political understanding of citizens in ideological terms, but it could also be an artifact or measurement error. Furthermore, Converse himself has shown that party identification is substantially more stable over time than ideological self-positioning.

More recent research has led to new reviews of Converse's findings. For example, John Zaller has shown in *The Nature and Origins of Public Opinion* how citizens' beliefs and attitudes are changed and polarized according to political elites' discourses even within the group of citizens in which ideologies are not structured and coherent belief systems are not dominant. Additionally, comparative research has shown how the extent to which citizens hold ideologically structured belief systems also depends on some contextual features, such as the political party system, the structure of party competition, and the electoral system.

BILATERALISM

Bilateralism refers to any relationship between two parties. In the study of international relations, we normally think of bilateralism as referring to relations between two states. But this is an overly narrow definition. Bilateralism can denote an arrangement between two private companies—economists, for instance, write of a "bilateral monopoly" where there is effectively only one seller and one purchaser in a market. Alternatively, bilateralism can involve two nongovernmental organizations (NGOs), two intergovernmental organizations, or any two-party combination of these actors (including states). For instance, a bilateral agreement is negotiated when an intergovernmental organization, such as the United Nations Children's Fund (UNICEF), commissions a local NGO to manage a project for it.

The term *bilateralism* is also used to refer to a strategy of how relations are conducted; it denotes an approach that prioritizes reaching agreement with one other party rather than acting by oneself (unilateralism) or together with two or more other parties (multilateralism). It is also differentiated from regionalism, where relations are conducted with two or more other parties within the same geographical area. Bilateralism need not involve geographical proximity—an instance is the U.S. free trade agreement with Bahrain.

The vast majority of treaties between states are of a bilateral character. These cover the full range of diplomacy, including agreements on extradition, overseas development assistance, cultural and educational exchanges, aviation, double taxation, cooperation on criminal and terrorism issues, the exchange of nuclear materials, postal services, visa requirements, mutual acceptance of domestic standards, cooperation on meteorological services and space exploration, as well as defense, investment, and trade issues. It is in the areas of investment and particularly trade that strategies of bilateralism have become most controversial in recent years: The focus in the remainder of this entry is on these areas.

Bilateralism has been the dominant form of international trade agreement since the start of international commerce. Such treaties have a history as long as that of international trade itself—the first known bilateral trade agreement was between Egypt and Babylonia, dating to 2500 BCE. As international commerce expanded, so did the number of bilateral trade treaties multiply, driven first by the establishment of the great maritime empires of the 16th and 17th centuries and then by the Industrial Revolution in the 18th and 19th centuries.

These bilateral agreements customarily assumed the form of a treaty of friendship, commerce, and navigation, which typically outlined the terms under which trade and shipping between the two states would take place and the rights enjoyed by individuals and firms from one state who lived, conducted business, or owned property in the partner state. The treaty also detailed the tariff treatment to be applied to various goods.

In the 19th century, in particular, these bilateral commercial treaties were used not just to protect existing commerce or to establish, on a reciprocal basis, new markets for the two parties but also to impose decidedly unequal arrangements on militarily weaker states. The most notorious examples were the treaties imposed by Britain on Qing Dynasty China after the First Opium War (1839–1842). The Treaty of Nanking opened five ports to British exports, at fixed tariffs to be agreed between the two governments, and ceded Hong Kong to Britain. Other industrializing countries followed suit, the United States, for instance, negotiated a commercial treaty with China in 1884 that was markedly unequal in the concessions made by the two parties.

Although the development of the unconditional most-favored-nation principle by leading European trading states in the 19th century laid a foundation for multilateral commercial treaties, bilateralism remained the norm throughout the interwar period. The decline in commerce following World War I prompted an innovative attempt at multilateral cooperation on trade through the staging of a World Economic Conference in 1927, but the treaty negotiated failed to gain enough signatories to come into effect when countries retreated into protectionism as the depression deepened at the end of the decade. In response to the Great Depression, governments typically sought to negotiate bilateral commercial treaties.

Only with the establishment of the General Agreement on Tariffs and Trade (GATT) in 1947 did a multilateral approach to trade cooperation gain precedence over bilateral treaties. The GATT established rules intended to ensure that countries that agreed to participate in multilateral rounds of tariff reduction negotiations would not be able to act unilaterally to negate the obligations to which they committed. The GATT, however, did permit some exceptions to its rule—that contracting parties must unconditionally provide most-favored-nation status to other parties. It thereby opened the way for bilateral agreements to continue to play a role in the governance of global trade. First, it "grandfathered" existing arrangements between imperial powers and their current and former colonies. Second, it permitted the negotiation of free trade agreements and customs unions. Although the original expectation was that the latter provision would apply primarily to regional arrangements, it has increasingly been used to legitimate bilateral arrangements.

For most of the period between the establishment of GATT and that of its successor, the World Trade Organization, in 1995, multilateralism dominated the governance of international trade. All the major trading powers (the United States, the European Union [EU], and Japan) gave strong support to multilateral liberalization despite domestic resistance to the opening up of "sensitive" sectors. In the 1980s, however, bilateral strategies gained new prominence on two dimensions.

First, with the rapid growth of exports from East Asia that caused problems for domestic manufacturers in North America and Europe, and led to rapidly burgeoning trade imbalances, governments increasingly turned to bilateral agreements (as well as unilateral measures) to alleviate these problems. Most prominent were the actions taken by the U.S. government under Section 301 of the U.S. Trade Act. The 1962 Trade Expansion Act had contained a provision granting the U.S. president authority to impose retaliatory measures when foreign governments were considered to have harmed U.S. trade interests. This measure was substantially strengthened by Section 301 of the 1974 Trade Act, which moved the primary responsibility for action from the president to the U.S. Trade Representative (USTR).

Section 301 provided that in the event of the USTR determining that foreign trade practices were unfair, negotiations should take place, and, if these failed to realize a satisfactory outcome, the United States could then impose restrictions on its partner's exports or withdraw existing concessions. Although the act allowed for unilateral action, the outcome of the Section 301 investigations often took the form of bilateral negotiations. These produced agreements with a number of East Asian and other industrializing economies (most notably Japan, Korea, and Taiwan), under which their governments undertook to limit the volume of exports of specific products (at various times, automobiles, steel, textiles, clothing, and footwear). These arrangements circumvented GATT regulations in that the country responsible for exports "voluntarily" undertook to restrain them. In 1984, the EU implemented a commercial policy regulation that had similar provisions to the U.S. legislation. "Voluntary export restraints" were outlawed by the World Trade Organization (WTO) Treaty: Such bilateral agreements, subsequently, have largely disappeared.

Meanwhile, a new form of bilateralism gained prominence from the mid-1980s: preferential trade agreements (PTAs). As noted above, the GATT exempted parties to free trade areas and customs unions from the requirement of applying for most-favored-nation treatment. In the 1960s, a wave of PTAs had been negotiated by developing economies—but most of them proved ineffective. Among industrialized economies, only the European countries—through the EU and the European Free Trade Association—had pursued regional strategies that led to significant exceptions to the multilateralism of the GATT. The United States and Japan (and other East Asian economies) were enthusiastic supporters of multilateralism. Their attitude began to change—in part because of concerns about the "unfair" trading practices of East Asian economies and about a perceived loss of bargaining power vis-à-vis the EU. The key development that symbolized a U.S. move away from a multilateralism-only strategy was the negotiation of its first bilateral free trade agreement—with Israel—in 1985 (the United States had earlier entered into a bilateral sectoral agreement with Canada—the U.S.–Canada Automotive Products Agreement of 1965—and had introduced a system of trade preferences for Caribbean countries in 1983). The Canada–U.S. Free Trade Agreement followed in 1989; in turn, this was converted into the North American Free Trade Agreement in 1993 with its extension to Mexico.

Other countries quickly followed suit; the consequence was a veritable explosion in the number of bilateral trade agreements in the years after the establishment of the WTO in 1995 (an ironic outcome in that the creation of the WTO had been regarded as a significant advance in multilateralism). The WTO reported that it had been notified of nearly 300 new PTAs between 1995 and 2008; bilateral agreements accounted for more than three quarters of all PTAs notified and in force. Of particular significance in this context was the abandonment by East Asian states of their previous commitment to nondiscrimination. Whereas only one preferential trade agreement was in place in the region in the mid-1990s (the ASEAN Free Trade Agreement), a decade later more than 80 PTAs either were being implemented or were under negotiation.

Several factors contributed to this growth in bilateralism: the slow progress made in global trade negotiations and perceptions that bringing the Doha Round of WTO negotiations to a successful conclusion would be difficult; the growth in regionalism in other parts of the world (especially the enlargement and deepening of cooperation within the EU), which caused a "domino" effect as other countries sought not to be excluded from the new preferential agreements; and the financial crisis in East Asia in 1997–1998 (which led governments to reconsider prevailing orthodoxies on trade policy).

Proponents of the new bilateralism believe that it offers several advantages over regional and multilateral negotiations: In principle, bilateral agreements should be simpler to negotiate given the small number of parties involved; they also afford an opportunity to negotiate "deeper" cooperation than in the WTO and in doing so can construct a model that provides states with an incentive to emulate its provisions at the global level. Critics, on the other hand, argue that such arrangements are inherently discriminatory, cause distortions because partial and discriminatory liberalization can advantage actors who are not the most efficient producers, politicize trade and bring power considerations to the fore (see the "Unequal" treaties of the 19th century or those between Nazi Germany and its Central European neighbors), and divert attention and scarce resources from potentially more beneficial negotiations at the global level.

Biology and Politics

For most of the past century, the so-called standard social science model (SSSM) has been the overwhelmingly dominant paradigm in American political science. As we know, the SSSM holds three tenets to be critical:

1. that humans have no innate behavioral tendencies;
2. that, consequently, human nature and human behavior are solely the products of learning and socialization; and
3. that, consequently, human nature and behavior are essentially malleable.

The launching of the "biology and politics" movement in the mid-1960s by a handful of political scientists was the result of two intellectual convictions they held in common. One was an acute dissatisfaction with the state of the discipline in general and with the hegemonic SSSM in particular; the other was a growing appreciation of the significance for political science of recent advances in the biological sciences—especially in neo-Darwinian evolutionary theory, genetics, psychopharmacology (the demonstrated ability of some drugs to change behavior), primatology, and ethology. The first conviction led to a profound difference with their mainstream colleagues in their understanding of the factors that shape human nature and human political behavior. The second produced equally sharp differences with regard to the proper scope and method of political science research and the third in their respective understanding of what constitutes sound public policy. These three, then, constitute the major points of disagreement between proponents of what is commonly called *biopolitics* and the loyal partisans of the SSSM.

The Wellsprings of Political Behavior

As noted above, the SSSM tenet that culture alone shapes behavior is flatly rejected by those who believe in a "more biologically oriented" political science. Yes, culture is important, they agree, but so are the genetically transmitted behavioral tendencies that our species, as social primates, has evolved over literally millions of years. To ignore or even to slight these is to turn a blind eye to forces that often powerfully influence how we act socially and politically. If the discipline ever hopes to understand and explain political behavior, they insist, both nature and nurture must be given serious attention. That calls, in turn, for some major changes in both the scope of what we study and the methods employed in our research.

Research

Expanding the Scope

The Importance of Genetic Influences

Mainstream political science, to be sure, rejects this idea entirely. From an evolutionary stance, like it or not, there are a number of genetic predispositions that we share with other social primate species. Among the politically most important of these are a proclivity for hierarchical social and political structures characterized by dominance and submission, marked differences of status resulting in unequal access to the good things of life, aggressive behavior (especially among males), xenophobia, and nepotistic favoritism.

Relevance of Primatological Data

According to the SSSM, since behavior is shaped entirely by culture, knowledge of other species, no matter how akin to ours, serves no useful purpose. From a biopolitical viewpoint, however, the study of closely related species—and especially the social primates—can yield valuable clues as to the possible sources of our own behavior. This being the case, careful attention should be given to the other apes and, especially, to the species with which we share some 98% of our genetic material, the chimpanzees.

Better Methods

The study of human behavior from a neo-Darwinian perspective emerged from ethology, a biological discipline guided by the dictum that if we hope to understand how and why an organism acts as it does we must study its actual behavior in its natural setting. This means that while there are many similarities in research methodology between the two approaches there are also some key differences. We will mention only two here:

Survey Research

The strengths and shortcomings of survey research as a means of ascertaining attitudes, possible future behavior, or reporting past actions have already generated an abundant literature, so we will be quite brief. As John Wahlke (1979) argued in his American Political Science Association (APSA) presidential address, survey data, which are necessarily based on self-report and with responses often possibly colored by the framing of the questions, are too often unreliable guides to the respondents' actual political behavior, political beliefs, or the intensity of those beliefs. Accordingly, biopolitics, with its ethologically derived focus on actual behavior, sees surveys, by and large, as a research instrument of reluctant resort.

Experiments

Mainstream political science and biopolitics alike view experiments as a valid means of inquiry. The latter insists, however, that the experiments mirror, to the greatest degree possible, the challenges, problems, and environments that its subject(s) would encounter under real-life conditions. Accordingly, its practitioners are skeptical about the validity of experiments where subjects (often college students, hardly representative of the general population) are placed in a patently artificial setting and asked to perform tasks that lack meaningful consequences.

The Formulation of Public Policy

Not surprisingly, the disagreements on the wellsprings of human behavior, on the need to study closely related species, and on key aspects of research methodology result in markedly dissimilar conceptions of how to best shape public policy. Two of the most important of these are the view that past behavior can guide future behavior and that it is able to be converted into policies.

Past Behavior as a Useful Clue to Future Action

Evolutionary theory assumes that, barring mutation and/or some profound environmental change, the behaviors that a species has evolved and exhibited in the past are likely to remain essentially the same. Thus, as those in biopolitics see the world, when efforts to alter or even prohibit "undesirable" social and political behaviors have consistently failed in the past, similar policies are unlikely to be any more successful in the future. In short, the leopard does not readily change its spots. On the contrary, by believing in the essential malleability of human nature, the SSSM is much more prone to discount past failures. Maybe by better manipulating its environment, we can induce, or even better, compel, the leopard to change its coloration.

Trade-Offs Versus "Solutions"

Evolutionary change almost always entails a trade-off—that is, a price. A massive protective shell or carapace comes at the cost of lessened mobility and greater size requires greater caloric demands; as we have seen with our own species, larger brains carry the cost of more painful and more hazardous childbirth. Given their neo-Darwinian set of mind, those in biopolitics tend to approach public policy problems less in terms of far-reaching "solutions" and more in terms of what is to be gained—and what might possibly be the negative political or social consequences. These are matters almost totally ignored, to take some obvious instances, by the ill-fated Eighteenth Amendment, the futile "War on Drugs," and the predictably futile efforts, literally over the centuries, to prohibit prostitution.

There could be no more convincing an example of the "big-solution" approach than the decision to forcibly export "democracy" to Iraq. Given Homo sapiens' innate inclination to hierarchical and authoritarian social and political structures, an inclination evidenced both by the rarity of democracies historically and their relative scarcity today in a so-called Age of Democracy, this mode of governance requires a complex of "special enabling conditions" for its emergence and survival. But even to the most untutored eye, very, very few of these essential, enabling conditions were—or even now are—present in that unfortunate nation.

Slow Start, Brightening Prospects: Long-Term Implications for Political Science

The attempt of the biology and politics movement to reshape the discipline quickly received formal recognition from the International Political Science Association in 1973 and, a bit less readily, from the American Political Science Association in 1981. The task of achieving a distinct "field" identity was basically completed with the establishment of a professional organization, the Association for Politics and the Life Sciences in 1980; the establishment of a peer-reviewed journal, *Politics and the Life Sciences*, in 1982; and the publication, several years later, of a 90-page Master Bibliography listing more than 1,000 "biopolitical" papers, articles, and books.

Nonetheless, their determined evangelical efforts notwithstanding, until quite recently the proponents of a "more biologically oriented" political science constituted only a minuscule fraction of the discipline, with the Association for Politics and the Life Sciences having, at most, only 300 or 400 members in contrast with APSA's some 101,000 members. Understandably, the great majority of the profession was unwilling to consider, let alone embrace, a conceptual framework at loggerheads with the orthodoxy in which they had been trained and had labored. Although a biopolitical course or two eventually made its way into the graduate curriculum at a dozen or so schools, only one department (at Northern Illinois University) initiated a formal doctoral program in the field; very few of the professional journals published biopolitical articles; with rare exceptions, biopolitical books somehow escaped the attention of the journals' book review editors; and the one or two biopolitical panels at APSA's annual meeting were fortunate to draw more than a dozen or so attendees.

Over the past 3 or 4 years, however, there has been a definite sea change. The professional journals have become much more receptive to biopolitical topics; both the number of biopolitical panels and panel attendance at the APSA meetings have notably increased; and a biopolitically oriented Conference on Experimental Political Science held its third annual meeting in 2010.

There are several reasons for this development. The introduction of functional magnetic resonance imaging (MRI) technology has opened a new way to study how the brain reacts when experimental subjects are presented with political questions or stimuli—and this research has received a surprising, if regrettably uncritical, coverage in the popular media (some relevant works on the neuropolitical perspective can be found in Rose McDermott, 2007, and Darren Schreiber, 2007). Another handful of biopolitical papers have reignited interest in the debate about the respective roles of nature and nurture in shaping political attitudes (in this instance, of identical twins)—and these, too, have received flattering media attention.

In addition, other influences have also been operative. Over the past couple of decades, biologists have done a superb job of popularizing evolutionary theory and the understanding of, and interest in, the manner in which genes and culture interact to shape our behavior. At the same time, an evolutionary approach has made considerable headway in several of the other behavioral sciences—anthropology, sociology, psychology, law, and what is now called "behavioral" economics. Political science has a well-established history of borrowing concepts and methods from our sister disciplines, and, among these, psychology and economics have long been the most prestigious and influential. And we should surely mention one more possible influence. According to Thomas Kuhn (1970), new paradigms often triumph not simply because of their superior scientific merit but also because of the implacable toll taken by rigor mortis on the avatars of the old order.

Whatever the relative weight of these several factors, their combined impact will almost surely profoundly modify our discipline's understanding of the forces shaping political behavior, the manner in which it conducts its research, and the intellectual framework within which it formulates its public policy recommendations. In the future, advocates of these views may come to represent a sizable plurality of the profession rather than the current small minority.

Bipolarity and Multipolarity

Bipolarity and multipolarity are theoretical concepts that refer to the distribution of relative power capabilities among the major powers in the global and/or regional international system. Bipolarity exists when there are two dominant powers—commonly referred to as "superpowers"—in the system whose power capabilities are considerably greater than those of other major powers. The prime example of bipolarity is the U.S.–Soviet competition during the Cold War. Multipolarity exists when there are three or more great powers in the system. Historically, multipolarity has been the dominant power configuration in the modern European states' system.

Polarity: Theoretical Approaches

The significance of the distribution of relative power capabilities in the international system is widely contested. For realists, it is the single most important determinant of international politics. Liberals also accept that the distribution of power is an important factor shaping international politics, although they attach greater significance to domestic-level factors (such as regime type) or the existence of international regimes and institutions as determinants of international outcomes. Similarly, the English School has traditionally recognized the importance of the balance of power and the management role of great powers, even though this approach stresses the importance of "international society" as a factor that ameliorates the operation of power politics.

Critical theorists and postpositivists, on the other hand, question the significance of polarity as a theoretical tool for understanding international politics. These, more radical approaches challenge the very concept of "power" as used by realists and other rationalist theories; power, they argue, cannot be reduced to resources, geography, and other material factors. Like constructivists, they tend to emphasize the significance of normative and ideational factors and stress the role of nonstate actors. Consequently, they argue that concepts of bipolarity and multipolarity are irredeemably freighted with realist assumptions and that focusing on polarity obscures the "real" operation of power in the international system that serves the interests of privileged elites.

For realists, however, the distribution of power in the international system is the key factor shaping any regional or global conjuncture. International political systems are inherently unequal, diverse, and pluralistic: They consist of a variety of different actors with wildly differing power capabilities, with a relatively small number of more powerful states. Realists argue that this handful of powerful states—generally known as great powers—exert a disproportionate influence on international affairs and that relations between them provide the key determinants of the structure and dynamics of the international system.

Classical Realism

The classical realist tradition of Hans Morgenthau, E. H. Carr, and Reinhold Niebuhr, as well as English School theorists such as Hedley Bull and Martin Wight, were centrally concerned with the balance of power. They explored the relations between the great powers from a perspective informed by the study of history and philosophy, and their analyses of multipolarity and bipolarity drew heavily on the experience of the modern European states' system. Much of their work explored the implications of multipolarity and bipolarity for diplomacy and statecraft. Classical realists tended to regard multipolar systems as more stable than bipolar systems, because their greater uncertainty and unpredictability encouraged foreign policy decision makers toward caution and circumspection.

Waltz's Theory of International Politics

With the publication of Kenneth Waltz's *Theory of International Politics* in 1979, the concepts of multipolarity and bipolarity acquired a new theoretical context and analytical significance. Waltz sought to introduce a far-reaching "Copernican revolution" into the study of international relations by demonstrating how much of states' actions and interactions, and how much of the outcomes their actions and interactions produced, could be explained by forces operating at the level of the system rather than at the level of the units. His neorealism (also known as structural realism) was a parsimonious theory that focused almost exclusively on the distribution of relative power capabilities between states, specifically the great powers. Waltz argued that the determining feature of any international system, and the basis for any theoretical analysis of international politics, must be about how power is distributed between the major units. If there were three or more great powers, the system was characterized by multipolarity; if there were only two great powers—or superpowers—the system was bipolar. This distribution of relative power capabilities was thus crucial in determining international political outcomes and shaping the structural conditions for war or peace.

Waltz's *Theory of International Politics* was as controversial as it was influential. In contrast to many of his classical realist predecessors, Waltz argued that multipolar systems were more unstable and war prone than bipolar systems because in the former, the great powers had a number of potential conflict dyads and defection from an alliance could have a destabilizing impact on the balance of power. In multipolar systems, he argued, dangers were diffused, responsibilities unclear, and definitions of vital interests easily obscured. Moreover, in multipolarity, it was not always clear who was a danger to whom, which complicated the process of alliance building and the establishment of a stable balance of power. In bipolar systems, in contrast, there were only two superpowers and, consequently, the question of who was a danger to whom was never in doubt. This, he argued, was the first big difference between bipolarity and multipolarity. Moreover, power balancing between them depended primarily on "internal balancing" rather than on "external balancing" (i.e., on the generation and more effective use of their own capabilities and resources rather than on alliance building, which relies on the capabilities of others). Thus, the defection of allies was of less significance than in multipolar systems.

Waltz, however, also argued that the "default" position of international systems, whether bipolar or multipolar, was the balance of power. This, he argued, constituted the key insight of his theory of international politics. From the theory, he argued, one could predict that states will engage in balancing behavior, whether or not they consciously seek a balance of power. The expectation, he argued, is not that a balance, once achieved, will be maintained but that a balance, once disrupted, will be restored in one way or another. Waltz's argument that international political systems tend toward balance, and that states were primarily concerned with maximizing their security rather than their power, gave his brand of structural realism a relatively benign and status quo flavor, leading some of his realist critics to dub his theory "defensive realism."

Neorealist Critiques of Waltz

First and foremost among Waltz's Neorealist critics was John Mearsheimer. He argued that precisely because great powers were security maximizers, they were also power maximizers. In a competitive, self-help system, Mearsheimer argued, the most effective way for great powers to ensure their security was by becoming the most powerful state in their neighborhood and establishing their regional hegemony. Hence, great powers, whether they liked it or not, were faced by a systemic imperative to maximize their power. This emphasis on power maximization is at the heart of Mearsheimer's theory of "offensive realism," which presents a much more conflict-prone and pessimistic view of the "tragedy" of great power politics.

Mearsheimer also introduced an important distinction between different forms of multipolarity. He argued that where power capabilities are roughly equivalent between the great powers, a situation of "balanced multipolarity" existed in which no one great power could make a bid for regional hegemony. In this context, great power cooperation was possible, as occurred in the "Concert of Europe" following the end of the Napoleonic Wars. However, in the context of a multipolar system in which one great power was significantly stronger than the others, "unbalanced multipolarity" existed. Unbalanced multipolar systems were inherently war prone, because the strongest great power would face a systemic imperative to maximize its power by making a bid for regional hegemony. For Mearsheimer, his theory of "offensive realism" provided an explanation for the major great power conflicts, such as the Napoleonic Wars and World Wars I and II.

The Contemporary Debate

With the end of Cold War bipolarity, a wide-ranging debate has taken place on the nature and significance of the distribution of relative power capabilities in the international system. One thread of this debate focuses on the concept of "unipolarity." Some realists have argued that the United States, as the sole remaining superpower, is so overwhelmingly powerful compared with other great powers that the system is best described as "unipolar." Among American realists, much of the debate has focused on whether this "unipolar" world order will be relatively short lived or long lasting (i.e., whether it constitutes a unipolar "moment" or a unipolar "era"). Waltz, on the other hand, has argued that after a relatively brief interregnum in which former great powers "relearn" their great power roles and new great powers emerge, the system will return to a multipolar dynamic. In this context, the emergence of the "BRIC" countries (Brazil, Russia, India, and China) has been taken by some as heralding the emergence of a new multipolar international order.

Against these debates among realists on the nature of contemporary polarity, more radical approaches have taken issue with the realist understanding of the nature of power and power politics. Power is an essentially contested concept in political science, and some have argued that power cannot be understood in terms of material capabilities. Rather, they argue that nonmaterial factors such as reputation, trust, and the attractiveness of states' economic, political, social, and cultural attributes constitute a new form of power, which they describe as "soft power." Some critical theorists even speak of "normative power" (i.e., the power of norms and values), which, they suggest, can have a system-transforming impact over the long term.

These more radical understandings of power are linked to arguments about the changed nature of international politics. Some argue that economic interdependence and the emergence of a globally integrated international order have weakened the significance of the distribution of hard power capabilities and therefore made long-established notions of multipolarity and bipolarity largely redundant. Globalization, some now argue, has blurred the distinction between domestic and international politics and weakened the significance of sovereignty. In this postmodern system, borders are increasingly porous, power is diffused, and security can be achieved through governance and interdependence rather than through the balance of power. Concepts of bipolarity and multipolarity thus continued to be employed in international relations, although their significance is deeply contested.

BOOLEAN ALGEBRA

Boolean algebra is the subfield of mathematical logic devoted to operations and functions of logical variables. After a brief historical introduction, a broad idea of its main concepts, ideas, rules, and applications is given below.

Origins

In his work about the laws of thought, the English mathematician George Boole (1815–1864) showed that it is possible to represent logical thought processes using a system of binary variables: 0-1, TRUE-FALSE, and YES-NO.

As early as 3000 BCE, the Chinese emperor Fu Hi used, within a magical symbol, a set of eight trigrams, in which three binary variables yield a written representation of integers from 0 to 7 (Figure 1). Gottfried W. Leibniz (1646–1716) took inspiration from it when he laid down the basic rules of binary arithmetic (*Explanation of Binary Arithmetic*, 1703). He realized that he had found a way to translate logic into calculations and laid plans for the first four-operation computing engine. However, it needed Boole's work for the idea to mature, giving birth to a genuine theory—Boole's algebra—with its calculation rules, its properties, and its theorems.

Sets, (Classical) Logic, and Boolean Algebra

A specificity of this new theory is that it may be explained under three completely equivalent forms, notwithstanding their apparent differences, using set theory, elementary logic, or Boolean algebra. In a way, we have three different descriptions of the same theory, in three different languages, but allowing perfect translation between them.

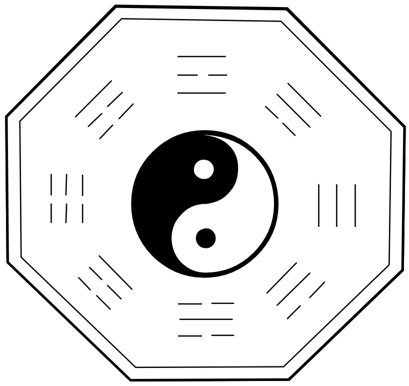

Figure 1 Fu Hi Trigrams (From Ancient China)

Sets

"Naive set theory" uses a set of well-defined elements—its universe—and considers a series of relations and operations between those elements and subsets of this universe. For example, if the universe is the set of all national flags at some specific moment in time, one can easily imagine all kinds of subsets: flags using red, black, or both; those featuring a cross, a circle, bars, stripes; and so forth. Using red is a binary variable, with value YES (or 1) or NO (or 0) for each flag.

Although not absolutely needed for conceptual development, a visual representation using Venn diagrams can show this relationship (see Figure 2). This figure shows the flag Universe and three of its subsets, namely flags using red (R), those using black (B), and those using yellow (Y). It immediately can be seen in the diagram that each subset automatically determines its complement (flags without black, without red, or without yellow). The Italian flag (i), for example, belongs to subset R but to neither B nor Y; this can be noted as $i \in$ R, $i \notin$ B, and $i \notin$ Y.

It is also possible to consider operations on subsets. The *intersection* ($\cap$) of **R** and **B** is the subset of all flags using both red AND black; the *union* ($\cup$) of **R** and **B** is the subset of all flags using either red OR black—or both; this is the inclusive variant of OR. One can see that the French flag (f) satisfies $f \in \mathbf{R} \cup \mathbf{B}$ and $f \notin \mathbf{R} \cap \mathbf{B}$. Finally, some subset may be totally *included* ($\subset$) within another: The set of

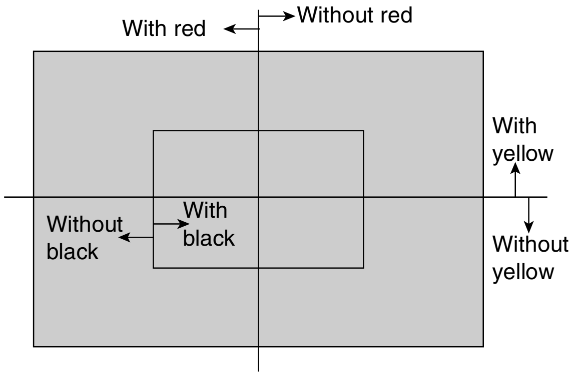

Figure 2 Venn Diagram With Three Subsets of Flags

all flags using both red and black is included in the set of all flags that merely use red. This is noted as **R ∩ B ⊂ R**.

Logic

Classical logic is able to translate any statement of the elementary set theory; for example, **R ∩ B ⊂ R** translates into an implication (⇒): If a flag uses both red and black, then it uses red. More generally, any statement of the form A ⊂ B becomes A ⇒ B (if A is true, then so is B). Three logical operators are defined at the beginning: logical conjunction, "AND"; logical disjunction, "OR"; and negation (or denial), "NOT."

Boolean Algebra

Boolean algebra is based on the following conventions: Each variable is binary; it has only two possible values; and those will be noted 0 (corresponding to the empty set and logical FALSE) and 1 (corresponding to the universe and logical TRUE).

Boole then defined three operations: Boolean product (·), Boolean sum (+), and complement. Boolean product corresponds to logical AND and a set-theoretical intersection; Boolean sum corresponds to OR and set-theoretical union; and complement corresponds to set-theoretical complement and logical NOT.

To determine how operators make this algebra work, the rules of the game—that is, the axioms—are needed. They are the following:

Law of excluded middle: $A + \bar{A} = 1$

Noncontradiction principle: $A \cdot \bar{A} = 0$

Boundedness conditions: $A \cdot 1 = A$; $A + 0 = A$

Twofold commutativity: $A + B = B + A$; $A \cdot B = B \cdot A$

Twofold associativity: $(A + B) + C = A + (B + C)$; $(A \cdot B) \cdot C = A \cdot (B \cdot C)$

Reciprocal distributivity of "+" and "·": $(A + B) \cdot C = (A \cdot C) + (B \cdot C)$; $(A \cdot B) + C = (A + C) \cdot (B + C)$; this last identity is less intuitive than others, since it does not hold in ordinary (real-number) arithmetic.

From there, several properties may be deduced, among which are the following:

$\bar{0} = 1$ *and* $\bar{1} = 0$

Idempotence: $A \cdot A = A$; $A + A = A$

Absorbing: $A + 1 = 1$ and $A \cdot 0 = 0$

Successive applications of these rules make possible the simplification of complex Boolean expressions, in particular by using the following results:

Absorption theorems: $A + (A \cdot B) = A$; $A \cdot (A + B) = A$

Redundancy theorems: $(A \cdot B) + (\bar{A} \cdot C) = (A \cdot B)$ $(\bar{A} \cdot C)(B \cdot C)$

De Morgan's laws: $\overline{A + B} = \bar{A} \cdot \bar{B}$; $\overline{A \cdot B} = \bar{A} + \bar{B}$

Boolean Functions and Truth Tables

Any Boolean function—that is, any combination of Boolean variables using Boolean operators—may be analyzed using its truth table. The truth table for a function of n variables is always made of $2n$ lines and $n + 1$ columns; each line corresponds to one combination of values of the variables (0 or 1). For example, the truth table for function $F(A, B) = A \cdot \bar{B} + \bar{A} \cdot B$. B is as follows (Table 1):

Table 1 Truth Table for $F(A, B)$

A	*B*	*F(A,B)*
0	0	0
0	1	1
1	0	1
1	1	0

All truth tables of two variables will have the same first two columns as this one; the third column completely describes the function. This last column is made up of four binary values; therefore, there are 24 = 16 different functions of two variables. Using set-theoretical representation, function $F(A, B) = A \cdot \bar{B} + \bar{A} \cdot B$. B is shown in the shaded part of Figure 3.

Using two variables, 16 different shaded zones may be defined, made up of 0 to 4 elementary zones (the quadrants of the diagram) (Table 2).

This number increases rapidly with the number n of variables.

This exponential increase explains the need for using algorithms when analyzing Boolean functions of more than three variables (see Figure 3).

Each compound zone of a Venn diagram also corresponds to a Boolean function. However, there is more than one formula for a given function.

It is therefore interesting to find, among those logically equivalent formulae, which one is the simplest. Simplicity is not a well-defined notion, but an intuitively reasonable approximation will be to choose the shortest formula.

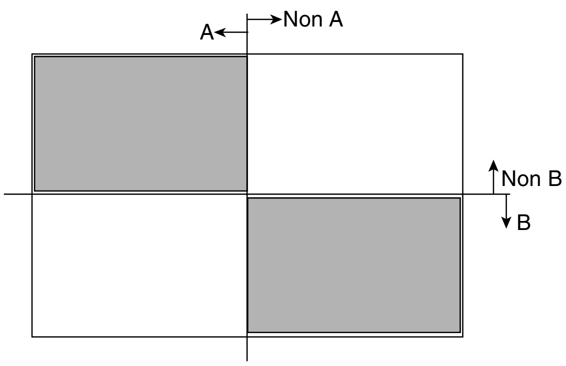

Figure 3 Venn Diagram With Two Subsets

Table 2 Number of Zones

Number of Variables	*Elementary Zones*	*Compound Zones*
1	2	$4 = 2^2$
2	4	$16 = 2^4$
3	$8 = 2^3$	$256 = 2^8$
n	2^n	$2^{(2n)}$

Reducing a Function's Algebraic Expression

The longest formula for a given function (its canonical disjunctive form) is very easy to write down: It is merely made up of a union of elementary zones, therefore of a sum of products (monomials, minterms) using all variables. For example, to the following truth table (see Table 3) corresponds the long formula $F(A, B, C) = \bar{A} \cdot \bar{B} \cdot C + \bar{A} \cdot B \cdot C + A \cdot \bar{B} \cdot C + A \cdot B \cdot C$.

This formula lacks brevity. Using a succession of Boolean algebra rules allows us to simplify it until we get the shortest possible formula:

$$F(A, B, C) = A \cdot B \cdot C + \bar{A} \cdot B \cdot C + A \cdot \bar{B} \cdot C + \bar{A} \cdot \bar{B} \cdot C$$

$$F(A, B, C) = 1 \cdot B \cdot C + 1 \cdot \bar{B} \cdot C$$

$$F(A, B, C) = B \cdot C + (\bar{B} \cdot C) = (B + \bar{B}) \cdot C = 1 \cdot C = C.$$

This search for the shortest form of the function is the object of the simplification algorithms mentioned above. Karmaugh's algorithm, a heuristic method for simplifying that can be worked by hand, with acceptable results, for $n \leq 4$, may give a good idea of how such algorithms work; other algorithms need a computer to perform, such as the

Table 3 Truth Table for $F(A, B, C)$

A	*B*	*C*	*F(A,B,C)*
0	0	0	0
0	0	1	1
0	1	0	0
0	1	1	1
1	0	0	0
1	0	1	1
1	1	0	0

Breakdown of Political Systems

The term *breakdown of political systems* connotes the collapse of any rule-based institutional network engaged in the allocation of scarce resources. Though this rubric could technically embrace networks ranging from empires to smaller, nonstate entities such as clans, the vast majority of the literature on the breakdown of political systems focuses on the collapse of either regimes or states. The disintegration of both regimes and states has been a constant throughout history, and thus, the literature on the breakdown of political systems is vast. This overview merely introduces this literature through a discussion of its basic terms, its origins, and some of its principal arguments. The discussion is confined to four types of political system breakdown: the breakdown of dictatorship, the breakdown of democracy, and the breakdown of states, leading either to new, functioning states or to failed states.

The Basic Notions and Its Origins

Drawing on Robert Fishman's distinctions, we can define a *regime* as a country-based network of formal and informal organizations at the center of political decision making that determines who has access to political power and how those who are in power deal with those who are not. Democracies and dictatorships are the dominant regime types in our literature.

A *state* is the larger institutional context in which a regime exercises its power. A state is a more permanent structure of domination and coordination in part because, unlike a regime, a functioning state always maintains a coercive apparatus and both the means to administer a society and to extract resources from it. Though there are many state types in our literature, the distinction most relevant to a discussion of system breakdowns is the one between functioning states and failed states.

The current literature on the breakdown of modern political systems has its roots in ancient Athens. Plato attributed political system change (and difference) to "the dispositions of men" and argued that regime types were forged from "the human natures" of their citizens. Later classic commentaries linked the breakdown of oligarchy to societal crises related to taxation, to the successful uprising against the Spartan occupation that followed conflict between Athenian elites, and to structural changes related to the Persian Wars. Aristotle linked political system longevity to levels of economic inequality. Arguments relating the breakdown of political systems to cultural dispositions, fiscal crises, elite divisions, war, and economic inequality remain fundamental to political science literature today.

The Ancients' attempts to derive general, explanatory arguments from specific, contemporary political events remain fundamental to current literature as well. This is one of the reasons why scholarship on the breakdown of political systems has so often come in clusters, following waves of dramatic political system change. Four clusters of system breakdown stand out as catalysts.

The Main Explanations

The first set of debates about regime collapse in the 20th century focused on the breakdown of democracy in interwar Europe. Proponents of psychosocial arguments asserted that the cause lay in the nexus of personality and politics: Individuals who were profoundly insecure found the uncertainty of democracy intolerable and sought comfort in authoritarian leaders and authoritarian regimes. Though this argument was rooted in social psychology, it resonated with scholars of politics as well. Hannah Arendt attributed the breakdown of interwar democracy to the "negative solidarity" engendered by a mass of "furious individuals" united by "apprehension." Seymour Martin Lipset attributed "working-class authoritarianism" to economic insecurity and authoritarian family patterns.

While some analysts concentrated on citizen attitudes as a root cause of democratic breakdown, other scholars concentrated on classes instead. Barrington Moore attributed the breakdown of interwar democracy to an alliance between landed elites and sectors of the bourgeoisie who desired a level of labor repression that democracy would not allow. Gregory Luebbert attributed the breakdown to alliances between the family peasantry and the urban middle classes, arguing that their interactions with socialist parties were decisive.

The focus on class actors was eventually challenged by approaches that focused on political institutions and political (rather than class) elites. Juan Linz and Alfred Stepan took the lead in fostering this approach. Though Linz ultimately blamed the breakdown of democratic political systems on "citizens of weak commitment," he attributed citizen defections to a broad range of nonstructural factors, including ineffective leadership and problematic institutional design. In so doing, he argued that system breakdown might have been avoided with better judgment and better institutions, including single parliamentary executives, constructive votes of no confidence, and laws preventing the proliferation of small parties.

The breakdown of democracy occurring during the Cold War was the second major stimulus for explanatory theory and Linz intended his argument to apply to these cases as well. Gabriel Almond and Sidney Verba also sought to offer a general theory of democratic breakdown but promoted arguments related to political culture instead. They proposed that democratic stability could only be ensured where a "civic culture" based on moderate attitudes, interpersonal trust, and muted interest in political participation existed. In a similar vein, Harry Eckstein proposed that political systems would be viable only if their authority patterns were congruent with authority patterns in other social organizations.

Suspecting that the roots of citizen attitudes and behaviors lay in economic structures, Lipset proposed that a democratic system breakdown would be less likely as economic development progressed, arguing that the prospects for democratic system stability improved as wealth, industrialization, urbanization, and education expanded. A large middle class would mean decreasing class differences, more moderation, and better odds for democratic system stability.

Focusing on the frailty of democratic political systems in South American countries with comparatively large middle classes, Guillermo O'Donnell challenged Lipset and argued that economic development would not guarantee democratic stability if it took place in the context of economic dependency. Democracy could not be maintained in the face of contradictory pressures from transnational capital on the one hand and a popular sector empowered by democratic freedoms on the other.

Debates about the cause of democratic system breakdown were still unresolved when authoritarian regimes began to break down in the 1970s. The theories stimulated by this third set of events were equally diverse. Philippe Schmitter and Guillermo O'Donnell offered one of the first attempts to make sense of the change. They proposed that the breakdown of dictatorship is always the consequence of divisions among regime elites and that "elite dispositions, calculations, and pacts" determine whether system breakdown is possible. Beyond this, they insisted that the breakdown of authoritarianism constituted an example of "underdetermined" social change where class, sectoral, or institutional analysis had little predictive utility.

As cases of authoritarian breakdown began to accumulate, scholars argued that the causes of regime breakdown varied across countries. Samuel Huntington drew attention to three scenarios for breakdown: one in which regime elites played a major role, another in which the breakdown of dictatorship resulted from joint action by regimes and oppositions, and a third in which oppositions took the lead. This last scenario dominated in Africa and Eastern Europe.

Barbara Geddes pointed out that different sorts of authoritarian systems broke down for different reasons and at different rates. Through quantitative work, she found that military dictatorships were the most likely to break down, that personalist regimes were more resilient, and that single-party regimes were the most resilient of all. Military regimes were susceptible whenever the interests of the military as an institution were at risk. Personalist regimes were susceptible when an equilibrium based on coercion and spoils was disturbed by the death of the leader or by economic crisis. Single-party regimes were the least susceptible to breakdown because their leaders typically had no alternative source of power and thus had stronger incentives to face crises and resolve disputes internally.

The idea that economic crises or economic factors of some sort are the root cause of the breakdown of dictatorship is widespread but still contested. Studying the period between 1950 and 1990, Adam Przeworski and Fernando Limongi found that the relationship between economic development and the breakdown of dictatorship was bell shaped. Though the likelihood of regime breakdown rose with development in middle-income dictatorships, dictatorships in countries with either very low or very high incomes tended to be stable despite growth. Studying the period from 1800 to 1990, Carles Boix and Susan Stokes drew a different conclusion. They found that economic development always *increased* the probability that dictatorships would become democracies, though the impact of growth on the likelihood of regime change decreased at higher levels of development and after World War II.

Debates about the roots of dictatorial political system breakdown were enriched by the wave of regime changes associated with the collapse of the Soviet Union in 1989. This fourth stimulus for explanatory theory brought arguments with an international focus to the fore. Scholars such as Marc Beissinger showed how the breakdown of dictatorships was affected by the cross-border diffusion of models for mobilization. Huntington argued that demonstration effects were so powerful that they worked independent of economic and social conditions. Jon Pevehouse illustrated that the breakdown of dictatorship was linked to membership in international organizations dominated by democracies. Dankwart Rustow concluded that the most powerful impetus for the breakdown of dictatorship was the global trend of "intensifying communication and economic integration," which spread the awareness of "democratic lifestyles" and delegitimated the myths that sustained dictatorship.

In addition to invigorating work on the breakdown of regimes, the disintegration of the Soviet Union sparked new interest in theories explaining the breakdown of state systems. Scholars explained why new states emerged from old states with a variety of arguments. Linz and Stepan attributed the change to problems of "stateness": Subnationalist groups that never accepted the boundaries of the state moved to change them as soon as coercion declined. Valerie Bunce offered an institutional explanation, highlighting the fact that all the European states that split apart after 1989 were federal. Carol Skalnik Leff made the point that democratization had a "state-shattering" impact because it shifted power to regions and thereby changed the incentives of regional elites.

The system breakdowns after 1989 also sparked new literature explaining the emergence of "failed" states as places where state actors prey on their citizenry, enjoy no monopoly of force, and fail to control rampant violence. This form of system breakdown is most likely in poor countries, but Robert Bates points out that its roots may lie in poor state resources rather than in poverty per se. Robert Rotberg argues that poverty and institutional weakness contribute to state failure but accords the greatest weight to leadership errors and the drive for personal gain. Jack Goldstone, Robert Bates, Ted Robert Gurr, and Monty Marshall conclude that state failure is most rooted in political factors and that hybrid regimes that are neither democracies nor dictatorships are most susceptible to collapse. We cannot know which of the many explanations for system breakdown given here will prove most convincing in the future, but we can be almost certain that political systems will continue to collapse.

BUDDHISM

Buddhism is frequently regarded as a quietist religion, but while there may be some justification for this perception, its political presence and impact in many parts of Asia should not be underestimated. Ever since the period of the Indian emperor Aśoka (269–232 BCE), the religion has shown itself to be a distinctive social and political force in various countries, having considerable backing among the relevant populations. Naturally, where Buddhism is a small minority, as in modern Western countries, its influence is small and the quietist image is strong, but in the countries of Asia, where Buddhism is the majority religion, the situation is quite different. Here, both Buddhist monks and lay leaders have been prominent from time to time in elitist and military maneuverings and more recently in revolutionary and electoral situations. Self-consciously Buddhist political activism is not a stranger in India, Burma, Thailand, and Vietnam. Indeed, in most Asian countries, Buddhist leaders have at various times contributed to both support the prevailing establishment and revolt against it.

Characteristics of Buddhism

The underlying reason for the complex interactions between Buddhism and political forces may be found in two characteristic features of the religion. First, we must look back to the story of the historical Buddha's decision to proclaim his teaching in the first place, which is a constitutive narrative both for his own biography and for the emergence of Buddhism as an organized religious system. The central story is that Gautama (in the 5th century BCE), though blessed with many privileges as a young man, passed through a personal heart-searching experience about human suffering, illness, old age, and death. Recognizing the transience of existence, he perceived the cause of suffering to lie in ignorance, desire, and attachment to transient things, while its resolution lay in knowledge and detachment. The understanding of all these relationships is summed up as his "enlightenment" or *bodhi*, which is why he was regarded as a *buddha*, an enlightened one. Had he preferred a quietist, personal resolution of these general questions of human existence, which according to the narrative he considered steadily as an option, the social impact would most likely have been nil. As it was, the very decision to proclaim his system of teaching (in Sanskrit *dharma*, in Pali *dhamma*) led not only to the first ordinations of monks but also to sponsorship by prosperous laity and royalty. This meant that a strong and active symbiosis with a supportive laity grew up from the very beginning, so that the social and political ramifications began to extend themselves in a continuous process.

Second, the concept of the "wheel turner" (in Sanskrit *cakravartin*, in Pali *cakkavattī*) is significant. On one hand, it is part of the mythologization of the figure of the Buddha himself, for he is regarded as having achieved the right to "turn the wheel of dharma." However, the same concept is applied to kingship, for a "wheel-turning monarch" is one who claims the power of extending his rule to the four quarters of the earth, spreading stability in support of a moral society. When a suitable individual is reborn as a "great person," with excellent qualities and at an appropriately high-class of society, he—presumed to be male—has the option of turning the wheel of dharma or of turning the wheel of political power. Ideally, therefore, a powerful and righteous king will be the contemporary and the patron of a living Buddha. This dual, tandem-like concept was later integrated under the concept of the "wonderful union of king and Buddha." In some cases, such as the Tibetan model, this means that the incarnated spiritual leader or Dalai Lama is at the same time the political head of the population, which naturally causes a collision with any modern state such as China, with its secular ideological base. Tensions over this model may be seen to a lesser extent in Mongolia, Bhutan, and Nepal. In a variation of this union, certain kings or princes have been given the title of "Dharma King" (in Sanskrit *dharmarāja*), which has usually implied not only an elitist espousal of Buddhism, but also that they have authority, direct or indirect, over senior appointments in the monastic hierarchy, as frequently seen in premodern Japan.

Evolution of Buddhism in Southeast and East Asia

The expansion of Buddhism into the countries of Southeast and East Asia took place largely with the help of political domination or influence, with the notable exception of China. As a result, these underlying concepts of the Buddha as both political and spiritual head have played a major role. Starting with a response by the Indian Emperor Aśoka to the Sri Lankan king of the time, Devānampiyatissa, the Theravāda monastic order was set up in Sri Lanka. While this order had royal patronage, the tradition of lay support for the order spread to most levels of society. As a result, the postcolonial independence movement looked to Buddhism, still predominating in a religiously and culturally plural society centuries later, to provide an ideological reference point that would be nationally recognizable as Sinhalese. An important modern Sri Lankan Buddhist was Dharmapala (1864–1933), who, assuming the title of Anagarika or "homeless one," did much to further a modern revival of Buddhism in India itself, where it had largely died out. This revival was massively furthered by the conversion of Dr. Babasaheb R. Ambedkar (1891–1956), a major contributor to the constitution of independent India, who led some millions of previous "untouchables" into a casteless state under the banner of a modernist, rationalist, and ethically oriented Buddhism.

Following the earlier mission to Sri Lanka, a transmission of the *Dhamma* to Burma, Thailand, Vietnam, and Laos followed in various stages, with the result that Buddhist traditions played a major role in state formation in all of these countries. There were also establishments in Sumatra and Java that had less long-term influence. While kingship models derived from Hinduism were also influential, with even Brahmans functioning at the Thai court, it was the Buddhist monastic order that has remained a pillar of political influence in mainland Southeast Asia. Thus, regardless of contemporary politicians, the two fundamental foci of authority in Thailand remain to this day the monarchy and the monastic order. A key figure in the formation of Thai national consciousness was King Mongkut (Rāma 4th, 1824–1851) who managed the modernization process of the whole country while preserving its independence from Western colonial powers. Before becoming king, he was a dedicated monk who played a leading role in reforming and modernizing the Buddhist religion in Thailand. The process of modernization was continued by his successor Chulalongkorn (Rāma 5th) and later monarchs. In Burma, Buddhist layman U Nu (1907–1995) played a major role in postcolonial political development under the slogan of "Buddhist socialism," while at the beginning of the 21st century a number of monks have been attempting to recall the country to its rightful path as they see it. In Vietnam, the wars of independence saw cases of Buddhist monks burning themselves alive in the 1960s as a symbolic act, protesting against the repression of the population. This engagement in the social and political process became widely known through writings of the monk Thich Nhat Hanh, such as *The Lotus in the Sea of Fire*.

If China, with its strong Confucian traditions, did not really need the Buddhist religion to provide a leading civil ideology, the importation of Buddhism from India via Central Asia nevertheless presented a strong challenge to the incipient religious institutionalization of Daoism. Buddhism reached a high point of influence during the Tang dynasty, but it suffered greatly as a consequence of Daoist-inspired persecution in the mid-9th century. If the rivalry of the three religions had frequently led to strife and persecution, now of Daoism and now of Buddhism, there were also attempts to coordinate them. The classic model for this was the idea of the "three teachings" (*sān jiào*), which was most influentially set forth in a treatise ascribed to the first Ming emperor shortly after he had taken political control of the country. The compromise that he regarded as essential for political stability does not give a privileged place to Buddhism among the "three teachings," but it crystallized a model that even today implicitly underlies the law of a secular Chinese regime. Just as the Ming solution juxtaposed Confucianism on the one hand with Buddhism and Daoism on the other, so also now the state ideology of communism is the common reference point for the permitted religions: Buddhism, Daoism, Islam, Catholicism, and Protestant Christianity. Confucianism does not occur here as "religion," having been displaced by communist ideology as the normative backdrop, but Buddhism holds a clear position. The older "three teachings" concept implied the exclusion and suppression of the so-called heretical sects on the assumption that such minority sects lead to instability and are probably a cloak for agitation. This reasoning is therefore not a new communist invention, and observers need to consider contemporary cases carefully, for example, when new movements such as Falungong claim to be "Buddhist" and at the same time call for the overthrow of the government.

Buddhism was transmitted first to Korea and from there to Japan from the 6th century onward. If the dominant ideology in Korea up to the Japanese imperialist period was Confucianist, the postcolonial and postwar period has seen a resurgence of pride in the shamanistic traditions of that country, thus giving them a civil religious function. The political and social influence of Buddhism arises less from the traditional orders in Korea—strongly established though these are—and more from the newly founded lay movements such as the self-consciously modern Won Buddhism. Japanese history has seen immensely complicated variations of Buddhist influence via the imperial court on one hand and the power centers of major denominations on the other. While monks of Mount Hiei to the northeast of Kyōto occasionally led armed raids into this former capital, the millions of followers of the Shin Buddhist faith and others in the Nichirenite tradition were also a political force to be reckoned with and occasionally suffered dire consequences. In modern, postwar times, the influence of the Buddhism-inspired Kōmeitō ("Public Brightness Party") has been considerable but seems to be receding in the 21st century. Increasingly, lay Japanese Buddhist leaders have promoted a "peace" agenda, the Nichiren-oriented Risshō Kōsei-kai and the Sōka Gakkai being prominent in this respect. The strongly established Shin Buddhist denominations have led the way in reflecting on Japanese war responsibility and in educating their followers accordingly. In Sōtō Zen Buddhist circles, there has also been much heart searching while various influential Buddhist voices support the campaign to preserve Clause 9 of Japan's present constitution, prohibiting war as a means of settling international disputes.

BUDGETING, RATIONAL MODELS

Budgeting refers to decisions about how much funding to provide for the programs, staffs, and infrastructures of government, as well as about the processes used to arrive at funding levels. In examining processes, budgeting theories explain how individuals who hold budget-writing positions choose funding levels for programs. A second class of theories explain how and why political elites try to manipulate budgets to foster their goals.

Rational theories of individuals responsible for choosing how much to fund budget lines offer bounded rationality explanations of these decisions.

Due to limits on human cognition, vast numbers of lines in the budget, and complex decision-making environments, budgeters' forecasts about how well their choices will facilitate their goals are imperfect. Despite these limitations, budgeters use decision-making strategies that help them foster their goals. Such strategies are boundedly rational because, although the choices and behavior resulting from such strategies are not optimal, budgeters' decisions still help them realize program goals. In this way, budgeters "satisfice"—they make decisions that are "good enough."

The first generation of boundedly rational budgeting theories was developed in the 1960s by Aaron Wildavsky, whose contributions to understanding budgeting continue to exert a profound influence on budgeting scholarship. This perspective, developed with respect to the federal government in the United States, emphasizes that individuals responsible for contributing to the budget must take an incremental approach to arrive at funding levels. Budgeters begin by examining the "base" for each budget line, which refers to the amount that was spent on the line in the previous year's budget. From this base, budgeters make small adjustments based on new information and limited by the availability of funds. For example, if program advocates can make an effective argument about why additional funds are needed, budgeters may increase funding levels slightly from the previous year. Nevertheless, even if budgets change from year to year, budgeters do not make drastic changes. Budgeters follow this approach out of necessity. Examining the budget holistically would involve the impossible task of investigating each budget line to ascertain the optimal volume of funds required to realize the goals embodied in the programs. Unfortunately, such an approach is not feasible given the vastness of the government and the resulting volume of decisions that must be made. By taking an incremental approach, however, budgeters arrive at funding levels for all budget lines, ensuring that programs continue serving their purposes even if neither the funding levels nor the achievement of program goals are optimal.

Additional research, however, observed that many budgeting decisions were not incremental, spurring refinement of Aaron Wildavksy's approach. John Padgett's serial judgment theory of budgeting stresses continuity with the incremental perspective in that budgeters' decisions are understood from a boundedly rational perspective. Budgeters cope with the volume and complexity of the decisions they face by starting with the level of funding from the previous year and satisficing to arrive at funding levels for the current budget. However, the heuristic employed by budgeters is not incremental choice. Rather than consciously choosing a funding amount that differs slightly from that disbursed previously, budgeters consider, one after another, alternatives for funding levels until they arrive at one that is acceptable. In this way, budgeters satisfice in that they do not try to discover optimal funding levels for programs. Critically, though, budgetary outputs are predicted to differ from outputs predicted by incremental approaches. Because budgeters move from alternative to alternative until they reach an outcome that is good enough, it is possible for them to arrive at funding levels that are substantially different from the amounts funded in the previous year's budget. Such dramatic changes can occur, for example, when budgeters' understandings of what is necessary from a programmatic standpoint leads them to pick a funding level that happens to be a significant departure from the previous year's base. Research focusing on the distribution of year-to-year changes in programs' funding levels in the context of U.S. government budgets revealed that this perspective explained better the distribution of year-to-year changes than an incremental approach did. By specifying more precisely the decision-making heuristics employed by budgeters, the serial judgment perspective improved on the incremental model while remaining anchored firmly to a realistically bounded rational view of human decision making.

More recent research by Frank Baumgartner and Bryan Jones integrates research on agenda setting with a boundedly rational approach to budgeting. Because the set of issues that they can attend to is small, budgeters ignore most information from the political environment. They do so even in the face of political mobilizations by coalitions favoring substantial funding changes. Under these circumstances, year-to-year changes in budgets are characterized by incremental shifts in funding levels. However, when groups in favor of change are successful in securing space for their concerns on the government's agenda, budgeters are forced to attend to the issues that these groups prioritize. In doing so, budgeters begin to consider alternative funding amounts for budget lines serially. Since past decisions related to the issues have resulted in incremental changes, political coalitions that have focused budgeters' attention on a specific budget line are likely to desire significant change in that line. Therefore, the funding levels that allow budgeters to satisfice in such instances are likely to constitute sizable increases/decreases. After all, substantial changes are the only ones likely to satisfy the political forces behind the mobilization. In this way, the heuristics that budgeters employ differ depending on whether advocates for change can secure space for their priorities on the agenda. If not, budgeters ignore information from such groups, leading to incremental changes. However, when agenda space is secured, serial judgment heuristics are triggered. What is more, the nature of the mobilization implies that only substantial changes in funding levels allow budgeters to allay the concerns of the coalitions—and, by extension, allow budgeters to satisfice.

Shifting gears, a separate tradition on government budgets asks whether political elites manipulate budgets to serve their goals. One line of such research asks whether ruling political parties stimulate the economy prior to elections in order to maintain their control of government and its decisions. This political budget cycle thesis was spurred by research conducted in the 1970s examining indicators of economic health in light of election cycles in the United States and in other major industrial democracies during the post–World War II era, observing that unemployment dipped and economic growth increased in years during which elections occurred. Naturally, the argument behind the thesis is that the ruling party prefers to remain in control of government. Therefore, it pursues policies that stimulate the economy to achieve economic growth prior to the election. Voters, the ruling party hopes, observe this performance and reward it by returning it to power.

Subsequent research on this hypothesis has produced mixed findings regarding the ability of ruling parties to pursue this strategy successfully. In recent research, James Alt and David Lassen suggest why: The ability of ruling parties to exploit their position is conditional on several factors. The first involves how transparent the government's fiscal policy decisions are to the public. Transparency allows the media and political opposition, and by extension the public, to observe the government's intentions, making it more difficult for the ruling party to try to create economic growth without being accused of doing so for its own benefit. The second factor is the level of polarization between parties. As policy conflict increases between the ruling party and its rival(s), the costs to the party of losing control of government to the opposition increases. These costs increase with policy conflict because the policies that the opposition (as the future ruling party) will adopt will be more offensive to the (present) ruling party for higher levels of policy disagreement between parties. In summary, while it may be feasible for the ruling party in government to rig the economy in order to maximize its chances of continuing in power, the circumstances under which this strategy is feasible may be limited.

Another line of research focusing on elite influence over budgets examines the participation of bureaucrats in shaping the budgets of their agencies. One theory advanced in the early 1970s held that bureaucrats were "budget maximizers" in that they wished to expand the size of their agency's budget as much as possible. What is more, bureaucrats are well positioned to do so because they possess more information about what is necessary to achieve the policy goals their agencies are responsible for meeting than elected officials who create budgets. This information asymmetry allows bureaucrats to receive substantial increases in their agencies' budgets.

Subsequent research in the tradition of the budget-shaping perspective by Patrick Dunleavy and others, however, has led to a substantial refinement of this view. In addition to noting that budgets are not characterized by the growth predicted by the maximization perspective, these critics note that, because an agency's budget is a collective good, bureaucrats face a collective action problem in advocating budget expansions. Moreover, because agencies' budgets are disaggregated, bureaucrats possess no guarantee that increases to the budget will accrue to their corner of the agency, undercutting the incentive to lobby. Bureaucrats also face varied incentives to lobby for expansions based on the type of agency they work for and their position within their agency. In particular, the highest ranking officials most capable of lobbying possess the least incentive to do so because, from a pecuniary standpoint, their salaries do not increase with budget increases. Instead of budget maximizing, the budget-shaping view argues that agency executives prefer to use the budget to construct an agency such that its staff perform professional functions characterized by high levels of discretion that foster creative solutions to problems. Executives in public agencies are thought to prioritize such "shaping" because individuals drawn to career advancement in such agencies are likely to value such a professional orientation. Additionally, and at any rate, laws forestall the ability of bureaucrats to capture pecuniary rewards from public service beyond their salaries.

BUREAUCRACY

The term *bureaucracy* denotes a particular form of organization that is complex and differentiated, has defined rules and procedures, and is subject to a command-and-control system of hierarchical authority. This entry discusses the nature and functions of bureaucracy and the bureaucratic state, as well as the problems and deficiencies associated with it.

Definition and Characteristics

The illustrious German sociologist Max Weber noted several characteristics of the bureaucratic form of organization that defined it as an ideal type.

First, bureaucracy derives its authority through law. It depends neither on traditional nor on personal modes of authority. It is instead based on a form of legal-rational authority that defines the foundations of the organization's jurisdiction and its procedures of operation.

Second, bureaucracy has differentiated offices or units that have specialized competencies and jurisdictions. This aspect of bureaucracy provides it with some obvious advantages, including the ability to bring technical expertise and experience to bear on particular aspects of problems. It also raises some difficulties, however, in coordination of tasks, and it sometimes creates conflicting perspectives as to what the task is or how a problem should be defined.

Third, bureaucracy is characterized by an internally hierarchical system of authority required to bring its distinctive parts together as part of a unified system of coordination. The extent to which this hierarchical control system can actually be put in place is almost always imperfect, though the extent to which it can be consummated rests on many factors other than coercion. These include leadership that obtains support from all of the organization's distinctive offices and units, clarity of purpose from organizational leadership, and careful assessments of feasible paths to ends.

Fourth, bureaucracy is also characterized by rules and procedures that govern its internal functions. It has a memory and a set of procedures for dealing with recurring matters. Weber referred to this as the organization's "files," and this storage of experience and written rules anchors bureaucracy in the legal-rational system of authority. The files provide precedents and also produce standard operating procedures (SOPs) that enable bureaucracies to become more proficient in responding to problems that can be readily identified and are within the organizational repertoire. The more ambiguous or multifaceted the problem, however, the more complicated will be the sorting process within a bureaucratic organization and the more likely, therefore, that problems are recognized and defined in ways reflecting the complex differentiation of bureaucratic organizations. This means that there are likely to be many different perspectives rather than a unified one.

Fifth, bureaucracy is typically characterized by a full-time corps of officials. In governments, these officials are known as civil servants; they represent the continuity of the organizations of government, their missions and functions, and the antecedent ongoing commitments of government. Similarly, in private enterprise and even in nonprofit organizations (nongovernmental organizations), full-time managers and subordinates provide the basic maintenance functions within an organization, negotiate its external environment, and organize its production and marketing functions.

Realities are often more complex than this ideal-type description of bureaucracy. Sometimes bureaucratic forms exist but without the reputed benefits of expertise and efficient allocations of attention. Bureaucratic pathologies may run deep reflecting both environmental and cultural influences, shortages of resources, and incentives for suboptimal performance. These pathologies are especially notable in less developed countries. Consequently, to understand the topic better, this entry addresses the following questions: Why do we have bureaucracy? What are the relationships with capitalism and market? What is the bureaucratic state and what are its relationships with democracy? What are the internal and external pathologies of bureaucratic behavior?

Why Do We Have Bureaucracy?

In Weber's ideal-type description of bureaucracy, he noted that bureaucracy was the technically most proficient and efficient form of organization. Far from the negative stereotypes that have arisen in the contemporary era from pathologies associated with bureaucracy, Weber observed that bureaucratic organization was a necessary concomitant condition for the rise of capitalism based on economic efficiency. The rise of the modern public stock corporation separated management and ownership making the managers extremely important to the direction and guidance of the firm.

Capitalism necessitated legal-rational forms of authority. The modern corporation is itself a legal entity. Unlike a person or even a partnership, corporations have limited liability for their officers. Corporations and other types of firms require legally grounded rules in a capitalist system. Disputes must ultimately be settled through juridical means, and agreements must be carefully and legally delineated so that there is a record—what Weber referred to as "the files"—or a recorded precedent. Impersonal authority is central to a system of rational-legal authority, and bureaucracy is the embodiment of an organization defined by rules of procedure and responsive to external legal authority.

Above all, complexity requires organizational differentiation, specialization, and limited jurisdiction coordinated through a hierarchical system of authority. These crucial aspects of bureaucracy not only allow for greater efficiency, economy of effort, and expertise but also lead to problems of coordination.

Bureaucracy and Markets

On the face of it, bureaucracy and capitalism seem to live in an uneasy coexistence. One is structured by authority and legal rules, while the other in its pure form reflects an uninhibited free exchange of goods and services mediated by the price mechanism. The reality, however, is much more complicated. Sellers are not necessarily numerous, and where possible, they seek to control markets and thus influence, if not dictate, prices. Public stock corporations' interests lie in increasing the value of their stock. Rarely are consumers fully armed with perfect information as classical theories of economics assume. The rise of governmental regulation of markets and marketing practices and of the safety of products provides a means of short-circuiting the information needs that consumers by themselves would be unlikely to obtain. As a consequence, the rise, and, to some degree, the inevitable excesses of the profit motive lead to the necessity of regulation and the growth of governmental bureaucracy. Newly capitalistic systems, in fact, often suffer from a rapid expansion of production without adequate means of regulating the quality or safety of what is being produced. Such mechanisms tend to evolve in developed capitalist systems in order to counter the adverse impacts of unregulated capitalism.

The ascendency of capitalism and the modern corporation roughly parallels the rise of professionalism in government and the development of the modern state, characterized by governmental bureaucracy. Ironically, while it is sometimes claimed that capitalism rests on the free exchange of goods and services through the price mechanism and is thus antithetical to bureaucracy, the reality is that modern governments, through their bureaucracies, pave the way for markets to function by providing infrastructure, regulation of markets, transparency in market processes, and regulation of the relationships between private and public interests. In reality, states and markets have been more often collaborative than in conflict. Indeed, it is hard to imagine the effective functioning of markets without the effective functioning of government. The complexity of the modern corporation and the complexity of modern government have grown together more symbiotically than antagonistically.

The Bureaucratic State

It is hard to imagine modern government without bureaucratic capability. Weak states lack capability. And weak states are often characterized as ones affected by civil strife, lacking effective records, influenced by corruption, and unable to bring services to their populations, especially those that are remote from their capital cities. They are also typically incapable of collecting revenues in an impartial fashion. Cronyism runs amok. A professional corps of civil servants is usually absent and government is most often turned into a spoils system of tribal winners—or, as a means of keeping peace among contending factions, sometimes awarding some of the spoils to each of them. Weak states are inept precisely because they lack the desiderata of professional bureaucratic organization and a professional civil service and the resources to ensure their ability to function. Consequently, modern government and bureaucracy are nearly interchangeable. Continuity, specialized expertise, a professional corps of civil servants, the rule of law and impersonal authority, and documented records are the essence of bureaucracy and of modern states capable of governing, providing services, and collecting revenues.

For the most part, the bureaucratic state largely preceded the arrival of democratic government. It served the interests of a sovereign crown and typically led to the crown's extension of its authority and, eventually, to what we know of today as the modern state. As a result, the state bureaucracy often has been seen as a conservatizing force in society—the consolidator of existing authority rather than a challenger to it. With the growth of mass enfranchisement, the bureaucracy was often viewed as the upholder of the existing regime and a potential threat to democracy. Its power rests on its continuity and specialized expertise and its permanence and durability, while the temporarily mandated leaders of government are often in a position of dependence on the bureaucracy. In a frequently invoked phrase, are the experts on tap or on top?

One major exception to the bureaucracy–democracy sequence was the United States where mass enfranchisement among White males preceded the development of a professionalized bureaucracy. Even after a professional civil service emerged, the federal government had few responsibilities until the 1930s, when the Franklin Roosevelt administration extended the federal role into the realms of economic and business regulation, the provision of social insurance, and, ultimately, the welfare state.

There has been much discussion across many developed societies about transforming bureaucracy, lightening its load, and moving toward market-oriented incentives, but especially in the United States, the bureaucracy has been deeply controversial. There, the identification of bureaucracy with "big government" and with controversial social reforms makes it both a point of partisan division and an object of derision.

The essential point is that while a facade of bureaucracy is no guarantee of effective government, it is virtually impossible to imagine effective government without bureaucracy. That, however, does not mean that public bureaucracy will be without controversy or demands for reform to which it has been subjected especially since the 1980s. Nor does it mean that the bureaucratic organizational form is without contradictions or that it can lead to certain pathologies.

Bureaucratic Pathologies

Despite the advantages conferred by bureaucratic organization, pathologies result from the internal contradictions of this form of organization. These we will call internal pathologies. Another set of pathologies results from the ways in which bureaucracies relate to their environment. These we will call external pathologies.

Internal Pathologies

Analysts, as well as antagonists, of bureaucracy have pointed to a variety of problems stemming from the logic of bureaucratic organization. These are presented in no particular order of importance.

One pathology stems from the very system of impersonal authority and legal rationality on which bureaucratic organization is based. As a rule-driven form of organization, bureaucracies must defend decisions based on legal rulings and precedents. Consequently, bureaucracies may be short on compassion, empathy, or extenuating circumstances of case equity. Uniform procedures rather than case equity are a hallmark of bureaucratic organization. A frequent criticism of this formalism in bureaucracy is characterized by accusations directed to "faceless," "nameless," or "unfeeling" bureaucrats whose decisions defy "common sense." Actually, some studies of bureaucrats dealing with clients indicate that bureaucrats themselves often try to provide sympathy, guidance, and solace within the constraints of the law. But law is what guides bureaucracy, and this particular pathology, in reality, is a critique of the rule of law. By contrast, personal relationships often govern politics, and these relationships, in turn, generate charges of favoritism.

A second pathology stems from the command and control system of hierarchy in bureaucracies. Hierarchical authority is necessary to coordinate the various specialized jurisdictions as well as to provide an ultimate point of organizational accountability. Still, there is a continuous tension in all complex organizations between strict control from the top and devolution of authority to those at more operational levels within an organization. Paradoxically, control from the top downward produces more definitive accountability while also stymieing an organization's ability to adapt to problems it encounters on the ground. It also may encourage risk-averse behavior and a desire on the part of subordinates to keep chastening news away from their superiors. Studies of military units observe that noncommissioned officers (the bottom rung of authority) are crucial to adaptability and to organizational effectiveness. How to apportion and allocate authority in bureaucratic organizations in ways that keep it from flying apart and thus adhering to no common identity remains unresolved. At the same time, how to imprint leadership direction without imposing stultifying restrictions on operational units is also unclear. Organizations need to be responsive and adaptive to their environments but frequently cannot be if control from the top is excessively restrictive. Obviously, balance is needed, but it is unclear, certainly in the abstract, as to exactly where that balance should be struck. Without sufficient control, unaccountable behaviors may become rampant—a potential issue especially for organizations with many "street-level" bureaucrats. But too much control is likely to lead to cautious, perhaps even timid, behaviors on the part of those responsible for hands-on operations.

A third pathology of bureaucratic behavior stems from the differentiated and specialized jurisdictional character of bureaucratic organization. Especially when individuals have spent much of their careers in a given unit, they are likely to look at and define problems within the definitional context of their units. A number of studies show that each unit tends to see the "face of a problem" in a way consistent with their unit's responsibilities and the subculture of their unit. Given the tendency to search for problem definition and responses in a cognitively economical fashion, responses are apt to rely deeply on how specific organizational units define and codify responses and perpetuate them. Does this produce a cacophony of voices or a necessary diversity of perspectives? Again, a problem of finding the ever-elusive right balance appears. Organizational subunit responses are not random. In fact, they are typically predictable. But the various subunits' responses cannot all be equally satisfied, which is, of course, where leadership comes in. Differentiation and the codification and subcultural practices that stem from the distinctive component parts of bureaucratic organization provide predictability but not synthesis, which then becomes the responsibility of central organizational leadership.

Studies, even of crises, show how distinctive "the face of the problem" will appear to different organizational units in accordance with their distinct missions and their core cultures, technologies, and perspectives. Can unity and clarity of direction be woven against the backdrop of these distinctive perspectives? And can central organizational leadership coax the losers in bureaucratic battles to cooperate rather than to continue the struggle covertly?

A fourth potential pathology of bureaucratic organization is the reliance on precedent. One of the most important characteristics of bureaucracy is that it provides for continuity. Critical to continuity is the recording of precedents and the use of precedents as a platform through which to assess current issues. Precedent serves to economize on cognitive energy. Basing current choices on precedents reduces the costs of search for organizations. However, reliance on precedents may lead to a highly conservative outlook temperamentally, one that may be more wedded to the past than to the future. Bureaucracy tends to be thought of as a lumbering status quo form of organization. That is due in no small part to the emphasis on following rules and procedures and the reliance on precedents set by the organization. Ultimately, bureaucracies are expert at routinizing the previously unexpected or contingent. But once this is done, continuity with precedents becomes part of the operating modality and departures that may be required for adaptability, equity, or even sensibility become harder to achieve. Bureaucracy provides ballast and stability but by itself is unlikely to provide fresh direction.

A fifth possible pathology lies in the intersection between the individual interests of bureaucrats and collective well-being. Some analysis based on economic models, for example, suggests that bureaucrats have a stake in the growth of their agencies' funding as they themselves are apt to benefit from the growth of revenue. A more compelling interpretation, though, would propose that where the fundamental technology of an organizational unit is invested in significantly by the bureaucrats of that unit, changes in the core technology puts at risk those whose training has been part of a prior technology. The more intensive and specialized that training, the more resistance there may be to alterations in it that would threaten the status of the current technology. The usual cliché about this is that all military forces are prepared to fight the previous war. This bit of conventional wisdom may well be overstated but there is a fundamental truth behind it, and that is that no one likes to be displaced by a newer or different technology that renders one's own training obsolete. The human being inside the machinery of complex bureaucratic organization, therefore, needs to be taken into account.

In summary, the virtues of bureaucratic organization also contain the seeds of its deficiencies. Continuity, predictability, legality, precedent, and specialized expertise, accordingly, may lead to difficulties in adapting to change or recognizing novelty, difficulties in applying case equity, and problems of coordination. Hierarchical authority also can lead to a lack of sensitivity to problems on the ground. Yet a lack of hierarchical control may lead to a lack of accountability. Because these problems are built into a system of law and impersonal authority, there are no set formulas for resolving them. But they remain problems inherent in bureaucracy.

External Pathologies

Despite our dependence on bureaucracy to provide orderly processes, the virtues of bureaucracy tend to be hidden to the unschooled eye, whereas its deficiencies seem to be obvious. One of these defects lies in the rule boundedness of bureaucracy resulting in the well-known "red tape" problem. In contrast to the realm of personal authority where one may petition to have a problem fixed through political means, procedural fairness and the accountability of bureaucracy to legal and auditing requirements inevitably produces large amounts of paperwork. The objective is to reduce the improper use of funds and procedural irregularities and to ensure a record of transactions. Few people, even bureaucrats, are enthralled by red tape. Most are frustrated by it. But red tape is the product of demands for accountability and procedural regularity, especially in the public sphere. A bureaucracy notably responsive to its clienteles might be regarded as showing favoritism and evading lawful procedures. The reality is that while we extol the rule of law in the abstract, we often prefer personal relationships concretely. That is, we often want a "fixer" to deal with the complications that regularity of procedures demands. Everyone wishes to cut through the maze of red tape to get what they want, but they also want to have procedures in place to deter others from getting what is improper.

Public bureaucracies particularly are expected to be both accountable and responsive. These terms, however, are remarkably elusive. *Accountable* to what and *responsive* to whom are questions that immediately arise. There appears to be no definitive agreement as to what precisely these words mean. Often, they are used interchangeably. If, however, accountability is taken to mean being answerable to a legally grounded authorization—a constitution, a sovereign, a law, or a fiduciary responsibility—and if responsiveness is taken to mean acceptance of the demands of temporary political authorities or of agency clienteles, one can see how these ideas may come into conflict. The great dilemma is for bureaucracies to be accountable and responsive up to a point—a point, however, that rarely can or even ought to be satisfied fully. An overly responsive bureaucracy will no longer be seen as neutral, fair, or judicious. A bureaucracy, however, that is unresponsive either has succeeded in displacing the elected or, at the other extreme, has lost its political relevance. Bureaucrats need some independence from the current political authorities if they are to function properly, but the line demarcating independence and unresponsiveness is very murky indeed. To find the appropriate balance is as difficult as it is necessary. Studies of senior civil servants in many developed countries indicate that they are sensitive to their political context but are frequently concerned about the proper equilibrium between neutral competence and accountability on the one hand and political/policy responsiveness to the current authorities on the other.

From a political perspective, another criticism of bureaucracy, especially as a regulator of business is that it is a "deadweight" on the functioning of markets by imposing costs on firms that add to prices. While regulation by bureaucrats is the product of political decisions made by duly authorized governments, free market proponents believe that bureaucratic regulation diminishes economic dynamism and efficiency. Each new regulation drives up the cost of doing business and restricts the options that businesses may have available to them. When the regulatory hand is made lighter, however, risks often arise that result in crises or avoidable tragic outcomes, and the call for regulation is renewed. The proper balance between regulation and business flexibility, as with other relationships between desirable but contradictory values, is hard to define, and the proper instrumentation for overseeing and enforcing regulatory behavior is equally difficult to pinpoint.

Finally, a significant criticism of bureaucracy is that its incentive structures are all wrong. Civil servants are insulated through tenure. This insulation may lead to behavior that provides little incentive to promote efficiencies that could disturb the status quo since there is little reward for doing so. A contrast is frequently drawn with private enterprise where continuous innovation is believed to be necessary for a firm's health and growth prospects. According to this perspective, the business model is presumed to be the form of organization worth emulating, though, of course, most large-scale businesses are also bureaucracies. Administrative-reform efforts beginning in the 1980s, falling under the rubric of "new public management," essentially emphasized the business model, emphasizing the off-loading of many government functions to the private sector and providing managerial incentives to improve performance in a scaled-down public sector. The assumption was that what worked in the market place would work equally well in government. Freeing up the managers and holding them accountable for performance was one reform pathway. Creating agencies and managers with limited-term contracts was another. In at least one case, tenure itself was eliminated in the public sector.

The results of this emphasis on making government more like business are still uncertain, and the movement toward providing incentives for promoting efficiency and improved performance may rest on an as yet unconfirmed assumption that officials in the public sphere have similar motivations as their counterparts in the private sphere. In fact, what evidence there is on this matter suggests otherwise. In the business model critique of bureaucracy, performance should be based less on adherence to rules and more on results. A lessening of rules-based administration, one can imagine, would be open to extensive challenges, and a fundamental search for consistent application of law would hardly disappear. Emphasizing results, of course, requires agreement on what the results should be and on the metrics required to assess performance. It is likely that some agency missions may not be easily susceptible to clear metrics. It is also likely that some agencies will adjust the definition of their missions in ways that allow for favorable metrics even if they are peripheral to their broader, if ill-defined, missions.

Living With Bureaucracy

Not all organizations are bureaucratic and, indeed, some of the most innovative ones in the private sector tend to be flat and intermingled to some degree in their functions. However, the growth of bureaucracy reflects modernity and a system ruled by legal authority and by differentiated function. That produces annoyances such as the heavy emphasis on procedures, rules, and specialized offices whose understandings may not be fully integrated with one another. Nevertheless, bureaucracy is able to provide continuity in government, consistency in application, proficiency through specialized and limited jurisdictions, and professionalism through a full-time civil service based on merit.

The limits and critiques of bureaucracy are notable. Its virtues are also often its vices. Balancing the contradictory tensions of the bureaucratic form of organization presents a continuing challenge. There is also no doubt that much of the criticism of bureaucracy is distinctly political and has little to do with bureaucracy itself and more to do with views about the appropriate scope of government. Finally, to appreciate the advantages of bureaucracy, it is useful to contemplate life without it. It would be a world without continuity, without consistency, and with a shortage of competence. We may not like bureaucracy, but we would assuredly dislike a world without it even more.

Bureaucracy, Rational Choice Models

This entry discusses rational choice models of the bureaucracy. It first defines what it means for a theoretical model of the bureaucracy to employ rational choice and discusses two major applications of these models. It then discusses the basic assumptions underlying most models of the bureaucracy. Finally, it presents major themes and findings in the literature and discusses how these are related to modeling assumptions.

Rational choice models of the bureaucracy operate under the assumption that all relevant actors are rational. All players in the model—the government, bureaucrats, and private sector entities affected by bureaucratic decisions—have well-defined preference orderings over possible outcomes and act in a manner that ensures that their preferred outcomes are realized.

To facilitate analysis, scholars in this tradition typically assume that players' preferences satisfy several properties. It is generally assumed that players' preferences can be represented by a *utility function*, such that a player prefers outcome A to outcome B if and only if that player's utility from outcome A is greater than that from outcome B. It is often further assumed that players have consistent preferences regarding risk, so that preferences over uncertain outcomes may be represented by *expected utilities*. Many models further assume that players react to new information according to Bayes's rule (i.e., how one should change one's existing beliefs in light of new evidence).

Rational choice models of the bureaucracy tend to be game theoretic. All players are assumed to be strategic in their interactions—each player considers the strategies of all other players in attempting to reach his or her preferred outcome. Analysts derive equilibrium solutions to these models, where an equilibrium is defined as a set of strategies wherein each agent's strategy is a best response to all other agents' strategies, and agents' beliefs are consistent with those strategies.

The rational choice literature on bureaucracy has primarily focused on two, interrelated, problems: delegation and special-interest influence. Models of delegation involve a government granting authority to a bureaucratic agent. The crucial problem for the government lies in the fact that the bureaucracy may not perfectly share its preferences. The government must, therefore, oversee bureaucratic decisions and provide incentives to ensure that the bureaucracy acts in the desired manner. This problem closely relates to the branch of microeconomics known as principal–agent (or contract) theory, which examines a similar problem between firms and their employees.

Models concerned with the influence of special interests focus on the interaction between the bureaucracy and the private sector. Private sector agents may wish to manipulate the behavior of bureaucrats. The mechanisms to do so may involve bribery, appeals to bodies charged with bureaucratic oversight, or the provision of jobs to former members of the bureaucracy (following the principle of the "revolving door). Such models may also relate to delegation, as the government may wish to curtail special-interest influence and will conduct oversight accordingly.

Model Assumptions

The Preferences of Bureaucrats

Since rational choice models of bureaucracies assume that bureaucrats act to achieve their most preferred outcomes, these models critically depend on assumptions about what bureaucrats prefer. Preferences may be assumed to be *primitive*, or they may be *induced*. Primitive preferences describe outcomes bureaucrats inherently enjoy. Induced preferences are defined by actions. Bureaucrats are driven to prefer certain actions as, in equilibrium, these lead to preferable outcomes.

The rational choice literature on bureaucracies has generally defined bureaucrats' preferences in one of three ways. William Niskanen introduced the assumption that bureaucrats attempt to maximize their agencies' budget allocations. This preference is treated as primitive for modeling purposes. But Niskanen argues that the preference for budget maximization results from an implicit theory of the interaction between bureaucrats and the government. An individual bureaucrat is presumed to attempt to maximize his or her salary (both currently and in the future) and prestige. Both salary and prestige depend, in part, on the budget of the bureaucrat's agency. Since the bureaucrat's salary and prestige are assumed to be improving in the budget allocated to the bureaucrat's agency, the bureaucrat acts to increase this allocation.

Other models of bureaucracy work with assumptions regarding bureaucrats' primitive economic preferences. Like other economic agents, bureaucrats attempt to maximize consumption and leisure. Such models may be used to *derive* induced preferences over actions. For instance, *career concerns* models predict that bureaucrats act to maximize their reputation in time t because this reputation affects their career prospects, and thus consumption, in time $t + 1$. This result is an equilibrium prediction from the model—an author of a career concerns model need not assume that bureaucrats have primitive preferences regarding their reputation.

Finally, many models of bureaucratic politics treat bureaucrats (and governments) as having preferences over policy outcomes—that is, ideological preferences. Ideological preferences are generally treated as primitive. Individual bureaucrats may have inherent preferences over policy outcomes—a reflection of their individual political ideology.

Alternatively, ideological preferences may be treated as induced by an unmodeled interaction between bureaucrats and other entities. For instance, many models of the American bureaucracy assume that agency preferences reflect those of the president. Because the president is able to appoint and remove many agency heads, it is assumed that bureaucrats will behave *as if* they share the president's ideology.

Information

The information available or not available to players shapes their strategies to achieve their preferred outcomes. In models of delegation, it is typical to assume that bureaucratic agencies have an informational advantage vis-à-vis the government. The government delegates rule-making authority to agencies because bureaucrats have technical knowledge and experience that are not available to the average member of government. Governments may be less able than bureaucracies to design policies to achieve desired outcomes.

Other forms of informational asymmetries may also be incorporated into models of the bureaucracy. For instance, if the government cannot perfectly observe the skill or ideology of potential bureaucrats, it is faced with a problem of *adverse selection*. In models of adverse selection, the government must conduct oversight and provide wages keeping in mind the type of agents these incentives will attract. For instance, if some possible recruits are willing to engage in corruption, while others are not, sufficiently low wages may attract corruptible recruits who are better able to supplement their salaries with illicit income.

If the actions of bureaucrats in office are only imperfectly observable, then governments are faced with a problem of *moral hazard*. It is important to note that moral hazard is only an issue if outcomes are also imperfectly observable or are imperfectly determined by bureaucrats' actions. If bureaucrats' actions perfectly map into observable outcomes, then the government can accurately deduce bureaucrats' behavior based on these outcomes. However, if this is not the case, then the government must conduct oversight in a manner that minimizes the costs of moral hazard. These costs arise because the government is not able to optimally reward and sanction agent behavior. Instead, it can only respond to outcomes that imperfectly reflect this behavior.

Finally, all players may lack information over the future composition of the government due to political uncertainty. Members of the current government may be replaced by elections, coalition realignments, retirement, or death. As new individuals enter government, the ideological preferences of the government may change. All players in the model are therefore uncertain of future government policy preferences.

Government and Bureaucratic Structure

The final elements in a model of bureaucratic politics are assumptions about the number and composition of players. Models of delegation must include, at least, a unitary government and a single representative bureaucratic agent. Similarly, models of interest-group influence require at least a representative bureaucrat and a single special-interest group. But more sophisticated models may incorporate more realistic assumptions about the number of players and their interactions—with important effects on equilibrium outcomes.

For instance, models may vary the number of players considered to be in the government. Some models may incorporate the existence of multiple legislators or the separation of powers between branches of government. Such a model is said to include *multiple principals*.

Similarly, bureaucracies may be modeled as consisting of multiple bureaucrats or multiple agencies. Models incorporating more than one bureaucrat are said to feature *multiple agents*. Bureaucrats or agencies may be redundant—that is, assigned to similar or identical tasks. Alternatively, some agencies may be granted oversight authority over others.

Finally, all models of special-interest influence—and some models of delegation—incorporate private sector agents. These may be one or more firms seeking to maximize profits, one or more citizens or groups thereof with ideological preferences, or groups of consumers. The number and composition of these interests affect their interactions with the government and the bureaucracy.

Models of Delegation

As noted above, models of delegation involve a government's decision to grant authority to a bureaucratic agent, who may not perfectly share the government's preferences. These models are used to derive predictions about which bureaucrats will be appointed, how they will perform in office, what forms of oversight will be employed, and how much discretion they will be granted. These predictions will depend, in part, on assumptions regarding the preferences of—and information available to—all players, as well as the number and composition of players in the model.

Appointment

Models of appointment attempt to deduce which candidates will be selected for bureaucratic office, where candidates vary on some dimension. Typically, models of appointment assume that candidates for bureaucratic office have primitive preferences over policy, and candidates vary in their preferred policies.

In most settings, models of bureaucratic appointment predict that governments will appoint officials whose primitive ideological preferences are most proximate to the government's own. This finding is known as the Ally principle. The logic of this finding is straightforward: If a bureaucrat is granted discretion to implement policy, his or her policy choice will be dictated by his or her preferences. The closer the bureaucrat's ideological preference to that of the government, the more the government can expect to benefit from the bureaucrat's policy choice. This principle relates closely to the literature on attempts to politicize the bureaucracy.

However, the Ally principle may be violated under conditions of uncertainty. Assume now that candidates for office vary not only in their ideological preferences but also in their technical knowledge. More precisely, assume that some candidates are better informed of the mapping from policies into outcomes than are others. In this instance, the government may prefer to appoint a more knowledgeable candidate with preferences more removed from its own over an ill-informed candidate with proximate preferences. The ideologically proximate candidate may be unable to ensure that the policies he or she would adopt in office would, in expectation, lead to outcomes that the government prefers over policies that the more ideologically distant—but more competent—candidate would adopt.

The Ally principle may also fail to hold in settings where bureaucratic appointees interact with other players in formulating policies. For instance, a government may prefer to appoint a central banker who is more inflation averse than the government itself. This result holds because policy outcomes—here inflation and unemployment—reflect the interaction between the central banker and the public. Central bankers cannot commit to implement policies they do not prefer. Therefore, if the central banker is not inflation averse, the public will expect him or her to attempt to generate unexpected inflation—thus reducing unemployment. These inflationary expectations produce inflation—and no reduction in unemployment—in equilibrium. However, if the central banker is inflation averse, the public will expect inflation to remain low—a more favorable outcome for the government.

Bureaucratic Slack

A second major concern of models of delegation is the danger of bureaucratic slack. Bureaucrats are said to be shirking—yielding slack—when they exert little or no effort in their duties. Slack is typically a feature of models wherein bureaucrats are assumed to have economic preferences—they maximize consumption and leisure. Slack thus occurs when bureaucrats face insufficient incentives to forgo leisure.

Questions of bureaucratic effort are intimately linked to the power of the incentives bureaucrats are offered. Incentives are said to be *high powered* when rewards and punishments are heavily conditioned on outcomes. They are *low powered* when rewards and punishments are largely independent of outcomes. Low-powered incentives tend to increase slack.

The degree of bureaucratic slack will also depend, in part, on the structure of information in the model. In particular, moral hazard will tend to increase shirking. The rationale behind this result is intuitive: If the government is unable to determine the degree of effort exerted by bureaucrats, it will be difficult to reward or punish this effort. It is therefore difficult to encourage bureaucrats not to shirk.

Slack will also be affected by the number of players with authority over the bureaucracy. Models with multiple principals will tend to have lower-powered incentives and greater slack than models with a single principal. Slack will also tend to increase as the interests of the principals diverge. So, for instance, one might expect greater bureaucratic slack to occur when powers are separated between branches of government and when different parties dominate each branch.

The presence of multiple government principals may produce bureaucratic slack for one of two reasons. First, multiple principals may all try to induce bureaucrats to behave in their preferred manner. If principals have different interests, these incentives will tend to conflict, offsetting one another. This type of model is most likely to make sense when depicting a lower level bureaucrat with multiple overseers.

Alternatively, multiple agents within the government (e.g., legislators) may need to coordinate to punish or reward a bureaucrat for his or her performance. As the number of legislators with conflicting interests rises, it grows less likely that a reward or punishment will be agreed on.

Slack will also be affected by the presence of multiple bureaucratic agents in a model. Redundancy—the assignment of an identical task to more than one bureaucrat—will tend to increase slack when bureaucrats only care whether one member of a team performs a task successfully. Such a situation may result if, for instance, multiple police officers are assigned to a given case and all share credit if the case is successfully solved. In such a situation, each officer prefers to shirk while the others work on the case. He or she then might enjoy leisure time and benefit from the rest of the team's efforts. Since all officers have the same preference for slacking, no officer will exert the optimal amount of effort in solving the case. As a result of this problem, the probability that at least one member of the team solves the case may not rise with the number of officers assigned.

However, in situations characterized by moral hazard, redundancy may reduce slack. In such a situation, the government may compare the performance of one bureaucrat or agency with that of other bureaucrats or agencies charged with the same task. This comparison will allow the government to deduce better the level of effort exerted by the agency and reward or punish it accordingly.

Low-level bureaucrats may also slack in models where the bureaucracy assumes a tiered structure, such that some agents are given oversight authority over others. In such a system, low-level bureaucrats will tend to face low-powered incentives. Were they to face high-powered incentives, low-level bureaucrats may attempt to bribe their overseers to ignore poor performance. As the power of their incentives increases, low-level bureaucrats have greater reason to collude with their overseers and are thus willing to pay larger bribes. The government will thus optimally reduce the power of incentives faced by low-level bureaucrats so as to deter such collusion.

Bureaucratic Drift

Bureaucratic drift refers to the phenomenon wherein bureaucrats adopt policies that differ from those preferred by the executive or legislature. Drift is therefore typically a concern in models in which bureaucrats have preferences over policy. Drift results when bureaucrats are given discretion to implement their preferred policy outcomes.

Drift is typically controlled through one of two mechanisms: *ex ante* limits on bureaucratic discretion or *ex post* review of bureaucratic decisions. The former refers to legislative limits that prohibit certain policy positions from ever being adopted. The latter refers to the ability of other government entities (the legislature, the courts, etc.) to review and overturn bureaucratic decisions. These two mechanisms act as substitutes in preventing bureaucratic drift—as *ex post* review becomes more difficult, *ex ante* discretion is likely to decline.

The extent of bureaucratic drift will be affected by the extent of the informational asymmetry between the bureaucracy and the government. The more technically knowledgeable the bureaucracy, relative to the government, the fewer *ex ante* limits on discretion. As levels of discretion expand, the bureaucracy has greater latitude to implement its own ideological preferences.

Adverse selection may also affect the degree of policy drift. A provocative recent paper demonstrates that the degree of policy discretion afforded to bureaucrats may affect their willingness to remain in office and to acquire policy relevant expertise. Policy-motivated bureaucrats will be more likely to invest in acquiring expertise if they are granted discretion. To the extent that discretion is limited, policy-motivated bureaucrats will value office and expertise less. Such officials will be less willing to exert effort to arrive at correct decisions when discretion is limited. In other words, policy drift may be a necessary cost for an informed bureaucracy.

The number of government principals may also play a role in bureaucratic drift. If these principals must coordinate to overturn bureaucratic decisions—as in a legislature—their ability to exercise *ex post* review may be limited. The greater the number of principals and the more conflicted their interests, the less likely *ex post* review will be exercised. To combat the resultant danger of drift, *ex ante* restrictions on bureaucratic discretion will tend to rise.

Finally, the threat of changes to the governing coalition may affect drift. Suppose that the government at time t fears that it will be replaced by an alternative government with divergent preferences in time $t + 1$. To the extent possible, such a government prefers to lock in current policy choices, limiting the policy discretion of successor governments. One means of so limiting policy discretion is to adopt administrative procedures that limit the oversight authority of future governments. Since future governments may use their oversight powers to force through undesirable policy changes, the government at time t will seek to insulate the bureaucracy from such oversight.

Models of Special Interests

Models of the interaction between special interests and the bureaucracy are centrally concerned with when, and whether, special interests will be able to influence bureaucratic decisions. Influence may emerge through a number of mechanisms: bribery, offers of future employment, and appeals to the government to review bureaucratic decisions. Influence might also be exercised through more subtle mechanisms—for instance, through threatening appeals to overseers. Special-interest influence may affect the agency relationship between the government and the bureaucracy and the decision of whether or not to delegate authority to bureaucrats in the first place.

Capture

A particular concern of models of the interaction between special interests and the bureaucracy is whether bureaucrats—most particularly regulators—will collude with the citizens or the industry they are meant to regulate. This collusion is commonly termed *capture*. In models of bureaucratic politics, capture is typically modeled using the assumption that bureaucrats have primitive economic preferences and/or are influenced by career concerns. This assumption ensures that bureaucrats may be motivated by bribes or the promise of future employment in the regulated sector.

When models of capture incorporate the agency relationship between the bureaucracy and government, they assume that the government is faced with the problem of moral hazard. If the government had perfect information regarding the actions of the bureaucracy, it would be able to observe, capture, and punish the offenders directly.

Capture may be deterred by legal institutions that investigate the bureaucracy. All else being equal, bureaucrats will be less willing to accept bribes as the risk of detection and punishment rises. Capture may also be deterred by the payment of an *efficiency wage*—a wage above what bureaucrats would receive from alternative employment. The efficiency wage raises the costs to the bureaucrat of being removed from office and thus deters malfeasance.

Appeals to Overseers

Special interests need not resort to bribery to influence the bureaucracy. They may be able to influence bureaucratic decision making simply through the use—or threatened use—of oversight mechanisms. The threat of appeals to the government or to the courts may be sufficient to dissuade the bureaucracy from performing its anointed tasks.

It has long been recognized that special interests may play a role in overseeing bureaucratic performance. Interested members of the public may review bureaucratic performance and report malfeasance or slacking to the government. This form of oversight is frequently termed *fire alarm* oversight and has the advantage of being costless to the government.

However, private sectors entities may be self-interested in their decisions to sound fire alarms. A fire alarm oversight may therefore result in biases in favor of special interests. For instance, an interest group may only report bureaucratic malfeasance if bureaucrats act in a manner that harms that group's interests. Bureaucrats may thus be tempted to favor special interests to avoid review. A government interested in preventing interest-group influence may therefore need to rely on active investigations into bureaucratic decisions in place of, or in addition to, fire alarm oversight. Such investigations are termed *police patrol* oversight.

It is possible that special interests may exercise influence without resorting to the oversight process. The mere threat of appeals to the legislature or courts may prove sufficient to deter regulators. One model of such deterrence assumes that an interest group can signal its willingness to appeal bureaucratic decisions by making campaign contributions to legislators. These contributions act as costly—and informative—signals of the interest group's willingness to contest bureaucratic decisions. The interest group is thus less likely to be regulated as it contributes more to political campaigns.

Bureaucracy, Street-Level

Throughout the world, legislators and government administrators have increasingly called for greater accountability and improved performance in the delivery of public services, reflecting in part the continuing influence of the theory of new public management that stresses more market-based approaches to service delivery and increased responsiveness to citizens and communities. The worldwide financial crisis has further intensified the pressure on government to improve the efficiency and effectiveness of services.

The performance and accountability movement puts the spotlight on the central role of street-level bureaucrats in the development and implementation of public services. As defined by Michael Lipsky in 1980, street-level bureaucrats comprise workers who interact directly with citizens by providing a valued public service; they include teachers, police officers, case workers, physicians, mental health counselors, and home health workers, and they typically possess a substantial degree of discretion over their work. Importantly though, this discretion is bounded by the restrictions on individual choice placed on street-level bureaucrats by factors common in public and nonprofit agencies, including resource constraints, difficult working conditions, and vague and sometimes conflicting expectations on performance. To cope with these work-related challenges, street-level bureaucrats can sometimes reach decisions that are at variance with the rules and procedures of the agency. Thus, the discretion of street-level bureaucrats can result in policy implementation at odds with the goals and priorities of top administrators, legislators, and the citizenry.

Historically, street-level workers occupied key positions in public agencies. Indeed, the growth of the welfare state in advanced industrial countries in the 20th century typically entailed substantial expansion in the ranks of public sector workers, especially in regions such as the United Kingdom (UK) and the Scandinavian countries. However, in some countries such as Germany and the Netherlands, governments worked in close alliance with large nonprofit organizations who provided social and health services, staffed by countless numbers of street-level workers. The ranks of street-levels workers rose sharply around the world in the 1960s and 1970s with the expansion of the welfare state in policy areas such as health care, social services, criminal justice, and education.

Many of these programs in the United States and abroad encountered serious implementation problems prompting a subsequent reassessment of public services and the role of street-level bureaucrats in service provision. As a result, street-level practice has changed profoundly in the past few decades. First, street-level bureaucrats in social and health care are much more likely to work in a nonprofit or for-profit service agency due to a sharp rise in government contracting for services with these agencies. Indeed, the expansion of services such as home care, community care for the disabled and elderly, substance abuse treatment, and workforce development has been almost entirely through government contracting with private nonprofit and for-profit agencies. While this increase in contracting is particularly pronounced in the United States, it is also evident in many other countries, including the UK, Australia, New Zealand, and Germany.

The growth of contracting has been accompanied by new performance management strategies, including performance contracting, intensified testing, more rigorous practice standards, and outcome evaluation. Overall, these strategies are often an attempt to control the discretion and autonomy of street-level workers. For instance, performance contracts in welfare-to-work programs include specific expectations for street-level workers on the target program goals and sanctions for the agency if these goals are not attained. Similarly, policies promoting "evidence-based practice" seek to enhance the extent to which street-level workers such as mental health counselors or child welfare case workers adhere to professionally recognized standards of best practice. Recurrent fiscal crises of government have also forced public and private agencies to implement new policies to increase the productivity of street-level workers, with corresponding limitations on their ability to depart from established practice standards.

Importantly, the emphasis on productivity by street-level workers is also a ripple effect of intensified competition among service agencies. The paradigmatic street-level bureaucrat of earlier eras possessed autonomy and discretion and was largely immune from market pressures; teachers, child welfare workers, and physicians certainly fit this model well. Currently, though, private nonprofit and for-profit agencies in many countries and jurisdictions actively compete with each other for government grants and contracts as well as private fee income (and in the case of nonprofit agencies, charitable donations). The degree of competition, though, varies tremendously. Rural areas, for example, may lack a sufficient supply of providers to create a competitive market. Government rules and regulations also may affect the supply of providers. Nonetheless, the shift toward more competition in services is a worldwide trend that is evident even in countries with comprehensive welfare state policies and long-standing traditions of private agency and professional autonomy.

Competition in services is also fostered by the growing trend for more individual choice and control in service delivery. The classic street-level bureaucrat working in a large public or nonprofit agency existed within a top-down hierarchical authority system where individual clients had little control or choice in the street-level workers or agencies from whom they received service. In this role, street-level bureaucrats played a key role in constructing the identity of service recipients as well as their access to services and their very understanding of their service rights and expectations.

Changes in the Bureaucrat–Client Relationship

Two developments are changing this street-level bureaucrat–client relationship, although national, regional, and local practices vary tremendously. First, governments are employing a more diverse set of policy tools to address public problems, including vouchers and quasi vouchers and tax credits and deductions. Vouchers in child care, education, housing, and substance abuse treatment can be a more empowering way to engage clients in key decisions regarding their public services. For instance, in community care services for the disabled, individual client accounts have been established by government, allowing the disabled individual to purchase needed services directly, rather than relying on street-level workers. The widespread use of vouchers and quasi vouchers and different forms of payments to private agencies has restructured the contracting relationship so governments have shifted away from direct contracts with an agency to funding support that is tied to the individual citizen users. This funding relationship is inherently more unstable from the contract agency's perspective and puts further competitive pressure on the private service agency and its frontline workers.

The diversification of policy tools is also indicative of a second trend: broad interest and support for individual choice and control in service decisions, evident in vouchers; tax credits for services such as child care; government-subsidized client accounts to purchase needed services; and regulations requiring or promoting greater choice. Over time, this shift is likely to transform the work of street-level bureaucrats who will need to be responsive to client goals and priorities in order to compete effectively for client service dollars.

Greater client choice reflects growing worldwide interest in "coproduction," or the idea that important services such as mental health or community care are coproduced between the street-level worker and individual clients; thus, street-level workers need to pay heed to client motivation and goals in order to achieve successful programmatic outcomes (John Alford, 2009). Coproduction is also related to the concept of "backward mapping," advanced by Richard Elmore (1979/1980), who argued that policymakers should begin the formulation of policy by examining the interactions between clients and street-level bureaucrats. With this information, policymakers should be able to design more effective programs.

In recent years, the coproduction approach has broadened to incorporate more active engagement of clients and community organizations in the work of street-level bureaucrats. Indeed, street-level bureaucrats may need to work with several different public and private organizations on behalf of an individual client. Many service programs are designed at their inception as public-private partnerships with hybrid governance structures representing an array of different local interests and organizations. Thus, the governance of street-level work is vastly more complicated today than in the past, with street-level bureaucrats often engaged with multiple internal and external stakeholders in vertical and horizontal relationships. Consequently, sound policy design is even more important to successful policy implementation today than in the past.

This evolving role of street-level bureaucrats has profound implications for citizenship. Teachers, police, case workers, and emergency shelter staff, to name a few, provide valuable public services that may determine the life chances of individual citizens. As the welfare state grew, so did the ranks of street-level bureaucrats and their importance in providing social benefits such as health care and education essential to full citizenship. Yet street-level bureaucrats can also directly affect the political participation and civic engagement of citizens, so street-level workers also can significantly shape political rights as well.

The capacity of street-level bureaucrats to engage in effective coproduction—and effective services in general—may be severely limited by the intensifying market and accountability pressures facing public and private service agencies. Quality street-level practice requires an ongoing investment by government in training and education. To the extent that street-level workers are engaged in contracting and partnerships, new skill development is often essential. Moreover, the investment obligations of government are not limited to support for public sector workers; the staff and volunteers of private nonprofit and for-profit agencies receiving government contracts require ongoing technical assistance and capacity building to provide responsive, effective services. In an era of scarce resources for public services, street-level bureaucrats will need to work actively with allies in the public and private sectors to create advocates for the value and key importance of public services for all citizens.

Cabinets

Cabinets are small organizational units within governments that consist of politicians who are responsible for the overall policy performance of the government. This entry first describes the history of cabinets and their functions under various forms of government. It then discusses a framework for the analysis of cabinets, which must consider the structural characteristics of the political system, the roles of political parties and of individual ministers, the behavior of the prime minister, and the power of the prime minister's office. Last, the entry describes important tasks for future research on cabinets worldwide.

Historical Origin and Functions

The notion of a cabinet derives from the designation "Cabinet Council," first given in Britain by the king in 1622. The monarch counted on this inner core of privy counselors to legitimize his or her political decisions and thereby his or her duration in office. With the emergence of the modern state in the 19th century, monarchs lost power, and newly developed political parties subsequently replaced their authority. As stressed by John Mackintosh (1968), after these mass parties had come into existence in the 1860s and 1870s, the contemporary structure of the modern cabinet system became visible. Today, a cabinet is a small group of politicians (mostly ministers) responsible for political decision making in countries that have a form of government known as cabinet government (i.e., in Western and Central Eastern Europe and much of the Balkans; in many Commonwealth countries such as Canada, Australia, New Zealand, India, Malaysia, and Singapore; in most ex-British Caribbean and Pacific Islands; in Japan; and in Israel).

Cabinets may also exist in constitutional presidential systems (typically in the Americas), in authoritarian presidential systems (e.g., in Africa and in parts of Asia, including the Middle East), or in traditional monarchical systems (e.g., in the Middle East). In these political systems, however, members of the cabinet serve purely as advisors to the president or the monarch. They are not—as in cabinet government systems—dependent on the majority support of parliament for their duration in office or for getting legislative proposals approved.

In cabinet governments, individual members hold a collective responsibility, which stipulates that all cabinet members are bound to cabinet decisions. They may disagree with these decisions in private but must agree in public. As chairman of the cabinet, the prime minister wields a power that is generally seen as superior to the other cabinet members ("first among equals"). The cabinet members, at least its chair, are responsible to parliament and are expected to control the executive and the legislative branches.

Such cabinets can function satisfactorily only if an equilibrium is found between two opposite requirements—those of representativeness and of efficiency. As Jeffrey Cohen (1988) notes, the requirement of representativeness means that decision making is in the hands of the whole cabinet and not, as, for instance, in the presidential system, in the hands of the leader of the government alone. A cabinet government has therefore to be "collective": Decisions are taken "together." This requirement of "togetherness" is regarded as central to the cabinet system because such a mode of operation is felt to be a more liberal, more democratic, and therefore a superior form of decision making.

Yet this representative-cum-collective principle runs directly against the requirement of efficiency, as efficiency entails that decisions be taken speedily despite the continuous increase in the number and complexity of these decisions. Since representativeness entails togetherness, decisions are likely to be taken only after substantial discussions. This may mean delays in elaborating compromises or even, in cases of extreme conflict, the fall of the cabinet. Bernard Grofman and Peter van Roozendaal (1997) note that because the fall of a cabinet is mostly associated with political crises, cabinet stability becomes the key test of the success of all cabinet systems and the number-one indicator of the performance of cabinets.

Framework for Analysis

In the contemporary literature, such as the work of Jean Blondel and Ferdinand Müller-Rommel (1997, 2001), cabinets are analyzed in the context of the constitutional setting, of the cabinet structure, of the external and internal life of cabinets, and of the decision making among their members.

Constitutional Setting

The general setting of cabinets is provided in broad terms by constitutions. Although constitutions usually give only a little attention to the organization of cabinets, they typically devote more space to matters of appointment and dismissal of cabinet ministers, in particular to the role of the head of state in this respect. Constitutions may, for instance, give the head of state the power to participate in the formation of cabinets (as in France, Finland, Belgium, Bulgaria, and the Baltic States and in Poland until 1993). Constitutions may also foster cabinet stability, for instance, by making it relatively difficult for parliaments to pass "no confidence" motions against the prime minister or other ministers. Future research needs to analyze more systematically the constitutional powers of presidents, prime ministers, and ministers in different cabinet systems.

Internal Operation of Cabinets

The cabinet structure is foremost determined by its size and by its organizational subunits. Most cabinet governments tend to have around 20 members on average. Because these cabinets are too large to be fully involved in all aspects of decision making, cabinet meetings must be well structured and well prepared. In this context, prime ministers, cabinet committees, and cabinet secretariats play an important role. Although the power of prime ministers varies significantly across countries, they are usually more influential in cabinets based on a majority party than in coalition cabinets. Cabinet committees have been set up in many cabinets to speed up the decision-making process. These committees are different in size and status, but they usually include relevant ministers, junior ministers, and civil servants who prepare filtered suggestions for cabinet decision. Some committees are composed only of civil servants who aim to iron out problems that might occur among the different governmental departments. Cabinet secretariats or prime minister's offices, on the other hand, ensure efficiency in cabinet decision making. They control the flow of proposals coming to and emanating from cabinet meetings and resolve problems over proposed agenda items in advance of the cabinet meeting. Studies conducted in parliamentary democracies have shown that the impact of prime ministerial staffs on cabinet government can be excessive. The functions of these staffs range between an administrative and a political pole. These officials act administratively when organizing meetings of the cabinet and the flow of business between prime minister and ministers. They also play a part in the development of long-term ideas about cabinet activities and on the improvement of cabinet decision making, but these forms of activities are never wholly administrative. In most cases, they affect the political operation of the cabinet. Future research must therefore consider, in a systematic and comparative manner, not just personnel and budget but also the actual tasks of the prime ministers' offices.

Impact of External Actors on Cabinets

The operation of cabinets is strongly affected by political parties, parliaments, bureaucracy, and other external actors. Political parties clearly have an impact on the formation, the composition, and the development of cabinets. This impact depends on the overall number of parties in the cabinet (single-party vs. multiparty government) and the type of cabinet coalition (e.g., with or without a dominant party, minority vs. majority party governments). There is usually a stronger battle between cabinets and parties in multiparty coalitions than in one-party majority governments.

The impact of parliament, civil servants, and other political groups on cabinets is closely tied to the role of parties and to the character of coalitions. In some countries, parliaments have substantial power; for example, they may be able to prevent political parties from revolting or erupting. This appears to be particularly true in coalition governments. The impact of civil servants, on the other hand, depends on their position within the administration. The higher civil servants are ranked, and the closer they are to the ministers, the greater their impact on the preparation of cabinet decisions. The role of other external groups in the life of the cabinet can be seen as similar to that of political parties. The most important interest groups are usually linked to specific parties and thereby exercise an indirect impact on cabinet proposals.

Decision Making

Cabinet decision making takes place in the context of a conflict among many patterns of relationship. There are, for instance, differences in the extent to which cabinet meetings are genuinely involved in decision making rather than simply ratifying proposals made by other bodies. The efficiency and effectiveness of cabinet decision making to a large extent depend on the ministerial experience and behavior of prime ministers. Studies on cabinet government have shown that ministers with greater political experience or greater expert knowledge can be expected to exercise more influence on cabinet decision making than other cabinet members. Future research on cabinets has therefore to collect more information on the social background and the careers of ministers under comparative perspective. Further, to understand ministerial behavior, one must know what ministers think about their own work, the work of their colleagues, and the part played by the cabinet meeting itself. If cabinet decisions matter, cabinet members also matter; it is therefore essential to find out how ministers view their role in cabinet government. This means interviewing (former) ministers—an enterprise that is long and complex but is surely rewarding. Cabinet decisions are also affected by the behavior of prime ministers as heads of cabinets. Prime ministers are "arbitrators" or "activists" with respect to the implementation of cabinet policy goals. If they are arbitrators, prime ministers may not be involved personally in policy proposals and must be content with moving the cabinet toward an acceptable solution. If they are activists, they are likely to be deeply interested in particular proposals and to attempt to push these proposals through cabinet. A systematic comparative investigation of cabinets has therefore to develop a typology of prime ministerial leadership style and to relate this typology to the different phases and aspects of cabinet decision making.

Directions for Future Research

Given the difficulties that most cabinets in democratic countries currently face, a common theory about the functioning of cabinets needs to be developed. This theory needs to take into account five key factors that are responsible for the general functioning of cabinets in democratic countries: (1) the structural characteristics of the political system, (2) the role of the political parties, (3) the role of individual ministers, (4) the leadership style of the prime minister, and (5) the administrative characteristics of the prime minister's offices. Systematic research on the functioning of cabinets has first to focus on these five aspects in succession to obtain reliable and comparable information about cabinet governments worldwide. Meanwhile, hypotheses linking these five aspects need to be formulated and tested. This is a vast undertaking, especially since the principles of classification still have to be elaborated in a number of ways. If such an approach is adopted, however, it will become possible to discover and assess the explanations that account for the operation of cabinets.

CAPITALISM

Since the early 20th century, the concept of capitalism has been used to capture the structure and dynamics of a particular historical formation of economy and society that first emerged during the late Middle Ages in Southern Europe and later spread to Northwestern Europe. Capitalism emphasizes the attainment of profit through the operation of the market and private ownership of the means of production. This entry describes the role of markets and property rights in capitalism and examines the functions of firms and institutions in its operation. The characteristics of capitalist culture are then discussed. The entry closes with a review of endogenous critiques of capitalism and of the shape it may take in the future.

Since its beginnings in Europe, capitalism has expanded to virtually all parts of the globe. Capitalism can be contrasted with subsistence economy, feudalism, socialism, and slave economy. Third World developing societies may contain insular capitalist patterns in their economy without thereby becoming capitalist *societies*. Comparative social scientists and historians have distinguished a great number of stages, types, qualifiers, and variants under the broad umbrella concept of capitalism, such as agrarian, commercial, industrial, and financial capitalism; state capitalism and coordinated capitalism; and Nordic, Anglo-Saxon (chiefly British and American), East Asian, and "Rhenish" capitalism.

Most scholars who use the concept of capitalism in a holistic way view it not only as an economic system but also as comprising a type of social structure, political institutions, and specific cultural norms and values. The complementarity, goodness of fit, and range of variation that exist among these realms—essentially the realms of capitalist interests, institutions, and ideas that together make up capitalism—have been the focus of social science analysis since the pioneering works, around the turn of the 19th century, by Max Weber and Werner Sombart to contemporary research on comparative capitalism. On the European continent, the use of the term *capitalism*, in both political and academic contexts, almost always had critical overtones. Authors who wish to avoid such connotations use "social market economy," "industrial society," or simply "modern society" instead; however, such usage may cause them occasionally to lose sight of the *problèmatiques* and insights of those classical authors of social science.

Defining Features of Capitalism

There are six defining features of capitalism: (1) *markets*, (2) *property rights*, (3) the role of private *firms*, (4) politico-economic *institutions*, (5) capitalist patterns of the cognitive and normative *culture* (Weber's "spirit" of capitalism), and (6) reflexive dynamics of *critique* that are specific to capitalist societies. Theorists differ as to the emphasis they attach to each of these components of capitalism. The study of capitalism is a highly interdisciplinary field of investigation to which historians, economists, sociologists, lawyers, political scientists, and philosophers have significantly contributed.

Markets

Capitalist societies are based on economic systems in which most goods and services are bought and sold in markets for a monetary price, thus making them commodities. The commodification of goods makes for the contingency of economic transactions, meaning that the parameters of these transactions—who buys from and sells to whom and what commodity at which point in time and at what price—become a matter of continuous choice and an ongoing competitive recombination of social relations. Market transactions are governed by a regime of social norms and legal rules (law of contract) that is enforced by a neutral state-operated court system and that specifies the mutual rights and liabilities of agents entering into economic transactions. These norms and rules are designed to rule out the use of openly predatory practices such as individual or organized violence, fraud, theft, deception, conspiracy to deny potential suppliers market access, to some extent even practices of cartelization and monopolization, and bribes as "unfair" means employed in the pursuit of economic gain. To the (historically highly unlikely) extent that such rules are fully implemented, we can speak of a civilizing function of market competition, ideally leaving only prices and qualities/novelty of goods as action parameters of competitors. Yet as prices are "given" in any (nearly) perfect (or "atomistic") market, suppliers are under strong incentives to innovate both products and (technical and organizational) production processes. Markets determine prices in response to changes in the volume of supply of and demand for specific goods and services. The prominent role of choice, contingency, and civility in economic interaction has led theorists such as Milton Friedman (1962) to equate capitalism with individual freedom. Markets make people "free to choose."

Yet a defining feature of capitalist market societies consists in the fact that not only goods and services manufactured for the purpose of being sold but also the "factors of production" employed in the process of manufacturing are subject to market exchange under capitalism. Even though these factors—natural resources, human labor power, and money—have not been "produced" (and certainly not produced with the intention of being marketed), they are still subsumed under the commodity form. This "commodification of noncommodities" has been attacked, both in the Marxist tradition and famously by Karl Polanyi (1944), as the core contradiction of capitalism—that is, a source of conflict and instability that constantly calls for (interventionist, reformist, revolutionary, authoritarian, military, etc.) remedies and institutional safeguards to be installed by holders of political power. The commodification of money through speculative investments, with their potentially disastrous effects on financial markets; the commodification of natural resources with their associated environmental damages; and the commodification of human labor power with its distributional and other adverse impacts can all be cited as contemporary instances of this key "mistake" of commodifying what by their very nature are noncommodities, or "fictitious" commodities. Thus, one defining feature of a capitalist society and its dynamics is the existence of a labor market in which the capacity of workers to perform productive services is being traded under labor contracts.

Such commodification of noncommodities has provided for the enormous gains in efficiency, growth, and prosperity that have accompanied the history of capitalism. While under capitalism the commodity form is extended to noncommodities, it is on the other hand restricted (compared with precapitalist monetized exchange relations) to items of "economic" value—that is, excluding items such as positions in the state administration, court decisions, academic titles, marriage licenses, or, most important and since the abolition of slavery, human beings themselves, who are instead governed by the principle of inalienable "self-ownership," a concept that has its roots in the work of theorists such as John Locke.

By exposing labor to market contingency under the regulatory regime of the labor contract, capitalism inserts workers into the organizational framework of productive organizations (firms), which, due to the division of labor, organizational control mechanisms, and efficiency-enhancing investment goods, allow labor power to be used much more productively than was the case in precapitalist forms of production. Yet the reverse side of this growth and prosperity lies in the commodification of (nominally "free") contractual labor and the distributional patterns as well as the contingencies following from it. Not only does the individual employer exercise power (as authorized by the labor contract) over the employees within the firm, but the collectivity of all employers also exercises "structural" or class power over the labor force as a whole. The latter arises from the fact that labor is tied to capital in a relationship of asymmetrical dependency. Because wages are normally workers' only source of subsistence, workers typically depend more urgently on being employed than employers depend on employing labor, or at least on employing it "here, now, and continuously." One important cause of this asymmetry resides in the fact that employers are in control of (as well as incentivized through competition to put to use) productivity-enhancing and hence of labor-saving technical and locational change, whereas workers, by themselves, can do little (if anything) to enhance the "welfare yield" of the wages they earn and spend. The process that has been set up by the fundamental capitalist institutions of the labor market and the labor contract can thus be looked on as a "wealth-maximizing game" and, at the same time, a "poverty- and insecurity-generating game."

After the end of the golden age of stable growth and full employment—an age that coincided roughly with the third quarter of the 20th century for the nations in the Organisation for Economic Co-operation and Development (OECD)—one of the core problems of open (globalized), advanced capitalist economies has become the chronic imbalance between the supply of labor and the demand for it, as was pointed out by Guy Standing (2009). This core problem translates into the divisive dilemma often confronting workers, who must either yield "flexibly" to the pressures to become—and remain—"employable" (which they can rarely accomplish through their own means and efforts alone) or face the prospect of socioeconomic insecurity, precariousness, unemployment, and exclusion.

Property Rights

Participants in markets enjoy state-enforced property rights. More important, such property rights do not imply that every member of the legal community has a right to own some share in the total of the material resources available in the community (as was envisaged by 18th-century revolutionary writers such as Thomas Paine). Rather, it means that members of the community who already happen to be in the possession of units of property are recognized and protected in their ownership status (provided that such property has been acquired in legally permitted ways). Such protection means that the ownership status is safeguarded against the loss of property (e.g., through theft, destruction, confiscation, etc., although, of course, not against losses that may result from unfavorable choices made by the owners). The right to property further means that the owner is free (within limits established by regulatory law) to determine the use to which the property is being put as capital, as well as to appropriate the gains (profits) flowing from its use. One highly consequential aspect of the freedom of owners as constituted by property rights is to use these rights to hire labor, with the further implication that those hired as workers are rendered incapable of acquiring property themselves, under the terms of remuneration under which they are hired and in the absence of potentially productive property of their own. In this case, the availability of property rights to some does not simply coexist with but causes the denial of property rights to others (particularly as the latter typically lack the collateral that they would need to obtain a commercial bank loan).

Firms

If property owners decide to invest their monetary resources (which is the only chance they have to make their property a durable asset or even increase it through accumulation), this investment will show up as capital in firms, unless it is a purely speculative investment in financial markets. The firm is the key capitalist institutional location where investment (in buildings, machinery, raw materials, etc.) is combined with wage labor for the purpose of producing marketable commodities. The two defining features of the capitalist firm are (1) its distantiation (in space, time, social function, and accounting principles) from the household and (2) a hierarchical structure of command and control (with an entrepreneur or a managing board at the top) and a formalized vertical and horizontal division of labor designed to promote the efficiency of the productive process and the realization of its results in markets. In sharp contrast to voluntary and highly contingent market transactions, the interaction (which Marx called "despotic") that occurs within firms is based on the contractual right of some agents to give orders and the duty of others (as enforced by some measure of the right of superiors to terminate the labor contract) to carry them out. While the degree of authoritarianism of the internal regimes of capitalist firms may vary greatly, some measure of authoritative coordination seems indispensible. This is so because, first, the labor contract is (for good reasons in terms of efficiency) essentially an incomplete contract with gaps that need to be filled by commands and, second, the conflict of interest inherent in any asymmetrical contractual relation will make it highly unlikely that those gaps in the contract will reliably be filled by acts of spontaneous cooperation, thus overcoming this tension. The result is friction between the (nominally) voluntaristic, egalitarian, and freely chosen relationship between firms and their external market partners, on the one hand, and the authoritarian and hierarchical relations inside the firm as a formal organization, on the other.

The existence of this relationship of social power can be factually accounted for in terms of the asymmetry that capital can hire labor; yet labor, in the absence of savings or a collateral, cannot normally hire capital. And it can institutionally account for the fact that, once employees enter into the labor contract, they subject themselves to the command structure of the enterprise. Virtually all of the labor market, labor relations, and industrial relations policies that we find in the history of capitalist societies (including the building of institutions for collective bargaining and codetermination) can be seen as ongoing attempts of states, workers, and employers to regulate and (un)balance these two basic kinds of power relationships. They are analytically distinct from a third one: the political "exit power" of capital to relocate (or to threaten relocation or shifts to speculative investments in financial markets), to which states and their political elites are vulnerable. This vulnerability results from the dependence of states on tax revenues obtained, directly or indirectly, from investment, growth, and employment, all of which are ultimately controlled by decisions of capitalist enterprises.

The aggregate effect of activity in firms and labor markets generates and reproduces specifically capitalist patterns of inequality, reflecting the differential marketability (employability) of labor. As Standing (2009) notes, these patterns pertain to earnings, employment opportunities, income security, wealth, organizational resources, political power, and even life expectancy. These inequalities unfold in interindividual, intersectoral, interregional, international, and global dimensions. At the bottom of distributional hierarchies are people, regions, and even an entire continent (Africa) whose survival is placed in jeopardy by the dynamic of capitalism or whom the dynamic of capitalism can afford, as it were, "to do without."

Firms are the institutional location where a specific kind of capitalist rationality unfolds. At every point in time, the intellectual technique of rational capital accounting of costs and returns allows a firm to assess its own value and to evaluate alternative courses of action in terms of probable returns to the capital invested. At the same time, there are two sources of irrationality, one at the source and one at the outcome of rational calculation. As to the former, accumulation is seen as originating from a deeply irrational dynamic of entrepreneurial intuition and vision that can be neither taught nor learned—a kind of imaginative "creativity at the top" that guides the innovation of products and processes. As to the latter, the aggregate outcome of the capitalist dynamic triggers social (including environmental and cultural) changes that just "happen" as unintended and unpremeditated outcomes and cannot be attributed to any rational design or calculation. Even firms themselves can never be certain, given the unpredictability of their environment, that decisions will turn out to have been rational in light of the outcomes. This latter irrationality of outcomes is a point at which the dynamics of capitalism and the normative ideals of modernization diverge. If the project of modernity means the effective mastery of society over its collective fate, this is clearly not a virtue in which capitalism (according to Max Weber, arguably still the "most fateful force of social life") excels.

Institutions

Firms interact not only with external market participants (customers, workers to be hired, and other firms as suppliers or buyers) but also, and in ways that are not mediated by markets, with the institutional environment in which they are "embedded." Sociologists and "institutionalist" economists have explored the vast field of noncommercial interaction that both firms as employers as well as workers as employees are involved in. These noncommercial relations of capitalist firms, as well as of everyone else participating in markets, are governed by institutions and the legal rules, formal procedures, and social norms that institutions consist of. The institutional environment of market actors (beginning with private law and its enforcement in courts and not ending with state-provided investment in infrastructure) is something that they, on the one hand, depend on to reach their market objectives; yet on the other hand, the institutional environment is one that market actors try to actively shape and transform in ways that best suit their respective interests. They are involved in a reflexive process that may be termed the *production* of the conditions of production (as well as their *distribution*). The politically mediated production of conditions of production applies to the areas of research, development, and technical change, for instance, in the areas of communication, transportation, and the development of new materials and sources of energy. It also applies to the vast policy areas of infrastructure investment, regulation of markets, trade policy, taxation, labor market and social policy, and macroeconomic steering. At any rate, we would get a seriously deficient and distorted picture if we were to model action in capitalist societies as primarily the market action of buying, selling, and investing. To succeed, market actors take an equally strong interest not only in complying with but also in strategically shaping the noncommodified environment of commercial interaction in markets. The relationship between the actors of a capitalist economy and the institutional environment in which they act is a reciprocal one: Firms, consumers, owners, and workers would not be able to make a single move without relying on premises such as laws, courts, legislatures, regulatory agencies, police protection, schools, physical infrastructure, systems of taxation and tariffs, social insurance systems, central banks, research and development organizations, and many others, mostly supplied, sponsored, and regulated by state agencies and all kinds of private–public hybrids, which in recent literature are referred to as agencies of "governance." Although capitalism is a global system, the configuration of capitalist economic actors and their institutional environment appears to be still largely shaped by national traditions, path dependencies, and policy approaches shared by the political and economic elites of nation-states. These institutional-context conditions are never "given," fixed, or sacrosanct according to a master formula of the "mixed economy" but are, in fact, in constant flux under the impact of hegemonic doctrines of social order (e.g., neoliberalism) as well as the strategic efforts of economic actors to alter them in ways that allow for better exploitation of the emerging opportunities. These agents depend on an institutional framework of social order, yet at the same time they are constantly involved in strategic activities designed to disorganize and reorganize it. The capacity for the latter is derived, in spite of the apparent primacy of political state power over economic exchange, from the fact that modern states, in particular modern, liberal, democratic states, and their stability depend as much on the reasonably smooth operation and growth performance of the capitalist economy as the agents in the capitalist economy depend on the state-provided institutional setup. Again, there is an asymmetrical mutual dependency (in contrast to the notion of a hierarchical primacy of the state over the economy), due to the fact that (capitalist) states, in their turn, depend on both fiscal resources and political support (with labor market outcomes as one of its important determinants) for the sake of their stability. This dependency of the state on capital and its profitable investment is all the greater, and the state's vulnerability more significant, the more the state is a welfare state (i.e., a state with substantial legal commitments to the provision and maintenance of social security) and the more investors enjoy the "exit option" that a denationalized pattern of trade and investment (globalization) provides.

What agents under capitalism actually do is thus much more than buying and selling in the pursuit of gain, profit, and utility maximization. Beyond that, they act reflexively on the very institutional context conditions under which they act, revising, as it were, the rules as the game goes on by constantly reframing what Robert Boyer and Yves Saillard (2002) call their "accumulation regimes." Firms and their associations are involved in the legal or managerial design and ongoing adjustment of "production regimes" and modes of "corporate governance." Moreover, they form cartels and alliances, make threats and promises, warn and demand, bargain and negotiate, associate, advertise, influence, lobby, launch campaigns, donate, resist, mobilize, implicitly blackmail political authority by virtue of the fact that some economic agents are "too big to die," complain about state policies and advocate alternative ones, opportunistically evade legal and contractual obligations, strike political deals, and so on—all to shape, reshape, and occasionally also subvert the institutional context within which the core economic process of capitalism and the competitive pursuit of profits is going on. Capitalism is a political economy in the sense that it can hardly be conceptualized in terms of a durable institutional equilibrium. To the contrary, rules and their recognition are permanently contested. If the state and its institutions can be said to be devices to generate security of expectations leading to trust and to protect capitalist market society from its own inherent dangers of destabilization, it can also be said that this device is itself not reliably protected from the repercussions of such destabilization. Charles Lindblom (1982) has even compared the market to a "prison" in which the makers of public policies are incarcerated. The assumption that capitalism is at all "governable" (as opposed to essentially "anarchic") is, in other words, far from axiomatic. This condition of uncertain institutional embeddedness applies even to the overall political regime type. For while it is true that all liberal democracies contain capitalist economies (in spite of the friction that exists between the two), the reverse is not true: Both historically and in the contemporary world, capitalism has coexisted with (and indeed flourished under) various types of nondemocratic regimes.

Capitalist Culture

What Max Weber has termed the *spirit* of capitalism is a complex and multifaceted phenomenon that includes cognitive and epistemic as well as motivational and justificatory elements. It has in part motivated the transition from precapitalist to capitalist modes of economic life, and it is in turn shaped and inculcated by the realities of life under capitalism. It also applies differently to different types of actors (e.g., manual workers, white-collar workers, the self-employed, entrepreneurs, managers, and consumers) in the capitalist game, as well as to different stages of its development and associated "production regimes." For example, Boyer and Saillard (2002) contrast "Fordist" mass production versus post-Fordist "flexible quality production." Central to the core model of capitalist culture is the notion of selfish and "unfraternal" (as Max Weber put it) individuals' pursuit of acquisitive rationality for its own sake. These individuals methodically explore the physical and social world in constant search of opportunities for gain. In doing so, they follow their interests, control their own passions through self-imposed discipline, and resist the passions of rulers. This pursuit of interest is conceived as endless—both in the sense that there is no end or state of satiation to be reached where further efforts become pointless and in the sense that it can (and in fact must) go on forever, as any standstill spells failure in a competitive environment. The rationality that governs this behavioral dynamic is "formal," "abstract," "self-referential," unendingly and relentlessly expansive in time and space, and boundless. Everything we encounter in the world is first of all being framed in terms of costs and returns, risk of loss, and opportunity for gain alone. At the same time, the accounting frame of capitalist assessment of costs and returns is too restricted and myopic—that is, insufficiently intelligent—to capture long-term and collective negative externalities, which therefore tend to be systematically ignored. Weber has claimed an "elective affinity" that exists between the urge to accumulate and Puritan asceticism, which abhors wealth to be enjoyed and instead lauds its being transformed into capital to be invested, with the satisfaction of need just being a by-product of the process. Weber, in his 1904 book *The Protestant Ethic and the Spirit of Capitalism*, argued that the religious values of Calvinism provided motivation for work and the accumulation of wealth in the secular world. He saw this as an alternative to Marx's doctrine of historical materialism as the basis of economic structures. (Marx almost never used the term *capitalism*.) Relentless and often fear-driven patterns of acquisitive search behavior have become common today not just among entrepreneurs and the self-employed but also among a wide range of employees who have adopted entrepreneurial attitudes and values such as the values of flexibility and mobility.

But this characterization of capitalist culture and cognitive style captures just one of its facets. As Daniel Bell (1976) pointed out, others include patterns of hedonistic consumerism with its mindless shortsightedness that creates ever more needs and desires amid affluence. Still another consists in countertendencies to abstract formal rationality, the spread of which can be observed in the irrationalities of superstition, magical thinking, and prejudice of "authoritarian" modal personalities, or in tendencies in postmodernist and antiauthoritarian countercultures that challenge dominant modes of rationality, thus causing "cultural contradictions of capitalism" (Bell, 1976). Whether or not we can speak of specific cultural prerequisites (as opposed to formative cultural consequences) of capitalism is an issue of considerable interest for social research, given that East Asian capitalism has thrived within the cultural framework of Confucianism and also given that there was hardly any founding generation of a capitalistically "spirited" middle class in some of the now capitalist societies that emerged from state socialism in central East Europe, where capitalism was built "without capitalists," as was stressed by Gil Eyal, Ivan Szelényi, and Eleanor Townsley (1998). As is the case with political institutions, both high culture and popular culture and both the normative and the cognitive "mental infrastructure" of capitalist societies are constantly (re)negotiated through the joint governance of private actors (e.g., much of the media industries) and public authorities.

Critiques of Capitalism

From its historical beginnings, capitalist market societies have encountered strong endogenous critiques. The intellectual and political critique of capitalism and its inherent dynamics comes in two main variants that are often combined by critics. One is based on empirical analysis and prediction and focuses on the observable instability of the systems and its built-in self-destructive tendencies; this kind of critical perspective yields crisis theories according to which the system will become, sooner or later, unsustainable. The other critical perspective is normative and highlights the suffering, deprivation, exclusion, sense of meaninglessness, and various kinds of injustice that are perceived as concomitant features of capitalist growth and development; in response to this experience of injustice, social conflict, be it in the form of class conflict or otherwise, is both predicted and advocated by critics to overcome capitalism and transform it into a type of society that is both more just (at the level of "social integration") as well as more stable as a viable economic system.

However, the empirical observation of cyclical patterns of crisis that unfold under capitalist institutions, as well as the normative focus on injustice, does not provide a robust argument to the effect that we are entitled to anticipate a crisis or a conflictual challenge of capitalism. This non sequitur is widely recognized today as an analytically unwarranted leap of political faith. For just as cyclical crises and recessions set the scene for ever new rounds of accumulation and growth, capitalism can also thrive on at least some versions of its normative critique, thus arguably continually contributing to the system's perpetuation rather than its demise.

Conclusion

It seems safe to state that the notion of a modern society "after" and "without" capitalism and its key features—a notion that has inspired much of the history of the political left—has largely been rendered obsolete today. This obsolescence is epitomized by the demise of European state socialism in 1989 to 1991. Neither the probability nor the desirability of a full-scale historical abolition (breakdown) of capitalist patterns of socioeconomic organization is widely advocated any longer. Instead, capitalism is seen to be subject to numerous forces of endogenous change, leading to a great deal of variation and institutional diversification of capitalisms. The longitudinal notion of a diachronic sequence of types of social order has yielded to a "synchronized" perspective, with post- and anticapitalist, "decommodified," and solidaristic patterns of socioeconomic organization now playing a role in ongoing and contingently reversible modifications of enduring capitalist core structures and the ongoing recombination of its components. As stated before, it is in the nature of capitalism that it consistently breeds reflexive critiques of capitalism. These aim at curbing and holding accountable the various manifestation of the social power of capital and propose to deploy a variety of institutions and policies for its domestication—be it social power over a firm's employees, power at the level of class relations and its distributional consequences, the role of economic (veto) power in the making of public policy, the power of investors to inflict vast negative externalities on everyone else (and even on themselves) through economic crises and environmental destruction, or the power of capital to shape and "colonize" the process of cultural reproduction.

Case Studies

Although much of what we know about the empirical world has been generated by case studies and case studies continue to constitute a large proportion of work generated by the political science discipline, the case study *method* is poorly understood. Even among its defenders, there is confusion over the virtues and vices of this research design. Practitioners continue to ply their trade but have difficulty articulating what it is they are doing, methodologically speaking. The case study survives in a curious methodological limbo. The problem of ambiguity begins with the term itself. To refer to a work as a *case study* might mean that its method is qualitative, small *N*; that the research is holistic and thick (a more or less comprehensive examination of a phenomenon); that it uses a particular type of evidence (e.g., ethnographic, clinical, nonexperimental, non–survey based, participant observation, process tracing, historical, textual, or field research); that its method of evidence gathering is naturalistic (a "real-life context"); that the research investigates the properties of a single observation; or that the research investigates the properties of a single phenomenon, instance, or example. This entry presents a more precise definition of this method and discusses its strengths and limitations.

Evidently, researchers have many things in mind when they talk about case study research. Confusion is compounded by the existence of a large number of near synonyms—single unit, single subject, single case, $N = 1$, case based, case–control, case history, case method, case record, case work, clinical research, and so forth. As a result of this profusion of terms and meanings, proponents and opponents of the case study marshal a wide range of arguments but do not seem any closer to agreement than when this debate was first broached several decades ago. To talk about this subject in a productive fashion, we must arrive at a narrower definition. In this entry, we stipulate that a *case* connotes a spatially delimited phenomenon (a unit) observed at a single point in time or over some period of time. It comprises the sort of phenomena that an inference attempts to explain. Thus, in a study that attempts to explain certain features of nation-states, cases consist of nation-states (across some temporal frame). In a study that attempts to explain the behavior of individuals, individuals make up the cases. And so forth. Each case may provide a single observation or multiple (within-case) observations.

For students of political science, the archetypal case is the dominant political unit of our time, the nation-state. However, the study of smaller social and political units (regions, cities, villages, communities, social groups, and families) or specific institutions (political parties, interest groups, and businesses) is equally common in other subfields and, perhaps, increasingly so in comparative politics. Whatever the chosen unit, the methodological issues attached to the case study have nothing to do with the size of the individual cases. A case may be created out of any phenomenon so long as it has identifiable boundaries and comprises the primary object of an inference. Note that the spatial boundaries of a case are often more apparent than its temporal boundaries. We know, more or less, where a country begins and ends, even though we may have difficulty explaining *when* a country begins and ends. Yet some temporal boundaries must be assumed. This is particularly important when cases consist of discrete events—crises, revolutions, legislative acts, and so forth—within a single unit. Occasionally, the temporal boundaries of a case are more obvious than its spatial boundaries. This is true when the phenomena under study are eventful but the unit undergoing the event is amorphous. For example, if one is studying terrorist attacks, it may not be clear how the spatial unit of analysis should be understood, but the events themselves may be well bounded. Following this understanding of "case," a case study could be defined as *the intensive study of a single case for the purpose of understanding a larger population of cases*. Several implications flow from this definition, as applied to the social sciences.

By virtue of the small size of the sample and the heterogeneous nature of most social phenomena, the *representativeness* of a case study is always rather uncertain. One does not know for sure whether the chosen case or cases are similar (in relevant ways) to the larger population of theoretical interest. Of course, there is always some uncertainty attached to the quest for external validity. Even so, the uncertainty normal to this sort of inference is compounded whenever the chosen sample is very small. By virtue of the small size of the sample, it can usually be presumed that the evidence at hand is *nonexperimental*. Note that if a treatment can be manipulated, there is usually an opportunity to generate large treatment and control groups, moving the style of research away from an intensive focus on a single case. (That said, it is certainly possible to combine a large-*N* cross-case analysis of experimental evidence with the in-depth study of an individual case, or several cases, within that sample—perhaps with the goal of shedding light on causal mechanisms. Varying approaches to the same evidence often serve a complementary function.)

Case study research may incorporate several cases, as in the style of research known as *comparative historical*. However, at a certain point it will no longer be possible to investigate those cases intensively. At the point where the emphasis of a study shifts from the individual case to a sample of cases, we shall say that a study is a *cross-case* one. Thus, the distinction between a case study and cross-case study must be understood along a continuum. The fewer cases there are, and the more intensively they are studied, the more a work merits the appellation case study. Although the case study has been identified thus far by the smallness of the sample, it is important to appreciate that whenever one is conducting an intensive analysis of a single case (or a small number of cases) one is gathering multiple observations from the case(s). Intensive study means multiple observations, usually at a lower level of analysis. Insofar as these observations are comparable with one another, they may be analyzed in a quantitative fashion. Thus, the case study format is entirely compatible with large-*N* statistical analysis of within-case evidence.

To clarify, what distinguishes a large-*N* analysis embedded within a case study from a large-*N* cross-case analysis is that the former is nested within the units of primary theoretical interest. Thus, if one's purpose is to explain the process of national-level democratization, the units of theoretical interest are nation-states. A case study approach to this question would focus on a single country or a small sample of countries. As part of such a study, one might conduct a survey with thousands of respondents to determine attitudes and behaviors relevant to democratization. This provides the fodder for a quantitative analysis, nested within the case study format. If, on the other hand, one's theoretical purpose is to explain *individual-level* variation in attitudes/behavior related to democratization, then the same study is probably best classified as cross-case, rather than case study: One now has a large sample of the things to be explained, none of which receives a great deal of attention.

So conceived, a case study analysis may contain qualitative or quantitative evidence. Typically, it combines both. So conceived, the case study method is consonant with any theoretical framework and virtually any methodological framework—for example, behavioralism, ethnography, rational choice, institutionalism, interpretivism, and, very occasionally, experimental research ($N = 1$ experiment). So conceived, it is possible to look dispassionately at the strengths and weaknesses of the case study research design, in contrast with cross-case research designs. These trade-offs derive, first of all, from basic research goals such as

1. whether the study is oriented toward hypothesis generating or hypothesis testing,
2. whether internal or external validity is prioritized,
3. whether insight into causal mechanisms or causal effects is more valuable, and
4. whether the scope of the causal inference is deep or broad.

These trade-offs also hinge on the shape of the empirical universe—that is,

5. whether the population of cases under study is heterogeneous or homogeneous,
6. whether the causal relationship of interest is strong or weak,
7. whether useful variation on key parameters within that population is rare or common, and
8. whether available data are concentrated or dispersed.

Along each of these dimensions, case study research usually has an affinity for the first factor and cross-case research has an affinity for the second. All else being equal, case studies are more useful when the strategy of research is exploratory rather than confirmatory/disconfirmatory, when internal validity is given preference over external validity, when insight into causal mechanisms is prioritized over insight into causal effects, when propositional depth is prized over breadth, when the

population of interest is heterogeneous rather than homogeneous, when causal relationships are strong rather than weak, when useful information about key parameters is available only for a few cases, and when the available data is concentrated rather than dispersed. These trade-offs are summarized in Table 1. To clarify, they represent methodological *affinities*, not invariant laws. Exceptions can be found to each one. Even so, these general tendencies are often noted in case study research and have been reproduced in multiple disciplines and subdisciplines over the course of many decades.

It should also be stressed that each of these trade-offs carries a ceteris paribus caveat. Case studies are more useful for generating new hypotheses, *all other things being equal*. The reader must bear in mind that many additional factors also rightly influence a writer's choice of research design, and they may lean in the other direction. Ceteris is not always paribus. One should not jump to conclusions about the research design appropriate to a given setting without considering the entire range of issues involved—some of which may be more important than others.

In conclusion, it may be granted that case studies and cross-case studies explore the world in different ways. Yet, properly constituted, there is no reason why case study results cannot be synthesized with the results gained from cross-case analysis and vice versa. Indeed, they are often complementary. In this light, one might cite the current popularity of multimethod work (triangulation), which often combines large-*N* cross-case analysis with an intensive focus on one or a few carefully chosen cases. Although this discussion has been brief, it may help restore a greater sense of coherence, purpose, and integrity to the case study method. This narrower and more carefully bounded definition may alleviate some of its most persistent ambiguities. It is also hoped that the characteristic strengths of this method, as well as its limitations, will be apparent to producers and consumers of case study research. The case study is a useful tool for some research objectives but not all.

Categorical Response Data

The term *categorical response data* refers to data for outcome variables whose values represent distinct categories as opposed to continuous quantities. Categorical variables are pervasive in political science. Examples are as diverse as party affiliation ("Democrat," "Republican," "other," "none"), union membership ("yes," "no"), form of government ("republic," "monarchy," "military dictatorship," etc.), voter participation ("yes," "no"), or confidence in the government ("a great deal," "quite a lot," "not very much," "none at all"). Although examples for the collection of categorical data can probably be traced back as far as the ancient censuses in Egypt, it was not until the early 20th century that a systematic development of statistical methods for the analysis of categorical data began. The starting point was the work of Karl Pearson and G. Udny Yule, who debated over how best to analyze associations between categorical variables. Many fundamental contributions that prepared the ground for the emergence of a wide variety of approaches in the subsequent decades were also made by R. A. Fisher in the 1920s and 1930s. This entry provides a brief overview of the rich collection of methods for the analysis of categorical data available today. First, a description of different types of categorical data is given. Second, various ways to analyze categorical data are summarized.

Typology of Categorical Data

The most important differentiation of categorical data distinguishes between *nominal* and *ordinal* variables. The values of a nominal variable identify categories that do not have a natural rank order. Examples are ethnicity ("Black," "White," "Hispanic," etc.) or marital status ("single," "married," "divorced," "widowed"). Methods using nominal data should not depend on the numerical values assigned to the categories. The categories of ordinal data, in contrast, possess a natural ranking. Examples are social class ("lower," "middle," and "upper"), agreement with the statement "Democracies are indecisive" ("strongly agree," "agree," "disagree," and "strongly disagree"), or self-reported political left–right orientation (on a scale from 1 = *left* to 10 = *right*). Methods using ordinal data take into account the order of the values, but the exact spacing does not matter. The distinction between nominal and ordinal variables is not always clear. For example, political parties can be ranked on a left–right scale, but the order may be ambiguous for some parties (because they may rank differently on different policies). Moreover, whether a variable is treated as ordinal can depend on the research question.

A further distinction is made between *qualitative* and *quantitative* data. Some authors use the former as a synonym for categorical data. However, while nominal data are clearly qualitative, ordinal data are an intermediate type, often treated as quantitative in practice. Moreover, quantitative data can sometimes be treated as categorical. Quantitative data are either *continuous* or *discrete*. Continuous variables can take on any real value in a given interval, whereas discrete variables are restricted to a fixed set of distinct values (e.g., integers). Discrete quantitative variables are often considered as categorical when the range of observed values is small. Count data are an example.

Categorical variables can be divided into *dichotomous* variables that only have two possible outcomes ("yes"/"no"; "male"/"female") and *polytomous* variables with more than two categories ("Christian," "Muslim," "Hindu," "Buddhist," "Jewish," etc.). A dichotomous variable that is coded 0 and 1 is called an *indicator* or *binary* variable. Dichotomous variables are often technically and conceptually easier to handle than polytomous variables.

More of a philosophical question, which also was the root of the dispute between Pearson and Yule, is whether categorical variables should be treated as inherently categorical (Yule's view) or whether they can be conceptualized as coarse-grained manifestations of an underlying continuum (Pearson's position). The distinction, however, has practical consequences for how categorical data are modeled and analyzed. Both views have their justifications, but in some cases, it is more natural to assume fixed categories (for nominal variables such as gender or nationality), whereas in others the assumption of an underlying continuum, or a so-called latent variable, is more applicable (for ordinal data, in particular).

A strong case for the latent variable approach can be made for hybrid variables where a continuous variable is only partially observed. For example, think of a variable classifying households by income; for each household, the range, but not the exact value, of income is known. For such *interval data*, an underlying continuum exists, and thus it is natural to model the data using a latent variable. *Truncated* or *censored variables* (sometimes called *limited variables*) are a related type of hybrid variable, where the continuous data are only observed under certain conditions or within a certain range (e.g., top-coded earnings). A somewhat different type of hybrid data is *time-to-event data* (survival data), where a categorical variable (the type of event) is tied to a quantitative variable—the duration until the event occurs, possibly censored for some observations (e.g., the timing of military interventions in conflicts or the career paths of politicians).

Categorical Data Analysis

Depending on research interest and data type, a variety of categorical data measures and methods are available.

Describing Distributions of Categorical Variables

One may first wish to describe the relative frequencies (proportions) of the different categories of a categorical variable. For example, in the context of election forecasts, one predicts different parties' shares of the vote by polling a random sample of voters. If data are available for the entire population, the proportions can be derived by simple counting. Usually, however, the shares have to be inferred from a random sample. The theoretical distribution used to model statistical properties of dichotomous variables in random samples is the *binomial distribution*, which can be approximated by a normal distribution for large samples. For polytomous variables, the closely related *multinomial distribution* is used. Based on these distributions, exact and approximate (i.e., large sample) methods have been developed to compute *confidence intervals* for proportions and to test whether an observed distribution deviates significantly from a given theoretical distribution of interest (*goodness-of-fit test*). The most common (multinomial) goodness-of-fit test is the *chi-squared test*, which is based on the squared differences between the observed category counts and the counts that are to be expected (on average) according to the theoretical distribution. For ordinal variables, the cumulative distribution function (which is a step function) and tests that exploit this additional information, such as the discrete *Kolmogorov-Smirnov test*, are of interest.

For nominal data, a sensible measure of location is the *mode* (most frequent category). For ordinal variables, the *median* is also useful (the middle of the ordered data), as well as the arithmetic mean if the differences among the categories are assumed to be comparable. A measure of variation for nominal data is, for example, *Simpson's index of diversity*, which reaches its maximum if the distribution is uniform (an equal frequency of each category). For ordinal data, the *range* and measures based on differences between quantiles, such as the *interquartile range* (range of middle half of data), are also meaningful.

Association Among Categorical Variables

For research questions examining relationships between categorical variables, the joint distribution of the variables can be analyzed using a *cross-classification table* (*contingency table*). The cells of such a two-way table report the frequencies or proportions of the different combinations of the variables' categories. It is often useful to condition on row or column totals so that the differences between conditional distributions can easily be identified. For example, think of a table with party preference in rows and ethnicity in columns. Proportions conditioned on column totals (column percent) would then, in each column, reflect the party preference distribution for a specific ethnicity.

To test whether the data provide support for the hypothesis that the conditional distributions across rows or columns are different or, equivalently, whether the two variables are associated with each other, researchers often use the *chi-squared homogeneity or independence test*, which is based on the squared differences between observed cell counts and the cell counts that would be expected if the two variables were unrelated. Since the chi-squared test may be biased in small samples (especially if there are many cells with low expected frequency), exact tests have also been developed (Fisher's exact test for 2 × 2 tables and its generalizations to $n \times m$ tables).

The chi-squared test statistic depends on the number of observations and the size of the table and is therefore not a very useful association measure. However, two popular chi-squared–based measures that can be compared across tables and samples of different size are Pearson's contingency coefficient and Cramér's *V*. A second class of association measures for nominal data is based on the concept of proportional reduction of error (PRE). PRE measures quantify the degree to which knowledge of an observation's value for one variable can be exploited to predict the value of the other (or, more precisely, to which degree the prediction error can be reduced). Different conceptualizations of prediction errors lead to different PRE measures. Examples include Guttman's lambda, Goodman and Kruskal's tau, or the uncertainty coefficient (likelihood ratio index). If variables are strongly associated, then one variable provides a lot of information for the prediction of the other, and the PRE measures are larger. In the case of two dichotomous variables (2 × 2 tables), additional important measures are the odds ratio (the ratio of cross- products of frequencies in the main and secondary diagonal) and the phi coefficient (point correlation coefficient).

The measures discussed so far can be used for any type of categorical variable. For ordinal variables, additional association measures that indicate the direction of a relation have been proposed. Examples are Goodman and Kruskal's gamma, Kendall's tau-*b*, or Somers' *d*, which can be expressed in terms of the numbers of concordant and discordant pairs. An alternative approach is to assign scores that roughly reflect the distances between categories and then compute the linear correlation. Assigning ranks to observations, instead of scores (using midranks for observations in the same category), leads to the rank correlation (Spearman's rho).

Association measures are useful to describe the relation between two variables. A more general framework to uncover association patterns among two or more categorical variables is provided by *loglinear models*. The basic idea of loglinear models is to express the cell counts in contingency tables as a function of the categories defining the cells. The basic independence model contains one parameter for each category of each variable and simply models the marginal distributions of the variables. Association patterns are then captured by additional parameters for combinations of categories across variables (interaction terms). A vast literature on loglinear models was developed from the 1960s through the 1980s, but the methodology seems to be somewhat less in use today.

Other multivariate methods for categorical data include (multiple) *correspondence analysis* and *latent class analysis*, which are similar to principal component analysis and factor analysis but for categorical data. Latent structure models with categorical observed and continuous latent variables are covered by *latent trait analysis* (*item response theory*).

Further special topics in the analysis of the association between categorical variables are *rater agreement* and *segregation*. The degree to which raters agree with respect to a categorical rating or classification can be analyzed using loglinear models, but specialized measures such as Cohen's kappa are also available. Segregation analysis asks how group members are distributed among the values of a categorical variable (occupational sex segregation, racial residential segregation) and has its own specialized measures, such as Duncan and Duncan's index of dissimilarity.

Explaining Categorical Outcomes

Methods for contingency tables are often exploratory and descriptive in the sense that they do not distinguish between dependent and explanatory variables. To analyze research questions that make assertions about causal relations, regression-type statistical methods are required. Explanatory variables in such models can be continuous or categorical. Regression coefficients for binary explanatory variables simply reflect conditional group differences, and categorical predictors with more than two categories (called *factors*) can easily be included in a regression equation by means of indicator variables for the different categories.

First, assume the dependent variable to be *dichotomous* (binary). For example, think of analyzing union membership of employees (1 = *yes*, 0 = *no*) as a function of variables such as sex, age, or political orientation. The expected value of a binary variable is equal to the probability of Outcome 1. As such, standard linear regression methods that model the conditional expectation can be applied. This linear probability model (LPM) has the advantage that regression coefficients can directly be interpreted as partial effects on the probability of Outcome 1. However, the LPM is not always appropriate (e.g., assuming a linear relation between the explanatory variables and the outcome probability is usually unreasonable), and dedicated binary response models such as the logistic regression (logit model) or the probit model have been developed. In the logit model, the log odds, the logarithm of the odds of Outcome 1, are expressed as a linear function of the explanatory variables. In the probit model, the probability of Outcome 1 is linked to the linear predictor through the cumulative normal distribution. Although the interpretation of the coefficients is somewhat more difficult, these models are generally considered more appropriate than the LPM to analyze a binary dependent variable.

Multinomial logit or probit models are generalizations of these models to nominal dependent variables with more than two outcome categories. Multinomial models contain a separate set of coefficients for each outcome, allowing for complex effect patterns of the explanatory variables on the outcome probabilities. Likewise, ordinal logit or probit models are used to analyze ordinal dependent variables, although these models usually contain only one set of coefficients plus a number of cutoff parameters that reflect the latent spacing of the categories. More flexible variants such as the stereotype logistic regression or the generalized ordered logit model are also available. Powerful extensions to multinomial models are choice models that are based on data containing alternative-specific information. The classic example is travel mode choice, with information on characteristics such as costs, comfort, and travel duration for each mode. Such models include the conditional logit and the alternative-specific multinomial probit. A related model is the nested logit, which is used if the alternatives can be grouped according to a nested structure (e.g., restaurants grouped by cuisine).

As mentioned above, one can treat count data as categorical, particularly when counts are low. The most prominent regression procedure for count data is the Poisson regression that models event counts as a Poisson process. However, because the inherent assumption of events' independence is often too restrictive, more flexible models such as the negative binomial regression are generally preferred. Further, an overrepresentation of zeros is often observed in count data, which can be handled by a zero-inflated count model or, depending on the assumed process, a hurdle model that combines a binary response model with a zero-truncated count model. Note that regression models for binary variables and for count variables are both covered in the framework of generalized linear models (GLMs).

Limited dependent variables are analyzed with methods closely related to binary response models. The most well-known is the censored normal regression (tobit model), which is based on the concept of a latent variable with normally distributed errors, as is the probit model. A natural extension are sample selection models (e.g., the Heckman model), which explicitly model the process causing the censoring. Sample selection models have also been developed for the case of a fully categorical dependent variable.

Another closely related field is event history analysis (survival analysis), which is concerned with the explanation of the duration until the occurrence of an event. Time-to-event data are often modeled in terms of the hazard rate: the conditional probability of an event at a certain time point given that the event has not yet occurred. Accelerated failure time models, which are similar to the tobit model, can also be used. Further, discrete-time hazard models are used if the duration is categorical. These models apply a binary response model to the expanded data containing one record per time point for each observation. Another topic in event history analysis is sequence analysis, used to identify and describe typical patterns of event sequences (e.g., career paths of politicians).

Discrimination and classification is a further area in categorical data analysis that has some resemblance to the regression methods discussed. A key difference, however, is that discriminant analysis makes no assertions about direction of causation. It is an exploratory tool to evaluate how well groups can be distinguished with respect to a set of observed characteristics and to derive optimal rules for classifying new observations for which group membership is unknown.

As outlined in this entry, a well-established and diversified toolbox exists for the analysis of categorical data. Moreover, special areas such as categorical panel data and multilevel models, exact inference for binary response and count data models, or nonparametric estimation have made great advances over the past few decades.

CAUDILLISMO

Caudillismo refers to a system of political-social domination that arose after the independence wars in Spanish America. The caudillo (strongman—from the Latin word *capitellum*, meaning head) was the head of irregular forces who ruled a politically distinctive territory. These forces were governed through an informal system of sustained obedience based on paternalistic relations to the leader, who attained his position as a result of his forceful personality and charisma. Caudillismo as a concept was first used in Spanish America to describe the characteristics of leaders who challenged the authority of the governments arising from the independence process after 1810 and to refer to the political regimes instated by such leaders. In this limited meaning, the notion of caudillismo is a heuristic instrument for analyzing a given historical period that started after the wars of independence and concluded with the emergence of the national states in the second half of the 19th century. John Lynch, one of the historians who made the greatest efforts to define the characteristics and attributes of Latin America's caudillos and their political leadership conditions, stated that caudillismo was the image of society and that caudillos were its creatures. This entry is a review of different interpretations of caudillismo, its origins, and its forms of leadership.

The terms *caudillismo* and *caudillo* continued to be used after the conditions that gave rise to "classical caudillismo" had disappeared. The extension of the notion to encompass any kind of personalized leadership that exercises power in an arbitrary manner within a context of fragility or crisis of the political institutions is not that relevant to critical qualitative research. Caudillismo is used to designate and also stigmatize the governments of "strongmen" with no contextual reference.

Caudillismo After Independence in Spanish America

We will now elaborate on the limited meaning of caudillismo restricted to the framework of the struggles to control power that followed independence in Spanish America. In 1845, the book *Facundo*, written by Domingo Faustino Sarmiento, provided the classical interpretation of caudillismo in Spanish America in the 1800s. From that standpoint, caudillismo is the expression of political barbarism and the antithesis of a government that ensures security, freedom, and ownership rights for a country's inhabitants. Sarmiento's book is a portrait of Facundo Quiroga, the "Tiger of the Plains," a caudillo in the first half of the 19th century. In Quiroga, Sarmiento believes that he sees the incarnation of the antinomy of civilization and barbarism faced by the peoples of the Americas as a result of their revolutionary experience and geography—the desert—which had turned violence into a lifestyle. Quiroga in the Argentine pampas and José Antonio Paéz in the Venezuela prairies represent caudillismo as a system of government and type of political leadership. Physical vigor, spontaneous cruelty, and the rusticity inherent in the rural world they come from can account for the despotism of the regimes they represent. Antonio López de Santa Anna from Mexico appears as the "Attila of civilization" and Juan Manuel de Rosas as the "River Plate Caligula" of Argentina.

Latin American historiography and the contributions of European and U.S. studies revealed practically unknown facets of the caudillismo phenomenon in the postindependence period, which led to a better understanding of an era obscured by myths and legends. The caudillo figures started to appear with more nuances than in the view of their contemporaries, and it was noted that their governments, in many cases, adapted traditional legality within the emergence of a new context.

The origin of caudillismo has been interpreted differently, encompassing factors such as the militarization of politics as a result of the independence wars, the absence of formal rules after the collapse of the colonial order, the ruralization of power, the importance of monarchic tradition, the legacy of authoritarianism and anarchism from the Spaniards, or the characteristics of the village societies. In Venezuela and the River Plate area, where the war against the royal troops was more radical and the whole of the population took arms, caudillismo developed quicker and in a more pronounced manner. Cattle herders and gauchos, layabouts and bandits joined the *Montoneros* (an unruly group of horsemen who fought against Spanish colonization in the 1800s, usually under the federalist caudillos of the provinces outside Buenos Aires), which were truly "informal armies" that got supplies by pillaging and acted under the subordination of the bosses' prestige.

The militarization of politics and society that outlived the battles for independence linked caudillismo to military power and political competition with armed struggles. The caudillo was first a warrior, during wars of liberation, civil wars, and national wars; the caudillo was the strongman who could recruit troops and protect his people, as John Lynch outlined. Studies on Latin American caudillismo in the 1950s considered it a variable of authoritarianism and militarism in response to anarchy. Agustín Gamarra of Peru, known as "Cuzco's black angel," was seen as a prototype of military leaders who, under different guises, dominated politics in postindependence Spanish America. The militias constituted the core of *Gamarrismo* (a militaristic state based on the [invented] tradition of the Incas). As pointed out by Charles Walker, the militias controlled local society by monitoring any threat of opposition, and they also served as veritable military academies and vehicles of social mobility. High-ranking positions in the militias represented important avenues for political and economic gain. In Mexico and Peru, professional military men played an important role in the political process as pressure groups. In other countries, the military organization of the end of the colonial period was swept away by the wars of independence, although with different outcomes. Nonetheless, some military heads were prevailing figures—for instance, Francisco de Paula Santander in Nueva Granada (present-day Colombia), Juan José Flores in Ecuador, and Paéz in Venezuela and Andrés de Santa Cruz in Bolivia. As Walker notes, the analysis of caudillismo needs to shift its attention from the battlefield and to reconsider the state, as middling officials such as subprefects and militia leaders proved more important for Gamarra than military officers and guerrillas.

Caution is needed with respect to generalizations about Spanish America's politics during the half-century following independence because of the distinctive institutional legacies of colonialism, as well as differences in geographical and ethnic composition between countries where the indigenous population prevails and is only partly assimilated into Spanish culture and countries with a Creole population mainly integrated into Spanish culture. The church and the army were two big corporations during colonial times, with an institutional and economic preponderance in Mexico not found in other regions. This was an important source of divergence between Catholics and anticlericals in Mexico. Conflicts between rural and urban areas, between federalism and centralism, and between rival trends in trade policies—"protectionism" and "liberalism"—all hindered the consolidation of a stable national policy. The duration and pace of the transition to postcolonial order varied between countries, as did the role of the regional or national caudillos. In all cases, however, the constant feature is loyalty to caudillos, most of whom had no defined ideologies and fluctuated between contradictory positions, whether unitary or federal, conservative or liberal, or favoring protectionism or free trade.

Tulio Halperín Donghi explored the relationship between militarization and democratization that is at the heart of the promotion of the caudillo power. Social promotion opportunities arose after the rupture of colonial order. Agustín de Iturbide, the "constitutional emperor of Mexico," belonged to a poor family; Gamarra and Ramón Castilla, both from Peru, were Creoles. They all reached positions that would have before been inaccessible to them, but this relative liberal opening was an instrument to impede the excessive dissemination of popular participation within a context in which power legitimacy was always questioned.

In the middle of the 1970s, Eric Wolf and Edgar Hansen defined caudillismo as a subcategory of "clientelism." These authors believe that caudillismo refers to the quest for power and wealth through violent conquest that establishes a link between protector and protected in an unstable society lacking the institutional channels through which people can compete for these social and financial advantages. John Lynch also states that the patron–client relationship was the essential link that was finally built into the state and became the model of caudillismo. Alan Knight's more recent view underlines the relevance of traditional authority in village societies, combined with elements of charisma, to understand the command–obedience relationship inherent in caudillismo.

The notion of caudillismo encompasses different leadership subcategories, for instance, the "sword caudillos," the warlords who dominated during a period of great instability when popular support and force were decisive. Pacification and progressive institutionalization of power relations were carried out by new leader profiles, the "tame caudillos," who were deemed to be the arbitrators capable of achieving national unification and building more stable institutions. Rosas's government (1829–1852) is an example of a new modality. Sarmiento believed that was the end of caudillismo since it combined elements of barbarism with elements of civilization. Cruelty became more sophisticated, the press and the legislature replaced barbarian passion, and strong personalism allowed for the exertion of influence on the political orientation of other River Plate provinces, although Rosas's powers were not included in a constitutional system. In Mexico, Benito Juárez, a lawyer born into a poor family, used the 1857 Constitution to take on emergency powers and govern in an authoritarian manner, constitutional but cruel. Diego Portales's constitutional authoritarianism sought support, as he himself defined, in "the weight of night," in the acquiescence of the masses, passive and ignorant. A prevailing political figure in Chile in the 1830s, Portales was a trader and omnipotent minister but never took office as president. From Sarmiento's viewpoint, Portales was an example of an illustrated caudillo. The use of the term *caudillo* was extended to encompass authoritarian leaders such as Juárez or Portales, who governed within the framework of constitutions. According to Lynch, the "impenetrable dictatorship" of Dr. José Francia in Paraguay combined despotism and isolation for 3 decades in which he ensured the basic needs of a Creole society.

The notion of caudillismo makes possible a better understanding of the political processes that took place during that period since interpretation of the past cannot ignore the categories used by their contemporaries.

CAUSAL HETEROGENEITY

See Causality

CAUSALITY

Causality refers to the relationship between events where one set of events (the effects) is a direct consequence of another set of events (the causes). Causal inference is the process by which one can use data to make claims about causal relationships. Since inferring causal relationships is one of the central tasks of science, it is a topic that has been heavily debated in philosophy, statistics, and the scientific disciplines. This entry reviews the models of causation and tools for causal inference most prominent in the social sciences, including regularity approaches, associated with David Hume, and counterfactual models, associated with Jerzy Splawa-Neyman, Donald Rubin, and David Lewis, among many others. One of the most notable developments in the study of causation is the increasing unification of disparate methods around a common conceptual and mathematical language that treats causality in counterfactual terms—that is, the Neyman-Rubin model. This entry discusses how counterfactual models highlight the deep challenges involved in making the move from correlation to causation, particularly in the social sciences, where controlled experiments are relatively rare.

Regularity Models of Causation

Until the advent of counterfactual models, causation was primarily defined in terms of observable phenomena. It was the philosopher Hume in the

18th century who began the modern tradition of regularity models of causation by defining causation in terms of repeated "conjunctions" of events. In *An Enquiry Into Human Understanding* (1751), Hume argued that the labeling of two particular events as being causally related rested on an untestable metaphysical assumption. Consequently, Hume (1739) argued that causality could be adequately defined only in terms of empirical regularities involving classes of events. He asked, "How could we know that a flame caused heat?"—only by calling "to mind their constant conjunction in all past instances. Without further ceremony, we call the one cause and the other effect and infer the existence of one from that of the other" (*Treatise of Human Nature*, Book 1, Pt. 3, sec. 6). In the *Enquiry*, Hume argued that three empirical phenomena were necessary for inferring causality: (1) contiguity (the cause and effect must be contiguous in time and space), (2) succession (the cause must be prior to the effect), and (3) constant conjunction (there must be a constant union between the cause and effect). Under this framework, causation was defined purely in terms of empirical criteria, rather than unobservable assumptions. In other words, Hume's definition of causation and his mode of inference were one and the same.

John Stuart Mill, who shared the regularity view of causation with David Hume, elaborated basic tools for causal inference that were highly influential in the social sciences. For Mill, the goal of science was the discovery of regular empirical laws. To that end, Mill proposed in his 1843 *A System of Logic*, a series of rules or "canons" for inductive inference. These rules entailed a series of research designs that examined whether there existed covariation between a hypothesized cause and its effect, time precedence of the cause, and no plausible alternative explanation of the effect under study. Mill argued that these research designs were effective only when combined with a manipulation in an experiment. Recognizing that manipulation was unrealistic in many areas of the social sciences, Mill expressed skepticism about the possibility of causal inference for questions not amenable to experiments.

The most widely used of Mill's canons, the "Direct Method of Difference," entailed the comparison of two units identical in all respects except for some manipulable treatment. The method of difference involves creating a counterfactual control unit for a treated unit under the assumption that the units are exactly alike prior to treatment, an early example of counterfactual reasoning applied to causal inference. Mill (1884) stated the method as follows:

> If an instance in which the phenomenon . . . occurs and an instance in which it does not . . . have every circumstance save one in common . . . [then] the circumstance [in] which the two instances differ is the . . . cause or a necessary part of the cause. (Book 3, chap. 8)

The weakness of this research design is that in practice, particularly in the social sciences, it is very difficult to eliminate all heterogeneity in the units under study. Even in the most controlled environments, two units will rarely be the same on all background conditions. Consequently, inferences made under this method require strong assumptions.

Mill's and related methods have been criticized on a variety of grounds. His canons and related designs assume that the relationship between cause and effect is *unique* and deterministic. These conditions allow neither for more than one cause of an effect nor for interaction among causes. The assumption that causal relationships are deterministic or perfectly regular precludes the possibility of measurement error. If outcomes are measured with error, as they often are in the social sciences, then methods predicated on detecting constant conjunctions will fail. Further, the causal relationships typically studied in the social and biological sciences are rarely, if ever, unique. Causes in these fields are more likely to have highly contingent effects, making regular causal relationships very rare.

Counterfactual Models of Causation

Regularity models of causation have largely been abandoned in favor of counterfactual models. Rather than defining causality purely in reference to observable events, counterfactual models define causation in terms of a comparison of observable and unobservable events. Linguistically, counterfactual statements are most naturally expressed using subjunctive conditional statements such as "If India had not been democratic, periodic famines would have continued." Thus, the counterfactual approach to causality begins with the idea that some of the information required for inferring causal relationships is and always will be unobserved, therefore some assumptions must be made. In stark contrast to the regularity approach of Hume, the fact of counterfactual causation is fundamentally separate from the tools used to infer it. As a result, philosophers like Lewis (1973) could write about the meaning of causality with little discussion of how it might be inferred. It was statisticians, beginning with Splawa-Neyman in 1923 and continued most prominently by Rubin, who began to clarify the conditions under which causal inferences were possible if causation was fundamentally a "missing-data problem."

Counterfactual Models in Philosophy

In philosophy, counterfactual models of causation were largely absent until the 1970s due to Willard van Orman Quine's dismissal of the approach in his *Methods of Logic* (1950), where he pointed out that counterfactual statements could be nonsensical. He illustrated this point by his famous comparison of the conditional statements "If Bizet and Verdi had been compatriots, Bizet would have been Italian" and "If Bizet and Verdi had been compatriots, Verdi would have been French." For Quine, the incoherence of the two statements implied that subjective conditionals lacked clear and objective truth conditions. Quine's suspicion of conditional statements was also rooted in his skepticism of evaluating the plausibility of counterfactual "feigned worlds," as he explained in *Word and Object* (1960):

> The subjunctive conditional depends, like indirect quotation and more so, on a dramatic projection: we feign belief in the antecedent and see how convincing we then find the consequent. What traits of the real world to suppose preserved in the feigned world of the contrary-to-fact antecedent can only be guessed from a sympathetic sense of the fabulist's likely purpose in spinning his fable. (p. 222)

Perhaps because of this view of counterfactuals, Quine had a dim view of the concept of causality. He argued that as science advanced, vague notions of causal relationships would disappear and be replaced by Humean "concomitances"—that is, regularities.

In philosophy, Lewis popularized the counterfactual approach to causality 50 years after it first appeared in statistics with Splawa-Neyman's 1923 paper on agricultural experiments. For Lewis, Quine's examples revealed problems only with *vague* counterfactuals, not counterfactuals in general. A cause, according to Lewis in his 1973 article "Causation," was "something that makes a difference, and the difference it makes must be a difference from what would have happened without it" (p. 557). More specifically, he defined causality in terms of "possible" (counterfactual) worlds. He postulated that one can order possible worlds with respect to their closeness with the actual world. Counterfactual statements can be defined as follows:

> If *A* were the case, *C* would be the case is true in the actual world if and only if (i) there are no possible *A*-worlds; or (ii) some *A*-world where *C* holds is closer to the actual world than is any *A*-world where *C* does not hold. (p. 560)

More intuitively, causal inferences arise by comparing the actual world with the closest possible world. If *C* occurs in both the actual and the closest possible world without *A*, then, according to Lewis, *A* is not the cause of *C*. If, on the other hand, *C* does not occur in the closest possible world without *A*, then *A* is a cause of *C*. Lewis's theory was concerned with ontology, not epistemology. As a result, one might argue that his work has limited use to empirical research since he provided little practical guidance on how one could conjure the closest possible worlds to use as comparison cases. Without additional assumptions, Lewis's model suggests that causal inference is a fruitless endeavor given our inability to observe nonexistent counterfactual worlds.

Statistical Models of Causation

Fortunately, statisticians beginning with Splawa-Neyman in 1923 elaborated a model of causation that allowed one to treat causation in counterfactual terms and provided guidance on how empirical researchers could create observable counterfactuals.

Say we are interested in inferring the effect of some cause T on a parameter $\bar{Y}$ of the distribution of outcome Y in population A relative to treatment C (control). Population A is composed of a finite number of units and $\bar{Y}_{A,T}$ is simply a summary of the distribution of that population when exposed to T, such as the mean. If treatment C (control) were to be applied to population A, then we would observe $\bar{Y}_{A,C}$. To use Lewis's terminology, in the actual world, we observe $\bar{Y}_{A,T}$, and in the counterfactual world, we would observe $\bar{Y}_{A,C}$. The causal effect of T relative to C for population A is a measure of the difference between $\bar{Y}_{A,T}$ and $\bar{Y}_{A,C}$, such as $\bar{Y}_{A,T} - \bar{Y}_{A,C}$. Of course, we can observe only the parameter that summarizes the actual world and not the counterfactual world.

The key insight of statistical models of causation is that under special circumstances we can use another population, B, that was exposed to control to act as the closest possible world of A. If we believe that $\bar{Y}_{A,C} = \bar{Y}_{B,C}$, then we no longer need to rely on an unobserved counterfactual world to make causal inferences; we can simply look at the difference between the observed $\bar{Y}_{A,T}$ and $\bar{Y}_{B,C}$. In most cases $\bar{Y}_{A,C} \neq \bar{Y}_{B,C}$, however, so any inferences made by comparing the two populations will be *confounded*. What are the special circumstances that allow us to construct a suitable counterfactual population and make unconfounded inferences? As discussed below, the most reliable method is through randomization of treatment assignment, but counterfactual inferences with observational data are possible—albeit more hazardous—as well. In either case, causes are defined in reference to some real or imagined *intervention*, which makes the counterfactuals well-defined.

The Neyman-Rubin Model

The counterfactual model of causation in statistics originated with Splawa-Neyman's 1923 model, which is nonparametric for a finite number of treatments, where each unit has a potential outcome for each possible treatment condition. In the simplest case with two treatment conditions, each unit has two potential outcomes, one if the unit is treated and the other if untreated. In this case, a causal effect is defined as the difference between the two potential outcomes, but only one of the two potential outcomes is observed. In the 1970s, Rubin developed the model into a general framework for causal inference with implications for observational research. Paul Holland in 1986 wrote an influential review article that highlighted some of the philosophical implications of the framework. Consequently, instead of the "Neyman-Rubin model," the model is often simply called the Rubin causal model or sometimes the Neyman-Rubin-Holland model or the Neyman-Holland-Rubin model.

The Neyman-Rubin model is more than just the math of the original Neyman model. Unlike Splawa-Neyman's original formulation, it does not rely on an urn model motivation for the observed potential outcomes but rather on the random assignment of treatment. For observational studies, one relies on the assumption that the assignment of treatment can be treated as if it were random. In either case, the mechanism by which treatment is assigned is of central importance. The realization that the primacy of the assignment mechanism holds true for observational data no less than for experimental data is due to Rubin. This insight has been turned into a motto: "No causation without manipulation."

Let Y_{iT} denote the potential outcome for unit i if the unit receives treatment, and let Y_{iC} denote the potential outcome for unit i in the control regime. The treatment effect for observation i is defined by $\tau_i = Y_{iT} - Y_{iC}$. Causal inference is a missing-data problem because Y_{iT} and Y_{iC} are never both observed. This remains true regardless of the methodology used to make inferential progress—regardless of whether we use quantitative or qualitative methods of inference. The fact that we cannot observe both potential outcomes at the same time is commonly referred to as the "fundamental problem of causal inference." Let T_i be a treatment indicator: 1 when i is in the treatment regime and 0 otherwise. The observed outcome for observation i is then

$$Y_i = T_i Y_{iT} + (1 - T_i) Y_{iC}.$$

The average causal effect τ is the difference between the expected values $E(Y_T)$ and $E(Y_C)$. We observe only the conditional expectations $E(Y_T|T = 1)$ and $E(Y_C|T = 0)$, not the unconditional expectations required for obtaining τ. Until we assume that $E(Y_T|T = 1) = E(Y_T)$ and

$E(Y_C|T = 0) = E(Y_C)$, we cannot calculate the average treatment effect. Note that the estimand of interest, such as the average treatment effect, is conceptually distinct from the estimators used to infer it from data, such as difference in means, linear regression, or other techniques.

Experiments

To estimate the average treatment effect, we require the assumption of *independence*. The singular virtue of experiments is that physical randomization of an intervention ensures independence between treatment status and potential outcomes. Ronald Fisher, in the 1920s and 1930s, first emphasized the importance of random assignment for eliminating bias, calling randomization of treatment the "reasoned basis for inference." From a Lewisian perspective, the control group in an experiment functions as an observable "possible world." With the independence assumption, the average treatment effect can be estimated from observables using the following expression:

$$\begin{aligned}\tau &= E(Y_{iT}|T = 1) - E(Y_{iC}|T = 0)\\ &= E(Y_{iT}) - E(Y_{iC}).\end{aligned}$$

Under randomization, the assumption that T_i is independent of Y_{iT} and Y_{iC} is plausible, making the treatment and control groups exchangeable in expectation.

One of the assumptions that randomization by itself does not justify is that the response of one unit should be unaffected by the particular assignment of treatments to the other units. This "no interference between units" is often called the Stable Unit Treatment Value Assumption (SUTVA). SUTVA implies that the potential outcomes for a given unit do not vary with the treatments assigned to any other unit and that there are not different versions of treatment.

Observational Data

In observational data, stronger assumptions are usually required to estimate causal effects. In observational studies, the causal quantity of interest is often the "average treatment effect on the treated" or ATT, which is the average effect conditional on being in the treatment regime. The parameter of interest is

$$\tau|(T = 1) = E(Y_{iT}|T = 1) - E(Y_{iC}|T = 1).$$

Since the counterfactual control units, $E(Y_{iC}|T = 1)$, are not observed, a control group must be constructed. The two assumptions required to construct a valid control group are conditional independence of the potential outcomes and treatment assignment and overlap, or

1. $Y_{iT}, Y_{iC} \perp T|X$,
2. $0 < \Pr(T = 1|X) < 1$.

When these two conditions hold, we can say that treatment assignment is *strongly ignorable*. Once a control group is constructed that enables us to satisfy these two conditions, the ATT can be estimated as

$$\begin{aligned}t|(T = 1) = E[E(Y_{iT}|T = 1)\\ - E(Y_{iC}|T = 0)]|T = 1.\end{aligned}$$

It is important to note that the outer expectation is taken over the distribution of $X|(T = 1)$, which is the distribution of covariates among the treated units.

Note that the ATT estimator is changing when individual observations are weighted, and the observations that are outside of common support receive zero weights. That is, if some covariate values are observed only for control observations, those observations will be irrelevant for estimating ATT and are effectively dropped. Therefore, the overlap assumption for ATT requires only that the support of X for treatment observations be a subset of the support of X for control observations. More generally, one would also want to drop treatment observations if they have covariate values that do not overlap with control observations. In such cases, it is unclear exactly what estimand one is estimating because it is no longer ATT as some treatment observations have been dropped along with some control observations.

The key assumption being made here is strong ignorability. Even thinking about this assumption presupposes some rigor in the research design. For example, is it clear what is pretreatment and what is posttreatment? If not, one is unable even to form the relevant questions, the most useful of which may be the one suggested by Harold Dorn in 1953, who proposed that the designer of every observational study should ask, "How would the study be conducted if it were possible to do it by controlled experimentation?" This clear question also appears in William Cochran's 1965 Royal Statistical Society discussion paper on the planning of observational studies of human populations. Dorn's question has become one that researchers in the tradition of the Neyman-Rubin model ask themselves and their students. The question forces the researcher to focus on a clear manipulation and then on the selection problem at hand. Only then can one even begin to think clearly about how plausible the strong ignorability assumption may or may not be.

Structural Equation Modeling

Another prominent approach to causal inference using counterfactuals is structural equation modeling, a method most associated with the work of Judea Pearl. Structural equation modeling is an old enterprise that has a rich history, including foundational work on causality in systems of structural equations by the geneticist Sewall Wright (1921), the economist Trygve Haavelmo (1943), and the political scientist Herbert Simon (1953). Modern advocates of structural equation modeling argue that the probability calculus approach to causal modeling used by researchers in the Neyman-Rubin tradition is too narrow in that it does not explicitly take into account knowledge about the mechanisms linking background, independent variables, and dependent variables. Rather than modeling causality in relation to experiments, structural equation modelers prefer to write out a more elaborate causal model of the relationships under investigation through a system of structural functions. A system of such functions is said to be structural if the functions are assumed to be invariant to possible changes in the form of the other functions. Under this framework, the effects of treatments are understood as interventions in a prespecified structural model.

For structural equation modelers, hypothetical interventions should be explicitly and formally related to the causal mechanisms under study. In Pearl's version of structural equation modeling, for example, the mathematical operator "*do(X)*"is used to represent physical interventions in a set of equations that deletes certain functions from the model, replaces them by a constant, and preserves the rest of the model. The counterfactual conditional "If X had been x" is interpreted as an instruction to modify the original model so that some causal variable X is set to x by some intervention, experimental or otherwise. This operator is accompanied by a set of rules called "do calculus," which helps a researcher judge whether or not sufficient information exists to identify the effect of the intervention of interest. Rather than identifying one all-encompassing assumption—strong ignorability—as in the Neyman-Rubin approach, Pearl proposes that researchers adopt a series of local assumptions about how an intervention interacts with a prespecified structural model to identify causal quantities. Despite the rather substantial conceptual differences between these two approaches, however, they are mutually compatible. This compatibility arises from their shared reliance on counterfactual understandings of causality.

Causal Mechanisms

The Neyman-Rubin counterfactual approach is primarily concerned with defining *what* the effect of a cause is, not explaining *how* causes affect outcomes. The apparatus of most statistical models of causation has no formal role for social theory, explanation, or causal mechanisms. Given social scientists' interest in these issues, a common critique of the Neyman-Rubin model and its cousins are that they are too narrow for the social sciences. Advocates of the statistical approach have countered that counterfactual models of causation can be augmented to take into account the causal mechanisms.

While experiments have the virtue of credibly identifying the causal effect of an intervention, they are sometimes criticized as "black boxes." To understand the pathways by which interventions affect the outcome, social scientists have relied on a method known as "mediation analysis," which models the relationship between a treatment, a potentially posttreatment variable, and the outcome ultimately of interest. An important distinction in this literature is whether or not the "mediator" is treated as posttreatment or not. If the mediator is not affected by treatment, the effect of interest is how the manipulable mediator affects or moderates the outcome when the main treatment variable is fixed, known as the "controlled direct effect."

This controlled direct effect is not always the effect of interest, however, since mediation analysis is often intended to shed light on the role of mechanisms, which in this framework can be defined as a process that can transmit, at least partially, the effect of a treatment on an outcome. An important distinction between a manipulation (a "treatment") and a mechanism is that the former involves an external intervention, while the latter does not. The goal of this type of mediation analysis is to estimate what fraction of a causal effect is "indirect"—that is, due to the treatment changing the level of the mediator and consequently the outcome—and what fraction is "direct"—that is, due to the treatment affecting the outcome through other pathways. Expressed in counterfactual language, an "uncontrolled" indirect effect is a comparison between the outcome when the mediator is set at the value realized in the treatment condition and the outcome when the mediator is set to the value that would be observed under the control condition while holding treatment status constant.

Uncontrolled mediation effects are often of great interest, but unfortunately, even with a randomized intervention, their identification rests on strong assumptions. In mediation analyses, the level of the mediator is generally assumed to be independent of the counterfactual outcomes conditional on treatment assignment—that is, the mediator is assigned "as if" random. Given that an uncontrolled mediator variable, by definition, is not randomly assigned, this assumption is strong indeed. While the identification assumptions may be warranted in special circumstances, the main lesson of the statistical literature is that the quantitative study of causal mechanisms is an enterprise fraught with difficulties, even in the context of randomized experiments.

Qualitative Evidence and Theory Falsification

While the quantitative study of causality is well developed and increasingly unified under counterfactual models, many social scientists supplement statistical methods with qualitative reasoning to aid causal inference. Sometimes called "causal process observations," qualitative evidence can be an important source of leverage for both the design of causal analyses and the interpretation of their findings. In the social sciences, for example, most evidence for mechanisms is qualitative, not quantitative. Qualitative researchers argue that by direct observation of causal processes, a researcher can discern potentially important mechanisms that may have escaped notice. Insight derived from observations that are poorly suited for rectangular data sets may then lead to more formal investigations using experimental and observational quantitative methods. The health sciences, for example, are replete with examples of qualitative observation paving the way for groundbreaking experiments.

Given that most questions in the social sciences are studied using observational research designs, another role for qualitative insight is the justification of the conditional independence assumption. Although many and perhaps most observational studies pay inadequate attention to justifying the adequacy of their designs, careful observational research must identify important confounders and uncover fortuitous "natural" experiments for making well-grounded inferences. Qualitative evidence can be used to identify appropriate confounders to adjust for as well as to justify any claim that treatment was allocated "as if" random.

For many questions in the social sciences, however, a research design guaranteeing the validity of causal inferences is difficult to obtain. When this is the case, researchers can attempt to defend hypothesized causal relationships by seeking data that subject their theory to repeated falsification. Karl Popper famously argued that the degree to which we have confidence in a hypothesis is not necessarily a function of the number of tests it has withstood but rather the severity of the tests to which the hypothesis has been subjected. A test of a hypothesis with a design susceptible to hidden bias is not particularly severe or determinative. If the implication is tested in many contexts, however, with different designs that have distinct sources of bias, and the hypothesis is still not rejected, then one may have more confidence that the causal relationship is genuine. Note that repeatedly testing a hypothesis with research designs suffering from similar types of bias does not constitute a severe test, since each repetition will merely replicate the biases of the original design. In cases where randomized experiments are infeasible or credible natural experiments are unavailable, the inferential difficulties facing researchers are large. In such circumstances, only creative and severe falsification tests can make the move from correlation to causation convincing.

Censored and Truncated Data

Both censored and truncated data involve a lack of information about a random variable and occur in the context of quantitative analysis of data, when one is using that variable either to estimate a population mean (or other population parameters) or as the dependent variable in a regression analysis. The key distinction between them is whether one has information about missing values. With censored data, one observes some information about the missing data, either in the form of a range of values that they might fall into or in the form of the knowledge that they are missing. With truncated data, one has no information about the existence or value of missing observations. The difference in the structure of information for two types of data determines how one approaches censored or truncated data, whether in the context of a single random variable or as a dependent variable in a regression analysis. This entry discusses the consequences of this kind of missing data for regression analysis and sample selection.

Concerns about censoring and truncation abound in empirical analysis. They can occur either through the structure of data-gathering efforts or through legal requirements. Historically, researchers relied on assumptions about the distribution of the variable to adjust the estimates to account for truncation or censoring. These concerns are just as important when censored or truncated variables are the dependent variables in regression analyses. Scholars have long worried about the consequences of processes such as self-selection for the validity of their regression results, since they often result in biased and inconsistent coefficient estimates. While estimators to correct for censoring and truncation have been around for more than 3 decades, researchers have worried about their sensitivity to distributional assumptions and model specification. While recent work attempts to relax some of these critical assumptions and diagnose sensitivity issues, researchers have also extended previous work by designing estimators for a greater variety of data.

Types of Missing Data

Censored and truncated data are both forms of missing data, which have been categorized in three ways: (1) missing at random (MAR), (2) missing completely at random (MCAR), and (3) nonignorable (NI). A variable that is MCAR has missing values that are determined randomly, so that they occur with equal probability and do not depend on any information in the data set. A variable that is MAR exhibits a pattern of missingness in which the probability of a missing value depends on other observed variables for that same observation. A variable exhibits NI missingness when unobserved information in its value helps explain its missingness. In this case, the pattern of missingness depends on information beyond that which is contained in the observed variables.

Censored and truncated data can emerge through any of these three forms of missing data. Making valid inferences requires making valid assumptions about the structure of the missingness. Except for the case of MCAR, one will generally reach inaccurate conclusions, whether regarding population characteristics or regression parameters, unless one properly models the pattern of missingness.

Censored and Truncated Random Variables

A random variable is censored if one does not observe its true value but rather observes a bound for the range of values into which it falls. If X is a random variable, then X is censored if when $X > b$ the researcher observes only b. Similarly, X may be censored from below by a value a. The density function of the observed values of X therefore has point masses at the values a and b. This form of censoring occurs commonly in political science in the study of the duration of political events. For example, if a researcher observes a set of states that might adopt a particular policy, then states that have not adopted the said policy by the end of the study period are said to be right censored. For those states, the researcher does not know exactly how many years will elapse before they adopt the policy, only that it exceeds the number of years in the study period so far.

A random variable is truncated if the researcher has no information about missing values, including their existence. For example, observations with $X < a$ might not be observed at all. Observations of truncated data do not exhibit point masses at the truncation points. Rather, one accounts for the missing values by focusing on the distribution conditional on observation. This involves normalizing the distribution of the underlying variable, which includes observed and unobserved values, by the probability of the observed region.

An example occurs in the study of campaign finance in the United States: Political contributions to candidates for national office are not reported if the amount does not exceed \$200. Data from the government therefore list no contributions less than \$200, making it impossible to know the number of such contributions or their amount if any such contributions were made.

Censoring and Truncation in Regression Analysis

Regression analysis of censored and truncated variables often requires adaptations of the standard regression model. If the dependent variable is censored, then one must treat observations that take on the censoring value differently (note that the value at which censoring occurs and the value that is observed for censored observations need not be identical). In the case of state policy adoption, discussed above, the data are censored from above, in the sense that the dependent variable for states that have not adopted the said policy by the end of the study period takes on a value equal to the length of the study. In the context of duration analysis, this is referred to as right censoring. If one treats these observations the same way as those observations that have actually been adopted in the past year, bias will likely ensue. Rather, one should model the information accurately: One knows only that the observation is greater than the censoring value.

Another common form of censoring occurs when smaller values of the dependent variable are not observed. Often this corresponds to situations in which the dependent variable takes on nonnegative values, such as one country's foreign aid to other countries. Many countries will receive no foreign aid dollars, while others will receive positive amounts. The clump of countries receiving zero dollars can be thought of as cases in which the host country might have preferred to give negative aid, but since this is impossible, the observed value is censored at zero. One would generally analyze data with this structure with a Tobit model, which accounts for the censoring process.

When the dependent variable suffers from truncation, one does not have information about data for which the dependent variable is outside the bound(s) of truncation. To account for this structure, one must normalize the distribution of the dependent variable to account for the lack of observations in certain regions (so that the distribution over observed values integrates to one). In the case of campaign contributions discussed above, one would observe information only about contributors that donate at least \$200, since that is the legal cutoff for reporting requirements. Thus, one would likely have a data set with complete information for all individuals who contribute at least \$200 but no information and no observations for individuals who contribute less than that amount. Unlike the case of censoring, however, there will not be a large number of individuals clustered at \$200.

Censoring and Truncation Through Sample Selection

A related form of censoring and truncation occurs when a second process determines whether the dependent variable is missing for a given observation. This is often referred to as nonrandom sample selection and can result in selection bias if one ignores the selection process. One can think of the data-generating process as occurring in two stages: The selection equation determines whether one observes the dependent variable of interest for an observation, and the equation of interest determines the value of this variable given the observation. When the unobserved component of the selection equation is correlated with the unobserved component in the outcome equation, nonrandom sample selection is a form of nonignorable missingness. This will generally result in biased coefficients if one ignores the selection process.

Nonrandom sample selection can take two forms. If one observes cases for which the dependent variable is missing, the data suffer from stochastic censoring. One knows that the observation could have experienced the outcome of interest, but because of the selection process, it happened not to experience it. Alternatively, one might have information only about observations with observed values of the outcome of interest. For example, if a survey respondent answers all questions save the dependent variable, then the data exhibit stochastic censoring; whereas if a potential respondent chooses not to answer the entire survey, then the data exhibit stochastic truncation.

Both can be dealt with in the regression context by simultaneously modeling the selection process and the outcome of interest. The most well-known estimator of this type was developed by James Heckman and is often referred to as the Heckman model. While the Heckman model is designed for a continuous dependent variable and data that suffer from stochastic censoring, similar estimators exist for discrete outcomes. Analogous estimators also exist for continuous and discrete outcome variables when the data exhibit stochastic truncation.

Estimation requires proper specification of the selection equation. Furthermore, the estimates tend to be sensitive to the distributional assumption for the error terms (generally bivariate normal). Dealing with stochastic truncation generally poses a greater estimation challenge because one has no information about incomplete observations, making the distributional assumption even more important, since it is the mechanism for identifying the selection process.

CENSORSHIP

Censorship is restriction of the circulation of information, ideas, and images or of political, cultural, religious, and artistic opinions; it occurs mainly when the rulers consider that these could weaken or damage their hold on power. Characteristic of nondemocratic systems, and also present in some democracies, censorship is usually exercised by an authority responsible for monitoring the dissemination of ideas, including those circulated by governmental agencies as well as those from private individuals and organizations. The term *censorship* has its origin in the Roman Empire, where the "censor" was the person who controlled the dissemination of political ideas.

Since premodern times, censorship has existed under different political regimes. It began to be questioned in the 17th century, when critics of the period's absolutist states started to call for the limitation of state power and discretion and for the institutionalization of civil and political rights and, particularly, freedom of speech.

Censorship has also existed in social institutions such as the Catholic Church as well as in other religions such as Islam. In this case, the upper echelons of the religious hierarchy exercise censorship to ensure that the content of writings by priests and bishops is in line with the religion's main tenets.

Censorship is generally at odds with democracy, which is characterized by the institutionalization of civil and political rights, civil liberties, and the existence of an opposition. Although free expression is a central democratic value, some opponents of censorship do recognize exceptions. One of the most commonly proposed exceptions is of child pornography, due to its connection with individuals or organizations that commit crimes such as pedophilia. Supporters of censorship in such cases argue that the right to free expression is outweighed by the need to prevent the extraordinarily harmful impact on children caused by the creation and distribution of child pornography. In contrast, critics of censorship with respect to child pornography argue that the connection between pornography and actual harm to children has not been established. Although some proponents of free speech argue that it has precedence over the defense of children's interests, most Western democracies ban the possession, production, and distribution of child pornography.

Hate speech is another controversial subject of censorship; again, supporters argue that hate-filled speech encourages actual violence and that this potential harm outweighs the value of free expression. For example, such arguments are made to justify the censorship of neo-Nazi propaganda both in the United States and in Europe.

The use of censorship may be seen not only in a formal way—that is, through officials entitled to control political information using known political means—but also through informal mechanisms, such as threatening independent journalists, punishing a critical press through the denial of paid advertisements, and so forth. These informal censorship mechanisms can be found in young democracies established after military or authoritarian regimes, in which there are political constraints inherited from the prior political order limiting the institutionalization of political rights or caused by the lack of democratic beliefs among the governing elite. Referred to by Wolfgang Merkel as "defective democracies," they may simply not have repealed the previous regime's restrictions on press freedom or may consider that censorship is necessary in certain cases for reasons of national security. In this latter case, it is used to restrict publication of information about issues that are considered very sensitive for the armed forces and to avoid possible tensions and ensure the consolidation of democracy. In defective democracies or hybrid regimes, censorship by governing officials is exercised through formal and informal mechanisms, including threatening journalists. The elimination of censorship is one of the priority demands of an agenda that seeks to establish real democracy. In delegative democracies, such as Venezuela during Hugo Chavez's presidency (in power since 1999), public officials use a variety of methods to limit freedom of press, including not only censorship but also actions such as the cancellation of TV and radio licenses. Although censorship is formally rejected in established democracies, freedom of speech can be restricted not as a governing decision but as a consequence of the ownership structure of the media, when business people seek to influence public opinion with their own beliefs or political views, rejecting the dissemination of opposing views. In these situations, editors may employ extensive self-censorship to block the dissemination of news and ideas that may damage the government.

Censorship can be imposed *preventively*—by defining conditions for the dissemination and circulation of ideas through any channel—or ex post facto, with the authority sanctioning those who infringe the norms that establish limits on freedom of speech.

Although censorship is incompatible with democracy, this does not mean that public officials lack the resources with which to attempt to persuade the media to block news and information that may be damaging or favor reports that may be negative to the opposition. One of these key tools is the placement of advertising, which can be an important source of media revenues.

With the development of modern technology, particularly the expansion of Internet, the imposition of censorship is more difficult than ever, posing enormous problems for public officials seeking to limit the dissemination of information and news critical of the government. The Internet opened a new channel of communication for dissidents in nondemocratic regimes (e.g., Cuba and China) to denounce abuses and make their demand for pluralism and freedom known to the world. These actions, in turn, trigger support from NGOs and political parties and governments in democratic countries, which helps protect the authors from reprisals. Large international corporations—notably Google—have also emerged as new players in favor of greater pluralism in nondemocratic regimes or defective democracies.

Censorship plays a very important role in authoritarian regimes. It serves as a tool to ensure that limited pluralism—a central element in their identity—remains within the bounds established by the authorities. These regimes allow certain sectors of the elite access to, and even control of, the media and publishing houses through which they seek to gain political power or influence while also restricting the access previously enjoyed by other sectors of the elite. Self-censorship is widely applied in these regimes by editors of private media companies that support the regime, are interested in its continuity, and are particularly strict in preventing the publication of negative news, particularly that referring to opposition activities or conflicts and divisions within the governing elite.

Francisco Franco's Spain (1939–1975) provides an example of the evolution of censorship, which was not applied uniformly during his regime but underwent a number of changes as a result of conflicts among factions of the ruling elite, which had more influence when the regime was consolidated. With the consolidation of political power and in a context of economic development and social progress, there was a tendency to relax censorship in order to allow the press to play a role in controlling excesses, abuses of power, and, particularly, corruption among top officials. This explained the press law of 1966 in Franco's Spain, which began a certain liberalization of the official press, bringing greater transparency about the decisions of the authorities. However, the information concerning abuse of power, particularly of economic character, was used by sectors of the governing elite to weaken the power position of other factions, provoking a scandal that led to a cabinet reshuffle and the dismissal of ministers involved in this conflict. However, it also permitted the appearance of opposition publications and even magazines (e.g., *Cuadernos para el Diálogo*), which had costs for the regime in terms of a significant increase in negative political information since they published news about cases of corruption and conflicts within the government and the elite. As a result of these direct and indirect effects of the liberalization of the press, censorship was, in practice, reestablished.

In the context of liberalization of authoritarian regimes, the relaxation of censorship and self-censorship was widely extended, as in the Pinochet regime in Chile (1973–1990) during a period of political instability caused by the economic crisis in 1983 to 1984. Independent radios and magazines could inform in a broader way on several political facts that had been censored earlier, including repression against opposition organizations. However, the government continued threatening and punishing journalists with formal and informal mechanisms and applying censorship in particular cases. The political space opened by the weakening of censorship was widely used by journalists and media, leading to a significant increase in political information, including adverse information, and favored the development of the opposition and, as a result, the weakening of the political bases of authoritarian rule.

CENTRAL BANKS

Modern central banks are public, nonprofit, economic, and political institutions, with special functions derived from their command over monetary resources. They shape monetary policy, have a strong influence on exchange rates, and are the guardians of financial stability. Their decisions influence economic variables determining growth, output, and national development policies and have a bearing on the conditions of international financial and monetary cooperation. As a general rule, central banks are regulated by a mandate from government(s) specifying their goals and the conditions under which control over monetary resources is exercised.

After situating the topic in its theoretical context, this entry discusses the rules and social institutions on which central banks' command over monetary resources ultimately rest; stresses the establishment of central banks as a trustworthy system of monetary authority, at the domestic and international levels; and examines the way in which the institution's power has been recast and strengthened in the financial globalization era, in connection with the widespread trend toward central bank independence from elected governments in old and new democracies.

Central Banks as Substate Actors: Theory

An updated review of existing central banks shows a greater variance than is assumed in the dominant rational expectations theories framing the universalistic prescriptions and the role models recommended over the past 30 years. Influence is noticeable, however, in two global trends: (1) in terms of goals, the convergence toward the primacy of price stability, and (2) in terms of the mandated use of monetary resources, the dramatic increase in the number of institutions that acquired statutory independence vis-à-vis governments. Yet the actual variance in the practices and mandates of those institutions across countries and regions limits the scope for generalization. Moreover, central bank functions and powers have been recast over time since the establishment of the first institutions of this breed in the mid-19th century.

A central bank's status as a public, nonprofit institution is the outcome of an evolutionary process, based on the rules and social institutions that underpin its three core functions: (1) as banker to the government, (2) its monopoly of note issuance, and (3) as banker to the banking system—including that of last-resort lender. These functions refer to the unique relationships between the institution and its principal clients: the government and the profit-maximizing financial institutions, mainly commercial banks.

The Relationship Between the Central Banks and the Government

As a public national institution, the central bank derives its functions from a state-backed power as the sole issuer of a unique currency circulating in a geographical territory—to which it has been granted the status of legal tender (*cours forcé*).

Parallel to the processes of political delegation, a contractual, economic relationship with the government involves mutual economic interest and economic calculation. Lending to the government, at an agreed fixed interest rate, generates profits alongside those drawn from currency issuance. For the government, having "its own bank" ensures cheaper deficit financing; its power as principal borrower is used to press for a minimum rate of interest. On the other hand, central banks typically stand out as major holders of a government's debt, insofar as they invest their capital in government long-term debt instruments, mainly bonds. Where a domestic public debt market exists or is being established, voluntary loans from private savers provide an additional source of deficit financing. It is a market monitored by the central banks—adding the function of debt management to their other functions.

While the government's preference for cheap finance is an intrinsic component of its relationship to their central banks, deficit financing through monetary expansion—that is, through the monetization of the government's debt—was exceptional in industrialized countries. Long-term reviews of past practices supplied by Charles Goodhart's team and by Barry Eichengreen indicate economic as well as political reasons for central banks to be congenitally inflation and risk averse. Because they are major holders of the government's debt and because they already profit from lending to the government, they have an overriding interest in keeping the real value of its loans stable. There is also a reputation dimension to its practice, in that the strength of the currency issued is closely related to the creditworthiness of the issuer and to the commitment of the issuing institution to price stability. Prior to the 1970s, the commitment of central banks to convertibility and/or price stability was overridden in only one circumstance: when the survival of the state was threatened by wars. Thus, the "inflationary bias" of economic policy and the temptations of monetary financing of government spending in industrialized countries are late developments that call for a more contextualized analysis of the unstable monetary "regime" in the financial globalization era.

Prompted by two "structural" factors, some developing countries, mainly in Latin America, resorted to an "inflation tax." The first factor was a weak tax system, reflecting the limited capacity of the state to establish itself as a widely accepted fiscal authority. The second was that the inflation tax operated as a conflict-minimizing device to socialize the costs of "catching-up" industrialization. This was typically, as in the case of Brazil, where the state's commitment to a proactive strategy of rewarding the winners was based on the reiterated distribution of skewed fiscal and monetary incentives to selected economic agents.

Bank to the Banking System

As bankers to the banking system, central banks play a leading role mainly vis-à-vis commercial banks and less effectively vis-à-vis other profit-maximizing financial institutions. Such a role is, first of all, one of guidance and monitoring. Because commercial banks act simultaneously as deposit takers and loan makers, they are credit multipliers. Since credit is money, their individual microeconomic decisions, guided by profit-maximizing considerations, have a direct bearing on the increase or reduction in the stock of money available in the economy. Central banks' overriding concern with financial and economic stability gradually evolved toward a proactive role in averting this source of volatility. Their function as lender of last resort to the banking system—asserted always in the wake of crises—revolves around the bank's systemic responsibility, in exchange for enhanced powers of supervision and regulation of commercial banks' behavior. While the necessary function of lender of last resort is called for and is reiterated in crises, it is through its open market operations that the leadership of the central bank over profit-maximizing institutions is exercised. To maintain day-to-day control over the short-term nominal interests rates in all market conditions, the central bank purchases or sells financial securities for cash to change the monetary base. Its power to influence the money supply and other economic variables in this case is *exercised through the markets*. In other words, through a complex system of incentives and penalties—mainly the bank's discount rate—it may induce commercial banks to proceed with their lending strategies (or dissuade them). Because the central bank can impose the ultimate conditions for granting credit, it enjoys the "magical powers" of creating or destroying money. But it does so by relying on market mechanisms—namely, on its monopolistic position in the credit market and on the predictably self-interested response of profit-maximizing institutions to its interest rate policy.

Set against this background, the use of the term *central bank* is equivalent to and interchangeable with that of *monetary authority*—a use that is common to economists of all persuasions. This identity relies on three assumptions. One, wherever a market exists, financial firms and investors act independently from one another. Two, the central banks' power over monetary resources is that of a rule maker—an extension of the state's capacity of enforcement. Three, its creditworthiness derives from its governance capacity in terms of price and financial stability, which in turn derives mainly from its technical credentials.

Political scientists assume a political economy approach to the international monetary regimes in which central banks operate as rule based and contingent. They take as a premise that domestic and world markets are embedded in and permeated by social institutions. From this perspective, the history of the international monetary order (or disorder) is thought of as "the history of the construction and demolition of rules, constitutive and regulative, explicit or tacit, substantive and procedural," in the words of Bruce Hall (2008, p. 10). Central to this cognitive framing are the politico-economic processes underlying the establishment or disruption of a policy consensus around a monetary regime.

The International Political Economy and Central Banking

A major distinctive feature of the current monetary and financial regime is the rising power of central banks vis-à-vis established governments and the redefinition of their authority vis-à-vis cross-border market actors. To situate such processes requires a shift of focus from its role as a predominantly substate institution to one including its capacities as a public transnational actor in a multilevel system of global governance. The bank's command over monetary resources has been recast in tandem with new modes of interaction with government(s) and with market actors. Those shifts were carried out within the cognitive framing of the rational expectations revolution—centered on the notion of central banks' credibility with the financial markets. They are closely linked to a number of developments that distinguish the post–Bretton Woods monetary era, extending from the 1970s to the present, from its predecessors: the classical gold standard (1844–1945), the interwar decades, and the Bretton Woods system (1945–1971). While the previous systems constituted international monetary regimes proper, whose rules and social institutions were designed and enforced by the United Kingdom (UK) and the United States, respectively, the post–Bretton Woods is considered by many, including Barry Eichengreen, as a "nonsystem." Successive failures at establishing a durable international monetary order and a great deal of technical experimentation underlie the process by which the powers of the central banks were recast.

The issues around which the practice and theory of central banking came to revolve are explored by the monetary economist Stanley Fisher. On the one hand, the inflationary tendencies are brought about by the conflict between the short-term and the long-run effects of monetary expansion. On the other, it should revolve around the conflict between the need to shield central banks from the political pressures underlying the monetary financing of government spending and the principle of accountability to the public.

Central Banking and Governments

Central banks' current powers are tied to critical shifts in their relationship with their constituencies and in the cognitive maps adopted by central bankers. A salient aspect of those developments is a shift in the priorities of monetary management toward the primacy of price stability over other policy goals, such as the promotion of full employment and maximum output. The underlying politico-economic framework is shaped by the threat of runaway inflation in the dominant capitalist democracies, in the 1970s and 1980s, mainly in the United States and the UK, which was an unprecedented experience in peacetime. The international political consensus underlying the Bretton Woods regime had already been shaken in 1971 to 1973 by President Nixon's unilateral decision to detach the dollar (to which all other currencies were pegged) from the gold standard so that dollars could no longer be converted to gold. Because the dollar was the reserve currency, severe losses in the value of foreign reserves held in dollars were inflicted on the other members in the international monetary system. The ensuing legitimacy crisis was compounded by the refusal of Germany and France to import inflation engendered in the United States.

A matter of interest to the social scientist is brought to the fore by this episode. It highlighted the capacity of a powerful state, the hegemon, to deflect the costs of an overdue domestic adjustment to trading partners. It also highlights the critical role of transnational political coordination in counteracting that mode of power. The unique experience of Europe is a case in point: Both that episode and the crisis of the European Exchange Rate System in the early 1990s propelled the gradual crafting of the institutions that underpinned the Maastricht Agreement provisions aimed at establishing a regional monetary order. The powers of national central banks were redefined accordingly, in tandem with the transfer of their command over monetary resources to the European Central Bank. Insofar as it involved a long-term project, multiple acts of sovereign political delegation, and democratic deliberation, the European Central Bank is a unique case of establishing a transnational monetary authority through statecraft, in the sense explored by Lourdes Sola and Laurence Whitehead (2005) in connection with developing countries.

It is within this shifting monetary, financial, and political context that the new powers and functions assigned to central banks vis-à-vis the governments become meaningful. The centrality of the monetary policy and the monetary counterreaction to the dominance of Keynesian thought marked out a paradigmatic shift away from the postwar economic dirigisme structured around demand management and based on exchange rate, price, and interest rate controls. It brought to an end the subordination of central banks to domestic fiscal authorities.

The empowerment of such institutions, in particular the U.S. Federal Reserve System, highlights in what sense the exercise of monetary authority—as a special mode of political authority—can be strengthened and redesigned within the domestic framework of liberal constitutionalism. Three dimensions are of interest: (1) the strengthened role of central banks as rule makers, (2) the political dimension of their effective capacity for monetary governance, and (3) the relative power of the hegemon—the United States, as the issuer of the international reserve currency, the dollar—to lead the international arrangements that deflected the costs of adjustment to developing countries.

The authority of the Federal Reserve as a substate actor is constitutionally specified and limited. Its autonomy vis-à-vis the executive is constrained by the oversight of the U.S. Congress and, in terms of its goals, by its dual mandate—price stability and full employment. Neither these constraints nor the prospect of the huge social and political costs inseparable from recession and unemployment barred the option for a shock therapy to curb runaway inflation—basically a dramatic increase in the U.S. interest rates by Federal Reserve Chairman Paul Volcker. The political dimensions of the decision-making processes underlying a sharp turnaround of monetary policy remain understudied—despite the evidences that it was premised on successive acts of political delegation from both the executive and the legislative powers.

It is widely agreed that the Federal Reserve's capacity for monetary governance, in terms of its success in curbing inflationary expectations, is better explained by its political components than by its technical ones. Monetary economists, practitioners, and political economists agree that as a technical exercise, it was hardly a success. Volcker's economic objective was achieved thanks to his decision to emphasize price stability and to de-emphasize (also on theoretical grounds) the possibility that monetary policy could affect the level of output. This, in turn, relied on the flexible, dual-mandate design of the Fed and, above all, on Volcker's intellectual authority and moral credentials. To many practitioners, such as Alan Blinder, this is a critical asset to forge the near unanimity required in the collegiate decisions within the Fed. Also, insofar as monetary policy works through the markets, the technical and moral credibility of practitioners in the eyes of market actors are critical. The technical complexities of monetary management make this mode of personal, contingent authority a powerful instrument of persuasion and legitimation in the deliberative processes in Congress—and in the eyes of the relevant constituencies.

The systemic international functions of the Fed and other core central banks—both as rule makers and in their capacity of governance—relate to one of the most consequential implications of the dramatic rise in U.S. interest for developing countries, particularly for Latin America: soaring indebtedness, vulnerability to further external shocks, and the withdrawal of foreign investors for 9 years. Central banks in core countries were called to lead the coordination of the international arrangements aimed at deflecting to debtors the costs of the U.S. adjustments. The threat that their rising debts might feed on the international banking system prompted the emergence of new institutional arrangements, in concert with the International Monetary Fund (IMF) and the representatives of the private banking system. The responses to the "debt crisis" in Latin America were designed by the committees organized to this end and enforced on a country-by-country basis. They were conditioned on the implementation of structural economic reforms, including deregulation of the domestic financial systems and, ultimately, central bank independence. Competition for credit and foreign investments explains the compliance with most of those prescriptions. Sylvia Maxfield explains the move toward central bank independence in developing countries as driven by the need to obtain credibility in the eyes of increasingly competitive financial market actors. However, to the extent that this is a global trend across five continents, the recasting powers of the institution at the global level must be specified too.

Independence as Global Governance: The Emergence of Private Authority

Underlying the *problématique* of central bank independence is a critical shift in the mode of interaction between the "monetary authority" and market actors. The rising influence of cross-border financial transactions is closely linked to the empowerment of foreign exchange markets and disintermediated debt and bond markets in individual nation-states. The intensified competition among banks and between banks and other financial intermediaries in the past 3 decades continues to be central to this process. Competitive pressures explain also the proliferation of "financial innovations"—that is, the recurring creation of new debt/credit instruments intended to make them more attractive to borrowers and to lenders, both corporate and public. Such innovations lie outside the direct control of domestic central banks, are enhanced by information technology, and are driven by the deregulation and the liberalization of domestic financial markets.

In an international system where there is no world government, governance capacity is found in multiple sites of monetary (and fiscal) authority—public and private, national and transnational. Hall hypothesizes that central banks are integrated into an emerging new system of global multilevel monetary governance. Public transnational institutions endowed with supervisory and coordinating monetary powers include the Bank of International Settlements (BIS) and the European Central Bank. The fact that adherence to such rule-based systems is voluntary—and applied domestically by statutory authority—indicates that its implementation depends also on domestic political variables. At the national level, the executive is the main locus of monetary governance; a central bank may share them with fiscal authorities if it has not been granted independence by the government.

In this context, private market actors operating in the foreign exchange and disintermediated bond markets are empowered to adjudicate the credibility of fiscal and monetary policies through the operation of the markets. This function is complemented by private rating agencies that grade the market of sovereign, corporate, and municipal debt instruments. All such shifts reflect the unprecedented emergence of private authority conceptualized by Thomas Biersteker and Bruce Hall.

It is against this shifting context of deregulated, liberalized financial markets—where all money is fiat money—that the global trend toward central bank independence becomes meaningful. Constructing a trustworthy monetary authority is about making credible its long-term commitment to price stability, ensuring private and public wealth holders that their loans will be redeemed at their real value, plus a risk premium. Insofar as central banks can directly control only very short nominal rates of interest, the technical question of how monetary policies will work effectively through the markets is a matter of great concern. Economists and practitioners of all persuasions agree that it has been settled technically along the lines of the rational expectations theory. In other words, monetary policy can work through the markets when central banks properly anticipate and coordinate future expectations of economic agents. For this reason, the case for central bank independence at the global level has been strengthened by the rational expectations school and its analysis of the conditions necessary to attain credibility with financial markets. The central bank's independence from governments and transparency in communicating its long-term future monetary strategies are the major conditions enabling the institution to achieve credibility with market actors. In this intellectual and economic context, the economic and financial impacts of central bankers' utterances and communicating strategies can hardly be exaggerated.

While rationalists assume a self-equilibrating free market of actors acting independently and including in their calculations the expected impact of monetary policies, constructivists assume a relational mode of interaction between them and among market actors. It rests on shared understandings of the rules, norms, and values that underlie what are and what should be considered best practices—underpinned by epistemic communities of monetary economists and central bankers. Hall, a political economist of a constructivist cast, sets the generalized trend toward central bank independence in the context of multilevel global governance: The powers assigned to the institution are related to its ultimate role as the only nominal anchor to achieve international stability. Policy convergence, in this approach, is meant to drive the most critical structures down to the lowest possible national level of governance so that a uniformly effective impetus toward price stability can be provided. Whether or not this desideratum implied in the rational expectations theory is feasible is a quintessentially political problem. It is constrained by the current shifts in the axis of global monetary power, in particular the diversity of monetary strategies of new, "catching-up" countries. China's central bank is the most extreme case of subordination to the unique strategies of the government, aimed at national development and integration into the world market.

There are, however, many points of intersection between the two schools. Most important among them is the unspoken assumption underlying their prescriptions on how to reconcile two desiderata: (1) shielding the monetary authority from political pressures and (2) political legitimacy. Both schools take for granted the political framework within which central bankers operate in core democratic governments—that of liberal constitutionalism. The solution is then settled by means of the distinction between "full operational independence" and "goals independence." The discretion of central banks, in the first case, would be limited to the choice of monetary tools to achieve the goals ultimately set by elected politicians. Basically, these tools provide free access to periodically publicized reports on the fiscal practices, the economic models, the forecasts and outcomes of monetary policy, and the accountability of elected politicians, in periodic hearings of Congress.

Emerging market democracies, in contrast, confront the task of reconciling integration into global markets, with its ensuing fiscal and monetary disciplines, while building the institutions and policy consensus indispensable to legitimate the construction of a monetary authority. It involves a long-term project, an open-ended process of democratic deliberation, leadership, and the development of constituencies supportive of price and financial stability as priority goals. In this regard, they constitute experiments in statecrafting monetary (and fiscal) democratic authorities.

CHANGE, INSTITUTIONAL

Scholars in political science have approached the problem of institutional change in two very different ways that can be explained by the type of institutions on which they have focused. Institutions are most commonly understood as the *rules of the game*. As such, they can be written formal statutes, such as constitutions, electoral systems, and legal codes. They can also be generally established social norms, such as routines, customs, and habits. In almost all accounts of institutions, they are understood as relatively stable and persisting entities that do not change easily or instantly. The broad notion of institutions and the focus on continuity imply that understanding institutional change is both complicated and equivalent to understanding large-scale social and historical change.

The reasons why institutions are usually seen as durable and difficult to change vary. One is that institutions give rise to self-reinforcing "feedback" mechanisms that may or may not be purposively designed. For example, a social insurance program may be organized so that it covers a majority of the population, thus creating not only social protection but also support from the political majority. Or it may cater to broadly held norms about social justice in the population. In either case, a self-reinforcing mechanism is at work. Another reason for institutional stability is that none of the actors that are involved have an incentive to change. For example, political parties in a "first-past-the-post" two-party political system have little reason to change to a proportional electoral system, or vice versa. Third, formal institutions may become dominating social conventions, and agents may have difficulties imagining a different institutional order.

Explanations for institutional change can be divided into three broad categories. Change may occur as a result of unpredictable and unforeseen "exogenous shocks." For example, countries may radically change their institutions when hit by an international economic crisis or when drawn into a war. A second type is a change through an evolutionary functionalist logic. Institutions that best suit the underlying structural changes survive through the operation of some kind of selective mechanism, and institutions that do not follow this functionalist logic are weeded out by the competition from more successful institutional orders. Third, institutions may change by intentional design by strategically acting as agents that construct new institutions that serve their future interests. However, the outcome of such strategic design may not always be in line with the agents' intentions because outcomes from institutional changes are hard to predict, especially if there are simultaneous changes of other institutions outside the control of the designing agents.

The Two Schools of Institutional Change

There are currently two very different approaches to the problem of institutional change. In development research, including research in comparative political economy, there is now almost a consensus that the problem of massive poverty (and the many resultant social ills) in most developing countries is due to their dysfunctional social, legal, and political institutions (e.g., Daron Acemoglu & James Robinson, 2008). This problem, also known as the "good-governance" or the "quality-of-government" problem, has been well captured by the economist Dani Rodrik (2007, p. 153), who argued that the encounter between neoclassical economics and developing societies has revealed the great extent to which market economies rely on a complex and not well understood set of social, legal, and political institutions. Rodrik's list of such institutions is extensive: a well-specified system of property rights, effective regulation that hinders monopolies from dominating markets, uncorrupted governments, the rule of law, and social welfare systems that can accommodate risks. In addition, Rodrik adds the importance of informal institutions that foster social cohesion, social trust, and cooperation. Following Douglass North, Rodrik criticizes neoclassical economics for omitting the importance of such institutions and argues that the problem is that most economists usually take them for granted. In fact, most poor countries are plagued by a very different set of institutions, such as systemic corruption, systematic infringements on property and human rights, and low levels of social trust and lack of institutions that can handle individual and collective risks. In this type of analysis, the main problem is to explain why societies with a set of institutions that are clearly dysfunctional in terms of general social well-being generally seem unable to adopt the "new set" of institutions that Rodrik lists and that are known to lead to economic prosperity and social well-being. As Bo Rothstein (2005) notes, the central problem in this type of analysis is that the historical record clearly shows that dysfunctional institutions, such a systemic corruption, clientelism, and patronage, are very hard to change. Political and economic leaders in these systems may be able to change the institutions from above, but since they are the group that collects the most rents from the system, they have no incentive to induce change, at least not in a short-term perspective. Change of these systems from below is difficult because agents who want change face a formidable collective action problem. Thus, as Douglass North, John Wallis, and Barry Weingast (2009) have shown, in this research area, the main issue is the lack of institutional change despite the pressing human need for such change. For example, systemic corruption not only hurts economic growth, causes extreme poverty, and induces civil strife, but it also has devastating humanitarian consequences in areas such as provision of health care, level of infant mortality, and access to safe water.

However, in several recent studies of the rich welfare states and their systems of industrial relations and social provisions, the picture is very different. Here, change of important institutions occurs almost constantly in a mostly incremental process, either because agents are able to find compromises and viable solutions to common problems or as a result of power struggles. As James Mahoney and Kathleen Thelen (2009) and Thelen (2009) have shown, adaptation to new circumstances such as increased international competition for goods and services, globalization of financial markets, and new technologies in the production process may not always be easy in these societies and may be the outcome of difficult political disputes and difficult compromises. Still, the general picture is that in such societies, political and economic elites are, after some initial difficulties, usually able to gradually change central institutions to bring about the distribution of resources and power that they believe will follow from their ideas of new institutional designs.

A problem for our understanding of institutional change is that these two research approaches seldom communicate their theories, problems, or results. Why do the political and economic elites in some (rich, capitalist) societies usually manage to change institutions, while other (poor, developing) societies seem stuck with formal as well as informal institutions that are fundamentally detrimental to their need for economic growth and general social well-being? One reason for this apparent paradox may be that these different approaches to institutional change are dealing with institutions that are fundamentally different.

Two Logics of Institutional Change

The idea that institutions include not only formal but also informal rules implies that it is difficult to distinguish them from a society's basic cultural traits. In explaining institutional change, this becomes problematic because while it is possible to change codified systems of rules and "standard operating procedures" through methods such as direct and deliberate political intervention, this is much more difficult with institutions viewed as shared mental models and other such generally held basic beliefs that are rooted in a society's historically established culture. For example, one such informal institution is people's belief that others in their society are, in general, trustworthy. Comparative survey research shows that this informal institution varies to a large extent among countries. Clearly, changing such a system of beliefs is not the same thing as changing a piece of social insurance legislation or a system of wage negotiations. Thus, as a first distinction, we can differentiate between two basic logics of institutional change, namely, change in a society's formal institutions and change in its informal ones.

A second distinction has been suggested by George Tsebelis (1990)—namely, between "redistributive" and "efficient" institutions. *Redistributive institutions* are rules that move resources or power from one group of agents to another. A familiar example would be most tax systems and systems of industrial relations. Historically, one can also think of slavery as a formal redistributive institution. Examples of redistributive informal institutions would be professional networks that give status and prestige to a particular set of its members. Another example is economic systems in which business contracts and career systems follow family lines. Third, many political systems are characterized by informal clan-based nepotism or various forms of corruption.

Socially efficient institutions, on the other hand, have quite the opposite character since their purpose is to improve the welfare of all actors in a system of exchange. As such, they are genuine public goods, implying that they serve a common interest. According to Elinor Ostrom (1990), seen in light of noncooperative game theory, these are institutions that make it possible to avoid situations known as suboptimal outcomes in prisoner's dilemma, collective action, or tragedy of the commons types of interaction. Rothstein (2005) notes that in the closely related theory about social dilemmas, socially efficient institutions make it possible for agents to avoid ending up in situations known as social traps. These are all situations in which the agents know that they would all be better off if they could collaborate to establish a common set of institutions; however, because they do not trust that the other agents will adhere to the rules or contribute to the costs of establishing and running the institution, the individual agents have no incentive to collaborate. This lack of trust leads to a situation in which all agents are worse off. For example, a corrupt doctor in a public health system may realize that all would gain by ending corruption, but it becomes meaningless for the individual doctor to stop taking bribes if she or he cannot trust that most other doctors would do the same. Similarly, it makes little sense for the single judge or police officer to stop taking bribes if he cannot trust that (almost) all his colleagues will also refrain from this practice. In an emerging democracy, it makes little sense to be the only political party that does not tamper with ballot boxes. The list of examples illustrating this problem is endless.

Examples of socially efficient formal institutions are the rule of law, protection of property rights, and an honest and impartial civil service. In economic terms, such institutions are public goods because they dramatically lower what are known as transaction costs and thereby contribute greatly to economic prosperity. Universal social insurance systems can also be categorized as socially efficient institutions since they handle individual risks in a more cost-efficient way than do market-based social insurance systems.

The most well-known example of informal socially efficient institutions is the existence of generalized trust that is widespread in the population. Institutions such as this increase the likelihood that other agents will not use opportunistic or treacherous strategies but instead will behave in a reciprocal manner. Thereby, generalized trust also decreases transaction costs, but in a less costly way than if agents were to use only the formal legal system.

The reason why it is so difficult to change from dysfunctional to socially efficient institutions (e.g., establishing honesty in a corrupt civil service or changing political exchange from clientelism to impartiality) is that such a change necessitates the trust among agents that (almost) all of them will play by the new rules from time t_1 and that such a trust is not easily manufactured by political means. As Ostrom (1990) has argued, socially efficient institutions can be seen as collective action problems of the second order.

It should be added that the distinction between socially efficient and redistributive institutions is a theoretical construct and that many, if not most, institutions have traits of both redistribution and social efficiency. Why the distinction is useful may be better understood from the following parallel example. Most political scientists are willing to distinguish between democratic and nondemocratic political systems. However, all democratic systems contain nondemocratic elements, and most nondemocracies feature some kind of system for popular influence and for establishing consent.

The reason why scholars studying the rich democracies and scholars studying developing countries have come to such different conclusions about the possibility for institutional change is that they study fundamentally different types of institutions. The former usually concentrate on redistributive institutions for which the analysis of power constellations explains change. The latter study the lack of socially efficient institutions, which are difficult to establish because they are public goods. According to Acemoglu and Robinson (2008), the problem is that there is currently no generally accepted theory for how they can be established or why they are reproduced. Following standard assumptions about self-interested rational agency, socially efficient institutions of the type described above would not exist, and poor countries that lack them would not be able to change from inefficient to efficient institutions.

Charisma

Most basically, charisma refers to a rare trait found in certain humans that combines unusual charm and an ascribed "magnetic" quality of personality and/or appearance. Deriving from the Greek word χάρισμα (chárisma), it includes the meaning of "gift" or "divine favor," in particular with reference to innate and sophisticated personal communication and persuasiveness.

Charisma as a concept has been employed in several contexts, as a religious concept, a sociological concept, or a psychological concept, and also in journalistic and common language usage. Although impossible to operationalize accurately, charisma is often used to describe, or rather to label, a personality trait that includes the seemingly "supernatural" ability of some rare persons to lead, charm, persuade, and inspire others due to their "magnetic," alluring quality, without using power or threat. It refers to an ascribed quality, not to be achieved purposefully, in certain people who draw the attention and admiration (but also hatred if the attribution of charisma is perceived to be dangerous) of others.

As a political concept, charisma became famous most of all due to the analytical formulation by Max Weber (1864–1920) as one of his three types of legitimate rule (*legitime Herrschaft*). In addition to the rational-legal (-bureaucratic) rule (*legale Herrschaft*) and the traditional rule (*traditionale Herrschaft*), the charismatic rule (*charismatische Herrschaft*) was applied by Weber (1924/1947) to historical forms of political domination "resting on devotion to the exceptional sanctity, heroism or exemplary character of an individual person, and of the normative patterns or order revealed or ordained by him" (p. 215). In his writings about charismatic rule, Weber (1946) applies the term *charisma* to

> a certain quality of an individual personality by virtue of which he is considered extraordinary and treated as endowed with supernatural, superhuman, or at least specifically exceptional powers or qualities. These are not accessible to the ordinary person, but are regarded to be of divine or similar supernatural origin, and on the basis of which an individual is perceived and accepted as a "leader." . . . How the quality in question is ultimately judged from any more general ethical, aesthetic, or other point of view is, of course, irrelevant for purposes of definition. What only matters is how the individual is actually regarded by his "adherents" or "disciples." (p. 329)

Charisma thus denotes a relationship rather than an individual personality attribute. Should the strength of this belief fade, the domination of the charismatic leader can also fade quickly, which is why this form of rule can be very unstable, as the exercise of charisma is founded purely on its recognition by the leader's followers. Although charismatic domination evolves in contexts of traditional and/or rational-legal rule, it tends to challenge these forms of rule and is therefore interpreted by Weber as revolutionary. Although charismatic domination represents personal and noninstitutionalized leadership, Weber points to some processes of longer duration for which he employed the term *routinization of charisma* (*Veralltäglichung des Charisma*). Under the constant challenge of traditional and/or rational-legal forms of domination, he recognizes the partial institutionalization of charisma through the establishment of specified positions open exclusively to persons who demonstrate special personal qualities. Institutionalized charisma is also represented by *charisma of office* (*Amtscharisma*), which pertains to beliefs that certain officeholders, by virtue of occupying an office (e.g., priesthood), acquire certain special powers or qualities. By contrast, the pure personal charisma attributed to revolutionaries, prophets, and sages resists institutional influences; it is antithetical to stable authority based on fixed codes and customs.

Weber saw the charismatic leader as a vital agent of social, political, and religious change, which led to some criticism attributing an idealistic "Great Men" theory of history to him. In any case, charismatic leaders generally are said to arise in unsettled times permeated by disorienting sociocultural change. In such periods, unconventional political and/or religious groups arise composed of people who are fearful of the future, who hope that by placing their faith in some charismatic leader they will eradicate the past and protect their lives against unknown and unseen dangers. For example, the two most charismatic leaders in the 20th century are Mahatma Gandhi in India and Nelson Mandela in South Africa. Ayatollah Khomeini of Iran is an example of a leader with combined personal and office charisma.

The volatility of charismatic authority and of groups manifesting charismatic leadership has been a persistent theme. In essence, charismatic domination is unstable because it lacks both institutional restraints and institutional supports. The absence of institutional restraints on charismatic leaders coincides with the lack of institutional supports available to sustain a leader's authority. Charismatic domination is fundamentally a precarious state of affairs because the leader's claims to domination rest purely on subjective factors, as the perceptions of the followers of his or her extraordinary qualities may be situation specific and ephemeral. The charismatic leader must continually face the prospect that her or his special "gift" of "grace" will no longer be perceived the way it once was and that her or his authority will fade, as happened in the case of Kwame Nkrumah of Ghana. Charismatic leaders must continually be on the alert for threats to their authority from outsiders, dissidents, and rivals within the movement as well as from their administrative staff of traditional and/or rational-legal domination. The latter is generally oriented toward expanding the scope of its authority and rationalizing administrative procedures to the detriment of the charismatic leader's freedom of action, sometimes leading to his or her actual deposition.

An additional consequence of the lack of institutional supports for charismatic leadership involves the absence of regularized procedures for the transfer of authority, that is, the problem of succession. The failure to effectively institutionalize the charisma of the founding leader usually leads to intensifying factionalism and ultimately to the end of charismatic domination.

The precariousness and instability of charismatic leadership and its consequences in terms of group volatility, factionalism, and possible violent episodes represent instances in which the concept of charisma can facilitate the explanation of sociohistorical events. In this context, the concept of charisma has been criticized as basically a descriptive concept that labels rather than explains the power of leaders and the submission of believers. It has been suggested, further, that the development of controversial new movements and noninstitutionalized forms of charismatic behavior has been enhancing the importance of charisma. Yet charismatic authority and its concomitants in terms of the tendency to view social relationships and organizations in personal terms and to envision a messianic termination of present evils is generally thought to be associated more with traditional rather than complex modern societies.

Christian Democratic Parties

Political families can be identified, following Maurice Duverger's approach of *familles spirituelles*, as parties that share the same ideological inspiration, by adopting Stein Rokkan's structural approach, which identifies parties according to their roots in social cleavages or in terms of institutional international networks, which connect ideologically similar parties in various countries. In the case of the Christian Democratic parties (hereafter CDPs), all these approaches provide fruitful hints in assessing the profile of this political family across countries, since the evolution of the ideological and social orientations coincided with changes in the international organization. This entry discusses some specific features of CDPs, their origins and their evolution over time, and their role in the present world.

CDP is a specific label that implies a rather narrow focus—parties sharing the "Christian-democratic ideology." However, the acronym *CDP* is often used more loosely. If we were to follow the structuralist and ideological approaches very strictly, all Christian parties would be part of this political family. To classify CDPs, Rokkan's framework can be used to refer specifically to religious parties that either arose in Catholic countries as the result of a church–state conflict or were formed when independence was sought by Catholics versus a dominant power as in Belgium, Ireland, and also partly Poland at the time of national independence after World War I. Because the formation of CDPs involved primarily the relationship between the Catholic Church (hereafter the Church) and the political sphere, Protestant denominations of Christianity play a minimal role in CDPs (with the partial exception of the Netherlands) and, thus, are not discussed in this entry.

However, to provide a complete picture, other Christian parties do exist in Europe—for example, in Norway since the end of World War II and in Sweden and Finland since the 1960s and the 1970s, respectively. But these parties represent only a very small number of voters. After 1989, some CDPs emerged in the new democracies in Central-Eastern Europe—for example, the Christian Democratic People's Party (Kereszténydemokrata Néppárt, KDNP) in Hungary, the Slovenian Christian Democrats (Slovenski krščanski demokrati, SKD) in Slovenia, the Lithuanian Christian Democratic Party (Lietuvos krikščionys demokratai partija, LKDP, which in 2001 merged with the Christian Democratic Union to form the Lithuanian Christian Democrats—Lietuvos krikščionys demokratai, LKD) in Lithuania, the Christian Democractic Movement (Kresťanskodemokratické hnutie, KDH) in Slovakia, and the Christian and Democratic Union/Czech People's Party (Křesťanská a demokratická unie/Československá strana lidová, KDU-ČSL) in the Czech Republic. All these parties and the various subsequent mergers never played a pivotal role comparable with their Western counterparts. In most of these cases, they did not even attain 10% of the votes. Most striking is the absence of a true CDP in the fervently Catholic Poland, except for a very short period.

Further, CDPs are present, in descending order of political influence, in Latin America, Africa, and Asia. In Latin America, CDPs played a significant role in various countries thanks to prominent leaders such as Eduardo Frei in Chile and Rafael Caldera in Venezuela. In 1949, these parties created a regional organization, the Christian Democratic Organization of America (CDOA). The formation of CDPs in Latin America followed a different route from the one taken in Europe. Some Catholic parties were present in Latin America in the 19th century, but they were much more conservative than the nascent Catholic political organizations in Europe at the time. After the 1930s, and especially after the 1950s, new, more genuine "Christian Democratic" parties emerged in Latin America, often in opposition to preexisting Catholic parties, as in the case of Ecuador and Uruguay. The most successful case among these parties was the Chilean Christian Democratic Party (Partido Demócrata Cristiano, PDC), which played a dominant role in the democratic periods before and after the military dictatorship of Augusto Pinochet. Other relevant parties are the Social Christian Party (Partido Social Cristiano de Venezuela, COPEI) in Venezuela, the Guatemalan Christian Democracy (Democracia Cristiana Guatemalteca, DCG) in Guatemala, and the PDC in El Salvador, all of which dramatically declined in the late 1990s, and the Social Christian Unity Party (Partido de Unidad Socialcristiana, PUSC) in Costa Rica and the union of the Christian Democratic Party with the Popular Democrat legislative group (Partido Demócrata Cristiano/Democracia Popular, PDC–DP) in Ecuador.

Even in their initial formation, CDPs in Latin America had a much looser relationship with the Church than did their European counterparts. However, they have caught up with European trends both in their emphasis on social concerns—at least for most of them—in the first postwar decades and then in relaxing their religious connection following the European trend of a more secular-conservative approach. Given the instability of the Latin American regimes and the frequent disruption of democracy (with the exception of Costa Rica), this analysis will focus mainly on the European context.

In Europe, a different approach to the study of CDPs, such as the "actor-based" one offered by Stathis Kalyvas, leads to the same focus on Catholic parties only (again with the exception of the Netherlands). According to Kalyvas's landmark contribution (in his book *The Rise of Christian Democracy in Europe*) "core European" CDPs were the by-product of Catholic political entrepreneurs' reactions to the mounting secular and anticlerical attitude of the liberal elites at the end of the 19th century. The Church did not sponsor the formation of religious/Catholic political organizations; on the contrary, it acted to limit, discourage, or even suppress such initiatives. This interpretation stresses the *autonomous* role of political entrepreneurs during the formation of the religious parties in Western Europe. The Catholic parties of the late 19th and early 20th centuries grounded their legitimacy in themselves; they did not depend on an external institution for their legitimation. Such internal legitimacy is an important asset for the institutionalization and organizational development of a political party. But despite these favorable internal conditions, the Catholic parties either collapsed or underwent profound modifications after World War II. However, even though they played a rather limited role in the prewar party systems, their role became pivotal and in some cases dominant in postwar Europe. Scholars disagree on the question of whether this shift in the status of European CDPs is best understood as a complete break between prewar and postwar parties or whether there was some continuity despite the change. This academic dispute can be better understood in light of a series of factors: (a) the attitude of the Church vis-à-vis the "modern world," and of CDPs in particular; (b) the ideological renewal of CDPs; (c) the novel postwar international context; and (d) the role played by CDPs in the various party systems.

Christian Democratic Parties' Formation and Evolution

The Church and the Modern World

As the first Catholic parties in Europe emerged at the turn of the 20th century, they were in more or less open conflict with the Church over the acceptance of the principles of liberal democracy. The Church still indulged in its self-representation of a "*societas perfecta*" with the Pope at its apex—as a sovereign among sovereigns—and maintained its condemnation of modern society and liberal-democratic principles, which it held were leading to a general and harmful "social disorder." The anticapitalist "social doctrine" of the Church as expressed in the encyclical *Rerum novarum* (1891) derives from this vision of society. However, in the same period, Catholic intellectual circles, especially in Italy and France, elaborated on the mundane ideology of "Christian democracy," which advocated the protection and promotion of Catholic interests through social networks and communities and the fostering of these positions in the political arena as well. In other words, Christian democracy recognized the opportunity offered by democracy for developing social activities based on Catholic principles and defending Catholic values (and interests) through democratic institutions. The Church radically condemned this ideology in the encyclical *Pascendi* (1907), declaring that the Christian-democratic ideology would cause "confusion between evangelization and the promotion of democracy." In accordance with this, the pontificate of Pius XI (1922–1939) aimed at restoring the "kingdom of Christ" against the liberal society.

This intransigent position was confronted during World War I and its aftermath. The war involved, in an unprecedented way, the religious hierarchies and the religious constituency in support of each respective state, and this relaxed the negative relationship between the Church and the liberal state. For the first time, the Catholic world overtly supported the state, ending that sense of extraneousness that had been growing since the 1880s. Moreover, the introduction of mass male suffrage enfranchised millions of new voters, and these voters needed a guide to prevent their becoming adherents of atheist socialism. As a consequence, the Church somewhat relaxed its negative attitude regarding political activities by Catholics and Catholic parties, even if it avoided any direct sponsorship.

CDPs did not exploit this "autonomy" from the Church by building up a solid identity and institutionalizing the party organization; on the contrary, they suffered from this distance and remained prone to adapting themselves to whatever position the Church took. Lacking open legitimation by the Church, they were constantly seeking the Church's approval of their policies. When the Church signed concordats with fascist Italy and Nazi Germany in the 1930s, the CDPs, with few exceptions, accommodated themselves to fascism and in some instances even supported it. The most dramatic case was provided by the Spanish Civil War (1936–1939). The radical anticlerical attitude of the Spanish Republican forces led the Church to sponsor, even with enthusiasm, General Francisco Franco's restoration and the intervention of the Italian fascist troops. The Church espoused the fascist regimes so easily because of its long-drawn-out opposition to modern society, whose liberal institutions and worldview the Church still despised. In addition, the economic depression was seen as a failure of capitalism, increasing the dissatisfaction with liberal society. The economic crisis reinvigorated Christian social doctrine, which was seen now as a "humanistic" third way between capitalism and communism.

The Emergence of Personalism

In the same period, however, a different elaboration was emerging, especially in Italian and

French intellectual circles. That milieu, where Emmanuel Mounier and Jacques Maritain played a crucial role, produced an original and quite powerful "ideology" of Christian inspiration: personalism. In a nutshell, personalism emphasizes the role of the person in society: The person is not conceptualized as the individual of the liberal tradition, an "isolated monad," but rather as a part of a collective body, intertwined with all the others through a network of associations and communities. Each person has intrinsic value *and* value as a member of a community or an intermediary body: Persons cannot be disconnected from their social environment, starting with the family. This new ideology played a dramatic role in moving CDPs (and to some extent, the Church) toward acceptance of the modern world and in distancing them from fascism. The most visible confirmation of this change came with the Pope's Christmas address in 1944, when for the first time he acknowledged democracy explicitly and clearly (*apertis verbis*). According to some scholars, however, Pius XII (1939–1958) accepted democracy only instrumentally, as the antagonist of communism, rather than for its own sake. Thus, according to Martin Conway and Tom Buchanan, Catholicism in the 1940s and 1950s remained intransigent and made few concessions to the modern world.

Postwar Christian Democratic Parties

At any rate, the CDPs that reemerged or were created *ex novo* after World War II proved much stronger than those of the prewar years. The international context, the Church strategy and profile, the CDPs' ideological-religious references, the party systems' new configurations, and the issue at stake are the factors that explain this change.

Church Profile and Strategy

World War II changed the image and the mass perception of the Church. Contrary to the antimodern, traditionalist, and mildly profascist stance of the prewar Church, after the conflict it emerged with a new image thanks to its charitable, comprehensive, and universal messages. France was an exception because of the deep involvement of the episcopate with the Vichy regime, which was partially counterbalanced by the support of the lower clergy for the anti-Nazi Maquis. The Church's acceptance of democracy and its more or less unequivocal accommodation with the modern world facilitated a positive reception of its role in a larger sector of the population than was the case previously. Even more important was the Church's modified attitude vis-à-vis the political presence of Catholics. Whereas in the interwar years the Church had kept its distance from the Christian parties and even despised them, during the war, the Church began to support CDPs and even sponsored their resurgence and the creation of new CDPs. This positive relationship provided the CDPs with the support of the Church organization: Priests became quite active, and parishes served as local branches or centers of support for the CDPs.

Anticommunism

One reason for this change of attitude lay in the new international setting. With the descending of the Iron Curtain and with atheist communism gaining power in Eastern Europe and making strides in Western Europe, too, the Church called on all religious persons to defend Christian civilization. And the CDPs followed suit. Anticommunism was the strongest and most successful appeal for the CDPs. They became the bastion against communist subversion and its antireligious politics. This appeal led to an enlargement of the electoral constituency; not only the faithful but the moderate voters as well were mobilized by anticommunism.

Location of CDPs in the Party System

CDPs gained a pivotal position in the various party systems. They were almost always a part of coalition governments in Belgium, the Netherlands, Luxembourg, Italy, and France until 1958 (and afterward the residual component in the United Democratic Front [UDF]). In Austria and Germany, however, they had to be in the opposition during some periods (the Austrian People's Party [Österreichische Volkspartei, ÖVP] in the 1970s and 1980s and the Christian Democratic Union/Christian Social Union [Christlich-Demokratische Union/Christlich-Soziale Union, CDU–CSU] in the 1970s and in the 1998–2005 legislatures in Germany). The CDPs' central position and broader ideological appeal were supported by the postwar collapse of the moderate-conservative bourgeois parties. These parties were discredited by their inability to counteract the totalitarianism of the interwar period or by their acquiescence to it. Where they attempted a resurgence after the war, it turned out to be a fiasco. The CDPs thus absorbed the conservative constituency too. In this way, the CDPs went beyond their traditional rural constituency, penetrating into the urban bourgeoisie (and sometimest the urban proletariat, too, thanks to the espousal of social welfare in the first years after the war, following the example of the French Popular Republican Movement [Mouvement Républicain Populaire, MRP], the most leftist and welfare oriented of all CDPs).

Ideology and Policy

The postwar CDPs' ideological bases were their reference to the Church on moral issues; the elevation of personalism as an encompassing "ideology"; the adoption of welfare systems combined with the principle of subsidiarity, placing the family at the center; an adequate dose of state intervention congruent with the social market economy; and a consensual/consociational conception of democracy, multilateralism, and peaceful coexistence. In particular, in the 1950s and 1960s, CDPs competed with communists and socialists on their own ground, presenting a social and "humanist" alternative to the Left's socialistic project. Later, the CDPs fully endorsed the "social market economy," which became their distinctive economic policy. All these elements have not changed up to the present time, except that state intervention has been downsized due to the neoliberal mood of the 1980s and 1990s. Nevertheless, CDPs were affected by the combination of the processes of modernization and secularization, which reduced the social basis of religion and, by the Second Vatican Council, had distanced many believers from active political support of CDPs. The Council had a tremendous impact on the Church and on most fervent Catholics. As far as politics was concerned, the Council fully recognized the principle of liberal democracy as such—and not instrumentally as a bastion against communism—and it disengaged the Church from day-to-day politics and from open support of CDPs. These changes provoked some criticism and backlash against many CDPs but not all of them. As far as their electoral fortunes were concerned, in the Netherlands and Belgium, the impact was strong, negative, and immediate; in Austria and Switzerland, perceptible but limited; and surprisingly quite limited in Italy. Only the CDU–CSU in Germany, thanks also to its interreligious nature, did not suffer any reversal.

The process of secularization and the decline or collapse of most "Christian Democratic" parties in the core of Europe (the Christian Democrats [Democrazia Cristiana, DC] in Italy, the Christian People's Party/Social Christian Party [Christelijke Volkspartij/Parti Social Chrétien, CVP–PSC] in Belgium, and the Christian Democratic Appeal [Christen-Democratisch Appè, CDA] in the Netherlands) favored a shift toward a more moderate and less religious orientation, following the imprint of the CDU–CSU. The evolution of the European Peoples Party (EPP) in the European Union (EU) shows this tendency quite clearly. EPP was progressively enlarged by moderate secular parties, which relaxed the religious tone while keeping some basic tenets of the CDP ideology: (a) the humanist personalism, (b) the centrality of the family, (c) the welfare concern and the social market economy, (d) subsidiarity, (e) the pro-EU attitude, and (f) the multilateral orientation in the international sphere.

Electoral Evolution

In the first elections after World War II, CDPs emerged as the strongest parties in France, Italy, Belgium, the Netherlands, Luxembourg, Austria, and Germany and as the third strongest in Switzerland. With the exception of France, where the MRP rapidly declined facing a newly established competitor, the Gaullist Party, and then collapsed with the advent of the Fifth Republic, the other CDPs retained their pivotal position for at least 3 decades. In the 1970s, their electoral fortunes and key positions in coalition governments declined. The Belgian and Dutch CDPs suffered the worst blows, losing votes and their dominant position up to the point where the three main Dutch religious parties had to create an interconfessional new party (the CDA) in order to retain their relevance in the political system. In Austria, the ÖVP lost its primacy to the Socialist Party in the 1970s and never recovered afterward. In Germany, the CDU–CSU, too, scored below the Social Democratic Party (Sozialdemokratische Partei Deutschlands, SPD) in the 1970s; it recovered in the 1980s but lost again in the 1998 elections. The most dramatic decline was experienced by Italy's Christian Democrats (Democrazia Cristiana, DC), a party that had always been in government since 1945 as the first national party; it was reduced to nearly 10% in 1994, losing almost 20 percentage points in 2 years (from 1992 to 1994). From the DC, a variety of parties emerged: The most relevant were the Italian Popular Party (Partito Popolare Italiano, PPI), its more direct heir, and the more moderate Christian Democratic Union (Cristiani Democratici Uniti, CDU) and Christian Democratic Center (Centro Cristiano Democratico, CCD), which then merged into the Union of the Center (Unione dei Democratici Cristiani e di Centro, UDC).

The crisis of many CDPs was due mainly to the process of secularization, on the one hand, and the reemergence of moderate-conservative parties, on the other, which in the first postwar years had left the political space empty. This reemergence brought a new ideological reference—neoliberalism and neoconservatism—which contributed to the marginalization of the two main elements of the CDP ideology, personalism and social concerns.

International Networks

The evolution of the international network of CDPs illustrates quite well the recent changes in this political family. Immediately after the war, in 1947, CDP leaders met informally and quite discreetly in the so-called Geneva Circle. That was an occasion for facilitating the relationship between the German Christian Democratic politicians and the other European partners, especially the French ones. It was meant mainly to promote mutual understanding among former rivals and to support the German chancellor Konrad Adenauer. Parallel to this initiative was the somewhat more formal Nouvelles Equipes Internationales (NEI), which was a gathering of Catholic parties and associations. The NEI worked together with the confessional parties of the European Coal and Steel Community (ECSC) and later in the European Economic Community (EEC) member states. In 1971, the NEI evolved into the European Union of Christian Democrats (EUDC).

This development of international networks in Europe was paralleled by a more global initiative to bring together all the CDPs in the world. Significantly, the Christian Democratic World Union (CDWU) was founded in Chile, in 1961, emphasizing in this way the relevance of Latin American parties and the truly international scope of the organization. The golden era of CDPs, as already stated, came to an end with the process of secularization, with the Church distancing itself from daily politics since the 1970s, and with the return with a vengeance of moderate-conservative ideology and political forces.

In the mid-1970s under the auspices of the CDU–CSU, a new organization was created, the European Democratic Union (EDU), which brought together CDPs such as the CDU–CSU and the ÖVP, and also secular moderate-conservative parties. This move influenced also the former EUDC, which evolved into the EPP in 1978. The new name, not by chance, did not include any reference to religious inspiration. The German CDU–CSU endeavor to enlarge the former CDP network to include secular moderate-conservative parties proved successful: The EPP expanded to become the strongest parliamentary group in the European Parliament in the 1990s. The tendency to loosen the religious connection was not counteracted by the core Catholic parties because of their growing marginality. Such trends affected also the international organization Christian Democratic World Union (CDWU), which in 1999 changed its name to Christian Democratic and People's Parties International.

CHRISTIANITY

Christianity generally refers to a system of belief that centers on the assertion that Jesus of Nazareth is Christ the Messiah, the Savior of all humanity. It is embodied in the historical reality of communities that spread across the world through 2 millennia, with a wide variety of expressions in life and liturgy. Because of this earthly embodiment of their belief in human society, Christianity has been the fount of theories and practices that are of particular interest to those in the field of politics.

Source

The "good news" that Christianity proclaims is salvation by the person and the work of Jesus Christ as attested in the scriptures. The New Testament provides basic accounts of the advent of Jesus and his subsequent reception. Because Jesus announced that his advent was the fulfillment of the promise of salvation foreshadowed in the writings of the Israelites, the Old Testament is also included in the authentic canon of Christianity. The terms *Old Testament* and *New Testament* therefore suggest a Christian perspective. In Christian tradition, the Old Testament is read in anticipation of the coming Christ and the New Testament in remembrance of the crucified and risen Christ.

The Old Testament contains the same books that Judaism views as scripture, though different in sequence and importance. It has three parts, roughly reflecting the Hebrew distinction of law, prophets, and other writings. The New Testament may be divided into two parts. The first part has four narratives of Jesus from his birth to his death and resurrection and a record of the deeds of the apostles. The Gospels according to Matthew, Mark, Luke, and John were written around the late 1st century, with different authorships, sources, and viewpoints, projecting a polyphonic but coherent figure of Jesus. The second part is composed of letters, written by the Apostle Paul and other early disciples, addressed to the scattered churches and believers of the 1st and 2nd centuries. Taken together, the Bible gives a view of the world and its history, beginning from creation to its apocalyptic consummation.

Judaism, Christianity, and Islam share not only part of their scriptural texts but also the concept of *canon*. The word is derived from the Greek word meaning *rule* and refers to a collection of writings exclusively demarcated as authoritative to their faith. The concept is missing in Eastern religious traditions, notably Buddhism, and its absence results in ever-increasing bodies of scriptures. The canon and the creeds it produces mutually authenticate each other and serve as the ultimate guarantor of "orthodoxy," a concept unique to the Abrahamic traditions. The process of editing and defining the canon took a number of politically charged stages through several centuries, and its different interpretations have often lent themselves to controversy.

Founding

Historians agree that a Jew called Jesus of Nazareth became the source of a distinct religious movement that arose from within Judaism. He was born in line with the Old Testament prophecies, proclaimed the advent of the reign of God, and was crucified by

Pontius Pilate sometime between CE 30 and 33. According to Christian doctrine, Jesus was resurrected from the dead and appeared before disbelieving disciples for a short period before his ascension into heaven. Christianity claims that this Jesus was God incarnate. Not merely was he the messenger, he was the message. Not merely did he give moral teachings and exemplify them by his life and death, he was God himself in utmost humiliation. His resurrection is understood as divine approbation and victory over death. The incarnation, crucifixion, and resurrection thus constitute the fundamental basis of Christian doctrine—that God came into this world to save humanity from their sin and alienation and restored them to wholeness by the sacrificial death of the sinless Jesus and that those who believe in him shall be saved.

The biblical accounts of this salvific event gave rise to a series of difficult questions regarding the nature of Christ and his relationship with God. The first few centuries of Christian history were spent in giving definitive forms to the faith that Christians came to believe and confess. The first Council of Nicaea, convened by the Roman Emperor Constantine the Great in CE 325, formulated the doctrine of the Trinity to confirm that Christ the Son of God is of the same substance and coeternal with God the Father. God is three persons—Father, Son, and Holy Spirit—united in one eternal essence. The Council of Chalcedon in CE 451 dealt with the issue of the nature of Christ and declared that he is truly divine and truly human at the same time. These doctrinal formulae are full of mystery not amenable to arithmetic reasoning, but they are the end result of the critical and often controversial reflections on the faith expressions of the early Christians.

The doctrinal decision-making process was naturally subject to concerns that were not purely religious, but it would be misleading to think of the development of Christian doctrines merely in terms of political manipulation and exploitation. The conspiracy theories often framed for contemporary entertainment have no place in actual history, for there is no individual or organization that has the power and authority strong enough to steer the voluntary faith of the multitude of believers in a preferred direction. Theologians and delegates of all levels, even the pope and ecumenical councils, must give due recognition to what the congregations actually believe and practice, albeit critically. The modern sanctioning of the Marian dogmas by the Roman Catholic Church is a good example. The age-old maxim *lex orandi, lex credendi* (how we pray defines the rule of faith) epitomizes this organic and indissoluble correspondence of historical faith and its theoretical formulation.

It is difficult to identify the political vision of early Christianity. While Jesus was crucified by Roman authorities for his allegedly political assertion that he was "the king of the Jews," the coming kingdom he proclaimed did not lay any immediate claim beyond individual ethics. "Render to Caesar the things that are Caesar's, and to God the things that are God's" (Matthew 22:21) well captures his spiritual claim. The teachings of both Jesus and Paul are in most cases marked with the anticipation of the impending eschaton, and as such they offer little to the constructive agenda of temporal politics. Paul's injunction not to resist but to obey political authorities (Romans 13:1–7) should also be understood within this context of imminent eschatology. Withdrawal from the world was the guiding principle for the early Christians.

History

For the sake of brevity, an overview of Christian history is presented here in three stages that combine epochs and geography. The first stage is called the "Pan-Mediterranean" era, for this is the period in which Christianity spread along the European and African shorelines of the Mediterranean Sea. The axiomatic question of this period pertains to their self-definition: "*What* is Christianity?" Using the wisdom of Greek philosophy and Roman law, Christianity defined orthodoxy by councils and dogmas and organized the church and its ruling hierarchy. After the imperial decision to employ Christianity as the state religion, it began to exercise influence in all realms of human life and extended over the European continent to form a gigantic compound of religion and culture called *corpus Christianum*. The early principle of withdrawal was replaced with that of synthesis, mutual interference, and even domination. The 11th century saw the official severance of the Eastern Church from the Western, but both traditions developed elaborate systems to balance the secular and ecclesiastical powers.

The second stage is the "Pan-Atlantic" era. A major split caused by the Protestant Reformation in the 16th century made it clear that there could be a plurality of faith in geographical proximity. For Christianity, this meant the task of designing a civil society in which religious adherence was not necessarily defined by region or clan. The paradigm shift from parish to free church was gradual on the European continent, but a small number of English-speaking Puritans took an epoch-making step by sailing the Atlantic sea to the New World to build a civil society in accordance with their own choice of religion. The Christian world evolved on both sides of the Atlantic, and their common question was "*How* should Christianity be woven into a modern civil society?" Medieval synthesis was taken apart, and new models of relationship between church and state were explored. This era coincided with the Enlightenment, and issues of human rights began to command attention through repeated experiences of persecution and oppression, providing the basis for the claims of religious toleration and other basic rights including the freedom of speech, press, assembly, and voluntary association. The modern vision of Christian politics has been reshaped accordingly, taking into account the distinction between the private and public spheres of individual life.

Christianity in the third stage moves its geographical center further West to represent the "Pan-Pacific" era. Though a thread of early missions had reached India and China in the first era, Asia came in contact with Christianity primarily via missionaries from America in the 19th and 20th centuries. In turn, it was in Asia that Christianity encountered radically different forms of religion for the first time. Facing traditions such as Hinduism and Buddhism, the predominant question now asked was "*Why* Christianity among other alternatives?" The presence of other religions relativizes the internal distinction of Catholic and Protestant, Western and Eastern Churches. As the vanguard of Christian history, Asia and the Pacific now share with the United States a leading role in the development of global Christianity. American Christianity remains exceptionally active in comparison with "post-Christian" Europe, where it is more a cultural heritage than a lived reality. In regions where Christianity shows a strong presence today, the surge of nationalism and ethnocentrism supported by conservative Christians has gained the attention of political scientists.

Contemporary Outlook

Statistics show that Christianity is no longer a religion of the West. Christians living in Europe and North America now account for a mere third of the world Christian population. Among other religions, Christianity continues to have the largest number of adherents, with Islam having the second greatest number. Within the Christian tradition, the Roman Catholic Church is by far the largest body, with more than 1 billion members. The Eastern tradition is divided by several patriarchs including Greek, Russian, and other Oriental Churches. The Episcopal Church originated in England but now has the worldwide Anglican Communion, in which the English Church is in fact a minority. Among the Protestants, Presbyterian, Methodist, Baptist, Lutheran, and other denominations have often been named "mainline," but in most parts of the world they are rapidly yielding to the fast-growing Pentecostal or Charismatic movement. This movement emphasizes direct and personal revelation through the Holy Spirit, with enthusiastic and often emotional affirmation of miraculous phenomena in efforts to imitate the fervency of the early church.

The church is a human and earthly entity instituted for the transmission and promulgation of the original revelatory content that is by nature difficult to institutionalize. As long as Christianity tries to remain faithful to its contradictory mandate, there will always be oscillation between institutionalism and the free spirit. The cycle of formation and reformation is a hallmark of life.

Church–State Relationships

Church–state relationships often produce complicated political and constitutional issues even in advanced, consolidated democracies. Despite the expectations of the modernization theory that predicted a decline in the political importance of religion with the rise of modern industrial society, current cross-national studies indicate that the relations between church and state or the question of secularism are still major issues in many societies. Even in countries where a basic consensus exists on these relationships, religiously driven moral issues, such as divorce, abortion, homosexuality, euthanasia, school prayer, and public funding of church schools and other religious institutions, are still hotly debated. This entry examines variations among Western democracies in their approach to secularism as well as the more complicated problems in the Islamic world.

The common brief definition of secularism is the separation of state affairs and religion. It is also commonly accepted that this implies the absence of an official (or state) religion (established church); freedom of religion and conscience for all citizens regardless of religion and sect; full equality before the law and access to public office, again regardless of religion and sect; the absence of a legal requirement for state acts to conform to religious rules and injunctions; and the separation of institutions performing religious services and public (governmental) activities.

Not all Western democracies meet all these conditions. In England, the king (or the queen) is the head of the Anglican Church. The Norwegian Constitution states that

> the Evangelical-Lutheran religion shall remain the official religion of the State. The inhabitants professing it are bound to bring up their children in the same. (Article 2)
>
> The King shall at all times profess the Evangelical-Lutheran religion, and uphold and protect the same. (Article 4)
>
> More than half the number of the Council of State [i.e., Council of the Ministers] shall profess the official religion of the State. (Article 12)

Under the Danish Constitution,

> the Evangelical-Lutheran Church shall be the established Church of Denmark and as such shall be supported by the State. (Article 4)
>
> The King shall be a member of the Evangelical-Lutheran Church. (Article 6)

The Greek Constitution of 1975 states that

> the prevailing religion in Greece is that of the Eastern Orthodox Church. . . . The text of the Holy Scripture shall be maintained unaltered. Official translation of the text into any other form of language, without prior sanction by the Autocephalus Church of Greece and the Great Church of Christ in Constantinople, is prohibited. (Article 3)

The Greek constitution also prohibits proselytism (Article 13 [2]) and provides for a special regime for Aghion Oros (Mount Athos), under which the region is governed by its 20 Holy Monasteries, as a self-governing part of the Greek state (Article 105).

The preamble of the Irish Constitution of 1999 declares that the Constitution was adopted

> in the name of the Most Holy Trinity, from Whom is all authority and to Whom, as our final end, all actions both of men and States must be referred . . . [and] humbly acknowledging all our obligations to our Divine Lord, Jesus Christ, who sustained our fathers through centuries of trial.

The 1997 Polish Constitution contains the following:

> all citizens of the Republic, both those who believe in God as the source of truth, justice, good, and beauty, as well as those not sharing such faith but respecting those universal values as arising from other sources.

It also refers to "the Christian heritage of the Nation" and "our responsibility before God."

The First Amendment to the U.S. Constitution states that "Congress shall make no law respecting an establishment of religion, or prohibiting the free exercise thereof." The U.S. Supreme Court has issued many decisions that define the scope of this constitutional provision, known as the Establishment Clause.

Despite these seemingly significant deviations from the conventional meaning of secularism in the constitutional formulas, it is clear that religion no longer plays a determining role in the public life of the advanced industrial democracies. In virtually all these societies, the principle of equality before the law is firmly established, discrimination on the basis of religion is forbidden, full freedom of religion and conscience is recognized for all religions and sects as well as for nonbelievers, and the legitimacy of public (governmental) acts do not normally derive from conformity to religious rules and injunctions. This seems to be the irreducible core meaning of secularism and also an indispensable prerequisite of democratic government.

Beneath these common core elements, however, one can observe two different conceptions of, and approaches to, secularism in Western democracies. One, which may be termed *passive secularism*, essentially means a state neutral with respect to, or equidistant from, all religions and sects without precluding the public visibility of religion. "Assertive" or "combative" secularism (*laicité de combat*), on the other hand, aims at eliminating religion from the public sphere and confining it to the private domain, that is, to the places of worship and the consciences of the individuals.

Most Western democracies adhere to some version of the passive secularism model, while France and Turkey are the chief protagonists of the assertive secularism approach. The difference between the two approaches can be explained by different patterns of political development. The critical condition that affects the emergence of one or the other model, as Ahmet Kuru argues, is the absence or existence of an ancien régime that combines monarchy with a hegemonic religion. The emergence of assertive secularism in France and Turkey seems to be a response to such a combination of historical conditions. The assertive character is much more marked in Turkey because, in contrast to the strict separation of religion and state in France, the Turkish state maintains a monopoly over religious services and religious education. Therefore, Turkey provides an example not of strict separation but of a system where the individualized version of religion is at the service and under the control of the state.

The situation in the Muslim world is more complicated. It is a commonplace to argue that, as opposed to Christianity, Islam assumes the unity of state and religion and, therefore, is inherently incompatible with secularism; and to the extent that secularism is a sine qua non for democracy, this also means incompatibility with liberal democracy. Indeed, many Muslims see secularism as a creation of Christendom.

The picture is more complicated and nuanced, however, than what these extreme positions suggest. While maintaining the unity of state and religion in principle, Islam provides almost no rules in the field of public law. Even the major Islamic political institution, the Caliphate, is not based on the Koran and Sunnah (the Prophet's sayings and actions) but on the consensus of believers (*icma*) after the death of the Prophet, and it ceased to exist with its abolition by the Turkish parliament in 1924. The Islamic law (sharia) covers mostly private law relations (notably, personal status, marriage, divorce, inheritance) and provides some rules in the fields of criminal law and procedural law. Therefore, Islam has been considered compatible with very diverse forms of government in the past and at present. Many Muslim countries have secularized their legal systems to some extent, usually leaving areas such as family and inheritance laws subject to the Islamic rules. Again, Turkey is one of the very few states with a Muslim majority having a totally secularized legal system.

In addition, there remains a considerable difference between Muslim countries and Western democracies in their approaches to secularism. Even in the constitutions of most secularized Arab countries, it is stipulated that Islam is the religion of the state, the chief of the state has to be a Muslim, and the sharia is a major source of legislation. Further, certain rules of the sharia, such as those pertaining to inequality between genders, inequality between Muslims and non-Muslims, the prohibition of apostasy, and a number of rules in the field of criminal law are clearly incompatible with liberal democratic norms.

When it comes to popular attitudes toward democracy, however, there does not seem to exist a major difference between Western and Muslim societies, contradicting Samuel Huntington's (1996) clash-of-civilizations thesis. Pippa Norris and Ronald Inglehart (2004), in their worldwide survey including 11 societies with a Muslim majority, have concluded that as regards democratic values (support for democratic ideals, evaluations of how well democracy works in practice, and disapproval of strong leaders), there is minimal difference between the Muslim world and the West. According to their findings, the chief cultural difference between the West and the Muslim world concerns not political values but social values toward gender equality and sexual liberalization.

In cases of many advanced democracies, a reasonable degree of consensus over the place of religion in public life seems to have been constructed after long periods of public debate and negotiations. Even after such a consensus is crafted, however, certain religiously inspired issues are still on the political agenda. Indeed, neither the passive nor the assertive approaches are without problems. Passive secularism presupposes the existence of a broad consensus, which is difficult to maintain in countries with believers of many religions as well as nonbelievers. Assertive secularism, on the other hand, is prone to lead to conflicts between secularists and believers. Secularists will be suspicious of believers' commitment to a secular democratic system, and believers will react to secularists' efforts to eliminate religion from the public sphere.

Perhaps the key to the dilemma is the construction of "twin tolerations" (see Stepan, 2001, pp. 213–253), as the system where religious groups are allowed to organize and propagate their views in civil society and political society but refrain from imposing their views on the other members of society, respecting democratic rules and procedures, and where this boundary line is carefully guarded and monitored by the state.

CITIZENSHIP

The concept of citizenship has a great elasticity of meaning because of its varied spatial and functional dimensions (e.g., we speak of family citizenship, state-national citizenship, cosmopolitan citizenship). The notion is all the more difficult to use as it refers to very different historical experiences, ranging from the civil makeup of ancient Rome to the contemporary experience of postnational citizenship in Europe, including numerous liberal, republican, and communitarian declensions from this membership. Another difficulty lies within an ethical framework that is an essential part of the scientific debate on citizenship. A few years ago, issues related to the ethical implications of citizenship led certain theoreticians to believe that the notion had become theoretically ineffective in social and political sciences. Although such an opinion may be somewhat excessive, it highlights the need for a rigorous definition of the concept. In this entry, citizenship is defined as (a) a juridical status of membership in a political community, (b) a status that is the condition of the political participation of citizens in the democratic functioning of the community, and (c) a status that endows individuals with a sense of citizenship that differs from their other social and cultural identities. These three basic elements of citizenship are discussed in the first part of the entry; then, recent transformations of modern civic configurations are examined.

Basic Elements of Citizenship

Three basic elements are necessary to consolidate the notion of *citizenship* and to outline distinctive characteristics that make using the term heuristically possible in political science.

Citizenship as a Juridical Status of Membership

The first element identifies the juridical foundation of citizenship as a status of membership in a political entity (often national but not exclusively so) that is juridically codified. In this regard, citizenship is often linked to nationality, which entails the recognition of rights and obligations associated with this status; in most nation-states, this criterion of nationality is still the condition for inclusion in the citizen community. With the development of migration trends and with the diversification in the scales of citizenship, the residency criterion is also sometimes taken into account to facilitate the civic integration of those who live in a nation or other juridically defined territory without full membership as a citizen of that nation-state or other group. This juridical foundation is at the center of the sociological debate put forward by Thomas Marshall when, during his famous conference in Cambridge in 1949 (see Gershon Shafir, 1998, chap. 6), he made citizenship a federative concept for political science. For Marshall, who was particularly concerned about the coherence of an English society threatened by class divisions, the interest in this concept lies in the ability of the juridical status to guarantee equal rights to all citizens. In the now established fashion, Marshall characterizes citizenship as consisting of three components: (1) the civil element, that is, individual rights such as freedom of the person, freedom of speech, freedom of thought, freedom of belief, right of ownership, right to sign contracts, right to a fair legal system, and so on; (2) the political element, including the right to participate in political activity, right to run for office, right to vote, right to petition, and so on; and (3) the social element, mainly through the free and equal access to its social welfare system. Heavily influenced by the British historical experience, this liberal and evolutionary model of citizenship still reflects an interest in putting the status of citizenship into a historical perspective that includes the birth of the constitutional state, the advent of universal suffrage, and the birth of the welfare state, all of which encouraged the progressive expansion of such a juridically codified social role. Here, citizenship is a type of indicator of political modernity. This perspective on citizenship, contested by many critics of Marshall, especially Albert Hirschmann, is based on the evolution of Western societies in which these societies moved away from feudalism and its system of discriminatory orders. Since the introduction of this argument, many works have completed this model by including new elements; in particular, scholars such as Will Kymlicka (1995) have added an important cultural dimension that establishes the notion of "multicultural citizenship," which is intended to take into account cultural, linguistic, or religious diversity. However, in *American Citizenship,* Judith Shklar (1991) shows that the symbolic possession of citizenship status is often just as important and sometimes even more fundamental than the actual practice of rights attached to it. Taking the example of American citizenship, for a long time denied to those of African ancestry and linked to the practice of slavery until the passage of the Thirteenth Amendment in 1865, Shklar argues that for many who have benefited from the fight for civil rights, what is important is not only the regular practice of rights as the recognition of a juridical and a political status that give a minimum of social dignity but also this symbolic recognition.

This first element of citizenship gives rise to a number of important debates and scientific studies in political science, including current discussions surrounding the dissociation between citizenship and nationality. Whether one considers a postnational model of civic membership, as Rainer Bauböck or Yasemin Nuhoglu Soysal suggest (see Shafir, 1998, chap. 10), or analyzes the partial denationalization caused by the emergence of European citizenship in 1992, as described by Yves Déloye (2008), the debate is centered on the pertinent degree of the social closure of the limits of citizenship and the ability today of this status to match juridically the open conception of human rights that now contrasts with the former closed-minded conception of national rights.

Citizenship as a Foundation of Democratic Practice

The second element of citizenship is characterized by the philosophical and historical link between this membership and the workings of political democracy. Because this link marks the advent of a new way of legitimizing power, which is completely dissociated from any aristocratic or theocratic perspective, citizenship entails a division of political work between the government and the governed, which has made the idea of a change in power the very principle of representative democracies. Political science literature usually compares two stances on this issue. In an elitist version, defended in the past by Gaetano Mosca, Joseph Schumpter, and more recently by Samuel Huntington, the main idea is to protect democracy from excessive interference by citizens, because civic apathy is seen as functional for the democratic political system, helping it avoid "governability crises" such as those encountered in Western democracies in the 1970s. Conversely, the participatory version advocates a strong involvement (in the sense in which Benjamin Barber uses this term) of citizens in the public sphere. The advocates of this opinion are therefore inclined to increase *acts of citizenship*. In using this term, some theoreticians have recently advocated a profound transformation of the studies dedicated to citizenship. They leave behind the perspective of citizenship as the possession of a membership status representing the modern civil freedoms guaranteed by the state, which in return demands the loyalty of its citizens, and instead put forward the practice of civic freedom and the repertoire of political expression (e.g., flash mobs, consumer awareness, hijacking political symbols through art), which play a role in making citizens the first actors of a citizenship that escapes the state's control and sometimes even questions it. The reversal of this perspective from top to bottom cannot be mentioned without referring to the old dialogue between two antagonistic civic conceptions observed by the English historian John Pocock (see Shafir, 1998, chap. 2). According to Pocock, two ideal conceptions of citizenship have coexisted since antiquity. The first, expressed by Aristotle, emphasizes the civic dimension and defines citizenship as a mode of activity specific to humanity; the second conception, outlined in the work of the Roman lawyer Gaïus, sees citizenship above all as a specific legal status and one that values its civil dimension. Beyond this founding opposition, the contemporary analysis tends to emphasize the fact that an "act of citizenship" questions the nature of "civic virtues" expected from citizens. Usually when citizenship is discussed, this questioning is related to the normative position of those who participate in the debate. The argument between liberals and communitarians is largely influential in political science and in other disciplines. Following John Rawls, liberals view citizens as individual rational agents rather than as members of a community that helps shape their values. Conversely, the communitarian critique (as presented by Michael Walzer and Alasdair MacIntyre) claims that the status of citizen presupposes an engagement in the public sphere, a sphere that constitutes the cement of the community and the solidarity that characterizes it. The topic of this intense debate, which borders on normative political philosophy and political science, points to the third element of citizenship: the impact on identity.

The Impact of Citizenship on Identity

This third element of citizenship emphasizes the principle of separation between citizen membership and other social memberships—rival sources of identification. As Jean Leca (1990) indicates in his classic text, citizenship constitutes "a civil society distinct from family, lineage and seigneurial communities" (p. 148). If the model of the Western medieval city analyzed by Max Weber is often referred to here as the paradigm of this necessary differentiation between civic identity and corporate or religious identities, it is, however, with the political experience of liberal revolutions of the 18th century that this illustration of modern citizenship develops. It is then associated with two fundamental historical movements: (1) individuation, which contributes to strongly linking individualism to citizenship, to the extent that the individual and the modern citizen merge in the *Declaration of the Rights of Man and of the Citizen* of 1789, and (2) the universalization of rights, which makes citizenship all the more inclusive. By causing a reorganization of social and religious identities between the public and private spheres, citizenship demonstrates the establishment of a social formation where the combination of status and affiliations to primary groups (family, ethnic, religious, etc.) is compatible with the promotion of an allegiance to a political community. As the classic sociologists Émile Durkheim and Georg Simmel had established, the system of division from which these civic allegiances are created favors the emancipation of the individual and the promotion of civil liberty. The classic works of Reinhard Bendix (*Nation-Building and Citizenship*, 1977) and Ernest Gellner (*Culture, Identity and Politics*, 1987) show that this civic emancipation is often in harmony with the affirmation of the nation-state, whose cultural cohesion is linked to the ability of citizenship to evoke in individuals a strong sense of identification to its culture and to its political vision. The comparative historical sociology of the nation-state, as described by Déloye (2008) and Juan Linz (1993), claims, however, that this cultural homogeneity is often questioned by the populations and therefore depends on the level of success in establishing political and social identities. One must be particularly aware of the diversity of historical paths in building the nation-state. As Linz indicates, the process of nation building—which aims to historically complete the process of state building and to develop among its citizens a strong subjective sense of belonging to the same political and cultural community—is often in the end thwarted by demands for cultural, religious, or linguistic recognition. Such demands make it politically very costly for a republican-type homogeneous citizenship to emerge, capable of making peripheral or social identities invisible—identities that individuals hold on to because of their primary socialization. Taking this historical fact into account, Linz puts forward a conceptual reflection useful for an analysis of citizenship: Establishing the exceptional character of the nation-state (with the exception of the successful model of the French state and its model of republican citizenship), he encourages us to abandon "the idea according to which every state should try to be a nation-state" in order to "turn to methods of state [and civic] integration rather than those based on national construction" (Linz, 1993, pp. 356, 365). At the heart of this conceptual shift—which leads him to prefer the notion of "state-nation" to "nation-state"—is a whole series of essential questions examined by political theory and by the comparative approach to citizenship: the recognition of cultural diversity in a liberal democracy, the development of "multicultural citizenship" models, the political construction and political validity of multinational states founded on the plurality of civic and cultural methods of identification (e.g., in Canada, India, Belgium), the "postnational" future of contemporary societies, and the transformations of the different types of political patriotism and allegiance associated with models of citizenship. The common factor here is the insistence that the observer distance himself from the abstract notion of citizenship, that of "man born again" (a favorite expression of many French revolutionaries of 1789), without the primary social or cultural characteristics, to recognize the man who is embedded, enclosed in a series of social identities that help shape his behavior in public and make him feel like a "citizen."

This shift links up with the communitarian and feminist critique formulated in contrast to a universalistic conception of citizenship linked to an "ideal" separation between the public and the private sphere. For the communitarian critique of liberalism, the issue is the atomized conception of "Oneself," with no true meaning, or historical and empirical contingency, which is capable of thinking in an independent and rational way and capable of implementing civil liberties, which are recognized by one's status as citizen in a purely autonomous way. Contrary to this definition, which Isaiah Berlin strongly defends in his *Four Essays on Liberty* (1969), the communitarian theoreticians developed the hypothesis of "Oneself," inevitably "embedded" and dependent on his common environment. This "communitarian constitution of

Oneself," to borrow Charles Taylor's terms, leads the communitarian critique of liberal citizenship to emphasize the fact that the political and civic identity of citizens is constituted on the basis of an attachment to one or several communities of reference that noticeably reduces the degree of possible differentiation from the political city.

This tension of citizenship between private man and public duty, formerly mentioned by H. Mark Roelofs (1957), is also at the heart of the feminist critique of liberal and republican citizenship. According to Carole Pateman (1989), quite rightly, this critique betrays the androcentrism of the traditional notion of citizenship, which, behind a conception of the abstract universal, tends to reflect the civil evolution of men more than it does of women. From this point of view, it is obvious that the famous typology of civic rights formulated by T. H. Marshall and discussed earlier hardly concerns women who, in most Western countries, are denied the civic rights considered by the British sociologist. In the same way that universal suffrage was considered "universal" for a long time when only men had the right to participate in the election of parliamentary elites, the notion of citizenship remained for too long a prisoner of a conception of politics that overlooked gender. In light of gender, studies on citizenship are now enriched with new sociological analysis and major conceptual reappraisals; the idea that the public and the private sphere constitute two hermetic and distinct spheres, a hypothesis that is at the foundation of liberal and republican conceptions of citizenship as described, for example, by Engin Isin and Bryan Turner (2002, chaps. 8 and 9), has been criticized because it was the main source of the exclusion of women from the political city. In a similar way, the universal perspective of citizenship was strongly modified to recognize the multiple irreducible differences between men and women. Some of the most substantial studies in gendered political science, however, deal with the inclusion of women in parliament. Whether in terms of correcting the flaws of representativeness, adjusting the electoral system to increase the presence of women in elective assemblies, or thinking of the effects of parity on politics, research on civic representation has been greatly expanded as a result of a gendered approach that most often combines political theory with comparative political analysis.

Transformations in the Civic Community

Beyond these theoretical debates, the concept of citizenship is an excellent reflection of contemporary political metamorphoses, as Isin and Turner (2002) have shown. The controversies enliven the numerous studies on citizenship that force political science to put the political actor in touch with themes such as rights and obligations, political loyalty in political configurations made more complex by the globalization and the uprooting of politics, and new methods of political communalization in multicultural societies often marked by postcolonial demands. Without trying to cover every civic transformation, Figure 1 summarizes the two main transformations of political citizenship observed at

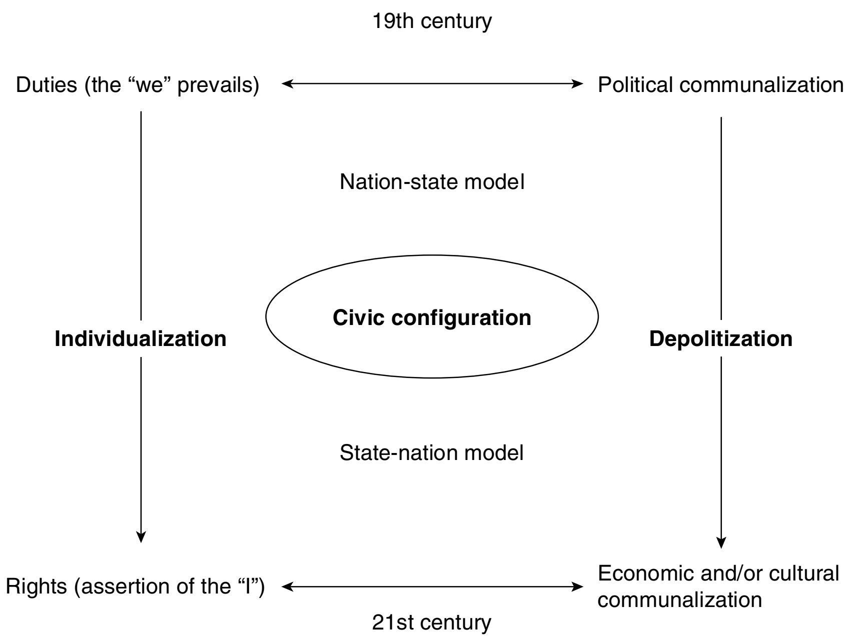

Figure 1 Historical Changes of Civic Configurations

the beginning of the 21st century. The first line of evolution concerns the normative impact of citizenship (left-hand side of Figure 1); the second transformation applies to the degree of politicization of the contemporary status of citizenship (right-hand side of Figure 1).

In the same way as classic works approach the topic of citizenship, the identification of individuals as members of a political community (local, national, or postnational) is historically linked to the normative integration of citizens. It is because individuals share not only the same system of values and representations but also common rules of behavior that they become aware of their "unity." The strength of the idea of identification with a national "we" revealed by various political science studies is also due, in one part, to this normative tonality of membership in a nation-state and its emotional capacity to unite citizens around a body of central and shared values and rules. New civic methods experimented with in Europe, North America, and Asia are probably in line with a different perspective. In many current political configurations (e.g., European Union, India, Canada, Australia, South Africa), a plurality of values coexist in the public sphere and set the social actor against cultural subsystems of different values. In this case, the question of political legitimacy is no longer asked in relation to ultimate values but often on an administrative and a technocratic level. The weakness of cultural integration—which was at the heart of this state-national civic project, for instance, the republican one—is compensated for by the economic capacity of the social welfare system to ensure to every person a certain equality of access to material well-being. The pragmatic running of society occurs here without reference to the founding values on the basis of which citizens struggle to come together because of former or present distributive conflicts. This new paradigm creates a model of citizenship, slightly inclusive in political and cultural terms but also capable of encouraging equal—more or less fair—access to economic and social goods and services (bottom of Figure 1). From this point of view, it might seem to have an affinity with historical logics used in this process of building the "state-nations" referred to by Linz (1993). However, such a conception of citizenship makes it very difficult to develop a strong sense of belonging to contemporary political spheres whose economy is also highly globalized and increasingly discriminatory.

In the manner of an ideal type, it is possible to compare these two models of civic configuration. On the one hand is the model of citizenship, which was experimented with for Western countries (top part of Figure 1), encouraging the politics of vertical integration and a certain level of homogenization or at least a certain level of cultural convergence. This model is based on a common body of values, beliefs, and representations, which conveys norms and duties that the state has to uphold. At the other end of the scale is a model of multicultural citizenship, whose horizontal inclusive logic is limited to ensuring that every citizen has equal access to the economic and social welfare of society and is free to choose his or her cultural and identity affiliations (bottom part of Figure 1). Numerous intermediate positions are possible between these two models.

A second line of evolution takes shape in the background once attention is turned to the contemporary sources of civic "communalization." Three dominant sources of communalization can be identified in a broad outline, thanks to Max Weber's old typology: a cultural source (religion, e.g., for feudal societies), a political source (e.g., the civic loyalty demanded by the nation-state), and an economic source (e.g., access to the economic market). Historically, these three sources of communalization operate in a mixed way but in varied proportions and according to different connections. What is at stake here is clarifying the respective contributions of the political order, of the cultural order, and of the economic order to the communalization of citizens. Today, in Europe and elsewhere, the market and economic or professional mobility hold a decisive place in the processes of regional integration, and these forces may lead to rivalry between groups with different cultural identities. At the same time, other social institutions, such as religion or the family, may lose some of their power to regulate relationships between cultural groups. Thus, these contemporary transformations of citizenship call into question the very status of the political with respect to its role as a source of integration and regulation. Whereas citizenship was once seen as a vehicle for distinguishing civic membership from other social identities, today it must accommodate itself to societal demands. This relative "depoliticization" appears to be the result of a new stability between different sources of civic communalization that clearly reduces the importance of political loyalties in favor of both transnational patterns of material consumption and self-assertion on a cultural level.

It is in this overall historical transformation that it seems necessary to locate present conditions of identification and of political participation in contemporary societies. It is also by taking into consideration these profound transformations that the concept of citizenship can remain a central notion in political science.

Civic Culture

Civic culture is a subtype of political culture, that is, a set of political attitudes, habits, sentiments, and behavior, related to the functioning of a democratic regime. It implies that although citizens are not necessarily involved in politics all the time, they are aware to a certain extent of their political rights and also of the implications of the decision-making processes that affect their life and society. Both political awareness and participation are supposed to be relevant to the stability of a political regime. By contrast, citizens' withdrawal from political life has consequences not only for their ability to get what they want from the political community but also for the quality of democracy. Civic culture involves, therefore, some level of perception of the republican character of modern politics and adds a psychological dimension to the concept of citizenship. In the following, the evolution of this concept, its criticism and limitations, and its relevance for contemporary politics are discussed.

The concept of civic culture is part of a long tradition of thought that investigates the nature of democracy from a historical perspective. It refers to the role of political traditions, values, and culture in the achievement of democratization and the stabilization of a regime. Its rationale goes back to the thinking of ancient political philosophers such as Aristotle, but in modern and contemporary times also, Niccolo Machiavelli, Baron de Montesquieu, Alexis de Tocqueville, John Stuart Mill, Max Weber, and Norberto Bobbio, among others, have discussed whether a set of specific political attitudes, convictions, and behavior are a necessary and/or sufficient condition for the success of modern democracies. The question is controversial, but it has never disappeared from the debate about the necessary conditions to achieve the "good government," that is, a political regime committed to the ideal of full human realization.

While Aristotle and some Roman philosophers were mostly concerned with the excesses of the original models of democracy and popular republics, Montesquieu and Tocqueville focused on the links between the "spirit" of political institutions and laws and the "habits of the heart" that drive people toward greater public cooperation and associational life. Aristotle spoke not only of the political goodwill necessary for a political regime to be able to fulfill its mission but also of public virtues such as civic partnership and political restraint. Tocqueville claimed that the success of modern democratic regimes depended on an [individual's] self-interest rightly understood" and asserted that an open and free public life is not a natural given but depends on human will; he also emphasized the importance of a sense of moderation and self-restraint in the process of political participation.

Contemporary concern with civic culture is due mainly to two political phenomena of modern times: first, the excesses of political revolutions (e.g., the French, the Paris Commune, and the Soviet), and second, the collapse of democracy in Europe in the period between World Wars I and II, as was the case with the Weimar Republic. Democracy cannot fulfill its promises if there are no democrats; and if the nature of the democratic regime does not create an excess of political participation—which may degenerate into violence against minorities and opponents—neither does it predicate a cynical or apathetic public, which withdraws from public life and which could lead to abuses of power. As a system of government both *of* and *for* the people, but not directly *by* the people, representative democracy demands public involvement, political participation, and vertical, horizontal, and social accountability. The existence, independence, and autonomy of civil society are integral parts of it. Moreover, a widespread tolerance for a plurality of views and interests and a widely distributed sense of political efficacy, trust in government, and mutual trust among the citizenry are seen as key elements in effective civic culture.

Civic Culture as Political Culture

The most important contemporary contribution to the development of this theme appeared early in the 1960s in the work of the American political scientists Gabriel Almond and Sidney Verba. Their book *The Civic Culture* demonstrated the connection between specific political attitudes and the historical experience of democratic stability or the absence of it in five regions: Germany, Italy, Mexico, the United Kingdom (UK), and the United States.

In the context of the process of decolonization and redemocratization that emerged after World War II, Almond and Verba were concerned with the broader question of the emergence of a new world culture involving positive and negative political tendencies in countries that had become democratized as a result of external pressure, such as Germany, Italy, and Japan, and also in Third World nations recently freed from their colonial status but not necessarily from their traditional political heritage. They wanted to know whether those countries had the necessary conditions to give birth to effective democratic regimes or whether old authoritarian or antidemocratic values would prevent those countries from establishing free, competitive, and effective political systems. The continuing existence of a number of authoritarian regimes in Europe (Spain, Portugal, and Greece) and similar experiences in Latin America, Africa, and Asia in the 1950s, 1960s, and 1970s showed the relevance of their concern.

According to the logic of political culture theory—in which some critics found that psychological approaches had too great an influence—the effective performance of a democratic regime would require some kind of accommodation between the elitist conception of the role of political leaders and some level of citizens' involvement in the realm of politics. While it was later defined in terms of the strategic role of political elites in making governments govern—through their political initiatives and performance—the new theory maintained that there was also an area of collective political convictions and modes of participation to be taken into consideration. The latter was said to provide the context for the emergence of the former. The microdimension of politics, perceived at the individual level, should be congruent with its macrostructures, seen at the national level. Incongruence of political attitudes and the behavior of the masses and elites, on the one hand, and the functioning of democratic institutions, on the other, could produce a situation in which there were incomplete, untrustworthy, or dysfunctional political systems. Looking at the survival of democracy in Britain, the United States, and some European countries in the interwar period, Gabriel Almond and Sidney Verba discussed what kind of citizenry was needed to achieve a proper balance of power and to enable a stable democratic regime to be responsive.

This theory held that to work according to its principles, the democratic process should involve a healthy tension between civic obligation and actual civic performance. It required appreciation by the public of the virtues of democracy as compared with its alternatives. To submit to the law, to the mechanisms of its enforcement, and to the authorities, citizens should give both formal and informal consent to the functioning of the political system; but at the same time, they should have a proper sense of their own duties. In this respect, both the subjective and the objective political competences of citizens were considered to be of great importance. Such a political culture depended also on the levels of mutual trust among citizens. This long-established notion referred to the fact that interpersonal trust is necessary to stimulate common action directed toward the realization of collective goals. Citizens should acknowledge their obligation to be part of the system and also believe that political institutions would be accessible to their participation, but at the same time, they should be selective if their performance fell short of what was required. Then, how could one balance political activity and passivity while allowing political leaders both to exercise power and to respond to the demands and preferences of citizens? A political division of labor—strongly criticized by both communitarian and republican defenders—was seen as an essential condition to allow the political system to work effectively, to make political choices, and to encourage voters to evaluate the performance of political leaders and governments.

Politics presupposes conflict and antagonism between parties and groups in open democratic systems, but these forces should be contained by a general national loyalty and support for the political system. The civic culture approach presupposes that a political culture congruent with a stable democracy involves a high degree of consensus concerning the legitimacy of democratic institutions and the content of public policy.

Political culture has been defined as a set of attitudes, beliefs, and sentiments that give order and meaning to the political process and provide the underlying assumptions and rules that govern behavior within the political system. Expanding on this definition, Almond and Verba distinguished between three different types of political orientation: (1) *cognitive*, referring to knowledge of and belief in the political system, its roles, incumbents, inputs, and outputs; (2) *affective*, translated as feelings and sentiments about the political system, its roles, personnel, and outcomes; and (3) *evaluative*, based on judgments and opinions about political objects, particularly, the input and output processes, incumbents, and their performance.

The political culture of the five nations that they compared was characterized in terms of two key attitudinal variables: commitment and involvement. The first looks at individual attitudes toward the political system, distinguishing between *allegiant*, *apathetic*, and *alienated* political orientations; the second measures attitudes toward participation, differentiating between *parochial*, *subject*, and *participant* attitudinal types. Civic culture would combine both a participatory and a deferential perspective of politics, forming a mixed political culture in which action and nonaction, obligation and performance, and conflict and cooperation would be balanced and combined. Citizens would have to mobilize certain particular civic virtues in order to be able to evaluate issues relevant to them and their society. These civic virtues would then help prevent both the overload of the political system and an excessively deferential polity, which could give way to new forms of authoritarianism.

Critical Views of the Concept

The concept of civic culture had a considerable influence on the development of political analyses in the late 1950s and early 1960s. Conceptually linked with the so-called behavioral revolution, its proponents wanted to signal a movement away from the study of formal institutions—typical of the so-called old institutionalism—toward the study of informal behavior to see politics in real life. In the 1970s, however, the cultural approach fell out of academic fashion and came under strong criticism for being conservative, static, and tautological; for ignoring real-power relations; and for being incapable of explaining social, political, and cultural change. The view of political culture and democracy presented in *The Civic Culture* rapidly became the subject of considerable and rather heated debate. Its critics said it was deterministic, ideological, and inconsistent with the real nature of liberal capitalistic societies and only represented an idealistic (and ideological) version of politics in the United States and the United Kingdom, their prototypes of civic cultures. But the strongest charge against the theory concerned the direction of causality in the relation between culture and political structure. The British political philosopher Brian Barry and the American political scientist Dankwart Rustow claimed that Almond and Verba failed to explain the assumption about the congruence between political structure and the culture needed for democratic regimes to succeed. The culture of politics is a consequence, not a cause of institutional structure, they argued. People believe in a system through learned processes based on "habituation" and "accommodation" with the logic of democratic institutions and not the other way round. But neither Barry nor Rustow did any empirical research to prove their point. At the time he was making his criticism, Barry thought that there was not enough research to allow consistent conclusions about the controversy to be drawn and suggested that to advance the debate, scholars should study the phenomenon of transformation of political regimes to be able to grasp the real sense of causality—at the time, however, there were no regimes undergoing such a change.

Political values and orientations certainly cannot exist in a vacuum, but critics were missing the point—as Arendt Lijphart pointed out. Almond and Verba allowed causality to work both ways; in other words, political culture not only influences institutional design, but it is also influenced by institutional quality and its functioning. Moreover, the critics did not explain the normative basis of institutional choices, something else that was not to be taken as a given. In other words, institutions are chosen to carry out specific functions in order that societies can work as people want them to, and unless one assumes that institutional choices are disembodied and independent of human desires, ideals, and objectives, they do refer to normative goals, which are part of political tradition and culture. Individuals' continuing commitment to political principles—such as the right to contest power or participate in the political process—is a central aspect of the process of institutional choice. Rational motivations involved in such choices are contextualized by power relations, political culture, and tradition.

The concept has also been criticized for its supposed inability to deal with political and cultural change. Citizens are not automatons, passively receiving and internalizing political values and norms, said the critics, and although political culture is transmitted from generation to generation, it is not transmitted unchanged, nor is it transmitted randomly or without question. Cultural transmission is an active and responsive process, which is continuously being negotiated by individuals. The adult political experience over time, rather than just political socialization during childhood, is crucial to explain the ways political views are shaped. This means that experiences with institutions do matter, but critics of *The Civic Culture* never acknowledged that its authors did actually draw attention to the fact that previous political analysis had underemphasized the crucial role of experience within political systems. The study was also criticized for not properly considering the process of competing norms and values within a society. Marxist critics or liberals such as Carole Pateman also claimed that they did not deal with class cleavages in their study and were therefore not able to grasp the processes of political cultural changes occurring as a consequence of the dispute for power and political hegemony in contemporary societies.

Between the 1970s and the 1990s the civic culture approach became squeezed between two extremely prestigious and critical perspectives of contemporary political science: neo-institutionalism and the different theories that investigate the success of a democratic regime on the basis of the political and economic performance of governments, political leaders, and parties. While the first excludes any reference to a normative approach to explain the design and functioning of institutions, the second emphasizes the effects of economic and political performance. Both approaches contradict the notion that an individual's internalization of values and cultural norms is relevant in explaining the outcomes of a political system.

Consistent responses to those critics appeared, however, in the mid-1990s when the complexity of processes of political transition in different countries around the world demanded more sophisticated explanations, recognizing factors other than only those relating to institutions or political performance. The question now was the quality of democracy, not just its mere existence.

The Renaissance of Civic Culture

Recent explanations of democratization are once more returning to the cultural approach. These studies are less deterministic and are based on a probabilistic perspective about the influence of political culture. They also assume that political structures and civic culture have a mutual influence. One of its main motivations is the perception that the simple transformation of institutions that usually characterizes the end of processes of political transition is not enough to explain the different outcomes. The fact that in different parts of the world there are democratic regimes that do not fully uphold the rule of law, the principles of civil and political rights, and the mechanisms of accountability has directed researchers' attention once again to the role of attitudes, convictions, and behavior of people in explaining the variance of the quality of democracy.

This renaissance of the civic culture approach is principally due to two kinds of contributions. The first is the work of Robert Putnam on the role of social capital in social and political development. Social capital—bonding, bridging, and linking—is defined as networks and social norms of trust and reciprocity that strongly connect individuals to the common interests and goals of their community. Putnam has shown with his work on Italy and the United States that social networks based on mutual trust and the desire of individuals to act in common is decisive for the achievement of social goals and for the development of a democratic institutional environment. While in the south of Italy traditional ties do not work toward achieving openness in public life and form part of a cycle of political abuse, corruption, and governments characterized by low performance, in the north a long and cumulative tradition of cooperation and mutual trust has engendered higher levels of social and political participation and allowed regional governments to perform much better. Social trust derived from the accumulation of social capital makes citizens more cooperative, reciprocal, and willing to associate and act collectively. Thus, Putnam's contribution has emphasized how different objective and subjective conditions affect institutional development.

The second refers to the extensive work of Ronald Inglehart about the relevance of postmaterialist values from a human development perspective, which involves the consolidation of attitudes that contribute toward democratic structures. Inglehart revised the theory of modernization and argued that social and economic changes profoundly affect the traditional political culture of contemporary societies in such a way that individuals leave behind, as time passes, their attachment to survival values and develop means of self-expression that enable them to have more autonomy and independent patterns of relations with political authorities. Basing their studies on the five waves of the World Values Survey, Ronald Inglehart and Christian Welzel tested, on the one hand, the impact of values over time on the existence of effective democracies and, on the other, the influence of democratic institutions and the length of time a system of government with democratic values is in place. According to them, the results clearly demonstrate that while values are decisive in determining the existence and duration of democratic institutions, the latter have only a weak influence over time in creating a civic culture; indeed, under the influence of other variables their effects disappear altogether. They claim that studies have confirmed some basic assumptions of theories of political culture even when other variables are included in explanations of democratization processes.

Toward the end of the 1990s and at the beginning of this century, the works of Pippa Norris, Richard Rose, and Doh Shin also became associated with the resurgence of the civic-cultural approach. Using different arguments, they reacted to the analyses that in the 1970s and 1980s were deeply concerned with the decrease of political trust in Europe and the United States and also to the enormous difficulties faced by newly democratized countries in creating effective democracies. In the book *Critical Citizens* (1999), Norris and her collaborators combine the institutionalist approach with the recognition that citizens' political experience is crucial in explaining their attitudes and behavior. Shin, Rose, and others argue that ordinary people's support for a democratic regime is a learning and relearning process in which both their values and their normative perspectives have a role to play as well as their rational perception and evaluation of the functioning and performance of institutions. In both cases, without opposing the perspectives of civic culture and institutionalism, they emphasize the importance of the adult political experience of citizens in explaining the conditions under which normative expectations about the role of institutions interact with rational evaluations of institutional and governmental performance. The critical view of citizens is interpreted as part of the new civic culture.

Conclusion

The Civic Culture remains a model of scientific inquiry, allowing researchers to test, refine, or reject their hypotheses. According to Aaron Wildavsky, Almond and Verba made their evidence speak on a profound theoretical issue, and their empirical work allows others to test their assumptions. Presently, the concept is undergoing a renaissance, but this does not simply imply going back to the original approach. New developments have incorporated a more flexible interpretive and less formalistic perspective, integrating both institutional and cultural approaches that explain how citizens are involved in politics and how they influence it. Civic culture is considered to be relevant not only for the stability of any democratic regime but also for its quality.

CIVIC PARTICIPATION

Civic participation can be defined as

> citizens' access to and participation in information, decision making, and implementation of public policies broadly construed;
>
> taking part in democracy—individually or as a part of organized groups—through communication and public actions (including electoral campaigns and elections) where public interests prevail over private ones;
>
> the act of becoming involved in the political process and working to better the community; and

a means to guarantee the credibility of institutions, through articulation of citizens' demands and holding public officials accountable.

As the base concept of participation, the notion of civic participation is rooted in the normative assumption that the efficiency of any economic, management, and other social system as well as the legitimacy of democratic political systems depends on the involvement and participation of the public and does not simply derive from the output dispensed by the system.

The term *civic participation* concentrates on the different means by which the public can participate in the decision-making process within the political community. Democracy is considered to be the political regime that allows for the best civic participation, because democratic regimes are based on the principle of interaction and communication between political institutions (parties, parliaments, local government, etc.) and the people. Civic participation brings a great number of people with diverse sources of information and interests into the process of public decision making. Widespread and intensive public discussions enhance the critical assessment of different moral ideas, informing decision makers. As a result, civic engagement contributes to the quality of democracy.

This entry presents an analytic overview of the concept's academic interpretations. It considers the conceptualization and various empirical manifestations of civic participation and evokes several unresolved theoretical issues.

Conceptualization

Civic participation (*civic* is derived from the Latin word *civis* ["citizen"] and refers to involvement in the public sphere, as in the classical Greek *polis*) is an old concept that was introduced when civil life surpassed the arbitrary absolutistic monarchies or feudal powers, calling for individual freedom and the balance between individual liberty and social equality. Alexis de Tocqueville argued that participation in purpose-driven associations socialized people into a polity with more than merely egotistic desires, and he concluded that democracy worked through people's participation in collective activities, independent of the state.

The concept of civic participation was further elaborated in modernization theories (theories of social and economic development and democratization) and became one of the main vehicles of international (mostly sponsored by the United Nations) development policies in various regions of the world. As Gabriel Almond and Sidney Verba note, the idea is that prospects of socioeconomic development and democratization rely on a civic culture, participatory public attitudes, and social values. Through civic participation, people can influence social, cultural, and economic policies, and their participation extends beyond regular participation in elections. This means that decision makers must continuously take into account the interests, rights, and opinions of members of society. If participatory culture is weak and/or political institutions are inaccessible to people (or representation is biased toward the privileged), then the connection between people and politics is poor, compromising sustained socioeconomic development. Amartya Sen (1999) argues that "no substantial famine has ever occurred in any independent country with a democratic form of government and a relatively free press" (p. 152). The thrust of this argument is that politicians in democratic settings (with a minimum of respect for the freedom of expression) face the demands of citizens and have to accommodate them (including those of the most disadvantaged groups).

Robert Dahl presented an institutional model, linking participation within the structure of political institutions. In his account, political actors are individuals who rationally calculate if, when, and where they spend their scarce resources (e.g., money, time, know-how) in the pursuit of broader collective goals in public affairs. Individuals' public involvement is shaped by their individual taste and preference for political actions, contrasted with opportunities for other social activities (and the possibility to free ride, as the theory of collective action emphasizes). The institutional model of participation confines the issues with which each individual might be concerned and alleges that the scope and ways of people's participation are rather limited. Yet it claims that conditions of pluralistic democracy allow people to participate in public affairs roughly as equals. This approach views democracy instrumentally, as a bargaining process among different groups, where interests of each group are not subject to any further debate.

In normative democratic theory, the institutional model of participation is prominently criticized by Carole Pateman, who refined the concept of participation and focused it on a community or a social group rather than on separate individuals. Pateman elaborated the notion of participation, which, as a form of genuine civic action, is possible only in democracies, contrasted with totalitarian or authoritarian states, which force participation by propaganda or sheer repression. Civic action is defined as being undertaken collectively in pursuit of the general good, in line with the principle of political morality that benefits and burdens all citizens equally. The individual pursuit of self-interest is not its only and decisive driving force. In her generic account of civic participation, Pateman puts forward public discussions of common issues rather than rational strategies aiming at individual or narrow group goals. In a way, she makes a conceptual distinction between participation as an instrumental action (pursuing mostly protective functions) and as an interaction (with mostly educative functions) and clearly attaches more importance to the latter.

In the tradition of Aristotelian and Rousseauian political philosophy, the ideal of active deliberation lies at the basis of Hannah Arendt's conception of participatory citizenship, which in democratic polities rests on values and preferences that are discursively examined, acknowledged, and renewed. Active engagement of citizens in the public realm (discussing public issues and solving problems of their communities) provides people with the experience of public freedom and conveys a sense of their political agency (meaningfulness). In that respect, it is important to underline that Arendt cherished the idea of direct political participation and claimed that citizenship can only be practiced as a common action, collective deliberation, and the sharing of power. According to Arendt, relations of civility and solidarity among citizens can be established and maintained only through their engaged public participation. By contrast, Arendt argued that citizenship should not be conceptualized in terms of intimacy, warmth, authenticity, and communal feelings, since those inevitably led to the loss of public values such as impartiality and civic friendship and the blurring of distinctions between public and private interests.

Attempts to synthesize these two apparently incompatible models of institutional and communal participation gave birth to the concept of civic engagement, as described by Robert Putnam, Theda Skocpol, and Morris Fiorina. Here, engagement means being interested in public issues and getting and staying involved in social activities. Civic engagement refers to individuals' belonging and participating in various social groupings or associations. Civic engagement is grounded in the face-to-face interaction and communication among persons (in real empirical settings such as neighborhoods, clubs, schools, churches). As Putnam notes (2000), without "face-to-face interaction, without immediate feed-back, without being forced to examine our opinions under the light of other citizens' scrutiny, we find it easier to hawk quick fixes and to demonize anyone who disagrees" (pp. 341–342). However, civic engagement interactions usually (and realistically) do not evolve into any elevated political discussion, that is, they do not yield acute public debate about the future of the entire community or about the totality of social activities within the community. The conversations and exchanges here mostly concern everyday-life issues and community routines. Civic engagement generates social networks, habits of cooperation, interpersonal trust, and norms of reciprocity, which further contribute to the social capital, or generalized social trust (mostly measured by the trust in public institutions and in people in general). Subsequently, the stock of social capital might be applied to cooperative discussions of political issues and joint civic actions, and hence, it might ultimately contribute to better results in all domains of public life. Putnam (2000) observes that "in the language of economics, social capital lowers transaction costs and eases dilemmas of collective action" (p. 346).

From the historical-institutional perspective, Skocpol claims that associative activities are not by and of themselves sufficient to ensure good governance. Reminiscent of the protracted pernicious activities of various racist and xenophobic organizations, Skocpol argues that state institutions remain important in channeling and focusing public activism, bringing together different perceptions of the public interest as well as limiting arbitrary political power. Along with Putnam's observation of the decline of social capital in modern societies, Fiorina and Skocpol acknowledge that the rise of professional organizations and single-issue advocacy groups alienate many ordinary citizens from public life. The authors maintain that encouraging more participation by ordinary people is the best way to counteract these destructive tendencies of constricted participation in modern democracies.

Although civic engagement places broadly defined social participation before political participation, it is a type of participation that is aimed at the core of state institutions and public affairs. The civic engagement model helpfully addresses issues such as the scope and types of nongovernmental (voluntary) activities in society, the fields of nonprofit activity, the degree of public affairs politicization, and so on. Yet more questions arise when one studies the problems of defense of public interests, not readily concentrated in some geographical space and not united in some well-thought-out groups. These include environmental concerns, consumer awareness, good governance (transparency) ideals, and human rights, which are exceedingly dispersed and usually opposed by concentrated, entrenched interest groups, often including state agencies. The concept of *social movement* is frequently used to address such research puzzles.

Social movements are defined as a series of contentious performances, displays, and campaigns by which ordinary people make collective claims. Charles Tilly enumerates a series of factors that brought about modern social movements. They include urbanization (the massive presence of people in cities facilitates social interaction and the formation of purposeful groups), industrialization (significant groups of workers are concentrated in factories), mass education (higher education helps develop and articulate ideologies and collective claims), communication (technological progress makes contacts and interaction easier), and democratization (the worldwide spread of democratic regimes legitimizes the quest for political rights and empowerment).

In the contemporary world, given the uncertainties caused by representative democracy and the failures of formal mechanisms for civic participation under conditions of modern complexity, the importance of large-scale informal actions is very great. Even though informal structures and ways of participation in public affairs have always coexisted with codified procedures, yet the recent phenomenon of continuous and adaptable civic participation through social movements represents a significant expression of active civil society. New consequential societal goals (expressive and deliberative actions, devoid of purely pragmatic aims) are achieved through changes brought by social movements into existing ideological and organizational environments.

Actually, social movements extend in terms of range from local and international movements to multilevel and global movements. In terms of methods, violent movements continue to play an important role and are often shaped as semiterrorist and terrorist organizations with some social support. Yet the majority of social movements seek to achieve social and civic goals by peaceful means. Rights and obligations associated with civic participation require the constitutional framework that can be jeopardized by violence. There are important examples of (at least partially) successful peaceful social movements: Mahatma Gandhi's civil disobedience movement against the British rule in India (1930s–1940s), the American civil rights movement (late 1950s–1960s), the Polish *Solidarność*, and the Lithuanian *Sąjūdis* movements against the Soviet-imposed communist regime (1980s–1990s). Events such as the Orange Revolution in Ukraine (2004) and the Rose Revolution in Georgia (2005) can also be termed social movements because of the accepted methods of opposition and the huge popular involvement.

Concerning the interests represented in social movements, most of the 19th-century movements had their roots in social classes or cultural communities (workers, peasants, aristocrats, petty bourgeois, religious [mostly Protestant] communities, Whites, etc.). They attempted to advance their living conditions or social status. Often, these types of social movements developed into political parties. In the second part of the 20th century, new social movements (feminist, prolife, pro-abortion, gay rights, antinuclear, environmental, etc.) began to emerge and reshape the sociopolitical landscape in many countries and even internationally. The new social movements present an opportunity to reestablish the basic standards, values, and norms of civic participation. They require continuous commitment and personal activity in the public sphere.

The public sphere, in Jürgen Habermas's sense, is defined as an area of social life that has the following four primary governing principles: (1) the social status of participants is disregarded, (2) discussions within the public sphere presuppose the challenging of previously unquestioned issues, (3) issues in the public sphere are driven and decided by rational arguments, and (4) the public is inclusive. Contrary to the private sphere, where individuals decide to participate in accordance with their private interests, and to the public authority sphere, where the actions of individuals and institutions are shaped by formal decision-making procedures aimed at the implementation of public policies and the distribution of public goods, the public sphere is a sphere *suis generis* transcending individual interests and profit maximization and is mostly concerned with the deliberation of public issues.

Civic Education as an Integral Part of Civic Participation

In all these conceptualizations, civic participation is associated to some extent with civic education and the cognitive mobilization of citizens. As early as in 1861, John Stuart Mill argued that democracy tends to enhance the moral qualities of citizens because when people in some way participate in decision making, they have to listen to others, they are obliged to justify themselves to others, and they have to act sensibly, taking into account the interests and concerns of others. Rational choice theorists also agree that when people find themselves under circumstances of participatory democracy, they genuinely consider the issues of the common good and justice. Hence, civic participation tends to enhance the autonomy, rationality, and morality of participants.

In their analysis of survey data from five countries, Almond and Verba considered education (based on critical thinking and analysis) to be the most important factor creating attitudes and values vital for a participant culture. Adherents of deliberative democracy maintain that public discussions represent the only way available to democracies for the promotion of the intellectual and moral progress of the citizenry, which is their raison d'être. Proponents of the civic engagement model underline the importance of capacity development: empowering people to effectively participate in public life, to learn the routine practices of cooperation, and to acquire a taste for public affairs. Yet it must be acknowledged that people's capacities to communicate, organize, analyze, negotiate, and take positions on issues have to be commensurate with adequate capacities of staff in government institutions and other organizations in order to account for such activities.

Analytically, the extent and forms of civic participation depend on civic dispositions (interpersonal trust, people's confidence to participate in civic life, openness, tolerance, and responsibility of citizens), civic knowledge (people's familiarity with political issues and their social context; knowing one's political, civil, social, and economic rights; understanding the roles, rights, and responsibilities of citizens and public officials), and civic skills (the ability to explain, analyze, evaluate, and defend a position; using knowledge for informed participation). United Nations Development Programme (UNDP), for example, claims that sustainability, equity, and empowerment are direct results of civic education leading to inclusive participation.

Empirical Measurements of Civic Participation

Recognizing that democracy is the prerequisite for any meaningful civic participation, different forms and intensity of civic participation can be observed across countries, social groups, and times. According to Samuel Barnes and Max Kaase (1979), the level of civic participation can be seen as a continuum. At one extreme are people who have no interest in politics at all (they do not vote, petition, or demonstrate; do not read newspapers; are not informed and do not want to be informed about public issues; and never volunteer); at the other extreme are active citizens (they are interested in politics; vote; are involved in political parties, trade unions, nongovernmental organizations and civic associations; and use other forms of contention). Between these two extremes, most citizens participate through conventional electoral events (they get mobilized in special circumstances); they more or less understand public issues and occasionally attempt to have an impact on them.

Political scientists identify several sets of incentives and disincentives of participation. Pippa Norris presents an institutional account of incentives of political participation (defined narrowly as voting in elections): a proportional electoral system, not very frequent elections, small distances between the relevant contenders, and great electoral choice of candidates (parties). These factors are intrinsically related to the cognitive conditions of democracy and certainly foster civic participation. The institutional clarity of a political system and party polarization facilitate social and political mobilization, since clear ideological conflicts socialize citizens to comprehend complex political issues through simplified and normatively coherent discourses.

Putnam compiled the social capital index, consisting of measures of participation in civic and political activities, including group membership, attending public meetings on local and school affairs, service as an officer or committee member of an organization, attending club meetings, volunteer work and community projects, home entertaining and socializing with friends, social trust, electoral turnout, and the incidence of nonprofit organizations. It appears that these indicators of formal and informal civic participation and social trust are strongly intercorrelated. Research shows that local differences in the social capital index have an effect on child welfare and education, safe and productive neighborhoods, economic prosperity, health and happiness, and democratic citizenship and governance performance.

Comparative research initiated in the 1970s, such as that by Inglehart (1997), demonstrates that citizens not only want to hold their leaders accountable through elections once every 4 or 5 years but they increasingly intend to scrutinize and to influence their leaders during their term of office. It is a global evolution of continuous democracy, combining electoral rights, freedoms of association, and new kinds of contentious participation.

Another line of research considers the idea that people understand public issues and eventually involve themselves in public affairs because of and through the images given by political leaders and the media, not through personal experience. Therefore, along with institutional account and civic education considerations, research on political communication is an integral part of the study of civic participation. Civic journalism dwells on the principle that adequate coverage of politics is important for public life. The role of mass media is very important for civic participation: When journalists, academics, human rights activists, intellectuals, and artists publicly contest various norms and decisions, they safeguard the rights and freedoms of the entire community, benefiting from mobilization and vigilance of its most active citizens.

Theoretical Tensions Regarding Civic Participation

There is an inherent tension between the universalistic (communal, civic engagement, social movement) and functional (institutional) concepts of civic participation. The universalistic rhetoric claims that any public action is derivative from the civil society and contributes to the general interest, common good, and justice and not just to the agenda of interest groups. The idea of civic participation assumes that the actions undertaken by organized groups (mobilized minorities) can contribute to the benefit of the entire community and strengthen the administrative accountability and political legitimacy of the regime.

Interest groups frequently use words such as *citizens*, *civil society*, *people*, and *general public* (practicing pluralist, lobbying, or corporatist strategies). Yet most concrete proposals concern organized groups. Therefore, in empirical terms, the logic of negotiation between the institutions and some limited groups remains at the core of active citizens' participation.

Another problematic issue of civic participation has to do with its limitation to the nondecision (the consultative, predecision) stage or the deliberative part, although contemporary democratic governments claim to promote civic participation throughout the whole policy chain. Civic participation in the implementation and evaluation of public policies is limited. Considering that actual public policy decisions usually are taken by public authorities in cooperation with selected organized groups, other social actors have to face the decisions *ex post.*

The thrust for promotion of civic participation is derived from the liberal conception of democracy. Openness and transparency, organized consultation, better communication, decentralization, and so on can make institutions more accountable. However, these techniques are not substitutes for the representative forms of democracy and citizenship, and they do not encourage an average citizen to become active, since they require considerable intellectual and financial resources.

Finally, the concept of civic participation concentrates on sets of functional groups with particular ends (trade unions, employers' organizations, professional associations, community-based organizations, charities and religious groups, etc.). Yet civic participation research often overlooks the general actors (e.g., political parties) who represent a global view at the grassroots, while only the top of their organizations belong to the public authorities, acting on behalf of the state.

Civil Service

A civil service is a system for managing human resources using mechanisms with which governments select, employ, and promote the personnel who act as public administrators. A civil service system takes into account the qualifications and aptitudes of employees. In other words, it is the institutional framework within which the human resources employed in the public sector are organized in a way that allows governments to employ the best people. These employees work to achieve the results of projects put forward by their governments, regardless of their political affiliation or party. The bases of the civil service are established in statutes, laws, or regulations, and for its successful operation, an autonomous structure is required—a body that will oversee its strict operation and the observation of the norms that regulate the civil service, so that its usefulness contributes to strengthening the democratic values of the societies it serves. This entry describes the characteristics of career civil service, the forms it may take, and the subsystems involved in its operation. The place of the civil service in public administration and the benefits associated with it are then examined in light of evolving democratic values.

Characteristics of the Civil Service

Given its autonomous role as described above, the civil service is not simply a series of rules and technical conditions; rather, it should be seen as a type of moral code for public service that is designed to achieve common objectives and should be shared by all its functionaries. Civil services are based on three fundamental values for a democratic public administration, taken principally from the logic of bureaucratic organization proposed by Max Weber: (1) equality, (2) merit, and (3) impartiality. Thus, modern civil services are based on the following:

1. Recruitment is based on the *merits* of the civil servants and not on patronage or inherited posts.
2. The idea of *equality* allows anyone to participate in the competition to occupy public posts, provided that they meet the prerequisites established for the position in question; and, once they are in the civil service, the system of evaluation and any sanctions should be comparable for all the functionaries.
3. *Impartiality* guarantees that the members of the civil service should maintain a neutral position toward political parties, related to an internal logic, to grant all applicants the same opportunities and, when dealing with the public, provide the same attention and quality in the services offered to all citizens regardless of their gender, religion, or partisan preference.

The concept of a career civil service can be given at least two meanings. First, it is used as a synonym of public bureaucracy, although not all the government functionaries necessarily form part of it. The Latin American Center of Administration for Development (CLAD) maintains in the Ibero-American Charter of Public Affairs that, in Ibero-America, the terms *public function* and *civil service* are generally used as synonyms. Within this acceptance, there is an enormous variation in the use of the term, since sometimes *civil service* may in fact consist of any or all functionaries who carry out administrative work within a government. The second use given to the term *civil service* refers specifically to the area or areas of the government in charge of performing the recruitment and evaluation of the functionaries.

Therefore, not all civil services are the same; the systems of recruitment, sanctions, and recognition and, above all, the attributes and extent of the civil service vary according to the political and institutional context they are in. It is important to mention that within the same civil service there can be various types of labor relations; this means that there can be some functionaries appointed by direct political nomination and others by means of a public competition.

Members of the civil service are known as career public servants, and they can be employed at any level of government (federal, provincial, or local), depending on the size of the civil service, or in the autonomous institutions, such as electoral organisms or any of the three powers of government: executive, legislative, or judicial. In some countries, such as the United Kingdom (UK), career civil servants are only those who work for the Crown; functionaries who serve in the lower levels of government are not included. In the United States, on the other hand, there are civil servants within state and local governments, and in France, officials of some public enterprises are also included.

Further, career civil services are regulated by laws or statutes that have different characteristics relative to the rest of the labor legislation for the country in question; as a result, these functionaries usually remain separate from other public employees. These differences become apparent in the policies relating to retirement and the establishment of pensions, as well as the type and degree of sanctions, or in the capacity to organize themselves in unions and other associations.

As the name suggests, the military are not included in career civil services, although some civil servants who work in the areas of national defense are generally considered to be career civil servants. There are also functionaries who hold their posts because they were political nominees or because they were elected by popular vote, which places them outside the civil service. In the case of Ireland, for example, government ministers and some of their political advisors are excluded from the civil service.

Types of Civil Services

Closed Versus Open Services

Conceptually, a career civil service can be either open or closed. A closed service takes for granted that persons entering the public service plan to develop their whole career there. It is a closed system because one can enter only at the lowest levels of the organizational pyramid and from there gradually climb up to the higher positions. That is, personnel tend to be hired for the lower echelons, and from there, mobility through the ranks may be possible. To enter, one has to have a certain level of education and submit to a public competition in order to be selected; because entrance takes place at the lower levels of the organization, the participants' experience has little relevance in the selection process. One great advantage of this system is the creation of an ethos in the public service, as the functionaries manage to accumulate important knowledge about their organizations. The following are the principal disadvantages of this model. The first is that upward mobility within the organization is usually linked to the seniority of a functionary and not to his or her performance. The second is that this system limits the universe of contestants to those who have accumulated little or no experience; finally, this model can produce unwanted results by generating incorrect incentives, and it can even lead to poor performance by the functionaries, by not generating competitiveness with the outside labor force. The oldest civil services are built on the basis of this model and have found it necessary to make important revisions to their schemes, as in the cases of the career civil services in France and Germany.

An open civil service, in contrast, allows for public competition not only for posts at the lower levels but also for the higher positions within the organization. The system is therefore open to outside participants, although there may be a clause stipulating that preference be given to those who already belong to the civil service. In this system, the creation of a spirit of public service becomes less evident, since there is the possibility that employees from the private sector can become public functionaries and vice versa. Nevertheless, one evident advantage of this assumption is that by alternating between private enterprise and the public sector the number of participants increases, allowing for a broader universe for recruitment of the most qualified as well as the benefit of the transfer of knowledge from one sector to the other. These employment civil services are being tried out in countries that have recently created or reformed their civil services, such as New Zealand and the UK.

Executive Versus Senior Service

Because of their scope at the different levels of government, the civil services are also classified as executive or senior civil services. This distinction implies the separation between the authority of the higher and middle levels of command within the public sector.

Operational Subsystems

Whatever model is adopted, the civil service operates with certain subsystems that are indispensable for their proper functioning. The subsystems that make up a "traditional" civil service are the following.

Recruitment and Selection

The subsystem for recruitment and selection establishes the selection procedures in the contest for the position (if there are to be quotas for positive discrimination or not, i.e., if it is mandatory to include applicants or representatives from minority or marginal sectors of society). In addition, it specifies whether the contest is to be public or closed, what type of exams and study guides are to be used, and what interviews are to be held and with which of the functionaries, among others. It also establishes the requisite profile and academic qualifications, experience, samples of work, and personal references that the candidates for the post should have, as well as establishing the conditions under which they would be integrated into the public sector, that is, what type of contract they would subscribe to, what salary they would receive, and if they would be evaluated before being confirmed in the post or if they would first be subjected to a trial period. For this procedure, first, there should be a process of revision of the applicants' curricula vitae; second, they should undergo examinations and psychometric tests; and third, they should submit to an interview, and on occasion, as previously mentioned, they are given a trial period in the post. Ideally, this subsystem should have mechanisms allowing rejected candidates to appeal the decisions made by the recruitment team, something that is not always taken into consideration. Moreover, the system demands constant revision to remain adapted to the requirements of the different posts, revising among other things the pertinence of the evaluations to make sure they correspond to the catalog of existing posts.

Education and Training

The subsystem of education and training regulates the training of the public servants, whether initial, continuous, or a combination of both. Initial education consists of generating mechanisms that allow for the development of competence relevant to the post aspired to, which would not have been acquired during the professional education of the functionary, as well as those that lead to the homogenization of the knowledge of the functionaries to facilitate more or less uniform performance in the job. It should be mentioned that not all civil services have subsystems for initial formation, as many demand that this should be provided by a particular institution, which could be internal, such as the Civil Service College of the UK, or by an external institution such as the Hautes Écoles or the École Nationale d'Administration in the case of France. Continuous education, on the other hand, responds in some cases to the demands of the public and in others to the modifications or updating of the forms and procedures of the different administrations or the incorporation of new values in the face of changing scenarios, including in organizational culture. Recently, this subsystem has greatly benefited from the advances in information technology, from the possibility of attending courses and presenting evaluations at a distance. All this has, no doubt, resulted in better use being made of working hours and improvement in the activities undertaken by public functionaries. Although one should mention that in many cases these resources are not optimized because continuous education has been focused on nominative subjects instead of operative affairs, which detracts from the possibilities of immediate usefulness.

Evaluation

The subsystem of evaluation seeks to identify the strengths and weaknesses in the public management from individual and organizational evaluations. It is necessary to decide in what domain to conduct an evaluation, how evaluation is to be carried out, what indicators will be used and with what frequency, and what is to be corrected or improved. This subsystem can be linked to sanctions applied to public functionaries, ranging from verbal reprimands to permanent removal from the post. It also covers the schemes for evaluating performance, where there is a relation between wages or the bonuses of the functionaries in relation to the goals set, in the first case, and to an outstanding performance, in the second. Linking the assessment of performance to the budget may be advantageous because it leads to increases in efficiency and effectiveness, better planning, and a clearer focus on results. However, it can also have its disadvantages, by exceeding the budgets of the organizations or by cutting resources in areas where they are needed, without determining accurately the causes of a deficient performance, which may have been, for example, due to inadequate resources. In addition, evaluations should become an important input for the subsystem of continuous education, since they can identify the areas that require a greater effort in formation and training and the contents that these options should include.

Promotions and Mobility

The subsystem of promotions and mobility manages the horizontal and vertical mobility of the civil servants. Because mobility can be horizontal as well as vertical (particularly in the case of an open employment system), the exchange and transfer of knowledge from one area to another are encouraged, although this situation can cause a loss of experience within organizations. Mobility can occur both in an open system, where anyone can have access to a post, and in the so-called elitist systems, in which only graduates from certain universities or careers can occupy positions at the highest levels. In the more traditional systems, promotion of functionaries has been related to seniority in the post and within the schemes of the civil service; however, as a result of reforms arising from the adoption of ideas associated with the new public management approach, priority is now sometimes given to the performance of functionaries rather than to the length of time that they have held the post.

Removal From Office

Under the traditional principles of administration of the subsystem for removal from office, a functionary would leave office only to receive a pension. However, the stability that this immobility gave the functionaries is a negative performance incentive. Current tendencies indicate that removal from office can occur for at least two reasons: (1) the civil servant's retirement or (2) the temporary removal or separation from office due to the poor performance of the public servant, a situation that should be very accurately documented.

Public Administrations and Career Civil Service

The successful implementation of a career civil service is indispensable for improving and modernizing public administrations, since this allows for greater continuity in public policies and also increases the efficiency and efficacy of the administration. In addition, to set in motion a professional civil service requires prior institutional action to integrate a catalog of posts that allows complete restructuring of public administration from within and in the medium and long terms. Detailed job descriptions of each post also favors an increase in accountability within each organization.

The career civil services are remarkably effective in reducing corruption and increasing the equity of the public services, since functionaries know that permanence in their posts depends on their performance and not on electoral cycles, political movements, or arbitrary dismissals, all of which discourage them from creating and attending to specific clienteles. The autonomy that the administration acquires facilitates continuity in the application of programs and laws, because the administration is evaluated by the degree of fulfillment of the programmed objectives, and it also minimizes the influence of the politicians on the implementation of programs.

Similarly, adequate administration of human resources inside government results in enhanced transparency, as much for individuals as for organizations, since beginning with the integration of a catalog of posts and a clear definition of organizational structures, one can know who is responsible for the results of programs and government policies. At first glance, civil services may appear rigid; however, when their schemes are well integrated, they can even give greater flexibility to the public administration since it is easier to make quick adaptations to the demands of changing circumstances.

The professionalization of the public administration can also result in greater confidence by citizens. First, by legitimating the government through more efficient administration, and second, by being more flexible, and thus more successful, in the interaction with average citizens. In fact, a civil service system also tends to foster values within public administration such as impartiality, awareness of financial limitations, as well as legality and integrity of the government and public officers. These values contribute to the collective construction of an ethos for the public sector, indispensable for the identification of the personnel as part of an organization that aims at the collective, consecutive pursuit of objectives, preserving the institutional memory and promoting its prestige outside the organization. The public sector ethos also has a function within the public administration: It enhances communication between the various members of the organization and can direct efforts toward common objectives. In this way, communication and coordination between bureaucratic organizations can improve. Moreover, career professional services within the civil service can build up skills and expertise within the public administration, which, in the long run, will enhance not only the government institutions but also a solid democratic system.

From their perspective, public functionaries are also directly benefited by forming a part of civil service, since apart from the obvious advantage of not being arbitrarily removed from their offices, they are subjected to clear regulations and specific responsibilities, and they receive a continuous education that allows them to keep their knowledge up-to-date and to eventually make a career within the public administration, which is useful socially.

The nature and usefulness of the schemes for a career civil service have been the subject of intense debate and important processes of adjustment because, among other reasons, they are recognized as a fundamental element in the processes of renovation and modernization of public administrations. A career civil service plays a central role in the transformations favored by democratic schemes, such as commitments to making public administration more transparent and improving the mechanisms for public accountability and the management of public resources. Professionalizing the public function is an indispensable condition for national development.

Civil Society

From the perspective of political sociology, the concept of civil society refers to a certain type of society. Its basic characteristic is the attitudinal capability of its members, that is, citizens, to actively organize themselves to pursue certain (common) goals, within a framework of specific formal institutions. In detailed definitions, depending on particular research goals, civil society may therefore be defined in either attitudinal or institutional terms. This entry discusses their perspectives, their origins, and their applications to the contemporary world.

In the attitudinal perspective, the pivotal concept is that of citizenship as an individual's attitude toward the entire political collectivity and other individuals, as well as to institutions and procedures. The basis of this attitude is seen as the individual's internalization of the rights and obligations associated with membership in the collectivity, and this attitude constitutes the foundation of the citizen's role.

Elements of citizenship thus defined include, for instance, political identity and self-awareness, the character and sources of agency, law and order, attitudes toward recognized authorities, attitudes toward pluralism and diversity, the level of openness toward the terms of membership in a political community, and, finally, convictions regarding the nature of civil rights (their universality or particularity). From this perspective, a civil society is a state of democratic political culture, a conglomerate of norms and values typical of a community of citizens who are free and equal before the law, which they shape and develop through their active participation in a public life.

In the institutional approach, civil society is seen as an arena of citizens' activity embedded in an institutional framework, a structurally described sphere of social and individual autonomy that extends between the state and private life. This institutional framework includes, among others (constitutionally guaranteed), civil rights and freedoms (in particular, freedom of speech, assembly, and association and the right to vote), the rules for obtaining citizenship, the rule of law, and welfare state institutions. In this context, a civil society usually stands for the totality of institutions, organizations, and associations operating in the public sphere with relative autonomy from the state, established at the grassroots level and usually characterized by voluntary member participation.

No matter how it is defined, the concept of civil society is inextricably intertwined with the concepts of collective and individual autonomy and political sovereignty. To that extent, it also contains, at its deepest level, a strong normative postulate on how an autonomous community of free and equal citizens should be structured. This normative aspect is manifested in various theoretical approaches that present diverse solutions regarding the relations between the collective and the individual and between the private and the public. The opposing positions on that matter are especially clearly displayed in the disagreement between classical republican (or today, communitarian) concepts and liberal theories, which can in fact be described as a normative controversy over civil society. Theories of civil society, articulating the ideal of a free and self-governed community, inevitably refer to some kind of democratic social order. In the Tocquevillean perspective, civil society is a space for associational life and a condition for preserving a democratic political culture and truly free democratic institutions. Hence, this concept is cognitively useful especially in analyzing both the theory and the practice of democracy. It also gains a special importance in the era of globalization, in the modern world of cross-border structures, in the slogan of a "global civil society."

Civil Society: Classical Roots and Modern Developments

The idea of a civil society is deeply rooted in European culture. It goes back to ancient Greek and Roman thought. To Aristotle, a civil society (*koinonia politike*) was an ethical and political community of free citizens pursuing and achieving full humanity through active participation in the life of the *polis*—its tradition, law, morality, and interest. The ancient Greek *agora* as a space of communication for citizens, a forum for exchange of arguments, for sharing visions of the common good and taking communal decisions, was the proper space of cogovernance and, hence, the realm of politics. What the Roman tradition contributed to the idea of civil society was the concept of natural law, discovered through rational thought. According to Cicero, the civil society (*societas civilis*) was the highest kind of social order, reflecting the eternal and unchangeable natural law, a community of people who recognize the same law and work together for the common good (*res publica*). A continuation of such republican thought on the eve of modern times can be found in the writings of the Renaissance Italian thinkers. For Niccolò Machiavelli, the civil society was a political community bound by efficient governance that ensured its stability, internal order, harmony, security, and glory. At the same time, this was a space for political virtue to emerge and be pursued. Despite differences, these classical republican perspectives have in common the perception of civic community as valuable in itself, defining a good to which individuals' particular interests must be subordinated. Here, the freedom and sovereignty of a political community as the common good is the prerequisite for an individual citizen's freedom, which is only achievable through membership in this political community. What regulates those freedoms is the authority of the law and political institutions as well as shared values and customs. This common good is discovered, identified, and, as a consequence, pursued through citizens' participation in public life. In this classical republican perspective, civil society is therefore a moral and political community pursuing a common good, where its citizens realize their freedom by exercising their rights, fulfilling their duties, and exhibiting civic virtues.

Modern times brought a dramatic reversal of this relationship. The revolution started with rationalism as a philosophical trend that regarded each human being as capable of rational judgment and established the individual, rather than the community, as the source of morality. This thought was followed up by the pioneers of the Enlightenment and liberalism, who held equal rights of individuals (e.g., habeas corpus, private property) to be natural and inalienable. The primordiality of those rights vis-à-vis the political assembly is expressed in the concept of the "social contract," according to which a voluntary agreement of free and equal individuals is established to secure their natural rights against the abuse of power. The despotism of nation-states that emerged after the Westphalian Treaty of 1648 often gave rise to a negative definition of a citizen's freedom as a sense of security (founded on a law that restricts the arbitrariness of other political actors). Subsequent political revolutions in England, the United States, and France adopted and strengthened this modern perspective of an individual as holding natural rights and freedoms that a state, as a legal institution established by a voluntary political assembly of its citizens, must safeguard.

The classic liberal thinkers believed in fundamental individual rights that include property rights and the freedom to dispose of one's property. According to liberalism, the basic domain of freedom is the market, through which individuals can most efficiently pursue their particular interests. The clash of those individual interests is seen as a universal model shaping the dynamics of the free social space. Hence, in this liberal perspective, civil society is treated as a universe of free individuals who pursue their own goals in their own way while respecting agreed-on principles. It is a sphere of independence and freedom extending between the family and the state, where a spontaneous self-organization of individuals emerges, making it pluralist and heterogeneous (politically, economically, and culturally). What immanently binds this social space of diversity and conflicting interests is, according to the followers of the Scottish Enlightenment, either the inherent social impulse—the friendship and altruism of human beings—or conformism, vanity, and a desire to please others. Even though distinguished from the institution of the state, the sphere of civil society remains in a constructive relationship to it, as citizens use it to decide with others on matters of shared interest.

This liberal perspective on civil society became a negative point of reference for thinkers such as Georg Hegel and Karl Marx, who did not share its optimism as to the immanent powers regulating the conflicts of particular interests and egotisms. Both Hegel and Marx explicitly equated the civil society (*bürgerliche Gesellschaft*) with the economic society and the private sphere, with which they contrasted the public sphere as the only one capable of curbing conflicts and disparities within civil society. According to Hegel, the embodiment and guarantor of this superindividual order was the state. For Marx, it was a political civil society that can be created after the abolition of private property, which is the source of disparities, domination, and social conflicts. It was with reference to these two thinkers that Antonio Gramsci developed his concept of civil society in the first half of the 20th century.

However, from the mid-19th century until the 1970s, the interest in the concept of civil society virtually disappeared, replaced by a more detailed reflection on the institutional and normative framework of the democratic order. The renaissance of this idea in the last decades of the 20th century is related to the birth of opposition movements in Latin America and Central and Eastern Europe, where self-organizing social and civic structures operated beyond the state or in opposition to it. From the perspective of mainly Western analysts, the category of a civil society seemed to be an appropriate tool to describe them. Civic movements in authoritarian countries were undoubtedly a major impulse for the renaissance of interest in the category of civil society. It was all the more important, however, that they occurred concurrently with social and political phenomena and changes taking place in Western societies themselves (e.g., the welfare state crisis, new social movements). In the public debate, criticism was directed either at the excessive welfare state or at the alienation of representative democracies from civil society. The advocates of social and economic mobilization or social and political democratization, of increasing civic participation and involvement in public life, and of combating alienation and individualism quite often made reference to the classical republican visions of the truly civil society. At the same time, they forced political thinkers to revisit this issue in the context of the modern era.

With respect to the concept of civil society, the most interesting aspect of this debate is the dispute between liberals and communitarians, pursued with varying intensity over the past 30 years of the 20th century. Even though it is rooted in two different visions of the individual–collectivity relationship and the factors constituting the Self, this dispute finds its practical expression mostly in the different understanding of a civil society and its relationship to the democratic state. Putting it as simply as possible, for liberals, a state is one of the many voluntary assemblies of free and equal citizens who agree on the principles of justice, which they can reflect on, question, and renegotiate. Its basic role is to safeguard the agreed procedures. Those procedures (e.g., the rule of law) and the results of their application are what liberals are inclined to consider a "procedural" common good. A state, largely restricted to safeguarding the agreed rules, would open even more space for the development of a civil society. As a guardian of procedures, it should remain neutral to various goals, visions, and ideals of good life, which are to emerge and compete with one another within the very space of the civil society, in the "free marketplace of ideas." It is civil society rather than the state that selects and orders these procedures. In this sense, a liberal civil society, as distinct from the state, remains in a constructive relationship with the state but is more significant than the latter. A political society is important but has no absolute priority.

For communitarians, by contrast, the state is the most powerful political community, defined as a particular "community of experience" in which a shared past and future are intertwined. The community's tradition is its substantial common good, and its maintenance is a common goal and endeavor. Active participation and involvement in the community's life leads to identification with its goals and generates a sense of solidarity, so promoting the culture of participation is a value worth supporting. A state may remain neutral on various matters but not on the matter of patriotism. Only by discovering the principles, ties, and loyalties that bind the community together can individuals fully understand their social and civic roles. Civil society is not a chaotic set of competing or cooperating associations but an entity united by a shared self-awareness of its own history, tradition, culture, institutions, and achievements; the goals and concepts presented in the "free market of ideas" must be intelligible to everyone and must be embedded in the culture or tradition of the community. Thus, the state is entitled and obliged to support a common understanding, by following the policy of preference for the common good and establishing a hierarchy of goals and values to inspire its members. This policy of preferring a substantially understood common good over the policy of neutrality makes the state the ultimate entity. In this sense, the state is more important than the civil society, or to put it in other words, a civil society is tantamount to both the political community and the state.

This controversy over ideas, theories, or even ideologies can often be found in daily life and disputes in liberal democracies. It refers, among other things, to the practical dimension of the relationship between the state and the civil society, in particular in different models of cooperation between public administrative structures and the so-called third sector.

State and Civil Society

Analytically, we can distinguish three types of relationships between the civil society and a democratic state. In the first, a civil society is a complement to the state. In the second, the state is a complement to civil society. In the third, the state and civil society are in an antagonistic relationship. The first type of relationship emerges where the state is the major agent for the redistribution of national wealth and takes responsibility for providing and operating many spheres of collective life (e.g., education, health care, pensions). In this situation, civic organizations enter only those areas of collective life that the state does not provide with sufficient social services. Such a relationship can be observed in welfare states characterized by an extended sphere of social benefits, and its theoretical grounds can be found in communitarian concepts. An excessive welfare state may, however, lead to the "learned helplessness" syndrome (or dependency on social benefits), which converts some citizens into the welfare state's clients. This weakens the vigor of civil society.

The second type of relationship refers to the situation where the state's responsibilities are restricted to the minimum (e.g., police, army, courts, diplomacy). The remaining part of public life is taken care of by grassroots citizens' groups. Such a relationship stems from liberal concepts of citizenship and state. It is worth noting that where a state's noninvolvement is too restricted, social inequalities may increase, which may lead to the marginalization or exclusion of some segments of society. This, in turn, reduces the vitality of a civil society because for marginalized individuals, dealing with public matters ceases to be of importance, having to focus on survival. The third type of relationship echoes the relation between individuals and the authoritarian state. It can be found predominantly in young democracies as this antagonistic relationship between citizens and the nondemocratic state is still present in the collective memory and in common cognitive structures. In this case, various organizations of civil society usually have little trust in the state institutions (and vice versa). As a consequence, conflict prevails over cooperation. Over time, especially when a young democracy has completed the consolidation phase, this generalized antagonism may disappear, replaced by civic defiance focused on certain acts of a democratic state.

Cognitive Usefulness of the Concept

The usefulness of the concept of civil society changes over time. There are periods where researchers' attention is drawn to other areas, with the civil society itself being treated as secondary to some more fundamental issues (e.g., the rule of law, functioning of democratic state institutions, party system development and functioning). In such cases, sociological or political science narratives push the concept of "civil society" to the background, if they refer to it at all. This happens where the subject of research is a well-consolidated democracy (at least in some of its aspects).

There are times, however, where researchers rediscover the cognitive usefulness of the concept. This takes place, for example, where a stable functioning and reproduction of the democratic order is disrupted and the very existence of democracy is jeopardized. This is also the case when new social movements emerge in the public sphere, contesting a particular part of reality as, for example, ecological movements that have had an impact on political decision makers and made the public opinion sensitive to the consequences of environmental devastation. However, the revival of this concept can be seen most clearly in times of great historical revolutions, leading to a democratic order that emerged after the breakdown of authoritarian systems, as was the case in the 1980s and 1990s.

In different theories of democracy, the analytical usefulness of the concept of civil society varies. Generally, in theories that focus solely on the procedural dimension of democracy, where the problem of civic participation in public life is of lesser importance, the usefulness of this concept is less than in theories focusing on substantial aspects. In the former approach, a civil society is reduced to the so-called third sector, understood as the totality of voluntary nongovernmental associations that articulate various interests in the public sphere. In the latter approach, the usefulness of civil society is greater as the activity of citizens in the public realm determines the vitality of democracy. Examples of such a perspective are the associational democracy model as well as the deliberative democracy model.

Civil Society and Globalization

In the globalized world of today, with the progress of technologies, transport, and, most of all, means of mass communication that cover the entire world, problems that used to be of local impact (humanitarian disasters, epidemics, financial crises) now turn into global issues. These problems are addressed by governments of nation-states, international economic and political organizations (e.g., the United Nations, the World Bank, or the World Trade Organization), as well as private financial or industrial multinational corporations. The global governance of transnational decision-making structures creates the need to ensure civil scrutiny and to build a "global civil society."

However, using the concept of civil society in a global context creates both theoretical and practical difficulties. It is true that some institutions of civil society are becoming globalized. The 1980s were a breakthrough decade in this respect, when some civil initiatives (e.g., human rights and pacifist movements) transcended the borders of the nation-states. They referred to global problems and demanded global solutions as well. Some of those initiatives entered the institutional phase, which resulted in the emergence of nongovernmental civic institutions of global scope (e.g., Greenpeace, Transparency International, Amnesty International). However, the conclusion that we are dealing with the beginnings of a global civil society seems to be premature for a number of reasons.

First, a civil society consists of citizens to whom authorities, legitimated by democratic procedures (e.g., elections), are accountable for their decisions. Global governance cannot be equated with political power defined in this way; because there is no global accountability procedure, this relationship cannot be directly transposed to the global level. Second, there are no rules to legitimize the actions of global civil structures, as a result of which their activity faces claims of usurpation. Third, the emergence of "global civil society" would require a common normative base, on which even contradictory civil initiatives could meet and operate in mutual respect. In a global dimension, there is no such common cultural denominator. Even the concept of basic human rights is not generally recognized and is sometimes interpreted as a product of the Western culture and a tool for its expansion.

The importance of global governance is rising, as is that of global grassroots civil initiatives. However, because there is no "social contract" on the global level, both institutions that execute global governance and global civil organizations suffer from legitimacy deficits. Therefore, their relationship is usually antagonistic. Hence, the concept of civil society may again turn out to be a useful analytical category to describe further developments of globalization.

Civil War

Civil war can be defined as a violent conflict that pits states against one or more organized nonstate actors on their territory. This distinguishes civil wars from interstate conflict (where states fight other states), violent conflicts or riots not involving the state (sometimes labeled intercommunal conflicts), and state repression against individuals who cannot be considered an organized or cohesive group, including genocides or similar violence by nonstate actors, such as terrorism or violent crime. This entry first discusses the various kinds of civil war and reviews the key patterns and trends in such conflicts. It then presents theories on the causes of civil war and the current research agenda.

The above conceptual definition of civil war clearly encompasses many different forms of conflict. Some analysts distinguish between civil wars where insurgents seek territorial secession or autonomy and conflicts where insurgents aim for control of the central government. Conflicts over government control may involve insurgents originating from within the *center* or state apparatus, as in military coups, or challengers may come from the *periphery*, or outside the political establishment. Others separate between *ethnic* civil wars, where the insurgents and individuals in control of the central government have separate ethnic identities, and *revolutionary* conflicts, where insurgents aim for major social transformation. *Colonial* conflicts are sometimes singled out as a set distinct from civil wars on states' core territory. However, even if these suggested categories may be conceptually distinct types and could suggest different causes and dynamics, a given civil war will often combine several elements. For example, insurgencies may be both ethnic and ideologically based, and aims can shift over time from secession for a limited territory to controlling the entire state. Thus, most researchers do not impose such strict a priori distinctions between varieties to analyze these as separate types but instead study civil war as a common class of conflict.

Patterns and Trends in Civil War

Even though the modern state sometimes is defined by its alleged monopoly on violence, armed challenges to state authority are as old as states themselves. Despite numerous historical accounts of civil wars, there are few systematic data sources on civil conflict prior to 1945, since so little is known about the extent of conflicts outside the developed countries before this date. Figure 1 displays the number of ongoing conflicts (top) and new outbreaks (bottom) since 1945, using data from the Uppsala Conflict Data Program at the Department of Peace and Conflict Research, Uppsala University and Centre for the Study of Civil War at the International Peace Research Institute, Oslo (UCDP/PRIO), Armed Conflict Dataset. UCDP/PRIO classifies conflicts claiming more than 25 deaths in a year as interstate conflicts, extrasystemic (or colonial) conflicts, as well as internal conflicts, or as civil wars, including internationalized internal conflicts where other states fight on the side of the government. Figure 1 shows that while there are relatively few interstate wars since 1945, civil wars have been common. Whereas interstate conflicts tend to be short, civil wars often persist for a long time. Research also demonstrates that civil wars are less likely to be settled by formal agreements than interstate wars and much more likely to recur. Many observers saw the initial rise in new outbreaks of civil conflict after the end of the Cold War as evidence that the world would be more turbulent and violent after a period of stable deterrence between the superpowers. However, Figure 1 demonstrates a clear decline in civil war since this peak after the Cold War. The specific causes that may underlie this decline remain disputed, and the number of ongoing civil wars remains high in absolute terms.

Civil wars are generally less severe than interstate wars in terms of the direct battle deaths. However, civil wars have been more frequent and often persistent, and more than 90% of the recorded deaths in battle since the Cold War stem from civil wars. Further, war can have a substantial indirect impact on human welfare beyond the direct loss of life. Studies indicate that countries experiencing civil war see a pronounced fall in their gross domestic product and never recover their earlier growth trajectory. According to Paul Collier et al. (2003), "Civil war is development in reverse." Civil wars also dispel trade and investment and leave large social legacies in unemployed former combatants and displaced individuals. The negative consequences of civil war are not limited only to the countries that experience them; studies find that neighboring countries also suffer a negative economic impact and may be more prone to violence themselves as a consequence of conflict among neighbors.

Causes of Civil War

The literature on the causes of civil war is enormous, and it is impossible to provide an exhaustive review of the many arguments that have been presented here. Contributions have emphasized a variety of social, economic, and political factors. However, theories of civil war, in general, point either to specific motives for why people resort to violence or to specific opportunities that make violence more or less feasible or attractive. This entry examines theories of civil war by the specific clusters of factors emphasized, in an order roughly following the chronology of theory development and the specific events and cases that motivated these arguments.

Economic Grievances, Motives, and Opportunities

Most civil wars take place within relatively poorer societies, and many studies corroborate the link between development and income. Early contributions to the study of violence within societies tended to focus on economic deprivation and grievances as key motives. In particular, Ted Gurr highlighted inequality and how groups may resort to rebellion if they are dissatisfied with their current economic status relative to their aspirations. The literature on nationalist conflicts has emphasized how both relatively poorer and wealthier groups are likely to rebel against the center if they believe that they can do better under independence. Civil wars in Latin American countries were often interpreted within a framework focusing on economic grievances, in the form of either unequal land distribution or high income inequality. However, the empirical evidence linking individual income inequality and conflict is mixed. Older studies focusing on a broad range of political violence often found a positive effect of higher inequality, while newer studies of civil war more specifically tend to find little support. However, one should be cautious in making strong inferences from this, given the poor quality and coverage of cross-national data on individual income inequality.

More recent political economy studies of civil war tend to be very dismissive of the role of grievances. Some researchers have argued that grievances are ubiquitous and that it is more important to focus on variation in the opportunities for violence. Collier and Anke Hoeffler argue that low income makes it easier to mobilize insurgencies, since potential recruits have less to lose in forgone income from normal economic activities and wages for soldering will be much lower than in wealthier societies. James Fearon and David Laitin argue that civil war is primarily a problem of weak states, which in turn is largely determined by economic development. Researchers in this tradition also link mobilization to the role of individual incentives. Opportunities for insurgencies are better when participants can do well out of war, for example, through looting or rents derived from valuable natural resources. Empirical studies lend some support to link between natural resources and a higher risk of civil war. Civil wars in Africa are often taken to support these perspectives.

Political Grievances, Motives, and Opportunities

Political deprivation, such as colonial subordination or lack of political rights, provides another plausible motivation for resort to violence. Many conflicts after 1945 first emerged as groups sought to achieve independence for areas under colonial rule. The Indochina War and the Algerian War of Independence helped mobilize movements in other countries by showing how overwhelmingly more powerful colonial powers could be defeated through sustained violent campaigns. Although overseas colonies eventually received their independence, many ethnically distinct groups within contiguous empires such as Russia or Ethiopia see themselves in similar struggles of national liberation. Researchers have highlighted how violence may arise around such peripheral ethnic minority groups. The violent conflicts in the former Yugoslavia spurred renewed interest in ethnic conflict. Many researchers postulated strong parallels between the security dilemmas in an anarchic international system and relations between ethnic groups, where only full territorial partition could provide stable solutions.

Much of the subsequent empirical literature has emphasized that there is little evidence that ethnically more diverse countries are generally more prone to conflict. However, looking only at the number or relative size of ethnic groups disregards their political status and the extent to which ethnic groups are systematically excluded from political power or discriminated against by the state. Studies looking at ethnic exclusion find stronger evidence for a relationship to violence. Ethnically diverse countries are not necessarily more prone to conflict if they have inclusive institutions or grant autonomy rights, and control of the state or access to power does not always follow directly from the relative size of ethnic groups. Many ethnic civil wars see minority groups controlling political institutions and excluding larger groups from power, such as the Amhara in Ethiopia until their defeat by a coalition of other groups in 1991. Political, economic, and ethnic grievances are often linked. Studies that focus on inequalities that follow group lines rather than individual income inequalities find a stronger relationship to conflict.

Struggles for broader political rights in autocratic systems provide another context where violence may occur. Political democracy provides many avenues for actors to express dissent through nonviolent political means. Autocratic regimes typically deny citizens room for political activities and often resort to severe repression of protest, which in turn may motivate resort to arms. Protests against autocratic or exclusionary regimes have often turned violent, sometimes leading to sustained campaigns, as, for example, in South Africa. Claims for greater political rights and freedom are clearly important elements of the rhetoric and call for mobilization of many insurgent movements, even if these do not necessarily move to implement democratic institutions if successful in achieving power.

Much of civil war research has focused on the role of political institutions in structuring the opportunities for violence rather than the potential accommodative effect of greater democracy. Many have argued that although autocratic institutions provide fewer avenues for nonviolent political activities and protest, autocratic regimes are often sufficiently repressive to successfully deter dissent. By contrast, anocracies, or regimes combining autocratic and democratic features, are seen as the most prone to see violent conflict by combining the lack of political freedom motivating violence with the sufficient opportunities afforded by a less repressive regime. Many studies have found evidence for such an inverted U–shaped relationship between democracy and civil war. However, there is no consensus on the underlying mechanisms (e.g., reforms in autocracies may be a response to conflict potential rather than a prior cause). Some hold these relationships to be in part artifacts resulting from the definition of empirical democracy measures.

Opportunity Structures and Dynamic Events

Most of the theories discussed above emphasize structural factors that rarely change or change only slowly over time. Such persistent structural features do not provide clear explanations for why civil wars break out at specific times and not others. Research on social movements suggests that certain events can create "political opportunity structures" that afford groups better prospects for extracting concessions from the state or center. This may include demonstrations of state weakness, conflict between elites, or events that make it easier for groups to mobilize, for example, by bringing groups together or indicating focal points for organizing protests. The concept of opportunity structures has so far not had much direct impact on studies on civil conflict, but there are many existing arguments and findings in civil war research that can be interpreted within this framework. Regime change and other signals of weakened state authority can increase the perceived chances of success or extracting concessions from a government. Studies have shown that economic crises and natural disasters can increase the risk of conflict. This is consistent with the idea that crises and emergencies can help provide a setting for rallying protest against the government. For example, the 1973 earthquake in Nicaragua, and the massive corruption and lack of subsequent reconstruction, generated widespread disillusionment and helped a long-standing Marxist insurgency dramatically increase recruitment.

International Dimensions of Civil War

Most research on civil war has assumed that since civil wars are "internal" conflicts rather than conflicts between states, their main causes must also be domestic or located within state boundaries. However, factors outside individual countries can play an important role in the outbreak of conflicts, as well as how they evolve. Many actors in civil wars are not necessarily confined within individual countries. Ethnic groups often span international boundaries, and transnational kin frequently participate in or provide support for insurgencies in other states. The status of international borders generates different constraints and opportunities for governments and rebels. Borders are, in a technical sense, just lines in the sand and are often not difficult to cross from a purely military perspective. However, the fact that borders formally delineate state sovereignty makes it more difficult for governments to violate the sovereignty of other countries, while such constraints are less relevant for rebels. Governments risk retaliation from neighboring countries from territorial incursions and face difficulties in targeting transnational support. This in turn means that rebels can have a logistic advantage in operating out of extraterritorial bases, and transnational rebel movements can be more difficult for governments to deter or defeat. The presence of conflict in another state can help facilitate violent mobilization, either through emulation of successful rebellions or through the direct imports of arms and combatants. Finally, civil wars are often closely linked to interstate war. Poor relations between states may motivate governments to support insurgencies in rival countries, and civil wars may in turn promote military conflict between states, for example, as a result of conflict over border violations, alleged support for insurgents, or conflicts over the externalities generated by conflicts. Western Africa in the 1990s, for example, provides many examples of governments supporting insurgencies in neighboring countries and retaliating against alleged support and border violations. The fact that conflicts are not necessarily limited to single countries and may involve participation by other states in various forms demonstrates how a strict dichotomy between civil and interstate wars often may be untenable.

Civil War Termination and Duration

Although most research focuses on accounting for the original outbreak of civil war, there has also been growing interests in understanding the prospects for conflict termination and why some conflicts are so persistent. Many researchers argued that there must be some symmetry between the original causes of civil war and the factors that lead to their eventual termination. From this perspective, efforts to foster conflict settlement should focus on addressing the issues that gave rise to the conflict. For example, civil wars would be likely to end earlier in more developed countries, where the opportunity costs are higher and states are stronger. Events such as political reform and increasing accommodation could help promote the end of conflicts. However, other researchers argue that the factors that make conflicts endure can be quite different from those influencing the initial outbreak of conflict. While interstate wars tend to be relatively short and typically end quickly in some kind of formal settlement once the relative strength of the actors becomes clear, civil wars often persist for a long time, as in the case of Southern Sudan or Angola. A number of explanations have been proposed to account for this paradox. Some emphasize how civil wars tend to be low-intensity conflicts fought in the periphery, where the features that facilitate insurgency make it difficult for governments to conclusively defeat rebels. Others point to how insurgents that can do well during war through looting and control over valuable resources may have little interest in seeking an end to conflict. Other research emphasizes how conflict termination involves severe problems of credible commitment. Even if it may be relatively easy to reach consensus on the terms of an agreement in principle, carrying through with an agreement may be difficult since parties have incentives to make promises that they later renege on. For rebels, laying down arms is a risky choice, since they will be left less able to defend themselves. Moreover, it can be difficult for governments to ascertain whether rebels will uphold their end of agreements, for example, through decommissioning or controlling violent breakaway factions in the aftermath of agreements. Research on credible commitment problems after civil war argues that the success of agreements often hinges on whether third parties can serve as external enforcers. New research on peacekeeping and conflict management suggests that involvement by international organizations such as the United Nations (UN) can increase the prospects for settling conflict and preventing wars. However, many interventions in civil conflicts have clearly been less than fully successful. There is little consensus on how best the UN may contribute or to what extent the characteristics of conflicts or initial prospects for settlements determine whether external actors are willing to be involved in the first place.

Disaggregation in Civil War Research

Civil war has gone from being a peripheral area to a major focus in the study of conflict. Moreover, the field shows clear positive synergies from the interaction between theory development and research design. Older studies of civil war were often quite descriptive, focused on single cases, and frequently reluctant to consider general theories of civil war. The renewed interest in civil wars in the 1990s recognized the need to take into account nonconflict cases and turned to cross-national studies, comparing the various characteristics believed to make countries more prone to conflict across countries and its relationship to civil war. However, recent research has highlighted how the proxy measures used in cross-country comparative studies are often quite far removed from the key theoretical concepts. Moreover, looking at states and countries at large often downplays the nonstate actors in civil wars and ignores the often considerable variation within countries. Conflicts tend to be localized and often involve actors and regions that are markedly different from national averages, as, for example, the Chechen conflict in Russia. Recent contributions, accompanied by many new data developments, often turn to greater disaggregation within countries and a more specific focus on actors to more carefully evaluate theories of civil war. A number of studies have looked at the specific conflictual events within individual countries over time to better understand the microlevel interactions between actors in conflict. Some studies have looked at dyads of peripheral groups and the center to take into account how the attributes of nonstate actors may influence the risk of conflict. Other studies have looked at the characteristics of specific rebel groups to better understand capacity or opportunities for conflict or used individual-level data on participants in insurgencies to examine motivations. Some researchers consider geographically disaggregated data, either on the characteristics of the places where conflict occurs or using smaller units within countries, for a more detailed resolution of how social, economic, and political factors may be related to conflict. These studies indicate that the characteristics of conflict zones tend to be quite different from national aggregates and averages. Moreover, the conclusions from country-level studies on who participates in insurgencies and their motivations are often not supported by more direct evidence. Such innovations in the study of civil conflict attest to the vibrancy of this research area. Moreover, they underscore the important relationship research design and the conclusions that we reach, and how theory must inform the former. Although existing research has clearly generated many useful insights about civil war, this review illustrates the considerable changes in the conventional wisdom on civil war over time. Advances in theory development and research are likely to continue to spur further changes.

Class, Social

The concept of class is one of the most important and most controversial in social sciences. It is important because classes have been traditionally considered a key to the study of social inequalities and social and political behavior. It is highly controversial because different definitions and contrasting perspectives on the role and impact of class have been proposed. In everyday language, class refers to social groupings based on similar occupational conditions that have the same access to economic, social, and political resources. It is also assumed that experiencing analogous social inequalities favors the formation of a specific cultural identity and influences social and political behavior. However, in scientific language, classes are to be considered a "modern" phenomenon. This means that whereas social inequalities have always been present in human history, the specific inequalities based on class require two conditions: the equality of citizens before the law and the development of a market economy. These conditions occur after the end of the 18th century with the advent of modern society, shaped by democratic revolution and growth of the market economy and industrialization.

Therefore, classes can be defined as social groupings that are based on similar occupational conditions in societies where a market economy prevails and the formal equality of citizens before the law is recognized. People belonging to the same class de facto experience an unequal access to economic, social, and political resources depending on the jobs they occupy, despite the formal equality of rights. However, they can change their class through social mobility. This possibility clearly distinguishes classes from other social groupings, such as religious castes or medieval estates, for two main reasons. First, in the case of castes or estates, inequalities are established by traditional laws. Second, the class position of people cannot be changed, because social mobility is not allowed (as for castes) or is subject to special conditions defined by law (as in the case of medieval estates). In modern societies, mobility is a normal condition, although classes presuppose a certain degree of enclosure.

While this definition of class is widely accepted in the literature, sharp differences have emerged along two dimensions. First, opinions diverge on the economic base to be used to analyze the class structure. Second, strong disagreement persists on the cultural, social, and political consequences of classes. On the one hand, this is related to the specific mechanisms that trigger the transformation of classes from mere aggregates of people into social groups: collective actors that recognize common values and interests and organize themselves to pursue common goals. On the other hand, scholars differ in the evaluation of the impact, over time, of classes on social behavior (lifestyle, consumption) and political behavior (participation, voting).

In the next section, the main approaches to the origins and consequences of social classes are discussed. First, the perspectives of classical authors such as Karl Marx, Max Weber, and Émile Durkheim are contrasted. The influence of these authors on the ensuing research is extensive. Contemporary studies are still affected by their different views. After discussing the most important proposals for reframing class structure in the light of economic and political changes, attention is devoted to debate over the past decade on the decline of social classes: To what extent do social classes remain important as an instrument for understanding contemporary societies?

Contrasting Views in the Classics

Among the classicists, Marx is the author who gave greatest emphasis to social classes. The struggle between classes plays a fundamental role in the historical development of human societies. Classes are social groupings that share a specific position in the control of the means of production. Each historical type of society is characterized by a dominant mode of production and specific classes. The capitalist mode of production is based on the private property of the means of production and on the role of the market in regulating productive activities and the distribution of incomes. Capitalist societies were therefore increasingly shaped by the capitalist mode of production with its two main classes: (1) the owners of the means of production (capitalist bourgeoisie) and (2) the workers, who are employed by the former and receive a wage. According to Marx, there was an objective conflict of interest between these two classes, because the industrial bourgeoisie could maintain, and strengthen, its position of economic, social, and political privilege as far as it was able to exploit the workers and extract from their activities a surplus value as determinant of profit. Over time, however, the growing crises of the capitalist economy would worsen the conditions of the working class and would encourage its social and political organization, which, in turn, led to a revolutionary change in the mode of production and the advent of a socialist society.

Marx was aware that the class structure of capitalist societies was more complex. At the same time, he recognized that the making of the working class as a historical actor did not depend on economic factors alone. He frequently discussed the sociocultural and political factors that could affect the formation of class consciousness (as he puts it, the passage from a "class in itself" to a "class for itself"). However, over time the extension of the capitalist mode of production would lead to the increasing polarization of bourgeoisie and workers and to an overwhelming trend toward conflict. The history of the past 2 centuries has shown the importance of classes and class struggle, but it has also demonstrated that Marx overestimated the role of class conflict and overlooked the autonomous role of social and political processes and institutions.

Weber was convinced of the important role played by class and class conflict. However, he saw class structure in a more flexible way, which allowed him to account for the increasing differentiation introduced by the development of a modern capitalist economy. This was done by defining classes as social groupings based on a common position in the market rather than on the control of means of production, as Marx asserted. Therefore, a class is composed of people who have similar life chances, affected by the income they can obtain in the market. This common power in the market ("class situation") is determined not only by the ownership of the means of production but also by wealth, education, and professional skills.

Another difference concerns the passage from a common class situation to the formation of self-aware social groups that organize themselves to pursue common interests. While Marx was convinced that the economic dynamic of capitalism would lead, in the end, to class consciousness and collective action, Weber was much more skeptical about this possibility. He thought that people within the same class situation would share life chances, social inequalities, styles of consumption, social and even political behavior, but they would usually remain aggregates of individuals rather than becoming self-aware social groups based on social interaction. In this respect, the German sociologist distinguished between mass action and community action. A common class situation usually brings about mass action. But the passage to community action requires certain noneconomic conditions: Status groups (religious, ethnic groups) must be absent or marginal; a large number of people must be in the same class situation; because they are concentrated in large firms and urban neighborhoods, it is relatively easy to organize them; and intellectuals will play an important role in the diffusion of a class ideology and in the organization of the people involved. Despite these clearcut differences in their view of classes and class conflict, both Marx and Weber recognized the importance of social inequalities as a determinant of social behavior and source of conflict in modern societies.

A different perspective was adopted by another founding father of sociology, Durkheim. Writing at the end of the 19th century, he emphasized the increasing division of labor as the main feature of modern society. A fundamental requisite of this society, based on the high differentiation and integration of specialized roles, concerns the recruitment and reward of individuals. It is necessary that each individual be called to fulfill the function he or she will perform best and receive an adequate reward for his or her efforts. In other words, people must be motivated to perform different roles thanks to structured social inequalities. This is the main function of stratification in the social system according to Talcott Parsons, the most influential figure in the sociology of the 1950s, who developed the functionalist premises of Durkheim's work. Parsons and other scholars of the functionalist approach, such as Kingsley Davis and Wilbert Moore (1945), gave a more optimistic account of the role of social stratification in the stability of society. This trend—which was also influenced by the economic and social climate of the postwar period—fostered the growth of descriptive research on social stratification, especially in the United States. Social strata were constructed by reputational analysis (asking people to rank others) or by a mix of reputational evaluations and objective indicators, such as wealth, income, and education. Usually, as in the well-known work by Lloyd Warner (1963), these studies presented a classification based on various status groups (upper classes, middle classes, and lower classes).

Reframing Class Analysis

In the 1950s and 1960s, the stratification approach largely prevailed in the study of social classes. This situation changed in the 1970s with the development of new empirical research based on occupational classes. In this strand of literature, there is a shared critique of the descriptive features of stratification studies and an emphasis on the "relational" attributes of classes. This means classes are to be defined on the basis of their position in the market and in the productive process, as in Weber and Marx, and therefore in relation to the other classes with which they compete for greater resources. However, the origins and aims of the new studies are clearly different. The component most influenced by Marx and the Marxist tradition is more interested in the analysis of the middle classes and in its consequences for the proletarianization of work, originally foreseen by Marx. The other component is closer to the Weberian perspective and looks at the empirical study of classes as the necessary basis for a more adequate analysis of social mobility.

The followers of the Marxist perspective tried to account for both the persistence of the petty bourgeoisie and the unexpected (in Marxist terms) growth of the new, dependent, middle classes (managers, supervisors, technicians). In designing an empirical map of social classes, Erik Wright tried to solve this problem through the concept of "contradictory class locations." In his studies, he distinguished between the ownership and control of the means of production. This allows him to explain the new middle-class positions as based on various degrees of control over the concrete use of the productive means without formal ownership. As a consequence, top and middle-level managers, technicians, and supervisors may also experience variable degrees of autonomy in performing their role.

In the 1980s and 1990s, another influential class map was provided by John Goldthorpe. He distinguished between a labor contract and a service contract. Employment regulated by a labor contract entails a short-term and specific exchange of money for work, while a service contract involves a delegation of authority, specialized knowledge, and a certain degree of autonomy on the part of employees. On this basis, a class schema for empirical analysis and comparisons was worked out. It included seven main classes: (1) service class (managers, professionals, higher-grade technicians), (2) less skilled white-collar workers, (3) petty bourgeoisie (artisans, small proprietors), (4) skilled manual workers, (5) unskilled manual workers, (6) small farmers, and (7) farm laborers. In practice, this schema is similar to the map designed by Wright. Both account for the growth of the new middle classes and an increasing differentiation among manual workers. Both of them can be used in diachronic and cross-country comparisons. For example, over time the class structure of advanced countries shows a decline of the old middle classes (the petty bourgeoisie); an increase in professionals, technicians, and white-collar workers (the new, dependent middle classes); and a growing differentiation among manual workers. Cross-country comparisons may help analyze the differences among advanced countries, which are related not only to the productive model and organization but also to the role of the state and the extension of nonmarket forms of coordination ("varieties of capitalism"). Interesting insights may also come from comparisons between advanced and developing countries. However, the main application of the Goldthorpe schema has been in the comparative study of social mobility. In this respect, robust research findings have been produced on the strong influence of classes on social mobility. These findings do not confirm the expectations of the liberal theory that industrial societies tend to become more mobile and more open. Rather, mobility rates (in particular relative rates) show a high degree of temporal stability. The chances for the children of less privileged classes of moving to the upper positions of the class structure remain low, without revealing significant differences among countries.

In spite of their different origins and goals, both the Marxist and Weberian maps achieved similar results and shed light on the class-based social inequalities typical of advanced capitalist societies until the 1970s. However, in the following period, there was a double change. On the one hand, the crisis of the "Fordist" model of production brought about a decline of large firms and their organization of labor. New forms of productive organization developed, based on flexible specialization and networks linking firms. On the other hand, welfare systems had to be restructured to deal with increasing costs. As a consequence, important changes affected the whole class structure. New maps had to be designed. "Postindustrial" societies are characterized by the growing role of the service sector. The traditional axis of stratification based on industrialism has shrunk, both because of the new technologies that reduce the use of labor and because of increasing trends to outsource manufacturing activities to developing countries. In advanced capitalist societies, new activities have developed in business services (finance, legal and accounting services, software programming), in social services (health, education, and welfare services), and in consumer service (restaurants, laundries, services related to leisure). Therefore, as Gøsta Esping-Andersen has pointed out, a new axis of stratification has emerged. This requires that new groupings be more clearly distinguished within the middle classes and the workers. The roles of professionals and scientists, together with that of technicians and semiprofessionals (schoolteachers, social workers, technical designers), become more important in the middle classes and have to be differentiated from those of managers and supervisors. Among the workers, it is necessary to distinguish new figures such as skilled service workers (police officers, hairdressers, etc.) and unskilled service workers or service proletariat (cleaners, wait staff, shop assistants, etc.). The new groupings tend to experience specific forms of career regimes and life chances and therefore are involved in processes of class closure that differentiate them from the traditional classes based on the Fordist industrial model.

Persistence or Decline?

Two macrochanges have influenced the debate on social classes in the past decades: (1) postindustrialism and (2) globalization. According to many scholars, the crisis of Fordism, the emergence of a service-based economy in advanced capitalist countries, and the increasing delocalization of manufacturing activities toward the developing countries have brought about a decline in social classes. The basic arguments in support of this thesis refer to two main trends: On the one hand, the increasing fragmentation of class structure and the growing individualization of life chances, and on the other hand, the weakening of class-based attitudes and behavior. For example, according to Ulrich Beck (1992), social inequalities tend to become "classless," whereas Anthony Giddens pointed out that—as a consequence of fragmentation and globalization—classes are no longer experienced as a significant source of collective identity.

Those who share the idea of a class decline usually refer to both dimensions: the loss of influence over social inequalities and social behavior. In contrast to this thesis, other scholars strongly criticize this view of a decline. However, they mainly focus on the relationship between classes and social inequalities. Goldthorpe provided a clear synthesis of the latter position, which makes wide reference to empirical findings. He pointed to the more detailed arguments advanced in support of the decline: insecurity and mobility. The theorists of decline assume that within the context of globalization, the threat of unemployment is not confined mainly to the members of the less advantaged classes but tends to become pervasive. As for mobility, globalization and postindustrial forms of economic organization are supposed to break up the continuity of working careers and of membership in the traditional occupational classes. The growth of flexible and nonstandard work and the emergence of new, more fragmented work trajectories reduce the significance of class as a lifetime experience. However, in contrast to these expectations, empirical findings show the persistence of class as the main determinant of inequalities. Thus, it is true that economic changes have brought about increasing job insecurity and a growth of nonstandard employment, but the chances of losing their jobs remain much higher for skilled and especially nonskilled workers than for professional, administrative, and managerial posts. In addition, empirical research demonstrates that inequalities in important spheres such as income, health, and access to education remain strongly associated with the class of people, defined according to the job they hold. As for social mobility, there is clear evidence that the overall association between class origin and destination is still characterized by high temporal stability and, therefore, despite changes in the organization of work, classes continue to provide lifetime experiences.

In the debate on class decline, particular attention has been devoted to the influence of class on voting and political participation. According to the theories that point to the weakening of class experience, class politics gives way to new forms of political behavior influenced more by cultural factors, lifestyles, and elective choices. One of the most powerful factors that feed this trend is the dramatic reduction in size of the traditional working class and the growth of service workers and the new middle classes. As a consequence, class cleavages become a less important basis for social identity. Their place is increasingly taken by other divisions, such as race and ethnicity, gender and sexuality. Many scholars also share Ronald Inglehart's (1990) thesis of the new "postmaterialism" in the politics of the advanced societies. This view sees politics no longer as influenced by the search for economic well-being and the defense of material interests but as increasingly affected by a personal search for autonomy and self-fulfillment and by a greater cultural interest in the quality of life.

As in the case of social inequality, scholars mainly involved in empirical research have rejected the thesis of a declining class influence on politics. They have pointed to findings that clearly question the hypothesis of a class dealignment—a reduction in the level of class voting—controlling for changes in the relative size of classes and the overall popularity of parties: Old relations between classes and parties—such as those of workers and left-wing parties—still hold. It has also been noted that a possible realignment will usually reveal new links between class and voting patterns rather than their disappearance. Thus, in concluding his accurate comparative study, Geoffrey Evans pointed out that the theory of a generalized decline in the class basis of voting is wrong.

However, in assessing the influence of class, a more clear-cut distinction has to be made between the impact on voting patterns and party affiliation and the strength of social classes as political actors, that is, as self-aware collective subjects, capable of pursuing their own interests in the economic field as well as in the political arena. Empirical findings show the persistence of this impact on voting and party affiliations, but the trend does not contradict the weakening of class on another dimension: the formation of self-aware social groups. There are clear signs of a decline in this respect, especially with reference to the role of the working class in advanced countries. Its decline in size, the fragmentation of working conditions, and the growth of the service economy have substantially weakened the working class as a social and political actor. This trend is confirmed—with variations from one country to the next—by a decline in trade union membership and union strength and by the changes that have affected left-wing political parties in their attempt to adjust to the transformations in class structure. The opening up of income differentials, at the expense of the less privileged classes, the restructuring of welfare systems, and the overall weakening of social protection are clear indicators of this decline.

Therefore, it may be said that class still clearly influences social inequalities and life chances (income, health, education, social mobility), but when it comes to action its impact is weaker. To return to Weber's distinction between mass action and community action, one can maintain that the influence of class on social and political behavior (i.e., on some aspects of consumption and on voting) usually takes the form of mass action involving aggregates of individuals. Over time, however, the impact of class on the formation of self-aware social and political groups through community action has declined.

Cleavages, Social and Political

The term *cleavage* identifies social and political divisions characterized by a close connection between individuals' positioning in the social stratification system, their beliefs and normative orientations, and their behavioral patterns. This close connection contributes to the resilience and stability of cleavages over time. In this entry, the constitutive elements of this concept are discussed and brought into a coherent overall framework that helps illuminate the political relevance of such cleavages.

The Concept

Empirical evidence about individual actors in politics concerns these three distinct dimensions: social structural, attitudinal, and behavioral. Individuals can be regrouped in social aggregates on the basis of gender, residence, education, property, ethnic group, religion, competence in political matters, available social relationships, and so on. Scholars regroup individuals in this way because some theory or previous research has led them to believe that these social aggregates have an impact on the other two kinds of information we can collect about the same individuals: (1) their subjective perceptions and judgments about the world of politics and (2) their actual political behavior.

Individuals in fact have opinions, preferences, and value judgments about a large variety of political issues, institutions, and actors, as well as normative views on good government, a just society, welfare and redistribution, race and ethnicity, religion, and so on. Some of these beliefs and values are superficial and unstable and change rapidly and frequently, while others are profound and resilient and more impermeable to environmental changes. In some cases, these various beliefs are unrelated to each other, while in other cases, they are strongly correlated and constitute clusters or systems of beliefs.

We also can collect information about what individuals do—their behavior. People establish wide or narrow social relationships (they marry, do business, establish friendships) in their environment. Some individuals invest heavily in culture and education, while others have different consumption patterns. Some cooperate easily with others while others withdraw. (See Table 1.) People vote or abstain, join parties or interest groups, rebel or acquiesce, and, more generally, engage or do not engage in a vast repertory of political acts.

Most sociopolitical research is based on the attempt to investigate relationships between social positions and aggregates, beliefs systems and value orientations, and behavioral patterns. While it is clear that objective social positions are derived from theories of social stratification criteria that are independent of the normative orientations and the behavioral patterns of the individuals, the relation between beliefs and behaviors is more intimate and the direction of influence more difficult to ascertain. These three sources of information should, therefore, remain conceptually distinct as much as possible.

The literature frequently associates these three sources of information about individuals with different kinds of "cleavages."' Objective social positions are often thought to be the basis for "social" cleavages (sometimes called "economic" cleavages);

Table 1 Types of Information About Individuals

"Objective" social positions	Attribution of individuals to "relevant" social categories as defined by the observer
Beliefs and value orientations	Subjective orientations toward political and social objects, institutions, and actors
Behaviors	Repertory of socially and politically relevant behaviors

beliefs and values are considered to be the source of "cultural" cleavages and also of "political cleavages"; and political behavior is often indicated as an expression of political cleavages. The term *cleavage* is therefore frequently accompanied by qualifying adjectives such as social, political, economic, attitudinal, behavioral, cultural, ideological, structural, segmental, institutionalized, and so on. This generates considerable theoretical confusion and has led to a soft use of the term *cleavage* as a general concept that is largely synonymous with the broad notion of divisions, oppositions, or conflicts.

In fact, the historical divisions to which the term *cleavage* originally was applied by Seymour Martin Lipset and Stein Rokkan in reference to party system formation (center–periphery, urban–rural, class, religion, etc.) included socioeconomic bases; attitudinal, ideological, or, more generally, normative bases; and behavioral or organizational bases. None of the historical cleavages was ever purely "economic" or "demographic," merely attitudinal or ideological, or exclusively behavioral. On the contrary, they represented a peculiar combination of these divisions, with a tendency to overlap and to reinforce each other. Indeed, the peculiarity of the concept of "cleavage" is its capacity to bridge social with ideological or normative and with behavioral/organizational divisions. In short, the theoretical connotation of the concept of cleavage refers to the combination of *interest orientations* rooted in social structure, *cultural/ideological orientations* rooted in the normative system, and *behavioral patterns* expressed in organizational membership and action.

To properly define and identify cleavages, therefore, it is necessary to locate them in relation to the various kinds of "divides" that exist and are continuously generated and redefined in our societies. Cleavages then emerge as a peculiar combination of different types of divisions. This is achieved by first discussing separately the sources of divisions rooted in the (a) social stratification system, (b) normative system, and (c) behavioral system.

The Social Stratification System

Pure divisions of interest rooted in social stratification, based on property, market positions, education, religious affiliation, and so on, are unlikely to constitute a sufficient base for the structuring of cleavages unless they tend to overlap and reinforce each other. The higher the frequency and the degree of overlapping membership in different social contexts, the more unlikely it is that any such social context will be dominant.

Individuals play a range of different social roles, some of which imply competing and contradictory tasks, activities, expectations, and values. Individuals' group memberships (in the family, employment, friendship, communication, and leisure activities) and relative social positions (with respect to education, property, income, class, religion, ethnic group, etc.) in modern societies are usually highly differentiated, and the chances are low that many individuals will share the same combination of stratification positions and group membership. At the extreme, however, there may be only a few socially relevant categories, which are characterized by mutually exclusive membership, as in a strongly stratified caste society or a society with strong ethnic, religious, or similar divisions. Then, a high proportion of agents act exclusively in one category or social group. This second situation generates and exacerbates potential divisions among self-containing groups whose nonoverlapping but reinforcing membership facilitates common values and perceptions but makes an exchange of information, experiences, and so on across groups much more difficult. This accentuates group conflicts, particularly because closed groups will tend to claim the complete and total involvement of their members toward some collective aspiration or design.

In low-mobility and high-status contexts, the social boundaries of social groups may be so strong and so institutionally reinforced that exit options at the individual level are basically unthinkable. This reinforces cultural solidarity in the group and reduces individualistic options in favor of collective choices. The more the empirical evidence approaches this situation, the greater the likelihood that the similarity of social positions and interests will give birth to strong and cohesive normative visions of the group's role in society—that is, to a code of collective identity.

The Normative System

At the core of all codes of collective identity is a distinction between "we" and "the others." A typology of the symbolic codes of collective identity distinguishes between codes of primordiality, civility, and culture.

Primordial elements of collective identity focus on gender, generation, kinship, ethnicity, and race as bases for constructing and reinforcing the boundaries between inside and outside. This code of closure makes reference to original and unchangeable distinctions that are by definition exempted from communication, reflexivity, and exchange among the members of the community. Such distinctions cannot be changed by voluntary action; they relate to "nature" and as such provide a firm and stable basis beyond the realm of voluntary actions and thus do not allow for shifting involvements. In other words, primordial types of codes basically "naturalize" the constitutive boundary between insiders and outsiders, and they tend to be exempted from social definition and alteration. Therefore, primordial boundaries are very difficult to change, and complex rituals to cross these boundaries actually reinforce and reaffirm them.

Identity boundaries built on the *civility code* of closure and exclusion are constructed on the basis of familiarity with implicit rules of conduct, traditions, and social routines that define and demarcate the boundary of the community. Tradition and collective civic rituals are important (the myths of the founder; particular persons, places, and historical events such as revolutions; migrations, etc.). Very often these are embedded in the constitutional practices of the public arena. There are some civic rituals but no peculiar rituals of initiation, commitment, or confession to demarcate the boundaries. The stranger is primarily "unfamiliar." Civility codes allow a stronger differentiation between the "public" and "private" spheres, between polity and the market, and between the entitlements to public goods, which are restricted to members of the community, and access to commodities exchanged in the market, which are open to everyone on the basis of material rewards and instrumental calculation and which, therefore, are identity free.

The third code of collective identity—*the cultural code*—is based on the boundary between "us" and the "other" on a particular relation of the collective subject to some fundamental values. The collectivity so defined on the basis of values related to God, reason, progress, rationality, or to some sort of definition of the ideal mundane or heavenly world. Boundaries between members and nonmembers can be crossed by communication, education, and conversion, and in principle everyone is invited to do so. The cultural code usually represents a rupture between past and present, in strong opposition to primordiality codes that always overemphasize the past as the source of legitimacy. The openness of the boundary is compensated by stratified access to the center by rituals of initiation.

Primordial, civic, and cultural codes of identity can be ranged in terms of difficulty in crossing the boundary of the identified community; that is, to exit and to enter the social relationship. We go from the exclusive codes, based on primordial traits, to the inclusive and cultural codes, while civility codes are located in an intermediate position between these two extremes.

The level of identity, solidarity, and loyalty generated by different codes entails consequences for the allocation of resources and for the definition of the entitlements of the members of the collectivity as distinct from those of outsiders. Groups' identities differ with respect to what entitlements are distributed in the name of the collectivity to its members and the mode of distributing those entitlements (hierarchical vs. egalitarian).

The Behavioral System

Collective action is undertaken by social movements, interest groups, and politico-electoral organizations or political parties. The levels of rigidity/permeability of the social stratification system and of the normative closure of the identity code affect the predominant form of political behavior and the structure of political agencies.

There is no one-to-one relationship between codes of closure and types of organizational membership. However, some predominant associations can be specified on the basis of the synthetic scheme of organizational membership variations presented in Table 2. Forms of organized political action can be ranged along four dimensions. First, they can be characterized by different degrees of territorial centralization/decentralization (national vs. regional or local forms). Second, forms of organized political action can be analyzed in terms of their degree of "segmentation" along cultural dividing lines (as, e.g., in the case of religious and ethno-linguistic divisions). Third, they can be organized by level of "fragmentation" along ideological dividing lines (as, e.g.,, the political Left–Right fragmentation). Finally, different forms of organized political action can be studied in terms of the level of their "organizational interlocking" with other forms—for instance, the more or less interlocking relationships between political parties, unions, interest groups, or sociopolitical movements.

The presence of primordial codes of closure is likely to generate territorially decentralized or culturally fragmented political organizations and social movements within a country. Civility codes in their pure form are more likely to be associated with the ideological fragmentation of political action, where divisions concern primarily the level, type, and quality of resources distributed within the collectivity and the access to public goods. However, they can occasionally be associated with decentralized forms of political action resting on the specific civic traditions of certain territories. Cultural codes are more encompassing and are conducive to both cultural segmentation (e.g., religious mobilization) and/or ideological fragmentation (progress vs. conservatism, change, and tradition). Well-integrated territorial polities with no internal primordial groups and with high civility and cultural homogeneity tend to produce political organizations that more closely mirror the ideological differences between social and economic interest–based groups.

Therefore, membership- and action-based divisions may be organizationally expressed by territorial decentralization, cultural segmentation,

and ideological fragmentation and by different degrees of interlocking relations between specific sociopolitical movements, corporate, and electoral organizations.

Types of Divisions and Cleavages

At this stage, a general typology of all possible divisions and the place that cleavages occupy in such a typology can be achieved by combining the elements of the separate dimensions of the social stratification, normative, and behavioral systems. This is presented in Table 3, which identifies the three bases for all sorts of conflicts and oppositions. They correspond to the interest orientation linked to the social stratification system, the cultural/ideological orientation linked to the normative system, and the organizational base linked to the behavioral system. Taken separately, these oppositions and conflicts identify *simple* divisions. They generate *compound* divisions when they interact and cumulate. In line with the definition at the beginning of this entry, *cleavages* are identified as a special type of complex division that combines these three bases and roots.

Simple Divisions

Some divisions are based simply on processes of interest differentiation and perceptions of interest similarity. Though these interest divisions are mainly categorized as statistical or analytical, they may also occasionally generate conflicts and oppositions. Cultural divides exist among social identities linked to various types of civility and cultural codes (primordial codes are by definition rooted in the social structure via the stigmata of the group), and they have proved their historical resilience even in situations unsuitable for their behavioral expression (e.g., repression). Finally, we can observe conflicts and oppositions that are mainly related to the behavioral divisions among various types of voluntary organizations and that are not linked to divisions rooted in either the social structure or in the normative cultural system.

However, none of these "simple divides" is likely to provide long-lasting sources and bases for the political structuring of the polity unless they are combined. Interest divisions are unlikely to overcome the free riding problem and the cost of organizational mobilization without normative or organizational foundations. Interest orientations need to be "generalized" and somehow made "universal" through an idealized appeal to solidarity. Similarly, pure membership divisions are unlikely to maintain the organizational cohesion of the membership groups only by distributing material incentives and resources. Even the most scandalous and corrupt "spoils" party or organization is likely to require some cultural and/or ideological underpinning to

Table 3 Types of Divisions

survive and stabilize over time. Cultural divisions may be the only ones that are able to survive "underground" with weak interaction bases and loose organizational support.

Compound Divisions

The most important divisions are, therefore, "compound," and they are the only ones able to generate the forms of organized political action we usually observe as social and political movements, interest organizations, and political parties.

The combination of interest orientations with organizational membership may be sufficient to generate highly contingent and goal-oriented organizational cooperation without necessarily being rooted in strong cultural orientations. Indeed, this type of division may allow a considerable amount of within-group differentiation in many other domains different from the one in which the organizational cooperation is generated. This is the typical and elementary form of interest (or pressure) group formation.

Social divisions are based on the combination of interest orientations rooted in the social structure with stronger normative orientations concerning the identification of the group and its role in society. In this type of division, the social determination is less strong than in corporate divisions. The distinctiveness of social roots may be more or less fundamental but the normative orientation is usually essential and decisive. In this case, cooperation is not based on specific and well-defined interests, and the organizational capacity is weak, intermittent, not consolidated, or sometimes nonexistent. The normative orientation is therefore essential to the definition of the group identity. This seems to be the typical form for the emergence of social movements.

The ideal type of political division is expressed via a combination of cultural/ideological orientations with a strong organizational dimension. The ideational solidarity takes the form of common but general goals to be achieved in the polity through the organizational–ideological competition for the attainment of binding decisions. These divisions are more institutionalized and strongly embedded in the institutional structure of the polity. The organizational dimension gives them solidity and stability over time, which may enable them to survive even when the original cultural and ideological bases fade way. Political parties are a typical expression of such political divisions.

Cleavages

Finally, "cleavages" are a type of division that incorporates the three elements of a clear interest orientation, a clear-cut normative vision, and a strong organizational basis. Cleavages encompass corporate and social divisions with political ones. Cleavages show a remarkable degree of resilience over time. They are not transient and intermittent but durable, entrenched, and entrapped. Given their high degree of organizational infrastructure and institutionalization, they often endure over and beyond the interests and the normative orientations that historically gave birth to them. Cleavage lines manifest themselves through an intense interlocking relationship between corporate interest organizations, social movements, and specific electoral organizations. Actually, the distinctive characteristic of cleavages as opposed to all other divisions is that they are characterized by a dense and profound overlapping of membership and exchange of personnel and of resources among social movements, corporate organizations, and electoral organizations. From the organizational point of view, the specificity of cleavage structures is indeed their vertical integration of different forms of organizational action.

As bases of a cleavage, territorial oppositions are more solidly entrenched than cultural segmentations, and the latter are more solidly entrenched than ideological fragmentations. As argued previously, territorial oppositions are rooted in either primordial or civility codes of exclusion, and these have proved to be extraordinarily resilient and impermeable. Cultural codes are by far more open and permeable and therefore both cultural segmentations and ideological fragmentations rest on roots that are historically more malleable and changeable. For example, compared with their impact on ethno-linguistic community definitions, it is more likely that socioeconomic and technological changes make social class positions more permeable and denominational affiliations less significant.

CLIENTELISM

Clientelism involves a particularistic exchange between patrons and clients in which resources of some kind are traded in a mutually beneficial way. Both parties are supposed to benefit from the exchange, but it involves actors of unequal status. The patrons, for example, landlords or local notables, are the more powerful actors in the exchange. They possess privileged access to resources, such as land, which is denied to their clients, typically poor peasants, migrants, and other marginalized groups. The patrons release these resources in a selective way that directly benefits the clients, and in return, they expect their help, support, or allegiance. These exchanges eventually produce an enduring social relationship, typical for traditional societies, governed by a sense of obligation and loyalty that binds the client to the patron. In modern political settings, clientelism is associated with the selective use of public resources in the electoral process. The patrons, who can be individual politicians or political parties, selectively release various resources—jobs in state administration, titles, pension schemes, or building projects—to individuals or groups in order to "purchase" their vote. This is an understanding dominant in the political science literature where clientelism is seen as a type of representation or of political mobilization that differs from both universalistic programmatic appeals and appeals based purely on personality traits and charisma. This entry focuses on this understanding of clientelism. The first part discusses the concept of clientelism, in particular its relation to other closely related concepts, such as patronage, corruption, and pork barrel. The second part discusses the relevance of clientelism in contemporary political process.

Identifying Clientelism

The passage from traditional to fully mobilized mass democratic societies brought about substantial changes in patron–client relationships. The traditional clientelistic linkage, characterized by face-to-face contact that is managed by a powerful person, has been replaced by exchanges in which an organization, the political party, has become the key distributor of goods and services to the clients. The individual patron–client ties of local notables and powerful landlord has thus eventually evolved into the clientelism managed by complex political organizations. However, studies on the subject have long suffered from a high degree of conceptual vagueness and ambiguity. This problem is particularly evident in the use of the concepts of patronage and clientelism, which are seen either as the same phenomenon or, in contrast, as two different phenomena but without any explanation of what differentiates the two.

Patronage and clientelism do fundamentally denote the same type of exchange but, as Simona Piattoni (2001) points out in the introduction to her edited volume, the latter is a far more penetrating phenomenon. The difference between the two lies in the objects of exchange (i.e., the type of resources that are used in the trade) and in the goals of the exchange (i.e., what the deal is supposed to achieve). Regarding the object of exchange, the key feature of patronage is the discretional allocation of public jobs by (party) politicians. The recipients of these jobs are normally assumed to be party leaders, party activists, influential party backers, or party voters, though the fact that politicians have power for discretional hiring is more important for defining patronage than the characteristics of appointees. In other words, patronage should not necessarily imply that appointees are exclusively party members or party supporters, though in reality it has always been associated with rewarding individuals or groups who have played an important role in party life and party strategy. Concerning the goal of the exchange, parties or politicians are typically seen to allocate jobs in order to secure supporters' votes. However, given that most modern polities are best characterized as having "too few jobs and too many votes," the use of patronage as a way of directly securing electoral support is unlikely to be a very feasible strategy. Instead, patronage has always served mainly organizational and governmental goals, such as entrenching party or politicians' networks within the public sector, serving as an inducement for building and maintaining party organizations by offering selective incentives to party activists in exchange for their work for the party, or ensuring the effectiveness of (party) government by controlling the process of policy making and policy implementation through the appointment of like-minded individuals to key public positions. This understanding of *patronage*—as a distribution of public jobs—coincides with the Anglo-Saxon use of the term. In the American literature, for example, it is widely used to describe the politics of (city) machines in which bosses handed out patronage jobs to shore up their campaign organizations; it is also employed to describe the wholesale changes in administration following presidential elections, sometimes referred to as the "spoils system."

In contrast to patronage, clientelism should essentially be considered an electoral tool in which benefits are delivered to obtain the recipients' vote. In fully mobilized mass societies, clientelism denotes an exchange between a political party on the one hand and individuals or groups on the other hand, in which divisible benefits are offered directly and on a wide scale to tie supporters to the party. The object of these exchanges can of course be public jobs, but this is unlikely to secure any major electoral advantage to patrons, as argued above. Clientelism most often includes distribution of a wide variety of other benefits, ranging from food and medicines to a pension or a low-interest loan, access to housing, or award of selective development projects in a particular area. Therefore, in contrast to patronage, clientelism, especially in its mass society incarnation, requires other methods of reaching the clients than just a distribution of a handful of state jobs. These methods are often fairly bureaucratized and based on impersonal measures, such as when the incumbents pass a decree favoring a particular category of persons, such as taxi drivers, teachers, or small shopkeepers. Clientelism also implies an asymmetrical nature of the linkage, which takes place between actors of different status and power. Even when both sides accrue benefits and both may perceive the exchange as mutually beneficial, the clientelistic linkage often entails an element of inequality. This is also why, empirically, clientelism is most often found in the context of widespread urban and rural poverty and inequality. In contrast, distribution of patronage jobs to party activists or key party benefactors is likely to involve a far more symmetrical relationship of power, at least in that the recipients will be less dependent on obtaining these jobs, and their social status will often be equal to that of their political patrons.

Pork barrel politics is normally subsumed as a subtype of either clientelism or patronage. Yet it is a distinct practice that denotes tactical allocation of government funds, usually in the form of legislation on public works projects, to favor specific constituencies. Susan Stokes (2007) distinguishes pork barrel from clientelism on the basis of their different distributive criterion. While the distributive criterion of clientelism is "Did you (will you) vote for me?", the implicit criterion in the distribution of pork barrel politics is "Do you live in my district?" In other words, while clientelism entails a benefit for particular individuals or groups, pork barrel implies that a whole constituency is favored by a public policy decision. Although the goal of both clientelism and pork barrel politics is to obtain the recipients' electoral support, they also differ in that the element of exploitation and inequality that characterizes the former is absent in the latter. That is probably the reason why these two practices are viewed differently in normative terms. Politicians who deliver goods and services on a clientelistic basis usually try to keep it as a secret matter between them and the clients. In contrast, politicians who manage to pass pork barrel legislation are often eager to present them as a political asset.

Indeed, both patronage and clientelism are nearly always seen as corrupt or morally questionable practices, even though corruption is empirically and conceptually a distinct phenomenon. Political corruption denotes illegal public decisions taken by parties or individual politicians to obtain financial resources, such as when parties may favor firms by handing over the concession of a public utility or permitting the development of an economic activity without the fulfillment of all legal requirements and demand, in exchange, financial kickbacks to party coffers. Clientelism and patronage can undoubtedly lead into corruption, such as when discretionally appointed party hacks use the state office for personal enrichment through demanding bribes or when politicians try to obtain resources for their clientelistic policies through illegal dealings with economic firms. In that sense, both patronage and clientelism can breed corruption, which might explain why the public discourse in many postcommunist countries refers to clientelism in connection with the penetration of the state by organized crime and by other rent-seeking groups. However, patronage appointments are often legally sanctioned and above board, and hence not corrupt; similarly, many of the clientelistic deals between patrons and their voters and supporters fit, even if uneasily, within the legal remit of policy and administrative decision making. Importantly, clientelistic exchanges are never directly aimed at obtaining monetary goods on the part of the patrons.

To recap, clientelism and patronage, though closely related, can usefully be distinguished on the basis of the goals and objects of the exchange. Clientelism—a particularistic form of political and electoral mobilization—is by definition more penetrating than party patronage, usually reaching larger numbers of people and covering wider ranges of exchanges. However, patronage—discretional allocation of jobs—is the necessary (but not sufficient) condition for the emergence of clientelism, for it is mainly due to their ability to control public jobs that parties and politicians are able to manipulate administrative processes in order to deliver targeted divisible benefits to their clients. In other words, insofar as parties or politicians do not control at least the key jobs in the public administration, they will hardly be in the position to develop large-scale "clientelistic" exchanges. This is why patronage and clientelism will always remain closely related in empirical reality, in spite of the fact that handing out state jobs will lead to tangible electoral returns only in very small democracies or in countries with limited suffrage and partial mobilization.

Clientelism in Contemporary Democracies

Traditional clientelistic practices have usually been seen as a product of early-modern development and to be particularly important in rural and less economically well-developed regions and in political systems in developing countries. For numerous reasons, they were expected to disappear in the process of political and economic modernization and development of mass party organizations that characterized the 20th century. First, the individualized processes of vertical integration and mobilization associated with patron–client ties were undermined by the forms of horizontal mobilization and integration promoted by class politics and cleavage structuring. In other words, as a society developed mass electoral alignments, the scope for individually based networks of supporters became more limited. Second, as the mass party itself took over from premodern and cadre parties, and as appeals based on programs and ideology replaced those based on more personalized political representation, it also became more difficult to sustain patron–client links, and especially to build a distinctive clientele. Third, as polities modernized and professionalized, meritocratic systems of advancement became more acceptable and widespread, and hence objective rules, exams, and qualifications replaced favors, friendships, and networks in the process of career building. Here too, then, the scope for patronage as one facet of clientelism became limited, in this case as a result of a shortage of supply. Fourth, as economies modernized, local markets, especially in poor rural areas, became better integrated into larger regional, national, or even supranational units. The members of these initially isolated communities entered into commercial and social ties with persons in other places, which, in turn, diminished demand for patrons to advance their interests at the center.

Finally, as societies also became richer and more educated, the demand for particularized benefits or favors diminished, while citizens also became more confident of their own ability to deal with the bureaucracy. In this sense, citizens began to handle their own affairs more effectively and hence have less need of a patron to work on their behalf. As a result, the deals between patrons and clients also became increasingly difficult to monitor and enforce. Now it was no longer possible to scrutinize clients' behavior through their natural seclusion in relatively small and homogeneous communities; in addition, the increased mobility and education among the electorates made the enforcement of clientelistic deals nearly impossible.

All of this implies a more or less secular process, whereby clientelism becomes steadily eliminated in favor of collective representation and accountability. The key actors in this process are, of course, the emerging mass parties, which encourage horizontal rather than vertical integration and which promote the provision of universal rather than particularistic benefits. However, this is not to suggest that clientelism did not survive the advent of the mass party. In many countries, for example, Italy, Austria, Ireland, and Japan, mass parties have also been known to adapt these practices as a means of ensuring their own electoral survival. Rather than making a full leap from traditional clientelistic to programmatic politics, as was widely expected in the 1950s and 1960s, the mass parties in these countries instituted a relatively bureaucratized and impersonalized system of clientelism, which combined particularistic politics with the more universalistic appeals. This was no longer the personalistic patronage system based on organic ties between patrons and clients but still a system in which a large proportion of public services and jobs was distributed to selective clienteles in an attempt to build political support and win elections.

What is clear, however, is that clientelistic practices in general have gradually become more difficult to sustain in the era of the mass party and hence proved more exceptional than conventional in modern democracies. Indeed, bureaucratic clientelism became difficult to maintain even in the advanced democracies in which it functioned well into the 1970s and 1980s. This happened mainly for two reasons. First, parties and politicians today face more and more constraints on acquiring clientelistic resources. With the shrinking of the public sector due to privatization and marketization on the one hand, and increasing exposure of domestic economies to pressures of globalized markets on the other hand, it is now more difficult for politicians to obtain resources for greasing the clientelistic system without compromising performance of the economy and inflow of investments. Second, the shrinking of resources is also related to the vigilance of mass media and civil society groups in reporting clientelistic and other abusive state practices, on the one hand, and the increased willingness of judicial authorities to punish them, on the other. These may not be universally effective in all countries, but it is clear that anticorruption programs together with various measures to limit the politicization of the public sector have constrained the range of options that clientelistic parties and politicians can exploit at their discretion. All in all, therefore, whether one looks at the supply or demand side, in contemporary modern polities, the tide seems to operate against clientelism.

Does this mean that clientelism is irrelevant in contemporary societies? If one looks at the upsurge of works on clientelism in the recent decade, such as Piattoni (2001) and Herbert Kitschelt and Steven Wilkinson (2007), the answer must be a resounding no. These new studies suggest that far from being dead, clientelism is likely to be an enduring feature of politics and to encourage inquiries into the conditions that favor or constrain clientelism in contemporary democracies. This is in no small part thanks to the recent waves of democratization in Latin America, South Asia, Eastern Europe, and Africa. In many of these emerging new democracies, clientelistic practices were well-entrenched phenomena prior to democratization and hence were always likely to play a role in the quest for power and votes after the (re)entry of competitive politics. These newly democratized polities are often marked by the emergence of weakly structured parties and party systems that are unlikely to attract voters (only) on the basis of coherent programmatic packages. Recent developments in the patterns and processes of politics in advanced industrial democracies also suggest at least a partial rethinking of the familiar assumption about the relative insignificance of clientelistic practices as a mode of representation. It can, for example, be argued that the declining intensity of ideological differences across parties in many modern democracies may encourage cultivation of clientelistic links at the grassroots level at the same time as it encourages a more personalized style of leadership at the top.

In other words, whether one looks at contemporary new or long-established democracies, it seems that political clientelism has received a fresh impetus and hence might prove to be, somewhat paradoxically, the product of modernization rather than its victim. Few case studies aside, however, there is still a lack of solid cross-national empirical evidence that would probe into these theoretical expectations concerning the resurgence of clientelism and show how important it is as a mode of citizen–politician linkage. The evidence is clearer with respect to patronage, which was distinguished here from clientelism on the basis of the type of resources that are traded and the goals that it serves to politicians. Like clientelism, patronage politics can also prove resilient and adaptable. Indeed, patronage is still likely to prove an effective strategy for dealing with problems of party organization and party building, particularly as the traditional representational links between parties and society become weaker. In other words, as modern parties become more entwined within the institutions of the state, and as they lose their traditional grounding within the wider society, patronage can become a key resource in anchoring the party presence within the political system and in controlling flows of communication. Through the appointment of party personnel to key agencies and institutions, parties can hope to gain an oversight of the likely demands posed to political leaders as well as of the likely policies and programs that are needed to meet these demands. Patronage can therefore compensate for otherwise decaying organizational networks.

Several studies focusing on both new (e.g., Anna Grzymala-Busse, 2007; Conor O'Dwyer, 2006) and established democracies (e.g., Guy Peters & Jon Pierre, 2001) have effectively shown that political use of public jobs is a rampant practice in many of these polities; these studies also ask critical questions about factors that might explain cross-national differences in the pervasiveness of patronage practices. However, it is probably fair to say that political science literature has dealt with the development of patronage networks within the state usually only in passing, under the banner of party government (see, e.g., Jean Blondel & Maurizio Cotta, 1996). Moreover, as Dominic Bearfield (2009) correctly points out, the negative connotation associated with patronage has led academics to understand patronage as corrupt and pathological, and hence something either undesirable or difficult to study empirically. It is for these reasons that many excellent studies dealing with patronage appointments can be found in public administration rather than in political science literature, even though the specific concern of that literature is usually less with the role of parties and politicians in the process of patronage appointments and more with the impact that it has on the performance of bureaucratic organizations. Largely as a result of this disjuncture between public administration and political science analytical objectives, here too we still lack solid cross-national evidence that would allow us to scrutinize the range and depth of patronage practices and lead us to appreciate the precise goals that political patrons seek to achieve in making patronage appointments. This represents a significant gap in the literature on the workings of democracy, political parties, government, and institutions of the state because theoretical reasons for the survival and adaptation of patronage practices in contemporary democracies are perhaps even more compelling than the expectations concerning the relevance of clientelism.

Coalitions

A coalition is the temporary cooperation of different individuals, groups, or political parties to achieve a common purpose, which can be either short term or long term. Almost all politics can be conceived as involving the formation of some kind of coalition. Pressure groups, social movements, and political parties are coalitions of individuals with a common interest; governments can be formed by coalitions of political parties, not only in parliamentary regimes but also in regimes of division of powers; maintaining political stability or resolving political or ethnic conflicts can induce the formation of broad coalitions committed to support a new regime; and different governments and states can form military coalitions unified under a single command. A coalition implies cooperation among its members. A relationship of conflict usually develops between different coalitions whose members have opposite interests.

The most usual analyses of coalitions in politics deal with the formation of multiparty cabinets in parliamentary regimes. In government coalitions, several political parties cooperate, usually during a legislative term between two elections. Coalition governments are the most usual form in most parliamentary regimes using electoral rules of proportional representation, which typically do not produce a single-party majority of seats. This includes most countries in continental Europe, as well as other democratic countries such as India, Israel, and New Zealand. However, other broad coalitions have resulted from political settlements or conflict resolution, such as in South Africa, Zimbabwe, Kenya, or Madagascar, often involving international or external moderators.

An example of government formation in parliamentary regimes is Germany, where all cabinets since the end of World War II have been multiparty coalitions. The chancellor or prime minister has always been either a Christian Democrat or a Social Democrat, but government coalitions include several formulas: rightist Christian Democrats (always with their allies, the Bavarian Social Christians) with center-right Free Democrats, center-left Social Democrats with Free Democrats, Social Democrats with left Greens, and the so-called "grand coalition" of Christian Democrats and Social Democrats. All these governmental formulas have had majority support in terms of both popular votes and parliamentary seats. Due to the long-term participation of a few parties in government and other institutional mechanisms, the degree of stability in major public policies in Germany is very high. In contrast, the alternation of single-party cabinets when different parties receive a majority of seats in successive elections, as in Britain, may provoke periodic shifts in major public policy making.

Within political science, the formation and termination of cabinet coalitions have been analyzed as cooperative games in game theory. Both the search for office and the search for policy or ideological goals can be presumed to be realistic and legitimate motivations of politicians when they try to form a multiparty coalition. At the time of forming government, the interest of members of parliament in enjoying as much power as possible translates into the aspiration to accumulate as many government portfolios or ministries as possible for their party. This becomes a criterion to form a coalition with the minimum viable size. The explanation for this is that if a government is formed of a multiparty coalition without superfluous members, it can give each party a relatively high share of power to exert and enjoy. In a minimum winning coalition, each of its party members is pivotal, in the sense that the loss of a party would render the coalition no longer a winning coalition. In the particular case when a party has an absolute majority of seats in parliament, the minimum winning "coalition" is the majority single-party government without additional partners.

For parties interested in policy, a criterion to select potential partners in a government coalition is the minimization of policy–ideology distance. Specifically, parties may try to form a coalition with "connected" parties, for example, on the left–right dimension, that is, with parties that are contiguous to their positions and then devoid of unnecessary parties. Closeness can facilitate the negotiation of a government program and diminish internal policy conflicts within the coalition. For instance, social-democratic, leftist, and green parties are more likely to form coalitions among themselves than with liberal, Christian Democratic, or conservative parties, which in turn can be prone to unite themselves in some governmental coalition.

A minimal connected winning coalition with more than two parties may include some superfluous partners in terms of size that are located on intermediate ideological positions and are thus necessary to maintain the ideological connection between its members. But also in a minimal connected winning coalition, each party is pivotal because the loss of a party would render the coalition either no longer winning or no longer connected. On a single-dimension policy space such as the left–right axis, the median party will always be included in a connected winning coalition. The median is the position having less than half positions on each side and is, thus, necessary to form a consistent majority along the issue space. Empirical analyses show that government coalitions containing the median party in parliament are more likely to be formed.

When different winning coalitions can be formed in a parliament, the party composition of the government may depend on the bargaining power of each party and the presence, or not, of a dominant party. Several tools can be used to analyze these points. Different political parties may have bargaining power to form a government coalition, which does not mechanically correspond to their numbers of seats. A relatively minor party, which is "pivotal" to form a majority, that is, a party able to contribute with the necessary number of seats to make a coalition winning, may have relatively high power to negotiate cabinet membership or policy decisions. For example, some center, agrarian, ethnic, radical, or democratic parties may be located in a central place able to form coalitions, at different moments, with either the parties on their left or those on their right. In contrast, a relatively large party whose contribution can be easily replaced with that of a smaller party may have relatively low bargaining power in comparison to its size. A party's bargaining power in parliament can be measured, thus, not by its number of seats but by the proportion of potential winning coalitions in which the party is pivotal. There are several "power indices" available to measure a party's bargaining power. They slightly differ in their assumptions regarding actors' criteria, coalition models, and decision rules, but most of them produce similar results.

In certain configurations, the largest party in parliament, even if it does not have a majority of seats, can be dominant if its central position makes it able to block any coalition cabinet and take all portfolios. In other words, a party is dominant if the other parties cannot form a winning coalition without that party. If the nondominant parties are unable to form a majority coalition among themselves due to their ideological distance, then the dominant party can block any coalition and form a minority cabinet. Minority cabinets of a dominant party are viable and likely to be formed the greater the policy–ideology divisions and the smaller the size of the parties in the opposition. For example, the Indian National Congress party in India, the Christian Democratic Party in Italy, the Liberal Democratic Party in Japan, and the Social Democratic parties in Denmark, Sweden, and Norway were dominant single parties for long periods.

Additional analyses deal not only with which parties are more likely to enter a coalition cabinet but also with the allocation of ministries to the parties within the cabinet. The distribution of cabinet portfolios among coalition parties tends to be proportional to the number of seats controlled by each party—that is, with its contribution to making a coalition winning. However, different parties have preferences for different portfolios depending on the policy issues they emphasize the most, which may produce varied allocations. The prime minister's party usually controls most of the portfolios in charge of major policy domains, especially economy, defense, and home affairs. Other cabinet portfolios can be allocated to parties with a strong profile on certain issues on which they tend to campaign and attract citizens' votes, such as social policy for Laborites or Social Democrats, education for Christian Democrats, finance for Liberals, agriculture for Agrarians, and so on.

Different coalition formulas are associated with different durations of cabinets. Regular parliamentary elections are usually scheduled at intervals of 3, 4, or 5 years, depending on the country. But a significant number of parliamentary cabinets do not last as long as they legally could because there are anticipated dissolutions of parliament, elections (which can usually be called by the prime minister), resignations by prime ministers, and successful motions of censure and defeated motions of confidence. Regarding the party composition of cabinets, single-party majority cabinets tend to last longer than multiparty coalition or minority cabinets. In single-party governments, conspiracies among party members to replace the incumbent prime minister are relatively likely, especially if party members expect to have better electoral prospects with a new candidate. In contrast, in multiparty coalition governments, internal party cohesion tends to increase, but coalition partners are more willing to work against the incumbent formula. For coalition cabinets, the higher the number of parties and the broader the ideological distance between them, the more vulnerable to splits and departures and less durable they should be expected to be. This kind of crisis is relatively frequent in parliamentary regimes. In 15 countries of Western Europe since World War II, about one sixth of parliamentary governments have not concluded their term due to a change of prime minister, a change in the party composition of the government coalition, or the dissolution of parliament and the call of an early election.

Multiparty coalition cabinets in parliamentary regimes tend to induce a relatively balanced interinstitutional relationship between the prime minister and the parliament. As political parties need to bargain and reach agreements in order to make policy decisions and pass bills, they learn to share power and develop negotiation skills. Cabinet members from different parties need to cooperate as well. The prime minister cannot prevail over the cabinet or the assembly as much as when leading a single-party government because, even if he or she is a member of one of the parties involved, he or she has to negotiate with the other parties and maintain the coalition united. In a parliamentary regime, the institutional role of the parliament thrives when no party has an absolute majority of seats.

Cohort Analysis

A typical question posed by researchers of political socialization is whether people socialized under distinct political and social conditions manifest different attitudinal and behavioral patterns and the extent to which such differences persist during their life span. Addressing this question at the individual level is difficult because it requires tracing different age-groups during their life trajectories. Since long-term panel data are still scarce in political science, a common approach is to focus on aggregate patterns of change. The accumulation of cross-sectional data during recent decades has enabled the use of pseudopanels, created by pooling repeated cross-sections over a long period of time. Accordingly, units are aggregated after being classified according to their age and the period in which the phenomenon of interest is measured. For example, if the aim is to examine the sources of variation in turnout levels over the past 50 years, 25-year-olds interviewed in the 1970s can be simultaneously compared with 50-year-olds interviewed in the same year interval and with 25-year-olds interviewed in the 1990s. In so doing, the aim of this type of analysis, known as cohort analysis, is to explore whether variation in an attribute of interest is mainly accounted for by particular political periods, age-groups, or subcategories defined by an interaction of the two. The aim of this entry is to describe this analytical strategy and to shed some light on some of its limitations.

Period Effects

As a way to motivate the discussion, let us imagine a population of interest, voting for one of the two parties, A and B, which compete in elections that are held every 4 years. Assuming that the only source of change in the composition of the population is that of succession, that birth and death rates are approximately equal, and that the structure of the party system remains stable, the question is how can political change occur in this context? It turns out that change regarding a social attribute of interest under these circumstances is essentially produced through two different mechanisms, both of which can be traced in Table 1, which distinguishes only between two subgroups of interest, namely, young and old voters (the reason for using age as a forcing variable will be clear in the next paragraph). The first mechanism involves a coming event or a sequence of events that might induce people to change their minds. This is referred to as a period effect. For instance, people might vote predominantly for Party A during Time 1. An event takes place, and they shift to Party B. If this shift occurs at approximately equal rates between different age-groups, one should observe a difference between the two columns of Table 1, whereas no difference should be found between the two rows of each column. This is shown in the upper panel of Table 1.

Cohort Effects

Political events, however, are unlikely to affect all people in the same way. Most of the time researchers

Table 1 An Illustrative Example of Period, Cohort, and Life Cycle Effects

	Time 1	*Time 2*
Period effects		
Young	A	B
Old	A	B
Cohort effects		
Young	A	B
Old	A	A
Life cycle effects		
Young	B	B
Old	A	A

observe (or assume) particular cohorts, that is, groups of individuals who pass some crucial stage of their lives at approximately the same time, to be considerably more affected by political events than other cohorts. Although different cohorts of interest have been examined, the most common approach is to distinguish between new cohorts and older ones with the first deemed more susceptible to political stimuli. That this assumption is implicitly made in most cohort analyses is evident from the definitions given to different cohorts so as to distinguish one from the other. In most cases, each cohort is characterized by the salient historical and/or political features that marked its early adulthood (the "war generation," the "1968 generation," etc.). If such shaping socialization processes dominate over inertial forces of intergenerational transmission of political attitudes, young adults can differ in terms of their value orientations or any other attitudinal aspect of interest from one generation to another. This second mechanism of change, known as a cohort effect, is presented in the second panel of Table 1. Whereas the older age-group remains stable over time, young cohorts shift from Party A to Party B. According to this scenario, change is driven only through the entrance of new generations.

Life Cycle Effects

Political change can hardly ever be attributed to either of the two sources independently. In most cases, the two mechanisms interplay and the evaluation of their independent contribution in aggregate change is far from a straightforward enterprise. This effort is further blurred by the role of life cycle. The latter can incorporate physiological, social, and psychological intracohort changes taking place during chronological aging. Physiological changes may have important attitudinal implications (e.g., participation in politics becomes more costly for the elderly) but they tend to vary only slightly among different political contexts, and thus, they do not constitute the primary source of interest in most political science applications. Social change due to aging involves contextual influences stemming from peer groups and social roles (getting married, finding a job, settling down, etc.) that most people assume during his or her life span. These influences might, for example, lead young people to opt for a more liberal party than their older counterparts. Such evidence would be the outcome of an age gap, largely persistent through time. This is seen in the final panel of Table 1, which indicates an age difference in party choice that holds at both points in time. This pattern cannot account for change over time unless the population distribution changes in a consistent fashion. For instance, if older people opt for more conservative parties than younger people, a gradual increase of their relative portion in the composition of the population might reveal an aggregate difference over time without people actually changing their attitudinal profiles. Such a pattern would be due to aging effects.

Psychological change can manifest itself in various ways. For instance, disengagement theory asserts that some otherwise distinct life stages might for different reasons discourage people from participating in political affairs. More important, aging might serve as a proxy for the process of reinforcement and crystallization of people's prior orientations. This is probably the most salient effect of the life cycle, especially in applications of voting research, and has been already implicitly alluded to in the previous section. People form their political predispositions in a developmental manner, and thus, change in attitudinal respects is increasingly less likely to occur as people accumulate experience with the political world. The example provided below shows how this process might confound the observed pattern of aggregate change.

An Example

Let us now assume that in our imaginary population we observe a trend shown in Figure 1, that is, the percentage of the population affiliated to a party during the past 30 years decreases in a rather progressive fashion. What could we infer about the sources of change? On the one hand, people's attachments with the parties might have declined as a consequence of disappointing government performance. On the other hand, the coming of new cohorts that are on average less attached to the parties might also account for this pattern. Looking only at Figure 1, it is impossible to say which of the two explanations is at work. Consequently, a typical first step in such types of analysis is to disaggregate this general trend into different cohorts. Figures 2 and 3 do that, each one giving pride of place to one of the two mechanisms described previously.

As can be seen, the two figures tell a completely different story. In Figure 2, pure period effects are observed. Each new cohort enters the electorate from the exact point that the previous cohort stopped and they continue together thereafter. No intercohort difference is observed and hence the cohort-specific curves merge in a single curve, making the graph look identical to Figure 1. In other words, distinguishing between age-groups is redundant because all of them react identically to the political influences they experience. Figure 3,

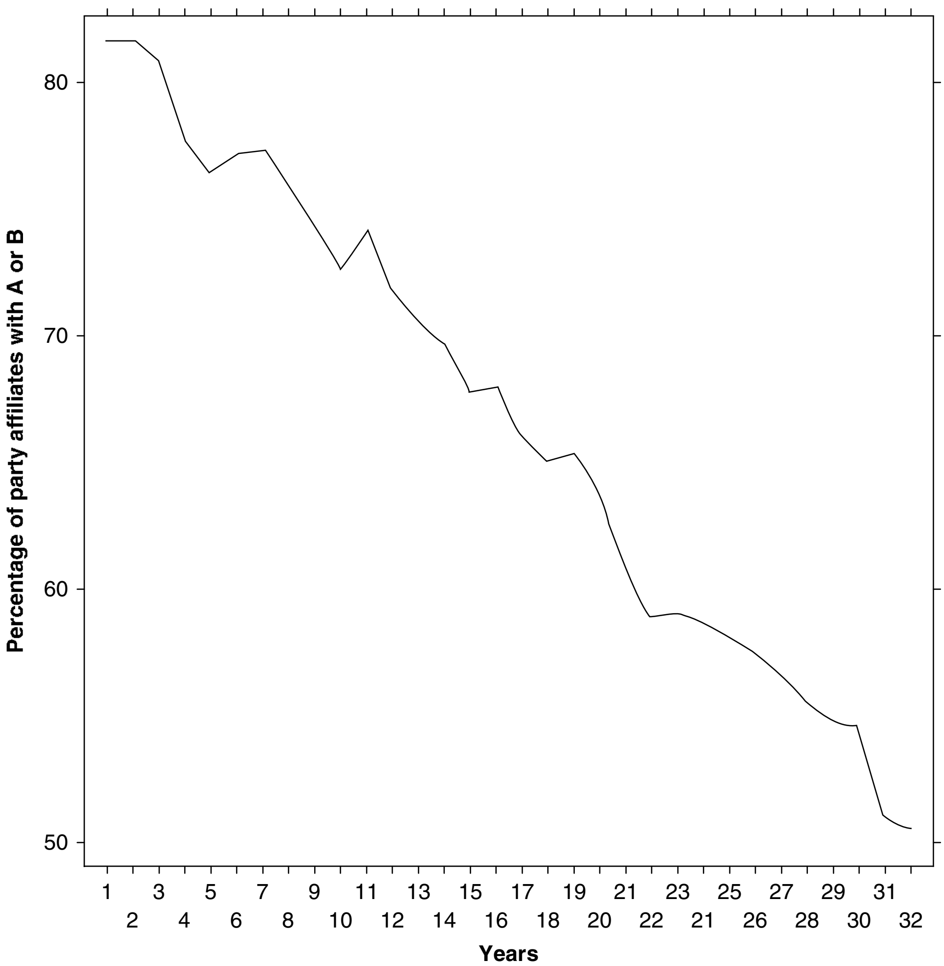

Figure 1 Percentage of People Registering Partisanship With Either Party A or Party B in a 30-Year Time Interval

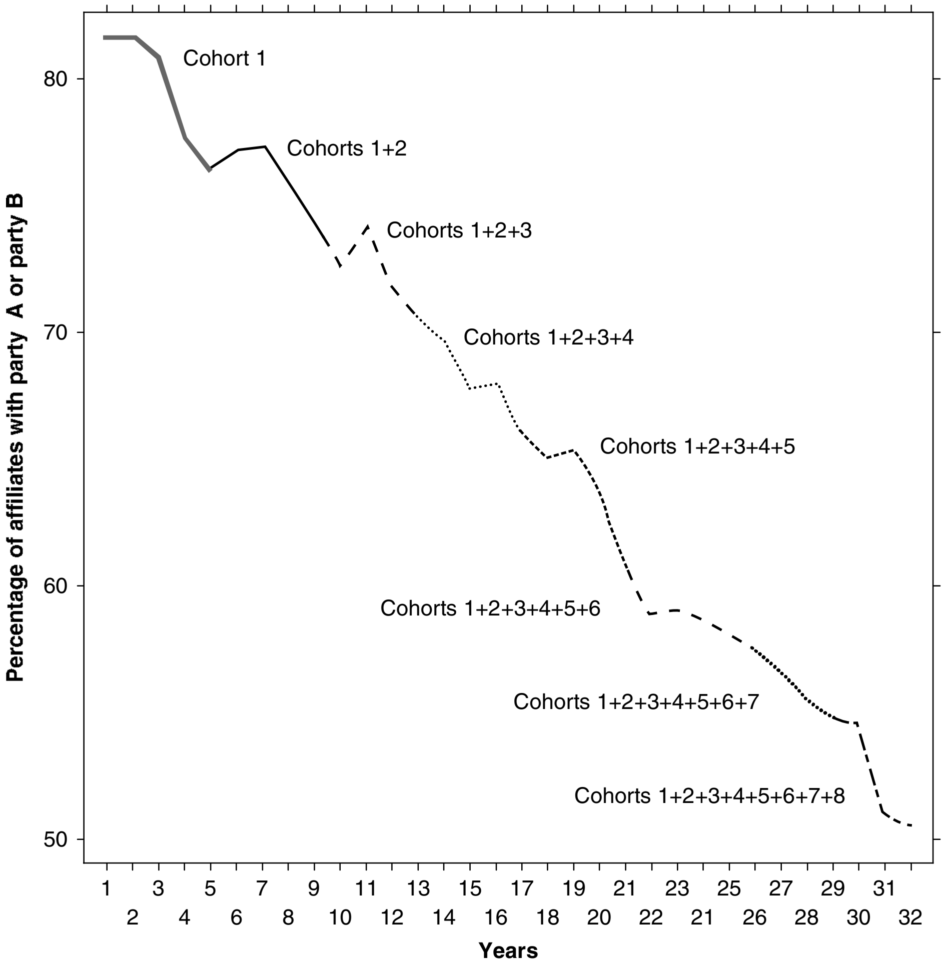

Figure 2 Period Effects

in contrast, shows that all cohorts remain relatively stable through time but each coming cohort is constantly less affiliated to either of the two parties. Consequently, the overall trend is simply the outcome of intercohort variation, although each cohort designates remarkable stability in its political orientations during the observed time interval. Political change, in this case, is simply due to the lower starting level of each coming cohort. If that was what produced the average decline, change would need to be allocated to pure cohort effects.

Needless to say, the artificial lines drawn here only serve as idealized benchmarks useful to evaluate the role of each of the two mechanisms against real data. That said, social reality is much more complicated since both mechanisms, albeit at different rates, are typically at work. To make matters worse, any analysis of such effects needs to account for the role of aging, which can confound either cohort or period effects. In the first case, if aging implies a societal type of change, not taking it into account might give room to spurious cohort effects. Addressing this possibility requires gathering data over a long period of time. This is the only way to examine whether differences between young people and older cohorts persist over time. For instance, to see whether the fact that 20-year-olds in the 1970s vote at lower levels than 40-year-olds is due to aging or cohort effects, one needs to

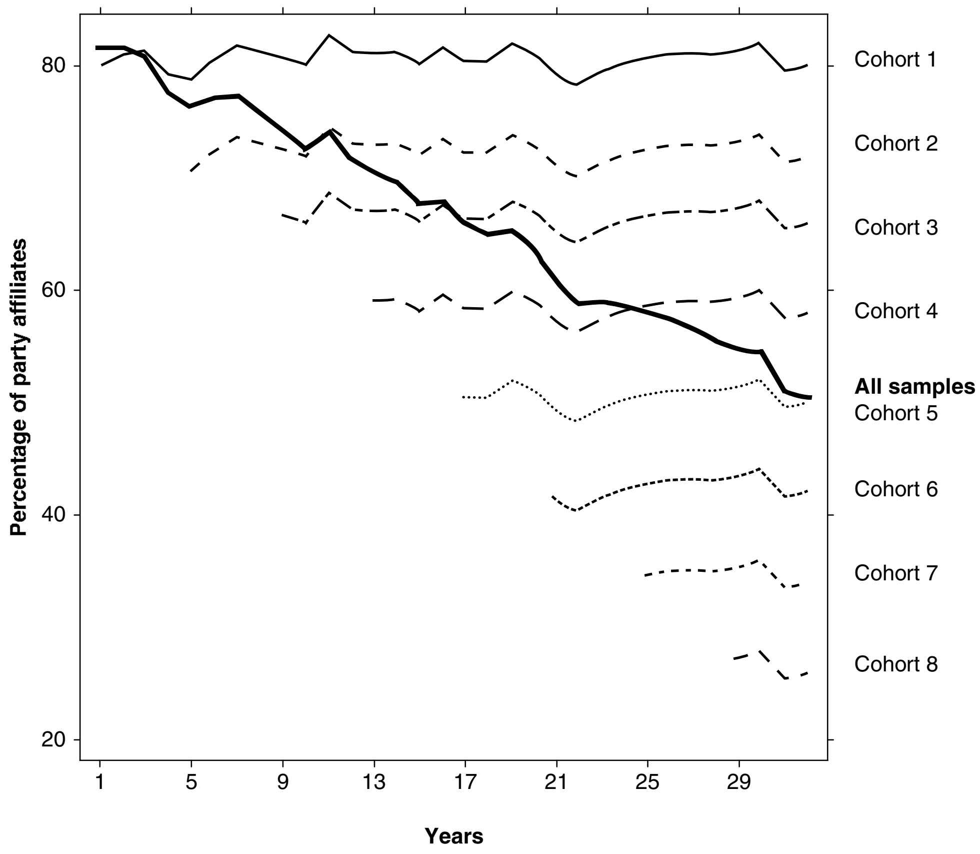

Figure 3 Cohort Effects

Note: There is always some noise (error) in the curves, indicating that even in the most ideal case, some fluctuation would still exist due to sampling variability.

trace both groups for at least 20 years. If both groups continue voting at the same levels as 20 years ago, we would observe evidence in favor of cohort effects. If the first group approaches the turnout levels of the older group, this would constitute evidence for life cycle effects. The problem, of course, is that on many occasions these mechanisms might coexist, making their independent contribution in the overall pattern of change difficult to assess.

Aging can also be a confounder or a mediator of period effects. This is mainly through the immunization hypothesis. To explore whether aging implies an increased resilience to political change stimuli, we need to compare the trajectories of different cohorts over time. This is done in Figures 4 and 5. In the first case, no particular period shock is assumed. The first group, representing people with an already long record in political affairs, seems to remain stable over time. Newly coming cohorts, however, begin from a low starting level but progressively strengthen their feeling of belonging to a particular party as they accumulate electoral experience. Failing to account for this intercohort difference might falsely result in attributing the change to period effects. To be sure, there are ceiling effects in this process that make further differences due to age evaporate. This pattern can be grasped by the comparison of Cohorts 6 and 7 of Figure 4, where initial age-related differences diminish as both cohorts increase their level of attitudinal stability. The only difference between the two cohorts is that the more recent one began its trajectory with a lag. However, their

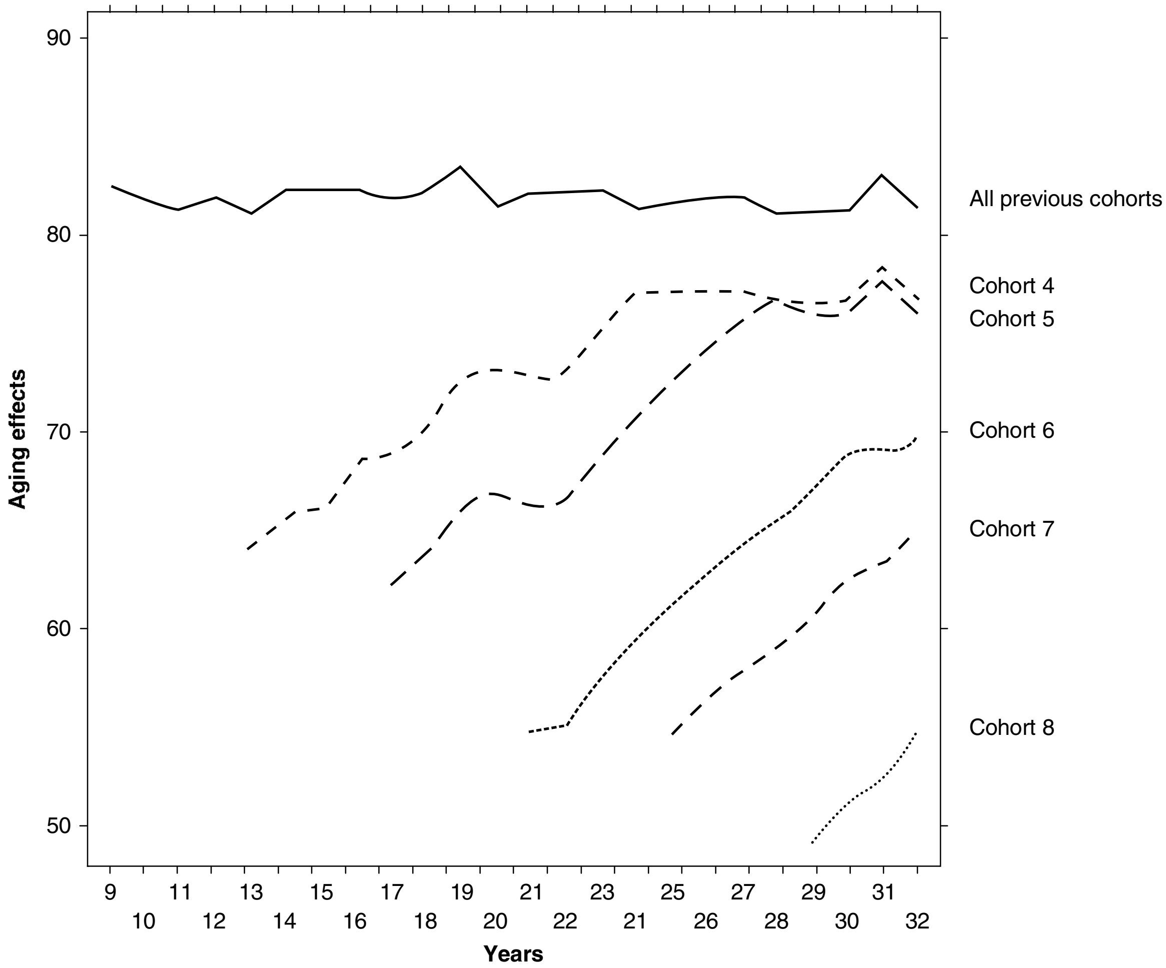

Figure 4 Aging Effects I

route is otherwise indistinguishable. In the presence of ceiling effects, this means that they eventually converge once this process of partisan learning is complete.

Figure 5 shows how aging can work as a mediator of period effects by approximating the idea that period shocks are more consequential among younger cohorts. A temporal shock causing a decline in the level of partisan affiliation in Year 28 is more decisive for people with lower levels of prior electoral experience. As can be seen from the downward spike, the magnitude of this effect diminishes in a monotonic fashion as we move from younger to older cohorts. The reason for that, once again, is that the latter experience this shock having already established firmer political beliefs.

The Age–Cohort–Period Framework and Its Deficiencies

A systematic attempt to simultaneously address all three potentially confounding factors is next to impossible. Until recently, the industry standard in this subfield was to disentangle the sources of political change through the so-called Age–Cohort–Period (ACP) framework. Four important limitations characterize this procedure. The first problem is the well-known identification problem. Since each of the three terms is a linear function of the

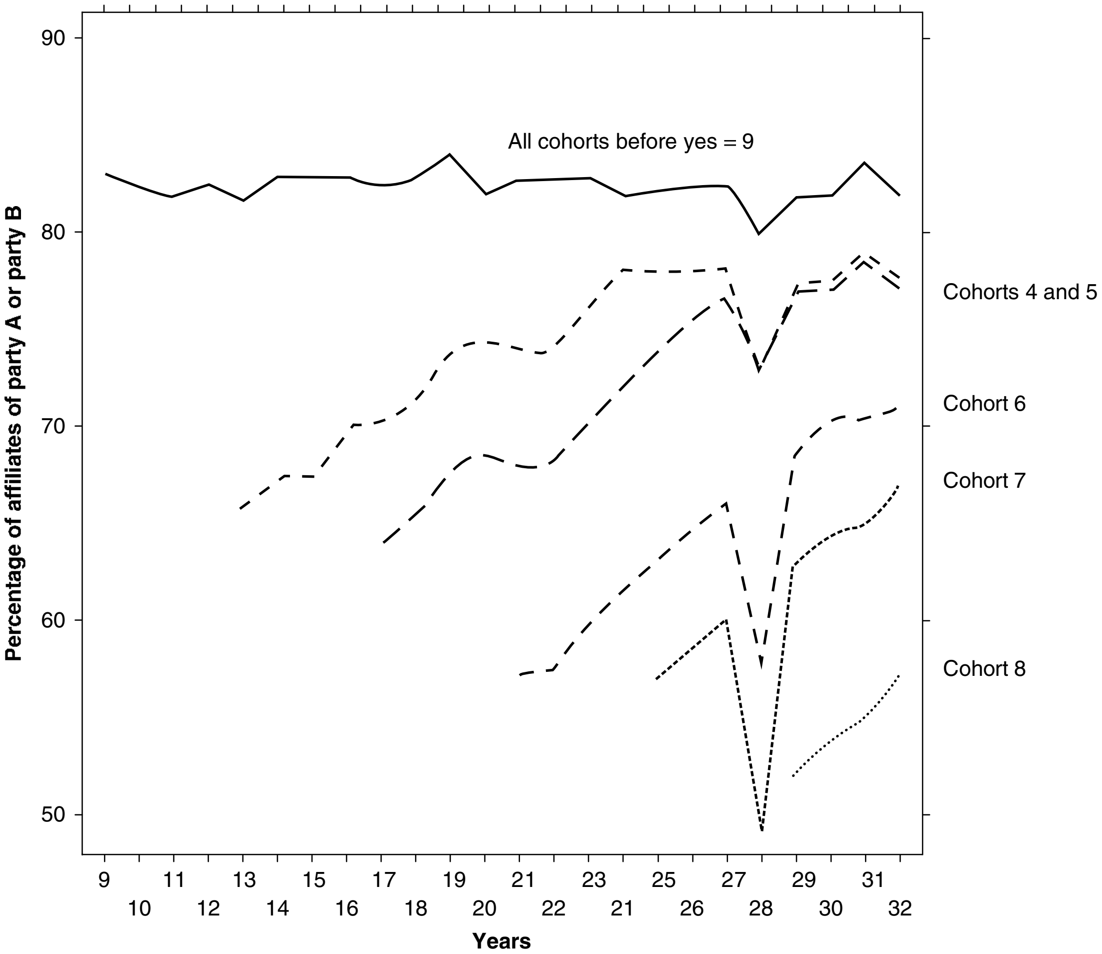

Figure 5 Aging Effects II

Note: To retain simplicity, each group is allowed to return to previous levels immediately after the shock, hence it is assumed that there is no difference in the long-term effects of this shock on different cohorts.

other, unless one of them is assumed to have a nonlinear impact on change, their effect, let alone interactions, cannot be independently estimated from the data. To see why this is so, consider the following equation, where A, P, and C stand for age, period, and cohort, respectively: $A = P - C$; equivalently, $C = P - A$ or, alternatively, $P = A + C$. In other words, any of the three variables is a linear function of the others: Age can be directly deduced by knowing the year of the survey and the cohort in which the person belongs. Examining, for instance, respondents belonging in the 35-year-old cohort in 1987 is equivalent to examining those born in 1952. Evidently, we cannot isolate the impact of belonging in this cohort from the effect attributed to the role of age.

The usual way out is to constrain the impact of one of the three factors either to zero or to a nonlinear function. If, for instance, age is thought to be related to political participation in a curvilinear fashion, or cohort effects can be measured in a categorical way, a simple ordinary least squares (OLS) regression can capture adequately the independent effects of each confounding factor. To be sure, this leverage comes only at the cost of a more parsimonious specification, which assumes that period or cohort effects operate in the same way across cohorts with different years of birth. More recently, the use of Bayesian methods, generalized additive models, nonlinear regression models, discriminant analysis, or dynamic modeling of the effect of period shocks on different cohorts has helped examine the three factors independently, making only minimal assumptions about the way they affect the phenomenon of interest.

The second problem is that even when a typical regression model manages to produce point estimates for the effects of each of the three mechanisms, the standard errors will typically be unreliable. The reason for this is that the unit of analysis is usually an aggregate measure (percentage, mean values, etc.) of a group of individual responses taken from a sample of a targeted population. Thus, even in a case of a full-probability random sample, each cell represents an estimate, and thus, the uncertainty associated with this estimate needs to be also taken into account. The third problem is that tracing a cohort over a long period of time is also subject to nonrandom sampling error. As a given cohort becomes older, the number of observations representing it falls drastically. Importantly, the probability of survival may well be nonignorable to the trait of interest.

This last, less cited but probably more serious, problem of the ACP framework relates to its exploratory rather than explanatory character. Any ACP analysis is primarily useful as an effort to partition change into each of its components. However, since the year of birth and/or the year of survey cannot be logically treated as autonomous influences on any observed phenomenon of interest, unless some further examination of the causal processes that lead to this observation is made, any ACP account is only useful as suggestive evidence for what might be considered as the potential explanations for the underlying phenomenon. A more elaborate analysis, however, would need to model these processes and unpack the structural factors lurking behind each of the three terms. In statistical parlance, no analysis of this kind can account for the underlying process generating the data.

This last remark should not be interpreted as an argument against the use of cohort analysis altogether. That would mean throwing out the baby with the bathwater. In effect, cohort analysis, which started in the 1970s as a powerful tool that social scientists adopted from demographers to study patterns of social change, remains a creative strategy to disentangle interrelated sources of aggregate change. Although the difficulty of the ACP framework to separate these mechanisms creates limitations in the statistical analysis, it is also useful in showing researchers that social reality is often more complex than assumed by models, which fail to take into account all these competing mechanisms. Cohort analysis can be very useful either as a first explorative step accompanied by individual-level panel analysis or as a way to examine well-developed theories that mainly focus on one of the three mechanisms of change. Any such analysis needs to provide rigid theoretical argumentation and empirical evidence that would help unpack any of the three terms into substantive factors that operate through this process. In sum, cohort analysis can provide suggestive evidence about the dominant source of aggregate change when such exists or, as a minimum, make it clear that in various instances disentangling these effects is asking too much from the existing information that we have at hand.

COLLABORATION

Collaboration is a process in which the state engages with business and civil society to shape policy agendas, and to design and implement policy programs. Sometimes this is interpreted as meaning that the public policy process reflects the principles of deliberative democracy, in which actors engage in a rational debate with the intention of seeking a consensus solution. Other literatures place more emphasis on collaboration arising from resource interdependencies and complex problems that require a multisectoral response. A more critical understanding of collaboration is as one of the mechanisms through which the state subjugates populations via new mechanisms of self-governance.

Despite definitional differences, there is general agreement that collaboration is different from cooperation and coordination. All, however, are points on a continuum from organizational independence to organizational integration. Cooperation involves sharing information or expertise in a context where organizations remain autonomous from each other, for example, in client referrals in social welfare networks. Coordination involves a process of independent organizations introducing a degree of integration by undertaking mutual adjustment to produce a better overall outcome. This takes place when organizations agree to redesign their procedures so that, for example, clients can use a single point of contact to access services from a variety of agencies. Collaboration is the next step in the continuum. It involves organizations recognizing that they are interdependent and creating a greater degree of integration of procedures, policies, and structures. Such collaboration might involve the creation of an overarching board to make strategic decisions that are binding on the constituent organizations.

Collaboration is often regarded as an activity that takes place at the subnational level, and there is a large literature on partnership and other forms of collaboration at city or neighborhood level, for example, in urban regeneration and sustainability. However, it would be incorrect to privilege these spatial scales. In an era of multilevel and global governance, it is important that the discussion of collaboration also take into account interactions at national and transnational level, as well as interactions between these and other levels of governance. This is because collaborative mechanisms engaging government with civil society and business have become the preferred delivery mechanisms for many aspects of European and national policy, including those related to economic restructuring, social inclusion, environmental sustainability, and the knowledge society. These policy initiatives stimulate activity at the subnational level and in some cases (as in a number of European Commission initiatives) become the instrument through which specific policy intentions are expected to be realized. In the field of international relations, the creation by states of instruments of global governance can be regarded as the outcome of a process that is intended to lead to greater collaboration, for example, through the regulation of standards or economic, environmental, or social policies. Collaboration, therefore, involves both horizontal and vertical forms of interorganizational engagement.

How Does Collaboration Relate to Other Concepts?

The concept of collaboration is closely related to other concepts in common usage. The first term to consider is *governance*. In political science and public policy, this typically refers to a changing form of state rule through which government attempts to engage other actors in its political projects through cultural rather than coercive mechanisms. However, the extent to which actors from business and civil society are able or willing to engage in collaborative activity with government will be influenced by the nature of the state and its historical relationships. So the experience of the United States with its tradition of "small government" and extensive private provision of public services will be very different from that of Western Europe, where the state has played a much more prominent role in service provision. The emergence of multilevel governance is especially a recent consequence of European integration, although decentralization and different levels of government are a part of traditions inside and outside Europe.

Second, collaboration is broadly synonymous with the concept of "partnership." This concept is used in some English-speaking countries (e.g., the United Kingdom [UK], Australia, New Zealand) to refer to the quasi-formal organizational arrangements that provide an envelope for interaction between state, civil society, and business on particular policy questions. In these countries, "public–private partnership" typically refers to contractual agreements between government and business related to the provision of infrastructure or services, whereas in Europe and the United States, it tends to encapsulate both this specific meaning and the wider Anglo idea of partnership. For U.S. scholars, "collaborative public management" has a meaning synonymous with the idea of "partnership" in the UK.

The third concept with which collaboration connects is that of "networks," which develops the older idea of policy networks. Here, the emphasis is on an institutionalized pattern of relationships between autonomous actors in a particular policy realm. Negotiated agreements between actors could be understood as collaboration to the extent that the actors agree to forgo some of their autonomy in order to realize collective benefits.

Why Is Collaboration Important Today?

The contemporary importance of this idea arises from the changing role of the state in the late 20th and early 21st century. The argument is that the state lacks the necessary capacity and resources to deliver public policy goals in advanced capitalist economies and chooses to fill this gap by involving others sectors more into functions that would—under traditional public administration—have been reserved to the state and its functionaries. Collaboration is therefore part of the new public management movement, which includes the view that public services could be delivered more efficiently and effectively by external providers—including the widespread fascination with the involvement of the private sector.

A related explanation is that neoliberal ideology, especially in social welfare and former socialist states, has resulted in a fragmentation of government due to privatization, contracting out, the creation and hiving off of separate agencies from large public bureaucracies, and other new public management initiatives. Collaboration arises from the need to retain a capacity to integrate across this distributed organizational landscape so that policy intentions can be realized and steering is possible. Such integration occurs at a number of levels. At the discursive level, there are powerful ideas—for example, about "partnership"—which mobilize actors around collaborative projects despite the differences between them. At the institutional level, collaboration involves a process of rule creation where there is greater flexibility for actors than in representative government. And at the behavioral level, boundary spanners and network managers are valued because of their capacity to build coalitions between organizations and groupings in an ambiguous and changing environment.

What Are the Democratic Implications of Collaboration?

From a progressive perspective, collaboration offers a way of developing participative forms of governance that bypass, or at least complement, representative democracy. It facilitates the engagement of a wider range of actors in the policy process and potentially enables them to contribute throughout the process rather than just being consulted at the start and excluded from the black box of decision making. So collaboration can be treated as synonymous with deliberative and participative democracy, and the opening up of the state to other interests (and especially those of citizens and civil society actors). This progressive perspective is reflected in the normative tone that can be found in the literature.

A more critical reading positions collaboration in the light of Foucauldian governmentality, where close engagement with the state introduces a regime of discipline on participants. In this process, they become part of the mechanisms of governance in a complex society, taking on themselves the concerns of the state and self-regulating their actions in this way. Thus, citizens involved with the state in regenerating disadvantaged communities take on the mantle of the state's discourse of disadvantage and the performance management systems that go along with delivering public policy. This constrains their capacity to think and act outside this discourse in ways that might serve their interests better but go against the state. On this basis, citizens might adopt a political strategy of exit rather than remain trapped by the false reality of collaboration.

This discussion reminds us that collaboration—for all its progressive overtones—is about political action. The prevailing discourse of collaboration conceals the darker side in which decisions are removed from the arena of representative government with its public interest safeguards and located instead in less transparent institutional contexts whose rules in use are evolving and more malleable. If we agree that the relations of power between state, business, and civil society are structured to give advantage to the former two actors, and thus biased against civil society, then collaboration is likely to do little to redress these more fundamental imbalances. The challenge for academics analyzing these new arrangements is to investigate beneath the epiphenomenon of political discourse and understand the nature and impact of collaboration on the relations between actors in historically embedded contexts.

Collective Security

A collective security system is one in which each state in the system accepts that the security of one is the concern of all and agrees to join in a collective response to threats to, and breaches of, the peace. A weaker version posits a system that commits governments to develop and enforce broadly accepted international rules in the area of international peace and security and to do so through collective action legitimized by international institutions.

The idea of collective security goes back at least to the European peace plans of the 18th century and gained ground in the post–World War I period as international society sought to restrict the previously wide-ranging right of states to resort to war as an instrument of state policy, first in the League of Nations and then in the United Nations (UN). The UN did not constitute a pure collective security system (e.g., in relation to the veto given to permanent members of the Security Council); but it contained powerful elements of collective security, above all in terms of the clear prohibition of aggressive force in Article 2(4) of the UN Charter, and in the far-reaching responsibility of the Security Council for the maintenance of international peace and security, including the authorization of mandatory sanctions and military action. The end of the Cold War appeared to many to open new opportunities for collective security, with an increasing number of enforcement resolutions adopted under Chapter VII and a very significant expansion in the number and coercive character of UN peacekeeping operation and of UN-established international administrations.

The Nature of Collective Security

Collective security raises five sets of questions about its nature, with respect to the participants in collective security arrangements, the kind of security provided, and the forms of collective action to be taken.

Security for Whom?

The traditional conception of collective security was intended to strengthen the rights of states to independence and to reinforce an international legal order built around the concepts of sovereignty and nonintervention. On the Wilsonian view, one of its chief attractions was that, in contrast to the balance of power, it guaranteed the independence of all states, including small and weak states. Yet the stress on reinforcing the rights of states and on maintaining the sanctity of established borders against forcible change has given rise to one of the most enduring dilemmas: how to accommodate change and how to prevent a collective security organization from becoming an instrument for maintaining the status quo. The liberal assumption of a shared interest in the peaceful maintenance of the status quo has been repeatedly challenged.

What Kind of Security?

Second, what kind of security is embodied in the phrase *collective security*? As it developed in the late 19th and early 20th centuries, collective security was conceived as a response to the dangers of formal interstate violence and, in particular, to the problem of the aggressive use of force by states. Faced with the united opposition of the international community, states would come to accept that aggression simply could not pay. Although not as novel as sometimes claimed, the post–Cold War period has seen an enormous literature on the changing character of security and the changing dynamics of the global security landscape: the easing of major power rivalry and the emergence of a wide range of new security challenges connected with civil wars, domestic social conflicts, ethnic strife, refugee crises, humanitarian disasters, and transnational terrorist threats. In addition, many have argued that much greater priority should be given to human security, rather than the security of states or of regimes. Such moves illustrate the politically contested character of the concept of security, emphasized, in particular, by critical security theory. Collective security is sometimes understood analytically as a problem of capturing a well-understood and broadly shared interest (perhaps by viewing security as a global public good) in the face of the twin problems of defection and free riding. Clearly, these problems are formidable in a world in which states and government leaders are faced with powerful incentives to protect their immediate short-term interests. But such rationalist logic underplays the challenge of the essentially contested nature of security. Very different historical circumstances and divergent values mean that there is rarely an easy answer to the question of whose security is to be upheld or against which threats that security is to be promoted. Together with the deeper intervention required to deal with many new security challenges, this in turn increases the problems of legitimacy as well as the difficulties of securing the willingness of states to commit armed forces to conflicts that are often seen as marginal to core foreign policy interests.

Which Collectivity?

Third, which collectivity is involved in "collective security"? There have always been strong arguments for the broadest possible membership of a collective security system: to ensure that the power of the collectivity is sufficient to deter aggression and, if necessary, to enforce its decisions against all states, and to reduce the danger that collective security will merely provide a framework within which power political competition and alliance politics are played out under a different guise. On the other hand, there have also been repeated arguments that an effective collective security system requires leadership and that an effective collectivity will consist of a smaller group of like-minded states with the effective (as opposed to theoretical) power to enforce their decisions. Hence, there have been recurrent arguments that regionally based collective security systems are most likely to prove effective, and the post–Cold War period has seen an expansion of the role of regional security organizations.

What Form of Collectivity?

Fourth, what form of collectivity? It is important to disentangle two approaches to thinking about collective security systems. In one view, the dominant one in the recent past, collective security has been seen as a means of enforcing order between independent political communities, of achieving a degree of centralization that does not radically threaten the independence and autonomy of states. An alternative, and historically deep-rooted, conception has viewed moves toward the collective management of armed force as part of a broader process of reorganizing the political system and moving beyond the state system toward more centralized or federal forms of global political order.

The other issue here concerns the dilemma of preponderant power. In theory, collective security offers the purest solution to the dilemma of preponderant power. Inequality is not to be feared, opposed, or balanced against but is, instead, to be harnessed to the legitimate collective purposes of the international community. In practice, the situation is more complex. On the one hand, the veto within the UN Security Council reflects the reality of a power distribution in which attempts to coerce any of the major powers of the system could be achieved only at great risk and high cost. On the other hand, unable to command substantial military forces of its own in the ways envisaged in the Charter, UN enforcement action has operated by means of authorizing the use of force by member states, especially those with the capacity to deploy effective military power. Such a situation is always likely to create problems of effective delegation and control and to increase the risk that a system aimed at collective security will in fact become one of selective security.

What Forms of Collective Action?

Finally, what forms of collective action are envisaged in a collective security system? Collective security involves a shared acceptance that a breach of the peace threatens the interests of all states. It also involves a shared willingness to act effectively to enforce the law and to protect the interests of the international community. Enforcement has very often been seen as critical, but not always. Much of 19th-century liberal thought, for example, believed fervently that the clear elaboration of international law would be crucial. Others believed in the power of enlightened international opinion. The arguments for effective enforcement grow through the century and are, of course, given particular force by the catastrophe of World War I. At the same time, however, these older liberal views never entirely faded, and there remained the hope that the paradox of fighting a war to ensure peace could be avoided.

It should also be noted that the emphasis on deterrence and enforcement places collective security analytically close to mainstream realist writing on alliances and the balance of power. This can be contrasted with constructivist writing on cooperative security and on security communities. It is the possible emergence of a situation in which cooperation goes beyond instrumental calculation and in which the use of force declines as a tool of statecraft that opens the door to constructivist theories. Such theories highlight the importance of historically constructed interests and identities, of learning and ideational forces, and of normative and institutional structures within which state interests are constructed and redefined. Instead of focusing solely on material incentives, constructivists claim that understanding intersubjective structures allows us to trace the ways in which interests and identities change over time and new forms of security cooperation and community can emerge.

Liberals argue that, although there is no collective security *system*, the collective *element* in security management has increased and even major states need multilateral security institutions both to share the material and political burdens of security management and to gain the authority and legitimacy that the possession of crude power alone can never secure. Realists continue to stress that peace is not indivisible, that states and their citizens are often unwilling to bear the costs of collective action in conflicts in which their direct interests are only weakly engaged, and that large parts of the global security system continue to be shaped by the unilateral pursuit of state interest and by practices of both the balance of power and hierarchical power.

COLONIALISM

Colonialism is usually understood as a political doctrine promoting and justifying the exploitation by a colonizing power of a territory under its control either for its own benefit or for the benefit of the colons settled in this territory. In this sense, colonialism refers mainly to the unequal relationships developed between European colonizers and their respective colonial empires. This conventional definition has been considered too restrictive by some scholars who, in the past 20 years, have stretched the notion. Colonialism has come to include many different kinds of unequal power relationships between two countries (e.g., between Israel and Palestine) and between the West and the world (the concept of colonialism replacing to some extent that of imperialism). Colonialism can also refer to unequal relationships between a dominant majority group and a minority group that is an indigenous group or considered to be not autochthonous (internal colonialism). Colonialism has also been used in association with larger modern political and economic processes such as the economic world system since the 16th century or, more generally, with a vision of European "modernity." The polysemy of colonialism is largely due to the renewed interest, since the 1980s, in the colonial and postcolonial periods among literary critics, historians, anthropologists, and political scientists. In this entry, colonialism is analyzed only as a set of complex, unequal, and past relationships linking European colonizing powers to colonies (for other meanings, see the entry on postcolonialism). It is, thus, useful to dissociate colonialism as a political doctrine forged by those writing during the colonial period from colonialism as a paradigm reexamined by scholars since the 1980s. In the last section of this entry, the way postcolonial thinkers have portrayed colonialism is briefly explored before other approaches examining colonialism from a more political, social, and economic angle are examined.

Colonialism as a Political Doctrine

The word *colonialism* is created from the words *colonial* and *colony*, which have a longer history. English and French terms for *colonial* and *colony* derive from *colonus*, the Latin word for "farmer." The founding of colonies was one of the strategies the ancient Romans employed in establishing their empire. During the Renaissance and the 16th-century European expansion, the words *colon* and *colony* gradually took on their current meaning: The word *colon* referred to a person living in a colony, as opposed to an inhabitant of a European colonial power; the world *colony* designated a territory dominated and administrated by a foreign power or a group of settlers; the verb *to colonize* gradually came to mean "to conquer a territory." At different periods but mainly in the second half of the 18th century, the words *colonial*, *colonize*, and *colonization* appeared in English and were then translated into French.

The term *colonialism* obviously derived from *colonial*, but it appeared later, in the framework of 19th-century imperialism. It first appeared in English around the middle of the 19th century and was used to mean practices or idioms peculiar to, or characteristic of, a colony. In 1886, it was used to mean the colonial system or principle, thus referring to colonialism as a systematic and wide-ranging phenomenon. In France, it also followed the pace of overseas expansion. The word *colonist*, common after the conquest of Algeria in 1830, referred specifically to a partisan of the colonization of Algeria, while *anticolonist* referred to opponents of this process of colonization. This specific use did not last, however, and *colonialism/anticolonialism* came to replace the terms *colonist/anticolonist* in the early 20th century.

It is thus not really surprising that colonialism became a political doctrine promoted by theorists and defended by interest groups only in the 19th century, during the heyday of imperialism. Colonialism can hardly be understood without the element of self-legitimation inherent in it. The most powerful form of self-legitimating was the colonizer's claim of improving the conquered country and bringing the fruits of progress and modernity to the subject peoples. All European powers claimed to pursue a civilizing project in their colonies, but they used different terminologies to this end. In the 19th century, it was called *improvement*, *betterment*, or *moral and material progress*. All these terms were then subsumed under the term *civilizing mission*, which became the imperial ideology and official doctrine from the late 19th century onward. Parallel to this historical trend, there was an increasing feeling of racial superiority in European nations, along with the development of a positivist approach in the natural and human sciences associated with an increasing obsession with classifying people, plants, and animals. Some Western philosophers, academics, writers, and politicians developed a new vision of the world. There were continents with history and those without history (Friedrich Hegel, 1770–1831); there were superior and inferior races to colonize (Jules Ferry, 1832–1893), fortunate and less fortunate races to educate (Rudyard Kipling, 1865–1936), inferior and superior languages (Ernest Renan, 1823–1892), and a primitive or prelogical mode of thought and a logical one (Lucien Levy-Bruhl, 1857–1939).

In the 19th century, however, colonialism as a political ideology was not yet a unifying body of knowledge. In the British Empire, the aim for moral improvement and material betterment of society became common among a generation of administrators guided by the 18th-century legal reforms of Warren Hastings (1732–1818), Lord Cornwallis (1738–1805), and Jeremy Bentham (1748–1832). Gradually, British historiography started to describe colonization as a history of progress. This is well exemplified by James Mill's *History of British India*, an early and influential piece of colonial historiography that was published in 1818. In contrast, a specific doctrine of modern colonization emerged in France only in the early years of the Third Republic (1871–1940). Following Germany's defeat of France in 1870–1871 and France's loss of the two provinces of Alsace and Lorraine, some disparate groups developed a common set of arguments to justify overseas expansion. In 1874, the economist Paul Leroy-Beaulieu (1843–1916) advanced the view in his famous book *De la colonisation chez les peuples modernes* (Colonization among modern nations) that investing in colonies was the best business for an old and rich country such as France. The most influential Republican leaders, Léon Gambetta (1838–1882) and Jules Ferry, also defended colonial expansion as a way to recover from the events of the 1870s. While colonization initially divided monarchists, republicans, and radicals in France, no political parties in Europe opposed colonization prior to World War I.

The making of 20th-century colonialism was a process driven by a set of intellectuals, writers, and academics and by a new administrative machinery (the colonial office) assisted by experts (ethnographers, ethnologists, and later on anthropologists and sociologists) and increasingly after World War II by technicians (medical officers, educationists, town planners, welfarists, etc.). While the idea of progress was very common in justifications of colonial conquest in the 19th century, a considerable debate emerged in the early colonial days of administration concerning what kind of colonial rule was desirable. Assimilation, association, and indirect rule are generally considered to be the three major colonial doctrines that emerged between the end of the 19th century and the 1920s. This debate became most intense in France and Germany; it was more restricted in the United Kingdom, where there was general agreement that indirect rule should be the underlying philosophy of the system of government. The doctrine of assimilation was based on the heritage of the French Revolution and the belief in the equality of all people irrespective of their racial origin or cultural background. Colonized people had to prove themselves worthy of assimilation by demonstrating to the authorities that they had the attributes needed for citizenship. Practically, however, access to full rights of French citizenship was highly restricted, mainly to the inhabitants of four communes in Senegal (Dakar, Gorée, Rufisque, and Saint-Louis) and to a limited number of educated people (*évolués*) before World War II. In contrast, the doctrine of indirect rule was inspired by the idea that Europeans and Africans were culturally distinct, and indigenous political institutions were necessary for the purposes of local government. This was conceptualized by Lord Frederick Lugard, Governor General of Nigeria from 1914 to 1919, in his *Dual Mandate in Tropical Africa*, published in 1922. Rather than preserving the precolonial polity, indirect rule largely modified the public authority of traditional chiefs to ensure the exploitation of the country through means such as the introduction of taxes and forced labor and the modification of customary law. The differences in colonial doctrines should not be overstated. For instance, association was mainly another word for indirect rule in French colonial theory. In the administrative offices within the colonies themselves, colonial theory was less important than in European capitals; most of the time, colonial administration used indirect rule without acknowledging it as the cheapest way to govern colonies.

The participation of soldiers from European colonies in the two World Wars, the multiplication of colonial exhibitions all over Europe, the increasing number of colonial magazines, and the teaching of the history and geography of the empires in schools generated popular support for European colonization between the two wars. The legitimacy of colonialism was little contested at the time. Anticolonialism was limited to a few writers and to the extreme left (although the Communist Party in general was not really anticolonial when it was in government). It was only during and after World War II, with the rise of nationalism in Asian and African countries, that colonialism became radically contested both in colonizing and in colonized countries. Providing different rights to different peoples on the basis of their racial classification became illegitimate after the defeat of the Nazis and the rise of a bipolar world. In addition to the revolutionary anticolonialism of the far left, there was a broader moral opposition to violence arising in the colonial context, such as that in Madagascar, Kenya, and Algeria.

The various European colonial powers reacted differently to the new postwar order. Portugal decided not to concede independence or freedom to its African colonies, while other European governments granted new political and social rights and tried to reshape a more legitimate colonialism under the new ideology of development through technology, public health, and economic and local government reforms. Subjects were transformed into citizens, and they began to demand the same social and political rights as those in the European colonizing countries. The cost of this new dispensation, however, was too high for postwar European budgets; these economic concerns, together with the rise of nationalism, convinced European leaders to give up formal political ties with their former colonies. In less than 15 years, colonialism ceased to be a legitimate political doctrine and ultimately disappeared in the early 1960s. It survived only in Portugal, in Portuguese colonies and in settler colonies, where it was described sometimes as internal colonialism (as, e.g., in South Africa or Rhodesia). Elsewhere, the notion of colonialism and anticolonialism was replaced by neocolonialism, a neologism used to describe, and more often to denounce, the conditions under which former colonies continued to serve the economic, political, military, and other interests of powerful, mostly Western, countries. The concept of neocolonialism was popularized by the new independent leader of Ghana, Kwame Nkrumah, in his 1964 book *Neo-Colonialism, the Last Stage of Imperialism.*

Colonialism as a Contested Paradigm

When colonialism was a highly contested political issue in the 1950s, the French sociologist Georges Balandier wrote a pioneering article on the colonial situation (1951), in which he explained the necessity of understanding colonization as both a social phenomenon and a specific historical process. Balandier's recommendation was not followed, however, as researchers in the 1960s and 1970s were no longer interested in a political ideology that had been banished from the realm of legitimate forms of political organization. As mentioned by Frederick Cooper, there is something strange about the writing of colonialism: Scholarly interest in colonialism arose when colonial empires had already lost their international legitimacy. This rediscovery is partly explained by the rise, in academic institutions of the English-speaking world, of what has been labeled as postcolonial studies.

During the first decades after independence, the ideology of progress and modernization (then perceived to be Western) was largely shared by the political and intellectual elites of former colonies. However, the various projects of modernization of the state and the economy implemented after independence were seen by critics as inefficient and socially unjust. It is against this background that a critique of colonialism reemerged within a group of intellectuals from the former colonial world, who were mostly educated in Western academic institutions. Edward Saïd's book *Orientalism*, published in 1978, is often considered to be a starting point for the analysis of colonialism as a specific configuration of knowledge and power. Influenced by the work of Michel Foucault, Saïd argues that the intellectual construction of the Orient by Western scholars has served as an implicit justification for the colonial and imperial ambitions of European nations and the United States. Valentin Mudimbe, 10 years later, proposed a similar textual and cultural reading of the colonial domination of Africa, asserting that Africa was invented by a colonial and anthropological discourse and this process was a way for Europeans to build their own identity. Also important in the critique of the European colonial ideology was the initiative launched by a group of Indian historians such as Ranajit Guha, Partha Chatterjee, Gyanendra Pandey, and Dipesh Chakrabarty, who contested the nationalist historiography of India. In 1982, they initiated a series of edited books titled *Subaltern Studies*, which focused on the subaltern groups (or oppressed people) of colonial India. The central notion of *Subaltern Studies* is the notion of "agency," which includes autonomy of the subaltern in the political arena and a consciousness of self that is not controlled by the Western elites and their nationalist counterparts, who have supposedly adopted the values of their colonizers. This agency can be particularly understood in the words and knowledge of subaltern people.

The major aim of postcolonial studies was to deconstruct a Western epistemology associated with colonialism that reified the non-Western world in an ahistorical moment. The result was a critique of the civilizing-mission discourses; the works of Aimé Césaire, *Discourse on Colonialism* (1953); Albert Memmi, *The Colonizer and the Colonized* (1957); and Franz Fanon, *The Wretched of the Earth* (1961) received new attention from the 1980s onward as texts that pioneered the denunciation of the pernicious cultural and psychological effects of colonialism. This rediscovery has largely popularized the idea that colonized people have no other story than that of colonial oppression.

According to the historian Frederick Cooper, a significant part of postcolonial thought has taken colonial studies out of its historical context, treating colonialism abstractly, generically, as located somewhere between 1492 and the 1970s, and as something to be juxtaposed with an equally flat vision of European "modernity." Moreover, colonial societies should not be understood merely in terms of a "European versus indigenous" dichotomy, and the actions of former colonized people should not be reduced to merely resistance to colonialism or collaboration with the colonial order. Similarly, when colonialism is portrayed as a power-demarcating and -racializing space, the complexities of the colonial situation are ignored or one tends to neglect the internal divisions within European and indigenous communities alike.

The analysis of the relationship between colonialism and biomedicine can be used as an example to explain the capacity of colonialism to produce both a contradictory and a generic discourse on colonized people. According to Megan Vaughan, who traced the emergence of various medical discourses in Africa, there was, on the one hand, a long tradition, elaborated by Christian missionaries, that viewed the "primitiveness" of African societies as a factor predisposing them to certain diseases. On the other hand, research on the relationship between colonialism and biomedicine from the interwar period indicated that Africans got sick because they forgot who they were: Urbanization, industrialization, and deculturation were seen as factors leading to insanity, sexually transmitted diseases, or leprosy. Taken together, these contradictory viewpoints show, however, a fundamental difference in the emergence of biomedical discourse in Europe: Africans were always conceived of as members of a collectivity—as colonial people—and beyond that as members of collectivities—in the form of tribes or cultural groups—and this led to different views in tracing the relationship between colonialism and biomedicine.

This reification of groups by colonialism has been contested by social historians and anthropologists. Groups and categories under colonial rule (chiefs, the educated elite, traders, peasants, workers, and also women, youth, and elders) pursued their own agendas, defended their own interests, and consequently changed the limits of subordination within the colonial system. In this sense, opposing too markedly the "bourgeoisie" and the "working class" or the "elite" and the "people" includes the risk of reproducing the old colonial dichotomy as well as creating new ones (opposing the modern to the traditional). A large part of African and Indian historiography in the past 3 decades has tried to overcome this vision present in colonialism by looking at the agency of individuals and groups, the contingent nature of their connections and networks, and their respective roles in shaping power relations. Actually, colonialism did not produce only differences between colonizers and the colonized. It also produced individuals with varying investments in a range of identities, sexual identities, class identities, religious identities, and ethnic identities. Similarly, colonialism not only led to conflicts between colonizers and the colonized, it was also decisive in shaping new roles, divisions, and conflicts between elders and youth, men and women, and migrants and urban dwellers.

The understanding of conflicting colonial repertoires helps explain why colonialism was not pervasively efficacious in implementing modernization. According to Nicholas Thomas (1994), "colonialism was not a unitary project but a fractured one, riddled with contradictions and exhausted as much by its internal debates as by the resistance of the colonized" (p. 51). Colonized people were able to turn the discourse of modernization into a language of claims concerning the obligations of colonial powers. For instance, when development emerged as a colonial project with aid from the former colonial power, it did so in the face of serious objective challenges from the West Indies and Africa in the 1930s and the 1940s.

The various forms of present-day oppressions in some former colonies have sometimes been regarded as a legacy of colonialism. For instance, Mahmood Mamdani (1996) argues that colonial rule created a "bifurcated state" that distinguished between a despotic tribal power in rural areas and a democratic civil society based in towns and cities. According to Mamdani, this duality of power has been a major obstacle to democratization in postindependence Africa. However, historians have shown that colonial power was limited by tribal chiefs' obligation to ensure the well-being of their community to maintain the legitimacy on which colonial authorities depended. As mentioned by Thomas Spear (2003), colonial dependence on chieftaincy often limited colonial power as much as facilitating it. The reification by colonialism of categories of citizen/subject and urban/rural overstates the role of urban and elite power and undervalues the strategic place of rural constituencies and the importance of urban–rural links in the making of African politics. Eventually, drawing a direct causal connection between the indirect rule of the 1920s and 1930s and the politics of authoritarianism and ethnicity in the 1980s and 1990s fails to see what lies in between, especially the explosion of citizenship in the final years of colonial rule.

Historians, anthropologists, and political scientists interested in understanding the everyday practices of colonialism have changed their framework of analysis to take account of these issues. They today insist on the necessity of looking simultaneously at the colonizing countries and the colonies and the process by which each entity affected the political transformation of the whole empire. This marks an important break with former imperial historiography, which had long treated colonies as marginal to a history that remained national or as a projection of national culture and power. Empirical evidence now suggests that new forms of administration, town planning, architecture, policing, and medical practice, to mention just a few examples, were not only a one-way imposition of norms coming from the metropolis but were also coproduced in the colonies and contribute to larger debates about the nature of colonialism and its impact. Colonialism profoundly shaped both colonized and colonizers' society.

Common Goods

Social scientists call *goods* all the resources that people use in their life. A well-established taxonomy of goods distinguishes them on the basis of two attributes: excludability and rivalry. The first attribute refers to the right of the owner to exclude other individuals from the consumption of the goods. The second means that the consumption of a unit by one individual prevents the consumption of the same unit by another. Private goods, with which basic microeconomics is concerned, are excludable and rivalrous. Goods that lack one or both of these attributes are called common goods by political analysts. This entry discusses the attributes of common goods, a variety of forms of these goods, and ways in which they can be managed.

Three different types of common goods have been envisaged since the 1950s. Economists have drawn attention to public goods, which are nonexcludable and nonrivalrous, such as national defense, traffic lights, air to breathe, and eradication of contagious diseases. More recently toll goods or club goods have been considered, that is, nonrivalrous and excludable goods, such as highways, cable television, shooting or fishing permits, and museums. Finally, environmental scientists and political analysts have envisaged common pool resources (CPRs) or commons, which are nonexcludable but subject to rivalry, such as fisheries, free meadows, hunting game, and groundwater basins. Table 1 illustrates the positions of goods in the taxonomy.

Nonexcludability and/or nonrivalry of common goods pose a series of problems for collective action that have been extensively examined.

Collective Action for Public Goods

Political scientists began to study the role of groups in politics at the beginning of the 20th century. With time, a scholarly tradition became established, and a group theory was proposed that implicitly assumes that whenever all the individuals in a group have the same aim, they will all act to achieve that aim. Mancur Olson, in his book *The Logic of Collective Action*, was the first to argue that this apparently obvious assertion is in general untrue for public goods.

Olson's argument is that the attribute of nonexcludability implies that no individual member of a group has an incentive to contribute voluntarily to the provision of a public good, as each would get his or her part, in any case, once it came into existence. Irrespective of the nature of the group (i.e., a rural community, a town, a union, or a nation), this free riding behavior may spread among individuals, so that a group may be unable to give rise to a

Table 1 Taxonomy of Goods

	Excludable	*Nonexcludable*
Rival	Private goods	CPRs (commons)
Nonrival	Toll goods (club goods)	Public goods

Note: CPRs = common pool resources.

single unit of public good, no matter how important it might be for the group. Consequently, the existence of a public good depends on the capacity of the group to prevent free riding, which means detecting and punishing people who do not cooperate in its provision. This is easiest when the number of group affiliates is small, because they know each other personally, interact frequently, and can regularly monitor their respective actions. Because of this capacity to surmount opportunistic behavior, small groups are privileged and are able to activate and stabilize. Large groups, on the contrary, are anonymous, so that it may be difficult for partners to detect and punish free riding. This is why large groups are difficult to mobilize and may remain latent.

The Tragedy of the Commons

For goods with the rivalry attribute, a unit of CPR taken by one person is taken away from another person. For goods with the nonexcludability attribute, no one can singularly claim property rights. Because CPRs have both these features, they not only have the problem of free riding, shared with nonexcludable public goods, but also are vulnerable to intense exploitation, which may completely erode their value. Garrett Hardin drew attention to this problem in a 1968 article published in *Science*, where he gave the example of an open pasture. Because no individual property right can be claimed on its land, each herdsman will try to keep as many cattle as possible on the pasture. This spontaneous arrangement might last for centuries, as long as wars and diseases keep the population of both men and cattle below the highest level that the meadow can sustain. However, were these traditional evils to be defeated, the population of herdsmen and cattle would grow beyond that threshold, and a new evil, called by Hardin the tragedy of the commons, would emerge.

The catastrophe by no means depends on the carelessness of the herdsmen. Deciding whether to introduce a new unit within the pasture, a perfectly rational herdsman will weigh up expected costs and benefits: Introducing an additional beast gives him the opportunity to add nearly the value of this unit to his income, while the cost of overgrazing produced by that new unit generates only a little erosion of the free grass, a loss that furthermore is distributed among all herdsmen. This reasoning can be extended to any one additional beast and to any herdsman. Therefore, individual rationality pushes each herdsman to increase his herd without limit, progressively reducing the likelihood that any animal will find enough food to survive, and finally, leading all the herdsmen to complete ruin.

Managing Common Goods

In spite of the tragedy of the commons and the problems with collective action, groups of any size have always existed in human societies, delivering common goods to their members in a more or less efficient manner. Of course, this is well known to scholars, who have pondered the various ways in which practical politics has adapted to cope with the problems that theoretical analysis has envisaged.

To begin with, both CPRs and public goods are nonexcludable, which implies exposure to free riding. Then, the theoretical insights considered so far would be corroborated if the strategies of practical politics were to be aimed at increasing the cost of free riding or at giving to common goods some attributes of excludability.

The first strategy amounts to making use of the coercive force of the state—whether or not legitimized by democratic procedures and majority endorsement—in order to deter opportunistic behavior. This strategy is actually largely adopted by all public authorities under all regimes, as the reality of enforced taxation makes clear beyond any doubt. However, the alternative strategy of providing common goods with the attribute of excludability is no less important. Convinced that CPRs generate social evils, Hardin maintained that the history of civilization is that of limiting the "freedom of the commons," introducing property rights by law, and transforming them into private goods, as happens when concessions are granted. Also, public goods can be equipped with elements of excludability. This is accomplished when public authorities introduce fees or tickets that transform public goods into toll goods. Appealing to this strategy, Olson is able to explain how large groups succeed in providing their members with public goods when no mutual control is available to defeat free riding. His explanation is based on the role of selective incentives. These are benefits that the group offers to each potential member as an inducement to join and bear a share of the collective enterprise. Thus, large latent groups have the opportunity to mobilize and gain their public goods as by-products of selective incentives.

An Alternative Way to Cope With CPRs

The strategies so far considered by which groups can provide their affiliates with common goods imply an institutional change, toward either centralization or privatization. However, institutional changes are costly, and in both cases, further analysis of additional costs is needed. This has been clearly pointed out by Elinor Ostrom in her book *Governing the Commons*, devoted to the analysis of CPRs. Her first point is that only public authorities are entitled to introduce property rights on CPRs. That means that creating a market for commons implies the costs that public authorities must bear to establish an agency to define market rules and control their effectiveness and efficiency. On the other hand, if property rights remain in government hands, one must add the cost of detecting defectors as well as the costs of errors, such as mistakenly sanctioning those who cooperate or failing to sanction defectors.

From all this, the conjecture emerges that full privatization or full centralization imposed by external authorities may be a questionable means of coping with the problems with CPRs and that institutional arrangements provided by the commoners themselves may offer better solutions. To examine this hypothesis, Ostrom makes a thoughtful analysis of the decision processes in many empirical cases of CPRs ruled by self-governing communities, such as forest tenures, irrigation systems, or inshore fisheries from various countries in different continents with different levels of economic development. Her scrutiny reveals that people interacting in a CPR can avoid resource erosion through a system of rules contingent on the specific situation, monitored by accountable individuals, and regulated by graduated sanctions. However, to realize such an institutional change, the individuals concerned must know one another through other repeated interaction, so that over time, they can accumulate the social capital necessary to discover shared norms promoting mutual cooperation. These conditions are more likely to be met in the type of small-scale CPRs investigated in Ostrom's book.

It is important to underline the fact that Ostrom does not deny the relevance of the problems that Hardin and Olson have pointed out with common goods. Her aim, more limited and yet extremely important for political analysis, is to show that the assumption that problems with common goods can be solved only by external authorities imposing privatization or centralization, although widespread among policy analysts, is invalid.

Social analysts have scrutinized common goods using contributions of increasing complexity. Hardin's approach exemplifies the environmental scientists' concern for the ultimate tragic consequences of the commons. Olson enhances Hardin's analysis, paying due attention to decision processes and proposing an economic model where individual incentives interact with a given institutional framework. Ostrom considers many aspects concerning the provision and maintenance of common goods. Her analysis strongly suggests that designing the necessary institutional change and considering its costs should not be omitted when modeling decisional processes concerning human attempts to attain collective benefits. Her teachings have been very influential, and subsequent research on common goods has followed her analytic framework, focusing on institutional design and multilevel governance. Thus, it has been possible to extend her method far beyond the small-scale CPRs to research into the international governance of common goods such as the Internet and financial markets and environmental global commons such as Antarctica, the oceans, and the atmosphere.

COMMUNISM

After the fall of the Berlin wall in 1989 and the collapse of the Soviet Union in 1991, it seemed that communism belonged only to the past and was a more appropriate subject of research for historians than for political scientists. This impression is wrong. Communism is directly relevant to political science, not only because communist regimes still exist in Cuba, China, and elsewhere in Asia, but also because an adequate account of communism must include an explanation of why it is attractive or, on the contrary, why it has failed. An understanding of communism must also include an examination of its future as well as its legacy in former communist countries that are now democracies. This entry addresses these topics by analyzing communism as a theory, a type of regime, and a political organization. As a political theory, communism has changed over the years but has always been significant to some philosophers and activists, and it remains an important point of reference in critiques of capitalism and current political debates. In this respect, it is necessary to distinguish between the idea and its political realizations.

Evolution and Actualization of the Idea of Communism

The idea of communism is a very old one that has its roots in the vision of a society based on the absolute equality of human conditions and the elimination of individual enrichment. It is present in the works of many thinkers from Plato through the 18th-century utopians, the Soviet analysts, and some contemporary theoreticians. The terms *communism* and *communist* were first used in France during the 11th century to designate the common practices, interests, and rights of some peasants. During the French Revolution, some authors used the word *communism* in its more modern sense of a general sharing of goods in a regime established by a revolutionary process. Others, for example, Robert Owen, Etienne Cabet, Wilhem Weitling, and Moses Hess, used the term to designate utopian projects of societies based on a new system of exchanges and distribution. But it was around the mid-19th century that the idea of communism became more widespread. The creation of the Communist League by Karl Marx and Friedrich Engels in 1847 and the publication of their *Communist Manifesto* in 1848 marked a turning point in the evolution of the communist idea as embodied in a political structure and metamorphosed into a coherent doctrine that, despite Marx's protests, quickly took on a religious and dogmatic dimension. The word *communism* came to refer to a general project, a political action, and a political ideology presented as a real and powerful science, different from reformism. For Marx, communism meant not only social equality and the end of private property but also the necessity of a revolution based on class struggle directed by an organized proletariat that would completely destroy capitalism and the bourgeoisie, establishing the dictatorship of the proletariat. After this first step, it would be possible to establish a perfected new order with collective ownership, a progressive disappearance of the state, and the dissolution of social classes.

Prior to 1917, there was confusion within the international labor movement concerning the relationship between socialism and communism. After the Russian Revolution of 1917, Lenin gave the name *Communist* to the Bolshevik party, and with the creation of the Third International in 1919, the distinction between the Communist Party and social-democratic and socialist parties was strengthened. Lenin and his comrades set themselves up as Marx's only heirs, delegitimizing the numerous other interpretations of Marxism.

Marxism–Leninism became the main and strongest codification of the doctrine of communism during the 20th century, with the Soviet Union presented as a model. Thus, the Soviet Union can be considered the first incarnation of communism; however, after World War II, other nations, such as Mao Zedong's China, Kim Il-Sung's North Korea, and Fidel Castro's Cuba, created their own versions of communist regimes.

Communism as a Type of Regime

Because of the existence of these countries who claimed their affiliation to communism and Marxism, communism also designates a type of regime. Usually, they show important specificities in terms of how they implemented the communist program and in their respective historical, national, and social environments. However, there were also commonalities; in particular, the establishment of a communist regime was in each case followed by an intense period of violence and terror marked by mass crimes, genocides, trials, deportation, and the creation of detention and concentration camps for all political, cultural, and religious "enemies" as well as bloody purges of opponents inside the party. The prime example was the Soviet Union under Lenin and then under Stalin, until the latter's death in 1953. One of the grimmest examples of communist terror was in Kampuchea (Cambodia), where from 1975 to 1978, the communist Khmer Rouge was responsible for the death of an estimated 1 million to 1.5 million people.

Often, a period of acute repression in a communist regime was followed by a relaxation of the repression; this was the case in Russia and in East and Central Europe after Stalin's death in 1953 and Khrushchev's de-Stalinization in 1956. However, during this period, there remained a restriction of liberties and a general fear based in part on memories of past repression. Other common features are the following:

- the establishment of one-party rule or a hegemonic and preeminent communist party, with some insignificant allies who keep alive the fiction of plurality, as in some of the Eastern and Central European countries after 1945;
- the monopoly of all activities, including political, economic, social, intellectual, and cultural activities, and of the media, who were used for intensive propaganda;
- an emphasis on the importance of ideology for the party and for the whole population;
- the rigorous control and surveillance of society;
- the endeavor to create a "new man," who was ideologically convinced, completely devoted to the party, and willing to sacrifice his life;
- the centralization of all powers, especially in countries with great cultural, ethnic, religious, or geographical diversity; and
- the preeminent affirmation of the leadership, which may lead to an organized cult as, for instance, in the cases of Stalin, Mao, Kim Il Sung, Ho Chi Minh, or Castro.

During the years 1920 to 1930 and after World War II, these features sparked polemics about the nature of communist regimes and their classification: What were they exactly? Were they a new version of classical dictatorship or a variety of authoritarian systems, or did they belong to totalitarianism? The debate about this last notion was always fierce. Supporters of the totalitarian concept insist that it is as valid for communism as for fascism or Nazism. Some, such as Hannah Arendt and Raymond Aron, thought that, after 1956, the Soviet Union, for instance, became a posttotalitarian regime or an authoritarian one that experienced a deep political and economic crisis, resulting in a reduction of its attraction. Other specialists emphasized the permanence of the essential characteristics of totalitarianism from the beginning to the end but recognized that there was alternation between the extreme and the more relaxed forms of totalitarianism. In contrast, other scholars reject the pertinence of the totalitarian concept for communism and criticize the validity of comparing it with fascism. For them, totalitarianism is too wide and schematic a concept for comparison, because it does not take into account the differences between fascism, Nazism, and communism, as well as those between communist countries. These critics also argue that the concept of totalitarianism does not take into account the spaces of autonomy that were operating despite the weight of oppression. In any case, communist regimes also served as a model for dictatorships elsewhere.

Communism as a Political Organization

Communism also refers to an important mutation of political organization. Marx spoke in favor of the importance and the necessity of a communist party but without giving precise definitions or recommendations about its structure. It was Lenin who described more precisely the process of building such a party, in his book *What Is to Be Done?* published in 1902. Lenin is the inventor of the first prototype of an ideological party, composed of a vanguard of professional revolutionaries, with a military and secret service component, publishing a newspaper conceived as a key element of the party's activity, propaganda, and ideological formation. This party was to be ruled such that there was complete submission of the inferior echelons of the party to the superior ones, a strong and centralized authority of the leadership, absolute discipline (whereby the minority had to obey the majority), and, in democratic countries, total control of the members of parliament by the central leadership of the party. This famous invention, called democratic centralism by Lenin, was completely counter to the classical concept of a mass social-democratic party. The party also had to form specialized mass organizations for attracting a variety of people. Through their propaganda, the ideas of communism could be spread more easily, and they could also be used as a channel of recruitment for the party. Trade unions were considered a decisive influence on the working class, but as a transmission agent, they had to be subject to the party's orders. This specific communist party was supposed to be adapted to the conditions of political struggle under tsarist Russia. But after the victorious Soviet revolution, Lenin and Trotsky decided to generalize the model and impose this organization on the new communist parties all over the world. They also created another important rupture with the internationalist working class tradition by inventing a new Communist International, with its powerful center in Moscow. The Communist International was conceived as a world party with one unique goal: to make revolution on a global scale. In reality, with Stalin's leadership from the end of the 1920s, the Communist International had to defend the Soviet Union against the supposed attacks of "imperialism."

The party was completely Stalinized and became monolithic. In other countries, the communist party tried to transform itself into a mass party open to different social categories, for example intellectuals, but with a prominence of working-class members at all levels. In some countries, and especially in China under Mao's authority, priority was given to the peasants. The military had to consist of disciplined members, courageous and always ready to defend the party's positions and, if necessary, to sacrifice their lives, as was the case, for instance, during World War II in the Resistance, during some civil wars (in Spain 1936–1939, in Greece 1946–1949), and in the national liberation movement in Vietnam. The party was attractive because it offered the only possibility for political, social, or symbolic promotion. In the course of time, the ideology was no longer an element of faith but just empty rhetoric, with its sole aim being to legitimize those who were in power. The party was a party-state where the state was only an appearance; the reality of power, leadership, and decisions was under its control. At the international level, the communist parties had been organized from 1919 into the Communist International, the so-called Komintern, which was self-dissolved in 1943. This organization was also Stalinized from the end of the 1920s and had to respect the orders from Moscow. The leadership of the Communist International, directly under Stalin's authority, decided the strategy of each party, controlled the internal life of the party, and selected its leaders. After World War II, the Kominform was created as a successor organization. The Soviet party, with the support of the East European parties, tried to maintain the unity of world communism and the centrality of the Soviet Union by organizing international communist conferences, organizing formal meetings among parties, and providing material (even financial) support. The Soviet party tried to structure this world communist system to achieve its expansion over all continents. But it was confronted with a trend toward autonomy and, sometimes, a defense of national interests (e.g., with the Romanians and the Polish). Some parties decided to oppose Soviet primacy and to split communist unity, such as the Yugoslavs in 1948 and the Chinese and Albanian Communists in the 1960s. In the West, communist Italians after 1956, the French in the 1970s, and then the Spanish soon after tried hard to invent a form of Eurocommunism that emphasized the importance of democracy and personal freedoms and rejected dictatorship. However, they always defended Soviet superiority when confronted with imperialism and capitalism.

Communism as an Ideal

The theoretical, political, and sociological interpretation of communism has always divided the scientific community. Communism has been interpreted as a contemporary form of utopia that would fulfill the classical quest for happiness in a perfect and pacified world and give expression to the "passion of equality" that Alexis de Tocqueville saw as inseparable from democratization. Many thinkers have argued that although communist regimes vigorously repressed religion, communism itself took the form of a secular or political religion. In Europe, communism had more success in Catholic and Orthodox countries and in some Jewish communities than among Protestants. Where Islam was the dominant religion, communism generally failed to take hold; however, it prospered in Buddhist, Taoist, and Confucian countries. Thus, communism could be seen as a secular substitute for traditional religions and its establishment, the result of a transfer of faith from classical religions to this new one.

Communism was embraced by many different sections of the population, from the uneducated to intellectuals, who found in its beliefs a basis for political involvement. Even though it was closely associated with the protection of Soviet interests, communism also may be seen to involve a commitment to internationalism as the foundation of world fraternity. However, communism could also strengthen nationalistic values, as it did in some countries that were fighting for their independence, such as Vietnam or Cambodia. Such ambivalence existed on other topics as well. Communism succeeded as a movement determined to practice violence against dictatorships but also within democracies (as the communist parties did from the 1920s to the 1940s); yet, at the same time, especially in the West, communism presented itself as a peaceful movement allied with Catholic and Protestant associations and independent personalities who were not properly affiliated to a party but were strongly committed to leftist values. Obviously, in theory, communism was a child of the Age of Enlightenment, with its ideals of equality and its aspiration to emancipation and democracy. But in practice, although there were differences between communism and totalitarian movements such as fascism and Nazism, communism translated to dictatorship. In Western countries, communist parties criticized the "bourgeois" and "formal" democracies in the name of a future and perfect democracy. After World War II and their active participation in antifascist resistance or anticolonialist movements, communist parties—the most powerful of which were in Western Europe—gradually accepted democratic principles and made some changes in their own organizations.

But the main question is whether communism represented an archaic political phenomenon or a modern one. Communism, as an affirmation of the values of a classless society, can be seen as archaic because of its rejection of capitalism, the market economy, individualism, and liberal and representative democracy. Communism could also be presented as a specific authoritarian form of economic and social modernization developed by a ruling communist party—a modernization that was a complete disaster everywhere. However, in democratic countries where strong communist parties existed, as in France or Italy, their presence and the protection they gave to the poorest people could be seen as providing a foundation for the modern welfare state.

Communism and Today's World

Communist regimes no longer exist in Russia and in Eastern Europe. Efforts to reform communism in Hungary, Poland, Czechoslovakia, and the Soviet Union under Gorbachev failed. Western European communist parties are in decline or have changed their names and identities. Communism as a whole has lost its momentum. But it is still alive in some countries as a totalitarian regime, as in North Korea, or in the form of coexistence between a market economy and the domination of a single party, as in China. Communism has left an important legacy. Communist domination did leave its mark on welfare in countries that have undergone a transition to democracy, which explains the nostalgia for equality and social protection. In some countries, Communists have maintained a good reputation among the public because the collective memory associates them with the social class struggles of the past and with antifascism. Communist doctrine itself is in a deep crisis, but some authors find an actuality in Marxism. Some elements of the communist culture are still alive in the form of anticapitalism, aspiration to utopian ideals, the search for a radical alternative, contestation of the reality of democracy, and hostility to reformism. In other words, communism is perhaps finished as a political centralized and authoritarian organized movement but remains alive and present as an aspiration.

Communist Parties

Communist parties are radical Leftist political organizations that aim to facilitate either a coercive or peaceful transition of society from capitalism to communism. Such parties initially emerged as factions within many European socialist and social-democratic parties at the end of the 19th century. Communist parties claim to represent the interests and values of the working class. The seizure of power by the Russian Social Democratic Labour Party (Bolsheviks) in a coup d'état in Tsarist Russia in November 1917 was a signal for the emergence of communist parties nearly all over the globe. After World War II, communist parties seized power in Eastern Europe, China, and some other Asian countries. A rapid decline of communist parties worldwide began after Mikhail Gorbachev as General Secretary of the Communist Party of the Soviet Union (CPSU) initiated reforms of the Soviet regime in 1985. This entry discusses their ideology, origins, organization, and worldwide impact.

Ideology

The term *communist* was used for the first time by the utopian socialist Goodwyn Barmby, who introduced the word into the English language as a translation of the French word *communiste* and founded the London Communist Propaganda Society in 1841. An essential distinctive characteristic of communist parties was the importance accorded to ideology. In communist parties, ideology occupies a much more fundamental place than in other parties as a primary concern of the party is to indoctrinate the rank and file with communism or Marxism.

The doctrine of communism refers to the theory of society developed by Karl Marx and Friedrich Engels in the 1840s. In the mid-1840s, Marx and Engels became engaged in politics by joining the League of the Just, a secret society consisting mainly of émigré German artisans. In February 1846, Marx and Engels set up the Communist Correspondence Committee with the aim of reclaiming control of the League of the Just. In June 1847, the League was transformed from a secret society into an open revolutionary organization—the Communist League. The second congress of the Communist League, in December 1847, asked Marx and Engels to draw up a manifesto stating its principles. In February 1848, Marx and Engels published the *Manifesto of the*

Communist Party, where they formulated the basic principles of communism. The major author of *Manifest der Kommunistischen Partei* was Karl Marx; it was originally published in German in London.

A cornerstone of Marxist theory was the economic (often called the *materialistic*) interpretation of history and theory of the social revolution. According to this doctrine, human society is developing through a series of historical stages based on changing modes of production, which are the fundamental determinants of social structures and social relations. As seen by Marx and Engels, the history of human society is the history of class struggles. According to Marxist doctrine, human society has passed through the successive phases of a primitive society, slavery, feudalism, and capitalism and must advance to communism. The class struggle under capitalism is between those who own the means of production—the bourgeoisie—and those who labor for a wage—the working class. Communism means an abolition of private property and the creation of a classless society in which productive wealth is owned collectively.

Origins

Several predecessors of modern communist parties existed, but the major roots of revolutionary movements with a clear communist leaning and a direct involvement of the father of the communist doctrine, that is, Marx, go back to the International Working Men's Association, or the First International. The First International, an organization of workers that represented an alliance of people from diverse groups, such as the French Proudhonists, Blanquists, the English Owenites, the Italian Republicans, proponents of individualistic anarchism, and other socialists of various persuasions, was founded in 1864. Under the influence of Marx, the Social Democratic Workers' Party of Germany, the strongest member of the First International, was founded in 1869. In 1872, the First International split between Marxist and anarchist currents, and the organization was disbanded 4 years later at its 1876 Philadelphia conference.

In July 1889, European socialist and labor parties from 20 countries established the Second International, excluding the powerful anarcho-syndicalist movement. One of the most prominent Russian communist leaders—Vladimir Ilyich Lenin—was a member of the Second International from 1905. The Second International dissolved during World War I, in 1916, as the national parties that composed it did not agree on a unified position against the war.

Marx and Engels argued in the *Manifesto of the Communist Party* that among the immediate goals of Communists were the "formation of the proletariat into a class, the overthrow of the bourgeois supremacy, and the conquest of political power by the proletariat." The ultimate aim of communism was the replacement of the old bourgeoisie by a classless communist society.

Until the collapse of the Second International, Marxists worked within existing social-democratic parties. Marx claimed in the *Manifesto of the Communist Party* that "the Communists do not form a separate party opposed to the other working-class parties." However, in his words, Communists differ from other working-class parties in that they "bring to the front the common interests of the entire proletariat, independently of all nationality," and "they always and everywhere represent the interests of the movement as a whole."

In 1902, Lenin wrote a political pamphlet—*What Is to Be Done?*—where he developed a concept of a "party of a new type." Here, Lenin formulated the basic elements of the concept of a revolutionary party:

a. a centralized and disciplined (cadre) party of professional revolutionaries,

b. a party organized as a bureaucratic or semimilitary hierarchy, and

c. a party able to communicate socialist ideology to the more intellectually developed workers, who could act as the vanguard of the working class and be capable of overthrowing the regime of the bourgeoisie and establishing the dictatorship of the proletariat.

This "Leninist" type of party, as an authoritarian structure, was to become the highest authority of the class-based organization, which would lead all other organizations of the working class and society as a whole. For many decades, the organization, strategy, and tactics of the Leninist party were interpreted as providing the impetus for the establishment of the totalitarian regime in the Soviet Union.

In 1990, however, the American socialist Hal Draper published an article "The Myth of Lenin's 'Concept of The Party' or What They Did to *What Is to Be Done?*" where he argued that Lenin's concept of the working-class party was highly misinterpreted. First of all, Lenin did not speak about intellectuals as the carriers of socialist ideas in the political organizations of the working class. Second, Lenin's demand of centralism did not mean a "democratic centralism"—that is, a semimilitary hierarchy within the party—but rather the aim to establish an organized all-Russian party for the first time. The aim of having a class-based party was just a reaction to the fact that throughout history, the socialist movement was mostly organized in sects. Third, Lenin did not propose a revolutionary sect, but instead, he aimed "to organize the revolutionary current as a political centre of some sort inside the mass party." John P. Plamenatz (1954), a political philosopher, argued long before Draper that in 1902, Lenin's ideas of a revolutionary party were not "undemocratic, but merely advice adapted to the needs of a revolutionary party active in Russia in the first decade of the twentieth century" (p. 225), which, however, took an antidemocratic turn in "what happened after the Bolshevik Revolution."

In 1918, the Russian Social Democratic Labour Party (Bolsheviks) was renamed the Russian Communist Party (Bolsheviks), and from 1920 until 1991, it was the only legal political party in the Soviet Union. In 1925, the name of the party was changed once again, and it became the All-Union Communist Party (Bolsheviks) and eventually was transformed into the CPSU in 1952. After the attempted *coup d'état* in August 1991, the CPSU was dissolved by Russia's President Boris Yeltsin.

Organization

As the first communist parties were splinter groups of existing social-democratic and/or socialist parties, initially, they inherited the traditional organization of mass parties. After the October Revolution of 1917, the Russian Communist Party gradually centralized political power and developed a strict cadre policy. A high degree of centralization is a distinctive characteristic of communist parties. All mass-based parties tend to be centralized, but within communist parties, it was significantly more important than in other mass-based parties.

All political factions and dissent were forbidden within the Russian Communist Party in 1921, and afterward, all party members had to adhere to the decisions that had been made by the central bodies. The internal party organization was based on the principle of democratic centralism, where "democracy" meant the freedom of party members to discuss matters of policy and to pass decisions by majority vote, and "centralism" was understood as a duty of party members to uphold decisions taken by the majority. In theory, democratic centralism also included elections to all party institutions from the bottom to the top, accountability of party structures and leaders to the rank and file, strict party discipline and mandatory decisions of the upper structures for the lower structures, and personal responsibility of party members for the assignments given to them by the party. In reality, democratic procedures were an empty formality as leadership at all levels of the party organization prohibited criticism and dissent in decisions and actions.

The Russian Communist Party also introduced a *nomenklatura* system through which party elites were appointed to key positions in the administrative, economic, military, cultural, and educational bureaucracies as well as throughout the party's own hierarchy. Lenin himself formulated the first criteria for *nomenklatura* appointments as follows: reliability, political loyalty, and administrative ability. Joseph Stalin finished the building of the party's patronage system and used it to distribute his confidants throughout the party bureaucracy. Under Stalin's direction in 1922, the party created departments of the Central Committee and other organs at lower levels that were responsible for the appointment of party officials. After Leonid Brezhnev's accession to power in October 1964, the party considerably expanded its appointment authority. At the all-union level, the Party Building and Cadre Work Department supervised *nomenklatura* appointments. This department maintained records on party members throughout the former USSR, made appointments to positions on the all-union level, and approved *nomenklatura* appointments to the lower levels of the hierarchy. The head of this department was sometimes a member of the party Secretariat and was often a protégé of the General Secretary of the CPSU.

The communist parties developed a new structural organization. While other mass-based parties focused their organization and drew their support from a particular geographical or territorial area, the communist groups formed their cells in the workplace. Party members were employed in the same enterprise or professional institution, above which were territorial district, city, regional, and national party committees. The workplace cell organization proved to be effective. These workplace cells were more numerous than territorial local branches in other mass-based parties' sections. Also, this system led each cell to concern itself with problems of a corporate and professional nature rather than with more political issues. Last but not least, this organizational system allowed party leaders to have extensive authority over primary party cells. At the end of the 1980s, the CPSU had around 20 million members organized into about 400,000 primary party cells.

At the top was the party congress, which met only every few years, where strictly selected delegates elected the members of the republican and the all-union party central committees. The Politburo was the highest political and executive institution of the CPSU. It was created on the eve of the Bolshevik Revolution in 1917, but it became fully functional only in 1919 and soon overshadowed the Central Committee in power. Nominally, the Politburo was elected by the Central Committee to direct the party's policy between the Central Committee's plenary sessions. In fact, the Politburo was the most important decision-making institution in the Communist Party and has commonly been seen as a rough equivalent to the cabinet in Western political systems. The size of the Politburo of the CPSU varied, and from 1952 until 1966, it was called the Presidium of the Central Committee.

In addition, the Communist Party was surrounded by various satellite mass organizations. In the Soviet Union, among the most important were the Communist Youth Union (Komsomol), from which nearly 75% of party members were recruited, and the All-Union Central Council of Trade Unions, with more than 100 million members. The Communist Party controlled all facets of economic, political, military, and cultural life, and Article 6 of the 1977 Soviet Constitution stated that "the leading and guiding force of the Soviet society and the nucleus of its political system, of all state organizations and public organizations, is the Communist Party of the Soviet Union."

Communist Parties Worldwide

After the establishment of the Communist International (Comintern) in 1919 by representatives of 34 parties, most emerging communist parties worldwide were patterned along the model of the organization of the Russian Communists. In 1920, the Second Congress of the Communist International formally adopted the *Twenty-One Conditions*—officially the *Conditions of Admission to the Communist International*—as prerequisites for any political group wanting to become affiliated to the Communist International. These conditions encouraged the buildup of communist organizations along democratic centralist lines.

Many European Socialist parties went through splits based on whether they adhered to the Communist International. The French Section of the Workers International (SFIO) broke away with the 1920 Tours Congress, leading to the creation of the new French Communist Party. The Communist Party of Spain was created in 1920 on the basis of the Federation of Socialist Youth; the Communist Party of Italy was created in 1921 following a split in the Italian Socialist Party; the Belgian Communist Party emerged in September 1921 following a split from the Belgian Workers Party, and so on. Membership in the Communist International in itself formalized the split between the Communists and moderate social democracy.

In the interwar period, the Communist Party of Germany was not only a major party in Germany but was also the strongest communist party in Europe outside of the Soviet Union. In the four Reichstag elections of 1930–1932, the Communist Party polled between 5 and 6 million votes. The party was then suppressed by the Nazi regime. A considerable number of senior German communist leaders in exile were also executed during Stalin's Great Purge of 1937–1938, and more than a thousand were handed over to Nazi Germany by Stalin's regime. The Soviet-dominated communist parties and the Comintern in the interwar period were the main instruments to export the Bolsheviks Revolution. By the end of the 1920s, the revolutionary upsurge in Europe was over, and communist parties were established in most countries, but in most cases, the Communists did not play a leading role in the labor movement.

After World War II, the Soviet victory over fascism contributed to a surge of popularity of communist parties, even in Western Europe, which were originally established in 1918 to 1923. Communist parties were stronger in the less developed countries of Southern Europe, particularly in Greece and Italy but also in France. However, their influence significantly decreased from the 1980s onward.

The Italian Communist Party was established in 1921 through a split within the Italian Socialist Party. It was outlawed by the Mussolini regime but eventually reemerged as the strongest party of the Left in Italy, and at its peak, it was the largest communist party in Western Europe, with a membership averaging about 1.5 million from the 1940s until the early 1980s. The party was organized like the CPSU, with local sections forming federations, which in turn were grouped into regional committees. Since the late 1940s, the Italian Communist Party has held power in many municipalities, and since the 1970s, it has shared control of major urban centers in the country with the Socialist party. However, much of postfascist politics in Italy was organized around the perceived need to keep the Italian Communist Party out of central government.

The French Communist Party was founded in 1920 as an antisystem, leftist, and secular political organization representing French workers and became especially strong in the industrial areas of northern and eastern France and the suburbs of Paris, obtaining a high of almost 29% of the votes in the 1946 elections. Although the French Communist Party has never won a majority of voters, by the late 1970s, it was the largest of all French parties, with a membership of some 700,000, and a few Communists served in the leftist cabinets in 1981 to 1984 and in 1997. Beginning in the 1970s, some currents in the French Communist Party joined with those of Italy and Spain to advocate a more liberal and pluralistic form of communism, that is, Eurocommunism.

Greek Communists, similar to those in France and Italy, built their leading role on the claim of anti-Nazi resistance during World War II. In 1944, Greek Communists participated in the national unity government, holding a number of important portfolios, including the position of Minister of Finance. After the Greek Civil War in 1946 to 1949, the Communist Party was banned until the restoration of parliamentary democracy in 1974. Two other Southern European communist parties—the Spanish and the Portuguese—were politically strong and at their peak after the transition to democracy in the 1970s. They captured about 15% and 20%, respectively, of the total vote in national elections.

In Western and Northern Europe, with the exception of Finland, communist parties had only a marginal political influence. In Finland, Communists created the Finnish People's Democratic League, which received around 20% of the vote on a regular basis till the end of the 1970s.

Eastern Europe, with the exception of Yugoslavia, became a bastion of Soviet-style communism, as communist parties, relying in most cases on Soviet military presence, were able to win and consolidate power in 1945 to 1948. Nonetheless, all the communist parties of Eastern Europe, with the exception of Albania (the party was founded in 1941), had their origins in the period 1891 to 1921. Communist-led governments after 1945 were formed in East Germany, Hungary, Czechoslovakia, Bulgaria, Romania, and Poland. In some cases, communist parties cemented their power through a merger with other socialist or social-democratic parties, as in the case of the Socialist Unity Party of Germany, the Hungarian Working People's Party, the Romanian Workers' Party, and the Polish United Workers' Party. Soon after coming to power, ruling communist parties abolished free elections and other political freedoms. Attempts to reform the existing regime in the Communist-ruled countries were suppressed directly by the intervention of Soviet-led military forces—as in the German Democratic Republic in 1953, Hungary in 1956, and Czechoslovakia in 1968—justified by the Brezhnev Doctrine of the limited sovereignty of socialist countries or by the repression of the national communist government, as in Poland in 1981 to 1983.

However, the CPSU was not able to maintain unity and control of the international communist movement and communist regimes. As early as 1948, the Yugoslav Communists removed themselves from Soviet subordination. Yugoslavia and Albania were liberated by communist partisans (led by Josip Broz Tito) and without Soviet military aid. This was the main reason to stay largely independent of the CPSU hegemony and to advocate national communism as an independent road to socialism. Albania remained allied with the Soviet Union from 1945 to 1960, but the Party of Labour of Albania was Stalinist even after the CPSU had turned away from Stalinism in the late 1950s. After 1960, it broke with the former USSR and joined ranks with Maoist China.

The supremacy of the CPSU was most challenged by the Chinese Communist Party (CCP). The party was founded in 1921. In 1949, the Chinese Communists were able to win power on their own and established the People's Republic. Since 1949, the CCP, initially led by Mao Zedong, has been the country's only legal party. Organizationally, the CCP followed the model of the CPSU, having at the top a Politburo and Central Committee, together with party committees at the provincial, district, county, and municipal levels. Divergence between the Chinese and Soviet parties gradually emerged from the mid-1950s through ideological disputes and Khrushchev's policy of de-Stalinization; later, it led to a Cold War–like conflict between the two communist nations. At the end, the CCP tried to win over to its side communist parties throughout the world. This was most successful in Southeast Asia and in Albania.

In some Latin American countries, notably Chile, El Salvador, Brazil, Mexico, and Venezuela, mass communist parties exercised considerable political influence but never held power as a single party. They supported, however, various leftist coalitions and sometimes guerrilla activities. The only ruling communist party in Central America is the Cuban Communist Party, which came to power in 1959 through a revolutionary movement led by Fidel Castro. The Cuban Communists were heavily dependent on the former USSR for financial support during the 1970s and 1980s. The Cuban communist government was able to survive the collapse of communism in Eastern Europe after 1989, and Fidel Castro ranked among the world's longest-serving heads of state.

In the 1980s, more than one fourth of the world's population lived under communist rule. Two of the world's most populous nations, China and the former USSR, had communist governments. Communist parties held power in Asia (Afghanistan, Cambodia, Laos, Mongolia, North Korea, and Vietnam), many countries of Eastern Europe (Albania, Bulgaria, Czechoslovakia, East Germany, Hungary, Poland, Romania, and former Yugoslavia), Africa (Ethiopia), and Central America (Cuba).

The communist parties, despite the same or similar principles of organization and similar ideological beliefs, have never been a fully uniform or monolithic phenomenon. It is possible to point out the following distinct phases of development of communist parties worldwide:

a. a period of establishment of these parties as autonomous political organizations in the second and third decades of the 20th century;
b. Bolshevikization and Stalinization of the communist parties in the 1920s and 1930s;
c. a challenge to Soviet hegemony in the communist movement of the late 1940s and 1950s through the ideological split between Tito and Stalin and the rise of Maoism;
d. the de-Stalinization of the CPSU and most Eastern European communist parties in the late 1950s and early 1960s;
e. the rise of Eurocommunism, or "socialism with a human face," primarily in Southern Europe since the 1970s; and
f. perestroika in the Soviet Union and the end of orthodox communism in Eastern Europe in the late 1980s and early 1990s.

Altogether, the 20th century could be called the "age of shine and decline" of communist parties worldwide.

Communist Parties After 1989

With the collapse of communism in the Soviet Union and Eastern Europe, communist parties were severely weakened throughout the world.

CPSU membership declined from about 19.5 million in 1988 to 15 million in 1991, and after the attempted coup d'état in August 1991, it was finally dissolved. Responding to democratic upheavals in the former USSR, European and other communist parties redefined their ideological positions moving in a direction of social democracy. Some of them changed their names, and some disappeared from the political scene altogether.

However, at the end of the 20th century, the transformation of the communist parties was not a linear process. Unlike the communist organizations of Eastern Europe, the CCP was able to stem the democratic protest in the late 1980s and introduced economic reforms from above, which led to an impressive modernization of the country. The CCP is the largest communist party in the world, with an estimated membership of more than 66 million at the beginning of the 21st century.

In some Eastern European countries such as Bulgaria, Lithuania, Poland, and Romania, communist organizations were transformed into social-democratic parties, and these successor parties have achieved significant electoral success. In many post-Soviet countries, except the Baltic States, communist parties survived the demise of the Soviet Union as they were reorganized along national lines. The Communist Party of the Russian Federation was (re)founded in 1993. In general, these parties preserved certain leftist ideological beliefs and regained reduced political influence emphasizing nationalism instead of communist ideology (in Moldova, Ukraine, and Russia).

In recent years, in a number of countries such as Nepal, Cyprus, Brazil, India, Venezuela, South Africa, and Sri Lanka, Communists have enjoyed a certain level of electoral success and shared power in multiparty national and local governments. In five countries—China, Laos, Vietnam, Cuba, and North Korea—communist parties remain in power. However, three countries—that is, China, Vietnam, and Laos—have moved toward market economies but without major privatization of the state sector.

Communist Systems

Communist systems were historically shaped in the 20th century and based on oppressive centralized political power aiming at control over a usually nationalized economy, culture, and society. Such systems appeal to a communist ideology according to which a fully communist system ensures the liquidation of exploitation and equality in a classless society. Because this ideology remained an unfulfilled utopia, the term *communist systems* refers to existing systems based on the characteristics mentioned above: oppressiveness and striving for control over a nationalized reality. According to communist ideology, such systems are supposed to be only transitional forms on the path to full communism, while in reality they are the only form of communism in existence. Although this entry discusses communism considered as a system rather than an ideology, it should be remembered that the communist ideology caused the deaths of tens of millions of victims of communist repression. This ideology was responsible for economic waste and the stifling of human energy that led to the collapse of the system in Europe in 1989 and the fall of the Soviet Union, leaving only a few communist countries on the map of the world.

Communism was a peculiar system in which formal solutions generated their opposites, as many researchers noted (e.g., Alain Besançon, Elemer Hankiss, Robert Sharlet, Jadwiga Staniszkis). Centralization gave rise to spontaneous decentralization, formal regulation resulted in informality, and ideologically based unity brought a diversity that could not be coped with. This is an example of the dynamic of this system. What created communism as a system was an ability to generate and absorb these contradictions in a single whole. A system driven by contradictions was integrated by the relations between particular poles of opposition, with the result that both opposing poles were in need of each other and were strengthened. This created communism as a system and allowed it to reproduce itself. At the same time, however, these contradictions were also a factor for change and adaptation of the system. The informal economy and its relation to the official economy can serve as an example here. The informal economy made it possible to function and somehow also changed the system but, by consuming resources, also contributed to its erosion. These contradictions of the official form of communism were the result of its inability to adapt to social needs and aspirations, and as a result, the contradictions were tolerated by the official system—a mechanism of adaptation extending the life of the system and enabling reproductions.

This entry presents three basic areas of function of communist systems: politics, the economy, and society. Making a precise separation of the three areas is difficult because the specificity of communist systems lay in the powerful tangle of political economic and social structures. At the same time, there was a hierarchy: Politics was the prime cause overriding the other areas.

From Dominance by Politics to a Lack of Politics

In the institutional sense, communism was a system based on the domination of politics over other spheres of life, the organization of life being based on principles of centralism and the elimination of political and social pluralism. One consequence of the aim to eliminate independent structures was an economy based on state ownership, but the economy is just one example of the attempts to subordinate social life to the political authorities. The system sought its justification in an ideology that derived communism from criticism of the structural contradictions of capitalism and promised the creation of a society free from contradictions. Communism in reality has sometimes been seen as a system fulfilling the requirements of the totalitarian model, something rather doubtful in view of the many internal contradictions mentioned above. The totalitarian model then can be seen as a certain type of communist system.

An important characteristic of communism as it actually existed in the political dimension was the paradoxical coexistence of revolutionary mechanisms in the power system and the façade of institutions of parliamentary democracy remaining from the previous system. Although the communist party was the dominant actor, the existence of a government and parliament provided a façade of parliamentary democracy. Its main function was legitimation, although it was also the meeting point and place of negotiation for various group interests, above all at the local level. The communist system, based on the assumption of a unity of interests in society—because after the elimination of antagonistic classes, the basis for opposition of interests was supposed to disappear—had, however, to deal with their real differentiation. These interests were various but in a significant way arose from the segmentation introduced by the system itself, in various branches and sectors throughout the institutional whole. Communism was unable to suspend the working of the laws of economics, which is why real if not overt negotiations and peculiar bargaining appeared in the economy. It was also not able to suspend the generation of interests by all organizational structures—interests in a large part autonomous with respect to central decrees. In an informal way, they had therefore to penetrate the formal structures. This created fertile ground for phenomena related to corruption.

The necessity of taking into account the differentiation of interests in the political sphere in fact marks one of the institutional contradictions of the communist regime. On the one hand, there was the principle of centralism, while on the other, to maintain its ability to reproduce and adapt itself, it was necessary to incorporate into its structure the differentiated interests, at least to an extent that enabled it to continue functioning. The coexistence of those incoherent elements constituted both an opportunity for reform and a limitation on the reformability of the institutional system of communism. The opportunity was created by the incompletely defined character of the boundaries, and the limit was the fundamental contradiction: The more bottom-up representation of interests was strengthened, the more central control was weakened. This mechanism was clearly visible in the case of unsuccessful economic reform.

The aim of total political control not only resulted in its opposite but also led to the disappearance of any meaningful politics. A system in which everything is controlled by politics in fact does not leave room for any politics at all. A lack of real politics, understood as negotiation of pluralistic interests, seems obvious in the case of communism—in which, paradoxically, everything was meant to be politics.

From a Centrally Planned Economy to Disorganization

The economy was one of the spheres in which the communist system was supposed to fulfill ideological aims. In practice, this was a matter of subordination of economic choices to political criteria. This mechanism was based on institutional structures joining economic organisms with the administration of the state, which moreover was the chief owner of the economy. The basis for economic choices and decisions was a system of economic plans whose justification was the overcoming of the irrationality and contradictions of the capitalist economy and the ensuring of social needs by an economy of real socialism. This system created institutional frameworks for the so-called socialist industrialization, which according to the Polish sociologist Witold Morawski was characterized by preeminence of the means of production, central planning, hierarchic administrative control, strong engagement of the party in the economy, and a lack of independent economic institutions.

The striving for political control was manifested in management and planning carried out centrally. The centralist way of planning and the command-distribution system of management was justified strictly by economic necessity; sometimes, it was argued that it was necessary in a situation of limited resources. In practice, it turned out that linking an economy of scarcity to centralization produced the opposite of what was intended. Centralization failed as a mechanism of control precisely when resources were scarce, and it transformed itself into its own opposite, into spontaneous decentralization. Sociologists such as Lena Kolarska-Bobińska have shown that in such a situation of an economic scarcity, real influence was gained by suppliers of resources at the cost of the political authorities, and this is a way of decentralizing without a precise awareness. As a result, the system of management of the economy, instead of being a system of its hierarchical control became instead the space for various games in which organizations and various interest groups within the institutions of management participated. However, that spontaneous decentralization did not damage the essence of the system because it still had at least two mechanisms of control. The first was control by personnel policy, including the *nomenklatura* mechanism, through which the party controlled its personnel. Perhaps, the economy was uncontrollable, but that did not mean that some other source of control gained power. The economy drifted rather than moving in another ideologically unacceptable direction. The economy was further limited by the fact that due to communism's definition of the preeminence of the branch producing the means of production, suppliers of precisely that branch gained more influence and indirectly reinforced the strategic aim of control over the economy. That control at best became more static than dynamic; the economy did not achieve the set goals.

A second source of limitation on the centralizing mechanisms was the cycle of reform. To satisfy the needs of society, the communist economy had to realize economic aims, not merely political ones. The implementation of communism showed that these aims remained in contradiction with one another, and in the last instance, political aims took precedence. The typical cycle of unrealized reform resulted in low effectiveness of management leading to the danger of social upheaval, which was quite frequent in some communist countries (e.g., Poland). In response to this threat to its power, the current government instituted economic reform by loosening its regulation of the economy; however, this decreased control of the economy, which, in turn, heightened the government's fear of losing power, and therefore, the government retreated from this economic policy. In this way, the same political factor (fear of loss of power) led both to the initiation of reform and to withdrawal of the same. This does not mean, however, that the reforms had no effect. Each led to the discovery of successive limits to the reformability of the system. At different points of time during communist rule, various provisions were considered as solutions to existing problems, such as change of cabinets, managerial reform (more independence for directors of firms), and a role for mechanisms of self-government. None of these reforms on its own was introduced systematically, but together, they had a cumulative effect. That accumulation of experience of unsuccessful attempts at reform led in the end to the discovery that it was impossible to reform communist economic policy.

The next characteristic of the communist model of management was emphasis on formal procedures and mechanisms that also generated their own contradictions in the form of the role of informal mechanisms. The inability to satisfy the needs of the population generated various informal mechanisms that can be regarded as types of supply structures. The informal economy is compatible with different systems, but under communism, it fulfilled a specific function. This is because its essence was not avoidance of registration for reasons such as taxation, as happens in market economies. In the nonmarket economy, it served as a mechanism compensating for the deficit of market goods. From this point of view, it can be said that it constituted a necessary supplement to the economy of "first circulation" to a certain degree tolerated by the official system. Therefore, it is possible in fact to talk about a powerful entanglement of formal and informal structures in which the existence of the latter was an important element of the economy.

However, not every deviation from the economic aims of enterprises was a result of informality. Some were direct results of ideological assumptions according to which the workplace was supposed to be a forum for achieving not only pragmatic but also social aims: the socialization of employees to function in conditions laid down and preferred by the system. Creation of the real communist economy was at the same time an attempt to create a class of socialist employees. For this reason, there were various forms of competition, ideological schooling, and methods for satisfying the needs of employees in their role as consumers, not through the market but through the workplace. The whole system of the communist welfare state was based to a large extent on the distribution of various goods through the workplace. The provision of health care, access to cultural events, and education were often tied to the workplace. This social function of the workplace—constituting an element of the ideology—was at the same time functional in addressing the permanent state of economy of scarcity. Distribution through the workplace of consumer goods in short supply was in fact a supply mechanism of the economy of scarcity. Simultaneously, it found its justification in the ideology of the system.

Society: From a Myth of Unity to Real Contradictions

The model of communist society in its actual form never achieved full unity. This section first outlines the mechanisms creating inequality into a system appealing to the idea of equality and then discusses the rejection of the legitimization of the system that according to its ideology rested on mass support.

The real communist principle of "from each according to his usefulness to the authorities" infringed the principle of "from each according to his work," which was an element of the ideological basis of communism. The two therefore were in contradiction and, what is more, infringement of either of them brought about a crisis of legitimization with respect to the basic principles of the identity of the system. The mechanisms of the deviation from the principle of "from each according to his work (ability, contribution)" were largely caused by politics that by a system of priorities favored defined institutional segments of the system. In the economic sphere, it was the branch of production of the means of production, and above all heavy industry, and those segments of machine building that were useful for military production. This was not just a matter of ideologically motivated segmentation. In the case of the real economy of scarcity, branches or indeed firms producing scarce consumer goods took on particular importance.

This whole mechanism demolished in an obvious way the official vision of social stratification. It led to the decomposition of status factors described in the literature by shaking the tie between contribution of work measured in terms of—for example—qualifications and prestige or earnings. Instead, in the definition of the level of income from work, or more broadly the economic position of the individual, an essential role was played by the branch of industry or indeed the type of organization in which one worked. Systemic sources of social inequality in communism were supposed, in theory, to ensure the political stability of the system but, in practice, led to further erosion of its legitimization. This is because it was not possible to justify any of the legitimizing principles—by appeal either to the slogan "from each according to his work" or to the slogan "from each according to his needs." This is another example showing how the adaptive mechanisms generated by systemic incoherence sustained its further reproduction in the short term while, in the longer term, contributing to its collapse.

All this revealed that mass legitimization (the conviction that subordination to the system is morally justified) was a myth to be replaced by multiple processes of adaptation. Various authors have shown that adaptation rather than legitimization was the factor maintaining stability, albeit within a limited scope and for a limited time. It lasted for some time, however, and those factors of accommodating stabilization were varied and evolving. There were attempts to substitute economic achievements for political legitimization, with a relative quasi legitimization or various forms of pragmatic adaptation to the system.

Without doubt, the establishment of the Solidarity trade union in Poland in 1980 dealt a vital blow to the legitimizing myths of communism. This was because for the first time, workers questioned the myth of unity of interests in an open and in fact institutionalized manner. They demanded neither joint management nor participation in decisions, as had occurred after 1956 on the wave of popularity of self-management. Rather, the demand was for trade unions as separate organizations that would serve their interests as employees, interests that they did not see as identical to those of their employers. This was the beginning of the end of the system based on the myth of unity of those interests because the state under real communism was supposed to be precisely the representative of employees' interests since that was why private ownership of the means of production was abolished. In this way, the legitimizing myth of communism came to an end. Before that happened, however, communist systems were torn by waves of outbreaks of social dissatisfaction (e.g., during 1956 in Hungary and in 1970, 1976, and 1980 in Poland) prompted by frustration with an inefficient economy that failed to meet workers' interests and economic needs. By degrees, however, these revolts took on a political character and articulated a demand for institutional change, one example of which was the creation of trade unions independent of the authorities, as noted previously.

Variations in Communist Systems

Communist systems were not static; they underwent change over time. This dynamic was one of the two fundamental sources of their variety. The second was differentiation resulting from various traditions and social and cultural conditions. The first communist state constituting a sort of template of the system was the Soviet Union. (Formally, it was established in 1922; however, Soviet Russia came into existence in 1917 and was not dissolved until 1991.) The government of Joseph Stalin (1878–1953), who led the Communist Party in the USSR from 1922 until his death, can be seen as the formative period of the institutions of the communist system. This period coincided with the building of the military position and the significance of the communist system that controlled many countries of Central and Eastern Europe after World War II (1939–1945), realizing the imperial mission of the Soviet Union in the face of the passivity of the West with respect to the expansion of the USSR, recently an ally in the war against Nazi Germany. The building of this position was achieved at the cost of millions of victims of a whole system of repression comprising police terror, administration of justice entirely under political control, and a system of labor camps. Estimates of the number of victims of the entire communist system fall, according to Jean-Louis Margolin and

Nicolas Werth, in the range of between 65 million and 93 million (Stephen Courtois et al., 1999). After the death of Stalin, the communist system underwent gradual liberalization, with a somewhat looser political control over different spheres of life and a weakening of the system of mass repression against individuals and groups seen as enemies of the system. Even though the wave of terror and repression of Stalinist times did not return, nevertheless, the systems never achieved complete liberalization because their full realization would have simply meant questioning their very essence.

Apart from changes over time, it is also worth noting local variations in the communist system. Communism was introduced by force after World War II in many countries of Eastern and Central Europe and was brought to an end by the peaceful revolutions of 1989. Since 1949, a communist system has prevailed in China, which today has a population of more than 1.3 billion; communist systems also exist today in North Korea and Cuba. There is therefore a group of communist countries with varied traditions and social and ethnic structures. Communist systems within Europe were also quite varied. For example, the Romanian variant, which maintained a certain independence from the Soviet Union, was much more repressive than the Hungarian or Polish versions, while the Yugoslavian variant in turn strongly accented self-management (under the control of the Communist Party, however). Taking the Asian variants into account only deepens the differentiation. The Chinese model links a powerful, almost fully market economy with political control by the Communist Party; in contrast, the North Korean model approaches the totalitarian model in the scale of its control and repression. In spite of the differences among communist systems, the limits to change were defined, and attempts to cross them met with refusal. They were emphatically manifested in the military interventions by the Soviet army in Hungary in 1956 and in Czechoslovakia in 1968 (when the Soviet army was accompanied by those of a group of countries from the Warsaw Pact) and also the introduction of martial law by the Polish Communists in 1981. In each case, these actions constituted a brutal reaction to attempts to liberalize the communist systems.

Collapse of Communist Systems

The sources of the downfall of the communist system lie above all in its inability to accommodate itself to social needs and aspirations. This brought about many manifestations of dissatisfaction and the establishment of movements of opposition to communism in many countries (e.g., Sajudis in Lithuania, Charter 77 in Czechoslovakia, and the Workers' Defence Committee in Poland). The catalyst for these changes was without doubt the disintegration of the Soviet Union, being an unintended effect of reforms begun by Gorbachev, leader of the Soviet Communist Party in the last period of existence of the USSR. Additional factors in the erosion of communist systems were the opposition to communism and the diplomatic efforts of Pope John Paul II. It is a unique phenomenon in the history of civilization that basically, apart from certain exceptions, the collapse of the Soviet Union and the communist systems in the European countries took place peacefully, mainly as a result of negotiation by opposition elites with the communist authorities.

Communist systems, then, had internal sources of dynamics and change. The dynamic was neither ideologically based, nor one consisting exclusively of constant protest under which communism eventually folded and collapsed. It was also a matter of a dynamic resulting from contradictions generated by the system itself that turned out in the end to be insurmountable and that led to its collapse.

Not all the cracks in the systems arose from contradictions generated by the dynamic of communism: Some of them were the result of the persistence of certain systemic remnants from the previous regime (in certain countries, e.g., in Poland, a large role was played by private ownership of agricultural land and by the Roman Catholic Church).

In this way, then, the processes of adaptation that made continuation of the system possible, in the end, also constituted the seed of its collapse, as they led to erosion of resources that finally rendered the system incapable of production. They were, therefore, the source of the persistence of the communist system, its modification, and finally its collapse.

Communitarianism

Communitarianism is a social philosophy that builds on the assumption that the good should be defined socially. This core assumption is in sharp contrast with liberalism, which assumes that each person ought to determine the good individually. Communitarianism stresses that individuals are socially "embedded" rather than free agents, that people have social responsibilities to each other, to their communities, and to the common good.

Although communitarianism is a small philosophical school, it has a measure of influence on public dialogues and politics, especially as an antidote to the laissez-faire conservatism championed by Margaret Thatcher in Britain and Ronald Reagan in the United States. President Barack Obama gave voice to communitarian ideas and ideals in his book *The Audacity of Hope* and repeatedly during the 2008 presidential election campaign, calling on his fellow citizens to "ground our politics in the notion of a common good" (2006, p. 9), for an "age of responsibility" and to forgo identity politics in favor of building community-wide unity. At the same time, it should be noted that many in the West consider *communitarian* an awkward term that evokes misleading associations. Hence, Obama, as well as other public leaders who have embraced communitarian themes, such as Tony Blair in the United Kingdom and Bill Clinton in the United States, avoid the term itself.

Branches of Communitarianism

Academic (Philosophical) Communitarianism

In the 1980s, communitarian thinking was largely associated with the works of political philosophers such as Charles Taylor, Michael Sandel, and Michael Walzer. Others sometimes associated with this group include Alasdair MacIntyre, Seyla Benhabib, and Shlomo Avineri. These scholars called attention to the mistaken assumptions about the nature of the self on which liberal philosophy, especially as espoused by John Rawls, rested. Liberalism, these communitarian critics pointed out, views the person as divorced from all his moral commitments and communal attachments. These communitarians challenged this view, depicting the self as fundamentally "situated" or "contextualized" in a given culture, within a particular history, and with a particular set of values. These academic communitarians, and the sociologists who preceded them, like Émile Durkheim and Ferdinand Tönnies, stressed that individuals in viable communities not only flourish as human beings but also are more reasonable and productive than isolated individuals. Only if social pressures to conform rise to excessively high levels do they undermine the development and expression of the self.

Academic communitarians also argued that the nature of the political community was misunderstood by liberalism. Where liberal philosophers described a neutral framework of rules within which a diversity of commitments to moral values can coexist, communitarians showed that such a "thin" conception of political community was both empirically misleading and normatively dangerous. Good societies, according to these authors, rested on much more than "neutral" rules and procedures; they relied on shared moral culture.

Some academic communitarians argued even more strongly on behalf of particularistic values, suggesting that, indeed, these were the only kind of values that mattered and that it was a philosophical error to posit any universal moral values. Alasdair MacIntyre wrote that human rights are as real as unicorns. Michael Walzer initially argued that concrete universal values were philosophically illusory and that societies could be measured only according to their own particularistic moral standards. As the debate over abstract universal values gave way to a discussion about cross-cultural justifications of human rights, the problems of such a relativistic position came to be widely (though not universally) acknowledged. In the 1990s, responsive communitarians developed a position that accommodated both particularistic and universal values (see below).

It should be noted that, despite being widely referred to as communitarians, Taylor, Sandel, and Walzer systematically avoided the term. Arguably, this was the case because the term used to be, and to some extent still is, associated with authoritarian communitarianism.

Authoritarian Communitarianism

Often referred to as East Asian communitarians, authoritarian communitarians argue that to maintain social order and harmony, individual rights and political liberties must be curtailed. They hold that individuals find their role and meaning in their service to the common good, are organic parts of a great whole, just as human cells are in a human body.

Some East Asian communitarians believe in the strong arm of the state (e.g., former Singaporean Prime Minister Lee Kuan Yew and Malaysian head of state Mahathir Bin Mohammad) and some in strong social bonds and the voice of the family and community (especially the kind of society Japan had, at least until 1990). Authoritarian communitarians argue that the Western value of *liberty* actually amounts to social, political, and moral anarchy and that legal and political rights are a distinctively Western idea that the West uses to impose its own vision on other cultures, which have their own preferred values. Over the years, East Asian communitarians have moderated many of these claims, have made more room for individual rights, and have been increasingly eclipsed, at least in the West, by responsive communitarians.

Responsive (Political) Communitarianism

Early in the 1990s, a new group was founded by Amitai Etzioni, working with William A. Galston, which took the communitarian philosophy from a small academic group, introduced it into public life, and recast its academic content. The group, variously referred to as "responsive," "neo," or "political" communitarians, stressed the importance of society and its institutions above and beyond that of the state and the market, the focus of other public philosophies. It emphasized the key role played by socialization, moral culture, and informal social controls rather than state coercion or market pressures. Responsive communitarianism served as a major correction to authoritarian communitarianism by stressing that strong rights presume strong responsibilities and that one should not be neglected in the name of the other.

The group started by forming a platform, whose drafters included Mary Ann Glendon (law); Thomas Spragens Jr.; James Fishkin and Benjamin Barber (political science); Hans Joas, Phillip Selznick, and Robert Bellah (sociology); and Alan Ehrenhalt (author). The platform was initially endorsed by more than 150 public leaders from across the political spectrum. The voice the group raised was soon found in numerous op-eds and public lectures and on TV and radio programs in a considerable number of countries. The group also issued several position papers on subjects such as organ donation, character education, and HIV testing. In the 1990s, several of the members of this group worked with the New Democrats and advocates of the Third Way in Europe.

The ideas of the group were further developed, both on the public side and on the academic side, in books and in an intellectual quarterly, *The Responsive Community*. These works stressed that social institutions and public policies should reflect shared values and the common good in addition to aggregation of individual preferences, which themselves are culturally penetrated. Beyond universal principles, communitarianism emphasizes particularism, the special moral obligations people have to their families, kin, communities, national societies, and the nascent global community.

Responsive communitarians showed that society is best understood not as composed of millions of individuals, but as pluralism within unity. That is, subcultures and loyalties to various ethnic and regional communities do not undermine the integrity of society as long as a core of shared values and institutions—such as the Constitution and its Bill of Rights, the democratic way of life, and mutual tolerance—are respected. These observations are of special import today for societies that are in the process of coming to terms with mass immigration (e.g., many European societies and Japan) and in which minorities are questioning their place in the national whole (Quebecois, Scots, Basques, Sunnis in Iraq, etc.).

Although this model of the good society is applicable to all societies, at different moments in history, a given society is likely to miss the desired balance between rights and the common good or between particularistic loyalties and society-wide bonds but in a direction different from that of others. Hence, different societies may need to move in different directions in order to approximate the same balance. Thus, contemporary East Asian societies require moving toward much greater tolerance for individualism and pluralism, while in American society, as Robert Bellah and his colleagues along with many others have shown, excessive individualism ought to be reined in.

Applications of Responsive Communitarianism for Political Science

The following are a few illustrative, salient issues to which responsive communitarianism has contributed.

International Relations Theory

Although communitarianism has dealt mainly with national societies, it has also been applied on the international level. Given the rapid increase of pressing transnational issues, such as environmental degradation, illegal immigration, financial crises, transnational mafias, and terrorists with global reach, the need for significant changes in transnational governance (sometimes referred to as global governance) seems evident. As a rule, transnational problems are still tackled by the Old System—by national governments and the international organizations managed by national representatives and funded by national allotments. But in most cases, this Old System has proved to be inadequate to cope with these problems.

Communitarians have addressed the question of how new transnational institutions may be constructed. They argued that just as in early ages, loyalties and commitments once limited to local communities were transferred in part to national communities, in the future, some such transfer will have to take place to global institutions. Supranationality, the concept that forms the backbone of the communitarian theory of international relations outlined here, characterizes a political body that has acquired some of the attributes usually associated with a nation, such as political loyalty and decision-making power, based not on an aggregate of national decisions or those made by representatives of the member states but rather on those made by the supranational bodies themselves. Their capacity to make decisions on their own terms allows supranational bodies to move with much greater agility and speed than international organizations. At this stage, few such institutions exist and those that do face strict limitations because nations still form the major communitarian bodies. A study of the International Criminal Court, the Internet Corporation for Assigned Names and Numbers, and the World Trade Organization illustrates this point. The European Union, the most advanced attempt to form supranational institutions, is not global but regional, and it too, so far, has had only limited success in transferring significant communal loyalties to a transnational level.

Homeland Security

Liberals and especially libertarians tend to seek to protect individual rights against the claims of homeland security. For instance, they call for treating terrorists like other criminals, according them the full rights of citizens. East Asian communitarians tend to hold that security is a common good that trumps individual rights and, hence, support policies that give up civil liberties for the sake of security. Responsive communitarianism holds that there must be a carefully crafted balance between rights and security and that the point of balance changes as technical and international conditions change. They point out that courts in free societies regularly use the terminology of balance between the public interest and individual rights and allow the latter to be curtailed when they undermine a "compelling public interest"—for instance, allowing the violation of privacy of sex offenders in order to protect children from sex abuse and authorizing wire taps for suspected killers. Responsive communitarians have extended the same concept to homeland security.

On reviewing new security measures introduced in the United States after the terrorist attacks of September 11, 2001; in the United Kingdom after the IRA's terrorism; and in Spain after the Madrid train bombings, responsive communitarians found a somewhat more complex picture than the claim that fear mongering had led to wholesale violations of rights ("privacy is dead") or that rights advocates block vital security measures (indeed that even raising such questions is "aiding and abetting the enemy").

Some measures are fully justified, indeed overdue. These often entail a mere adaptation of the law for technical developments. For example, the Foreign Intelligence Surveillance Act (FISA) of 1978 provided guidelines under which a federal agent could obtain authorization to conduct surveillance for "foreign intelligence purposes." Prior to 9/11, wiretap warrants were limited to a given phone. Due to the increasing use of multiple cell phones and e-mail accounts over the last decades, federal officials engaged in court authorized surveillance under FISA could not follow suspects as they changed the instruments they were using unless they got a new court order for each communication device. The USA PATRIOT Act, enacted in October 2001, amended the FISA law to allow what is called "roving surveillance authority," making it legal for agents to follow one suspect, once a warrant is granted, whatever instrument he or she uses. It seems that unless one holds that terrorists are entitled to benefit from new technologies but law enforcement is not entitled to catch up, this is a reasonable measure. (Note that the American constitution bars only "unreasonable" searches and was never absolute in this matter. Although the PATRIOT Act has become a symbol for great excesses in hasty pursuit of security, only a small fraction, about 15 of its more than 150 measures, have been seriously contested. Most are considered reasonable.)

Whatever the new security risks, there are measures that no nation should resort to. These taboo tactics should remain so even if one's adversaries employ them. Banning these measures sets free societies apart from those whose regimes and actions are illegitimate and provides them with the moral high ground. Key examples of such measures are torture, the indefinite suspension of habeas corpus, and mass detention on the basis of race, ethnicity, or national origin.

Further, responsive communitarians hold that many measures are neither inherently justified because enhanced security requires them nor inappropriate because they wantonly violate rights. Instead, their status is conditioned on their being subject to proper oversight. A measure that may seem tilted toward excessive attention to security may be tolerated if closely supervised by oversight organs, while a measure that is judged as tilting toward excessive attention to individual rights may be tolerated if sufficient exceptions are provided that are backed up by second balance organs. That is, new measures can either be excessively privileged (undermining either security or the regime of rights) or excessively discriminated against (leading to inaction on behalf of either element of a sound balance).

The balance sought here is not between the public interest and rights but between the supervised and the supervisors. Deficient accountability opens the door to government abuses of power, and excessively tight controls make agents reluctant or incapable to act.

In effect, the history of homeland protection can be told in terms of lack of accountability being overcorrected, which in turn is overreduced, in the quest for a sound balance. In the United States, the FBI went way overboard in its surveillance of alleged Communists and civil rights activists. In the 1970s, the FBI was reined in by the Church Committee and additional rules the FBI itself issued—rules that in turn became one reason why 9/11 was not prevented. In reaction, the Bush administration introduced a large number of extreme security measures—which were curtailed by the Obama administration as of 2009. Whether the proper balance has been reached between rights and security and the proper level of accountability is far from clear.

Communal Moral Dialogues as Agents of Change

Thus far, this entry has focused on responsive communitarianism's answer to the question of what makes a good society—a balance between social order and individual rights. The remainder of this entry deals with the next question of how understandings of the good are shaped and spread in societies.

One widely shared liberal answer to the question just articulated—what are the main ways and processes by which people's sense of what is legitimate is shaped and reshaped?—is provided by the students of deliberative democracy. These authors point to "reasoned deliberations" as the key way in which citizens of a democracy come to change their judgments and emphasize "cool" and rational processes while minimizing the role played by emotions and other such "hot" factors.

Responsive communitarians argue that such cool, rational deliberations are almost impossible to achieve or even to approximate under most circumstances. The examination of actual processes of decision making, especially when they concern normative matters, shows that they are much more impassionate and proceed by means different from those depicted by the champions of deliberative democracy. More important, deliberative democracy is the "wrong" model for determining the normative bases of political acts—for determining the good. Instead, individual preferences and judgments are shaped largely through interactive communications about values, through "moral dialogues" that combine passion with normative arguments and rely on nonrational processes of persuasion, education, and leadership. According to responsive communitarians, although information and reason have an appropriate role in dialogues about which policies are legitimate, information and reason play a much smaller role than is often asserted. This is so both because they are much weaker tools than believed and because a much greater role is played by another factor: the appeal to values.

Moral dialogues often have no clear opening point or closing event. They are prolonged, heated, and seemingly meandering. However, they often lead to new or reformulated shared normative understandings (cases in point follow). Even very large and complex societies engage in moral dialogues that lead to changes in social definitions of the good. These dialogues take place by linking millions of local conversations (e.g., between couples, in neighborhood bars, in coffeehouses or teahouses, and around watercoolers at work) into society-wide networks and shared public focal points. They take place during regional and national meetings of many thousands of voluntary associations in which local representatives dialogue—in state, regional, and national party caucuses; in state assemblies and in Congress; and increasingly via electronic links (e.g., groups that meet on the Internet). Focal points of these dialogues are national call-in shows, debates on network television, and nationally circulated newspapers and magazines.

Society-wide moral dialogues are often fostered, accelerated, and affected by public events such as hearings (e.g., the Clarence Thomas/Anita Hill case focused discussion on sexual harassment), trials (e.g., the 1925 Scopes trial challenged the normative standing of evolution), and demonstrations (e.g., those that highlighted the normative case against the war in Vietnam).

A brief illustration follows. Until 1970, the protection of the environment was not considered a shared core value in most societies. A book, Rachel Carson's *Silent Spring*, which was very widely read and discussed, triggered a society-wide moral dialogue. A massive oil spill and the ensuing protests and the Three-Mile Island incident further established the subject on the national normative agenda. An estimated 200,000 people gathered on the Capitol Mall in 1970 in Washington, D.C., to demonstrate concern for the environment on Earth Day. These are a few of many such incidents. All these served as dialogue starters and were followed by billions of hours of dialogue, culminating in a shared sense that both persons and communities had a moral commitment to Mother Earth.

The new commitment was strong enough to legitimate various public acts. It moved a conservative president, Richard Nixon, to establish the Environmental Protection Agency and pushed Congress to introduce many policies favorable to the environment, such as recycling and Corporate Average Fuel Economy (CAFE) standards. Similar dialogues led to profound changes in what is considered just treatment of minorities, especially African Americans (dialogues triggered and nurtured by the civil rights movement), relationships between genders (by the women's movement), and many others. Some current dialogues in American society, concerning same-sex marriage and the death penalty, have already affected the normative culture and public policies, though they are less advanced than those listed above.

The opening up of many societies (especially former communist ones), the spread of education, the widening of people's attention horizon from the local toward the national and even global public affairs, the rise of worldwide TV networks (the "CNN effect"), increased travel and immigration, and the World Wide Web—all arising over the past few decades—have led to the development of transnational moral dialogues, in general, and dialogues about what is considered legitimate, in particular. These are global not in the sense that all citizens participate, let alone agree, but in that these dialogues reach across most borders. Thus, concern for the environment now is very widely shared; following transitional moral dialogues, a widely shared understanding evolved that the 2003 invasion of Iraq by the Bush administration was not legitimate; and shared moral understandings have been inching forward on matters as different as the bans on sex tourism, land mines, and whale hunting.

COMPARATIVE METHODS

At the most general level, the term *comparative methods* may be used to refer to any research technique that focuses on patterns of similarities and differences across cases. More commonly, however, the term is used to refer to a family of techniques employed by small-*N* researchers. It is this family of techniques that is the main focus of this entry. Though comparative methods do have particular advantages for small-*N* researchers, there is no inherent connection between comparative methods and small *N*s. The development of formal methods of comparative research—specifically, qualitative comparative analysis (QCA) and related techniques—has facilitated the extension of comparative logic, which is configurational in nature, to large-*N* studies.

This entry has six major sections. The first emphasizes the case-oriented nature of comparative research. This feature clearly differentiates it from conventional variable-oriented research and underscores its broad links to qualitative inquiry in general. The second section considers the goals of comparative research, linking comparative research to both inductive theory building and deductive theory testing. The logic of comparative analysis is the central focus of the third section. The importance of the analysis of set-theoretic relations to comparative research is emphasized, and the analysis of sufficiency and necessity is linked to subset and superset relations. These connections are important because much of social science theory is formulated in terms of set relations, and it is important to use analytic methods that are true to theoretical formulations. The language and logic of sets underlie both informal and formal methods of comparative analysis, which is the topic of the fourth section. Traditionally, comparative researchers have made use of informal methods, explicitly or implicitly relying on John Stuart Mill's methods of agreement and difference. Over the past 2 decades, Charles Ragin has formalized the comparative method as QCA, which is discussed in detail in this section. In the fifth section, discontinuities between comparative research and conventional variable-oriented research are addressed, and in the closing section, current development in formal methods of comparative analysis is described.

The Case-Oriented Nature of Comparative Research

Comparative researchers tend to conceptualize causality in terms of necessity and sufficiency. A common concern is the combination of conditions that are sufficient for an outcome. Often, comparative researchers find that different combinations of causal conditions generate the same outcome. This approach to causal conditions is distinct from that of variable-oriented research programs, which seek to identify the net effect of each independent variable on the dependent variable, isolating its effect from that of competing variables.

While the sufficiency of causal combinations is a major preoccupation of comparativists, necessary conditions are also important, especially to theory. For example, Barrington Moore's famous maxim, "No bourgeoisie, no democracy," exemplifies the necessary condition: The rise of a capitalist class is necessary for—but by no means guarantees—the development of democracy. The bourgeoisie would also need to resist domination by the aristocracy and peasantry, promote the development of commercial agriculture, and participate in a revolutionary break with the past. This combination of conditions, Moore found, was sufficient to produce a democratic state in the cases he studied.

The analysis of necessity and sufficiency requires that cases be considered on their own terms, as interpretable wholes. To identify and make sense of the bourgeoisie's revolutionary role, Moore conducted a series of historical case studies. For each case, Moore examined how various aspects of the case (e.g., the relationships among the bourgeoisie, aristocracy, and peasantry and the development of commercial agriculture) interacted with and influenced each other. This is the defining characteristic of case-oriented research: A case constitutes a coherent whole, and its various aspects are understood relationally. Thus, case-oriented research is inherently *configurational.* The comparative aspect of comparative research, therefore, is the comparison of configurations of interconnected aspects—the cross-case analysis of configurations of similarities and differences.

Within the social sciences, comparative research is most commonly associated with small-*N* macrocomparative research. But in fact, its logic may be applied at any level of analysis. The same techniques that a macrolevel comparative researcher might use to examine the relationship between economic development and the emergence of democracy could be used by a microlevel comparative researcher exploring the relationship between religious beliefs, socioeconomic status, and divorce. What matters is not the number of cases under investigation but that the researcher make sense of these cases by treating them as instances of interconnected aspects, respecting their coherence and integrity as cases.

There is, of course, always a trade-off between the breadth and the depth of an analysis, and it is the researcher's responsibility to determine whether a given research question is best answered by examining fewer cases in great detail or more cases in less depth. Generally, this choice is dictated by the goals of the research.

The Goals of Comparative Research

Comparative methods can be used for either theory development or evaluating hypotheses. When developing theory, the researcher conducts a series of case studies, strategically selecting cases so as to produce an accumulation of knowledge. For example, a specific type of evidence that is not available in one case may prompt the investigator to select for his or her next study a case that offers this evidence. Questions raised by previous case studies direct the investigator's subsequent case selection. In this manner, comparative researchers can develop their theoretical arguments inductively, building their theories from the bottom up. This grounded approach of theory development can be contrasted with a deductive, hypothesis-testing approach that begins with multiple cases. Here, the researcher starts with a preliminary specification of the relevant cases. For example, a researcher interested in testing Theda Skocpol's theory of social revolution would begin by identifying cases that fall within her specified scope conditions, as explained by Gary Goertz in his book *Social Science Concepts: A User's Guide*. The researcher would then examine the characteristics of these cases to see if they are consistent with Skocpol's theory—namely, that countries experiencing social revolutions exhibit the relevant causal conditions (e.g., state breakdown combined with peasant revolts and some form of international pressure).

The inductive approach to comparative research seeks to develop an individual explanation for each case, in relative isolation from other cases. Of course, it is impossible for researchers to wear blinders or forget what they have already learned, and knowledge of one case will invariably influence one's understanding of subsequent cases. Nor would such a "clean-slate" approach be desirable—the knowledge gained during the research process assists the researcher in determining where to focus his or her attention next. Still, the goal of the inductive approach is to produce a series of individual case studies, allowing for maximum diversity. It is only on completing the individual case studies that the researcher turns to the task of making an encompassing comparison. The researcher examines each case against the others, sometimes by applying formal techniques, such as QCA. The goal of this cross-fertilization of case studies is to identify what the cases do and do not have in common. The researcher uses these comparisons to develop an analytic frame that clarifies the nature of the cases under investigation and their relationship(s) to one another. The construction of this analytic frame produces a structured theoretical account of the cases that may be used to identify cross-case patterns of similarity and difference (e.g., different paths to the same outcome).

Where the inductive approach concludes with the development of an analytic frame, the deductive approach begins with it. Based on existing theoretical and substantive knowledge, the researcher develops an analytic frame to guide his or her investigation of the hypothesis that he or she intends to test. Here, think of an analytic frame as akin to a survey instrument that "interrogates" each respondent (case) in a uniform manner. The analytic frame directs the researcher's investigation, identifying plausible cases for inclusion in the analysis and telling him or her which characteristics of the cases to examine, what questions to ask, and how to record the information. Fundamental to the deductive approach are the goals of unbiasedness and efficiency, both of which a clearly defined analytic frame helps achieve. Having completed data collection, the researcher then seeks to assess the hypothesis. As in inductive comparative research projects, a formal technique such as QCA may be used to simplify the analysis. In fact, it is somewhat more common for QCA to be used in deductive comparative research than in inductive research because *N*s tend to be larger.

The inductive and deductive approaches are combined when a researcher seeks to study a theoretically specified range of cases. As with the deductive approach, the researcher relies on a preexisting analytic frame to guide case selection. Here, the analytic frame serves as a device for classifying cases according to aspects of theoretical or substantive interest. For example, the researcher might construct a contingency table cross-tabulating the level of development of countries with their level of democracy. The researcher then seeks to fill each cell of this table with at least one case. He or she can then subject these cases to in-depth, inductive analysis, confident in the knowledge that important case aspects are well represented in the study.

Inductive comparative research proceeds in a bottom-up fashion, accumulating case knowledge so as to generate new theory. By contrast, deductive comparative research follows a top-down formula. Beginning with theory, the deductive comparative researcher seeks out cases to subject to some form of hypothesis testing. Of course, neither of these strategies is practiced in pure form, and there are many examples where the two are explicitly blended. Regardless of the direction in which the research proceeds, however, the same basic analytic logic is employed.

The Logic of Case-Oriented Comparison

As noted previously, comparative research is fundamentally case oriented. Cases are conceived as configurations, and comparison of these configurations is achieved by categorizing cases into sets. Thus, the logic of comparative research is fundamentally set theoretic. Set-theoretic social research, based on Boolean algebra, involves the analysis of set relations, especially the identification of subset relationships. Most social theoretical statements are framed in terms of subset relationships. For example, when social researchers observe that "religious fundamentalists are politically conservative," they are specifying a subset relationship: Religious fundamentalists constitute a subset of political conservatives. The observation that economically developed countries are democratic follows the same pattern; the conjecture is that the former constitute a subset of the latter.

Subset relationships such as these—ones in which the cause (e.g., religious fundamentalism or economic development) is a subset of the outcome (e.g., political conservatism or democracy)—are consistent with a relationship of sufficiency. That is to say, membership in the set of religious fundamentalists (economically developed countries) is sufficient for membership in the set of political conservatives (democratic countries). Conditions of necessity, by contrast, are identified by establishing that the outcome is a subset of the cause. Referring again to Moore's maxim, which may be understood as the specification of a subset relationship, democratic countries (outcome) constitute a subset of countries with a bourgeois class (causal condition).

Of course, subset relationships need not be perfect. For example, there are certainly some religious fundamentalists who are politically liberal. Some relationships, therefore, might be more accurately characterized as "rough" subsets. Ragin has proposed a measure of set-theoretic consistency that assesses the degree to which a given set of evidence conforms to the subset relationship. Clearly defined subset relationships produce high consistency scores; as consistency drops, the claim that a rough subset relationship exists is less tenable.

While having a measure of set-theoretic consistency is useful for assessing subset relationships empirically, researchers ultimately must rely on their theoretical and substantive knowledge (which includes their knowledge of the cases under investigation) when determining whether the claim that a subset relationship exists—even a rough one—is justified. Social life is complex, and perfect subset relationships are rare, especially when the number of cases is large. Individuals, for example, are notoriously inconsistent. Although it is highly unlikely that an individual with little education will achieve a high-prestige occupation, it has happened. Whether such occurrences are considered common enough to challenge the claim that a rough subset relationship exists between education and occupational prestige is a determination that the researcher must make. Is a high level of education "almost always necessary" for a high-prestige occupation? Such questions cannot be answered through the rote execution of a consistency calculation but instead require that researchers apply their theoretical knowledge and interpretive skills.

The analysis of set-theoretic relations has other uses, in addition to the assessment of conditions of necessity and sufficiency. Set-theoretic analysis also facilitates theoretical development by providing an empirical basis for constructing and evaluating ideal types. Max Weber conceived of the ideal type as a "one-sided exaggeration" that serves to distinguish a class of social phenomena. The usefulness of the ideal type, Weber argued, is that it is not designed to perfectly represent all aspects of the phenomenon under investigation but, rather, its essential aspects. Once these essential features have been established, it is possible to assess, using set-theoretic methods, the degree to which empirical cases conform to the ideal-typical formulation.

The categorization of cases according to their degree of memberships in sets (using fuzzy sets) is crucial to assessing their degree of conformity to an ideal type. Gøsta Esping-Andersen's distinction among types of welfare regimes is a case in point. There are, of course, no pure cases of liberalism, social democracy, or corporatism. In practice, states of each type borrow from the others. How, then, does one decide on the proper categorization of welfare states? The first step is to conceive of each welfare regime as an ideal type and to specify the essential elements that constitute it as a type. These elements can then be formulated as sets, and the degree of membership of each empirical case in each set can be assessed (via fuzzy-set membership scores). The membership of each empirical case in each ideal-typical regime type is given by the minimum of its memberships in the constituent sets for each regime type. (Using the minimum in this way is known as fuzzy-set intersection.) The use of the minimum is based on the simple idea that degree of membership of an empirical case in an ideal type is only as strong as its weakest link (lowest membership score), a principle that follows from the theoretical notion of the ideal type as a specific combination or coalescence of essential elements. The analysis of necessary and sufficient conditions and the construction of ideal types are not necessarily independent of one another. Frequently, the results of one analysis will prompt the researcher to reconsider the results of the other. Whether they recognize it or not, comparative researchers commonly engage in both forms of analysis.

Formal Versus Informal Methods of Comparative Research

Classical studies in comparative political economy such as Barrington Moore's *Social Origins of Dictatorship and Democracy* and Theda Skocpol's *States and Social Revolutions* rely on informal methods of comparative analysis, and to date, most comparative researchers continue in this tradition. It was with the publication of *The Comparative Method* in 1987 that formal methods of comparative analysis first gained prominence. Informal and formal comparative methods share an underlying logic and, in the hands of a capable researcher, will produce the same general conclusions. The difference is that formal methods explicitly make use of Boolean algebra to structure the analytic process.

The logic of comparative analysis and inductive inquiry in general can be traced to the work of John Stuart Mill and George Boole. In *A System of Logic*, Mill proposed a series of methods of inductive reasoning that would lay the logical foundation of informal methods of comparative research. Contemporaneously, Boole was developing his calculus of truth values. Boolean algebra, as it came to be known, would develop into set algebra and, ultimately, be integrated into formal methods of comparative research, especially QCA.

Mill's Method of Agreement and Indirect Method of Difference

The simplest of all comparative logics are Mill's method of agreement and his indirect method of difference, both of which assume that any given outcome has one and only one cause. Although Mill described these methods in terms of individual causes, it is straightforward to extend these methods to accommodate combinations of causal conditions when it makes sense to conceptualize them as decisive causal conjunctions. A researcher using the method of agreement examines a set of cases, each of which exhibits the same outcome. If the researcher finds that all the cases share one or more causal conditions, he or she can infer that this causal condition (or combination of causal conditions) is linked to the presence of the outcome. The indirect method of difference operates under related premises, except that both positive and negative instances of the outcome are examined. This method applies agreement and difference *seriatim*; for this reason, it is often referred to as the joint method of agreement and difference. The researcher first applies the method of agreement to cases exhibiting the outcome. On identifying a causal condition (or causal combination) linked to the outcome, the researcher examines the negative cases to see if the absence of the outcome is associated with the absence of the cause or causal combination. This double application provides researchers with stronger evidence on which to base their conclusions.

Comparative researchers continue to employ these methods today, albeit under different monikers. The method of agreement is the basis of the most different systems design, which is better conceived as a most different/same outcome design (MDSO). This alternate labeling makes it clear that in this design, diverse cases share the same outcome.

The researcher attempts to identify the decisive, causally relevant conditions shared by these diverse cases. The other popular design implements the indirect method of difference. It is commonly known as most similar systems design, but it is better understood as a most similar/different outcome design (MSDO), making it clear that there are both positive and negative cases. Ideally, negative cases should be matched as closely as possible with positive cases.

Mill's methods also provide the underlying logic of the "most likely," "least likely," and "crucial" case study research methods. The most likely case study employs cases that theory predicts should strongly exhibit the outcome, while the least likely case study employs cases that would do so weakly, if at all. Least likely cases that conform to predictions serve to marshal support in favor of a given theory. In contrast, most likely cases that do not behave as predicted cast doubt on a theory's validity. The strongest claim is made by the crucial case study, which asserts that a case must exhibit the outcome if the theory is not to be falsified.

The limitation of Mill's methods and derivative techniques is that they are incapable of addressing various forms of causal heterogeneity, especially equifinality and multiple conjunctural causation. Mill himself noted that his techniques fail when an outcome has more than one cause. Researchers are able to overcome this deficiency by immersing themselves in the cases. This immersion, however, necessarily restricts the breadth of analysis. It is perhaps for this reason that comparative research has become so closely associated with small-*N* analysis. QCA challenges this affinity by formalizing many aspects of the comparative research process and enables comparative researchers to address larger *N*s.

Qualitative Comparative Analysis

QCA was originally developed for use with binary data or "crisp sets." The logic of QCA, however, extends to fuzzy sets in which set membership scores can be coded in the interval from 0.0 to 1.0. The present discussion encompasses both types of data. Note that crisp-set analysis is easier for novices to grasp, while fuzzy-set analysis provides more nuanced results. There are four basic steps in most applications of QCA. In practice, of course, these are intimately connected, and researchers should view the research process as a dialogue among four analytic moments. In other words, comparative research is usually retroductive rather than predominantly inductive or deductive.

Step 1: Calibration

As has been emphasized, comparative research is fundamentally set theoretic. The classification of cases into sets, therefore, is of primary importance. This classification process is referred to as calibration. Calibration is a routine practice in the natural sciences. Simply put, calibration refers to the practice of adjusting measuring instruments so that they conform to dependable, known standards. The act of adjusting one's watch is an act of calibration as is checking the accuracy of a thermometer. While calibration is routine in the natural sciences, most social scientists make use of uncalibrated measures that merely show the positions of cases relative to one another. Uncalibrated measures, however, are clearly inferior to calibrated measures. With an uncalibrated thermometer, for example, it is possible to know that one object has a higher temperature than another, but one still does not know whether either object is hot or cold. This is the key: Calibrated measures provide directly interpretable values. Calibration permits researchers to classify a country as democratic or autocratic, not merely more versus less democratic than the next (or the average).

The reason that crisp-set analysis is more accessible is because the calibration process is more straightforward. When calibrating crisp sets, the researcher need only determine whether each case is part of the target set or not. So, for example, a poverty researcher might seek to classify respondents as "poor" or "not poor." When calibrating fuzzy sets, by contrast, the researcher must determine the degree to which each case belongs to the target set. The relevant distinctions here might be between respondents who are poor (membership = 1.0), somewhat poor (membership = 0.67), not that poor (membership = 0.33), and not poor (membership = 0). As with a calibrated thermometer, a calibrated fuzzy set integrates both qualitative and quantitative assessments in a single instrument.

Regardless of whether the researcher is calibrating crisp or fuzzy sets, the process demands that he or she carefully consider the nature of the target set—specifically, what the target set represents and how it is labeled. In other words, conceptualization and calibration are closely intertwined. With crisp sets, a case is either in or out of the target set, and sometimes, cases must be force-fitted into categories. Alternatively, the researcher may generate new crisp categories to capture wayward cases. Fuzzy-set calibration, by contrast, permits the use of finely grained distinctions. When calibrating fuzzy sets, it is important for the researcher to specify thresholds for set membership and nonmembership in the set, as well as what is known as the crossover point (fuzzy membership = 0.5), which distinguishes cases that are "more in" the target set from those that are "more out." The calibration process concludes with the production of a data set. As with a conventional data set, cases occupy the rows. The columns, however, do not represent conventional variables but instead represent sets, and the values in the cells indicate the degree to which each case belongs to each set.

Step 2: Necessity Analysis

Having generated the calibrated data set, the researcher next tests for the presence of necessary conditions. As described earlier, the necessity test takes the form of a set-theoretic analysis. A necessary causal condition is one that is a superset of the outcome. Visually, a set relation consistent with necessity is represented by a scatterplot of two fuzzy sets (with outcome membership scores on the *Y* axis and membership in the causal condition on the *X* axis) in which all cases reside in the lower-right triangular region. With a calibrated data set, this situation can easily be tested, and a relationship of necessity can be established if, for each case, the value of the causal condition is greater than or equal to the value of the outcome (i.e., $X_i \geq Y_i$), within the bounds of the consistency threshold. This test can be extended to combinations of causal conditions, and software packages such as fuzzy-set QCA (fsQCA) contain functions to automate the procedure.

Step 3: Truth Table Construction

Truth tables are used to assess the sufficiency of causal conditions, especially in combinations. Necessary conditions are excluded from the truth table analysis, which is why the researcher tests for them first. Sufficiency is indicated when a causal condition (or, more commonly, a combination of causal conditions) constitutes a consistent subset of the outcome and is mathematically represented by the equation, $X_i \leq Y_i$. Again, the consistency test is conducted within the bounds of the consistency threshold established by the researcher.

Superficially, a truth table appears similar to a conventional data set in that it presents a cases-by-variables format. But the rows of a truth table are not observations as they are in a conventional data set. Rather, each row represents a logically possible combination of causal conditions (which, in turn, can be seen as constituting an ideal-typical case or configuration). Consisting of one row per logically possible combination of conditions, a truth table has 2^k rows, where k equals the number of causal conditions. As the number of causal conditions increases, the size of the truth table grows exponentially, and analysis becomes increasingly complex. Software packages help manage this complexity; nevertheless, most practitioners restrict their analysis to between 4 and 10 causal conditions.

To construct the truth table, the researcher refers to the calibrated data set and uses the consistency measure to determine which combinations of causal conditions are linked to the presence of the outcome and which are linked to its absence. With a large number of cases and/or causal conditions, this process can become error prone. Software packages facilitate the conversion of a calibrated data set into a truth table and should be used for all but the simplest analyses. Researchers should keep in mind that the process of converting the calibrated data set into a truth table will frequently force them to reconsider the measurement and calibration of both their causal conditions and outcome. In many ways, the process of constructing the truth table is the heart of the comparative research process, and it must not be approached mechanically. It is during this phase of research that the researcher refines and, ultimately, finalizes his or her analytic frame. Indeed, for a descriptive project, the researcher may choose to conclude simply with a presentation of the truth table. Functionally, the truth table is a compact way of presenting a multidimensional typology.

Step 4: Truth Table Reduction

The analysis of a truth table involves a process known as truth table reduction or Boolean minimization. This process results in a Boolean equation that expresses the various causal combinations that are linked to the presence of the outcome. Researchers interested in the mechanics of this process are directed to Ragin's three books on this subject: *The Comparative Method*, *Fuzzy-Set Social Science*, and *Redesigning Social Inquiry*. The following discussion focuses on the results of the reduction procedure. The truth table reduction produces two main types of solutions, known as the complex and parsimonious solutions, depending on whether or not the researcher chooses to make use of remainders. Remainders are rows of the truth table that lack cases (empirical instances). Remainders are not uncommon. The social world is characterized by limited diversity, and many combinations of causal conditions simply do not exist.

Remainders are best understood as potential counterfactual cases—combinations of conditions that do not exist empirically, at least not in the investigator's data set, and are thus subject to conjecture. By including remainders in the truth table reduction process, the researcher is able to use QCA to conduct counterfactual analysis. The most common use of remainders in QCA is to produce a parsimonious solution in addition to the usual complex solution. The parsimonious solution allows the use of any remainder, as along as its inclusion in the solution results in a logically simpler formula for the outcome. The complex solution bars the use of remainders altogether on the assumption that all the different combinations that are linked to the outcome in question are represented in the investigator's data set.

QCA also provides researchers the opportunity to use their theoretical and substantive knowledge to produce intermediate solutions. This knowledge is input into the software via a simple table and is used to bar the inclusion of untenable counterfactuals from the solution. In general, intermediate solutions are best because they more closely mimic the use of counterfactual cases in traditional case-oriented comparative research. Of necessity, complex solutions constitute subsets of intermediate solutions, and intermediate solutions constitute subsets of parsimonious solutions. In other words, the three solutions are logically nested, according to the degree to which each incorporates counterfactual combinations. Complex solutions incorporate no counterfactual combinations and thus are often needlessly complex; parsimonious solutions are the simplest, but they often incorporate counterfactual combinations that contradict existing theory and knowledge. Intermediate solutions, by contrast, are based on counterfactual analysis that is guided and constrained by theoretical and substantive knowledge.

As has been repeatedly emphasized throughout this discussion, the process of comparative research is iterative. It is likely that the results of the truth table reduction will motivate the researcher to revisit one or more of the previous steps. It is also quite common for researchers to reconsider not simply the calibration process but also whether they are, in fact, capturing the appropriate causal conditions and outcome. Comparative researchers regularly reflect on the nature of their research questions and frequently refine their questions as the research proceeds. QCA does not eliminate the necessity of this process. On the contrary, it makes it explicit. Both overly simplistic solutions and overly complex ones serve as warnings, directing the researcher to reconsider their solutions, revisit their evidence, and sometimes reformulate their analytic frames.

Discontinuities Between Comparative and Variable-Oriented Research

It is best to understand comparative analysis as a distinct methodological approach, one that can be conducted using either informal or formal methods. Far too often, QCA is viewed as a methodology in and of itself when, in fact, it is a formalization and extension of case-oriented comparative research. As has been emphasized throughout this discussion, the comparative approach is fundamentally case oriented, and as such, its tools are designed to answer questions that differ from those of conventional variable-oriented research. Nevertheless, the distinctiveness of comparative research is often overlooked, with the result that comparative researchers and variable-oriented researchers often talk past each other when discussing their research.

Ironically, the popularity of QCA has, to some degree, exacerbated this issue. Just as the rise of desktop statistical software has made it easy to estimate a poorly designed regression model, it is now straightforward for naive users to conduct a QCA without recognizing the different assumptions that they are taking on board. This does not refer to philosophical debates regarding epistemological and ontological differences between case-oriented and variable-oriented strategies. Rather, there are substantial differences between what the research tools themselves produce in terms of social-scientific representations.

The importance of these differences can be seen clearly in the contrasts between how each perspective establishes causality. As this entry has discussed, comparative researchers establish causality by identifying subset relationships: "No bourgeoisie, no democracy." But such a claim does not make sense from the variable-oriented perspective. Subset relationships typically exhibit little to no covariation, which is the foundation for the variable-oriented researcher's causal inference. Similarly, the covariation of variables is insensitive to subset relationships—the type of explicit connection that is central to case-oriented comparative analysis. From each perspective, the other's claim to an empirical basis for causal inference appears flawed. Although both approaches use theory and data to construct representations of social life, they do so in ways that involve sharply contrasting orientations regarding the consideration of cases, the relationship between causal conditions and outcomes, and the criteria of a successful analysis.

The Consideration of Cases

From the perspective of a comparative researcher, the primary problem with variable-oriented methods is that they veil cases. When a variable-oriented researcher, for example, computes a correlation between two variables, it is the variables that take center stage. The cases essentially disappear. In contrast, it is the cases that take center stage in a comparative analysis. It is a simple matter, for example, to map cases onto the rows of a truth table, and some software packages automate this procedure. The two approaches also differ in their methods of case selection. As previously noted, comparative researchers choose cases purposefully, based on either theoretical or substantive criteria. Further, the set of cases included in an investigation may shift as the researcher decides that one or more cases do not "fit" with the others or realizes that an important type of case is missing from the analysis. Variable-oriented researchers, by contrast, typically delineate their samples of cases at the outset of their research. What matters most is that the cases are selected in a manner that ensures that the sample is representative of the larger population, however conceived and defined.

The Connection Between Causal Conditions and Outcomes

Variable-oriented research is usually concerned with explaining variation in the values of a dependent variable—an outcome that varies across cases. The goal of such research is to explain how changes in the values of independent variables affect the value of the dependent variable. Techniques such as linear regression accomplish this by identifying the net contribution of each independent variable. Comparative research, in contrast, is concerned with how causal conditions combine to produce a particular outcome. The solutions of a QCA application, for example, represent different paths or recipes for a given outcome.

In a variable-oriented study, causation is inferred from patterns of covariation. Usually, the researcher measures the relative strength of several causal variables simultaneously. Frequently, the goal is to assess the relative strength of competing theories by determining which independent variable (or set of independent variables) explains the most variation in the outcome variable. In other instances, the goal may be simply to appraise the relative importance of the different independent variables or simply to establish that the causal impact of a theoretically important variable is significant and can be estimated. In virtually all types of variable-oriented analysis, variables compete with one another to explain variation. The moniker of *independent* is important here. Each independent variable is considered on its own terms, capable of affecting the outcome variable regardless of the presence or level of the other causal variables. The comparative researcher, by contrast, does not assume that causal conditions are independent of one another. Independence is the exception rather than the rule, and causation is understood to be conjunctural in nature. The goal of the investigation is to identify combinations of causal conditions that are shared by sets of cases and, in tandem, produce the outcome.

The Criteria of a Successful Analysis

It is useful as well to contrast the different criteria used to judge a successful conclusion of a study. For the variable-oriented researcher, the analysis is successful when a theory can explain why changes in the values of the independent variables affect the value of the dependent variable in a particular manner. For the comparative researcher, by contrast, a successful conclusion is one in which the various paths to the outcome are clearly and convincingly articulated and cases can be associated with the different paths. In short, to justify their conclusions, comparative researchers point to their cases, while variable-oriented researchers point to theory.

From the perspective of variable-oriented researchers, comparative research is replete with analytic sins and errors. Samples are purposively constructed, and their sizes are small. Researchers may add or drop cases at any stage of the analysis. Important causal factors do not vary. In a variable-oriented analysis, any of these situations would undermine attempts at causal inference. Likewise, common practices in variable-oriented research would seriously undermine the validity of the conclusions when viewed from the perspective of comparative research. There are too many cases for an in-depth analysis to be conducted. A fixed sampling frame assumes a level of comparability among cases that may be unwarranted. And the focus on independent effects of variables violates the configurational assumption of comparative analysis. Comparative research is fundamentally case oriented, and consequently, its practices fundamentally clash with those of variable-oriented research. It is therefore not surprising that researchers frequently talk past one another.

Current Developments in Comparative Research Methods

The use of informal methods of comparative research is, of course, well established among social researchers, as is the use of crisp-set QCA. The extension of QCA to encompass fuzzy-set analysis has been welcomed by researchers, although there is a lag between new developments in the approach and their adoption by researchers. For example, the inclusion algorithm (using the principle of set inclusion) described by Ragin in *Fuzzy-Set Social Science* has been superseded by a hybrid algorithm that uses truth tables to synthesize the results of the analysis of fuzzy-set relationships. Although the transition to the truth table algorithm has been widely documented, a number of researchers continue to rely on the procedures discussed in the 2000 text. The publication of Ragin's *Redesigning Social Inquiry* establishes the superiority of the truth table algorithm.

The popularity of QCA has encouraged a number of researchers to propose various extensions to the method. Many of these proposed extensions can be found in working papers at the COMPASSS website, which serves as a hub for researchers interested in the development of formal methods of comparative analysis. Although a number of these proposals aim to incorporate variable-oriented techniques into QCA, such proposals have not gained much traction. The most promising of these extensions are those arising from or inspired by the concerns of traditional small-*N* researchers. Particularly promising is the application of QCA to the analysis of scope conditions, which are used to distinguish between cases that do and do not apply to a given theory. Also promising is the application of QCA to possibility analysis. A relatively recent development, the analysis of possibility seeks to identify those cases that are within a theory's scope but for which the outcome is nevertheless impossible or virtually impossible. The question of whether an individual born into poverty can acquire a high-status occupation, for example, is a question of possibility: What conditions serve to make social mobility possible? The appeal of extending QCA to the study of scope and possibility is easy to see: Such questions are set theoretic in nature. They are theoretically important questions but outside the grasp of conventional quantitative methods.

The popularity of multimethod research suggests that researchers will increasingly seek to use QCA in tandem with other analytic methods. Such projects have proved to be most successful when QCA is combined with both case-oriented and variable-oriented techniques. The combination of QCA and techniques of social network analysis have also proved to be particularly fruitful, and development in this direction is expected to continue. Initiatives to implement the QCA techniques in statistical environments such as R and Stata have begun. By and large, these translation efforts are incomplete, and the canonical package remains

Ragin's fsQCA. Cronqvist's Tools for Small-*N* Analysis (TOSMANA) is also popular. Although lacking fuzzy-set capabilities and procedures for counterfactual analysis and intermediate solutions, TOSMANA includes a number of attractive features such as a threshold-setting tool—to aid the construction of crisp and multivalue sets—and the ability to graphically represent Boolean solutions as Venn diagrams.

The popularity of formal comparative methods is expected to continue to grow. There are two reasons for this. First, QCA permits comparative researchers to include more cases in a given study. Research projects previously too complex to conduct due to the limitations of informal comparative methods are now feasible. Second, and perhaps more important, the process of formalizing the comparative approach served to highlight the fact that despite the popularity of variable-oriented methods, most social theory is actually set theoretic in nature. Many research questions are actually more appropriately answered using comparative methods, because of their set-theoretic nature, than variable-oriented ones. Researchers who previously would have turned to variable-oriented techniques are more likely today to recognize the value of comparative methods.

Comparative Politics

Comparative politics is a subdiscipline of political science. The goal of political science is to promote the comparison of different political entities, and comparative politics is the study of domestic politics within states. It differs from the other subdiscipline of political science—international relations—which instead focuses on politics between states. Traditionally, it has been assumed that whereas comparative politics studies politics in contexts where there is an ordering principle (the sovereign state), international relations, instead, studies politics in contexts without such a principle (the international system). The first is interested in studying politics in stable domestic contexts, the second in studying politics in unstable, extradomestic contexts. The first has concerned itself with studying order (because it is guaranteed by the sovereignty of the state), the second with studying disorder (an outcome of the anarchy of the relations between states). Some have questioned whether such a distinction between these subdisciplines is still plausible at the beginning of the 21st century.

This entry is divided into four parts, beginning with an analysis of the main methods of comparative politics. The second part discusses the main theories of comparative politics, and the third part identifies some of the issues of comparative politics investigated in the various regions of the world. The entry concludes with a discussion of the future of comparative politics in a globalized world.

Methods in Comparative Politics

Although comparative politics is defined primarily by the phenomena it researches, it is also characterized by the method employed in that research. One cannot engage in comparative analysis without a method for comparing; a method is necessary for testing empirical hypotheses about relations between variables in different cases. Such hypotheses concern the relations between the variables that are held to structure the political phenomenon one wishes to study, investigate, or interpret. In general, political research aims to understand the links between the dependent variable (the outcome of the process one wants to explain), the independent variable (the structure, the context, the cognitive frame within which this process unfolds), and the intervening variable (the factor that exerts an influence on that given process). As Hans Keman observed, the question to understand is which independent variables can account for the variation of the dependent variable across different political systems.

Political science employs several methods—four in particular—to check its research process and falsify its results: the experimental method, the statistical method, the case study, and the comparative method.

The Experimental Method

The experimental method can rarely be employed by political scientists. In contrast to the natural scientist, the political scientist cannot hope to study politics in a laboratory, in which the intervening factors can be kept constant so that the causal effects of the independent variable on the dependent variable can be reconstructed. Politics is rather more complex than what is studied in a science laboratory, above all because it involves factors that cannot be isolated and is structured by interactions that cannot be separated. Moreover, whereas in natural science the objects of study may be inanimate, the same cannot be said of politics and of those who engage in it. Politics is activated by actors (heads of governments, ministers, members of parliament, party leaders and activists, members of movements and associations, and citizens) who continually learn from their experience, thus modifying their behavior, even in the absence of variation in the independent variables.

The Statistical Method

The statistical method, however, is ever more widely employed by political scientists. It obviously presupposes the availability of numerical data. Those data are the product of a standardized process of quantitative measurement of aspects of political life—standardized because the same criteria of measurement can (and should) be used in different contexts. It goes without saying that, to be effective, this method requires a large number of quantitative and reliable data. However, whereas the experimental method presupposes the existence of a cause-and-effect relation, the statistical method does not. It provides information, but as such, it does not suggest an interpretation. Thus, without the support of a theory concerning relations between variables (measured quantitatively), the statistical method is destined to be of little use in scientific research. Moreover, when using this method, one is forced to neglect factors that are not easily quantifiable, such as cultural factors.

The Case Study Method

The analysis of the idiosyncratic factors mentioned above, instead, constitutes the object of the third method at the disposal of political research: the case study. This method has also characterized historical research and is designed to collect the largest possible amount of information (quantitative and qualitative) on a specific country (or other political entity). This method is also referred to as ideographic. A case study may have a purely descriptive purpose or, instead, may have an interpretative goal or even be designed to generate hypotheses (if not theories) susceptible to generalization (e.g., Alexis de Tocqueville's study of U.S. democracy, from which several hypotheses as well as a theory on the tendencies of Western democracies have been derived). This method is largely used in the United States, as is evident even from the comparative politics section of the book reviews in the American Political Science Association journal *Perspectives on Politics*, where there is an abundance of studies on single countries. This is not so (or rather less so) in Europe, where comparison generally involves the study of several cases.

The Comparative Method

There can be no doubt that the main method at the disposal of political science is the comparative method. In a now-classic 1970 essay, Giovanni Sartori pointed out that all political science presupposes, even if implicitly, a comparative frame of reference. The same author would write repeatedly that he who knows only one thing knows nothing at all. The comparative method requires, first, that the object to be compared be defined, next that the units used to compare and the time period to which the comparison refers be identified, and, finally, that the properties of those units be specified. Whereas the statistical method presupposes that the variables of many cases can be quantified, the comparative method is generally applied to a more limited number of cases. These cases may be very similar—that is, the strategy of the most similar research design—or they may be very dissimilar—the strategy of the most dissimilar research design. The first strategy allows more in-depth comparisons, whereas the second yields broader comparisons. The choice of strategy depends on the purpose of the study (see Table 1).

Comparative politics has become increasingly identified with the comparative method, to the extent that that method has become the defining characteristic of the academic discipline. It has permitted the construction of a particular type of scientific explanation based on correlations, as it assesses the validity of an explanation by assuming a correspondence between the properties of the independent variables and those of the dependent variables. But how and where do such correlations operate? The comparative method does not provide a clear answer. Regarding the *how*, the correlations operate if there are actors that activate them. How then should political agency be conceptualized? There is no univocal answer to this question. Regarding the *where*, the comparative method has to rely on few cases. The method of correlations has proved to be satisfactory when

Table 1 Methods of Comparative Analysis

Method	*Strength*	*Weakness*
Experimental method	(Few applications)	(Few applications)
Statistical method	Extensive information	Little interpretation
Case study	In-depth knowledge	Generic comparison
Comparative method	Hypothesis testing	Limited application

those cases are not only limited but also homogeneous (e.g., established democracies, post-Soviet democratizing countries). But if one wishes to broaden the perspective by comparing many nonhomogeneous cases (e.g., democracies, nondemocracies, and emerging democracies), what happens to a method based on correlations between uniform variables? It is no coincidence that political scientists have "regional" knowledge that cannot be easily applied in other "regions."

Conclusions

Certainly the buoyant growth of available data on the various political systems of the world has permitted complementing the statistical method with the comparative one, thus arriving at some classificatory systems that manage to comprise more cases belonging to different "regions," thereby making the analyses less Western centric. Yet the problem raised years ago by Sartori remains unsolved. Sartori argued that empirical concepts are subject to a sort of trade-off between their extension and their intensity. If a concept is applied to a large number of cases (extension), it will display only a limited ability to generate valid explanations for each case (intensity), and vice versa. When concepts are so abstract that they can be applied to the entire world, then, analytical vagueness is inevitable.

Comparison is a method used to test research hypotheses. The comparative method is generally employed by scholars of comparative politics, although it is increasingly complemented by the statistical method. The end of the Cold War in the early 1990s has brought about an enormous growth in the number of formally sovereign countries. Simultaneously, the available information resources (e.g., databases) also grew significantly, thus making it possible to have recourse to statistical comparisons. Yet a method is a tool at the disposal of researchers who take a scientific approach. It is a way of organizing the conceptual relations between the factors that are thought to structure the problem under investigation. Accordingly, there is a need for a theory that identifies those relations on the basis of a logically consistent argument. The theory informs us what to research and why. Bereft of a theoretical orientation, even the most sophisticated method provides only information or description. How to use or interpret the data depends on the theory.

Theories of Comparative Politics

There are many theories in comparative politics. The main theories generally have a focus on institutions; they are variations of the institutionalist approach. Institutionalism not only constitutes the main branch of the theories of comparative politics but also stands at the origin of political science as a whole. Without harking back to Aristotle, the genealogical tree of comparative politics had its roots at the beginning of the 20th century in the sociological constitutionalism of scholars such as Max Weber and Vilfredo Pareto and the legal constitutionalism of scholars such as James Bryce and Woodrow Wilson. From there developed, after World War II, the comparative historical sociology of scholars such as Stein Rokkan and Harry Eckstein as well as the comparative political science of scholars such as Robert A. Dahl, Samuel P. Huntington, and Giovanni Sartori. These roots obviously have not prevented the subsequent emergence of noninstitutionalist developments, frequently deriving from political scientists' use of theoretical constructs from other social sciences. Examples include behavioralism (derived from social psychology), structural functionalism (derived from anthropology and subsequently from sociology), and systems theory (derived from the new cybernetic sciences).

All these new developments had to live alongside the institutionalist approach (or "old" institutionalism), which never ceased to exert its influence on the comparative political research of the post–World War II period. Since the 1980s, the old institutionalism has been superseded by theoretical developments that have merged in the new institutionalism—new because it is distinct from its predecessor owing to its nonformalistic vision of institutions and norms. As noted by Ira Katznelson and Helen V. Milner, there are significant differences within the new or neoinstitutionalism. Some are microlevel institutionalist theories, as they take their point of departure from the preferences or interests of individual political actors or collective political actors understood as unitary. Others, instead, are macrolevel institutionalist theories, as they depart from supraindividual aggregates. Still others are mesolevel institutionalist theories, as they study the cognitive interactions between determined (but not limited) institutional configurations as well as the actors that operate within them. Whereas the macrolevel and mesolevel approaches treat the institutions (i.e., their structural characteristics or their cultural codes) as the independent variable, in the microlevel theories, this role is played instead by the preferences or the interests of the individual actors.

Rational Choice Institutionalism

The Theoretical Apparatus

The main microlevel theory of comparative politics is rational choice institutionalism. It constitutes an adaptation to political science of theories developed in the field of economics. The scholars who have most influenced the rational choice theorists are Anthony Downs, William Riker, Mancur Olson, and Douglass North. The point of reference for rational choice theorists is the neoclassical economic model, which conceptualizes collective action as the outcome of the behavior of individuals aiming to maximize their own utility (i.e., their own egoistic interests). Similarly, the political theory of rational choice postulates that the individuals who participate in politics are rational actors, acting on the basis of strategic considerations in order to maximize their utility. The actors' preferences are formed outside the political process. They are exogenous with respect to the interaction between the actors. Accordingly, individual preferences can be treated as the independent variable in this approach.

The basic unit of analysis of the rationalist theories is the actor. Politics is a game between individual actors or between collective actors understood as unitary subjects. As Riker has argued in many writings, the aim of this theory is to explain how collective action emerges in a multiactor game and to examine the microlevel foundations of processes that give rise to macrolevel effects. This does not imply that the macrolevel effects are necessarily rational (on the social level). Rather, as pointed out by Margaret Levi, a scholar working within this approach, collective action may be irrational even though individuals act in a rational way, unless they are subjected to the constraints of specific rules in the pursuit of their interests.

Institutions matter because they make collective action possible by lowering the transaction costs between the actors, by furnishing reliable information on the rules of the transaction itself, and by sanctioning free riding, thus making individual behavior predictable. Rational choice institutionalism assumes that institutions are necessary because they make possible virtuous interaction (i.e., cooperation) between the actors. Without the rules guaranteed and promoted by institutions, the game would become uncooperative. Institutional equilibrium obtains when none of the actors has an incentive to question the status quo because no actor is able to establish whether a more satisfactory equilibrium may result from doing so. Such equilibriums are defined as Pareto optimal, with reference to the well-known Italian economist and sociologist Vilfredo Pareto (1848–1923). For rational choice theory, as it is employed in comparative politics, institutions and norms are intervening variables—factors that intervene from the outside to regulate the interactions between individual actors.

Rational choice institutionalism is a testable theory because, once the institutional framework that regulates behavior is known, it can yield falsifiable statements. It establishes a correlation of events identifying the causal mechanism that links the independent with the dependent variables. By assuming that individual behavior (as well as the behavior of collective actors whose actions are taken to be unitary), in any context whatsoever, is driven by the maximization of individual utility, rational choice theory is able to claim that its analytical framework has universal validity. Moreover, this scientific claim is supported by quantifying variables so that the rational choice theory can be expressed in a formal mathematical language. Indeed, according to these theorists, political science may legitimately compete with economics as long as it adopts the highly formalized analytical apparatus characteristic of the latter. Hence, rational choice theory derives its extraordinary academic and scientific success, especially among the community of U.S. political scientists, where it still sustains a strong hegemony of neoclassical economics within the social sciences.

Criticisms

Rational choice theory has not been spared criticism. First, it has been pointed out that an analysis that assumes institutions to be ahistorical entities ends up being overly abstract. Institutions are not aseptic rules but structures that are permeable to history. The same institutional structure may produce different effects in different historical periods. Second, it has also been shown that institutions constitute coherent and interconnected agglomerates of regulative structures. As a result, it is hardly plausible to examine a given institutional variable in isolation, assuming that the other institutional variables will remain constant. In reality, there is a reciprocal interaction between them, since the institutional variable considered may produce different effects if the variables with which it is linked are subjected to specific and unforeseen influences. Third, it has been argued that rational choice institutionalism runs the risk of turning into a remodeled functionalist theory, to the extent that it explains the existence of an institution with reference to the effects that it produces.

Fourth, it has been shown how an intentionalist conception of human agency lurks behind the theory of rational choice because it assumes that the process of creating an institution is intentional—that is, controlled by actors who correctly perceive the effects of the institutions created by them. Indeed, it is rarely the case that the actors intend to create institutions or that the actors correctly foresee the future impact of institutions. Moreover, rational choice institutionalists conceive the formation of institutions as a quasi-contractual process marked by voluntary agreements between relatively equal and independent actors, almost as if they still found themselves in a state of nature. Again, this is rarely the case. The elegance of the formal theory is insufficient to compensate for the weakness of the hypotheses of rational choice institutionalism concerning the driving forces of individual choice and the persistence of institutions.

Rational choice has been shown to be convincing in the analysis of microphenomena (e.g., why a certain decision was made in a committee of the U.S. Congress or why the negotiations within the intergovernmental conference of the European heads of state and government led to a certain outcome), but it is less successful in analyzing macrolevel processes (e.g., why the U.S. Congress has established itself as the most powerful legislature of the democratic world or why the process of European integration has given rise to a political system unforeseen by the states that had launched this process). Rational choice theory is generally of little use when the number of actors involved in the phenomenon under examination is large and when the timeframe is extended. It is certainly true that rational choice theory has positively contributed to raising the degree of formalization of political science. Yet as Barbara Geddes points out, it is equally beyond doubt that rational choice scholars have focused only on those phenomena that would allow such formalization. As a result, rational choice scholars have ended up studying a problem not because of its political relevance but of its ability to be formalized.

Historical Institutionalism

The Theoretical Apparatus

The main macrolevel theory of comparative politics is historical institutionalism. It has been developed by scholars such as Paul Pierson, Theda Skocpol, and Kathleen Thelen among others, elaborating the rich tradition of the historical social sciences of the 1950s and 1960s, represented by Barrington Moore Jr., Reinhard Bendix, and Seymour M. Lipset. It differs from rational choice institutionalism to the extent that it understands institutions not simply as arrangements that serve to regulate an interactive game but as historical structures that have origins and develop independently from those that operate within them. Moreover, whereas the analytical focus of rational choice institutionalism is on the actor, the analytical focus of historical institutionalism lies instead on institutional structures and their evolution over time.

Historical institutionalists analyze institutional and organizational configurations rather than single institutions in isolation, and they pay attention to processes of long duration. They show how general contexts and interactor processes give shape to the units that organize the political process. For them, time is a crucial intervening variable in explanations of specific outcomes. The aim of the analysis is to establish the sequences and the variations of scale and time that characterize a given political process. One of the fundamental concepts of historical institutionalism is path dependence. The theory of path dependence argues that, in politics, decisions made at time t will tend to shape the decisions made at time $t + 1$. Once a given institution has asserted itself, it tends to reproduce over time. Contrary to what occurs in the economy, however, in politics, the marginal productivity of an institution increases over time, as Paul Pierson has shown.

To the individualistic outlook of rational choice theory, historical institutionalism has placed in opposition a vision of the political process as structured by institutions that have consolidated over time and thus shape this process. Also, windows of opportunity for institutional change open up under conditions of institutional crisis, but the actors, nevertheless, are constrained to act within the bounds inherited from the previous arrangements. Here, there is no heroic vision of actors as in the voluntaristic vision of agency that rational choice institutionalism assumes. Simultaneously, regarding historical macro-analyses, historical institutionalism has steered clear of the pitfalls of teleology that have frequently imprisoned historical research.

Criticisms

This theory too has been subject to criticism. First, historical institutionalism has paid less attention than rational choice institutionalism to the role of individual actors, and, in general, it has been more concerned with the possibility of agency in the historical evolution of a given institutional structure. The absence of a theory of agency has led historical institutionalists to emphasize the inertia of institutions (conceived as "sticky" structures), even though they were frequently constrained to modify or adapt themselves. For this reason, they are unable to provide precise indications concerning the chains of cause and effect that operate between the institutional macrostructures and the microlevel individual decisions. Second, historical institutionalism does not have at its disposal an analytical device to falsify its conclusions. Once a particular institution or policy has been reconstructed, it may prove difficult to imagine an alternative sequence. If every historical development is unique and if it is not possible to employ counterfactual hypotheses, then the possibility that the theory will fall into some kind of determinism is high.

Third, historical institutionalists have compared only a limited number of cases (and it could not have been otherwise, given their need to examine each case in depth), so how can valid knowledge be generated from these few cases unless supported by an extensive verification of the postulated hypotheses? It is no coincidence that the scholars who most extensively employ statistical methods criticize historical institutionalists for selecting their case studies according to the dependent variable that they wish to explain. As Gary King, Robert Keohane, and Sidney Verba have pointed out, historical institutionalism, like rational choice institutionalism, tends to select cases that fit with the approach adopted while ignoring those that do not. For example, historical institutionalists compare countries in which a political revolution occurred but do not explain why this did not happen in other countries with similar economic, social, and cultural characteristics.

Sociological Institutionalism

The Return of Political Culture

The main mesolevel theory of comparative politics is sociological institutionalism. Among the representatives of this approach, James G. March and Johan P. Olsen should be mentioned. According to sociological institutionalism, institutions are not just the source of rules for solving the problem of collective action or path-dependent structures that condition future decisions but configurations of meanings that the actors come to adopt. They solicit the formation of mental maps concerning the appropriate political behavior that guide the actors operating within institutions. They are sources of meaning independent of the actors that embrace them. Sociological institutionalism is a mesolevel theory that conceptualizes interactions between actors within institutional systems that are not limited (unlike limited systems, e.g., the committees of the U.S. Congress) and that are not extended (unlike systems such as welfare states).

Sociological institutionalism exhibits a strategic interest in culture (i.e., in meanings, symbols, common sense, ways of thinking, and cognitive frames). Indeed, it is a development of the rich tradition of cultural theory of comparative politics, which was rather relevant in political science until the 1970s. After a phase of decline, during the 1990s, the interest in political culture has clamorously returned to the stage of scientific debate. In particular, with the development of large-scale researches on social capital, the interest in political culture was and continues to be shared not only by political scientists but also by sociologists, economists, and anthropologists. Robert Putnam has been a pioneer in this regard, first conducting extensive empirical research on the relations between the social capital of the various regions of Italy and their institutional performance (Putnam, 1993) and then investigating the decline of social capital in the United States and its effects on the associationalism of that country (Putnam, 2000). In both cases, Putnam has shown how the quality of civic life forms the basis for the development of effective institutions in the context of a democratic society. This model was thus tested in a comparative research effort, directed by Putnam and published in 2002, which analyzed the relation between social capital and institutional performance in the main contemporary advanced democracies.

According to these theorists, political culture has to be treated as the independent variable and institutional performance as the dependent variable. Societies differ because they are characterized by different politico-cultural attitudes. Those cultural differences are relatively durable, even if they are not immutable. They can explain, for example, why some countries enjoy a stable democracy whereas others do not. The theorists of political culture have sought to provide an intersubjective analysis of politics, in which the intersubjectivity is conditioned (if not determined) by the cultural context in which it develops. This approach has been of considerable relevance for the contemporary world as it has provided an explanation of why institutional innovations encounter difficulties in unchanged cultural contexts and why processes of democratization find it difficult to advance in certain countries where the cultural assumptions of the previous regime have not been questioned. Yet, according to the critics, the concept of political culture risks being tautological in character. Citizens behave in a certain way because of the presence of a particular culture, but that particular culture is defined by the fact that citizens behave in a certain way. As a consequence, this concept makes it hard to explain the changes in social behavior and individual beliefs, changes that nevertheless occur regularly in contemporary political systems.

Sociological institutionalists have sought to come to terms with that debate by reducing the concept of political culture to the institutions that shape it and to the individuals that legitimate them. According to these scholars, institutions are not only rules of the game or crystallized historical arrangements but also encompass symbolic systems, cognitive maps, and moral frameworks of reference that represent the meanings that guide behavior. Accordingly, culture is transmitted by means of institutions, and because of this, they are simultaneously formative and constraining. Culture functions as the independent variable to the extent that it is institutionalized. Sociological institutionalism has undertaken a holistic analysis that seeks to recombine agency and structure in a comprehensive scheme of meanings and ways of thinking. As has been noted, anyone who has spent time waiting at a traffic light when nobody else was around will be able to understand the importance of internalized ways of thinking. In stable institutional contexts, as March and Olsen have noted, behavior is rarely motivated by the logic of utility but rather by the logic of appropriateness. Individuals behave in a certain way because that is what is expected of them in that particular institutional context. A given political culture is a component of the process that produces it, thus making the relation between the independent and the dependent variables in this process much more interactive.

Criticisms

Sociological institutionalism has not been immune to criticism. Two points are of particular relevance. First, as Peter A. Hall and Rosemary C. R. Taylor (1996) have argued, sociological institutionalism is based on the assumption of stable and legitimate institutional conditions. But what happens if one wants to explain the emergence or construction of new institutions? And what is the appropriate behavior in a situation of change? Processes of institution building inevitably tend to involve actors with diverse and contradictory cognitive frameworks and with conflicting interests. Second, the holistic approach of sociological institutionalism does not allow for a conceptualization, and even less measurement, of the contrasts between cognitive frameworks—that is, of competition or conflict between actors over how to understand and apply the predominant cultural frames. Institutions and actors stand in a relation of reciprocal influence: Whereas institutions contribute to defining the identity of the actors, sociological institutionalism must also hold that the characteristics of the latter (their decisions, their strategies, their visions) tend to define the identity of the former. Sociological institutionalism, thus, underestimates the impact of competition and conflict between actors (and between their contrasting interpretations of the appropriate behavior) on the definition of those same institutions. This implies that even consolidated institutions are cognitively less determined than sociological institutionalism assumes. For a summary of the discussion on the three institutionalisms, see Table 2.

Conclusion

It is difficult to find a theory of comparative politics that does not refer, in one way or another, to institutions. For comparative politics scholars, institutions matter. Yet these theories differ significantly with respect to (a) what is understood to be an institution, (b) how institutions are created, (c) why and when they are important, and (d) how institutions change. The different viewpoints of institutionalist scholars have also highlighted the existence of different research programs. The rationalist approach is engaged in a formidable undertaking of simplification of comparative politics, as these scholars aim to provide their research program with a microeconomic foundation. Historical and sociological institutionalists, instead, seem to be engaged in an equally formidable enterprise of complexification of comparative politics, as they start from less limited and less restrictive assumptions. The former seek to construct a theory on the basis of the actor, whereas the latter start from the structures or the meanings embedded in them.

This division ultimately refers to the problem of what is to be understood as a theory in political science (Charles Ragin, 1994). According to the rationalists, political science needs to equip itself with an epistemological structure similar to that of the most formalized social science—namely, economics. For nonrational approaches, its social utility is justified by the ability to provide conceptual frameworks within which problems of public relevance can be examined but without any pretense of becoming a positive science. The first wants to predict what will happen; the other two want to explain what has happened. Which one of the available theories to employ should be decided by the problem under investigation and not as a matter of principle. Because it is the task of political science to investigate different problems, then, as Donatella Della Porta and Michael Keating submit, the lively theoretical pluralism of the discipline should be welcomed.

Table 2 Neo-Institutionalist Theories

Theories	*Level of Analysis*	*Independent Variable*	*Intervening Variable*	*Dependent Variable (Examples)*	*Role of Institutions*
Rational choice institutionalism	Micro	Individual preferences	Institutions	• Decisions • Allocation of resources and posts	Make collective action possible
Historical institutionalism	Macro	Institutional arrangements	Time	• Systems of regulation • Public policies	Structure the context of the political process
Sociological institutionalism	Meso	Institutionalized cultural systems	Meanings	• Decisions • Strategies	Shape the identity of the actors

Issues of Comparative Politics

There are significant regional differences in the issues investigated by scholars in Africa, Asia, Latin America, Europe, and the United States since the end of the Cold War. However, those issues generally deal with the implications, functioning, and transformation of democracy. This is perhaps why institutional theories of comparative politics have become so successful. Democracy is a political regime that requires specific institutions, although those institutions may function properly if legitimated by coherent values (or political culture) diffused among the citizens. Since the end of the Cold War, democracy has become the only legitimate game in town. In 1900, only 10 countries were considered democracies, but in 1975, there were 30 such countries. In 2010, 115 out of 194 countries recognized by the United Nations were considered electoral democracies by the international nongovernmental organization Freedom House. This spectacular diffusion of democracy has inevitably attracted the interest of comparative politics scholars. Certainly, other topics unrelated to democracy have been investigated in a comparative perspective (e.g., revolutions, civil wars, ethnic strife, Islamic regimes). Nevertheless, the issues connected to democracy have represented the operational link between Western and non-Western scholars. The following sections identify a few areas of investigation within the vast literature.

Democracy and Supranational Developments

The debate on democratic models has continued to be at the center of comparative politics in the Western world. Thanks to the pioneering work of Arend Lijphart (1999), different patterns of democratic organization and functioning have been detected within the family of stable democratic countries. According to Lijphart, democracies might be classified according to the two ideal types—majoritarian democracies and consensual democracies—as a consequence of the structure of their social cleavages and institutional rules. This classification has been very important for freeing the analysis from the old normative argument, which assumed that there were more developed democracies (of course, the Anglo-American ones) and less developed democracies (of course, the continental European ones). Lijphart's classification has been revised by several authors. For some of them, such as Sergio Fabbrini (2008), the distinction between patterns of democracy concerns more their functional logic than their specific institutional properties. What matters is the fact that certain democracies function through an alternation in government of opposite political options, whereas others function through aggregation in government of all the main political options. Indeed, alternation in government takes place regularly in democracies that do not adopt a majoritarian (Westminster) first-past-the-post electoral system, such as Spain, Greece, or Germany. These democracies are competitive, notwithstanding their nonmajoritarian electoral systems. The consolidation of democracy in Eastern Europe, Latin America, and Asia has increased the number of countries to be considered for the identification of democratic patterns. In dealing with this process, Lijphart (in his subsequent works) has gradually (and surprisingly) shifted to a more normative approach, arguing that the consensual model represents a better model for the new democracies to adopt.

At the same time, the end of the Cold War and the prospect of the political reaggregation of the continent have accelerated the process of European integration; in the period from the Maastricht Treaty (1992) to the Lisbon Treaty (2009), Europe has become the European Union (or EU). The process of European integration was traditionally considered a unique experiment in international relations. International relations scholars were interested in explaining the process of integration rather than its outcome (i.e., the community system and its institutional characteristics). Since the Treaty of Maastricht (1992), a new generation of studies has started to investigate the EU as a political system. However, although the EU could no longer be considered an international regime, it could not be compared with other domestic political systems. In some cases, its supranational character has come to be considered exceptional, sui generis, unique by several observers and scholars. Or, if compared, the EU has been compared on the basis of generic or behavioral criteria, such as the style of decision making, ways in which political leaders interact, attitudes in managing public policies, and relations between interest groups. Lijphart (in his book of 1999) considered the EU as a case of consensual democracy.

A different comparative approach has been taken by other authors. Based on specific institutional criteria, Fabbrini (2010) has argued that the EU is a political system organized around multiple separations of powers. In the EU, there is no government as such, as in the parliamentary or semipresidential systems of its member states that are organized according to the principle of the fusion of powers. Contrary to systems of fusion of powers, the system of multiple separations of power functions without a government as the final locus of decision-making power. Such systems are proper unions of states rather than nation-states—in particular, unions of asymmetrically correlated states. Because of this (structural and cultural) asymmetry, such unions cannot accommodate the centralization of decision-making power. If institutions matter, then to classify the EU as a consensual democracy appears highly unconvincing. Like other democratic unions of states, such the United States and Switzerland, the EU is a species of a different democratic genus, and could be called a compound democracy. Asymmetrical unions of states can be subsumed neither under the model of consensual democracy nor under the models of majoritarian/competitive democracy, because they have neither a government nor an opposition. One might argue that they are Madisonian systems functioning on the basis of checks and balances between institutions and not between political options as in fusion-of-powers democracies. The classification of democratic patterns, if it is to take into consideration institutional systems, needs be enlarged to a more comprehensive typology. The development of the EU has allowed comparative politics to overcome national borders and apply its tools, concepts, methods, and theories to the study of a supranational political system. At the same time, the EU has also been compared with other regional organizations, a comparison that has shown the difference between political and economic regionalism. The comparative analysis of politics has been relaunched by the development of the EU.

Democratization and Consolidation

The end of the Cold War also had dramatic effects in the non-Western world, ushering in a new democratic era in Africa, Latin America, and Asia. In these regions, a process of democratization started with the aim of creating regimes able to provide, as it was claimed in many quarters, security in the sense of protection against widespread and arbitrary violations of civil liberties. Many political elites of new democratizing countries seemed to share the belief that a democratic regime has an intrinsic value. This belief was epitomized by the introduction of democratic rule in South Africa in 1994. On these empirical bases, the 1990s registered a diffusion of studies on democratization (e.g., Geddes, 2007), studies that benefitted largely from the previous generation of works on the democratization of Southern Europe and Latin America, such as that by Leonardo Morlino (1998).

Democratization has entailed the introduction of reforms aimed at limiting the role of the state in the political sphere. It has been about restoring political pluralism, whereby different political and civic organizations participate in the political process without hindrance. According to Ben O. Nwabueze (1993), democratization was meant to enhance transparency and accountability. Although most countries in Africa and Asia have introduced political changes in their polities, the crucial question, especially in Africa, has continued to be whether democratization is reversible or not. As Larry Diamond and Marc Plattner, among others, have pointed out, in some cases, newly established democratic orders have devolved into pseudodemocracies. Despite this, Africa, Asia, and Latin America have made tremendous progress toward democratization, although North Africa and the Middle East have yet to make a major step in this regard. Especially in the 1990s, scholars of comparative politics devoted their work to seeking to explain why some countries and not others were successful in transitioning from nondemocratic to democratic systems. Some studies focused on the strategic role played by individual leaders (Nelson Mandela in South Africa or Mahathir Mohamad in Malaysia) as key drivers of change and guarantors of political transformation. Others emphasized the role of specific institutional settings for supporting the democratization of a country. Still others have investigated the role of civil society in fostering or contrasting democratization, according to an approach not dissimilar to the social capital approach.

With the diffusion of democracy in Africa, Asia, and Latin America in the first decade of the

21st century, scholars have started to investigate the conditions that have helped or impeded the consolidation of democracy after two decades of repeated elections and broad institutional reforms. The challenges of democratic consolidation have been greater in Africa than in other parts of the world. The democratization of Eastern European and Latin American countries has been largely supported by regional organizations (e.g., as the EU or Mercosur [Mercado Común del Sur]). One of the conditions for participating in these organizations and for enjoying their economic benefits is that democratic principles should be respected. This has not been the case in Africa because of the fragility of the African Union. Although there are still cases of conflict and instability in countries such as Venezuela, Peru, Timor-Leste (East Timor), Thailand, Georgia, and Kyrgyzstan, these are isolated cases. It is in Africa that the consolidation of democracy has continued to be an open question. Although Africa has made a big step toward democratization, democracy is far from having been consolidated. Democratic reversal has continued to be a likely possibility for most African countries. The political crises in Kenya, Zimbabwe, and Madagascar in the past few years are cases in point. Democratic consolidation requires, among other things, a government turnover, and most countries in Africa are yet to undergo this crucial test. Even in countries that have maintained stability, such as Botswana and Namibia, one-party dominance remains a key feature of their democracy.

Quality of Democracy and Development

Following pioneering works on the quality of democracy, such as that by Larry Diamond and Leonardo Morlino (2005), scholars have investigated the same in the countries of Africa and Asia, reaching very critical conclusions. In Africa, due mainly to the low levels of development and widespread poverty, the traditional debate on democracy versus economic development has been very much alive (Adam Przeworski, Michael Alvarez, José Antonio Cheibub, & Fernando Limongi, 2000). In the 1990s, the return to multiparty democratic systems in African countries raised hopes and expectations for development. After almost two decades of multiparty elections, however, those hopes have begun to dwindle as development is slow and poverty levels have remained high. A number of surveys, such as those by the Afro Barometer Group, United Nations Economic Commission for Africa (UNECA), and Transparency International and several others based on regional and individual country comparisons, have been conducted in Africa on the subject of public perceptions of good governance, the effective delivery of services by the state, and levels of corruption and performance on human development indicators. In Asia, similar studies on public perceptions of democracy and the effects of government performance on development have been common.

Investigating developments in Africa and Asia, comparative politics scholars have come up with indicators that purport to measure democracy and good governance. The World Bank has been a leading institution in asserting that good governance is the basis for economic success. It has argued that those countries that have successfully instituted rule of law, established a culture of regular free and fair elections, and minimized corruption have been able to attract foreign private investors and thereby performed much better in development than those that have been unable to do so. Other organizations based mainly in Europe and North America, such as Freedom House, International Institute for Democracy, and the United Nations Development Program, have come up with criteria for assessing performance in political and civil rights, democracy, governance, and economic performance. In Africa, the UNECA has developed an elaborate survey methodology seeking to evaluate public perceptions of the state in various countries, comparing their performance on some key governance indicators, such as rule of law, freedom and fairness of elections, women's participation in politics, levels of corruption, and the effectiveness of the checks and balances between the core institutions of governance (with a particular focus on the independence of the judiciary).

Africa experienced poor governance and rampant corruption in the decolonization decades of the 1970s and 1980s, in part because of the diffuse corruption of public officials and governors. As a result, since the 1990s, Africa has been under pressure from international organizations and local reformers to embrace governance reforms. The African Union has acknowledged that good governance continues to be a challenge in Africa. It has therefore introduced the African Peer Review Mechanism and the African Union's Convention on Preventing and Combating Corruption and Related Offences for improving the standards of governance in the continent. Finally, some investigations have shown a correlation between human development and political stability. Indeed, human development has evaded most countries of the developing world because political instability has continued to be a major and recurrent problem. Examples include Algeria, Burundi, Kenya, Nigeria, Rwanda, Somalia, Sudan, and the Democratic Republic of the Congo in Africa; parts of India, Nepal, and Pakistan in Asia; and Colombia and Guatemala in Latin America.

Democracy and Constitutionalization

The study of constitutions and constitution-making processes features prominently in the comparative politics discourse, especially in the newly democratizing countries. The return to democratic rule has ushered in new debates on how best to craft and reform constitutions and helped ensure that constitutions facilitate democratic governance and protect human, ethnic, cultural, and other rights that characterize complex postcolonial and postconflict societies. In this regard, in Africa, the constitutions of Namibia and South Africa have been considered good examples because of their racial and ethnic balancing, power-sharing mechanisms, protection of basic human rights, and enshrined checks and balances. Constitutional reforms have been introduced in Kenya, Zimbabwe, Swaziland, and Lesotho to deal with internal conflicts. In these and other cases, the reform of the national constitution has been considered necessary for engineering peaceful political succession.

Many countries, especially in Africa, have set a two-term limit for the presidency. In practice, this innovative measure has sparked controversy and conflict in Malawi, Namibia, and Zambia, among others, where the outgoing president has sought to change the constitution to ensure that he could serve a third term. The third-term issue has thus become central in political debate. Succession is an area that has attracted interest and controversy in Africa and in some Latin American countries, such as Venezuela and Honduras. The succession not only to the state's presidency but also to the party leadership have become political issues. The cases of Botswana, Kenya, Malawi, Namibia, Nigeria, Uganda, South Africa, and Zimbabwe show that the African continent has not yet resolved these issues. Succession in the party has been a concern because it has been closely linked to succession in the presidency. As a result, political scientists such as Roger Southall and Henning Melber have focused on the role of former presidents, the legacies of political power, and the importance of term limits.

The issues of constitutions and constitution making have been central in the European debate also. Through the 1990s, all the Eastern European countries had to redefine their constitutional settings drastically. At the same time, the process of enlargement of the EU has accelerated the search for a new constitutional setting able to guarantee the functioning of a regional organization encompassing (in 2010) 27 member states and half a billion inhabitants. The first decade of the 21st century has been the constitutional decade of the EU, although this decade has witnessed the amendment of the existing treaties rather than the approval of a new and encompassing constitutional treaty. Even the contrasted process of constitutionalization of the EU has appeared less exceptional when compared with the experience of other compound democracies. This debate has also led to a vivid discussion on European citizenship and more generally on how to guarantee human rights in a multilevel supranational system.

Democracy and Representation

Political representation has changed dramatically since the end of the Cold War. In established democratic systems, starting with the United States, political parties have entered a long phase of downsizing and restructuring. Mass political parties have become icons of the past. Political parties have become state agencies in Europe (as argued by Richard Katz and Peter Mair) and electoral committees in the United States (as argued by Sandy Maisel). On both sides of the Atlantic, they have developed as supporting structures of the leader at the electoral and governmental level. A vast literature has shown how parties have been integrated by other actors in the electoral arena. While in the West scholars have been investigating the consequences on governance of the decline and transformation of political parties, in the non-Western world, the research issue has been the opposite: What role can newly founded parties play in promoting democracy? In democratizing countries, strong political parties have been considered a necessary pillar for supporting democratic consolidation (M. A. Mohamed Salih, 2003). Political parties have generally been weak and constrained by a lack of resources. This has also drawn attention to the issue of their funding. The weakness of political parties has been fed also by their tendency to fragment along ethnic lines or to rally around a founder patron who has often constrained their ability to institutionalize and practice internal democracy. Opposition parties, in particular, have been conflict ridden and fragmented throughout the new democracies, leading to their poor showing at elections.

In Africa, Asia, and Latin America, comparative politics has focused, in particular, on the functioning of elections, thus contributing to identify criteria for evaluating the legitimacy of the electoral process. The issues have concerned the impact of election rules on the legitimacy of emerging democracies, the institutional conditions that make elections free and fair, the role of electoral management bodies as institutions of governance, and the implications of observation and monitoring on the outcome of the electoral process. These studies have inspired specific regulations, such as the Southern African Development Community's (SADC) *Principles and Guidelines Governing Democratic Elections* and the Electoral Institute of Southern Africa/Electoral Commissions Forum's *Principles for Election Management, Monitoring and Observation in the SADC Region*, both made public in 2004. That notwithstanding, in many African countries, elections have not called into question the power of former liberation movements or ruling parties to dominate domestic politics.

Weakened parties in the European parliamentary democracies have contributed to the decision-making decline of legislatures, thus leaving larger room for maneuvering to the executives. Indeed, parties have come to be controlled by their leader once in government, thus justifying, as noted by Thomas Poguntke and Paul Webb, a process of presidentialization of politics in modern democracies. This process has not concerned separation of powers systems; the U.S. Congress has continued to be the most powerful legislature in the democratic world. Although for different reasons, in non-Western democracies also, parliaments have continued to remain weak institutions. For instance, it has been argued that African parliaments have been weak because of both one-party dominance of the country and an overly powerful executive, although other studies have pointed to a lack of public support for them.

To foster such support, proposals for integrating traditional institutions of leadership and governance into modern structures of representation were advanced. These traditional institutions are still influential at local and regional levels in many countries around the world. In Africa, the institution of chieftaincy, or even kingdom, is still important in people's daily existence. Political efforts to sideline, and in some countries to abolish, these traditional institutions have not succeeded. Many countries, in Africa especially, have molded their modern governance institutions around traditional ones. Botswana, Namibia, and South Africa present a model that seems to have struck a balance of mutual respect between modern and traditional institutions. In other countries such as Zimbabwe, chiefs have been directly co-opted into parliament, while in other countries such as Swaziland, it has been the traditional monarchy that has sought to incorporate modern political institutions.

The return to institutional approach in comparative politics is linked to global support for democracy. Many development agencies (e.g., as the U.S. Agency for International Development, the United Nations Development Programme, and other nongovernmental organizations) have devoted significant resources to the strengthening of the institutions of governance. In particular, across the former Soviet Union, Africa, Asia, and Latin America, the focus has been on strengthening parliamentary and judiciary institutions, and academics and practitioners are studying these programs to assess their impact. A substantial body of comparative politics literature on development assistance has thus emerged.

Comparative Policy Analysis

The interest in the organization and functioning of democratic regimes has inevitably promoted research on the latter's performance by scholars of comparative politics. Starting with the 1981 volume edited by Peter Flora and Arnold J. Heidenheimer during the 1980s, the comparative approach to policy analysis came to be adopted by many scholars, in particular for understanding the historical development of different welfare systems and for explaining the different features of welfare policies in Western Europe and the United States, as shown by the contributions of Gøsta Esping-Andersen, Paul Pierson, and Francis Castles. One might argue that the analysis of Western welfare policies constitutes the starting point of comparative policy analysis, and even today, it represents its core business.

However, with the end of the Cold War and the development of the globalization process, the comparative study of welfare systems has come to include the analysis of new social risks, risks that epitomize the pathology of contemporary postindustrial societies, as argued in the volume edited by Peter Taylor-Gooby in 2004. At the same time, the diffusion of the process of globalization has made the Western experience with welfare systems less peculiar than in the past. The problems associated with guaranteeing social security in market societies have come to be shared by many countries—developing as well as developed, democratizing as well as democratic. Market globalization has generated new social externalities, bringing to the center of comparative policy analysis new problems, such as immigration and environmental issues. In this regard, one has to consider the 1997 volume edited by Martin Janicke, Helmut Widner, and Helge Jorgens on national environmental policies and the 2007 volume by Eytan Meyers on international immigration policy.

Starting in the 1990s, the field of public policy has also seen a dramatic expansion. Globalization and Europeanization have not only created new problems, but they have pressured international institutions to promote thorough investigations of the economic, financial, administrative, and political performance of the various countries, investigations accompanied by frequent, specific recommendations for public policy. The conspicuous development of comparative policy analysis has been made possible by an easier access to empirical data concerning the various members of international and regional organizations. The latter have also supported specific policy priorities, introducing new criteria for evaluating countries' approximation to the expectations for good governance, including the call for the promotion of gender equality. Indeed, since the second half of the 1990s, gender policy has emerged as a significant policy interest, and not just in developed countries, as shown by the 1995 volume edited by Dorothy McBride Stetson and Amy G. Mazur. This policy field has been finalized not only to investigate the structural constraints on women's participation in the economic and social life of a country but also to identify resources and practices that might promote women's interests in the various national contexts.

The gender approach to public policies has thus called into question the normative premises of many public policies. In fact, the latter have been based on a culturally defined view of family organization, social needs, and individual expectations. The same concept of security has been redefined to meet new social preferences and personal attitudes. Indeed, the comparative study of public policy has led to a greater understanding of the value structures of contemporary societies, thereby helping combine empirical analysis and normative assessments.

The Future of Comparative Politics

Comparative politics (as an academic discipline) has been a major success. In the post–Cold War era, our knowledge of democratic, democratizing, and nondemocratic political systems has grown enormously. The methodologies, concepts, and theories of comparative research are widely used by political scientists. With the exception of the United States, where "American politics" scholars constitute the majority, comparative politics has become the central subdiscipline of world political science. Indeed, as noted by Henry Brady and David Collier, the discipline as a whole has been defined epistemologically by the debate in comparative politics. However, the success story of comparative politics has reached a critical juncture. Comparative politics is encountering issues with confronting the political problems of a globalized world. Its methods and theories face difficulties when applied to processes that transcend state borders and undermine the structure of the traditional political relations on which comparative politics is based.

The historical transformations that have occurred after the end of the Cold War have called into question the concept of sovereignty itself, which is the foundation of the study of comparative politics. With the processes of globalization that have unfolded tempestuously since then, the external and internal sovereignty of the nation-state (the basic unit of analysis of comparative research) has been eroded. Simultaneously, the complexity of political systems and their external relations has increased to such an unprecedented extent as to give rise to a complex interdependence. This complex interdependence is changing the nature, powers, and outlook of the units used by comparative analysis for the study of politics. It simultaneously disarticulates domestic and international politics, creating more levels of correlation between variables, levels that are not necessarily connected with each other.

This being so, it becomes increasingly less plausible to establish what constitutes an independent cause of a dependent outcome. If domestic political systems are not independent of external processes and if the actors that operate within them do not have the ability to act as agents that connect cause and effect, then the fundamental preconditions of comparative analysis are being eroded. Therefore, it is increasingly less likely to assume that the various political systems are distinct entities, because in reality, they are not.

Globalization and Europeanization

Domestic political systems are embedded in an institutionalized international context that noticeably constrains the autonomy of their decisions. The majority of nation-states are members of international economic organizations (e.g., the World Bank, the International Monetary Fund, and the World Trade Organization) or of military alliances (e.g., the North Atlantic Treaty Organization [NATO] and South East Asia Treaty Organization [SEATO]) where decisions are made (with their participation, of course) that have significant domestic implications. Over and above this, the sovereignty of the nation-state is also being eroded from below. At least in Europe, the unitary and centralized state is being superseded. New regional and municipal authorities have emerged and have become institutionalized. Not only has the room for maneuver of the national or central authorities been reduced, but the cognitive context itself, within which their actions unfold, has changed. Our conception of the state has been modified.

Globalization, as noted by Philippe Schmitter, has become the independent variable in many national contexts. It has reduced the impermeability of the nation-states to external pressures. This, in turn, has weakened relations between the citizens and the institutions of those states, as soon as the former have become aware that the latter are unable to respond to their demands. The legitimacy of public institutions has been further reduced by the growing role that noninstitutional actors have acquired in the context of globalization. These actors comprise companies, associations, and transnational nongovernmental organizations that operate outside the border of single states, and they have contributed to the emergence of new supranational regulative systems or international regimes. One may claim that no nation-state (not even the most important ones like the United States or China) is able to control domestic decision-making processes, autonomously steer its own economic dynamics, or develop its own separate cultural identity.

If globalization has challenged the assumptions of comparative politics, this is even truer in the case of the Europeanization induced by the process of European integration. There are many definitions of Europeanization. According to Vivien Schmidt, it consists in the process through which the political and economic dynamics of the EU have become part of the institutional and cultural logic of domestic politics. However one defines Europeanization, there can be no doubt that it consists of the implementation, at the level of the single member states, of institutional procedures, public policies, and cognitive frameworks to address the domestic problems deriving from the EU level. No member state of the EU (not even those most proud of their own traditional sovereignty, e.g., the United Kingdom and France, or those most proud to have recently regained sovereignty, e.g., Poland and the Czech Republic) can decide (in myriad areas of public policy) on the basis of autonomous considerations. This does not mean that the European nation-states have disappeared. Rather, it is even plausible to argue, as

Alan Milward has done, that European integration has rescued them, taking care of tasks they were no longer able to tackle. This, however, means that their sovereignty has been eroded and redefined. They are sovereign in some areas of public policy (e.g., defense and, partially, foreign affairs), whereas they are entirely bereft of sovereignty in other areas (e.g., monetary policy and, more generally, all areas related to the creation of the common market). In yet other areas (e.g., environmental and research policies), they share sovereignty.

It is clear that Europeanization constitutes a formidable challenge to the assumptions of comparative politics—namely, to conceive of the European states as sovereign and independent units that are autonomous in terms of decision making. In Europe and elsewhere, the dividing line between internal (domestic) politics and external (international) politics has shifted significantly (Robert Elgie, 1999).

Toward an International Comparative Politics

Globalization and Europeanization have brought radical transformations to the states and to the relations between them. These transformations call into question the traditional distinction between comparative politics and international relations. Regarding comparative politics, the sovereignty of nation-states has been fundamentally questioned. Sovereignty has been unpacked, fragmented, and segmented, thereby challenging a long normative (and hypocritical) tradition that assumed that sovereignty is an indivisible reality. The same supposed order of the domestic polity is dramatically belied by the fact that most of the major conflicts that occurred during the 1990s have happened within states rather than between them. Regarding international relations, it is no longer certain that the international system is the anarchic world that has formed the basic condition of interstate relations. This system is organized in several international regimes and managed by several international organizations, each of them equipped with tools and norms to peacefully adjudicate disputes between public and private actors.

Various studies have recognized that the epistemological and methodological boundaries between the two subdisciplines of political science are no longer evident. Scholars developing the foreign policy analysis approach have included the domestic structure of a given regime in their analysis, showing how it exerts a significant influence on the decisions and styles of foreign policy of a country. Scholars investigating the relations between the economic structures and the political arrangements of various countries have shown the interactions between international pressures and domestic arrangements (with their effects on the organization of markets, the construction of welfare regimes, the organization of systems of representation, and interest intermediation). One could mention the most recent literature on democratic peace, which has sought to show why democratic countries do not go to war with each other, because of the domestic constraints to which their decision makers are subjected; however, this does not imply that they are not inclined to go to war with nondemocratic countries. Finally, leading international relations scholars have continued to work with models connecting international and domestic variables.

These and other studies have called for the development of an integrated political science that is subdivided by the topics it seeks to study rather than by the units of analysis chosen (the domestic system or the international system). A political world marked by complex interdependence calls for a political science ready to experiment with new methods and new theories. A new field of study, which some scholars call International Comparative Politics, might be developed to confront the challenges of this world. However, the structure of academic careers, still rigidly organized around the distinction between the two subdisciplines, will make such development difficult.

Conclusion

The fundamental transformations induced by the processes of globalization and Europeanization have ended up questioning the methodological and theoretical self-sufficiency of comparative politics. These processes have urged scholars of comparative politics to take the international context of a country into account as an essential variable in explanations of the functioning of domestic politics. Simultaneously, the effects of domestic structures on supranational and international processes have driven international relations scholars to reexamine the methodological and theoretical self-sufficiency of their discipline. Substantial changes in the real world of politics are urging political scientists to develop methods and theories that can come to terms with the complex domestic and international forces that shape the important problems requiring study and explanation. After all, the undertaking of political science, as of all other social sciences, is justified by its ability to furnish plausible solutions to real problems. Accordingly, the profession should not be afraid to question itself, to overcome consolidated divisions between subdisciplines, and to seek new perspectives. A self-sufficient political science serves neither political scientists themselves nor the citizens of the contemporary world.

Competition, Political

Competition is understood as the struggle between two or more agents to capture scarce, limited, and valued resources within a defined system or context. It is often assumed that competition is a zero-sum game, in which one participant's gain or loss is exactly matched by the loss or gain of another. Political competition involves the struggle for power, for example, through elections in a democratic regime. It is a concept employed in virtually all subdisciplines of political science, for it is a universal aspect of human life. Although in one way or another everyone is affected by it, a clear definition of the concept remains elusive. This entry is structured as follows: First, the term *competition* is isolated from other concepts with which it has been fused or mixed. Second, using an analysis of measurement, a distinction is drawn between the two most important areas of political competition in democracies: the electoral and the governmental. Finally, the entry differentiates between the latest developments in electoral and governmental competition in new Third World democracies and those in other developed democracies.

Definition of Competition

One of the reasons for the concept's elusiveness is that the term has often been conflated with *competitiveness.* A democracy may not have competitiveness during long periods of time despite being a competitive regime (as in the example of predominant party systems). Indeed, Robert Dahl's definition of polyarchy allowed for the free exercise of political contestation in—and between—elections, but it never implied that effective competition had to occur. Thus, competition comprises a possible competitiveness but not otherwise. In the words of Giovanni Sartori (1976/2005), "*Competition is a structure*, or a rule of the game. *Competitiveness is a particular state of the game*" (p. 194, emphasis original). The literature is rather strong in claiming that the more competitiveness an election has, the higher the probability that a single vote can affect the outcome, which increases the expected utility of voting and, thereby, voter turnout. Thus, high levels of competitiveness are strongly related to the health of a democracy.

Areas of Competition: Elections and Government

Contemporary democracies are the systems in which political competition occurs par excellence. Democracy could be understood as a system of government that frames, regulates, and limits political competition in order to ensure that those elected will enjoy broader popular support and that there is equal opportunity for all competitors. Of course, not every public office to be filled in a democracy is elected (e.g., justices of the highest court) and not every aspect of democratic life is subject to political competition (e.g., respect for basic human rights is not contingent on political competition but guaranteed to all). The scope of political competition's excluded areas is still a fertile ground for theoretical discussion (e.g., why not elect high officials through lots instead of votes and why not select the best instead of the one chosen by the many?). Despite these debates about the limits of political competition in the democratic realm, political competition and competitiveness are clearly observed in two major arenas of democracies: the electoral and the governmental.

Within the realm of electoral competition, Joseph Schumpeter offered perhaps the first attempt to provide a working definition that challenged the classical, more normative doctrine of democracy. In his view, democracy was not an end in itself but rather a political competitive process or struggle for the people's vote. Schumpeter's "minimalist" definition of democracy has been a catalyst for innovation in this literature. Nonetheless, it is only after Anthony Downs that the formalization of political competition, especially among political parties, was bolstered by the analogy to markets. Political parties are crucial organizations in contemporary democracies as competition is channeled by them. The principal way to understand the competition among them was through the lens of partisanship: Parties were aggregates of vote-seeking politicians. While we usually see political competition as an ongoing and never-ending process, paradoxically, the formalization of political competition has almost the sole purpose of seeking equilibrium—that is, an outcome from which no party has an incentive to deviate—something hardly ever attained.

Downs delivered a model of political competition of candidates with respect to their ideological position in a single-issue dimension. Along a single-issue dimension, a two-party competition is expected. Parties will experience strong pressures to converge on the position of the median voter if they wish to avoid electoral defeat. Important works have been devoted to showing that this predicted convergence is just partial in real life, given that Downs's theory relies on highly restrictive assumptions; for example, much of this literature has been centered on direct democracy or voting in committees, where very few players are involved. The median voter theorem produces a Nash equilibrium, in which no player has anything to gain by changing strategies unilaterally. The literature that emanated from Downs's seminal work was strongly influenced by Duncan Black's median voter model, in probably what is one of the founding texts of social choice theory, and by Kenneth Arrow's discussion of the dilemmas of aggregating single-picked individual preferences into a collective choice. All of them were predated by Harold Hotelling's model of spatial competition—the location of different sellers in a market with respect to one another—probably the pioneering paper in public choice. Here, the market analogy is more than an analogy; this literature really does derive from the idea of market competition.

Up to that time, the literature on political competition was notably influenced, and inspired by, the bipartisan background of the U.S. political system. Although U.S. elections have tended to exhibit tremendous competitiveness, governing activity exhibited stable patterns of competition (i.e., a party in the executive and basically two large parties in the legislature of roughly the same size). The discussions arise concerning how the government performs when the party that holds the executive does not have a majority in Congress—a situation usually known as a "divided government."

Yet the Downsean perspective was not unique in observing and understanding spatial models of party competition. George Rabinowitz and Stuart Elaine Macdonald, for example, use a directional-spatial model of electoral competition in which utility is based on the intensity and direction between voters and candidates in contrast to the traditional proximity spatial model, which represents utility as a declining function of distance between voter and candidate ideal positions. The directional-spatial model of electoral competition suggests two main hypotheses: The first is that voters prefer candidates who are on their side, and the second is that given two equidistant candidates, they prefer the more intense and more credible to their cause. From the directional models, a new line of research emerged—the theory of discounting—denoting that candidates cannot fulfill all their promises, and therefore, voters discount the campaign and judge according to what they expect candidates to realistically achieve in government. This theory emphasizes the role of status quo in setting expectations about what the candidates can really do and assumes a programmatic or ideological linkage between candidates' and voters' understanding that the electorate's decisions are very focused on policy proposals or ideological stances.

An extremely lucid analysis of electoral competition was advanced by Adam Przeworski (1991). He remarked that "democratization is an act of subjecting all interests to competition, of institutionalizing uncertainty" (p. 14). Like economic competition, where there are clear limitations against a single agent imposing a price or product, political competition obeys rules among relevant actors. Thus, the institutionalization of uncertainty has three main features: *ex ante* uncertainty (anyone can win), *ex post* irreversibility (losers do not try to reverse results), and repeatability. Without any of these, democracy is hardly possible.

Measures and Theory

While there is little consensus on how to properly calculate competition—students of democracy and elections have developed different measures of this vague concept—some advances are evident in the literature. For example, it is possible to measure political competition as the frequency of alternation in power over a delimited period of time or by building multidimensional and longitudinal indices of competition for a few political units (i.e., the American states). This long-term perspective is not very useful for new democracies, in which just a few elections may have taken place. Other scholars have measured competition as the winner's percentage of the votes, the percentage margin of victory, or the raw vote margin of victory in elections. Such measures are less contingent on time and provide clearer pictures of political competition in a particular moment, yet they are heavily biased against two-party systems because margins of victory tend to be smaller in multiparty democracies.

A more useful measurement of competitiveness comes from Markku Laakso and Rein Taagepera's widely used *N* index, which is a weighted average of the number of parties that compete in a national political system, and it is expressed as $N = 1/\sum p_i^2$, where p_i is the share of seats a party has in the legislature. The *N* index is strongly related to the Herfindahl-Hirschman Index, an indicator of the amount of competition among firms in relation to the industry, which is denoted as $H = 1/\sum s_i^2$, where s_i is the market share of firm *i* in the market. Though both indices, the *N* and the *H*, were created as indices of diversity (fragmentation) of political parties or firms, they are frequently used as measurements of competitiveness. The higher the index, the more the competition. These indices also suffer from important limitations, such as other institutional features like degree of proportionality of legislatures, mathematical distributional procedures of seat allocation (e.g., D'Hondt, Hare), party registration limitations, and others.

With all their limitations, the Laakso and Taagepera or Herfindahl-Hirschman indices provide an accurate view of the correlation of power among agents in a given arena (the legislature or the market itself). Still, their major shortcoming is that little is said in regard to how the legislature or the market would perform. Knowing that counting parties is not sufficient for analyzing a party system, Giovanni Sartori in his classic work of 1976 presents a theory of the dynamics of political competitiveness in regard to whether centrifugal or centripetal forces act in a given party system, which is an improvement over the earlier ones. Recent developments have tried to make a more subtle connection between electoral results and governmental activity. For instance, David Altman and Aníbal Pérez-Liñán developed a measure that weights the sizes of the "typical" parties in government, $G = \sum g_i^2/\sum g_i$, and in opposition $O = \sum o_i^2/\sum o_i$, in the following way: $C = 1 - (|G - O|/100)$. The value of *C* tends to zero whenever the government (or the opposition) controls the whole legislature and to one if there is balance between government and opposition. This index provides a forecast of governmental activity and the relationship between the executive and legislative because it reflects the opposition's access to the legislative process rather than mere electoral outcomes.

In spite of these miscellaneous indices, a whole body of research was detached from the American model and jumped the Atlantic in search of new models of political competition, particularly in the context of governability and executive coalition theories. It is not hard to understand why this literature bloomed in the context of the study of governing coalitions in Western European parliamentary democracies. The process of forming coalitions in parliamentarian regimes involves a relatively reduced number of actors (parties) competing in a closed and rule-bound milieu (parliaments) for clear purposes (membership in the executive cabinet), where the quantity and quality of portfolios are crucial. One of the strengths of this literature is exactly that it is not circumscribed by political competition, but it necessarily touches on the flip side of the coin—political cooperation—and hence provides a more comprehensive panorama of political competition.

Thus, in the late 1950s and early 1960s, in the political competition literature, mainly via the study of coalitions, the meaning of "getting votes" shifted and came to be understood as a means to reach other objectives: office, and then policy making. Probably, the three models of party competition (votes, offices, and policies) are relevant to all parties at any instant in time, although more so at some times than at others. Doubtless, new research on governing coalitions in presidential regimes shows that parties shift their objectives in synchronization to the fixed electoral calendar. Before a national election, they are principally concerned with obtaining votes. After elections, party members strive to obtain political appointments from elected officials, and then later, policy-seeking behavior ranks first in their preferences.

This literature has developed a great deal since William Gamson's and William Riker's seminal works. Gamson theorized that parties compete for office and seek their payoff (players' utilities resulting from the outcome of a game), which is fair as it is directly proportional to the amount of resources that they contribute to a coalition. The prediction of his theory is that payoffs in any government are limited and therefore, the greater the number of parties in a coalition, the lower is the payoff for each. Resources are limited because, for example, a governing coalition cannot satisfy all policy demands simultaneously (e.g., lowering and increasing taxes). As a result, in order to not distribute unnecessary payoffs, Riker predicted the formation of winning coalitions of minimum size (meaning the number of parliamentary seats a coalition of political parties must control to receive a majority vote for investiture).

Since then, authors have devoted themselves to testing variables that presumably would affect political competition. Robert Axelrod argues that coalition parties are likely to be adjacent in a one-dimensional policy space, predicting minimal connected winning coalitions. That is, parties in an executive coalition will be adjacent to each other in a one-dimensional policy space, and also, the coalition will not include any more parties than necessary to be connected and winning. Others, such as Norman Schofield, have centered their arguments on the importance of large parties and their position in the policy space; large parties whose policy positions are located in the core of the policy space—that is, parties with policy positions such that no alternative policy is preferred by a simple majority—tend to form minority and surplus majority governments. In short, most of this literature on political competition has as its hard core the fragmentation of the party system and each party's location and coverage of the ideological space.

Although a vast number of alternative hypotheses for why and how parties compete have been put forward, three facts must be underlined. First, little research has been done on how differences in party organizations affect political competition. Most studies from a rational choice perspective treat parties as unitary actors that bargain over a set of well-defined gains—usually office or policy. There is some truth in this assumption but more error. Parties are complex organizations, where internal divisions and structures affect how they and their leaders behave. Important works in the literature have already underlined the problems attached to treating parties in this manner. Despite the fact that many of the ordinary political phenomena can be explained by treating parties as if they were unitary actors, we undoubtedly need to take into account what goes on inside parties if we want to provide an explanation of party decision making in a model of some political course of action. While some scholars stress one of these motivations, other scholars combine them in one way or another.

Second, a proper specification of political competition requires a theory whereby parties compete in multidimensional spaces, because even if one is interested only in one narrow particular policy (say taxes), the position on other issues will affect the equilibrium in that narrow particular policy. Following Downs, most commonly used theories of political competition posit a unidimensional political space where competition occurs or at least—acknowledging the multidimensionality of political life—try to isolate the particular dimension in consideration. Yet, even in the case of single-peaked preferences of political actors, the results might be unstable and inefficient as regards social decisions, as was clearly demonstrated by Condorcet's paradox of voting and Arrow's impossibility theorem. It does not mean, as Gordon Tullock shows, that unstable social decisions generate total chaos or instability of these decisions because institutions play a crucial role in suppressing the underlying unsteadiness (institutions such as agenda setters, party discipline, or procedural rules in parliaments). Some scholars (e.g., Kenneth Shepsle) call the equilibrium resulting from these regulating forces a structure-induced equilibrium.

Third, the regime divide has been minimized and brought into the discussion. Incentives for party competition are quite different in a presidential system than in a parliamentary one for four reasons. First, in a presidential regime, fewer coalition configurations are likely because one party—the president's party—is normally expected to be a coalition member. The rare exceptions to this rule so far have not undermined this normal expectation. Second, given the prominence that the president's reputation has in citizens' evaluations of governmental performance (either positive or negative), the president's coalition partners are less able to claim credit for good government performance. Thus, under presidentialism, players have fewer incentives than under parliamentarism to join or to remain in a coalition. Consequently, third, the president's approval rating has a powerful effect on parties' decisions to associate themselves with, or to distance themselves from, the government. And fourth, based on the previous statement, most of the incentives change over time in synchronization with the fixed electoral calendar. Because parties know when the next elections will take place, they have incentives to distinguish themselves from the president and start to compete in order to increase their chances of getting elected in the next election.

Despite important progress in the development of coalition theories, the jury is still out on certain issues. All theories of coalition formation and survival under parliamentary regimes make assumptions, hidden or explicit, about political parties' preferences and their concomitant logics of competition. Michael Laver provides new extensions of policy-driven political competition into a multiparty environment where voters constantly evaluate party support and switch parties to augment their expectations; parties continually readapt policy positions to the shifting affiliations of voters. Political competition is based on four clear types of party behaviors:

1. *predator* (move party policy toward the policy position of the largest party),
2. *aggregator* (adapt party policy to the ideal policy positions of party supporters),
3. *hunter* (repeat policy moves that were rewarded; otherwise make random moves), and
4. *sticker* (never change party policy).

Laver's contribution provides the first steps toward endogenizing key features of the process of competition, including the birth and death of parties, internal party decision rules, and voter ideal points.

Developments in New Third World Democracies

At the risk of making a gross generalization, some countries of what is often called the Third World are lately showing signs of new patterns of electoral and governmental competition. These patterns are characterized by the emergence of personalistic leaderships, hegemonic actors, and a tendency to institutional innovation rather than consolidation, all in the context of high levels of civic disaffection, distrust of political parties, and in general, animosity toward democratic actors and institutions. The arena of electoral competition involves new forms of citizen mobilization through a large dose of social polarization, often fed from above. Once in power, in the realm of governmental competition, leaders provide comprehensive packages of institutional reforms, endorsed by constituent assemblies and usually ratified by direct popular votes (plebiscites). The proposed reforms more often than not include the reelection of elected officials, particularly of presidents, and a concentration of power in the executive at the expense of others, primarily the judiciary. This is particularly relevant in Latin America (e.g., in Venezuela, Bolivia, and Ecuador) but is not confined to this region.

In short, political competition is probably one of the most complex concepts in political science, and as such, a clear definition of it is likely to remain hard to pin down. In any case, as a concept that touches on every aspect of political life, political competition will remain at the center stage of political science.

COMPLEXITY

The science of complexity in the natural and social sciences involves the use of formalized (mathematical or computational or both) theoretical models to study systems of interacting agents where the following hold:

1. Each agent's behavior is governed by a small set of simple rules, which often depend on local information and feedback from the agent's past behavior and from other agents' behavior.

2. Characterizing and understanding the behavior of each of the agents does not directly lead to predicting or understanding the behavior of the entire system. The local rules produce emergent patterns—stable equilibria, cycles, unstable equilibria and long transitions to new equilibria, and randomness—and emergent properties such as robustness.

3. Agents' interactions are interdependent and affect others in the system; thus, removing an agent has consequences for the system beyond merely subtracting out that single agent's direct effect on other agents with which it interacts.

This entry presents the foundations of complex system modeling and points to diverse applications in political science.

Foundations

It is said that Thomas Schelling proposed the first modern complex systems model in the social sciences. In research in the 1960s into the phenomenon of racial segregation in housing, he modeled a process where people (agents) decide where to live based on the racial mix of their neighborhood. Schelling randomly placed nickels and dimes on a checkerboard, with each coin resting on only one square and with fewer coins than available squares. He then randomly picked one of the coins, say a dime, and examined its neighborhood, meaning the squares that bordered the square on which the dime stood. There will be eight squares in the neighborhood (unless it rested on the edge of the board, which we shall ignore for this example). If the neighborhood consisted of fewer than 5 nickels, Schelling did nothing. Otherwise, he moved the dime to another place on the board where there were fewer than 5 nickels in the neighborhood. He then iteratively moved through each coin and either moved it somewhere else or kept it in place, using the 5/8ths rule for tolerance of neighbors of the other type. Schelling argued that 5/8ths was a pretty tolerant threshold, in that his coins (agents) would stay put even if half of their neighborhood consisted of the other type. He showed that even with this relatively tolerant threshold, the dimes and nickels segregated into homogeneous zones on the checkerboard. He then started over and examined what happened with other kinds of thresholds (1/2, 3/4, etc.) and how quickly, if at all, the agents segregated themselves incrementally.

Note what happens in the dynamics of the Schelling model. When a coin is moved to another area of the checkerboard, it changes its own neighborhood and the neighborhood to which it moves. A single move alters the diversity of the neighborhoods of multiple agents and thus potentially alters the decisions of multiple other agents. This is an example of the kind of feedback that occurs in complex systems. Further, it is difficult to predict simply from the decision rule of the agents how the system will behave. Schelling confessed that he could not predict in advance when and if the system would segregate into neighborhoods of all dimes and all nickels.

Today, researchers using complex systems methods typically rely on computer programs to simulate the interactions of artificial agents, examining the aggregate patterns that emerge from many instances of microlevel behaviors. (Some additional terminology: What is sometimes called agent-based modeling is the use of computation to study the links between microbehavior of agents and macropatterns in a complex system.)

As can be seen in the Schelling example, it would be misleading to say that this branch of science involves the study of highly complex models. As with any theoretical modeling in the sciences, complex systems modeling involves making simplifying assumptions to craft a model of behavior, analyzing the consequences of those assumptions, and then linking the model to real-world phenomena. The use of the word *complex* refers to the characteristics of the social system under study and not to the approach of the modeler. Many complex systems models, such as the Schelling example, are extremely simple in their construction.

Applications in Political Science

A variety of social systems have been characterized as complex, and accordingly, in social science disciplines, the use of complex systems modeling has grown. Within political science, complex systems modeling has been applied to the study of international diplomacy and war, electoral competition, voting systems, the spread of culture, the evolution of cooperative behavior, criminal behavior and punishment, the sorting of people into communities, political networks, and the development of law.

Researchers studying diplomacy and war, for instance, have devised modeling frameworks to analyze the sensitivity of international alliances to changes in resource inequalities across alliance partners. When a developing country discovers oil, what effect does this have on military or trade alliances? Complex systems models can enable researchers to analyze the system-level, often nonlinear, effects of such changes.

Using complex systems models on collective action and cooperation, researchers learned of the importance of reciprocity and forgiveness in the evolution of cooperation. For a long time, scholars puzzled over the question of how cooperative behavior arises among selfish individuals. Recently, researchers have made new discoveries about the importance of "tagging" or noninformative markers on agents that permit discrimination and discernment in choosing partners. Such tags can actually promote more cooperation among all agents rather than create groupings that shut out others. And in a practical application of these types of models, some have analyzed social systems where some agents can choose to commit crimes (citizens) and others can choose to enforce community norms (police). These models have led to discoveries about the trade-offs among different strategies for fighting crime. Societies face trade-offs between devoting resources to monitoring behavior and to stricter punishments for criminals. The consequences of particular strategies for law enforcement are difficult to understand without models that specifically incorporate feedback effects from agent behavior to the development of new agent strategies.

Researchers have also used complex systems modeling to discover the conditions under which a group of diverse individuals with different ways of framing a problem can choose more effective public policies than a group of homogeneous individuals who all frame the same problem identically. Diversity, these models tell us, can in common circumstances improve collective decision making in legislatures, councils, organizations, and committees.

Research into social and political networks has increasingly included complex systems modeling. There are models that help researchers understand better the conditions in a social network that encourage innovation and the spread of innovations among agents in that network.

Complex systems modeling is sometimes seen as a challenge to traditional game-theoretical methods of modeling. But most practitioners of complex systems modeling within political science view it as complementary to game-theoretical methods. Not only are quite a few well-known complex systems models within political science based fundamentally on game theoretical techniques, but the researchers themselves have typically published work spanning a variety of modeling tools, including game theory. Well-known complexity models depict iterated prisoner's dilemma situations. Agents in these models play repeated prisoner's dilemma games with each other, and researchers seek to discover the kinds of strategies that do well in environments with agents that can alter their strategies to get ahead.

A large portion of complexity research in political science focuses attention on models where the agents are not fully rational in the manner defined by economists and many other social scientists. That is, agents are portrayed as adaptive and boundedly rational. This certainly characterizes the Schelling agents. More generally, this means that agents display a subset of the following features:

1. they do not fully optimize their utility functions given their information;
2. they are not forward-looking in being able to predict accurately the probability of certain outcomes in the future, given their behavior; and
3. they are myopic in that they do not have information outside of some defined local "zone" of interaction or geography.

Many game-theoretical models in political science have agents with one or more of these features—modelers through various assumptions end up restricting the information or actions available to agents. Nevertheless, one generalization that can be made is that, at heart, game theory relies on the assumptions following the work of John von Neumann, Oskar Morgenstern, and John Nash that agents are rational (optimize) and intelligent (they know the game they are in as well as the modeler does). Complexity systems models can violate both of these assumptions, especially the latter. Note in the Schelling model how the agents are assumed to make decisions solely on the mix of other agents in their limited neighborhood. They do not consider the implications of their actions in the long run or what happens outside their own neighborhood (either the one they leave or the one they move to).

In fact, some commentators have identified insight gained from studying systems of adaptive, less than fully rational agents as one of the noteworthy benefits of using complexity methods. There is nothing inherent in the methodology that requires that agents be boundedly rational or adaptive, but it is clearly a common feature of such models.

Consider the recent work on political party systems using complex systems modeling of electoral competition. In the work of one researcher, adaptive political parties were assumed to be one of four types, each boundedly rational but in a different way. Hunter parties change their ideological positions in a hill-climbing pattern; that is, they keep changing in the same ideological direction as long they continue to win more votes. Predator parties change their ideological positions to mimic the most popular political party. Aggregator parties adopt the most popular ideological position among their existing supporters in the electorate. And Sticker parties do not change their ideologies. The researcher attempted to simulate the party politics of Ireland using this model, matching up the type of party to a real-world example. For instance, the researcher concluded that the Fine Gael party was like a Hunter, while the Democratic Left was like a Sticker.

What is innovative about this work is the incorporation of real-world data on micromotivations directly into the assumptions of a model. Then, after a series of complex systems simulations, the researcher compared the distribution of votes among the artificial parties and the ideological positions of the artificial parties with real-world data on parties from Ireland. The methodology permits researchers to unpack the dynamics of the system by running the simulations under various scenarios, discovering what aspects of the model are driving which system-level results.

Complex systems models are best described as a set of tools for analysis. Researchers consider what they do as providing a platform for the study of specific research questions. For example, what can cause the international system to fragment into multiple centers of power, such as what happened in the early 20th century prior to World War I? Alternatively, what causes the international system to fall into a pattern where there is one dominant, hegemonic power, such as what happened after 1990? The models enable researchers, equipped with plausible assumptions about microlevel motivations and interactions among agents, to devise counterfactuals, with careful attention to interactions, feedback, and nonlinear effects. Researchers can discover the causes of macrolevel dynamics switching from one phase (e.g., multipolarity in the international system) to another (e.g., unipolarity). In this sense, complex systems researchers provide something analogous to experimental laboratories. (There are sophisticated software programs that enable students and researchers to develop complex systems models even if they have only limited training in writing computer code.) The models are platforms for researchers to study a variety of questions in careful detail, especially about how microlevel interactions aggregate into macrolevel patterns.

Compliance

Compliance, simply put, is the extent to which an actor fulfils its obligations. In the realm of international relations, scholars are most concerned with state compliance and have focused their attention on the degree to which states conform to the prescriptions and proscriptions stipulated by their international commitments.

Interest in compliance has burgeoned as states increasingly construct and enter into rule-based governance arrangements to guide behavior and solve problems in a variety of issue areas, such as trade, security, human rights, and the environment. Scholarship on international cooperation, regimes, law, and institutions has focused on why states do or do not comply with their international obligations and what conditions and institutional features facilitate compliance.

The subject of compliance is often connected to the debate over the importance and efficacy of international institutions, but the relationship between compliance and effectiveness is a murky one. There is widespread agreement that compliance is not sufficient for effectiveness; however, there is a debate over whether and to what extent high levels of compliance are necessary for, or at least associated with, consequential institutions and effective agreements.

Scholars from the realist tradition are generally skeptical that international institutions and law are significant determinants of state behavior. In the view of the majority of realists, power relations are the most reliable predictor of international outcomes, and states often strive to avoid complying with inconvenient obligations. In cases where compliance rates are high, realists tend to see the outcome as the result of shallow agreements that reflect the law of the least ambitious party or as merely codifications of what states would have done even in the absence of an agreement.

Other perspectives, such as neoliberal institutionalism and social constructivism, are more sanguine regarding the potential influence of international institutions and agreements Neoliberal institutionalism, with its rationalistic metatheoretical orientation and focus on constellations of interests, sees high levels of compliance with international rules as a possibility. Moreover, compliance or even good-faith efforts that fall short of full compliance, together with other factors such as the achievement of policy goals and behavioral change, can be treated as an indicator for evaluating the impact of international institutions and agreements. This perspective holds that states operate according to a logic of consequence and that institutional design matters in influencing how states will calculate their interests and goals and evaluate the costs and benefits of compliance or noncompliance. Institutional properties and mechanisms, such as monitoring capabilities and verification systems (e.g., the International Atomic Energy Agency's safeguard system fulfills this role in the case of the nuclear nonproliferation regime), can result in increased transparency, greater information, and the creation of material (sanctions, loss of privileges) and social (reputational) costs for noncompliant behavior.

Social constructivist and normative approaches take the position that international institutions and regulations are meaningful and that their norms and rules tend to enjoy widespread compliance. As the legal scholar Louis Henkin (1979, p. 47) concluded, "Almost all nations observe almost all principles of international law and almost all of their obligations almost all of the time." Social constructivism, which has a sociological metatheoretical orientation, emphasizes the interplay between norms and identity and stresses knowledge and communication dynamics to explain state behavior. Constructivists see states as role players and have found that international institutions can play an important role in socializing states to accept and internalize particular norms and rules. In their view, decisions about compliance are driven by a logic of appropriateness that reflects intersubjective normative understandings and identity concerns. Behavior is not strictly determined by rational calculations of the state's interests but by deeper norms and shared beliefs about what actions and policies are legitimate and appropriate in international relations (Thomas Franck, 1990, pp. 205–207). Therefore, from this perspective, the decision to comply with international provisions concerning issues such as slavery, piracy, human rights, the use of chemical weapons, and the acquisition of nuclear weapons serves the important function of both shaping and reflecting a state's identity.

Promoting Compliance and Coping With Noncompliance

As Helmut Breitmeier, Oran Young, and Michael Zürn (2006) have noted, while states often comply with international rules, compliance problems remain a persistent challenge. For this reason, scholars have attempted to identify the factors that foster compliance and have debated the best way to reduce noncompliance, whether it be deliberate, inadvertent, or due to lack of capacity. The management and enforcement approaches provide contending views of the most important determinants of compliance.

The management approach has stressed the importance of transparency, dialogue among the agreement's parties, dispute resolution procedures, and technical and financial assistance to promote compliance and has downplayed the need for punitive enforcement mechanisms, such as sanctions. Advocates of the managerial school argue that this approach usefully addresses the primary types of noncompliance. The provision of resources or expertise can address noncompliance that has resulted from a lack of capacity. Clarification procedures, for example, can be used to address ambiguous behavior that other parties might perceive as possible noncompliance. Finally, mechanisms that provide transparency can deter and expose purposeful breaches. "For a party deliberately contemplating violation, the high probability of discovery reduces the expected benefits rather than increasing the costs and would thus deter violation regardless of the prospects of sanctions" (Abram Chayes & Antonia Handler Chayes, 1993, p. 18).

The enforcement approach criticizes the managerial school for underestimating the importance of sanctions and punitive measures. Enforcement scholars have argued that even in the case of environmental regimes, which are the source of many managerialist examples demonstrating high compliance levels, "enforcement plays a greater role in successes than one is led to believe and its absence is conspicuous in some notable failures" (George Downs, David Rocke, & Peter Barsoom, 1996, p. 395). They hold that in matters of deep cooperation, such as security, there is always the possibility that the benefits of cheating might be too great to be offset solely by transparency. According to advocates of the enforcement approach, elaborate verification measures attest to the importance of transparency, but to believe that the power of transparency can be exclusively depended on to compel compliance in the absence of sanctions is naive. Therefore, the enforcement approach has stressed monitoring activities in conjunction with potent sanctions. Ideally, from this point of view, multilateral agreements should be equipped with mechanisms that provide incentives (resource carrots) for compliance while applying strong sanctions (punishing sticks) for noncompliance.

Rather than treating the management and enforcement approaches as diametrically opposed propositions, some scholars have argued that well-designed international regimes or agreements would benefit from including elements recommended by both approaches. They contend that the provision of help and assistance, and clarification procedures, followed by investigation, followed by inspection, followed by detection, followed by material and social sanctions is better thought of as a continuum or process to be carried out rather than as a choice between preferred extremes. For example, a study by David Victor (1998) of the noncompliance procedure of the Montreal Protocol—the regime designed to protect the stratospheric ozone layer—found that the protocol's implementation committee was most effective when it blended the two approaches. "Management avoids the most severe and unproductive antagonism, but the credible threat of tougher actions, including sanctions, helps ensure cooperation, especially when dealing with parties who are unswayed by management alone" (Victor, 1998, p. 139).

An important study that used a relational database covering 23 international environmental regimes found elements of both the management and enforcement approaches wanting and concluded that neither was able to convincingly "explain patterns of compliance with international regimes" (Breitmeier et al., 2006, p. 110). Although this study confirmed that institutionalized enforcement measures and strong verification procedures were indeed crucial, it also found that the compliance pull exerted by legal rules that enjoyed widespread legitimacy was more important than commonly understood. According to their findings,

> adequate and even impressive rates of compliance with international environmental rules occur when appropriate incentive mechanisms are coupled with juridification, participation on the part of transnational NGOs in the rule-making process, and a responsive approach to the development of compliance mechanisms over time. (p. 112)

In the years ahead, additional work—methodological and conceptual—will be needed to help us better judge to what extent states are complying with their international obligations and more effectively evaluate to what extent international governance arrangements are actually achieving their goals. Moreover, more effort needs to be expended to improve our understanding of the relationship between compliance and the influence exerted by international institutions, regimes, and agreements. The dense thicket of long-standing and emerging transnational problems that demand international solutions ensures that the subject of international cooperation and the challenge of compliance will be of enduring relevance and interest to scholars and practitioners alike.

Concept Formation

Concepts are central to the enterprise of political science. The concepts we use shape the world we see. Without solid conceptual foundations, the edifice of political science is insecure. If we fail to develop clear and precise concepts, our theoretical insights and empirical discoveries will fail to be clear and precise, too. This entry reviews major pitfalls for conceptual analysis as well as the fundamental challenges to concept formation and conceptual innovation in the study of politics.

In contemporary political science, concept formation is often regarded as a distraction, a mere prelude to serious research that is given scarce attention. Scholars sometimes ignore conceptual disputes, resolve them by fiat, or delegate their resolution to political philosophers. At the same time, a strong tradition of self-conscious and systematic concept analysis, resting on the pioneering work of Giovanni Sartori, David Collier, and others, does exist in the discipline. This entry offers an analytical synthesis that weaves together insights of conceptual debate in both philosophy and political science.

Conceptual Commitments Since its origins in ancient Greece, Western philosophy has been debating the nature and meaning of concepts. For centuries, thinkers tried to resolve one fundamental problem: the relation between the world and the mind, the objective and the subjective, things and ideas. They conceived the mind as a mirror and concepts as mental images of the outside world, as cognitive representations of objective realities that uphold the fragile correspondence between the two worlds. In the mid-20th century, the so-called linguistic turn in modern philosophy, brought about by authors like Ludwig Wittgenstein and John Austin, redefined the basic coordinates of concept analysis. It shifted the axis of conceptual debate from cognition to language and from language as a system of representative symbols ("Platonism") to language as a medium of social action ("pragmatism").

Language Acts

According to the classic conception of language, concepts are our basic units of thought. According to a pragmatic understanding of language, concepts are our basic units of (linguistic) action. In this perspective, concepts are not interior images that correspond to external realities but practical tools that allow us to do many things, many more than just putting vivid labels on inanimate objects. They allow us to threaten and promise, to bless and condemn, to give orders and to request favors, to express tenderness and anger, to know and believe, to contract marriage and christen ships, and so on. Designating objects "out there" in the external world (reference) is just one linguistic function among innumerable others.

As practitioners of social science, too, we do more than offer aseptic statements about the world. In our texts and speeches, we do more than describe and explain, more than refer to facts and associations between facts. We laud and criticize colleagues, highlight and downplay themes, support and refute arguments, persuade and dissuade readers, and so forth. However, while reference is not everything, it does play a leading role in the social sciences. All types of "speech acts" (John Searle) characteristically contain referential elements. They refer to something, be it in the physical world of objects, the social world of norms and interaction, or the subjective world of emotion and cognition. Arguably, articulating empirical and theoretical propositions constitutes the nucleus of our linguistic activities. It is what we are supposed to do with social science concepts: developing descriptive and explanatory inferences, making and breaking claims about the social word. In these linguistic performances—our primary speech acts in the social sciences—reference is key. We need our concepts to perform referential roles. We need them to grasp concrete realities in abstract terms. Classical philosophy was centrally concerned with one specific purpose of language: its referential role. We should not be surprised to see that conceptual discussions in contemporary social sciences, too, privilege traditional reference over other linguistic roles.

Meaning

If concepts are means of action, their meaning does not derive from their correspondence to objective realities but from their practical roles in linguistic communication. In Wittgenstein's famous dictum, "The meaning of a word is its use in the language" (1952/1968, sec. 43). Language is a medium of social communication. Its rules of usage and meaning are public, not private. Our shared knowledge about the meaning of a word derives from our shared linguistic practices. As competent language users, we know what others know about the meaning (the conditions of legitimate use) of a concept. As responsible language users, we accept the meaning of a concept (its conditions of legitimate use) when we use it and accept that others can hold us to account for using it. As in other realms of social action, responsibility means that we accept the consequences of our deeds. Take the standard example of a promise. If I promise you x, I understand the meaning of promise making and accept its conditions of validity. Among other things, I understand and accept that x is a future action that benefits you, that I am able to perform it, that my promise obliges me to perform it, and that I actually intend to perform it (Searle, 1969, chap. 3). If I promise, yet violate any of these conditions of validity that constitute the meaning of promises and in consequence fail to carry out x, you can hold me accountable.

When we employ concepts more specifically as means of propositions (the primary form of speech acts in the social sciences), we use them as carriers of general claims about the empirical phenomena they are referring to. When applying them to concrete cases, we subscribe to these claims. We commit ourselves to their truth (applicability). If I call a man a friend, a thief, or a left-wing dictator, I articulate (and thus embrace) certain (contextually understood) claims about my relationship to him, his relationship to alien property, or the form and substance of his exercise of state power. In case of doubt, confusion, or contestation, I must be ready to justify my conceptual choices and accept the consequences. The bundles of claims we commit ourselves to when employing a concept comprises its meaning. Often these claims and commitments remain implicit. Formal definitions serve to make them explicit (Robert Brandom, 2000).

Reification

In political science, we still have to assimilate the insights of pragmatic philosophy. Our discussions of concepts, as far as they take place, still tend to be anchored in the classical distinction between mental creations and real objects. In addition, we tend to reify both sides of the mind–world distinction. We tend to treat both concepts and their referents as if they were things. The result might be described as a kind of double false consciousness. We tend to misrepresent social reality as well as our representations of reality.

(a) The Reification of Reference. Concepts are abstractions, not proper names. They do not serve to designate particular objects but classes of objects. On the referential side, our paradigms of objects are still concrete, material things with observable properties. Very few objects of political research correspond to this model. The realities we study are symbolic. Our concepts are not generalizations from observed properties but abstractions of symbolic realities.

(b) The Reification of Concepts. On the conceptual side, we tend to treat our abstractions, too, as if they were tangible objects, fixed in time and space. Employing the language of factual propositions, we tend to ask what a concept is (and is not) and what its essential attributes are (and are not), as if comprehending the concept required discerning its visible properties.

The Triangle

According to the widely used tripartite conception of concepts developed by Charles Kay Ogden and Ivor Armstrong Richards (the Ogden-Richards triangle), concepts are symbolic entities that consist of three elements: their meaning (connotation or intension), their referents (denotation or extension), and a term or word (their name). This conception of concepts, introduced by Sartori into political science, is still indebted to the notion of concepts as symbolic intermediaries between mind (as location of meaning) and the objective world (as location of reference). It is therefore vulnerable to the reification of both reference and meaning. Still, it serves well to understand the contingent nature of conceptual commitments (the element of choice in the relations between terms, meaning, and reference) and in general offers a set of useful distinctions to analyze the formation and de-formation of concepts (which will guide parts of our subsequent discussions).

Conceptual Disorders

Conceptual discussions in the social sciences often carry therapeutic ambitions. In the pursuit of clarity and precision, they strive to cure scientific language of the multiple disorders that are thought to afflict ordinary language. The tradition of conceptual analysis in political science that was initiated by Sartori and his colleagues in the 1970s and is continued today most prominently by David Collier and John Gerring (2009) partakes of this therapeutic project. Ordinary language is not generally defective, though. It is as clear and precise as speakers need it to be. Still, scientific language differs from ordinary language in some fundamental regards. Among other things, it is written in form and literal in style; it involves a strong commitment to truthful, transparent, and evidence-based argumentation; it aims at generating general knowledge; and it demands the development of a common specialized vocabulary within the academic community. Most of these distinctions are normative, not empirical. They do not give social scientists a mandate to remedy the deficiencies of ordinary language, but they do involve the professional obligation to craft a shared specialized vocabulary that steers clear of major conceptual disorders and malpractices.

Conceptual Opacity

Everyday linguistic communication unfolds on the basis of implicit meaning. Neither do speakers offer formal definitions of the words they use, nor do their interlocutors ask for them—except when their shared understandings turn problematic and when communicative irritations arise, which are instances of incongruence between the concrete application of concepts and their social meaning that we take for granted. You promised to be punctual and are an hour late. Is this your notion of punctuality? You say we are friends, but you left me alone in the face of danger. Is this your idea of friendship?

In the social sciences, we run higher systemic risks of breaking through the thin ice of implicit understandings. Our key concepts are often complex and contested, and we cannot take for granted that others comprehend them in the same manner as we do. Linguistic transparency is, therefore, our first obligation in the social-scientific use of concepts. Karl Marx remarked once that he needed three volumes to explain the concept of capital. We need not go that far in explicating the core concepts we use in our research. Concise formal definitions will often suffice. Yet if we fail to make explicit our central conceptual commitments, our theories and findings cannot contribute to the construction of common knowledge, only to the accumulation of fragmentary statements whose interrelations are uncertain. Conceptual opacity engenders opaque research.

Conceptual Confusion

As the descendents of Noah in ancient Babylonia set out to build a premodern skyscraper ("a tower, whose top may reach unto heaven"), God, alarmed by their capacity of monolingual coordination, intervened to "confound their language, that they may not understand one another's speech" (Genesis 11:7). More than anything else, the concept analytical tradition of Sartori has been concerned about conceptual confusion. According to its disciplinary diagnosis, the builders of comparative political science are afflicted by a similar confusion of tongues as the architects of the Tower of Babel. Lacking discipline and coherence, schools and scholars are speaking past each other with different, mutually incomprehensible vocabularies.

If concepts form triangles of terms, meanings, and referents, conceptual confusion may arise from three sources: confusing relations between terms and meanings (ambiguity), confusing relations between meanings and referents (vagueness), and confusing stipulations of meaning (definitional defects).

Conceptual Ambiguity

To ensure unequivocal associations of words and conceptual commitments "the golden rule is to have one word for each meaning" (Sartori, 1984/2009, p. 113). Confusion may arise if we have several words for one concept (synonyms) or one word with various meanings (homonyms).

Genuine synonyms pose no problem for communication. They enrich our vocabulary and help us avoid tedious repetition. The troubles arise from fuzzy synonyms—neighboring or overlapping terms that are situated in a disorderly semantic field and whose exact relations remain unspecified. Political science is replete with such terms. While language users employ them (loosely) as synonymous, it is unclear whether they actually do carry equivalent conceptual commitments. For instance, *institutions* are often defined as *rules*, and vice versa. Yet we do not know to what extent we can treat the two as interchangeable concepts. In the best of cases, fuzzy synonyms share a recognizable semantic core but differ in their precise connotations (additional shades of meaning). For example, *genocide* and *ethnic cleansing* may refer to the same murderous acts, yet the former maintains analytic distance, while the latter adopts the hygienic discourse of the assassin.

Although words frequently carry multiple meanings, in ordinary language, homonymy does little to disturb our ability to communicate. In everyday talk, context determines meaning. If it fails to do so, we can always ask for clarification. In the social sciences, by contrast, homonymous terms are more corrosive to communication. If scholars attach incongruent meanings to key terms that define their fields of inquiry, they will fail to create common knowledge. Instead of studying one class of phenomena, they will be studying different subjects under the same name. The unity of their field of research will be apparent only, a nominal delusion veiling the substantive fragmentation of their research. For instance, if some hold the goal of "democratic consolidation" to be the prevention of authoritarian regression while others take it to lie in the achievement of democratic deepening, comparative inquiries into the conditions of democratic consolidation will address qualitatively different substantive problems.

Conceptual Vagueness

Concepts are abstractions. They allow us to speak about empirical phenomena in general rather than marvel at them one by one, in puzzlement over their uniqueness (which we could not grasp anyway without a prior notion of generality). In the social sciences, we want concepts to be precise, to circumscribe clearly the realm of phenomena to which they apply. Vague concepts fail to do so. They leave the relation between conceptual claims and empirical objects indeterminate. They do not allow us to decide which phenomena lie inside and which outside their realm of application. Political actors often apply such elastic concepts of unclear denotation as weapons of political struggle. For instance, candidates would condemn “vote buying” by their adversaries without making clear what kind of acts they are referring to. Are they condemning any campaign promise that offers voters material benefits in the future? Squeezed between conflicting expectations, political contenders often benefit from evasiveness. Scholars, by contrast, cannot leave their readers guessing what they are talking about. Leaving its empirical referents in the dark, vague concepts lead our research into obscurity.

Definitional Defects

Our semantic definitions are sources of confusion if their relations to words and things are confusing. They are confusing, too, if their internal structure is defective. Definitional defects may be manifold. Our definitions may be contradictory or tautological. They may be incomprehensible or prone to provoke misunderstandings. They may ignore standard rules of classification by offering classificatory schemes that fail to be exclusive, exhaustive, and one-dimensional. Or they may confound levels of abstraction within taxonomical orders of classes and subclasses. As a matter of fact, there is nothing easier than to be confusing. A moment of distraction, a slip of the tongue, a typographical mistake, and the meaning of what we meant to say dissolves in mist.

Conceptual Instability

In the social sciences, linguistic stability permits continuity in research. The diffusion of new theoretical approaches tends to involve major shifts in our vocabulary. That is what new theories often are: new vocabularies and redescriptions of the world. The waves of conceptual instability they induce tend to reshape collective research agendas. They tend to disrupt established lines of inquiry even when substantive concerns remain essentially the same. Each time we replace our theoretical vocabularies, we tend to reinvent the wheel of empirical research. For instance, the new literature on the political economy of political regime change ignores earlier debates on capitalism and democracy, the new literature on state failure ignores the earlier literature on state building, and so on. Unless we develop and conserve the ability to translate between theoretical languages, destabilizing our core categories can be deeply damaging to the much cherished accumulation of knowledge.

Conceptual Abuse

The tools of language are open to almost limitless forms of abuse. Two symmetrical strategies of reality distortion are of particular interest to political scientists: conceptual stretching (Sartori) and conceptual masking. Conceptual stretching involves the application of (often value-laden) concepts to cases that lack essential characteristics of these concepts (as when a corrupt politician describes himself as an honest man). Conceptual masking involves the description of (morally relevant) cases through neutral concepts that disguise the essential characteristics of these cases (as when a bank robber describes himself as a common customer). The former puts forward semantic overstatements in which concept application betrays fundamental conceptual commitments. The latter puts forward semantic understatements in which concept application denies fundamental factual realities.

These forms of conceptual abuse are surely more frequent and more severe in politics than in political science. Modern authoritarian regimes, masters of linguistic abuse, routinely practice both. Stretching the notion of popular rule beyond recognition, they tend to portray themselves as higher forms of democracy, as when Augusto Pinochet described his form of military dictatorship in Chile as “protected democracy.” The totalitarian regimes of the 20th century were notorious in inventing quasi-neutral technical terms and bureaucratic acronyms to camouflage the unspeakable atrocities they committed against humanity. For instance, the Nazis described their factories of assassination as “concentration camps,” the Soviets under Stalin their officially inexistent colonies of slave labor and death as “Gulag,” “the zone,” or simply and enigmatically “the other side.”

Both malpractices destroy conceptual validity. They sever the link between connotation and denotation, between conceptual commitments and factual applications. In instances of conceptual stretching, speakers claim too much, and realities negate the essence of the concepts they use (often, their moral essence). In instances of conceptual masking, speakers claim too little, and concepts deny the essence of the realities they face (often, their moral essence).

Conceptual Lumping

Names allow us to designate individuals, concepts classes of individuals. More general concepts capture larger classes, more concrete concepts smaller ones. According to the well-known "ladder of abstraction" introduced by Sartori, the number of defining attributes of a concept (connotation or intension) and the number of its referents (denotation or extension) are inversely related. At a high level of abstraction, concepts carry few defining attributes and cover many cases. At low levels of generality, they contain numerous defining features and apply to few cases.

In scholarly research, just as in ordinary language, we have to choose the level of conceptual abstraction that seems appropriate for our purpose. If we talk too abstractly in everyday life, our interlocutors may get irritated: Come down, be concrete, we don't want to hear generalities! If we are overly specific and draw excessively fine distinctions, they may well get impatient, too: Focus on the relevant, stop splitting hairs! In William Ockham's famous formulation, "You need no razor to cut butter."

In crafting social-scientific concepts, we have to seek a pragmatic balance between our ambitions of theoretical generalization and our needs for analytical differentiation. As in everyday interactions, we may err on either side when choosing our levels of conceptual abstraction. If we aim too high and employ excessively general concepts that obliterate "differences that make a difference" (Gregory Bateson), our critics will accuse us of conceptual lumping (Sartori). If we aim too low and choose excessively specific concepts that trace irrelevant distinctions, our critics will reproach us with conceptual splitting.

Overall, to the extent that the social science community is amenable to "linguistic therapy" (Umberto Eco) and avoids developing conceptual pathologies, it strengthens its collective capacity to communicate effectively. Social-scientific language demands more than conceptual health and discipline, though. It also requires theoretical and conceptual creativity, grounded in linguistic competence and empirical knowledge.

Concept Formation

Concept formation is the systematic development and explication of the core claims to which we commit ourselves when applying a concept. It requires us to understand ordinary and specialized uses of the concept, map its location within its semantic field, situate it within empirical realities and analytical frames, understand its structural properties, choose our semantic commitments, and choose the term that best resonates with its meaning.

Reconstruction

If the meaning of a word lies in its use, we need to comprehend the usage of a word if we wish to comprehend the semantic commitments it involves. The first question to ask concerns usage in ordinary language. In English, this question has a straightforward answer: the *Oxford English Dictionary* (OED). Initiated well before the advent of 20th-century pragmatic philosophy of language, the OED is a monument to a pragmatic understanding of language as a medium of social practice. Alien to prescriptive or regulatory pretensions, it meticulously registers "the meaning of everything" (Simon Winchester) by documenting concrete instances of word usage across centuries of linguistic development.

The second question concerns the scientific usage of a word. According to Sartori's seminal "Guidelines for Concept Analysis," the semantic "reconstruction" of a concept starts with a review of the relevant scholarly literature. Unlike the OED, Sartori does not recommend tracing concepts in usage in order to uncover the implicit claims that can be inferred from their practical applications. Rather, he directs scholars to compile lists of explicit definitions (until they get bored by repetition and redundancy), enumerate the attributes included, and bring them "into some meaningful kind of organization" (Sartori, 1984/2009, p. 120). Meaningful organization, indeed, is the central task of concept formation and the most difficult one, as it escapes rules and recipes. To begin with, it requires us to place our concepts in their linguistic contexts.

Semantic Fields

If we wish to understand a concept properly, we must not analyze it in isolation. We need to map the semantic field it inhabits and locate it in the web of relationships that connects it with its conceptual neighbors. Unless we know what the concept shares with proximate concepts and what separates it from them, we cannot grasp its specificity. Neighboring concepts often share large intersecting circles of meaning, yet carry semantic nuances that are relevant for our research purposes. For instance, if we set out to study civil wars, we step into a rich semantic field of overlapping, yet not identical, concepts, such as guerrilla war, revolution, rebellion, ethnic violence, regional violence, organized violence, political violence, state failure, anarchy, political disorder, and political fragmentation. Semantic cartography, surveying and mapping the "systems of terms" (Sartori, 1984/2009, p. 142) that constitute semantic fields, provides a relational and comparative understanding of such clusters of concepts. It helps us grasp better not only the central connotations of interrelated concepts but also their finer shades of meaning that may be decisive in choosing one concept over another.

Empirical Boundaries

In shedding comparative light on the precise meaning (intension) of related concepts, the analysis of semantic fields also helps clarify their precise referents (extension). To the extent that we grasp the differences and similarities in the substantive claims neighboring concepts contain, we grasp the differences and similarities in the empirical phenomena they refer to. For instance, in the semantic field of civil war, some concepts, such as political violence, are situated at high levels of abstraction and include violent actions outside contexts of societal warfare (e.g., terrorism), while others, such as regional violence, refer to more narrow categories of violent conflict. Some concepts, such as ethnic violence, involve claims about the motives of violence, while others do not. Some, such as guerrilla war, emphasize the presence of organized actors, while others, such as political disorder, emphasize the dissolution of central authority. Some concepts, such as state failure, attribute agency to the state, while others, such as civil war, distribute it among societal actors.

All these semantic differences involve empirical differences. They point to different empirical phenomena. Understanding these differences allows us to understand the empirical scope of concepts—their bounded territories. It gives us an idea of what they include and exclude. Depending on what we want to see and what we decide to ignore, it allows us to choose and use the concepts most akin to our analytical interests. Concepts, writes Gary Goertz (2006), are "theories about the fundamental constitutive elements of a phenomenon" (p. 5). Within the semantic field of civil war, we will select our concept of choice depending on the empirical dimensions our theories designate as relevant—the organized nature of civil wars, their political motives, their outcomes, their causal association with state power, or their membership in the general category of political violence. Sometimes, our inherited vocabulary does not trace the precise distinctions we are interested in. Still, our semantic maps allow us to visualize the configurations of empirical boundaries as previous concept users have found them relevant. Though at times incomplete and inconclusive, they open up a first dialogue between concepts and cases, mediated by theory.

Analytic Frames

When scholars reconstruct the scientific usage of their core concepts in relation to proximate concepts (semantic fields), they may come up with long lists of contending or coexisting, divergent or convergent terms, definitions, and applications. In and of themselves, such listings are of little analytic use. The key challenge is to order them in a manner that resonates with theoretical traditions and empirical concerns in relevant fields of research, and this is easier said than done. The standard recommendation sounds simple: First identify underlying analytical dimensions and then show how different concepts and uses of concepts differ along these dimensions. But which are these underlying dimensions? They do not just lie around, self-evident and open to simple inspection. How then can we find them, and how can we construct them?

The answer is perhaps disappointing: Concept formation is not a bureaucratic enterprise but a constructive one (like social science in general). It is not about the mechanical application of rules, be it of logic or language, but about the creative process of abstraction. In our efforts to make sense of divergent definitions and uses of concepts, we have to renounce the comfort of rules. This is the weak point, the structural lacuna, regarding guidelines for concept formation: There is none for this crucial task.

As a first step, it is always helpful to ask about units of analysis. If authors talk about democracy, is it regimes or states they are talking about? If they talk about the rule of law, is it individual decisions or judicial systems they are talking about? Clarity about the kinds of "objects" different usages of a concept strive to grasp often helps us locate them at different levels of abstraction. However, it does not tell us anything about the substantive claims different usages carry. We are not biologists looking at elephants or cows, tangible, objective phenomena whose observable characteristics make them easy prey to the classic logic of classification *per genus et differentiam*. Identifying the general commonalties that determine their genus and then the specific characteristics that determine their species still involves a good deal of complexity and controversy within the biological community and yet in principle requires little "sociological imagination" (C. Wright Mills). But this is not so in the social sciences. If we have determined, for example, that students of "ideology" alternatively refer to structures of thought, language, or behavior, we still do not know what kind of structures they are talking about. We still have to discern (somehow) the analytical dimensions that distinguish different claims about the defining structures of ideologies, such as internal coherence, external differentiation, sophistication, factual accuracy, abstraction, hierarchy, stability, dogmatism, sincerity, and consciousness (Gerring, 1997).

Scholars do not, however, enter the process empty-handed. They are not naive observers of unstructured data. They know the literature, they know the facts and the theories, and they know the language and the paradigmatic cases that define their field of study. The analytical dimensions they introduce (as well as the analytical dimensions their predecessors introduced in the first place) to bring "meaningful order" into conglomerates of contending definitions are anchored in their theoretical and empirical knowledge. It is such theoretical as well as empirical anchorage that makes the meaningful, fruitful, useful organization of semantic fields possible.

Conceptual Structures

Once we have succeeded in bringing analytical order into multiple uses of a concept, we can reconstruct its structural properties. Conceptual structures are configurations of conceptual commitments. Once we have understood the claims authors commit themselves to when using a certain concept, two questions ensue: How strong are their conceptual commitments? And how do those commitments they consider binding (the "essential features" of a concept) relate to each other?

Conceptual Cores

The strength of our commitments to the conceptual claims we articulate varies by degrees. Some claims we hold to be indispensable across contexts. They constitute the core meaning of a concept. Other claims we deem to be secondary and contingent. They form the peripheral and contextual connotations of a concept. According to the classical approach to concept analysis, from Aristotle to Sartori, if we wish to comprehend a concept, we need to identify the former, its semantic core. In the face of multiple uses of a concept, the semantic core is located at the intersecting area of those claims competent concept users declare to be binding ("necessary and sufficient"). Staking out a common ground of binding conceptual commitments ("the core concept") often allows us to distinguish "narrow," "thin," or "minimal" definitions (that limit themselves to the core) from "broad," "thick," or even "maximal" ones (that go beyond, up to envisioning ideal-typical instances of the concept).

Family Resemblances

According to the classical conception of concepts, if different uses of a term do not share common semantic ground, they do not count as instances of the same concept. They appear as instances of multiple concepts. Modern philosophers of language (reinforced by more recent psychological research on typicality effects) have shed doubt on the notion that our ordinary usage of concepts is governed by the strict membership rules of necessary and sufficient conditions. They have contested the notion that concepts carry semantic cores. Rather than committing themselves to a fixed set of indispensable claims, they have suggested that concept users often commit themselves to a more open set of mutually substitutable claims. Wittgenstein (1952/1968, sec. 66–71) introduced the idea of family resemblances to describe concepts that are defined by an ensemble of alternative attributes rather than sharing a core of necessary attributes. In set-theoretic terms, the relevant features of family resemblance or radial concepts do not form intersections but unions. In terms of classical logic, they are not linked by the operator AND (necessity) but by the operator OR (substitutability) (Goertz, 2006, chap. 2).

It seems indeed to be the case that ordinary language users routinely apply empirical concepts, such as fruit and furniture, to concrete objects on the basis of their closeness to typical examples ("prototypes"). These intuitive applications are not based on an invariable set of claims all competent language users subscribe to. However, the use of family resemblance seems less frequent (and less compelling) in the social sciences. When students of politics use the notion of family resemblance, they commonly apply it not to the highest level of abstraction (the definition of general properties of a concept) but to lower levels of abstraction (the definition of constitutive dimensions or the observation of concrete instances of a concept). Concepts described as family resemblances often do seem to share an abstract semantic core (at a high level of generality), even if either their constitutive dimensions or their observational indicators are mutually substitutive (at lower levels of generality).

As a matter of fact, the observation of family resemblances seems to be generally dependent on the prior comprehension (at least vaguely and implicitly) of an abstract semantic core. It is only because we possess a general notion of their common nature that we can discern the elastic observational resemblance of certain classes of cases. Otherwise, we would perceive no more than superficial similarities among disjointed phenomena. Arguably, this is even true for the two paradigmatic concepts of "families" and "games" from which Wittgenstein derived his notion of family resemblances.

Consider families. The sociological literature offers numerous overlapping definitions of families and subtypes of families. For instance, the modern nuclear family typically includes spouses and their dependent children. The notion of family resemblance, however, does not explicate the meaning of the concept of family. It does not respond to the semantic question of conceptual essence but to the phenomenological question of empirical appearance. It does not pretend to identify families and distinguish them from other social groups on the basis of their general characteristics but to identify the members of particular families on the basis of their physical appearance. Family members may look alike, but they are not members of a family (neither in general nor in particular) because they look alike.

Diminished Subtypes

In cases of family resemblance, empirical referents may lack relevant characteristics of a concept and still represent genuine instances of it. In cases of "diminished subtypes" (David Collier & Steven Levitsky, 1997), empirical referents do not fully possess the relevant characteristics of a concept and therefore do not represent genuine instances of it. Classical typologies do not differentiate among members of a category. Objects are either in or out. If they are in, they are equal members of full standing. Diminished subtypes take into account that all members are equal—but some are less equal than others.

Diminished subtypes arise from continuous multidimensional concepts. When all constitutive dimensions of a concept are held to be essential, the full absence of any dimension involves the absence of the phenomenon in question. However, if constitutive dimensions are not dichotomous, but continuous, cases may lie somewhere in between full presence and full absence on any specific dimension. Situated in the "gray zone" (Goertz) of one constitutive dimension, these cases are still recognizable members of a general class of phenomena. Yet they are less than full members. Due to their structural deficiencies, they appear as distant, damaged, distorted representatives. By adding qualifiers (adjectives) to the original concept, we can avoid conceptual stretching (fraudulent claims to full membership in a category) and point to their specific deficiencies. The beauty of diminished subtypes lies in their diagnostic precision.

For example, if democracy requires competitive elections under universal suffrage, the absence of either electoral competitiveness or electoral inclusiveness renders a political regime nondemocratic. Yet governments may impose partial restrictions on either electoral competition or electoral participation that are not severe and systematic enough to involve the absence of either dimension. Such bounded, ambiguous constraints may turn electoral regimes into diminished subtypes of democracy. In the face of bounded restrictions on competition, we might speak of controlled democracies. In the face of bounded suffrage restrictions, we might speak of exclusionary democracies.

Diminished subtypes of multidimensional concepts may arise from the limited presence of one (or some) of their essential dimensions. They may also arise from the full absence of desirable, yet nonessential, attributes. Diminished subtypes of democracy often seem to express structural deficiencies whose benchmarks are not the core of democracy but the ideal of democracy. They refer to democratic regimes that are in full accordance with democratic minimum standards, yet fail to fulfill more stringent expectations to democratic governance. For example, in clientelist democracies, citizens lack the programmatic orientation, and in apathetic democracies, they do not show the participatory enthusiasm we expect from high-quality democracies. In a symmetrical manner, as empirical cases may be underperforming in relation to a particular standard, they may also be overperforming, thus giving rise to "enhanced subtypes."

Contested Concepts

The notion of family resemblances introduces some degree of flexibility and fuzziness into the classical idea of essential attributes. The notion of "essentially contested concepts," formulated by British philosopher Walter Bryce Gallie only a couple of years after the publication of Wittgenstein's *Philosophical Investigations*, involves a potentially more radical objection to the classical idea of conceptual cores. According to Gallie's (1956) seminal paper, all concepts are open to contestation, yet some are "essentially" contested insofar as "their proper use . . . inevitably involves endless disputes about their proper uses" (p. 169). Which is the source of such intrinsic and irresolvable conceptual disputes? There are two plausible answers. One points to the complexities of concept application, the other to inner tensions that lie at the very core of some concepts.

Gallie's (1956) account focuses on concept application. For concepts to become essentially contested, he says, they must be multidimensional—"internally complex"—and normative—"appraisive" (pp. 171–172). Competent speakers recognize and value the various dimensions of the concept. "Any explanation of its worth must therefore include reference to the respective contributions" of each dimension (p. 172). Yet, despite their abstract consensus on the fundamental component parts of the concept, speakers are likely to weight them differently and apply them differently. They are likely to dispute their relative importance as well as their practical implications under changing circumstances. For instance, actors may agree that modern democracy rests on the principles of majority rule and constitutional government but still disagree about their rank order (which is more important) and their operationalization (how they are to be put into practice).

According to a more radical reading, essential contestation affects the very core of concepts, not just their application. It arises when concepts involve irresolvable inner contradictions and when they are founded on genuine dilemmas, paradoxes, or impossible ideals—"conflicting imperatives" (Reinhard Bendix). Consider the ideas of democracy and the rule of law. The etymological root of democracy ("rule of the people") assigns citizens the double, paradoxical role of rulers and ruled. Their powers cannot be maximized simultaneously. In addition, modern democracy arguably embodies fundamental principles (e.g., popular participation and constitutional restraints) that are mutually supportive as well as (at times) mutually subversive. Balancing the trade-offs they impose demands more than establishing simple orders of priorities. The concept of "the rule of law" suggests a mode of impersonal domination where formal rules govern, rather than human beings—the government of laws, not people. Yet the abolishment of human judgment in the exercise of power constitutes an impossible ideal. These inner tensions are constitutive for concepts such as democracy and the rule of law. Since they are irresolvable, they feed an inexhaustible stream of legitimate disputes that are irresolvable as well. In this perspective, appraisive concepts are likely to be essentially contested if they are essentially self-contradictory.

Conceptual Innovation

Language is a social medium of communication and is public and restrained by shared rules of grammar and semantics. At the same time, it is the quintessential medium of personal expression, free and open to variation and innovation as no other societal institution. Ask James Joyce and Ernst Jandl, for example. In the social sciences, our license to innovative uses of language is more limited than, say, in poetry or insult. Still, within constraints, we do enjoy important margins of conceptual innovation.

New Definitions

In the face of contending definitions, scholars cannot rely on the common, accepted usage of a concept. They have to meddle with the rules of the language game by formulating their own conceptual commitments. The particular definitions they develop may relate in various ways to preexisting definitions. They may privilege one usage against others (selective definitions), they may tie new bundles of conceptual claims by accepting some but shedding others (eclectic definitions), they may strive to express underlying commonalities among multiple conceptions (synthetic definitions), or they may embrace new claims that alter the central connotation of the concept (deviant or original definitions). The last move overlaps with the creation of new concepts.

New Concepts

When do we need new concepts? The answer is very simple: when we wish to draw distinctions that we had not drawn before or when we wish to grasp commonalities that we had not grasped before. Sometimes we wish to seize new empirical phenomena, and sometimes we would like to adopt new perspectives on old phenomena. In the study of politics, we are continually confronted with novel realities; continually, we are trying to see together what political actors tend to look at in isolation; and continually, we are developing theories that redefine the relevant boundaries of the political world. Hence, our incessant demand for conceptual creativity.

Like the political realities they try to capture and the political theories they strive to express, new concepts seldom emerge de novo as radical breaks with the past. More often than not, scholars introduce new concepts by modifying old ones. The repertoire of incremental conceptual innovation is broad. Authors may craft new concepts by (a) redefining the substantive meaning of a given concept, (b) importing concepts from other languages or scientific disciplines, (c) remodeling the ladder of abstraction by adding new distinctions or removing established ones, (d) introducing diminished or enhanced subtypes, or (e) changing the property space of a concept (by altering the distance between conceptual poles, shifting their location, or introducing intermediate categories).

New Terms

When we have reviewed the various uses of a concept and its semantic neighbors and when we have understood the configuration of conceptual claims others accept as binding and chosen those we do, we sometimes face the task of "selecting the term that designates the concept" (Sartori, 1984/2009, p. 123)—sometimes but not always. Sometimes we have terminological choices; sometimes we do not.

The names of grand concepts in political science, such as justice, power, and rationality, the terms we use to designate them (and have used to designate them for years, decades, or even centuries), are given and fixed at present. Scholars often disagree about the precise meaning they associate with certain concepts designated by certain terms. They embrace contending "conceptions" of the concepts under dispute. The tight coupling between terms and concepts, however, prevents their semantic disagreements from spilling over into terminological disagreements. Switching the term under discussion would involve switching the concept under discussion. Authors who discuss, for instance, the concepts of justice, power, and rationality either discuss these concepts under these names, or they discuss something else. If they move even to neighboring terms, such as fairness, authority, and intelligence, they move into different (albeit contiguous) conceptual terrains. When terms and concepts are welded together through strong bonds of semantic history and when the former represent the latter without equivalent substitutes, terminological choices precede semantic debates. By choosing a term, we bring the concept it stands for into focus, which then allows us to partake in ongoing disputes about disputed aspects of its meaning.

When concepts are less deeply anchored in history and theory, the sequence can be inverted. We can first determine the substantive claims we are interested in and then settle on appropriate names, either by selecting among available terms or by crafting new ones. If we articulate our conceptual claims in a precise manner, we put ourselves in a position of selecting the precise terms whose connotations correspond most closely to the substance of our concept. Semantic fields that are densely populated with near-synonyms of similar standing (with none of them dominating all the others) offer the most latitude for fine-tuning our terminological choices. For instance, if we study the consolidation of political regimes, we may choose alternative terms that lie in its semantic vicinity yet emphasize diverging substantive concerns. If we wish to stress the duration of regimes over time, we may talk about continuity, endurance, or persistence. If we wish to stress their ability to weather systemic crises, we may talk about resilience, viability, or sustainability. If we wish to stress the process character of consolidation, we may talk about stabilization, institutionalization, or entrenchment.

While refined concepts ask for refined vocabularies, new concepts demand new terms. Whenever the diffusion of new theories (e.g., game theory) or the emergence of new realities (e.g., electoral autocracies) induces waves of conceptual creativity, they are accompanied by waves of terminological innovation. The rise of game theory has brought a whole new vocabulary into political science that includes notions such as backward induction, bounded rationality, perfect equilibrium, incomplete information, cooperative games, focal points, mixed strategies, and so on. The rise of electoral authoritarian regimes since the end of the Cold War has led comparative scholars to propose a broad assortment of labels designed to capture these novel political systems, such as hybrid regimes, semiauthoritarian regimes, inconsistent regimes, multiparty autocracies, competitive authoritarianism, and institutionalized dictatorship. Overall, driven by changing theories as well as changing realities, terminological innovation is a pervasive phenomenon in political science.

Semantic Constraints

Linguistic innovation, in political science as elsewhere, is always anchored in linguistic tradition. While deviating from tradition, it cannot cut itself loose from it. Conceptual innovations in political science, whether they involve new definitions, new concepts, or new terms, are therefore inevitably constrained innovations (whether tightly or loosely). They are constrained by the semantic past of concepts (etymology and conceptual history) as well as by their semantic present (ordinary and specialized usage). They are also constrained by the systemic logic of semantic fields. Modifying individual nodes in the web of interdependent terms that constitutes a semantic field reverberates throughout the entire web. Any pretension to remake our conceptual tools has to recognize this twin linguistic reality that concepts are rooted in their semantic past and present and embedded in their semantic environment. Semantic constraints are not straitjackets. They leave room for critique and creativity, for selective changes and selective continuities—some more, some less. Yet if conceptual innovations depart too sharply from established usage and create arbitrary associations between words and meanings, they will fail to serve as effective tools for communicating novel insights. They will be outright incomprehensible, liable to provoke systematic misunderstandings, or devoid of resonance and thus condemned to oblivion.

Conclusion

"Clear thinking requires clear language," Sartori (1984/2009, p. 102) wrote a quarter of a century ago. To begin with, it requires clear thinking about language. If we learn to incorporate conceptual self-awareness into our canon of methodological sophistication, we will do better theory and better research. We may not reach the impossible ideal of a fully transparent, clear, and precise technical language, and as a scientific community, we may be too diverse and competitive to build another tower of Babel. Yet we will put the edifice of political science on more solid foundations.

Conditionality

Conditionality in political science refers to the use of the conditions an actor attaches to awarding benefits to—or to not imposing costs on—another actor in order to influence his behavior. Benefits are granted only if the target actor has fulfilled certain requirements (*ex ante* conditionality). Such external rewards can also be suspended or withdrawn if the recipient reneges on his commitment (*ex post* conditionality). Rather than withdrawing a promised or granted reward (positive conditionality), the violation of predetermined conditions can also be punished (negative conditionality). Conditionality targets either performance and outcomes (policy conditionality) or the governance and administrative systems (political/democratic conditionality).

The term refers more narrowly to the Bretton Woods institutions seeking to impose the Washington Consensus around the world or, more broadly, to all explicit and implicit requirements for lending, including covenants for project-based aid, environmental safeguards, and performance-based aid allocation. This entry follows the broader understanding of conditionality as a political instrument used by national governments and international organizations to advance their foreign policy goals. First, the concept is linked back to the instrumental logic of social action in order to specify the causal mechanisms through which conditionality is to influence the behavior of third countries (i.e., those who are not members of the European Union [EU]). Second, the emergence of conditionality as a key instrument of development cooperation and foreign policy, more broadly speaking, is traced. Finally, critical evaluations regarding the effectiveness and legitimacy of conditionality are discussed to outline how these have led to readjustments of the instrument.

Conditionality and the Manipulation of Utility Calculations

Conditionality seeks to influence the behavior of actors through the manipulation of utility calculations, by providing negative and positive incentives. Donor states or organizations seek to promote structural adjustments in third countries by promising or granting additional benefits, such as financial and technical assistance, a loan, debt relief, or conditional membership in an organization. Or they incur costs through economic and diplomatic sanctions. "Reinforcement through reward" (Frank Schimmelfennig & Ulrich Sedelmeier, 2006) or "correction through punishment" differs from political instruments based on a normative logic of social action, such as political dialogue, which seek to change the behavior of actors through persuasion and learning (Jeffrey T. Checkel, 2005). Conditionality and political dialogue both aim at influencing the choice of actors, whether they are informed by cost–benefit calculations or guided by normative concerns about socially accepted behavior. They thus contrast with coercion and assistance. While the former does not leave actors any choice, the latter provides unconditional financial and technical aid to enable actors to make choices.

Evolution of Conditionality as an Instrument of External Governance

Conditionality emerged in the field of development cooperation. In the 1980s, the International Monetary Fund and the World Bank increasingly linked loans, debt relief, and financial aid to certain conditions, known as structural adjustments, which included aid effectiveness (e.g. anticorruption measures), financial austerity, or the privatization of key public services. While international donors have used conditional aid to promote selective reforms deemed necessary for good governance, the EU turned conditionality into the key instrument in its attempt to support the transformation in postcommunist countries after the end of the Cold War (Heather Grabbe, 2006). The Maastricht Treaty had made any contractual relations of the EU with third countries conditional on the respect for human rights, the rule of law, and democracy (see Tanya Börzel & Thomas Risse, 2009). States applying for membership in the EU have to fulfill the so-called Copenhagen Criteria (democratic conditionality). Once the EU agreed to open accession negotiations, accession conditionality gave the European Commission a powerful tool to push candidate countries toward downloading the comprehensive *acquis communautaire* and introducing institutional reforms (see Schimmelfennig & Sedelmeier, 2006).

Conditionality is also applied in the EU's attempt to transform the domestic structures of its neighbors, which do not have a membership perspective (yet). The European Neighbourhood Policy offers the Mediterranean countries and the Western Newly Independent States financial and technical assistance, progressive integration into the internal market and its regulatory structures, and closer diplomatic relations (e.g., association) in return for economic and political reforms. Conversely, it may (threaten to) suspend bilateral agreements, withhold assistance, and impose political sanctions (e.g., visa bans). Donor–recipient relationships in the European Neighbourhood Policy are less tight than in EU enlargement policy, but association agreements still create closer ties than most international instruments.

Evaluation and Adjustments of the Instrument

The efficiency of conditionality has become a key concern for analysts and practitioners. The approach as developed in the 1980s has increasingly been called into question. There is wide consensus over the limited effectiveness of both policy and political conditionality in development cooperation. Donor leverage cannot substitute for domestic political will, leading to the call for stronger government ownership and *ex post* evaluation of outcomes. Research on EU conditionality points to similar limitations regarding the impact of conditionality. While target states have formally adopted a massive amount of EU legislation, this is often not properly applied and enforced and, thus, has not changed the behavior of actors (Gerda Falkner, Oliver Treib, & Elisabeth Holzleithner, 2008). Weak norm internalization has given rise to concerns about shallow Europeanization. As in development cooperation, the limited administrative capacities of the candidate countries have curbed the domestic impact of EU accession, which accounts for its differential outcome (Schimmelfennig & Sedelmeier, 2006).

Overall, the effectiveness of conditionality seems to depend on a number of specific scope conditions. The promised rewards have to be credible and big enough to pay off the compliance costs; the same applies to the threat of sanctions. Moreover, there needs to be a coalition of actors within the target country that is willing to use external incentives to push for compliance domestically (Jan Pronk, 2001). These conditions are seldom met, even among the current EU candidate countries, including the Western Balkans and Turkey.

In reaction to the limited effectiveness of conditionality, issues of recipient ownership, greater selectivity based on country performance, stronger results orientation, and thus a shift to *ex post* conditionality have gained relevance. While the World Bank and the International Monetary Fund aim to streamline conditionality and rely on greater selectivity and new approaches, such as programmatic lending, the European Commission attempts to reconcile a predictable budget support for low-income countries with a stronger performance orientation that bases disbursements on outcomes. Other critical observers call for the abandonment of conditionality altogether and argue instead for broad political dialogue and the allocation of funds on the basis of need.

The legitimacy of conditionality is equally contested. On the one hand, the output legitimacy of external interference has come under fire because structural adjustments have failed to produce the intended outcomes or have even been blamed for causing negative effects. On the other hand, the input legitimacy of conditionality is challenged by international norms of state sovereignty and self-determination. This legitimacy problem is exacerbated if externally promoted norms and standards are not equally promoted inside the donor organization or state (double standards). At the same time, conditionality has a legitimating function inside the donor states to justify payments to third countries, especially under high uncertainty regarding the effect on external actors. There seems to be a trade-off between legitimacy concerns in recipient and donor countries that creates a serious normative dilemma and adds to the controversy surrounding the use of conditionality both among policymakers and researchers.

Conditions, Necessary and Sufficient

Social science, as all science, is a continuous quest for an explanation and understanding of the world around us. This search is carried out through Benjamin Most and Harvey Starr's "research triad" of theory, logic, and research design, all of which are central to both hypotheses and results. The key element of explanation and understanding is causation. Social scientists are concerned with causation as applied both to individual events or cases and to classes or groups of events. The causal relationship may take many forms. Two of the most prominent, important, and commonly used forms of the causal relationship involve necessary and/or sufficient relationships. As emphasized in the work of Most and Starr among others, analyses must be concerned with the form of the relationship. David Hume's classic definition of cause involves the "constant conjunction" of an object followed by another, where all objects similar to the first are followed by objects similar to the second. Causation is seen as including three elements, the first being the existence of correlation between two factors or variables. That is, changes or attributes in one factor are associated with changes or attributes in another. Correlation is one possible form of any specific relationship. Correlation itself may take several forms, such as linear or curvilinear. The second element of cause involves the temporal dimension—the proposed causal factor must take place before the "effect" or the phenomenon to be explained. Cause must precede effect. The third element is the most rigorous and difficult—the elimination of other explanatory factors beyond those proposed (the central idea of "control"). Below, the various implications of these relationships and some current applications in political science are discussed.

Necessity and sufficiency are themselves different forms of the causal relationship. They represent different forms of constant conjunction. Scholars have argued that research designs (the nature of the theoretical logic and research hypotheses being employed) built around these different forms of causation will be affected by the nature and types of the cases selected, the controls employed for dealing with possible other (explanatory) factors, and the methods used for evaluating the theory and proposed research hypotheses. All three elements of the research triad—theory, logic, and research design—are thus affected by the form of the relationship, especially looking at necessary relationships in distinction from sufficient relationships or even simple correlational relationships. The differences between how necessary and sufficient conditions are treated are additionally important in regard to the research designs needed to investigate inference in the small-*N* studies that characterize much of comparative politics (and qualitative analyses more generally). The logics of necessary and sufficient conditions need to be investigated in order to cross the boundaries between political science subfields as well as the quantitative–qualitative divide.

Definitions and Logics

The most basic definition of sufficiency states, "if *X* then *Y*." That is, *X* always leads to *Y*, but *Y* is not always preceded by *X*. For example, proponents of the theory of democratic peace argue that democracies have peaceful relations with one another—that is, a pair of democracies (X) will lead to peace (Y), which is defined as the absence of war. However, peace may result from many other factors (e.g., power preponderance, lack of contact or opportunity), so that it may occur without the presence of a democratic dyad. The presence of democratic dyads predicts the presence of peace: *X* "yes" and *Y* "yes," as in Cell A of Figure 1. A much less important prediction (or expectation) is that the absence of a democratic dyad is followed by an absence of peace: the "no/no" Cell D of Figure 1. Cell B in Figure 1, where a democratic dyad is not present but peace is, is not relevant for sufficiency, because *Y* may occur without *X* (i.e., when *X* is a sufficient but not necessary condition for *Y*). The key relationship is in Cell B, when *X* does occur but *Y* does not. This cell will be empty when *X* is a sufficient condition for *Y*. Thus, a research design that looks for sufficient relationships must look at the full range of *Y*, the dependent variable—when *Y* occurs and when it does not. Herein rests the strong admonition by scholars that the researcher cannot select on the dependent variable (which would toss out the ability to look at the key cell that permits the investigation of sufficiency).

	$X = 1$	$X = 0$
$Y = 1$	(A) Predicted	(B) Irrelevant
$Y = 0$	(C) KEY—should be empty	(D) Predicted

Figure 1 *X* Is Sufficient for *Y* (If *X* Then *Y*)

	$X = 1$	$X = 0$
$Y = 1$	(A) Predicted	(B) KEY—should be empty
$Y = 0$	(C) Irrelevant	(D) Predicted

Figure 2 *X* Is Necessary for *Y* (Only if *X* Then *Y*)

In many ways, necessity produces reverse expectations. Necessity means the following: only if *X*, then *Y*. That is, *Y* is always preceded by *X*, but *X* does not always lead to *Y*. Bruce Bueno de Mesquita's theory of positive expected utility (EU) notes that positive EU is a necessary condition for war—that war (*Y*) is always preceded by positive EU on the part of decision makers going to war (*X*). In essence, necessity asks us to look for preconditions or prerequisites of some phenomenon *Y*. It should be noted that the authors in Gary Goertz and Harvey Starr's edited volume define necessity in various ways and using different logics: set theory, calculus, a probabilistic logic, fuzzy logic/sets, and Aristotelian two-valued logic. Returning to the current example, simply having positive EU does not mean that there will be war, for a variety of domestic and external factors, again including lack of opportunity. As seen in Figure 2, Cell A, the presence of the causal factor (positive EU), predicts or is followed by the presence of war, or the dependent variable. A much less important prediction (or expectation) is that the absence of the independent variable or causal factor *X* is related to the expectation or prediction that the effect, or dependent variable, *Y* is also absent (Cell D). Cell C presents the condition where *X* is present, but there is no effect on *Y*. This is not relevant to necessity because *X* does not always lead to *Y* (indeed, this has been a major confusion in critiques of the early EU models of Bueno de Mesquita and colleagues). For necessity, the key relationship is when the causal factor *X* does not occur but the effect *Y* still appears—Cell B. If *X* is a necessary condition for *Y*, this cell or set will be empty. Note that this means that the whole range of the independent variable *X* must be included. One must see cases where *X* does not occur. Necessity then can be tested using only the occurrence of *Y*, the dependent variable. With questions of necessity, therefore, the researcher may select on the dependent variable but cannot select only on the occurrence of *X*, the independent variable. This distinction between sufficiency and necessity suggests that case selection should be guided by the outcome that the researcher is interested in and how the logic of the proposed causal mechanism identifies that outcome (as argued by Goertz and colleagues). As noted above, one evident way to do this is with set theory. Thus, a strong set-theoretic basis to the logic of necessary relationships is found.

It should be clear that the logics of necessity differ from those of sufficiency. Much of the analyses performed on relationships of sufficiency use continuous variables, looking to find linear relationships on normally distributed values and to maximize the explanation of variance in the dependent variable (these have been called frequentist statistical methodologies). Necessity more often looks at the presence or absence of an explanatory factor *X*. That is, a necessary analysis looks to see if values on a measure have crossed a threshold, reached a "turning point," or have come to a "critical juncture" (see also the "powder keg" explanations discussed by Gary Goertz and Jack Levy). Goertz thus argues that necessary conditions and the statistical models related to them set out different sorts of hypotheses from standard quantitative analyses of sufficient relationships. Rather than tracking how changes in any *X* are related to changes in some *Y*, most necessary analyses focus on whether *X* makes *Y* possible or more likely. Goertz contrasts a "necessary condition hypothesis," which might propose that some minimum level of variable *X* is necessary for an outcome variable *Y*, with a "correlational hypothesis," which would propose that the greater the value of some *X* then the greater the value of some *Y*. Another example of analytical differences has been identified by Charles Ragin, among others. He has argued that while standard statistical techniques are often applied to deal with (i.e., remove) heteroskedasticity, this is a central condition and characteristic of necessary relationships and thus needs to be part of the analysis and not removed.

Necessary and sufficient hypotheses, then, often work within different causal chains. Correlational hypotheses tend to focus on classes of events, while necessary-condition hypotheses tend to focus on causation within a single case (but which may also be aggregated probabilistically across such cases). The latter is often associated with process tracing within cases to identify the causal mechanisms at work and is thus of importance to comparative politics, qualitative approaches, and comparative-historical methodology. Goertz has demonstrated the range, ubiquity, and importance of necessary-condition hypotheses found throughout the political science literature. They often take the form of counterfactuals, especially in case studies focusing on explaining individual events. The necessity relationship claims that *only if X* can there be *Y*. The counterfactual claim holds that *without X*, if *X* had not happened, *Y* would not have occurred. Goertz and Levy contrast a necessary-conditions counterfactual approach (looking for necessary conditions within individual cases) with a nomological covering-law approach (based on the constant conjunction of covering laws stated and tested with large-*n* statistical/probabilistic methods). More than 2 decades ago, Most and Starr demonstrated that researchers will produce meaningless findings when creating research designs that can test only for necessary conditions while stating their hypotheses in terms of sufficiency (and vice versa). That is, the cases selected and the methods used must match the questions asked. The method of selecting cases will logically preclude some questions and some designs.

Scholars across political science subfields as well as different research traditions have come more and more to seek designs that uncover complex causality, recognizing that there may be multiple causal paths to the same outcome. This is often called *equifinality*. Contingency plays a large part in such causal complexity—that some theory or hypothesis will hold only under certain conditions or that a pair of contending theories may both be true under different conditions or contingencies (or what Most and Starr call "nice laws"). In many cases, contingency is expressed as a necessary condition, without which some effect, outcome, or other dependent condition could not occur. This is why necessity is a key component of a philosophical view of causality becoming more prominent in the literature—the INUS view of causation. An INUS explanation is an "Insufficient but Nonredundant [i.e., necessary] part of an Unnecessary but Sufficient condition," for which James Mahoney and Gary Goertz (2006, p. 232) provide a succinct explanation:

> An INUS cause is neither individually necessary nor individually sufficient for an outcome. Instead it is one cause within a combination of causes that are jointly sufficient for an outcome. Thus, with this approach, scholars seek to identify combinations of variable values that are sufficient for outcomes of interest. The approach assumes that distinct combinations may each be sufficient, such that there are multiple paths to the same outcome.

Research findings with INUS causes can often be formally expressed through Boolean equations such as Y = (A AND B AND C) OR (C AND D AND E).

The logic of necessity and sufficiency, and multiple causal paths, may thus be clearly captured by Boolean logic and methods (most fully introduced in the work of Charles Ragin). The conjunctive Boolean AND denotes necessary conditions. Thus, in the above equation, A, B, and C are all necessary conditions in combination, to be sufficient for Y. But note, so are C, D, and E in combination. The Boolean disjunctive OR indicates that either of these two combinations is sufficient for *Y*—multiple paths to the same outcome. The reader should note that the philosophy of science dealing with concepts holds a similar position—that a good definition of a concept is one with necessary conditions that are jointly sufficient.

Conclusion

This brief overview has attempted to present the most recent reflections and findings on necessity and sufficiency, setting out the basic phenomena and issues that are currently being discussed in the political science literature. The reader who investigates the works cited and suggested below and follows the footnotes and references in those materials will obtain the most comprehensive picture of current thinking on necessity and sufficiency. These works reinforce the observation of Most and Starr that there is a need for a better understanding of logical linkages that serve as alternatives to the standard statistical techniques commonly employed in large-*N* statistical analyses with an almost exclusive focus on sufficient relationships.

These newer works provide the theory, logic, and findings that support Mahoney's refutation of a set of "erroneous beliefs" about necessity and sufficiency. Based on the present discussion and the works cited, one can, in fact, say that

1. necessary and sufficient causes do exist and are found in interesting hypotheses;
2. necessary and sufficient causes are not trivial, tautological, or irrelevant (see Goertz's work for an in-depth conceptualization of the trivialness, importance, and relevance of necessity and sufficiency and ways to measure them);

3. necessary and sufficient causes are neither deterministic nor inconsistent with probabilistic analysis, and they can be measured continuously (see especially Ragin); and
4. subsequently, methods do exist to test hypotheses of necessity or sufficiency, including tests for significance/trivialness.

For Points 3 and 4, see especially work by Mahoney as well as Goertz.

Finally, and perhaps most important, newer works on necessity and sufficiency point out ways in which research can be designed to capture causality (in its various forms) across small-*N* and large-*N* analyses and cross boundaries between so-called qualitative and quantitative analysis. In so doing, this work also enhances boundary crossing between international relations and comparative politics at a time when greater and greater attention is being directed toward two-level analysis, taking into account the impact of internal/domestic factors and context along with external/international factors and context.

Configurational Comparative Methods

Configurational comparative methods (CCMs) designate both a methodological approach and a set of specific techniques enabling systematic cross-case comparison while also taking into account within-case complexity. They have been developed, initially, for small- and intermediate-*N* research designs in the social sciences (Benoît Rihoux & Charles Ragin, 2009). The whole CCMs enterprise was initiated by Ragin (1987), who outlined a "synthetic strategy" that could bridge case-oriented and variable-oriented approaches to social phenomena. He also developed a first technique, QCA (qualitative comparative analysis—now labeled *crisp-set QCA* [csQCA]), and applied it to macro-level cases such as countries. Below, the basic assumptions, specific techniques, and applications, and recent developments are discussed.

Core Assumptions and Goals

The whole ambition behind CCMs is, on the one hand, to make qualitative case analysis more systematic and to offer case-oriented researchers some tools that enable them to systematically compare thick, complex cases. On the other hand, it strives to offer an alternative way to envisage causal arguments made in mainstream quantitative (read statistical) social-scientific work. The overarching goal of CCMs is to unravel causal complexity by applying set-theoretic methods to cross-case evidence. In more concrete terms, the different QCA techniques developed within CCMs enable one to identify core combinations of conditions (input variables), which explain the variation of a given outcome (output variable) of interest. Therefore, QCA techniques are geared toward the identification of so-called specific connections between conditions and outcomes. In contrast to most statistical techniques, they are not geared toward the establishment of general, tendential, or correlational connections between each independent variable, on the one hand, and the dependent variable, on the other (Ragin, 2008; Rihoux, 2008).

Causality, or linkages between conditions and the outcome, more generally, are assumed to be multiple and conjunctural. This implies the following assumptions: (a) Most often, it is a combination of conditions (rather than a single condition) that generates the outcome; (b) several different combinations of conditions may produce the same outcome; and (c) there is no fixed effect of a given condition on the outcome—depending on how it is combined with other conditions, different values of this condition can produce the outcome. The concrete goal of CCMs, from this perspective, is to identify those different causal paths leading to some outcome of interest, each path being relevant in its own way, regardless of the number of cases it covers. Thus, this concept of causality does not take on board most of the core assumptions underlying mainstream statistical analysis, such as permanent causality, uniformity of causal effects, unit homogeneity, additivity, linearity, and causal symmetry (Dirk Berg-Schlosser, Gisèle De Meur, Benoît Rihoux, & Charles Ragin, 2009).

The logical foundations of CCMs can be found in John Stuart Mill's "canons," in particular the method of agreement, the method of difference, and the joint method of agreement and difference, which are all logical ways to systematically contrast and match cases, so as to establish common causal relationships. In practical terms, in CCMs, this is translated into tests for necessity and sufficiency.

Techniques

The overall rationale behind the QCA techniques is that, through some step-by-step logical operations (based on Boolean algebra or set-theoretical logic), one is able to reduce complex data tables to shorter combinations of conditions explaining the outcome of interest. Therefore, at the heart of CCMs lies the quest for parsimony—but not in such a way that within-case complexity would be sacrificed. So far, three specific techniques have been developed under the umbrella term of *QCA*: crisp-set QCA (csQCA), the initial technique that uses Boolean, that is, dichotomous, sets; multivalue QCA (mvQCA), which allows the use of multiple-category conditions; and fuzzy-set QCA (fsQCA), which uses finer grained fuzzy-set membership scores.

These techniques can be exploited in at least five different ways. The first two uses are more descriptive or classificatory. One can use QCA techniques, first, simply to summarize data through the production of a truth table (or table of configurations), which can be examined to discover, for instance, how cases cluster together, or to elaborate typologies. Second, QCA techniques can be used as a tool to assess the coherence of the data—in particular through the detection of so-called contradictory configurations—which lead the researcher to reflect on the cases and the theory.

The three other, more full-fledged uses of QCA techniques imply some sort of testing of a causal argument: checking hypotheses or existing theories, quickly testing some conjectures made by the researcher, and developing new theoretical arguments. Thus, QCA techniques can be used for both theory testing and theory building.

In a full QCA application, whatever the specific technique, the core steps are basically the same (Benoit Rihoux & Bojana Lobe, 2009). In a first phase, upstream of QCA proper, a comparative research design is chosen, cases are selected in a purposeful way, sufficient intimacy is gained with each one of the cases, the outcome of interest is defined, the conditions are selected (model specification), and the cases and the model are visualized or synthesized in various ways. These first operations already result in some level of reduction of complexity by transforming thick, complex case narratives to analytical (i.e., variable-based) data.

The second core phase corresponds to the more formal, computer-run part of QCA. There are several steps to be performed: operationalizing the outcome and condition variables (dichotomization or some finer grained calibration), producing the truth table, solving the contradictory configurations so as to obtain a contradiction-free truth table, minimizing the truth table (with and without the inclusion of logical remainders, i.e., nonobserved cases), solving contradictory simplifying assumptions produced by the use of logical remainders, and finally obtaining minimal formulae that contain those core, most parsimonious combinations of conditions leading to the outcome of interest.

The third phase, downstream, consists of different ways of moving back to more (case) complexity: identifying more crucial conditions, interpreting the minimal formulae in a case-by-case manner, interpreting cross-case patterns, performing limited historical or modest generalizations, and finally, possibly, going through the next cycle of

QCA, for example, through the examination of some more, rather proximate cases.

All these steps should be performed in a reflexive, iterative way, and with frequent loops back to theoretical and/or case-based knowledge. As QCA techniques have been consolidating and as applications have been becoming more diverse, a body of good practices has also been consolidated.

Applications

The applications of CCMs have become increasingly diverse. More than two thirds of them are found in various subfields of political science—in particular, comparative politics and policy studies. The breadth of applications has expanded in several respects. In terms of number of cases, though QCA techniques were initially geared toward small- and intermediate-*N* designs, larger-*N* applications have also proved successful. In terms of the nature of cases envisaged, most applications so far envisage macrolevel (e.g., countries, political systems, and policy processes) or mesolevel (e.g., party organizations, social movements, and collective actors) cases. However, some researchers are beginning to apply QCA on microlevel cases as well. Another type of broadening is related to the fact that some users who are more application oriented are also becoming interested in such methods, for example, in the field of policy evaluation and monitoring, beyond the academic sphere. With regard to the number of conditions included in the analysis, there is also broad variation, though a good practice dictates that QCA models be kept relatively short due to the limited-diversity issue—that is, too long a model will not be in the interests of parsimony.

Gradually, applications have become technically more sophisticated. Two main computer programs have been developed and are now used for most applications: TOSMANA (Tools for Small-*N* Analysis; for csQCA and mvQCA) and FSQCA (fuzzy-set qualitative comparative analysis for csQCA and fsQCA). Some other interfaces are also being gradually exploited, such as R and STATA.

Debates and Further Developments

As CCMs are still rather recent and as they are being perceived by some as a challenge to some other methodologies, they are subject to a lot of debate. The core critiques concentrate in particular on the following points: the dichotomization of the data, the use of nonobserved cases, case sensitivity, the difficulty in selecting conditions, the inability of CCMs to actually establish causal linkages and broad generalizations (inference), and the nonexplicit inclusion of the time dimension. Naturally, as with all methods, there are limitations and weaknesses with CCMs, but many strategies have been developed to overcome most of these drawbacks. One should also bear in mind the specific goals and assumptions of CCMs. For instance, contending that CCMs are weaker than statistical techniques because they do not produce inference (generalization from a sample to a whole population) is a misplaced criticism, because this is not the goal of CCMs—they follow a more case- and diversity-oriented logic.

Many developments and improvements of CCMs are under way—the launching of mvQCA and fsQCA is an example; these programs were developed as a response to some of the limitations of the dichotomous csQCA. Among the many ongoing refinements, one can mention the following: the improvement of computer software, the inclusion of the time dimension, the distinction between distant and proximate conditions (two-step models; see Carsten Schneider & Claudius Wagemann, 2006), the Most Similar Different Outcome/Most Different Same Outcome (MSDO/MDSO) procedure in the process of model building (Berg-Schlosser & De Meur, 2009), more elaborate strategies to tackle logical remainders and contradictory simplifying assumptions, better visualization of the cases and the minimal formulae, and so on.

In another line of improvements, CCMs have been increasingly combined or sequenced with qualitative and/or quantitative methods. On the smaller-*N* side of the spectrum, the connection with qualitative, case-oriented work is self-evident, as in-depth case knowledge goes along with the QCA protocol—the graphic display of synthetic case descriptions is one way to bridge more explicitly the thick case evidence and the formal QCA procedure (Rihoux & Lobe, 2009). In intermediate- and larger-*N* designs, several works have fruitfully confronted or mutually enriched some QCA techniques with statistical techniques, such as discriminant analysis, factor analysis, and various types of regression-based analyses.

Many more developments can be expected within the next few years as the community of users of CCMs is enlarging and also becoming more diverse in disciplinary terms—in fact, some of the cutting-edge work is now also being done in fields such as management, organizational studies, and communication studies. The speed of further improvements of CCMs will largely depend on the ability of this growing community to share experiences as well as innovations and to make this a cumulative enterprise.

Conflict Resolution

Conflict resolution is a term that we all understand until we try to define it. Synonyms abound: such as *conflict settlement*, *conflict termination*, *conflict management*, and *conflict transformation*. Moreover, conflict resolution is both a situation and a process. A conflict is resolved when all the parties to a dispute agree that it is over for good, in full knowledge of the situation, and without any form of coercion, whether personal, manifest or structural, since they acknowledge that their respective interests and values have been satisfied. The concerned parties are those who cannot be seen off or defeated and without whom there can be no resolution in the long run. Resolution requires a new relationship to be self-sustaining without any form of coercion.

All conflicts end. Even bitter and decade-long disputes involving several wars have been resolved. On the way to resolution, there may be truces or temporary settlements in which coercion is exerted, but the roots of the conflict remain embedded so that any weakening or withdrawal of coercive mechanisms may risk a new flare-up. Thus, for example, in the Franco-German context, the Treaty of Versailles (1919) was a conflict settlement, whereas the Charter of Paris (1990) was a conflict resolution.

Conflict resolution is at the far end of a spectrum of outcomes that begins with a *diktat imposed by a victor*. But losers usually have leeway since victors are often dependent on local cooperation. Very rarely is the complete destruction of the enemy, or genocide, envisaged. A second outcome is a *negotiated one involving compromise* and lengthy negotiations often accompanied by considerable violence. Such a settlement is contingent on the balance of forces, and should these change, the smoldering conflict may again flare up. A *stasis outcome* is one in which actual physical violence has ended and its recurrence is unlikely, but the protracted conflict continues by other means since major issues remain unresolved. Finally, a full *resolution* is one in which all the parties have their values and interests satisfied. Conflict resolution is the most ambitious outcome sought since resolution based on a noncoercive framework is hard, but not impossible, to achieve.

Conflicts occur at all levels and in all social relationships. Each has its special characteristics, but there are elements in common. General statements can be made about conflict resolution, which apply to international, intercommunal, industrial, marital, or other conflict. Many principles and, indeed techniques, may be similar, albeit with due account being paid to the idiosyncrasies of level and type.

In political conflict, broadly defined, we can identify three traditions with differing approaches, conceptions of its origin and modalities, as well as aspirations for ending it. The first is the realist or power politics tradition that lays emphasis on the nature of international relations in an anarchical society. Societal elements exist, but they are weak and relations are close to the Hobbesian characterization of life as nasty, poor, brutish, solitary, and short. This is particularly true of the international system where the only reliable help is self-help due to the absence of sufficiently strongly held shared values to form the basis for a collective security. The ensuing security dilemma confronts actors with a tragic choice between guns or butter. Judgments are required about the capabilities and intentions of potential adversaries. Moreover, if this security dilemma is also linked to the notion that all individuals and groups have a drive to dominate, then there can be no peace in a real sense. There can be a truce, a cold war, order, and stability, but all this is contingent on a balance of forces between those who dominate and those who are dominated. It is an eternal struggle between the status quo and the revisionist powers. Order and stability are the products of a particular balance of forces, and any major change will upset that balance and a new equilibrium will have to be established to reflect those changes, perhaps on the battlefield. This is a classic case of conflict settlement.

The second traditional approach points to the importance of structures, with conflict being the result of incompatible interests built into structures. Structural violence suggests that peace is more than the absence of overt violence. Structural violence occurs where an actor may be a "happy slave," unable even to conceive of behaving as others can or prevented from so doing by prejudice, ignorance, or lack of access to facilities available to others. Such impediments are often not of a legal nature or enforced by overt pressure, but they are found in the mind, history, education, and culture of individuals and the society within which they live.

Not all structures are instruments of structural violence. Self-sufficiency is not necessary where we can benefit from comparative advantage, as long as the "terms of trade" are seen as fair by all parties in full knowledge of all aspects of the relationship, including the structural ones. Then a role differentiation can be legitimized and with it the structure within which the roles are embedded. Different roles do not necessarily imply an unfair relationship dependent on coercion. All may benefit equitably if the differentiation is acceptable to all with their eyes open.

Dyed-in-the-wool structuralists in a Marxist tradition would regard the concepts of legitimacy and evolutionary change as simply a means of throwing sand in the eyes of the masses. They insist that structures with embedded incompatible interests cannot be reformed and must be destroyed. Peace, or conflict resolution, is thus dependent on the destruction of existing exploitative structures and the creation of a revolutionary peace, if necessary by violence. Increasing the degree of confrontation in society is thus a step toward revolution and, thereafter, conflict resolution.

At all levels, conflict resolution is very different in the pluralist tradition since it gives salience to the notion of harmony of interests. Collective security will work if all the actors in a system come together to agree on the rules of behavior and on how to alter the rules to accommodate change. They further accept that if anybody strays from the fold they shall be brought back into it, forcibly if necessary. Underpinning this is the idea that all human beings have a high degree of shared values and that they can pursue these in a rational manner, in the right circumstances.

Rationality in this context is primarily concerned with the opportunity cost, that is, what other desired goals have to be sacrificed in order to achieve a particular goal. Parties in conflict frequently have a tunnel vision in which they become obsessed by one particular goal, paying a very high price in other desired goals to attain it. To see this in context, actors are encouraged to spell out the full range of their perceived goals and then attempt to minimize the opportunity cost between those goals. The next stage is to repeat the exercise, but this time in the context of others, so that in the long run all parties will be in a position where they are maximizing the totality of their values and minimizing the overall opportunity cost. Such an exercise in rational opportunity costing frequently leads to a consideration of basic human needs that must be satisfied if conflict is to be resolved.

Basic human needs include food and water as well as social needs such as security, identity, participation, self-actualization, and esteem. But these needs are not necessarily in short supply. One person's or group's identity is not necessarily at the expense of another's nor is their security, their development, or their self-actualization. They may be seen as zero sum at a particular moment, but conflict resolution as a process seeks to move to a win-win position. This is difficult since there is no panacea and it often requires third-party facilitation. Nevertheless conflicts can be resolved because the things that we all seem to care about are not inherently in short supply.

Article 33 of the United Nations Charter says that the member states "shall, first of all, seek a solution by negotiation, enquiry, mediation, conciliation, arbitration, judicial settlement, resort to regional agencies or arrangements, or other peaceful means of their own choice." Conflict settlements in the realist tradition rely on an uncertain balance of power. A revolutionary peace requires the destruction of exploitative structures and the eradication of structural violence. The pluralist approach to the process of conflict resolution is of a different ilk. In deep-rooted conflicts where there is little or seemingly no value consensus, negotiation between the parties very quickly descends into a rut of accusation and counteraccusation with little understanding or effective communication. Thus, recourse to other measures under Article 33 involving a third party is frequent. If the goal is merely conflict settlement then a biased mediation from a major actor to impose a settlement may suffice. However, if the goal is conflict resolution, it is more likely that the process is one of facilitation, which has a number of characteristics.

Facilitators in the resolution process are nonjudgmental since they do not pronounce guilt or innocence nor are they directive. They do not contend that they know best. They are, however, extremely supportive of all the parties since the values and interests of all must be met. The process is highly participatory with all the veto holders present, no matter what their past. Finally, there is a disempowerment of the parties by emphasizing that they share a joint problem that they can only resolve together. This approach typifies a more general movement at all conflict levels from judgmental decision making to that of a supportive framework. This is particularly apposite in "new international conflicts," where civil wars, transnational conflicts, and fragile and collapsed states are seemingly endemic in struggles of greed and grievance. Wars and conflicts that go beyond the international system require approaches, methods, and institutions that do likewise. Second-track diplomacy, especially facilitation, becomes thereby a major tool for resolution, involving a variety of actors both governmental and nongovernmental.

The process of conflict resolution is frequently the last resort when the parties know that they can neither win nor are likely to lose. They cannot escape from the conflict, but they know it is costing a great deal in various ways. The process of conflict resolution therefore accumulates many of the hard cases. It is brought in when all else has failed and it is trying to achieve the most difficult goal. However, conflict resolution is relevant earlier in the conflict cycle, as a preventive measure. Much thought has been given to this due to the upsurge of international interventionism and the evident need for emancipatory resolution based on social justice and solidarity in a local context.

Conflict Theory

See Conflict Resolution

Conflicts

In everyday English-language usage, *conflicts* refer to (a) serious disagreements, (b) prolonged struggles (e.g., armed clashes resulting in loss of life, or labor disputes), or (c) the clash of incompatible claims or principles, as in conflicts of interest.

In political science, conflicts can be analyzed as the outcomes of a certain kind of relationship, comparing relationships of cooperation and competition with those of conflict. When there is cooperation, humans work together in pursuit of common objectives. When there is competition, they struggle with one another in contests governed by rules that determine who succeeds and that identify the sanctions to be imposed for noncompliance. When there is conflict, either no rules are recognized or any relevant rules are not properly enforced. While rules may be embodied in laws or treaties, there may be dispute about their application. Moral principles may sometimes be regarded as rules of conduct. It should be noted that even in armed conflicts between states, offenders can be punished for war crimes, while the Geneva Conventions specify the ways in which civilians are to be protected in international conflicts.

Though the absence of conflict is not considered newsworthy, it can be just as important to political science as the analysis of violence. Distinguishing the dimensions of conflict makes it possible to uncover underlying principles, such as has been done in game theory. Less abstract lines of analysis, such as field investigations of the strategies pursued by the parties to conflicts, and the options open to them, can be equally illuminating.

Everyday Language

In the newspapers, and in popular discussion, conflicts are divided into kinds or classes of conflict, such as economic, ethnic, national, racial, and religious conflicts. Yet conflicts do not fall into any natural classification. If they are classified, it can only be for a specific, and limited, purpose.

National conflicts have been of particular interest to political scientists; they are commonly associated with the formation of states and the delimitation of their territory. After major wars, state boundaries have been drawn or redrawn at international conferences convened by what used to be called "the Great Powers." Thus, in the history of Europe, two long-running wars were brought to an end in 1648 by the Treaty of Westphalia; this marked the birth of the concept of the nation-state. After the Napoleonic Wars, the Congress of Vienna in 1815 redrew the political map. After World War I, the Paris Conference of 1919 revised that map and gave birth to the League of Nations. After World War II, the three-power conference at Yalta delimited "spheres of influence"; the United Nations (UN) was established, and its Security Council provided a forum for the regulation of interstate conflicts. The UN has made states responsible for the regulation of conflicts arising within areas subject to their jurisdiction.

The then–UN secretary-general, Boutros Boutros-Ghali, in his 1992 report *An Agenda for Peace*, stated,

> Since the creation of the United Nations in 1945, over 100 major conflicts around the world have left some 20 million dead. The United Nations was rendered powerless to deal with many of these crises because of the vetoes—279 of them—cast in the Security Council, which were a vivid expression of the divisions of that period. With the end of the cold war there have been no such vetoes since 31 May 1990, and demands on the United Nations have surged.

International conferences, such as the Paris Conference of 1919, have often changed state boundaries or created new ones without the agreement of the populations concerned. Campaigning for the restoration to a country of territory occupied by coethnics is known as irredentism. One of the challenges to political science is to explain why, after the ending of the Cold War in 1989, Armenia, Croatia, and Serbia engaged in expensive irredentist campaigns while Hungary, Romania, and Russia did not.

The new international order has been unable to resolve some interstate conflicts. For example, the United Kingdom (UK) decided that it would withdraw from India in 1947 and that the territory should be divided to create the new state of Pakistan. It made this decision in advance of any agreement about the course of the boundary between the two states and about whether Kashmir (i.e., what was then the princely state of Jammu and Kashmir) would form part of India or Pakistan. With partition, Muslims and Hindus moved across the new border, rioting occurred elsewhere, and some 2 million men, women, and children lost their lives. The conflict over Kashmir remains unresolved and is a threat to peace in the region.

The following year (1948) saw the creation of the state of Israel and the intensification of the conflict between Israelis and Palestinians; this conflict has also remained unresolved and is a threat to peace in the Middle East.

The Paris Conference led to the recognition of the Kingdom of Serbs, Croats and Slovenes, as an extension of what had earlier been the Kingdom of Serbia. In 1945, it was reconstituted as the Federal Republic of Yugoslavia. The Federation broke up after Croatia and Slovenia seceded in 1991. Disputes have persisted over recognition of the state of Macedonia (and its name) and over the status of Kosovo, traditionally part of Serbia but with a largely Albanian population.

Elsewhere there have been serious intrastate conflicts, sometimes initiated by elements within the government itself, such as the attempted genocide in Rwanda in which, in 1994, many ethnic Hutus attempted to murder all ethnic Tutsis.

The Dimensions of Conflict

It is difficult to classify conflicts because each conflict is unique. A conflict is, by its very nature, political, but it may also have other dimensions.

Consider the case of Northern Ireland, an entity that was created in 1922 when what is now the Republic of Ireland was allowed to leave the UK and become independent. A narrow majority of the population of Northern Ireland identified as Protestant and wished to remain part of the UK. A minority, identified as Catholic and Republican, believed that no boundary should have been drawn, because the island was one unit. This was not a conflict between two homogeneous blocs, for many Republicans, despite believing that they had legitimate grievances, would have been satisfied without a united Ireland, and many in the majority disassociated themselves from the extreme expressions of Unionism. On both the Unionist and Republican sides, there was more than one political party competing for votes, quite apart from the party that was trying to bridge the divide.

Over the years there were issues that mobilized varying degrees of support either for protest or for the repression of what was perceived as a terrorist movement. Some sort of conflict continued, but it varied in intensity. It had a national dimension because, although the border had been guaranteed by the two states, it was still contested. It had an economic dimension because the Unionists monopolized the better-paid jobs. It had a religious dimension because many identified themselves by the faith they professed. Insofar as there were distinctive communities, it may be said that there was a conflict with an ethnic dimension. Different individuals had different motives for participating in the conflict (or for evading it by emigration). Individual identification with the opposing parties, and with the actions which expressed the conflict, varied continually.

If a broad definition is employed, it could be said that Northern Ireland provides an example of an ethnic conflict, though ethnicity is scarcely its distinguishing characteristic, and a classification as "ethnic" does not contribute anything of value to the analysis of events there.

Pakistanis are affronted that Kashmir, with a majority Muslim population, should remain a part of India, therefore the conflict there also has both a national and a religious dimension. Since the territory is valuable, it has an economic one as well. The conflict between Israelis and Palestinians likewise has a national dimension, reflecting a struggle between, on the one hand, a people with a Zionist state, and, on the other, a people who want either a new state of their own or equality in a reconstituted non-Zionist state. It has a religious dimension and, because of the great inequality of the conditions of the two peoples, an economic dimension as well. What is now the People's Republic of China contends with two conflicts that are either—depending on interpretations of the historical record—within or on its borders. Tibet and Xinjiang have at times been subjected to Chinese overrule; in both, the indigenous people practice their own religions and demand a greater autonomy than that accorded by Chinese policies. Since the parties to each of these four conflicts are distinctive peoples, they are often represented as having an ethnic dimension. This suggests that all persisting conflicts, like all persisting social groups of the kind called communities, are almost certain to be multidimensional.

Theories of Conflict

In the 1960s and 1970s, some sociologists criticized prevailing assumptions that societies were based on consensus and that conflicts were therefore a deviant condition. Such inferences were criticized by Ralf Dahrendorf and others who maintained that, in industrial societies, there were necessarily conflicts of interest, such as those between employees and their employers. Indeed, according to the Marxist version of what was sometimes called "conflict theory," the institutional structure of any capitalist society had to be explained as an imposed scheme for the regulation of class conflict. This was a useful correction of the approach known as structural functionalism, but to call it "conflict theory" was to use the word *theory* to describe a philosophy of society rather than to build a set of testable propositions.

A different example of theory in political science is the application of game theory to the study of conflict. Some conflicts resemble a zero-sum game: If one side makes a gain, the other side loses by an equal amount. Gains and losses sum to zero. Other conflicts have a positive-sum outcome. For example, conflicts serve the common good if they bring underlying disputes to the surface and lead to their resolution. In industrial relations, a threatened strike over pay can force an employer to make changes (e.g., investing in new machinery) that increase production and improve the income of both employers and employees. The sum of gains and losses on both sides is then more than zero. Yet other conflicts either leave both sides worse off, or any gain is more than counterbalanced by losses elsewhere; these then resemble a negative-sum game.

During the Cold War, game theory was used for calculating strategies for military opposition between East and West. The planners reasoned, "If we do this, they may retaliate with Policy A or Policy B. What is then the best course for us to follow in either event?" This was an application in which the two superpowers were seen as playing a game. The same reasoning can picture individuals as players—for example, "Will my gain exceed my losses to a greater degree if I support one side or the other in a given conflict? Or will it pay me to support neither?" This reasoning relies on rational choice theory to calculate the costs incurred by any failure to follow the course that maximizes net advantages.

In recent times, some major conflicts have been resolved by the intervention of a third party. During the Cold War, each of the superpowers intervened to resolve major conflicts within its own sphere of interest lest the opposing superpower exploit them in its interest. (For example, the North Atlantic Treaty Organization [NATO] powers could not allow the conflict between Greece and Turkey over Cyprus to become an armed conflict.) Since the ending of the Cold War, the United States (helped by Canada) has intervened successfully to resolve the conflict in Northern Ireland and, so far unsuccessfully, the conflict over the rights of Palestinians. Superpower intervention is more potent because only such a power is able to promise rewards for all parties and thus hold out the prospect of a positive-sum outcome.

Those who apply game theory liken the parties to a conflict to the players of a game, but they cannot explain why there is a conflict in the first place. In the game of chess, one party plays white and one plays black. Game theory cannot explain which party gets to play white rather than black. Nor has this approach yet been very successful in linking the considerations of domestic policy to those of foreign policy, though models of two-level game theory take a step in this direction. In domestic negotiations, the executive is pictured as absorbing the concerns of interest groups and building coalitions with them; at the international level, the executive then tries to further these concerns without committing to anything that will have deleterious effects at home. When the objectives of actors at both levels are in harmony, an international agreement can be negotiated.

Strategy

That conceptions of interest may be overlaid by other perceptions can be illustrated from studies of conflicts arising within the Hindu caste system of India. That system institutionalized inequality in ways that can be seen as attempting, with only limited success, to prevent competition between caste groups and to make protest illegitimate.

Some conflicts can be observed at the level of the village. A study in the state of Orissa by Frederick George Bailey in the early 1950s described a village in which the population was divided into caste groups (or *jatis*). Almost everyone was a Brahmin, a warrior, a distiller, a herdsman, a potter, a washerman, or a weaver, and there was no exit option. The weavers were "untouchables" (now often referred to as *Dalits*). They knew that the passing of the Temple Entry Act in 1947 had made it an offense to bar Hindus from temples on the grounds of untouchability, and they decided to assert their new right. They notified the local police headquarters that on the occasion of a particular festival, they would, as usual, take their offerings to a temple, but this time they would, like the higher castes, take them into the forechamber. The upper castes mounted a guard to prevent their doing so. The police arrived. They apparently advised the weavers to seek a remedy through the courts and probably said that if there were any more reports of trouble, two constables would be stationed in the village. The upper castes punished the weavers by ceasing to employ them as musicians on festive occasions, but the alleged failure to observe the 1947 Act did not go to court, and the previous equilibrium was restored.

The strategy of the weavers showed calculation in their choice of a particular temple and of a nonviolent form of protest, and in declining the opportunity to pursue legal action. They invited oversight of their dispute, but they did not press for intervention. Everyone knew that if a police unit were to be billeted on the village it would be a collective punishment, a negative-sum outcome. By demonstrating a capacity to press a shared interest, they had presumably gained an enhanced self-respect at the price of a small material loss. They had warned the higher caste groups not to take traditional distinctions for granted.

Interpersonal relations within the village were multidimensional. Throughout, the caste groups cooperated but on terms that were not universally accepted. Dissent over these terms led to the challenge in which all concerned counted the cost of their actions.

Tolerance of what some regard as unjustified inequalities can be changed by the eloquence of mobilizers or by the messages of the mass media. Commentators agree that the highly selective use of television and radio to disseminate misleading accounts of the conduct of members of the national groups in the former Yugoslavia did much to stimulate violent conflict and led to the breakup of the federation. In Rwanda, radio messages inciting Hutus to slaughter Tutsis helped mobilize the mobs responsible for the genocide there. The calculation of strategy at the local level may be skewed by events beyond local control.

Questions and Answers

Political science research on the nature of conflicts needs to delimit the area of inquiry by examining a particular kind of conflict, or a particular aspect of it. Only by delimiting the question posed can an inquiry culminate in the sort of answer that characterizes social science.

Many studies have concentrated on violence, especially deadly violence. As forms of collective violence, riots have been distinguished from feuds, violent protests, terrorism, civil war, and genocide. Some of the questions posed have had a top-down character: Why are there more violent conflicts in some regions than in others? Why does their incidence vary from one historical period or time to another? Why do some localities experience repeated violence? Most of the violent conflict in India is not between caste groups but centers on the hostility between Hindus and Muslims. Why should eight cities, containing just 18% of India's population, have accounted for nearly half of the total deaths from Hindu–Muslim urban violence between 1950 and 1995?

Ashutosh Varshney compared the conflict-prone city of Aligarh with the relatively conflict-free city of Calicut. In both cities there were conflicts between Hindus and Muslims, and in both cities committees to prevent violence had been established. They were effective in Calicut for several reasons, among them the counterbalancing effect of caste divisions among the Hindus. In Calicut, the interest of the political elite lay in the prevention of violence. In Aligarh, by contrast, different sections of the elite could gain from it. The study counted Hindu–Muslim violence as *ethnic* conflict, which is questionable; it took violence as a criterion for determining when an opposition became a conflict, which may not suffice as a criterion of conflict in other circumstances.

Is there an association between the nature of the state and the nature of the violence? For example, it has been argued that whereas a democratic country with a powerful state, such as Japan, experiences low levels of violence, a less democratic regime with a powerful military, such as Turkey, experiences more and that, because of state power, it has to take the form of terrorism rather than of rioting. Such an explanation must be qualified because, in Turkey, the actions described as terrorist have been taken on behalf of a minority seeking recognition as an ethnic or national unit, and there is no comparable minority in Japan.

Some questions have a bottom-up character. Why is one category of persons attacked rather than another? After the assassination of Prime Minister Indira Gandhi in 1984 by a Punjabi Sikh, mobs in Delhi attacked Sikhs, but those they attacked were Sikhs from parts of India other than the Punjab, and the victims were not supporters of Punjabi separatism. In the Northern Nigerian town of Kano, in 1953, and again in 1966, Ibo settlers from the southern regions were attacked but not Yoruba settlers. The Northerners had just as much reason to suspect the political and commercial ambitions of the Yoruba from the Southwest as the Ibos from the Southeast. Why should one group have been victimized while another remained unharmed?

Rioters often justify their actions as responses to provocation, yet sometimes incidents that could be represented as provocative are ignored. Such differences inspire important questions about how violent incidents are organized and the willingness, or ability, of officials (such as police commanders), and of political elites, to suppress them.

Why, it was asked earlier, did Armenia go to war in 1991 with Azerbaijan in order to establish a corridor linking up with an Armenian enclave living in Azerbaijani territory? It proved an expensive venture, and the result has not been acceptable to other states. Why did Croatia try to grab portions of Bosnia inhabited by fellow Croats and Serbia risk so much on behalf of Serbs outside Serbia? Can these actions be attributed to nationalism? If so, why did Hungary not try to renegotiate its boundary with Romania to recover some of the territory it lost in 1920? Romania lost Bessarabia in 1939; later it became the state of Moldova. Why did Romania and Moldova not reunite after 1989? Why, after the dissolution of the USSR, was not more done to bring the 25 million people outside Russia into closer contact with their motherland? A closer analysis of these cases shows, for example, that Armenian nationalism was exceptionally sensitive because of the genocidal persecution of Armenians in Turkey in 1916. Nationalist sentiment in itself achieves little unless there are politicians who can attain power by inciting it, while the voters do not want to carry the costs of incorporating a minority from whom they have grown distant.

Apart from the questions about the policies of states, there are many questions about the behavior, in conflict situations, of the public. Why do otherwise peaceful neighbors kill each other? If they kill others, why do they kill them in one way rather than another? Why are the bodies of victims of collective violence sometimes mutilated? Why are certain sorts of people more inclined to participate in collective violence? Within the same group, some prefer peace and others riot. Why are men more prone to violence than women? Anyone who favors a particular answer to such a question then has to ask why that answer obtains in certain circumstances and not in others.

Conclusion

Germany and France were at war with one another from 1870 to 1871, 1914 to 1918, and 1939 to 1945. In the 21st century, it is inconceivable that either country would declare war on the other because their economies, and the lives of their peoples, are now so closely intertwined. The sources of peace are to be sought in the relations between humans, their understanding of the nature of these relations, and their knowledge of other people. By seeking these sources, political science research aims to advance knowledge about the nature and regulation of conflicts, and it has therefore to account for the absence of conflict as well as for variations in the intensity and scope of conflicts. While the detailed historical examination of particular conflicts is essential, there are general issues that continue to stimulate research.

Confucianism

Confucianism is the general system of ethics that the Chinese thinker and social philosopher Confucius (ca. 551–479 BCE), his interpreter Mencius (ca. 372–289 BCE), and their early followers advocated to build a moral community of *datong shehui*, known as the Great Harmony Society, in which people could live happy and worthy lives. To build such a community, the Confucian ethical system offered a unique model of benevolent government through moral education and virtuous leadership. This entry first introduces the central values and principles of Confucianism and then highlights its differences from the Western liberal democratic model of government.

Confucian Principles of Good Government

What makes good government? Who should rule and how? What should rulers do to promote good government? On the basis of a positive conception of humans as moral and social beings, not as free and autonomous individuals, Confucius and Mencius sought to address these questions concerning both the ultimate ends and operational means of governance from the perspective of building a harmonious moral community of *datong* (grand harmony), where robbers, thieves, rebels, and traitors had no place, and hence the outer doors remained open and were not shut. Specifically, they conceived of government as an institutional mechanism to achieve such a community. They endorsed economic prosperity, physical security, and popular trust in government as the three essential substantive components of good government.

To create a harmonious and prosperous community, who should rule? In the Confucian conception of good government, the quality of government depends exclusively on the quality of people in the government. It has very little to do with the way in which institutions are organized or how authority is distributed across the institutions (such as, for example, by separation of powers). Accordingly, Confucius and Mencius advocated an open system of meritocracy by dividing people into the two categories of governors and the governed (*The Analects of Confucius*, IV 14). To these and other early Confucians, society becomes harmonious only when those who occupy positions of responsibility are the ones with the ability to discharge those responsibilities.

What specific quality is required of those who should govern? Confucianism endorses the possession of virtue—understanding of and commitment to the common good—as the only proper basis for a claim to governmental authority. Accordingly, Confucius and his followers called for government by the virtuous and wise, not by ordinary people. Yet they did not favor the hereditary system of aristocracy. Instead, they advocated a merit-based system of government, which would allow every citizen to take competitive examinations that test virtues and knowledge. Thus, the most talented would rise to the highest offices. This system of meritocracy replaced the rule by hereditary aristocracy in Confucian Asia long before the same was done in the West.

How should rulers govern the state to build a harmonious and prosperous community? Early Confucians advocated the principle of *minben* as the most important principle of governing. Minben, which originates from the pre-Confucian period, means treating "people" (*min*) as "roots" (*ben*). Thus, they form the foundation of the state. To govern according to this principle is, therefore, to govern for the people (min), for their economic prosperity, and for their physical security just as the roots of trees (ben) should be tended (*Analects*, XIII 9). By embracing ordinary citizens as the roots of government, this principle demands that rulers seek the prosperity and welfare of ordinary citizens as the ultimate end of good government.

To govern according to the principle of minben involves not only providing sufficient food and security but also disseminating virtue throughout society (*Analects*, XII 7). In this regard, Confucius said that people should be educated as soon as their livelihood is secured (*Analects*, XIII 9). Confucianism gives priority to the task of securing livelihood because people can only be expected to behave morally after they are relieved of poverty. As Benjamin Schwartz (1985) points out, Mencius (3a.3) emphasized an economic livelihood as an indispensable precondition for moral education and advocated the hierarchy of human needs as a conceptual tool for governance more than 2 millennia before Abraham Maslow did.

To early Confucians, moral education was essential to the building of a harmonious community because law and punishment were viewed as ineffective means for maintaining order. The higher goal of social harmony could be attained only when people became virtuous and fulfilled their duties to others voluntarily. To build a nation of virtues, therefore, Confucianism emphasized the importance of providing education to all segments of the population. Confucius himself said there is no class distinction in education (*Analects*, VII 7). He was the first scholar to advocate and popularize the notion of mandatory universal education.

The minben principle also holds that good government depends on the mutually beneficial relationship between rulers and the ruled (*Analects*, XII 9). For this reason, Confucius advocated not only good intentions but also benevolent behavior on the part of rulers and the avoidance of cruelty, oppression, injury, and meanness (*Analects*, XX 2). Confucius urged rulers to treat people as generously and honestly as their own guests. They were not to impose on others what they themselves did not desire (*Analects*, XII 2). Only when rulers practice this golden rule of *ren* (benevolence) can the people provide a sense of legitimacy to their government. In other words, rulers can govern people only when they have acquired their trust. Otherwise, people will begin to think they are oppressed (*Analects*, XIX 10).

According to early Confucians, heaven consents to the legitimacy of a government when its people consent to it. According to Mencius (5a.5), heaven sees with the eyes of its people; heaven hears with the ears of its people. They further emphasized popular consent as the most essential component of good government, more essential than sufficient food and sufficient weapons (*Analects*, XX 2). In short, early Confucians proposed an important political theory that holds that governmental legitimacy depends solely on popular support and trust. This notion of governmental legitimacy is at the heart of the contemporary theory of democratic regime consolidation. As Juan Linz and Alfred Stepan (1996) observe, democracy becomes legitimized only when people embrace it unconditionally.

To obtain good government, the early Confucians advocated the use of moral persuasion rather than universally applicable penal laws, because the latter often require coercion. Having assumed that people are inherently good and thus capable of learning and achieving moral development, they can be persuaded to overcome their selfishness and exercise moral discipline instead of being forced to do so by law. By motivating them to follow positive examples and fulfill their duties voluntarily, the rule of virtue or rule by morality can win their loyalty to the government.

Rule by law, on the other hand, involves forcing people to submit to government through punishments, thus making them distrust it. For another reason, early Confucians preferred the rule of morality and customs to that of laws and regulations. They believed that a sense of losing face and being shamed would serve as a more effective deterrent to crime than the sense of guilt that the latter engenders.

The third Confucian principle of good government is known as *zhongyong,* or the doctrine of the Mean. This tells rulers how to make decisions in order to achieve the state of harmony among those with different preferences and interests. To underline the importance of this decision-making principle, Confucius said that perfect is the virtue that is according to the Mean. The core idea of this principle is that going beyond the limit is as bad as falling short (A. T. Nuyen, 2000). It requires being reasonable and moderate without going to the extreme or being one-sided. As a decision-making rule, this principle predates the contemporary median voter theory, holding that politicians should commit to the median policy position preferred by the electorate in order to maximize their votes (Anthony Downs, 1957).

Conclusion

Confucianism equates good government primarily with a benevolent government built on the consent of the people. It also equates good government with primary reliance on virtue and morality. The Confucian governing model calls for government for the people by a virtuous and meritocratic leadership, not government by the people. The Confucian model contrasts sharply with the liberal democratic notion of government, with its emphasis on a government elected by the people and operated according to the rule of law. Due to these differences, there is contemporary debate among scholars such as David Hall and Roger Ames, Samuel Huntington, and Fareed Zakaria over whether China and other East Asian societies shaped by Confucianism can fully accommodate to liberal democracy as practiced in the West.

Nonetheless, we should note that Confucianism has played a vital role in the process of socioeconomic modernization in Asian societies by inducing their governments to promote universal education as a means of national development. To the scholarly community, it offers the original notion of a human-needs hierarchy and theories of governmental decision making and legitimacy. The rich Confucian cultural heritage, moreover, provides the mass publics of the Asian nations the essential premises on which they can construct a viable balance of individual rights and interests with communal goods and obligations as an alternative to the liberal democracy model practiced in the West.

CONSENSUS

Unlike many concepts in political science whose meaning is quite contentious—for example, democracy, ethnicity, and state—the concept of *consensus* is among the simplest and most transparent in the discipline. It is universally agreed that the term denotes agreement or unanimity. It is often used in phrases and in conjunction with qualifiers, such as near-consensus, consensus building, international consensus, moral consensus, consensus-based approach, permissive consensus, and cross-party consensus. Although there is strong agreement on the meaning of consensus, there are many concepts that refer to its absence, including cleavage, conflict, competition, contestation, division, majoritarianism, pluralism, and polarization.

The concept of consensus has played a key role in four areas of research within political science: political philosophy, where John Rawls proposed the term *overlapping consensus* to describe a framework for reconciling fundamentally divergent comprehensive worldviews; comparative politics, where Arend Lijphart proposed the term *consensus democracy* as an ideal type within the genus of democratic regimes; economic policy, where the concept of the Washington Consensus has been highly influential since the 1980s; and organization theory, where the concept of domain consensus denotes the fact that different organizational settings are characterized by distinctive norms and behavior. While the concept of consensus has been centrally important in these four significant research areas, it has been used in each without recognition of its key role in the other three research programs. This entry first describes the four uses of the term and then identifies some applications of consensus in political practice.

Four Scholarly Uses of the Concept of Consensus

Overlapping Consensus

Rawls proposed the term *overlapping consensus* to provide a practical solution to a fundamental political problem for liberal democratic theory: How is political order maintained when reasonable people hold deeply divergent comprehensive worldviews? Rawls believed that there is no philosophical solution to the problem, that it is impossible to reach a consensus by rational discussion on the meaning of the public good. His solution was to propose a liberal political framework, one maintained by overlapping consensus among those with fundamentally different comprehensive worldviews. The framework reflects a "thin" theory of the good—that is, one not based on a single conception of the good. However, Rawls claims that this liberal framework of overlapping consensus is not a second-best pragmatic compromise, a mere result of a stalemate among competing worldviews, and a regrettable necessity given that no one worldview is sufficiently powerful to dominate all others. Instead, he claimed that a liberal framework is the best political solution, one that can be a crucial element in competing comprehensive worldviews. (Some critics questioned his optimism on this score.)

Other political theorists, including Charles Taylor and Jürgen Habermas, have advocated seeking to develop consensus through rational discussion, and the concept known as deliberative democracy has highlighted the value of promoting extended discussion to reach consensus rather than foreclosing deliberation by majority vote. (Political theorists who have contributed to the project are James S. Fishkin and Jon Elster.)

From another vantage point, some political theorists have challenged the normative value of consensus. They claim that a hallmark of democracy is divergence, debate, and conflict. For example, Chantal Mouffe praises the value of what she terms *antagonistic pluralism*. At an extreme, Isaiah Berlin warned decades ago of the danger of a totalitarian temptation implicit in seeking and imposing a single consensual understanding of the common good.

Consensus Democracy

Lijphart suggested the term *consensus democracy* as an extension and partial revision of the earlier concept that he developed: consociational democracy. Consociationalism is a pattern of governance that Lijphart first identified in the Netherlands and later applied, in both descriptive and normative terms, to other deeply divided societies. It involves a pattern of decision making in which elites from separate sectors or pillars reach accommodation or consensus across ethnic, religious, or ideological divides.

Lijphart identified consensus democracy as a broader form of political accommodation. It is an ideal type of regime, one characterized by inclusion, in contrast to its polar opposite, what Lijphart termed *majoritarian democracy*. Some key institutional features of consensus democracies are bicameral legislatures, the use of proportional representation to elect the lower house of the legislature, multiparty systems, multiparty governing coalitions that typically promote supermajority support for the passage of significant reforms, and ample protection for minorities. Consensus democracies are associated with broad governing coalitions. Rather than reaching decisions by narrow majorities, consensus democracies promote policy changes only if they enjoy broad political support.

Critics of Lijphart have challenged what they regard as antidemocratic features of his approach. They charge that the accommodations reached by elites in consociational democracies come at the expense of democratic participation and decision making. And requiring supermajorities within consensus democracies enables minorities to block the majority will. Lijphart responded that comparisons between the two regime types suggest that consensus democracies outperform majoritarian democracies on significant measures of good governance.

Washington Consensus

The term *Washington Consensus* was coined in 1990 to describe a policy agenda developed by officials in the U.S. government and the World Bank and International Monetary Fund (IMF), influential international financial institutions whose headquarters are in Washington, D.C. Leaders of these institutions agreed that neoliberal economic policies were the most appropriate and desirable to promote economic development and growth. The Washington Consensus accorded priority to economic "fundamentals," including balanced budgets, price stability, tax and spending cuts, trade liberalization, deregulation, and privatization of state-provided goods and services such as utilities, transport, and education. These goals were to be achieved by adopting structural adjustment policies consistent with neoliberal doctrine. In simplest terms, the Washington Consensus advocated more markets and less state. It was crafted in reaction to the approach stressing state-directed economic policies, which was practiced by less developed countries, especially in Latin America, in the 1950s and 1960s. A key element of the statist approach involved import substitute industrialization—that is, state intervention to foster domestic industrial development, especially by substituting local production of consumer goods for foreign imports. The Washington Consensus was extremely influential for several decades. It informed the aid policies of the U.S. government, the World Bank, and the IMF and shaped the orientation of many governments throughout the less developed world.

The Washington Consensus was far from commanding a consensus. Opponents included progressive economists in the advanced industrial world and governmental leaders and popular movements in countries such as Malaysia, Russia, and Argentina, which experienced economic dislocations and crises after adopting the policies of the Washington Consensus. Critics charged that the Washington Consensus promoted austerity for the broad mass of the population without generating adequate economic benefits, reflected a one-size-fits-all approach that ignored extensive variations among countries, emphasized the value of large industrialization projects that often caused social dislocations and environmental degradation, bypassed democratic decision making, produced financial panics and economic crises, and neglected problems of poverty, corruption, and autocracy.

By the 1990s, modifications occurred within the Washington Consensus. For example, the World

Bank reduced support for large-scale industrial projects such as giant dams; placed priority on developing honest, effective political institutions; and provided for wider consultation in developing policy recommendations. However, as a general matter, changes have occurred *within* the Washington Consensus; no comparably broad alternative has *replaced* the paradigm.

Domain Consensus

The concept of domain consensus has been an important element within the field of organization theory. It refers to the fact that expectations about what is appropriate behavior varies for members of different domains, including sectors such as civil society, the market, and the state; different regions and localities; and specific organizations. The concept refers to expectations about how members in the domain will interact with each other and with nonmembers, about the nature of their respective roles and responsibilities, and about what the collectivity will and will not do.

Political Applications of Consensus

Consensus-based approaches to decision making are relatively rare in nation-states. Bureaucracies usually make decisions by fiat, often after top-down consultation. Legislative decision making is usually made on the basis of majority rule, although in many cases (especially in Lijphart's consensus democracies) supermajorities are the rule. The situation is different in most international organizations, where decisions typically require a consensus of member states. Examples include the Association of Southeast Asian Nations (ASEAN), Asia-Pacific Economic Cooperation (APEC), Southern Common Market Agreement (Mercado Común del Sur, MERCOSUR), and World Trade Organization (WTO). There are exceptions. In the European Union, voting on many issues is by a simple majority, decisions on others is by a weighted majority in which certain member states have plural votes, and some issues are of such importance (notably, the admission of new members or changes of constitutional importance) that unanimity by member states is required. The United Nations Security Council practices a form of supermajority voting. Not only must a proposal pass by majority vote but all five permanent members of the Council must either support or at least refrain from vetoing proposals.

There are many examples of microlevel institutions that employ a consensus-based approach based on the principles of deliberative democracy, including consensus conferences in Denmark, citizens' juries in the United States, planning cells in Germany, and citizens' panels in Britain. These mechanisms often bring together technical experts, government officials, and rank-and-file citizens to analyze issues such as the siting of waste treatment plants or the risks involved in genetically modified organisms and other technological innovations. The goal is to encourage those of diverse perspectives to engage in extended dialogue in order to forge a consensus or at least avoid polarization.

As is evident from this overview, if the definition of consensus is unproblematic, there is no consensus on how the concept is applied and evaluated. It has played a role in highly diverse political analyses and practices. This both testifies to its utility and invites further reflection and experimentation by scholars, practitioners, and citizens.

Conservatism

Conservatism is one of the basic currents of democratic political life, which is founded on a (moderate) critique of liberalism. Conservatism generally accepts the political institutions of liberal democracy, but it denounces the dangers that come from the decline of traditions and from the modern emancipation of individuals. The study of the diverse traditions of conservatism must start with the explanation of its complex nature as philosophy and as political attitude; it requires a historical study of the growth of conservatism from the Enlightenment to the birth of modern democracy through the democratic revolutions of Europe and America and, in the end, a philosophical examination of its theoretical foundations. This entry begins with a definition of conservatism as both a philosophy and a political ideology, briefly traces its historical origins and development in British politics, and concludes with a look at contemporary conservative thought.

Conservatism is both a political philosophy, with its concepts, traditions and classical authors, and a political ideology, which is one of the main currents of political life in modern democratic politics. As a philosophy, it is founded on a critique of modern liberalism, which, as Philippe Bénéton has shown, is directed against what conservatism regards as three great illusions that are the consequences of individual liberalism. The first of these illusions is epistemological and comes from one of the main tendencies of modern philosophy, originating with René Descartes and the age of Enlightenment: It consists in identifying individual reason as the judge of truth. The second one, more directly political, makes individual reason the only foundation of political legitimacy. The third could be named "sociological" and leads to the notion of society as a mere aggregate of individuals, to the detriment of community and/or of social hierarchy. To these illusions, conservatism objects that the individual is never really independent, that all his or her accomplishments have some underlying communitarian or traditional condition that escapes individual reason, and that the neglect of such a debt is a danger for the community and finally even for the individual.

Conservatism is not only a philosophy but also a political attitude that interacts with other currents in political life. To understand its nature, we can start with the usual tripartition that makes conservatism one of the three basic political currents, together with liberalism and socialism: Liberalism is the center of gravity of modern democratic politics but, as it cannot satisfy all the expectations that arise in an open society, it engenders permanent criticisms that can be "socialist," if they argue for a new reconstruction of society, or "conservative," if they try to maintain or restore something of the "world we have lost." In both definitions, conservatism appears not only as an expression of permanent dispositions of human nature but also as a paradoxical product of modernity, which is dependent on what it contests, namely, the faith in individual reason as the foundation of authority, and the philosophical and political order, and which can be defined by three essential features:

1. Conservatism is a *modern criticism of modernity*, which criticizes or even condemns some principles of modernity but does not reject all the consequences of liberal modernity.
2. Even if conservatism was strengthened by its opposition to the French Revolution, its main themes were born before it, within liberal politics, as an internal criticism of classical liberalism.
3. The most central idea of conservative thought is that of the risk of self-destruction of liberal traditions and institutions, which is supposed to be the consequence of a violent rupture with the past and/or with the "natural" basis of human societies. The diverse varieties of conservatism differ in their interpretations of this common idea.

Thus, comprehension of conservatism requires a historical examination of the growth of conservative politics between the 17th and 19th centuries and then a philosophical examination of the diverse expressions of the conservative arguments.

The British Sources of Conservatism

The distinction between liberals and conservatives emerged within English politics, with the opposition between the Tory and Whig Parties, and it took on a new significance with the French Revolution.

Whig and *Tory* are two English words that refer to the two great tendencies—respectively, liberal and conservative—of British politics before the rise of the Labour Party. A Whig is not only a liberal but also a conscious heir of the constitutional English tradition, that of rule of law and parliamentary government; a Tory is devoted to a certain type of social relations, in which the authority of "gentlemen" goes with a protective function and which is connected with High Church Anglicanism. Before 1688, the appellation "Tory" designated the supporters of James II (who the "Whigs" mistrusted because of his alleged "papism" and his commitment to a French-style "absolutist" monarchy), but after the Glorious Revolution the signification of the opposition changed. Most Tories abandoned the absolutist doctrine and partially accepted the Whig interpretation of the English regime as a limited monarchy, but they remained faithful to the institution of prerogative, which authorizes the king to make exceptions to the law of parliament in some special cases, and, more generally, they were devoted to everything that, in the English regime, was favorable to traditional hierarchies. The Tory Party was marginal during the long period of Whig supremacy, which begins with the accession of George I to the throne (1714), but the opposition Whig and Tory became relevant again at the end of 18th century. The Tory Party found a new vigor with William Pitt the Younger, who founded a new alliance between gentry and the commercial elite, while the New Whigs became more democratic thanks to the leadership of James Fox. The French Revolution showed the significance of this evolution; it caused the rupture between James Fox and Edmund Burke who, although a Whig, denounced the French experience as a radical subversion of a tradition that English and even American Revolutions had respected. Whiggism and, more generally, liberalism divided into two tendencies, "radical" and "conservative," which never disappeared afterward.

Has English conservatism experienced a general significance beyond this historical context? One may think so, if one leans on the interpretation of English politics that David Hume gave and on a reflection on the philosophical implications Edmund Burke's criticism of the French Revolution.

David Hume (1711–1776) was certainly a "liberal" with some "conservative" elements in his doctrine, but he was neither a Whig nor a Tory, because he interpreted the English constitution in a sense that explains the permanent division of English politics between successive pairs of parties (first Tory/Whig, then Court/Country). According to Hume, the English regime is both republican, because liberty is expressed through the institution of Parliament, and monarchic, because of the executive power of the king. So the "parties of Great Britain" are for him the expressions of the dual nature of the constitution. In political philosophy, this opposition gave birth to two conflicting doctrines. The Whigs consider that all legitimate government must be founded on explicit consent ("original contract"); the Tories offer an extremist interpretation of loyalism and argue for the idea of "passive obedience" to legal authorities (especially to the king). Hume refuses both principles: "Original contract" cannot explain the real nature of political obligation, and "passive obedience" is incompatible with the real interest of society. Nevertheless, he considers that these two conflicting principles have some kind of truth in the English context, as expressions of the two elements of the constitution of Great Britain, and he shows how some strong "conservative" feeling can be a functional feature of a free government. But, even if he is not himself a "Tory," Hume provides a political philosophy that is "conservative" in another sense. Hume's doctrine of politics accepts the *effects* of revolution without assuming its *principles* because he refuses the illusion of a rational, deliberate reconstruction of political order; he argues for a sort of synthesis between "liberalism" and "conservatism," according to which the durable foundation of liberty requires the stability of institutions and a historical continuity that makes possible a translation of political innovations into the language of tradition. Beyond the Tory pastoral, another kind of conservatism is possible, philosophically skeptical and open to political innovation, intended as a paradoxical mean of conservation of social order (the well-known sentence of novelist Giuseppe di Lampedusa's hero in *The Leopard*—"Everything must change so that everything can stay the same"—could just as well be from Hume).

The French Revolution was seen as the critical turning point in the history of liberalism, which produced a division between two wings: the radical or democratic and the conservative. The most important author is Edmund Burke, who was the first great critic of the French Revolution, as early as 1790, with his major book *Reflections on the Revolution in France*. Burke was himself a genuine Whig, who had supported every great liberal cause, from the fight against political corruption to religious freedom, and who had even accepted American Independence; so his opposition to the French Revolution was especially significant as an expression of the divisions of liberal opinion.

According to Burke, there is an essential difference between the French Revolution of 1789 and the Glorious Revolution of 1688 or even the American Revolution. In one case, people make an exception to the constitutional rule in order to save a regime at risk (the Glorious Revolution of 1688) or to resist tyranny (the American Revolution of 1776); in the other one, a rule is made of the exception itself, by the affirmation that political liberty and the capacity to change the rulers are human rights. For that reason, the French theory of *droits de l'homme* (human rights) represents an aggression against the European political order and a rupture of tradition. On this foundation, Burke builds a coherent conservative doctrine, the influence of which is very large. The basic idea is that of the fragility of human nature, which implies that freedom cannot be natural but emerges only as a product of history and chance, much more than of deliberate action (such is the meaning of the well-known opposition between "rights of man" and "rights of English people"). For this reason, the first condition of liberty is historical continuity, and it explains the ambivalence of the Enlightenment: If, as in England, modernity respects tradition, its effects can be beneficent, but when modern reason revolts against the Christian and aristocratic sources of liberty, it becomes destructive. Thus, the English regime is an example of moderate liberty, in which open aristocracy associates itself with new elites thanks to a transaction between "landed interest" and "monied interest," whereas France is the theater of a mortal conflict between noblesse and bourgeoisie, which produces the insurrection of the mob. This philosophy implies a sound criticism of modern individualism, which constitutes the central argument of Burke in favor of "prejudices" and tradition, which are more rational than individual reason. Burke reasserts many liberal views, most of which come from English and Scottish traditions, but he reinterprets them in a new sense: The market is a way not only of cooperation but also of subordination; the social contract is not equalitarian but is founded on the alliance between God and His creatures. So this theory, which, in Burke's works, remains liberal and, in some way, faithful to moderate Enlightenment, is also one of the main sources of illiberal doctrines, as those of the French Counter-Revolution or German Political Romanticism.

If the legacy of classical conservatism ("Tory," "Humean," or "Burkean") is rich and even imposing in the English-speaking world, it is commonly seen as less impressive in continental Europe and especially in Germany and in France (even if politicians like Guizot and Bismarck or de Gaulle and Adenauer can be considered as great conservative statesmen). In this part of the world, as political liberty comes principally from the French Revolution, liberalism is not traditional, and the criticism of liberal and/or radical politics is often more *reactionary* than *conservative.*

Main Currents of Conservative Thought

To identify the main themes of conservative thought, one can either use a historical investigation (which presupposes some hypothesis about the nature of conservatism) or try to give a general analysis that follows from a view of the uses and functions of conservatism in political life.

The first way can be exemplified by Russell Kirk's *The Conservative Mind*, which is itself a classical work of conservative philosophy. Kirk presented himself as the American champion of a forgotten tradition, who tried to make Americans conscious of the conservative elements of their own culture. He goes back to the origins of American tradition and tries to resuscitate the classical or traditional dimension of the American regime, which he interprets as a mixed constitution, including, thanks to John Adams, some aristocratic features not reducible to the democratic spirit of Jefferson. Referring to diverse American and English thinkers, Kirk proposes a kind of ideal type of conservatism, which combines features such as the belief in a transcendent order, affection for the "variety and mystery" of human existence, acceptance of social hierarchy, and devotion to custom and tradition as conditions of legitimate innovations. Invoking sometimes tradition, sometimes divine revelation or natural law, Kirk is a religious (Christian) and traditionalist thinker whose philosophy conveys a kind of American Toryism.

One can find a good example of a structural analysis of conservatism in Albert O. Hirschman's *The Rhetoric of Reaction: Perversity, Futility, Jeopardy*, which describes the general features of conservative rhetoric when confronted by various examples of liberal or radical arguments or action. Conservatism (which could be called here a "reaction") is supposed to underlie the typical arguments that can be opposed to any attempts to transform or ameliorate the social order. One can say the projected action is dangerous, because it can produce unintended and bad or "perverse" effects (the argument of "perversity"). One can insist on the uselessness of reforms or revolutions, which never can change the human condition or the basic social relations ("futility"). One can, finally, assert that attractive innovations are dangerous for social goods ("jeopardy" vs., for example, the criticism of the welfare state as a danger for civil and political liberty).

Both theories present some interest as descriptions of the conservative spirit or attitude, but to some observers, neither of them seems really sufficient. One possible weakness of Kirk's account is a lack of emphasis on certain themes that are independent of religious faith: Many "conservative" authors, notably in what Robert Nisbet calls the "sociological tradition," were in fact nonbelievers or even atheists, whose criticism of modernity is not founded on nostalgia for the age of faith or on the idea of natural law. As for Hirschman, his model can be applied to any argumentation against deliberate action: the so-called reactionary rhetoric can be used by liberals or progressives (if they want to prevent some "reactionary" decision) and, on the contrary, conservatives can abandon and even reject it when they try to convince people to act with courage or to accept some risks for the public good. There are probably several sorts of conservatism, insofar as the criticism of modernity can be made from different points of view. Perhaps the definition of conservatism must be essentially negative, starting with what conservatives *refuse* rather than with what they *desire*. If one accepts the hypothesis with which this entry starts (conservatism is a basically a modern criticism of modernity), one can say that the main theme of conservatism lies in the refusal of two liberal and progressive ideas: that of the self-sufficiency of the individual and that of a possible social solution to the permanent problems of humanity. This refusal is evidently central in the thinkers that Kirk admires, but it is no less important in other traditions that are not committed to the nostalgia for religious tradition. In fact, besides lovers of transcendence, we find among conservatives many sober (and sometimes even cynical) critics of any sort of idealism. This is notably the case, in the sociological tradition, of the so-called Machiavellians, who contributed notably to the growth and vitality of conservative thought.

One of the most interesting contributions of social science to conservative thought can be found in Vilfredo Pareto's *Treatise on General Sociology*, which is at the same time very critical of humanitarian values and almost skeptical toward traditional ideas. The basic thesis of the *Treatise* is that of the eternity of the division of society between the elite and "the people": It comes from Machiavelli but without any of the democratic connotations that one can find in the Florentine philosopher. For Pareto, society is always divided between the mass of individuals and the ruling, honored (and generally propertied) minority, whose definition is itself value neutral. The elites are not necessarily virtuous or even beneficent: They include all the persons or groups that are in some way above the average. Concerning the *ruling* elite, it is defined by some capacity for domination, either by strength or by cunning (see Machiavelli's division of rulers into "lions" and "foxes"). So this "sociology" is supposed to refute the democratic and socialist idea of an egalitarian society, and it implies some "conservative" or "reactionary" argument in the sense of Hirschman's theory: If division of society is eternal, social change is an illusion, and revolutions are, at best, futile. Besides, Pareto gives not only an *argument* against some specific action but also a general theory, which includes a pessimistic view of human capacity to rationalize society. However, this theory is not "conservative" in Kirk's sense of the word; the social order has no transcendent basis or value, and the first aim of the ruling class is not to promote the social good but to make its domination legitimate. So we can consider Pareto's theory as an example of a conservative theory that abandons the arguments favoring tradition and legitimates the ruling elites without accepting their opinions or arguments.

From this point of view, the most important elements of Pareto's theory are probably, on the one hand, the idea of the circulation of elites and, on the other hand, the division of motives of actions between *residues* and *derivations*. The theory of circulation of elites derives from the elite–mass division: If that division is eternal, all that happens can be only a replacement of an old, exhausted elite by a new and vigorous one. But it implies also some political teachings for the ruling class. If it wants to keep its position, the elite must not submit to humanitarian illusion of egalitarian relations with the ruled, but it must also be open to some elements from the ruled, both to *attenuate* the conflict with other classes and to *regenerate* itself thanks to the incorporation of talented people. So, even if it includes some emphatic exaltation of the elite, the Paretian ideal of a ruling class is close to the moderate English idea of open aristocracy. The distinction between residues and derivations gives a sociological equivalent of a theory of human nature. For Pareto, the main problem of sociology is to explain what he calls "nonlogical" actions—that is, actions in which the means are not adapted to the ends, even if the actor believes that they are. People give many arguments for such actions, but, in fact, experience shows that these justifications are less important than the basic feeling, or instinct, that underlies human actions. So one can distinguish between two classes of motives, *a* and *b*. The first class—*a*, that of residues—includes constant and permanent motives of action; the second one—*b*, that of derivations—comes from the "work accomplished by mind in order to explain *a*" and is much more variable because it comes from "fancy" (*Treatise*, sec. 850–851). Pareto enumerates six classes of residues, among which the two first ones have the greatest importance and pertinence for political analysis. The first class is the "instinct of combinations," which underlies invention and innovation and which is the basis of progress or civilization. The second class is "persistence of aggregates," which explains the fondness for past combinations and the mistrust of innovations. Each of them corresponds to distinct types of human beings and the predominance of one class of residues in a society explains much of its culture and of its political trends. "Conservatism" in the vulgar sense evidently has a strong affinity with "persistence of aggregates," but, for Pareto, the conservation of society (and of an elite) requires an association between the two classes of residues. On one side, we have ancient Athens, or modern France, in which "instinct of combination" predominates: These societies are brilliant but unstable. On the other side, one finds Sparta, or 19th-century Prussia, in which "persistence of aggregates" is very important: They can seem stronger, but they lack the capacity of adaptation to change. The middle between these extremes could be ancient Rome or modern England, in which the combination of the two classes is such that innovation does not jeopardize the conservation of society or of political combination. So, the general theory of human motives (or of human nature) confirms the teaching of the analysis of social stratification: The best way for the elite is to accept change and circulation without adoring them and this "dynamic" conservatism is founded on a secular vision without any faith in Natural Law or in religion.

Pareto has many descendants in social science who could be defined as realists and modern conservatives. The most prominent of them is probably Joseph Schumpeter, whose theory of capitalism and of democracy is a touchstone of conservative sociology. In his political theory, Schumpeter shows that democracy is not really the government of the people by the people and for the people but is simply the free competition of elites for power, with the people as arbiter. However, he admits implicitly that people count, since he considers that democracy can undermine capitalism and even engender "socialism." His vision of capitalism includes a major topic of conservatism. Capitalism is defined by its capacity for innovation, but this strength is at the same time its weakness: The danger is that capitalism could itself destroy the cultural conditions of its development.

So conservatism includes a traditionalist criticism of modernization but is not reducible to that. If it has its roots in disillusionment with the effects of modern liberalism, it is possible to designate as "conservative" some other premodern doctrines, when they are founded on a similar skeptical reaction to social change. Inversely, one can consider that conservatism is always difficult in modern democracies, where innovation is generally more appreciated than stability. One example of this difficulty could be the so-called American neoconservatives, who advocated the use of radical means to attain conservative ends.

Conservative Parties

Parties are organizations that seek to mobilize public support in order to compete for political power. In principle, attempts at support mobilization can be, and not infrequently are, based on appeals other than those rooted in political views (e.g., the promise of patronage benefits). However, where the publics to be mobilized are very large (as in most liberal-democratic regimes), parties cannot avoid having to compete by espousing alternative sets of public policies—in their turn linked to, and informed by, contrasting political principles or ideologies. At their simplest, then, conservative parties can be defined as organizations bringing together people committed to the quest for power in order to advance an agenda of conservatism—which may in turn be defined as a set of political principles arising from and expressing a commitment to the status quo or the status quo ante. Yet on this definition alone, even parties that most political scientists would *not* see as belonging to the category—for example, the Soviet Communist Party after 1917—would qualify. So there is also a historical criterion that must be fulfilled, since the parties that have tended to attract the label are ones that first emerged in some parts of the world about 200 years ago to counter the demands of liberals—here meaning 18th- and 19th-century Europeans committed to four essential tenets: (1) a belief in the ontological priority of individuals as against society and (2) an unlimited potential for human improvement through the application of reason, therefore (3) a normative commitment to individual freedom and the view that (4) government is legitimate only insofar as it rests on the consent of the governed. Conservatives especially opposed, among the political positions stemming from these tenets, those according to which there was neither inherent value in tradition nor any role for hereditary or religious criteria in political institutions or decision making. This entry reviews conservative political principles in more detail, looking at how they have evolved over time. It also considers how the parties espousing them have been organized, who has supported them and how they have performed electorally, and the role they have played in the party systems that they have been part of.

Political Principles

Conservative parties have, generally, been reluctant to call themselves such, preferring more inclusive titles such as "People's Party" and sometimes even eschewing "party" as well. The reason is that "party" and "conservatism" implied that they sought to make a case for a specific point of view or interest, whereas they saw themselves as defending a way of life, society being viewed as an organic whole—and from their point of view, this was not something they ought to have been obliged to argue over in the first place. From this outlook stemmed their professions of antipathy to "ideology"—the product of reason—with its capacity to disarticulate a body politic whose parts were integrated, not by design but thanks to the accumulated wisdom of the ages. This did not mean that the conservative position was one of opposition to change of whatever kind: On the contrary, societies, like organisms, had to adjust to new circumstances if they were to survive. But it meant that change was to be adaptive, not revolutionary.

The role of change in the conservative outlook has meant that over the years its agendas and programs have—paradoxically—altered much more radically than have liberal and socialist agendas and programs with their greater attachment to abiding principles. Of the changes and trends that required this alteration, the two most significant following the conservative parties' emergence were the spread of industrialism and extension of the franchise. The first brought about, in many instances, a gradual reconciliation and integration of the interests of the landed elite with those of the rising bourgeoisie—the successful pursuit of whose activities required priority to be given to the quintessentially liberal principles of due process, the rule of law, and meritocracy. In such instances, the principles became conservative ones as well. The second trend threatened to render conservatism unappealing on account of its traditional opposition to democracy—but also offered the means to its survival. Conservatives' defense of the established order had always entailed a paternalistic sensitivity to the legitimate concerns of ordinary people and the poor. The mass franchise now enabled and required a renewed emphasis on this social reform aspect of the conservative agenda.

A third significant trend was the growth of nationalism. Originally popular and democratic, it was not therefore a distinctively conservative principle. However, as it increasingly became an accomplished fact—through the unification of Italy and Germany and similar events—it offered a means of countering the most significant threat posed by the advent of the mass franchise: the growth of socialist parties and ideologies of international workers' solidarity.

The final major adjustment in conservative thinking took place in the period after World War II. Initially, the collapse of fascism had brought a "technocratic" kind of conservatism. A social-democratic hegemony based around the principles of the welfare state and Keynesian demand management had gone hand in hand with the growth of so-called catchall parties seeking votes wherever they could find them and bending principles and ideology to that end. Under these circumstances, conservatives found the distinctiveness of their outlook increasingly difficult to convey, seeming to many to stand for little more than a claim to be able to manage politics more competently than their rivals. Later, the increasing difficulties encountered by social-democratic politics in the economic sphere, coupled with the growth in the social sphere of new movements pressing the demands of environmentalists, peace activists, feminists, gays, and ethnic minorities, provided conservatives with a renewed opportunity to press a distinctive agenda. This gave the pride of place not only to the old liberal principles of free markets and the minimal state but also, in opposition to the left libertarianism of the new social movements, to the strong state: a state that would enforce free markets through firmness in welfare and trade union matters and robustly defend laws embodying traditional social values.

Organization

In most cases, conservative parties originated as informal groups within predemocratic legislatures, only later, with extensions of the franchise, developing formally organized extraparliamentary structures covering the national territory. Even then, in many instances, the degree of formality of these structures for long remained incomplete and the real power acquired by them limited. The British Conservative Party, for example, did not have individual members before the 20th century, and until the 1970s, its local associations not infrequently refrained from fielding candidates in municipal and county council elections: giving, in such instances, a free run to "Independents," who were Conservatives at the national level. This was a convenient way of ensuring that local influence remained in the hands of preexisting Conservative elites and did not need to be shared with less privileged groups in the party. Nowadays, there is little that is especially distinctive about conservative parties from an organizational point of view. They differ between themselves depending on the mix of resources—money, activists, charismatic leadership, and so on—available to enable them to compete. Like parties generally, their penetration of society has declined in the postwar period, with internal distributions of power increasingly consolidated in the hands of elected officials, progressively more important, with the spread of the media, for mobilizing a mass electorate.

Social Base and Electoral Performance

Generally speaking, the likelihood of voting for a conservative party increases with religious observance and the belief that religion is important, with high socioeconomic status, with age, and with a view of oneself as being located on the right of the left–right spectrum. However, generalizing about the *precise* impact of variables such as these is impossible for two sets of reasons, the first being the influence of context in mediating their impact. For example, if in Britain the Conservatives have traditionally attracted very high levels of support among farmers, the same cannot be said of Conservatives in places such as Norway and Sweden, whose party systems, from the 1920s onward, included influential agrarian parties. Second, there is the problem of the choice of parties to include. Frequently in comparative analyses, conservative parties have been grouped together with other parties of the moderate right, such as Christian democratic parties with which they have sometimes shared important features, for example, size and significance in the party system, ideological flexibility, and the conviction that, in standing for the interests of the entire nation, theirs is more than a political point of view on a par with the rest. The choice makes a significant difference. Comparing the British Conservative Party with the pre-1990s Italian Christian Democrats, for example, would reveal not similarities but enormous differences, both quantitative and qualitative, in the impact of religious observance and left–right self-placement on propensities to vote.

In few other places in the postwar period have conservatives matched the electoral success of the British Conservative Party. Again, much depends on the choice of specific parties to include, with particular controversy surrounding the status of the U.S. Republicans and Ireland's Fianna Fáil, but if we include only the uncontroversial cases, then the British Conservatives' only real rival in Western Europe is Greece's New Democracy (which has averaged 43.9% of the vote in parliamentary elections since 1974 as compared with 37.8% for the Conservatives). Elsewhere in Western Europe, the best average performance has been by Luxembourg's Christian Social People's Party (with an average of 32.3% since 1974). In some countries, conservative parties are essentially nonexistent: the contrast with countries where they are strong being due to differences of party-system context inherited from the past.

Role in Party Systems

In Britain, the arrival of democratic politics enabled the conservatives to consolidate a position as one of two large parties by virtue of the relative insignificance of three of the major social cleavages—that is, center–periphery, state–church, land–industry—which elsewhere spawned more complex party systems; and by virtue of the fact that extensions of the franchise had begun early and taken place over a long period of time, enabling the party to adapt successfully to the emergence of the fourth major cleavage, that between owners and workers.

In other major European countries—Germany and Italy—the party systems supporting the reemergence of democratic politics after World War II could find no place for conservative parties because of the experience of Nazism and fascism: This made it impossible for anyone to espouse important conservative themes such as nation, tradition, order, and hierarchy without arousing painful memories and the suspicion that they harbored extreme right-wing sympathies. Consequently, in these countries the role of principal party of the center-right came to be played by a Christian democratic party.

In France, conservatism, though present, was able to make less headway than in Britain, for the country's deep divisions—between church and state; between monarchists, parliamentarians, and

Bonapartists; between land and industry; and between owners and workers—gave it a highly fragmented party system within which conservatives had many significant rivals. Meanwhile, the localism of party politics and the two-ballot system inhibited the development of cohesive national parties—and, thus, the emergence of conservatism as a unified force. Though the constitutional overhaul that ushered in the Fifth Republic in 1958 brought an initial decline in polarization, a degree of party–system fluidity continued, and today at least two significantly sized entities—the Union for French Democracy and the Union for a Popular Movement—themselves coalitions, can claim to provide a home to conservatives.

At the European level, the main transnational party organization embracing conservative parties is the European People's Party. This also encompasses Christian Democratic parties and the internal life of the organization is not without tensions between pro-European (mainly Christian Democratic) and Eurosceptic (mainly British Conservative) members.

Constitutional Engineering

Constitutional engineering refers, generally, to the process by which political actors devise higher law, which is usually—but not always—specified in a formal written document and labeled the "constitution." Constitutional design is a close synonym. Any particular instance of constitutional engineering must deal with certain basic questions of organization and process. These include designating who is to be involved, when that involvement takes place, and how the actors are to proceed in formulating, discussing, and approving a text. Although there are conceivably as many variants in the process as there are constitutions, several common patterns emerge. This entry describes the factors that distinguish instances of constitutional engineering and some of the typical patterns.

Stages

Constitution making occurs in discernible stages, some of which resemble an ordinary legislative process familiar to many drafters in consolidated democracies. A schematic design of these phases might include, in sequential order, the mobilization of interests (and counterinterests), drafting, consultation, deliberation, adoption, and ratification. These different stages interact with the possible actors who might fill the roles to create a matrix of options for designers. Afghanistan's constitution of 2004, for example, was drafted in relative secrecy by a commission with foreign advice and then sent to the president's office before deliberation and adoption at an inclusive constituent assembly, the Loya Jirga. In this model—which appears to be relatively common—each stage is potentially consequential, although it is likely that inertial forces and the power of agenda setting will apportion disproportionate influence to actors involved at earlier stages. Still, it is quite possible that early-stage actors will anticipate the preferences and needs of later stage actors, thus mitigating any sequence effects. Jon Elster has introduced the vivid distinction between upstream and downstream constraints in the process: Upstream constraints are imposed by the powers setting up the constitution-drafting body, whereas downstream constraints result from the anticipation of preferences of those involved in later stages. Ratification by public referendum, for example, is a downstream constraint that can hamstring leaders in an earlier stage who recognize that their document must ultimately obtain public approval.

Actors

Perhaps the most critical variable in constitution making has to do with which actors are included in the process. Actors involved in constitution making can include expert commissions, legislative bodies or committees, the executive, the judiciary, national conferences, elite roundtables, transitional legislatures, specially elected constituent assemblies, interest groups and nongovernmental organizations, foreign advisors, and the public itself. Public involvement has become the subject of particular attention in recent years and is urged by scholars, governments, and international organizations. But not all constitutions involve the public, and some are drafted by a handful of leaders behind closed doors.

Certainly, a central dimension on which constitution-making processes differ is the degree of public participation. Because the constitution is the highest level of lawmaking and provides the ultimate rule of recognition for lawmaking processes, it arguably requires the greatest possible level of legitimation in democratic theory. In an ideal world, one might desire universal consent over the rules of society, a standard that is obviously impractical. Higher levels of participation are presumed to function like supermajority rules, restricting the adoption of undesirable institutions and protecting prospective minorities in the democratic processes that are established. Participation thus legitimates and constrains, substituting inclusive processes for consent to make effective government possible.

The modal form of participation in constitutional design is the power to approve the charter, usually by referendum on the final document as a whole. Available data suggest a significant trend, beginning in the early 20th century, toward public ratification. Approval by referendum may be an increasingly popular mode of public involvement, but it is clearly a limited one in that it involves only an up or down vote over a package of provisions. Since at least World War II, however, participation in constitutional design has become more direct and has penetrated more deeply (or at least earlier) in the process. One common approach is to involve the public in selecting those who will draft or deliberate over aspects of the charter. This sort of voice is possible whether the representative group is a constituent assembly elected expressly for the purpose or is a regular legislature that takes on the project in addition to other duties. Some constitutional processes have experimented with more bottom-up methods of direct democracy, such as the citizen initiative, in which ideas can bubble up from civil society.

Still another mode of participation involves direct consultation with the public or representative groups at various stages, which might occur before, during, or after the drafting of the initial text. The drafting phase seems to be especially crucial because we can expect a fair degree of inertia in the later stages of the process. But the phase is also likely to be the least participatory, given the challenges of writing-by-committee, much less writing-by-nation. Indeed, in some well-known cases, the public is excluded from the drafting process and not consulted at all.

Of course, actors and their accompanying constraints may come from outside, as well as inside, a state's borders. An extreme case is that of the "occupation constitution," a document drafted when a country is under the control of a foreign military power. Such constitutions are usually presumed to have less involvement on the part of local actors and hence to be less legitimate. Some scholars believe that international involvement creates disincentives to enforce the constitution locally, as actors will strategically acquiesce to conditions they have no intention of fulfilling simply to remove external oversight.

Of course, international constraints on constitution making can range in their intensity and degree of coordination, from borrowing to imposition. External influence need not be as blatant as in occupation constitutions. Constitutional drafting that occurs concurrently with peace negotiations often attracts international advisers and interests, be they donors, creditors, interested states, or the United Nations. The prospect of future membership in the European Union, for example, led some Eastern European countries to make modifications to their draft constitutions at the behest of the Council of Europe. Many accounts of foreign borrowing point to the decisive role of influential consultants who appear to be part of a cottage industry of constitutional advisors.

The voluminous literature on policy diffusion reminds us that any sort of policy or institutional reform will be a highly interdependent process.

Constitution making—often undertaken during moments of crisis when states are at their most amenable to foreign models and suggestions—may be especially interdependent and networked. Certainly, scholars have long noted a high degree of similarity across documents, and nearly anyone privy to the details of a case of constitution making can recount an episode of international borrowing. The persistence of presidentialism in Latin America, the use of French and Westminster models of government in former colonies, and the recent use of national conferences in Francophone Africa are all examples of diffusion that occurs at a subglobal level. Given the persistent centrality of the U.S. Constitution to the American legal academy, there has been a fair amount of interest in documenting its influence over the years, but other constitutional models have also clearly had some impact.

Other Conditions

There are potentially consequential aspects of process other than the identity of the actors involved. Some constraints reflect the circumstances that lead to constitution making in the first place. The conventional wisdom is that constitution making is coincident with a cataclysmic event of some kind, such as war, coup, economic crisis, or revolution. In fact, some evidence suggests that, although crises do frequently precede constitutional reform, the degree of noncrisis constitution making is probably underestimated. Sweden's 1972 reform of its 163-year-old constitution is a prominent example of crisis-free reform. The various socialist constitutions, such as those in the Soviet Union (1936, 1977) and China (1982), seem to follow the installation of new leaders, a practice that was often justified by the Marxist view of evolution in stages. These different patterns, reflecting various degrees of crisis or continuity, will affect the process, creating an atmosphere of either urgency or deliberation.

The process can also vary in terms of time involved. At one extreme, the secretive process that led to Myanmar's 2008 constitution took 17 years. At the other extreme, a small group of American bureaucrats working for the occupation authorities drafted the basic form of Japan's 1946 constitution in a little over a week, and the entire process, including elections, legislative deliberation, and approval by the emperor, took a mere 8 months. Both of these cases are distant outliers. On average, constitution making takes around 16 months. Anecdotally, constitution-making processes involving either a very short or very long amount of time seem to occur in nondemocracies. Speedy processes do not allow sufficient time for mobilization of the public and civil society, whereas extended processes are unlikely to hold public attention for the duration.

Another dimension on which processes differ is the size of the deliberative body, an issue that has also plagued those who design legislatures. The concern is that large bodies—which have the advantages of minimizing deal making and assuring representativeness—can be unwieldy and lead to collective action problems.

Constitutions and their design have long been central to the work of political scientists since at least Aristotle. For whatever reason, however, the scientific study of the rules that govern the process of constitutional engineering has lagged. This state of affairs is regrettable but, happily, quite remediable. Processes of constitutional design and adoption vary widely along a number of identifiable dimensions. Speculation about the effects of these differences runs rampant and evidence will undoubtedly be close behind.

CONSTITUTIONALISM

Constitutionalism is sometimes regarded as a synonym for limited government. On some accounts, this doctrine is associated in turn with minimal or less government. But that is only one interpretation and by no means the most prominent historically. A more representative general definition would be that constitutionalism seeks to prevent arbitrary government. At its most generic level, arbitrariness consists in the capacity of rulers to govern willfully—that is, with complete discretion—and to serve their own interests rather than those of the ruled. Constitutionalism attempts to avoid these dangers by designing mechanisms that determine who can rule, how, and for what purposes. However, constitutional traditions differ as to what precisely counts as an arbitrary act and which mechanisms offer the best defense against their occurring. The classical, neo-republican tradition of political constitutionalism identifies arbitrariness with domination of the ruled by their rulers and seeks to avoid it by establishing a condition of political equality characterized by a balance of power between all the relevant groups and parties within a polity, so that no one can rule without consulting the interests of the ruled. The more modern, liberal tradition identifies arbitrariness with interference with individual rights and seeks to establish protections for them via the separation of powers and a judicially protected constitution.

Both traditions are present within most democracies and can be found side by side in many constitutions. The first tradition focuses on the design and functioning of the democratic process, including the selection of electoral systems and the choice between presidential or parliamentary forms of government, of unitary or federal arrangements, and of unicameralism or bicameralism. Although the detailing of these procedural mechanisms and the relations between them usually forms the bulk of most constitutional documents, their constitutional importance has come to be eclipsed—in legal circles particularly—by the second tradition. This view emphasizes the specification and judicial protection of the different competences of the political system and of constitutionally entrenched rights by a constitutional court. Political theorists and scientists disagree, however, on whether these two traditions are complementary, mutually entailed, or incompatible. The second is often seen as necessary to ensure the fairness of the procedures and/or the outcomes of the first. Yet it lays itself open in turn to doubts that courts are, or could ever be, truly bound by constitutions so that law rather than judges rule and if so whether judicial processes are not more arbitrary and prone to error for deciding constitutional outcomes than the democratic procedures and outcomes they are often thought legitimately to limit. In the following sections, this entry traces these two traditions and then turns to exploring their respective advantages and disadvantages and any tensions and complementarities that exist between them.

Two Traditions of Constitutionalism

Political Constitutionalism: From Mixed Government to Representative Democracy

The theory of mixed government originated with ancient thought and the classification of political systems on the basis of whether one, a few, or many ruled. According to this theory, the three basic types of polity—monarchy, aristocracy, and democracy—were liable to degenerate into tyranny, oligarchy, and anarchy, respectively. This corruption stemmed from the concentration of power in the hands of a single person or group, which created a temptation to its abuse through allowing arbitrary rule. The solution was to ensure moderation and proportion by combining or mixing various types. As a result, the virtues of each form of government, namely, a strong executive, the involvement of the better elements of society, and popular legitimacy, could be obtained without the corresponding vices.

Three elements underlie this classic theory of mixed government. First, arbitrary power was defined as the capacity of one individual or group to dominate another—that is, to possess the ability to rule them without consulting their interests. To be dominated in such an arbitrary way was to be reduced to the condition of a slave who must act as his or her master wills. Overcoming arbitrariness so conceived requires that a condition of political equality exist among all free citizens. Only then will no one person or group be able to think or act as the masters of others. Second, the means to minimize such domination was to ensure none could rule without the support of at least one other individual or body. The aim was to so mix social classes and factions in decision making to ensure that their interests were given equal consideration, with each being forced to "hear the other side." To quote another republican motto, "The price of liberty is eternal vigilance," with each group watching over the others to ensure none dominated them by ignoring their concerns. Third, the balance to be achieved was one that aspired to harmonize different social interests and maintain the stability of the polity, preventing so far as was possible the inevitable degeneration into one of the corrupt forms of government.

Thus, mixed government provides a model of constitutionalism according to the institutions that structure the way decisions are taken. Although elements of the theory can be found in Aristotle's *Politics*, the locus classicus is Book VI of Polybius's *Histories*. He underlined its prime purpose as providing mechanisms whereby no individual, body, or group could rule alone, thereby curbing the descent into tyranny, oligarchy, or anarchy. Polybius regarded the republican constitution of ancient Rome as exemplifying this theory. Thus, the consuls provided the monarchical element, the Senate provided the aristocratic, while the popular element was represented by the Tribunes of the People, the Plebeian Council, and the electoral, judicial, and legislative powers the people could exercise directly. As he noted, the key feature of Roman republican government was that each of these three groups exercised slightly different powers but required the cooperation of the others to do so. So consuls might exercise war powers, yet they needed the Senate to approve generals, reward them, and provide the necessary funds, while the people approved treaties and could try high officials and generals for misconduct. Meanwhile, the more-executive roles possessing the most discretion were further weakened by their power being shared among multiple officeholders and its being dependent on elections and of short duration. Thus, there were two consuls, each able to veto the other's decisions, 10 tribunes with similar countervailing powers, and so on, with none able to hold office for more than a year.

The resulting need for different groups to work together was summarized in the slogan *Senatus Populusque Romanus* (The Senate and the Roman People, frequently abbreviated to SPQR). In reality, though, their relationship was far from harmonious, with the patrician element largely predominating, except when factional disputes led a given group among them to seek the support of the plebeians. The conflict between social classes was given greater emphasis by Machiavelli, who offered a radical version of the Polybian argument in his *Discorsi*. He observed how all polities contain two classes, the nobles (*grandi*) and the people (*popolo*), whose desires conflict. However, he claimed that their discord, far from being destructive, actively promoted "all the laws made in favour of liberty"—each was led to promote freedom by virtue of seeking ways of checking the arbitrary power of the other. However, like Polybius, Machiavelli believed that all systems ultimately became corrupt and degenerated into either tyranny or anarchy—the balance of power merely served to stave off this inevitable cycle.

The 17th and 18th centuries brought three main changes to the doctrine. The first, explored below, was the development of the separation of powers as a variation on the doctrine of mixed government. The theory of mixed government involves no clear distinction between the different branches of government. Executive, legislative, and especially judicial tasks were shared between the different social classes and exercised by all the government bodies. Indeed, the popular element exercised certain legislative and judicial functions directly through plebiscites and as jurors. The second change was in the type of "balance" mixed government was supposed to achieve. The classic theory took the idea of the "body" politic literally. Just as bodily health was said to rely on a sound physical constitution and a balanced diet and way of life, so the health of the polity depended on a sound constitution that achieved a "natural" balance between the various organs and "humors" of the political body. As we saw, in line with this organic imagery, the aim was to hold off the inevitable degeneration and corruption of the system. Balance was a static equilibrium, designed to maintain the status quo. However, the 17th and 18th centuries saw a new, more dynamic notion of balance, inspired by Newtonian physics and based on mechanics and physical forces. In this conception, balance could involve a harnessing of opposed forces, holding them in a dynamic equilibrium that combined and increased their joint power. The change can be seen in the notion of the "balance of trade," which went from being an equal exchange of goods between states to become a competition between trading nations that encouraged their mutual productivity and innovation. In this account, the "cycle of life," where growth was followed by decay, became replaced by the idea of progress, in which change and transformation had positive connotations.

The third development drew on these two. This was the idea that political balance now consisted in the competition between government and a "loyal" opposition. As parties evolved from simple factions and patronage networks among rivals for office, and became electoral machines defined as much by ideology and social composition as by the personal ambitions and interests of the political class, they became the organs of this new type of balance. In keeping with the older theory of mixed government, one of the virtues of parties was their ability to mix different social classes and interests and combine them around a common program. Indeed, just as economic competition led rival firms to compete over price, innovate, and explore untapped markets, so electoral competition led rival parties to compete over policy efficiency and effectiveness, devise novel forms of delivery, and focus on areas appealing to different sections of the electorate. This modern form of political constitutionalism has proven constitutional in both form and substance. Equal votes, majority rule, and competitive party elections offer a mechanism for impartially and equitably weighing and combining the views of millions of citizens about the nature of the public good. And in making politicians popularly accountable, it gives them an incentive to rule in nonarbitrary ways that respond to the concerns of the different minorities that form any working majority, thereby upholding both rights and the public interest rather than their own interests.

Meanwhile, mixed government has developed in new ways through federal and convocational arrangements that likewise seek to ensure that different kinds of interest are involved in the policy- and lawmaking processes on an equal basis. Yet nobody would deny that the systems of most democracies are far from perfect, and it has become increasingly common to look to other constitutional traditions to rectify these problems.

Legal Constitutionalism: From the Separation of Powers to Rights and Judicial Review

According to Article 16 of the French Declaration of the Rights of Man and of the Citizen of 1789, "A society where rights are not secured or the separation of powers established has no constitution at all." Though widely accepted today, this view was novel at the time, shaped by the experience of the English, American, and French revolutions. The separation of powers developed out of the theory of mixed government during the English civil war of the mid-17th century. In 1642, Charles I belatedly invoked the doctrine of mixed government to defend the joint rule of Monarch, Lords, and Commons as implied by the notion that Parliament meant all three (the doctrine of "King in Parliament" as the sovereign body of the realm). His execution posed the problem of how to control government in a society without distinctions of rank. Dividing the executive, legislative, and judicial functions between three distinct agencies appeared to provide a response to this dilemma. However, it took some time to evolve. Although Book 11, Chapter 6 of Montesquieu's *The Spirit of the Laws* has been credited with offering a definitive statement of the doctrine, his account still bore the hallmarks of its origins in the system of mixed government—not least because of its being based on an analysis of the British parliamentary system and the respective roles of monarch, lords, and commons within it. The functional division also remained far from clear-cut, with the judicial branch and function still imperfectly differentiated from the other two. Only with the drafting of the U.S. Constitution and the debates surrounding it, most notably the *Federalist Papers*, did the doctrine emerge in its mature form.

The underlying rationale of this separation is that individuals or groups should not be "judges in their own cause." The division between the three branches aims to ensure that those who formulate the laws are distinct from those entrusted with their interpretation, application, and enforcement. In this way, lawmakers are subject to the same laws and so have an incentive to avoid self-interested legislation and to frame it in general terms that will be equally applicable to all. These laws then guide the decisions of the executive and judiciary, who because they are similarly under the law also have good reason to act in an impartial manner. Separating functions also brings the efficiency gains associated with the division of labor. In particular, the activity of the legislature is made less cumbersome through delegating more short-term decisions to an executive branch capable of acting with greater coherence and dispatch.

On its own, it is unclear how effective this separation is. Not only are the four functions hard to distinguish clearly, but unless a different group operates each branch, there is nothing to prevent their acting in concert. However, four other theoretical developments accompanied the shift from mixed government to the separation of powers that changed its character. First, mixed government had been challenged earlier by theorists of sovereignty, such as Jean Bodin and Thomas Hobbes, who regarded the idea of dividing power as incoherent. The separation of powers came into being in a context shaped by the notion that at some level power had to be concentrated, and, in the context of the English, American, and French revolutions, the natural assumption was to shift the sovereign power of the monarch to the people as a whole. Second, the notion of the people as a whole was likewise new. Previously, the "people" had simply meant the "commons" or the "many." The whole people became the authors of the constitution, which as the embodiment of their will became sovereign over the will of any subdivision of the people, including the majority. Third, as a corollary, constitutions became entrenched written documents expressing a "higher" law, which could be amended only by the people as a whole or by some supermajority that could plausibly be said to represent their will. Fourth, notions of rights became key aspects of the constitution. Initially rights were no more an intrinsic part of the separation of powers than they had been of mixed government. The Bill of Rights was an appendix to the U.S. Constitution, which had previously been confined to describing the system of government. Nevertheless, the securing of individual rights gradually became the goal of all constitutional arrangements.

These four developments, but particularly the last two, had a tremendous impact on constitutionalism and proved crucial in moving it in a legal and especially a judicial direction. Within the "pure" theory of the separation of powers, all three branches were coequal. As with the theory of mixed government, the aim was to prevent any one section of society dominating another by obliging each to collaborate with the others. If anything, the legislative power was logically prior to the others—producing in the U.S. scheme federal and bicameral arrangements within the legislature that harked back to the doctrine of mixed government and a clear division between the legislature and executive. As noted earlier, the distinctiveness of judicial functions was weak in the doctrine of mixed government and slow to emerge in the theory of the separation of powers. However, making a legal document sovereign—only challengeable by the sovereignty of the people as a whole—inevitably empowered the judiciary, particularly given the comparative length of judicial appointments and their relative isolation from electoral pressures by contrast to the other branches. The judiciary now decided the competences of the various branches of government, including their own, and set limits not only to the processes of government but also to its goals with regard to individual rights. These features have come to define modern constitutionalism and are reflected in all the constitutional arrangements of postwar democracies. Yet they also coexist with forms of political constitutionalism and mixed government. It remains to explore their respective advantages and disadvantages and the tensions between them.

Political and Legal Constitutionalism Compared

An entrenched, rights-based, and justiciable constitution is said to ensure stable and accountable government, obliging legislatures and executives to operate according to the established rules and procedures, and above all prevents their sacrificing individual rights to administrative convenience, popular prejudices, or short-term gains. Given no working constitutional government has not been also a working democracy, few analysts believe constitutions can restrain a genuinely tyrannical government. Rather, the aim is to prevent democratic governments from falling below their self-professed standards of showing all equal concern and respect. So a legal constitution is seen as a corrective to—even a foundation for—a working political constitution. Yet it remains a moot point whether it performs its appointed task any more effectively or legitimately.

Democratic governments are said to be prone to overreacting to emergency situations, sacrificing civil rights to security, and pandering to either electorally important, yet unrepresentative, minorities or the populist sentiments of the majority. Insulated from such pressures, a court can be more impartial while its judgments are bound by constitutional law. However, others contend these supposed advantages turn out to be disadvantageous. Going to law offers an alternative to entering the political realm, yet access is more restricted than voting and the costs of a case as prohibitive to most ordinary citizens as founding a new party. Meanwhile, it allows those with deep pockets to fasten on to a single issue that affects their interests without the necessity of winning others to their point of view. Courts may be restricted to the law in their judgments—but what does that mean? Is the law to be found in the text of the constitution, the original intentions of those who drafted it, the objective meaning of the principles, or the common understandings of the people? Words are open to multiple meanings, so textualism hardly proves binding on judgments, while semantics seems an odd way to decide difficult moral and political issues. The intentions of the drafters are unlikely to be consistent or knowable and may well be inappropriate in contemporary conditions. Being bound by the past favors the status quo and those who are privileged by current arrangements, thereby hindering progressive reform. If the principles behind the constitution are universal and timeless, then it could be applied to any and all situations. Yet legal philosophers—no less than citizens—disagree whether such principles even exist, let alone what they might require in particular cases. Appealing to a popular consensus will not resolve that problem, for it is either unlikely or better provided by a political constitutionalism that consults popular views directly. In all these respects, judicial review risks becoming arbitrary rather than being a block on arbitrariness.
