the *will to will*; power is nothing exterior to will, it is not something the will strives for, as if it did not possess it, but its very essence. Power means the inner necessity of the ever widening self-affirmation of the will. The expression 'Will to Power' makes manifest 'the unconditional essence of the will, that as pure will, wills itself'.¹² It is pure self-positing, detached from every grounding and with no goal other than its own conservation and augmentation. It must will to will, in emptiness – and finally will nothingness rather than not will. Moreover, Will to Power is the principle of the '*calculation of values*': the word calculation is repeated seven times in four pages. Will to Power is the subjectivity that counts only on itself, and that posits the values that can support it, while it reckons the quantity of forces necessary to maintain and increase itself. (3) In the *Holzwege* essay, 'Nietzsche's word "God is Dead"', Heidegger exposes again the ontological meaning of the Will to Power as the Being of beings and the definition of power as the essence of the will that knows and wants itself. But he underlines and develops mainly the theme of the establishment of values, which constitute a *stock of presence* that prefigures the technological stock. As it pretends to grasp Being, to lay hands on it, Heidegger calls the very thinking in terms of values a blasphemy and even a 'murder of Being'.¹³

The boldest and the most convincing of these three definitions is certainly the second, which shows the circular structure of the Will to Power as will that wills itself. This circularity allows the establishment of the parallel with the Hegelian Absolute Knowledge as 'circle of circles': it shows the supposedly total nihilism of the will that constantly comes back to itself and whose power lies in the constant overpowering of its own power over itself. It explains the essential link between Will to Power and Eternal Return; the latter is understood as the ultimate consequence or exigency of this eternally repeated return of the will to itself. This circularity finally anticipates the techno-economical circles of consumerism and the techno-political ones of directivism.

Some aspects of these definitions are highly problematic. *First*, when Heidegger interprets the Will to Power in a phenomenological fashion as transcendence, he seems to want to hide its truly metaphysical dimension. His reading underestimates the physical and metaphysical realism of forces, forgetting his own idea that all metaphysics is basically physics. Heidegger interprets the Nietzschean phrase about '*plus von Macht*' as the simple widening of the horizon open to intentionality; whereas Nietzsche, in his 'Physiology of art' insists that the Will to Power as art depends upon a 'real increase' of strength, the intensification of the powers of the body, a feeling of nervous and muscular quickness, a swiftness and lightness of movements, and so on.¹⁴ *Second*, the reduction of the Will to Power to essence neglects and keeps silent about the

Nietzschean critique of the traditional concepts of essence, substance, subject and identity. For Nietzsche, there is no essence in the Platonic sense of *eidos*, that is in the sense of a constant unity which would precede every multiplicity. There is no substantial essence either within or deriving from the Will to Power. 'The question, "what is it?" amounts to imposing a meaning from a certain point of view. Essence is something perspectivistic that already presupposes a multiplicity.'¹⁵ Will to Power should, in fact, always be said in the plural: the Wills to Power; a plurality which cannot be totalized or substantially unified, of forces engaged in complex and variable relations of struggle, commandment and obedience.

Every centre, every focus of meaning is fictitious, or the momentary expression of a balance of forces which is constantly changing. If this is the case, the metaphysical notions of *Grund* and *subjectum* are shattered and relativized. There is neither a grounding nor an absolute subject in Nietzsche, no *Grund*, but *Abgrund*, chaos. And finally the principle of the *calculation of values*, the key or core of the Heideggerian demonstration (especially as the stock of values prefigures the *Bestand*) raises the difficult question of the meaning of perspectivistic evaluation in Nietzsche. For Heidegger, evaluation only continues the work of reason since Descartes: to measure, to calculate beings, to give account to the subject which is both the stage where everything appears so to speak in court, or stands before the supreme judge. The thought in terms of values would not question the traditional stage of reason and representation: Heidegger calls values 'representing productions' (*Vorstellende Hervorbringungen*). Values are calculated to be adequate to the will ('you will only have the values that suit your degree of strength', says Nietzsche). The rationalism of the calculating Will to Power in art and science would be the prefiguration of the perfect oblivion of Being in the will to will. The perfection of calculation would hide the sombre emptiness and the absence of the goal of power exerted for the sake of power. But, can the Nietzschean idea of value as interpretation be reduced to the concept of rational representation? Nietzsche is clearly struggling with the tradition of reason as accountable to a normative and law-making authority. But when he writes, 'We cannot refuse the world the possibility of yielding to an infinity of interpretations', he states that the Will to Power is an indefinite process of interpretation which never arrives at a final and adequate representation, at a 'seventh day's rest' or 'sabbath of all sabbaths'. He breaks with the principle of reason. For every reason, whether Leibnizian, Hegelian or technological, does not pretend to achieve an infinity of *possible* calculations, but the only calculations which are the truest, that is the most correct, adequate . . . the best. Reason has to exclude the false, whereas interpretation imposes neither the application of the principle of contradiction, nor even that of the principle

of reality. A fictitious interpretation can have immense strength – such is the case with Eternal Return. The phrase ‘calculation of Values’ is metaphysical, and it is made up by Heidegger, as it cannot be found expressed *verbatim* in Nietzsche. Will to Power can never place values in front of itself and compare them objectively. All values are necessary. But because they are answers to constraints, or rather to situations of constraint in which the interpretative forces are themselves caught. An interpretation is not a theory. It is not calculated in the sense that it would constitute a detached representation, a scene. It has the spontaneous, ambiguous, unstable character of the attempt, the essay. Values are transitory. They cannot be seized or secured as can be the objects of science and technology. The models which Nietzsche uses to characterize interpretation (deciphering medical symptoms, or philological readings) simply cannot be applied to the non-ambiguous rationality of Technology.

Eternal Return and the theology of existence

The simplifying identification of the Eternal Return with the traditional category of existence is surprising, especially if we consider the multiple versions that Nietzsche gives of his doctrine. Indeed, Eternal Return apparently does not refer to the given-ness of being in totality, or to the mere fact that it is, but rather in its first formulation in the *Joyful Science* (§341), ‘The heaviest weight’, to the *hypothesis* of an infinite reaffirmation by the singular will of a singular moment, according to a question: ‘Would you want *this* once more and an innumerable number of times?’ This question also supposes a thought suggested by a demon: ‘This life as you live it now, you will have to live it again.’ The *demonic* and terrifying thought is the idea that whatever the attitude of the will in the face of this revelation may be, acceptance or refusal, the factual necessity of the eternal repetition will prevail. But this factual necessity is itself inscribed in the equally hypothetical ‘pre-’ question that opens the text: ‘What would you say if one day a demon . . . ?’ Therefore, the twofold hypothetical or twofold fictitious character of the Eternal Return seems to set it far apart from the traditional category of existence and make it participate simultaneously in the three categories of modality distinguished by Kant: *possibility*, *existence* and *necessity*. Among these categories, the category of possibility in a broader sense than the logical possibility considered by Kant (something whose contrary is contradictory) seems to prevail. Heidegger is ready to admit that Eternal Return is the thought of a possibility; ‘the possibility which is asked is, as a possibility, more powerful than any factual reality would be’.¹⁶ One should add that if Eternal Return is presented as an interpretation, it is also strongly characterized as a *belief*, or as Heidegger says, an *anti-*

belief,¹⁷ a sort of secret religion which is meant to make a selection among men and which constitutes, therefore, the ultimate trial in the process of overcoming nihilism. But the Return is also indissolubly linked to the experience of the ecstatic *instant*, the supremely affirmative instant of joy. It is equally attached to the experience of the *amor fati*, the experience of the supreme affirmation of the universal bond, of the ring encircling and uniting all things in a circle which is imperfect, 'vicious', because it includes evil, and is nevertheless divine: the *circulus vitiosus deus*.¹⁸ Finally, but it is not the last possible meaning, there is a cosmological sense of the Return, as an attempt to give a scientific explanation of the relation between the finitude of the totality of the forces constituting the universe and the infinity of time. Heidegger knows this plurality of aspects, which he mentions in his lecture, but he reduces all of them to the modality of *existence*. Why?

Because of a structural necessity inherent to the essence of metaphysics, so it seems. The Will to Power as *essence* of the world, as a *what*, must also have its *existentia*, its *how*. The circular or the cyclical movement is its most perfect replica or its closest image: the circle is, according to Heidegger, 'the most constant stabilization of the unstable',¹⁹ of the becoming, or of the chaos of forces and perspectives. It is the greatest fixity for mobility, or as Nietzsche says, 'the most extreme closeness of a world of becoming to the world of Being'.²⁰ At this point, which is called the 'summit of contemplation', the Eternal Return is indeed conceived as the 'widest actualization of the Will to Power'. Conversely, according to Heidegger, it is only from this doctrine of the Eternal Return that the Will to Power can be understood. The Return is the epitome of Nietzsche's philosophy. Nevertheless, Heidegger mentions that whereas the Will to Power is constitutive of the Being of beings, Eternal Return is only a modality. Will to Power 'exists' as Eternal Return. But how can that be the case? How can a thought, and moreover the thought of a possibility, be the modality of the existence, be the 'facticity' and the effectivity of the world. Must men not, as in Pascal's *Wager*, decide in favour of the Return? The Heideggerian reading underestimates the dimension of virtuality, of attempt, of fiction, but also of *choice* which is at work in the idea of the Eternal Return.

Moreover, it raises the difficult question of the passage from the ontological character of the *existentia* to its theological character. By a kind of levelling of differences, the 'katholou' or the *koīnotaton* (that is according to Aristotle the most common character of being) and its highest, noblest, most divine character (*theïon*) melt into one another, so to speak. Ontology is theologized, in as much as the Return as modality of the essence of the world receives the attributes of divinity. Nietzsche's God would be both 'a state of maximum', the maximum of strength of the Will to Power, its highest concentration, and the habitual,

current state of the world. In any case, God or the divine can no longer be submitted to the traditional determinations of the metaphysical God: Nietzsche's God is neither the first being (is he even a being?), nor the *causa sui*, nor the prime mover, nor the *demiourgos*, nor the creator. Heidegger notes that to speak of 'pantheism' ('God' in this case would be understood as the dionysian world itself considered as the supreme being), is not very illuminating, since the 'pan' and the 'theos' are both unknown, or undefinable, or impossible to reduce to concepts. We could add the fact that Nietzsche criticizes the very idea of totality when he writes for instance: 'We must make the Universe crumble into pieces, lose the awe before the All. . . . There is no All. Profound aversion to reposing, once and for all in any one total view of the world.'²¹

Heidegger characterizes Nietzsche's theology in two ways:

(1) The divine as such is not dead. Only the 'moral God', that is, God reduced to a supreme judge who rewards and punishes, the God of the weak and the suffering, is dead. God survives beyond good and evil.

(2) The Nietzschean thought of the Return constitutes 'a negative theology from which the Christian God is absent'.²² The phrase, 'negative theology' sounds strange but it can be defended in many ways. The most abysmal thinking is, if not unsayable at all, at least the object of a silence, a reservation. *Zarathustra* hesitates to communicate it and Nietzsche himself expresses it only in three passages of his published works. On the other hand, the Return implies the concept of world as chaos, i.e. with the negation of all its positive, anthropomorphic determinations, especially order, beauty and finality. This negative theology, in dehumanizing totality, saves the possible coming of a new god that Heidegger calls a 'more divine god'.

But is not this reading too one-sided? For if the 'too human' concepts of order, finality and beauty are negated, other attributes, absolutely positive attributes, are conferred upon totality – namely permanence and necessity. 'The overall character of the world is . . . chaos *not* because of the absence of necessity, but *because of the absence of order*'.²³ There is, therefore, a necessity of totality, and so a *positive theology* in Nietzsche, who calls many things divine. Heidegger seems to avoid discussing Nietzsche's positive thinking about divinity.

The Janus-head of the Overman

The analyses concerning the Overman show a striking contrast between the manifest content of Nietzsche's texts and their unthought. Heidegger's changing of his interpretation of the Overman is particularly radical. In 1940, he defines him both as the penultimate figure of the *animal*

rationale and as the *Master of the Earth* who would anticipate a calculating domination under the veil of the artistic will in the 'grand style'. The type of the Master of the Earth is interpreted as the future planetary ruler, later called the 'civil servant of technology'. On the contrary, in *What is called Thinking?* in 1951/2, the Overman no longer possesses any nihilistic qualities. He is nearly the prefiguration of the Shepherd of Being: 'The Overman is poorer, simpler, more tender, harder, calmer, more generous, slower in his decisions and more sparing in his speech.'²⁴ He stays away from the masses and from the techno-economical and political power. He represents 'a higher man',²⁵ who is 'qualitatively different from traditional man',²⁶ far from being his mere 'enlargement'.²⁷ How can we understand this Turn?

The first definition tries to show that the Overman belongs totally to the general essence of metaphysics. His meaning is *deduced* from the inner necessity that governs this essence and its realization in technology. The repetition of the word *must* (*müssen*) underlines this essential necessity (*Wesens-notwendigkeit*).²⁸ The Hegelian subjectivity of the Spirit, Heidegger remarks, *must* still be inverted in the subjectivity of the body conceived as 'great reason';²⁹ the absolute subjectivity *must* be embodied in the highest type of man, the Overman. Heidegger insists on the continuity between mankind and the Overman (understood as the perfection of mankind), whereas Nietzsche speaks of a rupture and outright juxtaposition of the two. 'Not mankind, but the Overman is the goal', says *Zarathustra*. The Last Man and the Overman, Nietzsche states, 'will live side by side (in the distant future) separated as much as possible, the latter similar to the Epicurean gods who have no preoccupation with men'.³⁰ The Last Man, as stated in *Zarathustra*, is needed in order to let the Overman appear as his strongest opposite. Eternal Return does not *eliminate* the Last Man, even if it always selects the more 'super-human' types who can bear such a thought.

There is another contradiction with the manifest meaning of Nietzsche's text: for him, the Overman cannot exist in the singular, but only as the plurality of exceptional individualities.³¹ For Heidegger, on the contrary, the Overman is interpreted as 'the supreme and unique subject'³² that embodies the most affirmative Will to Power.

'The Overman', he writes, 'does not know the barren isolation of the simple exception',³³ but constitutes for him the collective will of a mankind that knows how to *calculate* the mastery of the earth.

Finally, there is a contradiction between the Overman as the prefiguration of the technocratic ruler and the Nietzschean idea of a secret, non-violent, non-dominating reign of the future 'Masters of the Earth', who would reign in their own creative sphere apart from the masses. Indeed the whole technological unthought of the Overman is linked to the unthought of the notion of 'grand style'. Why does the 'grand style',

which Nietzsche does not associate with the Overman, but with 'classical art' (that is, every art with an economy of means, with clarity, with laws, with mathematical sobriety, with the strongest concentration), why does grand style reveal the future essence of technological power? Precisely because of the artistic *reign* attributed to the Overmen. But for Nietzsche, they will reign, however secretly, invisibly, over men, without governing, as 'artistic tyrants'. They will be artists in the largest sense, by their power of seduction. Nietzsche does not say that they will necessarily practise the 'grand style'. But the real hermeneutic violence in Heidegger's reading is the link he establishes between the grand style and the essence of technology. 'The grand style which includes, in advance, universal domination, includes the gigantic.'³⁴ Here there is another break with the literal sense: the grand style, according to Nietzsche, is turned towards what is 'pretty, short, light, delicate',³⁵ whereas the giganticism of technology supposes exaggeration of effects, accumulation of power, constant overpowering.

Is there any analogy between the autonomy of aristocratic artists and the planetary domination of technology? In Nietzsche's texts, the allusions to industrial production are very rare, and he hardly speaks of industrialization as a means of levelment. But the presupposition of the Heideggerian analysis is that the unthought of the Will to Power is calculation. It is true that Nietzsche speaks of a surplus of force, of the 'quantity of power', of 'scales', of 'measures of force', but the Overmen are presented as personalities with a spiritual or affective radiance: 'it would be a Caesar with the soul of Christ', or the 'unity of the thinker, the creator, and the lover', or the 'gathering of the poet, the lawmaker, the scientist, and the hero, capable of deciphering enigmas'.³⁶ In any case, the Overman according to Nietzsche is radically detached both from political action and economic production. He does not calculate. Calculation can only be general, that is to say, applicable to the masses. How can a totally solitary type, whom Nietzsche compares to the gods of Epicure, be the prefiguration of managers and planners? The Overman is clearly an anti-universalistic figure. Why would the Overman have to select men? Men, for Nietzsche, select themselves according to their attitude towards the Eternal Return.

This is why the image and the definition given by the 1952 lecture seem nearer to the Nietzschean texts. According to the second version, the Overman is totally disinterested towards government and planification. He wisely steps aside from the political world. One must not look for him 'in the marketplaces of a manufactured public opinion'.³⁷ He has given up intervening in the affairs of the world, acting *in* or *on* the technological world. 'The Overman never shows up in the clamorous escorts of the so-called powerful men, nor in the prearranged meetings of the heads of State.'³⁸ Heidegger does not describe the non-technological

activity of the Overman, but evidently, since he is 'sparing in his speech', this activity could be related to poetry and thought.

In spite of this change, Heidegger hesitates to acknowledge – even in the second version – the radical novelty of the Overman versus man. Though he constitutes a 'rejection of traditional mankind', he leads traditional mankind to its perfection and full accomplishment.³⁹ It seems that the ultimate figure of the Overman remains ambiguous. Nevertheless, the change is not arbitrary and is not due to the political changes. National socialism is gone, but technology stays. On the level of the unthought, the double face of the Overman corresponds to the Janus face of technology, to the link between *Gestell* and *Ereignis*. Is it pure chance that the *Blitz* (flash of lightning) is both the symbol in the Nietzschean text of the apparition of the Overman and in the Heideggerian text of the coming, invisible to most men, of the *Ereignis*? But can the same men be the servants of unbridled rationality and the preservers of the enigma of Being? The actual use of power and the powerlessness of thought seems incompatible. The Heideggerian opposition between the 'civil servant of technology', and the 'Shepherd of Being' seems to repeat the Nietzschean cleavage between the Overman and the Last Man.

Again Heidegger seems to hesitate between two interpretations. On the one hand, in a Nietzschean, 'pessimistic' way, he presents the theme of a *co-existence* between two ontological types of humanity which are destined to incommunicability. On the other hand, looking for a reconciliation in the name of the unity of Being, he refuses any analogy with the extreme dualism of the herd type and the affirmative type. Nevertheless, the complete cleavage reappears when Heidegger foresees an 'extreme danger'⁴⁰ which would be tantamount to the 'death of human essence': that those who are imprisoned by calculative thinking and those who are still open to the secret and to the withdrawal of things, would no longer meet, no longer communicate, would move away from each other at an ever faster rate. The two dimensions would be then, according to Heidegger, like two completely foreign constellations.

But in a less dramatic interpretation, the co-existence of the two Nietzschean types would only mean that two possibilities are simultaneously offered to man in his relation to technology. It is the same man who should be calculative and meditative, capable of planning and of letting be, able to say yes *and* no to technical objects. In spite of the Nietzschean temptation of a cleavage, Heidegger maintains the unity of the essence of man because of the unity of the essence of Being.

In building up deliberately Nietzsche's philosophy into a metaphysical system, Heidegger does violence to his text; in trying to reject it totally

in the past, in transforming the main themes into rigid theses, he covers up the novelty of Nietzsche's method of interpretation.

Nevertheless, the very resistance of Nietzsche's text to this unilateral reading makes it all the more powerful and enigmatic. Its irreducible character puts in question the very notion of a transhistorical 'essence of metaphysics' and its all too simple continuity.

Heidegger and the principle of phenomenology

Klaus Held

According to Husserl's¹ programmatic explanation in *Ideas I*,² phenomenology rests on the principle of self-given intuition or evidence. 'Evidence' thereby acquires the broad meaning of original givenness. In his later period, Heidegger frequently emphasized that he had preserved the principle of phenomenology in a more substantively correct and original manner than its founder.³ I would like to take this claim as a guiding thread, with a view to investigating how far, and to what an extent, Heidegger, in the course of his development, actually thought in a phenomenologically consequential manner.

It was in his *Formal and Transcendental Logic* that Husserl explained most clearly the import of the evidence principle for phenomenology.⁴ The basic theme of his phenomenology is the intentionality of consciousness. Intentionality however rests upon evidence; for every consciousness stands in an intentional relation to objects only because it disposes of the possibility of bringing the objects in question to original givenness. So, in its essentials, intentionality is evidence-related.⁵

The phenomenological research into intentionality is itself a form of intentional consciousness and stands accordingly under the obligation of substantiating its discoveries through self-given evidence. In this way, both the object and the method of phenomenological research are equally determined through evidence. It is then possible to ask: does evidence in both these functions share a common basic trait? In the lecture 'Prolegomena to the history of the concept of time', from 1925, which contains Heidegger's most impartial and most complete confrontation with Husserl's phenomenology, he also allowed himself to be guided implicitly by this question and found, in the concept of categorial intuition, the basic trait of evidence in Husserl.⁶

The possibility of self-giving intuition is presupposed by Husserl's principle of evidence, and the former is in turn only possible in so far as it

is assumed that intuitable material is already available for it prior to its concrete fulfilment in individual instances. This pre-given intuitable material is provided by universal formal and eidetic determinations, in whose light alone – or so Heidegger understands Husserl – perceptual objects can appear with evidence to intentional consciousness. These determinations are described by Husserl in the sixth *Logical Investigation* with his broad concept of the categorial.⁷ To be sure, the categorial is not apparent to the philosophically untrained vision; but as what makes the appearing of perceptual objects possible it is – in any case, according to Heidegger's understanding of Husserl – that which really makes its appearance in its appearing.⁸ What is for Heidegger decisive with regard to Husserl is that the categorial universal is nothing subjective, that is, neither read off the internal constitution of consciousness through reflection nor attested in subjective acts of intellectual derivation.⁹ According to the principle of evidence, we should not quibble about that characteristic which yields the categorial in its originary apprehension. This originary apprehension is however the categorial intuition, and in it there appears – as the concept 'intuition' already shows – the categorial universal as something given.

This discovery, that the categorial is nothing subjective but possesses the character of something trans-subjectively pre-given, Heidegger considers to be Husserl's path-breaking insight in the 'Prolegomena'. In his eyes, this is at the same time the focal point of his phenomenology,¹⁰ because the categorial intuition not only makes possible the intentional appearing of the perceptual object¹¹ but also the phenomenological analysis of this appearing; for this analysis rests upon ideation or an intuition of essences whose object is the categorial universal.¹² As the later writings of the sixties show, this picture of Husserlian phenomenology, at which Heidegger arrived in the twenties did not undergo any further alteration over the decades.

The discovery of categorial intuition has, in Heidegger's eyes, an epochal significance which reaches beyond Husserl. This is indicated in a particularly noteworthy passage in the 'Prolegomena': Heidegger claims there that with the insight into the trans-subjective status of the categorial the nominalistic position in the dispute about universals is overcome.¹³ At this point, Heidegger's view of phenomenology acquires a new relevance for us. For the debate about the real basis for linguistic philosophy points more and more today towards the pros and cons of nominalism – as the former pupil of Heidegger, Ernst Tugendhat, has shown.¹⁴

Heidegger's anti-nominalist interpretation of categorial intuition is unambiguously confirmed in the later writings of the sixties. According to Heidegger, in as much as the categorial universal makes possible the evident appearing of the perceptual object and, in this way, intentional appearing in general, it prefigures the dimension of openness in whose

light beings first become knowable or intelligible.¹⁵ The categorial dimension of openness for beings has the function of a *ratio cognoscendi*. It is at the same time also a *ratio essendi*; it vouches for the objectivity of objects.¹⁶ For Husserlian phenomenology, the object possesses no being in itself over and above its intentional appearing. In so far as the categorial, in the double role of *ratio cognoscendi* and *ratio essendi*, builds a bridge between knowledge and being, it fulfils the same function as the Platonic idea or the forms of the pre-nominalistic scholastics. It should not therefore come as a surprise that, in the last of the *Four Seminars*, Heidegger aligns categorial intuition with the Platonic intuition of Ideas.¹⁷ Because categorial intuition itself opens up access to the concreteness of beings Heidegger could in the 'Prolegomena' say already that through its discovery it became possible to 'restore a comprehensible meaning' to the scholastic, or pre-nominalistic¹⁸ definition of truth (one which goes back to the Greeks) as adequation.

Admittedly, one must take care to avoid a misunderstanding. All this does not mean that Heidegger took the return to a naive, pre-nominalistic concept of the *eidos* to be the fundamental achievement of phenomenology.¹⁹ He regards the lasting philosophical outcome of the discovery of categorial intuition to consist solely in this, that in such an intuition the trans-subjective pre-giveness of a dimension of openness²⁰ announces itself which, as the ground of the possibility of being and true knowledge, links the two together in an a priori²¹ manner. Thus the phenomenological evidence principle leads philosophy out of the bottleneck in which it had fallen through late medieval nominalism and secures for it, as Heidegger says in *Zur Sache des Denkens*,²² a new access to Greek, that is, original pre-nominalistic openness to unhiddenness, the *aletheia* of the appearing being.²³ In what concerns the concrete determination of the pre-given dimension of openness however, Heidegger takes neither Husserl's categorial nor the *eidos* or forms of the pre-nominalist tradition for the last word.

When Heidegger compares the categorial with the eidetic, a limitation has to be noted from the very outset, a limitation which Heidegger certainly does not observe in the 'Zähringer seminar' but which cannot be overlooked in the light of his own review of Husserl's 'Prolegomena'.²⁴ The categorial universal of the *Logical Investigations* falls into two radically different groups: the synthetic-formal universal, which – in accordance with the later distinction in *Ideas I* – conducts consciousness in the direction of the universalization process of 'formalization', and the eidetic universal, given through Ideation, which arises in the universalization process of 'generalization'.²⁵ A similarity with the *eidos* or forms of the pre-nominalistic tradition can only be established for the categorial in the second sense. For this reason, Heidegger emphasizes, in his 'Zähringer seminar', that the categorial in Husserl's sense, is 'more than a form'.²⁶

With his own new determination of the pre-given dimension of openness since *Being and Time* which I shall trace in what follows, Heidegger leaves the path of generalization and strikes out – without ever methodically articulating the matter in this way – down the path of formalization, as will be shown in what follows.

I am now going to follow Heidegger in thinking that, with regard to a trans-subjective, pre-given dimension of openness, it is possible to abstract from its pre-nominalistic concretization in a philosophy of the *Eidos* or of the Forms. Certainly, this abstraction does not suffice to render acceptable the supposition of such a dimension for post-nominalistic, modern thought which is grounded in consciousness along Cartesian lines. As philosophy first became aware of the full extent of the uncertainty into which it had fallen through late medieval voluntarism, there remained, in the first instance, only the radical nominalistic scepticism to which Descartes gave expression in the deceitful God argument of the First Meditation. When the general determinations which confer upon being its content, its reality, depend upon the whim of a *deus absconditus* which is in principle impenetrable to human thought it appears a *limine* inadmissible to accept a pre-given dimension of openness in whose light the reality of being would be open to us.

Thus philosophy is only able to take refuge in the immanence of a consciousness which is, in the first instance, cut off from the world. And then there arises the classical problem of modern epistemology, how such a world-less consciousness is able to transcend itself toward the world. From the very outset it is clear that the condition of any such transcendence and therefore for any genuine knowledge can only be found in itself and not in a trans-subjective, pre-given dimension of openness which would connect knowledge and being together a priori.

Husserl was only too aware of this sceptical starting point for modern philosophy.²⁷ For this reason he had to accept the Cartesian immanence of consciousness. He does however try to link it with the phenomenological discovery or rediscovery of a given dimension of openness. This is supposed to take place through the concept of intentionality. If it belongs to the essence of consciousness to be a consciousness of something, then consciousness is in fact, and from the very outset, beyond itself 'outside' and alongside the world. In this way, the classical epistemological problem of the external world is disposed of. At the same time Husserl holds on to immanentism. The transcendence of the world remains included in the immanence of consciousness. It is – in accordance with Husserl's paradoxical and often varied, formula – 'transcendence in immanence'.²⁸ Through this transcendence in immanence of intentionality, consciousness is supposed to furnish from itself the dimension of openness, the locus of the appearing of being.

In the sixties, Heidegger had, quite rightly and repeatedly, drawn

attention to the fact that, with this Cartesian immanentalism, Husserl waters down his basic phenomenological discovery of the dimension of openness.²⁹ On the other hand, Husserl has good reason for his Cartesianism. It seemed as though phenomenology could only defend itself against nominalistic scepticism in this way.

Thus, in Heidegger's critique of Husserl, there comes to light the fundamentally ambivalent point of departure for phenomenology. In pursuit of the principle of evidence, Husserl discovers the pre-giveness of a trans-subjective dimension of openness and so offers the philosophy of the twentieth century the epochal opportunity of overcoming modern Cartesian worldlessness. On the other hand, he feels obliged to secure this discovery against nominalistic scepticism with an immanence of consciousness through which that opportunity is once again jeopardized.

Although Heidegger never expresses the configuration which determines the point of departure for phenomenology at any point in his critique of Husserl, I nevertheless get the impression that the struggle to avoid the dilemma outlined here gave his thinking a distinctive orientation from the twenties on. As a result, it seems to me legitimate to claim that even in the decades after the *Kehre* Heidegger's thinking remains phenomenological, despite the fact that he hardly referred to Husserl. At the very least, a few basic ideas from this time can be interpreted as a result of the attempt to think the principle of evidence through to its conclusion. I would now like to develop the basic steps in this attempt.

To begin with, Heidegger had to pose the question of how the pre-given dimension of openness was to be determined if it could no longer be grasped in the light of the *Eidos* or of the Forms. Basically, the answer proceeded from the structure of intentionality as evidence-related. Because intentional consciousness is referred from non-original to original modes of givenness, its entire experience is carried out in perspectival modes of givenness. In as much as we are confronted by beings of any kind whatsoever, this can only take place in corresponding modes of givenness. We cannot apprehend the object directly by, so to speak, circumventing the latter. This 'universal correlational a priori' is the operational basis of any phenomenology. For this reason, in *Crisis*, Husserl quite rightly characterized the latter in retrospect as the basic theme of his life's work.³⁰

If Husserl located the modes of givenness, in a Cartesian manner, as constituent elements of intentionality in the immanence of consciousness, this step was appropriate, at least to this extent; that these modes of givenness are the forms which determine how consciousness carries through the intentional appearing of objects. But this characteristic only covers one side of the modes of givenness. For they are also the forms in which the entity offers itself from itself. There are no grounds for

according the priority to the side of the consciousness-related effectuation of the appearance over the side of the self-showing of the entity. The modes of givenness cannot therefore be assimilated one-sidedly either to the appearing of the entity or to the lived experience directed toward the entity. They make up a dimension of subject-object indifference or better, a dimension of the between³¹ which first makes possible the falling apart of the subject, as 'executor' of the appearing and the object as what manifests itself in the appearing. This means: we have to look for the pre-given dimension of openness in the realm of the modes of givenness.

Now the modes of givenness never arise in an isolated fashion. For every mode of givenness is a reference in a referential complex of modes of givenness. The referential complexes are the visual circuits, the horizons for our intentional life and in connection therewith, the field of play in which alone objects are ever able to appear at all. The horizons have for this reason the same character of the 'between' as the modes of givenness. As visual circuits they stand on the side of consciousness and as the fields of play of what shows itself, on the side of the object. All horizontal referential complexes also refer amongst themselves to one another and belong in this way in a universal horizon which encompasses all horizons. Thus the world, understood as universal horizon, turns out to be the original between, and that means: the dimension of openness in question. Only because, with Husserl, intentionality is grounded in the between-character of this dimension of openness, was it possible to place the contemporary epistemological problem of the external world upon a new basis through his intentional analyses.

From what has been said, it follows that, by pursuing the principle of evidence in a consequential manner, only *one* basic theme should remain over for phenomenology: the universal *world* horizon. It is not the categorial universal which makes up the dimension of openness but the world. And any revival of the phenomenological theory of categorial intuition, as, for example, that which is recommended in the context of the nominalist, linguistic philosophical critique,³² has to come to grips with the task of elucidating the categorial universal as the manifestation of the world horizon. In distinction from the Ideas of the pre-nominalist tradition and to the eidetic categories, the world horizon, as the totality of reference relations, has a formal character.³³ It is only to be expected that the formal categorial should be elucidated on the basis of the foregoing. But even the experience of eidetic variation whereby, according to Husserl's later theory,³⁴ the material-eidetic contents of the earlier so-called 'intuition of essences' was brought to light, presumably presupposes this horizontal consciousness. For only through the regulative structures of this consciousness is it possible to determine, in advance, the limits which

phantasizing consciousness runs up against in the free 'pre-figuring' of the material determinations of any noetic or noematic contents whatsoever.³⁵

In his controversy with Husserl, Heidegger frequently employed the phenomenological maxim: 'To the things themselves', a maxim by means of which the principle of evidence was formulated as a challenge, in the singular: 'To the thing itself.'³⁶ This modification is in fact justified. For, at bottom, what is in question in phenomenology, as Eugen Fink saw most clearly, is only one thing, the world as the dimension of openness. The phenomenological analysis of 'objects in their modes of appearance' reaches out to the analysis of the 'how of the appearance' itself,³⁷ that is, in the final analysis, to the appeariential dimension 'world'.

Husserl came ever closer to this insight as the concept of the horizon was for him brought ever more into the centre of his attention with the development of his genetic phenomenology from the twenties on. In 1933, he authorized a paper by Fink,³⁸ a paper which adopted the problem of the world as the basic theme of phenomenology, as the authentic representation of his position. This tendency was continued in the life-world thinking of the *Crisis* material. Husserl now more clearly than ever acknowledges the historical task of phenomenology. The world-loss of modern thinking is to be traced back to this, that objectifying science radically abstracts from the perspectively situated appearing of the entity, that is, from its incorporation in modes of givenness and horizons. The world totality is now only taken up as the essence of objects, not however as the universal horizon which Husserl now calls the life-world.³⁹

It is possible for this impoverished world experience to become in turn the basic trait of intentional consciousness through evidence-relatedness. This consciousness is not static but dynamic. In the intentional striving towards evidence there reigns a will which fixes consciousness on objects, which seeks to apprehend it in original modes of givenness. This fixation upon objects prevents consciousness from becoming aware of the horizontal 'how' of its appearing, that is, of its modes of givenness and of its life-world.

With this wilfulness of intentionality,⁴⁰ a wilfulness which is not always brought out clearly by Husserl, something of the derivation of the modern world-loss out of voluntarism becomes visible – even though he himself never noticed it. The human will, rendered profoundly uncertain by the voluntaristic overstepping of the divine will, achieves self-affirmation solely through the Cartesian withdrawal to immanent consciousness. And from this 'Archimedean point' it reaches out resolutely to the objects. On this basis, it becomes clear why with Husserl it requires an act of will to free consciousness from its enslavement to objects. The epoché which first makes possible a phenomenological analysis of modes of givenness is – already from its descent from the Stoa – a wilful change of attitude.⁴¹ Through it consciousness wins the unconstrained composure

– Husserl speaks of ‘disinterest’ – in which the world can become thematized as universal horizon.

Although, in Husserl’s late philosophy, everything turns on the universal horizon ‘world’ or ‘life-world’, nevertheless another theme takes precedence in his programme: consciousness as transcendental subjectivity. Husserl transfers the pre-given dimension of openness or ‘world’ into the immanence of consciousness in as much as he accounts for the former as the constitutional product of the latter. In so doing, he fails to appreciate that the world, as the referential field of play of all modes of givenness makes up, as it were, ‘the element’⁴² in which consciousness and being form an original unity. Only because there is this prior unity can they later also be taken apart. That transcendental consciousness which posits the world over against itself through its constitutional operations, already presupposes the dimension of openness of the ‘world’. Husserl stands this grounding connection on its head.

Heidegger saw through Husserl’s failing from the very outset. For his own part however, he did not, as was called for, replace world-constituting consciousness, as the dimension of openness, with the world, but rather with being. In the ‘Prolegomena’, and with the aid of an ostensibly strictly immanent critique of the Husserlian doctrine, he makes being the ‘matter of phenomenology’. His thesis runs: Husserl has to determine the being of intentional consciousness and he does not fulfil this task or at least does not fulfil it adequately.

Whether this critique actually possesses the immanent character which Heidegger claims for it seems to me of decisive importance for the issue concerning the phenomenological or non-phenomenological character of Heidegger’s being-question, as well as for a proper judgment of his interpretation of phenomenology as the method of ontology.⁴³ The question is as follows: can Heidegger really show that Husserl had to pose and to answer a question concerning the being of consciousness in order to carry through his phenomenology in a satisfactory manner? And can he show that Husserl either did not pose this question or did not answer it satisfactorily? I am going to pick a few significant points out of the Heidegger critique, points which bear upon the *being* of intentional consciousness.

The first and weighty reproach runs: Husserl characterized the being of intentionality as absolute consciousness not with regard to itself but only with regard to a fourfold reference to the relations which obtain between such a consciousness and the other.⁴⁴ However, it is difficult to see which positive determinations of the being of intentional consciousness still remain possible over and above the four bearing upon Heidegger’s reconstruction of the Husserlian determinations. For the being of something cannot be determined other than with reference to something else (*determinatio est negatio*). When Heidegger, in *Being and Time*,

replaces absolute consciousness with Dasein and marks off its existential mode of being from that of being-ready-to-hand and being-present-at-hand, formally speaking, he does not proceed any differently.

What is particularly remarkable in this connection is the nature of Heidegger's critique of the first Husserlian determination, that consciousness is immanent being.⁴⁵ 'Immanence' means here that, with an act of conscious reflection upon a lived experience, this very lived experience is 'actually (*reel*) included' in the act as the object of such an act – in distinction from an object of external perception. Heidegger now claims that with the establishment of an immanence of this kind all that is determined is a relationship within the region 'consciousness', not however the being, that is, the mode of being of this region itself.

Such a critique would only be relevant if it made phenomenological sense to talk about a being of consciousness regardless of how it is itself given. According to the already mentioned phenomenological principle of correlation however the being of any object – therefore also of consciousness as an object for itself – manifests itself exclusively in the how of its originary appearing. If therefore consciousness itself appears originally in acts of reflection (a) and if the how of this appearing possesses the character of the said immanence (b) then it follows (c) that immanence is a determination of the being of consciousness. There might be good reasons why Heidegger would call in question the presuppositions (a) and (b). Care, as the preoccupation of mortal man with regard to his being, is a more original 'self-relation' than the lived experience of objectifying reflection (a), and whether my lived experience is really immanent in an act of reflection directed toward it and is not rather already transcendent (b) is something which remains questionable for Husserl in his later analyses of time. Characteristically enough however, Heidegger's critique is not directed towards these two points but towards the conclusion drawn therefrom (c), in order to demonstrate that Husserl has not answered the question concerning the being of consciousness. And it is this claim which misses the mark.

The critique of Husserl in the 'Prolegomena' then culminates in the following line of argument. In order to distinguish the absolute being of world constituting consciousness from the consciousness-relative being of the world, Husserl needs being as a point of comparison; but he omitted to enquire into the meaning of this presupposed being.⁴⁶ According to this line of argument, being would be the genus within which Husserl distinguishes the two species 'absolute' and 'relative' being. But since Aristotle it has been recognized that 'being' is not a genus concept, and nobody knows that better than Heidegger. So, in the context of his phenomenologically immanent critique of Husserl, he makes use of an unsustainable concept of being. Therewith his critique finally loses its conviction and at the decisive point.

This still leaves it open that Heidegger's use of the concept of being could be justified with the aid of extra-phenomenological arguments. At this point I am only concerned to show that the introduction of this concept along the way to a phenomenologically immanent critique does not succeed. All the indications are that Heidegger's being question is itself set up on extra-phenomenological grounds, in the first instance by means of an attachment to Aristotle. Just as Husserl establishes his claim by appealing to the consciousness of the *post*-nominalistic situation and therefore recurs to the Cartesian idea of philosophy, so Heidegger, motivated by the *pre*-nominalistic basic experience of the givenness of the dimension of openness, takes up again the reigning pre-Cartesian idea of philosophy: the Aristotelian question concerning beings in their being.⁴⁷

In both cases phenomenology is committed to another topic than the one which arises naturally out of its principle of evidence, the world.⁴⁸ Even this theme however allows in addition for an attachment to a traditional idea of philosophy. Contrary to the claim of Heidegger's pilot Aristotle that the enquiry was always directed to the *on* from the beginning,⁴⁹ in early Greek thinking it was not a matter of being – this only first emerges with Parmenides⁵⁰ – but of the whole pure and simple, the totality, the *panta*, the *cosmos*. The world was the most 'original' 'subject matter of philosophy', and this is the sense in which phenomenology counts as a renewal of the oldest idea of philosophy.

Although Heidegger would not have given his assent to this thesis, the world keeps on breaking through as the genuine theme of phenomenology, from the being-in-the-world of *Being and Time* to the later problematics of the fourfold and the enframing.⁵¹ In what follows I would like to take Heidegger to task on this score, since it seems to me that 'being' has not proved to be the 'subject matter of phenomenology'.⁵²

Husserl thinks world constitution along the following lines: in the intentional experience of objects, consciousness builds up corresponding horizons and, on the basis of these horizons the universal horizon is 'built up'. That is to say, he starts out from the object relation of consciousness and on that basis first reaches an openness to the world horizon. With this construction however, his phenomenology falls prey to the forgetfulness of the life-world. For in this fashion the world has to be understood as something like an all-embracing object. This is not however possible for, as the dimension of openness, it first makes possible the appearing of objects. For this reason Heidegger's phenomenology in *Being and Time* begins with the thesis: the first determination of consciousness must be the relation to the world. But since 'consciousness' is defined through its object-relation, this latter concept must also be given up. The contemporary subject is in *Being and Time* radically re-defined by its fundamental openness to the world as the dimension of openness. It is nothing other than the 'there' for the appearing of this

dimension,⁵³ that is, 'Dasein' as 'being-in-the-world'. The relationship of Dasein to the world is now no longer, as with Husserl's intentionality, trapped in immanence, because self-surpassing toward a trans-subjective 'outside' of the world has become constitutive for Dasein. The intentional relation to objects is itself grounded in the transcendence of the world.⁵⁴

In the writings and lectures of the years immediately succeeding *Being and Time* this transcendence emerges ever more decisively as the basic feature of Dasein.⁵⁵ At the same time, it becomes ever clearer that the transcendence idea is still being played off voluntaristically against the spirit of the principle of evidence. In the original movement of transcendence toward the world, Dasein strips away from the self-enclosed, obscure realm of beings⁵⁶ that very bright dimension of the appearing, of the world horizon, in whose light alone beings can manifest themselves. Just as in Husserl's object-oriented intentional consciousness the will to evidence is operative, so Dasein, in the freedom of its existence, gives vent to a militant will which, as its 'for-the-sake-of-which',⁵⁷ gives the world in advance as the field of play for this freedom. With this idea Heidegger forces the sovereignty of the will and the modern voluntaristic world-relation to its extreme and outbids even Husserl's immanent theory of world constitution. The world is now fully integrated under the sway of the will.

If the dimension of openness is to be thought through anti-voluntaristically as something pre-given, as a genuinely trans-subjective 'outside', then it has to lie outside the sway of the will. It cannot be encountered by Dasein as something that arises out of its freedom but as something from which it receives its freedom. Such receptivity on the part of Dasein for the dimension of openness presupposes that this dimension is withdrawn from its control. In this way, thinking through the anti-nominalist, anti-voluntarist implications of Heidegger's principle of evidence leads to the *Kehre*. In the appearing of the dimension of openness 'world', a self-withdrawal, that is, a self-concealing, has to be brought into play as a counter-movement to any 'bringing to light'. This is the point at which Heidegger's phenomenology first makes the decisive step beyond Husserl according to his own later self-interpretation.⁵⁸

It is even possible to read this thinking about concealment into the research maxim 'To the things themselves', the imperative formulation of the principle of evidence. For the call to bring to light the things themselves, the phenomena, was only meaningful under the assumption that precisely these things normally remain concealed.⁵⁹ Husserl however attributed this concealment to the objective fixation of consciousness in the natural attitude. And even Heidegger in *Being and Time* still located concealment in the constitution of a Dasein which takes the place of consciousness, in Fallenness.⁶⁰ Only with the *Kehre* does Heidegger realize that concealment belongs to the 'things themselves'. Henceforward it

becomes determinative of the essence of that dimension of openness which the principle of evidence presupposes as pre-given.

Although with this step phenomenology takes on a character which is very different from Husserl's, still, in the late work *Crisis* one finds an intellectual configuration which places beyond doubt that an original tendency of Husserl's phenomenology is also to be found in the thinking about concealment. The world as a horizontal totality of referential modes of givenness has to remain hidden from the naturally instituted consciousness because it makes what appears in it its object, its theme. The world which is the medium for all such objectifications is withheld from the procedure of thematization. Only with the emergence of philosophy and science, that is, with the historical transition from the natural to the philosophical attitude, does the world arise out of its unthematized state under such auspices as *kosmos* or *ta panta*. With its thematization however it unavoidably becomes the object of philosophico-scientific thinking, and that means: it loses precisely that character through which, as horizon, it can be distinguished from the objects of the natural attitude. In this way, philosophico-scientific thinking falls back, from the very beginning, into that natural attitude from which it would like to be marked off through the thematization of the world. Through the objectification of the world it falls a prey to that very misunderstanding of 'objectivism', which is pushed to the extreme with the modern mathematization of the natural sciences.⁶¹ But how can the suspension of objectivism be thought? Obviously only in this way – even though with Husserl one can only catch traces of the refinement of this line of thought to full recognition – that philosophy succeeds in thematizing the world in its unthematic character, in that character through which it remains withdrawn from the objectifying tendencies of the natural attitude and remains hidden from it in this sense. Thus, if one takes Husserl's critique of objectivism seriously, there remains no other task than that which is carried through by Heidegger: to think the concealment character of the dimension of openness implied by 'world'.⁶²

That philosophico-scientific thinking was from the very beginning on the track of this concealment character – however deeply buried and hardly conceptualized – was, for Heidegger, proved by the *aletheia* concept of the Greeks. The word construction 'un-concealment' contains for him the first indication that the becoming-manifest of the world horizon is constrained by a self-withdrawal or self-withholding.⁶³ The emergence of world, the becoming open of the dimension of openness itself has the character of a counter-movement to an original concealment. In the period immediately after *Being and Time* Heidegger still assumed that this counter-movement has its basis in the free will of Dasein, a freedom forcefully acquired through the self-affirmation of modern man. From around 1930, he sees that the most radical consequence of the principle

of evidence can only consist in this, that the emergence of the world arises out of a prior holding to self, that the light of the world is not contained in Man's original freedom and is not freely given to Dasein.⁶⁴

With this line of thought the trans-subjective pre-giveness of the dimension of openness is at last protected and indeed in a way which is basically closed off from pre-nominalistic thinking which already had an awareness of this pre-giveness. For the light of the Ideas or forms was not regarded as a gift springing from an original darkness. The appearing of this light was not troubled by any obscurity. For this very reason Heidegger characterizes the release of the world-emergence out of withholding as 'clearing', in contrast to the light metaphor of the tradition.⁶⁵ At the same time he preserves – without ever giving direct expression to it – the moment of truth in voluntarism with the supposition of a foundational concealment formulated in non-theological terms.

When Heidegger re-evaluates the pre-voluntaristic–pre-nominalistic consciousness of the pre-giveness of the dimension of openness he therefore in no way reinstates a residual form of metaphysics but remains upon post-voluntaristic, modern terrain. Heidegger is not a neo-Thomist in disguise. This is also evident from the fact that in one decisive respect he does not give up the modern standpoint of subjectivity.⁶⁶ To be sure, the 'subject' itself is no longer thought as consciousness but out of the world-relation as Dasein, and the modern freedom of the will, through which the subject is set against the voluntarist, nominalist uncertainty, is first made possible out of the release of the world-horizon from concealment. But – and this is the point – the openness which comes to man out of the clearing is sent to him as its recipient.⁶⁷ Clearing 'needs' Dasein as the place where world-emergence can alone come to be.⁶⁸ Only that does not mean that clearing is a constitutional product of Dasein itself.⁶⁹

Heidegger's position here may be compared with that of Hegel. Like Hegel, but in a completely different way, he sets himself the task of re-establishing, for modern subjectivism, certain fundamental insights from the pre-voluntaristic, pre-nominalistic tradition, without falling back into those prejudices or naiveties which have been overcome.

In as much as the pre-giveness of the world as the dimension of openness is recognized, the chances of suspending the modern world-loss⁷⁰ (that very worldlessness which Husserl already addressed with his critique of the forgetfulness of the life-world) are improved. Heidegger describes the referential character of the world (which Husserl had determined with the aid of the concept of horizon), in a completely new way by means of his phenomenology of uncovering concealment. First of all, and in view of the pre-giveness of the world from out of which it arises as Dasein, Man belongs, together with things, in the world. Second, he exists in the world as a being in whose 'there' the world appears as

world, that is, in its emergence out of fundamental concealment. This origin in concealment pervades human existence itself in the unavoidable mystery of death. For this reason humans are mortals, that is, the only beings who are able to 'die'. The basic experience of mortality in turn is not possible without the complementary relation to the immortality of the divinities as the reverse side of mortality.⁷¹ Even divinities are beings who are open to the clearing, therefore who live in the world and experience the world as world.⁷² The distinction between mortals and divinities overlaps with a second distinction. World is encountered by that being who experiences the world as world primarily as the all-embracing place wherein it resides, that is, as region. The distinction between luminous openness and dark concealment stamps the world as region in this fashion, that there are two regions for mortals and divinities/heaven and earth, with respect to which however one of the two predominates.

In this way the referential totality of the 'life-world', that is, the world in the 'how' of its original being-lived-by-the-living, is determined anew as 'the fourfold' of mortals and divinities, heaven and earth.⁷³ When Husserl embeds the individual perceptual thing in the horizontal referential totality of the life-world one can already sense the supplementary intention of saving it in this way from any objectivist reduction to a substitutable component of the 'world', which, as fundamental to all objects, becomes something like a vast container in which everything is disposed of. Heidegger was the first to appreciate the full drama of a situation which, in the guise of the ecological world crisis, has today become a matter of common concern. For him, the individual thing re-acquires the value that it lost through its enframing as the exchangeable object of research, as technologically available material, and as an article of consumption in a waste society, in that it becomes the gathering place for the references of the fourfold.

Whether or not one thinks that this analysis carries conviction, it seems to be noteworthy that at this point, where, after the *Kehre*, Heidegger's thinking becomes phenomenologically concrete again, it finally gets to grips with the real 'subject matter of phenomenology': the world as a referential totality and with it the embedding of the individual thing in this totality. Already with Husserl, the perceptual thing was no longer really a substance but a collection of worldly relationships in the guise of a noematic pole for syntheses of horizontally referred relations. That the thing, experienced in an original way, is, in the strict sense, a collection of world relations first gets thought out by Heidegger, in that he lets the originary polarity of thing and fourfold take the place of the Husserlian polarity of perceptual object and horizon.

The hidden continuity of the phenomenological thinking about the life-world in the transition from Husserl to Heidegger can also be noted

from the fact that Heidegger holds to the primacy accorded by Husserl to the individual entity in the world, the 'thing', over what Husserl and the path-breakers of the linguistic turn called the 'state of affairs'. The fact that Husserl's analyses were primarily oriented toward the individual perceptual object, rather than starting out from the totality made up of propositions related to states of affairs, made them appear outdated, at least in the eyes of the nominalistically oriented linguistic philosophers.⁷⁴ To my knowledge, linguistic philosophers did not however realize and recognize that the primacy of the individual object over the state of affairs could be better supported through Heidegger's phenomenology of the thing than through Husserl's phenomenology of perception. Heidegger would have agreed with linguistic philosophers on the primacy of speaking over perception. But for him the 'genuine linguistic unity is not the sentence but the word';⁷⁵ the original speech act is not the propositional connection (in the case of the assertion, the semantic form *ti kata timos*), but the purely poetic nomination, the *onomazein*.⁷⁶ Out of the hiddenness of the clearing into the referential connection of the fourfold, everything that man in general wants to be confronted with is called forth by its name. If individual things could not be brought forth through the singular linguistic comportment designed to serve this purpose, there would be nothing at all for propositional language to connect.⁷⁷

The Heideggerian *Kehre*, the introduction of a reversal in the movement between the dimension of openness and Dasein, is, in contemporary philosophy, accompanied by a suspicion which can be voiced in the following question: is that hiddenness which is supposed to preserve the autonomy of the world horizon not something which has simply been thought up; does not the supposition of a ground of truth transcendent to consciousness simply continue the style of thought of a superseded metaphysics; and does it not for this reason fall under Occam's razor? What proof is there that in the appearing of 'world' a withdrawal really prevails?

In the light of the proposed Heidegger interpretation, the thinking about the *Kehre* gets its coherence from the anti-nominalistic tendency of the principle of evidence. What is decisive, as Heidegger himself has stressed, is that the *Kehre* only represents a re-direction of the course of his thinking on the surface.⁷⁸ This re-direction should be understood as the precursor of a world historical renunciation of the principle of the will. The consequence of this principle of the will was a world-loss intensified to the point of a forgetfulness of the life-world. This world-loss proves already that we are not 'master' of the dimension of openness 'world' and that our freedom is therefore dependent upon a hiddenness which prevails therein. The nominalistic scepticism with regard to the pre-giveness of a trans-subjective dimension of openness is itself the

philosophical expression of a world-loss. In as much as this scepticism betrays the fact that we are caught up in a dimension of openness which we do not ourselves create, it is the mouthpiece of a forgetfulness of world which, for its part, is not due to man but to which man is destinally exposed through a withholding in clearedness. Nominalistic scepticism with regard to the supposition that openness is granted to man from an obscure 'outside' lying beyond his control therefore only confirms, contrary to its own intention, what it disputes.

How the *Kehre* is made possible as a world-historical breakthrough is well known. With the extreme intensification of the 'danger' of world-loss in the 'enframing', the chances of experiencing this loss as a loss, and therefore the chances of experiencing the hiddenness out of which this loss is historically assigned as belonging to the essence of clearedness, increases. There remains however one last question. How can this opportunity be realized? How can that principle of the will which functions as the basis of world-loss be overcome?

Husserl proposed the epoché as the way, that is, a laying to rest of intentional wilfulness. This laying to rest was however itself something about which we decide and therefore an act of will. The phenomenologist carries through this act because the imperative conception of the principle of evidence, the maxim 'To the things themselves', represents an appeal to the responsibility of the scientist. In the principle of evidence there resides the demand to account responsibly for the appearing of the world. This responsibility was quite rightly emphasized repeatedly by Husserl.⁷⁹ Phenomenology was for him at its best nothing other than the explicit taking over of ultimate responsibility.

At this point Heidegger throws out the baby with the bath water. He underlines the fact that, because it is destinally assigned to man out of that withholding which takes place in clearedness, the modern forgetfulness of world represents a kind of tragic delusion to which not even the philosopher is immune.⁸⁰ If Husserl thinks he is going to overcome the modern principle of the will through a wilful decision on the part of the philosopher then – this is what Heidegger would have said – with this faith in the will of the philosopher he only underscores yet again the sovereignty of the principle of the will.⁸¹ The hope for an end to world-forgetfulness demands, according to Heidegger, an attitude in which even the will to assume such an attitude disappears.

The conception of human being which is instated through such a radical abdication of the will Heidegger calls 'relinquishment' (*Gelassenheit*). *Gelassenheit* is no longer an ethical attitude in the sense of the tradition; for such attitudes are wilfully practised. They rest upon decisions for which men have to take responsibility. By contrast, in the realm of relinquishment, there is, as Heidegger puts it literally in the *Feldweggespräch*: 'On the elucidation of "*Gelassenheit*"' nothing to take responsibility

for.⁸² Thus he radicalizes the thinking about the trans-subjective pre-giveness of the dimension of openness in so very extreme a fashion that the moment of responsibility which is prominent in the imperative concept of the principle of evidence finally comes to grief.⁸³

In my opinion the thinking about *Gelassenheit* is overdone. I won't appeal to the *argumentum ad hominem* that Heidegger's entire intellectual endeavour is, as a matter of fact, wilfully inspired, inspired by an energetic determination to account for our time and what might proceed therefrom, and that with this wilfulness he gives the lie to his own renunciation of the will. Above all it seems to me that he confuses the will to responsible accounting (a will which is *always* presupposed whenever serious philosophizing occurs) with a voluntaristically overemphasized will (a will which first comes to prominence in a particular historical epoch and which, for this very reason, can also disappear). Characteristically enough, Heidegger translates the word *logos*, a word which is included in the very concept of 'phenomenology' and which he thought about so much, with every possible circumlocution but never with the most adequate German concept 'accountability' (*Rechenschaft*). He expressly refused the correct rendering of the basic Socratic formula for philosophizing: *logon didonai* as 'accounting for'.⁸⁴ One has to suppose that with this refusal he also wanted to keep his phenomenology clear of the overtones of wilful responsibility which one hears, in this translation.

One could ignore Heidegger's lack of understanding for the ethical dimension of responsible accountability if this deficiency did not have a very noteworthy consequence. Out of the will to reciprocal accountability there arose, with the Greeks, a historically new form of public life in a community of citizens who are alike in the freedom of their capacity for being accountable. It was not an accident that philosophy, as the most radical form of the *logon didonai*, arose at the same time as citizenship in the true sense of political community.⁸⁵ And Aristotle (a man so much admired by Heidegger) took it to be a not unimportant task of philosophy to think about the best form which a community of mutually accountable citizens might assume.

Heidegger was certainly inspired by the concept of praxis to be found in the *Nichomachean Ethics*. But because he played down the moment of responsibility he did not take much interest in the tradition of political philosophy founded therein. And so he was able to take Hitler's nihilistic imposition upon the political community – even if only briefly – for the breakthrough into that new era which he hoped for and to commit himself at the requisite point to national socialism. This should not be glossed over. But the continuing controversy over Heidegger's political abdication should not blind those who really want to get to the root of the matter to the fact that he thought the principle of evidence through to the end in an exemplary fashion and thereby actually opened the door

to an overcoming of modern worldlessness. It is my impression that the conclusive significance of Heidegger's views on phenomenology, views developed in a retrospective perspective and through which his thinking pointed the way forward for philosophy, is to be sought not in his fundamental contribution to existential philosophy⁸⁶ nor even in his reproduction and transformation of the Aristotelian question of being but in his radicalization of the original idea of phenomenology.

Translated by Christopher Macann

Notes

1 The titles of the following works of Husserl and Heidegger will be cited with the following abbreviations:

19 Characteristically he says at the place indicated ('Prolegomena', p. 98) that this conflict was *provisionally* resolved with the discovery of categorial intuition (author's italics).

20 The concept 'dimension' in connection with 'openness' is to be found in Heidegger, *Einl. WM*, p. 375; for 'dimension' see also *ZSD*, p. 15.

21 Cf. 'Prolegomena', p. 99.

22 Cf. *SD*, p. 87.

23 I have tried to set out the original basis of the pre-nominalistic world-relation in early Greek thinking, in contrast to the point of departure of the scholastics with Anselm, in my article 'Zur Vorgeschichte des ontologischen Gottesbeweis. Anselm und Parmenides' in *Perspektiven der Philosophie*, 9 (1983), pp. 217ff.

24 Cf. 'Prolegomena', pp. 85ff.: Following Husserl, Heidegger refers to the following difference as one between 'synthetic acts' (§6c) and 'ideational acts' (§6d).

25 Cf. *Log. Unters.* §48 and §§50–1 of the 6th Investigation deal with the intuition of the formal categorial and §52 has the eidetic categorial as its theme. The distinction between formalizing and generalizing in *Ideen I*, §13 refers to substantially the same difference.

26 *VS*, p. 113.

27 A. Aguirre has most impressively made us aware of the too easily underestimated significance of scepticism in Husserl with his *Genetische Phänomenologie und Reduktion. Zur Letzbegründung der Wissenschaft aus der radicalen Skepsis im Denken E. Husserls* (Den Haag: Nijhoff, 1970), *Phaenomenologica*, Bd. 38, pp. 65ff.

28 I have given a detailed presentation of my phenomenological critique of this paradox in a paper entitled 'Husserls Rückgang auf das Phänomenon und die geschichtliche Stellung der Phänomenologie', in *Dialektik und Genesis in*

der *Phänomenologie*, ed. W. Orth (Freiburg, 1980), *Phänomenologische Forschung*, Bd. 10, pp. 89ff.

29 Cf. *SD*, pp. 47 and 69ff.; *US*, pp. 119ff. and 123.

30 Cf. *Krisis*, p. 48.

31 Cf. Tugendhat, *Der Wahrheitsbegriff bei Husserl und Heidegger*, pp. 172 and 184. On the 'between' see also my paper 'Husserls Rückgang auf das Phänomenon', pp. 90ff., and my article 'Phänomenologie der Zeit nach Husserl' in *Perspektiven der Philosophie*, 7 (1981), pp. 185ff.

32 Cf. Tugendhat, *Einführung in die sprachanalytische Philosophie*, pp. 150ff. and 164ff., after he had previously analysed categorical intuition with approval in *Wahrheitsbegriff bei Husserl und Heidegger*, pp. 126ff.

33 It is in this light that Tugendhat justifies his thesis (in *Einführung in die sprachanalytische Philosophie*, pp. 38ff.) that the basic theme of philosophy can only be determined through formalization and not through generalization. But what is attempted along the proposed lines is not the semantic form of everyday understanding but the world in the sense of the universal horizon as a philosophical theme.

34 Cf. *Erf. u. Urteil*, p. 410.

35 This suggestion I owe to U. Claesges' *Edmund Husserls Theorien der Raumkonstitution* (Den Haag: Nijhoff, 1964), *Phaenomenologica*, vol. 19, pp. 29ff.

36 Cf. with regard to its meaning 'Prolegomena', pp. 104ff., then later the 'Richardson letter', p. xiii; *SD*, pp. 69ff., 73 and 87; on the concept of the 'thing' in this connection, see also *SD*, pp. 41 and 67.

37 Cf. Tugendhat, *Der Wahrheitsbegriff bei Husserl und Heidegger*, p. 270.

38 Cf. E. Fink, 'Die phänomenologische Philosophie Husserls in der gegenwärtigen Kritik,' in *Kantstudien*, 38 (1933), pp. 319ff., republished in *Studien zur Phänomenologie* (1930-9) (Den Haag, 1966), *Phaenomenologica*, vol. 21, p. 79. Thereto the instructive remark of S. Strasser, 'Der Begriff der Welt in der phänomenologischen Philosophie', in *Phänomenologische Forschungen*, vol. 3: *Phänomenologie und Praxis*, ed. W. Orth (Freiburg, 1976), pp. 174ff.

39 On the distinction between world as an essential concept and horizon, cf. U. Claesges, 'Zweideutigkeit in Husserls Lebenswelt', in *Perspektiven phänomenologischer Forschung. Für L. Landgrebe zum 70. Geburtstag*, ed. U. Claesges and K. Held (Den Haag: Nijhoff, 1972), *Phaenomenologica*, vol. 47, p. 85; I have developed this line of thought in my investigation 'Husserls neue Einführung in die Philosophie: Der Begriff der Lebenswelt', in *Lebenswelt und Wissenschaft*, ed. C. F. Gethmann (Bonn, 1988) (in preparation).

40 On the wilful character of intentionality, cf. *Erf. u. Urteil*, pp. 81-92 and 231, also *1. Philosophie II*, pp. 98ff. and 152ff.

41 On this connection see my cited paper 'Husserls Rückgang auf das Phänomenon', pp. 100ff.

42 With this formula I am citing the turn of phrase with which Heidegger in *SD* frequently characterizes uncoveredness, i.e., clearedness.

43 Cf. 'Prolegomena', pp. 124, 158 and 178.

44 Cf. *ibid.*, pp. 146ff.

45 Cf. *ibid.*, p. 142.

46 Cf. *ibid.*, pp. 158 and 178.

47 Cf. Aristotle, *Metaphysik* 1 003a 21.

48 What he rightly reproaches Husserl with in 'Prolegomena' (p. 147) also holds for Heidegger: he opened up the 'thematic field of

phenomenology' . . . 'not by going back phenomenologically to the things themselves but by going back to the traditional idea of philosophy'.

49 Cf. Aristotle, *Metaphysik* 102b 2ff.

50 I have furnished a justification for this thesis in my book *Heraklit, Parmenides und der Anfang von Philosophie und Wissenschaft. Eine phänomenologische Besinnung* (Berlin, 1980), pp. 122 and 576ff.

51 For the decisive proof I refer to the summary by W. Marx, *Heidegger und die Tradition* (Stuttgart, 1961), pp. 183ff. One can already find this use of the concept of world in the earlier Freiburg lectures on Aristotle, pp. 85ff. On the central significance of the concept of world as the dimension of openness see also Tugendhat, *Der Wahrheitsbegriff bei Husserl und Heidegger*, pp. 272ff.

52 I could accept the expression 'being' as 'the subject matter of phenomenology' if this concept had been employed by Heidegger in that thoroughgoing and unambiguous sense formulated by Fr.-W. von Herrmann, namely, that 'disclosure and openness makes up the simple essence of being' (Fr.-W. von Herrmann, *Subjekt und Dasein. Interpretation zu 'Sein und Zeit'* (Frankfurt a. M., 1974), p. 80). I also share von Herrmann's view 'that it is Heidegger's deepest and most basic thought, a thought which carries in its train all his later intellectual insights, that, before all else, we have to think the essence of disclosure and the emergence of openness'. As a result of this basic thought, Heidegger is in my eyes the phenomenologist who has thought the principle of evidence through to its conclusion.

53 Cf. *SZ*, p. 132; thereto the pregnant commentary of Fr.-W. von Herrmann, *Subjekt und Dasein*, pp. 30ff.

54 On this whole connection see above all *Anfangsgründe*, pp. 212ff. and the corresponding text in *WG*, pp. 157ff.

55 Cf. *WG*, pp. 157ff.

56 Cf. *Anfangsgründe*, p. 281.

57 Cf. *Anfangsgründe*, pp. 246ff. and correspondingly *WG*, pp. 157ff.

58 Cf. *SD*, pp. 70ff.; *VS*, pp. 123ff.

59 Cf. already 'Prolegomena', p. 119.

60 This first determination of covering over was later transformed by Heidegger after the *Kehre*, cf. *Humanismusbrief*, pp. 332ff.

61 The historico-systematic problematic of objectivism as a 'natural attitude of the second rank'; has been analysed by me in 'Husserl's neue Einführung in die Philosophie: Der Begriff der Lebenswelt'.

62 I have gone into the parallel between the delimitation of the thematization of the life-world with Husserl and the delimitation of the uncovering of being with Heidegger more carefully in the article 'La diagnosi fenomenologica dell' epoca presente in Husserl e Heidegger' in *E. Husserl, la 'crisi delle scienze europee' e la responsabilità storica dell' Europa*, ed. M. Signore (Mailand, 1985), pp. 125ff.

63 For the decisive proofs up to 1961 I refer to the condensed summary by W. Marx, *Heidegger und die Tradition*, pp. 148ff.

64 The most important document concerning this turn is of course the lecture 'Vom Wesen der Wahrheit' (*VW*, pp. 187ff.).

65 Cf. above all *SD*, pp. 72ff.

66 Cf. Tugendhat: 'Rightly understood these new positions will not carry the Philosophy of Subjectivity backwards but will rather enable it to advance in a consequential manner' (*Der Wahrheitsbegriff bei Husserl und Heidegger*, p. 276). In principle a similar line of interpretation is pursued by C. F. Gethman in his

investigation *Verstehen und Auslegung. Das Methodenproblem in der Philosophie Martin Heideggers* (Bonn, 1974).

67 Cf. W. Marx, *Heidegger und die Tradition*, p. 224.

68 A similar expression is to be found in *VS*, p. 106.

69 Cf. Einl. WM, p. 375; *Humanismusbrief*, p. 336; Hegel u. d. Gr., p. 442; *VS*, p. 124.

70 In *Technik und die Kehre* Heidegger himself has this to say on this new situation: 'World occurs' (*TK*, p. 42).

71 In my book *Heraklit, Parmenides*, pp. 434ff., I have tried to show how, at the beginning of philosophy, Heraclitus' thinking about the *logos* is quite consequential and free from that mythical resonance with which Heidegger's thinking about the fourfold has been reproached (the thinking about the complementarity of divinities and mortals). And, on a Heraclitean basis, the Greek polarity of heaven and earth can be explained in just as rational a fashion – as I have tried to show in my 'Life-worldly interpretation of Heraclitean cosmology', p. 342.

72 Cf. *VA*, pp. 278ff.

73 Cf. above all Heidegger's convincing paper in Part II of *VA*, pp. 145ff.

74 Cf. Tugendhat, *Einführung in die sprachanalytische Philosophie*, p. 105; thereto note the preparation of this conception in: *Der Wahrheitsbegriff bei Husserl und Heidegger*, pp. 399ff.

75 Also p. 402.

76 Cf. *US*, pp. 18ff.; *VS*, pp. 66ff.

77 A question which leads further admittedly, and on which little has been said in Heidegger's hitherto published work, is the following: if the original disclosedness of the world-whole as a whole (as Heidegger already lays it out in those paragraphs of *Sein und Zeit* devoted to state of mind), takes place in mood, must it not then be the case that the original speech act consists in the articulation of mood? An expression of state of mind as disclosedness of the whole, wherein nothing like a distinction between subject and object or even a discrimination of individual objects from one another is to be found can only be contained in so-called 'subject-less' sentences such as 'it is bright,' or 'it is strange,' etc. If human being (as *Dasein* in Heidegger's sense) becomes human through world-openness and this world-openness, as such, is articulated in impersonal speech, then it can be surmised that both the *onomaxein*, as also later the propositional sentence construction, are founded in an original speech act which leaves an echo in subject-less sentences. The 'real linguistic unity' would be the one-word sentence with which the world-whole would be called forth in its ongoing mood-qualified disclosiveness, therefore an *onomaxein* of the world before an *onomaxein* of things. On this theme cf. my study *Heraklit und Parmenides*, pp. 82, 216, 352, 371, 415, 513.

78 Cf. the 'Richardson Letter', p. xix.

79 Cf. in *Krisis*, pp. 15 and 272.

80 I have looked into this problem in my paper 'Heidegger's These vom Ende der Philosophie', in *Zeitschrift für philosophische Forschung*, 34 (1980), pp. 535ff.

81 Cf. 'Gelassenheit', p. 38ff.

82 Cf. 'Gelassenheit', p. 53.

83 Cf. Tugendhat, *Der Wahrheitsbegriff bei Husserl und Heidegger*, pp. 372ff.

84 Cf. *SG*, p. 118 and also the remark by Tugendhat, *Der Wahrheitsbegriff bei Husserl und Heidegger*, p. 368.

85 I have tried to reconstruct phenomenologically the way in which the philosophical *logon didonai* stands in relation to the *Polis* through the middle term

of the doxa, of the 'it seems to me so' (*docei moi*), as political opinion in my article, 'Die Zweideutigkeit der Doxa und die Verwirklichung des modernen Rechtsstaats', in *Meinungsfreiheit – Grundgedanken und Geschichte in Europa und USA*, ed. J. Schwartländer and D. Willoweit (Kehl/Straßburg, 1986), Tübinger Forschungsprojekt Menschenrechte, vol. 6, p. 9.

86 W. Janke has amply established how this contribution has been developed in the path of thought from *Being and Time* to the late work: *Existenzphilosophie* (Berlin/New York, 1982), pp. 172ff.

The question of being and transcendental phenomenology: reflections on Heidegger's relationship to Husserl

John D. Caputo

The recent appearance of the first volumes of Heidegger's *Gesamtausgabe*, commencing with the publication of the Marburg lectures (1923–8), has already begun to illuminate one of the cloudier issues in Heidegger's thought.¹ I refer to the problem of how Heidegger, at least the Heidegger of *Being and Time*, is a 'phenomenologist', and *a fortiori*, to the puzzling relationship of Heidegger to Husserl. We have always, it is true, been able to point to a number of brilliant phenomenological analyses in *Being and Time* – of the tool, the world, the givenness of others, anxiety, death, primordial temporality and the like. We have always been able to refer to the definition of phenomenology in §7 of *Being and Time* and to compare it with the principle of principles in §24 of *Ideas I*; we have always recognized Heidegger's concern with first-hand seeing and getting back to the things themselves. Yet with all of this, there remains something deeply unsettling about Heidegger's relationship to phenomenology, so long as least as we take Husserl, to whom *Being and Time* is dedicated, as the paradigm of the phenomenologist. For where does Heidegger stand on the critical and central steps of the phenomenological method, the *epoche* and the phenomenological reduction? And what does Heidegger have to say about intentionality, the refutation of psychologism, or transcendental constitution?² And how can there be a phenomenology when the whole idea of 'consciousness' has been superseded?

Heidegger's published works to date have not so much taken issue with Husserl on these points as they have totally ignored them. Heidegger makes virtually no reference to these matters in *Being and Time*. Yet he says this work would not have been possible without Husserl. The incontestable virtue of the publication of the Marburg lectures will be, I think, to illuminate these dark corners of Heidegger interpretation. As a contribution in this direction I would like to discuss the knotted problem of Heidegger's relationship to transcendental phenomenology, i.e.,

to Husserl's view that the objects of experience are constituted in and through transcendental consciousness. This will involve making a determination of where Heidegger stands on the question of the phenomenological reduction and the constitution of objects in consciousness. My point of departure for this discussion is provided by a section of *The Fundamental Problems of Phenomenology* (§5), in which Heidegger makes his own determination of the basic elements of the phenomenological method, and in which – *mirabile dictu* – Heidegger speaks of his own 'phenomenological reduction'.

To be sure, no matter is closer to Husserl's heart, no procedure more indispensable to Husserl's method, than the phenomenological reduction. Moreover it was this very question of the reduction that led Husserl to reject Heidegger's interpretation of phenomenology. In an important letter to Roman Ingarden on December 26, 1927 Husserl writes:³

I allow myself to become depressed by the kind of impact that my publications have and by the fact that my better students overlook the depth dimension that I point to and instead of finishing what I have started, time and again prefer to go their own way. So also Heidegger, this natural power of a genius, who carries all the youth away with him, so that they now consider (which is not at all his opinion) my methodic style to be out of date and my results to be part of a passing era. And this from one of the closest of my personal friends.

... the new article for the *Encyclopedia Britannica* has cost me a great deal of effort, chiefly because I again thought through from the ground up my basic direction and took into account the fact that Heidegger, as I now must believe, has not understood this direction and thus the entire sense of the method of the phenomenological reduction.

By the reduction the phenomenological investigator is, according to Husserl, carried back (re-reduction) from the hitherto naively accepted world of objects, values and other men, to the transcendental subjectivity which 'constitutes' them. Without the reduction and without the operation of transcendental constitution which it uncovers, philosophy is cut off from achieving radical science. Philosophy would be, in Husserl's view, confined at best to the empirical-psychological level, to the level of 'philosophical anthropology', which deals with the real experience of real men in the world, with what Husserl calls 'mundane subjectivity'. It is evidently in this way that Husserl understands Heidegger's talk of 'existence' and 'being-in-the-world'. For in the '*Nachwort zu meinen "Ideen"*', in

a thinly disguised reference to Heidegger, Husserl characterizes the objections that have been raised against this work in the following way:⁴

They all rest on misunderstandings and ultimately on this, that one wishes to push my phenomenology back to the level [anthropology, mundane subjectivity] the overcoming of which constitutes the whole meaning of the phenomenological reduction.

In Heidegger 'consciousness' is superseded by being-in-the-world. The world is that in which Dasein always already (*immer schon*) is, and anything like an '*epoche*' or reduction which would free Dasein from the world is ruled out from the start. Heidegger-interpretation has always proceeded then with the understanding that in Heidegger there is neither *epoche* nor reduction. As Walter Biemel said in 1950:⁵

Since Husserl's questioning leads back to the ego, his method stands under the stamp of the reduction, through which the totality of beings is bracketed, in order to retain the pure ego. In Heidegger the reduction is totally absent.

We are faced then with a remarkable state of affairs. Heidegger is an important phenomenologist – yet he has not, in the opinion of Husserl himself, understood the basic sense of the central methodological step in phenomenology, the reduction. In Biemel's view, Heidegger has abandoned the reduction altogether. Yet, as if to intentionally complicate the entire matter, Merleau-Ponty claims in his admirable 'Preface' to the *Phenomenology of Perception* that the entire discussion of being-in-the-world in Heidegger is possible only against the background of the phenomenological reduction.⁶ Finally, in the midst of this confusion, Heidegger himself has, in his published writings thus far, said nothing whatever about the reduction.

Heidegger's interpretation of the phenomenological method

It is then of no little interest to find that Heidegger himself, in the hitherto unpublished Marburg lectures, did once address himself to the question of the meaning of the phenomenological reduction for his interpretation of phenomenology. What can the 'phenomenological reduction' mean to Heidegger? Let us listen to his words:

We characterize that element of the phenomenological method which has the sense of a leading back of the investigative look

from the naively grasped being to Being as the *phenomenological reduction*.

(Gp, 29)

This is a strange saying. Every reduction is, in one way or another, a 'leading back' (*zürück-führen*, *re-ducere*). In Heidegger's reduction the look of the phenomenological investigator is led back from beings to Being. Thus, by the reduction, we open up what is elsewhere in these lectures called the 'ontological difference'. Obviously, Heidegger is here adopting Husserl's vocabulary, but he is hardly saying the same thing as Husserl. Thus he adds:

For Husserl the phenomenological reduction . . . is the method of leading back the phenomenological look from the natural attitude of the man who lives in the world of things and persons to the transcendental life of consciousness and to the noetic-noematic experiences in which objects constitute themselves as correlates of consciousness. For us the phenomenological reduction signifies the leading back of the phenomenological look from the grasp of the being, which is always something definite and determinate, to the understanding of the Being (projecting upon the manner of its unconcealment) of this being.

(Gp, 29)

For Husserl the reduction means a 'leading back' from a naive consciousness, which takes the being as something 'there', as an autonomous thing in itself, to a critical consciousness which understands the hitherto anonymous life of consciousness which 'constitutes' the object. It is the passage from the naive givenness of the being to the giving life of consciousness, from a world which is ready made to the creativity of transcendental consciousness. For Heidegger the reduction means the movement by which we no longer take the being naively, as something simply 'there', but discover the being *in its Being*. It is the revelation that the being, which naive common sense takes to be 'given', depends upon a more original 'giving'. For Heidegger, the reduction discloses the hitherto anonymous operation of Being by which the being emerges as a being. The being becomes a phenomenon for Heidegger only when we grasp it in its Being. The simple and determinate grasp of a particular being is nothing phenomenological, but a mere naiveté of natural common sense.

Unfortunately, Heidegger devotes no more space to this phenomenological reduction than the paragraph that we have just quoted. For his comments occur in the 'Introduction' to *The Fundamental Problems of Phenomenology*, in which he merely outlines the three parts of this lecture course. Unhappily, the whole of Part III, which was to concern

itself with methodological reflections on the nature of phenomenology, was never completed. We are once again left with a Heideggerian 'fragment'. And our confusion is just as great as before, for this text raises more questions than it answers. The whole passage has the appearance of a rather arbitrary reinterpretation of Husserl's words which has nothing to do with the substance of the Husserlian reduction. What are we to make of this reduction? How seriously can we take it? How does it in any way illuminate the essence of Heidegger's phenomenological method? Let us reflect upon it further.

The mention of this phenomenological reduction occurs, as we said, in §5, in which Heidegger is discussing the basic elements in the phenomenological method. He identifies three such elements: reduction, construction and destruction. This position is developed as follows. Phenomenology is radical science (*Wissenschaft*), i.e., philosophy in its most radical sense (*Gp*, 3). But a truly scientific philosophy is possible only as a philosophy – phenomenology – of Being. For the understanding of Being is necessarily prior to the experience of any particular being, and therefore to every particular science (*Gp*, 14). 'Being is the genuine and only theme of phenomenology' (*Gp*, 15). But this demand upon phenomenology to be a science of Being raises the methodological question of how Being is accessible to us. Now Being is given to us only in beings.⁷ Thus the look of the phenomenological investigator must be directed at beings in such a way as to disclose them in their Being, i.e., to 'thematize' Being. The task of thematizing Being is to be carried out in three methodic steps, the first two of which – reduction and construction – we shall treat together. (1) *Reduction*: in this step the phenomenological look is directed negatively 'away from' beings to their Being. It is, Heidegger says, a 'pure turning away', a negative movement which looks away from beings. But this essentially negative element of the method must be perfected in a second and more central element: (2) *construction*: in this second step the phenomenological look is directed 'towards' the Being of beings; it 'leads into' Being (*Hinführung*). Being is not, Heidegger says, simply lying about like a being so that, were we to look away from beings, we would just naturally 'come across' (*vorfinden*) Being. On the contrary, we must actively 'project' (*entwerfen*) Being; we must actively bring it into view. This projecting of the being upon its Being is what Heidegger calls phenomenological 'construction'.

In *Being and Time* the term 'construction' is used in quite a different sense. There it referred to a dogmatic presupposition introduced from outside the *Sache* in such a way as to be imposed upon the *Sache* and to do it violence. A 'construction' there is an *a priori* presupposition which, far from releasing the being and freeing it to be the thing which it is, actually does quite the opposite. It imposes determinations upon

the things themselves whose effect is precisely to prevent us from seeing things as they are. Thus phenomenology is described as the opposite of all 'free-floating constructions'.⁸ A case in point is the Cartesian projection of the things of the life-world in terms of the mathematical construction of extension and velocity and the consequent covering over of life-world phenomena, such as 'hardness' (*SZ*, 97/130). The construction described in *The Fundamental Problems of Phenomenology* is precisely the opposite kind of projection, one which releases the being to be what it is, which puts the right presupposition upon the being. It is somewhat like Merleau-Ponty's example of 'gearing' ourselves up in the appropriate way so that we can experience the thing as it is, finding, e.g., the right position from which to view the painting.⁹ We find the right angle, the right distance, the right lighting in which the painting can show itself. The task of the phenomenologist is to find the right horizon, the right framework of conditions, the right structure of Being (*Seinsverfassung*, *Seinsart*) in which the being can be what it is. Thus the things of the *Umwelt* should be projected not in terms of extension (*Vorhandensein*) but of 'instrumentality' (*Zuhandensein*) if they are to be seen for what they are.

Actually, this process of construction or projection is to be carried out for Heidegger on a two-fold level. In the first place, the being is to be projected in its Being. That process we have already briefly characterized. But secondly, and more radically, Being itself can and must be projected in terms of that which lets it be what it 'is' (*west*). Here we are referring to the process by which Being itself is projected upon temporality, which Heidegger discusses in §20b of *The Fundamental Problems of Phenomenology* (*Gp*, 395ff.). It is also clear that what Heidegger means by construction here is identical with the projection upon 'meaning' (*Sinn*) in *Being and Time* (*SZ*, 151/193; 324/370-1): the meaning of a thing is that upon which it must be projected in order to be understood as what it is. To understand the meaning of a thing is to put the right construction upon it. More precisely we do not 'put' a construction 'on' the *Sache* – for that is precisely the procedure of construction in the bad sense. Rather, we set forth the Being-structure which the being itself suggests and evokes, and which we have learned from the being and through the being itself. The genuinely phenomenological construction is not *impressed* from the outside, but is *prompted* from within by the things themselves.

(3) The third step involved in thematizing Being phenomenologically is called by Heidegger 'destruction' (*Gp*, 30-2). In making the regress from beings to being, Dasein must perforce begin with the actual experience of Being which is offered to it by its current historical situation. Beings are not homogeneously accessible in all ages. Indeed there is to be found in the history of Western philosophy from Plato to Hegel a tendency to level off all beings in terms of a single kind of being,

particularly accessible to that particular thinker, which is then made to do service for all the differing modes and areas of beings (*Seinsarten, Seinsgebiete*). We today have inherited this vast fund of fundamental concepts which purport to disclose the Being of each of the differing regions of beings. In a radical science, which starts from the beginning, that claim cannot be accepted without further ado. Hence the reductive-constructive regress (*Rück- und Hinführung*) to Being must be at the same time an historical regress, an historical 'destruction'. It must in Husserl's terms be an historical-genetic phenomenology, in the manner of the *Krisis*, which re-traces the steps which the history of Western philosophy has taken and which uncovers the original and founding experiences (Husserl's *Urstiftungen*) from out of which beings first received their determination. Thus, while the first two steps of Heidegger's phenomenological method have more the appearance of the ahistorical reductions characteristic of *Ideas*, the third compares to the historical way of Husserl's later period. In *The Fundamental Problems of Phenomenology*, however, Heidegger insists that all three methodic steps must be applied together, that all three steps belong together.

Nonetheless, there remains something profoundly unsettling about the 'phenomenological method' which Heidegger sketches in these pages, unsettling in the sense of how it relates to Husserl's phenomenology. For Heidegger has radically altered the terms of Husserl's reduction and recast it in the likeness of his own 'ontological difference'. The *terminus a quo* and the *terminus ad quem* of Heidegger's reduction are beings and Being, respectively. These categories supersede for him the terms of the Husserlian reduction: objects and consciousness, objectivity and subjectivity. Heidegger has thus replaced Husserl's 'epistemological difference' with his own ontological-phenomenological reduction. For in Heidegger's view both objects and subjectivity remain within the sphere of beings and cannot claim to be ultimate categories. Indeed they themselves need to be interpreted in terms of their Being. Thus Heidegger's reduction claims to be more radical.

From Husserl's point of view, however, Heidegger appears to have emasculated the reduction by stripping from it the whole idea of a reduction to 'transcendental subjectivity'. Thus, while Husserl may concede that Heidegger possesses the 'natural power of a genius,' he believes him to have struck out so thoroughly on his own path that it can no longer be called phenomenology. For what does Heidegger's reduction have to do with the constitution of objects in transcendental subjectivity? In §59 of the *Cartesian Meditations* Husserl protested against those pretended phenomenologists who lack this most radical element of the phenomenological method. Husserl would certainly regard Heidegger's talk of his own phenomenological reduction as a bit of terminological tokenism which has nothing of substance to do with his phenomenology.

Dasein, subjectivity and transcendental phenomenology

The question to which we must next turn then in this essay is what Heidegger's reduction of Being has to do with the reduction to transcendental subjectivity. My aim in pursuing this question is not, I hasten to add, to attempt to bring Heidegger into conformity with Husserl, for there is no merit in that, nor to justify his credentials to the Husserlians of the strict observance. I am concerned simply to *understand* Heidegger's relationship to Husserl, for *Being and Time* would not have been possible 'if the ground had not been prepared by Edmund Husserl' (SZ, 38/62). Heidegger and Husserl are two great and ultimately independent philosophical geniuses. I do not wish to absorb Heidegger into Husserl, nor to say that everything of worth in Husserl's thought is to be found *eminentiore modo* in Heidegger's thought. I simply want to understand better the enigmatic relationship which existed between these thinkers during Heidegger's Marburg period. This will, among other things, serve to clarify Heidegger's later development when his divergence from Husserl is even more pronounced.

I believe that the best point of departure for this question is to be found in an investigation of Heidegger's view of the relationship between Dasein and 'subjectivity' during this time. Such an investigation reveals that a central idea in Heidegger's concept of phenomenology in those days lay in what he called the 'regress to the subject' (*Rückgang auf das Subjekt*). Thus, in a discussion of Kant's determination of 'reality' in terms of what is given to 'perception',¹⁰ Heidegger says:

Yet the direction of the way upon which Kant enters, through the regress to the subject, is in the widest sense the only possible and correct one.

(Gp, 103)

This expression, 'the regress to the subject', or its like, occurs frequently in *The Fundamental Problems of Phenomenology* (cf. pp. 156, 172, 220, 308-9, 318-19). In another important text Heidegger says:

Accordingly, if the philosophical problematic has from the beginning of ancient philosophy . . . been oriented towards reason, soul, spirit, consciousness, self-consciousness, subjectivity, this is no accident. . . . The bent [*Zug*] towards the 'subject', which is not always equally clear and unambiguous, is grounded in the fact that philosophical inquiry somehow understood that the basis for every substantive [*sachlich*] philosophical problem could and must be drawn out of an adequate elucidation of the 'subject'.

(Gp, 444)

This text substantially repeats the opening section of Heidegger's version of the *Encyclopedia* article in which Heidegger says:

Phenomenology means: the fundamental clarification of the necessity of the regress to consciousness, the radical and expressed determination of the way of, and of the laws governing the steps of, this regress. [It means] the delimitations of principles and the systematic searching through of this field of pure subjectivity which is disclosed in this regress.¹¹

There can be no doubt that Heidegger saw his fundamental ontology of Dasein, his return of the problem of Being to the being which raises the question of Being, in terms of Husserl's return to subjectivity. This regress was in keeping with the basic tendency of modern philosophy from Locke through Kant, a tradition with which at this stage Heidegger willingly aligns himself. It is furthermore, Heidegger argued, in keeping with the basic, though less easily identifiable tendency of classical thought: with Parmenides (*noein*), Heraclitus (*logos*), Plato and Aristotle (*psyche*), and the middle ages (*intellectus*, transcendental *verum*). The return to subjectivity is for the Heidegger of those days an age-old, necessary and fundamental philosophical step which, properly carried out, secures for philosophy a truly scientific status.

Nevertheless, this characterization of Heidegger's orientation in the '20s must not be left unqualified. Indeed Heidegger himself is quite careful to refine his stand. He says:

in the emphasis on the subject, which has been a vital force in philosophy ever since Descartes, there does indeed lie a genuine impulse for philosophical questioning. It only sharpens what the ancients sought. Yet, on the other hand, it is just as necessary not simply to proceed from the subject, but rather also to question whether and how the Being of the subject, as the point of departure for the philosophical problematic, must be determined, [to question the subject] in such a way that the orientation to it is not *one-sidedly subjectivistic*. Philosophy must perhaps proceed from the 'subject' and with its ultimate questions go back to the 'subject', but it may not pose its questions in a one-sidedly subjectivistic way.

(Gp, 220)

Here Heidegger introduces a critical and decisive qualification upon his conception of the phenomenological return to subjectivity. The Being of the subject must not be determined subjectivistically but rather in such a way as to exhibit its Being as radically turned towards the world.

Heidegger's subject is nothing subjective because its Being consists in

the concerned use of tools (*Besorgen*) and the solicitous sharing of the world with others (*Fürsorge*) and because it is itself ultimately a care for its own Being (*Sorge*). Dasein is a self not because it is self-consciousness (*Selbstbewusstsein*) but because it must *be* itself (*Selbstsein*), because it must decide to be its own or not its own self (*Eigentlichkeit*, *Uneigentlichkeit*). One can see in Heidegger's conception of a non-subjectivistic subject both a residual 'Cartesianism', a Cartesianism which is in truth inseparable from transcendental phenomenology, and yet also the makings of what Landgrebe calls the 'departure from Cartesianism'.¹² Dasein is in no sense a worldless ego, but an openness towards the world, yet is a 'self', an 'I myself'.

It is no wonder then that even in these early texts from the 1920s Heidegger puts single quotation marks around the word 'subject'. In connection with the supposedly Aristotelian thesis that truth belongs in the subject, not in things, Heidegger comments:

Being-true is revealing. Revealing is an activity of the ego. Thus they say being-true is something subjective. We rejoin: 'subjective' to be sure, but in the sense of a properly understood concept of the 'subject' as existing Dasein, i.e., as being-in-the-world (*als des existierenden, d.h., in der Welt seienden Dasein*).

(Gp, 308)

There is a fundamental tension in these early texts, and in *Being and Time* itself, between Dasein as 'subject' and its unsubjectivistic character, which is finally resolved only in the later works, in which Descartes and Husserl, the whole philosophy of transcendental subjectivity, and finally the entire history of Western 'metaphysics' are ultimately overcome. One can already find here the makings of the later Heidegger out of the early.

But while this overcoming is already underway in the early works it has not yet been carried out. If there is a tension here which needs resolving, it is because Heidegger's work still stands within the framework of a now more broadly conceived 'transcendental phenomenology'. That is why Heidegger could say in his important letter to Husserl of Oct. 22, 1927:¹³

There is agreement between us that the being which you call 'world' cannot be explained, in terms of its transcendental constitution, by a regress to a being with the same mode of Being.

For both Heidegger and Husserl the 'world' is not constituted by something mundane (Husserl), by something innerworldly (Heidegger), but by a being with a radically different mode of Being (*Seinsart*), by pure

transcendental subjectivity (Husserl), by Dasein (Heidegger). The letter continues:

We have not thereby said, however, that that which makes up the place of the transcendental is not a being at all.

This is not to say, Heidegger adds, that this being is in no sense something really existing. Here Heidegger begins to formulate his break with Husserl, for whom the pure or absolute Being of consciousness is opposed to the real being of the world. Husserl's brackets include both the world and the ego. Heidegger does not wish to *bracket* the Being of the 'subject' but to penetrate to a deeper *understanding* of its *Being*. Husserl moves from a real-empirical to an irreal-transcendental ego. Heidegger moves from the superficial grasp of Dasein as something *Vorhanden* to the Being of man as *Existenz* and Dasein. Husserl's subject is irreal; Heidegger's 'subject' ex-ists.

Rather the problem precisely arises: what is the mode of Being of the being in which the 'world' is constituted? This is the central problem of *Being and Time*, that is, a fundamental ontology of Dasein. It must be shown that the mode of Being of human Dasein is totally different from that of every other being, and that, being what it is, it harbors within itself the possibility of transcendental constitution.

Here *Being and Time* is cast in a startling light: it is an inquiry into the Being of the being which constitutes the world. Fundamental Ontology is, in its own way, transcendental constitutive phenomenology. *Being and Time* determines the Being of the 'subject' in which innerworldly beings, and other persons, are 'constituted'. It determines these 'subjective' processes (*Verhaltungen*) as concern and solicitude and it determines the Being of the 'subject' as care and ultimately as temporality.

Transcendental constitution is a central possibility of the existence of the factual self. For this [= a factual self] is what concrete man is as such. Concrete man is, as a being, never a 'mundane real fact' because man is never merely something present at hand. Rather he exists. And the element of 'wonder' lies in the fact that the existence-structure of Dasein renders possible the transcendental constitution of every posited entity.

This is a remarkable passage in which the break with Husserl is given its sharpest formulation of all. It states what for Husserl must be a blazing paradox: transcendental constitution takes place in and through the 'factual self'. Whereas in Husserl the transcendental subject was

separated by an 'abyss' from everything factual (*Ideen I*, §49), in Heidegger transcendental subjectivity is located in the 'facticity' of existing Dasein. The being which constitutes the world is thrown into the world and will be wrenched from it. The being which constitutes others is from the very start there, along with them, one with them, dominated by them. The being which transcends being and so is free is ever prone to be untrue to itself, to fail to be itself. This transcendental subject is radically finite and factual, and is itself separated by an abyss from the 'absolute Being' of Husserl's 'pure subjectivity'. Still Dasein does in a meaningful sense 'constitute' its world: through its moods the world is constituted as that into which Dasein is thrown. Without solicitude the 'they' could never appear and dominate Dasein. Without anticipation my death would not 'be' for me. And in a word, without temporality nothing at all would be for Dasein. Temporality is the deep-structure which 'gives' Dasein a world (*Logik*, §19–20), which in Husserl's language, which Heidegger is willing to employ in this letter, 'constitutes' the world. While Dasein is 'factual' it is not factual and constituted. Rather, Heidegger claims, the process of factual ex-isting, the unitary process of existence-facticity-and-fallenness (ahead-of-itself-being-already-in-along-side-others) is itself the constituting process which gives Dasein its world. Husserl thought that whatever is in any way *real* is constituted. Heidegger rejoins that Husserl is being dogmatic about what Being means (if something is real it is constituted), and that a distinction needs to be made between what is real as a *Vorhandenes* and what is 'real' because it 'exists'. The latter is in no way constituted, but rather discloses the Being of itself (*Selbstsein*), others (*Mitsein*) and innerworldly things (*Vorhandensein*, *Zuhandensein*).

Walter Biemel says that in this passage Heidegger's use of the word constitution arises from an attempt to be accommodating to Husserl, to cast his thought in the language of Husserl, but that the expression 'constitution' is avoided in *Being and Time* because of its idealistic overtones.¹⁴ I endorse Biemel's observation quite fully. However I would point out that the importance of the passage lies in the fact that Heidegger can put the problematic of *Being and Time* in the language of 'constitution'. This is possible I believe because Heidegger has in mind a *non-idealistic notion of constitution*, one very much like Merleau-Ponty's example of finding the right standpoint from which the painting can then 'show itself from itself'. If the 'subject' does not for its part do what is required of it, if it does not bring its own mode of Being to beings, then they cannot appear as what they are. Thus Heidegger, speaking of Kant's theses about reality and perception, observes:

Perception uncovers the present-at-hand and lets it be encountered in the manner of a definite *uncovering*. Perception takes away its

coveredness from the being and makes it free to show itself from itself.

(Gp, 98)

Or again, in discussing the 'assertion' as a mode of uncovering:

The appropriation of the being in the true assertion about it is no ontic taking in of the present-at-hand into the subject, as if things were transported into the ego. . . . The assertion is a letting be seen of the being, one which exhibits it.

(Gp, 213)

In Heidegger, constituting means an uncovering, a letting be seen, which is absolutely requisite if the being is to show itself from itself. If Dasein does not build, and so hammer, then the hammer cannot be too heavy or indeed be a hammer at all. *Besorgen* constitutes the hammer as a hammer, in as much as it opens up the horizon within which it can show itself as a hammer. 'Letting be seen' in Heidegger is no mere passive opening of our eyes so that things may just pour in upon us. It is a matter of actively projecting the being in its proper mode of Being, so as to make it accessible to us. It is letting be in the active sense of freeing the thing to show itself as what it is. Dasein constitutes the world by releasing it.

Being and phenomenology

One might protest that our essay up to this point is disjointed and that it has made two essentially different and independent claims which do not all coincide: (1) in Heidegger's early work we find a genuine phenomenology of Being because in Heidegger there is an analogue to the phenomenological reduction, viz., the constructive-reduction to Being; (2) in *Being and Time* there is a genuine phenomenology of Being because *Being and Time* is an essay in transcendental phenomenology; it inquires into the Being of the being which constitutes the world, and so there is a reduction to (Heidegger's version of) transcendental 'subjectivity.' In the first place there is a reduction (regress) to Being (ontological reduction), in the second to the 'subject' (transcendental phenomenological reduction), Which is it? Or are these the same thing? In the first thesis there seems to be a tokenism which uses only Husserl's words, not his meaning; the second is more substantive (*sachlich*), but how is it related to the first?

The answer to this question is and must be that the two kinds of reduction – ontological and transcendental-phenomenological – belong

together and are, for the Heidegger of the Marburg period, inseparable. The unity of the two claims can be expressed simply: the reduction to Being is a reduction to Dasein conceived as the 'subject' which harbors within itself the possibility of transcendental constitution. This is because Being for Heidegger at this point is to be interpreted in terms of Dasein's *understanding* of Being. The reduction is made not simply to Being, Heidegger says, but to the understanding of Being possessed by Dasein. Let us listen again to the important text from *The Fundamental Problems of Phenomenology*:

For us the phenomenological reduction signified the leading back of the phenomenological look from the grasp of the being, which is always something definite and determinate, to the understanding of the Being [these italics mine] (projecting upon the manner of its unconcealment) of this being.

(Gp, 29)

It is in and through Dasein's understanding of Being that it is able to 'constitute' (uncover) the world, i.e., to free beings, to release them into being what they are. Being at this stage of Heidegger's thought is conceived after the model of an intentional phenomenology, a phenomenology of *noesis* and *noema*, in which Being is the correlate of and is accessible only through Dasein's understanding of Being.¹⁵

If we have conceived the fundamental problem of philosophy to be the question into the meaning and ground of Being, then we must, if we do not wish to engage in phantasy, methodically stay with that which makes something like Being accessible to us, i.e., with the understanding of Being which belongs to Dasein.

(Gp, 319)

The regress to Being (the ontological reduction) is made possible by a regress to Dasein's understanding of Being (the transcendental-phenomenological reduction). In another text Heidegger says that the uncoveredness of beings depends upon the disclosedness of Being, but that the Being of beings is disclosed only 'if I understand it' (Gp, 102). And again in the 'Introduction' to *The Fundamental Problems of Phenomenology*:

The Being of a being is met with by us in the understanding of Being. Understanding is that which first of all opens up or, as we say, discloses something like Being. 'There is' Being only in the specific disclosedness which characterizes the understanding of Being.

(Gp, 24)

Now the disclosedness of Being is that which has been called from antiquity 'truth':

But there is truth only if a being exists which opens up, which discloses, and indeed in such a way that disclosing itself belongs to the very manner of Being of this being. We ourselves are such a being.
(Gp, 25)

And so accordingly:

There is Being, only if truth, that is, if Dasein exists.
(Gp, 25)

These texts can also be compared with a number of similar passages in *Being and Time* (SZ, 212/255, 230/272, 316/364).

Dasein is the being which harbors within itself the possibility of transcendental constitution *because* it is the being which is characterized by an understanding of Being. The deepest and most fundamental reason why beings are manifest as beings, why they show themselves as phenomena, is Dasein's understanding of Being. Dasein discloses the being *as* a being. To be a phenomenon is to stand forth, to emerge into presence, to show itself from itself. But it is only if presence itself, if emerging into presence (*Anwesen, Sein*), is itself first understood that the being *can* emerge and be present. Heidegger carries out Husserl's demand that the phenomenon be led back into the act which discloses and constitutes it as a phenomenon, but he identifies that act as the pre-ontological understanding of Being. That which discloses the being as such, which makes it possible for being to be met with and experienced at all, is the *a priori* which discloses every being as such: Being. Thus Heidegger planned a section of *The Fundamental Problems of Phenomenology* which was to bear the title 'The *a priori* of being and the possibility and structure of *a priori* knowledge'. Heidegger rejects the idea that the *a priori* refers to some innate or inborn structure in the mind (Gp, §22c). Rather the *a priori* means for him the 'towards which' (*das Worauf*), the horizon, upon which a thing is projected if it is to appear as such, that 'in respect to which' (*in Hinblick auf, das Worauf eines Hinblicks*) a thing must be seen in order to be what it is. Being is the *a priori* in this sense: it is that in reference to which beings are manifest as beings and which must be *first understood* if beings are to be accessible. Being is prior to beings and only the prior understanding of Being (not in chronological time) makes the experience of beings possible. In this understanding the being is 'constituted' in its Being, i.e., uncovered as a being.

Dasein's understanding of Being is the sole condition under which

both ontology and phenomenology are possible. Not only is ontology possible only as phenomenology, but phenomenology is possible only as ontology. The regress from beings to Being and the regress from the world to the being which constitutes the world merge into one and the same regression (*Rückführung, Rückgang*): the way back into Dasein's understanding of Being. It is only under the condition that Dasein understands Being that beings can be experienced as beings (phenomenology) and that they can be understood to be (ontology). The reduction to Being and the reduction to the 'subject' (Dasein) are in this sense one and the same.

Conclusion: Heidegger and Husserl

How then does Heidegger of the Marburg period stand in relationship to Husserl's 'transcendental phenomenology'? Is he a revisionist whose breach with Husserl is too enormous to gap, with whom there are only incidental similarities? I think not. I see Heidegger's work in this period as an attempt to further radicalize that which Husserl had described as radical, strict, scientific philosophy. For as the world depends in Husserl upon the disclosive activity of transcendental subjectivity, so in Heidegger does it depend upon Dasein's radically temporal understanding of Being. There can be no naive acceptance of the world for either thinker. Husserl recovers the up-to-now anonymous and forgotten life of transcendental consciousness; Heidegger makes explicit the up-to-now hidden pre-ontological understanding of Being. The 'anonymous' life of the ego in Husserl is paralleled in Heidegger by the 'forgotten' understanding of Being. Prior to all 'reflection' (Husserl), to all 'listening in' (*SZ* 139/179), there unfolds an activity which, wholly unknown to our natural life in the world, renders that world possible. There is for both a natural attitude which takes the world as ready-made, autonomous, objective, and there is for both a breach with this attitude which discovers the constitutive life which renders the world manifest. The breach is a breach with the world, though in quite different senses for each thinker. In Husserl the breach takes the form of an *epoche* which brackets the contingent world in order to find the necessary sphere of pure consciousness, a sphere which could survive even the destruction of the world (hardly a possibility for being-in-the-world). In Heidegger the breach consists in raising the question of Being, in questioning the being in its Being. This questioning – something of a Heideggerian *epoche* – discovers not a pure ego but the radically worldly Being of being-in-the-world – in whose temporal understanding of Being the world is disclosed. Heidegger's breach is perfectly described by Merleau-Ponty: it consists in slackening the bonds which tie it to the world – the broken hammer – just long enough to

bring the world as such into view; it consists in attempting the *epoche* just long enough to discover the impossibility of carrying it out.¹⁶

What then can we say of Husserl's judgment of Heidegger – that he has not understood the basic sense of the reduction, and that he leads phenomenology back to the level of anthropology? I believe this judgment is too harsh, though it is perhaps the only judgment the author of the method could render upon such an independent appropriation of his work. Heidegger has indeed understood the reduction, but he has understood it – as he understands everything – in his own way. His version of the reduction does not lead phenomenology back to the level of natural, mundane subjectivity, but, on the contrary, to the disclosive activity in which everything natural and mundane comes to be 'there' (*da*). *Being and Time* represents a brilliant appropriation of Husserl's thought which, while it clearly depends upon the preparation made by Husserl, also has an inspiration of its own.

The whole discussion of the early Heidegger's relationship to Husserl and so to the phenomenological movement illuminates the problem of Heidegger's path of thought. Heidegger was throughout his life moved by Husserl's call to the things themselves, to the *Sache* of all philosophical thought, and he has always adhered in his own way to the principle of direct seeing. To that extent he has always been in Husserl's debt. But in the Marburg period, in *Being and Time*, Heidegger was still profoundly affected by the transcendental motif in Husserl's phenomenology, as the numerous texts we have cited amply document. In this light his *Kehre* consists in overcoming that very 'orientation towards the subject' which seemed to Heidegger in the '20s to be the very life-line of philosophy. Thus we can find something like the first reduction (to Being) which we discussed in this essay in the later Heidegger's writings but not the second (to the subject). For in the later works the regress to Being would become the 'step back' (*Schritt zurück*) into Being, the regress into the ground of metaphysics (*Rückgang in den Grund der Metaphysik*). But the regress into the subject was to be overcome and identified with the history of metaphysics. We saw that even in *The Fundamental Problems of Phenomenology* Heidegger thinks that the history of Western philosophy was characterized by a return to the subject, the difference being that he was willing to associate himself with that tradition in those days. In the later works Heidegger would still conceive Dasein as 'releasing' beings in their Being, but that would mean not the horizontal projection of them in their Being, but pure *Gelassenheit*. Dasein would still have an 'understanding' of Being (or rather it would have Dasein!), but that would have to do not with any transcendental 'subject' but with 'standing under' Being's address. The makings of the later Heidegger out of the early can be seen in these lectures by those who have the eyes to see, and who have the advantage of the hindsight afforded by the intervening

years. But the special contribution of the publication of the Marburg lectures is, I believe, to throw into relief what *Being and Time* meant to and for Heidegger and his generation a half-century ago.

Notes

1 Martin Heidegger, *Gesamtausgabe*, II. Abteilung: Vorlesungen 1923–44, B. 21, *Logik: Die Frage nach der Wahrheit* (Frankfurt: Klostermann, 1976), hereafter 'Logik'; B. 24, *Die Grundprobleme der Phänomenologie* (Frankfurt: Klostermann, 1975), hereafter 'Gp'. I will refer to the later title in the body of this article by its English translation. *Logik* represents the 1925–6 lectures, *Gp* the lectures of the Summer semester, 1927.

2 'Intentionality' is discussed in *Gp*, §§9b–c, 12a, 15c, 18b. The refutation of psychologism is discussed and subjected to an anti-critique in *Logik*, §§6–10. See also F. Olafson, 'Consciousness and intentionality in Heidegger's thought', *American Philosophical Quarterly*, 12, No. 2 (April, 1975), 91–103.

Heidegger and Merleau-Ponty: Being-in-the-world with others?

Christina Schües

If the balance of processes is destroyed,
then the underlying
unity of the cosmos will cease.

G. S. Kirk

Es ist mehr Vernunft in deinem
Leibe, als in deiner besten
Weisheit. Und wer weiß denn, wozu
dein Leib gerade deine beste
Weisheit nötig hat?

Nietzsche

Heidegger's 'hermeneutic of facticity' and Merleau-Ponty's 'existential phenomenology' both take shape as *philosophies of interrogation* and as *movements of thinking* in the everyday world. The former enquires into the possibility of an *understanding* of Being through *Da-sein*, the latter 'engages' philosophy in a *questioning* process which takes as its theme the relation between the sensual world and the world of expression. It inquires into the fundamental pre-conceptual structures of our relation to the world.

The words 'Being-in-the-world' are used by both authors, and at first sight it seems as if Merleau-Ponty took over the notion of 'Being-in-the-world' from Heidegger. I would like to begin by pointing out that the English expression 'Being-in-the-world' can be translated in more than one way. Even though Merleau-Ponty's use of the expression '*être-au-monde*' was certainly influenced by the Heideggerian notion 'Being-in-the-world', it should be noted that '*au monde*' is a dative which means 'giving oneself to', 'directing oneself to', i.e., a movement, of the subject to the world. So the French make use of two expressions: '*être-dans-le-monde*' which means Being-in-the-world and which carries a more spatial

meaning; and 'être-au-monde'; literally, Being *to* or *at* the world, with its customary connotation of 'being born'. 'Être-au-monde' is utilized in order to enlarge the former, somewhat spatial, conception into a lived contact with the world.¹ Therefore, 'être-au-monde' should be translated as 'being-to-the-world', an expression which comes closer to the Heideggerian notion of 'Falling', itself a mode of Being-in-the-world but clearly differentiated from it.²

The question whether Merleau-Ponty merely took over Heidegger's notion of 'Being-in-the-world' is the guiding theme of the following paper, and will be considered with regard to their respective attitudes towards the world, as also toward the possibility of co-existence and of a concrete encounter with others. Finally, in the last part, and based on a comparison of the earlier work of the two authors, I will look at the later development of their thinking – Heidegger's so-called 'turn' and Merleau-Ponty's 'deepening' thinking into the region of 'wild being' (*l'être sauvage*).

Husserl, the predecessor of both and the representative of 'transcendental phenomenology', envisaged the possibility of a meeting with the other in my world through his bodily givenness. Thus the problem of understanding the other becomes a problem of reflecting on the type of consciousness involved in the constituting procedure. Husserl employs for this purpose a special kind of apprehension which he calls 'appresentation', i.e., empathy. He finds the resources for such an apprehension in the subjective structures of transcendental consciousness. Thus, his attempt to constitute the other proceeds from an *egocentric* standpoint. Heidegger tries explicitly to overcome the philosophy of consciousness by radicalizing the Husserlian programme into a 'hermeneutic of facticity', with the requirement that the transcendental ego be comprehended as a factual, concrete self which understands itself in any self-interpretation as historical. Heidegger investigates a human understanding which grounds its questions in a being whose Being is ontologically privileged, in as much as it is able to thematize its own mode of Being: Dasein as the mode of Being of the human. Life is a structure of meaning for Heidegger as well as for Merleau-Ponty; but it is constituted as a factual structure and not as a structure of consciousness. For Heidegger, facticity is supposed to be the fundamental characteristic of Dasein; therefore, any question of Being has to be developed from the standpoint of the ontological constitution (*Seinsverfassung*) of Being, i.e., through the factual constitution of Dasein. Thus, the notion of 'facticity' assumes a philosophical status which points to the essential difference between Husserl and Heidegger.

And so the question arises whether the procedure adopted by Heidegger and Merleau-Ponty leads to an *inter-facticity* or rather to a *method of isolation*. 'Inter-facticity' would name the concrete encounter between

human beings. The idea behind a 'method of isolation' is motivated by the suspicion that, although Heidegger does suppose a fundamental unity of Dasein and world, the demand for a reference of Dasein to itself presupposes that Dasein only understands itself in terms of its *own* existence and therefore in such a way as to be *isolated* from the world. Dasein is introduced as that being which we ourselves are, one of whose possibilities of Being is that of questioning and which must consequently comport itself with respect to its Being (existence) in certain essential ways: (1) as questioning about Being; (2) as having a relation to Being. 'Dasein, in its Being, has a relationship towards that Being – a relationship which itself is one of Being.'³ Thus, any questioning about the Being of Dasein presupposes that comportment which Dasein always already assumes with respect to its own Being.⁴

This is the place where Heidegger's inquiry begins; a place where we already stand, the place of the questioning, relating, understanding and disclosing of Being. And Heidegger says that to such a Dasein 'there necessarily belongs: Being in a world'.⁵ But one might well ask whether the introduction of 'world' is to be taken seriously. For if the suspicion of 'isolation' can be confirmed with reference to the concept of Being-in-the-world, then *either* Dasein takes a world along with itself, but it is always its *own* world; *or* Heidegger puts forward an acosmism in which he *escapes totally* from the world. In either case, we would be faced with a *movement of monocentric thinking*. One might wonder whether such a method of isolation would require that we fall back on Husserl's transcendental reduction, thereby engendering an 'absolute aloneness' based upon the distinction between the transcendental and the natural ego. However, Heidegger's isolationist move only *appears* to resemble the transcendental reduction. Whereas Husserl strenuously seeks to bring to light a 'disinterested observer' who undergoes a 'complete personal change',⁶ Heidegger's interpretative 'isolation' is not a reduction; rather, it is an 'existential performance'⁷ which has as its methodological presupposition a determinate 'conception of authentic existence', one which leads the ontological interpretation from the outset as a 'factual ideal of Dasein' (SZ, p. 310/BT, p. 358).⁸ Hence the question: is authentic Dasein concerned with itself alone in a centrifugal movement of thinking?

In other words, does Heidegger ever actually propose a hermeneutic of inter-facticity?⁹ To put the question along the lines of Heidegger's characterization of philosophy:

Philosophy is universal phenomenological ontology, and takes its departure from the hermeneutic of Dasein, which, as an analytic of *existence*, has made fast the guiding-line for all philosophical inquiry at the point where it *arises* and to which it *returns*.¹⁰

Phenomenology and hermeneutics are to be linked to a hermeneutical ontology. In addition to the task of establishing the structure of that postulate, it is interesting to observe that Heidegger has no difficulty in showing how philosophical questions arise out of (*entspringen*) the concrete existence of worldly relations; but is he also able to do justice to the further move of return (*zurückschlagen*)?

Since Merleau-Ponty radicalizes his predecessor Husserl (as also Heidegger), I would, with regard to my question concerning 'Being-in-the-world with the other', like to argue for an 'existential phenomenology'.

Merleau-Ponty's 'existential phenomenology' is based upon a phenomenology of the body which is important for the thematization of the relation between the sensual world and the world of expression – as also for a 'reversal' of this relation. That is, he tries to thematize the fundamental pre-conceptual structures of our relation to the world by a *zurück-versetzen* of all essences in the factual existence and understanding of human being and world.

Looking for the world's essence is not looking for what it is as an idea once it has been reduced to a theme of discourse; it is looking for what it is as a fact for us, before any thematization.¹¹

'*Zurückgehen*' (*chercher*) here means using a phenomenological reduction but not in the sense of Husserl's transcendental reduction because it is never possible to achieve a total reduction, that is, a total neutralization of the body and of worldly embeddedness. A phenomenological reduction which does not assume the form of a philosophical idealism, but rather that of a philosophy of existence and of finality, is one which puts us right in the middle of perceptual happenings. Thus, for Merleau-Ponty, perception becomes exemplary and primary since it takes place in all modes of human existence and since it provides access to that which can appear. Thus, the notion of perception is overdetermined, yet still important from the standpoint of throwing light upon the structure of human experience. In the light of this phenomenological reduction, and by an application of that very method, we are able to realize our relation to the world and to discover ourselves as Being-to-the-world because the possibility of a total *detachment* from the world is in principle never fully possible. Therefore, philosophical interrogation is not necessarily a state of beginning, but a *movement of thinking* which enters into that which 'is given to be thought' by nature, history, time and world. In line with our theme and with reference to Heidegger, the questions for Merleau-Ponty are the following: if it can be shown that the assertion of Being-to-the-world is indeed an ingenious epistemological bridge between subject and object, inner and outer, then is it not the case that the subject¹² simply collapses into the world? Does his conception not

result in a downgrading of the world to something 'which is nothing apart from our Being inserted into it?'¹³

I Heidegger's Being-in-the-world

Heidegger's 'hermeneutic of facticity', confronted with the reproach of a *method of isolation*, will be investigated by way of his *movement of thinking* (particularly in *Being and Time*) and with reference to the disclosedness (*Erschlossenheit*) of Dasein (the Da) and its basic constitution (*Grundverfassung*): Being-in-the-world. The latter is to be taken methodically as the first discovery in his philosophical interrogation of Being, and will be used to bring out the implications and questions concerning his method, particularly in respect to the relation with others, its existential constituents and the modification of *Falling*. The total phenomenon of Being-in-the-world is explored in terms of its three basic aspects: world, Being-with and Being-in. We shall take each of these in turn.

1 World

'World' understood as surrounding world (*Umwelt*) is ontologically 'not a way of characterizing those entities which Dasein essentially is not; it is rather a characteristic of Dasein itself'.¹⁴ Essential to Heidegger's description of the 'world' is his analysis of *Zeug* (tool) in its serviceability (*Dienlichkeit*), which turns into the notion of concern (*Besorgen*). 'That wherein Dasein understands itself' is 'that for which it has let entities be encountered beforehand'. Heidegger continues: 'And the structure of that to which Dasein assigns itself is what makes up the worldhood of the world.'¹⁵ The purpose of this analysis is to show that we always have a pre-understanding of the referential totality (*Verweisungszusammenhang*) included under the head of doing something 'in order to' (*um-zu*) in our dealing with tools. The worldliness of the world is that which enables Dasein to experience beings as a kind of tool located within a certain context of action. In daily experience, i.e. in the world of what is ready-to-hand within the world, the tool is perceived as a 'thing' to do something with, e.g. I perceive a pencil as a tool to write with. A *tool* is an entity of such kind that it always refers to others, because it is useful for others as well as myself and because it is made by others. Hence, Heidegger tries to avoid any mentalistic implications by using terms modelled on notions of dealing, e.g. doing-something-with.

2 Being-with

Heidegger starts neither with a pure ego who posits a world, nor with an isolated ego who constitutes the relation to the other. The others are always already there with me when I refer to the surrounding world.

Dasein understands itself proximally and for the most part in terms of its world; and the Dasein-with of Others is often encountered in terms of what is ready-to-hand within-the-world. But even if Others become themes for study, as it were, in their own Dasein, they are not encountered as person-Things present at hand: we meet them 'at work', that is, primarily in their Being-in-the-world.¹⁶

But *who* are the others? Heidegger's answer can be restated in the following way: they are not aliens; they are with us in their similarity. I am with the others in our common dealings. I never need to question or worry about my relation with others because we exist as dealing concretely with one another and as directed towards each other by our common work. However, Heidegger opposes the idea that the 'who' of our everyday practical dealings might be identified with these dealings. Furthermore, he also rules out Husserl's empathic constitution of the other as a 'Double of the self'.¹⁷

'The world of Dasein is a with-world [*Mitwelt*]. Being-in is Being-with Others [*Mitsein mit Anderen*]. Their Being-in-themselves within-the-world is Dasein-with [*Mitdasein*].'¹⁸ Thus, the relation to the other is an irreducible Being-relation (*Seinsbezug*) of Dasein as Being-in-the-world. Heidegger uses the analogy between a concerned dealing with tools and a solicitous dealing with others in his description of the alien experience. The problem consists in (1) the danger that this analogy could lead to an objectification of the relation with the other. The similarity between the 'tool' and the 'other' consists in the idea that they are both integrated (*eingefangen*), in my world-projection (*Weltentwurf*).¹⁹ (2) The difficulties and misunderstandings connected with the experience of others are not addressed. For Heidegger chooses examples which, for the most part, do not show the *otherness* of the others: in his historically constituted 'Handwerker- und Schusterperspektive',²⁰ I always meet them 'at work' . . . which limits the analysis of the notion of the tool as well as that of the analysis of Being-with. The limits and differences in my understanding of others are never thought through, even though they appear quickly enough when I 'meet' others who 'disturb' me in *their* way of being-in-the-world.

The idea that Dasein is equi-primordially Being-in-the-world means that the world is always shared with others. But, in the end, it turns out that the otherness of the others is reduced to structures of equivalence. 'The violence of the encounter with the non-I is deadened by the equivalence of this otherness.'²¹ A first answer to the question 'who is the other?' can now be risked: *the other is the one who is just like me in all essential respects*.

But there is a more positive side to Heidegger's understanding of Being-with, a side which is brought out by Waldenfels when he says:

Während der Andere auf diese Weise im Mitvollzug meines Weltlebens ebenso mit da ist, wie ich selbst mit da bin, frage ich zunächst nicht, mit *wem* ich es zu tun habe, sondern *was* ich mit ihm zu tun habe. (Since, in the course of my interaction with the Other, the latter is there with me in just the same sense as I am there with it, it is more pertinent for me to ask, not with *whom* I have to do, but *what* I have to do with the Other.)²²

In addition to the direct, frontal and so personal relation to the other (*mit wem*), Waldenfels sees here the basis for an indirect, lateral and so situational relation to the other, a relation founded in a common task (*was ich mit ihm zu tun habe*), in work done together. If this 'situational' experience of the other were to be regarded as the only basis for an understanding of the other, it might then be possible to object, with Theunissen, that the relation to the other has not been properly accounted for since, in *Being and Time*, 'encounter' means that 'inner-worldly beings encounter a Dasein that lets itself be encountered'.²³ But if this situational 'what' is interpreted as just one aspect of the inter-human relation then this extension would make it possible to introduce intentional structures founded on an 'in-between' which bears upon the fact that I have something to do with the other.

For Heidegger, dealings with the other are characterized by the notion of *care* which is described in its twofold modification: there is a negative care which takes away the care of the other in order to control him. But there is also a positive side to care, essentially to authentic care, which lets the other be *free for himself*.²⁴ Thus, Heidegger uses a strictly twofold *evaluation* for the comportment of Dasein which parallels the distinction of inauthenticity and authenticity. This way of talking disperses the authentic and inauthentic modes of Being on the ground of a normative accentuation of ontological modalities. This description can at most show us that Being-with the other does not necessarily consist in a good or bad understanding of the relation with the other but of a '*right* kind of objectivity which frees the Other in his freedom for himself';²⁵ which in turn leaves Dasein free to focus undisturbed upon the purity of its own destiny. Certainly, both modes of existence function in concrete daily practice. So Heidegger's normative privileging of the *own* Dasein gives it an idealist-constructive status which sees the other as someone who can drag Dasein down into the, pejoratively described, modus of the They: through distancing, averageness and levelling down (*Abständigkeit, Durchschnittlichkeit, Einebenung*). The others are unindividuated others who can be summarized under the title of 'They'. Thus, the next answer to the question of 'who is the other?' is the following: *the other is the 'They', the One, people in general*.

The 'They' is that which anonymously reduces public life and dealings

between people down to averageness. There are rules which one follows; we do certain things because 'one' does them; in this sense it does look as though we can find here some viable descriptions of our general experience of daily life. However, despite Heidegger's valuable description of some aspects of our co-existence with the other in daily life,²⁶ it seems that although the two modi of the comportment of Dasein may well be equi-primordial (*gleichursprünglich*) they cannot be equi-valent (*gleichwertig*). If the self-reference of Dasein is supposed to lead to a disclosedness of Dasein, i.e. a Being-in-the-truth, the structure of the 'They' in its average everydayness appears as a 'Being-in-untruth'.²⁷ Who is the other? 'The *Who* is the neutral "They" '28 who may *drag me down* into everydayness, averageness and Falling – and so into *un-truth*.

3 *Being-in*

The analysis of Being-in the world focuses on the role of the others as belonging to a 'They' which runs the risk of dragging Dasein down into the Falling of inauthentic existence. However, the Being-in of Being-in-the-world is characterized by a description which runs into a contradiction in as much as Heidegger's move away from the world generates a problem with regard to the possibility of a corresponding (centrifugal) movement of return.

Heidegger's description concerns the existential constituents of the *Da*, the everyday Being of the *Da* and the Falling of Dasein. It seeks to grasp the concept of Dasein as a whole and in relation to time, and so to prepare the way for authenticity. It has the task of rescuing Dasein from the dangers of averageness and indifference, dangers which follow from living with people. A description of the existential constituents and of the concept of temporality shows Falling to be a contradictory concept, only 'one side' of which can therefore be used to establish a parallel with Merleau-Ponty's Being-to-the-world.

Heidegger's existential constitution of the 'Da' consists in State-of-mind (*Befindlichkeit*) and Understanding (*Verstehen*).²⁹ This twofold structure can also be found under the name of facticity/existence, and thrownness/projection.

The term State-of-mind is characterized by its relation to the world: 'Existentially, a State-of-mind implies a disclosive submission to the world, out of which we can encounter something that matters to us.'³⁰ In contrast, Understanding is employed whenever Heidegger wishes to talk of Dasein's potentiality for Being: Understanding is a 'disclosive potentiality-for-Being' in which Dasein can come to the 'possibilities of its own Being' and in which it can project that 'ownmost potentiality-for-Being' embedded in the 'Worldhood of its actual world'.³¹ Thus, State-of-mind and Understanding are two of Dasein's *existentialia* (*Existenzialien*), *existentialia* which characterize the 'primordial disclosedness

of Being-in-the-world'.³² And, in addition to the characterization of that twofold structure, Heidegger also exposes the everyday Being of Dasein: 'In addition to characterizing the primary constitution of the Being of disclosedness, we will require . . . an interpretation of the kind of Being in which this entity is its "there" '. This basic mode of Being of average everydayness is named 'Falling'.³³ It is a specific 'disclosedness of Being-in-the-world, in so far as the latter, as something which is everyday, maintains itself in the kind of Being of the "They" '.³⁴ In this context, Falling is not another *existentialia*, next to the former two, but rather an 'everyday modification of that disclosedness which Dasein is',³⁵ an '*existential modus* of Being-in-the-world'.³⁶ In this sense, Falling, understood as idle talk, curiosity and ambiguity, would be a specific form of State-of-mind and Understanding; it would be its everyday form (and so not to be understood as equi-primordial). In other words, it could be said that Falling is a modification of the fundamental movement of Dasein, a modification which takes Dasein away from itself in accordance with 'its ownmost inertia [*Zug*] of falling'³⁷ and towards the alienation of inauthentic Dasein, that is, towards the 'dictatorship of the Public'.³⁸

That Falling is a modification of the two basic constituents becomes apparent through the description of 'being-alongside inner-worldly beings', i.e., in the mode of everyday and average Being-with. Heidegger, in contrast to Merleau-Ponty, does not give Falling, i.e., the *modus* of the 'They', any (re-)productive possibilities, that is, certain regularities, or a set of inter-factual rules which would not have to be newly constituted each time Dasein was investigated. This is rather unfortunate because if such (re-)productive possibilities were to be conferred upon Dasein then Heidegger could not simply assume that we necessarily have to start from scratch each time. At this point I simply want to insist (and with Merleau-Ponty it will become much clearer), that we do need inter-subjective regularities, a 'background' of some kind to function as a 'spring-board' for spontaneous acts.

However, implicitly built into the structure of Dasein is the idea that it can turn away from itself and that it can think itself in the wholeness of itself. The wholeness of Dasein is construed in the following tension: in Thrownness and State-of-mind, Dasein is 'always already thrown into a world'; and the wholeness of Dasein consists in the 'ahead-of-itself-Being-already-in-(the world) as Being-alongside (entities encountered within-the-world)'. As such it fulfils the meaning of the title '*Care*'.³⁹ 'Dasein's factual existence . . . is always already absorbed in the world of its concern', i.e. in Falling. Hence, Dasein is essentially characterized by the twofold structures of existence and facticity, projection and thrownness. The reason for the fact that Falling is not constructed on a parallel with State-of-mind and Understanding in this 'essentially indivisible wholeness'⁴⁰ remains unfortunately opaque.⁴¹

To sum up, Falling as a modification of State-of-mind and Understanding, of facticity and existence, transforms Heideggerian Dasein into Being-in-the-world in its everydayness and averageness, i.e., in the structure of untruth. Having discussed the formal structure of care in its relation to the description of Dasein in its everydayness, I would now like to contrast this account with the description of Falling in relation to the temporality of Dasein.

Later in the Heideggerian analysis, i.e., when he discusses *the temporality of Dasein*, Falling slips into an ambiguous role because it then changes into the third constituent of the totality of the structure of Care: the three in question being 'existentiality, facticity and Falling'⁴² which are united through 'temporality'. Up to now, the analysis was oriented on the inauthentic understanding of Dasein because the unitary ground for the complex formula: 'ahead-of-itself-Being-already-in(the world)' as 'being-alongside' had not yet been developed. Heidegger hopes to show that if Dasein finds its original unity, that is, its authentic sense as temporality, then each element of Care must show itself as an authentic form within this temporal unity. Heidegger introduces this 'second characterization' of Falling as equi-primordial (*gleichursprünglich*) with existence and facticity, i.e., understanding and state-of-mind, both now being interpreted both in terms of authenticity and inauthenticity.

(a) Understanding

Understanding is 'ahead-of itself' (*sich-vorweg*) and it is *primarily* the future toward whose 'existential possibilities'⁴³ Dasein can project itself. The future comes forward as 'anticipation' (*Vorlaufen*) in its authentic form and as 'awaiting' (*Gewärtigen*)⁴⁴ in its inauthentic form (by making it dependent upon what is indispensable in our everyday business).⁴⁵ According to the alternatives of authenticity and inauthenticity, the whole temporality of Dasein is unfolded out of the future. Thus, Dasein can return from the authentic future to its past, while its own 'having-been' (*Gewesen*)⁴⁶ is closed off from the inauthentic future.

(b) State-of-mind

The temporal 'ekstasis' of State-of-mind is characterized by 'always-already-Being'. This 'ekstasis' means always 'finding oneself in some state-of-mind or other'.⁴⁷ State-of-mind is developed *primarily* in the 'having-been' (*Gewesenheit*),⁴⁸ and is expressed in Dasein's having a mood (*Gestimmtheit*), a mood (*Stimmungen*) in which it can encounter its authentic (anxiety) and inauthentic (fear) modes of pastness. In fear, which is always a fear about oneself, Dasein holds on to the past. The inauthentic past which Heidegger determines as 'forgetting'⁴⁹ forces 'Dasein back upon its Thrownness, but in such a way that this Thrownness gets quite closed off'.⁵⁰ In contrast, Dasein is authentically

brought back to itself in anxiety which brings Dasein back before its own Thrownness and reveals the uncanniness of everyday being-in-the-world. 'This bringing-back has neither the character of an evasive forgetting nor that of a remembering. Rather anxiety brings Dasein back to its own Thrownness as something possible which can be repeated.'⁵¹ 'And bringing one face to face with repeatability is the specific ecstatic mode of that pastness which is constitutive of the State-of-mind of anxiety.'⁵² So the past as well as the future both allow for that temporalizing of Dasein in which Heidegger already envisages an *escape* from everydayness, i.e. an escape from imprisonment in the uncanniness of Dasein.

(c) Falling

'Just as understanding is made possible primarily by the future and moods are made possible by having been, the third constitutive item in the structure of care – namely, falling – has its existential meaning in the *Present*.'⁵³ Accordingly, the structure of care associates the present with Being-alongside (*Sein-bei*). However, the description of Falling is different from that of the other two: for there is no *convincing* opposition between authentic and inauthentic presence. Heidegger is more or less only concerned with the mode of inauthenticity which consists of self-entanglement and alienation. If the present only made its appearance in the mode of inauthenticity then the potentiality for the unification of temporality would be obstructed and potentiality-for-Being would be forced back upon that facticity of Thrownness to which Dasein is delivered over. As a systematic rescue operation, Heidegger rather awkwardly introduces an authentic mode of the present. He calls the inauthentic present a 'making-present' (*Gegenwärtigen*), in contrast to the *authentic* present, which is called the 'moment of vision' (*Augenblick*).⁵⁴ And, strangely enough, the 'moment of vision' is derived from the authentic future which is gathered together in the anticipation which goes along with resoluteness. In this way, he avoids having to speak directly of an 'authentic Falling' – even though the logic of temporality demands it. With regard to Care, the concrete foundation for an authentic present is missing, even though such a foundation was provided for State-of-mind and Understanding. Thus, the authentic present, *qua* 'moment of vision', remains a dubious dilemma.⁵⁵

The problem seems to be the following: Falling furnishes a 'stage' which must be overcome in one respect and which is authentically required: 'To understand in an existential manner implies projecting oneself in each case upon one's ownmost factual possibility of having the potentiality-for-Being-in-the-world.'⁵⁶ Thus, there is an ambiguity between everydayness and inauthenticity: with respect to everydayness, Falling must be overcome in the temporality of authenticity and yet it must be excluded from it as authentic. In the course of his investigation,

Heidegger oscillates between an evaluation of the They as a grounding category and as a personal state of mind.⁵⁷ And in so far as Falling is regarded as that present which is needed for authentic, totalizing time, Falling (in everydayness) remains within the field of authenticity. A radicalization of Being-with would have to balance the modalities of authenticity and inauthenticity and it would have to renounce the proclamation of the projection of Dasein 'upon its ownmost potentiality-for-Being'⁵⁸ as the authentic mode of existence.⁵⁹

The problem is that the authentic present (the *Augenblick*) is officially and formally grounded in Falling, but thematically it has another much less official origin.

4 Resolution (Entschluss)

Falling remains included in the temporal interpretation of care, even with regard to authenticity. But it no longer assumes a fundamental role. Dasein can 'choose' to be-itself or not-to-be-itself through the anticipation that goes along with resoluteness. Both an active encounter and a resolute withdrawal from such an encounter are to be found in the present in which a decision is made.⁶⁰ The result is that the 'situation' of the present is opened up through choice. Resoluteness (*Entschlossenheit*) is however a mode of disclosedness (*Erschlossenheit*), and not of Falling. Falling (as the ir-resoluteness of the They) becomes that element of opposition in the 'moment of vision' which would have to be named 'authentic Falling', according to the second interpretation. The resolution which lies in the 'moment of vision' belongs to the future as the transposition of futural resoluteness.⁶¹ Thus, Dasein gives itself from the future. Resoluteness is thought out of the future. The world as a 'meaningful whole' furnishes the 'field of play for a resoluteness [*Entschlossenheitsspielraum*]' which opens Dasein up but which, at the same time, returns Dasein to an individualization founded in temporality'.⁶²

So, the notions which are used to construe the authentic present stand opposed to Falling. 'In as much as Dasein gives itself its own situation it disposes – out of the future – of that which it encounters in this situation.'⁶³ Thus, Heidegger's Dasein remains in the tradition of a Reason 'which only has insight into that which it produces in accordance with its own project'.⁶⁴

With that move, a *movement of thought* which could be called a 'centrifugal movement of the self towards Being',⁶⁵ isolated Dasein escapes from the 'uncanniness' (*Unheimlichkeit*) of Falling, and it finds its salvation in its own self, a self which resolves to determine itself from itself and which, therefore, loses, in isolation, its own essential structure: its Being-in-the-world. Thus, Heidegger's thinking remains in the grip of a subtle acosmism which leads on to the problem that the 'facticity of Dasein' actually misses both its historical Being and that 'starting-place'

(Being-in-the-world) definitive of its very Being. For this reason, his project should be regarded as a '*hermeneutics of isolation*' rather than a '*hermeneutics of facticity*'.

The Selfhood of the self, i.e., its isolation and acosmism, is attested in Being-toward-death, which is both personal and solitary, and with regard to which nobody can replace me; however, it cannot be held against Heidegger that his thesis is guided by the anonymity of mortality in general. Thus, the structure of Being-with is one which holds the others in a certain relation to the structures of *my* Being; that is, they are there, yet not to interfere in my *monocentric* freedom.

The implication behind this acosmism is that Heidegger prefers the monocentric, authentic Dasein, which exists beyond any involvement in the daily world, to the concrete-factual self who would be characterized by an inter-connection of personal and anonymous traits and by an involvement in the world. Therefore, Heidegger basically *fails* to provide a theory of a decentralized subjectivity and he fails in his undertaking to show how we get back from this authentic mode to the concrete-factual existence of intersubjectively construed Being-in-the-world. The idea that Heidegger does not place any especial value on human reality, is also evident from the *Letter on Humanism* in which he writes that the essence of man is essential for the truth of Being, and that apart from the truth of Being man himself does not matter.⁶⁶ Heidegger stressed that the essence of man rests in Being-in-the-world; but by 'world' he later came to mean the clearing of Being, wherein man stands out from his thrown essence.⁶⁷

Much of this will be called in question by Merleau-Ponty. But before I turn to Merleau-Ponty I would like to make one further remark about Heidegger's preference for temporal over spatial structures. For he does speak of the spatiality of Dasein and the spatiality of Being-in-the-world. Innerworldly ready-to-hand (*Zuhandene*) tools belong in a region, along with other human beings, and are there for Dasein through Dasein's daily dealings both with the former and the latter. The encounter with the ready-to-hand (including therein the others) is made possible on the basis of the spatiality of Dasein with regard to its Being-in-the-world. The spatiality of Being-in-the-world consists of an abolishing of the distance (*Ent-fernung*), i.e., an approximation based upon the 'subjective' a priori of Being-in-the-world.⁶⁸ De-severance or approximation is complemented by directionality or orientation. And both have to be regarded as modes of Being of Being-in-the-world. One constitutive moment of Being-in-the-world is Dasein's taking up space (*Einräumen*) through the circumspective concern and solicitude with which it discovers a region. Taking up space (*Einräumen*) also means making up space – *Raumgeben*. Hence Heidegger concludes: 'Space is not in the subject, nor is the world in space. Rather, space is "in" the world in so far as space

has been disclosed by the Being-in-the-world which is constitutive for Dasein.⁶⁹ The notion of disclosedness, which is based on anticipation in the future, shows that the temporality of Being-in-the-world is the fundament of the specific spatiality of Dasein. The spatiality of Dasein, constituted by directionality and de-severance, can only be 'spiritual' (*geistig*), because the extended (physical) body would not be capable of taking up space in that quite specific sense. Thus, 'in existing, it has already "made room for" its own "field of play" (*Spielraum eingeräumt*)'⁷⁰ which latter is neither an extended physical space nor a space which can be opened up without the necessary modes of Being of Dasein which are themselves based on temporality, in the sense of an existential foundation. Thus, for reasons of normative preference, Heidegger gives the temporal structure preference over a spatial structure which could actually have been developed further with a view to a basic description of inter-facticity. But so far from attempting to draw the consequences which follow from any such introduction of the body as that which could alone be the medium of a 'taking up space', he does not even try to explain the ontological reasons for the preference accorded by him to time.⁷¹ Had he paid more attention to the phenomenon of 'taking up space', he could not have neglected the body, i.e., the own body as well as the body of the other (see chap. 5, vol. I of the present work). The rationale behind this criticism and the re-evaluation of the significance of the body can only adequately be addressed with reference to the work of Maurice Merleau-Ponty.

II Some remarks by Merleau-Ponty directed at Heidegger

In texts by Merleau-Ponty we find scattered remarks and a few criticisms directed at Heidegger, which we shall take up in order to develop a few comments which might have led to a dialogue between the two philosophers; witnesses of such an event could at least have tried to comprehend *what* one learnt from the other and *how* the one understood the other.⁷²

For Merleau-Ponty, Heidegger is a philosopher who has managed to regain possession of the self and, consequently, to free the self from any external, worldly determination. However, whereas Husserl's radical reflection focuses on the privileged domain of consciousness in terms of its reflective power, Heidegger is obliged to introduce unfounded elements into his philosophy. That is, according to Merleau-Ponty, Heidegger does not focus on a privileged domain of knowledge as did Husserl; rather, he incorporates much more primordial and 'irrational elements'⁷³ into his philosophy. Therefore, it was only to be expected that he would bring his philosophy back to the domain of 'facticity'.

But actually, and this is probably Merleau-Ponty's strongest criticism of Heidegger, he simply uses 'dogmatic formula'⁷⁴ for the definition of the philosophical attitude and knowledge. He 'seems to see no difficulties in assuming an unconditional philosophic intuition'.⁷⁵

The point is not that an unconsciousness is built into philosophical knowledge: for instance, even Husserl was prepared to admit a 'certain degree of naivety'.⁷⁶ But he did so by using the method of 'bracketing' and carefully describing its status and role. Heidegger, however, takes his stand in the Being-in-the-world of Dasein which, for Merleau-Ponty, means that the philosopher who is 'thrown' into the world would, for this very reason, have difficulty in arriving at a state of adequate knowledge. For example, the *natürliche Weltbegriff*, the natural concept of the world, has to be understood, according to Heidegger, independently of the sciences.⁷⁷ Thus, Merleau-Ponty criticizes Heidegger for presupposing an understanding of, and a thinking about, the world which dispenses with human experiences and the empirical sciences. Heidegger's descriptions already assume that the everyday subject is capable of raising its arm in order to drive a nail into the wall, that it is capable of looking around, communicating with others and so on. The reader notices too late that the author's very detailed and exact descriptions of Dasein's being-in-the-world are matched by an equally complete negligence of the world. This is the ground on which it has been claimed that the basis of Merleau-Ponty's understanding of experience is laid out 'deeper' than Heidegger's.⁷⁸

The difference between the empirical sciences and philosophy, or even stronger, between the former and the prerogatives accorded by Heidegger to a philosophy which overlooks the contextual features of the world is not itself the only problem. To be sure, the human sciences and our ordinary human understanding already presuppose the philosophical knowledge of the world and its principles. The empirical investigator simply assumes such principles as that of induction in order to understand the facts. Even Husserl has his a priori assumptions. However, Husserl addressed the question of the reciprocal relation between philosophy and the natural attitude by his method of 'bracketing', i.e., his phenomenological reduction. For Merleau-Ponty, philosophical reflection is only truly radical if it understands itself as a 'reflection upon the pre-reflective'; that is, if it does not forget its dependence upon the pre-objective functions of life from whence it arises, if it does not forget itself as event, and if it does not forget to comprehend itself as a situated and contingent movement of thinking. A phenomenological reduction which responds to these requirements leads on to an existential phenomenology: 'Heidegger's "being-in-the-world" appears only against the background of the phenomenological reduction.'⁷⁹

Heidegger, by contrast, or so Merleau-Ponty argues, remains fixed on

the opposition between the ontological and the ontic and tries to investigate Being-in-the-world through his preoccupation with a thinking about wholeness. Hence, Merleau-Ponty's criticism focuses on Heidegger's two drastic distinctions between the ontological and the ontic, on the one hand, and between authenticity and inauthenticity, on the other.

Quite rightly, Merleau-Ponty points out that Heidegger is not concerned with a description of Dasein as an autonomous and fundamental sphere but that he tries to get 'through Da-sein', to Being, and that therefore, the analysis of human attitudes is 'undertaken only because man is the interrogation of Being'.⁸⁰ Merleau-Ponty notices that Heidegger's analysis of truth and our openness to truth, as required by 'Being and Time', overshadows his description of anxiety, freedom and concern. In Heidegger's later writing, which we shall briefly consider at the end of the paper, the relation between human beings and Being is no longer regarded as an *ekstasis* or in terms of a centrifugal movement of the self towards Being. Which prompts Merleau-Ponty to ask the following question: 'If we call philosophy the quest for Being or for the *ineinander*, is not philosophy quickly brought to silence – that very silence which Heidegger's essays break from time to time?'⁸¹

Heidegger's *abstract worldless existence* is replaced, in Merleau-Ponty's thinking, with an investigation of the body, a body which consists essentially of Being-to-the-world, and which is, or so I would argue, construed rather differently from the Heideggerian notion of Being-in-the-world. For Merleau-Ponty, the world is the field of our experiences, and we are a certain modification of it. Therefore, he can open a third dimension on this side (*en deçà*) of the inner and outer, self and world by means of the 'body', and later by way of a 'deepening' thinking which leads into the concept of a 'wild being'.

III Merleau-Ponty's 'bodily existence'

To disentangle the ambiguous way in which the notion of the body is brought out, we need to look at its particular usages. We⁸² observe the body in the empirical worldly natural context as a physical body among other things. It has its spatial relations, a form, and it affects, and is affected by, the world. 'Far from my body's being for me no more than a fragment of space, there would be no space at all for me if I had no body.'⁸³ For Merleau-Ponty, it makes little sense to say: my arm rises to greet a friend, my hand drives a nail in the wall, a car hits my body in the city. For only the actor would distance himself from the body in that way.⁸⁴ Rather, at this point, and in agreement with Heidegger's notion of *Einräumen*, I raise my arm to greet a friend, I drive a nail in the wall and I hit myself with the hammer. In these cases we deal with the body

as a body in which we live; it is an affected object which has pain and kinaesthetic sensations, which I feel internally, and which I do not ascribe to myself from the outside. Therefore, my physical body is not the same as my living body. When 'I regard my body, which is my point of view upon the world, as one of the objects of that world',⁸⁵ I falsify the sense of what it is to be a body. For body and object are not binary poles on the same level of abstraction, since only through the functioning of my body do I recognize my body as a part of the world. In this sense, the body stands in a relation to the 'I' and so 'I cannot understand the function of the living body except by enacting it myself, and except in so far as I am a body which rises towards the world'.⁸⁶ In other words, I can only understand the (own) body from the point of view of the functions of the body, since all 'possession' of the world, that is all cognition, action and expression presuppose the body. Therefore, the body is the relation between the world and myself, a relation which is itself directed towards the world. 'The world is not what I think, but what I live through. I am open to the world, I have no doubt that I am in communication with it but I do not possess it; it is inexhaustible.'⁸⁷ The body '“understands” in the cultivation of habits'⁸⁸ because the body inhabits space and time.⁸⁹ Habitual body means habituated body as well as habituating body. Since I perceive through my body (i.e., the body is the medium through which I relate to the world), and since I therefore inhabit the world through my body, my perceptions and actions are habituated and habituating.

It is peculiar, however, that, on the one hand, the body fulfils its mediating role more adequately the less its materiality is felt. A heavy body does not run well, a mentally ill patient needs to 'find' his arm before he can draw an abstract figure.⁹⁰ In all these cases, malfunctions, or the condition of the environment, point to the materiality of the body which stands back in 'normal' situations, e.g., I write 'better' when I am not conscious of my fingers moving along the keyboard. On the other hand, the body does have its materiality in the sense of its situatedness in the world. Our body is not only a medium of communication but is also 'our anchorage in a world'.⁹¹ If the body is the medium between the I and the physical body, the I and the world, then we can infer that *through* the body I *have* the world and have my *anchorage* in the world.

A further sense of the body is that it is a body-subject, 'a natural self and, as it were, the subject of perception'.⁹² This idea, which radicalizes the thought that the body is on this side (*en deçà*) of the alternatives of consciousness and the thing, can now be formulated in a positive way: the body through which we perceive and which is the subject of perception is itself the 'natural ego', that is, the 'expression of a concrete Ego'⁹³ which belongs neither to the determinate sphere of nature nor to the (indeterminate) sphere of free will. Rather, I am conscious of the world

through my body and I am conscious of my body through the world. We are body-subjects and we have a (bodily) space because of our body. A bodily being is presupposed by all actions and cognitions. The embodiment of the world, or bodily spatialization (*Einräumen*), is determined in accordance with the borders of my (living) bodily space, a space which makes up my existence and my 'being alive' (the concept of which is broader than Heidegger's because, in addition to its spatial connotations, it includes that of 'being born'). Thus, the directedness towards the world, and the unity of the world, is realized through the schema of the body. Hence the subject of synthesis is not the 'I' (as with Husserl), but the body.

Merleau-Ponty certainly does not think that the body is pure passivity; rather it is the rising and falling off of an activity, which is not in the sphere of the pre-ego.⁹⁴ The crucial difference between Merleau-Ponty and Husserl seems to be the following: Merleau-Ponty follows Husserl in some respects. However, he does not subscribe to the Husserlian transcendental reduction which, despite its insights into the genesis of consciousness, remains within the privileged realm of consciousness. Merleau-Ponty's conception does go beyond the limits of a philosophy of consciousness because the body is not a reality for *consciousness*, as it is for Husserl, but rather for *existence* – life and the natural I. So, if the bodily subject is the basis or pre-supposition of a reflective, projective, constituting and expressive, consciousness, corporality cannot be made into a constituted object for a constituting consciousness which would then have to place itself prior to 'corporality'. Thus, in his articulation of the primordial structures of existence, Merleau-Ponty locates subjectivity not in the mind or consciousness, but in the body, which is, therefore, the locus of intentionality, as presence to the world and openness upon its possibilities.

Thus, the intentionality which, in connection with Heidegger's description of being-with, would have to be located *in-between* the others, can find its application here: since we perceive through the body, the body must have understood the world already. Consequently, Merleau-Ponty can bring out a moment of perception which happens in myself without being merely initiated by my mind nor strictly caused by the physical body. Perception takes place somewhat in anonymity. 'Every perception takes place in an atmosphere of generality and is presented to us anonymously. . . . Every sensation carries within it the germ of a dream or depersonalization.'⁹⁵ Therefore, sensitivity or perception is neither an objective nor a subjective state of consciousness. This anonymous existence reveals the non-egological sense of the field of experience, a sense which can be taken up into the personal ego. This becomes particularly apparent with the notion of 'perspective', a notion which corresponds to the subjective side of an inter-subjective constitution of sense. Thus, the

body is embedded in the concrete ego (whose expression it is) as a pre-personal, anonymous, natural and cultural existence. It is that which my personal existence always was from my birth (which is an anonymous natality) and so on towards my death (which is an anonymous mortality).⁹⁶ And it is that which it has become through life. It is my primary and my secondary nature, both natural and cultural at once.⁹⁷ In other words, I am my body.

Temporality also has a role as a dimension of existence. His analysis of time relies heavily on Husserl and Heidegger in distinguishing a lived time from an objective time. Time is understood as subject, the subject as time.⁹⁸ Yet by contrast with Heidegger, who contrasts an authentic with an inauthentic time, Merleau-Ponty locates us in a present which expands into the past and future as 'presence-to-the-world'. In other words, time, for Merleau-Ponty, is a time of existence. However, neither the body nor existence can be taken as original because they presuppose each other in the *drame existentiel*⁹⁹ of life: the body is a fixed and general existence, and existence means undergoing embodiment.

I am my body, at least wholly to the extent that I possess experience, and yet, at the same time, my body is, as it were, a 'natural' subject, a 'provisional sketch of my total being.'¹⁰⁰ It is my mode of being in the world. Thus it represents the facticity, concrete quality and personal style of my intentions and actions which become recognizable by other individuals, at least in theory, as my way of being and acting. Thus, according to Merleau-Ponty, my body is my way, and my style, of projecting myself towards the realm of things. The object '*is already in front of us as an other, thereby helping us to understand how there might be perception of other people.*'¹⁰¹ In some sense, I always know of the existence of others by looking at any cultural object since they are always experienced, if not explicitly, at least implicitly, under the 'veil of anonymity'.¹⁰² The others belong to the world and, therefore, co-exist with each other; however, they co-exist in a condition of (relative) indifference, i.e. as an anonymous generality in an undifferentiated social field.

The undifferentiated social field is one side of the notion of inter-facticity; the other side, belongs to the actual encounter with the others. If perception takes place in a sphere of anonymity, and if the perspectival character of perception is due to the concreteness of my incarnate consciousness, then it seems as if the perception of the other is established through a notion of *inter-corporality*¹⁰³ as well as through a process of *de-differentiation*. Inter-corporality (something like an anonymous bodiliness which I share with other organisms – a common language),¹⁰⁴ can be taken as a fundamental structure of our bodily being-to-the-world, one which not only encompasses our pre-personal, anonymous articulation of concrete co-existence, but which also points to the ontological relevance

of a 'third dimension', i.e., a contexture of embodiment into which ego and world do not collapse because our concrete bodily co-existence with the other shows itself through our sensibility regarding the other. This sensibility is not meant in the form of physical violence but in the form of a 'violence' in which the other's look can affect me. The look of the other (without my necessarily seeing her) can be felt as a burning in my neck;¹⁰⁵ it can make me uncomfortable or flatter my vanity. The 'violence' of the other's look shows the power of a certain dialectic between me and the concretely undifferentiated other. Thus, the de-anonymization of the other is a process of de-differentiation which takes place on the basis of anonymous, pre-personal inter-corporality. In as much as the sphere of inter-corporality prevents anything like a proper distinction between ownness and otherness, the sense of the own can only arise from the *differentiation of the own from the alien*.¹⁰⁶

What is important in inter-personal perception is that I experience *how* the others look, *how* the others smile, i.e., I see *how* the others 'carry' their personal style in a process of *diminishing* otherness and anonymity. The encounter with others and the world is established through a primordial anonymous socialization, as the element of de-personalization within inter-personal experience. Hence, there remains a *drama* of de-differentiation played out in terms of a de-anonymization which brings with it a certain de-personalization. Moreover, a total personalization would not, in Merleau-Ponty's view, be desirable since it would result in a total detachment from the world; hence, it would result in the loss of myself, as body-subject; which in turn would produce the very opposite of what was sought, namely total de-personalization.

Moreover, any theories which try to explain the relation to the other in terms of an analogy or in terms of an oscillating between inner and outer, introjection and projection forget that the problem of the other is only a special case of the relation to the *others* and that this entire relation is transformed in the light of Merleau-Ponty's resetting of the analysis.

Others are not situated at a distance from me. They are to be found in my experience, lodged in the crevices which indicate what I do not see and what they see. Our experiences are therefore truthfully interrelated. Together, each clearly possesses what is unknown to the others. Through our conjoined functioning, we form a totality which progresses towards enlightenment and fulfilment. Our opening upon the others is sufficient to put us in their perspective, both intellectually and imaginatively. We are never shut up in ourselves.¹⁰⁷

Recapitulating the emergence of the three basic determinations of the body which are all closely related: (1) the body is the medium of being

towards the world, (2) it provides an anchorage in the world and (3) it appears as a natural Ego. The manifest 'ambiguity' consists in the fact that none of these usages can be developed univocally; rather there remains a 'tension' among them which keeps them as a '*drama*', as *bodily existence*, as being-to-the-world. Our experiences of movement, sexuality, sensitivity, cognition, etc. open up for us a mode of access to the world but only on the basis of the factum that we already are *to* the world. So we are held in a tension of engagement in, and detachment from, the world. In other words, we are always caught up in a *movement* to-the-world. The subject cannot be without being-to-the-world; to exist is to be to the world ('exister, c'est être au monde'¹⁰⁸). And, in contrast to Heidegger, being-in-the-truth is not to be distinguished from being-in-the-world.¹⁰⁹

IV From 'Escape' and 'drama' to 'leap' and 'dramatic depth'

The central notion of 'bodily existence' makes it possible to draw the lines between Husserl and Merleau-Ponty, on the one side, and between Heidegger and Merleau-Ponty, on the other. The Husserlian transcendental subject is given up in the name of a return to an existential, incarnate subject which opens up a finite, factual and fully concrete existence towards the world, and which holds us in a tension between the modes of engagement and detachment. The *existential drama* marks a movement of thinking which is not (as is Heidegger's) centrifugal, but which is both *centrifugal* and *centripetal*. More specifically, the abstract movement is centrifugal, the concrete movement is centripetal; the former takes place in the realm of possibility or of non-being (non-ontic), the latter takes place in the realm of reality (world) or being; the former unfolds its background, the latter is attached to the background. In distinction to Husserl and Heidegger therefore, Merleau-Ponty's thinking can be considered neither as egocentric nor as monocentric.

With regard to our principal question concerning Being-in-the-world *with* others, it turns out that Merleau-Ponty did not just take over this notion. He does not follow Heidegger in the normative accentuation of authenticity and inauthenticity, nor does his description of Being-to-the-world follow the itinerary of Heidegger's pejorative description of inauthenticity and everydayness. Since I diagnosed Heidegger's *Daseins analytik* in terms of an acosmism, it is obvious that he does not give us a developed theory of inter-facticity. A social theory, or a theme of inter-subjectivity, was not his main interest. Nevertheless, his descriptions of alienation and co-existence are of interest, especially with regard to his conception of Being-in-the-world and the difficulty he encounters in addressing the regression back to a worldly context. It is for this reason

that I have called his thinking *monocentric*. Any thinking which detaches itself from its pre-objective modes, from a reflection upon itself and its relation to the world can be considered a transmundane thinking, or, to name it with a notion from Merleau-Ponty's later text: a '*pensée de survol* [qui diment] l'inhérence de l'être au néant et du néant à l'être'.¹¹⁰

This thinking 'surveys' (literally, flies over), because it searches for an absolute evidence which will surmount the historicity of our existence and world by way of a transmundane isolation which is detached from its pre-objective, pre-reflective fundaments. Thus, Merleau-Ponty's philosophy radicalizes Heidegger's work in so far as it searches for interfactivity *in and through* the concrete, dramatic play of life. However, Merleau-Ponty's *Phenomenology of Perception* does still retain a vestigial link with the trans-mundane and trans-social thinking of a philosophy of consciousness. Thus, in his last work, *The Visible and Invisible*, he notes that the problems posed in the earlier works were insoluble because 'I [Merleau-Ponty] start out there from the "consciousness"-"object" distinction.'¹¹¹ Whether this self-criticism is too harsh does not matter. Much more interesting is his attempt to 'deepen' his thinking with notions of the 'between' (of detachment and engagement) and with a transformation of 'bodily existence' into a concept of 'wild [*sauvage*] Being', a 'there is' (*il y a*) or a concept of 'flesh' (*chair*) which takes him away from any philosophy of consciousness.

From now on the body names the visibility of the self and its becoming visible (*natura naturata* and *natura naturans*), a process in which we and the others participate since we belong to the same texture of the world. The third dimension is now described as the field of the 'inter-', the chasm (*chiasme*), in which the reversal between the visible and invisible takes place. Inter-corporality, which shows itself as a fundamental structure of our bodily Being-to-the-world, not only concerns the pre-personal and pre-objective functions of meaning constitution, but also the ontological relevance of a social field in which I and others are intertwined. A movement of thinking which comprehends a philosophy of the chasm is contrary to a *pensée survolante* which escapes from the world in an acosmism.

For Heidegger, the world in its transcendental structure is not an ordered world in the sense of a cosmos with articulated phenomena. For Merleau-Ponty, the world is certainly not reducible to the field of all Beings, i.e., the clearing of the Being through the disclosedness of the Da of Dasein. Rather world is a 'polymorphous matrix' (*matrice polymorphe*)¹¹² i.e., nature as the other side of the human (as flesh, not as matter), as texture, as vertical and carnal universe, as barbaric principle.¹¹³ The flesh is a cosmological dimension in the form of a 'wild' Being constituting nature and affecting the place of the intertwining chasm. The reversibility of the visible and the tangible opens us up to

an intercorporality which is expanded further than the things which I see momentarily.¹¹⁴ Thus, his ontology is one of 'depth' in the sense of an 'amorphous' world of perception which, in its autonomy and simultaneity, also furnishes an inspirational source for painters like Cézanne.¹¹⁵ Thus, Merleau-Ponty's new style of thinking will make good use of a painterly notion like *chiaroscuro*. For *chiaroscuro* describes a certain way in which the phenomena of light and shade can be treated in a painting so as to produce the *impression* of depth.

If the result of our analysis concerning Heidegger's earlier work *Being and Time* is the diagnosis of a monocentric, centrifugal, i.e., abstract, movement of thinking, then it seems highly unlikely that he can address the depth of the reversal effected by Merleau-Ponty as between the visible and visibility, that is, the flesh, or the amorphous world of perception – which brings with it an ontological rehabilitation of the sensible. Consequently, it is difficult to avoid the conclusion that Heidegger's thinking can also be regarded as one which deserves the title *pensée survolante*. For the 'turn' in Heidegger's thinking moves from a dimension in which the human is primary (even though the thinking forces human reality into a condition of isolation) to a dimension in which Being is primary.¹¹⁶ The work in which Heidegger prepares the way for an overcoming of metaphysics is his later essay 'Zeit und Sein' which is, at least for him, a thematical continuation of his earlier work dating back to 1927. 'To think Being explicitly,' he writes, 'requires us to relinquish Being as the ground of beings in favour of the giving which prevails concealed in unconcealment, that is, in favour of the *It gives* [*Es gibt*].'¹¹⁷ However, it is very doubtful whether this *Es gibt* can be thought of as an ontological rehabilitation of the sensible, or as a 'wild Being', in Merleau-Ponty's sense.

If this interpretation of Dasein's isolation (solipsism) and escape from the world (acosmism) is correct, then the Heideggerian 'turn' could not be thought as a continuation of his earlier work, but would have to be regarded as a 'leap', a *salto mortale*, a leap out of metaphysics and into . . . what? The collectivity? New paths of thought? A new consideration of art and technology?

Notes

1 Compare also Spiegelberg (1984), p. 581 who speaks of the notion of 'being alive'.

2 See the remark by the translator, R. Boehm, of the German edition of Merleau-Ponty, *Phenomenology of Perception*, p. 7.

4 Sallis, p. 39.

5 SZ, p. 13.

6 Husserl, p. 151.

7 Theunissen, p. 188.

8 Theunissen, p. 188.

9 The term inter-facticity is chosen over the term inter-subjectivity because Heidegger, as well as Merleau-Ponty, takes issue against philosophies of subjectivity, especially Cartesian subjectivity. Both have, though in different ways, reworked the notion of the subject; therefore, it seems to be inappropriate to ask for a notion of inter-subjectivity in the case of Heidegger.

10 SZ, p. 38.

11 Merleau-Ponty, *Phénoménologie de la perception*, tr. Colin Smith as *Phenomenology of Perception* (London: Routledge & Kegan Paul, 1962), p. xv.

12 Perhaps some readers wonder that Merleau-Ponty uses the term *sujet* (subject) frequently and without hesitation. The term 'subject' does not carry the connotations of a Kantian substance but should be linked to Thomas Aquinas' notions of 'pati, recipere, subjectum esse'.

69 SZ, p. 111.

70 SZ, p. 368.

71 Actually in his later essay 'Zeit und Sein' he says in reference to SZ, §70, that the spatiality of Dasein cannot be reconnected with temporality.

72 Since a real confrontation between the two philosophers would have undoubtedly led to misunderstanding, Boehm confronted the two by showing *how* they might have encountered each other in the subject-matter (*Sache*) without judging how in fact they did understand and misunderstand each other.

73 Merleau-Ponty, *The Primacy of Perception (Primacy)*, p. 93.

74 *Primacy*, p. 93.

75 *Primacy*, p. 92.

76 *Primacy*, p. 94.

77 Compare e.g. SZ, p. 52.

78 See Müller, pp. 226/7 who also refers to Waehlens, p. 2, in this passage.

79 *PP*, p. xiv.

80 Merleau-Ponty, *Praise*, p. 177-8.

81 *Praise*, p. 179. Unfortunately the translation by J. Wild and J. Edie is misleading here. Compare *Résumés de cours*, p. 156, 'la recherche de l'Etre ou celle de l'Ineinander . . . ce silence justement que rompent de temps en temps les petits écrits de Heidegger?'

82 Merleau-Ponty prefers the 'we' to the 'I' in order to express his move away from any egological conception of the relation to the world.

83 *PP*, p. 102.

84 *PP*, p. 104.

85 *PP*, p. 70.

86 *PP*, p. 75.

87 *PP*, p. xvii.

88 *PP*, p. 144.

89 The notions 'space' and 'time' are meant to be taken as *lived* space and *lived* time, and not as physical space and time.

90 *PP*, p. 109; also see other cases of abnormalities which are used by Merleau-Ponty to show the body functions in relation to the I and the world.

91 *PP*, p. 144.

92 *PP*, p. 206.

93 *PP*, p. 55.

94 Compare this account with Husserl's notions of 'passive Synthese' and 'fungierende Intentionalität'. Only by way of transcendental consciousness can the Husserlian phenomenologist discover the passive achievements of a consciousness which goes beyond myself and which is disclosed to the natural attitude.

95 *PP*, p. 215.

96 See *PP*, p. 215.

97 Merleau-Ponty, *La structure du comportement*, p. 227, footnote:

Il y aurait lieu cependant d'approfondir la distinction de notre 'corps naturel', qui est toujours déjà là, déjà constitué pour la conscience, et de notre corps 'culturel' qui est la sédimentation de ses actes spontanés. Le problème est posé par Husserl quand il distingue 'passivité originaire' et 'passivité secondaire'.

Lask, Lukács, Heidegger: the problem of irrationality and the theory of categories

István M. Fehér

Emil Lask scarcely ranks among the widely known philosophers of our century. His work, H. Sommerhäuser wrote on the occasion of his ninetyeth birthday, 'has remained practically without any aftermath'.¹ The number of studies dedicated to his thought has remained relatively small up to our own time. This claim about the lack of influence, however, may also be understood in terms of the lack of an *explicit* or *direct* influence, and it may admit some kind of an indirect, more subtle and hidden impact.

Indeed, it is not insignificant that we find appreciation and acknowledgement of Lask's work in Lukács' *History and Class Consciousness* and in Heidegger's *Being and Time* – two of the most influential philosophical works of our century. Lukács praised Lask for having perceived 'most clearly and uncompromisingly' what he came to regard as one of the ultimate problems of philosophical system-building (namely that 'irrational' matter reaches into the form and thus into the structure of the system), and called him, therefore, 'the most ingenious and coherent among the modern neo-Kantians'.² Lask was the only one outside the phenomenological school, Heidegger claimed in his turn, who took up Husserl's *Logical Investigations* in a positive sense and did not limit himself, in critically rethinking Husserl's theory of truth, to what was said in the first volume of Husserl's work.³

What *History and Class Consciousness* and *Being and Time* have in common is their attempt to overcome the dominating epistemological tradition of the day, i.e., they attempt to transcend it within the framework of a historical (Lukács) or an ontological (Heidegger) perspective. Their positive references to Lask are thus significant on their own account. But the significance of such references increases if we realize that, precisely in virtue of their attempt at a break, Heidegger and Lukács display little generosity or acknowledgement toward their spiritual

ancestors (those whose 'bourgeois' thinking makes them unable to grasp the 'totality', or the metaphysical tradition sunk into oblivion of Being). The fact that in two of the most influential philosophical works of our century, both extremely critical of their contemporaries, the work of Lask is positively referred to allows us to view the claim concerning Lask's lack of influence in new light. Since apart from Lask there is, as far as I can see, no other philosopher *both* Lukács and Heidegger quote with acknowledgement, and, further, in works of theirs preceding their *magnum opus* the name of Lask turns up with a certain frequency – so much so that we even find one Laskian passage quoted significantly by both (II, 333). This fact occasions a comparative study of Lukács and Heidegger with an eye to the way they confronted – adopted, criticized or developed – Laskian themes. In what follows I wish to offer a contribution to such a study. An attempt will be made to show Laskian influences and parallels (1) in Lukács' development up to and including *History and Class Consciousness*, and (2) in Heidegger's development up to and including *Being and Time*. The discussion of the Laskian influences and parallels will be preceded in both cases by a short sketch of the development of the philosopher in question (Lukács, viz. Heidegger) in order to make visible the philosophical perspective in which the confrontation with Lask took place, and to better situate the respective convergences or divergences. I will conclude the paper by comparing more directly Lukács and Heidegger with regard to (and also beyond) their relation to Lask.⁴

I Lukács and Lask

1.1 *Lukács and the quest for system*

'The system is a structure of mastering the totality [*Gesamtbewältigungsgefüge*], an all-encompassing unity', writes Lask in one of his unpublished fragments bearing the title of 'Die philosophische systematik' (III, 253). Roughly at the same time, during World War I, in his similarly unpublished fragmentary *Heidelberg Aesthetics* Lukács complained about the 'inevitable difficulty' of having to centre his discussion of strictly aesthetic problems around questions pertaining to philosophical systematization (*Systematization*), without having a chance to pose, let alone to answer, the problem of the system itself. The difficulty springs from the fact that it is equally impossible to clarify any one philosophical problem without assigning it the systematic connection within the whole, and, conversely, to treat the problem of the philosophical system prior to posing particular philosophical problems.⁵ Any one question, however, once formulated, already anticipates or points to some sort of a system, within which alone it finds its proper 'methodic home'.⁶

Lukács' development from the essays of the early 1910s up to *History and Class Consciousness* can, I think, be aptly characterized by his quest for the system. The sort of all-encompassing unity Lask speaks of, the horizon of the system, was provided for him in *History and Class Consciousness*, within the frame of a Hegelian systematics, by the concept of history. Until this solution was found Lukács had a long way to go. He began as a literary critic, interested in the 'axiology and philosophy of history of the works of art' rather than in their precise critical appraisal.⁷ One of the main themes of Lukács' first collection of essays, *Soul and Form* (1910), is the relation between art and life; more precisely, life as it appears in works of art, and works of art in so far as they are destined to embrace an a priori limited material or content. A basic dilemma which Lukács faces at this point is this. Works of art are of utmost importance in man's life; they have, however, no 'life'. This must be so, for the approach of the work of art to life is to deprive it of its distinctive character, i.e., form. The concept of form provides the criterion to split reality into two distinct spheres. On the one hand, there is the domain of works of art – a world of lucid forms, endowed with absolute validity and meaning; and on the other, there is common, everyday life – a world completely opaque and confused, without any proper intelligibility. Within this distinction, history is, of course, situated in the sphere of everyday life. Indeed, Lukács has only contemptuous and scornful words for it. In what is generally called 'history', he writes, 'something is because it is, and as it is'. History is a domain characterized by 'the unselective power of that which exists just because it exists'.⁸ 'Yet there is an order concealed in the world of history', but it is 'the undefinable order of a carpet or a dance; to interpret its meaning seems impossible, and it is still less possible to give up trying to interpret it'.⁹

Whether possible or not, Lukács in any case did *not* give up trying to interpret it. He did so until he thought he found the longed-for interpretation and meaning in a historicist reading of Hegel, elaborated in *History and Class Consciousness*. Before coming to this point, it is important to see that there is concealed in Lukács' above dilemma a methodological problem. Indeed, once the essential sources of our knowledge of history (and of the world, in general) are provided by different cultural products – works of philosophy, literature, religion, arts – to speak of the 'historicity' of such products comes menacingly close to relativism or scepticism. What is valid should be eternally valid, Lukács seems to suggest in a way similar to Husserl,¹⁰ for to speak of temporary validity, apart from its logical absurdity, would imply a falling back into the chaotic, formless domain of everyday life, characterized by the lack of any norms whatsoever. Still, the way in which change – a succession or perhaps even a development – is possible in the eternal sphere of forms calls for an explanation; for that there *is*, empirically, such a change can hardly be

denied. Or, put in Hegelian terms, how is 'the historicity of timeless Absolute Spirit' possible? 'How is it possible that the arts, religion and philosophy have a history at all?'¹¹ This question, and the perspective connected to it, is likely to have been suggested to Lukács by Lask, who some years before, in his *Antrittsvorlesung* on Hegel, had formulated the question: 'How does it come about that the eternal, that which is not susceptible to change, the timeless world of thought, has a history?' (I, 344f.).

Parallel to and in addition to the Platonic vision of forms indicated here, there was in Lukács, however, from the very beginning, another way to face the same problems – an approach that may be called socio-logical-historical, and was represented by works such as the *History of the Development of Modern Drama* and *The Theory of the Novel*. The latter work is based on the assumption that the novel as a genre, with its characteristically unhappy heroes in its centre, does not belong in the domain of the eternal forms, but is rather to be explained *geschichtsphilosophisch*, that is, as a product of a certain historical period.

Lukács' sensitivity to the problematic suggested by the early twentieth-century cultural crisis, as well as the very form of his early production (the essay-character), may well be seen as parallel to contemporary developments in German philosophy, especially in *Lebensphilosophie*. These developments challenged the systematic character of philosophy by opposing the 'irrationality' of life to philosophy itself. The clearest and sharpest formulation of the fact that scientific questions and problems of life belong to quite different domains was provided by Wittgenstein somewhat later.¹² But in any case, a major dilemma presented itself to early twentieth-century German philosophy in terms of an either-or: philosophers could either insist upon the systematic (or 'scientific') character of philosophy, its claim to universal validity, as it was handed down by predominantly epistemology-oriented neo-Kantianism, thereby running the risk of making philosophy, in the face of urgent problems, ever more irrelevant for life – of making it a sterile academic activity.¹³ Or philosophers could choose to dramatically enunciate the 'irrationality of life', thereby vehemently rejecting systematic (or 'scientific') philosophy with its claim to eternal validity.¹⁴ The alternative is quite clearly articulated by Husserl, who joins in the defence of 'philosophy as strict science' with a sharp criticism of both historicism and the philosophy striving to enunciate a world view (*Weltanschauungsphilosophie*).¹⁵

Lukács, however, for all his susceptibility to the tragic or irrational character of life, did not give up the quest for a 'system'. The posthumously published Heidelberg manuscripts, written during the war, show him engaged in an attempt to embed his aesthetic investigations into the frame of a larger philosophical system. Lukács distinguished here between two kinds of systematization. The first is characterized, in the

Kantian, or rather neo-Kantian fashion, by the total autonomy of the different spheres of theory, ethics, metaphysics and aesthetics. The other, by contrast, although not blind to the specific differences of the different spheres, tries to find a common ground or substratum which can comprehend the various spheres as a whole. This may be 'culture', or even Hegel's 'Spirit'.¹⁶ It is significant that Lukács, from a typically neo-Kantian perspective, rejects the Hegelian view of systematization. For Lukács, the homogenization of the different spheres seems to abolish the autonomy and the specific form of objectuality (*Gegenständlichkeitsform*) of the different spheres – a result which is incompatible with his attempt to lay the foundation for an autonomous aesthetics.

In *History and Class Consciousness* Lukács moves to the Hegelian form of systematization. His appropriation of Hegel's perspective is based upon a reinterpretation of German Idealism and Hegel's dialectics – a reinterpretation in which 'history' emerges as the central interpretive category. This, as Lukács understands it, is not equivalent to a kind of development, change or progress, coming about within the frame of previously established or posited (and as such timeless and ahistorical) values or norms – as the neo-Kantians conceive it. 'History' – he writes – 'does not merely unfold *within* the terrain of validity mapped out by these forms . . . it does not resolve itself into the evolution of *contents*. . . . On the contrary, history is precisely *the history of these forms*.'¹⁷ Or, as he puts this point later, history is '*the history of the unceasing overthrow of the forms of objectuality that shape the life of man*'.¹⁸ The concept of history so interpreted constitutes the axis of Lukács' analyses – it is the all-encompassing horizon destined to function as the organizing principle of the system he was striving for. It is important to see that Lukács attempts to show the emergence of this concept in the midst of the evolution of modern philosophy and of German Idealism in particular. He suggests that it is just such a concept of history that the unsolved difficulties and contradictions of German Idealism point to or call for. When, in his reconstruction of modern philosophy, he claims that it is the distinct feature of Classical German philosophy to have given conceptual elaboration to the new substance, now appearing for the first time, in which the basic order and connection of things are to be found, namely history,¹⁹ it is precisely this concept of history that he has in mind. Indeed, he identifies 'the problem of history' with the 'change [*Werden*] of the real contents'.²⁰ And Lukács views this as a problem with which modern rationalistic thought could not cope.

More particularly, Lukács' reading of modern philosophy and of German Idealism is articulated along the lines of two antinomies. What is at stake is the possibility of an all-encompassing rationalistic philosophical system. Earlier forms of rationalism, Lukács claims, had all been just partial systems: they explored a sector of reality with rational means and

left the others in their intangible irrationality. What is unprecedented in modern rationalism is its endeavour to permeate the totality of being – to construct an all-encompassing philosophical system. Whereas the correlation with the principle of irrationality created no special problem for forms of rationalism conceived as partial systems, it becomes crucial for modern rationalism in virtue of its tendency to grasp the totality: ‘it erodes and dissolves the whole system.’²¹ What erodes and dissolves the system are essentially the two antinomies. The first is ‘the problem of matter (in a logical–methodological sense), the problem of the *content* of those forms with the aid of which “we” know . . . the world’; in other words, this problem leads to the impossibility of penetrating any datum with the aid of rational concepts or of deriving them from such concepts. The second antinomy concerns ‘the question of totality’, i.e., it concerns ‘those ultimate objects of knowledge which are needed to round off the partial systems into a totality’ – problems treated by Kant in his transcendental dialectic (the soul, the world and God).²² Although it appears that we have to do here with two quite different problems, two different aspects of Kant’s concept of the thing-in-itself, upon closer examination we see

that the two quite distinct delimiting functions of the thing-in-itself [viz., the impossibility of grasping the totality with the aid of the conceptual framework provided by partial systems of rationalism, and the irrationality of individual concept-contents (*einzelne Begriffsinhalte*)] are but two sides of the same problem.²³

Now since modern philosophy, in conformity with Kant’s Copernican turn, no longer tends to consider the world in terms of something that has arisen independently of the knowing subject (e.g., as a creation of God), but rather as its own product,²⁴ there arises the demand for a system established by means of a deduction of the world from the subject – a demand compromised in its fulfilment by ‘the irrational character of the givenness of concept-contents.’²⁵ The greatness of German Idealism consists in taking up this challenge: Hegel’s dialectic, in particular, represents a response to this problem situation. His concept of an identical subject–object is destined to come to grips with the problem of the irrationality of the given. Such a unity is assumed in order to make intelligible – i.e., to deduce, to elucidate – the impenetrability of the given, as a product of its creative activity. To fulfil this requirement it is necessary to develop ‘a conception of form oriented towards the concrete content of its material substratum’.²⁶ The unfolding of the activity of the identical subject–object conceived in terms of a material-oriented form must finally be understood as history – history as the change of the forms of objectuality. Under such a perspective, both antinomies are

transcended, the whole of reality (viz., the totality) becomes transparent, and the impenetrable givenness (the irrationality of matter, viz., the concept-contents) simply disappears.²⁷

1.2 Laskian influences

This short sketch of the philosophical development of the young Lukács, together with a survey of some of the major themes of *History and Class Consciousness*, puts us in a position to focus upon Laskian influences.²⁸ Lukács' Hegelian perspective seems to be contrary to Lask's; however, if we understand 'influence' in a broader sense, namely in the sense that a philosopher may take over certain conceptual schemes, analytic tools, etc., from another philosopher, without necessarily retaining their original context, then it may be justified to speak of Lask's influence upon Lukács. The following discussion will begin with and focus upon the concept of irrationality.

If we search for the origins of some of the central concepts Lukács applies in his exposition and analysis of what he considers to be the basic antinomies of modern philosophy, we should realize that Lukács derives his central concept of irrationality from neo-Kantian philosophy and, in particular, from Lask. Indeed, irrationality as a distinct philosophical problem emerged in late nineteenth-century German philosophy.²⁹ In Rickert the term serves to denote individual or empirical reality (in contradistinction to rational and general concepts), and further, since history falls for him under the concept of individuality, it also denotes history.³⁰ Lask takes up the concept in Rickert's sense³¹ and gives it a thorough elaboration.

Among the variety of meanings it assumes in his logical theory, two are particularly important. 'Irrationality' denotes, first, that which is simply non-rational, a-logical, alien to *logos* – just any non-logical content in contradistinction to logical content. 'Irrationality', in a second and more important respect, means the impenetrability of the material – the impossibility for it to be totally permeated by logical forms. On Lask's view, what characterizes the relation between form and material is that logical form encompasses, as it were, the material and lends it theoretical lucidity, meaning – without, however, wholly penetrating it, let alone, creating it. Irrationality in this sense means the impossibility of total rationalization. The 'irrational', in the first sense, is everything except the logical component (*Gehalt*); in the second, however, it is everything, including the logical component in so far as this also may be in the position of 'material' (cf. II, 74–7).

Given the second (and for him characteristic) sense of irrationality, Lask departs from Rickert in an important respect, and indeed criticizes him. Irrationality, he argues, cannot be understood in terms of individuality, just as rationality is not equivalent to generality or universality.

Individual reality is also enclosed and clothed by rational form and is, therefore, in a sense 'rational'. And conversely, the general is 'irrational', in so far as it is itself impenetrable when in the position of the material. What is irrational is *not* the individual sensuous-intuitive component of reality, but the sensuous-intuitive component as such (II, 78). Everything and anything may be enclosed by rational forms (even rational forms themselves), but nothing can be wholly permeated by them (II, 221).

Lask's doctrine of form and material springs from, and is a conceptual development of, his earlier distinction between 'analytic' and 'emanative' logic. For the former, reality proper is always empirical; the concept is only an artificial product of thinking from which the particular existence can never be deduced, but is, in relation to it, 'accidental' or 'irrational'. The second, by contrast, attributes higher reality to the concept, and pretends to deduce particular reality from it (cf. I, 30, 41ff., 61ff.). The main representatives of the two logics are Kant and Hegel. It is evident that Lask's own logical theory of form and matter, as well as of irrationality, has been conceived with an eye to 'analytic logic'. But Lask concedes significantly that if there were a solution of the problem of irrationality it could only be provided by Hegel. 'Irrationality' – he writes – 'can be overcome, if and only if one may admit the possibility of dialectically changing concepts' (I, 72). However, he adds that he does not believe in the possibility of concepts of this sort.

Lukács, by contrast, came to believe in such concepts. It was apropos the above passage that he called Lask 'the most ingenious and coherent among the modern neo-Kantians'. That the neo-Kantians more or less rejected Hegel, whereas Lukács opted for him, is relatively unimportant at this point; more important are the following two points.

First, Lukács perceived what he came to consider as the 'antinomies' of modern philosophical thought through Lask's doctrines of irrationality and of form/material. His interpretation of modern philosophy relies for its central conceptual means – but not, of course, for its consequences – upon (partly re-interpreted) Laskian doctrines.

Second, the way Lukács came to interpret Hegel's meaning in the development of modern philosophy was clearly suggested to him by the perspective elaborated by Lask. Lukács' reading of Hegel is neo-Kantian precisely to the extent to which, hermeneutically viewed, he derived from neo-Kantianism his pre-ontological understanding of Hegel's meaning and achievement. Let us examine each of these points in more detail.

(1) Lukács takes over and uses Lask's concept of irrationality primarily in the sense of the impenetrability of the material. Although he occasionally uses the term 'contingency', what he means by it is the contingency of the way in which forms relate to their contents, rather than the contingency of the individual.³² He came to be concerned with this aspect

of Lask's concept of irrationality some time before: he applied it in his *Heidelberg Aesthetics*³³ and in his obituary on Lask he treated it at length.³⁴ But Lukács is indebted to Lask not only for his detection of the 'antinomies' of philosophical thinking, but in part also for his concept of reification. 'Modern critical philosophy springs from the reified structure of consciousness,' Lukács says at the beginning of his interpretation of modern philosophy, suggesting that the antinomies of philosophy are but secondary appearances of the all-encompassing social phenomenon of reification. However, in so far as he characterizes reification by the rationality of the forms, i.e., of the organizing principle, and the irrationality of the material, i.e., of that which is the substratum of rationalization, or by the rationality of the parts and the irrationality of the whole, it is clear that to a considerable extent he describes reification with an eye to what he will call the antinomies of philosophical thinking. In other words, though Lukács derives the antinomies of philosophical thinking from the social phenomenon of reification, he nevertheless *perceives* or *diagnoses* reification with the aid of the conceptual schemes provided by contemporary neo-Kantians.

(2) That dialectical logic was necessary to overcome the problem of irrationality is a recognition which, prior to Lukács, appears unambiguously in Lask (cf. I, 63, 201). It was also Lask who showed the strict connection between dialectics and absolute rationalism (cf. I, 66), although, of course, he rejected both. Lask and Lukács also both pointed out that 'intuitive understanding' is the main interpretive concept with the aid of which German Idealism can be explained in its development from Kant to Hegel.³⁵ In his *Fichte's Idealism and History*, Lask claims that his intention is to follow up the problem of irrationality in the development of German Idealism (I, 79); and Lukács interprets German Idealism in terms of the same problem. Lask ascribes an intermediate position to Fichte in the evolution of German Idealism (I, 83f.), and Lukács approvingly quotes this point in his obituary.³⁷ In *History and Class Consciousness* he then proceeds to give an interpretation of Fichte in much the same terms, quoting a passage of Fichte's he had likely come across in Lask (I, 173).³⁸

If Lask firmly rejected 'intuitive understanding' from the very beginning (in spite of admitting its high methodological value), Lukács had reasons of his own, long before adopting the Hegelian standpoint, to be predisposed in favour of it. Indeed, being concerned with problems of aesthetics, Lukács was particularly attentive to a concept of form no longer indifferent in relation to matter. It is in terms of this *materialechte* form that he had already interpreted Hegel's concept of form in his *Heidelberg Aesthetics*,³⁹ and the term '*materialecht*' recurs in his obituary on Lask.⁴⁰ Here he argues that Lask's concept of form as 'validity-directed-toward' (*Hingelten*) must be a kind of *materialechte* form in

order to fulfil the task assigned to it. In view of his interests, Lukács was likely to find the Laskian perspective, with regard to the concept of form, as an intermediate position (similar to that of Fichte) between Kant and Hegel.

Lukács, however, pursues the issue of 'intuitive understanding' a bit further and makes it a point of confrontation with Lask. This is worthy of particular attention for two reasons. First, because this is, as far as I can see, the only point where Lukács not only exposes or summarizes Lask's thoughts (as is customary in an obituary, which is what, in any case, he intends to do), or implicitly applies and builds them into the frame of his own perspective (as is the case with *History and Class Consciousness*), but openly discusses and, although in a very subtle form, attempts to criticize them. Second, because the implicit direction of Lukács' criticism, whether tenable or not, is characteristic of his later development. Indeed one might say that with regard to his attitude towards 'intuitive understanding', his obituary on Lask is an important intermediate stage between the *Heidelberg Aesthetics* and *History and Class Consciousness*.

The objection Lukács develops in detail at the end of his obituary concerns the knowability of Lask's original objectuality (*Gegenständlichkeit*). The objection seems, at first sight, completely out of place, for it seems to wholly ignore Lask's logic of the categories, especially his distinction between constitutive and reflexive categories. In fact, the latter are for Lask by no means original, but only secondary, artificial (*künstlich*), exempt from specific object-relatedness, parasitic (see II, 140, 150, 158, 162). The same holds true of the region of judgment in relation to that of objects. Hence it seems improper to claim that reflective categories (or the judgment) reach into the original region. Although objects are not beyond logic, Lask says explicitly, they are in any case beyond judgment (*urteilsjenseitig*) (II, 353). The region of judgment is erected upon a breaking-up (*Zerstörung*) of the original objectual region (II, 364). Lukács' objection seems, therefore, to contain an impossible demand, if not, indeed, a rudimentary misunderstanding of Lask's basic tenets – a somewhat surprising misunderstanding, for in his previous exposition Lukács showed a fairly good familiarity with Lask's views.

Upon closer examination, however, the problem turns out not to be that simple. To claim the knowability of the original region, writes Lukács, amounts to claiming the possibility of 'intuitive understanding' as its subject-correlate. This much, he adds, is also admitted by Lask, if not literally, still with regard to what he meant (*dem Sinne nach*). Now, if I am not mistaken, there is a passage towards the end of *Die Logik der Philosophie*, in which Lask comes very close to also admitting this literally: 'That the intelligible object "belongs" "to" an intuitive understanding' – he writes – 'that to the thing-in-itself the intellectual

intuition . . . "corresponds" . . . has never become a problem for Kant' (II, 245f.). Since Lask's own logical position is admittedly Kantian, 'analytic', this statement may be regarded as his own view on the conditions of the knowability of the original objectual region. A further implication of this statement is that in overcoming Kant, Hegel basically remained a good Kantian, in that he fully subscribed to the Kantian correlation of thing-in-itself and intuitive understanding,⁴¹ and only proceeded to fill in what Kant himself left empty. Lukács' overcoming of Lask may be interpreted in the same terms.⁴² The possibility of moving beyond Lask, together with its direction, may thus be said to have been prepared and anticipated by Lask himself, although, of course, this development could not be fulfilled in Lask's own terms. In any case, Lukács' confrontation with Lask shows him moving from Kant to Hegel. His major concern is the possibility of a form of knowledge that can be applied to Lask's original region over and above subjectivity – a concern that may help understand his later predisposition in favour of Hegel.

1.3 The development of 'irrationality' in Lukács

In order to complete our treatment of Lukács' adoption and application of Lask's concept of irrationality, I will briefly discuss the shifts of meaning it undergoes in Lukács. For Lukács irrationality has a totally negative meaning, whereas in Lask (and in neo-Kantianism in general) it has important positive aspects. It is precisely such positive aspects that Lukács not only does not adopt, but overlooks or even ignores. As mentioned above, he takes up the concept in its meaning as the impenetrability of the material,⁴³ and even where he speaks of 'contingency' he does so with regard to the relation of form to matter, in terms of 'intelligible contingency'. But for Rickert and Lask 'contingency', as well as 'irrationality', primarily referred to the individual; 'irrationality' denoted above all empirical, individual and (last but not least) historical reality, which resists being completely dissolved in general concepts. This dimension of the term 'irrationality' is lost in Lukács. Even before his adoption of the Hegelian standpoint of totality, there were other reasons why he defended Kantianism. He was primarily concerned with the autonomy of the different spheres of positing (*Setzung*) (of theory, ethics, etc.). It was the suppression of these, rather than of individual reality, that made him reluctant to adopt the Hegelian systematization of philosophy.

However, this does not mean that he was not concerned with the problem of subjectivity or individuality; in a sense the contrary is true. But what he was concerned with was not so much the defence of subjectivity, but rather, so to speak, its trans-substantiation. In several important respects the reasons are historical. Germany had a long cultural tradition to look back upon which the rapidly growing industrial

civilization, together with the increasing influence of the natural sciences, threatened to destroy. In this context the neo-Kantian doctrine of irrationality may be interpreted as a defence of subjectivity – i.e., as a defence of irreducible historical individuality in the face of the generalizing conceptual schemes characteristic of the natural sciences which look upon particular reality as an exemplar of a general concept rather than a unique, irreplaceable individual. Hungary, however, was underdeveloped from both social and cultural points of view. Life, as Lukács perceived it, is ‘an anarchy of light and dark’;⁴⁴ empirical individuality is but a bunch of obscure and confused inclinations, the domain of arbitrariness. Lukács’ characterization of it anticipates in some important respects Heidegger’s description of *das Man*.⁴⁵ These considerations may contribute to explaining why Lukács’ concern for subjectivity predominantly took the form of a concern for its redemption or trans-substantiation rather than for its defence with regard to how it simply is – and why he overlooked, or remained insensitive to, an important aspect of the neo-Kantian doctrine of irrationality, i.e., ‘the doctrine of the logical irrationality of the individual’ (I, 27).⁴⁶

For Lask, the irrationality of the individual stands in strict connection to his value; indeed irrationality alone permits one to view the individual as a value in itself (see I, 192ff., 226). Lask speaks of a ‘pathos of irrationality’ (I, 227). Irrationality is, in this sense, a necessary precondition of practical, historical activity (I, 154).⁴⁷ This element in Lask’s doctrine (as well as in neo-Kantianism in general) may also supply a reason for the rejection of Hegel. ‘Emanative’ logic tends to overlook the individual, Lask says (I, 97), and the extent to which a Hegelian sort of system implies this consequence appears unambiguously in the following passage of *History and Class Consciousness*: ‘The conscious desire for the realm of freedom . . . must entail the renunciation of individual freedom. It implies the conscious subordination of the self to the collective will.’⁴⁸

Further, whereas Lask sees in the Kantian perspective of ‘analytic logic’ important positive features (though he occasionally admits negative ones too), Lukács shifts the accent to a negative aspect, suggested to him by Lask – namely, that ‘analytic logic’, and its abstract consideration of values, implies an atomization of social institutions (I, 19, 68; see also I, 343 and II, 418). In this respect, Lask readily grants Hegel the merit of having made this point, but at the same time he suggests that Hegel erred by immediately transforming his reflection on the philosophy of culture into a purely logical theory. Lask’s main argument is that while one can reasonably speak of the scission of a cultural totality, one cannot speak of an atomization of the logical sphere unless one hypostatizes the notion – as Hegel does (I, 68).⁴⁹ In this respect, Lukács joins Hegel and thereby exposes himself to Lask’s critique. His devastating criticism of

capitalist 'atomization', 'isolation', etc., in *History and Class Consciousness*, became directly connected to, and expresses itself in, a criticism of what Lask calls 'analytic logic'. In this way Lukács anticipated a dubious tradition, later to assume extreme aspects (e.g., the fight against capitalism by suppressing formal logic).

II Heidegger and Lask

2.1 Introduction

In some of its basic intentions the young Heidegger's itinerary can be viewed as running parallel to that of Lukács. In addition to his perception of the ever more aggravating cultural crisis, the sense of the 'irrationality of life',⁵⁰ we find in him just as strongly as in Lukács, if not more strongly indeed, the quest for systematic philosophy. I will briefly characterize his fundamental philosophical efforts leading up to *Being and Time* in 1927, by viewing him as attempting to unify the so-called 'irrationalistic' or 'existentialist' or 'historicist' problematic (which permeated European culture at that time and was represented by thinkers like Kierkegaard, Nietzsche, Jaspers, Spengler and Simmel), with the Husserlian ideal of 'philosophy as strict science'. Finally, in Heidegger we also find a sense of dissatisfaction with the epistemological mode of philosophizing, and an early orientation towards, and confrontation with, Hegel.⁵¹

Brought up in the scholastic tradition, but highly attentive to the contemporary transcendental-logical trends in philosophy represented by neo-Kantianism and phenomenology, Heidegger had as early as his doctoral dissertation and his *Habilitationsschrift* (published in 1914 and 1916 respectively) outlined the programme of renewing the metaphysical tradition within the framework of an explicit elaboration of the Being-question. His appropriation of the modern epistemological-logical tradition was conditioned from the very beginning by his endeavour to arrive at metaphysical conclusions; doing pure logic, or epistemology, indispensable as it might be as a preparatory step, was seen by him as futile when conceived as an aim in itself.⁵²

The systematic exposition and elaboration of the Being-question which Heidegger offered in *Being and Time* in terms of a fundamental ontology conceived as existential analytic, relies for its basic project upon insights derived from Heidegger's more than ten-year-long confrontation with the history of Western philosophy. This may be characterized as insights into (1) the correlation of Being and *logos* throughout Western philosophy (viz., the metaphysical orientation of the logical-epistemological tradition, and the logical orientation of traditional ontology), (2) the functioning of the *logos* of the 'subject' as the 'ground' or 'place' of the ontological problematic properly so-called and (3) logic as the theoretical

comportment *par excellence*. Given these three recognitions, a thematization of the *being* of the subject in a deeper way than that provided by the tradition – one capable of showing epistemological comportment as a derived mode of being – offered a possible operative basis for posing and working-out the Being-question.

The metaphysical tradition from Aristotle on had developed theories of being in terms of objective presence; for Heidegger, this was a result of the fact that the tradition had gained access to Being from within the conceptual horizon provided by the theoretical attitude. Recognizing that this comportment was far from being *the* original mode of being of human existence was, however, an insight which required the prior unification of the Husserlian perspective of philosophy as 'strict science' with the anti-metaphysical, existentialist tradition.⁵³ Contrary however to the tendency of thinkers like, e.g., Pascal, Kierkegaard, Dilthey or Nietzsche, to combine turning toward factual-historical human existence with turning away from metaphysics, and thus totally rejecting systematic thinking, Heidegger's appropriation of the problematic of factual-historical life was conceived from the very beginning as a point of departure for the renewal of metaphysics. The posing and working-out of the Being-question belongs to what Heidegger calls 'fundamental ontology'. This, according to the above considerations, takes its point of departure from a thematization of the being of the subject – a discipline named 'existential analytic'. The appropriation of, and the confrontation with, epistemology and Husserlian phenomenology, and the attempt to radically re-examine the whole metaphysical tradition through the assimilation of the 'irrationalistic' problematic, are fused in Heidegger's efforts to gain a new ground for a renewal of metaphysics.⁵⁴

2.2 Lask and Heidegger

In the formation of his ontological perspective Heidegger repeatedly confronted Lask's works beginning with the early essay 'Neuere Forschungen über Logik' (1912).⁵⁵ My discussion of their relation will focus upon some basic themes: the theory of categories, the nature of truth, meaning (*Sinn*), the ontological difference, philosophy and the sciences, Lask's original region and Heidegger's Being, and, finally, the conception of man.

(1) *The Theory of Categories*. Heidegger's early quest for an ontological problematic proper centres, understandably enough, around what has been handed down by the tradition under the heading of the 'doctrine of categories' (*Kategorienlehre*). The history of philosophy may, in a sense, Heidegger approvingly quotes Eduard von Hartmann in his *Habilitationsschrift*, be understood as the history of the doctrine of categories.⁵⁶ Heidegger, however, is dissatisfied with the traditional doctrine of cat-

egories. This theory, in fact, centres around the ten Aristotelian categories. One of the main points his whole investigation wishes to make, Heidegger says explicitly in his *Habilitationsschrift*, is that the Aristotelian categories are not equivalent to the categories as such; they refer to no more than a certain class of a certain domain of reality.⁵⁷ Far from applying to every and any object of knowledge, traditional categories denote only 'natural' reality – a recognition which Duns Scotus was already aware of.⁵⁸ The point Heidegger suggests here is that the traditional theory of categories is 'blind' to spheres of reality other than the natural – first of all to the sphere of 'logic' which Heidegger (following the neo-Kantians and Husserl) would like to mark off as sharply as possible from both 'natural' and 'psychological' realities. The task Heidegger outlines is, then, an expansion, i.e., a radical re-elaboration of the doctrine of categories – one capable of doing justice to all the different domains of reality in their own right (even to history), without suppressing any of them or reducing some to others (as contemporary 'naturalism' and 'psychologism' threatened to do). In light of Heidegger's later development we may say that this is exactly what *Being and Time* will attempt to do under the name of 'existential analytic'. 'What is logic?' – this is one of the young Heidegger's first questions in 1912, and the *Habilitationsschrift* makes an important further step by claiming that it is not possible to see logic and its problems in the right perspective unless one seeks a 'translogical', i.e., metaphysical context for its understanding. In *Being and Time* we read, finally: 'the "logic" of the *logos* has its roots in the existential analytic of *Dasein*'.⁵⁹

Now it is important to realize that Heidegger's quest for a new foundation for the doctrine of categories takes shape in constant confrontation with Lask's works. For Lask, Kant provided the categories for the knowledge of natural reality. Indeed, logic and the theory of science have confined themselves up to our own time to doing justice to the natural sciences, i.e., to an elaboration and explanation of the way we come to know natural reality. When, however, contemporary anti-psychologism (neo-Kantianism and phenomenology) comes to hold complete autonomy in the sphere of 'validity' (over against the realm of natural reality), it is time logic, or the doctrine of categories, justifies this development by exploring the categories of philosophical knowledge itself. Lask explicitly suggests an 'expansion [*Erweiterung*] of the concept of the categories' (II, 22f.; see also II, 88, 237) – which he regards as a question of 'life and death' for philosophy (II, 89). In his review article, Heidegger pays special attention to Lask's search for a doctrine of categories able to embrace the whole of what can be thought.⁶⁰

In his historical sketch Lask significantly anticipates Heidegger's judgment concerning Aristotle's categories – namely, that they were conceived with a view toward empirical reality and then transposed to the

sphere of the non-empirical (II, 225; see also II, 178). From the point of view of a new metaphysics, Lask understands his own efforts as a kind of preparatory work: if beyond the sensible or empirical reality there is a non-sensible or metaphysical domain, then we should develop adequate categories in order to have proper access to it. The delimitation of the different spheres can only be carried out by metaphysics (II, 270) – a point with which Heidegger fully agrees.⁶¹

Lask understands Kant's Copernican achievement to the effect that 'being' has ceased to be a trans-logical concept and has entered the domain of transcendental logic (II, 27ff.).⁶² For Heidegger, too, being and logic are in strict correlation: being pertains to the sphere of logic. However, for reasons shown above, he came to understand logic in terms of existential analytic. This may then be seen as a polemical radicalization of Kant's replacement of traditional ontology, namely the transcendental analytic of pure intellect.⁶³ In the light of *Being and Time*, we can say that Heidegger radicalizes Lask's critique of the traditional doctrine of categories. Lask's main objection to it was that it was a logic of the 'lower tier' – that is, it was dominated by the logic of the sensible domain of reality (II, 178), or by a naive transposition of the latter onto the domain of non-empirical reality (II, 225, 237).⁶⁴ Heidegger radicalizes Lask in that through the assimilation of the 'irrationalistic' problematic he proceeds to undermine the bases of Lask's 'two world theory', i.e., of the Platonic distinction between sensible and non-sensible reality. For Heidegger, this distinction springs from man's theoretical relation to the world – a major reason why his analytic offers 'existentials' rather than 'categories'. An all-encompassing doctrine of *categories* becomes for Heidegger impossible precisely in so far as he comes to interpret 'categories' as determinations of beings other than man. The fact that 'categories' had an all-encompassing meaning in traditional ontology may be explained by the tendency of Greek ontology to gain access to Being on the level of (and in terms of) what turns up *within* the world.⁶⁵ Although Heidegger came to drop the term, he nevertheless took up Lask's attempt to give an all-encompassing theory of categories. He did so by transforming it into his project of fundamental ontology.

Heidegger's strategy of dismissing the foundation of traditional metaphysics, i.e., of the 'two world theory', parallels his reading of the history of metaphysics, and exhibits the adoption of some important Laskian themes – themes which Lask derived from Fichte's distinction between philosophy and life (see, e.g., II, 194, 201). Our way of thinking and speaking, Lask remarks significantly, is considerably conditioned by Greek intellectualism, according to which the non-sensible domain is accessible only to the intellect – or even appears as an intelligible realm in itself. The proper relation to transcendent reality was accordingly held to be a knowing attitude. 'The intellectualism of the Greeks' significantly

influenced Christian thinking. This, in its turn, did not remain unaffected by 'the theoretization of the transcendent sphere' (II, 203). 'All the terms which antiquity coined to denote the non-sensible and supra-sensible domain bear witness to their origin from the theoretical sphere' (II, 203). The 'intellectualistic prejudice' gives preference to 'thinking' in gaining access to the non-sensible; 'faith' is understood in a negative sense mainly owing to the intellectualistic distinction between 'knowledge' and 'faith' (II, 204f.). The 'theoretization of a-theoretical comportment' also further affects all those distinctions we usually make between, e.g., 'theoretical and practical', 'logical and intuitive', 'theoretical and aesthetic', and 'scientific and religious' knowledge (II, 208; see also III, 235).

These considerations are significant not only on their own account, but because they are important anticipations of some essential features of Heidegger's perspective. First, Heidegger's way of tracing the development of Western metaphysics shows considerable parallels with the considerations of Lask noted above. Heidegger, too, maintains that Christian thinking took over the conceptual apparatus of Greek metaphysics in order to obtain a systematic character, and that this appropriation was fatal from both philosophical and religious points of view: Greek ontology was given a one-sided and superficial interpretation, and religious comportment was constrained into a conceptual scheme incompatible with the lively Christian experience of life.⁶⁶ Modern philosophy, then, from Descartes on, offers no new development.⁶⁷ Second, the basic contention that underlies Heidegger's whole undertaking in *Being and Time* is that, parallel to the Greeks' access to Being in terms of presence, runs the theory of man in terms of *animal rationale*. His attempt, then, consists in inquiring into the horizon of the traditional philosophies' access to Being and in showing this access to be rooted in, and dependent upon, man's theoretical comportment. The existential analytic disengages itself from the traditional view of man as a rational animal,⁶⁸ and together with the rational-irrational distinction, explores dimensions of man's being underlying theoretical comportment, in order to thus gain a new ground for the Being-question. From this point of view, *Being and Time* may be said to carry out the programme suggested by Lask. The categories (the 'existentials') Heidegger develops (e.g., *Befindlichkeit*, *Verstehen*, *Gewissen*, etc.), do not rely upon traditional metaphysical or intellectualistic distinctions.⁶⁹

(2) *Truth*. Throughout his philosophical itinerary Heidegger considered Being and truth to be in reciprocal connection. 'Philosophy has always connected truth to Being', he wrote in *Being and Time*,⁷⁰ and he strengthened the link so much as to come later to speak of truth rather than the meaning of Being. Among the manifold sources in which he may have come across this connection, Aristotle and Husserl likely played the

primary role.⁷¹ However, we should also point out that this connection occurs in Lask: in his evaluation of Kant's Copernican achievement, Lask comes to interpret 'Being' with 'in truth' (II, 69; see II, 29).

Parallel to Heidegger's attempt to connect truth and Being, is his claim that the judgment (proposition) is not the original 'place' of truth,⁷² but is a derivative, secondary phenomenon. This claim fits well into the general perspective of *Being and Time*, in so far as it proposes to penetrate behind theoretical comportment and show it as a non-original relation one may have to the world. In his *Doctrine of Judgment*, Lask's main thesis is that 'in the comprehensive structure of logical phenomena the judgment belongs to the secondary, non-objectual region' (II, 288). In fact 'judgment is to be driven out of the domain of transcendental logic' (II, 289). The theory of judgment Lask wishes to elaborate will show the derivation of judgment from more original phenomena (II, 295) – from an original objectual region which is over and above any opposition. This conception implies that truth loses its primary meaning of 'correspondence with', i.e., it obtains this meaning only in a derivative sense (see, e.g., II, 388ff., 395, 399).⁷³ Lask's conception attracted Heidegger's attention in his *Habilitationsschrift*; on the one hand, Heidegger thought it could provide a context within which to pose metaphysical problems, and, on the other hand, he thought that this conception made the problem of the 'application of the categories' meaningless.⁷⁴ Immediately after stating this, Heidegger drew a conclusion which clearly indicated the path he was to take in the following decade: 'The theoretical [*erkenntnistheoretische*] subject does not grasp either the metaphysically most relevant meaning of Spirit, or – still less – its full content.'⁷⁵

This point may also explain Heidegger's positive reference to Lask in *Being and Time*. In his treatment of the concept of truth, Heidegger was well on the way to discarding the epistemological, viz., subjectivistic, perspective. What he was concerned with were the presuppositions of the traditional conception of truth as 'correspondence' between judgment and thing – a conception which Husserl reformulated in terms of the adequacy between intentional acts and their fulfilment.⁷⁶ The point Heidegger next makes and elaborates in detail is that in order for Husserl's 'identification' to be possible certain ontological presuppositions must come into play – namely, the Being-in-the-world of *Dasein*, its disclosedness. What Heidegger probably meant by saying that Lask was the only one outside the phenomenological school who 'positively took up' Husserl's *Logical Investigations* (with special regard for those investigations concerning 'evidence and truth') was that in a similar way to his own endeavour, Lask too was attempting to transcend the subjective-epistemological region. Heidegger, however, noted that Lask's *Logic of Philosophy* was influenced by Husserl's distinction between sensuous and categorial intuition. Though cryptic in many ways, this remark may be

interpreted (especially after the publication of some of Heidegger's Marburg lecture courses) in the following way. In enunciating the programme of a *logic of philosophy* (see II, 23), Lask productively developed and applied Husserl's conception of a categorial intuition. The latter was interpreted by Heidegger as providing access to the categorial sphere and as underlying all kinds of everyday perception and experience.⁷⁷ Now, what Lask proposed to undertake – namely, to bring philosophy to self-awareness (II, 23) – may well have been understood by Heidegger as a significant development of Husserl's discovery of categorial intuition, precisely to the same extent to which he himself fully subscribed to the latter in his programme of philosophy's gaining awareness of itself. Existential analytic, for example, is to centre around *Dasein* because it is 'the condition of possibility of all ontologies'.⁷⁸ It is, further, due to the discovery of categorial intuition that Heidegger proceeded to identify phenomenology and ontology.⁷⁹ Ultimately, Heidegger came to understand Husserl's categorial intuition not only as an adequate method for penetrating the region of categories, but also as a vague, pre-conceptual understanding of Being.

(3) *Meaning (Sinn)*. In addition to the correlation Being-truth, Lask anticipates Heidegger's understanding of the relation between meaning and Being. 'The representative [*nachbildliche*] region', writes Lask, 'is not *the* region of meaning, but only *one* region of it. The simple original structure of the authentic structural elements . . . appears as the original image of meaning' (II, 393).⁸⁰ 'Every logic of meaning has so far been a logic of non-objectual meaning, whereby "meaning" – e.g., of the judgment – is usually conceived as being in opposition to the "object" ' (II, 292). Similarly, for Heidegger Being and meaning, viz., Being and the meaning of Being, are not to be separated. When we understand something, he argues, what we understand is not 'meaning' but the being, viz., Being. Thus, when we search for the meaning of Being we do not seek something 'behind' Being, but Being itself, in so far as it enters into the scope of understanding proper to *Dasein*.⁸¹

(4) *Ontological difference*. In the distinction between the sensible and the non-sensible spheres, i.e., the spheres of being and validity, it is important to realize, Lask writes, that the very predicates which serve to designate the sensible sphere – e.g., Being – lie outside the sensible sphere. It is not the domain of Being (*Seinsgebiet*) but beings alone (*das Seiende*) – i.e., that which falls under the category of Being (*Sein*) – that constitutes the domain of what lies outside the sphere of validity. 'The being of beings belongs already to that which is valid, to that which is non-being' (*Das Sein des Seienden gehört schon zum Geltenden, somit zum Nicht-Seienden*) (II, 46; see also II, 393).

The way Heidegger came to understand what he called 'ontological

difference' shows significant similarities to Lask's preceding considerations. For Heidegger Being is, on the one hand, Being of a being (*Sein vom Seienden*) – i.e., it does not lie in a domain over and above beings, it is not a kind of highest being. Though strictly linked to beings, Being is, on the other hand, not a being: 'the Being of beings "is" not itself a being'.⁸² To overlook this difference is for Heidegger to overlook the ontological problematic proper; and conversely, to recognize it is to identify the theme of ontology.⁸³ If one approaches Being in the dimension of beings it can only appear as a non-being, i.e., no-thing – a major reason Heidegger discussed the problem of Being in terms of 'nothing' in his *What is Metaphysics?*⁸⁴

Heidegger's stress upon the importance of the ontological difference in identifying the ontological problematic proper allows us to bring to light a further parallel with Lask with regard to their understanding of the relation between philosophy and the sciences.

(5) *Philosophy and the sciences.* For Heidegger, ontology is concerned with Being; it is, as he puts it in the twenties, the science of Being.⁸⁵ The sciences, by contrast, address themselves to particular beings; they completely ignore the ontological difference. There are, however, no beings without Being. With regard to them, Being is the '*Apriori*'.⁸⁶ In order to understand beings we must always already have understood Being – possess what Heidegger calls a vague pre-ontological understanding of Being. Philosophy or ontology is in this sense a necessary foundation of sciences; these obtain their sense only in becoming rooted in philosophy.⁸⁷ The discipline called to fulfil this task is fundamental ontology, but the young Heidegger also uses the terms 'productive logic' or 'original logic'.⁸⁸

For Lask, philosophy is *Urwissenschaft* (III, 240; see III, 31).⁸⁹ The empirical sciences are 'half-sciences'; their knowledge is incomplete, 'without foundation' (III, 240). The sensible data which the natural sciences treat is a residuum alien to meaning (*bedeutungsfremder Rest*). In life, however, no 'pure nature' is given (III, 242). For Heidegger also 'nature' is an 'innerworldly' being, which emerges due to a shift in attitude.⁹⁰ Lask maintains that 'nature' does not spring simply from the 'generalizing' method characteristic of the natural sciences – as Rickert claims it does – but it springs rather from 'a certain way of consideration' (*Betrachtungsweise*). Nature is the unintelligible (*Undeutbare*) plus pure theoretical objectivity (III, 243). This characterization anticipates Heidegger's claim that understanding and interpretation are not to be modelled upon a particular kind of understanding – one which consists in 'grasping the present-at-hand in its essential unintelligibility [*Unverständlichkeit*]'.⁹¹ Lask's observations about the essential tendency of the natural sciences

to master the world (III, 246) also point to some characteristic features of the perspective of the late Heidegger.

(6) *Lask's original region and Heidegger's Being*. Given Lask's theses that the object is in itself meaning (II, 43), and that the original objectual region is over and above opposition and judgment (II, 374), it is clear enough that human understanding cannot know the original region, or formulate or say what that meaning is. The 'truths in themselves' discovered by Bolzano and Husserl are for Lask still laden with subjectivity, i.e., unable to reach up into the genuinely transcendent sphere. Although they are independent of subjectivity, they nevertheless appear only in and by the subject's efforts to attain something independent of itself – and in this sense they are dependent on it. 'Genuine transcendence is however a state of meaning prior to any contact with subjectivity' (II, 425). If meaning, in common usage, is understood as 'meaning of', then we should limit its application to the secondary region (II, 394). For with regard to the original region, the designation 'meaning of' is completely out of place (II, 394; see II, 34).

Analogous considerations may provide an explanation for the incompleteness of *Being and Time*, i.e., Heidegger's full project to elaborate the meaning of Being. Following the passage cited above concerning the correlation between Being and the meaning of Being, Heidegger significantly added: 'The meaning of Being can never be brought into opposition with beings, or with Being as "ground" of beings, for "ground" in its turn becomes accessible only as meaning, be it the abyss [*Abgrund*] of meaninglessness'.⁹² The meaning of Being emerging from the abyss of meaninglessness must evidently be – to use Lask's term – beyond opposition. It should, if it is to be all-encompassing, somehow indicate its own origin, i.e., the abyss it emerges from (the *lethe*-dimension of *aletheia*). This, however, far from being said, can only be pointed towards.⁹³

(7) *The conception of man*. In Lask and Heidegger (especially the late Heidegger) we find conceptions of man which show significant parallels. Their conceptions contain a double image and a double evaluation of man. Both conceptions hold up a kind of passivity as a paradigm, while human activity, if not condemned, is still regarded as negative or futile. Lask's interpretation of Kant's Copernican achievement clearly displays this feature. Since for Lask the sphere of logic is far wider than that of subjectivity, the transcendental-objectual sphere transcends subjectivity. Hence, knowledge becomes 'plain dedication' (*Hingabe*) to the object (cf. II, 85, 396).⁹⁴ *Hingabe* as a positive and emphatic characterization of human activity points in the same direction as Heidegger's term *Gelassenheit*. (A term Lask also uses is *Realisierungsstätte* (III, 96; see also III, 156) – one which might well turn up in Heidegger's vocabulary.)

In contrast, when man is active he simply intervenes in a destructive manner in the structure of meaning (cf. II, 416), brings about its artificial complication. The questions man copes with cannot be solved simply because they are not genuine problems. The subject is striving for solutions to problems which owe their existence to nothing else than its own destructive activity. Its activity and knowledge are based upon a forgetting of not only the original but also of the secondary region (cf. II, 427, 447). With regard to Heidegger, it is enough to call to mind such 'positive' determinations, his characterization of man in terms of being the 'shepherd' or 'neighbour' of Being.⁹⁵ As to the 'active', i.e., negative sense, we might recall some passages from 'The essence of truth'. Rather than turning to Being man mostly turns to beings (a breaking-up of Lask's original region, we might be tempted to say), and since man is forgetful of Being and, particularly, the element of hiddenness contained in the essence of truth, he fills up his everyday activity with wandering from one being to another, arranging and re-arranging them, vainly looking for satisfaction.⁹⁶

III Lask, Lukács, Heidegger

We undertook the confrontation of Lukács and Lask, as well as Heidegger and Lask, with the intention of not only finding similarities or parallels between their thought, but also in an attempt to show how Lukács' and Heidegger's confrontation with Lask influenced their philosophical development, helping them enter into full possession of their specific philosophical problematics. Are there, we may ask now, any conclusions to be drawn from Lask's influences upon both thinkers with regard to parallels between Lukács' and Heidegger's *Denkwege*? Why did both Lukács and Heidegger, in the midst of devastating criticisms of their contemporaries, give positive acknowledgement to Lask?

Both Lukács and Heidegger were, as has been seen, striving for a 'system'. Deeply affected by the crisis of early twentieth-century European culture and highly critical of the epistemology-centred philosophy of the day, both turned to the 'concrete', to 'life', and were proceeding towards a refoundation of philosophy – one accompanied for them by the hope in a cultural revival. Accordingly, both became engaged, although Heidegger only for a short time,⁹⁷ in politics. Though in different ways, both of them could rightly view upon Lask's achievement as an anticipation of what they were searching for.

For Lukács, Lask's significance consisted in clearly bringing to light, and uncompromisingly spelling out the ultimate difficulties which philosophical system-building had to face if it were ever to construct a 'system'. These difficulties, together with the set of problems common

to the epistemological tradition, Lukács came to understand in terms of 'antinomies' to be explained, in their turn, as reflections of a historical process of reification culminating in, but not restricted to, the age of capitalism. The overcoming of these antinomies, as well as the development of the 'system', could not, therefore, pertain solely to the domain of philosophy – indeed, philosophy itself had to be transcended.

Heidegger understood Lask's logical works as a preparation of a new metaphysics, as paving the way for posing metaphysical problems – an understanding not wholly alien to Lask himself (cf. II, 270). The task of the logician was, for Lask, to engage in a critique of pure *logos*, rather than of reason (III, 141) – and that is what Heidegger was doing all his life. Heidegger's recognition of the forgetting of the Being-question by European metaphysics, and his subsequent efforts to elaborate and answer it within the frame of systematic philosophy, led him ultimately to the insight that this task was not to be met by the conceptual means provided by European metaphysics. Indeed, metaphysics is indebted for its existence and development to the oblivion of Being. This is, then, an epoch of Being, a *Geschick*. To set aside this oblivion cannot, for good reasons, be the task of thinking. The late Heidegger, accordingly, no longer calls his thinking philosophy.

The context in which the following passage from Lask turns up in Lukács and Heidegger shows each of them engaged with their own problematic. The passage is this: 'The real "subject" is'. . . the material, the real "predicate" is the "category"!' (II, 333). Lukács found this significant for he thought he could perceive in it a radical abandonment or reversal of the formal logical treatment of judgment. He was also attentive to the fact that Lask found his *principium individuationis* in the material. In *History and Class Consciousness*, however, he came to view the same state of affairs – namely that the material penetrates into the realm of forms⁹⁸ – in a negative sense, as a sign of the impossibility of an all-encompassing system, and came, therefore, to defend the Hegelian logic of concepts in motion.

Heidegger quoted the above passage in order to show how Duns Scotus anticipated the modern theory of judgment. The reason he repeatedly laid stress on this aspect of Lask's theory (he had already discussed it in his review of new developments in logic)⁹⁹ may be seen in his predisposition in favour of an object-oriented interpretation of knowledge and judgment – an anticipation of his endeavour to connect *logos* and Being, logic and ontology. 'One must unite objectivism and Copernicanism', wrote Lask in an appendix to *The Logic of Philosophy* (II, 277), and Heidegger attempted to do the same by consciously applying, rather than merely ignoring (as did contemporary neo-Scholastics), the 'subjectivistic', epistemological tradition of modern philosophy in his re-appraisal of the ontological problematic.¹⁰⁰ It is against the background of his

endeavour to derive ontological conclusions from Husserlian phenomenology, and ultimately to connect Husserl to Aristotle that Lask's work assumed importance for the young Heidegger.¹⁰¹

Given their anti-epistemological attitude, both Lukács and Heidegger viewed some typically neo-Kantian epistemological problems (such as the problem of the 'application of the categories')¹⁰² with suspicion – as problems to be dissolved rather than to be met on their own terms. But Lukács did so with an eye to Hegel, whereas for Heidegger the Hegelian identification of thinking with Being, the conception of 'absolute knowledge', was untenable with regard to the basic ontological constitution of *Dasein*.¹⁰³ This is also the point where the two depart. It is, interestingly enough, in the midst of a further parallel that they do so – namely, the fact that moving away from the epistemological tradition both came across, and highly appreciated, the problem of *history*.¹⁰⁴ But for Lukács' Hegelian perspective, history had a subject (if not Hegel's *Weltgeist*, then class consciousness) – a subject which, once revealed, was to consummate history. In a sense history constitutes the horizon of Heidegger's system too. But it does so in terms of the historicity of finite *Dasein*, the historicity of the Being-question, as well as of the questioner. It is precisely in this sense that history makes 'absolute knowledge', i.e., an ultimate philosophical system, impossible. It is a horizon – or better, a background – which remains forever in the background.¹⁰⁵

Lukács thought he had found a solution to the problem of irrationality in the Hegelian sort of rationality – rationality and full transparency of the identical subject-object conceived as history. He came to view Hegel's dialectical logic as the paradigm of rationality. In his *The Destruction of Reason* he considered, therefore, all contrary positions, inclusive of that of Heidegger, as irrationalistic. His attempt to trace the development of contemporary philosophy in terms of his distinction between rationalism and irrationalism became oblivious of the origin of this distinction. While well aware, in *History and Class Consciousness*, of the historical problem situation, i.e., the historicity, of the concept of rationalism ('the concept of "rationalism" must not be employed as an ahistorical abstraction',¹⁰⁶ he wrote), this awareness gradually disappeared later. The thesis of an absolute, viz. dialectical-historical rationality had come to lose its own historical conditionality.

Heidegger did not reply to Lukács' classification of his thought in terms of irrationalism. For what might have been an answer of his, the following passages may provide some hints. By the separation of *logos* and *physis* in Greek philosophy 'begins the reciprocal correlation of "rationalism and irrationalism". . . . Irrationalism is but the evident weakness and complete failure of rationalism, and, therefore, itself a kind of rationalism.'¹⁰⁷ 'There is no such thing as "dialectics". . . . Dialectics is wholly dependent on the matter itself. . . . One cannot . . . pursue the

renewal of Hegel's philosophy and at the same time push aside . . . his christology and doctrine of the trinity.'¹⁰⁸ 'As long as the ratio and the rational . . . are still to be questioned the talk about irrationalism remains rootless.'¹⁰⁹

Notes

Bibliographical remark: bibliographical references to Lask's works occur in the text itself with parentheses; first the volume number and then the page number(s) of the *Gesammelte Schriften* edition of his works, 3 vols, ed. E. Herrigel (Tübingen: Mohr, 1923) are referred to.

1 H. Sommerhäuser, 'Emil Lask 1875–1915. Zum neunzigsten Geburtstag des Denkers', *Zeitschrift für philosophische Forschung*, 21 (1967), p. 144.

2 G. Lukács, *History and Class Consciousness: Studies in Marxist Dialectics*, tr. R. Livingstone (Cambridge, Mass.: MIT Press, 1971), pp. 211, 215 (tr. slightly revised; cf. G. Lukács, *Geschichte und Klassenbewusstsein. Studien über marxistische Dialektik*, Sonderausgabe der Sammlung Luchterhand (Neuwied and Berlin: Luchterhand, 1970), pp. 220, 257; references to this edition hereafter will occur in parentheses following the citation to the English translation).

3 M. Heidegger, *Sein und Zeit (SZ)*, 15th edn (Tübingen: Niemeyer, 1979); p. 218. In a lecture course held in the Summer semester of 1919, the text of which has recently been published, Heidegger claimed that Lask was 'one of the most powerful [*stärksten*] philosophical personalities of the time', adding how much he owed to him (M. Heidegger, *Zur Bestimmung der Philosophie, Gesamtausgabe (GA)* 56–7, ed. B. Heimbüchel (Frankfurt: Klostermann, 1987), p. 180). Lask was the only one, he specified the following Winter semester (1919/20) in terms anticipating the previously cited formulation of *Being and Time*, to have grasped Husserl's idea of pure logic. (I have drawn on Franz Joseph Brecht's *Nachschrift* of this course, with the title: *Fundamental Problems of Phenomenology*. I am grateful to Friedrich Hogemann of the Hegel archives of Bochum, who allowed me to use his transcription of the Brecht *Nachschrift*.)

12 L. Wittgenstein, *Tractatus logico-philosophicus* (London: Routledge & Kegan Paul, 1961), 6.52.

13 See, e.g., Rickert's *Die Philosophie des Lebens, Darstellung und Kritik der philosophischen Modeströmungen unserer Zeit* (Tübingen: Mohr, 1920), the second edition of which he dedicated, significantly, to the 'life of philosophy'. Rickert understands his critique of *Lebensphilosophie* as a defence of the systematic, conceptual character of philosophy.

14 On the intellectual climate of pre- and post-war Germany see H.-G. Gadamer, 'Heidegger's later philosophy', in *idem*, *Philosophical Hermeneutics*, tr. and ed. by D. E. Linge (Berkeley, Los Angeles, London: University of California Press, 1977), pp. 213ff. System-philosophy was considerably discredited already by Nietzsche (see M. Heidegger, *Schellings Abhandlung über das Wesen der menschlichen Freiheit*, ed. H. Feick (Tübingen: Niemeyer, 1971), pp. 28f.).

Dilthey, in much more cautious terms and in a slightly modified perspective (i.e., putting the accent on the historical character of philosophy), also expressed fundamental doubts about the possibility of metaphysics conceived of in terms of a universally valid philosophical system. See his *Das Wesen der Philosophie*, ed. O. Pöggeler (Hamburg: Meiner, 1984), pp. 86ff. The Kierkegaard revival, with special regard to his devastating critique of the philosophical system (i.e., Hegel) also contributed to stressing the alternative. In his essay on Kierkegaard, Lukács himself wrote that 'Kierkegaard's honesty' was 'to see everything as being sharply distinct from everything else, system from life' (*Soul and Form*, p. 32).

15 See E. Husserl, *Philosophie als strenge Wissenschaft*, ed. W. Szilasi (Frankfurt: Klostermann, 1965), pp. 49ff.

16 Cf. Lukács, *Heidelberger Ästhetik*, pp. 14f., 212ff.

20 *ibid.*, p. 144 (p. 259).

21 *ibid.*, p. 114 (pp. 214f.). That the idea of a 'philosophical system' is the product of modern philosophy is a thesis held later by Heidegger too: see *Schellings Abhandlung*, pp. 32ff.

22 Cf. Lukács, *History and Class Consciousness*, pp. 115f. (pp. 215f.).

23 *ibid.*, p. 116 (p. 218).

24 *ibid.*, p. 111 (p. 210).

25 *ibid.*, p. 117 (p. 220).

26 *ibid.*, p. 137 (p. 249).

27 For a more detailed discussion of the interpretation of German Idealism in *History and Class Consciousness* see my article 'L'interpretazione della filosofia classica tedesca in "Storia e coscienza di classe",' *Discorsi, Ricerche di storia della filosofia*, 9 (1989), pp. 41-60. For an attempt to connect the perspective of *History and Class Consciousness* to Lukács' later work I may refer to my paper 'Lukács e la filosofia contemporanea: Il problema della ragione', *Giornale di Metafisica*, 10 (1988), pp. 269-98.

28 Biographically, the Lukács-Lask relation is rather unexplored, but it seems that there was a rather strict and friendly connection between them during

Lukács' Heidelberg stay, and that Lask appreciated fairly well Lukács' thought. On 16 November 1912, Lask wrote in a letter to his sister:

The newest star that has come up in Heidelberg is still Georg von Lukács . . . from essayism he has completely passed over to systematic philosophy, and certainly much is to be expected of him. [Der neueste in Heidelberg jetzt aufgegangene Stern ist immer noch Georg von Lukács. . . Er ist jetzt vom Essayisten ganz zum systematischen Philosophen übergegangen, und es ist wohl sehr viel von ihm zu erwarten.]

See Eva Karádi, 'Ernst Bloch und Georg Lukács im Max Weber-Kreis', in *Max Weber und seine Zeitgenossen*, ed. W. J. Mommsen and W. Schwentker (Göttingen, Zurich: Vandenhoeck & Ruprecht, 1988), pp. 692, 690.

29 'As far as I know' – Lukács wrote later – '[the term "irrationalism"]' first crops up in Kuno Fischer's *Fichte*. Windelband, in his *History of Philosophy*, already deals with Schelling and Schopenhauer in a section headed "Metaphysics of irrationalism". This terminology is even more predominate in Lask' (*The Destruction of Reason*, tr. P. Palmer (London: Merlin Press, 1980), pp. 95f.).

30 Cf. H. Rickert, *Die Grenzen der naturwissenschaftlichen Begriffsbildung. Eine logische Einleitung in die historischen Wissenschaften*, 2nd edn (Tübingen: Mohr, 1913), pp. 222f., 229, 579. Rickert also stresses that 'irrational' means not so much anti-rational, but rather an indifference of beings with respect to concepts (p. 579).

31 Other thinkers to whom Lask refers are Windelband and Simmel (I, 29).

32 See Lukács, *History and Class Consciousness*, p. 138 (pp. 250f.).

33 See Lukács, *Heidelberger Ästhetik*, p. 16.

34 See G. Lukács, 'Emil Lask. Ein Nachruf', *Kant-Studien*, 22 (1918), pp. 355, 358, and *passim*.

35 Lukács, *History and Class Consciousness*, pp. 110f. (p. 209).

36 Cf. *ibid.*, p. 138 (p. 251), and Lask I, 56ff.

37 Cf. p. 356.

38 See Lukács, *History and Class Consciousness*, p. 119 (p. 222). The passage refers to the 'hiatus'. In notes Lask gives several further references to the occurrence of the same term in Fichte, but Lukács cites the one quoted by Lask.

39 See Lukács, *Heidelberger Ästhetik*, p. 172.

40 See 'Emil Lask', p. 357.

41 See also in Lukács, *History and Class Consciousness*, p. 138 (p. 251):

If, in the case of Kant himself, this only indicates the point from which it *would be possible* to complete and perfect the system, in the works of his successors this principle and the postulate of an intuitive understanding and an intellectual intuition becomes the cornerstone of philosophical systematic.

42 'It may be asked' – wrote Lukács in his obituary – 'whether there is in the . . . theoretical sphere really no place for an intuitive understanding, for a non-judgment-like [*nicht urteilsartiges*] . . . knowledge?' (p. 367). In II, 396, without mentioning the concept of intuitive understanding, Lask seems to suggest a positive answer: 'in so far as knowing is the subject-correlate of meaning . . . there must be a . . . knowing which is over and beyond judgment [*überurteilsartiges*]'. This remains, of course, a postulate for him. Lukács especially claimed an intuitive knowledge of Lask's '*schlichtes Ineinander*'

(p. 369); the term turned up in his *Heidelberg Aesthetics* (p. 120), even though such knowledge significantly remained for Lask a 'paradise lost' (II, 426).

43 In his obituary Lukács gave much prominence to this point – see 'Emil Lask', p. 355.

44 Lukács, *Soul and Form*, p. 153.

45 See note 4 above. Heidegger's concern for individuality is here closer to the Lukácsian sort. He too seems to urge a transsubstantiation (if we may use this term) of the individual (see, e.g., *Vom Wesen des Grundes*, in *Wegmarken*, GA 9, ed. F.-W. von Herrmann (Frankfurt: Klostermann), 1976, p. 162, and *Schellings Abhandlung*, p. 198), rather than a defence of it (this would be for him a defence of *das Man* (see, e.g., *Metaphysische Anfangsgründe der Logik im Ausgang von Leibniz*, GA 26, ed. K. Held (Frankfurt: Klostermann, 1978), p. 21; *Die Grundbegriffe der Metaphysik. Welt-Endlichkeit-Einsamkeit*, GA 29/30, ed. F. W. von Herrmann (Frankfurt: Klostermann, 1983), pp. 243ff., 254ff.). Due to the deepening of the European cultural crisis, and his negative appraisal of the Weimar Republic, Heidegger probably saw nothing worthy of being defended any longer. Rather, a new beginning was required (an 'anderer Anfang', as he came to call it in the 1930s). The parallel with Lukács, however, does not hold in an important respect. Heidegger's conception of *Dasein*, in virtue of its basic constitution (especially *Jemeinigkeit*), is still closer to a 'defence of subjectivity' than Lukács' Hegelian sort of class consciousness. And *Dasein* can never arrive at a fully transparent knowledge or a complete mastery of Being.

46 We should remark, however, that by adopting a theory of knowledge as *Hingabe* or plain dedication, Lask seems later to have in part abandoned the standpoint in terms of which we contrast him here with Lukács.

47 See also Rickert, *Grenzen der naturwissenschaftlichen Begriffsbildung*, p. 464: 'If the future were object of our knowledge it would never be object of our will. In a world which had become entirely rational, nobody would be able to act'. He observes later that 'only as long as we fail to grasp the world metaphysically . . . is history possible' (ibid., p. 579).

48 Lukács, *History and Class Consciousness*, p. 315 (p. 480); see also p. 193 (p. 332).

49 Later, however, Lask came to speak of a breaking up of the original objectual region (see, e.g., II, 363f.). To this extent his earlier criticism of Hegel may also, in part, be brought to bear upon his own position.

50 See, e.g., 'Abraham a Sankta Clara', M. Heidegger, *Denkerfahrungen*, ed. H. Heidegger (Frankfurt: Klostermann, 1983), p. 3; *Frühe Schriften*, GA 1, ed. F.-W. von Herrmann (Frankfurt: Klostermann, 1978), p. 409, as well as Gadamer's study quoted in note 14 above.

51 Cf. *Frühe Schriften*, pp. 410f.: 'Die Philosophie des lebendigen Geistes . . . steht von der grossen Aufgabe einer prinzipiellen Auseinandersetzung . . . mit Hegel.' In this context see also *Zur Bestimmung der Philosophie*, p. 97, where much the same terms occur: 'Dann stehen wir mit der Front gegen Hegel, d.h. von einer der schwierigsten Auseinandersetzungen', and ibid., p. 135. Finally, see Heidegger, *Ontologie (Hermeneutik der Faktizität)*, GA 63, ed. K. Bröcker-Oltmanns (Frankfurt: Klostermann, 1988), p. 59.

52 See Heidegger, *Frühe Schriften*, pp. 186f., 200, 403, 415.

53 For the term 'anti-metaphysical' see O. Pöggeler, *Der Denkweg Martin Heideggers* (Pfullingen: Neske, 1963), p. 28.

54 In the above summary I have drawn on some passages of my article 'Fundamental ontology and political interlude: Heidegger as Rector of the

University of Freiburg' (in *Knowledge and Politics. Case Studies on the Relationship Between Epistemology and Political Philosophy*, ed. M. Dascal and O. Gruengard (Boulder, San Francisco and London: Westview Press, 1989), pp. 317ff.). For a more detailed delineation of Heidegger's way to *Being and Time* I may refer to my papers 'Zum Denkweg des jungen Heidegger. I. Die ersten Veröffentlichungen', 'Zum Denkweg des jungen Heidegger. II. Unterwegs zu "Sein und Zeit": Die Auseinandersetzung mit Husserl' (*Annales Universitatis Scientiarum Budapestinensis de Rolando Eötvös nominatae*, Sectio Phil. et Soc., 20 (1986), pp. 163–84, 22–3; (1990), pp. 127–53), as well as to my book *Martin Heidegger* (Budapest: Kossuth, 1984), chaps I–II.

55 See *Frühe Schriften*, pp. 24ff., 32ff. On Lask's significance see also *ibid.*, pp. 56, 191, 407.

56 *ibid.*, p. 202.

57 *ibid.*, p. 211. See also pp. 286ff.

58 *ibid.*, pp. 287f.

59 *ibid.*, pp. 18, 405f.; SZ, p. 160.

60 See *Frühe Schriften*, p. 24.

61 *ibid.*, p. 406.

62 See also Heidegger, *ibid.*, p. 24.

63 See *Kritik der reinen Vernunft*, A 304 (B 247). Cf. also William J. Richardson, *Heidegger: Through Phenomenology to Thought*, 3rd edn (The Hague: Nijhoff, 1974), p. 31.

64 Cf. Heidegger's discussion of the emergence of the concept of metaphysics in *Grundbegriffe der Metaphysik*, pp. 56ff., especially p. 66.

65 Cf. SZ, pp. 44f.; p. 100. See also *Einführung in die Metaphysik*, 4th edn (Tübingen: Niemeyer, 1976), pp. 142f. A general reason for Heidegger's rejection of an all-encompassing theory of categories might be seen in his tendency to approach the Being-problem along its fourfold Aristotelian articulation, i.e., his reluctance to reduce the meaning of Being to categorial meaning, which is just one of the four Aristotelian meanings. See, e.g., M. Heidegger, *Vom Wesen der menschlichen Freiheit. Einleitung in die Philosophie*, GA 31, ed. H. Tietjen (Frankfurt: Klostermann, 1982), pp. 77ff.; *Aristoteles, Metaphysik 1–3. Von Wesen und Wirklichkeit der Kraft*, GA 33, ed. H. Hüni (Frankfurt: Klostermann, 1981), pp. 6ff. 11ff., 16f., 45ff. See also Jean Beaufret, *Dialogue avec Heidegger. Philosophie grecque* (Paris: Editions de minuit, 1973), p. 116; and, concerning the problem in general, Franco Volpi, *Heidegger e Aristotele* (Padova: Daphne, 1984). In his 1926 lectures, Heidegger explicitly protested against the reduction of ontology to a doctrine of categories or to a doctrine of substance (cf. Franco Volpi, 'Figure e problemi del corso del semestre estivo 1926 sui "Concetti fondamentali della filosofia antica"', *Itinerari*, 1–2 (1986) p. 253). The expression 'Existenzialien' turns up already in 1923 (cf. *Ontologie (Hermeneutik der Faktizität)*, p. 19).

66 Cf. *Phänomenologie und Theologie*, in *Wegmarken*, p. 59; *Prolegomena zur Geschichte des Zeitbegriffs*, GA 20, ed. P. Jaeger (Frankfurt: Klostermann, 1979), p. 6; *Die Grundprobleme der Phänomenologie*, GA 24, ed. F.-W. von Herrmann (Frankfurt: Klostermann, 1975), p. 140; *Sein und Zeit*, p. 10; *Metaphysische Anfangsgründe der Logik*, p. 211; *Die Grundbegriffe der Metaphysik*, pp. 64, 75ff.; *Einführung in die Metaphysik*, p. 147; 'Die Zeit des Weltbildes', *Holzwege*, GA 5, ed. F.-W. von Herrmann (Frankfurt: Klostermann, 1977), p. 76; *Nietzsche* (Pfullingen: Neske, 1961), vol. II, pp. 131, 413ff.; *Hölderlins Hymne 'Andenken'*, GA 52, ed. C. Ochwaldt (Frankfurt: Klostermann, 1982), p. 133; *Parmenides*, GA 54, ed. M. S. Frings (Frankfurt: Klostermann, 1982), p. 248.

67 Cf. SZ, pp. 21f.; *Die Grundprobleme der Phänomenologie*, p. 175; *Die Grundbegriffe der Metaphysik*, p. 64; *Einführung in die Metaphysik*, p. 143.

68 See SZ, pp. 25, 48.

69 For Heidegger's understanding of 'Sorge' and for his undermining of the 'theoretical-practical' distinction see SZ, pp. 57, 59, 69, 193, and later, e.g., *Brief über den Humanismus*, *Wegmarken*, p. 358. Lask had already written that, 'The completely atheoretical attitude is an abstraction' (II, 186), and moreover, in 1919, Heidegger said: 'The predominance of the theoretical must be broken, but not in such a way that one proclaims [now] a primacy of the practical.' In this attempt Heidegger referred to Lask in highly positive terms in his lectures held that year, which have now become accessible within his complete works (after the original version of this essay was finished). Lask was the first in the history of human culture to see the problem of the theoretical, Heidegger said at one point (cf. M. Heidegger, *Zur Bestimmung der Philosophie*, pp. 59, 87f.; see on this point also T. Kiesel, 'Das Entstehen des Begriffsfeldes "Faktizität" im Frühwerk Heideggers', *Dilthey-Jahrbuch für Philosophie und Geschichte der Geisteswissenschaften*, 4 (1986/7), p. 98). See also Heidegger's considerations of 'the unjustified predominance of the theoretical exactly within the essentially atheoretical sphere', in *Zur Bestimmung der Philosophie*, p. 89.

Following a suggestion of Lucien Goldmann's, Gadamer has recently claimed that certain passages of Lukács' Heidelberg manuscripts, possibly under the impact of Lask's anti-idealistic turn and his reception of American pragmatism, show the influence of the latter (even with regard to terminology), and come close to Heidegger's analysis of the envioning world in *Being and Time* (cf. Gadamer, 'Erinnerungen an Heideggers Anfänge', *Dilthey-Jahrbuch für Philosophie und Geschichte der Geisteswissenschaften*, 4 (1986/7), p. 24). Following up on Gadamer's hints we see that Lukács does in fact characterize what he calls *Erlebnismwirklichkeit* as a 'world of pragmatism', and if we search for Heideggerian parallels or anticipations, the following passage might prove useful: 'Das "Denken" der Erlebnismwirklichkeit ist . . . nichts anderes, als der Versuch, sich der Wirklichkeit der dem handelnden "ganzen Menschen" gegenüberstehenden, hemmenden oder fördernden Gebilde zu bemächtigen' (Lukács, *Heidelberger Ästhetik*, pp. 29, 31). The "Denken" der Erlebnismwirklichkeit', so characterized (and not terminologically emphasized), shows obvious parallels to Heidegger's *Umsicht*, namely in so far as 'der gebrauchend-hantierende Umgang ist . . . nicht blind, er hat seine eigene Sichtart, die das Hantieren führt und ihm seine spezifische Sicherheit verleiht . . . die *Umsicht*' (SZ, p. 69). What the "Denken" der Erlebnismwirklichkeit' and 'Umsicht' have in common is, characteristically, that neither of them is the application of already existing theoretical knowledge (Lukács, *Heidelberger Ästhetik*, p. 31):

Ein kontemplatives 'Denken' ist auf dem Niveau der Erlebnismwirklichkeit per definitionem unmöglich, denn durch den Akt des simpelsten Meinens ist die Erlebnismwirklichkeit aufgehoben. . . . Daneben bleibt aber zweifellos die Tatsache bestehen, dass aus der Erlebnistotalität des 'ganzen Menschen' das Denken doch nicht ausgeschaltet werden kann.

And Heidegger, SZ, p. 69:

Das 'praktische' Verhalten ist nicht 'atheoretisch' im Sinne der Sichtlosigkeit, und sein Unterschied gegen das theoretische Verhalten liegt nicht nur darin,

dass hier betrachtet und dort gehandelt wird, und dass das Handeln, um nicht blind zu bleiben, theoretisches Erkennen anwendet.

70 SZ, p. 212.

71 See Husserl, *Logische Untersuchungen*, vol. I, para. 36, 39 (esp. pp. 121, 131ff.); vol. II/2, para. 39, 43–4. See also Heidegger, *Logik. Die Frage nach der Wahrheit*, GA 21, ed. W. Biemel (Frankfurt: Klostermann, 1976), pp. 170ff.

72 Cf. SZ, pp. 214ff.

73 Cf. H. Sommerhäuser, 'Emil Lask 1875–1915', p. 143. In his *Gutachten* on Heidegger's *Habilitationsschrift*, Rickert observed Heidegger's inner connections to contemporary authors, in particular to the 'bedeutsamen "metagrammatischen Subjekts-Prädikats-Theorie" von Lask, dessen Schriften der Verfasser [sc. Heidegger] für seine philosophische Orientierung und auch für seine Terminologie ganz besonders viel verdankt, vielleicht mehr als ihm selbst zu Bewußtsein gekommen ist' (see. Th. Sheehan, 'Heidegger's *Lehrjahre*', *The Collegium Phaenomenologicum*, ed. J. C. Sallis, G. Moneta and J. Taminiaux (The Hague: Kluwer Publishers, 1988), p. 118).

74 Cf. *Frühe Schriften*, pp. 406f.

75 *ibid.*, p. 407.

76 See Heidegger's reference to chap. V of Husserl's Sixth Investigation (SZ, p. 218).

77 Cf. *Prolegomena zur Geschichte des Zeitbegriffs*, pp. 64, 97.

78 SZ, p. 13. Deriving the concept of *Vorhandenheit* from *Dasein*'s relating itself to the world, Heidegger actually shows the origin of a basic category traditional ontology applied in its description of the world (see §16).

79 Cf. *Prolegomena zur Geschichte des Zeitbegriffs*, p. 98.

80 The object 'is always already meaning' (K. Hobe, 'Zwischen Rickert und Heidegger. Versuch über eine Perspektive des Denkens von Emil Lask', *Philosophisches Jahrbuch*, 73 (1971), p. 364.

81 Cf. SZ, pp. 151f.

82 SZ, p. 6. See also pp. 4, 9, and *Die Grundprobleme der Phänomenologie*, p. 22.

83 See *Die Grundprobleme der Phänomenologie*, pp. 22f., 454; *Metaphysische Anfangsgründe der Logik*, p. 193.

84 Cf. 'Zur Seinsfrage', *Wegmarken*, p. 418. Furthermore, Heidegger sharply distinguishes between what he understands by *Sein* from an abstract generality which the tradition has come to interpret as *Sein*. This he names *Seiendheit* – that which is common to all beings (house, man, horse, stone, God), in so far as they *are* (cf. *Nietzsche*, vol. II, p. 211). In an interesting consideration Lask seems to anticipate this concept of Heidegger's too. He argues that the highest generality is the most abstract, for it denotes a pure content – that which is common to all beings. It designates therefore beings (*das Seiende*) rather than the category of Being (*Kategorie des Seins*) (III, 152).

85 Cf. *Die Grundprobleme der Phänomenologie*, p. 22.

86 *ibid.*, p. 27.

87 Cf. SZ, para. 3, his remarks in the Summer semester of 1926 (quoted by F. Volpi, 'Heidegger e la storia del pensiero greco: Figure e problemi del corso del semestre estivo 1926 sui "Concetti fondamentali della filosofia antica"', *Itinerari*, 1–2 (1986), p. 229), and *Nietzsche*, vol. I, pp. 372f.

88 Cf. *Prolegomena zur Geschichte des Zeitbegriffs*, pp. 2f.; SZ, p. 10. An early variant of this, turning up in 1921/2, and delimited against formal logic, is *eigentliche Logik, echte 'Logik'* (cf. M. Heidegger, *Phänomenologische Interpretation*).

tationen zu Aristoteles. Einführung in die phänomenologische Forschung, GA 61, ed. W. Bröcker and K. Bröcker-Oltmanns (Frankfurt: Klostermann, 1985), pp. 21, 38).

89 In 1919 Heidegger treats at length the concept of philosophy in terms of *Urwissenschaft*. Cf. *Zur Bestimmung der Philosophie*, pp. 13ff. and *passim*.

90 Cf. SZ, pp. 63, 100. 'The botanist's plants are not the flowers of the hedgerow; the "source" which the geographer establishes is not the "springhead in the dale"' (ibid., p. 70).

91 ibid., p. 153.

92 ibid., p. 152.

93 See Heidegger's positive reference to Lask's concept of *Übergegensatzlichkeit* in his *Habilitationsschrift (Frühe Schriften)*, p. 406). On the 'lethe or unintelligibility' as the basis of 'aletheia or intelligibility' see T. Sheehan, 'Time and Being', 1925-7', R. W. Shahan and J. N. Mohanty (eds), *Thinking About Being: Aspects of Heidegger's Thought* (Norman, Oklahoma: University of Oklahoma Press, 1984), p. 197.

94 Therefore, it may reasonably be argued that by the stress laid on the objective Lask completely reversed Kant's teaching – particularly his theory of the spontaneity of human intellect (see H. Sommerhäuser, 'Emil Lask 1875-1915', pp. 139f.; R. Malter, 'Heinrich Rickert und Emil Lask. Vom Primat der transzendentalen Subjektivität zum Primat des gegebenen Gegenstandes in der Konstitution der Erkenntnis', *Zeitschrift für philosophische Forschung*, 23 (1969), Heft 1, pp. 93, 97).

95 *Brief über den Humanismus, Wegmarken*, p. 342.

96 *Vom Wesen der Wahrheit, Wegmarken*, pp. 195ff.

97 See my articles 'Fundamental ontology and political interlude: Heidegger as Rector of the University of Freiburg' in *Knowledge and Politics: Case Studies on the Relationship Between Epistemology and Political Philosophy*, ed. M. Dascal and O. Gruengard (Boulder, San Francisco and London: Westview Press 1989), pp. 316-51, and 'Fakten und Apriori in der neueren Beschäftigung mit Heideggers politischem Engagement', in *Zur philosophischen Aktualität Heideggers*, ed. D. Papenfuß and O. Pöggeler, vol. 1, *Philosophie und Politik* (Frankfurt: Klostermann, 1991), pp. 380-408.

98 See Lukács, 'Emil Lask', p. 357, and *History and Class Consciousness*, p. 118 (p. 220).

99 Cf. Heidegger, *Frühe Schriften*, p. 33.

100 See on this point John D. Caputo, *Heidegger and Aquinas: An Essay on Overcoming Metaphysics* (New York: Fordham University Press, 1982), pp. 26ff.

101 On the connection of Aristotle and Husserl in Heidegger's thought, see T. Sheehan, 'Heidegger, Aristotle and phenomenology', *Philosophy Today*, Summer 1975, pp. 87-94.

102 Cf. Lukács, 'Emil Lask', p. 367, and Heidegger, *Frühe Schriften*, p. 407; SZ, p. 61.

103 See *Die Grundprobleme der Phänomenologie*, p. 217: 'The being of the subject consists not only in its knowing itself [*Sichwissen*].'

104 While this is evident in Lukács, in Heidegger this orientation appears for the first time in the concluding chapter of his *Habilitationsschrift* (cf. *Frühe Schriften*, p. 408). For a more detailed discussion of the parallel concerning history, viz. historicity in Heidegger and Lukács, see my paper 'Heidegger und Lukács. Eine Hundertjahresbilanz', in *Wege und Irrwege des neueren Umgangs mit Heideggers Werk. Ein deutsch-ungarisches Symposium*, ed. I. M. Fehér (Berlin: Duncker & Humboldt, 1991).

105 I borrow this way of speaking from Thomas Sheehan, who applies it in a different context: see, 'Introduction: Heidegger, the project and the fulfillment', *Heidegger: The Man and the Thinker*, ed. T. Sheehan (Chicago: Precedent, 1981), p. xvii. I think, however, that it perfectly applies with regard to history too, not only for the project of *Being and Time*, but also for the thought of the 'second' Heidegger, who even comes to reflect upon it in terms of *Seinsgeschichte*, *Geschick Ereignis*. On the problem of Historicity in Heidegger's thought see O. Pöggeler, ' "Geschichtlichkeit" im Spätwerk Heideggers', O. Pöggeler, *Heidegger und die hermeneutische Philosophie* (Freiburg-München: Alber, 1983), pp. 139-70.

106 Lukács, *History and Class Consciousness*, p. 211 (see also p. 114 (pp. 213f.)).

107 *Einführung in die Metaphysik*, p. 136.

108 *Hegels Phänomenologie des Geistes*, GA 32, ed. I. Görland (Frankfurt: Klostermann), 1980, p. 162.

109 'Das Ende der Philosophie und die Aufgabe des Denkens', Heidegger, *Zur Sache des Denkens*, 2nd edn (Tübingen: Niemeyer, 1976), p. 79. For a fuller discussion of the problem of rationality and irrationality in Lukács and Heidegger see my paper quoted above in note 104.

Translated from the German by Christopher Macann and reprinted by kind permission of the author.

Introduction

Christopher Macann

So lernt ich traurig den Verzicht.
Kein Ding sei wo das Wort gebricht

(Stefan Georg, 'The word')

Language is the House of Being.

(Heidegger, *Unterwegs zur Sprache*)

This third volume of the four-volume set is devoted to what might be called 'meta-theoretical' issues. As the medium through which philosophy is articulated and communicated, language and therefore any discussion of the use made of language is, by its very nature, meta-theoretical. But I have also grouped under this head other issues of a meta-theoretical character, for instance, truth and logic (in the Heideggerian sense), as well as transcendence. So this third volume might have been given the same title as Professor Ayer's most famous work – language, truth and logic.

There can be no doubt that one of the most remarkable shifts in the focus of philosophical attention through this century has been the shift from reality (whatever one might choose to mean by this rather ephemeral term) to language, from things to words, from the *subject-matter* which is addressed in philosophical inquiry to the *medium* through which it finds expression. In so far as philosophy may be regarded as a characteristically 'reflective' discipline, it would seem that philosophy has of late become doubly reflective, a reflection upon that (language) which has itself often been presented by philosophers as a reflection of something else – experience, consciousness, being, world (one is reminded here of Wittgenstein's 'picture' theory of meaning).

This shift probably took effect in the English-speaking world earlier than it did on the Continent. While, on the Continent, philosophers were still inspired by the Husserlian and Heideggerian injunction to get 'back

to the things themselves', in the English-speaking world, and especially in Britain, ordinary language had become not just the acknowledged *focus* of philosophical attention but also the identifiable *locus* of all so-called pseudo-philosophical problems.

When I was being introduced to philosophy at Oxford, in the early 1960s, the linguistic revolution then in progress was so far identified with the work being done at that time in Oxford that the new way of doing philosophy was often simply called 'Oxford' philosophy, even though the dominant inspiration was still the work of a German, Ludwig Wittgenstein, who, through the good offices of Bertrand Russell, had been adopted by Cambridge. Thirty years on little is heard of 'Oxford' philosophy, or the linguistic way of doing philosophy, though the broader title 'analytic' philosophy still applies to mainstream philosophy in the English-speaking world.

Initially, the self-destructive implications of linguistic philosophy were by no means as apparent as they became later on. The linguistic philosophy to which I was initially exposed possessed, and has indeed always retained, a spirit of direct confrontation with the problems. Thinking, in a sense defined by the analytical parameters of 'Oxford' philosophy, was so conceived that the humblest student could challenge the conclusions of Oxford's most exalted philosophical stars, and his or her position or objection would be considered at its face value, and in accordance with criteria of truth and validity assumed to be universal and therefore binding upon all and sundry.

Furthermore, from the very beginning, the 'revolution in philosophy' went along with a certain disinterest in the niceties of historical scholarship. A glance at the four books which constituted the classics of the linguistic philosophy of my day at Oxford, Gilbert Ryle's *Concept of Mind*, Peter Strawson's *Individuals*, Stuart Hampshire's *Thought and Action* and A. J. Ayer's *Language, Truth and Logic* suffices to confirm that it was indeed then possible to make major contributions to philosophy without an extensive critical apparatus. *The Concept of Mind* has no notes at all and nor does *Thought and Action*. *Individuals* has virtually no notes and *Language, Truth and Logic* sports only a modest sprinkling. Going back a little further, it goes without saying that Wittgenstein's *Philosophical Investigations* contains no supplementary notes since it itself consists of nothing but notes.

But there was another and much less positive side to the linguistic revolution. Every attempt by the analytical philosophers of that day to establish some kind of (ultimate) foundation for philosophical thinking was quickly met with a devastating critique which proved precisely what was in question, namely, the non-foundational character of analytical epistemology. Following in the footsteps of his mentor, H. H. Price, Ayer attempted to develop an empirical phenomenalism only to be con-

fronted with a savage critique by John Austin who showed convincingly that Ayer had simply presupposed the very reality for which he was attempting to provide a phenomenal foundation. The upshot of *Sens and Sensibilia* (disregarding the barely concealed infighting) was that if you are going to be an empiricist (and most British philosophers are empiricists of one variety or another) you might as well be a realist since you are effectively appealing to the very same world view as that which realism relies upon and since realism offers much the simpler and more straightforward account of this world view and one which, moreover, is already enshrined in ordinary language.

The non-foundational character of linguistic philosophy brought with it a sweeping critique of the history of philosophy in so far as this history attests to the manifold attempts of philosophers to establish some such foundation. The then fashionable representatives of 'linguistic philosophy' were apt to contend that the history of philosophy was the history of the grammatical errors committed by the great philosophers of the past, errors which would be resolved (not solved) just as soon as the necessary philosophical therapy had been carried through, just as soon to employ the peculiar, and peculiarly Wittgensteinian, expression, a 'fly had been shown the way out of the fly-bottle'. Ordinary language it was assumed, was devised for the ordinary purposes of everyday life and had been perverted by philosophers who, having drawn their concepts from the available stock, then twisted and deformed the term in question to meet demands entirely foreign to their native function. Doing philosophy therefore meant un-doing this misplaced perversion of language.

The 'revolution in philosophy' which owed its origins to the informal researches of Ludwig Wittgenstein soon demonstrated a marked tendency to esoteric insularity. Metaphysical philosophy, including not merely phenomenology in all its shapes and forms but the then fashionable existentialism of the Sartrian variety, became highly suspect. At the famous (or infamous) Royaumont conference, held in France in the early 1960s, the abyss that had opened up between British and European philosophy became amply apparent as philosophers from the two sides of the Channel talked past each other with little or no basis for communication.

But no matter how convincingly the new revolution in philosophy was portrayed, it was difficult not to notice that an element of frivolity seemed to have crept into the discipline. In compliance with the then fashionable dictum: 'ask not for the meaning of a word, ask for its use' seminars were devoted to debating the question whether or not it might be possible to 'want a cup of mud', that is, to construct a context in which it would make sense to *use* the word 'want' in this way. And this kind of discussion passed for a final resolution of the time-honoured

problem of the will. The conceptual connections between such key concepts as conditionality and possibility were examined by asking whether 'cans' were 'iffy' or, conversely, whether 'ifs' were 'canny'. Oxford philosophers modestly disclaimed the possibility of solving the problems of the universe in an armchair of an afternoon. But one was left with the disquieting suspicion that the modesty of linguistic philosophy might have something to do with the fact that linguistic philosophers had much to be modest about.

An implication of this programme was the self-effacing, if not the bleakly self-destroying, character of philosophy. In time, as one pseudo-problem after the other was unmasked, the scope of philosophy would be progressively reduced until, effectively, there would be no more 'problems' for philosophers to resolve. From 'under-labourers', philosophers would eventually be reduced to the ranks of the unemployed, or rather, the unemployable. For, having successfully applied the 'therapy', philosophers would be cured of the very linguistic disease which their discipline was defined as being. Having used the ladder to climb the wall, the ladder would then have to be thrown away, leaving the few surviving representatives of the discipline peering nervously down from heights which could never again be scaled and from which they themselves could no longer descend. *Après moi, le déluge!*

Even while I was still mastering the techniques of linguistic analysis it struck me that this dismissal of the history of philosophy was highly premature. The aims and objectives of philosophy, it struck me then, were not the ordinary aims and objectives of everyday life and communication. They were, by the very nature of things, *extra-ordinary*. He for whom common sense (enshrined in ordinary language) is already a philosophy needs no philosophy; and he who needs philosophy can surely not be satisfied with the common sense enshrined in ordinary language.

When I went to Paris to do my graduate work under Paul Ricoeur, I was happy to find in phenomenology a foundational thinking that seemed capable of getting to the bottom of things and of arriving at conclusions which were relevant to life as well as merely to knowledge and the possibility of knowledge. Indeed, I was doubly impressed, not merely by the persistence of what seemed to me a legitimate commitment to the things themselves but also by a masterly command of bodies of knowledge only indirectly connected to philosophy. The Oxford philosophers under whom I had studied 'linguistic' philosophy appeared, at that time, to know little or nothing (or to show little sign of knowing anything) about the science of linguistics, an area of inquiry which formed the centre of Professor Ricoeur's attention in the late 1960s (after his massive exploration of psychoanalysis), and which is reproduced in his book *La métaphor vive*. Indeed, a glance at Ricoeur's list of publications suffices to establish that his intellectual mastery extends to almost every branch

of the humanities – psychology, theology, sociology, anthropology, mythology, linguistics and so on.

As I was finishing my doctoral thesis a young man, named Jacques Derrida, was just beginning to come to prominence with a series of short works in which he displayed outstanding critical acumen, particularly with respect to the writings of Edmund Husserl and who, at that time appeared to belong to the new school of structuralist thinking. The specifically French structuralism of that time traced its ancestry back to the science of linguistics and in particular to the lectures of Ferdinand de Saussure, whose basic distinction between *langue* and *parole* made it possible to consider the more exactly constituted structure of *langue* independently of its more variable and ephemeral expression and communication in *parole*. This isolation of the text from its expression in discourse made possible a peculiar synthesis of Heideggerian 'destructive hermeneutics' with a structuralist examination of the text. And before very long we had 'de-constructivism'.

Once again philosophy had taken up residence in language – this time not so much in an analysis of the practice of language in everyday speech contexts as in a critical assessment of the inscription of language in texts. Writing could no longer be regarded as the shadow of the spoken word but had to be treated in its own right, and in accordance with its own intrinsic structures. Philosophical texts which relied upon what has now become known as the 'doctrine of presence' had to be examined with a view to disengaging the concealed premises upon which they relied and which were actually contrary, or even contradictory, to the avowed intentions of their author. Once again, language had become both the acknowledged *focus* of philosophical attention and the identifiable *locus* of misconceptions which it was the task of philosophy to uncover. Derrida's later interest in, for example, the work of John Austin, showed that this conjunction was by no means accidental.

I happen to find these developments disquieting. And perhaps the best way to bring out my sense of concern is to draw a brief analogy with contemporary developments in the arts, particularly the plastic and the musical arts. It seems to be the case that when the medium through which an art form finds expression becomes the central theme of that same cultural form we witness a peculiar deterioration in the character of the work produced in that field, a deterioration which is perhaps more noticeable in the arts precisely because this reflective turn inevitably brings with it an intellectual focus which cuts the moment of artistic expression off from its creative source, feeling or imagination or the unconscious or, as Bergson would have it, the *moi profond*. Music, as the most structured art, is particularly sensitive to this kind of intellectual self-cancellation. From modal tones music took a great leap forward with a harmonic theory based upon the eight-note scale. The eight-note scale

was in due course superseded by the twelve-tone scale, from where the only possible theoretical advance could be in the atonal direction of pure and simple sounds. Or even silence. But 'three minutes of silence' is not so much a musical statement as an intellectual statement about the development of musical theory and the same goes for blank canvases or canvases which go by the name of the one colour with which they are covered. In turn, the vacuum created by this excessive intellectualization of the arts has been filled by the emergence of simpler and more directly appealing 'pop' forms. Artists with the talent to work productively in the classical tradition are tempted to slip into the popular mode by the potentially vast sums of money which 'pop art' is capable of generating for its practitioners. 'Art', said Andy Warhol, in one of his more infamous pronouncements, 'is whatever sells.' And 'artists' have been laughing all the way to the bank ever since.

The medium of philosophy is language. If the analogy holds good, excessive emphasis upon the medium is likely to lead in the same direction as that briefly mentioned above; on the one hand, an ever-increasing sterilization of the officially (which means institutionally) sanctioned discipline complemented, on the other, by pop forms which take up again, in a more readily assimilable, and for this reason often miserably inadequate, fashion the vital themes that have been abandoned by the classical exponents of the discipline. Nothing could illustrate better the consequences of an abandonment of traditional themes by official philosophy than the proliferation of cult movements (often headed by leaders whose motives are utterly exploitative) which has grown up in the vacuum created by the withdrawal of philosophical thought from an area which once constituted its central concern.

Almost inevitably therefore, one volume of this four-volume collection has had to be given over to the topic of language. However it should be noted from the outset that Heidegger's approach to language does not fit into any readily available category or school. Though de-constructivism is apt to trace its roots to the Heideggerian programme of a 'phenomenological destruction of the history of philosophy', in a very real sense, Heidegger's approach to language was highly idiosyncratic and so has not furnished the basis for a distinctive conception of philosophy or of a distinctively philosophical conception of language. Neither ordinary language nor the science of linguistics was of much concern to Heidegger – which is not to say that Heidegger was not acutely aware of the way ordinary language works in discourse or of the advances that have been made in the scientific understanding of language. His interest in language was of another kind altogether. Summarily, Heidegger's interest in language can be brought under three heads, logical (in the distinctively Heideggerian sense of *logik*), etymological and poetic. At the same time

these, so to speak 'horizontal' demarcations are subject to a 'vertical' transformation which goes by the name of the *Kehre* or 'reversal'.

In accordance with the phenomenological slogan (to which Heidegger himself initially adhered): To the things themselves!, language plays a relatively subordinate role in Heidegger's first philosophy, that of the articulation of intelligibility. The term Heidegger adopts in *Being and Time* to talk about language is *Rede* (discourse), a term which belongs within the priority Heidegger accords to *praxis* over theory (*parole* before *langue*). Even the more theoretically appropriate term assertion (*Aussage*) is still connected with the communication of meaning through language and is directed toward a pointing out (*aufzeigen*) which is itself linked to the term employed to characterize the manifestation of being: *sich zeigen* – to show itself. 'To significations, words accrue' (SZ, p. 161). The pre-lingual character of language as *Rede* (discourse) is moreover linked to the extra-lingual character of *Rede* as *logos* in this respect; Heidegger is still thoroughly Husserlian, assuming an essential meaning core with reference to which language becomes an incidental or even an accidental overlay, a tool employed for a given purpose, that of speaking forth (*Heraussage*) and communicating (*Mitteilung*) – language as the overt expressedness of *logos*.

Indeed, so radically decisive is the pre-lingual and extra-lingual character of *Rede* in *Being and Time* that its inauthentic derivative 'small talk' (*Gerede*) can almost be defined in terms of the collapse of this pre- and extra-lingual character, a collapse by virtue of which the words themselves become all-important, the word for the sake of the word rather than the word for the sake of what can be signified thereby. And what calls Dasein away from the inauthenticity of the They? Conscience as a call, that is, as a voice which calls Dasein to itself – in silence. In silence, not in expression, let alone communication. Hence the significance of the emphasis placed upon the phenomenon of silence by Kotoh in his piece on 'Language and silence'.

In the context of a phenomenology defined, as Heidegger does define it in *Being and Time*, as the *logos* of the *phenomenon*, questions of truth and validity not only arise but form an integral part of the programme. Nobody is better qualified to talk on this subject than Tugendhat, whose *Wahrheitsbegriff bei Husserl und Heidegger* not only demonstrated an impressive command of the thinking of these two major phenomenological figures but already pointed in the analytic direction which Tugendhat adopted later. Tugendhat assumes as his task the need to critically assess the value of Heidegger's identification of truth with disclosedness. He goes about his business in a characteristically roundabout way, first exhibiting the Husserlian transformation of propositional truth into self-evidence and then using this phenomenological transformation of the problematic as the bridge between the ordinary conception of truth (as

correspondence) and the conception at which Heidegger himself *ultimately* arrives through a kind of suppression, or elimination, of certain key elements in the Husserlian conception.

The strength of Tugendhat's procedure surely lies in this, that he uncovers the surreptitious reasoning which leads Heidegger to his conclusions, but in such a way that the weakness of this reasoning is itself concealed, so that the reader is left in the dark as to what has actually taken place. Once this surreptitious reasoning is uncovered, the seeming validity of 'truth as uncovering' itself gets uncovered as something which relies upon a certain ambiguity and which has, in consequence, already covered over its own weakness and so is allowed to appear more reasonable than in fact is the case.

What is so interesting about Tugendhat's account is not that he dismisses Heidegger's extension of the concept of truth to mean disclosedness but that he criticizes Heidegger for doing so in such a way as to deny himself the fruits of his own labour. Such an extension could have been made in an ontologically profitable manner provided only that a clear distinction were drawn between what Tugendhat calls the 'broader' and the 'narrower' concept of truth, a distinction which would still permit Heidegger to claim that the narrower concept finds its ultimate foundation in the broader. But by failing to draw the necessary distinctions and leaving things in a state of deliberately unresolved ambiguity he either opens himself to a critique capable of calling in question the validity of the theory or is only able to defend the validity of the theory at the cost of trivializing its significance as a contribution to the theory of truth.

Tugendhat's paper seems to me a superb example of the sort of critical assessment of Heidegger's contribution to philosophy which is eminently *fruitful*, in the sense that it is capable of distinguishing what is positive and what is negative in a given Heideggerian position and, moreover, in such a way, that a revision is implied which would be capable of preserving the positive while eliminating the negative. He not merely exposes the weakness of unresolved ambiguities but suggests an alternative line of approach, based upon a clarification of these same ambiguities, which would preserve most of what Heidegger sought to accomplish while at the same time eliminating those very elements to which he (Tugendhat) takes exception – thereby advancing the very same cause as that to which Heidegger himself was committed.

Professor Mohanty undertakes the task of explaining what Heidegger meant by *Logik*, a particularly unusual task in that, although Heidegger did talk about logic in his own sense of *Logik* and although a volume of his *Gesamtausgabe* is entitled *Logik*, nothing that is done in the name of logic has much to do with what is ordinarily understood by the term, not even when the term is extended to include Hegel's *Logic* or Husserl's

Logical Researches. In effect by *Logik* Heidegger really means that by virtue of which it becomes possible to call ontology 'onto-logic', in the strictly etymological sense of the word – the logic of being. The importance of Heidegger's work, as Mohanty points out, is that, on the one hand, he should, while recognizing the relative validity of formal logic, have seen that this validity is dependent upon a derivative world view that, namely, of the present-at-hand conception of entities while, on the other, and because of his recognition of the merely relative validity of formal logic, he called for a more primordial investigation of the essence of truth, the significance of the copula, interpretative understanding, disclosedness and so on which, in some other sense, also deserves to be called 'logic'.

My own contribution to the general problematic of truth focuses upon the theme of transcendence. The connection between the theme of truth and that of transcendence is particularly apparent in the Kant book, no doubt because the theme of transcendence arises in its most acute form within the context of transcendental philosophy, and especially the transcendental phenomenology of Husserl. That the theme is still vital to the development of phenomenological philosophy in general is evidenced by the fact that two of the most creative of contemporary philosophers, Michel Henry and Emmanuel Lévinas, take their stand in a certain conception of, or reaction to, the problematic of transcendence. While Michel Henry's *Essence of Manifestation* takes its start in the ambition to develop what might be called an ontology of immanence (against Heidegger's ontology of transcendence), Lévinas' work might be summarily presented as an attempt to accentuate, to the limit, the structure of transcendence – the absolute and unqualified alterity of the other.

Because Heidegger resisted the tendency to abstract language from the context of thinking there are relatively few texts in which he focuses specifically upon the issue of language. One of these few is *Unterwegs zur Sprache*, a text from the later period the importance of which is carefully analysed by Robert Bernasconi. In a crucial passage from 'The transformation of language at another beginning', Bernasconi makes a remark which links his paper to that of Theodore Kisiel. In his 'The language of the event: the event of language', Kisiel uses the 'reversal', made explicit in *Time and Being* and formally instated in the concept of *Ereignis*, as the key to his understanding of the transformation of Heidegger's conception of language, thereby confirming the position assumed by Bernasconi when he writes:

What looked like a task we set ourselves – to bring language to language as language – becomes the way-making [*Be-wegung*] which is *Ereignis* itself. The transformation of the formula about bringing

language as language to language is the passage from Being to *Ereignis*.

John Sallis' double contribution (in adjacent papers) is specifically intended to highlight a reversal effective in the writing of a philosopher who has been working with Heidegger over an extended period of time. In 'Language and reversal' Sallis talks about the reversal in Heidegger's treatment of language. In 'Meaning adrift', a paper taken from a new book *Delimitations*, Sallis addresses Heideggerian themes in accordance with the rubric of 'reversal'. The 'reversal' about which he wrote now becomes a reversal operative in the act of writing itself.

The use Heidegger makes of etymology (and this is the second main category) to bring out the basic significance of words is so sweeping that it almost constitutes a stylistic signature. Jean Aler gives us an excellent example of a new word created by Heidegger which is immediately recognizable on etymological grounds alone – *Entfernung*: meaning, for Heidegger and in conjunction with a strictly etymological semantics, removing the distance, or getting close, but through a double negative which dramatizes the significance of this word in his theory of space. But in generating this compound Heidegger actually succeeded in creating a word whose philosophical meaning is the very opposite of what the word ordinarily means in German, namely 'distance' as opposed to proximity or, as I have rendered it in my own account of space, 'approximation'.

Etymological novelty is never, with Heidegger, a matter of the new for the sake of the new but the new for the sake of a renewal of the old. Hence the link with the history of philosophy. Heidegger's etymological creations are by and large directed against the philosophical language of his day and intended to revive older conceptions which, he thinks, are needed 'to preserve the force of the most elemental words in which *Dasein* expresses itself, and to keep the common understanding from levelling them off to that unintelligibility which functions in turn as a source of pseudo-problems'. Here we find the connection with both linguistic philosophy and de-constructivism clearly expressed in terms of the phrase 'pseudo-problems'. Ontological 'destruction' follows naturally from this countermovement directed against the levelling off into unintelligibility and is directed to re-awakening the primordial force of philosophical words.

Heidegger's use of Greek terms is critical in this respect. For, as terms drawn from what Heidegger takes to be the origin of Western philosophy, they already possess that 'primordial force' which only original conceptions can express. This reference back to supposedly original conceptions enshrined in Greek etymology leads to constructions which are, in a certain sense, untranslatable. However, once the basic, primordial conception has been understood, terms can be coined which more or less

satisfactorily reproduce the original force of the word. Thus, *Alethia* is not only taken over from the Greek to confirm Heidegger's conception of what truth is as an *existential*, the stress laid upon the negative prefix (*a-lethia*) is then reproduced in its German equivalents which finally have to be translated over into the English through the use of such strange terms as un-concealedness or un-covering.

But especially in the later work, etymological plays of this kind can lead to lines of thought which have no equivalent in many other languages and which, in this sense, are literally untranslatable – even though the basic drift can be conveyed by circumlocutions of one kind or another. The 'es gibt' which plays so prominent a role in *Time and Being* and which leads to conceptual resonances which play upon the term 'give'–gift (*Geschenk* therefore *Geschick*, or even *Geschichte*) cannot be reproduced in English, which follows the French in saying 'there is' (*il y a*, literally, it has there). This might, in English, lead to other equivalent kinds of reflection upon, for example, the 'there' of 'there is' (the *Da* to which Heidegger repeatedly recurs as an element in *Da-sein*), though such reflections would necessarily lead off in a completely different direction. One of the implications of this way of doing philosophy would be that *each* language locks its philosophy into a semantically sealed system with only indirect translational possibilities. Hence the relevance of Emad's piece on 'The question of translation'.

Finally, no discussion of Heidegger's approach to language would be complete without a consideration of his later reflections upon the nature of the relation of poetry to philosophy – or thinking, to give the proper name to that which, according to Heidegger, transpires after the end of philosophy. Although, as has been mentioned, Heidegger has no philosophy of language in the ordinary sense, it could be said that he takes language more seriously than any philosopher before him, and precisely because of the ever-increasing importance accorded to poetry. Biemel's paper furnishes an excellent guide to the theme of the relation of poetry and language in Heidegger's thinking and can perhaps be summarized in three steps. (1) Poetry brings beings into being through language. 'The aboriginal language is poetry as establishment of Being'. (2) As the element in which openness happens, poetry is also the advent of the truth of beings. The Work of Art is 'the letting come to pass of the advent of the truth of beings as such'. (3) As the art of language, poetry is also the paradigm case with reference to which it becomes possible to assess the language of art. 'The arts which do not realize themselves in the realm of language presuppose the disclosure of being through language.'

Thus, in the end, the essence of language is the language of the essence whereby, as Biemel is careful to point out, a radical shift of meaning takes place in the term 'essence'. In the first instance, it retains its

metaphysical significance as the *essentia* of a subject-matter, in this case, language. In the second instance, it is better translated as *Being*, since it refers to a thinking about Being which is only possible in so far as man dwells poetically in language. As that which takes place in saying (*Sagen* – Heidegger's later term for language), poetic thinking is itself a happening (*Ereignis*). It is not so much a matter of the locus of the 'event' being displaced (from being to language) as rather a matter of language being replaced at the very heart of being – so that 'thinking' ultimately assumes the role originally accorded to the *logos*. The *logos* of *Sprache* thereby in the end becomes, through the poetizing of thinking, the *Ereignis* of *Sagen*. Tracing the progress of this full circle makes it possible both to preserve the *identity* (or continuity) of Heidegger's thinking and also to let the *difference* become manifest, that difference which emerges in the course of Heidegger's philosophical itinerary.

Starting from two commonplace observations, that Heidegger, more than almost any other philosopher, makes use of metaphor, and that poetry is concerned with, or has always been regarded as concerning itself with, metaphor, Kockelmans makes a connection between metaphor, as a figure of speech, and metaphysics. The metaphysical distinction between the sensible and the non-sensible finds its linguistic equivalent in the distinction (conventionally taken to explain metaphor) between the literal and the figurative use of a word. The key term in Heidegger's dismissal of this conception of the role of metaphor in poetry is that of 'image', where by 'image' Heidegger means something that can be aligned with the figurative and non-sensible side of the equation. Because Heidegger wants to call in question the metaphysical distinction between the sensible and the non-sensible, he is able to deny that his response to the address of Being is metaphorical. Here we find Kockelmans defending Heidegger's conception of the place of metaphor in philosophy against the criticism brought by such philosophers as Ricoeur, Derrida and Greisch.

It is impossible to discuss Heidegger's conception of the relation of philosophy to poetry without discussing his engagement with the German poet Hölderlin. In this regard, we are fortunate to have two pieces specifically devoted to this topic, one by von Herrmann and one by Gethmann-Siebert. Friedrich-Wilhelm von Herrmann presses poetry to its source in the sounding of the word and so is able to connect Heidegger's concern with sounding (and its relation to saying) with the emergence of the two regions of earth and world – a notable theme of his later philosophy: This beautiful and evocative piece attests to the blossoming of language as 'the flower of the mouth'.

Annemarie Gethmann-Siebert's paper on 'Heidegger and Hölderlin' leaps into a completely different domain altogether. By explicitly connecting Heidegger's devotion to Hölderlin with his own attempt at a

coming to terms with his political mistake, she is able to raise the question whether in fact the new kind of thinking which emerges, in large part in response to Heidegger's later concern with poetry (and in particular the poetry of Hölderlin), actually offers a corrective and redeeming vision, a pathway from insight to discerning action. Gethmann-Siefert's conclusions are, on the whole, negative. While admitting the possibility that such a pathway leading from *Being and Time* through poetic thinking to discerning action might indeed have been opened up (along other lines) she feels that Heidegger himself obstructed this path. Neither his earlier 'unthinking' political commitment nor his later, poetic consideration of the relation of poetry and *praxis* actually served the cause of philosophically enlightened action.

I have chosen to close this volume with two comparative studies connecting Heidegger's conception of language with the findings of linguistic philosophy, represented by two of its most notable figures, Wittgenstein and Ryle, both of whom were at least acquainted with Heidegger's major work *Being and Time*. The two papers are strongly contrasted. Michael Murray manages to bring out the underlying affinities between two thinkers who, on the surface, appear poles apart. The linguistically oriented, but behaviouristically inclined, thinking of a Ryle finds its match in the ontologically oriented, but practically inclined, thinking of a Heidegger.

Karl-Otto Apel, on the other hand, though admittedly from the loftier standpoint of a comparison between Heidegger and Wittgenstein, brings out certain negative implications which, he thinks, follow from the underlying agreement which he notes between two of the most influential philosophers of the century. As different as Wittgenstein and Heidegger might appear to be, they both represent, according to Apel, a detrimental encroachment upon the time-honoured ideal of philosophical rationality.

Briefly, the reduction of philosophy to self-therapy, a reduction which Wittgenstein's critique of language and meaning linked with the pseudo-problems of traditional metaphysics, was paradoxical from the very beginning; for it represented a negation of critical philosophy's own claims to meaning and truth. Precisely this tendency created its own disciples. Moreover, in Heidegger's ever more radical 'Destruction' of Western metaphysics (and more completely in Derrida's 'Deconstructivism' and in Lyotard's 'Post Modernism', which refer back to Heidegger and Wittgenstein) this tendency is strengthened to the point of attesting to something like the *self-destruction of philosophical reason* [editor's italics].

Indeed!

Heidegger's conception of language in *Being and Time*

Jan Aler

Reflections on language occupy an important place in twentieth-century philosophy due to the situation in which philosophy finds itself today. This is particularly true for Heidegger's work. Not only do Heidegger's reflections on language stand out, but also his use of language is especially remarkable. Two aspects of his use of language must be considered: his mode of expression and the manner in which he presents his argumentation using linguistic (or also literary) data.

It is worthwhile to analyze this complex issue in detail. Many of Heidegger's admirers, as well as some of his adversaries, fascinated by the Heidegger publications that have appeared since 1936 (written when Heidegger was almost fifty years old) are inclined to deal with *Being and Time* as if the work were only of minor importance. Such neglect is unjustifiable and, furthermore, constitutes a serious obstacle if one wishes to concentrate fruitfully on the later publications. There is no doubt that the idiomatic peculiarities as well as the conception of language found in *Being and Time* offer ample material for reflection. This essay will therefore be limited to an analysis of Heidegger's work from this perspective. It will deal with Heidegger's style, his attitude toward the history of language and toward literature, and his conception of language. It will become apparent how the relationship between language and understanding in Heidegger's conception of language becomes more complicated because of the role played by *logos* (*Rede*). By taking these considerations as a unity and reflecting on them from the viewpoint of Heidegger's analysis of temporality, it will be possible to get a sharper picture of their genuine meaning.

Heidegger's style

When one is first confronted with Heidegger's analysis of man's Being, the linguistic peculiarities used in the explanations are among the most conspicuous aspects of the work. Not only are they found in some places in the book, but they pervade the work as a whole. However, the peculiarity of his mode of expression is most striking in one determinate sector of his language usage: in his effort to grasp the Being of man Heidegger's philosophical terminology particularly attracts our attention. A peculiar tension in the choice of words strikes the reader immediately. The formal connection of concepts in particular is indicated through the use of a Latin, or at least a Latinized, technical terminology; this underlines the strictly theoretical character of the exposition, which is intended to be a contribution to ontology. For example, Heidegger frequently uses common terms, such as *structure*, *mode*, *character*, and *constitutive*, and also words now more or less obsolete, such as *derivative*, *explicate*, *privatio*, and *deficient*, to structure his argument.

These technical expressions constitute the skeleton which Heidegger clothes with the fundamental concepts of man's Being. The latter concepts are indicated, however, if we disregard a very few exceptions, by words that have their origin in ordinary language or at least could have easily occurred there. One would expect such words to appear in lyric poetry or in edifying prose rather than in explanations of an intellectual nature in which the words are used in such a technical manner. Here we think immediately of *Dasein*, and then of *Zeug*, *Bewandtnis*, *Befindlichkeit*, *Entwurf*, *Sorge*, *Schuld*, and *Gewissen* and finally of *gewärtigen*, *gegenwärtigen*, *geschichtlich*, and *Wiederholung*, to mention just a few. The key word *Existenz*, which delineates the context of this anthropological concept formation, still belongs to the formalizing terminology that (not by accident) is strongly reminiscent of Scholastic philosophy. But the titles of the concepts employed within this context – that is, the titles of the 'existentials' (which, in contradistinction to the 'categories', are immediately related to man's Being) – are remarkably German. Heidegger prefers to use complicated German expressions rather than the very common technical terms such as *functionality* or *instrument* (although, on the other hand, he deals with the formal structure of the concepts in a manner that is certainly not puristic). The term *facticity* seems to be an exception; but this term, via the adjective *factual*, has a closer relationship to the everyday German language than one would be inclined to think at first sight (for *faktisch* is as German as *success* is English).

No doubt this choice of words surprises the reader, especially in contrast with the technical language that naturally accompanies it throughout *Being and Time*. Within the terminology this opposition of abstractness and a closeness to everyday life marks Heidegger's explanation.

However, in this contrasting phenomenon a basic unity of purpose manifests itself, saving the whole from ambiguity. This must occupy our attention next.

In the technical idiom previously mentioned, which is bound so strongly to a very old tradition, a certain freedom in regard to that tradition is manifested. The most obvious illustration of this freedom is found in the fact that Heidegger complements the existing vocabulary with a new term whenever it seems desirable for the clarity of his formulation. In addition to the adjective *existentiell* one finds *existential*, which plays an important role as a noun. In opposition to the immediacy of a concrete, individually lived existence, it refers to the concept of man's existence which has been formalized to abstract generality.¹

Such an addition, although not always completely new, is incorporated into the technical language and used throughout Heidegger's work – for example, *ontic* in addition to *ontologic*. Anyone who reflects on these additions will note that such renewals adhere to the idiom: the differentiation of *existentiell* and *existential* completely corresponds to a tendency in this direction that is common in German. Such an addition is a taking of liberty but not a sign of arbitrariness.

The regauging of an existing term such as *existence* goes even further, and yet this, too, is not arbitrary; it closely follows the word form itself, which indicates a 'going out towards'. This attention to the suggestion contained in the parts of words accordingly becomes manifest in the syllabized spellings *ek-sist* and *ek-stasis*, which recall the Greek origin of these words. Such a splitting up of the unity of the word intensifies the plasticity of the idiom. Although in this case the word form does not become absolutely meaningful, the word nonetheless gains signification; it no longer appears as a completely contingent label for the concept but, to a certain degree, shows a natural relationship with the concept. Once the spelling of a word is made conspicuous, one experiences himself as grasping an original connection between term and concept. Furthermore, the syllabizing process increases the emphatic character of the linguistic usage; an idea is hammered home with the aid of words that have been made more plastic. Such a usage of technical terminology searches for accuracy of language as the instrument of thought and, at the same time, enlivens the use of language by closely connecting itself with the 'spirit' of the language.

The possibilities of using such a procedure are naturally still greater in the author's living native language, and Heidegger has grasped every opportunity his language has to offer him in this regard. He lets himself be led by the language and is as frank as he is cautious in so doing. Concretely, one may point to the following:

First, in his terminology Heidegger systematically avoids expressions which are current in these kinds of considerations. At the very beginning

of *Being and Time*, *man* is replaced by *Dasein*, and the book only incidentally employs such expressions as *consciousness*, *spirit*, *mind*, and *soul*.

Second, Heidegger often strictly sets apart – and thus distinguishes between – synonyms of the everyday language, specializing them by means of definitions. In this way he distinguishes between *fear* (*Furcht*) and *anxiety* (*Angst*), disregarding the less strict, common usage.² By *Mitsein* he means something different from *Mitdasein*.

Third, Heidegger expands his well-considered stock of words by specifying and varying them with prefixes and suffixes, which he uses in a very strict sense. In this way he can create new words that are nonetheless wholly German, such as *Zuhandenheit*. In other cases an ancient word comes into play again – for instance, *Befindlichkeit*, which was used in the sixteenth and seventeenth centuries. When the author combines such variants in one determinate context, the radical word is uncommonly accentuated; this is particularly the case when the variants are accumulated. (The type which is found very often is ‘Das sich überhörende Hinhören’.)

Fourth, notwithstanding the fact that in this way it is possible to originate linguistic forms that are as much like current words as possible, in Heidegger’s terminology the systematic signification of such derivations sometimes differs completely from the one commonly used. For instance, *zeitigen* is perfectly good German, but in common usage it never signifies ‘to create time structures’. It indicates, rather, that *in* time certain processes bring something about. It pertains specifically to a vegetative development (‘to ripen’, ‘to make something become ripe’) or to a causal connection analogously associated with such development. It suggests that something is propelled to completion by the stream of time and reaches this completion when the time is ripe. All of this is intratemporal (*innerzeitlich*), whereas, in Heidegger, time (chronological time) is itself a temporalization (*Zeitigung*) – that is to say, one among others. The existential-aprioric structure of temporality temporalizes itself (*zeitigt sich*) in this way (or in another). Heidegger’s term penetrates much more deeply into all of this. It makes us become aware of that which constitutes the foundation of the *Zeitigung* in the common sense of the term and nonetheless somehow gives it the emotional value that the current signification possesses.

A striking example of such a creation of language, one that completely adheres to the rules of word derivations (etymology) and yet offers us a new word that can be recognized at first sight, is *Entfernung*. Heidegger uses it in the most literal sense conceivable – namely, as ‘making distance disappear’. Prefix and radical are employed correctly; and yet the result is a word signification that is the exact opposite of what one customarily understands by this word – namely, ‘distance’.

In all of these cases, Heidegger enlivens the use of language by means of etymology. But this linguistic virtuoso achieves the same effect by following the opposite road also – by isolating the simple form from its compounds. *Zeug*, for example, in itself, rarely has the signification that it often possesses in compounds – namely, ‘tool’ or ‘piece of equipment’.

The result of these and similar manipulations is a style of writing that is especially accurate, plastic, lively, emphatic, and original. There is seldom a case as paradoxical as that of *Entfernung*. Heidegger openly violates the rules of the language only once; namely, at a most central point in the explanation he departs, in his linguistic renovation, from the grammatical system of the German language by using the form *gewesende*. The gigantic battle over Being really leads here to disruption: *gewesen* is a perfect participle; with this ending, however, it is used as a present participle and is made active.

Heidegger surrounds this bold venture with excuses – which are found elsewhere in connection with a number of more common changes in signification. Such excuses are not as superfluous as the almost coquettishly emphasized introductory apology for the awkwardness of his explanation. For, next to Scheler, Heidegger is certainly the best stylist in modern German philosophy. He handles the most variegated figures of speech with greatest ease. Sometimes one suspects a kind of professional pleasure on his part – for instance, in his preference for the paradoxical connection of opposites in the oxymoron. The deliberate weightiness of many of his formulations can serve not only to clarify thought but to hinder it also. When the latter occurs, a laboriously controlled pathos breaks through, placing the reader under the pressure of its expressive force. The summaries following the careful and detailed descriptions are, in a sense, crushing. When one reads how the ‘there of the there-is stares man in the face with inexorable mysteriousness’, and how man ‘is shipwrecked on that mystery’, then one is prepared to experience as an oppression the concatenation (*Verklammerung*) of the existentials, to which Heidegger has rightly given the greatest possible attention.

Without anticipating Heidegger’s reflection on language, it is possible to understand the tendencies mentioned from the perspective of the range of ideas found in *Being and Time*. First of all, in the introduction Heidegger explains his plan to develop a scientific philosophy that would fulfill an old desideratum – namely, the development of the idea of the natural world – and to do this with the assistance of phenomenology. Phenomenology describes phenomena, that is, those things that show themselves the way in which they themselves are. Now the combination of a scientific philosophy and a philosophy that remains close to life is what is so striking in his choice of words. And the philosophy is close to life, also, in the sense that its formulation forcefully influences life itself.

Second, in his analysis of man's Being Heidegger always distinguishes between authentic and inauthentic Being. The latter is characterized by, among other things, a conventionality that never comes to self-activity. This is why Heidegger's close affiliation with the German idiom reserves for itself a language-creating freedom in opposition to the conventional.

Literature and the history of language

Upon reaching this point one is able also to account for Heidegger's position regarding the history of language and for his usage of linguistico-historical data. The inauthentic way of living, which does not appropriate the possibility of self-realization, similarly does not obtain that which, in the handing down of a cultural tradition, could serve that purpose. The possibility of self-realization is not even recognized in its authentic meaning. However, for a living tradition such a testing self-activity is a necessary condition. Heidegger's critical attitude toward the current use of language, which he sees as an eminent factor in the governing conventions, is thus complemented by his selective openness with respect to the history of language, which he sees as a branch of utmost importance of the history of the mind.

Heidegger's bold but by no means arbitrary use of the German language certainly seems to 'make' new expressions, but upon closer inspection all of these appear to be not so 'new'. It is, rather, a renewal of the 'old'. This 'old', the original, is therefore essential to the quest for a natural conception of world, a conception which is directed against the conventional. In the course of the mind's history the becoming aware, insofar as man himself is concerned, has obviously not become more 'natural' in the conceptual elaboration of reflection. That natural conception of world has become sedimented in language. It is still there, at one's disposal, but one must uncover it.

Let us suppose that someone wishes to clarify the fact that in the structure of *Being-in-the-world* the existential *Being-in* is not identical with the categorial *Being-in*. In clarifying this one can appeal to data of the history of language – for instance, to the origin of *in* as a prefix and to the etymology of *I am*.³ These data suggest that originally *Being-in* was understood, or at least was conceived of, as a 'Being-with', a 'Being familiar with'. These data obviously do not 'prove' that 'indeed' the Being of man is to be characterized by this relationship toward reality. At the most they provide a hint of the original awareness of this relationship within a determinate linguistic community – and this awareness, given the line of development of the mind's history, is important enough in itself. But the ancient usages of words obviously do not possess the value of an argument (because . . . therefore . . .) and are not employed

in that way in Heidegger's explanation. Rather, they serve the purpose of orientation; they constitute a valuable indication of the direction to take in uncovering a structure⁴ which one sees oneself and to which one wishes to draw the attention of others ('See what I mean there').

It is possible that the attention one pays to a certain state of affairs was aroused by these or similar data from the history of language. To this extent the explanation is circular, and this is by no means kept secret. Heidegger conceives of *alētheia*, for instance, as 'unconcealment' and then uses this conception to confirm his explanation of what truth taken as an existential is – namely, 'Being discovering'. This confirmation plays a part in the framework of the detailed explanation of this existential.⁵

Much earlier, in Heidegger's introductory remarks concerning his method, his use of the Greek word hints in this direction.⁶ The initial explanation is not much more than an assertion ('dogmatic interpretation') concerning the Greek idiom.⁷ But the later phenomenological descriptions focus attention on relationships which constitute support for these 'assertions' concerning the Greek idiom. The explanation of the Greek terms suggested earlier is now clarified insofar as their content is concerned. In this regard the explanation can be objectively justified. But is this sufficient for a historical proof? Certainly not; but, on the other hand, it at least justifies searching for a solution in this particular direction – that is, such an explanation is phenomenally justified. If the explanation can be deepened in this context, and if, furthermore, by taking a special view of the mind's history it is possible to clarify how it could ever happen that this original intention gradually came to be forgotten, then one's explanation of the Greek idiom is in turn reinforced.⁸

Such a striking case shows not only the illustrative but also the inspirational value of a word's history. However, one can experience at the same time the limitations which, in such an argument, are to be placed on the value of such an inspiration. Yet there is a third important aspect for delineating the limits of the function of linguistico-historical data. This aspect is connected with the whole nature of the transcendental-phenomenological argumentation. In each case such an argumentation, along very general lines, develops a structure in its constitutive moments. Then it proceeds from this most general horizon to more detailed explanations within the projected context. In this way the context becomes clarified at the same time. This road from the general via the particular back to the general does not have the character of a deductive foundation; if it did, this particular way of proceeding would be absurd. The phenomenologist does not want to deduce but rather wants to bring to light and make manifest.⁹

This relationship between the general and the particular is found in

each case to be the relationship between transcendental structure and concrete mode. After the structure is described initially, the connection that was so developed is put to the test with the help of a concrete mode (*Bewährung*). Will one succeed, for instance, in using the structure of the mood of finding oneself in (*Befindlichkeit*) as a guiding clue in analyzing a concrete mood – namely, that of fear?¹⁰ If this is the case, then the analysis has confirmed the general scheme: the scheme itself is tenable. Can the structure of original understanding (*Verstehen*) be applied generally to concrete assertions?¹¹ If so, one has shown that this construction is not merely a figment of the imagination; for it has proved its usefulness in the clarification of our experience. This experience, this concrete mode, is then a variation of the theme of the transcendental structure; and this structure in turn becomes more richly developed in such variations. This principle of verification is found in no other way in the further course of these trains of thought. Concrete verification (*konkrete Bewährung*)¹² is desirable after the proof (*Nachweis*) of an ontological fundament is given. An existential project is in need of an attestation to be given by the analytic of Dasein (*daseinsmässige Bezeugung*).¹³ A thesis that can be tested in this way, on concrete facts of life,¹⁴ and can stand the test has become phenomenally accessible. It is in this way, also, that the analysis of the traditional concept of truth develops the relationship between assertion and phenomenon.¹⁵

The linguistico-historical data can in their own way very well serve a purpose in verifying a general theory on the basis of the phenomena. That is why the data also appear to confirm the phenomenological results. Confirmation by means of the sources cited means that the results are not arbitrary constructions, that they did not come about forcibly. The analogy between this linguistico-historical argumentation and Heidegger's use of language is, within the perspective of the phenomenological method, self-evident: in both cases Heidegger tries to unveil original meanings, to bring the past to life again, and to free once more the forces that have produced the past. The quest for the natural conception of the world is set in motion by suggestions from language. The results of this search in turn confirm and clarify these suggestions. Because of the value that is necessarily attached to the elementary original, such a confirmation is not without meaning for the tenability of the structure that was developed in this way.

Heidegger announces his use of *alētheia* as follows:

The ultimate business of philosophy is to preserve the force of the *most elemental words* in which Dasein expresses itself, and to keep the common understanding from levelling them off to that unintelligibility which functions in turn as a source of pseudo-problems.¹⁶

His warning against 'uninhibited word-mysticism' means in this connection that, on the basis of the results of his investigation concerning the content (*Sache*), he sees through the word in its signification. He concludes: 'When Dasein so expresses itself, does not a primordial understanding of its own Being thus make itself known?'¹⁷ Heidegger thus recognizes in linguistico-historical data what he has found in the analyses in *Being and Time*. 'What is ontologically "new" in this interpretation is ontically quite old. . . . We are conceptualizing existentially what has already been disclosed in an ontico-existential manner.'¹⁸ With the help of the insight thus acquired, Heidegger tests the vocabulary and distinguishes the irrelevant data from the relevant in a manner such as we have dealt with here. This explains why he calls *validity*, as it is used in the terminology of logic, an 'idolized word'.¹⁹ Yet with the help of the etymological data for this word, it would have been easy enough to accentuate the ancient religious-ethical nuances in its signification. If one were offended by the development of the signification of *Geld* ('money'), he could still turn to the ennobling term *Gilde* ('guild'). But logical validity (as a further characterization of the truth of a judgment) does not fit at all in this conception. The concept does not speak; in this case the history of the word does not come into action. Thus *Being and Time* does not mention the data that are available here but are not actual.²⁰

Heidegger also finds fruitful points of departure in the history of ontology. But for that purpose ontology, too, must first be judged in regard to its tenability on the basis of the phenomenal structure. This leads to a revision, the ontological 'destruction'. The genuine experiences that gave rise to the concepts handed down become then rediscovered: namely, as the existential starting point of the existential-ontological theory.

But it is not only the vocabulary in general that can mediate this starting point; Heidegger incidentally taps yet another source of preontological becoming aware of man's Being. This source comprises literary documents that can confirm his existentials such as 'care', 'death', 'authentic Being': the ancient *Cura* ('Care') fable, Pindar's as well as Goethe's 'Become what you are', the enactment of the experience of death in a Renaissance poem, and a work by Tolstoi. While Heidegger conceives of the question of Being as the radicalization of a tendency that essentially belongs to man's Being taken as *ek-sistence* – that is, as the radicalization of man's preontological understanding of Being – at the same time he shuns conventions and searches for original experiences. His confrontations with poets thus have a function analogous to that found in linguistic foundations: they confirm what was already established.²¹ In both cases the phenomenologist apparently feels a need to legitimate the results as being already predelineated in order to show that they are not merely constructions and figments of the imagination.

The explanation given in connection with the *Cura* fable calls such a conclusive force 'merely historical' (*nur geschichtlich*).²² The expression, which Heidegger purposely puts within quotation marks, is a fine example of irony in a thinker who, at the moment he first delineates his investigation, posits that man's Being is essentially like time, and thus necessarily possesses historicity, so therefore each concrete mode of Being – including the ontologically questioning mode – is characterized by this fact. With this 'merely historical' (*nur historisch*) the full weight of Heidegger's theory is thrown behind the *Cura* fable as well as behind the literary documentation that follows.

Language and understanding

Once Heidegger's appeal to language and literature is recognized and the quality of his command of the language is known, it is to be expected that his theory will attach an especially important significance to language as existential and in so doing will pay particular attention to the word in its meaning with regard to thought. Let us therefore examine this aspect in greater detail.

It is well known that *Being and Time* is mainly concerned with man's Being in order to lay the foundation for a general ontology. This preparatory reflection is performed in two phases. First, a number of structures of man's Being are developed in an 'analytic', which in itself is again 'preparatory'; second, these structures are explained as modes of temporality. Temporality is the essence of man's Being; thus, time is comprehended as the horizon of that understanding of Being which is characteristic of man.

In the preparatory analytic of man's Being, one obviously expects also to find an explanation of language. Heidegger realizes who this man is who, in his Being, always comports himself with this Being in one way or another. The essence of man consists in this peculiarity, in the mode of Being as Being towards, in his ek-sistence. In man's ek-sistence his Being is disclosed to him; he himself discloses to himself the there of his Being-there. Two different things are found in this disclosedness. The fact that I know that I am there implies that in being-there I have to be thrown into a Being in which I always already find myself. But ek-sistence also means, on the other hand, that in being-there it is left to my own ek-sistence to decide what I will make out of it: this is the project of self-realization in which, anticipating the goals and returning from the goals to the means with which they could be achieved, I will never be able to escape from this thrownness. The chasm of such a conflicting twofoldness is the heart that Heidegger's analytic tries to make explicit in a way as tenacious as it is cautious. Its point of departure is

man's ek-sistence as concernfully being in the world together with others, and from this it develops this structure as a coherence of existentials.

But there is still another, equally essential dualism that determines the train of thought, and, at least for the time being, it must be distinguished from the first. This duality involves an opposition that we have already mentioned – namely, that of authentic and inauthentic being. Again, this distinction cannot be carried through as an absolute separation in the factual existence of man, but on the other hand it is necessary for clarifying the structure of this existence. It is true that in principle this distinction rests on an ontological structure which is neutral in regard to this contrast and which gives to both of these modes of Being as such their foundation. In fact, however, this neutral structure is practically identical with the inauthentic one. The thinker who, as we have seen, at all costs wishes to avoid the semblance of finally coming out with 'an idea of [his] own contriving', does not wish to deduce this anthropological structure from an 'Idea', either.²³ His phenomenological clarification is oriented toward man in his everyday doing, toward the most ordinary data concerning man. With this attention to this first and for the most part (*zunächst und zumeist*), to the everyday indifference (*alltägliche Indifferenz*), the difference between the neutral structure and its inauthentic variant is blurred; they sometimes blend imperceptibly into one another, and the inauthenticity, the fallenness, is an extreme form of appearance with regard to the indifferent point of departure.

Only relatively late – in the next to the last chapter of the preparatory analytic – is language even mentioned. The analytic concentrates least of all on this anthropological, pre-eminently fundamental phenomenon. It does not deal with language as the range of systematized possibilities of expression by means of symbols which appear in the possible combinations of vocal sounds; it is concerned, rather, with speech as that form of human behavior in which these possibilities become materialized. In this analytic, linguistic phenomena are dealt with in the same way as other basic forms and principles of man's Being – for instance, consciousness, intuition, thinking,²⁴ and even experience (*Erlebnis*), that key word in the philosophy of life.²⁵ Heidegger's investigation goes 'behind' such phenomena in search of some primary mode of man's Being as their ontico-ontological condition. This mode is reached here not via the basic forms mentioned but from the phenomenological characteristic of man's Being-in-the-world, which is to be developed with the help of the average everydayness of man's ek-sisting and is guided by the idea of a transcendental foundation of the immediate living reality.

In the introductory description of the disclosedness of Being-in-the-world Heidegger mentions language, among other things, as one manifestation of an existential called *logos* (*Rede*). Earlier, he briefly touches on this theme in mentioning the relationship between observation of

objects. (*Vernehmen des Vorhandenen*) and language.²⁶ Corresponding to this cursory indication in the investigation of ek-sistence is a passage in the methodological prelude to the investigation: in characterizing the *logos* of phenomenology, Heidegger also considers the relationship between *logos* and *phōnē*.²⁷

Both of these earlier passages give rise to the supposition that language will come to the fore only in a much later phase of the transcendental derivation and, as the first passage confirms, as an ontological derivative of *logos*. However, when in *Being and Time* the structure of man's disclosedness is brought to light in greater detail, it appears that in the final analysis language is reached in the continuing explicitation of man's understanding. We must dwell on this subject somewhat longer.

Language as found in words and sentences appears as a communicating speaking forth and constitutes the third and most accidental²⁸ moment in the structure of the assertion – namely, a mode of the predication in our judgment. This predication is, at this point, by no means thought of explicitly as a linguistic phenomenon. It is true, however, that in the predication there comes about the transition from being occupied with something to speaking to others about something, about something which merely occurs. Such a determination presupposes the indication of the this-here about which one wishes to speak. From such an indication the members of the predication grow forth;²⁹ for, in order for one to be able to indicate the this-here and point it out, he must dwell with it. On the other hand, the pointing out of something that is to be further determined presupposes some meaning or signification which, in the judgment, is formally attributed to what has been pointed out; but this signification must also belong to what was pointed out. These conditions for the possibility of a pointing out as the origin of a speaking out are fulfilled by the interpretative explanation (*Auslegung*).

With this existential we have penetrated one layer deeper into our derivation of language from the disclosedness of man's ek-sistence. The meaning which, in our concerned dealing with (characteristic of our concern for our own Being), is to be attributed to a thing is laid out in interpretative explanation. This explanation comes about in such a dealing with. It does not consider, but instead it handles. When someone gets something ready in order to use it later, he lingers with that piece of equipment. The tool becomes conspicuous to him *as such*, delineates itself in its meaning. In all other cases one keeps moving within the routine of the mutual relationships, a routine in which the things used refer to one another and in this way acquire and grant meanings. Signs are not the only bearers of meanings. They refer explicitly; namely, their usefulness is in referring to a context of usages as to a world in which one lives. Signs make us aware of their use and of the course of action

we have to take in their regard; but all tools refer in their serviceability for to this for-what.

This functional referential context always reaches finally beyond the tool to man himself. He ek-sists. In the world his own Being-in-the-world is at stake for him. The tools are therein at his service and constitute the realm of his possibilities. Man does not just encounter them; he does not just passively run into them. He discovers these possibilities in bringing them to the fore. In this way his meaning-giving behavior, his project of his own Being-in-the-world, co-constitutes the world of his labor, this equipmental totality. Within this project the things present themselves in their meanings. Interpretative explanation develops these possibilities projected by man's understanding; it unfolds these meanings. Explanation grasps the meanings that understanding has established. This totality of references, this whole that has been articulated before all explanation, this multifarious unity of meanings, is disclosed primarily by understanding. It is only on this third layer that the foundation, the ontological ground, of language is reached in the structure of man's ek-sistence. Then the long road from assertion to understanding comes to an end. But was it not said that language is a derivative of the existential *logos*? Yet *Being and Time* develops the context that has been briefly outlined here in minute detail in order to be able finally to dwell on language as a late derivative mode of the speaking forth of *logos*.

The role of *logos*

Within the framework of the analytic this way of dealing with language is an intended consequence of the phenomenological method and is by no means a 'jumbled' explanation to be straightened out afterward. The description repeatedly distinguishes a multiplicity of ontological determinations as the moments of a correlativity which, forced to its extremes, underlines the equivalence of the moments as well as their mutual determinateness. Heidegger's explanation describes the structural unity in which the ontological determinations are to be understood, beginning with a nucleus which is always carefully adhered to. Again in a circular movement such a description passes through the moments of the structure almost with desperate tenacity, guarding against its splintering.³⁰

But what is the case here with disclosedness? It consists of the basic mood of finding oneself in (the realization and emotional experience of the thrownness), understanding (the capacity to project), and *logos*. The first two in this sequence are dealt with separately, but they are understood together and through one another. Moodness has its understanding, and understanding always has its mood.³¹ In this way the threads are

knit to and fro, back and forth. This procedure is repeated for these two moments in regard to *logos*, although there is some difference insofar as this strict interdependence is established explicitly only at the very end and not, as it unambiguously appears, as the guiding clue throughout the train of thought.³²

In the meantime, however, the activity of *logos* is co-thought in the whole series of existentials derived from understanding and extending to assertion. For our discussion it is important that this occurs as well in regard to aspects characteristic of language: the understandability, although it is in principle wordless, is nonetheless articulated, comprising a context of significations; the disclosedness of ek-sistence is articulated by *logos* in the original sense of the word. This, in turn, constitutes the ground for the possibility of the derivative modes of understanding with which Heidegger deals. Parallel to this, it is always shown how fundamental moodness is articulated – for instance, in the coherence of the relating elements in a concrete mood³³ or as a sequence of distinguishable nuances in our being tuned (disposition)³⁴ – and thus how *logos* plays its part here also.

Language came to the fore as an accidental moment in the structure of assertion – namely, ‘speaking forth’ (*Heraussage*), ‘statement’ (*Aussagesatz*).³⁵ *Logos*, however, is a constituent of assertion as prelingual but articulated explanation. Thus it is consistent that this same moment appears accordingly as expressedness (*Hinausgesprochenheit*).³⁶ In this way language approaches, functions (in both aspects of foundation) in our Being with others in the world with things. Language is thus in every respect constitutive of our ek-sistence. That it is an ontologically derivative phenomenon by no means excludes this fact. But the mode of ek-sistence in which Heidegger’s exposition reveals the constitutive character of language is, within the general perspective of the preparatory analytic, the average everydayness: language is a tool to be used in social intercourse.

We employ this instrument because we are essentially in the world and committed to it: language is a consequence of man’s thrownness. Understanding, of which language is an ontological offshoot, was fundamentally explained, however, in its meaning-giving project character as the counterpart of original moodness, representing the thrownness in the structure dealt with. This understanding is prelinguistic. With the significations, it lays the existential-ontological foundation for language. However, as soon as understanding manifests itself as a phonetic expression of significations – as an expression in words – one can observe that the project appears in its being thrown. Looking back one notes how, with the introduction of the speaking forth (*Heraussage*), a transition is completed – one that could not be sufficiently elucidated earlier. Is this why the transition took place so incidentally and almost reluctantly?

Although one believes that he is dealing with linguistic phenomena, the issue remains one of ontological foundation. This is why Heidegger needs a distinction such as that between *assertion* (*Aussage*) and *speaking forth* (*Heraussage*), a distinction between words that at first sight appear to mean the same thing. A corresponding reservation, although expressed in another way, characterizes the mention of language in connection with the observation of objects.³⁷ However, is it perhaps possible that, when the transition from *logos* to language expressly constitutes the theme of the exposition, the precision of the analytic increases?

Meanwhile, this can scarcely be contended in regard to the formula that introduces such an analysis: 'To significations, words accrue.'³⁸ This is metaphorical language. However, in view of Heidegger's subtle use of language, this figurative representation of the phenomenal context should not be taken merely as a 'flower of speech'. There is still another reason to take this metaphor seriously. As we have seen, it appears earlier,³⁹ and there is objectively the closest possible connection between these passages. In the first reference the issue is the appearance of significations within the indication when interpretative explanation discloses the equipmental context in its meaningful articulation; in the later reference the issue is the manner in which these significations become word significations.

The presupposition common to both these indications is a process of growth, a thought-less (unpremeditated), and yet teleological, 'organic' occurrence of immanent lawfulness. But this presupposition is not approached both times in the same way. In the genesis of the significations, indication unfolds itself, as if it were to differentiate itself and begin to flourish (*erwachsen*). The process of the growth of the words, on the other hand, adds these words to the significations (*zuwachsen*), and at the same time the significations are on their way to the words (*zu Worte kommen*). The organic lawfulness comprises a wider occurrence within which this process of enrichment (*Zuwachs*) comes about. But the reader remains uncertain as to the nature of this organic compass. *Being and Time* is silent about the origin of this enrichment.

The reader is puzzled not only by the incompleteness of the metaphor but also by its organicistic character. How can this metaphor be applied to an instrument, to a factor in the equipmental context? On the other hand, in his preparatory reflection on the analysis of man's ek-sistence Heidegger has clearly spoken against a vitalistic easygoingness in philosophical anthropology.⁴⁰ His existentials certainly cannot be interpreted in that sense. At a decisive moment in the analytic this becomes fully clear: In his analysis of man's finitude Heidegger rejects among other things the conception of life as a kind of 'ripening process', 'completed' by death.⁴¹ By applying the organicistic metaphor to language, its genesis and relationship with man's Being become problematic.

The perspective that is opened here is surprising within the framework of the analysis. Would it be better still – keeping in mind the peculiar ‘coloring’ of what is perhaps the most fundamental existential, namely, ‘temporalization’ (*Zeitigung*) – to take such metaphoric suggestions as incidental and strictly accidental? This is forbidden, however, by the accurate rebuttal of the passage with which we have just dealt, which certainly excludes all accidentalness. For, in the same way that *Being and Time* introduces the analysis of language, it also drops the subject again. A number of questions that present genuine challenges to linguistics and philosophy of language keep the horizon open. Heidegger reminds us of three phrases about language in which language is conceived of as a living being.⁴² The applicability of such metaphors illustrates the basic problem formulated therein: Does language have the character of a tool, does it have an anthropological character, or is there a third possibility? In the light of our foregoing reflections, the direction in which Heidegger searches for the answer is clear.

This interpretation, however, concerns merely the ‘marginal phenomena’ that surround Heidegger’s analysis. In more direct descriptions his analysis develops a structural connection between *logos* and language that better harmonizes with the main lines of the exposition. In a certain respect, however, this connection offers a remarkable contrast to the characterization of the nexus between understanding and language. For, as far as the word *assertion* (*Aussage*) is concerned, one is dealing with an ontological fundament of the wording, although one believes that the issue is the wording itself. Conversely, the term *logos* (*Rede*) refers repeatedly to speech phenomena and linguistic phenomena although, on the basis of the meaning introduced, one expects to hear more about the prelingual existential. German promotes this obscuring even more strongly than English.⁴³ Heidegger’s terminology is guided by this tendency, although his exposition precisely underlines the distinction.⁴⁴

Such an obscuring contrasts with the foregoing pertinacity but nevertheless is also a symptom of the same intrinsic difficulty: the construction of the transition from existential to linguistic phenomena remains a point of concern. If this explanation is correct, the ontological description must confirm it.

In the description found in *Being and Time* Heidegger devotes his attention to the aprioric structure of *logos*. In the complex of phenomena to which this structure is related, one can distinguish four moments. In a conversation: (1) I say (2) something (3) to some one (4) concerning certain events that happened. These moments constitute the structure if all four of them are indispensable and irreducible. In this, ‘neo-realism’ (4) obviously fulfills these requirements. Since *Bekundung* (1) and *Mitteilung* (3) cannot be reduced to wording, they likewise fulfill these requirements. Heidegger even calls attention to the fact that their essential

realization is at stake in such an independence. Genuine understanding is something completely different from giving information.⁴⁵ When listening attentively, one does not concentrate on the acoustic phenomenon (*Verlautbarung*) but on what the other intends to say; one is not 'with' the linguistic phenomenon but 'with' the thing. Insight into the thing does not follow from but forms the foundation of our attention. What is genuinely expressive in language is precisely that which strikes us in the wording but nonetheless does not possess a word character. How meaningful silence can be! Such reflections all point in the same direction: these two constitutive moments of *logos* – namely, (1) and (3) – come to the fore most conspicuously extralingually and prelingually and in doing so possess the same relationship to language as the situation or event, the 'subject matter' (4). They found the possibility of language usage; but they do not form the correlate of language and certainly not its result.

Developing the irreducible character of these necessarily presupposed moments with the help of such experiences is obviously performed at the cost of the wording factor. The indispensability of this factor then becomes positively doubtful; the lingual element in speech seems to become ontologically irrelevant. Another reflection also leads to this conclusion. The correlation between moodness and understanding is constitutive of the structure of disclosedness. Both existentials find full expression in the structure of *logos* through expressing and understanding.⁴⁶ But in this way the latter is completely present in *logos* (as the articulation of disclosedness), and there is no need to appeal to a lingual moment (*das Geredete* (2)).

The opposite procedure, however, is found in Heidegger's dealing with *logos* in the mode of inauthenticity, where the wording is of prime importance and places its mark on speech. In a very colorful way Heidegger describes manifold variants of small talk (*Gerede*), in which the objective fundament (4) is lacking and where, without understanding (3) and without personal involvement (1), the word (2) dominates.⁴⁷ In '*Gerede*' the structural moment of '*das Geredete*' has made itself independent and absolute at the cost of what is ontologically constitutive in *Rede*.⁴⁸

Within the framework of this analysis we may note that (1) *logos* founds language, (2) that in the neutral structure of *logos* language is mentioned as a constitutive moment, (3) that the description of the structure disqualifies this moment, and (4) that language, however, dominates in one particular mode of *logos*. This complexity is a result of the modal variability that characterizes the structure of man's Being-in-the-world. In their variation and transition the different modes show a dynamic orientation. Thrownness tends toward fallenness. Man's Being-in as a Being-with is inclined toward Being away from. The neutral

ontological structure is fundamental in regard to this event but is also abstract. Viewed from the standpoint of *logos*, it suffices to distinguish three constitutive moments within the ontological structure. *Logos* then is not language, and consequently there is no language *in logos*. But, when we are in the world with others and with things, we express our insights in mutual understanding. Language then appears as the expressedness of *logos*, and in this way *logos* is existentially language. Language as 'the totality of words'⁴⁹ is a means toward mutual understanding and is at one's disposal as an element in the equipmental context. This phenomenon, with which we were concerned earlier in connection with the relationship between understanding and language, compels us to suppose a constitutive moment in *logos* which enables *logos* to manifest itself as speech (and therefore as language). The structure of *logos* then becomes (reluctantly on the part of Heidegger) enlarged.

If such a moment is lacking in the neutral aprioric structure, then the transition from *logos* to language cannot be accomplished. However, when one introduces that fourth element, the structure that is so constituted is no longer purely neutral, and one prepares in it the mode of inauthenticity. In this way an essential determination is introduced into the structure of disclosedness, giving us an opportunity to consistently develop from this structure the fallenness. Man employs equipment within a system of references and is thus committed to this equipment also. In-the-world he is permanently exposed to the temptation of being taken up by the world, of losing himself in it – of losing himself in, among other things, language as the mundane mode of Being of *logos*.⁵⁰ When *logos*, which is already exteriorized in speech, is furthermore taken up with language, then it *is* language.⁵¹ *Logos* taken in this verbal form of fallenness is mere banter, small talk.

It is in this manner that, in the changing determination of the relation between *logos* and language, the mode of Being of man decides the ontological character of language. Then one may posit that the mode of authenticity implies a characteristic of language that is fundamentally different from all of this. From the discussion of the phenomenon of language, what has been stated generally in the introduction to this investigation is manifested in detail: the neutral ontological structure is concretely never so neutral that it can keep itself outside the alternative of inauthenticity and its counterpart. If one approaches a structure in its everydayness, the everydayness determines its concretization. The disqualification of the moment of wording cannot remedy this; the structure of *logos* is merely made ambiguous by this disqualification.⁵² Furthermore, the transition to the fourth element does not solve the puzzle that occupied us in the organicistic metaphors. Just the opposite is the case: the fourth factor rests on this puzzle. Without words it is impossible to get to linguistic phenomena. Such phenomena cannot be derived from

the significations and thus not from understanding as *logos* articulates it. *Logos* taken in its fundamental function in the structure of disclosedness is therefore not a sufficient foundation for the significations of the words. There are words, and this phenomenon must be recognized; that is why *Being and Time* mentions them. But at the same time the hint concerning their origin transcends the horizon of the transcendental analysis of man's Being. Word and language transcend man's ek-sistence. In the constitution of *logos* as speech this phenomenon is taken into consideration. But does not *logos* equally transcend this ek-sistence?

Care, temporality, and language

In conclusion I wish to call attention to the way in which the continued investigation in *Being and Time* confirms the characterization that has been developed here. The general scope of *Being and Time* implies, as we have seen, that the same phenomena will be discussed again with greater clarification and that language, too, will again be dealt with. This occurs first in the conclusion of the preparatory analytic and, much later, in connection with the temporality of disclosedness.

In the concluding part of the preparatory analytic the various series of constituents are integrated into the structure of care (*Sorge*). This structure is finally clarified – naturally in the mode of inauthenticity – with the help of the problematic of the current reality and truth conceptions.⁵³ Truth as *adaequatio* is just as equally a third-rate phenomenon in regard to the fundamental existential of revealment (*Entbergung*) via discoveredness (*Entdeckt-sein*) as was language in regard to the existential principles of understanding via interpretative explanation and of *logos* via speech. Like understanding and *logos*, truth is found in the realm of assertion and small talk – that is, in the realm of man's inauthenticity. The fact that in characterizing language we have focused our investigation in this direction begins to bear fruit. After the recapitulating description of disclosedness,⁵⁴ the exposition mentions fallenness as being essential but says nothing about *logos*! When *logos* is finally mentioned,⁵⁵ one comes to know it on this basis, consistently and one-sidedly, as small talk (*Gerede*). The recapitulation thus does not completely parallel the preparatory analysis, in which the fallenness of disclosedness was thematized only after the structure of language and was illustrated with the help of an extremely deficient mode. This narrowing of the theme is taken for granted in advance in the concluding part of the preparatory analytic.

The same process occurs with regard to disclosedness and *logos* in the explanation of the temporality of the structure of care. What until this point was included in disclosedness as a constitutive moment because of the mode of 'everydayness',⁵⁶ is now mentioned as an integral part of its

'completeness'.⁵⁷ In addition to understanding and moodness there is fallenness. This is why the temporal structure employed in the explanation of the phenomenon of '*logos*' is that of fallenness (*gegenwärtigen*).⁵⁸ In the latter, man alienates himself from his genuine life-possibilities.⁵⁹ Immediately before this passage, small talk was again central in the temporalization of fallenness – namely, when it became clear that this phenomenon could not yet be temporalized because of the anticipation (in the reversed order of the exposition).⁶⁰ It appears that in a more general sense, too, the *logos* structure cannot be made visible in its own temporality within the context of an interpretation of man's ek-sistence precisely set up for that purpose.⁶¹ The extremely careful formulation of the relationship between disclosedness and *logos* as found in the preparatory analysis clearly gives its tone away.

In addition to the direct confirmation of the interpretation developed in this paper, an indirect confirmation is equally important. In *Being and Time* linguistic phenomena are brought up a third time – and in this case for the first time in the mode of authenticity. The authentic ek-sistence does not hover above everydayness but is a special mode of rooting therein, of appropriating Being to oneself. Thrownness inevitably tends toward inauthenticity and fallenness. Thrownness and fallenness both express an ontological conception of motion, a continuous and oriented course of motion. He who finds himself again, retrieving himself from this fallenness, radically changes the character of the motion. In the mode of authenticity one is indeed concerned with a movement against the grain. This is successfully suggested by such terms as *pull*, *push*, *plunder*, and *violation*, which help Heidegger to characterize the authentic mood.⁶²

Accordingly, all attention is drawn (as far as *logos* is concerned) to the 'call' (*Ruf*), a phenomenon that stands in sharp contrast to the endlessly babbling chatter of everyday talkativeness. The call is a way of speaking that possesses a concentrated intensity. The existential possibility of Being-one's-Self comes to the fore in Heidegger's analysis and is furthered by an explanation of the phenomenon of 'conscience'. The 'voice of conscience', which makes us understand something, presupposes language. But this *logos*, the genuine *logos*, is wordless.⁶³ The response to the call of conscience obviously is merely small talk. Such a response is an attitude within the world: man projects himself resolutely and silently toward the most proper possibilities of Being.⁶⁴

The authentic mode of *logos* thus does not properly belong to language, just as was the case with its counterpart, the effective dealing with equipment. The reflection on language becomes caught and pressed between the characterization of speechless dealing with and the picture of a speechless Being-one's-Self. Conversely, where *Being and Time* deals with language more fully, for the most part it depicts the empty talk of fallenness.⁶⁵ The authentic Being of man (*das eigenste Seinkönnen*) is

brought up only once in connection with language and *logos*. There, in the midst of an exposition that is extremely objective and abstract, the intimate and sensitive indication concerning 'the voice of the friend whom [den] every man carries with him' surprises us.⁶⁶ In using these metaphors the author sometimes gives only half a word 'to the wise'. If the reader strains his ears, he accomplishes exactly what the passage wished to teach him and illustrates the point that listening is constitutive of speaking. After one finishes reading *Being and Time*, he no longer needs to be a 'wise one' to recognize the presence of the voice of conscience as early as on page 163.⁶⁷ The subject was touched on there in order to shed light on the prelingual and extralingual aspects of man's understanding in the ontological characterization of speech. The entire terminology, from *logos* via interpretative explanation to speaking forth, tends directly toward language and speech; but in so doing Heidegger expresses for one series of derivatives a thesis which he then posits as a general rule: namely, that, ontologically viewed, all origination is degeneration. The series from *logos* as articulation to language as expression in sounds illustrates this.

The cause of this remarkable twist in the reflection on language is obvious. If in methodically striving for phenomenal accessibility one concentrates so attentively on that which 'in the first place and in general' is the case, then phenomenology substantially examines man's Being in the mode of appearing of everydayness. If in addition 'a factual ideal of Dasein'⁶⁸ promotes the one-sided focusing on the criticism of culture in the description, then one gives a strong voice to the inauthenticity found in everydayness. In this way method and tendency converge. If one still adds to all of this the fact that, with respect to a number of statements, the reflection on language has to remain within the framework of the substance of fundamental ontology, then the exposition of language as found in *Being and Time* is being considered with some understanding of the relativity of these statements, just as their functional determination implies.

A certain discrepancy between the reflection on language and Heidegger's actual practice is thus explained. His characterization of language usage cannot be applied without adaptation to his own style of writing. It also seems difficult to combine the role given to language and literature in the method of *Bewährung* with the disqualification of the word which we have discussed earlier. Yet one must also learn to notice the discord with respect to the governing language convention, a discord which manifests itself in Heidegger's choice of words. This is positively in accordance with the reservation in regard to language that appears in section 34 and the sarcasm of section 35. Such a style goes against the grain. Heidegger's linguistico-historical documentation travels upstream, back to the source. It undoes that degeneration in the same way as was

done in the struggle with the use of language. Heidegger obviously does not resign himself to the available language tool. In the process of gradually becoming aware of things, he does not let himself be guided by that tool; he does not understand man from his equipment but forges linguistic means in order to make a new insight communicable. Viewed in this way – that is, from the creativity of an original writer – the assertion that words accrue to significations receives a new emphasis from within. What is at stake here, just as in the case of silent self-realization, is the undoing of fallenness; what is at stake is thus an aboriginal experience that forces itself on us in dealing with our familiar equipment.

If one considers the restrictions which are placed on this reflection on language by the function that this reflection has in *Being and Time*, then such an assertion receives a meaning that transcends its immediate contribution to the exposition. In conjunction with cognate indications, such a remark moves away from the periphery to which these indications were pushed by the plan of the book to a somewhat more central position. It is true, however, that even then the vegetative suggestion of the formulation (*zuwachsen*) does not match the grandeur suggested by the style of writing. But is it not a question of whether or not both of these aspects are characteristic of creativity? Does this vegetative suggestion not have much in common with the 'struggle for a gift'?

In light of the functional determinateness of the exposition of *Being and Time*, another remark from section 34, this one concerning literature, is of special importance for an adequate explanation of Heidegger's conception of language. Precisely how literature appears as a linguistic work of art is not explained.⁶⁹ This is quite consistent; for otherwise Heidegger would be dwelling on the linguistic tool (albeit as plaything). What literature is able to accomplish is what Heidegger is concerned with: literature discloses ek-sistence; it communicates possibilities of moodness. It brings man to the there of his Being-there. The ontological rank of such language usage then becomes evident. One must take into account the epistemological valuation of moodness, which in its unveiling capacity reaches much further than theoretical knowledge.⁷⁰ The primary discovery of the world takes place in moods.⁷¹ From this point of view the essential significance of literature is already delineated in the explanation found in *Being and Time*. This again throws light on language and word. In linguistic art the sensitive (by no means to be taken yet as 'filled with feeling') explanation of our Being-in-the-world takes place in such a way that it also speaks to others. If this had not been touched on in principle, it would then have been impossible in *Being and Time* to develop the phenomenon of being united by a common fate within the framework of man's historicity.⁷²

In such cases the harmony between Heidegger's reflection on language

and his style of writing stands out. The author not only repeatedly demonstrates his ability to create such a harmony but also deals with the harmony explicitly in its own nature. *Being and Time* concentrates on a very special series of moods: fear, anxiety, concern, guilt. But, in reading the passages that follow the discussion of these moods, we are urged to distinguish in this respect the restriction imposed by the function of the book and therefore, to understand not only Heidegger's conception of language in a broader perspective but also the living reality he wishes to disclose. In the development of the instrumental perspective in regard to reality, all attention is focused on nature as equipment. This is obviously something other than nature in its pure being-present-at-hand but also different from nature as power of life: 'it is Nature as that which "stirs and strives", which assails us and enthralls us as landscape.'⁷³ Here the reader is again confronted – in passing, but nonetheless unmistakably – with a third possibility, the possibility of linguistic interpretation.

Notes

1 Heidegger is applying here a differentiation commonly used in German to a new case; in German one finds *rationell* and *rational*, *funktionell* and *funktional*.

2 In the common and current distinction between *Furcht* and *Angst*, among other things the more bodily concentrated tendency of *Angst* (oppression, tightness of the chest) plays an important role; in the case of *Furcht*, in addition to the objective relationship underlined by Heidegger, one can establish, on the other hand, a more transcendental nuance due to the indeterminateness of the word. For example, the following differentiation occurs in common language usage: 'Man ängstigt sich vor dem Kettenhund, und man hat Furcht vor dem Schicksal.'

16 SZ, 220.

17 SZ, 222.

18 SZ, 196.

19 SZ, 155–6.

20 See note 2 above. In this connection it may be pointed out that, according to German philology, *Angst* might very well be a relatively young derivative

from Latin (*angustus, angor*). In judging the method outlined, one must take into consideration this kind of complication also.

21 SZ, 183.

22 SZ, 197.

23 SZ, 196, 43.

24 SZ, 142–8.

25 SZ, 134–40.

26 SZ, 59–62, 130–4.

27 SZ, 32–4.

28 'Aussage ist mitteilend bestimmende Aufzeigung' (SZ, 156). The adverbial (undeclined) form makes 'communication' strongly peripheral in the definition.

29 SZ, 155.

30 SZ, 180, 351.

31 SZ, 142.

32 *Logos* is indeed as primordial as moodiness and understanding (SZ, 161), but it is not always mentioned together with them in the same breath as a mode of Being-there. Therefore, it so happens that *logos* is lacking altogether in the encompassing, repetitive formula for resoluteness (SZ, 182).

33 SZ, 134–42.

34 SZ, 136.

35 SZ, 155, 157.

36 SZ, 161.

37 SZ, 59–62.

38 'Den Bedeutungen wachsen Worte zu' (SZ, 161).

39 SZ, 155.

40 SZ, 45–50.

41 SZ, 244.

42 SZ, 166.

43 The German word *Rede* does not mean 'ratio' (*Vernunft*) but 'oratio', 'speech', 'conversation', or 'discourse', 'that which is said', 'oration' or 'address', 'phrase' or 'expression', 'rumor'. Heidegger uses the term in this context (1) to indicate the founding existential ('Rede liegt der Auslegung und Aussage schon zugrunde.' 'Die Hinausgesprochenheit der Rede ist die Sprache') and (2) as *nomen actionis* in addition to the infinitive made into a noun ('Reden ist Rede über'). Even when (2) is introduced (SZ, 161), (1) nonetheless keeps resounding in the phrases. That is why the conception of 'Rede als Aussage' (SZ, 165) can be rejected. Otherwise Heidegger very often, although never in section 34, uses *Rede-Redewendung* to mean 'phrase' or 'expression' (for example, SZ, 180, 186, 189).

44 SZ, 153–60.

45 SZ, 162.

46 SZ, 162, 164.

47 SZ, 167–70.

48 Here the quality of Heidegger's usage of language is particularly outstanding. The terminology expresses uncommonly well the exact results of the structural analysis. On the other hand, this analysis is a fine example of Heidegger's capacity to clarify implications of the German idiom.

49 SZ, 161.

50 SZ, 161.

51 SZ, 167.

52 To illustrate this once more with another example: the term *communication* (*Mitteilung*) changes, as far as content is concerned, depending on the phase of

the exposition in which it occurs. (1) In the foundation of assertion in understanding, 'communication' is synonymous with 'speaking forth' (SZ, 155). (2) In the structural analysis of *logos*, 'communication' is the aprioric foundation of the possibility of such a speaking forth, which, as 'communication' is a special case (*Sonderfall*; SZ, 162). (3) In the characterization of small talk, 'communication' is again *logos* which speaks itself forth (SZ, 168). It becomes clear that, as early as in section 33, the last derivative of understanding constitutes the mode of inauthenticity, even though it is not mentioned.

53 SZ, 212–30.

54 SZ, 220.

55 SZ, 223.

56 See, for example, SZ, 167.

57 SZ, 249; see also SZ, 350.

58 SZ, 349–50.

59 SZ, 348.

60 SZ, 346.

61 SZ, 349.

62 These terms clearly suggest the fact that this mood has a discontinuous character, that of the leap. Just as genuine knowledge leaps into the circle of understanding (SZ, 310–16), so man leaps into authentic being.

63 The silent call of conscience (SZ, 296) alarms man, pushes him into anxiety, confronts him with his fallenness (SZ, 276). Conscience summons us to be quiet and to listen.

64 In this connection *Verschwiegenheit* is persistently brought to our attention. See SZ, 297, 301, 305, 382.

65 SZ, 167–70.

66 SZ, 163.

67 That is why *Verschwiegenheit* (belonging to resoluteness) appears familiar to us when we look back at section 34.

68 SZ, 310.

69 However, the context focuses all attention upon tone, modulation, speech tempo, thus upon those kinds of nuances which linguistics knows how to suggest so compellingly.

70 SZ, 134.

71 SZ, 138.

72 SZ, 382–7.

Language and silence: self-inquiry in Heidegger and Zen

Tetsuaki Kotoh

I The question of the existence of the self

Our existence is thrown into total darkness. No matter how much our insights may illuminate it, darkness not only obscures the path we have come along and where we are heading for, but also casts shadows over our everyday life. If we are thrown into this world and are to be taken away from it without knowing why, this means that we exist as merely ephemeral and lack an ultimate goal. It is impossible to think that there are necessary reasons for human existence, which happens to be born on a small planet in the dark universe for such a short period of time in the vast history of the planet. Such a circumstance is not different at all from that of ants in the field. This absolute lack of ground constitutes the abysmal darkness of human existence. At the bottom of our existence is total nothingness which repels any kind of reasoning from the human perspective.

However, awareness of the darkness of existence is extremely rare. We are busy in everyday life, and if we instinctively sense anxiety in facing the darkness of existence we nevertheless usually manage to forget or avoid the abysmal aspect of our being. The structure of our everyday lives is informed by a double concealment: oblivion of the darkness of existence and escape from one's self. We ground our existence in numerous purposes which we think necessary for carrying out actual life. 'Customs' or 'habit' would be a name for this. Thus, the everyday self dozes comfortably in the peacefulness of existence, of which only the surface is comprehended.

There would be no problem if one could go through life in such pleasant somnolence without ever realizing its darkness. However, it is possible to share the tragic astonishment expressed by Kūkai in *Hizō Hōyaku*: 'It is dark at the very beginning of one's birth and is still dark

at the very end of one's death.' Human beings do not only exist but are also capable of conscious rumination about existence – which constitutes both our dignity and misery. Once a crack starts to open up in a life which runs along the tracks of custom, the dark abyss begins to threaten our existence. Human beings are not sufficiently cunning to be able to conceal their true selves to the end; nor are they strong enough to endure such darkness.

This is the very reason why, from the beginning, philosophy and religion have sought a way of being in which one interrupts the somnolence of everyday life, becomes aware of its darkness, acknowledges and illuminates this darkness, and rests with a peaceful mind. Illuminating and acknowledging life and death is the ultimate concern for Buddhism. Such inquiry into the self is what is urged by the 'Know yourself!' of Socrates, and is the essence of conversion in Christianity whereby one reaches the state spoken of in Galatians in which 'it is not I who lives, but Jesus Christ who lives in me'. There is no more urgent or basic concern for a human being than the conversion by which the everyday self becomes aware of its self-concealment, returns to the dark bottom of life and seeks a solid place in which to reside peacefully. However, self-transformation does not mean that the self changes to another self, but that the self whose true existence is concealed returns to the non-vacillating self, and in this sense means the birth of the true self.

There is a variety of ways of self-inquiry. It is possible to look at it as a change in the way one relates to others or to society, or as a change in total world-view. This could even be studied from a psychological or neurophysiological perspective. In this paper I shall treat the problem from the perspective of language. To explain why I take this perspective, I must touch upon 'the linguisticity of human experience of the world', as discussed by Heidegger and his successor Gadamer. Since the idea of the primacy of language is more prominent in Gadamer's thought, I shall present it with reference to his work, though I shall end by suggesting that he ultimately misunderstands Heidegger's thoughts on language.

II The linguisticity of human experience

In response to Heidegger's later thought, in which the emphasis on language is expressed in the famous dicta, 'Language is the house of Being' and 'Language speaks',¹ Gadamer develops his theory of the 'linguisticity of human experience of the world'. 'The linguisticity of human experience' means that 'the human relationship to the world is absolutely and fundamentally linguistic' (*WM* 45; *TM* 432–3). The question whether or not pre-linguistic experience can be described is not the issue; it is rather that the existence of any pre-linguistic state is denied.

Gadamer's contention is that 'coming to language' (*Zur-Sprache-Kommen*) constitutes a universal ontological structure and, therefore, all that can be understood is language (WM 450; TM 431-2). Normally, the propositional statement is considered to be the level at which language first emerges; but, according to Gadamer, possible objects of propositional expressions, preceding propositions, are included in the horizon of the world (WM 426; TM 408). This means that even a perspective independent of language, such as the 'pure transcendental subjectivity of the self' in Kant and Husserl, cannot escape involvement with a linguistic community and so cannot be posited at the ground of language as the subjective restriction which makes language possible and valid (WM 330; TM 311). In other words, language has invaded the transcendental domain as an *a priori* restriction that enables the world to emerge. Language in this sense has to be distinguished from linguistic phenomena (phonetic letters and forms of their representation) which are found alongside other beings within the world already constructed by language. Further, this function of language pervades not only linguistic phenomena but also the structure of all possible objects. An abysmal unconsciousness or self-oblivion which 'presents the world and itself disappears' envelops language perceived as 'a particular and unique process of life' (*Lebensvorgang*) (WM 422; TM 404), which enables the objectification of everything without itself becoming an object.

How does the linguisticity of experience gain its foundation? Gadamer argues that experience is essentially understanding, and that understanding and interpretation (*Auslegung*) are essentially intertwined (WM 377; TM 361). 'The internal twining' means that 'conceptualization is internally woven into all possible understanding', in other words, 'linguistic formulation' resides tacitly as the 'historical sediment of meanings' (WM 380f; TM 364f). Behind this is the claim that 'language is the universal medium in which understanding itself realizes itself. Its mode of realization is interpretation' (WM 367; TM 350). What constitutes the basis of Gadamer's thought is the thorough study of the historicity of human beings, and he connects this 'belonging-to-history' with Heidegger's elucidation of 'the structure of pre-predicative understanding'.

Human beings are constantly thrown into finite circumstances formed by historical conditions, and these historical circumstances delimit their cognition and experiences. Historical tradition is formed by the interaction of 'my past and not-my-past' and it involves 'pre-concepts or pre-judgements' which have become an historically active reality in our existence beyond our will and actions. Understanding does not follow tradition blindly. It includes existential possibilities of the future which apply to and vitalize the past (tradition), and it integrates these into the present circumstances (WM 290; TM 274). Therefore, tradition does not wither but continues to live as a determinant which opens up new

understanding. Though restricted by tradition, understanding is a creative process which vitalizes it. As in Heidegger, understanding becomes further articulated in linguistic interpretation.

Gadamer claims that the linguisticity of experience exhausts all possible experience. His argument for this rests on a combination of Heidegger's articulation of the 'as-structure' of experience with the historicity of experience. An extensive network of linguistic meaning-associations, which, sedimented historically, is the linguistic community in which we were raised through acquiring a language, forms the tacit perspective (world horizon) or ground for beliefs which have not yet been thematized. This network serves as the source of fore-seeing and of the as-structure of experience. Language constitutes a 'medium' (*Mitte* – WM 432; TM 414) between people and the world through representing (*darstellen*) the world for human beings. Human being as being-in-the-world is a being *in* language.

Why language is a guide to self-inquiry has become clear: it provides the encompassing perspective for all inquiry into the self. However, the question is whether this means that everything can be reduced to language. Can the entire reality of our being be grasped from the level of language? I shall not for the time being attempt to answer this interesting question in contemporary philosophy that has experienced 'the linguistic turn'. What I do want to say is that until one situates the approach to the question of self-transformation within the realm of linguistic phenomena it will not be possible adequately to illuminate the internal relationship between the reality of the self and language. Self-transformation can then be described as a process in which the normal relationship between language and reality breaks down into silence, and language then revives through such silence. It is only at the level of the everyday self that language as self-evident presupposition restricts our experience of the world. The true relationship between self and language is restored when the framework of everyday language breaks down to let silence emerge and give rise to creative language. This intimate relationship between language and the ground of self (silence), which is central to Heidegger's thinking about language, is something Gadamer fails to recognize. Furthermore, this emphasis on silence distinguishes Heidegger from the mainstream Western tradition, which makes *logos* central, and also brings him close to oriental thinking based on silence.

III The collapse of everyday language

A major theme in *Being and Time* is that everyday *Dasein* suffers from 'loss of self' (*Selbstverlorenheit*) through 'evaporating' (*Aufgehen*) into the world of its concern. *Dasein* allows itself to be absorbed into *das*

Man, the impersonal, collective 'one' – and a major factor here is language in its aspect of *Gerede*, 'idle talk' or 'chatter'. As *Gerede* language, rather than functioning as a medium, closes *Dasein* off from the world and from itself, and provides comfort and security by giving everything out as unmysterious and self-evident. In this capacity, language is, admittedly, necessary for carrying out the business of everyday life, but one should not be misled into thinking that it thereby discloses the world as it is. This becomes clear when language as *Gerede* collapses and is no longer viable.

Various things can trigger the awakening from the everyday self – incurable disease, the death of a loved one, the realization of one's own death, and so on. What is common to these triggers is a negative understanding such as loss of perspective or collapse of a value system, and the resulting feeling of insecurity and despair. In Nietzsche's words, 'We lose the center of gravity which has enabled us to live. For a while we lose all sense of direction.' (*Will to Power*, sec. 30) Existential questions like Kierkegaard's – 'Where am I? Who am I? How have I come here? What is this world called "the world"? Who has brought me here and left me here?' – surge forcefully forth.

These are not the ephemeral questions of a weak soul, but derive from the very structure of human beings, who are able to reflect upon their own existence and to try to seek reasons and meaning for it. In everyday life, the purposes of practical life have been substituted for the reasons for human existence. When the meaning-relations of everyday language collapse as a whole, one is thrown into an incomprehensible chaos of phenomena without meaning. When the ultimate meaning of life fails, what one sees is mere nothingness which repels any attempt at rationalization. Language is unable to grasp such a bare reality. The world becomes disconnected from language and floats by itself. 'Our entire foundation cracks and the earth opens up into abysses' (Pascal, *Pensées* 72). The experience of *Angst* is so oppressively heavy that one is unable to speak.

IV The authentic self and the creation of language

The experience of the abysmal nature of our being, of the nothingness at its ground, is not necessarily terrifying, as long as one has the appropriate attitude. From the perspective of Zen (and something similar is true for Heidegger) the experience of the abysmal nothingness of the self and the world is the starting point for 'salvation'. In Dōgen's words: 'One who falls to the ground gets up with the help of it' (*Shōbōgenzō*). For Zen, one who realizes the 'suchness' (*tathāta*) or 'Buddha-nature' of all things may be called 'the true person who exists everywhere and

nowhere'. In the 'Birth and death' fascicle of the *Shōbōgenzō*, Dōgen writes: 'When one lets go and forgets both body and mind, throws them into the Buddha's house, lets things happen from the side of the Buddha, following along with them, one would not force things or strive to expend one's mind – and thus one leaves behind the world of birth and death and becomes a Buddha.' Here, beyond the concerns of life and death, there opens up a condition in which one's true self is freely based on no-ground.

In such a condition there is no split between the world and the one who observes it. 'The mountains and waters of this very moment' (*nikon no sansui*) are at the same time 'the presence of the Way of the ancient enlightened ones' (*kobutsu no dō genjō*). The true self is not separated from the world but has become one with it; there is neither subject nor object. What opens up within the horizon where subject and object are not yet separated is the state where experiences remain as they are without being judged (Nishida's 'pure experience'). There the world, which had hitherto been rigidified by linguistic segmentation, gradually becomes fluid, thereby dissolving the boundaries created by segmentation. The shapes of things which have been sharply distinguished from each other subtly lose their sharp definition, and with the elimination of distinct boundaries things come mutually to interpenetrate each other. What now comes to the fore is 'spontaneous arising' (*jinen shōki*), in which things inherently arise and open up the field of cosmic mutual interpenetration, and which is itself Nothing, without segmentation, and one with itself. This entire *Ekstase* is 'pure experience'.

The Zen tradition offers many examples of such 'pure experience': 'samadhi in perception' (*chikaku zammai*), 'seeing color/forms, the self is enlightened' (*ken shiki myō shin*), 'hearing sound the Way is realized' (*mon shō go dō*). These expressions come from Zen masters' attaining enlightenment through seeing a flower, hearing a pebble strike bamboo, and so on. This state is also described in Dōgen's poem: 'Since there is no mind in me, when I hear the sound of raindrops from the eave, the raindrop is myself.' The raindrop is me because at bottom there opens up another dimension – spontaneous arising – in which we are of the same 'element'. There is no mystery in this state; it is rather that we are facing reality as it is. However, this reality is totally different from reality as ordinarily experienced, since it is perceived without the overlay of everyday language. In the former state, life is experienced as transparently condensed combustion. The moment of combustion is pure silence beyond where language is exhausted. There the primordial reality of the world, which cannot be reached by language, keeps silently boiling up.

The language of the true self emerges from this silence. It arises from and is nourished by silence to become something which expresses this

silence. Silence is also a feature of the experience of nihilism, in which one realizes the inadequacy and unreliability of ordinary language in describing the reality that is beyond it. In the case of nihilism silence is experienced 'negatively' in the severing of the thread connecting language with reality. Such silence is a dead silence which rejects linguistic articulation. However, for the true self silence is an echo of true reality, and it becomes the positive ground for the production of a language to describe the world. Kūkai calls this level of true reality 'esoteric language' or 'esoteric mantra', which Mahāvairocana (*dainichi nyorai* in Japanese – a *mana*-like life-energy which pervades the totality of nature) speaks in the silence of nothingness. Mahāvairocana is the working of spontaneous arising (which one might compare with Heidegger's *Ereignis*) which is the ground of the world without aspects or segmentations and makes possible the arising of all phenomena. Spontaneous arising, the genuine state without segmentation or differentiation, the source of all existence, is entirely hidden by ordinary language with its definitions of reality and its segmentation by means of standard constants.

Kūkai says: 'With ordinary people the true perception of true nature is prevented by "obscuring fantasies"' (*mumei mōsō*). What he means by 'obscuring fantasies' must be this ordinary language as a network of standardized invariables. The very language which was acquired to describe the world has concealed it and has confined the everyday self into a life run by habit and inertia. However, the true self, by returning to silence as the pure manifestation of reality, joins with the flow of spontaneous arising's silent segmentation, and for the first time encounters the original segmentation which begins to create the worlds of individual things. The pulse in the silence of the original segmentation, which is audible in the world's beginning to produce its original meaning, is Kūkai's 'esoteric language'. This is not of course a physical sound that can be acoustically perceived, but is rather what Dōgen calls the 'expounding of impermanence' (*mujō seppō*), which should be heard 'through the entire embodied self' (*tsū shin sho*), or what Kūkai calls 'the expounding of *dharmakāya*' (*hosshin seppō*) or 'the conversation language of *dharmakāya*' (*hosshin dango*). This can be considered as the original phenomenon (original segmentation of beings) which transcends language – corresponding to Heidegger's 'echo of silence' (*Geläut der Stille*). The original segmentation of beings that is esoteric language wells up within the silence of the true self. As Kūkai says in *The Meanings of Sound, Word and Reality* (*Shōji Jissō Gi*): 'Sound resounds through the five great things, there is language throughout the ten realms, everything in the six dusts is text.' This echo of the silence of the original segmentation of beings, which can be called 'cosmic language', flows out wondrously into the arena in which people live. This silence cuts into and explodes the network of ordinary language which has degenerated into

mannerism. At the same time it restructures and modifies previous meanings in such a way as to create a new form of language. Ordinary language can thus be constantly questioned and nourished by silence and be reborn as a language capable of describing the life-breath of silence. The thread which was cut between reality and language is then retied through this silence. Silence is the source of language.

V Heidegger and the echo of silence

It is possible to gain a better sense of Heidegger's thinking about language, which has not been fully understood so far, if we consider it in the light of the Eastern ideas about language, silence, and esoteric language discussed earlier. Furthermore, Heidegger's philosophical analysis, being relatively systematic and quite rigorous, can help to clarify the idea of the realm of silence, the Eastern descriptions of which have been primordially mystical in nature. Heidegger has clearly affirmed the fundamental role of language in constituting the world and our experience. Language is not 'the means to portray what already lies before one', but rather it 'grants presence – that is Being – wherein something appears as existent' (*US* 227; *WL* 146). Since language is 'the house of Being', one reaches Being by constantly going through this house. 'Whenever we go to the well, or walk through the wood, we are always already going through the word "fountain" and the word "wood", even though we are not saying these words or thinking of anything linguistic' (*Hw* 286; *PLT* 132). In saying this, Heidegger means that language is correlative with experience of the world. 'Phenomena in the world occur simultaneously with the occurrence of language'; and 'the world exists only where words exist' (*EH* 35ff). It is obvious that such a view, which could be misunderstood as a theory of the absolute primacy of language, has influenced Gadamer's view of language (*WM* 461; *TM* 443).

However, the central perspective in Heidegger's thought is that of viewing language in relation to Being – that is, questioning why language can be 'the presencing of Being' through returning to the truth of Being which constitutes the origin of language. Regarding the unhiddenness of Being, he says: 'This does not mean that we depend on what unhiddenness says, but that everything that is said already requires the domain of unhiddenness. Only where unhiddenness reigns can something be said, be seen, be indicated and be heard.' In other words, we stand in between Being and language, 'two principles which attract each other at the same time repel each other' (*EH* 43), and we try to find the way to the true nature of language where Being 'itself comes to language' (*EH* 74). What stands in between language and the truth of Being (the source of language) 'what has not yet attained birth (Old High German *giberan*)' is

not language but silence (US 55) – ‘blazing insight’ trembling in ‘the incandescence of sacred lightning’ (EH 67; WL 186). This means that the basic phenomenon which Heidegger attempted to reveal is the movement whereby language issues from and is supported by ‘the echo of silence’ which is heard and followed within ‘the silence of stillness’ (*Schweigen der Stille* – US 67), and that this movement is a basic current which flows through not only his theory of language but also through his thinking in general. The extent to which Heidegger’s thinking on this topic is consonant with the Eastern ideas discussed in the previous section should now be obvious.

Section 34 of *Being and Time*, which Heidegger later called ‘quite sparse . . . too short’ (US 137; WL 41–2), already suggests the origin of language. In these chapters the way of being of language is defined as *Rede* (discourse). *Rede* is ‘the articulation of the disposed (*befindlich*) intelligibility (*Verständlichkeit*) of being-in-the-world according to its significance’ (SZ 162). Heidegger’s early theory of language, developed through *Rede*, comprises the following three points: (1) the function of *Rede* is to articulate in terms of linguistic meaning our understanding of being-in-the-world and to make it possible to see it. *Rede* is the basic factor in disclosing the present ‘there’ (*Da*) of being-in-the-world. (2) However, both disposition (*Befindlichkeit*) and understanding (*Verstehen*) participate in the structuring of disclosedness. (3) What is essential in Heidegger’s theory of *Rede* is the fact that language is grounded in *Dasein*. Heidegger distinguishes meaning (*Sinn*) and significance (*Bedeutung*). *Bedeutung* (what is articulated by *Rede*) is preceded by already-projected meaning as something which is possible prior to linguistic articulation; that is, *Rede* is post-articulation of *Dasein*. This does not mean that *Dasein* is dependent on language but that language has its roots within *Dasein*. In other words, language appears based on being-in-the-world as historical existence and is cultivated and defined there. After the so-called turning (*Kehre*), corresponding to *Dasein*’s being seen from the perspective of the destiny of Being as the *Da des Seins*, the true being of language is vividly characterized as an echo or response to ‘the soundless voice of Being’. Language, which functions in the disclosing of world, considers the world (and the clearing of Being – *Lichtung des Seins*) as its own hidden source for appearing. It can be born for the first time only by responding to (*Entsprechen*) the calling (*Anspruch*) of the soundless voice of Being. Even though the openness of Being eventually manifests as language, it is itself the source of language and as such is not under our control. Language makes sense because it has its origin in the ‘soundless voice of Being’, which precedes and continues to accompany language, and without which language cannot say a word. Therefore, Heidegger says that ‘according to the essence of the history of Being, language is the house of Being which arises from and is

structured by Being' (US 79). Just as a wave is always a sway of the ocean, language is 'language of Being' (US 119).

However, this does not mean that the truth of Being quickly and at once becomes language. Being disappears the minute we thought it appeared (*An-und-Abwesen*). The truth of Being is not like 'a fixed stage where the curtain is left open' but appears from within in active tension where it constantly breaks out into openness. In order to correspond accurately to our original reality which appears as a duality of revelation and concealment, what is needed is a sharpened 'preparedness' which becomes aware of the hiding of the constantly escaping Being and which looks from the 'mystery' (*Geheimnis*) to the 'hidden source'. This awakened readiness is silence – a place of no language – and is a place of stillness (ZSD 75). Heidegger spoke earlier of the way in which anxiety silences speech and is 'one of the essential places of speechlessness in the sense of the terror that attunes man into the abyss of nothingness' (WM? 32 and 51). And later, in a different metaphor, he spoke later of 'looking at aspects of the invisible' (US 73).

It will lead to the mistake of focusing too much on language, as Gadamer did, if one fails to place the 'stillness of silence' (EH 66) at the center of Heidegger's theory of the relationship between language and Being. It is silence that hears the echo of stillness which constitutes the essence and origin of language. It is not *logos* but silence as 'basic mood/voice' (*Grundstimme*) that encounters the wonder of the presencing of Being, being attuned (*gestimmt*) by the silent voice (*lautlose Stimme*) of Being and responding (*abstimmen*) from it (EH 74). Therefore, the echo of stillness which can be heard within this silence, even though it is the source of language (*Ursprache* – EH 40) which moves language from its ground and supports it, is not in itself 'something linguistic'. The echo of stillness is the silent *logos* of the ancient origin beyond the particular features of everyday-level language, such as history, society, or communication, and is 'an original announcement' (*Urkunde* – US 267; WL 135) of the world-reality which can exist purely only inside the silence which does not yet allow the invasion of linguistic articulation. The echo of stillness should be distinguished from the articulation by 'the language of historical human being' (IM 50) which resulted from it. And, therefore, no matter how genuine a word may be, generated as the echo of stillness, it is not itself linguistic, and it is impossible to articulate exhaustively the echo of stillness, which can live purely only in silence. Silence which belongs and listens to the echo of stillness clings endlessly to the language which corresponds to the truth of Being both at the beginning and in its phenomenological process. In this sense, the true nature of language is characterized as 'not saying and at the same time saying' or 'silent indication' (*Erschweigen*) (N 471f).

If philosophy is to grasp the phenomenon itself, if it is to crystallize

into living language the primordial phenomenon by 'exploding already existing meaning', rather than by organizing 'a chaotic world' into an 'already acquired system of meaning', then it does not follow that philosophical thinking must necessarily consider language as ultimate and regulate everything in accordance with language. Rather, one should step into the circle of language and experience which are vitally and intensely tied together, and listen belongingly (*gehören*) to the sound of silence which constantly emanates from the depths of the indescribable, and continue to let this be the source of one's own language.

Heidegger's language and the problems of translation

John Macquarrie

Martin Heidegger's principal work, *Sein und Zeit*, appeared in 1927. Although the book is incomplete as it stands, it has nevertheless become recognized as one of the most important German philosophical writings of the twentieth century, and it has exercised a very wide influence. For a long time it was neglected in Britain, and several attempts at translation proved abortive. There even grew up the opinion that the book was untranslatable.¹ 'The genius – or rather, the demon – of the German language' was blamed for this by Paul Tillich.² But as well as the peculiarities of the German language, one has also to take account of Heidegger's own remarkable way of exploiting the possibilities of that language.

In collaboration with the late Edward S. Robinson, Professor of Philosophy in the University of Kansas, the present writer spent seven years in the endeavour to make an English translation of *Sein und Zeit*. That translation was published in 1962. Although at times we came near to despair, and although we freely acknowledged that our translation, like all translations, could be improved and made more faithful, we nevertheless came to believe that, within limits and in spite of Heidegger's linguistic idiosyncrasies, a presentable English translation can be made, and our belief has been confirmed by the fact that the translation has been widely used on both sides of the Atlantic for nearly thirty years. The purpose of this article is to give some account of Heidegger's use of language, to illustrate some of the difficulties for the translator, to show that, with certain qualifications, translation is possible, and finally, to point out some of the wider problems raised by such a use of language as we find in *Sein und Zeit*.

We shall not pause to consider the difficulties which are attendant on any translation – for instance, that of finding for a foreign word an exact English equivalent which will not bring with it unwanted connotations. These difficulties are present in full force in translating Heidegger, but

they are not peculiar to this field. We shall confine ourselves to those difficulties which arise from Heidegger's own linguistic idiosyncrasies, and further, we shall confine our view to *Sein und Zeit*, though the peculiarities found there are, if anything, intensified in the later writings.

Heidegger's language is a complex and formidable structure, but there is nothing woolly about it. He is remarkably consistent in the use of his vocabulary. One may be pretty certain that anything which seems unintelligible when first encountered will soon click into place as one reads a little further. The difficulties arise largely from Heidegger's conscious rejection of much traditional philosophical terminology. Thus, for instance, where traditional philosophy would speak of *Existenz*, 'existence', Heidegger speaks of *Vorhandenheit*, 'presence-at-hand', and reserves the term *Existenz* for the being of man.³ But again, he does not speak of *der Mensch*, 'man', but of *Dasein*, a verbal noun which literally means 'being-there', and the reason for the choice of which only becomes clear as Heidegger's analysis of human existence develops.⁴ A powerful reason for his rejection of the traditional terminology is his belief that it represented the self as substance, and in Heidegger's view, this is an inappropriate way of conceiving human existence. Here we might venture to suggest a comparison with Professor Gilbert Ryle's critique of 'mind-talk'. Heidegger's novel terminology is not an arbitrary invention, but an attempt to get away from ways of speaking which he believes to have been misleading.

A convenient way of outlining the peculiarities of Heidegger's use of language will be to divide these under three headings. First, we shall consider his terminological innovations; next, we shall look at his interest in etymology, and his way of using words in their supposedly original senses; and thirdly, we shall consider his habit of playing upon words of similar form, or upon two meanings of a single term.

I

Heidegger presents us with a large number of new words, which will not be found in any German dictionary. Of course, philosophers have a habit of coining new terms, but they rarely do so on the scale which Heidegger finds necessary. His new words fall into three main groups.

The first group comprises artificial neologisms, but of these there are relatively few. A frequently recurring example is the adjective *existenziell*, for which we may coin as an English equivalent, 'existentiell'. This artificial adjective, in conjunction with the more orthodox form, *existenzial*, 'existential', provides Heidegger with the convenient pair of terms, '*existenziell-existenzial*'. The first refers to the raw material, as it were, of concrete existing, the second to the structures of existence as conceptually

grasped in philosophical analysis.⁵ There are several similar pairs in Heidegger, for instance, 'ontisch-ontologisch', 'ontical-ontological', 'phänomenal-phänomenologisch', 'phenomenal-phenomenological', 'geschichtlich-historisch', 'historical-historiological', but in these cases Heidegger has not found it necessary to invent artificial words, but has assigned his special meanings to words already more or less current.

The second group consists of new words which are formed naturally in accordance with the conventions of word-building in German. 'Geworfenheit', 'thrownness', for instance, is a perfectly natural word-formation, but it is just as remote from ordinary German usage as its English equivalent is from our usage. It denotes the character of *Dasein* as already 'thrown' into a situation which limits the range of possible choices.⁶ The example given is a relatively mild one. Perhaps the most extraordinary instance of a strange word-formation in the whole of *Sein und Zeit* is a term which Heidegger constructs by adding the suffix of the present participle to the stem of the past participle. He has been stressing the point that *Dasein* is what it has been. The past participle of the German verb, 'sein', 'to be', is 'gewesen', 'been', and the ending of the present participle is '-end'. To reinforce his point, Heidegger constructs the astonishing form, 'gewesend'.⁷ Quite literally, the corresponding English formation would be the impossible 'beening'; and if we express this by the more intelligible 'being what it has been', then Heidegger's linguistic *tour de force* is lost in the translation.

Within the same group, we may note the many new compound words which Heidegger uses, some of them cumbrous enough, like 'Gewissen-haben-wollen', 'the will to have a conscience'. A large number of these new compounds include the verb, 'sein', 'to be', as one of the components. Thus we have 'Insein', 'being in'; 'Mitsein', 'being with'; 'In-der-Welt-sein', 'being in the world'; 'Seinkönnen', 'potentiality for being'; and many others.

In the third group of new terms, words are transferred in their function from one part of speech to another. Thus Heidegger can use adverbs, pronouns and relative expressions as nouns, and he frequently does so. We shall give one example of each. Heidegger has a good deal to say about *das Da*, 'the "there"'. It is common English usage to speak of the 'here and now', but it needs a little practice to become accustomed to the 'there'. The German indefinite pronoun corresponding to the English 'one' is '*man*'. Heidegger has much to say also about '*das Man*', 'the "they"', that is to say, man in the mass, undifferentiated collective humanity. '*Das Wofür*', the 'for-which' or the 'wherefor', is only one of many relative expressions which Heidegger makes into nouns.

On the whole, Heidegger's new words do not occasion too much difficulty for the translator. Sometimes the latter must coin new English

words, such as 'thrownness', on the analogy of Heidegger's – and it must be remembered that these words sound no more strange in English than Heidegger's equivalents do in German. Sometimes – as often with Heidegger's relative expressions used as nouns – it seems best to alter the structure of the sentence so as to avoid the awkwardness of a strictly literal equivalent. It must be pointed out, however, that when Heidegger does introduce a new word, he is usually careful to draw attention to it, and to say how he proposes to use it, and thereafter he sticks to the meaning that he has laid down.

II

We turn now to Heidegger's interest in the history of words, and his habit of using words in what he considers to have been their original senses. Simple archaisms are not uncommon. The rare German verb, *heischen*, 'to request', is now used only in poetry, but Heidegger employs it several times in *Sein und Zeit*. Sometimes he uses an obsolete form of a current verb, as *stünden* for the modern '*stünden*', the imperfect subjunctive of *stehen*, 'to stand'. It is impossible to reproduce these archaisms in English. Fortunately, that makes no difference to the argument, though it does sacrifice the literary atmosphere of the work – if it is permissible to use the expression. Heidegger's archaisms are probably not just an affectation on his part, but are a way of suggesting to us his intention, in *Sein und Zeit*, of going back to the original sources of philosophizing.

More important, however, is Heidegger's use of words in their etymological meanings. '*Insein*', 'being in', is a clear example. Heidegger explicitly tells us that in his usage this expression does not have its usual spatial sense but means rather something like 'being bound up with', and he cites the philologist, Jakob Grimm, for evidence that originally the preposition 'in' did not have spatial significance.⁸ Another interesting example is the verb, *entfernen*, which in German ordinarily means, 'to remove to a distance'. Heidegger can use it in that sense, but sometimes he writes it in the hyphenated form, *ent-fernen*, which draws attention to the structure of the word, and in particular to the privative prefix *ent-* (Latin: *de*). When thus written, the word has its supposedly original sense of something like 'to de-distance', that is to say, to take the distance away from, to bring near, the very opposite of its normal meaning.⁹ One further example may be added. The German verb, *geschehen*, normally means, 'to happen'. But for any event which happens within the world, Heidegger prefers to use the verb, *vor-kommen*, 'to occur', and reserves *geschehen* for *Dasein*. *Dasein*, however, does not just happen – *Dasein* exists and chooses its possibilities. But Heidegger

lays stress on the fact that *Dasein* exists in history. Now 'history' is, in German, *Geschichte*. Heidegger has fastened on the etymological connection of *geschehen* and *Geschichte*, and he uses the former as the verbal form of the latter. Thus the force of *geschehen*, when applied to *Dasein*, only becomes apparent in English when we translate it as 'to historize'.¹⁰

III

In the third place, we come to Heidegger's playing upon words – though the playing may be very seriously intended. This is probably the feature of Heidegger's language which causes most trouble for the translator, and it may, in some cases, defeat him altogether. Again we may subdivide this heading into three topics.

First, we may notice how Heidegger sometimes groups together in constellations, as it were, words of similar structure. In discussing the nature of interpretation, he points out that every interpretation is made with certain presuppositions in mind. These presuppositions are listed as *Vorhabe*, *Vorsicht*, and *Vorgriff*¹¹ – 'what we "have" in advance', 'what we see in advance', and 'what we grasp in advance'. Here it is possible to preserve something of the parallelism in English. In other cases, however, this is not possible. Thus, in describing how the structure of the instrumental world, normally taken for granted, may be lit up by something going wrong, Heidegger makes use of another trio of terms – *Auffälligkeit*, *Aufdringlichkeit*, and *Aufsässigkeit*¹² – 'conspicuousness', 'urgency', and 'obduracy'. Here there is no trio of English terms which would at once be faithful to the sense and similar to each other in form. This, however, would appear to be unimportant. There is a certain artificiality about these constellations in Heidegger. Their only advantage would seem to be that they help to throw into relief the structure of his argument.

A second way of playing upon words is of much greater importance. Here the words involved have a common derivation, and again Heidegger's interest in etymology comes to the fore. For instance, the German word '*Lichtung*' means a 'clearing' in a forest. It is applied to *Dasein*, because *Dasein* not only has being but also has some understanding of its being. *Dasein* is therefore like a clearing in a forest because it is the *locus* in which being becomes transparent to itself. But Heidegger links up this thought of *Dasein* as *Lichtung* with the word *Licht*, 'light', and with the traditional doctrine of the *lumen naturale*.¹³ Heidegger's use of language here cannot be properly rendered in English, but only indicated in a note. The question, however, may be asked, 'What value is to be attached to a line of argument which appears to depend on the fact that in a particular language two words happen to have a common root?'

Before we try to answer that question, let us look at another example. Heidegger discusses the problem of the self which endures through its changing experiences, and he designates this phenomenon as *die Ständigkeit des Selbst*, which we may translate as 'the constancy of the self'. We have noted already, however, that he rejects the notion of self as substance. For him, the self gets its unity from resolvedness, and *die Ständigkeit des Selbst* is identified with *Selbst-ständigkeit*,¹⁴ a word which, without the hyphen, is the usual German expression for 'independence', and which may be rendered here as 'standing by itself'. Here English, by using cognate words, can give at least some hint of what is happening in the German. But again, what of the argument itself? Is being not made to rest on a peculiarity of Heidegger's German? Kant, for instance, in his discussion of the self, uses the term *Beharrlichkeit*, 'permanence', where Heidegger has *Ständigkeit*. If Heidegger had used Kant's term, his remarks would lose their force. Does he then lend plausibility to his position – here, and in similar passages – by an arbitrary choice of terminology? We simply point out the problem. But it may be added that Heidegger would probably reply that his choice of language is not arbitrary. The very fact that *Dasein* can use such language points to something in *Dasein*'s understanding of itself, which it is the business of Heidegger's existential analytic to elucidate.

This last point is made explicitly by Heidegger in the course of his discussion of truth. In his view, the essence of truth 'lies not in any 'agreement' of a judgment with an entity, but in the 'unconcealedness' of the entity itself. But this view, he argues, is a return to the most ancient tradition in philosophy – indeed, it represents *Dasein*'s pre-philosophical grasp of truth. He supports this contention with an etymological consideration. The Greek word for 'true' is ἀληθής. 'Is it', he asks, 'an accident that the Greeks expressed themselves in a *privative* manner about the essence of truth?' Truth is ἀ-λήθεια, 'unconcealedness'. 'Do we not find proclaiming itself, in this way in which *Dasein* expresses itself, *Dasein*'s own primordial understanding of being?'¹⁵

In this same passage, he acknowledges that we have to guard against what he calls a 'word-mysticism'. But he adds: 'Nevertheless, in the end it is the business of philosophy to preserve *the power of those most elemental words* in which *Dasein* expresses itself, and to prevent them from being levelled down to unintelligibility through the ordinary understanding of them.' It may be that something of the 'word-mysticism' against which we are warned appears in Heidegger's own later works, but in *Sein und Zeit* his aim is to free words from popular glosses and distortions which conceal their elemental meanings.

A third way in which Heidegger plays upon words is to use a single term with two well-defined meanings. A good example is the verb *überliefern*. If we translate this as 'to hand over', we preserve the double

meaning in English, for we can think of the handing over either as surrender or tradition. In a complex passage,¹⁶ Heidegger allows these two senses of the verb to ring together. *Dasein* hands itself over to the situation into which it is thrown, and at the same time accepts the heritage of possibility which is handed over to it.

We are far from having set out an exhaustive list of the peculiarities of Heidegger's language, but perhaps the samples given are enough to give a fair idea of what some of the most distinctive peculiarities are. In the main, an English translation can show, with reasonable fidelity, most of what is happening in Heidegger's German. But, as we have seen, there are limits to Heidegger's translatability, and in some passages only notes on the German text can give a clear idea of what he is doing.

What are we to say of a philosophy which is so closely bound up with a particular language – and, indeed, with a highly individual exploitation of that language – that it scarcely allows itself to be expressed in any other? Here again we must be content with pointing out the problem, as when we raised the question of whether Heidegger sometimes engages in a kind of verbal sleight of hand. But it may be asserted that much of the criticism of Heidegger's language, which has been made from time to time, has been quite unjustified. When carefully studied, his language is seen to be an impressive and consistent structure. With all its difficulties, *Sein und Zeit* makes sense – though one would hasten to add that no claim is being made to understand this work in all its details. But the claim may fairly be made that *Sein und Zeit* is not the morass of verbal mystification that it is sometimes said to be. On the contrary, it is a work of quite extraordinary power and originality, expressed in a language which is never lacking in precision, though it may be complex. Heidegger is neither a pedant nor an obscurantist, but a careful and penetrating thinker whose work deserves to be studied with the greatest respect.

The reader of this article, however, should not be left with the idea that we have come too easily to the conclusion that Heidegger is translatable. Whether it be genius or demon, the spirit of the German language is too closely bound up with Heidegger's thought for any translation to represent that thought more than partially. Yet even to do that would be worthwhile, if Heidegger has the stature that we have claimed for him. The ideal solution would doubtless be, not to try to translate Heidegger, but to rethink his philosophy in English, and to exploit the resources of that language in accordance with its peculiar characteristics, as Heidegger has exploited the resources of German. But that could only be done by an English-speaking Heidegger – and so we are driven back to the question, 'Could there be anything but a German-speaking Heidegger?'

Thinking more deeply into the question of translation: essential translation and the unfolding of language

Parvis Emad

the difficulty of a translation is never merely a technical one, but pertains to the relation of man to the root unfolding of the word and to the dignity of language.

Heidegger, *Hölderlins Hymne 'Der Ister'* (GA 53, p. 76)¹

Heidegger's thinking comes into contact with the question of translation in at least five significant ways:

- (1) As a thinker Heidegger is involved in the activity of actual translation of texts in many places in his work. Not counting translations that appear in the lecture courses prior to *Being and Time*, we can say that Heidegger is engaged in actual translation of texts at least as early as the Foreword to *Being and Time*.
- (2) Heidegger's translations differ significantly from existing versions of those texts – an obvious and often misconstrued fact. For example, his rendition of part of the *Antigone* differs significantly from any existing translation; and his translation of certain portions of Plato's work differs from that of Schleiermacher.
- (3) Unlike many philosophers who translate without stating their own viewpoints on translation, Heidegger does not take the process of translation for granted. In Heidegger's works there are sporadic and brief inquiries into the process itself. As he comes to grips with the essential character of language, he also comes to grips with the question of translation. Translation itself becomes philosophically significant.
- (4) For Heidegger translation is a form of interpretation. From very early in his work he abandons the naive assumption that translation is a detached and objective reproduction of immutable 'facts' that appear in interlingual space.
- (5) Finally, there is Heidegger's well-known practice of hyphenating the

German word *übersetzen* and emphasizing either the prefix *über* or the suffix *setzen*, thus indicating that translation implies a process of crossing over and transposition. Adopted in the 1940s, this practice allows Heidegger to point out a process which the English word *translation* cannot easily say.

Reflecting on these five dimensions of the issue, we come to realize that Heidegger carefully, concisely and specifically thinks through the question of translation at various junctures in his work. These various turns towards the question of translation have one important thing in common: they all explicate translation in terms of the root unfolding of language (*das Wesen der Sprache*).² Heidegger is fully aware that translation is a commerce and an exchange between different languages. But it is not in this exchange *per se* that he finds the essential character of translation. Translation shows its essential character when it becomes an occasion for language to unfold in its core. (It goes without saying that translation of a business letter or legal document does not deal with essential translation.) Heidegger is not concerned with problems that dominate the discussion of translation in the 'sciences' of language. Rather he takes translation as a unique opportunity for the root unfolding of language. And this opportunity presents itself in the way in which translation responds to the very foreignness or strangeness which calls for a deeper translation in the root unfolding of language.

In Heidegger the question of translation has two poles. At one pole there are translation's undeniable attachments to the foreignness which rules between languages. At the other pole is the root unfolding of language as a response to that foreignness. Our co-enactment with Heidegger's thinking on translation requires that we consider what gathers in each of these poles.

Thus we lay out the course of the following reflections in terms of these two poles. First, we must grasp Heidegger's appraisal of the foreignness which rules between languages in translation. We grasp this best by looking at how Heidegger views the problem of semantic equivalency of translated terms. Heidegger's opening up of this problem (which plays an important role in the conventional approach to translation) helps to understand his thinking on translation as such. Second, we must consider how this foreignness can elicit a response from language by holding it (the foreignness) to its (language's) root unfolding in and through translation. Here we must consider Heidegger's characterization of translation as 'essential or originary translation' (*wesentliche oder ursprüngliche Übersetzung*) and examine some instances of his work as a translator.

I The problem of validity in translation

The problem that occupies a central place in the long and interesting history of reflection on translation is the problem of validity – the problem of semantic equivalency of translated terms. The conventional approach to translation takes this problem so seriously that it is preoccupied solely with the equivalency of translated terms. Are chosen terms fully representative of the original, or do they cover the original terms only partially? Is translation an accurate and reliable version of the original? Does translation replace the original relatively or absolutely?

From Cicero to Goethe to Walter Benjamin and beyond, conventional 'wisdom' about translation is plagued with the desire to have the words of one language cover fully those of the other language. This desire has given rise to at least three distinct positions: (1) that translations are nothing but distorted versions of the original and that all translations are to be rejected; (2) that it is possible to produce a translation that is absolutely identical with the original, i.e., that absolute identity with the original is a goal worth striving for; and (3) that translations are to be neither rejected off-hand nor accepted absolutely, for they take their place next to the original and do not replace it.³

Heidegger neither rejects translation as a distorted version of the original, nor does he take the translation to be absolutely identical with the original. He prefers to preserve to the fullest degree the difference between languages as this difference erupts within the problem of semantic equivalency in translation. When taken as they are, the differences between languages and the problem of semantic equivalency must be retained as a difference and must be seen for the problem that it is. The recourse to the dictionary, by which we try to alleviate or resolve the problem of semantic equivalency, is a recourse made in the hope that at some point we may do away with this problem and with the difference between languages. But a dictionary is not the ultimate authority, and it cannot resolve the problem of semantic equivalency and thus eliminate the differences between languages.

To consider a dictionary as an undisputed arbiter is to overburden the dictionary with expectations that it cannot fulfil: 'A dictionary can provide an indication for understanding a word . . . [but] it is never a simple [*schlechthin*] authority that would be binding a priori' (GA 53, p. 75). A dictionary cannot be the ultimate authority because it is the product of a particular way of looking at language and of interpreting it. No dictionary has descended from heaven; rather it results from a certain style of reflecting and interpreting language: 'The appeal to a dictionary is always an appeal to an interpretation of language which is often not grasped at all in its style [*Art*] and limits' (GA 53, p. 75).

Certainly dictionaries have an important function to fulfil. But this

function takes place only when there is traffic (*Verkehr*) between languages and when they are turned into means of transportation (*Verkehrsmittel*) (cf. *GA* 53, p. 75). But before languages enter this traffic, they have a historical spirit that dictionaries cannot grasp: 'Considered in view of the historical spirit of language as a whole, no dictionary provides an immediate standard; and none is binding' (*GA* 53, p. 75). To expect dictionaries to resolve the problem of semantic equivalency ignores the historical spirit of a language. Rather than attempting to 'resolve' this problem, we must see the semantic non-equivalency of translated terms for what it is, namely a confirmation of the ineradicable difference between languages. Translation is precisely where this difference shows itself to be ineradicable. For no translation can be perfect enough to minimize this difference: 'There is no translation at all in which the words of one language could or should fully cover the words of another language' (*GA* 53, p. 75). The difficulty of attaining a total identity between translated terms, along with the existing differences between languages, provides translation with a unique revealing power. The difficulty of attaining total identity between languages and the irresolvable difference between them are not entirely negative: they bring to the fore 'interrelations/interconnections [*Zusammenhänge*] which lie in the translated language but are not brought out' (*GA* 53, p. 75). These difficulties and differences reveal translation as a way of dealing with language in which we not only see interrelations in the translated language, but also come to terms with our own language. As Heidegger puts it: 'Translation is an awakening, clarifying, and unfolding of one's own language by coming to grips [*Auseinandersetzung*] with the foreign language' (*GA* 53, p. 80). This means that there is more to translation than just a transfer of words from one language to another. To initiate the move in such a transfer is to face the difference between languages as the foreignness that rules between them. By forcing us to see the foreignness and unfamiliarity of the languages under translation, the activity of translation clarifies our relationship to our own language. Thus, rather than serving as a means for transporting 'meanings' across the so-called 'language barrier', translation invites us to return to our own language. When we, in translation, turn back from the foreignness of another language, we discover another *translation*, one that occurs *within our own language*.

II Translation at the core of language

In the general context of translation between languages and *in the very process* of translation between languages, this 'other' translation shows that language unfolds in an even deeper way than translation between

languages. The fact that translation between languages is at all possible – regardless of its validity – points to a translation which occurs at the core of language itself. To see this ‘other’ translation properly, we must stop thinking of *interlingual* translation as the only form of translation. For, before translation takes the direction between two languages, it already occurs within our own language.

Initially we grasp the process [of translation] from the outside as a technical-philological procedure. We believe that translation is the transfer of a foreign language into another tongue or, conversely, transfer of a mother tongue into another language. However, we fail to see that we constantly translate our own language, the mother tongue, into its own words.

(GA 54, p. 17)

Thus, in contrast to the conventional approach to translation, which considers it solely as interlingual, Heidegger sees translation as occurring *first* within our own language. As interlingual, translation does not manifest itself in its deepest sense, even though the occasion for such a manifestation is made possible when thinking confronts the problem of the validity of interlingual translation.

Having observed what is gathered around that pole which is marked by the foreignness of languages and by translation’s validity, we are then led to see what transpires in or around the other pole, which shows that language unfolds in its core in the process of translation. When we speak with ourselves or with others, we are always involved in translation:

Speaking and saying are in themselves a translation whose essential unfolding is by no means exhausted by the fact that translated words and the words to be translated belong to different languages. An originary translation prevails [*waltet*] in every dialogue and monologue.

(GA 54, p. 17)

It goes without saying that, in order to gain access to this ‘other’ – which we call ‘innerlingual’ – translation, we cannot be guided by the questions that are concerned with validity of interlingual translation and semantic equivalency of translated terms. Rather we are guided by what Heidegger calls *reformulation*. Originary or ‘innerlingual’ translation includes the process of ‘replacing one expression with another one of the same language and so using a “reformulation” [*Umschreibung*]

(GA 54, pp. 17–18). Originary translation which occurs within language and is innerlingual occurs in the closest proximity to reformulation. This involves changing the chosen words, sometimes even choosing a more appropriate word-context. This change indicates that thinking is already

moved, crossed over (is 'translated') into 'another truth, another clarity, or even another matter calling for questioning' (GA 54, p. 18). How else could reformulation be possible? In and of itself reformulation shows a proximity to and a connection with the 'words' that make up the reformulation. Thinking must *be* with those words if reformulation is to occur. To *be* with those words means that thinking crosses over to those words, translates itself into them. Thus reformulation indicates an originary or innerlingual translation.

In addition to reformulation, poetizing and thinking offer other possibilities for grasping the process of crossing over which is essential to *innerlingual* translation. To take thinking and poetizing as they occur in our own language in a manner that is appropriate to them, we must cross over and get translated into the word which originally harbours a work of poetizing or thinking. Understanding poetry or following along in thinking requires innerlingual translation: 'The poetry of a poet and the treatise of a thinker reside in their own unique and singular [*einzig*] word. They force us to hear this word again and again, as if we hear it for the first time' (GA 54, p. 17). In order to read a poem or a work of thinking, we must be 'translated' innerlingually into their essential word.

What distinguishes the word in a work of poetizing is that it requires our being 'translated' into this word. What is called reformulation is also marked by a crossing/translating. Both movements occur when we cross over to the essential word of poetizing and to the word which is essential to reformulation; and both of these movements are movements of innerlingual translation which occurs *prior to* interlingual translation. Long before language enters the arena of interlingual translation, it must be heard in innerlingual translation. This is a translation which occurs independently of interlingual translation, whose validity is questioned by the problem of semantic equivalency. Occurring within language itself, this translation directs us to the root unfolding of language.

What is this root unfolding of language all about? Before we respond to this question, we must take another look at reformulation and what it reveals – for two reasons: (1) Reformulation could be taken as a 'doubling' of language which shows that language is not co-extensive with itself.⁴ (2) Reformulation could also be taken as an essential indicator of what happens in the experience of being *and* language. Reflecting on this second point helps to put the first point into proper focus.

If reformulation indicates the occurrence of an originary translation within language, then it is incumbent upon us to take the phrase 'truth of being, *die Wahrheit des Seins*' as a reformulation of the phrase 'meaning of being, *der Sinn von Sein*'. The change that occurs in the movement in language from 'meaning of being' to 'truth of being' indicates an originary translation within the language of thinking. (It goes without

saying that this occurrence of originary translation is appropriately thought only when reformulation is placed in the context of the experience of being and language, i.e., as an indicator of originary translation within language. If we take reformulation as a mere 'rewording', then of course thinking ceases to address this significant aspect of Heidegger's thinking.) If we consider the proximity of Heidegger's thinking to the 'truth of being' as he is coming to grips with the question of the 'meaning of being', then we have to say that the first phrase is a reformulation of the second. This presupposes that Heidegger considers the question concerning the 'truth of being' as already within the perimeter of the work which deals with the 'meaning of being'. As we gather from *Beiträge zur Philosophie (Vom Ereignis)*, this is indeed and precisely the case: truth of being already falls within the perimeter of *Being and Time* (cf. GA 65, p. 182).⁵ If the intention of this work is 'the concrete elaboration of the question of the meaning of being' (GA 2, p. 1) and if 'truth of being' already falls within the perimeter of this work, then 'truth of being' presents a reformulation of the 'meaning of being'. Originary translation as a translation that occurs within language already translates thinking of the question of the 'meaning of being' into a thinking of the 'truth of being' and thus reformulates it.

Seen in this light, reformulation does not present a 'doubling' of language, but rather testifies to its showing power. To take reformulation as a 'doubling' amounts to blocking access to the originary translation that makes reformulation possible. If one insists on seeing reformulation as a 'doubling' – as an indication that language is not co-extensive with itself – then one runs the risk of missing entirely what Heidegger says about translation, what he means by originary translation, and what his thinking shows us about translation and the root unfolding of language, *das Wesen der Sprache*⁶ in its relation to *ursprüngliche Übersetzung*, originary translation. Occurring within language itself, this translation directs us to the root unfolding of language.

III Root unfolding of language and originary translation

In order fully to understand originary or innerlingual translation as one which occurs in response to the foreignness of another language, takes place in every dialogue and monologue, sustains reformulation and upholds an appropriate entry into works of poetizing and thinking, we must determine the way in which this translation reflects the root unfolding of language. This determination is necessary because it prevents misconstruing originary translation as a 'linguistic' episode isolated from the root unfolding of language. This determination allows originary translation to be seen as an innerlingual event which is sustained by the

root unfolding of language and is one of its most accessible indicators. Considering Heidegger's work on language as a whole, we can say that what distinguishes originary translation and reveals it to be an intricate and relatively accessible indicator of the root unfolding of language is the occurrence of 'way-making' that initiates and guides this translation. Thus to grasp originary translation broadly and essentially, we must focus on this occurrence of 'way-making'. This requires nothing less than outlining the fundamental way of Heidegger's thinking about language.

First, we must note that for Heidegger language is not adequately and appropriately grasped when it is construed merely in anthropological and instrumental terms. For Heidegger language has a unique showing power that goes deeper than that. When language unfolds essentially, it allows things to show themselves and be manifest. Second, the root unfolding of language occurs as a 'way-making' (*be-wëgen*) so that things may appear and show themselves. What Heidegger means by the word *way/Weg* is captured by the word 'way-making'. When the word *way/Weg* appears at various junctures in Heidegger's work (for example, in the last lines of *Being and Time*) or when it appears as an adjunct to thinking (such as in *Denkweg*, pathway of thinking) or when it, finally, is used in designating the *Gesamtausgabe* as *Wege, nicht Werke* (pathways, not works) – these various uses of the word *way/Weg* receive their ultimate justification and meaning from 'way-making' as an occurrence which is central to the root unfolding of language. In its simple construction the word 'way-making' refers to the word *way*. For Heidegger this is not a metaphor that alludes to the task of thinking and to the incomplete and provisional character of its 'results' – thus implying relativism and perspectivism. Rather – third, and in view of what we have just said about this word – the word *way/Weg* perhaps as no other word in Heidegger's language directs us to what transpires in the thinking of the question of being as a thinking of *both* being *and* language. This thinking is a thinking of being and language in so far as being is thought in stretches of the way that is laid out in language's 'way-making' movement. The word *way* and what it indicates requires that we think of being and language, not as two separate and independent entities, but as always connected and in accord. They are distinct from each other but are not separate and independent of each other. It is language's way-making movement that takes us underneath language as an ontologically neutral and independent tool of communication. It is also the manifesting/showing/appearing of the being of things that keeps us from thinking that being occurs in a language-free zone. To think of language as an ontologically neutral tool and to think of being as appearing in a language-free zone is to overlook that, as von Herrmann puts it: 'Heidegger thinks being as being in the horizon of the root unfolding of language; and, conversely, he thinks the root unfolding of language in the horizon of being as being.' This means that to think of language,

we must think of its words' showing power, which is always a showing power that shows things in their being. When we state something in words, we always show something in its being. In short, every statement in language is stated in the horizon of the root unfolding of being; and being appears within the horizon of the root unfolding of language. Language's stating/showing/manifesting of things is a way-making. Heidegger captures 'way-making'/showing/stating in one word: *Sagelsaying*.

We must recall – and this is our fourth point – that the word *saying/Sage* is appropriate for showing what transpires when language unfolds in its core because *Sage* in its original form, *sagan*, maintains close ties with the word *zeigen/showing*. As it unfolds in its core, language shows things and makes them manifest. Unfolding in its core, language is a *saying/Sage* which lets things be manifest for what they are. When it unfolds as *saying/showing*, language makes way for things to be manifest. Thus: 'language . . . receives its determination from saying as from that which makes way for everything [*Sprache . . . empfängt seine Bestimmung aus der Sage als dem alles Be-wëgenden*]' (GA 12, p. 191; *ET*, p. 95). This suggests that 'way-making' occurs as *saying* in the realm of showing/manifesting, which is always the realm of being.

Having outlined – albeit briefly, as is required here – the essential issues that are involved in the root unfolding of language, we can now turn to the question which prompted the outline in the first place: to what extent and in what manner is the 'way-making'/saying/showing of language involved in originary translation? And to what extent is originary translation involved in the 'way-making'/saying/showing of language? Our response is simply: originary translation occurs as 'way-making'/saying/showing. Further, since this translation precedes interlingual translation, translating for Heidegger *in its core* implies, manifests, and is sustained by 'way-making'/saying/showing. We can see the fittingness of this response in two ways: (1) by returning once again to what reformulation reveals and (2) by considering translation of a work of thinking into its own language.

(1) Reformulation occurs when the matter that appears in the initial formulation (say as the 'meaning of being') reappears differently (say as the 'truth of being'). The mutual unfolding of being and language in their respective horizons 'makes a way' which requires a different *saying*. Heidegger's choice of word and its special spelling corroborates this essential occurrence of way-making. He chooses the word *bewegen*, which he hyphenates and to which he adds an umlaut, showing that he is concerned with a movement in language that is more than ordinary movement. This spelling is intended to stress the movement as a 'way-making' movement. Hyphenated and with an umlaut, *be-wëgen* indicates *Wege allererst ergeben und stiften*: yielding and bringing about ways in

an originary way (GA 12, p. 186; ET, p. 92). Reformulation depends on and represents one such yielding and bringing about of ways. In reformulation saying is not something that is added to the matter that reappears differently and needs reformulation. Rather, saying is just this appearing/showing itself. Thus reformulating or re-saying the question of being in terms of the 'truth of being' indicates that thinking moves along a path in language which opens unto the 'truth of being'. The path that thinking takes in reformulation points out an altered appearing and a translating into this appearing. Reformulation is called for, becomes necessary, and can be accomplished only because language 'makes ways' in this deep sense.

(2) Besides reformulation, the special circumstance of translating a work of thinking into its native language involves originary translation (language's 'way-making'/showing/saying). We can see this involvement by considering what transpires in such a translation. Translation of a work of thinking into its native language involves originary translation because it requires translating the language of this work into words that belong to its own language. And this is a task that is quite different from translating this work into another language. This task is different because

to translate one's own language into its ownmost [*eigenstes*] words is always more difficult. For instance, translation of the words of a German thinker into the German language is particularly difficult because here the obstinate prejudice holds sway that we are supposed to understand the German word automatically [*von selbst*], since it belongs to 'our' own language.

(GA 54, p. 18)

This difficulty is directly proportional to the 'way' which the thinker's language of thinking 'makes' in the thinker's own native language, i.e., is proportional to the extent that language is unfolded essentially and in its core. In so far as his work shows/manifests things in a special manner, his language of thinking 'makes' special 'ways' in his own native language. The difficulty of translating/interpreting the work of a thinker into his own native language consists in the fact that the translator/interpreter must translate himself (here the German *über-setzen*, with emphasis on the prefix *über*, works much better than the English word *translate*) into the saying, i.e., into the 'ways made' by the work of thinking in his native language.

Here the success of the translator/interpreter depends largely on his grasping that a work of thinking presupposes the mutual and horizontal root unfolding of being and language. A work of thinking represents such an unfolding, and its language is a measure of that. A translation of a work of thinking into its own native tongue requires as its first step

that the translator/interpreter gain access to the 'ways made' by that work in its own native tongue. Once these 'ways' are ascertained, then the language of the interpreter unfolds essentially and in its core. In this root unfolding, the originary translation of a work of thinking takes place as a translation into the 'ways made' by a work of thinking in its native tongue. Thus the difficulty of translating a work of thinking into its own language consists in gaining access to the 'ways made' in that language and in unfolding the interpreter's language in accordance with those 'ways'.

Here is the place to offer a brief criticism – proceeding from this understanding of originary translation – of the contemporary hermeneutic and structuralist theories of interpretation. Contemporary hermeneutic and structuralist theories of interpretation struggle with that distance which separates the interpreter from the work to be interpreted.⁸ But they do not seem to succeed in overcoming that distance. On one level the interpreter is certainly separated and thus distanced from the work that he wishes to interpret. However, if we understand the interpreter's response to the 'ways made' in the language of the work to be interpreted as a response within the root unfolding of language, then we find that the distance which separates the work from its interpreter is already overcome in and through originary translation. Originary translation overcomes this distance in its character as a translation into 'way-making'/showing/saying that occurs when the 'foreign-sounding' character of the language of the work of thinking elicits a response from its own native language. The distance between translator/interpreter and the work to be interpreted is already bridged by the originary translation as a response to the language of the work of thinking – a response which lets language unfold in its core.

This means that it is language – and *not* the interpreter – that initiates, carries through, and completes originary translation. Thus originary translation confirms Heidegger's basic position: 'It is not man who speaks, but language. Man speaks only by resonating with language within the root unfolding of being [*geschicklich*].'⁹ This way of saying originary translation confirms Heidegger's stance on the priority of language, in that this translation reveals a level of 'linguistic activity' that lies deeper than what usually happens in speaking and writing within a multiplicity of meanings. We tend to think of this multiplicity as something that is at our disposal as we speak. But considering the deeper 'linguistic activity' (as revealed in originary translation), we realize that the opposite is actually the case:

Multiplicity of meanings of a term does not originate in the fact that, in speaking and writing, we humans occasionally mean different things with the same word. The multiplicity of meanings is in each case an

historical [*geschichtlich*] multiplicity. It emerges from the fact that, when we speak the language, we are addressed and claimed by the being of beings in different ways, depending upon the root unfolding of being.¹⁰

Thus originary translation of a work of thinking into the words of its own language reveals the language of this work as one which 'makes ways' in its native tongue in accord with the root unfolding (*Geschick*) of being. Accordingly, this originary translation reveals being's most intimate involvement with language. This way of saying originary translation reveals that the language of a work of thinking is moulded in closest proximity to how language essentially unfolds in a work of thinking.

Let us show how this happens with an example from Kant. We can say that this unfolding takes place when Kant interprets *ratio* as both *Vernunft* and *Grund* and translates *principium reddendae rationis sufficientis* as *der Satz vom Grund*. But stepping over to the 'way made' by the Latin *ratio* – first in Latin and then in German, with *Vernunft* and *Grund* – is moving into a 'way' wherein interlingual translation (i.e., the translation of the Latin *ratio* into German) and innerlingual translation (i.e., the translation within Latin and within German) intersect. This means that translation of a work of thinking into its native tongue sometimes requires stepping over to the 'way made' by a word which is not a native word in a thinker's native tongue, but is none the less an essential word and gets translated into a thinker's native tongue. (In Kant's case this occurs when the word *ratio* is translated into German both as *Vernunft* and as *Grund*.) Heidegger regards this latter kind of translation – the one in which a foreign and essential word gets translated into another language, the one in which interlingual and innerlingual translations meet – as an instance of essential translation (*wesentliche Übersetzung*). In order to understand more fully what translation is all about, we must take a quick look at essential translation.

IV Translation as essential translation

The linguistic event which we pursued up to this point and which Heidegger calls 'originary translation' – which we call 'innerlingual translation' – takes place in reading a work of thinking or a work of poetizing, in essential reformulation, and particularly in that translation which occurs when a work of thinking is translated into the words of its own native language. However, sometimes translation of a work of thinking into the words of its own language unexpectedly brings us face to face with interlingual translation, in so far as the originary translation of that work

comes upon a translation which takes place within the language of that work but involves another language – as is the case in Kant's rendition of the Latin *ratio* into German. What happens *in* and *as* translation, when translation is interlingual and hands over to an historical epoch a 'way' of showing/manifesting that is 'made' by essential words of another language? In short, what sort of interlingual translation is essential translation? In order to respond to these questions, we must draw attention to a naive assumption that often plays a quiet and persistent role in the debate on interlingual translation. (When this assumption is rightly understood, then we can see interlingual translation as a particular occasion for language to unfold essentially and in its core.) Debate on the interlingual translation of a work of thinking sometimes naively assumes that essential words and concepts of a work of thinking are clearly circumscribed and reside without ambiguity on the other side of the so-called 'language barrier', simply waiting to be transmitted to this side of the 'language barrier' with equal clarity and unambiguously. But this assumption overlooks the fact that essential words of a work of thinking are not instances of clear and unambiguous circumscription: they are cases of 'way-making'/saying/showing power. These cases of 'way-making'/saying/showing power emerge from 'being's root unfolding within the horizon of language and from language's root unfolding within the horizon of being'.

Seen within the context of this mutual and horizontal root unfolding, interlingual translation of basic words of thinking is not primarily a matter of transmission of 'well-defined meanings' from one language into another. Interlingual translation as essential translation involves primarily being's root unfolding along with language's root unfolding. In view of this involvement, we can say that, strictly speaking, no wholesale transmission takes place in essential translations of *works* of thinking because 'way-making'/saying/showing power of elemental *words* of thinking cannot be transmitted intact. The most that essential translation can achieve is to convey a sense of what the 'way-making'/saying/showing is – that way-making that occurs in strict correspondence with the unfolding of the language which is to be translated. Essential or interlingual translation deals with being's unfolding within a given language as this unfolding shines through its words. Essential translation indicates that being's unfolding (*das Geschick des Seins*) corresponds to a certain way of speaking and that a certain way of speaking corresponds to being's manner of involvement in language. In Heidegger's words: 'An essential translation corresponds [*entspricht*] in each case to the manner in which language speaks within an epoch of unfolding of being and, in so doing, corresponds to the root unfolding of being.'¹¹ The word *entsprechen* (correspondence) that appears in this characterization of essential translation marks the unfolding of language within the horizon of being. As a

language, German corresponds to being's unfolding when this language puts forth *Vernunft* and *Grund* as translation/reception of the Latin *ratio*. If this unfolding/corresponding would not take place, then the 'way' of showing/manifesting things that is peculiar to *ratio* – i.e., the 'calculative way' – would not be conveyed into modern German thought. Deliberately exaggerating, Heidegger says that there would then be no critique of pure reason. 'If in modern [German] thought *ratio* would not speak in translation equivocally as *Vernunft* and as *Grund*, then there would be no critique of pure reason as delimitation of the possibility of the object of experience.'¹² In order that the 'way-making'/saying/showing peculiar to *ratio* be received by German thought, two words are utilized, a utilization whose philosophical justification may be found in Kant's work. By undertaking the project of a critique of pure reason, Kant lays out the principles and rules that heighten and intensify the 'calculative way' that was originally displayed in the word *ratio*. Critique of pure reason (the process, not the book) heightens the calculative way and thus sets the stage for the maximization of calculation as it occurs in modern technology.

As a language Latin unfolds within the horizon of being; thus it is in correspondence with the unfolding of being when this language puts forth *actualitas* as a translation of ἐνέργεια. But the Latin word is not and cannot be the exact replica of the Greek term because the mutual and horizontal root unfolding of being and language is not a selfsame and repetitive process. Being's unfolding as it gives rise to ἐνέργεια occurs in Greek as a language which unfolds within the horizon of being. Being's unfolding as it gives rise to *actualitas* occurs in Latin as a language which unfolds within the horizon of being. Being's unfolding within the horizon of Latin as a language in the unfolding of a withdrawal that marks the end of the First Beginning, the Beginning which initiates philosophy. This means that translation of the Greek ἐνέργεια into *actualitas* mirrors the unfolding of being which is distinguished by this withdrawal. We can see this by contrasting the 'way' made in Greek by ἐνέργεια – for showing/manifesting things – with the 'way' made in Latin by *actualitas*. The Greek ἐνέργεια makes a 'way' of showing/manifesting of 'the this' and 'the that' 'as presencing in work as work [*das im Werk als Werk-Wesen*]'.¹³ The Latin *actualitas* also makes a 'way' of showing/manifesting things as work, but *actualitas* accentuates the work aspect only in terms of 'what is effected in effecting, what is accomplished in accomplishing'.¹⁴ Thus *actualitas* covers over the work aspect as presencing by stressing the 'opus of operari' and the 'actus of agere'.¹⁵

Although *actualitas* covers over the showing/manifesting of ἐνέργεια (presencing in work as work), the Latin word is not entirely devoid of the original root unfolding of being: 'Beyond the indefinite relation to work, *actualitas* no longer preserves anything of the root unfolding of ἐνέργεια. And yet in *actualitas*, too, the initiatory root unfolding of

being holds sway.’¹⁶ The initiatory root unfolding of being holds sway in *actualitas* because, originating in a language which unfolds within the horizon of being, this word too ‘makes a way’ and has showing power.

When Heidegger focuses on the translation of these two words, he demonstrates that the root unfolding of language extends into actual cases of interlingual translation. This extension is not an artificial imposition of a ‘new’ meaning into an already existing word. Rather it involves forming a word which conveys (does not duplicate) the ‘way-making’/saying/showing power of the original word. This extension tells us that, when a word of thinking is a foreign word, language of thinking unfolds in its core by corresponding to being’s unfolding and by putting forth a word that evokes the original word’s ‘way-making’/saying/showing power. Since this unfolding occurs as language’s ‘way-making’/saying/showing, the very notion of an interlingual translation of the words of thinking no longer implies transportation of a word from one language into another. Rather interlingual translation of words of thinking is a response which for example, Latin provides in accordance with being’s unfolding to the ‘way-making’/saying/showing that is Greek. Thus we can now respond to our earlier question, namely ‘What happens *in* and *as* translation when translation of the words of thinking is interlingual?’ The response is: when it is essential, interlingual translation of the words of thinking is a translation into ‘way-making’/saying/showing. We come upon a specific case of this translation when we consider Heidegger’s rendition into German of a segment of the *Theaetetus* which differs sharply from Schleiermacher’s rendition.

We begin by putting together a chart which enables us to survey at a glance a number of central Platonic concepts and their renditions into German by Schleiermacher and then by Heidegger (for details cf. *GA* 34, pp. 149–240).

| <i>Plato</i> | <i>Schleiermacher</i> | <i>Heidegger</i> |
|---------------|-------------------------|---|
| διανοεῖν | Denken | Vernehmen |
| ἐπισκέψασθαι | Erforschen | Im Hinsehen etwas einer Sache ansehen |
| λέγειν | Reden, Sprechen | Sammeln, gesammelt etwas darstellen und offenbar machen |
| ἀγαθος | gut | tauglich |
| ἐπολέγεσθαι | aufsuchen ¹⁷ | auf etwas zustreben |
| ἔρω | Liebe | Erstrebnis |
| ἀναλογίζεσθαι | zu Schlüssen gelangen | hin und her überrechnen |
| ἀλήθεια | Wahrheit | Unverborgenheit |
| οὐσία | Dasein | Seiendes |

Just as the translation of the Greek ἐνέργεια into *actualitas* mirrors the unfolding of being which marks the end of the First Beginning, so also translation of Platonic concepts into German must occur in such a way as to mirror the unfolding of being *as* (not *at*) the end of the First Beginning and the beginning of philosophy proper in Plato. Just as in '*actualitas* the initiatory root unfolding of being holds sway', so also these central Platonic concepts must be translated by an unfolding of language which mirrors the initiatory root unfolding of being in the First Beginning, as this unfolding still holds sway in Plato. What is striking about Schleiermacher's translation of Plato's words of thinking (gathered in the above chart) is that his renditions of these words fail to mirror the initiatory root unfolding of being which still holds sway and is sheltered in Platonic words. True to the language that dominates the tradition that he inherits, Schleiermacher translates (to consider just a few) δianoεῖν with *Denken* (intellection), λέγειν with *Reden* (speaking) and ἀλήθεια with *Wahrheit* (truth). Despite the unmistakable 'accuracy' of his renditions, Schleiermacher's language is essentially repetitive and traditional. He does not seem to be shaken by the 'foreignness' of Plato's Greek to the extent that is needed in order to come to terms with the root unfolding of his own language. His renditions are 'good and accurate' interlingual translations, but they are not essential ones. Perhaps we can shed some light on this difficult and intricate issue by briefly examining Schleiermacher's and Heidegger's choice of terms for δianoεῖν.

Schleiermacher follows the prevalent practice of translating δianoεῖν with *Denken* (intellection). In Heidegger's words that is 'not only ungreek, but also fails to see all the issues that we face here . . . such a harmless rendition, though correct according to the dictionary, undermines the poignancy and ground of the whole question' (GA 34, p. 181). For Schleiermacher the word δianoεῖν is not primarily a 'way-made' for saying/showing/manifesting things, but denotes an 'activity' by which things are intellectually grasped. For Heidegger δianoεῖν is primarily a 'way-made' for showing/saying/manifesting things. He translates δianoεῖν as *Vernehmen*, i.e. taking in, interrogating and hearing. Heidegger keenly attends to the ambivalence (*Zweideutigkeit*) of the word δianoεῖν, which on the one hand indicates 'receiving' as 'taking in' (*Hinnenehmen*) and on the other hand stresses interrogating (as in *Vernehmung von Zeugen im Gericht*, 'interrogating witnesses in court'):

In δianoεῖν we come upon [the occurrence of] 'receiving/taking in' of what *shows itself* as a receiving that interrogates. This interrogating takes something in and receives it in that this interrogating takes up something in view of something [else]. [*Im δianoεῖν liegt dieses*

vor-nehmende, eine Sache auf etwas hin durchnehmende Hinnehmen dessen, was sich dabei zeigt.]

(GA 34, p. 181)

There is a world of difference between translating *διδασκω* with *Denken* and with *Vernehmen*. If we translate *διδασκω* with *Denken*, then we lose sight of the initiatory character of this word which places it at the end of the First Beginning. That this word shelters such an initiatory character is borne out by the fact that, when *Beiträge zur Philosophie (Vom Ereignis)* offers a series of hints and indications for understanding how the First Beginning ‘plays forth’ (*zuspielen*) into the ‘Other Beginning’, this work mentions *Vernehmen* and *Vernehmung* as words that still reverberate with the initiatory root unfolding of being (as *Ereignis*) (cf. GA 65, p. 198 and *passim*).

Thus the question that emerges from the above chart is not whether Schleiermacher’s renditions are accurate – they obviously are – but rather this: are Schleiermacher’s renditions into German ‘an essential translation which hands over to an historical epoch a “way” of saying/showing/manifesting, or are his renditions repetitive and traditional’? Schleiermacher’s translation does not unfold the German language in accordance with the root unfolding of being which occurs as the Other Beginning. His translation is accurate and takes over the existing and circulating reserve of words of the German language, and by that very token his translation is not an essential translation.

By contrast Heidegger’s renditions of Platonic terms are the unfolding of the German language in such a way as to correspond to the root unfolding of being which marks the Other Beginning. Because the First Beginning ‘plays forth’ into the Other Beginning – and this means that the end of this Beginning which occurs in Plato also ‘plays forth’ into the Other Beginning – Heidegger’s renditions of Platonic terms unfold the German language in such a way as to allow the initiatory character of these terms to emerge and reverberate. That is, the very words *Vernehmen*, *Sammeln*, *Erstrebnis*, *Unverborgenheit*, etc. are in each instance essential translation, i.e., move within the root unfolding of language within the horizon of the root unfolding of being (*das Wesen der Sprache im Geschick des Seins*).

If essential translation is a translation into ‘way-making’/saying/showing within an historical epoch, then language’s unfolding as saying could be viewed as a formative power in that epoch. But how formative is saying that occurs in essential translation? We see the formative character of saying appropriately when we recall that saying occurs as soundless showing and as stillness (GA 12, pp. 243ff.). Thinking deeper into the question of translation, we realize that innerlingual translation turns us away from the differences between languages and leads us to a saying which is

soundless showing and occurs right at the core of language. Thinking deeper into the question of translation, we get a glimpse of this soundless and still showing. Gathering all of this, we can say: the unresolvable foreignness that always remains in interlingual translation is the occasion for experiencing the root unfolding of language as a soundless saying/showing within the horizon of being.

Notes

1 Throughout this essay the volumes of Heidegger's *Gesamtausgabe* will be referenced within the text by using GA followed by the volume and then the page number (e.g., GA 2, p. 56). All of these volumes have been published by Vittorio Klostermann Verlag, Frankfurt am Main, beginning with the year 1975.

2 Obviously the word *Wesen* presents great difficulties for translation. Rendition of this term with 'essence' does not reflect the movement of emerging in its ongoing character which is crucial for this word. In *Beiträge zur Philosophie (Vom Ereignis)* Heidegger points out that *essentia* (hence also the English word *essence*) is a word that belongs to metaphysical thinking as a thinking that is concerned with 'beingness of beings' (GA 65, p. 270). Speaking of $\tau\acute{\iota}$ ἔστιν and $\delta\tau\iota$ ἔστιν, he says that the distinction between *essentia* and *existentia* 'springs from the beingness of beings and thus pertains to the *Wesung* of being'. Then he adds: '*Essentia* and *existentia* are not richer and do not originate from something simple. On the contrary [this distinction] is a definite impoverishment of the richer *Wesen* of being and its truth.' These remarks of Heidegger make it quite clear that, although the word *essence* pertains to the *Wesung* of being, there is a vast difference between *Wesen* and 'essence', which difference translation must not overlook.

Several approaches to the translation of *Wesen* point out the difficulty that this word presents for translation: (1) Gail Stenstad proposes that this word be left untranslated (cf. her unpublished dissertation *Heidegger's Question of Language: From Being to Dwelling*). The disadvantage of retaining the German word is that, by keeping it intact, no translation actually takes place. (2) Wilson Brown translates the word *Wesen* with 'issuance and abidance'. This comes somewhat close to the movement of emerging and unfolding that the word displays. But by using two nouns instead of a verb, this translation stifles the movement character of *Wesen* (cf. Wilson Brown, 'The selfsame and the differing of the difference', *Research in Phenomenology*, xiv (1984), p. 225). (3) Kenneth Maly suggests the use of the expression 'root unfolding', which preserves the movement of emerging in its ongoing character (cf. his 'Imaging hinting showing: placing the work of art', in F.-W. von Herrmann and W. Biemel (eds), *Kunst und Technik: Gedächtnisschrift zum 100. Geburtstag von Martin Heidegger* (Frankfurt am Main: Klostermann Verlag, 1989), p. 195). In this essay we shall follow Maly's practice and refer to *Wesen* throughout as 'root unfolding'. Although the word *root* runs the risk of indicating some lower/deeper place/thing 'from out of which' the *Wesen* takes place – thus intimating a stability that runs counter to *Wesen* – nevertheless the expression 'root unfolding', when heard in the resonance of the phrase taken as a whole, comes closest to indicating the significant movement which occurs in *Wesen*.

3 Miguel de Cervantes, among others, articulates the first position; Jorge Luis

Borges, the second; and Goethe, the third. Cervantes advocates the first view when he suggests that reading a work in translation is like 'viewing a piece of Flemish tapestry on the wrong side' (*Don Quixote* (Modern Library Edition), p. 869). For Cervantes reading translation is equal to reading a distorted view of the original.

On the other hand Borges suggests that translation is possible without distortion. His fictional Pier Menard envisions such a perfect translation in terms of actual writing, *not* rewriting the original. Three hundred years after Cervantes, Pier Menard plans to write *Don Quixote* in French. He knows 'Spanish well, "recovers" the Catholic faith, "fights" against the Moors and the Turks, and "forgets" the history of Europe between the years 1602 and 1918'; in short, he plans to be Miguel de Cervantes. This is a project which he 'should only have to be immortal' in order 'to carry out' (*Ficciones* (New York: Grove Press, 1962) pp. 49f.).

Goethe's position is somewhere between the two extremes just mentioned. He assesses the status of translation and equivalency in different terms, in that he sets a different goal for translation. In *Der West-Osterliche Divan* he designates as the last and third period in the history of translation one in which 'we would want to make translation identical with the original in such a way that the new text does not exist instead of the original [*anstatt*], but in its place [*an der Stelle*]' (DTV Edition), p. 244. Goethe's view on translation touches the crucial points in Cervantes as well as in Borges. Unlike Cervantes, Goethe considers translation to be reliable and strong enough to be identical with the original. Unlike Borges, Goethe sees this identity, not as an absolute, but only a partial and functional identity. In so far as Goethe does not envision the possibility of an absolute identity of translation with the original – as Borges seems to do – (translation, he says, does not exist instead of the original, but in its place) Goethe's identity of translation and original is partial and functional. He leaves open the access to and the need for a return to the original.

4 Cf. 'Ontology of language, ontology of translation in Heidegger' by Eliane Escoubas.

5 To say that the 'truth of being' is a 'reformulation' of the 'meaning of being' is to heed the occurrence of originary translation (which indicates language's 'way-making') and to heed what Heidegger says about *Being and Time* in Sections 42 and 91 of *Beiträge zur Philosophie (Vom Ereignis)*. In Section 42 we are told that in the field of the question of being there 'are no straightforward "developments."' There is much less *that* relationship between what comes later [*das Spätere*] to what comes earlier [*das Frühere*], according to which relationship the former is contained in the latter' (GA 65, p. 85). In the light of this statement we can say that the 'truth of being' is not contained in the 'meaning of being' in *Being and Time*. However, this does not exclude taking 'truth of being' as a reformulation of the 'meaning of being'. That *Being and Time* falls within the perimeter of the 'truth of being' emerges clearly from Section 91 of *Beiträge zur Philosophie (Vom Ereignis)*, where Heidegger characterizes *Being and Time* as 'the first step toward creatively overcoming metaphysics' and adds that this step 'had to be undertaken by holding firm, in one respect, to the posture of thinking [*Denkhaltung*] while at the same time, in another respect, basically overcoming this posture'. Both happen in *Being and Time* in so far as this work 'holds to the posture of thinking by inquiring into the *being of a being* and overcomes metaphysics in so far as [this work] inquires in advance into the truth of being' (GA 65, p. 182). Inquiring in advance into the 'truth of being' manifests a

proximity to this truth in language which allows an originary translation into it, in the reformulation of the 'meaning of being'.

6 See note 2 above.

7 F.-W. von Herrmann, *Subjekt und Dasein*, 2nd edn (Frankfurt am Main: Vittorio Kostermann Verlag, 1985), p. 169.

8 Only when thinking fails to experience originary translation – whose very occurrence denies the distance between interpreter and work – as translation into 'ways made' by the work, only then can thinking propose a 'fusion of horizons' (*Verschmelzung der Horizonte*), as Gadamer does, or utilize a 'deconstructive strategy', as Derrida is doing (cf. H.-G. Gadamer, *Wahrheit und Methode*, 2nd edn, Tübingen: J. C. B. Mohr, 1965), pp. 289ff.; *ET*, pp. 269ff. and J. Derrida, 'Plato's pharmacy', in *Dissemination*, tr. B. Johnson (Chicago: University of Chicago Press, 1981). We can go one step further and suggest that, when originary translation does *not* take place, the distance which operates prior to this translation manifests itself by the demand for a 'fusion of horizons' or for Derrida's concern for detecting 'binary oppositions' – manifesting a certain insecurity of thinking that grows out of the very distance from the matter to be thought. For, in order for the interpreter's 'horizon' to be 'fused' with the 'horizon' of the work, the two must be separated from each other by this distance. Likewise, identification and detection of 'binary oppositions' in the text – as well as other elements of the 'deconstructive strategy' – presuppose a distance and an *assessive* posture, which weigh and value one thing against another. (Is not this assessive posture what enables Derrida to detect 'binary oppositions' in every work that he reads?) However, originary translation is not assessive because it is simply this: moving/stepping into 'ways made' by a work of thinking.

9 Martin Heidegger, *Der Satz vom Grund* (Pfullingen: Verlag Günther Neske, 1957), p. 161. The German words *das Geschick* and *geschicklich*, as used by Heidegger, present significant trouble for translation. The usual way of translating the words into English, i.e. as 'destiny', is inadequate – for it covers over the *movement* character of the word. Moreover the dimension of the unfolding in any given epoch gets hidden and covered over.

In this essay I have opted for the translation of *Wesen* as 'root unfolding'. In view of the immense light that *Beiträge zur Philosophie (Vom Ereignis)* sheds on Heidegger's work, I find it necessary to use the word 'unfolding' also for translating the word *Geschick*. For, throughout *Beiträge zur Philosophie (Vom Ereignis)* Heidegger's use of the terms *Wesen* and *Wesung* suggests that *Geschick* too is a way of *Wesen* and *Wesung*, i.e., is a way of unfolding. This means that the movement named in *Geschick* emerges in the same place as the movement named *Wesung*, as this word is used in *Beiträge zur Philosophie (Vom Ereignis)*. The possibility of originary translation requires that interlingual translation focus precisely *not* on terms that are semantically equivalent, but rather simply heed that way of originary translation that takes place innerlingually, as the root unfolding of language. On this point see my discussion and translation of the term *Betroffenheit* (a term that appears in Heidegger's *Nietzsche*, volume II) as presented in my paper 'The question of technology and will to power', in von Herrmann and Biemel (eds), *Kunst und Technik*, pp. 137ff. See also by contrast translation of this term by David F. Krell in Heidegger, *Nietzsche*, vol. III. (New York: Harper & Row, 1987), pp. 189ff.

17 In this text Heidegger uses the word *erfassen*, using an earlier edition of Schleiermacher's translation. The Rowohlt edition of the Schleiermacher translation replaces *erfassen* with *aufsuchen* (cf. *GA* 34, pp. 30, 203 and 337).

Heidegger's idea of truth

Ernst Tugendhat

Heidegger is perhaps the only philosopher of our time who has tried to advance the classical tradition of ontologico-transcendental philosophy in a productive way. That this advance is presented as an overcoming and one in which philosophy is finally brought to a close, has of course made it suspect. The critique of Heidegger's thought is mostly carried out upon a plane which, for its part, is no longer that of the ontologico-transcendental tradition. Assuming that it still makes sense today to hold on to the formal idea of an ontological or transcendental philosophy as a desirable ideal, Heidegger's attempt must be examined specifically with regard to this guiding idea, if we are to arrive at an assessment of our own possibilities.

In this connection, a particular significance can be attributed to the concept of truth. Crudely expressed, one can say that it is a characteristic of the philosophy of the classical tradition that, on the one hand, it is universal (questioning into being in general) while, on the other hand, it starts out from some first, or most original, principle. For ancient metaphysics, this first principle was an absolute being. In modern, transcendental philosophy, the standpoint of knowledge and therewith that of truth comes to the fore, and this from two sides. All beings are questioned with regard to the condition of their possibility in so far as this condition can be known to be true, and the first and most original principle to which this question leads back is not so much an absolute being as rather something which is given with absolute certainty. Thus, Husserl understands his transcendental philosophy as a phenomenological clarification of everything posited as true, with reference to a transcendental subjectivity whose distinctive characteristic lies in its absolute self-givenness, that is, in its character as the sphere of the absolutely evident and therefore of a conclusive truthfulness. Heidegger holds on to the idea of a first and most original principle and, in so far as he does so he

remains, formally speaking, in the tradition of transcendental philosophy. However, the self-givenness of subjectivity is for him no longer an absolute principle but rather one that has already been mediated by the ecstatic temporality of Dasein through a precursory openness – its world as history. To this extent the transcendental (thesis) is surpassed. In order to have a word which describes both the continuity and the break, let us call this position ‘meta-transcendental’. What is most originally given is no longer characterized by the evidence of an absolute subjectivity but by the disclosure of the finitude of Dasein and – in so far as this disclosure stands out in an open field of play – through the clearing of this very field itself.

I do not want to offer an interpretation of this basic position of Heidegger’s but only to ask what it means that Heidegger, for his part, also understands this transformed transcendental ‘reference back’ in terms of a first and most original truth, even though he abandons the standpoint of certainty and evidence. In *Being and Time* he describes the disclosure of Dasein as the first and most original phenomenon of Truth (SZ, 221) and correspondingly, in his later writings, he describes the clearing of the world as the ‘Truth of Being’. This is not obviously in line with our normal understanding of truth and actually presupposes Heidegger’s own theory of truth, a theory for which truth is determined as ‘disclosure’ and ‘un-concealment’. One therefore has to subject this theory to an interpretation if one wants to understand with what right and with what meaning Heidegger chooses the word ‘truth’ to characterize his meta-transcendental reference back.

In order to keep the interpretation within a controllable frame, I propose to limit myself to a particular text, section 44 of *Being and Time*. Here Heidegger develops his concept of truth for the first time. To be sure, all the various aspects of his position have not yet been developed and the conception as a whole experiences a characteristic modification later through the so-called *Kehre*. But the essential decisions, those which remain fundamental for everything that follows, are already taken here and can therefore best be grasped here.

The treatment of the concept of truth is carried out in two steps. In a first section (a) Heidegger handles propositional truth and comes to the conclusion that it must be understood as ‘uncovering’ (or – as Heidegger says later – unconcealing). This finding then allows him in section (b) to extend the concept of truth to all that can be uncovered and to any disclosure. And since it has already been shown, in *Being and Time*, that all uncovering of inner-worldly beings is grounded in the disclosure of world, this latter proves, in the end, to be the ‘most original phenomenon of truth’. Section (b) therefore brings us back to our initial question, how, for Heidegger, the concept of truth can be the fundamental philosophical concept. But the decisive step in the argument of §44

is certainly the thesis of section (a) that the truth of an assertion lies in its disclosiveness. Once this has been conceded, everything else follows almost deductively. So first, we have to carefully interpret this analysis of propositional truth.

It is a methodological necessity that Heidegger takes propositional truth as his point of departure here, as also in the only detailed development of the concept of truth to be found later in 'On the essence of truth' (Wegmarken, GA 9). To be sure, the philosophical determination of a basic word does not have to be restricted to any natural understanding of this word but it has to start out from such an understanding all the same. From the standpoint of ordinary understanding, propositional truth is certainly not the only meaning of the word 'truth' but it is the most familiar. That a concept of truth agrees with the propositional concept does not perhaps accomplish much. But it does at least furnish the minimal condition that must be met if it is to feature at all as a concept of truth: Heidegger certainly did not recognize this requirement as clearly as this because he was of the opinion that propositional truth was first brought to the fore by Plato and Aristotle (probably the opposite lies nearer to the truth: it is precisely Homer who in general only speaks of truth in connection with an assertion and Heidegger could only arrive at his position because, in his own conception of the Greek pre-philosophical understanding of truth, he let himself be guided less by actual word usage than by a free interpretation of the etymology). Still, this much can be said: Heidegger does in any case take propositional truth to be primary for us, which places us in need of a new concept of truth. And so we do not run contrary to his intentions if we take him at his word in this respect.

He follows another hermeneutical maxim in that he not only starts out from our natural understanding of language but also holds to the traditional philosophical conception, that is to say, to the well-known formula: *veritas est adequatio rei et intellectus*. How, asks Heidegger, is this correspondence really to be understood?

He prepares an answer by way of a critique of various contemporary conceptions, in particular, the so-called theory of ideas: if we ask about the truth of a statement, it is a question not of a correspondence between an immanent representation and a transcendent being; rather, in the statement itself, we are already directed to the state of affairs. And the statement or assertion is now true when it shows the state of affairs 'as it is in itself', when the state of affairs is discovered to be 'in itself just as it is pointed out in the assertion' (SZ, 218).

In a remark, Heidegger refers at this point to the phenomenological theory of truth developed by Husserl in his sixth *Logical Investigation*, and quite rightly so. Just as Heidegger's critique of the theory of ideas only reproduces Husserl's line of argument, so does his positive

determination of the concept of truth seem at first only to take up again that of Husserl. Through his specifically phenomenological thematic, through his new distinction between the objective content and its intentional mode of givenness, Husserl arrived not only at a rejection of the theory of ideas but also at a comprehensive interpretation of the adequation formula. The distinction of different modes of givenness of the same object led to the knowledge that, according to the adequation formula, that which had to correspond with the facts is neither the subject (as this formula would wrongly have it) nor something else – for instance, the statement as a physical occurrence – but precisely the same thing, only in other modes of givenness. On the one side, we find the state of affairs as it is intended in so-called signifying givenness, on the other precisely this state of affairs, as it is itself. This ‘being itself’ of the state of affairs is not something transcendent to experience, but is only the correlate of a distinctive mode of givenness. The state of affairs as it is itself is the state of affairs as it manifests itself when it is itself given to us.

So when Heidegger says that the truth of an assertion consists in this, that it points out or discloses the entity ‘just as it is in itself’, one might at first suppose that he had simply repeated Husserl’s thesis. In which case one would only be in a position to appreciate the specificity of his concept of truth if one asked how and why he still distinguishes his own from Husserl’s position. Heidegger himself does not explicitly address the subject. Here we run up against an, at first purely incidental, peculiarity of Heidegger’s exposition. He develops his own concept of truth in opposition to that of other contemporary theories but only to those Husserl had himself rejected a quarter of a century earlier. What Heidegger arrives at with his own *line of reasoning* is therefore only the position assumed by Husserl. And the decisive step beyond Husserl is not subject to further justification, indeed, is not even presented as his own step.

In what respects Heidegger’s conception differs from that of Husserl can only be extrapolated from the different variations which he presents on the side as equivalent formulations to the former. The first specification runs: the assertion is true when it so indicates or discloses the state of affairs as it is in itself. The ‘so-as’ is here bracketed by Heidegger. Obviously, this ‘so-as’ is essential to the truth-relation since it describes the correspondence of the state of affairs just as it is disclosed by the assertion with precisely this state of affairs ‘as it is in itself’. It is all the more surprising that Heidegger now introduces without justification a formulation in which the ‘so-as’ is missing. He says: ‘The assertion is true, means: it discloses the state of affairs in itself’ (SZ, 218). Nevertheless, this revised formulation is still entirely legitimate, for it still entirely corresponds to Husserl’s conception. For, since the correspondence, when it proves correct, is an identity, one can, when the assertion points

out the state of affairs in the same way as it is itself, also simply say: it captures the state of affairs in itself. The 'so-as' is implied in the 'in itself'. In a third formulation however, Heidegger carries the simplification one step further. He cancels, again without justification, even the 'in itself'. The assertion is true now means quite straightforwardly: it uncovers the state of affairs. In this way he arrives at the thesis: 'The truthfulness (truth) of the assertion must be understood as its disclosedness' (SZ, 218). Only with this shift does Heidegger explicitly distance himself from Husserl and reach his own concept of truth which, from now on, he upholds in this formulation alone. So it is all the more remarkable that he does not elucidate further precisely this small, but yet decisive, step. How is this to be explained?

Initially, the claim that an assertion is true if and only if the intended entity is 'in itself just as it is pointed out or discovered to be in the assertion' did not seem to place any special weight on the word 'discovered'. For in general Heidegger does understand the assertion in terms of pointing out and discovering (cf. *Being and Time*, §33). And what the truth of the assertion brought out seemed not to be the fact that the entity should be uncovered by it but rather how it is uncovered by it, namely, just as it is in itself. In the latter formulation however it becomes clear that precisely this qualification, which appeared to bring out what is essentially at issue, has become dispensable for Heidegger; with the result that the truth consists in the pointing out and the uncovering as such.

In fact, Heidegger's characterization of the assertion as a pointing out and an uncovering makes an essential advance over Husserl's position. The question is only whether this new conception of the assertion also renders redundant any further qualification with regard to the determination of the truth of an assertion. With Husserl, the act of expression is understood statically, as it were, as a mode of intentionality, as the holding before oneself of a specific objectivity, as representation. Just as Heidegger leaps over Husserl's intentionality in general with the concept of 'disclosure', so he also understands assertion dynamically as a mode of disclosure, as an uncovering and specifically as a pointing out (*apophansis*). With the concept of disclosure, Heidegger seeks to thematize the 'clearedness' of human being, a clearedness which is only implicit in Husserl's intentionality and the corresponding concepts of the tradition. Clearedness is not adopted as a ready-made state; rather, the question arises, how it is brought about. Hence, disclosure is to be understood as an occurrence which is actively related to its opposite - closedness or concealment. In the special case of the assertion, it becomes clear that wherever it arises in a concrete connection with life and with science it is not to be understood in a functionless fashion as the rigid positing of an objectivity, but dynamically as a letting be seen in which we point

out something as something, in which we lift it out of concealment, both for ourselves and for others so that, as Heidegger says, it is 'unconcealed'.

And now it is also possible to understand the reason why, with regard to the determination of the truth of the assertion, Heidegger omits the supplement 'as it is itself'. As long as one understands the assertion statically, as a representation or meaning, one is, of course, not entitled to say: an assertion is true if and only if it means the entity in question; for the way in which it means the entity can also be false. One is therefore already obliged to say: it is true if and only if it means the entity as it is itself. If, on the other hand, we understand the assertion as a pointing out and an uncovering, it then seems to be sufficient if we say without further qualification: the assertion is true if it uncovers the entity, for, if it is false, it does not uncover the entity at all but 'covers it up' or 'conceals' it. It therefore already lies in the nature of uncovering as such that it must be true if it really is an uncovering.

Heidegger must certainly have reasoned along these lines when he made the attempt to give grounds for thinking why, for him, the supplement 'as it is itself' was redundant. As soon however as one lays out in clear steps the reflection which surreptitiously lies at the root of Heidegger's thesis, its weak point already manifests itself. It lies in the ambiguity with which Heidegger employs the word 'uncover'.

In the first instance, it stands for pointing out, the ἀποφαίνεσθαι in general. In this sense every assertion uncovers, the false just as well as the true. At the same time however, Heidegger employs the word in a narrow and pregnant sense, in accordance with which the false assertion is not so much an uncovering as a covering over. Here, it goes without saying that truth lies in uncoveredness. But what does uncovering mean when it no longer signifies a pointing out in general? How is ἀληθεύειν to be differentiated from ἀποφαίνεσθαι?

Heidegger gives us no answer to this question because he, in distinction from Aristotle on whom he relies (SZ, 219), does not explicitly distinguish the broad from the narrow meaning of uncovering. Hence, even after he first arrived at the conclusion that truth consists in uncoveredness, he can then still speak of an 'uncoveredness in the mode of the appearing' (SZ, 222). In this way, the thesis about truth as uncovering only becomes enlightening if one maintains that the false assertion does not uncover. Instead of this Heidegger now says that, in the false assertion, the entity is 'in a certain sense already uncovered and still not represented' (SZ, 222). The covering up of the false assertion does not exclude a certain uncovering. But then, in what sense does the false assertion uncover and in what sense does it cover up? Since Heidegger does not qualify more closely either the uncovering of the true assertion

or the covering over of the false, the only way out remains a quantitative determination. In the false assertion, the entity is 'not fully hidden' (SZ, 222). Should we therefore say: in the false assertion the entity is partly uncovered and partly hidden? In that case, the false assertion would be put together in part out of truth and in part out of ignorance. Of course, Heidegger never meant to say this. But then, if one limits oneself to the two concepts un-concealment and concealment, there remains absolutely no possibility of determining the specific sense of falsehood, and therefore also of truth.

The characterization of falsehood as a covering up is undoubtedly a step forward. But this covering up is neither a simple subspecies of that concealment from which the *apophansis* receives its pointing out nor a mixture of just such a concealment with un-concealment. The false assertion does indeed conceal but what and how? One has to say: it covers up the entity as it is itself and indeed in such a way that it uncovers it in another way, namely not in the way in which it is itself. For this reason there is no possibility of distinguishing the uncovering in the narrower sense which makes up the truth of an assertion from uncovering in the broader sense of *apophansis*, save by saying that it uncovers the entity just as it is itself. It is simply not possible to get around the supplement 'as it is itself' in the course of characterizing the true assertion. And the determination 'uncoveredness', which is supposed to make this point of view superfluous, does, for its part, actually have to make use of it, if it is going to be a determination of truth.

Even in the smaller writings which follow upon *Being and Time* however, Heidegger, in his attempt to trace the truth of an assertion back to un-concealment, continually passes over the very respect which is at issue in the question of truth. In 'On the essence of truth' (*Wegmarken*, GA 9), 'On the essence of grounds' (*Wegmarken*, GA 9) and 'On the origin of the work of art' (*Holzwege*, S. 40) the thesis is advanced that, in order that the assertion should be in accord with the entity, the entity in question must show itself, must be uncovered. Thus the truth of the assertion as adequation is grounded in the truth of the entity as un-concealment. That one should call that in the entity which the true assertion is directed toward 'the truth' is meaningful and also corresponds to normal word usage. When, for example, we say: 'we are inquiring into the truth', then clearly we are not asking about the correctness of the assertion. Rather, we are asking how the entity is itself. For Husserl too, the primary sense of truth lay in the truth of the entity. But one simply cannot see that towards which the true assertion is directed as merely consisting in the self-showing, in un-concealment as such. For the false assertion is also directed towards something that shows itself. Even semblance (*Schein*) is an unconcealing.

To be sure, one might object, semblance is not a genuine un-concealment.

But then we only run up again against the same ambiguity that made its appearance in *Being and Time* with the concept of 'uncovering', an ambiguity which Heidegger nowhere clarifies. We then have to say that the true assertion is precisely not directed toward the entity as it manifests itself immediately but toward the entity as it is itself. This difference, within the self-showing, between an immediate and, as it were, obtrusive givenness and the thing itself is never taken into consideration by Heidegger. So although, with his concepts of uncovering and un-concealment, he deepens Husserl's intentionality and givenness, the difference between givenness in general and self-givenness escapes him. Heidegger has quite rightly seen that the distinguishing characteristic of Husserl's concept of truth as well as, in another sense, that of Plato and Aristotle lay in this, that truth must here be understood in a circuit of self-manifestation and givenness. He then went straight on to broaden this givenness in and for itself by inquiring into the condition of its possibility, without noticing that truth, for Husserl as well as for Greek philosophy, in no way resided in givenness as such but in the possibility of a distinctive mode of givenness.

Perhaps Heidegger wanted to say that, in Husserl's talk about self-givenness, there still lurks a surreptitious relation to an absolute being in itself transcending experience. That is nevertheless not the case. Self-givenness, 'evidence', is for Husserl nothing but the – in the final analysis only partial – fulfilment of a significative intention and therefore still remains relative to the latter. The given possesses in itself a depth dimension, the so to speak obtrusively given points beyond itself.

On the other hand, if instead of explaining it as experientially immanent, one avoids the reference to self-givenness altogether, then, in the interests of consistency, one also has to drop the concept of truth. Only in so far as the ambiguity in the talk about uncovering is not made explicit can one be misled about this. If the meaning of unconcealing were exhausted in this, that it lifted the entity out of concealment into the light, then we would have no occasion to talk about truth and untruth. Rather, such talk is called for only because our relation to beings is a specifically mediate one, a relation of such a kind that ordinarily it is not given in itself, though we can nevertheless refer to it and *for this reason* also refer to it as being other than in fact it is. If, as Heidegger has shown, assertion is dynamically directed from concealment to un-concealment then it is, at the same time (if its *telos* is not merely *apophansis* but truth), directed from the subject-matter, as it actually manifests itself, to its self-manifestation. And this second direction is in a certain sense the opposite of the first, in that it is here a question not of bringing the subject-matter to givenness but of validating the givenness with reference to the subject-matter. Only through this second direction does the first acquire a validity, so that the revealing, which would

otherwise be arbitrary, is directed toward the entity as it is itself. If, on the other hand, one lets the revealing get directed in accordance with the givenness of the entity, as it shows itself, then this arbitrariness is immediately sanctioned. Being itself is the critical instance of revealing. Only when this second direction is recognized as self-sufficient can it be fruitfully explained with the help of the first, so that one can now say that the false assertion covers up the entity, namely in its being itself and that the true assertion alone really does reveal the entity, namely, as being itself.

Heidegger's new conception of the assertion as an uncovering and a revealing seems, on the one hand, and if it is suitably completed, entirely accommodated to a deepening of our understanding of the truth of an assertion. The functional-apophantic conception of the assertion is an advance upon the static intentional. In particular, this dynamic conception makes it possible to understand not merely the conclusive true assertion but the assertion along the way to the truth as an unconcealing of the thing itself and, in this sense, as a truth-relation (not as truth). On the other hand, this conception leaves out what is specific to the phenomenon of truth, at least in the form in which Heidegger actually worked it out. To be sure, it is implied even if only ambiguously, but for this very reason not conceptually articulated. The specific sense of truth is, as it were, submerged in the notion of uncovering as *apophansis*. And even the specific sense of untruth is, if not simply left out of account, then at least only subsequently taken into consideration, not only in *Being and Time* but also in 'On the essence of truth', so that its antithesis can no longer be essential to the meaning of truth but is instead taken up with it into the truth – which is of course only logical when truth is entitled *apophansis*. The specific problem of truth is overlooked but not in such a way that it is simply set aside and so still remains open. Rather, in as much as Heidegger holds on to the word truth but then deforms its meaning and this again in such a way that we still catch a glimpse of its true meaning, it is no longer possible to see what has been overlooked here.

What Heidegger accomplishes with his new determination of the truth of an assertion first becomes clear in section (b) of §44 of *Being and Time*. Here Heidegger arrives at an unusual extension of the concept of truth over and beyond the domain of assertion. This takes place in two steps.

In order to understand the first step, it is necessary to bear in mind that, in *Being and Time*, the word 'uncover' stands terminologically for any disclosure of inner worldly beings and so not merely for that disclosive assertion which points out but also for the circumspective disclosure of concern (cf. §18). It is on this point that Heidegger now rests his case. If the truth of the assertion according to section (a) lies

in uncovering, then it follows (or so he reasons), that in fact all letting be encountered of inner worldly beings is 'true' (SZ, 220). One sees that the thesis at which Heidegger had arrived in section (a), a thesis with regard to truth as uncovering which is only insightful in so far as one takes the term in the narrow sense, has actually been understood in the broad sense. Had it not been so understood, he would not have been able to reason in this fashion. Only because, for Heidegger, the truth of an assertion does not lie in the way in which it uncovers but only in that it uncovers is he then able to carry truth over to all disclosure in general without further justification. The question is no longer one of determining whether it is possible to find, in the realm of circumspective concern, a difference corresponding to that between the true and the false assertion. Rather, simply because it uncovers, concern is in general characterized as a mode of truth.

That Heidegger should have extended disclosure beyond intentionality, beyond objective representation, is a significant and decisive step. What has thereby been gained for the problem of truth now has to be considered in detail, whether it be that it has proved worthwhile to draw a distinction between truth and falsehood even in modes of disclosure which lie outside the theoretical realm, or whether it be that, in contrast to other modes of disclosure, those which are truth-related acquire a new emphasis. But it is precisely these questions, questions which it has now become possible to raise as a result of the plane upon which he poses the problem, which are cut off by Heidegger in virtue of his simple equation of disclosure and truth. By comparison with the genuine gain in insight which the concepts of uncovering, disclosure and un-concealment bring with them, their equation with the concept of truth only implies a loss. Not only is what has already been discovered in connection with the truth of assertion left in obscurity again, the new possibilities of broadening the truth-relation which were opened up from the point of view of disclosure, are not made use of. Instead of broadening the specific concept of truth, Heidegger simply gave the word truth another meaning. The broadening of the concept of truth, from the truth of assertion to all modes of disclosing, becomes trivial if one sees the truth of assertion as consisting simply in the fact that it is in general disclosive.

Where this all leads only becomes clear with the second step, which now follows. All uncovering of inner worldly beings is grounded, as was shown earlier (§18), in the disclosure of world. Hence, or so Heidegger is now able to conclude, disclosure of Dasein itself as being-in-the-world, the disclosure of its world (SZ, 220f.), is the 'most original truth'. We are now provided with an answer to our initial question, how Heidegger is able to describe as the 'most original truth' what is for him the most originally given, even though it is not characterized by evidence. This determination follows from Heidegger's peculiar conception of the truth

of assertion. But it also follows therefrom that, just as what Heidegger earlier called truth had nothing to do with the specific phenomenon of truth, so the same applies here too. In fact, this original disclosure or clearing is, for Heidegger, the product of a temporal field which first makes possible any self-manifestation of beings; *any* self-manifestation and not just the specifically true. That Heidegger speaks here of truth is due simply to the fact that he already calls self-manifestation itself truth.

To the above, one might respond with the question: doesn't it all come down to a matter of terminology? Heidegger's question is in any case the more comprehensive. And in as much as it is questionable to what extent one can distinguish between truth and untruth in what pertains to the disclosure of world, to the understanding of our historical horizon of meaning, as well as in the assertion of matters of fact, is it not then legitimate to understand the opening up of a world as the event of truth? No! – and for precisely this reason: because then the question whether and how the disclosure of world can also be related to the issue of truth in its specific sense, would be covered up.

This can no longer be regarded as a special omission but concerns the problem of truth as a whole. If, for instance, any truth-assertion about inner worldly beings is relative to the historical horizon of our understanding, then the entire truth problem is now concentrated upon this horizon and the decisive question now has to be: in what manner can one inquire into the truth of this horizon, or is it not rather the case that the question of truth can no longer be applied to the horizon itself? This question becomes untenable for Heidegger, in as much as he already calls any disclosive understanding a truth in and for itself. On the one hand, this makes it possible for us to still talk of truth in connection with understanding and its horizons. On the other hand however, it becomes pointless to inquire into the truth of this horizon since that would only mean inquiring into the truth of a truth.

To be sure, we find here the same ambiguity as previously with the assertion. But the distinction between ἀποφαίνεσθαι and ἀληθεύειν is in reality so clear that no one would waive the right to inquire into the truth of an assertion simply because he was already prepared to attribute truth to *apophansis* as such. With regard to the meaning horizons of understanding, on the other hand, it would be necessary to first consider in what respects a question of truth was at issue here. In so far as our horizons are continually given in an opaque fashion, the immediately given refers beyond itself even here to the thing itself but obviously, in a manner other than the assertion. We could say: when we inquire into the matter at issue with a pre-given assertion, we are trying to verify it. When, on the other hand, we inquire into the matter at issue with a pre-given meaning, we are trying to clarify it. An untrue assertion is false, whereas an untrue meaning is confused or one-sided. The truth of

an elementary assertion is decidable. It consists in a correctly comprehended 'in itself'. For the clarification of meaning, on the other hand, the in itself of truth, the 'as it is itself' which emerges in the evidence of complete transparency, is only a regulative idea of the process of critical questioning.

These crude indications suffice to show that in the realm in which Heidegger quite rightly grounds all truth, the explanation of what is specific to the truth-relation brought with it new difficulties and the question concerning the truth did in fact prove unsatisfactory in that a plain evidence and certainty, and therefore a positive hold on the truth, becomes unattainable, with the result that the meaning of the truth-relation comes to consist in something negative and critical. Hence the temptation to solve the problem, like the Gordian knot, by simply understanding truth as disclosure itself. Now, in the name of truth, even the challenge of the critique can be resisted, indeed, understood as the result of a subsequent historical restriction which, in its original meaning, was not contained in the truth-relation at all. If truth means un-concealment, in the Heideggerian sense, then it follows that an understanding of world in general is opened up but not that it is put to the test. What must have seemed so liberating about this conception is that, without denying the relativity and the opaqueness of our historical world, it made possible an immediate and positive truth-relation, an explicit truth-relation which no longer made any claim to certainty and so could not be disturbed by uncertainty either.

Therewith however, what is specific to the truth-relation is not only overlooked but is converted into its opposite. In what way this renunciation of the idea of a critical consciousness made itself known and worked itself out in detail can be shown with reference to the later writings, in particular, the paper 'On the essence of truth'. But the interpretation of Heidegger's analysis of the concept of truth in *Being and Time* already made it possible to advance the thesis that Heidegger overlooks the problem of truth precisely because of the way in which he makes the truth into his foundational concept. That he already calls disclosure in and of itself truth leads to the result that it is precisely not related to the truth but is protected from the question of truth.

This result is however not purely negative. It leaves unaffected the essentials of the position through which Heidegger distances himself from Husserl's transcendental position. And the question remains open whether, through his refusal of the critical approach, Heidegger did not give his own view an orientation which was not necessarily contained in it and, to this extent, left other possibilities open. Heidegger's thought is not so homogeneous as it makes itself out to be and we seem today to have gradually achieved that remove from him which permits us,

instead of taking sides for or against, to critically differentiate what does not appear to lead further from what should not be abandoned.

Since Heidegger uses the term truth for what is for him the most originally given – the disclosedness of Dasein (i.e., the clearing of being) but then takes truth in a sense other than the specific one, it becomes all the more pressing to try to place what is most originally given in relation to truth. What is most originally given, 'world' in the sense of the clearing of being is, of course, not the world of the moment, in the sense of whatever is contained within the horizon but rather the open field of play – not in the first instance of beings but of this horizon itself. Correspondingly, disclosure is not taken up in any actual world project. If one now takes account of the specific meaning of truth then certainly one could no longer call disclosure itself, i.e., clearing 'truth'. But one could say that disclosure is essentially directed towards the truth (even though it can also prohibit the question of truth) and that clearing is a field of play whose depth dimension refers to truth and that therefore whoever is preoccupied with the latter is called upon to raise questions concerning the truth and concerning the truth not merely of beings but also of the horizon.

In this way, Heidegger's radicalization of Husserl's transcendental position would be retained. The claim to a self-conscious subjectivity which finds itself in possession of an a-historical, absolute evidence would be discarded, without however giving up Husserl's concept of evidence as the idea of a specific givenness of truth. At the level at which Heidegger poses the problem, evidence does not lose its meaning but has simply to be understood (as in part it is already with Husserl) as a regulative idea, and the same naturally also holds of truth. The immediacy of the hold on evidence would be overcome but, instead of making way for a new but now pre-critical immediacy of truth, the critical consciousness would be retained, though held in that suspense which belongs to its essence. Precisely with regard to Heidegger's meta-transcendental position, for which the most originally given is neither substance nor subject but an open field of play, the critical consciousness would have been able to locate its own non-representative suspense. Here, when transcendental philosophy not merely takes in a historical dimension but where it opens itself up to it and gives up the idea of anchoring itself upon a last ground, it became possible to radicalize and to build up anew the idea of a critical consciousness. But, by the same token, it also became possible to give it up in preference for a new immediacy. In fact, the open field of play could not be held in suspense because, without the depth dimension of truth it was only thought as immediate, whether the immediacy in question was that of the project or of the destiny of un-concealment. And the step from the uncanniness of *Being and Time* to the belonging of the *Letter on Humanism* is only a small one because, what is for the

truth question the constitutive moment of reflection, is left out from the very outset. For this reason, Heidegger had to develop his position as an overcoming of the modern philosophy of reflection even though it could just as well have become the radicalization of the latter. Heidegger tied the philosophy of subjectivity down to the dogmatism of self-certainty. But it would be more correct to say that, with the idea of certainty, if only it remains a regulative idea, modern philosophy has radicalized the Socratic challenge of a critical justification and that means the challenge of a theoretical responsibility. In this way, there arose the task of developing the concept of truth in its full scope, a scope which had already been indicated with disclosiveness, but without giving up the regulative idea of certainty and the postulate of a critical foundation.

Translated by Christopher Macann

Heidegger on logic

J. N. Mohanty

Why should one write on Heidegger's understanding of logic? After all, Heidegger was not a logician, nor did he do philosophy of logic. Indeed, there is no justification for expecting of any great philosopher whatsoever that he should have views, and reasonably plausible views, about the nature of logic or on specific themes belonging to the domain of logic. A moral philosopher may totally bypass any concern with logic, without detriment to his thinking. As an existentialist philosopher, Heidegger could have done that, and much of his *Dasein*-analytic would yet have retained its value. But Heidegger was also an ontologist, and was deeply concerned, all his philosophical career, with metaphysics and with the various questions about the nature of thought and of being. These concerns, to say the least, bring him to the proximity of logic as it had been understood in the tradition going back to Aristotle. And, as a matter of fact, Heidegger's own access to the problems of ontology and metaphysics has been determined by his reflection on logic. Two claims may therefore be advanced. First, it is not unreasonable, and what is more important, not unfair to Heidegger, to enquire into his understanding of logic. Secondly, his reflections on logic may help us to gain a better understanding of his overall philosophical interests than would be possible otherwise. Even if he was not a logician he was concerned with the nature of logic, and with some central problems belonging to the domain of logic. This concern begins with his doctoral work on the problem of psychologism in theory of judgment,¹ continues in the habilitation work on the semantic categories in Duns Scotus,² and reaches its maturity in the Marburg lectures of 1925–8.³

In this essay, I will deal with three topics. In the first section, I will try to determine how Heidegger understood the nature of logic. In the second section, I will consider the one problem of logic to which he devoted a great deal of attention: the theory of judgment. In the third

section, I will look into how his concern with logic opens up for him several paths to go beyond logic. At the end, I will reflect on this entire account, not so much to find faults with Heidegger's understanding of logic, as to determine its precise nature and limitations.

1 Nature of logic

A A preliminary definition

One commonly held view of the nature of logic, in the traditional accounts, is that logic is a normative science of thought, whose aim is to lay down those *rules* which one *ought* to follow if one aims at truth. This account may be faulted on various grounds. First of all, 'thought' is ambiguous, referring both to the process of thinking and the content of thinking. Of these two, the former belongs to the field of psychology. If the content of thinking is understood in the sense of objective meanings or structures of meaning, propositions or configurations of them, then only logic may be said to be concerned with them. Why then is logic to be still regarded as a normative science? Of course, once there is a logical law to the effect 'If p implies q , and p , then q ' (where p and q are propositional variables), then it does follow that if a person believes in a proposition 'A implies B' and also believes that A (where 'A' and 'B' are names of propositions), then he also ought to believe that B. But such a normative demand on the person's rationality is no part of the business of logic. Finally, the term 'truth' is ambiguous, referring both to material truth (the sense in which the statement 'it is raining now in Norman' is true if and only if it in fact is raining in Norman) and formal truth or validity (the sense in which the inference 'All men are immortal, all Greeks are men, therefore, all Greeks are immortal' is valid, being a substitution instance of a logical law, even if one of its premises as well as its conclusion are materially false). It may appear as though logic is concerned with validity, rather than with truth understood, as it usually is, in the first of the two senses. If we accept these three emendations, then we can transform the initial account of logic into some such as this: logic is a science of meaning-structures in so far as they are valid. On this account, the task of logic is to lay down the laws of validity of meaning-structures.

Heidegger, under the influence of Husserl's idea of a pure logic of meaning, concludes his dissertation with a formulation of the task of logic that is very much like the one we have just arrived at. The logician, he concludes, must aim at bringing out the precise meanings of sentences and then proceed to determine the forms of judgments according to objective differences of meanings and their simple or compound structures, and bring such forms into a system.⁴ Although the notion of

validity does not figure in this account, the way forms of simple meanings and compound meanings can be brought into a system must be by showing the relations of implication amongst them, and the laws of their implication should be able to yield laws of validity of meaning-structures. But Heidegger has no doubt, in those early works, that the proper logical object is neither the mental process of thinking nor the reality (whether physical or metaphysical) about which one thinks, but the *Sinn*, understood both as the meaning of a sentence and as the identical content of judgment.

B Critique of psychologism

Such a preliminary account of logic already implies a rejection of psychologism. Heidegger is aware of Frege's rejection of psychologism, but it is Husserl who, he writes, 'has systematically and comprehensively laid bare the essence, the relativistic consequences and the theoretical disadvantages of psychologism'.⁵ Basic to the overcoming of psychologism is the distinction between psychic act and its logical content, the latter alone being the 'in itself subsisting sense' ('in sich Bestand habende Sinn'). But can psychologism, which seeks to ground logic in psychology, be logically refuted? Perhaps not, Heidegger concedes in his dissertation, but that does not matter a great deal, he answers us: 'the actual . . . (also the non-actual) cannot as such be proved [*bewiesen*], but in any case can only be shown [*aufgewiesen*].'⁶ While psychologism, according to Heidegger, as it is for Husserl, must be rejected, one needs nevertheless (i) to be clear about the real point of Husserl's critique of psychologism, and (ii) to decide where one should go after the error of psychologism has been discarded. For purposes of (ii), it is necessary (iii) to think about what is to be understood by 'Sinn', a concept which up until now has been used to define the domain of logic.

Part of Husserl's critique of psychologism in the *Prolegomena* relies upon a distinction between two modes of being, the real and the ideal. Thinking as a mental process is *real* being; the logical content of thinking has an ideal being. Psychologism confuses the two. The confusion does not lie in mistaking one given thing (the ideal content) for another given thing (the real mental process). It is rather based on the fact that the philosophers concerned were blind to, and prejudiced against, certain modes of being. So far Husserl's point was well taken. But Husserl's concept of 'ideal being' is far from being univocal. In fact, Husserl appears to have brought under this concept things that are very different from each other, such as universals, essences that are not universals, truths as well as the idea of truth. We shall look into some of these equivocations a little later. For the present, what is important in Husserl's critique, according to Heidegger, is not that ontological distinction which, however provisionally useful, could not be the final truth, but rather the

implied critique of a naturalistic psychology. Hans Sluga has recently shown that when Frege rejected psychologism, he was, in fact fighting against a more comprehensive philosophical naturalism of which psychologism was a consequence.⁷ This reading is corroborated by Heidegger's understanding of Husserl's anti-psychologistic critique.

For Heidegger, it is a misunderstanding of Husserl's deeper intentions to read him as though he was improving upon Bolzano's platonism,⁸ or even as though his critique was rooted in Lotze's *Geltungs-* and value-logic. These 'platonistic' readings of the *Prolegomena* have led to the standard complaint that in the second volume of the *Logical Investigations* Husserl relapsed into psychologism. If we are to make room for the charitable interpretation that Husserl's *Logical Investigations*, even the *Ideas*, constitute a progressive unfolding of the thoughts that were already anticipated in the early works, we have to say with Heidegger that Husserl rejected psychologism because it applied to logical theory a psychology which was not only poor as a psychology of the experience of thinking, but which was confused regarding its very project, which, in other words, did not understand its theme, i.e., the logical. The critique of psychologism therefore is a critique of psychology, and an implied plea for an intentional, descriptive, and eidetic psychology to replace the prevailing naturalistic psychology.⁹ Such a reading of Husserl's intention makes it possible for Heidegger to go beyond the provisional distinction between the real and the ideal, and to ask how the logical contents or *Sinne* are related to the acts of thinking, and eventually to the thinking being that man is.

It is well known that Lotze's ideas of *Geltung* or validity as the mode of being of propositions and truths influenced, in different measures, both Frege and Husserl. In his logic lectures of the twenties, Heidegger concerns himself at some length with Lotze. It is interesting to note that his assessment of Lotze underwent considerable change along the years. In 1912, Heidegger writes that Lotze's logic should be regarded as the basic book of modern logic.¹⁰ In the Marburg lectures of 1925/6 we find him, in the course of a critical examination of Husserl's notion of 'ideal being', tracing Husserl's equivocations to the confusions that characterized Lotze's concept of *Geltung*.¹¹ I will return to Lotze's concept of *Geltung* when we turn to the theory of truth. For the present it should suffice to note that amongst the entities whose mode of being is characterized by *Geltung*, Lotze includes: propositional contents or sentential meanings (= Frege's Thoughts), truths, the mode of being of a truth and the Essence of Truth. *Geltung* also means: *objective* validity (being true of objects) as well as universality with respect to all knowers. No wonder, then, that Heidegger severely criticizes those who find in this term 'a magic band' capable of solving all problems.¹²

Heidegger was no more enthusiastic about Bolzano, the other major

influence on Husserl. He cautions against regarding Husserl's *Logical Investigations* as nothing but attempts to improve upon Bolzano. It is, for him, more true to say that both Bolzano and Husserl were influenced by Leibniz. In any case, anti-psychologism does not lead Heidegger to the opposite camp of platonism. The goal is to be able to avoid platonism, without relapsing into psychologism.

C Remarks on mathematical logic

For one who was so deeply concerned with traditional logic as Heidegger, the rise of mathematical logic could not but be a challenge. We know that Heidegger was enthusiastic about Frege's papers on concept and object, and on sense and reference.¹³ Of these he wrote: 'G. Frege's logisch-mathematische Forschungen sind meines Erachtens in ihrer wahren Bedeutung noch nicht gewürdigt, geschweige denn ausgeschöpft. Was er in seinen Arbeiten . . . niedergelegt hat, darf keine Philosophie der Mathematik übersehen; es ist aber auch im gleichen Maße wertvoll für eine allgemeine Theorie des Begriffs.'¹⁴ But the appreciation of Frege did not carry over into an appreciation of mathematical logic. In the same paper of 1912, he argues that logistic – as mathematical logic was alternately called – does not liberate itself from mathematics and so is not able to penetrate into the proper problems of logic. Its chief limitations derive, in Heidegger's view, from an application of mathematical symbols and concepts (above all, of the concept of function) to logic – as a result of which the deeper significance of the logical principles remains in the dark. As a calculus of propositions, it is unaware of the problems of the theory of judgment. Furthermore, the conditions of the possibility of mathematics, as well as of mathematical logic, lie in a domain which those two disciplines cannot reach.¹⁵ In the Dissertation, a new objection is raised against mathematical logic: it is formal, and so is unable to deal with 'the living problems of judgmental-meaning, its structure and its cognitive significance'.¹⁶ Similar complaints surface in later writings as well. In *Sein und Zeit*, logistic is said to 'dissolve' judgment into a system of 'Zuordnungen'; judgment becomes an object of 'calculation', and so cannot be the theme for ontological interpretation.¹⁷ Since judgment has always a relatedness to objects and a claim to be objectively valid, logistic cannot reach the essence of judgment.

Of what worth are these remarks? There is no doubt that Heidegger's acquaintance with the logic that Frege laid the foundation of, and that by the time Heidegger was writing his dissertation had found its epoch-making systematization in Russell and Whitehead's *Principia*, was superficial and casual. Nevertheless, there may be some substance in his remarks.

That mathematical logic may well be so much of mathematics that it therefore becomes poorer as logic, is already implicit in Frege's criticism

of Boole and Schröder. The point of that criticism is that Boole and Schröder used mathematical concepts ('sum', 'product', for example) and often mathematical signs to develop their logics, which is unjustified inasmuch as logic, being more fundamental, cannot and should not borrow its concepts from any other discipline.¹⁸ Consequently, instead of reducing logic to mathematics, Frege reduced arithmetic to logic. He sought to make a fragment of mathematics logical, rather than make logic mathematical. It is true that Frege used at least two important notions in his logic which might be regarded as having been borrowed from mathematics. In fact, however, that is not so. Although the ideas of quantification and function are seemingly mathematical, they are not in reality. The mathematical notion of function Frege found confused and unhelpful. The logical notion that he introduced is that of any entity that is 'unsaturated', i.e., has empty places within its structure. Thus a concept is a function inasmuch as its true form, on Frege's theory, is (for example) '____ is wise', and this is an incomplete entity. The same may be said of the quantifiers; they are, for Frege, properly logical notions, and not mathematical ones. Thus we must recognize that Heidegger's anxiety is genuine, but, as against the original Fregean logic, unfounded.

Heidegger's next complaint is that mathematical logic being a calculus of propositions, cannot raise the problems of judgment as discussed in traditional logic and metaphysics. What are these latter problems? As far as I can see, these problems are: (a) the nature of assertion/denial; (b) the nature of the copula and the predication; and (c) the problem of truth. Limiting our view for the present only to Frege (and the logic of the *Principia Mathematica*, which is basically Fregean), we may say that Heidegger's critique is not justified if it means that Frege and the *Principia Mathematica* did not know of these problems. The only substance of the critique may be that the solutions offered by these new logicians were hardly satisfactory. Consistently with his critique of psychologism, Frege distinguished between assertion and the thought (or, in the *Begriffsschrift*, the judgable content, *beurteilbare Inhalt*) that is asserted. Thinking is grasping of the thought; judging is recognition of the truth value of the thought so grasped; and asserting is expressing that recognition. There is no doubt that the concept of assertion as a psychological (and linguistic) act and its relation (as well as that of grasping) to the thought (which on Frege's theory has an objective being) remains, in that theory, a 'mystery' – no less difficult to clarify than the role Frege assigned to 'assertion' in his logic, despite his anti-psychologism. These difficulties show that Frege's solution to the problem of assertion was not satisfactory, but there is also no doubt that he did concern himself with this aspect of the problem of judgment. As regards the problem of predication, which has been one of the central concerns of traditional logic and philosophy of logic, Frege's answer would run

somewhat along the following lines: the problem of predication concerns the internal structure of the thought being asserted, and has nothing to do with judgment. Judging is recognizing the truth value of a total thought; the thought, or the judged content, contains a predicative structure, but even with regard to it one should note that what is the concept (or predicate) depends upon how one analyzes the thought and there is no one way of doing that. What about the copula? The copula as the connecting link between the subject and the predicate is no longer needed, for in 'Socrates is wise', the predicate is '_____ is wise' and not 'wise'. This new way of analyzing a proposition better explains its unity than the copula does, for if the subject and the predicate were to be linked by a copula one may want to know what links the copula to both the terms, whereas on Frege's theory a thought consists of an 'unsaturated' part (with a hole, as it were) and a 'saturated' part (which just fits into that hole), each made for the other, and so not in need of a link.

What then is the point of Heidegger's remark that in mathematical logic, judgment is reduced to a system of *Zuordnungen* and not made a theme of ontological interpretation? If he means that modern logic looks upon a proposition as an unanalyzable primitive, then he is wrong. First-order propositional logic does so, but predicate logic precisely analyzes the proposition into its constituents. If he means a proposition is, for modern logic, a mere connection of concepts (or representations), then also he is wrong, for as Frege taught, a thought consists of a concept (or a function) and an object. Further, the concept, for Frege, is not a subjective representation, but an objective entity. What then is the 'ontological interpretation'? It may mean either of four things: (i) interpretation of the fact that a judgment is about something, i.e., about a being; (ii) interpretation of the fact that a judgment is either true or false; (iii) interpretation of the mode of being of the judged content or proposition; and, finally, (iv) an answer to the question *how* something like a judgment is at all possible.

Of these four questions, Fregean logic has an account of (i) in terms of the object constituent of the referent of a thought; and an account of (iii) inasmuch as a sentence which expresses a thought also names a truth-value. Logicians such as Frege and Quine, to take two extreme examples, have ontologized about propositions or thoughts. The spectre of platonism has loomed large before them. It is not clear what is being asked by (iv). In any case, Heidegger's concern goes deeper than these answers. They are not radical enough both in their questioning and in their answers. With regard to (i), the Fregean answer does not succeed in locating the intentionality or object-relatedness of judgment in the more general structure of intentionality, and gets by only with locating an object constituent. As far as (iii) is concerned, considering a sentence

as a name of truth-value, in spite of the elegance it succeeds in bringing about in the semantics of first order propositional logic, does not question whether a sentence is after all a name,¹⁹ and it demands an unquestioning acceptance of the very obscure ontology of the true and the false. It also does not, and indeed cannot, raise the deep question, Why is it that a judgment alone is capable of being either true or false? Taken together with a deep understanding of the question (iv), all these foregoing issues constitute what Heidegger calls 'philosophical logic'.

D '*Philosophical logic*'

In his Marburg lectures, Heidegger develops the notion of a philosophical logic as contrasted with the traditional 'school' logic. The latter had its philosophical basis, no doubt, but now is 'der veräusserlichte entwurzelte und dabei verhärtete Gehalt' of an original philosophical question. Philosophical logic has been developing through the centuries – its high points are reached in Aristotle, Leibniz, Kant, and Hegel. Amongst his contemporaries, Heidegger appears to have rated Lask most; he is the one who consciously strives toward a philosophical understanding of logic and sought to extend the domain of philosophical logic.²⁰ Husserl, in spite of the possibilities that phenomenology contained for a philosophical development of logic, did not succeed, in Heidegger's view, in conceiving logic philosophically: 'he even intensified the tendency to develop logic into a separate science, as a formal discipline detached from philosophy.' Nor did any other amongst the phenomenologists succeed. Pfänder's *Logik* – widely regarded then as *the* phenomenological textbook on the subject – is dismissed as 'eine phänomenologisch gesäuberte traditionelle Logik'.²¹ Without pausing to evaluate these judgments on other philosophers (including those on Kant²² and Hegel,²³ Bolzano²⁴ and Lotze), I will proceed to determine the tasks and the problems which Heidegger assigns to philosophical logic.

First of all, philosophical logic, as Heidegger conceives of it, is not a new discipline²⁵ but rather actualizes a *telos* which has characterized historical logic since its inception. The idea of philosophical logic, Heidegger claims, will first render the history of logic meaningful.²⁶ Philosophical logic, one may contend, can be brought about first by determining what philosophy is, and then by applying philosophy to logic. But where and how do we find the idea of philosophy to begin with? Heidegger prefers to follow another route. Let us begin with traditional logic (Aristotle or Leibniz, for example) and develop the central problems in it in such a manner that they will lead us into philosophy. We have no doubt a certain historical understanding of philosophy. With that much in our mind, we can question logic for its philosophical potentialities.

What are the problems that lead us from within traditional logic towards philosophy? These are:

1. Judgment, with which logic has ever been concerned, is characterized by intentionality; it is about an object, an entity. How to understand this intentional structure?²⁷
2. What is the relation between the 'being' of the copula and the 'being' of ontology? How much ontological weight can we assign to the copula?²⁸
3. What is predication and what role does it play in judgment?²⁹
4. What is 'meaning', and what is its relevance for the possibility of judgment?³⁰
5. What is the structure of judgment such that both the possibilities – of truth as well as of falsity – belong to it?³¹
6. How is truth related to judgment? Is it a property of judgment?³²
7. Why is it that traditional logic has had two concepts of truth: propositional truth, and truth as self-evidence? How are these two concepts related? Are these legitimate concepts? What is their common presupposition, if there is any?³³
8. There is a theoretical truth, as well as practical truth. Which one of these is the primary sense of 'truth'?³⁴
9. How is human thinking related to human existence?³⁵
10. What is the metaphysical foundation of logic?³⁶

To some of these questions we turn in the next parts of this essay.

2 Theory of judgment

A Rejection of psychologistic theories of judgment

In his *Dissertation*, Heidegger considers, in considerable detail, four theories of judgment – those of Wundt, Maier, Lipps, and Brentano. Each of these theories is examined with regard to the general definition of judgment it gives; that definition is then tested by how it works in the cases of negative, impersonal, hypothetical, and existential judgments.

Of these four theories, Wundt's theory is concerned with the origin of judgment, Maier's with how a judgment consists of constituent act parts or *Teilakten*, and Lipps' with the completion of the process of judging. Brentano's comes closest to a purely logical theory, but still falls short of it.

(a) Wundt defines judgment as the analysis of a total representation (or thought) into its components. Judgment does not put together concepts, but rather analyzes a thought into concepts. Of the latter concepts, the variable component is called the predicate, the relatively constant one is the subject.³⁷ Heidegger shows that Wundt's theory has no satisfactory account of impersonal judgments (such as 'It rains'), existential judgments (the predicate 'existence' is not given in the total representation that is

analyzed), hypothetical judgments (a ground-consequent relation cannot be extracted by analysis) and of negative judgments (Wundt does not in any case regard negation to be of special logical significance).³⁸

(b) Maier rejects two common elements of the traditional theories of judgment: (i) the primacy accorded to the declarative sentence (*Aussagesatz*) as a grammatical entity (which, according to Maier, leads to the subject-predicate analysis that takes place under the misleading guidance of grammar), and (ii) the belief that 'true' and 'false' cannot be predicated of representations (*Vorstellungen*) themselves, but only of connections of representations. As against these, and in agreement with Brentano, Maier argues that judgment in its most basic form, is not a connection of representations. In 'The sun shines', the subject 'The sun' is already a judgment. I assert the sun to be actual on the basis of perception. Even in 'This is sun', the 'This' is a judgment, a simple 'naming-judgment'.³⁹

Judgments consist, according to Maier, of acts of presentation, which are then transformed into logical judgments by supervenient acts of objectification. An objectifying act is a positing of actuality, it is a sort of interpretive act. Besides these, there are two other component acts: an identification of the presently apprehended presentation with a reproduced one, and a *Wahrheitsbewusstsein*, which extends over all the three component acts.

Obviously such an account is a psychological, genetic account. The elementary partial acts are generally, according to Maier, involuntary processes.⁴⁰ Against it, Heidegger asks: Is the primitive judgment of Maier the same as an elementary judgment in the sense of logic? Above all, Maier is concerned with the *act* of judging, not with the content of judging, the judgment as such. Logic has nothing to do with the processes, be they what they may, that might be 'culminating' in the logical judgment. The logical judgment is not the completed final-state of the act; it is rather the objective content.

(c) Brentano, in common with Wundt and Maier, rejects the theory that judgment is a connection of representations. It would not do to say that the content of a judgment is complex, while the content of a representation is simple. The content of a judgment may be as simple as in 'A is' (where one is not connecting 'A' with 'existence'); the content of a representation may be complex (as in the case of a question). This implies that, for Brentano, predication is not an essential component of judgment. What distinguishes a judgment from a mere representation is the presence of either recognition or rejection as a new manner of relatedness of consciousness to its object. Consequently, every judgment is existential, its object is being affirmed as existent or as nonexistent. Thus 'Some one person is sick' translates, for Brentano, into 'A sick man exists' and 'No stone is living' into 'a living stone does not exist'.

Heidegger's criticisms of Brentano consist in showing in what sense Brentano's theory of judgment is psychologistic. Judgment is, for Brentano, a class of psychic phenomena. The *content* of judgment, that which is recognized or rejected, is of no interest to him. Thus while the distinction between the act and its content could have helped him to overcome psychologism, Brentano's interest remains with the psychic phenomena and he does not succeed in isolating anything specifically logical. It is true that his psychology being 'eidetic', Brentano does not deny the universal validity of knowledge. But, as Heidegger insists, it is not a definition of psychologism to say that it denies the universal validity of knowledge.⁴¹ The latter is at most a consequence of psychologism. What is important is that Brentano wants to ground logic in psychologism. The act of recognition as such is not of interest to logic. The recognition must be justified. And the justification must lie in what is recognized. When one judges $a > b$ (if $a = 5$ and $b = 3$), what is recognized is not the relation 'greater than', but that the relation 'holds good', its *Gelten*. This *Gelten*, 'holding good', subsists independently of anyone's recognition.⁴²

(d) Since Lipps' thinking underwent several major changes, he may be said to have held three different accounts of judgment. At first, he defines judgment as the consciousness of actuality (*Wirklichkeitsbewusstsein*), this consciousness being identified with a feeling of constraint (*Zwangsgefühl*). Next, he came to define judgment as consciousness of truth (*Wahrheitsbewusstsein*), where this consciousness is described as being constrained, in one's representation, by the represented objects (*im Vorstellen durch die vorgestellten Objekte genötigt zu sein*).⁴³ Finally, judgment comes to be defined as consciousness of an object (*Gegenstandsbewusstsein*), where 'object' is distinguished from 'content' in that a content is sensed or represented, while an object is thought or meant and *demand*s recognition. This demand or *Förderung* is a logical concept, as distinguished from the constraint or *Nötigung* (of the first two definitions) which is a psychological concept.

In Heidegger's view, Lipps' theory even in its final form remains psychological. Judgment is still an act, 'my' response to the experience of *Förderung*. The 'feeling of necessity' even in the alleged logical sense should be kept out of logic.

The dissertation concludes with certain general remarks which point to further reflections. First of all, psychologism cannot perhaps be logically refuted. One can at most exhibit the peculiar nature of logical entities. If a logical entity is a *Sinn*, a *thought* (as distinguished from the act of thinking), then the essence of this entity is to be found not in a *Vorstellung*, but rather in the fact that it *alone* can be *either* true or false. It is to this last theme that much of the Marburg lectures of the late twenties are devoted.

Of the other conclusions Heidegger arrives at, some are more viable than others. I have already referred to his insistence that even if the logical entity has to be sharply distinguished from the mental process, the two must be set in some satisfactory relation. This, I think, is important. Both Husserl and Heidegger recognize this need, but pursue it along different paths.

Besides these two general conclusions which suggest further enquiry, Heidegger also proceeds to establish some specific conclusions. He, in a way, reestablishes the subject, predicate and copula analysis, as against its critiques by Wundt, Maier, Lipps, and Brentano. A judgment such as 'a is equal to b' has to be construed as having 'a' and 'b' as subjects and 'being equal' as predicate (as against the grammatical analysis which suggests 'a' as the subject and 'is equal to b' as predicate). If the two-membered analysis holds good, then the copula is needed as a third component; it is just the relation between the two.⁴⁴ The copula, Heidegger admits, signifies not real existence, but mere validity (*Gelten*). It is in fact characterized as 'something eminently logical', the most essential and proper element in a judgment.⁴⁵

Logically more interesting is the next claim that the judgment relation has a certain irreversibility, a directionality, a *Richtungssinn*. Even in 'a = b', equality holds good of 'a' and 'b' (and not that 'a' and 'b' of equality). By this, Heidegger rules out the possibility of different analyses of the same proposition.

As to negative judgments, he expresses dissatisfaction with the view that negative judgments are to be understood as judgments with negative predicates and refuses to regard a negative copula as an *Unsinn*.⁴⁶ In fact, negation, he adds, belongs originally to the copula,⁴⁷ and the two judgments, affirmative and negative, should be logically placed side by side.⁴⁸

What about the impersonal judgment 'It rains'. The judgment, Heidegger insists, is not a naming judgment. It rather says, something *happens*, *takes place*, suddenly breaks in. The judgment, then, must be translated to 'Raining is actual', 'Of the raining, actuality holds good'. He adds that this translation is unable to capture what we mean. The true meaning rather is something like this: 'Of the raining, it holds good to take place now, the momentary existing.'⁴⁹

These are topics which have little influence on his subsequent concerns. So let me turn to his really continuing concern.

B Judgment as the locus of truth and falsity

(a) Preliminary determination. If judgment is not a representation or a connection of representations, if its logical essence does not lie in its being a mental act, then we have to look for its essence elsewhere. It is generally agreed upon that judgments alone can be true or false. Perhaps

it is here that we may be able to discern a clue to the nature of judgment, as also of logic. For logic alone deals with truth in general; the other sciences deal with truths.⁵⁰ And logic thinks about 'truth' only in connection with assertive sentences. Heidegger looks for some determination of the nature of such sentences, or of their meanings or propositions, which would account for *both* the possibility of being true *and* the possibility of being false.⁵¹ Contrast Heidegger's problem with Frege's. Frege's problem was such that he could solve it simply by positing two objects which assertive sentences could *name*: i.e., the True and the False. This strategy works for the limited purpose of providing a semantic interpretation of propositional logic, but it leaves the main issue untouched. Are sentences in fact names at all? If they are not,⁵² then what sort of structure must they (or their *senses*) have in order to be true *or* false?

The structure that Heidegger identifies is opposition: putting-together (*Zusammensetzen*) and separating (*Auseinandernehmen*). The former is the condition of the possibility of truth and the latter, the condition of the possibility of falsity. But this is only an initial answer, and not quite correct. Not all affirmative sentences – in which elements are put together – are true, just as not all negative sentences – in which elements are separated – are false. The structure that is to be the condition of the possibility of both truth and falsity should consist in both putting-together and separation, in both at once.⁵³ What we need is a structure that is not merely a thinking together of the two surface structures of synthesis and separation, but which, being a unitary structure, precedes both.⁵⁴ We cannot think of this structure – or even of putting-together and separation – as a purely linguistic structure of the sentence. In the false judgment 'The board is not black', the *words* are not more separated than in the true judgment 'The board is black'. Where then are we to look for this structure?

(b) 'Copula'. Perhaps it is in the 'is' of the copula. We have seen that Heidegger does not go all the way with many of his contemporary logicians of different persuasions in rejecting the copula from theory of judgment. On the other hand, the precise sense of the 'is' of the copula – as distinguished from the 'is' of assertion – deeply interests him. In fact, as late as *Sein und Zeit*, Heidegger writes that the ontological significance of the copula has been lost to modern logic.⁵⁵ Logic since Aristotle has understood the copula as the sign for a combination of *ideas*, a combination that does not occur among things, but only in thinking. But at the same time, the 'is' of the copula also signifies existence, essence (whatness), and truth or validity, in different contexts. (This ambiguity, we are assured,⁵⁶ is not a defect, but rather an expression of the intrinsically manifold structure of the being of an entity. This is a suggestion we need not try to understand for our present

purpose.) What we need to focus upon is: what unitary structure of synthesis-cum-separation is to be discerned by reflecting upon the nature of the copula?

I do not think Heidegger's logic lectures lead to any definitive answer to this question. But taking up hints from his writings, the following points may be singled out:

(i) In 'S is P', what is asserted is not bare identity, which would make it a tautology; nor is, for that matter, P different from S, which would have rendered the proposition necessarily false. There is thus a relation of identity-cum-difference.⁵⁷

(ii) But what sort of things are S and P? They are not *Vorstellungen*, that was the point of the critique of psychologism. They are not words for obvious reasons. Are they Fregean senses or are they things? (Frege admitted both possibilities, but kept them apart. The sentence 'S is P' expresses a thought that is composed of the senses of 'S' and 'is P'; but the sentence also has a reference that is composed of the referents of the component terms.) I think Heidegger's answer to this is much more complicated, and, if intelligible, profound.⁵⁸ *Logos*, in its totality, is a complex structure of words, meanings, the referent (what is thought) and what *is*. It is only when one separates them, that one seeks to tie them together by such relations as that of a sign to the signified. Verbal sound is not a sign for a meaning. Nor is the meaning a pointer to what is thought or to what is. There is an identity between these components,⁵⁹ an identity which yet shows the differences.

(iii) This last mentioned relational structure may be described as a structure of identity-cum-difference between thinking and being (where 'thinking' includes speaking, meaning and the meant, and 'being' includes being-as-referred, i.e., object and being as it is in itself). In judgment, thinking and being enter into a relationship. This makes it unacceptable to construe a judgment simply as a mental act directed towards a thought-content. Such a construal would set thought (as a timeless, abstract entity) apart from the world, and the act of thinking and expressing (as real, temporal events) from that thought. Thinking is not, as Frege would have it, grasping a thought, but thinking *about* a real being. I think one of the deep concerns Heidegger expresses in the Logic lectures is, how to articulate this *aboutness*, or intentionality of judgment.

With these three points (i)–(iii), we have already gotten some glimpse into the structure of judgment as involving both synthesis (identity, totality, involvement) and separation (difference, distinction). Traditional logic has not seen this interinvolvement of identity and difference, of thought and being, and on the basis of their absolute distinction, distinguishes between verbal and real propositions (Mill) or analytic and synthetic propositions (Kant). This latter sort of distinction has been questioned by many logicians in more recent times: by Quine, because no

satisfactory criterion of synonymy is forthcoming, and by F. H. Bradley, earlier than Quine, because every judgment, in so far as it analyzes the totality of immediate experience, is analytic, and, in so far as it seeks to join together what analysis has torn asunder, is synthetic. Heidegger's reason is different from both. The distinction between 'the view of beings that makes itself manifest in common meaning and understanding, as it is already laid down in every language', and 'the explicit apprehension and investigation of beings, whether in practice or in scientific enquiry' can hardly be maintained; one passes over into the other. In fact, the so-called verbal propositions, Heidegger insists, are but 'abbreviations of real propositions'.⁶⁰

We still have to understand, how it is possible for a judgment to be about an entity. For Frege, it is so because the component name names an object (and the predicate refers to a concept under which that object falls). Heidegger's question is, how is that possible? Is he asking about the possibility of judgmental intentionality? To that, and some other related questions, we shall turn in the following part.

3 Grounding of logic

(a) Possible Moves. There are various ways philosophers and logicians have sought to provide a 'grounding' or foundation for logic. Starting with a logic, the most common move on the part of logicians, is to axiomatize it. This procedure will yield an axiomatic foundation. This is the most you can expect a logician qua logician to do. But in doing so, he is still doing logic, perfecting his logic, not 'grounding' it in a sense in which philosophers have understood that task. Another move is to provide a logic with an ontological interpretation. In this case one starts with an uninterpreted system, and then assigns to symbols of appropriate types suitable entities belonging to appropriate types: such objects as singular entities and concepts, individual concepts, and propositions. One may thus admit various sorts of entities into one's ontology, or if one distrusts abstract entities, then he can use the semantics of possible worlds.

A more radical, and strictly philosophical grounding is called for when one asks about 'the conditions of the possibility' of logic. How are logical entities such as judgments possible? How is it that formal logic is able to legislate the formal structure of any object whatsoever? Or, what are the conditions of the possibility of the objective validity and not merely formal validity of logic?

Faced with such questions, one may follow one of three possible paths. One may look for the transcendental foundation of logic in the structure of (human) consciousness; one may look for it in the structure of the

world; or, finally, one may want to ground logic in man's intentional relationship with his world. The first is the path of Kant and Husserl, however different their conceptions of transcendental subjectivity, transcendental logic, and formal logic may be; the second is the path of platonistic metaphysics. Heidegger's path is the last one.

(b) Logic and Intentionality. In his habilitation work, Heidegger characterizes the nature of the logical thus: 'The homogeneity of the domain of logic rests on intentionality, on the character of being-valid-of [*Hingeltungscharakter*].' Also: 'Intentionality is the "regional category" of the logical domain.' He proceeds to explicate 'intentionality' thus: There can be intentionality only in the case of what has meaning and significance, not in the case of what is just real.⁶¹

It would appear, then, that we can get at the roots of logic by following the guiding threads of this logical intentionality. This is what Husserl does in *Formal and Transcendental Logic*. But intentionality, for Heidegger, is not self-explanatory. It needs a 'metaphysical' grounding, for which Heidegger argues throughout his writings. An intentional grounding of logic will show how the logical entities such as propositions, or the logical principles such as the principle of non-contradiction, are 'constituted' in appropriate intentional acts. It will also show, as Husserl does in *Experience and Judgment*, how higher order intentional acts and their objects are built up on more primitive intentionalities and their objects. It should be noted that all this will be carried out within the scope of the transcendental epoché. The classical Kantian way is different, but also shares the same overall orientation. Formal Logic has to be founded on transcendental logic, and transcendental logic lays bare the synthetic, world-constituting functions of the pure rational subject.

Once psychologism in philosophy of logic was rejected, two alternatives loomed large: the platonic hypostatization of the logical entities, and the Kantian-Husserlian thesis of 'constitution' which, for one thing, respects the ideality of those entities, and, for another, sharply distinguishes the transcendental subjectivity from the psychological. Heidegger looked for a third alternative. But, in fact, he tries two different paths, and all his life sought to bring them together. One of these I will call the *metaphysical*, the other may be called the *practical*. They are brought together in a *hermeneutic* thesis.

(c) Logic and Metaphysics. In the Logic lectures of 1928, called *The Metaphysical Foundations [Anfangsgründe] of Logic*, Heidegger forcefully argues for the thesis that logic must be grounded in metaphysics.⁶² Against such a thesis, there is a rather familiar objection which Heidegger considers at length. The objection is that since metaphysics involves thinking and since all thinking must conform to logic, indeed must presuppose logic, metaphysics must presuppose logic rather than the inverse thesis. Indeed, logic must precede all sciences.

According to Heidegger this argument has the advantage that it proceeds from quite general ideas of logic and metaphysics, without considering their specific problem – contents. There is also an ambiguity in the word ‘presupposition’. It is true that all thinking – prescientific, scientific as well as metaphysical – must make use of the formal rules of thinking. But *use* of the rules does not require a *science* of those rules, nor does it require a ‘founded’ knowledge of those rules. The fact of their use, as much as the unavoidability of their use for thinking, needs to be accounted for. For such an account, one has to think about the conditions of the possibility of science, about the relation of science to scientific thinking, and of such thinking to human existence; logic itself is a science, historically developed and so determined by a tradition. It therefore cannot be a presupposition of thinking.

The barely formal argument to the effect that every thinking grounding must involve thinking, cannot be formally refuted – Heidegger concedes.⁶³ But, he adds, it can be refuted only by showing how such an argument is possible and why, under certain presuppositions, it indeed is necessary. At this point Heidegger does not go on to show this. As far as I can see, his point would be something like this: pre-logical thinking which is in direct touch with being, thinking which, according to Heidegger’s later writings, is either practical wisdom or poetic, does not follow the rules of logic and so no question arises about logic being its presupposition. It is only propositional thinking that follows the rules of (propositional) logic. A putative metaphysical grounding may remain within the limits of propositional thinking; it then does appear to presuppose logic (allowing for the sort of equivocation of ‘presupposing’ which was hinted at earlier). Such a grounding then does not go to the roots of the matter. A metaphysical grounding which does go to the roots of the matter would think, but think in a different, more originary manner.

What is this more originary manner of thinking, and how could such thinking provide a grounding for logical thinking and for logic as well? To be able to understand Heidegger’s answers to these questions, we need to do some more spade work to prepare the ground.

(d) Logic as Metaphysics of Truth.⁶⁴ Judgments alone can be either true or false. This is because in judgment, thinking and being enter into a peculiar relation of identity-cum-difference. Judgment is ‘about’ a being, and of this being it asserts a true predicate. Let us look closer at this ‘being about’ and also at the copula, the sign of predication.

(i) The ‘being about’ or judgmental intentionality is possible, according to Heidegger, only because a being has already been disclosed prior to the judgment under consideration. A judgment does not first establish the relatedness to the entity-about-which. A judgment is first possible on the basis of an already available disclosure of the entity, and the disclosure of that entity takes place within the context of an already latent

relatedness to or *Schon-sein-bei* beings. A judgment is true if its content is in agreement with the already disclosed object-about-which. The metaphysical here is the disclosure of being as a being, a disclosure without which judgment cannot substantiate its truth claim and would not be, qua judgment, possible. Thus judgmental intentionality presupposes a prejudgmental manifestation of being. We need not have to understand this thesis in any weird and mystic sounding sense. The best way to understand Heidegger, at this point, is to take his thesis as exemplified in the familiar case of perceptual judgments. A perceptual judgment 'This pen is blue' is possible inasmuch as the object-about-which, this pen, is already disclosed in perceptual experience, as lying there before me. It is important that we do not construe this perceptual disclosure itself as a judgment. What this disclosure is like, I will briefly touch upon later, but only in so far as that is necessary for my present exposition.

(ii) Predication likewise is founded upon display.⁶⁵ In predicating, what is disclosed is analyzed into one of its constituent moments, and this separated moment is exhibited as *belonging to* the entity disclosed. Predication determines an entity as being such and such, but the determination is founded on exhibition and separation. This shows why every judgment is both analytic and synthetic at once. The copula signifies the 'togetherness', the 'belonging-together', that 'unifying gathering' which belongs to our very concept of being as the *world*.

(iii) If the foregoing makes sense, then it makes sense to say that although truth in the sense of adequacy or correspondence has its locus in judgment, truth in the sense of disclosedness of being is prior to judgment. If this latter sense of 'truth' be called ontological, then logic is grounded in ontology. Hence Heidegger's enigmatic statement: 'Der Satz ist nicht das, darin Wahrheit erst möglich wird, sondern umgekehrt, der Satz ist erst in der Wahrheit möglich. . . . Satz ist nicht der Ort der Wahrheit, sondern Wahrheit der Ort des Satzes.'⁶⁶

We thus find that when Heidegger claims to ground logic in metaphysics he should be understood in a sense that takes into account the above mentioned three points. He should not be construed as grounding logic either in the structure of the subject or in the structure of the world.

(d) Logic and Practical Wisdom. Logic, we have seen, deals with meanings. With the rejection of psychologism, one is tempted to look upon meanings as eternally subsistent entities. At no stage of his thinking was Heidegger satisfied with such a hypostatization of meanings. The habilitation work ends with the 'metaphysical' suggestion that the opposition between real mental life and ideal meanings, between *Sein* and *Sollen*, be overcome in a more fundamental concept of living *Geist*.⁶⁷ The Logic lecture of 1925/6 suggests that although the primacy of theoretical truth in logic is not accidental, it is possible to show that a more

radical stance of questioning may lead to a revision of this naive point of departure of logic.⁶⁸ In fact, not formal logic but philosophical logic has to settle the question, which truth – theoretical or practical – is primary. Heidegger opts for the primacy of the practical.

To demonstrate this thesis of the primacy of the practical is to argue successfully that the meanings logic is concerned with, propositional meanings and their constituents, are *not* the meanings originally experienced along with that disclosure of being which is presupposed by judgment. The word, as *fixed* and stabilized for purposes of logical thinking, presupposes a pre-logical experience of being as meaningful. This latter sort of meaningfulness is tied to the way we live in our world and concern ourselves – practically and affectively – with things and situations. Things acquire their original significance (*Bedeutung*) from what we have got to do with them, from *Zutunhaben*. A pencil is meant for writing, a hammer for driving nails, and so on and so forth. Original practical judgments express such a significance of things: they do not ascribe properties to a thing. They are about my (actual or possible) relations to a thing.⁶⁹

It may be objected that this sort of practical and affective significance belongs only to tools and artifacts: pens and pencils, houses and automobiles, hammers and clocks, but not to natural objects such as rocks and mountains, rivers and trees, and animals and other persons. I think Heidegger's point is that in so far as these and other natural objects inhabit my *Lebenswelt* and not the world of physics, they fall within the horizon of my interests, passions, and possible actions directed at them. They are not mere objects of cognition. The logic of judgment is founded upon the prelogical disclosure of things as having the sort of practical significance that they have within our *Lebenswelt*. To say this, however, is not to *show* how apophantic judgment arises out of the practical. It would be the task of hermeneutic logic to show that. Heidegger has not himself done hermeneutic logic; some others have, and we need to turn to them. But before doing that we need to be clear about how the practical wisdom which recognizes for each object and situation its practical significance could be characterized as being hermeneutic.

(e) Logic and Hermeneutics. It was said earlier that Heidegger tried, all his life, to bring together two different groundings of logic; the metaphysical and the practical, and that they were to be unified under the concept of hermeneutics. We now need to ascertain how this is done. The connecting link is provided by two theses: (i) that action is a mode of understanding the world and involves a certain self-understanding on the part of the agent; and (ii) that the originary disclosure of entities which must precede judgmental 'being about' is not disclosure to a cognitive subject, to an objectivating consciousness, but rather to a projecting, caring, and acting being whose mode of being is to be in the world and to-be-already-with-entities. Being-in-the-world is to be interpreted as a

certain comprehension or understanding of oneself and one's world. Thus both practice and disclosure of entities involve a certain pre-conceptual understanding of oneself and one's world. To articulate and explicate this understanding is hermeneutics. If logic is grounded in a disclosure of being, and if logical meanings refer back to pre-logical significance, one can as well say that logic is ultimately rooted in a certain understanding of the world as well as of oneself.

The same thesis may be supported in a slightly different manner. Judging is an intentional relation to a being. But every intentional relation carries within itself a *specific understanding* of the being of the entity to which the intentionality relates. If judging presupposes a prior disclosure of that entity, it also requires a specific interpretation of it *as* such and such.

With this we are in a position to briefly consider Heidegger's thesis on logic as laid down in §33 of *Sein und Zeit* bearing the title: 'Die Aussage als abkünftiger Modus der Auslegung.' In this paragraph, Heidegger first distinguishes between three meanings of 'Aussage'; all three together constitute the full structure of *Aussage*. First of all, 'Aussage' primarily means manifesting an entity as it is. In 'The hammer is too heavy', the hammer itself, but not its representation, is manifested in the manner it is at hand. Secondly, *Aussage* also means predication. This sense is grounded in the first. Both the terms of predication, the subject and the predicate, belong to what has been manifested. Predication itself does not uncover anything but rather limits what has been uncovered to the subject, i.e., the hammer. Finally, *Aussage* also means 'communication', to let the entity be seen together with an other. What is stated can be shared, can be stated again. Taking these three meanings together, an *Aussage* may be characterized as 'communicating and determining, making manifest'. But how then is it also a mode of interpretation? The making-manifest that takes place in and through an *Aussage*, is possible only on the basis of what is already disclosed to understanding. It is not a worldless, transcendental ego who performs an *Aussage*. It is rather a *Dasein* who is a being-in-the-world and as such always has a certain pre-understanding of the world, who makes a judgment. The existential fore-structures of understanding, which together constitute its anticipatory structure, form the horizon within which any judgment is possible. In this sense the judgment of logic is founded upon the hermeneutic of *Dasein*.

Heidegger has still to give an account of how the entity with which one is practically concerned (the hammer as a tool for driving a nail here and now) *becomes* an object about which one pronounces a theoretical judgment. Obviously, if Heidegger's thesis is correct, the *Zuhandene Womit des Zutunhabens* has to be transformed into the '*Worüber*' der *aufzeigenden Aussage*. What transpires in this transformation? Something

whose mode of being is to-be-ready-at-hand becomes an object that is present-at-hand, merely *vorhanden*. The original 'as', which was a hermeneutic 'as' (recognizing a hammer as what is just right for my purpose) for practical wisdom, becomes a mere apophantic 'as' (*judging* this object over there to be a hammer) which determines the object as possessing a certain property. The logic of *theoretical* judgments is committed to an ontology of objects present at hand.

In an important, but not much commented upon paragraph, Heidegger concedes that between these two extremes, there are many intermediate phases, represented by judgments about happenings in the surrounding world, accounts of situations, depictions of events, etc. These intermediate cases, though expressed in linguistic sentences, cannot be reduced to theoretical statements, but rather refer back to their origin in the pre-conceptual interpretation of the world.

What now has become of the concept of meaning or *Sinn* which was earlier used to define the domain of logic? This concept of *Sinn* is to be traced back to its origin in another, more ordinary concept of *Sinn* which Heidegger formulates with some precision in §65 of *Sein und Zeit*: 'Danach ist Sinn das, worin sich die Verstehbarkeit von etwas hält, ohne daß es selbst ausdrücklich und thematisch in den Blick kommt. Sinn bedeutet das Woraufhin des primären Entwurfs, aus dem her etwas als das, was es ist in seiner Möglichkeit begriffen werden kann.' *Sinn* is that towards which the ordinary project of being-in-the-world is directed. To understand the *Sinn* of a thing (not of a word, in this case) is to grasp, unthematically, the possibility that the thing presents in the context of the prevailing project.

(f) Hermeneutic Logic. It is one thing to claim that formal logic is rooted in a hermeneutic experience of being-in-the-world. It is quite another thing to work out in detail the idea of a hermeneutic logic. Without such a logic, the Heideggerian thesis would remain empty of content, for not only logic but all theoretical cognition, on that thesis, would have the same 'origin'. With such a logic, the thesis receives specific content, but loses some of its ontological grandeur, for now formal logic will be traced back to another kind of logic, but we would still be within the field of logic, which thereby would receive an extension beyond the formal-theoretical.

Even if Heidegger does not give us sketches of such a logic, luckily we have excellent attempts in that direction. This is not the place to review those attempts, but it surely is appropriate that we briefly recall the more noteworthy amongst them. First of all, Husserl himself, in *Experience and Judgment*, extended the domain of logic to pre-predicative experience, and showed how truth-functional operators such as negation, disjunction and implication have their origin in pre-predicative experience. Husserl's thesis may be regarded as still being cognitive in

nature, the pre-predicative experience is construed not as active or affective dealing with entities, but rather as modes of receptivity and various modes of responses to what is received. In this sense, Husserl's pre-predicative logic does not come under the rubric 'hermeneutic logic'.

The most striking development of hermeneutic logic, developed in close contact with both Husserl and Heidegger, is to be found in the works of Hans Lipps.⁷⁰ If formal logic deals with logical entities which claim to be self-subsistent essences, and appear to have no connection with the living situations of everyday life, what Lipps does is to comprehend precisely the entities and structures of logic as arising out of human life, i.e., to bring out how they originally have the function of accomplishing quite specific roles in quite specific linguistic situations of everyday life. Thus judgment (*Urteil*) in its origin is not a statement, but an action by which a yet-to-be-decided question is finally decided, as in legal judgment. The concepts of traditional logic, according to Lipps, are quite different from the concepts of originary, practical thinking. To comprehend things, in practical life, is to come to terms with things, to know what to do with them, as in overcoming an opposition. Concepts in this sense are not definable, they can only be illustrated by examples. The same sort of distinction is made in the case of inference. In practical life one infers, not from premises, but from circumstances, situations, facts. *Proof* becomes necessary in a situation of conversation, when something has to be demonstrated for the other. An interesting development of the idea of pre-logical conception is Lipps' distinction between 'practical' and 'intuitive' (*sichtenden*) conceptions. Neither needs language, but both may function in a linguistic medium. The practical conception operates in knowing *how*; the intuitive conception operates in one's mastery over a wide range of diverse material without yet subsuming it under a common logical concept.

Meanings of words are, for theoretical logic, precise and fixed entities. In practical life, meanings cannot be fixed with precision. (Lipps elaborates on the Wittgensteinian example: the word 'game'.) This imprecision is not a deficiency; it is rather a strength. The words derive their meanings not autonomously, but in connection with situations in which they are uttered. This leads Lipps to consider various kinds of words and the great variety of situations that call forth appropriate utterances.

Josef König studied with Husserl, but subsequently attended Heidegger's Marburg lectures, and sought to appropriate their methodologies into a basically Dilthey-oriented position. I would here mention only a few of his important distinctions: (i) In his *Sein und Denken*⁷¹ König distinguishes between the merely present (*vorhanden*) thing and the thing as so-working (*so-Wirkende*). The former is not an original subject of predication, but is rather a transformation of a judgment of the form 'X is present'. The true subject of a statement about something present is

not this something present, but rather the X of sentences of the sort 'X is present'. But the latter, i.e., the so-working, or an entity that is not the merely present, is the original entity. The subject of so-working is *nothing but* a so-working being (a pleasing smile is a smile that so works on us; a sublime mountain is one which so works on us). Its being (*Sein*) is to be so-working.

(ii) König also distinguishes between a practical 'this' and a theoretical 'this'.⁷² The theoretical *this* is a *this* of such and such kind: for example, 'under this circumstance' = 'under *such* circumstance'; this man = a man such as this. As contrasted with this, a practical *this* is a pure this. For example, What is *this* that lies there on the table? A practical this is the merely existing reality. The practical this belongs to someone's world; it is hardly compatible with the thought of a closed system or with a world-totality as *Vorhanden*.

(iii) Another of König's related distinctions is that between practical cause and theoretical cause.⁷³ The former answers a practical 'why' question and the latter a theoretical question. A practical 'why' question is: 'Why does this ball start moving?' A theoretical 'why' question is 'Why do balls that receive an impact start moving?' The former is answered by giving another event as the efficient cause. The latter requires a ground in a general theoretical implication.

(iv) All these lead him finally to a distinction that is of direct significance for logic: that between practical sentences and 'theoretical sentences'.⁷⁴ A theoretical sentence (or proposition) can be rightly seen as built out of a sentential (or, propositional) function 'x is F' either by replacing 'x' by a constant 'A', or by quantifying over x (Some x is F; All x is F). A practical sentence, according to König, cannot be so construed without doing violence to its meaning and its role. The subject of a practical sentence is a practical 'this' or 'that'. The sentence, 'That is my friend Karl' cannot be regarded as having been built out of a sentential function 'x is my friend Karl'.

König's valuable, carefully developed, but incomplete researches shall constitute a necessary part of any satisfactory hermeneutic logic.

Lastly, I should mention the more well known and more recent attempt of Paul Lorenzen.⁷⁵ Lorenzen develops a systematic constructive procedure for building up formal logical concepts and operations from simple practical situations (such as one in which one person gives an order which the other obeys or does not obey; or one in which two are engaged in a game; or dialogical situations in which there is a proponent and an opponent). Lorenzen, interestingly enough, sees his task as having been made possible only after Dilthey and Frege.⁷⁶

One may want to say that these attempts fulfill the intention implicit in Heidegger's thinking about formal logic, in a more constructive and fruitful manner.

4 Critical remarks

But what to say about Heidegger's own foundational thoughts? To recapitulate what has already been pointed out, these thoughts are mainly five:

First, formal logic, *historically*, was possible within a metaphysical system (the Platonic), and can be possible only within a metaphysics. *Secondly*, formal logic is committed to an ontology of objects whose mode of being is to be present at hand (*Vorhandensein*).

Thirdly, (in spite of the above) philosophical reflection on the copula yields an insight into the identity-cum-difference, and the togetherness of differentiated elements that belongs to the *meaning* of Being.

Fourthly, judgmental being-about presupposes a prior pre-judgmental disclosure of an entity, which disclosure takes place within the context of Dasein's already-being-with the others.

Fifthly, judgmental *Sinn*, as also logical-theoretical meaning of words, refers back to a practical understanding of the significance of things in relation to human projects, i.e., in the context of the totality of life situations.

The final evaluation of formal logic would be somewhat as follows: formal logic has its own range of validity, no doubt, but philosophy should replace its naiveté by reflecting on its sense and its 'origin'. This will require a philosophical logic which is double-pronged: at once ontological and hermeneutic. Modern mathematical logic is degenerate formal logic, for whatever hermeneutic and ontological glimpses the traditional formal logic permitted is, or at least appears to have been, totally lost to mathematical logic, whose main blunder consists in confusing between a science of quantity and a science of intentionality and which is, historically speaking, possible only in an epoch for which the meaning of Being is understood through technology.⁷⁷

With regard to these thoughts, I would like to submit the following critical and, certainly, tentative reflections.

1. The historical judgment appears to me to be sound, namely, that formal logic arose within the Platonic metaphysics. One needed, to begin with, a doctrine of objective ideas and propositions. But the history of logic shows that logic has tried to free itself from that Platonic origin. Propositions have been replaced by sentences (even if they are 'eternal sentences'), concepts by words (even if they are type words, not tokens), and so on and so forth. To what extent, then, must we say that formal logic unavoidably presupposes a metaphysics (i.e., a theory of Being) and an ontology (a position as to what sorts of entities to admit)? My own view is that although formal logicians have sought to court a nominalistic

ontology, that just has not worked. (See how sentences have become eternal sentences.) The logical relations and structures need abstract entities to hold good of, so some sort of Platonism is 'the original sin' of formal logic. But these Platonic entities are of the genre of meanings, Fregean *Sinne* or Husserlian *noemata*. A certain theory of meaning, and its attendant ontology may well be regarded as the minimum commitment of formal logic. No other ontology of *Vorhandensein* is presupposed. Events and happenings, situations and circumstances, tools and gadgets, can all be referents of 'objects-about-which' of *propositions* that are subjected to logical operations.

2. It is not clear how much ontological burden can be carried by the copula. Heidegger's multifarious attempts to extract out of it insights into the meaning of 'Being' have been far from successful. By saying that 'Being' involves identity-cum-difference or the togetherness of distincts, is not to say much that could not be divined by simple metaphysical speculation independently of the guidance of the copula.

3. The thesis of the pre-logical, pre-predicative disclosure is important, and its validity recognized. I should add that this thesis derives its strength from the case of perceptual judgments such as 'This pencil is blue'. But not all judgments are perceptual, and not all disclosure is prior to judgment. In a judgment about electrons, one does not have a pre-theoretical disclosure of the object-about-which: in verifying such a judgment, the disclosure comes *afterwards* as the 'fulfillment' of the meaning intention of an originally empty judgment. The thesis of *prior* disclosure, then, may be saved by liberalizing the sense of 'disclosure' and at the same time by relativizing it to the context of a judging.

4. With regard to perceptual judgments about persons and material objects, it is true that originary disclosure is not a theoretical-cognitive mode of givenness, but rather practical and affective.⁷⁸ This alone justifies Heidegger's basing apophansis on hermeneutics. However, even if one does work out a hermeneutic logic in the manner of Lipps, König, and Lorenzen, one still needs to show how apophantic logic develops out of hermeneutic logic. Lorenzen's is the best attempt to show this, but it works for elementary truth functions, and even there a certain *discontinuity* between the primitive hermeneutic situation and the formal-logical is either slurred over or eliminated by choosing the former at a level that is not originary-practical, but rather primitively theoretical.

5. Heidegger is right, to my mind, in looking upon Husserl's anti-psychologism critique as a provisional, though indispensable step. In fact, Husserl himself treated it likewise. The gap between real mental life and ideal meanings has to be bridged. Transcendental philosophy and hermeneutics are two ways of doing this. Their relative strength has to be measured, among other things, by the extent to which each is capable of accounting for the ideality of logical meanings. For hermeneutics, the

question is: How do the practical-hermeneutic meanings of things get 'transformed' into the theoretical-logical meanings of words and sentences?

78 I have argued for this in my *Phenomenology and Ontology* (The Hague: M. Nijhoff, 1970).

The essence of transcendence

Christopher Macann

The concept of transcendence plays a pivotal role in Heidegger's first philosophy. The text which addresses the issue of transcendence most directly is undoubtedly *Vom Wesen des Grundes*. But, in a footnote immediately preceding the third part of this text from 1930, Heidegger tells us that what has already been published from his investigation into *Being and Time* takes as its task 'nothing other than a concretely disclosive projection of transcendence' (§12–§83; esp. §69).¹ Not only in *Being and Time* but also in the Kant book and in a number of other publications written about the same time (*Was ist Metaphysik?*, *Vom Wesen der Wahrheit*), the concept of transcendence figures largely and is developed in relation to the question of being. However, unlike such issues as that of Space, Time, Existence, World and so on, the concept of transcendence has something of a meta-theoretical character and this in a double sense. First, the concept of transcendence is as much a *methodological* as it is an *ontological* concept, in the sense that it deals with the *procedure* to be adopted to make possible a disclosure of ontological structures. Second, Heidegger's own concept of transcendence owes its historical origin to transcendental philosophy, in the sense that Heidegger sought to offer an ontological alternative to the transcendental theory of transcendence, and this again in a double sense, Kantian as well as Husserlian.

It will be our ultimate objective in this paper to distinguish, in Heidegger's thinking about transcendence, between what might be called a *progressive* and a *regressive* theory of transcendence. In a provisional way, the progressive theory can be defined as a transcending of *Dasein* toward the world or toward entities encountered in the world, the regressive as the transcending of beings toward their being. Strictly speaking, and particularly in the light of the historical sources of the theory of transcendence, these two sides to the theory of transcendence should stand in a complementary relation. But the tendency to disconnect the

two sides and, furthermore, to rely largely upon the regressive interpretation of transcendence takes Heidegger's thinking in a direction where it is no longer able to play a *foundational* role and so, indirectly, accounts for the disappearance of *Dasein* after the *Kehre*.

We will begin by considering the transcendental sources of Heidegger's idea of transcendence, go on to examine the connection between this concept of transcendence and that of being (section 2), the ground (section 3) and truth (section 4), before finally formulating our own conclusions on the subject.

The transcendental sources of Heidegger's theory of transcendence

Although references to the concept of transcendence are to be found throughout *Being and Time*, and although a specific section of the second part (§69) is devoted to 'the Temporality of being-in-the-world and the problem of the transcendence of the world', the references in question either rely upon an unclarified concept of transcendence or else they assume the form of a critique of the transcendental theory of transcendence. No doubt it was his own recognition of the need for further clarification which led Heidegger to his later, explicit, analysis of the concept of transcendence in *Vom Wesen des Grundes*. But precisely because there is nothing like an explicit theory of transcendence in *Being and Time*, his references stand in an essential dependence upon their historical source in transcendental philosophy. 'Being is the transcends pure and simple', he tells us in his Introduction, and then goes on to explain: 'Every disclosure of being as the *transcendens* is *transcendental* knowledge. *Phenomenological truth (the disclosedness of being) is veritatis transcendentalis*.'²

In the next work to be published after *Being and Time*, Heidegger makes extensive use of the concept of transcendence. But his use of this concept is peculiar in that, in name at least, the concept of transcendence (as opposed to that of the transcendental, or the transcendent) is not to be found in Kant's Critical philosophy. In making the concept of transcendence central to his Kant interpretation, he therefore really first imports the Husserlian concept of transcendence into his understanding of Kant's transcendental philosophy and then gives the latter an ontological twist. Let us follow up this detour for a moment.

Husserl's theory of transcendence is most explicitly set out in the text *The Idea of Phenomenology*. For instance, in the third lecture we are told that 'transcendence is both the initial and the central problem of the critique of cognition'.³ But, as Husserl points out in his second lecture, the concept of transcendence is ambiguous. It is for this reason that Husserl comes up with two conceptions of transcendence and that

his analysis proceeds from a preliminary, pre-critical, and to this extent still naive, concept of transcendence to a conclusive, more comprehensive and therefore more developed, concept of the same structure.

The first and preliminary concept is based upon the (intentional) act-object distinction. 'The genuinely immanent [*reell Immanente*] is taken as the indubitable just on account of the fact that it presents nothing else, "points" to nothing "outside" itself, for what is here intended is fully and adequately given in itself.'⁴ This concept of the actually or, as it is translated genuinely⁵ (*reel*) immanent brings with it its own complementary concept of the transcendent. Whatever exists in some way other than that of being an actual item of consciousness is transcendent and is, as such, excluded from the sphere of immanence. It is this limitative concept of immanence which poses the *problem* of transcendence in the most acute form.

The cognition belonging to the objective sciences, the natural sciences and the sciences of culture [*Geisteswissenschaften*] and on closer inspection also the mathematical sciences, is transcendent. Involved in the objective sciences is the *doubtfulness of transcendence*, the question: How can cognition reach beyond itself? How can it reach a being that is not to be found within the confines of consciousness?⁶

Qua actual lived experiences (*reelle Erlebnisse*) the *cogitatio* are singular existences. In so far as they are individual, transitory, irrepeatable, they belong to the act side of consciousness and are, in consequence, resistant to analysis. But, with the sole exception of hyletic data, *Erlebnisse* are directed toward, and in this sense intend, an object. Admittedly, the object intended is not, and cannot be, a real (*real*) transcendent object. But, for all that, the relation to an object does belong to the cognitive act. Cognition is concerned not merely with the actually (*reell*) immanent but also with what is immanent in the intentional sense – and this in a twofold way. Not only must the analysis focus upon the intentionality of consciousness, it must also take account of the 'what' that is intended. For, as a direct result of the reduction, this 'what' can be seen to display an essential structure. *Erlebnisse* are singular existences. Essences, on the other hand, are general structures which, as such, already transcend the consciousness in which they present themselves. At the same time, essences can only be given as the objective correlates of *Erlebnisse*, and so are also characterized by immediate or absolute self-givenness. From which Husserl concludes that it can no longer be taken for granted that

the *absolutely given* and the *actually immanent* are one and the same. For that which is universal is absolutely given but is not actually

immanent. . . . *The universal itself* which is given in evidence [*Evidenz*] within the stream of consciousness is nothing singular but just a universal, and in the actual [*reellen*] sense it is transcendent.⁷

Consequently, the concept of the *reell Immanent* turns out to be only a limiting case of a much wider concept of immanence. 'It makes clear to us in the first place that *actual (reell) immanence* (and the same is true of transcendence) is but a special case of the *broader concept of immanence as such*.'⁸ From this it follows that absolute or immediate self-givenness is no longer an adequate criterion of immanence. Rather, absolute self-givenness has now to be supplemented by the more fruitful criterion of evidence. Second, this wider concept of immanence has now to include what Husserl himself is ready to call '*reell Transzendenz*'.

And so we are brought to acknowledge the ambiguity of the concept of transcendence. In the first sense, immanent refers to the mental process itself and excludes whatever does not belong to the act side of consciousness. Immanent here means the actually (*reell*) immanent in the cognitive process. Husserl goes on: 'But there is still another transcendence whose opposite is an altogether different immanence, namely, absolute and clear givenness, self-givenness in the absolute sense.'⁹ In relation to this concept of immanence only that cognition which is not evidently given has to be excluded as transcendent.

In *Ideas!* this broader concept of transcendence is further developed with reference to noetico-noematic structures. From the more comprehensive standpoint of transcendence as absolute self-givenness, the *noema* can be seen to belong within the sphere of immanence. In order to avoid the problem of a duplication of reality, Husserl introduces a notion of the transcendental object = *x* which, as it were, stands on the boundary between the immanent and the transcendent and so helps to solve the enigma of an independent reality which nevertheless must draw its very meaning from consciousness itself.

Thus it remains as a result that the Eidos True-Being is correlatively equivalent to the Eidos Adequately given-Being and Being that can be posited as self-evident; and this, moreover, in the sense either of finite givenness or of givenness in the form of an Idea. In the one case, Being is 'immanent' Being, Being as a completed experience or noematic correlate of experience; in the other case, it is transcendent Being, i.e., Being whose 'transcendence' rests precisely in the infinitude of the noematic correlate which it demands as ontical material.¹⁰

The ultimate objective of the Husserlian programme is then to recover the very transcendent reality with respect to which the reduction first effected its suspension but in such a way that the meaning 'objective

reality' is now no longer taken for granted but set out in terms of a priori rules, rules which sanction and sustain the reasonableness of the objective affirmations to which they attest. It is this phenomenological concept of transcendence which Heidegger has in mind when he undertakes his interpretation of Kant.

In the very first introductory section of his Kant book, Heidegger makes known the central importance of the concept of transcendence. 'If truth pertains to the essence of knowledge, the transcendental problem of the intrinsic possibility of *a priori* synthetic knowledge becomes the question of the essence of the truth of ontological transcendence.'¹¹ Here we see the double bias of Heidegger's interpretation clearly articulated; on the one hand, the identification of transcendental philosophy with ontology, on the other, the importation into the Critical philosophy of a structure drawn from Husserlian transcendental phenomenology. This latter bias is even more evident in a passage a few lines earlier where Heidegger seeks to interpret Kant's statement to the effect that transcendental knowledge is knowledge occupied not so much with objects as with the mode of our knowledge of objects in so far as this mode of knowledge is to be possible a priori. He comments:

Thus, transcendental knowledge does not investigate the essent itself but the possibility of the precursory comprehension of the being of the essent. It concerns reason's passing beyond (transcendence) to the essent so that experience can be rendered adequate to the latter as its possible object.¹²

This use of the term transcendence in connection with Kant is at first sight surprising. For, in name at least, that term does not occur in the *Critique of Pure Reason* and certainly not in the form in which Heidegger wants to understand it. In the *Critique* we do find several sets of oppositions which imply a reference to transcendence (or at least which contain the etymological stem 'trans'), the opposition of the *transcendental* and the *empirical*, the *transcendental* and the *formal*, the *transcendent* and the *immanent*. In fact however, none of these contrasts are at issue in those passages in which Heidegger talks quite explicitly of the concept of transcendence in connection with the Critical project. For example, in §16 entitled 'The explication of the transcendence of finite reason as the basic purpose of the transcendental deduction', perhaps the section in which the theme of transcendence is most obviously at issue, Heidegger's concern is with an investigation of the act of objectification in so far as it is proposed in advance of any actual experience. Hence in the next section (§17) he is able to say that 'the intrinsic possibility of ontological knowledge is nothing other than the revelation of transcendence'.¹³ Again, in §25, we are told: 'Ontological knowledge has proved to be

that which forms transcendence.¹⁴ And this affirmation is then confirmed by way of an interpretation of the transcendental object = x as the unthematic horizon which is held open in advance and in such a way that an object can be encountered in the first place.

Here the Husserlian influence is only too apparent, not merely in the concept of horizon, but also in the way in which the movement of transcendence is itself characterized. The empirical reception of the object implies a movement from the world to *Dasein*. But the precursory holding open of the horizon implies an opposite movement from *Dasein* to the world, i.e., transcendence in the sense of a precursory passing beyond toward. . . . Hence the conclusion:

ontological knowledge 'forms' transcendence, and this formation is nothing other than the holding open of the horizon within which the Being of the essence is perceptible in advance. Provided that truth means: the unconcealment of . . . then transcendence is original truth.¹⁵

This connection of truth and transcendence is then further specified: 'If ontological knowledge discloses the horizon, its truth lies in letting the essent be encountered within this horizon.'¹⁶

Though the concept of transcendence is not to be found, as such, in the *Critique*, we do find two sets of distinctions which make much the same point as that made by Heidegger's (Husserlian) conception of transcendence. These two sets of distinctions are: 'analytic' and 'synthetic' methods, on the one hand and, 'progressive' and 'regressive' procedures, on the other. It should also be noted that both these distinctions are also supported by a further distinction between an Objective (regressive-analytic) and a Subjective (progressive-synthetic) Deduction.¹⁷ As is well known, the *Subjective* Deduction is the one primarily relied upon in the A edition while the B edition makes more use of the *Objective* Deduction. So there are two points to note. First, the analytic method goes with the regressive and the synthetic with the progressive procedure. Second, the two sets of terms are entirely complementary. More specifically, Kant tells us that analysis (separation) presupposes synthesis (combination)¹⁸ even though the investigation of the synthetic operations in question might never be possible without a prior analysis, if only because the analytic regression takes its start in what is already familiar, as given, and inquires back into the conditions of its possibility, which conditions can then be hypothesized as principles from which the given can be deduced.

Despite the duality in the Kantian method, the use Heidegger makes of his concept of transcendence in the Kant book relies almost entirely upon the progressive, synthetic method. It is for this reason that he bases

his interpretation largely upon the A (Subjective) edition of the Deduction (which adopts the progressive procedure) rather than the B (Objective) edition (which adopts a regressive procedure), to the point indeed of talking about 'Kant's Recoil' (from the insights of the A edition). This Recoil is attributed primarily to Kant's inability to comprehend the fundamental role of the imagination which, of course, Heidegger interprets as the faculty primarily responsible for creating that free-space (*Spielraum*) within which alone something can take up a position 'over against'.

We shall take over from Kant this distinction between a progressive and a regressive procedure and we shall try to show that Heidegger's thinking about transcendence takes two distinct forms, according as to whether the regressive or the progressive side predominates. However, we shall see that Heidegger not only fails to maintain the essential complementarity of the two, he tends more and more to privilege the regressive at the expense of the progressive – with all the consequences that follow therefrom.

The progressive, and therefore foundational, concept of transcendence proves, in the end, too Husserlian for Heidegger. For, it leads on in the direction of a grounding analysis the purpose of which it is to show how objects arise on the basis of a more fundamental involvement of *Dasein* in the world. This is the kind of analysis attempted by Husserl in his so-called genetic phenomenology, and it is the same kind of analysis which is employed by Merleau-Ponty. But it is a kind of analysis from which Heidegger withdrew, on the grounds that it represented nothing more than an extension of that traditional metaphysics which had to be overcome.

In one sense, the progressive and the regressive employment of the concept of transcendence stand opposed to each other. The one takes its stand in the ontological realm and then, on this basis, seeks to show how ontic knowledge thereby becomes possible. The other takes its stand in the ontic realm and, then, on this basis, seeks to bring out the necessity for a regression to the ground. In *Being and Time* the two procedures still remain more or less complementary. But in *Wesen des Grundes* the emphasis is deliberately displaced – away from the progressive and toward the regressive procedure. This in turn leads eventually to the disappearance of *Dasein* as a fundamental concept and to the opening up of a new way of thinking which takes Being as its theme.

Thus the concept of transcendence (which really only features in the first philosophy) not only serves to tie up many of the elements of Heidegger's thinking in this first period of his intellectual development, it also provides a clue to the further development of his thinking.

Being and transcendence

In *Being and Time* Heidegger makes extensive use of the concept of transcendence, but without ever working out the explicit meaning of this critical concept. This is clear both from the ambiguity with which the concept is articulated and the persistent tendency to refer this concept back to its transcendental origin. For both these reasons however, the progressive and the regressive employment of the concept tend to be linked up with each other.

Where Heidegger does not merely take over the transcendental concept of transcendence he undertakes something in the way of a critique of the traditional concept. In §13, Heidegger points out the inadequacy of any theory of knowledge which tries to explain how the subject gets out of a self-enclosed sphere of immanence to achieve transcendence. The reference to a sphere of immanence is already enough to indicate that it is Husserl whom Heidegger has in mind since, in the Heideggerian framework, there is no place for a concept of immanence. 'The scandal of philosophy' he tells us in the section (§43) devoted to the problem of reality, this time with an implicit reference to Kant, 'is not that this proof (of the existence of an external world) has yet to be given, but that such proofs are expected and attempted again and again.'¹⁹ Obviously, if, as Heidegger insists, being-in-the-world is a fundamental way of being of *Dasein* then, in a certain sense, there can be no *problem* of transcendence, since the very constitution of *Dasein*, as self transcending, 'solves' the problem before it can even arise. *Dasein* always is already *there* where it is supposedly problematic that it should be, namely, alongside entities in the world.

It is really only in connection with time, in the second part of the work, and especially in §69, that Heidegger begins to develop a theory of his own. Having established Care as the unity of being in the world, Heidegger then goes on to explore the temporalization of Care and in so doing encounters the problem of transcendence. 'If the thematizing of the present at hand – the scientific projection of nature – is to become possible, *Dasein* must transcend the entities thematized. Transcendence does not consist in objectifying but is presupposed by it.'²⁰ Here the implication is regressive rather than progressive. The presupposition in question refers, of course, to the Kantian procedure whereby philosophical thinking starts from the objective to inquire into the conditions of its possibility. But Heidegger seems to forget that the analytic-regressive movement is complemented, in Kant, with a progressive-synthetic movement the object of which it is precisely to show how objectifying actually takes place.

The point of this section (§69) is to bring out the connection of temporalization and world. 'Insofar as *Dasein* temporalizes itself, a world

is too. In temporalizing itself with regard to its being as temporality, *Dasein* is essentially "in a world", by reason of the ecstatico-horizonal constitution of that temporality.²¹ The temporalizing function of time means that time is transcendence and that therefore whatever is temporalized manifests itself as transcendent. This holds first and foremost of the world. 'Having its ground [*gründend*] in the horizonal unity of ecstatical temporality, the world is transcendent.'²² This sentence is doubly significant in that it employs the concept of ground, later to be thematized in *Vom Wesen des Grundes*, and in that it ascribes not transcendence but the characteristic of being transcendent to the world. This might seem strange in that the latter characteristic would seem to hold the world at a greater distance from *Dasein* than the structure of being-in-the-world should allow. It is clarified by another rather peculiar remark a few sentences later. 'The world is, as it were, already "further outside" than any Object can ever be.' This cannot mean that, as a totality, the world presupposes an aggregate of objects as that with respect to which alone such a totalizing procedure can take place, because Heidegger explicitly refuses any such interpretation. Rather it must mean that world is first projected as that *within which* alone beings can be encountered. This is why Heidegger then goes on:

The 'problem of transcendence' cannot be brought round to the question of how a subject comes out to an object, where the aggregate of Objects is identified with the idea of the world. Rather we must ask: what makes it ontologically possible for entities to be encountered within-the-world and objectified as so encountered. This can be answered by recourse to the transcendence of the world – a transcendence with an ecstatico-horizonal foundation.²³

In other words, what was previously, and in the context of a critique of traditional conceptions, described as the being transcendent of the world is now, and in a more properly ontological perspective, regarded as a function of transcendence. Transcendence makes being-in-the-world possible and it is only on the basis of being in the world that entities can appear transcendent. Thus, to try to explain the being transcendent of objects on the basis of being-out-of-the-world and in terms of the question of how a subject transcends the sphere of immanence to reach what transcends that sphere is seen to be non-sensical in as much as this very same transcendent character can itself only be explained with reference to the being-in-the-world of *Dasein*.

The etymological connection of ground (*Grund*) and abyss (*Abgrund*) makes it possible for Heidegger to bring his reflections on the ground into connection with his reflections on the abyss and therefore with his reflections upon nothingness and the way in which nothingness reveals

being. The very first pages of his later text *Einführung in der Metaphysik* make quite clear this connection between the concepts of 'being', the 'ground' and 'nothingness'. 'The question (why is there something rather than nothing) aims at the ground of what is in so far as it is.'²⁴ Furthermore, we are told that the ground can be both a primal ground (*Urgrund*) or an abyss (*Ab-grund*). Indeed Heidegger deliberately directs his analyses away from any supposedly naive, because foundational, concept of the 'primal ground' and toward a supposedly more sophisticated, because non-foundational and therefore abysmal, concept of the ground. However, it is in the earlier text *Was ist Metaphysik?* that the concept of the nothingness of being is most fully explored.

The central theme of *Was ist Metaphysik?* is not actually the nature of metaphysics, as the title would lead one to believe, but rather the concept, or better the experience, of nothingness. The theme of nothingness is however only employed as a strategy to get at the idea of being as a whole, or being as such, being before it has been broken up into the various regions of being investigated by specific sciences. Refusing the logical primacy of the concept of nothingness, Heidegger asks wherein the experience of nothingness reveals itself. His answer takes us into the realm of mood, in the first instance, the mood of boredom, then, more fundamentally, the mood of anxiety. 'Anxiety discloses Nothingness' (*Die Angst offenbart das Nichts*).²⁵

The theme of transcendence is introduced through the possibility of holding oneself open to being in totality, which is itself revealed through the experience of nothingness. 'This being beyond [*Hinaussein*] is what we call Transcendence.'²⁶ A more elaborate formula brings out the connection between 'nothingness', 'anxiety', 'being in totality' and transcendence. '*Dasein's* projectedness [*Hineingehaltenheit*] into Nothing on the basis of hidden dread is the overcoming of what-is-in-totality: Transcendence.'²⁷ What is at issue here is not just the priority of being in totality over beings, nor even the experience through which this priority becomes manifest but rather the nature of that structure through which this relation to being in totality is made possible. It is a 'holding oneself in', a 'being outside', a 'going out of', and what makes it possible is the fact that human being is always already *in* being – i.e., the primacy of transcendence.

The fact that human being is always already in being brings with it a reversal of the traditional conception of transcendence (revived by Husserl) as an answer to the question how the self over-comes the limits of its self with a view to standing in relation to what is not itself and, in this sense, transcends its self. No such movement of transcendence is called for because it has always already been accomplished. From this standpoint, the critical question becomes the very opposite question, how human being falls away from this fundamental relation, this being held

in relation. Heidegger's answer is interesting. The very structure (of transcendence) which accounts for the 'being always already in' also accounts for the 'having always already fallen away from'. On the surface such a position would seem to be contradictory. One and the same structure is produced to account for opposite characteristics. From *Being and Time* however, this contradiction is one with which we are already familiar. Because human being is from the first in being, beings are constantly encountered in such a way that effectively we lose ourselves in this very absorption with beings. In other words, what has to be explained is not how we come out of ourselves, come to be beyond ourselves and so to stand in a relation to what is other than ourselves, but rather the reverse, how we fall away from being and in so doing let being fall away until it can only manifest itself in the superficial relation to beings of one kind or another.

This is the very procedure to which I would like later to give the name 'ontological delimitation of transcendence'. For the moment it will be enough to note that, quite characteristically, Heidegger describes this falling away in purely negative terms. The being out of oneself which first makes it possible for there to be something – and not nothing – carries with it the seeds of its own self-annihilation in as much as the positivity of being (which becomes the positivity of beings) takes over from that sense of being in totality which can only be sustained against the background of the experience of nothingness. It is in this sense that Heidegger approves Hegel's equation of being and nothingness. 'Being and Nothingness belong together . . . because Being itself is in essence finite and so only manifests itself in the transcendence of a *Dasein* which is exposed to Nothingness.'²⁸

Through this 'falling away from' and only through such a falling away can definite regions of being make themselves known and, on this basis, can a science of such a region arise. Science wants to know nothing about nothingness (*will from Nichts nichts wissen*) and in this sense can only establish a (superficially) positive relation to being. But this positivism (which is the death of the negativity needed to sustain nothingness and therefore the sense of being in totality) cannot so easily be dismissed as nothing. Whatever the consequences of the development of the scientific spirit might eventually turn out to be, there can be no question that it represents an accomplishment, one of the most gigantic intellectual enterprises upon which human kind has ever engaged, one which has become absolutely determinative for world-civilization at this particular moment in its development – as Heidegger himself later recognized. Perhaps his later fatalistic resignation before the seemingly illimitable conquests of science and technology is but the inverse of his earlier dismissal of the scientific spirit as something utterly alien to the discipline of ontology? Having been only too ready initially to dismiss the scientific

spirit as alien to metaphysics, he eventually came to regard technology as the final working out of Western metaphysics.

Transcendence as the ground

Vom Wesen des Grundes is the text in which Heidegger seeks to articulate explicitly his own conception of transcendence. From the very outset Heidegger makes it clear that he intends to think the essence of the ground in connection with the problem of transcendence. Transcendence is said to be the domain (*Bezirk*) in which the essence of the ground is encountered and determined.²⁹ The essence of truth is said to be connected with the essence of transcendence and so indirectly with the essence of the ground.³⁰ Further, the transcendence of *Dasein* is said to be the ground of the ontological difference. 'This ground of the ontological difference we shall call *Dasein's Transcendence*.'³¹ And yet what is at issue is by no means clear, if only because Heidegger repeatedly links the question concerning the ground with a number of other historical issues only indirectly related to that of transcendence – the Aristotelian inquiry into first principles and causes,³² the Leibnizian principle of sufficient reason (*nihil est sine ratione*),³³ the Kantian highest principle of all synthetic judgments,³⁴ even Husserlian intentionality.³⁵

It is in the second part that he begins the work of analysis. Transcendence, we are told, means passing beyond or surpassing (*Überstieg*). In this movement of passing beyond three elements can be formally distinguished. (1) The relation 'from'–'to'. (2) That towards which (*woraufzu*) the movement takes place, which is generally called the transcendent. (3) That which is surpassed, or transcended, in the very movement of passing beyond (*was überstiegen wird*).

Heidegger's next step is to connect this threefold structure of transcendence with the being of that very being which we are ourselves as human beings. However initially, and for strategic reasons, Heidegger leaves it open whether this being is to be called *Dasein* or, more traditionally, the subject. But he leaves this question open only in order to be in a position to criticize the Husserlian theory of transcendence, in the context of which the above threefold formal description would assume the following concrete application. (1) That which passes beyond in the relation 'from'–'to' is the subject. (2) That toward which the subject transcends itself is the (intentional) object. (3) And that which is transcended in this movement of passing beyond toward is the sphere of immanence. It is this theory which Heidegger aims to refute when he states: 'Transcending *Dasein* neither passes beyond a "limit" stuck into the subject in advance and restricting it to an inherent immanence, nor a "gap" which separates it from the object.'³⁶

In place of such a Husserlian theory, Heidegger offers his own, three-fold specification of the structure of transcendence, which may be summarily represented in three points: (1) That which passes beyond in the relation 'from-to' is *Dasein* itself. Here the parallel with Husserl is sufficiently close for one to be able to say that we are dealing only with a terminological recommendation – *Dasein* instead of the subject. (2) That toward which the self passes beyond is not the object but the world, with the result that the structure of transcendence can be determined as being-in-the-world. (*Wir nennen das, woraufhin das Dasein als solches transzendiert, die Welt und bestimmen jetzt die Transzendenz als in-der-Welt-sein*).³⁷ Here the point is to replace the singularity of Husserl's intentional object with a totality, a totality the preparatory notions for which are however already to be found in Husserl with his concept of the 'world-horizon' or even the 'life-world'. So here again the difference is more nominal than real. (3) Finally, that which is transcended is neither a sphere of immanence nor a gap separating self and other but rather the whole realm of objectified beings – which are transcended towards their being.

It is this third point which furnishes the key to the radical difference separating Heidegger's theory from that of Husserl. The replacement of subject with *Dasein* can be accommodated within a broader concept of the self. The difference of object and world is one which is already allowed for within the Husserlian frame. It is the refusal of the ultimate distance of self and other (introduced with the Reduction and consolidated with the disclosure of a sphere of Immanence) in favour of the immediate proximity of being-in-the-world which marks the more radical break. There is no equivalent for the Husserlian reduction. Or, if you prefer, the Heideggerian 'step back' is a step back out of the objectified world view to a more primordial involvement. Which means that the 'step back' takes *Dasein* 'closer to' not 'further away from'.

And yet even here, a more Husserlian alternative might be proposed. For the 'step back' into the ground could have been formulated as a step into a sphere of being-in-the-world wherein *Dasein* transcends itself toward the world, *qua* own. In other words, the *ownness* of the world might have been regarded as an ontological immanence running parallel to the Husserlian transcendental immanence. In which case, the structure of transcendence could have been reformulated as a transcending of the ownness sphere toward *the* world, namely, toward that in which the ownness spheres of many selves join and interconnect.

Had Heidegger taken this route, his theory of transcendence would have been committed to a progressive procedure, or at least to an essential complementarity of the regressive and the progressive procedures. In his own concept of 'world', more precisely of 'being-in-the-world', we do find a subtle admixture of a progressive with a regressive

component. In as much as being-in-the-world is treated as an original structure constitutive of the very being of *Dasein* then *Dasein* must be regarded as always being already in the world and the world as that context in which, and in which alone, entities can be encountered and disclosed. Here the progressive procedure dominates. But Heidegger is only too well aware that by 'world' is generally meant a totality of objects amongst which *Dasein* itself simply figures as one among others. To be sure, we are told that 'world makes up the unitary structure of transcendence', and that 'with this term, everything that belongs to transcendence will be named'. But the false, because ontic, concept of world will still lead to a false conception of transcendence even when the latter is conceived as that 'toward which' the movement of transcendence takes place. 'The assertion: it belongs to the essence of *Dasein* that it should be in the world . . . proves to be false.'³⁸ On the other hand, 'The thesis: being-in-the-world belongs as such to the essence of *Dasein* contains the problem of transcendence.'³⁹

In sum, the ontological is to be distinguished from the ontic concept of world along three connected lines. (1) World does not so much mean a totality of objects as rather a certain way in which this totality is to be grasped as a totality. (2) This 'way in which' is a precursory determination. (3) The precursory determination of the world as a whole is a characteristic of the being of *Dasein* itself. The question then arises: how is the relation between the ontic and the ontological concept of world to be understood?

By and large, and largely because, as a methodological principle, Heidegger's phenomenological descriptions take their start upon the ontic plane, the relation between the ontic and the ontological concept of world is regarded as a regressive relation which requires that the phenomenologist work back to the ontological from the ontic. This means that the ontic concept of world (which includes objects in the aggregate) has itself to be transcended. So that the world as that toward which the movement of transcendence takes place calls for a transcending of beings toward their being or, if you prefer, a transcending of beings apprehended in the aggregate, and outside of any essential relation to *Dasein*, toward the being-in-the-world of such beings in so far as the latter is grounded in the being of *Dasein* itself. But another, progressive procedure might have been adopted as the model for the theory of transcendence because it often is adopted by Heidegger as an explanatory procedure in *Being and Time*. This procedure consists in showing how the fundamental relation of being-in-the-world gives way to a derivative relation by way of deficient characteristics (the ready-to-hand into the present-at-hand, ontological truth into a correspondence theory of truth, ontological space and time into the formal spatio-temporal framework). Here, there would be no need for a transcending of beings toward

their being, because the being-relation would be instated from the very beginning. The critical question would then be not: how the being-relation is to be restored? but the very opposite question: how was it originally lost? In one sense this latter question is obviously the more fundamental. For the being-relation can only be restored if it was once in place. And if it was once in place then a critical question necessarily arises as to *how* it was lost, a question to which the existential structure of *Fallenness* offers a poor answer because it seems to suggest that the being relation was lost *from the very beginning*.⁴⁰

And yet there are plenty of passages in *Vom Wesen des Grundes* where an original disclosure, prior to any representation of objects, is explicitly acknowledged. 'Disclosedness of Being [*Enthülltheit des Seins*] first makes possible the revelation of what is. As the truth about Being, this disclosedness will be called ontological truth.'⁴¹ Important here is the order of priority implied in the phrase 'first makes possible'. This kind of disclosure as a truth about being is called 'ontological' and is expressly contrasted with the more derivative, because 'ontic', truth. Much more interestingly, a little later on, we find a passage in which Heidegger makes an effort to articulate more explicitly the relation between the pre-ontological and the ontological, a relation which, in *Being and Time* is left vaguely indicated as a kind of enigma (SZ, S. 12). Not only does Heidegger distinguish a pre-ontological understanding of being from a fully developed concept of being and not only does he insist that the apprehension and comprehension of being consists in nothing other than the thematization of this pre-ontological understanding, he also confirms that between the original unfolding of the former and the conclusive development of the latter many stages are to be found. 'Many steps are to be found between the pre-ontological understanding of Being and the explicit problematic of an understanding of Being.'⁴² Unfortunately, he does not spend much time on the elaboration of these intermediary stages. But he says enough to indicate that these stages might include the working-out of the meaning of those pre-given regions of being which serve to demarcate the different branches of the sciences as well as the elaboration of an *apriori* description of regional ontologies – in other words, what might be called an objective as well as a transcendental or reflective stage in the understanding of being.

In this distinction between a pre-ontological and a fully ontological conception of being we find the root of the confusion between a progressive and a regressive conception of the structure of transcendence. From a pre-ontological standpoint, being-in-the-world is an original given. Transcendence is already operative as the structure that ensures that, from the very beginning, *Dasein* finds itself in a world. The movement to the ontic sphere can then only be explained negatively as a sort of loss or surrender of ontological truth. From the standpoint of a working-out

of the discipline of ontology however, the problem is how to get back to the origin, given that one finds oneself in a world which has already been levelled down to an aggregate of objects. It is for this reason that Heidegger will connect the problem of transcendence with the ontological difference. (*Diesen Grund der ontologischen Differenz nennen wir vorgreifend die Transzendenz des Daseins.*⁴³)

Although, for Heidegger, the question of the ontological difference is always presented as the question of how beings can be transcended toward their being, although in this sense therefore, the procedure adopted is always regressive, strictly speaking, the ontological difference could still be incorporated in a conception of transcendence which adopted the reverse direction, that is, which accounted for the difference as the emergence of the ontic out of the ontological rather than as a re-discovery of the ontological on the basis of the ontic. In a provisional way, we shall give the name 'ontological delimitation of transcendence' to just such a progressive account of the emergence of the ontological difference.⁴⁴ That some such structure is called for is indicated by the fact that the re-discovery of the ontological ground is only itself possible on two conditions; first, that it originally existed as a fundamental structure of the very being of *Dasein*, and second, that it was lost, or given up or covered over. Even the regressive conception of the ontological difference therefore presupposes the progressive, which is never actually identified by name, though many of Heidegger's descriptions do presuppose some such structure.

To bring out the peculiarity of the Heideggerian position, a reverse analogy with Husserl is in order. Had Husserl argued that what is transcended in the structure of transcendence is the natural attitude and that the natural attitude is transcended towards that transcendental consciousness from the standpoint of which the objectivities presupposed by the natural attitude can furnish the field for a transcendental investigation of constitutive processes, then we should have had the transcendental equivalent of Heidegger's regressive conception of transcendence. What Heidegger calls the 'ontological difference' would then have figured as the 'transcendental difference', i.e., the difference between objects and the subjective processes in and through which they can be constituted. For Husserl however, getting out of the natural attitude and back to transcendental consciousness could never have been an end in itself. In fact it was only a beginning, the beginning of a process of disclosing the subjective processes always already (though only implicitly) at work in the natural attitude; with the result that his transcendental concept of transcendence is *foundational* in the sense that it helps to explain how it is that objects come to possess the type of objectivity which is ordinarily ascribed to them.

Much more hangs on this difference than at first meets the eye. For

Husserl, the movement back (to transcendental subjectivity) is only the preliminary to a movement of return (to the world) as a result of which what was previously simply taken for granted in a naive and unfounded fashion can now be fully and properly comprehended. In other words, the movement back is not an end in itself but is only a means to effecting a transcendental clarification of the world (just as Kant's return from the empirically conditioned to the transcendental conditions of its possibility is only the prelude to a 'Deduction' of the conditioned from its transcendental conditions). For Heidegger, on the other hand, the regressive movement back (to being-in-the-world) tends to be an end in itself. I use the word 'tends' with the appropriate caution. There are many examples of the regressive step being undertaken with a view to investigating the emergence of the objectified world view.

On the whole however, and this tendency becomes ever more marked later on, the move back is undertaken with a view to bringing to light concepts and structures which have little or nothing to do with any clarification of the objective world view. And often, it may be objected, this disregard of the ontic seems to reduce the value of the analyses to which it leads. It is in this spirit that Tugendhat, in his paper on the concept of truth, complains that, in seeking to extend the concept of truth in the way he does, Heidegger not merely confuses matters but fails to throw light upon the naive and ungrounded character of the correspondence theory of truth. In so far as the regressive movement is not complemented by a progressive procedure, the return to the ground ceases to possess any foundational value. *Fundamental ontology ceases to be foundational.*

In arguing that what is transcended in the movement of transcendence is not *Dasein* itself or an ownness sphere and that therefore the latter is not transcended toward the world in which *Dasein* always finds itself (progressive conception), but rather that it is the entire realm of beings which are transcended towards their being (regressive conception), Heidegger gives an (unnecessarily) formalistic turn to his ontological investigation, a turn which, in the end, will so dis-connect the being-beings relation that, effectively, a transcending of beings towards their being ceases to throw any reciprocal light upon the realm of beings as such. The aim is to move back (regressive), and then not forward again (progressive) but further back, and then yet further back still. Historically, as Marlène Zarader has shown (see chap. 17, vol. II of the present work), this will mean a regression to the Greeks, then more specifically to the pre-Socratics, ending up with speculation about an origin more original still than beginning Greek philosophy. And when the aim seems to be the very reverse, for example in the papers on technology (where technology is seen as the culmination of a *telos* inherent in Western philosophy from the very first), what might be called his pessimism with

regard to the historical destiny of human thinking is surely nothing but the inverse of a refusal to provide ontological foundations in the sense of a progressive genesis. Because no attempt is made to offer an ontological grounding for formal thought (in a sense comparable to that in which Husserl offers a transcendental foundation for the same), the calculative-manipulative tendencies inherent in technology are simply taken to preempt the entire domain of theoretical inquiry, leaving nothing for the philosopher to do but to retreat into a marginal 'thinking' whose use of concepts is metaphorical (and poetic) rather than literal (and scientific).

Let us summarize what has been accomplished so far. We have distinguished a regressive from a progressive procedure in the articulation of the structure of transcendence and we have suggested that, with Heidegger, the two are often not held in a complementary relation each with the other, as they are with Husserl. Further, even when a complementary relation is established between the two procedures, the priority lies with the regressive rather than with the progressive. If there is something like a regression with a view to a complementary progression, it is only in order to ground the ontic sphere with reference to *deficient* characteristics. But before we attempt to follow up the implications of this way of working with the concept of transcendence, it would be advisable to first glance briefly at other texts in which the concept of transcendence plays a role, with a view to determining whether the theme of transcendence can be connected with other themes, such as the theme of freedom, the theme of nothingness, the theme of truth and so on.

Truth and transcendence

The central theme of *Vom Wesen der Wahrheit*, as its title implies, is that of truth. *Wesen der Wahrheit* begins with the conventional conception of truth as adequation in order to inquire back into the ground of the relation (between words and things, knowledge and its object) which makes such a conception possible. 'The essence of adequation [*Angleichung*] is rather determined by the kind of relationship prevailing between statement and thing.'⁴⁵ The object arises out of a letting stand opposed (*Entgegenstehenlassen*) and only so can it be posited (*Gestellt*) and represented (*Vorgestellt*). Thus the critical question now becomes one of determining the ground of the inner possibility of this letting stand over against and it is answered in a preliminary way by the introduction of a concept of freedom which can only be further determined through a further investigation of the way in which freedom lets being take up a stand over against. 'The overt character [*Offenständigkeit*] of comportment as the inner possibility of rightness [*Richtigkeit*] is grounded in freedom. *The essence of truth is freedom.*'⁴⁶

With a view to a further determination of the concept of freedom, the latter is now spelt out in terms of the possibility of letting-be. The freedom to reveal something overt lets whatever 'is' at the moment *be* what it is. Freedom is disclosed as the 'letting-be of what is'.⁴⁷ It is at this point that Heidegger accomplishes an absolutely characteristic reversal which finally, and for ever, makes it impossible for his concept of truth to throw any light upon the conventional concept, not even as a grounding of the latter. He draws a contrast between *Seinlassen* and *Sicheinlassen*. ' "Letting be" [*Seinlassen*] has here the negative meaning of disregarding something, renouncing something, indifference and even neglect.'⁴⁸ Against such a negative concept of 'letting-be', Heidegger opposes his own concept of 'getting involved with beings' (*Sicheinlassen auf das Seiende* – literally, letting oneself in for) which is presented not merely as different from the former but as its very opposite. *Sicheinlassen* is then further determined in terms of uncoveredness and disclosure.

The negative concept of *Seinlassen* might have been taken in the direction of a suspension of the original relation of being-in-the-world, a suspension which lets entities be what they are rather than seeking to interpret them in terms of the self. This would have allowed room for a progressive concept of transcendence which, admittedly, would have had to take the negative form of an ontological delimitation of transcendence. Instead Heidegger adopts the regressive route while still, nevertheless, making use of the essential complementarity of the two. The result is an inconsistency which is however exploited in terms of the equi-primordially of hiddenness and un-hiddenness, of truth and error (*Irre*).

To be sure, Heidegger is well aware of the inconsistency involved in equating being-in with letting be. In *Einführung in die Metaphysik*, he links the appropriative element of being-in with willing and resolve. The essence of resolve, he tells us, consists in an un-covering through which human being is brought into the clearedness of being, and he points to §§44 and 60 of *Being and Time* as places in which the disclosive character of resolve is presented. But, he continues, the relation to being is here one of letting-be, an idea which is never explicitly developed in *Being and Time*. 'The idea that all willing should be grounded in letting-be offends the understanding', he admits, referring the reader to *Vom Wesen der Wahrheit* for a clarification of this apparent inconsistency.⁴⁹

This inconsistency can perhaps best be brought out in terms of a concept which does not make its appearance in *Vom Wesen der Wahrheit*, even though it plays a dominant role in *Being and Time*. It is the concept of projection and, more generally, of projective understanding. Projection is, in an obvious sense, the projection of self (*Dasein*) upon, the interpretation of being in terms of that being for which the question of being first arises, human being. Such a projection does not so much let-be as rather appropriate, in the more narrowly circumscribed sense of 'making

own'. 'Letting-be' can indeed be regarded as the very opposite of 'making own', in the sense that it lets beings be what they are rather than trying to make them over into what they can be projectively interpreted as. In as much as being-in is the fundamental condition, and in as much therefore as human being is, by its very nature, disposed to interpret projectively 'as', letting-be can only arise by way of a 'step back', a 'withholding' of projecting. It would then seem reasonable to see the being-in of *Sicheinlassen* as the ground of the possibility of that *Seinlassen* (letting-be) out of which beings become available for positing, representing and so on. Such a developmental possibility is indeed suggested by Heidegger in a passage where he states:

Participation [*Sicheinlassen*] in the unhiddenness of what is does not stop there but is developed into a stepping back before beings, so that the latter may be revealed as what and how it is, may indeed be revealed in such a way that representational adequation [*vorstellende Angleichung*] gets its rightness from it [*aus ihm das Richtmaß nehme*].⁵⁰

The key to this insight lies in the phrase 'is developed into a stepping back before beings'.

The theoretical possibility inherent in this insight is however never itself developed. Instead we are offered the more standard (from a Heideggerian perspective) prospect of an uncovering which is at the same time a covering over. (*Die Entbergung des Seienden als eines solchen ist in sich zugleich die Verbergung des Seienden im Ganzen*⁵¹) – though even here a developmental possibility lies concealed. The original uncovering is presumably an ek-static uncovering of being in totality. As soon as this original uncovering becomes an uncovering of beings as such, there is at the same time a covering over of being in totality. It is in this sense that letting-be is a covering over (*Das Seinlassen ist in sich zugleich ein Verbergen*), more precisely, the covering over of being in totality.⁵²

What is lost in this hypothesis of the equi-primordially of un-covering and covering over, of un-hiddenness and hiddenness, is the very possibility of recognizing the letting-be that first makes truth (in the conventional sense) possible as an accomplishment. The root of the difficulty lies in the absence of a developmental perspective. It is one thing to say that that very being-in which, as such, is disclosive at the same time makes impossible the letting-be without which beings cannot be understood as they are in themselves and that, with the development of just such a letting-be, on the other hand, the un-covering of an original openness to being is lost, another altogether to posit the two as equi-primordial, and therefore to account for contrary characteristics in terms of one and the same structure. What is common to the two conceptions is that, in both cases, where something is gained something else is lost.

But by staging the process it becomes possible to recognize the rationale behind the development. Instead, the equi-primordially of hiddenness and un-hiddenness is presented as the inevitability of a degeneration of being-in-the-truth, which goes along with the denigration of the represented world as philosophically insignificant, with the refusal to acknowledge, for example, the colossal achievement of Aristotle's invention of Logic (in the conventional, apophantic sense). Instead, the invention of logic becomes the colossal error through which Western metaphysics is set on the wrong track in so far as it loses the original sense of the *logos* as the unity of thinking and being.

It is not the one-sidedness of the Heideggerian view which bothers me so much as the fact that by insisting so one-sidedly upon a dismissal of presentification (and all that goes with it) as a merely 'ontic affair', he makes it impossible for metaphysics (in the sense in which he is still ready to admit metaphysics in the very terms of the treatise *What is Metaphysics?*) to perform the grounding role for which, in certain respects, his fundamental ontology had already prepared it. Had he, for instance, adopted the developmental perspective suggested earlier, he would have been able to give an account of what, from the standpoint of the conventional doctrine of truth as adequation remains, and must remain, unthought, namely, the nature of the relation that prevails between the assertion and what is asserted in and through the assertion. The letting-be which first makes it possible for objects to stand over against could then be understood as an existential modification of appropriative projection. At the same time, the *Sich-einlassen* of appropriative projection would assume its proper place as that primordial disclosure of being in totality which is covered over with the step-back into letting-be.

The grounds for this deliberate one-sidedness seem to me to lie in the regressive methodology which Heidegger habitually employs. Beginning typically upon the ontic plane, the entire thrust of his thinking is directed towards an opening up of what has already been closed down. But if the starting point which is assumed had been the 'beginning thinking' itself, then the closing down (from the standpoint of being) could have been understood as an opening up (from the standpoint of beings). And this, surely, is exactly how the transition was grasped by those very philosophers who helped to bring the presentified world view into being. Aristotle surely never imagined that he was doing philosophy a disservice with his invention of subject-predicate logic, nor could Descartes ever have suspected that his original insight into a new way of letting beings be would be condemned as a kind of commonsensical superficiality which stands in the way of any genuine philosophical progress. The superficial understanding against which Descartes struggled in his day was the medieval view of the world as God's creation.⁵³ In ridding the

world of the entelechies and teleologies which medieval philosophy had inherited from Aristotle but which had hardened and congealed into unquestionable assumptions, Descartes cleared the ground for a new scientific conception of the world which has only recently itself hardened into a dogmatic assumption, an assumption the grounds for which Heidegger quite rightly questions, though, to my mind, in the wrong way. Thus it is that with Heidegger we experience the strange phenomenon of progressing backward. The further back we go (historically), the more we progress (ontologically). And of course this 'progress into the past' also implies a 'regress into the future' which inevitably brings with it a tendency to denounce the last results of our intellectual development as the ultimate regression into a bottomless abyss.

Only by understanding how the scientific world-view came about will it ever be possible to arrive at a satisfactory evaluation of the motives which led to its occurrence. To suggest, as Heidegger does in his *Nachwort zu: Was ist Metaphysik?*, that the will to will (as the ground of the will to power) is what set philosophy on the fatal course towards science fails to do justice either to philosophy or to science. Is it really plausible to see in Newton or Einstein (both men of the utmost unworldliness, even, one might say, Godliness), for example, leading exponents of the will to power? Is Husserl's ideal of dis-interested inquiry really only a cunningly concealed disguise for a will-full desire to push the domineering tendencies of human subjectivity to the ultimate extreme? Or would it not be more reasonable to see in Heidegger's own regressive ontology the basis for a lapse into primitivity which goes some way to understanding his, at least partial, sympathy for the Nazi cause – without question the most wilful political philosophy of modern times?

And yet, whatever Heidegger's earlier inclinations, his later philosophy is largely devoted to the development of a new regressive initiative which will overcome the will-full implications of his first philosophy, a *Gelassenheit* which will make of human being an instrument of being and of the self-unfolding of being, rather than the other way around. So perhaps it is not so much the regression to the ground as the way in which this regression is accomplished which stands in the way of an ontological philosophy consistently devoted to an overcoming of tendencies the frightfulness of which Heidegger's own historical epoch makes abundantly clear and of which Heidegger himself became very well aware. Perhaps there is a way in which ontological progress, in the Hegelian sense, can be reconciled with ontological progress in the Heideggerian sense, in which the forward march of reason can be reconciled with a backward-looking recuperation of the origin? Perhaps the difficulty lies in the fact that Heidegger's regression is too linear (as was Hegel's progression) and this despite the circularity which features as an inherent part of his own hermeneutical procedure. Is there some way in which

the regression to the ground can be re-conceived in non-linear terms without, at the same time, leading to a pointless repetition; whereby, in other words, the movement back to the ground can, at the same time be conceived as a movement on?

This is the point at which it becomes pertinent to contrast the Heideggerian way back (what might be called an objective regression) with what I have elsewhere called the 'reflective detour'. If, as I maintain, ontological philosophy (in the Heideggerian sense of the discipline of ontology) only arises as a reaction to (and therefore on the basis of) transcendental philosophy, then the accomplishments of transcendental philosophy cannot be so easily set aside in the attempt to develop an ontology. Rather the contrary, it will be the reflective resources first made available by transcendental philosophy which orient and direct the movement of return. And perhaps that to which we need to return, and to which the resources of phenomenological reflection will make it possible for us to return, is something much older and therefore (in the Heideggerian sense) much *wiser* even than Greek philosophy, a way of thinking which first made its appearance over a thousand years before the 'beginning thinking' of the Greeks and which was itself already old by the time Greek philosophy began to make its mark, namely, the Vedantic philosophy.

Conclusion: a genetic theory of transcendence

In this final section I want to try and tie up a number of loose ends left hanging at various points in the course of my critical assessment of Heidegger's (and Husserl's) theory of transcendence. This will be done by opening up what might be called a developmental perspective, a perspective which requires that we not merely distinguish several different concepts of transcendence but order these concepts in a 'logical' succession.

We will begin with Heidegger's distinction between a pre-ontological way of being and the discipline of ontology. However, unlike Heidegger, we shall want to argue that the pre-ontological way of being does also call for an appropriate concept of transcendence which, in so far as it points towards and so grounds the objective order, must be integrated in a progressive theory of transcendence. The starting point is the being-in-the-world of human being which is disclosive of entities in a quite distinctive and non-ontic way. Heidegger's later distinction between the 'thing' and the object⁵⁴ may provide a clue as to just such a non-ontic disclosure. In his Kant book, he goes even further than this and suggests the concept of the 'image' as a sort of prototypical object.⁵⁵ We have also suggested that it might be possible to integrate the immanence-

transcendence distinction within such a primordial concept of the ground. Immanence would then refer to the ownness of the world first opened up on the basis of projective disclosure, while the term transcendence would be reserved not merely for the process whereby such a sphere of immanence is transcended toward, but also for that inter-connection of own worlds which might be called 'the world' in an ontologically full and complete sense, the sense in which, for example, Heidegger interpreted Heraclitus fragment 7. 'To the awake there belongs one, common world. Each sleeper, on the contrary, is oriented toward his own world.'⁵⁶

In order however, to allow for the emergence of the ontic order on the basis of just such a progressive theory of transcendence, something in the way of a 'step back' is called for, a step back out of the dimension of being-in and into the dimension of representative thinking. The holding before of *Vorstellung* is then to be understood out of a holding back of the self, a self-withholding which first lets beings be what they are. We shall give the name 'ontological delimitation of transcendence' to just such a restrictive self-withholding. Instead of letting itself be *in*, (*Sich-einlassen*) human being withholds itself in such a way that beings are allowed to be what they are (*Seinlassen*). Through such a self-withholding, there arises something like that holding before (*Vorstellen*) without which an objective conception of entities would not be possible. In this sense, self-withholding would imply a restriction of the sphere of inherence of human being in being.

Upon the objective plane, the structure of transcendence is lost. It is replaced either with a naive realism which simply takes for granted the transcendence of the world, and therefore never speaks of it in terms of the structure of transcendence, or, with a characterization of the world as transcendent. In this respect, Kant's transcendental philosophy forms an interesting transitional figure. By aligning the immanent-transcendent distinction with a distinction between the phenomenal and the noumenal (or between things as they appear and things as they are in themselves), Kant opened the way to an analysis of the immanental sphere (the sphere of appearances) which, however, he is never able to understand as a sphere of immanence (in the Husserlian sense) and precisely because there is nothing like an explicit reduction to be found in the *Critique*.⁵⁷ For all that, as Heidegger has shown in his Kant interpretation (and in my Kant interpretation I have taken the immanental implications of the A edition of the Deduction even further than Heidegger), the A edition of the Deduction can fruitfully be interpreted as a major attempt to solve that problem of transcendence first opened up with the Cartesian method of hyperbolic doubt.

Strictly speaking however we need not one but two concepts of the 'step back' in order to accommodate the various stages of the emergence of beings out of, and on the basis of, their being, first, a step back which

prepares the way for an objective thinking about being and then a further step back which prepares the way for a critical reflection upon the latter. The latter step back is quite explicitly indicated by Husserl with his concept of the reduction, even though, in the Kantian philosophy, it remains implicit (evoked in the regression from what is, to an analysis of the conditions of its possibility).

In the Husserlian context of a transcendental philosophy based upon the disclosure of a sphere of immanence, a quite new theory of (transcendental) transcendence arises, and arises in response to the question of how the subject is ever able to transcend the limits of the sphere of immanence, come out of itself in such a way as to reach the object.

With the shift from the objective to the transcendental or reflective plane however, we seem to have lost the Heideggerian motif of a regression to the ground. That such a motif is still operative, even in the context of transcendental philosophy, is however evidenced by Husserl's own genetic phenomenology, which attempts its characteristic regression to the life-world on a transcendental basis. We shall give the name 'ontological transposition' to just such a 'transcendental' regression to the ground. Both in my Kant book and in my study of the Husserlian phenomenology, I have made extensive use of this concept of an 'ontological transposition' which I shall therefore make no further attempt to articulate in the context of this summary conclusion.

The structure of an 'ontological transposition' changes the very nature of the regressive movement back to the ground. Instead of assuming the form of a regression from the ontic to the ontological sphere, a transcending of beings toward their being, this conclusive regression now assumes the form of a leap from the transcendental back into the ontological, a leap which can leap over the ontic or objective order precisely because transcendental philosophy has always already taken account of the objective order and indeed is set up with a view to undertaking just such a critical assessment of the objective order. In more properly Heideggerian language, the 'ontological transposition' offers a new way of understanding the development of the discipline of ontology, a way which no longer ignores or circumvents the achievements of transcendental philosophy but precisely takes account of them, and has to take account of them, as the very condition for undertaking a regression to the ground. In the context of such a conclusive regression, many of the themes of Heidegger's own regressive understanding of transcendence can be picked up and further developed. For instance, letting-be (*Seinlassen*) no longer needs to be restricted to a species of self-withholding. Rather the contrary, it can now assume the form of a holding oneself into (*Sich-einlassen*), an involvement which is however non-appropriative, in the sense that by first completing the circuit of its own becoming human being overcomes the wilfulness of any primordial appropriation. Thus

appropriation, in the limited sense of 'making own', can now become the event of appropriation – *Ereignen* in the sense of *Ereignis*. The complementarity of the progressive and the regressive conception of transcendence is now no longer that of a regression to the ground making possible a grounding of what has been transcended, namely beings, but becomes a progression through the several stages of a genesis which finally turns around upon itself and leaps back into the ground, but only in so far as the recovery of the ground is now understood as the reflective re-appropriation of an original way of being of human being – the discipline of ontology as the articulation of a pre-ontological way of being.

But this paper was called the 'essence of transcendence'. Was this an incidental nomenclature in the sense that Heidegger sometimes seems to mean no more by the structure of the essence than an ambiguous linguistic gesture towards something profound and important (see Greider's paper in volume I of the present work)? With a view to furnishing the concept of the essence with a determinate content, I would now like to refer briefly to a conception of the essence (taken over from Hegel) which, in the context of *Being and Becoming*, has been employed to regulate the entire ontological genesis.⁵⁷

In the *Little Logic* (from the *Encyclopedia*), Hegel introduces his Doctrine of the Essence with a concept of the essence defined along the following lines.

The essence, as mediated through the very negativity of its own self-relation, stands in relation to itself only in so far as it stands in relation to the Other, and so ceases to be something immediately self-subsistent and becomes instead something posited or mediated. (*Das Wesen, als das durch die Negativität seiner selbst sich mit sich vermittelnde Sein, ist die Beziehung auf sich selbst, nur indem sie Beziehung auf Anderes ist, das aber unmittelbar nicht als Seiendes, sondern als ein Gesetztes und Vermitteltes ist.*)⁵⁸

Two things are to be noted. First, the structure of the essence mediates the immediacy of the concept of Being. Second, this mediating relation takes place as a relation whereby the self is only able to relate itself to itself by way of a relation to the Other. Of course, in the context of the Logic, the self in question is nothing less than the Fichtean Being-itself. But, in the alternative context of a Daseins analytik, this structure can be taken over and applied to the being of human being with the following result: the self only is *what* it is *through* that to which it relates itself as something other than itself.

In the context of the three principal stages of my genetic ontology, this structure of the essence can be differentiated with a view to accommodating what I have called the 'ontological delimitation of transcend-

ence'. First and most originally, that *to* which human being relates itself and *through* which therefore it comes to be what it is, is nothing other than Being. This is taken to mean that *Being* is the locus of the essence. Secondly, that *to* which human being relates itself and *through* which therefore it comes to be what it is, is the World. This is taken to mean that the *World* is now the locus of the essence. Third and last, that *to* which human being relates itself and *through* which therefore it comes to be what it is, is the self. This is taken to mean that the *self* is now the locus of the essence. This movement from a location of the structure of the essence in Being, in the World and in the Self is precisely what is meant, in general, by the ontological delimitation of transcendence.

But the general principle of an 'ontological delimitation of transcendence' has two instantiations. On the one hand, it regulates the internal movement of the first and most properly ontological stage in the overall genesis. That is, in Heideggerian terms, it explains the movement from the ontological to the ontic.⁵⁹ On the other hand, it also regulates the movement of the three stages which make up the genesis as a whole (originary, objective, reflective). That the movement out of the ab-original being-relation pre-figures a genesis which also includes within its compass the world of the natural attitude and the transcendently reduced sphere of consciousness means that the movement away from the ground never *really* leaves the ground but only *appears* to do so in order to make possible a conclusive regression to the ground (the discipline of ontology as the reflective re-appropriation of a pre-ontological way of being).

In as much as the overall genesis of human being is regulated by the structure of the essence, this same structure also suffices to locate all the relevant concepts of transcendence with which we have been concerned. First and originally, human being has its being *in* being. It is for this reason that *being-in* is a constitutive characteristic of the being of human being originally. Ontological transcendence (together with its own appropriate concept of immanence) emerges as a function of this original condition of being-in. From the standpoint of the secondary stage in the overall genesis however, the world to which the sphere of inherence is then reduced is the world of the natural attitude (the material universe). The philosophical positions which go by the name of 'realism', 'materialism' and so on result from just such an 'interpretation' of human reality in terms of categories derived not from human being itself but from beings whose mode of being is not that of being human. In the context of such a realist world view, the significance of transcendence is lost, since that in which human being now finds itself is simply *assumed* to be there quite distinct and independent of consciousness. Finally, the location of the essence in the self corresponds to that opening up of a sphere of immanence which results from the phenomenological reduction.

And which calls for its own correspondingly appropriate concept of transcendence – as the transcending of the sphere of immanence.

Furthermore, that the structure of the essence which regulates the overall genesis is itself pre-figured in a threefold movement within the ground, that therefore, and in the final analysis, the movement away from the ground can be seen to be one which merely brings human being back to the ground again, means that the structure of the essence also accounts for the 'ontological transposition' – and therefore for the possibility of the discipline of ontology *as* the reflective re-appropriation of an original way of being of human being. To speak in Heraclitean terms, the ontological ground (like the *logos*) has nothing to do with a beginning in time but remains that eternal source *from* which all takes its start, *through* which all is steered, and *to* which all must consequently return – in order to start all over again.

Seen in this light (summarily represented in these few concluding paragraphs), the structure of the essence can be seen to regulate the entire genesis of human being and therefore to exhaustively pre-determine the ontological relations which obtain between the several concepts of transcendence which we have sought to distinguish and to demarcate. To put it the other way around, the concept of transcendence is itself an expression of the structure of the essence. Hence: the essence of transcendence.

44 This notion of an 'ontological delimitation of transcendence' is one which more properly belongs in the context of my ontological phenomenology. In the alternative context of an epochal interpretation of the history of modern philosophy, it assumes the parallel form of what I call a 'descendence of transcendence'. That is, the Rationalist epoch is interpreted as one which 'solves' the problem of transcendence with reference to a *transcendent* principle (God), the transcendental, with reference to a *transcendental* principle (transcendental subjectivity), while it is only in the ontological epoch that the problem gets solved, or better 'resolved' with reference to an *ontological* principle (embodiment). This shift from a transcendent, through a transcendental, and so on to an ontological resolution of the problem of transcendence finds its equivalent, in *Being and Becoming* (see vol. I, chap. 4, n. 46 of the present work for further details), in

the shift from the aboriginal stage of the Natural Soul, through that of the World Soul, to that of the Actual Soul.

53 Of course, Descartes thought he was preserving this conception, indeed furnishing proofs of God's existence, continual creativity, etc.

54 This distinction forms the basis of Heidegger's later Kant study which goes by the name: *What is a Thing?* An equivalent distinction also forms the basis of Merleau-Ponty's reflections upon the 'concrete object'.

55 See esp. §20 'Image and schema'. In my Kant book I took Heidegger's analyses further than he would perhaps have been prepared to take them himself by talking about a 'world of images'; *Kant and the Foundations of Metaphysics*, Part Four, 4 e.

56 Cited in VWG, S. 141. This is also the thrust of Husserl's theory of intersubjectivity as presented, for instance, in *Cartesian Meditations V*, though in this latter text the task of linking distinctive 'own worlds' into one common world view is done by way of the concept of a Monadic Community.

57 The articulation of the relevant structure of the essence occurs in the Introduction to *Being and Becoming*. But a summary review of the position laid down in this Introduction is to be found in an edition of *The Journal of Speculative Philosophy*, II (1) (1988).

58 G. W. F. Hegel, *Enzyklopädie*, hrsg Nicolin und Pöggeler (Hamburg: Meiner Verlag, 1969), S. 123.

59 I have adopted as my guide to the internal structure of the first and most original stage the threefold doctrine of the Soul as presented by Hegel in his *Anthropology*, the text in which he comes closest to what might be called a *Daseins analytik*. Thus it is the progression from the Natural, through the World (not the Feeling) to the Actual Soul which marks the movement from the ontological to the ontic sphere. But this 'ontological delimitation' within the ground also pre-figures a delimitation which occurs upon the more extensive plane of the overall genesis.

The language of the event: the event of language

Theodore Kisiel

With the recent publication of the already well-known lecture of January 31, 1962 entitled 'Time and being', Heidegger's thought seems to have at last officially come full circle, and appears to bring some degree of completion to all that Heidegger had announced he would undertake in his prospectus in *Being and Time* (SZ, 39), though not exactly as it was announced there. The second part of this prospectus, dealing with the 'phenomenological destruction of the history of ontology', has proliferated far beyond the announced three divisions, notably in the Nietzsche volumes and including some of the lectures and essays most recently collected in *Wegmarken*. The outstanding omission has always been the third division of the first part, entitled 'Time and being', which was to have completed the chain begun by the two divisions published as *Being and Time*: These two divisions, which concluded by showing that temporality was the Being of the being which understands Being, of Dasein, was to have been completed by 'the explication of time as the transcendental horizon of the question of Being'. In the *Letter on Humanism*, Heidegger explains that this division was withheld because the available language of metaphysics (presumably including such phrases as 'transcendental horizon') was inadequate to express the turn from 'Being and time' to 'Time and being' (PW, 72). This is not to say that no breakthrough to the articulation of this turn was made until the recent lecture on the issue. In the same letter, Heidegger indicates that the lecture 'On the essence of truth' (1930–43) already gained a measure of insight into this turn. And according to Heidegger, the pivotal 'concept' of this turn, *das Ereignis* (the appropriating event), was already at work in his thought during this period (US, 260), appearing thematically in the Hölderlin essays and in 'The origin of the artwork' (1936), although it received no sustained treatment in his publications until *Identity and Difference* (1957) and *Underway to Language* (1959).

The incubation period was evidently necessary in order to develop a language suitable to express the issues and relationships involved in the turn. Not that the long preparation and waiting period for the necessary transformation is over. Heidegger continues to reiterate that he is still 'underway to language'. The 1962 lecture still proceeds 'cautiously' and 'with foresight' (ZS, 20), without hindsight back to metaphysics and its readily available language, groping its way toward a remarkable realm that does not readily yield to articulation. Not that an entirely new language of neologisms must be invented to bring the domain of the appropriating event to the fore. Rather, what Heidegger seeks is 'a transformed relationship to the essence of the old language'.¹

Heidegger's use of language has long been a philosophical notoriety. Carnap's parody of Heidegger's 'propositions' on Nothing has become a stock in trade in the positivistic debunking of metaphysics. Heidegger's response to such critiques are characteristically comprehensive. For him, the linguistic standards of logical positivism are simply the natural conclusion of a long tradition of the metaphysical approach to language, and hence themselves metaphysical. The first step in transforming our attitude to language is then to 'destroy' the logical-grammatical interpretation of language, centered on the proposition and its subject-predicate relationship, that a metaphysics of substance and of subject has conveyed to us, in order to clear the way for orienting language to the pre-predicative realm which is its source. It is in this re-orientation that Heidegger looks for new possibilities of expression that would hold themselves closer to this source. It is to some of these linguistic strategies that at once turn from metaphysical ways of speaking and toward a more fundamental penetration of the origins of language that we wish to address ourselves here. The choice of possibilities are manifold, e.g., Heidegger's interest in poetry and in Oriental ways of speaking, but the focus of our attention will be on the language of the event. Since the appropriating event lies at the very center of Heidegger's thought, the most basic traits of the transmutation of language that he seeks are to be found here. A more detailed characterization of the background and the approaches to this domain will help point the way in our investigation. Special emphasis will be placed on the linguistic devices used in these approaches, the first of which is the vicarious role which the 'and' plays in Being 'and' Time.

On the 'and' in Being and Time

It is often said that Heidegger is a man of one thought: Being. To say this relates him to a long tradition of Western philosophy, but it does not truly indicate what his unique question is. What we must do is to

get a glimpse of his central concern, of that one thought which has troubled him from the beginning, that draws him over and over again to the effort of thinking and that gathers all of his reflections together. What we are after is what Heidegger himself calls *die Sache*, 'that which concerns thought, that which for thought never ceases to be a question, that which is the very point of the question' (FP, 183).

His answers to Fr. Richardson's questions concerning his *Denkweg* are particularly enlightening on this point. Referring to the Aristotelian statement that 'being is said in many ways', which opens Brentano's inquiry into the manifold sense of being in Aristotle, the book which led him from the gymnasium into philosophy, Heidegger tells us that 'latent in this phrase is the question which determined my *Denkweg*: what is the pervasive, simple, unified determination of Being that permeates all of its multiple meanings?'² But before the 'common origin' of the polyvalence of Being can be established, a prior question must first be answered, namely, 'whence does Being as such (not merely being as being) receive its determination?'³ The phenomenological character of the quest for the source of the *Sinngebung* implied in this question only came to the fore later when Heidegger came in contact with the phenomenological 'method', which he interprets for himself in terms of the basic Greek senses of *phainesthai* (to show itself) and *logos* (to make manifest). This he identifies as the first of three decisive insights that clarified the venture of considering the Being-question as a question which seeks the sense (*Sinn*) of Being. The second was the interpretation of *aletheia* as unconcealment, gleaned from reading Aristotle, and the third the recognition that presence is the fundamental trait of Being as *ousia*. And Being as presence develops into the question of Being in terms of its time character.

Such is the complex of questions and insights which sets the stage for the problematic of Dasein posed in 1927 under the title *Being and Time*, in which 'the "and" in this title holds within itself the central problem. Neither Being nor time have given up their hitherto constituted meanings, but a more original interpretation must establish their justification and their limits' (KM, 219). That Being is related to time is already contained in 'the possibilities prepared for us by the "ancients"' (SZ, 19) who conceived Being as permanence in presence (*aei on*, *ousia*, *parousia*) and the whatness of beings as 'that which has always been', which in turn was one form of *a priori* and hence 'earlier' (KM, 216-17). And time has long functioned as a criterion for distinguishing realms of Being into the temporal, atemporal and supratemporal, so that even eternity was interpreted as a *nunc stans*, a permanent now. And yet why Being should spontaneously be conceived in terms of time has never really been made an explicit theme of philosophical inquiry. In opposition to this obliviousness, Heidegger sets himself the task of showing 'that and how the central

problematic of all ontology is rooted in the phenomenon of time, when rightly seen and rightly explained' (SZ, 18). In order for metaphysics in its entire history to be properly founded, one must make explicit the hidden relations of Being and time, the terms in which the very first thinkers of the question spontaneously expressed the issue, in which terms present thinkers continue to express themselves, manifesting that 'the understanding of Being in Dasein' almost of itself projects Being upon time' (KM, 219). The most apparent juncture of Being and time, at least in 1927, is then *Dasein* itself.

The issue of Being and time seems to resemble the well-known metaphysical distinctions of Being and becoming, Being and appearance, and Being and thinking. But the 'and' of the metaphysical distinctions is disjunctive: Being *and not*. . . . It serves to introduce something other than Being, which delimits Being and still somehow belongs to it. But 'in the formula "Being and time", "Being" is not something other than "time" inasmuch as "time" is named as the forename for the truth of Being, where truth is the essencing of Being and therefore Being itself' (WM, 17). Therefore, the essence of time considered within the question of Being points toward a completely different realm of inquiry than the metaphysical distinctions (EM, 157). And yet the most consequential of these metaphysical distinctions, Being and thinking, can be turned in the very same direction by investigating thinking not as a power of men but as a power of aboriginal Being, as the first essay in *Identity and Difference* does.

All of Heidegger is then an attempt to read Being and time into one another. Being and time are 'convertible' terms, i.e., they 'turn together'. And the thrust of the later Heidegger converges on a focus of thought in which Being 'and' time are read into one another to such a degree that they become One in a simple center which is the source of both. This 'and', left unspecified by the early Heidegger, is now given the singular and proper name of *das Ereignis* and described as the e-vent that appropriates Being and time, the It that gives both, the third that has always been first, and as such, the secret power hidden in both Being and time and holding the two in a relationship of reserve. But the two terms being unified have also developed in the course of the *Denkweg*. Hence he now states that 'the task of thought better perceived now needs a more appropriate determination of the theme which had otherwise been indicated under the title *Being and Time*. The title ought now to read *Presence and Clearing* [*Anwesenheit und Lichtung*]' (FP, 173).

It is in these deepened terms that Heidegger finally understands his preliminary question. 'Whence does Being as such receive its determination?' and its answer: 'Being is determined by the reach of time'. And in reply to the first question, it appears that the simple unified 'determination' of Being, the 'common origin' which pervades all of its

multiple meanings is now the event out of which Being as presence and time as clearing become apropos to each other.

If instead of 'time' we substitute: clearing of the self-concealing of presenting [*Anwesen*], then Being is determined by the reach of time. This comes about, however, only insofar as the clearing of self-concealing assumes in its want a thought corresponding to it. Presenting (Being) belongs in the clearing of self-concealing (time). Clearing of self-concealing produces presenting (Being) . . . this belonging and producing rest in an appropriation and are called event.⁴

Presenting and clearing

Now that the direction of Heidegger's thrust into the 'and' has been pointed out, we must follow through with a brief development of the content of its two poles. As already indicated, the two terms cannot be considered different from one another. Both refer to the essence of time. Both describe the process of unconcealment, the truth of Being. Both accordingly bear a reference to the ultimate concealment. The presenting process (*Anwesen*) is at once an absenting process (*Abwesen*). Essence (*Wesen*) for Heidegger is accordingly understood verbally in terms of an interplay of presence and absence. And clearing is always understood in terms of the background of obfuscation from which it frees itself.

But each of the terms makes its appearance in the Heideggerian opus in a different way, from a different source, in different contexts, and therefore carrying differing nuances, which is precisely the source of the difficulties of bringing them together in the turn. Presence and its presenting process are the temporal terms for Being which Heidegger finds in the Western tradition and accepts as such, while constantly mulling the secret essence of time which lies hidden and unthought in these terms. Presence more often than not is used as a variant expression of the ontological difference of Being and being, viz., the presenting of what is present, which emphasizes its association with a long tradition of metaphysics concerned with beings to the neglect of Being. And the various missions of presence sent by the appropriating event constitute the history of metaphysics.

Clearing, on the other hand, is that within which beings can present themselves, the free and open space which grants us access to the beings which we are not and to the beings which we are, the leeway and playing field of the world. More basically, when verbally understood, clearing is the regioning of a region, the expansive opening which permits an outlet for free play and enables presenting to take place and thus lets being be. As the enabling element, the clearing is not only that within which

beings present themselves, but also that by which things appear. As the site of openness, it is the here of Being, Da-sein.

Dasein was the preliminary pivotal concept of the first part of Heidegger's original prospectus for executing the turn to the event, just as its second part was to 'destroy' the traditional conception of time in order to prepare the ancient conception of *Anwesen* for the turn. In *Being and Time*, Dasein as Being-in-the-world is identified with the clearing, in the introduction to the well-known sections which elaborate the constitution of the here as the thrown and projected linguistic realm of meaning which is man's understanding of Being (SZ, 133). Here, it is also pointed out that a long tradition of *Lichtmetaphysik* has described this understanding figuratively as a *lumen naturale*. But the light of reason interpreted as a reified power somehow implanted in us is precisely what Heidegger from the beginning strives to surpass, in order to establish the ontological ground for any act of illumination or intuitive seeing. Such a backtracking ultimately leads to a reading of the traditional definition of man, the living being possessing *logos*, instead as the being possessed by *logos*, where *logos* is now (among other things) the indigenous field of language in which he lives, moves and has his Being.

Furthermore, even though *Lichtung* suggests *Licht* and hence has been translated as 'lighting-up process', Heidegger strives to surpass the *Lichtmetaphysik* from Plato on and to backtrack into the ground that precedes as well as makes possible such an interpretation. The clearing as such is neutral with regard to its medium and mode of reception, and sets free sounds, for example, as well as sights. For Heidegger, even more basic than the *Licht* of *Lichtung* is its metaphorical reference to a clearing in the wood which is first cleared by a process of lightening rather than lighting, a thinning of the thicket (FP, 170–1, 190–1). Obstacles must first be cleared *away* before obscurities can be cleared *up*. The disencumbering disclosure is first necessary to release the clearing for illumination. Parenthetically, it may be noted how the spatial metaphor which permeates language through and through continues to crop up in any attempt to discuss time, where, for example, the clearing continues to be described as a 'temporal playing field' (*Zeit-Spiel-Raum*).

From the beginning, the clearing process was conceived as temporal through and through. *Being and Time* concludes that it is ecstatic temporality which originally clears the here of Dasein and which unifies its articulated structure in terms of the three dimensions of time (SZ, 351). As the *ekstatikon* pure and simple, temporality is the condition of the possibility of the ex-sistence that Dasein is. Time is the primordial 'ex' that extends Dasein in its scope and limits, which determines the kind of understanding of Being which man has, appropriate to his time. 'With the disclosure of the "here" grounded in ecstatically stretched temporality, a "time" is allotted to Dasein' (SZ, 410).

This tensile character of time and its tenses is maintained in the 1962 lecture 'Time and being' in the way time is given in the event, as an offer of presence that reaches (*Reichen*) and that thereby defines the reach (*Reichweite*) of a region (*Bereich*). The three time dimensions constitute three different modes of reaching and of offering presence. In reaching to one another, the three dimensions of time not only establish a play of presence and absence, but clear for themselves a temporal playing field. This reciprocal interplay is under the sway of a fourth dimension in which the unity of authentic time reposes, an incipient offering and reaching-extending which clears the three dimensions by holding them apart and together in proximity, a proximating proximity which at once denies what has been and restrains what is to come and so conceals as well as clears, and clears only when the time is 'ripe', appropriate (ZS, 46–9). For 'the proximity which proximates is itself the appropriating event' (US, 196).

And its last word is silence. For the event is not a permanent presence, but instead gives itself by withdrawing itself. It is this withdrawing mystery which provides the permanent origin of all clearing. Accordingly, the clearing itself is not a fixed stage with its curtain always raised where the play of beings runs its course, but a shifting scene that fades into the background only to emerge anew. Because the event withdraws, it is still the indeterminate 'There is' of the Ur-phenomena of Being and time, the *Lethe* at the very heart of *aletheia* that continues to draw thought forward.

To describe the indescribable

With its principle of *zu den Sachen selbst*, phenomenology has acclimated us to a movement of radical regression which strives to undercut the constructions of the natural attitude, science and metaphysics in order to manifest the fundamental experiential structures that found them. The most fundamental and all-pervasive structure is that of intentionality, at once constituting and intuitive, productive and revelatory, active and receptive, and variously described by Husserl as a transcendental life experiencing the world in a 'living present', by Heidegger as the event of unconcealment in which thinking and Being are the 'same' in a point of intimacy between Being and man which precedes all distinction, by Sartre as a pre-reflective action of revealing the world, by Merleau-Ponty in terms of the active human body perceiving a world of ambiguity. Not that these formulations exhaust the issue. As Heidegger puts it in his foreword to Husserl's lectures on time constitution, 'the term "intentionality" is no all-explanatory word but one which designates a central problem'. In Husserl's words, we are standing before 'the deepest

essential bonds between reason and being in general, the puzzle of all puzzles'.⁵

The regress takes us to the root of human experience itself, in a radical effort to get to the bottom of things which ultimately reaches a point where the bottom falls out and gives way to an abyss (*Abgrund*), an undifferentiated and indeterminate chaos, 'the chasm out of which the Open opens itself' (*HD*, 61). Chaos here is thus not to be taken in the static sense of sheer disorder and confusion, but as a 'drive, flow, and motion, whose order is *hidden* and whose law is not immediately known' (*NI*, 566), 'the hidden, self-overflowing, unmastered excess of life' (*NI*, 568). We are before a radical beginning that posits itself beyond all distinction, as the immediate, the simple, the element, the *Lethe* of *aletheia*.

The drive to grasp experience by its umbilical cord takes us back to the moment of incipient pregnancy where meaning first takes hold in human experience, the original upsurge of 'reason' in experience, a fullness of meaning to be found in the very immediacy of experience, the ultimate *Sinnggebung* whose immediacy and spontaneous genesis of meaning at once find their apt expression in the double-entendre of the German *Es gibt*. Following what he considered to be a more faithful adherence to the phenomenological prescription *zur Sache selbst*, it was Heidegger who radicalized Husserl's quest for the most original givenness of beings into the question of the origin of givenness pure and simple.⁶

And yet this region of absolute giving is itself not given. 'The immediate, therefore, is never and nowhere "given"; it must always be restructured; and to "ourselves", that is to our most intimate life, we have no access'.⁷ 'For the "primal experience", upon which our experiences are grounded, has always passed irrevocably away by the time our attention is directed to it.'⁸ Here is the essence of the finitude of man, to whom life poses 'the colossal aporia, the insoluble dilemma'⁹ of glimpsing an immediate which is never accessible immediately (*HD*, 59–61). For consciousness always arrives too late to seize that which seizes it, the immediate present. 'Consciousness is senescence and a quest of things past.'¹⁰

And yet the immediate in its withdrawal is precisely what draws thought by calling out to be thought. The draw of its unthought is the very food for thought. It 'wants' thought, and 'gives' thought its sustenance, and in this way 'uses' thought to reveal itself. The lure of the ineffable, the call of the wild and aboriginal is the very provocation of thought. It is what sets thought on its way, its very incipience. It evokes thought, appeals to be thought – and therefore 'speaks'! Though it always holds itself in reserve, its silence is infinitely suggestive. Its draw is like the gesture of a finger pointing the way to the secret of our Being, of our time, of what is most appropriate to us. Accordingly, in its gestation

of what is most timely and original for us, it guides the course of our thought and of our history. And yet all this goes on surreptitiously, behind the scenes, as it were, outside of the arena of earth-shaking historical occurrences. The inaugural event of Being is not newsworthy. For, as the most immediate and comprehensive of our experiences, it is always with us as the element and background of all of our particular experiences, and in this sense quite ordinary. 'Nothing' really happens in this event (*N II*, 485) – which is why it is the most extraordinary and potentially devastating of our experiences when it does come into the foreground. Consider, for example, this description of the poet's venture into the ineffable immediacy ('the holy'): 'The shock of chaos, that offers no support, the terror of the immediate, that frustrates all intrusion, the holy is transformed through the tranquillity of the shielded poet into the mildness of the mediate and mediatizing word' (*HD*, 68–9).

But how does this event of language come about, if the immediate itself is ineffable, and can never be apprehended immediately? Even though the immediate is inaccessible in its immediacy, as the comprehensive event which permeates all particular experiences, it is at once the mediation of all mediated beings, and so can be glimpsed in and through its mediations. It is the word which articulates these relations among everything actual, and so itself is the mediation which holds and retains beings in Being. 'Without the holding and relating word, the totality of things, the "world", sinks into darkness' (*US*, 177). Language accordingly institutes the network of relations which is our historical world in its particular differentiations and bounded by its particular horizon. Its welcome capacity to domesticate the aboriginal in the 'mildness' of the word can nevertheless tranquillize the elemental power of its mediating ground into oblivion, as the current technological modulation of language has done. But it is always possible to revive the relationship of the event, 'the relation of all relations, the hold of all holds' (*US*, 267), since the horizon of our linguistic world 'is not a wall that encloses man; on the contrary, the horizon is *transparent*, it points as such to the non-established, becoming, and capable of becoming, to the possible' (*N I*, 574). 'The horizon throughout its transparent permanence lets the chaos appear as chaos' (*N I*, 575). Accordingly, the existing languages in which we find ourselves 'thrown' are always open to orientation toward this aboriginal language which 'speaks' in silence. And it is to our creative poets and thinkers that we look to find the words which somehow intimate the ineffable, old and familiar words long in use made to speak anew their relationship with the very source of language. This process of listening for the unsaid to be said in what has already been said has long been called hermeneutics.

To summarize, 'the intangible experience in itself cannot be apprehended nor mastered, but it manifests something to us, an appearance: says

something, an utterance. The aim of science, therefore, is to understand this *logos*; essentially, science is hermeneutics.¹¹ The mediatizing immediate which itself is unmediated, the ground which itself is an ungrounded abyss, the differentiating, articulating, unconcealing process which itself is undifferentiated, ineffable and concealed, such is the ultimate character of Being in its most archaic sense. Its concealment (*Verbergung*) is the very shelter (*Bergung*) of the aboriginal language, which speaks in its own time and its own unexpected way, according to which the hermeneute must bide his time.

Hermeneutical language

The language which orients itself to the silent event thus warrants being called a hermeneutical language. *Being and Time* situated the hermeneutical 'as' in a pre-predicative involvement in the referential relations of the world of gear preceding the theoretical predications of the apophantic 'as'. Later, the 'as' structure of 'something as something' appears again in the history of the metaphysical interpretations from Being as idea to Being as will. But 'the hermeneutical does not first signify the explicit interpreting that lays out, for even before this there is the bringing of the message and tidings' (*US*, 122). The hermeneutical language most basically is oriented to the 'primal tidings' of the aboriginal event, which 'speaks' silently, by withholding itself. To be true to its ineffable source, such a language leaves more unsaid in what it actually says. Its seminal, germinal, suggestive probing calls for a *logos* oriented to silence, a 'sigetic' logic.¹² 'Every incipient and authentic naming utters the unspoken, and indeed in such a way that it remains unspoken' (*WD*, 119). The unsayable is somehow said!

Such a hermeneutical language necessarily reaches beyond the resources of the current logical and grammatical conception of language, whose final court of appeal is the judgment and whose basic structure is the subject-predicate relation. For that about which one speaks here is no longer the self-givenness of a subject, but the self-withdrawal of the event. We are no longer dealing with the *An sich* of things on hand, but the *Ansichhalten*, the holding-to-itself of the basic mystery. Whereas the apophantic language arrives at a predicate which bestows a definite character on a subject that already stands out, the hermeneutical language, groping in the most primordial pre-predicative realm, culminates in the 'saying that does not say' (*sagenden Nichtsagen*) (*ID*, 72). In it, purely declarative sentences are no longer possible, its assertions take on a peculiarly non-assertive character, its propositions amount to a leap¹³ to which the usual logic of the substantive does not apply. It is no wonder that Carnap found in Heidegger a particularly rich source of

what for logical positivism can only be meaningless assertions or pseudo-statements, like 'nothing itself nothings'. 'A sequence of words is meaningless if it does not, within a specified language, constitute a statement.'¹⁴ It is precisely such a closed system of language, with its strictly defined rules of formation and rigidly fixed vocabulary, that Heidegger seeks to 'destroy'. How he does this, what linguistic strategies he employs, is what we now wish to examine.

Generally speaking, it can be prefatorily stated that Heidegger's resorting to these peculiarly non-assertive assertions arises from his attempt to think Being *itself*, Being *as such*. The following quotation strikes the pervasive keynote: 'Yet Being – what is Being? It is itself. This is what future thinking must learn to experience and to say. "Being" – it is not God nor a world-ground. For being is further than any being, be it a rock or an animal, a work of art or a machine, an angel or God. Being is the nearest. Yet the near is what is farthest for man' (*PW*, 76). And later: 'The appropriating event is the most unpretentious of the unpretentious, the simplest of the simple, the nearest of the near and the farthest of the far, within which we mortals sojourn and live our temporal life' (*US*, 259). As the simplest of the simple which is nearest in immediacy and farthest in accessibility, Being as such signalizes a new principle of identity toward which all converges and out of which all emerges, the *self*-given in a strictly terminal sense, 'at once *self*-withdrawn. Thus, echoes of the old tautological *A is A* are constantly heard in Heidegger's meditations. These apparent tautologies serve as bases for a leap into a new dimension of identity which in its immediacy defies articulation. Accordingly, we are told that the sentence 'language is language, speech is speech', apparently 'a tautology which says nothing' (*US*, 12) and its verbal iterative, 'speech speaks', can lead us to an abyss which opens onto the place of the essence of speech and of the speaking being, man. Far from being a meaningless tautology, such an iterative sentence serves to turn us away from thinking about language in terms other than itself, as an externalization of inner feelings or as an activity of man, for example, in order that we may consider language as language, in terms proper to it as such. It thus turns our attention to the power of language itself to reveal, to let beings be, and more profoundly, to the silent source of this power, to whose 'air' we as speaking beings are called upon to listen, to whose elemental modulation we already find ourselves attuned.

Speech speaks in order to summon the world and things to their essence, whereby the world worlds and the thing things. In thinging, the thing draws the world near and gathers it. The world in turn worlds by granting the thing its nexus for gathering. In reciprocal intimacy and with the articulation of the difference between them, each comes into

its own. Issuing out of the e-vent of appropriation, each receives its unique essence.

Speech speaks – the world worlds – the thing things – why these verbally iterative sentences (to which others can easily be added from the Heideggerian opus)? For one thing, such iterations stress the verbal over the substantive, and develop a series of iterative verbs designed to overcome the static permanence which the 'is' has acquired. Moreover, we are in the proximity of a family of phenomena to which the 'is' is to a large extent not applicable, for Being 'is' not a being, nor 'is' time. Finally, such a linguistic strategy serves to emphasize the phenomenon itself (*die Sache selbst*), 'as such', in its unique essence and essential uniqueness. From his early interest in Scotus' notion of haecceity to his ultimate selection of *Er-eignis* as his theme-word, Heidegger's concern for a uniqueness which is at once universal is everywhere apparent, as in the concreteness of the 'here' and the temporal riddle of uniqueness. All of these iterative verbs therefore seek to express how the 'proper' nouns, speech, the world, the thing, etc., 'essence'. In opposition to a tradition of static and eternal essences, Heidegger seeks to develop a verbal conception of essence. The iterative sentence accordingly points to an identity and sameness which permits difference, to an essence which is self-changing and historical, appropriate to its time.

This transmutation in the conception of essence is especially expressed in the following two turning sentences:

The essence of truth is the truth of the essence (WW, 26).

The essence of speech: the speech of the essence (US, 200).

In each case, the first essence is understood traditionally as quiddity, while the second is taken verbally and refers to the enduring abiding that makes way, i.e., the appropriating event. The other terms follow their contextual suit in the turn of phrase. Accordingly, the turning sentences now read: what truth as knowledge is emerges from the unconcealment of the event that appropriates; speech as human activity finds its incipience in the silent saying of the event. Both turns terminate in the appropriating event. The colon which breaks the second sentence serves to symbolize the leap that is necessary to execute the turn.

The way leading to the direct articulation of the event itself also traverses a linguistic evolution. It centers on the attempt to find a suitable way of speaking of the It which gives the Being which is there when we say 'there is Being'. At first, the It is simply identified with Being itself in its self-giving, so that 'Being gives Being' (PW, 80–1). But this way of putting it still has the disadvantage of suggesting that Being somehow 'is', like a being. Later, the giving of Being is identified with the sending of the mission of presence in the history of Being, which must be considered together with the giving of time as the extending of a clearing.

The substantifying effect of the It, which is now identified as the appropriating event, must then give way to the verbal impact suggested by these two modes of giving. For the event is nothing but the giving itself. It is unacceptable to say that 'the event is', since it is not a being, or that 'it gives the event', since all giving issues from the event. Both expressions therefore reverse the proper direction in which the event is to be thought, which in its giving always retreats into its abyss. The best that can be said is: 'The appropriating event events by appropriating' (*Das Ereignis ereignet*), not as a mere sentence subject to the questioning of logic, but as a touchpoint of meditation on the mysterious comings and goings and abiding character of the central concern of thought. Even to speak of Being *as* the event, which certainly is true in its general intent, risks placing what is thought here on the same level as the metaphysical interpretations of Being as idea, as will, etc. But the event is not a kind of Being subordinated to the basic concept of Being. And the reverse is no less objectionable: Being is not a kind of event, for the event is not a generic concept to which Being and time are subordinate. Relations of a logical order say nothing to us here. Being and time disappear into the event out of which they are appropriated and thus come into their own. The 'as' here is simply the giving appropriation of Being and time, the eventing of the event itself. The event events. All comes back to saying the same, going from the same and returning to the same, which at once is always different, the principle of uniqueness itself (ZS, 54–66).

Summary: a 'linguistic analysis'

The iterative and circular 'syntax' of the hermeneutical language serves to de-emphasize the predicative structure of our inherited languages, and therefore tends to concentrate our attention on its keywords within a pre-predicative context. The hermeneutical process ultimately focuses on the most fundamental words of our language, in order to listen to their changing modulations and mutual resonance. By way of summary and conclusion, an attempt will be made to unravel the strands of meaning knotted into the notion of *Ereignis* from a somewhat different perspective. And the translation of *Ereignis* as 'appropriating event' has yet to be justified.

In officially introducing *Ereignis* as the very centerline of his endeavors, Heidegger rather grandiosely asserts that 'it can be translated with as little success as the Greek keyword *logos* and the Chinese *Tao* (ID, 29). If we bracket the Teutonic pomposity of this declaration, it does suggest that we can expect in this word the same manifold convergence of connotations that Heidegger himself has unraveled from the Greek *logos*.

In fact, he later specifies the *Ereignis* as the one and only, unique and simple subject matter of thought, inaccessible in its simplicity, approachable only through a manifold thought, and *ipso facto* through a manifold language.¹⁵ This accounts for the structure of the Heideggerian opus, aiming at a single center, approached along numerous 'forest trails', some of them perhaps dead-ends.

As a first approximation of this unique *Sache*, Heidegger takes the phenomenological path. Recall the great circle of Heidegger, that it is first necessary to anticipate and acknowledge what is to be explicated, namely, the total situation where emergent Being shows itself. Once in the circle comes the problem of finding a suitable language to describe this process of emergence, the relations within it between man and the Being of beings, and finally the enabling element which is the condition of the possibility for such emergence and such relations. This enabling element is ultimately termed the *Ereignis*. Difficulties to this project are soon encountered in a language rendered opaque by a long tradition of metaphysics. In the face of this, Heidegger does not suggest that we take to neologisms, but rather calls for 'a transformed relationship to the essence of the old language'.¹⁶ What sort of a conversion? A phenomenological one, and to the extent that phenomenology calls for complete honesty, an ethical one as well. And if phenomenology is a matter of letting 'things' speak for themselves, then its most refined phase, thought, is a matter of letting language speak for itself. Indeed, at the aboriginal level of the *Ereignis*, language and *Sache* are one for Heidegger.

In what ways then does this aboriginal language speak of itself? I submit that a manifold of major linguistic constellations can be distinguished in Heidegger's own descriptions of the *Ereignis*. If indeed *Ereignis* is the common source of emergence of the manifold senses of Being that Heidegger wants it to be, then one should expect all the heavy-duty stems of our most archaic language to tend to merge here. Heidegger's own reflections on the convergent senses of *logos*, *physis*, *aletheia*, and the other old Greek words which somehow named the unnameable prefigure our discussion here, and in some sense are to be repeated for the sake of a new beginning in the event. The process of instituting *Ereignis* as a 'guiding word in the service of thinking' (*ID*, 29) in fact continues the reflection on the most fundamental words of our language in an attempt to approximate the archaic simplicity of the aboriginal language. What follows then is a highly condensed 'linguistic analysis' of Heidegger's most basic language in terms of the main linguistic constellations that thread through his conception of *Ereignis*:

(1) The language of *coming and going*, used to express the dynamics between man and Being. On the basis of such descriptions, *Ereignis* becomes the event of the advent of Being overcoming man through

intervention in his ventures. Certainly no ordinary event, limited to a moment or period of time, but one that is momentous and periodic, or better, that which makes events momentous and periodizes them.

(2) The suggestions of intermittence in the comings and goings of the event are countered by a second linguistic group of *stasis* words, of standing and bringing to stand, posing and positing, setting and fixing, in which man stands out into Being in a holding attitude that holds himself and beings in ex-sistential place. This incipient state-of-affairs ultimately points back to the *Ereignis* as the 'holding that holds to itself, the relation of all relations, the hold of all holds'.

(3) Insofar as aboriginal Being holds to itself, it holds back, withdraws, and in so doing draws man with it. We are now approaching the language of *hide and seek*, and the chiaroscuro interplay of *hide and show*. This always appears as Heidegger's last word on *Ereignis*, as the concealment.

(4) Closely tied to but significantly distinct from the language of hide and show is the language of *closing and opening*. Opening as clearing constitutes a releasing, a freeing, permitting an out-let for free play. Thus appears that all important Heideggerian word, *lassen*, and *Ereignis* becomes the dimension enabling the emergence of beings and providing viability to man.

(5) But the last word in Heidegger is still the closure of disclosure. That which grants access is itself inaccessible. Confronted with the ineffable opaqueness of the abyss of aboriginal Being, all that can be said is that 'there IT is', or – and here English fails to keep pace with the German – *Es gibt*. *Ereignis* as the indeterminate 'there is' which gives and promotes a language of *give and receive*, or more vehemently, in keeping with the violence of man and Being that Heidegger finds expressed in the Antigone chorus, *give and take*.

(6) 'To appropriate' says both give and take, as well as the all important proprium (*eigen*) and adapting (*eignen*) of the *Ereignis*. Heidegger's persistent use of these cognates and their variants suggest that these connotations were uppermost in his choice of this 'guiding word in the service of thinking'. Evidently *Ereignis* is to be the mutually appropriating realm of the give and take of uniqueness.

Zygmunt Adamczewski¹⁷ has suggested 'bearing' as a translation for *Ereignis*, which helps to bring out some of its further ramifications. For one thing, it intuitively brings to the fore another linguistic constellation, the language of *genesis* so time-honored in religion, philosophy and phenomenology. It thus emphasizes the perpetual pregnancy and fruitfulness of the engendering phenomenal ground. Bearing as begetting, carrying and delivering accentuates the creative character of aboriginal being, which Heidegger himself develops in his reduction of causality to a bringing forth or pro-ducere. It also suggests the carry-over and

deliverance of the inheritance of tradition (*Überlieferung*). Hence no one can deny that 'bearing' is a very fertile term. It furthermore suggests not only originating but also sustaining power. But here it is on a par with the holding action and staying power already indicated as proper to aboriginal Being. Likewise, some of the other nuances of 'bearing' are present and perhaps better expressed in the other linguistic groups. For example: forbearance is also withstanding and the ability to 'take it'; bearing as an attitude is also a stance or posture, an approach (*Angang*) or the now-clichéd openness. On the debit side, bearing suggests the teleology of the originating process to such a degree that it also connotes meaning and direction (*Sinn*), so that it in fact obscures its archeological character and the concomitant concealment at the heart of the 'e-vent', as an occurrence that comes from afar. And where are the closure and withdrawal that leads to degeneration and the intermittent need for regeneration? Finally, even though bearing suggests relevance, and hence implies the pertinence that belongs to the appropriate, it nevertheless verbally interrupts the profound resonance between the 'ownness' or proprium of the appropriate and the owing of a debt to my own existence to which I ought to own up, so well brought out by Adamczewski in his paper.

Not that we should reject the suggestions of gestation that 'bearing', brings to the understanding of the *Ereignis*. It suggests for instance that heavy-duty English root stemming from the Latin verb for 'bearing', *ferre*, which gives us that all important Heideggerian term, difference. In closest harmony with the *Ereignis*, Heidegger places the *Austrag* (ID, 10) which he roughly interprets as a 'bearing out'. In *Identity and Difference*, *Austrag* is the differentiation between Being and beings. In *Underway to Language* (22–5), it is also the gestation of the gestures of language, especially in the primordial articulation between world and thing. We are now evoking the language of *identifying and differentiating*, which conjures the most difficult of Heidegger's problems, the modulation of uniqueness, involving at once the exclusivity of selfhood, the disjunction of temporal epochs, and the historical discursivity of language.

Such is the language of the event in terms of its most primeval linguistic groups, which attempt to sound the most primeval event of language. The language of the event: the event of language. If we recall the double play of the 'of' that Heidegger emphasizes in other contexts, these two turns of phrase should ultimately be one and the same, at least in the sense of belonging together and corresponding to each other. In the metaphysics of grammar, 'of' is the genitive of possession; for Heidegger, it is the genesis of the proper, once again the appropriating event itself. More than once, he refers to an *Eigentum des Er-eignisses* (ID, 31; N II, 484; US, 265, ZS, 62–4). And what we have just surveyed in terms

of linguistic groups are those very 'properties' of verbal essence, or better, the propia of aboriginal Being.

The transformation of language at another beginning

Robert Bernasconi

Derrida's starting-point is the end of philosophy, or, as he would prefer to say, 'the closure of metaphysics'. The two terms 'philosophy' and 'metaphysics' are for Derrida, as they became for Heidegger, equivalent ways of referring to the tradition. 'End' is not an equivalent for 'closure' (*G* 14/4). Derrida uses the term 'closure' because he refuses to speak of the 'end' of philosophy in the sense of a termination. That philosophy is, if not finished, at least *at an end* is something which Derrida does not see any need to establish; he points to Hegel, Marx, Nietzsche and Heidegger (*ED* 117/79). It is for him quite simply the context in which 'those who are still called philosophers . . . in remembrance at least' ask the one question left to them – the question of the closure, that is the question of the relation between belonging to philosophy and achieving an opening beyond philosophical discourse (*ED* 163/110). Derrida's word 'closure' states his fundamental concern that it is impossible for us simply to transgress metaphysics, to leave it unambiguously behind us and stand unequivocally outside it. But it does not bear only this negative sense.

Derrida's name has come to be associated with a number of strategies which govern his approach to a text and whose function is to impose the closure on it. His procedure is most apparent in those places where he goes into greatest detail as, for example, in his reading of Plato's *Phaedrus* in *Dissemination* and of Rousseau's *Essay on the Origin of Languages* in *Of Grammatology*. Metaphysics is, according to Derrida, marked by a certain series of oppositions, the most fundamental of which is that of presence versus absence. In each of the metaphysical oppositions (inside/outside; speaking/writing; remedy/poison etc.) one of the terms is privileged over the other and the privileging of presence governs all these others. So Derrida's first task is to render the metaphysical reading of the text in hand and this tends to be accomplished by drawing attention to these oppositions and priorities at work throughout the text.

This prepares for a reversal of the priorities whereby what was primary becomes secondary and vice-versa. Finally this gives way to a reading in which neither term is privileged and we are introduced to a sense in which the terms (which at first – and second – reading were opposed) are ‘at play’ one with the other; the play takes place according to a logic which we do not associate with metaphysics. This play which exceeds metaphysics is thus found inscribed in texts which we provisionally took to be metaphysical. The inscription of this excess is in Rousseau borne by the word *supplement* and in Plato by the word *pharmakon*.

These various stages (which I have described rather more schematically than they are practised by Derrida) take the form of a series of readings of a specific text. We pass from a reading which is referred to the author’s intentions or an influential interpretation or even a standard translation and arrive at a reading which displays working through the text a logic which is not that of traditional metaphysics. And yet this passage is not arbitrarily enforced on the text, but is attained, by and large, through the use of fairly conventional hermeneutical techniques. The difference between Derrida and, for example, Gadamerian hermeneutics lies more in the greater resolution with which Derrida applies these techniques than is generally realized. The sense in which Derrida’s readings are immanent is indicated by his claim that every metaphysical text carries within itself the resources that will be borrowed from the metaphysical system to criticize it (*M* 70/60). The justification for reversing the hierarchy of terms is found inscribed within the text itself; the means for surpassing metaphysics are to be found within metaphysics itself. But this surpassing is not to be understood as a Hegelian *Aufhebung*.

Derrida’s approach is clarified somewhat in a discussion at the close of the 1968 essay ‘The ends of man’ (*M* 162–4/134–6). The context of the discussion is the apparent dilemma of our relation to metaphysics: we find ourselves on the inside yet recognize that ‘a radical trembling can only come from the outside’. Two strategies present themselves. The first is ‘to attempt an exit and a deconstruction without changing terrain’, where the risk is that we would simply be confirming, consolidating or subsuming (*relever*, the French equivalent of *aufheben*) what we claim to be deconstructing. The second is ‘to decide to change terrain, in a discontinuous and irruptive manner, by brutally placing oneself outside, and by affirming an absolute break and difference’. The second can never be successful on its own because ‘the simple practise of language ceaselessly reinstates the “new” terrain on the oldest ground’. Thus the call is for ‘a new writing’ to ‘weave and interlace these two motifs of deconstruction’. The first strategy is said by Derrida to be the one which predominates in Heidegger, whereas the second was the dominant one

in France at the time of the essay. But Derrida is quite clear that both strategies can be found in Heidegger.

Derrida's debt to Heidegger is obvious. The identification of metaphysics with the privileging of presence is found already in Heidegger's *Being and Time* – *Sein as Anwesenheit*. The very term 'deconstruction' which Derrida sometimes uses to describe his procedure clearly echoes Heidegger's notion of a 'Destruction of the history of ontology'. Nevertheless some of Derrida's followers, by emphasizing those passages in which Derrida draws attention to the metaphysical within Heidegger's texts, have tried to find a straightforward answer to the complex question of whether Derrida represents in any way an advance on Heidegger. Of course, Derrida also finds the rupture within Heidegger's texts, but those same Derridians can give the credit for this to Derrida himself as if it could be isolated as 'his' contribution. And yet this is to forget the sense in which Derrida's reading, like any other good reading, disappears into the text and becomes interwoven with it. The ambiguity of the Heideggerian situation is well described by Derrida himself when in *Of Grammatology* he writes that it is contained within the metaphysics of presence and logocentrism and yet it transgresses that metaphysics (*G* 36/22). For Derrida, to impose the closure on a text does not only mean to draw back within metaphysics what has pretensions to transgress it; it is at least just as much to force outside metaphysics whatever seems to stand within it. Of course, and this is crucial, the inside-outside opposition which is being used here to situate the closure is itself metaphysical. The two strategies of drawing within and forcing outside are inseparable. They belong together in an ambiguity for which Derrida prefers the title 'play' (*G* 104/71).

The temptation to see Derrida as simply representing the impossibility of any transgression of metaphysics and thus only the first of the two strategies described in 'The ends of man' is easy to appreciate. It arises because the case against the possibility of transgressing the history of metaphysics can be so clearly stated: 'we have no language – no syntax and no lexicon – which is foreign to this history' (*ED* 412/280). On the other hand, Derrida is adamant that this is not the last word: 'no concept is by itself, and consequently in and of itself, metaphysical, outside all the textual work in which it is inscribed' (*P* 78/57). In the present essay, by means of a reading of Heidegger's lecture 'The way to language', I shall attempt to investigate this language which is not simply metaphysical and which lies at the heart of the play of the closure interweaving the twin strategies. In Heidegger's own terms, it is the question of how the overcoming of metaphysics can take place when it is 'within certain limits, compelled to speak the language of that which it helps to overcome' (*W* 99; *EB* 380–1). This last quotation shows clearly enough that Derrida's question about 'the conditions for a discourse exceeding metaphysics' (*M*

70/61) is also one of Heidegger's questions and is not brought to him from 'outside'.

II

It is not difficult to imagine Derrida himself setting about a reading of Heidegger's essay 'The way to language' by first emphasizing the tendency of its translators or its commentators to re-inscribe Heidegger's text within metaphysics. The standard English translation in particular could readily be singled out for this purpose. By itself this could not constitute a reading Derrida himself might give: it would be but the first step on the way to such a reading. What I am concerned with is what happens when this 'part of a reading' is taken as a result. The partial reading, which could never be Derrida's reading, can nevertheless be called 'Derridian' in a sense often heard today: Derridian as opposed to Heideggerian. What characterizes a Derridian reading in this sense is the almost ritualistic attention to certain metaphysical prejudices to which Derrida himself has in his writings frequently called our attention. But in this case the reader fixes the prejudices in the text so that they cannot be undone from within the text, save only by a virtuoso performance which remains outside the text.

In order to sketch such a 'Derridian' reading of Heidegger's essay I shall consider six of these metaphysical gestures, all of which seem to be operative there:

- (i) Reliance on experience
- (ii) The priority accorded to speech over writing
- (iii) The quest for origins
- (iv) Logocentrism
- (v) The privilege accorded to possession
- (vi) The tendency to unite or unify.

The list is not supposed to be exhaustive. Taken singly or together the items on it are directed to the question of the inside/outside of metaphysics. I shall consider them in turn always with two points in mind: first, to indicate how on a first reading Heidegger's essay 'The way to language' might appear to be under the sway of these metaphysical motifs and secondly to show that to read Heidegger as falling prey to them seems to be in conformity with certain remarks of Derrida himself. Because my concern here is not a reconstruction of Derrida's own reading of Heidegger, I shall not restore those remarks to their proper context and the strategy from which they can be detached only at the risk of distortion.

First, there is Heidegger's reliance on experience. Derrida has always

insisted that the notion of experience is 'fundamentally inscribed within onto-theology . . . by the value of presence' (G 400-1/283). And yet Heidegger in 'The way to language' clearly defines his task as that of 'experiencing the unbinding bond within the web of language' (US 243/113). Companion essays to that one, 'The word' and 'The essence of language', similarly insist on undergoing an experience with language.

Secondly, we find the charge of phonocentrism, which means to uphold the priority accorded to speech over writing, the voice over the line. Again what is at issue is the privilege of presence over absence, this time as it concerns the presence of the speaker. In the essay 'The ends of man' Derrida charges Heidegger with privileging spoken language (M 159/132). When we turn to 'The way to language' it seems that writing is scarcely referred to, that the discussion is about speaking, and that there is even a sentence, seemingly Heidegger's description of his own position, which says that 'here too language shows itself first as our way of speaking' (US 250/120).

Thirdly, the notion of origin is also inscribed with the metaphysics of presence. The major part of Derrida's *Of Grammatology* is occupied with a deconstruction of Rousseau's texts on the origin of languages by means of a reading which gives rise to the notion of a 'nonorigin' of language (G 343/241), an 'incessant supplementarity' (G 334/235). And yet in 'The way to language' Heidegger can be found ascribing the origin of the word to Appropriation (US 265/133).

Fourthly, Derrida charges Heidegger with logocentrism (G 33/20). In so far as the issue of the closure is that of metaphysical language it amounts to the question of how one stands in relation to the *logos*. Heidegger's essay 'The word' culminates in the word *logos* (US 237/155). It also seems to figure in 'The way to language' in Heidegger's adoption of the word 'monologue' from Novalis and the discussion of 'gathering', a notion Heidegger frequently appeals to when explicating *logos*.

Fifthly, Derrida draws attention to what he regards as the ethico-ontological ground of Heidegger's notion of *Verfallenheit* or fallenness, in spite of Heidegger's denials that they are relevant. Derrida's justification is that it is the language and not the intention which is decisive (M 50/45). The objection extends also to cover the notions of authenticity and inauthenticity and then to the whole family of words in Heidegger which bear the same root. It is in this way that Derrida in *Spurs* seeks to draw the fundamental word of Heidegger's later thinking *Ereignis* back into the orbit of onto-theology. The translation of *Ereignis* as 'appropriation' would, if correct, support Derrida's claim.

Finally, Heidegger's emphasis on the unifying unity of the essence of language seems to reflect the totalizing tendency of metaphysics and offers itself as a suitable target for dissemination.

Is one not forced to acknowledge in the light of this catalogue – which

could readily be extended – that Heidegger remains tied to the language of metaphysics? It would seem unnecessary to pursue the matter further, particularly as Heidegger himself seems to concede as much in the final pages of the essay where he describes the present era as one in which the old is completed and nothing new begins (*US* 265/133).

But, as I have explained, it would be entirely uncharacteristic of Derrida himself to decide the question of the inside/outside simply by drawing Heidegger's text back within metaphysics. He would only want to show the possibility of a metaphysical reading of Heidegger to place alongside it another reading, one which would show Heidegger transgressing metaphysics (*G* 36/22). Such a reading of Heidegger's text 'The way to language' is given by Derrida in the course of an important article published in 1978, 'Le Retrait de la métaphore'. It is accomplished particularly by concentrating on the two families of words, that of *Ziehen* and that of *Reissen*. I shall not give an account of Derrida's essay here, both because I have had to leave to one side the question of metaphor with which it is concerned (highly relevant though it is to the topic of metaphysics) and because I am for the moment more concerned with Derridian readings than reconstructing Derrida's own reading.

For my purpose the question which needs to be clarified is whether this second reading, which shows the transgressive gesture at work in the text, would simply replace the first and metaphysical reading or whether the point is to leave us undecided between the two readings so that the ambiguity of the text becomes a means of reflecting the sense in which at the closure we find ourselves unable to say what lies inside and what outside. The answer no doubt lies in the notion of a history of textuality, indicated but not developed in *Of Grammatology*. Was one of the results of such a history the recognition that what defined reading in our own epoch was that it found at work, structuring certain crucial texts, a logic other than the traditional one? Before they were given a 'new' reading it had seemed that texts like Plato's *Phaedrus* or Rousseau's *Essay* belonged unambiguously to the tradition; and yet the deconstructed reading did not simply replace previous readings. It only existed in relation to those readings which constituted the text in its historicity. Having dismissed the idea of the original meaning of a text, whether it was to be identified with the author's intentions or not, Derrida came to identify the text with the history of its readings. Nevertheless in the case of the text of a contemporary such as Heidegger or Levinas, the issue became more acute. Could we not have a text which is written and read only in accordance with this 'other' logic?

Sometimes Derrida addresses this question by suggesting that it is the contemporary readers of Heidegger whom he remains concerned with and not Heidegger himself. The contemporary reader draws the text back within metaphysics. But over and beyond that is the fact that we

have at our disposal only the traditional language. And yet how can that point be made without rendering any transgression of metaphysics impossible and Derrida has never left us in any doubt that he recognizes the possibility of such transgressions or ruptures. The questions remain: How can there be any transgression at all? And if metaphysical language can be transgressed, why is Derrida so insistent as part of his strategy in showing the metaphysical language operating where he will find the transgression? Or to put it another way, why does Derrida insist on both the strategies outlined at the end of the essay 'The ends of man' and how are they to be united? I shall look for answers to these questions in the reading of Heidegger's 'The way to language' which shall occupy the next three sections of my essay (corresponding to the three sections of Heidegger's own essay).

III

After an important introductory section to which I shall return later, 'The way to language' begins with a discussion of the way language has been thought in the tradition, concentrating on two of the most influential accounts – Aristotle's in *Peri Hermeneias* and Wilhelm von Humboldt's in *Über die Verschiedenheit des menschlichen Sprachbaues*. Heidegger ended his 1957 lecture 'The principle of identity' by saying that 'only when we turn thoughtfully toward what has already been thought, will we be turned for what is yet to be thought' (ID 106/41). This is more than the customary warning that to remain ignorant of the tradition is to be in danger of repeating it. Heidegger is suggesting that there is a close relation between the dialogue with previous thinking and freeing oneself for what he elsewhere describes as 'the no-longer metaphysical'. The thinker attains the 'no-longer metaphysical' by the step back into the essence or ground of metaphysics (W 100/EB 382).

Heidegger has always insisted on a close link between what is transmitted by the tradition and what we regard as self-evident, what we take for granted (SZ 21). In outlining the traditional conception of language he also has in mind the 'ordinary' conception of language (US 255/125). Three common prejudices are highlighted in Heidegger's account. The first is that we tend to understand language in terms of speaking and not the other way round. The second is that we tend to conceive of speaking as an activity. The third is that we tend to take the activity of speaking for granted. At this juncture Heidegger reminds us that language is not a fixed possession and that sometimes we cannot speak through fear or because of some accident. But he is not thereby attempting to issue a direct challenge to the conception that man is the animal who 'has' the *logos*. The tradition was well aware that the capacity to speak is some-

times disrupted. The point would seem to be rather – and it has to be conceded that Heidegger in no way spells it out – that such cases of disruption came to provide the basis for the analysis of language, just as cases of hallucination or illusion tended to serve as the starting-point for the analysis of perception. The essential character of speaking came to be determined on the basis of those cases where speech fails us. One may have the intention to speak, but whoever does not make sounds does not speak; whoever has lost the capacity to activate the organs of speech has lost speech. Thus one of the primary ways in which speaking came to be regarded was in terms of the making of sounds.

To take the very clear, though relatively late, example of the Stoics, their treatment of language operates within the distinction between the word and what it signifies. This distinction is not given to the speaker or hearer deep in conversation, but arises only in the face of the barbarian, the outsider who addresses us but who fails to understand anything of what we say; he hears only noises. In this way the word is reduced to a word-thing or sign and the analysis of language concentrates on what the barbarian lacked, which the Stoics called *to lekton* – the sense of significant discourse (Sextus Empiricus, *Adversus Math.* VIII, 11–12). Essentially the same procedure can still be found to provide the basis of Husserl's analysis in the *Logical Investigations*. In such analyses the Being of language always goes missing, not so much because the investigation takes as its basis the case where language fails, but because the Being of language is not one constituent among others.

This response to the analysis of language is at best only hinted at by Heidegger. He is more directly concerned to provide the broad outlines of a history of the philosophy of language. He concentrates on three stages. First, using the example of Aristotle he suggests that the Greeks of the classical age understood the relation between the various analytic constituents of language – letters, sounds, passions in the soul, that which strikes the passions – in terms of showing, letting appear, letting shine. Secondly, following the time of the Stoa, the relation of showing gives way to that of the sign understood as an instrument. The subsequent history of language is treated simply by reference to Humboldt, although later in the essay he will give some indication of how the conception of language as an instrument reaches its peak in the modern view of language in terms of information. Heidegger refers this history of language to the account of the change in the essence of truth which he had developed in the essay 'Plato's doctrine of truth'.

Thus the point is made that Aristotle's discussion of language is not to be read in terms of truth as correctness, but in terms of *aletheia* as unconcealment. Heidegger provides a somewhat unconventional translation of the well-known passage at the beginning of *Peri Hermeneias* which explicates both the relation between the making of vocal sounds

and the soul's passions and the relation between what is written and vocal sounds in terms of *sumbola*. William of Moerbeke in his translation had understood *sumbola* to mean *notae* (tokens). Heidegger understands it in terms of showing. The interpretation on which this translation is based goes back at least thirty years to the 1925/6 Marburg Course where the focus of his reading is the interpretation of *logos* as synthesis (*L* 166–8). In 'The way to language' Heidegger does not refer to earlier translations and more familiar interpretations of the passage. Nevertheless the companion essay 'The essence of language' (contrary to the impression given by the standard English translation) gives the more conventional translation in terms of 'signs' (*US* 203–4/97). There is concealed in the translation Heidegger offers in 'The way to language' what at an earlier time he might have called a 'destruction' of the tendency 'of all later considerations of language' to take the sign as their standard (*US* 204/97). These later considerations are regarded by Heidegger as derivative of the more fundamental conception of language which recognizes it as a showing. Heidegger says nothing at this point of the essay to suggest that he recognizes this passage from Aristotle as an example of phonocentrism, which is how Derrida refers to it in *Of Grammatology* (*G* 21–2/11). Indeed in general there is no indication at this stage that any attempt will be made to go beyond Aristotle, let alone a clue as to how this might be done.

By contrast, Heidegger's discussion of von Humboldt follows the assessment of him already to be found in *Being and Time* where 'the philosophical horizon' within which he made language a problem was put in question (*SZ* 166). A similar point is made here. Humboldt speaks the language of metaphysics, specifically that governed by Leibniz, as when he writes of language as an activity, *energeia*. Furthermore, Humboldt's account is inadequate because it grasps language in terms of a higher universal. Language is not experienced in its own terms, but is explicated with reference to the notion of a 'world view'. Nevertheless there are hints of a more sympathetic treatment of Humboldt. His treatise is described as 'astounding, obscure and yet continuously stimulating'. Indeed at the end of the essay, Humboldt is given that rare honour, usually only accorded to Hölderlin, of having the last word.

In general this first section of Heidegger's essay is a very broad survey of the approach to language taken by two of the most eminent representatives of the philosophical consideration of language, with only brief indications of what passed between. For the most part the survey is not very different from one Heidegger might have given thirty years earlier. Even the discussion of the transformation of the sign in terms of 'the change in the essence of truth' is striking for being out of line with other discussions at about this time. Both in 'Hegel and the Greeks' six months earlier and 'The end of philosophy and the task of thinking' five years

later, and in spite of what seem to be striking differences between those two accounts, Heidegger was especially cautious that the passage away from *aletheia* not be referred to 'truth' as if that notion encompassed both terms of the transformation. And yet one has to say that because Heidegger does not give the conventional reading of Aristotle, but only his own re-reading of Aristotle, this first part of the essay does not seem to be setting up a straightforward metaphysical account simply in order for it to be 'overcome' subsequently.

IV

The philosophical consideration of language has tended to take the form of an analysis whereby language has been broken into its components. In the face of this diversity it has tended to let one aspect of language predominate (US 251/121) or else it has grasped language in terms of something other than language, such as activity, spirit or world view (US 250/119). But this means that the attempt to find the unifying unity of language, that which we might call the 'essence of language', fails because the universal only succeeds in co-ordinating or synthesizing relative to the analysis (US 250/120). For Heidegger the failure to attain language as language defines the traditional approach; the 'ownmost' character of language has always eluded it. Indeed so long as we think *das Eigentümliche* not as the 'ownmost' character of language, but – and this is how the standard English translation renders it – as what is 'peculiar' to it in distinction from other things, language is still being referred to what is not language and, in Heidegger's terms, is being thought metaphysically.

In consequence, Heidegger in the second part of the essay sketches an alternative account of language to that of the tradition of Aristotle and Humboldt (US 250–1/120). He does not indicate a source for this view of language. Nevertheless in certain important respects it resembles the account of discourse given in the thirty-fourth section of *Being and Time*. Heidegger had already there dismissed previous attempts to grasp the essence of language not only as one-sided and partial, but also as inadequate in terms of their starting-point (SZ 163). Furthermore, *Being and Time* rejected one of the pillars of the analytic approach when it insisted that 'word-things do not get supplied with significations' (SZ 161). Language was not to be understood in terms of constituents revealed by analysis. Indeed Heidegger was careful not to individuate constitutive items, but emphasized instead what he called 'the structure of discourse'. The essence of language as the unifying unity of language is anticipated in this notion, but it is not experienced and is not named. Both the metaphysical attempt and that of *Being and Time* – whose relation to metaphysics is still an open question – fail in this. The

account of language offered in *Being and Time* may claim superiority over previous accounts on the basis that it alone attempts the task of working out the structure of discourse on the basis of the analytic of *Dasein*. A close reading of section thirty-four suggests that we are there already invited to understand the relation between *Dasein* and language in such a way that this task is nevertheless to think language in terms of itself, and not in terms of something other than language. But there is no indication – the discussion of ‘keeping silent’ notwithstanding – that to bring language as language to language means anything other than finding a name for it.

Indeed Heidegger in ‘The way to language’ evokes this earlier discussion of keeping silent, where hearing and keeping silent were presented as ‘possibilities belonging to discursive speech [*Sprechen*]’ (SZ 161). In *Being and Time* Heidegger had with the introduction of a distinction between discourse and speech addressed the question of the privilege accorded to speech in the traditional accounts of language. No doubt a certain kind of reading would latch onto the phrase used to describe keeping silent – ‘discursive speech’ – in order to suggest that the privilege is not addressed there resolutely enough. Certainly the relation in which silence stands to speech needs further clarification, leaving the possibility that the conventional subordination of silence to speech has here simply been reversed. In ‘The way to language’ Heidegger introduces a distinction between ‘saying’ and ‘speech’ (US 252/122) which runs parallel to that between ‘discourse’ and ‘speech’ in *Being and Time*. This distinction is no more successful in displacing the traditional hierarchical ordering in favour of speech, as is conceded when in the second part of ‘The way to language’ we read ‘here, too, language shows itself first as our way of speaking’ (US 250/120). It is only when later in the essay the task of naming the essence of language comes to be associated with silence that the traditional priority accorded to speaking is addressed radically.

At this point of ‘The way to language’ the issue of the essence of language remains, as in *Being and Time*, that of the failure to grasp it, to bring it to language. ‘That which must remain wholly unspoken is held back in the unsaid, abides in concealment as unshowable, is mystery’ (US 253/122). And this is the fate of the essence of language which remains hidden in mystery for us. Heidegger in ‘The way to language’ makes one more attempt and immediately concedes that it has failed according to the standard he has already recognized: ‘with regard to the manifold ties of saying [*Sagen*] we shall call the essence of language in its totality *die Sage* – and admit that even now we have not caught sight of what unifies those ties’ (US 253/122–3). I shall leave aside for the moment the question of what conception of language might make possible such an arbitrary act of naming, if that is indeed what it is. For the

moment it is enough to notice that this is not the first occurrence of the word *Sage* in Heidegger's writings: it arises both in the discussion of the projective saying of poetry (*H* 61/*PLT* 74) and in another place in reference to the thinking of Being (*W* 188/*BW* 236). *Sage* is Heidegger's word for that originary language through which the destiny of Being happens and to that extent goes beyond what in *Being and Time* was named as *Rede*.

In 'The way to language' the essential being of language as *Sage* is referred to showing (*US* 254/123). 'Showing' is not to be understood in the sense that is given to it in Part One of *Being and Time* where its understanding, as so often in that book, should be approached in terms of the repetition of Aristotle referred to above. Here showing is that 'realm' which already in *Being and Time* had been called 'Lichtung' (*SZ* 133). In the 1964 essay 'The end of philosophy and the task of thinking' Heidegger insists that *Lichtung* should be thought neither as a transcendental condition nor as a spatial metaphor. Indeed it has remained unthought by metaphysics and presumably cannot be thought from within it (*ZSD* 74/67).

In this way Heidegger in 'The way to language' attempts to guard us against thinking of showing and thus saying primarily as a human activity (*US* 254/123). Self-showing marks (and the word *Kennzeichen* here is Heidegger's warning to his reader that the matter is still not thought deeply enough) the presence and absence of what-comes-to-presence. It is not human saying which lets things appear. Rather human saying is preceded by a *Sichzeigenlassen* which takes place as the speaking of language itself. It is language itself which reaches into the regions of presencing and lets what-comes-to-presence appear and disappear. The notorious phrase 'language speaks' was first introduced nine years before this essay in 1950. The showing of saying takes place when language itself speaks. Human saying is only a *Nachsprechen*, literally a 'saying after', a reiteration (*US* 255/124-5).

At the end of Part II of the essay Heidegger makes this speaking of language the context for an attempt to displace the metaphysical account of speech as a human activity. In a conversation it is not the case that one person speaks while another listens. Still less, we can add, is it the case that a person speaks and listens to himself. When Heidegger refers to a simultaneity of speaking and listening he is referring to something very different from the pure auto-affection of the voice as heard by its speaker. The listening is a listening neither to oneself nor to another, but to language before we speak. The recognition that we belong to language was not absent from *Being and Time*; and reticence was there already referred to a potentiality for hearing. One may even wish to attribute to the Heidegger of *Being and Time* the view, more openly stated in lectures given in the mid-1930s, that language had its origin in

keeping silent (*HG* 218). But Heidegger addresses that view in the third part of the essay, where it is exposed as an inadequate basis for entering into the essence of language, or, as one might rather say, it is brought to the closure and deconstructed.

V

In his introductory remarks to the essay, Heidegger described 'The way to language' as an attempt to bring 'language as language to language'. The stages of the path which constitutes 'The way to language' may be measured by the transformations that phrase undergoes. What at first seems nothing more than a vague directive takes on a greater determinacy as the essay proceeds, so that along the way it comes to be understood to mean bringing the essence of language (in the sense of the unifying unity) into the sounded word (*Sage* as a name for the essence of language) (*US* 261/130). In the third part of Heidegger's essay, of which I shall give only a highly selective account here, the phrase comes to mean letting the essence of language resound in all human saying. There is no word for the essence of language according to the metaphysical way of naming; indeed the attempt to name this essence is itself only a metaphysical ambition if it means to crack open and divulge the mystery of the unsaid. What is at issue is not 'the procurement of newly formed words' (*US* 266-7/134), but the transformation of our relation to language. To bring the essence of language to language now comes to mean to hear the essence of language in every word, or one might say to enter into the essence of language to which in a sense we already belong. We can only take the step back into the essence of language in so far as we have stepped outside all attempts to grasp language. What thereby enters the sounded word is the silent speaking of language itself. Heidegger is at great pains to point out that this does not mean that the accounts of language discussed in the first and second part of the essay are now to be dismissed as invalid (*US* 261/130). And he adds that the way to language taken in the second part of the essay becomes 'possible and necessary' only through the way taken in the third part, just as Heidegger would later say in response to Father Richardson that although Heidegger I is the only access to Heidegger II, Heidegger I becomes possible only if it is contained in Heidegger II (*BR* xxiii). On the present reading the second part of 'The way to language' corresponds to Heidegger I, in the same way as the third part corresponds to Heidegger II, and the manner of their presence together in this essay should serve as a confirmation that Heidegger II cannot be separated from, nor understood in simple opposition to, Heidegger I.

Although there is a sense in which the essence of language is always

brought to language whenever there is speaking, we are appropriated to it in our ownmost essence only when we hear the stillness speaking in language or correspond to it in our saying – as when we remain silent and renounce the attempt to name the essence of language metaphysically. The renunciation arises as a matter of destiny, specifically that our time as the time of *der Fehl des Gemeinsamen*, the lack of something common – a universal – which binds together and to which we may refer language. And it is through this lack that we enter into dwelling in *Ereignis*. What looked like a task we set ourselves – to bring language to language as language – becomes the way-making (*Be-wegung*) which is *Ereignis* itself (US 261/130). The transformation of the formula about bringing language as language to language is the passage from Being to *Ereignis*.

The essay 'The way to language' directs us to the special conditions which prevail in our epoch. 'That we cannot know the essence of language – know it according to the traditional concept of knowledge defined in terms of cognition as representation is not a defect, but rather an advantage by which we are favoured with a special realm' (US 266/134). Previous thinkers both did and yet did not know the essence of language in terms of the presencing of representation. They approached language in terms of *Vorstellung* but for that very reason did not enter into the essence of language which only becomes accessible once all attempts to 'know' it have failed and are renounced. The mystery of language only gives itself over to those who accept it as mystery; the essence of language is unconcealed only as concealed within the sounded word. The entry into *Ereignis* – whereby each is brought into his own – means that each is no longer mediated by the universal, by the governing representation. The universal acts as a binding relation between language as *Sage* and man. The lack of this universal turns us towards the insight which takes place as *Ereignis* – 'the unbinding bond' (US 243/113, 262/131) – whereby man does not seek to bind language, but is himself bound over to *Ereignis*, into his own, as he who belongs to language. And yet because Heidegger is describing the destiny of our epoch he can also call this lack 'the most binding relation' (US 265/134).

The nature of the transformation of language is indicated by the phrase, already introduced in 1950, *das Geläut der Stille*, 'the ringing of stillness' (US 215/108; 30/PLT 207). The phrase says that through the lack of a name for the essence of language – all language comes to be infused with silence. To bring the essence of language as *Sage* to the sounded word means to bring silence to the sounded word, to bring the unspeakable to the spoken. Indeed the directive 'to bring language as language to language' itself becomes 'a soundless echo' (US 243/113). That does not mean it comes to be negated, but that to experience language is to enter into the grant whereby the silence transforms

speaking. Heidegger's word for language – *die Sage* – says but does not say 'the essence of language' as the unnameable, the unsayable.

But what then is the place of *logos* in Heidegger's thinking on language? Does not *logos* enter into Heidegger's thinking as a word of Being? Both the companion essays to 'The way to language' – 'The essence of language' and 'The word' – point to the word *logos*, 'the oldest word for the rule of the word' (US 237/155). And they both recognize it as a name for Being and for saying (US 185/80). Does not that mean that *logos* is the word for the Being of saying? In which case how can we talk of the continuing failure to find a name for the Being of language? Of course, the Greeks did not hear the word *logos* as a word for Being, but if we accept Heidegger's reading of *logos* as a word of Being, does it not follow that it now stands for us as the word for the Being of language – *logos* as gathering?

Heidegger's answer would be that such questions ignore the very transformation of language which is at issue. This transformation does not mean that the word *logos* no longer imposes a claim on us; the recognition of a word as a word of Being takes place in its addressing us through the tradition which thereby shows how it still has a hold on us today. The word *logos* still determines thinking to this day (WHD 102/163); but like other archaic words it is no longer able to take up a place in the language and thinking of today (WHD 98–9/153). For the thinkers at the end of philosophy, at the closure, *logos* no longer speaks directly as it once did. It no longer asserts itself, but slips away into the abyss, *Abgrund*. Slipping into the abyss the word returns to where it came from – the silence of speaking language. *Logos* and the other words of Being still claim us, but we can no longer assert them nor read them without their undergoing this transformation. For metaphysics, the no-longer metaphysical is unsayable. For us, the metaphysical is no longer sayable. We read Plato and are introduced to a non-metaphysical Plato; we read Hegel and find a non-metaphysical Hegel, and so on. Or rather the metaphysical disappears as metaphysical for recollective thinking. For the rest, Heidegger leaves us in no doubt that where we do not in our questioning listen to language and entertain what it grants, the metaphysical is simply perpetuated.

For a word to be heard as a word of Being and for that word to transgress metaphysics are the same, for thereby it is no longer held back in the oblivion which marks the limits of metaphysics. And yet the word, heard or read, does not pass from oblivion into unconcealment in the sense of being brought to presence. Heidegger's essay 'The end of philosophy and the task of thinking' is particularly valuable for showing this transformation of language. *Lichtung* is *der Ort der Stille* – the place of stillness. *Lichtung* is named by Parmenides, but not thought by him as such, with the word *aletheia* (ZSD 76–7/69). What *aletheia* as *Lichtung*

grants is experienced and thought within metaphysics; what it is as such remains concealed (ZSD 78/71). Read by Heidegger as *a-letheia*, it announces in advance its own concealment within metaphysics. When we read *aletheia* as *a-letheia* we pass into the 'speaking of language'. When Aristotle's discussion of language is read not only in terms of *aletheia* but in terms of *a-letheia* his text is brought to the closure. When Heidegger in 'The way to language' introduces his word *Ereignis* calling it the earliest and oldest, he is also referring to *a-letheia* (US 258/127; cf. ZSD 25/24). It cannot be discussed or placed. There can be no *Erörterung* of it, for it is the *Ortschaft* or region of all places. The experience to which 'The way to language' is directed and from which it speaks is 'the plain, sudden, unforgettable and hence forever new look' not into a new dawn, but into that dawn from which the changing cycle of day and night first begins. The transformation of language was prepared for at the very beginning of philosophy – as a 'trace'.

What takes place with the transformation of language is that the old region of metaphysics is fitted with new ways by what Heidegger calls 'recollection' and 'way-making' (*Be-wegung*) and Derrida calls 'displacement' and 'transgression'. For Heidegger the preferred phrase is not 'a new beginning', but 'another beginning', an expression which occurs at least some eight times in his published writings. In this notion of 'another' the reference to what went before is maintained in its discontinuity with it. A similar language is found in Derrida, though perhaps not always with the same consistency. In 'The ends of man' Derrida uses the phrase 'a new writing'. The more careful formulation which corresponds to Heideggerian usage – 'another writing' – can also be found (P 72/53; D 172/149).

The question is that of whether there is available for us a language other than the language of metaphysics. The two quotations from Humboldt which end Heidegger's essay must be read in the light of it. The first passage includes the sentence: 'a people could by inner illumination and favourable external circumstances, impart so different a form to the language handed down to them that it would thereby turn into a wholly other, wholly new language.' Strictly speaking a wholly new language is impossible. It could arise only through the 'application of an already available phonetic form'. This is confirmed by the second passage Heidegger quotes from Humboldt, where he is found writing of filling an old shell with new meaning. This is what happens when the transformation of language becomes operative in our reading of the history of philosophy, transforming it into the history of Being: metaphysical language comes to echo with the *Geläut der Stille*.

The end of philosophy, or rather its closure (*Verendung*), takes place in both Heidegger and Derrida therefore only as a transformation of our relation to previous thinking. It is not therefore a termination of the

tradition, a 'dead end', nor does it take place in turning one's back on what has gone before. And yet even though there is no clean break with metaphysics there is a rupture, a discontinuity which cannot be understood simply as a dialectical reversal.

VI

How does it stand with the Derridian strategies listed in part two above after this re-reading of Heidegger's essay?

First, the inscription of presence in the notion of experience. Just as Derrida has provided a 'deconstructed' reading of certain metaphysical texts and their concepts, Heidegger has in *Hegel's Concept of Experience* in his reading of Hegel's word 'experience' as a word of Being heard its claim from beyond metaphysics. There Heidegger establishes the relationship in Hegel between experience and presence as *parousia* precisely to call it into question. So in seeking an experience with language what is experienced is not a presence but a lack, the lack of a word of Being in our epoch. And yet Heidegger is careful to insist that this lack is not a simple defect or something merely negative (US 266/134). This experience is for thinking the passage from the realm of the opposition of presence and absence into 'the special realm' within which that opposition arises and which as such is not governed by it.

Secondly, in Heidegger the priority accorded to speaking is mentioned only to be displaced. Speaking is secondary, not to the originary nature of silence, but to that relation of silence which Heidegger describes as an *Entsprechen* or 'corresponding' (US 262/131). Given that for Derrida the reversal of the priority of speaking and writing is for the sake of disturbing the privilege accorded to speech within the tradition and not in order to privilege writing (for that would be to maintain the metaphysical system of opposition) Heidegger subverts the metaphysical schema. The privilege is disturbed, but not in favour of another oppositional system.

Thirdly, there is the question of origins. We have seen how Heidegger turned away from regarding silence as an origin in the sense of *Ursprung*, but there remains the discussion of the origin of the word in the sense of *Herkunft* (US 265/133). This origin is not thought of as a first word, but in terms of *Ereignis* as the oldest of the old. In this way the quest for origins as a quest for a ground is abandoned (US 256/125). So far as the spoken word is concerned, it is rethought as 'an answer, a counter-saying' (US 260/129). But there are of course not two separate events – the speaking of language and the human speaking which answers to it. That the origin of human speaking takes place as an answer must be

understood as obeying that same 'logic' that Derrida's describes with Rousseau's word 'supplement'.

Fourthly, Heidegger's recollection of *logos* takes place from the experience of the end of philosophy. The recollection of *logos* does not remain within the logocentrism of metaphysics. The word *logos* like the word 'experience' is, as we saw, no longer determinative for us, nor available to us for our use as it was within metaphysics.

Fifthly, how can *Ereignis* overcome the connotations of ownership and property? What we witness here is the deconstruction of man as appropriating, man as the measure. Rather he is appropriated. Nor does Heidegger seek to appropriate the *lethe* but lets it be as *lethe*.

Finally, with the lack of a universal, the essence of language in the sense of the unifying unity passes into the unbinding bond (US 262/131). In being bound over to *Ereignis* the search for the unifying unity of language gives way to *Gelassenheit*. Or to put it another way, there takes place a transformation in the notion of 'essence'. This transformation is parallel to that we find in the essays 'The essence of truth', 'The question concerning technology' and 'The essence of language' and which we here recognize as a transformation of language.

How does it stand then between Heidegger and Derrida? In the 1968 essay 'Ousia and gramme' Derrida sets himself against a complicity between devoted Heideggerians and anti-Heideggerians in their refusal to *read* the texts of the history of metaphysics. Derrida there describes the opening of the Heideggerian breakthrough as the only place where the excess of metaphysics is thought, recalling to us the sense in which *a-letheia* has hitherto remained unthought. But at the same time Derrida insists that the texts of metaphysics be read 'beyond certain propositions or conclusions within which the Heideggerian breakthrough has had to constrain itself, propositions or conclusions which it has had to call upon or take its support from' (M 72/62). Derrida refers explicitly to the place of Aristotle and Hegel during the epoch of *Being and Time*. It is striking how modest is the position Derrida allots himself vis-à-vis Heidegger here. Nevertheless the question remains as to how and how far Derrida succeeds in going 'beyond' the propositions or conclusions Heidegger has in his reading of the history of metaphysics drawn on from that history for his support. The question is concerned with the sense of this 'beyond'.

What Derrida at this point of the 1968 paper was indicating as the great danger was the 'closing off of questions' brought about by the complicity of Heideggerians and anti-Heideggerians. The danger lay in the difficulties which would ensue were Heidegger's readings of the history of philosophy to fall into self-evidence, to be presented not as a dialogue between thinkers, but as a standard interpretation. It would be to reduce to assertion what lives only in the transformation of language away from assertion. By the same token, the ambiguity of Derrida's own

relation to Heidegger, the way in which he seeks to sustain a metaphysical reading of Heidegger and yet find a transgression within the Heideggerian text must be maintained.

The complicity of 'Heideggerians' and 'Derridians' is that their very stance towards each other closes off that non-oppositional relation to texts which is the hallmark of both Heidegger and Derrida. If the essay 'The way to language' appears now as Heidegger's own attempt to 'deconstruct' *Being and Time* then there can be little doubt that we are conceding that when we read Heidegger today, we find Derrida's Heidegger. We are no longer in a position to say how much of our current reading of Heidegger is indebted to Derrida. We can always point to those moments when we can distinguish the two, when (as Derrida himself would say) 'the seam does not hold', but that does not make it possible for us to use the distinction more universally. One consequence is that it ill behoves Derridians to try and contrast Heidegger with Derrida to the latter's advantage. If Derrida has helped us to a reading of Heidegger which gives the destruction of metaphysics the central place already allotted to it in *Being and Time* then we cannot subsequently identify Heidegger exclusively with, for example, the ahistorical readings of Heidegger which were at one time fashionable. Derrida's reading of the text belongs to the text just as much as those other readings.

But do Derrida's readings nevertheless attain a certain priority over other readings? If they do, would not the only way of justifying it be by referring those readings to the epoch, the time which we share with them? But would not that be just another way of maintaining the privilege of the present? The notion of 'trace' or, as in the explication of Heidegger's essay above, the notion of *a-letheia* or of *Ereignis* as the oldest of the old, must be understood as addressing precisely that issue. The closure is not brought to a text from outside; one should not really speak of 'imposing the closure on a text'. So Derrida writes:

Henceforth the closure of metaphysics . . . would not occur *around* a homogeneous and continuous field of metaphysics. Rather, it would fissure the structure and history of metaphysics, *organically* inscribing and systematically *articulating* the traces of the *before* and the *after* both from within and without metaphysics. Thereby proposing an infinite, and infinitely surprising, reading. An irreducible rupture, an excess, can always be produced within an era, at a certain point of its text (for example, in the 'Platonic' fabric of 'Plotinism'). Already in Plato's text no doubt.

(M 206/172)

And in 'The way to language' Heidegger also makes an attempt to save us from the idea that the transformation of language is something that

simply happens in our time and thus is our contribution. 'But it is only to us and only with regard to ourselves that the change of the way to language appears as a shift which has taken place only now' (US 261/130). The shift from understanding language in terms of human activity to the entry of the essence of language into *Ereignis* implies the shift away from thinking the closure as situated at an end-point.

And a further consequence is the disappearance of the idea that texts like those of Heidegger or Levinas should because of their contemporaneity not be given a 'double reading' on the grounds that they stand unambiguously outside metaphysics. If the notion of 'outside' has any meaning in this context it would have to be thought in terms of the entry into the 'ambiguity' of the *Geläut der Stille* which ambiguity precisely disturbs the definition of the outside. It is in this light that we must reexamine Derrida's practice of 'prefacing' his readings of the 'philosophical' classics with a presentation of translations of them or the standard interpretations which at one time seemed quite adequate to that for which they served proxy. Derrida's use of these surrogates is the conventionalizing of a common Heideggerian practice, especially visible in his essays on Greek thinkers where he would remind us either of the conventional translation or of Hegel's interpretation before providing his own. But this is no idle-preparation for the 'real' reading of the text. The space of the Heideggerian reading is the between-space which relates the multiplicity of different translations, the previous ones and his own. By conventionalizing this relation and turning it into a strategy Derrida misleads the Derridian. The language of strategy as a human activity is applied to the reading, but that reading takes place only as a necessity. This 'necessity', to which Derrida often refers, is the necessity of responding to what has already happened, specifically that the words no longer say the same to us, we can no longer follow the old ways.

The reference to inadequate translations and blatantly metaphysical interpretations belongs to the ambiguity of the text, its play, and is supported by the memory of what has gone before. This memory is kept alive in a history of textuality, a history of reading, a notion which in the absence of any detailed explication by Derrida should presumably be understood as similar to Heidegger's history of Being. So Derrida keeps open the space of Heidegger's thinking which is in danger of collapsing as Heidegger's readings fall into self-evidence. If the translations and previous interpretations were forgotten or ignored then the so-called ambiguity would be lost, the ringing of stillness would fade into silence, the discontinuity of rupture would dissolve into continuity. The maintainance of the rift is essential. (This would be the point to introduce Derrida's reading of the rift in 'The *Retrait* of metaphor'.) It is not that the metaphysical is needed as one term in an oppositional structure. The advantage of the account of the 'ringing of stillness' over an account

presented in terms of inside and outside lies precisely in avoiding that impression.

The fact that Derrida is parasitic on Heidegger is not from a Derridian point of view a weakness. Heidegger *experiences* the end of philosophy; but even if it is conceded that this is no longer a metaphysical concept of experience, it would still be the case that according to the logic of supplementarity the parasite is more original than the original. The difficulty in assessing the relation between Derrida and Heidegger is a much more complex issue when we look to see what Derrida has done to keep open the ambiguity – the play – of the Heideggerian space. This is most apparent when we return to the question of the two strategies that Derrida outlines at the end of 'The ends of man'. It is Derrida who here (and elsewhere) accentuates the inside-outside opposition, which may be present in Heidegger, but certainly does not dominate his texts as they have dominated so many of Derrida's. By identifying Heidegger's strategy predominantly with that of attempting an exit without changing ground, while conceding that the other strategy of deciding to change ground was also operative in his works, Derrida imposes a distinction born of a metaphysical opposition where it did not belong and at once denies it. The opposition Heideggerian-Derridian as a cultural event has come to be understood so that the terms serve as a reinscription of the metaphysical dualism of inside and outside. But the discussions of *Ereignis* and *a-letheia* which arise out of the transformation of the language of the history of philosophy into the language of the history of Being have precisely the effect of rendering otiose the application of the two strategies to a discussion of what Heidegger understands by 'another beginning'. With the notions of 'another beginning' and 'another writing' Heidegger and Derrida have attempted to think the sense in which there is today both a changing of ground and a dissolution of the notion of ground.

Note

The reading of Heidegger's essay 'The way to language' to be found here was first offered at the Collegium Phaenomenologicum, Perugia in August 1982.

I have in a number of places, and particularly in the case of 'The way to language', adapted the existing translations. I have been fortunate to have had at my disposal an unpublished translation of that essay by Ivan Ivanishevich. I have on occasion both adopted and adapted his 'solutions'.

Language and reversal

John Sallis

I The problem of language and reversal

The way on which Heidegger's thinking has moved is a way with which the question of language is intertwined, not just in the sense that language is one of those questions that is encountered on that way but also in the sense that language is the medium of that endowment with which anything like a way first opens up. How is this intertwining of language and way to be understood, especially in light of the fact that this way proves to be such that the movement appropriate to it is one of reversal? How is it that language and reversal belong together?

In *Sein und Zeit* Heidegger bears witness to the importance which the question of language had for his way even at that stage. Here he writes: 'It is, in the end, the business of philosophy to preserve the *force of the most elemental words* in which Dasein expresses itself. . . .'¹ Already, however, this statement betrays the curious character of Heidegger's involvement with the question of language by the way in which it construes the relation between language and philosophy. Rather than assigning to philosophy the task of determining the essence of language, of developing, as it were, a theory of language, he projects the task of philosophy with respect to language as one of preservation: it is the business of philosophy to preserve language, to preserve the force of the most elemental words. What is that way by entrance onto which the question of language comes to present itself in the guise of a demand for preservation? We need to see that what is at issue is a way on which thinking is drawn back into its element, a way on which thinking lets itself be engaged in a movement of reversal. We need to understand how the problem of language becomes in Heidegger's thinking the problem of language and reversal.

The peculiar way in which the question of language enters into Heideg-

ger's thinking is again indicated in Heidegger's denial that he is engaged in 'philosophy of language'.² Obviously, this denial is not to be taken as indicating that for Heidegger the question of language lacks sufficient importance to warrant an engagement in philosophy of language; on the contrary, this issue is so fundamental for his problematic that justice could not be done to it by engaging in mere philosophy of language. Heidegger says that the question of the essence of language 'is something other than philosophy of language'.³ To engage straightforwardly in philosophy of language would be already to presume that language is, as it were, one item among others to be interrogated in terms of an already established framework of interrogation, capable, in particular, of assuring us as to what is at issue in every search for an essence. But, as Heidegger says, 'Not only does language stand in question now, but also what essence means [*heisst*] – more still: it stands in question whether and how essence and language belong to one another'.⁴ A framework would need to be presupposed – hence, we cannot proceed immediately to a philosophy of language. Also, however, Heidegger's statement makes it clear that it is not a matter simply of suspending the question of language in order to turn to the question of the framework, to the question of essence, as though it were a prior question. The question of the meaning of essence is not just a question to be taken up by a questioning already assured of its own possibilities and directives but rather has, since Plato, belonged together with the question of the meaning of philosophical thinking as such; and this latter question directs us, in turn, back into the question of language inasmuch as philosophy is itself a distinctive way of speaking. Heidegger writes: 'Without a sufficient meditation on language we never truly know what philosophy is as a distinctive response [*Ent-sprechen*], what philosophy is as a distinctive way of speaking.'⁵ The questions of language and of essence meet in the question 'Was heisst Denken?' and it is only within the compass of this question that we can properly respond to the question 'whether and how essence and language belong to one another'. The question 'Was heisst Denken?' in its most decisive sense asks: 'What calls us to think?'⁶ To hear the question in this, its decisive sense is to be led into the movement of reversal.⁷ The problem of language enters into Heidegger's thinking not in the form of a philosophy of language but as the problem of language and reversal.

II The structure of the problem

The problem of language and reversal enters into Heidegger's thinking in two ways. The first of these ways is expressed in the fact that the very possibility of reversal is tied somehow to language – to such a

degree as to allow Heidegger to say that that division of *Sein und Zeit* which was to have carried through the reversal originally proposed, the reversal from 'Being and time' to 'time and Being', was held back because the language was lacking, because 'it did not succeed with the help of the language of metaphysics'.⁸ Language is, Heidegger says, that originary dimension in which man is first able to enter into that conformity by which he is engaged in the domain of the reversal.⁹ It is in the dimension of language that the movement of reversal is granted to him. This movement of reversal is a step out of metaphysics back into the ground of metaphysics,¹⁰ and for this movement the language of metaphysics – that is, language as dominated by metaphysics, language as it shows itself within the compass of the metaphysics of language – is insufficient. Language under the domination of metaphysics has fallen 'out of its element';¹¹ it has come into a condition in which precisely its character as the originating dimension capable of granting entry into the movement of reversal is concealed. Hence, the language of metaphysics cannot but fail to grant entry into the movement of reversal. What is called for, however, by this situation is not a mere exchanging of the language of metaphysics for another language but rather, more fundamentally, 'a transformed relationship to the essence of language'.¹²

How is this transformation with which language would be brought back into its element to be accomplished? The terms of this transformation, its 'from which' and 'to which', are expressed in a statement from Heidegger's essay 'Bauen, Wohnen, Denken'. He writes: 'Man behaves as though he were the moulder and master of language, but *it* nevertheless remains the master of man.'¹³ The transformation moves from a relationship to the essence of language in which this essence remains concealed and language gets taken as an activity of man¹⁴ to one in which language reveals itself as the master of man, as the 'clearing-concealing advent of Being itself' by which man is overpowered.¹⁵ But this transformation is, then, nothing less than the reversal itself. The reversal requires a transformation of our relationship to the essence of language, yet this transformation is itself identical with the reversal. Thus, there is here no question of simple priority; it is not a matter of the reversal having as its pre-condition the transformation demanded with respect to language; neither does this transformation, on the other hand, require the reversal as its pre-condition. Each requires the other. It is a matter of intertwining; the problem of reversal and that of language *belong together*.

The second of the two ways in which the problem of language and reversal enters into Heidegger's thinking provides a means for articulating that intertwining, that belonging-together, to which the first way leads. What is the character of this second way? Here the problem arises from the apparent discontinuity, even conflict, between what Heidegger says regarding language in *Sein und Zeit* and what he says of it in his later

writings. Within the architectonic of *Sein und Zeit*, language occupies a rather inconspicuous position. The only explicit discussion of it occurs in the chapter entitled 'Being-in as such', specifically in the portion of that chapter that is entitled 'The existential constitution of the "There"'. In this section Heidegger is involved in uncovering the constitutive structures, the existentials, by virtue of which Dasein is able to be its 'there' (*Da*), by virtue of which Dasein is 'in-the-world' in such a way as to be capable of encountering beings 'within-the-world'. There are three such constitutive structures, disposition (*Befindlichkeit*), understanding (*Verstehen*), and discourse (*Rede*). Language (*Sprache*) is introduced in subordination to the third of these existentials, discourse, which is defined as 'the articulation of intelligibility'. He writes: 'The existential-ontological foundation of language is discourse.' Language itself he describes as 'the way in which discourse gets expressed'.¹⁶

This apparent confinement of the issue of language seems almost totally out of keeping with the importance which language so obviously assumes in Heidegger's later writings. For example, in *Über den Humanismus* he discusses what he calls the nearness of Being (*die Nähe des Seins*) and proceeds to identify this nearness with the *Da* of Dasein. This nearness, he then insists, takes place (*west*) as language.¹⁷ What is obviously suggested is that language is not, as in *Sein und Zeit*, a mere derivative of the third of the three constituents of the *Da* but, rather, precisely the constituent of the *Da*. Language alone, it seems, is now regarded as enabling Dasein to be its *Da*. Much the same is suggested in *Unterwegs zur Sprache* when Heidegger writes that 'Language first enables man to be that creature which he is as man'.¹⁸ Language, it seems, is quite simply what makes man to be what he is. But, we feel compelled to ask, what about the other constituents of the *Da* which Heidegger elaborated with such care in *Sein und Zeit*?

There is still a further, even more fundamental difference between what is said regarding language in *Sein und Zeit* and what is said in the later writings. According to the former, language is the way in which discourse, the articulation of intelligibility, gets expressed. There is virtually nothing to suggest that such expression is anything other than an activity of man, something accomplished by man. Language, it seems, is simply an activity of man. But in the later writings, to state it in the boldest fashion, 'language is the language of Being', and man is called only to respond to 'the unspoken word of Being': '*Die Sprache spricht*.'¹⁹

Between what Heidegger says regarding language in *Sein und Zeit* and what he says in the later writings stands the reversal in Heidegger's thinking. Hence, it is only through a reflection on the reversal, only through an effort to understand in what sense the reversal 'stands between' *Sein und Zeit* and the later writings – it is only thus that we can approach the problem of the coherence of what Heidegger says

regarding language. Does the transition from the discussion of language in *Sein und Zeit* to the discussion in the later writings become intelligible in light of the reversal, in light of the way in which the issue of the reversal allows us to understand the movement from *Sein und Zeit* to the later writings? It is through this question that we shall attempt to take up the problem of language and reversal.

III Language in *Sein und Zeit*

Before considering the question of the reversal we need to ascertain more specifically what Heidegger says about language in *Sein und Zeit* and what is at issue behind what he says. We focus on two sections of Division I: (1) the section in Chapter 3 where Heidegger offers a description of signs and (2) the section in Chapter 5, referred to above, which deals with the constituents of the 'there'.

In the first of these sections there is a statement which comes directly to the point that is relevant to our problem. Heidegger writes: 'A sign is not a thing which stands to another thing in the relationship of indicating; it is rather an item of equipment which explicitly raises a totality of equipment into our circumspection so that together with it the worldly character of the ready-to-hand announces itself.'²⁰ Signs, presumably also linguistic signs, are not mere things. Like the other beings encountered within the *Umwelt* they are items of equipment bound up in an equipment-totality. A sign, however, is not just another item of equipment but rather has a distinctive function which distinguishes it from all other equipment. This distinctive function Heidegger calls 'indicating' (*Zeigen*). Indicating, however, is not a matter of a co-ordination of certain pieces of equipment, namely signs, in a one-to-one correspondence with other pieces of equipment, namely what is indicated by the sign. Rather, a sign, as indicating, raises the total meaning-context, the referential totality, into our circumspection.

It follows, then, that language is not to be regarded in terms of individual words or linguistic units correlated in some fashion or other either with discrete meaning-contents or with individual things. Rather, linguistic signs are bound up in a total meaning-context in the sense of bringing that total context to light. The way in which language indicates needs to be understood in reference to the total meaning-context rather than in terms of correspondence between words and things or words and meanings. Heidegger thus attempts to get beneath the traditional understanding of language in terms of correspondence and thereby to undercut the classical alternatives of correspondence by nature and correspondence by convention. This is not to say that the understanding of language in terms of correspondence is incorrect; it has its rights, but it is

not primordial. Heidegger wants to point beneath it to a more primordial dimension where language is, first of all, a lighting-up which lets the world, the total meaning-context, announce itself.

In the discussion of the constituents of the 'there' in Chapter 5, the issue of language enters much more explicitly. We have referred already to the way in which Heidegger takes up this issue in the context of his account of discourse, the third existential constituent of the 'there', and describes language as the way in which discourse gets expressed. However, it is not only in relation to discourse that the issue of language is taken up; Heidegger refers to it also, though briefly, in the course of his elaboration of the structures which derive from the first of the three basic constituents of the 'there', understanding (*Verstehen*).

Let us briefly review this elaboration in order to place the issue of language within it. Understanding is described by Heidegger as the projection of Dasein's Being upon possibilities, upon what Heidegger calls a 'for-the-sake-of-which' (*Worumwillen*).²¹ In projection Dasein throws before itself possibilities as possibilities, lets possibilities be its possibilities, and is itself these possibilities as possibilities. Possibilities, in turn, prescribe a referential totality, a totality of involvements, a world, in which ready-to-hand beings or equipment can be involved and thereby be what they are.²² However, in understanding, neither the possibilities nor the prescribed totality of involvements are grasped thematically, and understanding thus has itself the possibility of developing itself into a thematic grasp of the possibilities which it has thrown before itself. This development, this appropriation of what is already understood, Heidegger calls interpretation (*Auslegung*). In interpretation, items of equipment are made explicit with respect to their 'as-structure', with respect to their involvement in the referential totality, in the totality of signifying references which make up the structure of Dasein's world. Interpretation is an articulation prior to all thematic assertion, an articulation of what has been understood, of that upon which Dasein, in understanding, has projected.²³ The upon-which of a projection Heidegger identifies as meaning (*Sinn*).²⁴ Interpretation is an articulation of meaning prior to thematic assertion. Finally, there is the structure which Heidegger calls assertion (*Aussage*), which derives from the further development of interpretation. Assertion is not, however, merely an extension of interpretation but involves a decisive change, the transformation of the 'hermeneutical as' – the as-structure based in the referential totality – by which interpretation lets itself be guided *into* the 'apophantical as' under the guidance of which beings are now articulated with respect to definite characteristics. It is only with assertion that we gain access to such things as properties, and it is here that Heidegger sees the origination of presence-at-hand (*Vorhandenheit*) out of readiness-to-hand (*Zuhandenheit*). Heidegger assigns to 'assertion' three interconnected significations: 'pointing out',

'predication', and 'communication'.²⁵ With the last of these the analysis has obviously reached the plane of language. But Heidegger does not elaborate.

The dual locus of the issue of language in Heidegger's account of the constituents of the 'there' raises two problems. Through these problems, we can see how what is at issue behind what Heidegger says begins to take shape. First, we have seen that Heidegger states explicitly that discourse, the third basic existential constituent, is the foundation of language. We have seen, further, that language also is involved in the derivative structures which originate from understanding, specifically in assertion as communication. The problem is: How is it possible for discourse to be the foundation of language if language is also involved in another existential constituent, namely understanding – specifically in what develops from understanding? How can language be grounded in discourse and yet have one foot, as it were, in another of the three basic constituents of the 'there'? Presumably, this is possible only if the two basic constituents, understanding and discourse, are themselves fundamentally connected. This, then, is the second problem: What is the character of this connection? What is the character of the unity by which understanding and discourse belong together?

Let us try to formulate this problem more precisely. Heidegger defines discourse as the articulation of intelligibility or meaning. Thus, language, as the way in which discourse gets expressed, is the expression of an already accomplished articulation. Discourse provides something pre-given to the act of expression. What is crucial here, however, is that this definition of discourse corresponds precisely with the definition which Heidegger gives of interpretation. The latter too is an articulation of meaning. What, then, is the difference between interpretation and discourse? Heidegger writes: 'The intelligibility of something has always been articulated even before there is an appropriative interpretation of it.'²⁶ There is, in other words, an articulation of meaning prior to that articulation that occurs in interpretation. What is this prior articulation? Heidegger proceeds to identify it as discourse.²⁷ Discourse as articulation of meaning is prior to the articulation of meaning in interpretation. When meaning is articulated in interpretation, such articulation takes place against the background of a prior articulation already accomplished by discourse. What is the character of the prior articulation?

We have seen that in the development of understanding into interpretation and assertion the question of language first enters in connection with the third signification of assertion, namely communication. In the context in which communication is discussed, Heidegger alludes to a link between communication and what he calls 'fore-conception' and then makes the following crucial statement: 'The fore-conception which is always implied in an assertion remains for the most part inconspicuous,

because language already conceals in itself a developed way of conceiving [*eine ausgebildete Begrifflichkeit*].²⁸ This statement provides a solution to our problem, for it points to the fact that that articulation of meaning which is prior to interpretation and which Heidegger calls discourse is precisely that articulation – that ‘developed way of conceiving’ – which is always already accomplished by language itself but which remains concealed, hidden away in the language. Discourse is not, therefore, primarily an articulation of meaning which *we* perform but rather an articulation which is always already performed for us, an articulation which is, of necessity, already delivered over to us, which we have already taken over inadvertently, by virtue of our living in a language – by virtue of our having been thrown into a language with its concealed, yet already developed ways of conceiving.

Now it is clear also how interpretation, as operating always within the compass of the prior articulation (discourse), can stand in a relation to language. Interpretation always takes place against the background of articulation already accomplished by language. And *Sein und Zeit* itself, as an interpretation,²⁹ is likewise bound to the pre-articulation hidden away in language. What Heidegger’s work uncovers as regards language reflects back upon the character of the work itself and requires that *Sein und Zeit*, in its character as a work, be understood in its relation to language, as bound to what is handed over in language. Here is a clue for understanding Heidegger’s description of the business of philosophy as one of preserving the force of words.

We need to draw out a further conclusion implicit in this development of the problem of language in *Sein und Zeit*. In order to do so we call attention to a significant ambiguity centered in Heidegger’s account of understanding. This ambiguity is evident in the two fundamentally different ways in which Heidegger describes understanding: In the one instance, understanding is described as a projecting of Dasein’s Being *upon* possibilities, in the sense of letting possibilities be possibilities for Dasein, in the sense that Dasein assigns itself to possibilities so as to be these possibilities;³⁰ in the other instance, understanding is described as a projecting *of* possibilities, Heidegger writing explicitly of ‘possibilities projected in understanding’.³¹ The difference between possibilities projected *upon* by Dasein and possibilities projected *by* Dasein is, if taken without further refinement, immense, and it is especially crucial granted the context of the project of *Sein und Zeit*. Since a possibility related to Dasein’s projection is a ‘for-the-sake-of-which’ and, hence, prescribes a totality of involvements that constitute the structure of world, nothing less is at stake than the origination of world. If Dasein quite simply projects its own possibilities, bringing them forth, as it were, entirely out of its own resources, then it would follow that world is, in the end, something which Dasein projects. But it is precisely the referential

totality, constitutive of world, which allows ready-to-hand beings within-the-world to be what they are, which, consequently, is the Being of these beings.³² It would follow, then, that the Being of the ready-to-hand is nothing more than something projected by Dasein.

This conclusion is fundamentally at odds with the very project of *Sein und Zeit*. Heidegger repeatedly emphasizes in his various commentary statements on *Sein und Zeit* what was already evident in the work itself: that it already is involved in the step back out of metaphysics and specifically out of the subjectivism that characterizes modern metaphysics. But what is subjectivism if not the locating of the ground of objectivity, of the Being of beings, in the subject?³³ And if it is objected that, nevertheless, Dasein is not a subject in the modern metaphysical sense, then the problem is only re-stated; for it remains to be determined how Dasein is distinguishable from a subject if, indeed, Dasein projects its world and thereby the Being of what is encounterable within the world.

Clearly this alternative – that Dasein projects its possibilities – can be retained only if we grant that there is something else involved that serves to modify the most immediate sense suggested by such a notion of projection. Indeed, Heidegger himself indicates this when he writes:

In every case Dasein, as essentially dispositional [*befindliches*], has already gotten into definite possibilities; as the potentiality-for-Being [*Seinkönnen*] which it is, it has let such possibilities pass by; it constantly sets about the possibilities of its Being, grasps them, and makes mistakes. But this means that Dasein is Being-possible which has been delivered over to itself – *thrown possibility* through and through. . . . By way of having a mood, Dasein ‘sees’ possibilities, in terms of which it is. In the projective disclosure of such possibilities, it already has a mood in every case. The projection of its ownmost potentiality-for-Being has been delivered over to the fact of its thrownness into the ‘there’.³⁴

These statements call attention to the fact that understanding is not the sole constituent of the ‘there’ and indicate that the various constituents do not simply stand, as it were, alongside one another but belong essentially together. Dasein as projecting is thrown-projecting, a projecting executed within thrownness, a projecting of world only from out of its situation of being already engaged in a world already disclosed in disposition. Heidegger writes: ‘Indeed *from the ontological point of view* we must as a general principle leave the primary discovery of the world to “bare mood”.’³⁵ It is this discovery which always lurks behind every projection. Again, Heidegger writes: ‘As something factual, Dasein’s projection of itself understandingly is in each case already alongside a world that has been discovered. From this world it takes its possibilities. . . .’³⁶ It is, in

other words, primarily in disposition that possibilities are first delivered over to Dasein in order that Dasein might project these possibilities as possibilities, in order that it might assign itself to them, thus throwing them before itself and letting them *be* as possibilities. Dasein indeed projects *upon* possibilities in that Dasein 'has already gotten into definite possibilities', in that possibilities are already, by way of disposition, disclosed as delivered over to Dasein; yet, in the same measure, possibilities are projected *by* Dasein in that it is through Dasein as projecting, through Dasein's assigning itself, that they are thrown ahead and allowed to rule as possibilities, allowed to be as possibilities. Hence, Heidegger can speak indifferently of possibilities as being projected *upon* by Dasein and as being projected *by* Dasein.

The ambiguity is thus resolved, but beneath it a further problem opens up: the problem of how disposition and understanding belong together. It is on this problem that the development of the issue of language in *Sein und Zeit* has a crucial bearing. Discourse, we have seen, is, in the final analysis, that articulation of intelligibility which is already bound up and hidden away in language. Discourse is not simply an articulation which we perform but rather is an articulation which is always already in effect, delivered over to us insofar as we *find ourselves* in a language. Thus, discourse refers to a kind of finding-oneself-as-thrown (*Befindlichkeit*) which, as involving us in an articulation of intelligibility (*Verständlichkeit*), is inherently linked to interpretation and understanding (*Verstehen*). It involves a finding-oneself-as-thrown into a certain medium of intelligibility, into a certain already established way of articulation. It is discourse which points back to the unitary, yet complex, ground from which the multiple constituents of the 'there' arise. It is discourse as itself this 'common root' in which understanding and disposition meet – without, however, necessarily having their distinctive characters dissolved – it is this which forms the bridge from the analytic of *Sein und Zeit* to the insistence in the later writings that the 'there' takes place as language.

IV Reversal

Between what is said regarding language in *Sein und Zeit* and what is said in the later writings stands the reversal (*Kehre*). It is to this that we must now turn in order to be able to come to terms with the question of the coherence of what Heidegger says regarding language.

Heidegger uses the term 'reversal' in describing the relation between what is accomplished in the published portion of *Sein und Zeit* and what was to have been accomplished in the unpublished final section of Part I. In this final section, which was to have carried the title 'Zeit und Sein' everything would, Heidegger tells us, have been reversed. He describes

the reversal as a reversal from 'Being and time' to 'time and Being'.³⁷ Inasmuch as the later writings remain underway to what was still unaccomplished in *Sein und Zeit* as published, the term 'reversal' is used to describe the transition from *Sein und Zeit* to the later writings. What is the character of this transition that is here underway? What does Heidegger mean in speaking of reversal?

In the attempt to think through what is at issue in the reversal everything depends upon understanding the proper locus of the reversal. The reversal is not, Heidegger insists, 'a change of the standpoint of *Sein und Zeit*',³⁸ not a shift to a different, presumably more adequate, point of view in principle discontinuous with that which defined the project of *Sein und Zeit*. Nevertheless, he writes: 'The thinking of the reversal is a change in my thought.'³⁹ The reversal involves a change but one which is not to be construed as a shift from one standpoint to another – nor, indeed, as any other kind of shift executed merely within the movement of thinking: 'The reversal is above all not an operation of interrogative thought.'⁴⁰ The proper locus of the reversal lies rather in what is to be thought; in Heidegger's words, 'The reversal is in play within the matter itself';⁴¹ there is a reversal in the medium of thought, a change in Heidegger's thinking, only insofar as this thinking is led into the movement of reversal by letting itself be bound in essential cor-respondence to what evokes thought, to what calls it forth, and hence, to the reversal which is 'in play within the matter itself'.

A thinking which is able to let itself be bound by what calls forth thinking, by its sustaining source, is a thinking which, indeed, has undergone a change but which has not, as it were, executed that change out of its own resources. In order for it to be able to come to bind itself to what genuinely sustains it, the sustaining source must have shown itself in its capacity as granting sustenance to thinking. That which sustains thinking cannot, however, be posed before thinking as an object which could be made wholly transparent, from which all concealment could be banished, but rather is able to sustain thinking only in that it simultaneously withdraws from thinking. The source sustains thinking by drawing it along in this withdrawal.⁴² The sustaining source could show itself to thinking in such a way as to allow thinking to be bound to it, drawn along in the withdrawal, only by showing itself as withdrawing.

If thinking comes to be bound to what sustains it, it does so always from out of its situation of having been cast into an age determined by its characteristic mittence of Being (*Seinsgeschick*), by the way in which the source grants itself to and withholds itself from those cast into that age.⁴³ It is in the mittence of Being which governs our age that the source must reveal itself in order that, in thinking, we may be bound to it. Yet our age, the age of technology, is determined precisely by a radical self-concealment of the source; our age is the age in which the

forgottenness of Being reaches its culmination so that 'it appears as though there were no such thing as Being'⁴⁴ – as though Being were only 'a vapor and a fallacy'.⁴⁵ Ours is the age in which it comes to appear as though there were no sustaining source or, rather, as though thinking were its own sustenance, as though thinking were capable of providing its own sufficient ground, capable of executing that self-grounding for which it has striven at least since the beginning of modern metaphysics.⁴⁶ The source not only withdraws, not only conceals itself, but in our age has come to the point of concealing its concealment; it has come to conceal precisely that withdrawing in which thinking is drawn along and thereby sustained. Our age is determined by a radical self-concealment of Being, not because Being remains simply concealed from us, but rather because this concealment is itself concealed to such a degree that we are cast into utter obliviousness to Being. What is decisive is not that the source is concealed but rather that the fact of the source is concealed – the fact that thinking is sustained by a source and not by itself. Yet even in its obliviousness to its sustaining source thinking continues to be sustained by this source, and what is called for is that, in the midst of the effort on the part of thinking to be its own source, this effort reveal itself as violating what it would establish, that this effort reveal itself as sustained precisely by that whose sustenance it would deny. What is called for is that man's belongingness to Being break through at just that point at which the most radical concealment prevails – at the point of what Heidegger calls the highest danger. This is the reversal: 'In the essence of the danger a favor takes place and dwells, namely the favor of a reversal of the forgottenness of Being into the truth of Being.'⁴⁷

What calls for and calls forth this reversal is not, however, man himself. As sustained in his thinking by the source and as cast into an age of radical self-concealment of this source, man is able to enter into the movement of reversal only through being led into and sustained in it by the source itself. The reversal has its proper locus in the clearing-concealing advent of Being itself. There is a reversal in thinking only insofar as thinking succeeds in cor-responding to this '*Ereignis der Kehre im Sein*'.⁴⁸

The proper locus of the reversal is the clearing-concealing advent of Being itself. Now we can begin to understand the involvement of the problem of language in the reversal, for, Heidegger says, 'language is the clearing-concealing advent of Being itself'.⁴⁹ Language is the proper locus of the reversal. This is why, in discussing the fact that that portion of *Sein und Zeit* in which the reversal would have become explicit was not carried through, Heidegger calls attention to the issue of language. This also is why the reversal requires 'a transformed relationship to the essence of language'. But this transformation is no mere prerequisite to the reversal; it is the reversal. And it is a transformation of which we are capable only by cor-responding to what is granted to our thinking.

This conclusion – that language is the proper locus of the reversal – goes beyond what we have said thus far regarding language; we have been led to it only by introducing a cryptic statement from the later writings – that language is the clearing-concealing advent of Being itself – a statement which remains largely unintelligible as long as we have not understood the way in which the problem of language is taken up in Heidegger's later writings. But, then, it was precisely in order to move from what is said about language in *Sein und Zeit* to what is said in the later writings that we found it necessary to take up the question of reversal. The problem of language directs us into that of the reversal, and conversely. The two problems are intertwined; they *belong together*.

In order to lead back into the question of the coherence of what Heidegger says regarding language, we need now to try to understand, more generally, how the project of *Sein und Zeit* coheres with the thinking of the reversal that is underway in the later writings.

At first it appeared that the reversal stood between *Sein und Zeit* and the later writings, that it represented the point of transition. Now it is evident, however, that the reversal is not something once accomplished or undergone and then left behind for the sake of something else to which it is only a bridge. It is significant that Heidegger speaks not of the thinking *after* the reversal but, instead, of the thinking *of* the reversal. Thinking, when it enters into the movement of reversal, remains, as always, bound to that which calls forth thought but which does so only in that it simultaneously withdraws. Being incessantly withholds itself even in the midst of showing itself in that advent into which the reversal leads. The reversal does not terminate in a total revealment with which thinking could be brought to completion but rather issues in a recalling of Being as withdrawing. Heidegger's later works remain, and must remain, *in* the movement of reversal: 'Thinking itself is a way. We respond to the way only by remaining underway'; 'What remains in thinking is the way'.⁵⁰

Granted that the later works are engaged in the movement of reversal, how, then, are we to understand their relation to *Sein und Zeit*? Is this engagement already in effect even in *Sein und Zeit*, or is it only initiated in the later works? If the latter, then does *Sein und Zeit* in some fashion prepare the way to such engagement, or is it, on the contrary, simply left behind once Heidegger's thinking has entered into the reversal?

This final alternative is already virtually excluded by Heidegger's statement that the transition to the later writings does not involve an alteration of standpoint. Heidegger elaborates what is meant in this statement:

The thinking of the reversal *is* a change in my thought. But this change is not a consequence of altering the standpoint, much less of abandoning the fundamental issue, of *Sein und Zeit*. The thinking of

the reversal results from the fact that I stayed with the matter-for-thought [of] 'Being and time' [*bei der zu denkenden Sache 'Sein und Zeit'*], sc. by inquiring into that perspective which already in *Sein und Zeit* (p. 39) was designated as 'Time and Being'.⁵¹

The entry into the movement of reversal is, therefore, not an abandonment of *Sein und Zeit* but, on the contrary, is the outcome of staying with its fundamental issue. It came about through inquiring into the domain of the reversal already proposed in *Sein und Zeit*, the reversal from 'Being and time' to 'time and Being'. Heidegger's later works remain on the way to which *Sein und Zeit* pointed.

We have seen that the entry of thinking into the movement of reversal takes place only in a cor-responding in which thinking is able to let itself be drawn along by its sustaining source. The way of this entry is not something which is established by thinking but rather something granted to thinking. Thinking is of itself able to build no bridge by which it could pass over into the movement of reversal. Rather this entry is, regarded from the side of thinking, a leap. But, Heidegger insists, in the leap of thinking that from which it leaps is carried over: 'The leap of thinking does not leave behind that from which it leaps, but rather appropriates it in a more primordial way.'⁵² Not only, then, does the thinking of the reversal not abandon the fundamental issue of *Sein und Zeit*, but furthermore it is precisely the fulfillment of what was there undertaken: 'The question of *Sein und Zeit* is decisively fulfilled in the thinking of the reversal.'⁵³ In the thinking of the reversal what was undertaken in *Sein und Zeit* is fulfilled by being appropriated in a more primordial way.

Sein und Zeit already points ahead into the movement of reversal. Already it is engaged in the step back out of metaphysics through the fact that 'the problem is set up outside the sphere of subjectivism'. Already it keeps its distance from the effort by thinking to be its own sustaining source: '... the "Being" into which *Sein und Zeit* inquired can not long remain something that the human subject posits.' On the other hand, the thinking of the reversal appropriates in a more primordial way what was accomplished in *Sein und Zeit* and, hence, as Heidegger says 'furnishes for the first time an adequate characterization of Dasein'.⁵⁴ It is this way of understanding the coherence of his work which Heidegger expressed in his response to the distinction which Fr. Richardson formulated between 'Heidegger I' (the Heidegger of *Sein und Zeit*) and 'Heidegger II' (the Heidegger of the later works): 'only by way of what Heidegger I has thought does one gain access to what is to-be-thought by Heidegger II. But [the thought of] Heidegger I becomes possible only if it is contained in Heidegger II.'⁵⁵

IV Language in the thinking of the reversal

The thinking of the reversal involves an appropriation in a more primordial way of what was accomplished in *Sein und Zeit*. Presumably, this holds, specifically, of the problem of language, and it is in this connection that we turn, finally, to what Heidegger says regarding language in the later writings. We need to try to understand the way in which the issue of language is taken up in the thinking of the reversal as a fulfillment of what was undertaken with regard to language in *Sein und Zeit*, as an appropriation in a more primordial way.

In the thinking of the reversal the issues of *Sein und Zeit* are appropriated. However, they are not just appropriated in the sense of being taken over; rather, they are, Heidegger says, appropriated in a more primordial way, in such a way as to be brought, through this appropriation, to their fulfillment. This means that the issues of *Sein und Zeit* are, in the thinking of the reversal, brought explicitly into the compass of the fundamental issue their relation to which remained implicit in *Sein und Zeit*. This fundamental issue is that for the sake of which the entire analytic of Dasein was undertaken; it is the question of the meaning of Being. *Sein und Zeit*, however, failed to carry through the reversal in which this analytic would have been led back into the fundamental issue, and the connection of the analytic of Dasein to the question of the meaning of Being remained largely implicit. But in the thinking of the reversal this connection can come into the light. This thinking is enabled to take the step back out of metaphysics, to recover (*verwinden*) from the incessant effort on the part of thinking to be its own sustaining source. It is a thinking to which is granted the transition *from* utter obliviousness as regards Being, for which Being is simply nothing, *to* an experience of this nothing of Being as precisely the double self-concealment of Being, the concealment of concealment. It is thus that Heidegger writes: 'We must prepare ourselves to experience in the nothing the vastness of that which gives every being the warrant to be. That is Being itself.'⁵⁶ But, to be led to experience the nothing as the double self-concealment of Being is to be led from the concealment of self-withdrawing Being to the recalling of self-withdrawing Being, of the truth (clearing-concealing) of Being. The thinking of the reversal is a being drawn along in the withdrawal of Being itself, its withdrawal from every effort to set it back upon a ground in subjectivity. To appropriate the issues of *Sein und Zeit* in a more primordial way is to let them come into the compass of the recalling of Being as withdrawing. We need to understand how what is said about language in the thinking of the reversal is an appropriation of what was said in *Sein und Zeit* – *and also* how it is constituted as a more primordial appropriation through relation to the issue of withdrawal.

We saw through the analysis of signs in *Sein und Zeit* that language is not to be regarded in terms of correspondence between two classes of things, linguistic units, on the one hand, and what is meant or referred to, on the other. It is not, at the fundamental level, just a matter of words being matched up, as it were, with meanings or things, not a matter of simple correspondence. Rather, Heidegger insists that language needs to be understood in its involvement with the total meaning-context, with world which it brings to light as a whole, which it raises explicitly 'into our circumspection' so as to orient us within the world.

Implicit in this analysis is a denial that language is to be regarded in terms of the concept of expression. In the later works this is explicitly enunciated: 'Language is neither merely the field of expression, nor merely the means of expression, nor merely the two jointly.'⁵⁷ Fundamentally, language is not a matter of expression in the sense of words serving simply as vehicles by means of which something else, units of meaning, are made conveyable, made available for exchange. It is not as though a word were, first of all, merely a sound, something sensible, which then has, in addition, a nonsensible component, a signification, so that we would need to invoke 'a sense-giving act that furnishes the word-sound with a sense'.⁵⁸ It is not a matter of a word, as sound, containing sense as a bucket contains water. We pass over what is fundamental in language when we say that 'the word's signification attaches to its sound';⁵⁹ even in *Sein und Zeit* Heidegger said, not that significations get attached to words, but just the opposite, that 'to significations, words accrue'.⁶⁰ Words are not buckets filled with sense; they are rather like wellsprings that must be dug up:

Words are not terms and thus are not like buckets and kegs from which we scoop a content that is there. Words are wellsprings that are found and dug up in the telling, wellsprings that must be found and dug up again and again, that easily cave in, but that at times also well up when least expected. If we do not go to the spring again and again, the buckets and kegs stay empty, or their content stays stale.⁶¹

To speak is not simply to express, not merely to translate certain significations that we have on hand into a ready-made communicable form. It is not a matter of attaching significations to words. Indeed, there is a significance which sustains our speaking, which is taken up into it and to which our speaking must remain attached; we must 'go to the spring again and again'. But this taking up is no mere translating of something already on hand, no mere external attaching of significations to words. On the contrary, it is in being taken up into words that this significance first comes to light, and it comes to light not as so many discrete units of meaning through which reference to individual things

could be effected but rather in such a way that it 'explicitly raises a totality of equipment into our circumspection'. Thus, Trakl's poem, 'Ein Winterabend', is no mere describing, no mere naming in the sense of distributing titles, applying words, to the various objects and events that pertain to a winter evening but is rather an invoking, a calling forth into words, which by calling is able to bring near what is called; and what it invokes are things in their intimacy with the world to which they belong and from which they are granted to us⁶² – just as in the context of the analysis in *Sein und Zeit* the sign 'raises a totality of equipment into our circumspection so that together with it the worldly character of the ready-to-hand announces itself'. To significations words accrue in such a way as to bring to light significance, that is, world in its intimacy with things. Hölderlin wrote: 'But that which remains is established by the poets.'⁶³ Heidegger writes:

The poet names the gods and names all things in that which they are. This naming does not consist merely in something already known being supplied with a name, but rather in that the poet speaks the essential word, a being is by this naming nominated as what it is. So it becomes known *as* being [*als Seiendes*]. Poetry is the establishing of Being by the word [*worthafte Stiftung des Seins*]. . . . The essence of language must be understood through the essence of poetry.⁶⁴

To significations words accrue, however, not only in the sense that words invoke significance and bring it to light but also in the sense that significance, first of all, calls forth words. Our words, our speaking, is sustained, is called forth, is evoked. The poet names the gods; but, Heidegger writes, 'the gods can acquire a name only if they themselves make a claim upon [*ansprechen*] us and place us under their claim [*Anspruch*]. The word which names the gods is always an answer to such a claim'.⁶⁵ In the context of Heidegger's λόγος-interpretation this claim is thematized as what is given to speaking so as to come to light in the speaking. Speaking as λέγειν, laying, letting-lie, gathering and keeping watch over what is given, what is sent, is a speaking that is evoked, sustained by what is sent; speaking is ὁμολογεῖν.

We have seen that in *Sein und Zeit* discourse (*Rede*) is described as 'the articulation of intelligibility'. We saw, furthermore, that this articulation is not something which we simply execute but rather that it is an articulation in which we are caught up, which is always already handed over to us by virtue of our having been cast into a language – that it is an articulation already established, yet concealed, within language. It appeared then that discourse is promordially linked to the other two basic constituents of the 'there', that what is designated by 'discourse' is one's finding-oneself-as-thrown into a certain medium of intelligibility,

into a certain already established articulation. In the later writings what was called 'discourse' (*Rede*) in *Sein und Zeit* comes to be regarded as the primary sense of 'language' (*Sprache*). But beneath this shift the conclusion to which the analysis of discourse in *Sein und Zeit* pointed is not only retained but explicitly elaborated. Heidegger writes that 'language is not a tool';⁶⁶ language is not something which we have simply at our disposal, of which we are master. It is not an instrument with which to master things,⁶⁷ which itself would, in order to serve most effectively, need to be mastered. Rather it is something to which we are handed over, something in which we are always already caught up, something which we are subject *to* rather than subject *of*. According to Heidegger's λόγος interpretation speaking as ὁμολογεῖν is a gathering and a keeping watch over what is given to our speaking, that is, language itself. With this we return to what Heidegger said in *Sein und Zeit*: It is the business of philosophy to preserve the force of words.

In the same connection Heidegger writes that 'we are moving within language, which', he adds, 'means moving on shifting ground, or, still better, on the billowing waters of an ocean'.⁶⁸ If, again, we recall from the analysis in *Sein und Zeit* that discourse, language in its primary sense, is intended to indicate our finding-ourselves-as-thrown into a way of articulation, into a medium of intelligibility, then it is clear that this movement 'within language' is not just one movement among others but is rather that ground-movement through which intelligibility is already delivered up to our understanding, always already granted. But what is this understanding that is always already granted? *Sein und Zeit* gives the answer: 'Understanding of Being has already been taken for granted in projecting upon possibilities.'⁶⁹ This understanding which is always already taken for granted is what Heidegger calls pre-ontological understanding of Being. It is taken for granted, however, not in the sense that man as a subject is always in possession of a representation of Being, but rather in the sense that it is always granted to man in that he 'stands in the openness of the project of Being'.⁷⁰

The fulfillment, the more primordial appropriation, of these issues in *Sein und Zeit* comes about in the later writings in that language is now brought explicitly into connection with the pre-ontological understanding of Being and thereby its character as 'common root' made explicit. Language comes to be called 'the house of Being', and Heidegger adds, 'In its housing man dwells'.⁷¹ Man is housed in language, he moves within it, and thereby he is sustained in an understanding of Being. The development is explicit in a statement in *Was Heisst Denken?*: 'Every human attitude to something, every human stand in this or that sphere of beings, would rush away resistlessly into the void if the "is" did not speak.'⁷² Every human stand, all human comportment with regard to beings, requires – what? *Sein und Zeit* would answer: the pre-ontological

understanding of Being. But now Heidegger says: that the 'is' *speak*. It is required that the 'is' speak, that Being speak. It is required, not just that Being grant itself, but that it speak, and the two are now identical: Being grants itself in that Being speaks. But where and how does Being speak? It speaks *in language*:

‘Eon [Being] names that which speaks in every word of the language, and not only in every word, but before all else in every conjunction of words [*Wortgefüge*], and thus particularly in those junctures [*Fugen*] of the language which are not explicitly put in words. ‘Eon speaks throughout language and maintains for it the possibility of saying.’⁷³

Language is the language of being⁷⁴ – that in which Being speaks. It is in that which is hidden away in language and to which we are already subject that Being speaks, thereby sustaining man in a clearing of intelligibility, thereby sustaining him as the ‘there’. Precisely through a more primordial appropriation of that three-fold constitution of the ‘there’ elaborated in *Sein und Zeit* Heidegger is brought to say that the ‘there’ takes place as language. It is now evident why ‘language is the clearing-concealing advent of Being itself’; this, we have seen, is the proper locus of the reversal.

Heidegger says that Being speaks ‘particularly in those junctures of the language which are not explicitly put into words’. Being speaks unobtrusively in language. In its speaking Being conceals itself as that which speaks; it speaks, most of all, in those junctures which remain unspoken by us. At the heart of language as the language of Being there is self-concealment, withdrawal. Heidegger writes: ‘If we may talk here of playing games at all, then it is not we who play with words, but the essence of language plays with us, not only in this case, not only now, but long since and always. For language so plays with our speech that it likes to let our speech drift away into the more obvious meanings of words.’⁷⁵ Language is no game that *we* play; rather language plays with us and can do so precisely because we are not its master, because it withdraws its essence from us, holds itself aloof from us. It lets our speech ‘drift away into the more obvious meanings of words’ – the meanings that have lost their connection with the unspoken, the meanings in which the unspoken lies forgotten. Yet the unspoken is, most of all, where Being speaks: ‘Language denies us its essence: that it is the house of the truth of Being.’⁷⁶

In the folds, the junctures, of language Being conceals itself, withdraws itself from us. To be drawn along in this withdrawal is to enter into the movement of reversal; to be drawn along in this withdrawal is also to be drawn into ‘a transformed relationship to the essence of language’. Language and reversal belong together.

Notes

1 Heidegger, Martin: *Sein und Zeit* (9th Ed.; Tübingen: Max Niemeyer Verlag, 1960), p. 220, Heidegger has pointed out that even earlier, in the *Habilitations-schrift* of 1915, he was already engaged with the question of language, specifically with 'the metaphysical reflection on language in its relation to Being'. *Unterwegs zur Sprache* (Pfullingen: Verlag Günther Neske, 1959), pp. 91–2.

Meaning adrift

John Sallis

For language plays with our speech – it likes to let our speech drift away into the more obvious meanings of words.

—Heidegger, *Was Heisst Denken?*

But for the slightest twist, Nietzsche would be just the last metaphysician.

The story is at least twice-told. Once in Heidegger's text 'The will to power as art': the story of how Nietzsche set out to overturn Platonism, to invert it, to stand it on its head, of how, according to a familiar schema, he could not but be caught within that which he would invert, remaining ensnared in it almost to the end, twisting free of it only at the last moment:

During the time the overturning of Platonism became for Nietzsche a twisting free of it, madness befell him.¹

At the end, the slightest twist, setting one from that moment adrift from the logic of opposition, adrift in a certain oblique opposition to logic. Twisting, turning, drifting – into what? Into the end? Into a beyond? Into madness?

Yet Heidegger only retells – with a certain twist – a story that Nietzsche himself told during his final year. The story is, of course, that of 'how the "true world" finally became a fable'.² By now the story has perhaps been too often retold, has perhaps become all too familiar. Who cannot recite its six great episodes, the history of metaphysics from Plato to Nietzsche condensed to just over a page! The most fitting preface to every contemporary discourse that wants to be done with metaphysics, that thinks it can be done with metaphysics, every discourse that in addressing the end of metaphysics would fancy itself securely installed in a present perfect, if not a past perfect.

The story ends with high noon:

Noon; moment of the slightest shadow; end of the longest error; high point of humanity; . . .

What happens in this final moment, this end told of at the end of the story, in the sixth, the final episode? The earlier episodes tell of a certain drift of the 'true world', a certain drifting away in which that 'world' becomes unattainable for now, then unattainable as such, and eventually unknown. In the end, this drift is what serves to expose the 'true world' as an error, as due to be abolished. And yet, the abolition of the 'true world' is not what occupies the final moment, at least is not what is told of in the last episode. It is, rather, the penultimate episode that tells of how the 'true world' was done away with, of how well before noon it was thoroughly dismantled, at the coming at bright day, at breakfast, to the cheers, the infernal noise (*Teufelslärm*) of all free spirits. The final episode begins, then, with these words: 'The true world we have abolished: . . .' So, when it begins, the 'true world' has already been abolished; presumably, it is thus that the words no longer need be enclosed in those quotation marks which, in the fifth episode and in the title of the entire story, serve to mark a certain impropriety. When the final episode begins, the true world has drifted utterly out of sight, and, thus effaced, has been abolished, done away with. And that would be the end of it. The end of the supersensible, the end of Platonism, the end of metaphysics. That would be the end of it, were any of these such as could end once and for all. But do they indeed have – could they have – an end beyond which one would simply be done with them? Do they simply end? Is it not rather precisely because there is no simple end that a final episode is required? The final episode does not, then, tell of something after the end, of a 'beyond' in which the end of metaphysics would have been left behind. Rather, it continues the story of the end, tells of something else that cannot but have been done in and through the abolition of the true world, something which, though done at the same time, comes to be realized only after a certain lapse. The end is not a moment but an interval. It extends from daybreak to noon. At least to noon.

Thus extended so as to encompass (at least) both the twilight of the idols and the high noon of humanity, the end is anything but simple. Not only in its extension but also in its textuality; for it is, to adapt Nietzsche's words, a 'question mark so black, so monstrous [*ungeheuer*], that it casts shadows upon the man who puts it down'.³ How, then, does the end cast shadows upon its very inscription? The end is the end of a story, the story of how the true world finally became a fable, of how it finally turned into a story, of how in the end it proved to be nothing

more than a story, not only something told about but something posited only in the telling, in the story. What story? The story told by Nietzsche, perhaps for the first time in its full compass, certainly for the first time *as a story* and not as the history of being, as the 'history of an error'⁴ and not as the history of truth. The story is, then, on the one hand, a story about the true world, about its drift and eventual abolition, its drifting into abolition; and yet, on the other hand, the story is that which the true world becomes, the story into which it turns. In short, the story is about the true world becoming finally just the story itself. It is the story of the true world becoming the 'true world', words inscribed within and extending into the story itself. It is, then, a story from which that of which it tells cannot be simply set apart. It is the story of how the true world, drifting away into abolition, drifts into the very story of the drift into abolition. It is a story whose very meaning is set adrift in language.

It is thus appropriate that the story begins and ends as it does, enclosing the drift of the true world between two instances of writing. At the beginning, when the true world assumes its least remote, its simple, convincing guise, it is literally the translation of a sentence – a 'transcription [*Umschreibung*] of the sentence "I, Plato, *am* the truth" '. Product of a rewriting, the true world and its drift could never have been distinct from the drift in language, the drift of the story, which thus also ends by telling of a writing:

INCIPIT ZARATHUSTRA

Another story, beyond the story of the end, or, rather, a story that would extend the end.

The extension, the opening of the end, is produced, or at least decisively prepared, by what is told of in the sixth episode of Nietzsche's story. What is it, then, that happens at the end, disrupting the simplicity of the end, extending it not only from daybreak to noon but even, perhaps indefinitely, beyond? What is it that cannot but have been done in and through the abolition of the true world?

The true world we have abolished: What world has remained? the apparent one [*die scheinbare*] perhaps? . . . But no! *with the true world we have also abolished the apparent one.* [The punctuation and italics are Nietzsche's.]

The true world has drifted utterly out of sight, has disappeared once and for all; and in the end one has now only to proclaim that disappearance. The point of the final episode is that this proclamation does not leave simply intact the other world, the apparent world, that has always (i.e., since the beginning of metaphysics) been simultaneously both opposed

and subordinated to the true world: With the true world we have also abolished the apparent one.

And yet, there is a critical difference. What is proclaimed in the abolition of the true world is the utter disappearance of that world. What is proclaimed in the abolition of the apparent world is not its disappearance; for those things that have previously been consigned to the apparent world have by no means disappeared, but rather, whatever the story told, whatever the proclamation, they continue stubbornly to appear, to show themselves. What has been abolished is not that world that has always been understood as apparent but rather the possibility of continuing to understand it in that way prescribed by the metaphysical opposing of it to a true world. What has been abolished is any understanding of the apparent by reference to the true, by reference of the apparent thing to its meaning in the most rigorous determination; for the drift of the true world is the drift of meaning, and meaning set adrift can be, for metaphysics, hardly more than the sheer dissolution of meaning, its disappearance. What disappears is not the apparent world but its meaning; and the abolition of the apparent world is the proclamation of its meaninglessness, moment of the slightest shadow.

One could, of course, say – and it has often been said – that, once the true world has vanished, then the apparent one loses the character of apparentness, ceases to be appearance *of* the true, much less its mere semblance or even its dissemblance. What then would be required would be an understanding of the things of that world *from themselves* rather than one that would proceed by referring them to the true, to the intelligible, to meaning. And yet, things can be understood from themselves only by being taken as they show themselves, as they appear – that is, only by continuing to be taken (though now in a different way) as apparent, as appearances, if not as appearances *of* something exceeding the world of appearances. The things of *die scheinbare Welt* are to be taken as they shine forth in their self-showing. It is a matter of letting them show themselves.

It is, then, toward such a hermeneutics that the end of metaphysics opens. Afternoon. The shadows begin to lengthen; now in the opposite direction.

It is; then, upon phenomenology that the end of metaphysics opens. Rigorous openness – that is, engagement in the things themselves, in their self-showing, and simultaneously, reticence before them.

One could say, then, that the end of metaphysics is phenomenology. This would not be the same as saying (as has now often been said) that phenomenology is the end of metaphysics – that is, that phenomenology in the end only repeats, even if most rigorously, the founding gestures of metaphysics. The difference could perhaps be marked – though not

without beginning to disfigure the schema – as that between an end that opens out and one that closes off.

It all depends on how the things themselves are taken, for metaphysics too, from Plato to Hegel, appeals to τὸ πρᾶγμα αὐτό, measuring its rigor by its adherence to this injunction. In any case, to take the things themselves as they show themselves is never – whether in metaphysics or in phenomenology – simply to suppress all reference beyond the things; it is never simply to turn the thing upon itself (though such a turning does become a moment in the metaphysics of the subject); nor is it ever simply a turning of one thing toward another, a reference of one being to another. It is never a matter of forsaking the γιγαντομαχία περὶ τῆς οὐσίας for the sake of telling stories merely about beings.⁵ It is not movement within every field of reference that is – or can be – suppressed at the end of metaphysics but only movement within that field constituted by the metaphysical opposition between true and apparent, between intelligible and sensible. What must be inhibited in the face of the things themselves as they show themselves is the reference to an essence, an εἶδος, a meaning (in its classical determination). Otherwise, one ends up reconstituting metaphysics within phenomenology – that is, closing off phenomenology within the end of metaphysics.

Need it be said that *Being and Time* opens another field of reference, a field other than that in which appearing things would be referred to an εἶδος and thus understood from that εἶδος? *Being and Time* opens a field that is both other than the metaphysical field and in a founding way inclusive of that field, which is thus, in a sense, made possible by the phenomenological field.⁶ *Being and Time* opens a field in which appearing things, things as they show themselves, can be understood without the metaphysical opposition between true and apparent being reconstituted, without the story of the true world having to be retold.

Let it suffice to recall the phenomenological opening in the most schematic terms. The field opened by the phenomenological analyses in *Being and Time* is not, as with the metaphysical field, one that would lie between appearing things and something else to which, as to a true world, they would be referred. Rather, the reference through which things would come to be understood would be a referral of them to this field, a certain dispersion of them into the field, in no case a referral beyond the field. The phenomenological field is, of course, what Heidegger calls – at least in the initial analyses – *world*. To understand something by reference to world is not to refer it to something else that would shine through it, expropriating its self-showing, but rather to refer it to an open system of references to which, in its very self-showing, it is already referred. To understand something in this manner is to understand it *from itself*, to take it *as it shows itself*; for what the initial analyses of *Being and Time* demonstrate is that self-showing is always,

first of all, a showing from out of a system of references, from out of an envining world. Those same analyses, accordingly, also set about determining intraworldly reference as meaning (*Bedeutung*), hence broach a redetermination of meaning that would differ radically from the metaphysical determination.⁷ In place of meaning posited over against self-showing things in such a way as to expropriate their showing, in place of meaning as it has drifted away out of sight when the true world finally becomes a fable, Heidegger's phenomenological analyses redetermine meaning as nothing less than the very *drift of the world* from out of which things show themselves.

Meaning a drift, meaning adrift – as the very site of self-showing. To be in the world is, then, to mean this drift, to look ahead into it so as to let things show themselves from out of it. Being-in-the-world is being adrift in meaning a()drift.

Meaning, thus redetermined, is not simply to be set over against language as something utterly autonomous that language would only express. Even in *Being and Time* any such utter separation is already undermined, at least by the inclusion of discourse (*Rede*) as one of the constituent moments of the *Da* of *Dasein*, that is, of the disclosive opening of the world, of what Heidegger calls simply: disclosedness (*Erschlossenheit*).⁸

He calls it also truth, the primordial phenomenon of truth, ἀλήθεια. Thus, the phenomenological analyses of *Being and Time* issue in a re-determination of truth, one which does not metaphysically oppose truth to appearances, true world to apparent world, but rather displaces that opposition: truth as the opening/openness of the very site of self-showing. It is precisely for the sake of enforcing this displacement that Heidegger insists on distinguishing between truth as ἀλήθεια and truth as correctness (ὁρθότης), even if finally at the cost of relinquishing the word *truth*.⁹ This displacement, in turn, produces a displacement of the relation between truth and meaning, dissociating them only then to set meaning adrift in truth, to redetermine it as the very drift of truth. A()drift, too, in language.

This double displacement could provide a context for a careful reading of the recently published text of Heidegger's lecture course of 1942–3 entitled *Parmenides*.¹⁰ For that entire text, beginning with the Parmenidean words on/of the goddess truth, is addressed single-mindedly to the question of truth, perhaps most notably to recovering the meaning of truth and of untruth and to retelling the most momentous story told by the Greeks about truth and untruth, the μῦθος told at the end of Plato's *Republic*. One could perhaps even characterize the text *Parmenides* as an assembling of the elements of the double displacement.

Let me limit my reading to a single short passage. It occurs near the beginning of the text. Heidegger has introduced ἀλήθεια and proposed

the translation: *Unverborgenheit* – let us say: unconcealment. The word itself contains two indications, points in two directions in which *Unverborgenheit* can be investigated: (1) to *Verborgenheit* (concealment); and (2) to an overcoming of *Verborgenheit*, a kind of strife with concealment. These indications suffice to allow Heidegger to propose that truth is never simply present in and of itself but rather is something contested in strife with concealment, from which it must be wrested. Truth has – one might say – always already drifted away into untruth. The third direction thus indicated is that of truth as standing in ‘“oppositional” relations’ (‘*“gegensätzliche” Beziehungen*’).¹¹ It is a matter, then, of asking about the counter-essence (*Gegenwesen*) of ἀλήθεια. Or, rather, of asking about the *word* for the counter-essence of ἀλήθεια. Almost immediately the interrogation has drifted into language.

An interrogation of ληθές and of ψεῦδος commences, a discussion of the fundamental meaning (*Grundbedeutung*) of each. But the discussion is abruptly broken off, or, rather, it is interrupted, and before resuming it on the following page, Heidegger inserts two very remarkable paragraphs.¹² It is to this passage that I want especially to call attention.

The passage begins:

In the attempt to trace the fundamental meanings of words and expressions, we are, to be sure, not infrequently guided by an inadequate conception of language as such, from which then arise the familiar erroneous judgments concerning the investigation of fundamental meanings. We ought not think that the words of a language initially possess pure fundamental meanings and that with the passage of time the latter get lost and become deformed. The fundamental and root meaning remains quite concealed [*verborgen*] and appears only in what one calls the ‘derivative’.

Words are not like coins which with the passage of time, with the passage from hand to hand, get so effaced that their inscriptions become more and more difficult to discern. Words do not, in this sense, get worn out, used up; the very model of use and wear arises from an inadequate conception of language. The fundamental meanings of words do not get effaced in the course of time, through use or perhaps misuse, but rather are always already effaced, concealed, apparent only in what is already derivative. The root appears only in the stem.

The passage continues:

But this designation is misleading, because it presupposes that somewhere there is for itself a ‘pure fundamental meaning’, from which others are then ‘derived’. These erroneous conceptions, which even today still govern the science of language, have their source in the

fact that the first reflection on language, Greek grammar, was developed under the guidance of 'logic', i.e., of the theory of the saying of assertion [*vom Sagen der Aussagen*], as the theory of the proposition [*als Satzlehre*]. According to this theory propositions are composed of words, and words designate 'concepts'. The latter indicate what is represented [*vorgestellt*] universally along with words. This 'universal' of the concept one then regards as 'the fundamental meaning'. The 'derivatives' are particularizations of the universal.

An erroneous conception, still in force today, has arisen from the Greek reflection on language, from the reflection on language carried out both within and then under the guidance of Greek philosophy, preeminently the philosophy of Plato and of Aristotle, that is, at the beginning of metaphysics. That reflection proceeds according to the theory of the proposition as composed of words, the latter designating concepts or universals – that is, meanings as classically defined, fundamental meanings in distinction from the more particular meanings that can derive from and even serve to conceal the fundamental meanings.

It goes almost without saying that this reflection on language, setting meaning over against word, over against language, is inseparable from the metaphysical tale of the true world over against the world of appearing things. And equally, that this reflection is precisely the one that – now that the true world has finally become a fable – the phenomenological analyses of *Being and Time* radically displace by demonstrating that assertion is a derived (*abkünftig*) mode of interpretation; and that the apophantical 'as', according to which the proposition would be assembled from words designating meanings already detached from the world of appearances, is secondary in relation to the hermeneutical 'as' and a corresponding speech that would be attuned to meaning adrift in the world.¹³

But what is the erroneous conception that has arisen from the Greek, i.e., metaphysical, reflection on language? Heidegger is explicit: It is the supposition that somewhere there is for itself such a thing as fundamental meaning. Somewhere – not only beyond derivative meanings, but, more critically, beyond the designating words, beyond in a subsistence for themselves, independent of those words, capable even of drifting away behind the cover of 'derivative' meanings, of having always already begun drifting away, of drifting away just as, according to that history of an error told by Nietzsche, the true world has drifted away out of sight, beyond recall. Something to be abolished.

The passage concludes:

Yet, when in connection with our investigation we think about fundamental meaning [*auf die Grundbedeutung hindenken*], we are guided

by an entirely different conception of the word and of language. To think that we are pursuing a so-called 'word-philosophy', which sorts out everything on the basis of mere word-meanings, is, to be sure, a very comfortable opinion, but also one so superficial that it cannot even any longer be designated as a false opinion. What we call the fundamental meaning of words is that about them that is originary [*ist ihr Anfängliches*], which never appears at first but only in the end, and even then never as a detached and prepared structure [*als ein abgelöstes und präpariertes Gebilde*] that we could represent for itself. So-called fundamental meaning holds sway concealedly in all the ways that words have of telling [*in allen Sageweisen der jeweiligen Worte*].

Once meaning has – as the true world – drifted away out of sight, it comes – unless understood outside the classical definition – to be mere word-meaning, virtual meaninglessness; and nothing could be more superficial than to sort out everything on the basis of such word-meanings, except perhaps to mistake for such a 'word-philosophy' an attentiveness to the meaning of words as that which is originary in them. Fundamental meaning, displaced from the metaphysical opposition that has always determined it, is, then, that which is originary about words, that which, invoked by them, housed in them, lets things originate, come forth into self-showing. The originary in language is nothing other than world, ἀλήθεια, the open site of self-showing. It is also what lets metaphysics itself originate, enclosing the founding oppositions of metaphysics so as to delimit and yet withhold itself from metaphysics, remaining inaccessible, never appearing at first, in the beginning, in the origination, but only in the end, only when the drift of the true world finally transgresses the limit. It is not something detached that can be represented for itself, not only because all representing is already drawn along into its drift but also because it is itself drawn into the drift of language, holding sway in the ways that words have of telling.

Suppose that the originary, which can be called truth and world, were now to be called the true world. And suppose that one were to tell then of how the true world drifts along in the drift of language, in the ways that words have of telling, in their *Sageweisen*, or – letting the translation itself now drift ever so slightly – in the styles (*Weisen*) in which a fable (*Sage*) can be told. One would then have begun again to tell – though with an ever-so-decisive twist – the story of how the true world finally became a fable.

Poetry and language in Heidegger

Walter Biemel

There are two ways of dealing with the difficulties presented by Heidegger's thought: either it can be analyzed and criticized from the outside, or an effort can be made to understand it from the inside.

Let us look closely at the first possibility. It is in no way difficult to pin Heidegger's position down to certain theses and then to argue that these theses are untenable because they do not harmonize with the way of questioning one has adopted. This approach suggests itself especially if one tries to measure Heidegger with traditional conceptual schemes. In that case it soon becomes clear that this cannot be done; but this can mean two things: either that Heidegger's position is indeed untenable or that such an approach is intolerable. Obviously, the interpreter will most likely defend the first alternative; otherwise he would have to give up his own position and thus revoke his own interpretation. The difficulty which hides behind this approach, however, is even greater. When a thinker, in carefully considering tradition, tries to call it into question, his gradual abandoning of the language of tradition is inherent in his attempt. This can be shown very clearly in Heidegger; in *Being and Time* there already is no longer room for the traditional subject-object problematic, and a new way of understanding man is inaugurated, with the concept of 'Dasein'. It can be shown further that such concepts as 'phenomenology' and 'ontology', which are found in *Being and Time*, are later avoided. In fact, in *Being and Time* the concept of phenomenology is already substantially modified. The questioning back for the ground, which governs Heidegger's thought for such a long time, is finally superseded too in his last writings. All of this is merely meant to explain how, while thought proceeds, the language of thought changes. If an interpretive assessment is attempted from the viewpoint of traditional language, precisely that which constituted progress will be reproved by the interpreter because it does not harmonize with his position.

This difficulty must not be underestimated. We necessarily seek access to Heidegger from the standpoint of the tradition of Western metaphysics in which we stand. We are so biased by this tradition that we do not see how he moves away precisely from it. This moving away finds its linguistic expression in the phrase 'the overcoming of metaphysics'. In an interpretation based on this tradition Heidegger can easily be reproached with what, from his point of view, is precisely the advantage of his presentation, and his language, which frees itself from metaphysics, can be unnotedly retranslated into the language of metaphysics. As we have noticed already, this retransformation, although it seems to facilitate understanding, in fact makes understanding impossible; for that which is then 'understood' is no longer what Heidegger means but that from which he pushes himself away. It is then not difficult to advance criticisms, but these (in the final analysis at least) miss the point.

What about the second possibility? Here an attempt is made to arrive at Heidegger's position with a leap and then to remain there. What Heidegger says is no longer translated into a 'foreign' language and thus alienated, but now another difficulty arises – namely, that it is no longer apparent what explanatory steps were necessary in order to move into this new position. There is a false impression that Heidegger simply jumped out of the tradition one day and forcibly started something new; at the same time there is an impression of a relapse into the archaic – something new that is opposed to what is genuinely new. Such an interpretation is usually limited to repeating what Heidegger has said already, so the question immediately arises: What is the value of such an interpretation? Is it not merely a poor copy of the original?

There is also the question of whether the interpreter is really speaking from Heidegger's attitude or whether he merely believes he is doing so. There is thus a certain presumption in this way of speaking. The interpreter passes himself off as Heidegger, knows what is meant by this concept and that one, and can therefore save himself the trouble of traveling the laborious route over which Heidegger has gone. The interpreter even seems to be more fully informed of Heidegger's thought than Heidegger is himself. Strictly speaking, however, his interpretation is no more than a toilsome stuttering in which, however, neither the toil nor the stuttering are admitted. The movement in Heidegger's attempt at thinking from the very beginning until this very moment is thus denied; the interpreter acts as if Heidegger's insights sprang straight from a sudden inspiration, whereas Heidegger continually refers explicitly to the necessity of the movement and the execution and even wishes his entire thought to be understood as pathway. Hegel has already rebuffed the presumption of wanting to possess the results without traveling the road that leads to them. However, Heidegger cannot be hastily identified with Hegel; the characteristic of absolute certainty, which Hegel's philosophy

possesses, is not found in Heidegger, and this is certainly not just by chance. Heidegger is not pretending modesty when he allows a questionableness to hover over all his searching. We are here not in the position of absolute subjects for whom knowledge and truth coincide. This way of interpreting in which the interpreter argues that he stands within Heidegger's thought and is fully acquainted with it, would be rejected by Heidegger because it is not in harmony with the caution of his proceeding and the movement of his thought. Moreover, this kind of speaking about Heidegger contains a precipitance that contradicts the style of his thought.

If both possibilities of interpretation – the one that alienates from the outside and the one that overleaps from the inside – are inadequate, what are we then to do? We must begin by admitting that we are wholly unable to give an interpretation. An interpretation must be revealing. It must be able to show what lies hidden in a thought, on what that thought is grounded, what dimensions are opened up by it, and thus what margin for questioning is freed by it; and, where possible, the interpretation must be able to show what kind of change in understanding is brought about by that thought. None of this can be done as long as Heidegger's thought is the issue at stake. We can present criticisms of his thought, we can rebel against it, and we may try to unmask it or find delight in it; but in the final analysis all of this remains unimportant. To this day a genuine dialogue with Heidegger has never taken place because the partner for such a dialogue is lacking and because, strictly speaking, we remain strange to his thought. It is more honest to admit this strangeness than to pretend that what is said here is already known and familiar.

In this paper I will try to make some of this strangeness visible. This paper is not an interpretation; it cannot lay claim to such a title. If it should succeed in coming somewhat closer to Heidegger, I will be satisfied. It will not hide the difficulties that reading Heidegger has in store for us, but it will not act as if Heidegger is necessarily to be blamed for them. If a genuine discussion with Heidegger is ever to take place, preparatory work must be done; this text may be understood as a contribution to such preparatory work.

In order to experience something of the movement that is inherent in Heidegger's thought and to avoid the impression that his last and most strange insights emerged like a flash of lightning, I would like to pursue the following course. First I will briefly discuss the conception of language in *Being and Time*. Then, corresponding to the theme of this essay, I will describe language and poetry as found in 'The origin of the work of art' and 'Hölderlin and the essence of poetry', texts which stem from the period of the mid-1930s. Finally, a discussion of the later texts on language will consider those aspects of Heidegger's thought which are the most difficult and most strange.¹

Language in *Being and Time*

Language plays an important part already in *Being and Time*. In accordance with the existential-ontological formulation of the question which aims at freeing the structure of Dasein and which shows that the structural moments possess a constitutive function in regard to Dasein, language is shown to be such a structural moment (*Existenzial*). We need not elaborate here on the character of this analysis or on how Heidegger conceives of Dasein as Being-in-the-world. In chapter 5 of *Being and Time* the meaning of 'Being-in' is explained: Da-sein as moodiness (sec. 29), Da-sein as primordial understanding (sec. 31), and Da-sein as *logos* – language (sec. 34).

Heidegger says at the beginning of section 34 that 'the fundamental *existentialia* which constitute the Being of the "there", the disclosedness of Being-in-the-world, are primordial mood and primordial understanding'.² He leaves *logos* out of consideration in order to be able to make visible first what is characteristic of the immediate openness of Dasein in primordial mood and then the peculiarity of primordial understanding which belongs to Dasein in such an original way that Dasein can ek-sist only as understanding. Therefore, primordial understanding comprises the entire complex of Being-in-the-world – that is, the meaningfulness as basic structure of the world and the possibility of Dasein's own power to be. In so doing Heidegger shows that primordial understanding dwells always in the dimension of possibilities, because it is not a particular act of man but something that is founded in Dasein's original project – and the project constitutes the leeway of the power to be. 'As long as it is, Dasein always has understood itself and always will understand itself in terms of possibilities.'³ Without understanding there is no Dasein.

Dasein possesses the possibility of expressly appropriating to itself the understanding within which it keeps itself; for this Heidegger uses the term *interpretation* (*Auslegung*). 'Interpretation [is not] the acquiring of information about what is understood; it is rather the working-out of possibilities projected in understanding.' Heidegger further defines *assertion*, in contrast with *interpretation*, as 'a pointing-out which gives something a definite character and which communicates'.⁴ Assertion is possible only on the ground of that which is already made accessible in understanding. The question of how far Heidegger considers assertion to be a derivative mode of interpretation need not be dealt with here. What is important is the fact that it is founded in primordial understanding.

What new element emerges with *logos* when Heidegger attributes to *logos* such significance that he introduces it as being equiprimordial with moodiness and understanding?⁵ *Logos* is first determined as 'the articulation of intelligibility'. In order to forestall misunderstanding *logos* as something supplementary in regard to interpretation and assertion

(something like the mere report of what was already 'thought'), Heidegger says expressly that it is at the root of interpretation and assertion. What becomes articulated in *logos* is its meaning (*Sinn*). 'The intelligibility of Being-in-the-world – an intelligibility which goes with a mood, *expresses itself as logos*.'⁶ Original mood, understanding, and *logos* constitute a structural unity. Any context of meaning that was disclosed in primordial understanding is now spoken out in words. Primordial understanding always moves within contexts of meaning (cf. the concept of world as total meaningfulness). For these meanings words are created; words are necessary for one to utter meanings. Words do not exist for themselves as things to be supplied with meanings, but their Being is justified by the fact that they can manifest meanings. Since meanings and contexts of meanings become accessible in understanding, words are needed to make them comprehensible. It is in *logos* that 'the "significant" articulation of the intelligibility of Being-in-the-world' occurs.⁷

What must first be maintained in this determination is the relationships among moodness (original being open for . . .), understanding, and *logos* (articulation of moodlike understanding); they form a unity, articulated in a threefold way, in which Dasein ek-sists. *Logos* is in no way to be equated with language. In this period of Heidegger's thought *logos*, in contradistinction to the usual meaning of the word, is the constitutive moment, and language is merely 'the way in which *logos* gets expressed'.⁸ Language is that through which *logos* makes itself mundane; through language it becomes an element of the world and can be treated like other things found in the world.

Let us briefly consider the conception of *logos* as communication. The presupposition of communication is Being-with. Dasein is always with other Dasein and need not first secure the existence of its fellow men by means of artificial operations. In this Being-with Dasein understands itself and the other, as well as the world in which they, in each case, are; the other is at the same time given to Dasein in its own moodness as 'being tuned', although this giving might very well be subject to illusion. This sharing of the common experience that is immediately lived is expressly articulated in communication. Only because Dasein is Being-with, in Heidegger's view, is communication – that is, the explicit utterance of the gained experience in which Dasein in each case finds itself – possible. For this reason also, strictly speaking, communication is only possible among Dasein having a common experience of world. A report of the extreme living conditions on an exploring expedition becomes communication only if the reader is able to picture the conditions as possibilities that eventually could happen to his own existence. If this is impossible, then what is accessible through reading is not genuinely understood, does not become communication, but remains a 'foreign matter' (*Fremdkörper*). Communication thus does not create community

but presupposes a lived community which through communication merely experiences its explicit articulation. Dasein expresses itself in communication; this is not an uttering of something that was inside but an articulation of Dasein's Being-outside; it brings into work the original mood in which fellow men and environment encounter one another, as well as fellow men's understanding of environment and Being-with.

The leading idea in Heidegger's arguments about *logos* is the following: 'In *logos* the intelligibility of Being-in-the-world (an intelligibility which goes with moodness) is articulated according to significations; and *logos* is this articulation.'⁹ Heidegger thus does not take as his point of departure a subject which has the ability to speak, to disclose with words what is inside; his point of departure is the basic structure of Dasein as Being-in-the-world. *Logos* is considered from the viewpoint of this basic structure; it is nothing but the articulation of each concrete Being-in-the-world and implies all of the moments that belong to Being-in-the-world. As far as *logos* is concerned, utterance is not the decisive moment; each utterance is founded in the specific mode of Being-in-the-world.

Heidegger distinguishes four moments in *logos*: the 'about which' (that which the talk is about), the announcement (that which is said in the talk), the communication (taken here in the narrow sense), and the manifestation (that which is uncovered by *logos*). In *Being and Time* this distinction is only briefly mentioned; later, particularly the moment of manifestation (in the sense of uncovering or freeing) comes more and more to the fore, and this element then leads to the connection between *logos* and truth. But here we wish to draw attention only to the relation between *logos* and listening. Dasein is able to hear because it is determined by openness. In listening, Dasein is with the other and what he says; here we pay attention primarily not to words and speech but to that which is uncovered by them. Modulation, rhythm, and everything that can be said to belong to the modes of speech are subordinated to a manifestation, or, it can also be said, to the engagement, of the speaker to the thing which is at stake. In other words, the manner of saying is heard also, not in order to stick to it, but in order to make understandable the relation, the attitude of the speaker in regard to the events brought forth. Thus, via *logos*, we are with the thing itself and immediately with the attitude of the speaker in regard to the thing. In *Being and Time* Heidegger reproaches linguistics because, in its conception of *logos* as utterance (*Aussage*), it attempts to conceive of language by taking the present-at-hand as guiding clue, as if language were a present-at-hand mundane thing, and because the mode of Being characteristic of language is therefore not expressly thematized. This is an idea which governs *Being and Time*, an idea which circles around the differences among the Being characteristic of man, the intramundane ready-to-hand, and that which is merely present-at-hand. This distinction is the

presupposition which is necessary in order genuinely to ask the question concerning the meaning of Being. This brief characterization of *Being and Time's* formulation of the problem in no way exhausts what is said there about *logos* and language but is intended to be merely an introduction to the context in which *logos* is seen there and what it means to understand *logos* as an existential of man's being-in-the-world.

Language and poetry

In 'The origin of the work of art', which was written in 1935, expanded in 1936, and published in *Holzwege* in 1950, Heidegger says, 'All art, as the letting come to pass of the advent of the truth of beings as such, is in essence poetry'.¹⁰ An explanation of this sentence will be presented which, it is hoped, will show a development in Heidegger's thought about language. It is necessary in this regard to give a comprehensive presentation of the truth concept, a central concept of Heidegger's thought.¹¹

In 'On the essence of truth', the first draft of which originated in the early 1930s and which may thus be drawn upon here, Heidegger begins with a description of the current concept of truth: truth as conformity. This conformity can be understood in two ways. (1) The thing tallies (*stimmt*); it can be seen as that which corresponds with what we possess of it as foreknowledge. The thing upholds, as it were, the scheme in which it is thought. True friendship, for instance, fulfills all conditions that we connect with the concept of friendship. (2) The proper place of truth, however, is preferably put in the realm of judgment; one may say that this has been done since Aristotle, although there is still another conception of truth in Aristotle, just as Heidegger has shown. According to this conception, what is stated in the assertion conforms to reality (to the thing). 'Veritas est adequatio rei et intellectus', as it has been said in medieval philosophy. The term *adequatio* can be understood in a twofold way. Man's intellect conforms to the things created by God; on the other hand, things conform to the *intellectus* – not man's, however, but God's, since they come into Being according to God's Idea. 'Both concepts of the essence of *veritas* always mean a conforming to and thus conceive truth as correctness.'¹² That man's intellect is able to conform itself to things is shown by the fact that both man and thing are mutually coordinated on the ground of the divine plan of creation.

Heidegger is not satisfied with this concept of truth, which is maintained even in modern times, although the Christian system of the world no longer possesses authority as ultimate truth. Heidegger asks more fundamentally for that which makes conformity at all possible. In order for an assertion to conform with the thing, the thing itself must be in

the realm of the open, appear as something manifest, be present. The one who makes the assertion must in turn take his domicile in the same domain so that the relevant thing may encounter him. In Heidegger's formulation, 'The assertion must derive its correctness from the openness [*Lichtung*] of the comportment'.¹³ Truth is thus understood from the viewpoint of the openness in which both the thing and the man who comports with this thing find themselves. This openness, however, is in no way to be seen as a pure clearing in which what was in the dark before becomes gradually brighter and brighter, the eventual goal being maximum brightness. It might be understood, rather, as a medium that at each time lets certain determinate traits come to the fore so that the being is able to show itself according to the openness that has been achieved. Therefore, the openness is subject to change. The openness of classical Greek thought (that is, of the Greek world) is different from the openness of the medieval world view, and the modern openness is, once again, quite different from both. This change is, for Heidegger, the fundamental change of history.

In the passage quoted earlier from 'The origin of the work of art', Heidegger defines art as 'the letting come to pass of the advent of the truth of beings as such'; by this he means that art is the 'bringing about' of the openness. 'It is from the poetizing essence of art that it comes to pass that [art] erects in the midst of beings an open place in whose openness everything is different from usual'.¹⁴ By speaking of 'letting come to pass' rather than of simply 'positing' or 'creating', Heidegger implies that in the final analysis the taking place of the openness is not merely an achievement of man but that, as it were, man can receive only what Being itself sends him and may open himself to or shut himself off from this. Art is eminently a possibility for opening, for meeting.

What until now has been the genuine poetizing element of art thus becomes the change of the openness by which being is able to show itself, to appear. At the end of his interpretation of the Greek concept of *alētheia*, Heidegger also uses the term *unconcealment* instead of *openness*. 'The effect of a work does not consist in a working. It consists in a change in the unconcealment of beings which comes to pass through the work, and this means a change in the unconcealment of Being'.¹⁵ *Being* means here 'Being-ness'; how beings in the ensemble become accessible depends on the unconcealment. What comes to pass in poetry is not the inventing of occurrences and events, as this is attributed to our poetizing fantasy, but the openness in whose open being makes its appearance, shows itself, is. The change is here conceived of as 'clearing project' – a project in which what is projected is the clearing (the openness). Later, Heidegger clearly specifies the character of this project in such a way that it is not man who 'throws out', but Being itself. The expression 'letting come to pass', which was quoted earlier and which

also appears in the following sentence, points in the same direction. 'What poetry as clearing project unfolds in the way of unconcealment and projects to the rift of the form is the open which lets the unconcealment come to pass in such a way that in the midst of beings the open makes the beings shine and sound forth.'¹⁶

If what is poetized in poetry is the openness, and if poetry is the essence of art, it may be understood that all other arts are to be reduced to poetic art in the narrow sense of poetry. However, this is not what Heidegger means in 'The origin of the work of art'. He conceives of poetry here so broadly that it is the basic condition of all art, including the art of language (*Sprachkunst*). But why draw upon this essay if our main interest is in language? The reason is that in a second move Heidegger expressly shows interest in the art of language, to which he grants 'a privileged position in the whole of the arts'. That is why we must first overcome the current conception of language as 'communication'. 'Language is not only and primarily a phonetic and written expression of that which is to be communicated.' Heidegger is criticizing the view that language forwards by means of words what is already manifest. He confronts this view with his interpretation that 'language first and foremost brings being as a being into the open'.¹⁷ In naming a being one first makes it appear. Where there is no naming, there is no openness. Therefore, Heidegger equates saying with the project of the clearing; through saying, unconcealment comes into being.

Thus, what Heidegger stated previously in regard to art as poetry (taken in a broad sense) he now concretizes with the help of the example of naming. Through naming, beings first become accessible as beings; it is the condition necessary for them to be recognized and used as determinate beings. This becoming accessible of beings as beings, this uncovering of their beingness, is unconcealment. This must not be understood as if beings were present before but in a state of concealment; unconcealment means, rather, the entering into Being as appearance. Through unconcealment there is being for man; being is integrated into the project of world. According to the way in which this happens the history of a certain nation comes to pass, and its essence becomes materialized.

Something peculiar is taking place here. Heidegger starts with poetry in the broad sense of the term in order to proceed to poetry in the narrow sense. But even before he speaks of poetry in the narrow sense, it becomes clear that what comes to pass in language coincides with the essence of art as poetizing which was first outlined. The explanations concerning language thus do not bring us anywhere other than where we were already in the first delineation of the essence of art; on the contrary, we have returned to it. This circumscription of the essence of art becomes concretized to the extent that language is that through which openness (unconcealment) comes to pass. 'This naming first nominates

a being to its Being, and from this Being. Such a naming is a projecting of lighting in which is expressed the manner in which being comes into the open.¹⁸

Heidegger does not go into detail as to how in the various languages different worlds come to the fore; that would be beyond the scope of this reflection on art. In his lectures, however, he refers repeatedly to the differences between the Greek and the Roman worlds in relation to the differences between their languages.

The train of thought of Heidegger's essay on the work of art undergoes a change when he asks 'whether art, specifically taken in all its modes from architecture to poesy, exhausts the essence of poetry'.¹⁹ Here he is pointing out that we may not limit ourselves to art in order to experience what poetry means but that we must appeal to thought in order to comprehend what occurs in poetry. This idea occupies Heidegger through his latest works.²⁰

Let us now return to language. 'Language itself is poetry in the essential sense. Because language is that event in which for the first time being as being is disclosed to man, poesy [poetry in the narrow sense] is the original poetry in the essential sense.'²¹ How is this statement to be understood? To understand it, we must explain the relationship between language and poesy. For poesy to be possible, man must move in the realm of language, must disclose to himself being through the medium of language. Within this domain poesy occupies a privileged position; it is expressly and exclusively dedicated to the disclosure of being. Poesy completes what is set up in language, that at which language aims. The arts which do not realize themselves in the realm of language presuppose the disclosure of being through language. 'Each of them is a special poetizing within the clearing of Being, which, wholly unnoticed, already came to pass in language.'²²

We must therefore distinguish an original clearing such as that which comes to pass in language from that which, within the clearing that already has taken place, establishes itself in a determinate way and gains a foothold there. Heidegger limits himself in this regard to concise remarks. Only one wishes that his analysis of this distinction were more concrete – for instance, showing how the Greek world, founded by its language, finds expression and reaches its completion in architecture. Without a doubt Greek architecture supposes a determinate conception of the essence of the gods and of the relationship of man to the gods. If the divine had not first been said in language, it would have been meaningless, even impossible, to erect memorials to the gods. In these memorials, sacred woods and temples, a certain measure is revealed, an order having an effect on the lived self-understanding of the Greek man and influencing him by forming him. Within the history of a nation, one form of art can temporarily occupy a privileged position and can give

new impulses, whether this be architecture, painting, or music; but in each case language is already there. The question now is whether language can decay in a certain way and whether one of the arts can guard the openness.

We have seen that the essence of art is poetry. The essence of poetry, in turn, is establishing the truth, the articulated clearing in which Being comes to pass. In 'The origin of the work of art' this establishment is seen in a threefold manner: as bestowing, founding, and beginning. *Bestowing* is understood as the making available of what is new, which 'never can be compensated or equaled by what is present-at-hand and available', and thus possesses the character of abundance. *Founding* frees the historical ground on which a nation stands. *Beginning* is the instigation of the agonistic essence of truth. 'The genuine beginning, as a leap, is always a leap forward in which all that is to come is already overleaped, albeit as something which is still veiled.'²³

This digression has shown how Heidegger understands language as poetry in connection with the essence of truth; that which comes to pass in art is 'an excellent manner in which truth is – that is, historically comes to be'. As historical, art is 'the creating preservation of the truth in the work'.²⁴ When art comes to pass, a nation begins a new epoch in its history.

In 1936, approximately one year after writing 'The origin of the work of art', Heidegger takes up the theme of poetry again, in his lecture 'Hölderlin and the essence of poetry'. For Heidegger, Hölderlin is the poet par excellence. Because he poetizes the essence of poetry, he can be questioned about it. Heidegger borrows five sayings from Hölderlin and, in explaining them, presents the essence of poetry and that of the poet.

1. [Poetizing is] that most innocent of all occupations.
2. Therefore language has been given to man as the most dangerous of possessions . . . in order that he may testify to what he is.
3. Man has experienced many things
And many of the heavenly ones has he named
Since the time we are a dialogue
And able to hear from one another.
4. But what remains is established by the poets.
5. Full of merit, and yet poetically, dwells man on this earth.²⁵

Since my intention here is not to present the relationship between Heidegger and Hölderlin but to deal with language and poetry, I will draw attention only to those passages of explanation which contribute something to this purpose.

In Heidegger's explanation of the second saying, the following state-

ment is found: 'In order that history be possible, language has been given to man.'²⁶ This is completely in harmony with the explanation from 'The origin of the work of art'. In language man may testify as to who he is; in language the constitution of a world comes to pass. Heidegger maintains the relation between language and openness also when he says: 'But now it is only by virtue of language at all that man is exposed to what is open, which *as* being besets and inflames man in his Dasein and as not-being deceives and disappoints him.'²⁷ Without language there would be no experience of being; there would be no realm of what is open, in which all doing and undergoing of man takes place. Heidegger sees the danger that Hölderlin attributes to language in several ways. The first of these is to be understood from Heidegger's basic statement 'Danger is the menace of being to Being'.²⁸ Language as danger can also mean that what is freed and at the same time preserved in language by no means needs to be the most noble; it can just as well be the most vulgar. Language can also become an illusion – the unessential can pretend to be the essential.

All of these latter statements constitute a resumption of the arguments central to 'The origin of the work of art':

Language is not a mere tool that man possesses in addition to many others; on the contrary, it is only language that affords man the very possibility of standing in the openness of Being. Only where there is language is there a world, i.e., the perpetually changing environment of decision and work, of action and responsibility, but also of arbitrariness and noise, of decay and confusion. Only where world holds sway is there history. . . . Language is not a tool which is at man's disposal but rather that event which disposes of the supreme possibility of man's being.²⁹

In this manner Heidegger wishes to remove the common comprehension of language as a means of communication and to make language the basic event of man's Being.

In the third saying language is conceived of as a dialogue in which the gods get a hearing and a world appears. Being able to talk and being able to hear are seen as equiprimordial, just as the naming of the gods and the appearance of the world are also simultaneous with language. In this connection the naming of the gods is possible only if they address themselves to us. (This parallels Heidegger's conception of Being – that it can be experienced only if it addresses itself to us.) This dialogue is mediated by the poets. In these comments a distinction must be made between what Heidegger has Hölderlin say – for instance, about conflict, intimacy, and the gods – and what Heidegger himself says about language and unconcealment.

In the discussion of the fourth saying Heidegger says, 'Poetry is establishment by and in the word'. The idea with which we are already familiar – namely, that what is established is the open – is further developed as follows: 'That which supports and holds sway over all that is must become manifest. Being must be disclosed in order that beings may appear.' That which is open of the Open is here explicitly called 'Being'; and Heidegger refers to the way in which Being is in need of man, is entrusted to man, in the same way as in Hölderlin everything heavenly is 'entrusted to the poets as a matter of care and service. . . . When the poet speaks the essential word, being is by this name first nominated as that which it is. Poetry is the establishment of Being by means of the word.'³⁰ Taking up what was said in 'The origin of the work of art', Heidegger sees the establishment of the open as simultaneous and somehow identical with grounding. 'The saying of the poets is establishment not only in the sense of the free bestowal but at the same time in the sense of the firm grounding of man's Dasein on its ground.'³¹ Heidegger later overcomes this idea of establishment as positing, as we shall see, and considers it to be a hidden echo of the philosophy of German idealism.

We started with the view that poetry needs language in order to be able to be; it appears that in the course of this presentation a change has taken place. Poetry that makes what is open possible at the same time makes language possible. The essence of language must be understood from the essence of poetry. Heidegger therefore calls poetry the aboriginal language – that is, what is at the root of language. In this connection poetry is then understood in the specific sense, as the disclosure of unconcealment, not as poesy. It can thus be maintained that in this period of Heidegger's thought the essence of language is understood from the essence of poetry. 'The ground of human Dasein is the dialogue in which language does truly come to pass. The aboriginal language is poetry as establishment of Being.'³²

From poetry understood as aboriginal language, Heidegger then comes to see the poets as Hölderlin sees them – namely, as the mediators between gods and men. The poet's establishing is hereby conceived of as an independent act but, at the same time, as an act of highest necessity. The naming of the gods presupposes that the gods grant themselves to be known through signs mediated to the nation by the poets. On the other hand, however, the poets are bound also to the myths of a nation, in which the historical good is preserved; and it is their duty to explain these myths. In Hölderlin's definition of the essence of the poet, Heidegger sees a verification of his interpretation of poetry as a coming to pass of the truth; the idea is taken from Hölderlin but is formulated by Heidegger in his own language.

Heidegger experiences yet another point in Hölderlin in which the two meet one another. Hölderlin's definition of the essence of poetry cannot

be atemporal, for man's existence is historical. Therefore, the time for which this definition holds good is specified, namely, the time in which the gods have flown and the coming of God is expected. Heidegger uncovers the kinship between this point of Hölderlin's and his own thought, which is understood as the revealing of Being's forgottenness – of Being's withdrawal – and as preparation for a possibly new approach. The expression 'needy time' also holds true for the way in which Heidegger interprets metaphysics and its being overcome. The coming to an end of the epoch of metaphysics and the preparation for the time of thought is the 'needy time' of that philosophizing which prepares for the transition to thought.³³

Poetizing and thought

We must now attempt the leap to Heidegger's later texts on language, written in the 1950s, two decades after the Hölderlin lecture. In his introduction to three lectures entitled 'The essence of language', Heidegger formulates the issue: 'to gain an experience with language'. This cannot mean that we should engage in experiments with language but that, 'once we become attentive to our relationship to language', we should reflect on our abode in language.³⁴ In other words, we should become fully aware of something that immediately concerns our own Being. Heidegger refers expressly to the fact that the issue is not to gather knowledge about language in the sense of metalanguage and metalinguistics. The question is therefore not merely one of criticism of another possibility of dealing with language. Heidegger makes it clear from the beginning that his questioning concerning the essence of language will no longer take place within the perspective of modern metaphysics and that the investigations in the sense of metalanguage remain dominated by that perspective. 'Metalinguistics is the metaphysics of the universal technification of all languages into the only functioning interplanatory instrument of information.'³⁵ In opposition to the scientific and philosophical knowledge of language, he proposes 'to gain an experience with language'. It might be added here that the issue is to try to get close to language in a thoughtful way; for in Heidegger's view philosophy and thought are basically different ways of approach.³⁶

In the experience with language one must try to have language bring itself up for discussion. Language has the special characteristic that we live in it, are familiar with it, and deal with it without catching sight of it. We continuously heed what becomes accessible to us through language and thereby overlook language itself. In order to get out of this position Heidegger again appeals to the poet, not merely because he has a privileged relationship to language but because he brings this relationship up

for discussion. Whereas Hölderlin poetizes the essence of the poet, Stefan George poetizes the relationship with language, our experience with language. This is why at the center of these explanations Heidegger interprets George's poem 'The word' (published in 1919).

I brought to the border of my country
 Miracles from afar or dreams
 And waited until the fierce Fate (Norne)
 Found their name in her well.
 Thereupon I was able to grasp it tight and strong
 Now it blooms and shines through this mark. . . .

Once after a good journey I arrived
 With a gem rich and tender
 She searched for a long time and told me,
 'There is nothing like it among the things
 which sleep in these depths.'
 Thereupon it escaped from my hand
 And my country never gained that treasure. . . .
 Thus I sadly learned the renunciation:
 'No thing be there where the word is lacking.'³⁷

One could immediately object that George's way of writing poetry, which tends to what is 'pathetically precious', no longer has anything to offer us. He is scarcely known, let alone read, by today's youth. His way of writing poetry is barely possible today, just as it is no longer possible to compose in the manner of Wagner. However, although George is obviously not 'up to date', it is possible that in his poem something of our experience with language becomes manifest, something that outlasts and surpasses his pretentious style of writing. Art can never be measured in terms of its popularity.

This poem is dedicated completely to the poet's experience with the word. The first stanza describes the power of the poet. He is able to collect astonishing things, as well as what has been seen in dreams, for which the Fate goddess grants him names. In this way the being which already is becomes fully manifest through its word, manifest also for others. Through the names, the poet secures what he has seen. A climax of the poetic activity is shown here. What the poet is able to grasp is hereby also accessible to others. Even the exceptional ('Miracles from afar or dreams') is brought close to his fellow men, albeit only with the help of the Fate goddess. By ending the stanza in the present tense ('Now it blooms and shines through this mark'), the poet shows the persisting, the presencing, which comes to pass in this poetizing in which the names receive power over the things.

In contrast with this, in the second stanza the poet mentions an experience in which he brings to the name-giving not something that comes from afar but something that lies in the hand (*auf der Hand liegendes*), which he calls 'a gem'. A gem is that through which the Being of the wearer becomes manifest. But it is precisely for this thing that the Fate goddess does not find a name. In view of the fact that until now she has found a name for every being, it might be assumed that what is presented is something which is not-being. On the other hand, however, it is designated as a gem, as being particularly precious, and thus as a being of a special kind. When the word for it fails to appear, the gem disappears; the poet is unable to retain it. Here a new mode of Being of the word comes to the fore. The word not only is able to yield the name for a being that is already there – 'it is not merely the naming grasp for that which is already present and proposed as such'³⁸ – but also grants the being present.

How is the final line of the poem to be understood? According to Heidegger, it names not what is renounced but the domain into which the renunciation must enter. 'What the poet learned to renounce is the view that he formerly subscribed to concerning the relationship between thing and word.' The word *be* (*sei*) must be understood as imperative; more carefully formulated, the renunciation of his former understanding implies a command. 'The word addresses itself to the poet as that which keeps and maintains a thing in its Being.'³⁹

The poet experiences himself as the custodian of the word. A limit experience for which the word does not suffice (the Fate goddess does not find a name) must not be understood merely negatively; for, with the poet's learning to renounce, it also becomes clear what the word is able to do. Heidegger sees in the mood of sadness 'the mood of composure in regard to the nearness of what is withdrawn but at the same time saved for an original advent'.⁴⁰ This mood can also be considered the basic mood for Heidegger's thought. Let us draw attention to the concept of 'needy time', to Heidegger's thought concerning Being's withdrawal, in which a possible new advent announces itself when the withdrawal is experienced as such, and which, at the same time, makes Heidegger's position in regard to metaphysics understandable. The history of metaphysics is thought of as the epoch of the forgottenness of Being. This epoch is not immediately overcome in Heidegger's thought, but in it the absence of Being is for the first time expressly thought; this epoch is conceived of as the time of Being's farness. In this way the possibility of a reversal is given, as this is expressed in the quotation above. Heidegger returns to the original thinkers, for in their thought the originating is still alive. From that, we wish to gather only the following: the considerations of language – the word of the poet – are

problems in which Heidegger's basic experience collects; in them a purified retrieval of the Being question takes place.

As far as Heidegger's way of proceeding is concerned, what matters for him is to listen to the address (*Zusage*) of language. 'Language must in its own way address itself – that is, its essence – to us.'⁴¹ If we succeed in this listening, we will be able to gain a thoughtful experience with language. The preparation for such an experience is being able to catch sight of the proximity of poetizing and thought, even being able to settle in this proximity.

Heidegger's explanation will show that, notwithstanding the important statements about language in the realm of thought, notwithstanding the exciting data found in what has been composed in language, the essence of language 'everywhere does not bring itself to word as the language of Being'. We have seen first that in speech language recedes on behalf of what is said in it. This recession can find its ground in the fact 'that language with its origin holds itself back [*an sich hält*] and thus denies its essence to our current pro-posing representation'. The difficulty is not immediately to personify the state of affairs expressed in this way; the formulation can certainly tempt us to do so. Heidegger points to a possible reason why the essence of language withholds itself: 'that the two privileged modes of saying – poetizing and thought – were not searched for expressly, that is, in their proximity.'⁴² This is exactly what Heidegger wishes to do in the second of the three lectures entitled 'The essence of language'.

Heidegger's interpretation of the final stanza of 'The word' was to show that the issue is to be found in the relationship between thing (being) and word – specifically, that the word helps the thing to its Being and keeps it therein. Thus the word is not merely related to the thing; it is that 'which maintains the thing as thing', that which Heidegger calls 'the relationship' (*das Verhältnis*). The word is thought of not as a mere reference or relation but as that which keeps and maintains (*das Haltende*) in the sense of that which grants.

What poets and thinkers have in common is the element 'language'; but we do not yet know how 'element' is to be understood and how it varies in meaning depending on whether the word is used poetically or in thought. At the beginning of the interpretation of George's poem it seemed as if the proximity of poetizing and thought was reached: that which has been composed must become accessible through thought. But, as Heidegger says in the second lecture, something essential is lacking in this interpretation – namely, the comprehension of proximity *as such*, the proximity which the interpretation takes as its point of departure. In both poetizing and thought we dwell already in language, but to catch a glimpse of this sojourn is most difficult. Since this sojourn determines man in his essence, the return 'into the region of our being human'⁴³ is

our main task and that which, within Heidegger's dimension of thought, governs all his pains and efforts. This region is not to be understood as a 'stationary place' to which man is nailed down but as the abode in which the possibility of developing is given to him.

Heidegger has never conceived of the return to this abode as an arbitrary archaization; that is impossible because Dasein is understood to be essentially historical, and history never goes backward. Indeed, Heidegger's comparison of 'the step backward to the abode of man's essence' with 'the step forward to the essence of the machine' – where the latter obviously is meant critically – is governed by the conception that, as long as man does not know in what his essence consists, in what it is grounded, progress in the sense of technical mastery is questionable. The one who progresses in this way can measure his progress only in regard to his progressing ability to master nature; he need not know anything about the position in which he finds himself there.

In the interpretation of George's poem it was left undecided how the gem is to be understood. But now Heidegger proposes that the gem for which the Fate goddess does not find a word is nothing but the word itself. According to Heidegger the limit manifests itself here for the poet. In the domain of the poet no word can be found for the word itself. Can that perhaps take place through thought? The word is not a thing. If we search for it among things, we shall never find it. The word 'is' not, if we reserve the word *is* for the realm of things; but nevertheless it 'is' in a more privileged way than all things. Heidegger expresses this in the following way: 'As far as the word is concerned (if in thought we wish to do justice to it) we should never say "it is" [*es ist*] but rather "it gives" [*es gibt*].'⁴⁴

Es gibt must not be understood here in the sense of being present-at-hand, in which one can say, 'There are [*es gibt*] beautiful apples this year', but in the sense of giving as granting. The word, according to its very essence, is granting. What it gives is *Being*. This is not to be understood in the sense that the word lets the thing come into being just as, according to the medieval conception, everything originated from God's thought. We must recall here the concept of clearing in which all being can appear without its being created by the clearing. The question remains as to how we are to conceive of the word as that which gives; that is precisely the task of our thoughtful concern for the word.

In searching for the proximity of poetizing and thought we have, so far, only reached the point of understanding that their nearness is to be conceived of on the basis of language. In the following statement a decisive shift is expressed: 'For man is man only insofar as he is devoted to the address of language, is used for language, to speak it.'⁴⁵ Until now the determination of man's essence was the main issue, and we came across language as the abode which, although nearest to man,

remains hidden from him; but here man suddenly steps backward, and language comes to the fore. This statement represents the extreme pole of the conception of language as merely a means of communication, a commodity. Man suddenly appears as the one who is used – by language. Is this not an impermissible hypostatization of language? How is language to be understood as the essential element with man merely at its service?

In order to proceed, Heidegger assumes that the essence of language is to be found in the saying (*Sage*). 'Saying [*sagan*]' means to show: to let appear, to free in a way which is at the same time clearing and hiding, taken in the sense of pro-offering of what we call world.⁴⁶ This is first of all the consistent continuation of the conception of language as found in 'The origin of the work of art', where the letting appear is seen in its twofold character of freeing and holding back, of revealing and concealing, and as mentioned there also in connection with the explanation of truth.⁴⁷

In order to get closer to the essence of language Heidegger takes the following guiding principle for his experience with language – the essence of language: the language of Being (*das Wesen der Sprache: die Sprache des Wesens*). In this guiding principle a change takes place which – once we have understood it, once it has taken place with us – will lead us to the extreme.

In the first part of this principle 'essence' (*Wesen*) is understood as quiddity (*to ti estin*). 'Language' is the subject; what is at stake is understanding the *essentia* of the subject. 'The essence which is thus understood is delimited to that which is later called the concept, the representation with the help of which we bring close to ourselves and grasp what a thing is.'⁴⁸ (This refers back at the same time to the first stanza of 'The word' by Stefan George.) The essence which is understood in this way keeps us in the domain of the proposing representation of metaphysics.

In the second part of the principle it is in no way permitted merely to bring a change of terms about so that *Wesen* thus becomes the subject and 'language' is attributed to it; this change must bring about a turn from the proposing representation of metaphysics to a thought which is no longer metaphysical. Since we have grown up wholly within the representation of metaphysics and have inherited from it one mode of representing, this new way of speaking must appear strange to us.⁴⁹

In the first statement *Wesen* means quiddity; in the second statement it must be understood as continuing and lingering, not as mere duration, but as that which concerns us, strikes us, touches and moves us. 'Language belongs to this continuous abiding and is inherent in that which moves everything as that which is most characteristic of it.'⁵⁰ However, how are we to think of that which moves everything? In one of Heidegger's most recent publications⁵¹ it is thought of as the Fourfold, as the

four regions of world – earth, heaven, men (mortals), and gods – which in their interplay constitute the world.

In his interpretation of some lines from the fifth stanza of Hölderlin's 'Bread and wine' Heidegger sees 'the word . . . as the region which lets earth and heaven, the flowing of the depth and the power of the highest, encounter one another, and which determines earth and heaven as the world regions'.⁵² Language is thus understood as that which governs the interplay of the four world regions. In this mutual interplay nearness takes place. Nearness and saying as that which lets appear are what continuously abide from language – they are the same (*das Selbe*).

Language as the Fourfold of world is no longer merely such a thing with which we, the speaking men, have a connection in the sense of a relation which exists between man and language. Language as the saying which moves the world is the matrix of all relationships. It relates, supports, and enriches the 'opposition to one another' of the world's regions, maintains and guards them while it – the saying – holds to itself [*an sich haltet*].⁵³

In this connection Heidegger no longer understands the sounding forth of language as a result of physiologico-physical processes. 'The sounding forth of language is detained in the tuning which chimes the regions of the world structure to one another by playing them onto one another.'⁵⁴

Heidegger has reached here, in regard to language, a summit in the realm of saying which touches upon the limit of that on which we can reflect and which must evoke astonishment. Language is thought of as the original source which keeps the world regions together, which keeps them opposite one another. We are constantly in danger of falling back into the usual representations, according to which language is like an external link, and one cannot understand from where this link comes or from what it derives its linking power.

If Heidegger is understood in an approximately appropriate way, language is nothing separate, found outside the Fourfold of the world (where else then should it be?); it is the relatedness of the Fourfold in the Fourfold itself. It is not a transcendent power, for that would be a metaphysical representation; it is, rather, the proximity that governs in the Fourfold, for which Heidegger uses the word *nearness* (*Nahnis*). Formulated in a different way, it is the original gathering (*Versammlung*). Here Heidegger agrees with Heraclitus and his idea of the *Logos*, which Heidegger for years has explained as the original gathering. Language as the original gathering is soundless. Through language, seen in this way, it is given to man to say 'is'; and Heidegger has thought about this from the start. The gathering and soundless language of the silence is the language of abiding Being (*Wesen*) – of Being provided it is not

represented metaphysically. In the last line of George's 'The word', Heidegger sees a poetic reference to the breakdown of the word as we are familiar with it and to thought's comprehension of language's stillness. This is possible only because poetizing and thought possess their proximity in language as nearness.

In order to avoid the impression that the issue here is about decreed theses through which the truth concerning language is fixed and not about a tracking of the unsayable or about always new traces which could lead to further approximation, another idea will be presented for consideration. This idea is taken from Heidegger's 'The road to language', which is the most recent of his texts on language. In this lecture Heidegger considers how man's speaking, man's language, is related to the language of the stillness. To understand *Ereignis*, a word which is at the center of this text, we must first briefly indicate the context in which the word emerges.

Language speaks by pointing. 'Language speaks in that it is the one that points; and, reaching into all the regions of the world, it lets that which comes to presence out of each region appear and disappear.'⁵⁵ The connection between language and letting appear is found in all texts about language, starting with *Being and Time*; but of course how this letting appear is to be thought of and what it is that speaks change. According to Heidegger, the speaker (man) can speak only because he listens to language, and he is able to hear only because he belongs to language. 'Only to those who belong to [language] does the saying grant the possibility of listening to language and thus of speaking.'⁵⁶ Thus Heidegger sets off this granting as a fundamental trait of language. The relationship between the speaker and language recalls the relationship between Dasein and Being that Heidegger mentions earlier, when he says that Dasein can be only by the grace of Being, but on the other hand Being is in need of Dasein.⁵⁷ 'Language is in need of man's speech and is nevertheless not the mere product of his speech activity.'⁵⁸

The basic language, which Heidegger calls saying, makes all appearing possible. 'The saying governs and joints the "Free" of the clearing, for which all appearing must search and from which all disappearing must flee, whereunto each being present and being absent must point itself, must announce itself.'⁵⁹ From what takes place in saying, conceived of in this way, Heidegger comes to the *Ereignis*. It makes something be suited for (*ereignet*), that is, it grants 'the Free of the clearing in which what is present can abide and from which what is absent can escape and, in withdrawal, can keep its abiding'.⁶⁰ This granting must not be understood according to the cause-effect schema. 'There is nothing else to which one could still reduce the e-vent and with the help of which it could be clarified.'⁶¹ It is the last thing that our glance comes across as it tries to unravel saying's granting. In another essay Heidegger says of

Being, 'it gives [*es gibt*]'; here he says that the *Ereignis* also grants this *es gibt*, 'of which Being, too, is still in need in order (as presence) to arrive at what is proper to it'.⁶²

The manifold possibilities of showing refer to the saying as that which shows, and this, in turn, refers to the *Ereignis*. It may be appropriate here to remember that we are not permitted to hypostatize the *Ereignis* as a power which is beyond everything and which holds sway over Being; we must rather try to grasp the *Ereignis* as that which governs in language and which we run into in our questioning back concerning language's pointing. In our attempt at thinking the *Ereignis*, by no means do we leave language behind. A new aspect of language offers itself here: the way in which language lets man himself speak by making available to him the clearing in which each being will appear. Again, this connection must not be understood in the sense that man is subject to a power to which he must submit himself; Heidegger wishes to show what man owes to language as saying. Through language man is able to speak in the sense of the *logos* that expresses itself with spoken words. (A change has taken place here which, in regard to *Being and Time*, is radical.) Genuine speech is for Heidegger a cor-responding to the saying and to the appropriating e-vent. The relationship between Dasein and Being, which we mentioned earlier, returns when Heidegger says, 'Man is used in order to bring the voiceless saying to sounding'.⁶³

In genuine speech nothing takes place but a manifestation of the appropriating e-vent, which remains hidden, however, for the one who speaks. That is why, according to Heidegger, the thinking experience of the essence of language is nothing but the freeing of the movement that leads from the appropriating e-vent to man's speech. Language is able to grant the clearing because in its very essence language is a granting and an appropriating e-vent. The historical moment, which Heidegger's thought never leaves, is present here too. The appropriating e-vent is not a unique occurrence. It is able to reveal itself, to show or to hide itself; according to this showing or hiding, language comes to pass, and man's speech is something that changes.

All language of man comes to pass in the saying, and as such it is genuine language in the strict sense of the word, although in each case the nearness to the appropriating e-vent will be different. Each genuine language, because it is assigned to man by the movement of the saying, because it is sent to him, is therefore fateful [*Geschicklich*].⁶⁴

In what way does this surprising idea at all pertain to the subject of this paper, which is poetry and language? Heidegger says, 'All pondering thought is poetry, but all poetizing is thinking'.⁶⁵ In Heidegger's view,

what genuinely poetizes is the appropriating e-vent, which remains appropriated also to language; in his earlier texts it can therefore be addressed as poetry.

Notes

1 Wolfgang Zucker made the following comments, with which Professor Biemel expressed agreement: 'Professor Biemel correctly warns against any fixation of Heidegger's thought into theses to be accepted or rejected by the reader and, in contrast, correctly demands an openness of the reader for the "strangeness" of Heidegger's way of thinking and a readiness for a dialogue beyond assent or dissent. Has not Heidegger demonstrated this very *methodos*, this sharing of the way, in the introduction to his own attempt at translating-interpreting the strangeness of the Anaximander fragment? Is not his analysis of the process of thinking as *nach-denken*, *an-denken*, and *danken* precisely the necessary attitude and activity by which, according to Professor Biemel's lucid presentation, the reader may approach an understanding? Furthermore, is not any attempt at translating Heidegger's German sentences into any other language perhaps one of the best ways of training in this "following on the road of thought" [*nach-denken*], in this use of strangeness as crystallization point [*an-denken*], and in this recognizing of strangeness as a favor [*danken*]?'

33 Erling W. Eng made the following comments which, according to Professor Biemel, certainly indicate an important task for the poet in our time: 'Is the poet perhaps limited to disclosing to us the uncanny character [*das Unheimliche*] of the machine? Since the meaning of the machine lies in its functionality, does it have any sense as phenomenon? Perhaps Brecht's "estrangement effect" [*V-Effekt*] is aimed precisely at the machinal as such, to expose it.'

36 L. J. Ferguson questioned Professor Biemel as to the difference between the approach of philosophy and the approach of thought to language. Biemel answered: 'By philosophical dealing with language Heidegger means the metaphysical approach which in our century is embodied in metalinguistics; by thoughtful dealing Heidegger does not mean to force language into the channels of metaphysics and to fasten it there, but rather to lead us to "make" an experience with language, as he explains in *On the Way to Language*, or, more carefully formulated, to think about language from the e-vent not as something that rules over man but as that to which he is exposed, that about which he must think.' (For the difference between philosophy and thought, see also Heidegger's illuminating text 'Das Ende der Philosophie und die Aufgabe des Denkens', *SD* 61ff.).

Heidegger and Hölderlin: the over-usage of 'Poets in an impoverished time'

Annemarie Gethmann-Siefert

It seems that everything there is to say on the topic of Heidegger and Hölderlin – if not too much – has already been said. Heidegger's philological errors have been thoroughly analyzed, as has the path of his thinking from the encounter with Hölderlin.¹

In 1934/5, Heidegger composed his first Hölderlin lecture as the answer to and justification for an abortive political commitment. The first interpretive option is naturally – if we follow Heidegger's later self-interpretation – the failure to disclose an error or misdirected commitment in this. Consequently it was also the case that from the perspective of practical philosophy, the relationship between thinking and acting, between interpreting and politics in Heidegger's encounter with Hölderlin, is treated exhaustively. At least Heidegger himself obviously must have accepted his confrontation with Hölderlin as the version of the way out of the political error that appeared most responsible to him, and indeed he camouflaged it as something wrung from his own cleverness. At the same time, it was to be understood as a clear rejection of the creations of National Socialism.²

If one reads Heidegger's Hölderlin interpretation in light of the clarification of the facts of the unpleasant political commitment to National Socialism, then the activity which apparently was thought to be only philosophical also reflects political errors and practical misdirections. We cannot settle the question here of the extent to which Heidegger, in his self-interpretation, is playing down an error, or the extent to which he interpreted differently in conscious distortion of what took place. On the other hand it can be shown that in Heidegger's way out of political activities (*Gemächte*), and in his way back into the power of poetizing (*Dichtens*) and thinking, the reason for the political error of misjudgment repeats itself in such a way that the factual decision turns out to be based on principle. Thus what is at issue is not a verdict of guilty, but

the question of the extent to which a person can obviate with philosophy a 'philosophy' which on the one hand is itself grounded in the tradition, but which on the other hand as 'authentic' thinking, essentially avoids its standards. As for Heidegger's 'path of thinking with Hölderlin', this path from the philosophical tradition to a new beginning allows essential thinking to be elucidated from the perspective of more practical consequences. At the same time we can find the first beginnings for not going along with Heidegger's advance from philosophy to 'thinking' as he understood it.³

1 Poesie and politics

Otto Pöggeler points out that in his first Hölderlin lecture, Heidegger wants to move away equally from a determination of the poetic and the political.⁴ Although Heidegger strictly refuses to rank the poet Hölderlin alongside the philosophers of German Idealism (cf. e.g., *Höld.* 34/5, p. 6; *EH*, 85f.), with the explicitly formulated intention of his Hölderlin interpretation he reverts to a manner of questioning that is constitutive for German Idealism.⁵

In fragmentary reflections referring to Schiller and in dialogue with Hegel (at first by letter, later in person), Hölderlin first sketched out an 'ideal for the education of a people' (*Ideal der Volkserziehung*) through art, which he hoped to satisfy in his poetry. Together with Hegel, Hölderlin wanted to expand Schiller's conception of aesthetic education in the sense of an historical ideal. This ideal extends from a unity of poetry and politics, which Heidegger also made his own. The decisive point is that the education for the coming of the age of reason, where it would be fulfilled through poetry, at the same time extends, indeed must extend, the original sequence of determinations of historical existence; it does not want the 'revolution of the spiritual world' as Kant had prepared it – hence Schiller's aporia – to founder on the principle of an apraxis of the Ideal.

Heidegger presupposes precisely this claim in his determination of the poet. First of all, he is a poet in 'an impoverished time', i.e., in that situation of 'being torn asunder' ('*Zerrissenheit*') which Schiller, according to Heidegger's partner in dialogue, Hölderlin, set forth as the symptom of modernity. Here, according to Hölderlin, it does not suffice to place the thought of a more human world in opposition to reality. Rather, everything rests on discovering a possibility for imagining it in history. Heidegger too defines poetry on the basis of this unity of projection and effect (*Entwurf und Wirkung*). Poetry and politics are joined together in such a way 'that the historical Dasein of the people – their ascent, peak and descent – spring forth from poetry, and from this authentic knowing

in the sense of philosophy, and from both springs the realizing of the Dasein of a people as a people through the state – politics'. Any 'original, historical time for a people' is thus for Heidegger 'the time of the poet, thinker, and founding father, i.e., of that which authentically grounds and establishes (*gründen und begründen*) the historical Dasein of a people. They are the authentic creators' (*Höld.* 34/5, p. 51). In opposition to his own intention,⁶ then, Heidegger explicitly retrieves that early conception of the ideal of the education of a people in which Hegel and Hölderlin meet, the working-out of which they divided up into an ideal of art, an ideal of religion, and the critique of their factual expressions.

Hegel paraphrases the same connection with a view to the 'ideal' of the efficacy of art and religion when he characterizes the Greek *polis*, the model for a fatherland which was founded through art, as 'work of art'. This characterization already arises – to be sure, just as with Hölderlin's late hymns – from the insight into the difference of times, into the distance to the origins, or rather, into a time in which art no longer produces religion, which in turn no longer produces the orientation of the ethicality of a people, the beautiful polity.

Heidegger skips such differentiations. With Hölderlin, he can emphasize in his lectures, it is a matter of 'our fatherland Germania' (*Höld.* 34/5, p. 4), [and] indeed not of 'what is handy and practicable for daily needs', nor of 'moderate timeliness', but again of something which, as 'loftiest', 'most difficult', and 'ultimate', must be achieved. Hölderlin gives no consistent clue for this *aggiornamento* [Italian; process of modernizing an institution or organization – trans.]. He himself sketches out more versions of the attempt to 'establish' a fatherland through art. A first such sketch is found in the novel *Hyperion*, in the fiction of founding a state through humane, 'beautiful' actions. The constitutive moments of this fictive founding agree in principle with requirements for an historical revolution. 'Difficult' because ultimately not practicable, but it remains not just the path from fiction into reality; rather it is already the determination within narrated history itself. Poetry generates itself with artistic immanence, i.e., if it narrates the history of a political achievement, [it does so] with no achieved world. Hegel's 'thesis for Germany', which makes possible the humanizing of the state, the revolution from above, becomes revitalized in the form of *Hyperion*. Intention and realization of successful life run aground because individual and collective success are not compatible. Consequently, motivated by the dialogue with Hegel, in working on *Empedokles* Hölderlin intensifies the immanent aporia of the work of art for the sake of the aporia of the confrontation between projection and historical reality. Wherever the actions of the individual want to set the conditions for the success of all, a human state, the projection into the effective making of one's mark, into what is concrete, turns into a legal entity instead of into a residue of the ethicality of the

people. Hölderlin's artistically immanent solution: the tragic conception implies a fixing of the general relationship between projection and actuality. The projection of a state produces no fatherland, but rather leaves it to historical action (which from time to time supersedes anew) to realize such a fatherland.⁷

Hölderlin's hymns, upon which Heidegger relies, modify this conception again in the sense that Heidegger himself also cites: they constitute that 'dialogue' by means of which action first becomes possible. The dialogue of the poet, language, creates – through exemplary experience of the poet and poetizing – the origin of historical human action, but first produces the (new) historical actuality in a dimension which continues to withdraw from poetry, which only prepares for it. The fatherland as 'secret origin' (*Höld.* 34/5, p. 4) at best still plays the role here of an intended (necessary to have established) but not yet realized goal.

Heidegger passes over the origin of the formulation of the question of early idealism altogether. Along with the majority of Hölderlin research at that time, he had 'no eye . . . for the way Hölderlin adopted the tendencies of the French Revolution and argued with them'.⁸ As to whether Heidegger shared a tendency of National Socialism with this blindness remains undecided. The question is: How does Heidegger's conception of the political look if it springs forth from the determination of Hölderlin's poetry, but if it interprets this poetry itself without its temporal referent, without the constitutive debate of the poet and the poetry with the great historical turning point, the French Revolution?

According to Pöggeler, Heidegger wants 'to adhere to the reference to the political only as withdrawal into an innermost domain'. Poetry itself appears as true actuality, or rather it suggests the truth about beings. If at the same time it names the origin of the political, then we must be permitted to expect a sufficient (true) orientation for action from it, at least in the form of a recommendation (as projection of reality). With the late Hölderlin, however, Heidegger believes he can disregard the concretion of the poetic world-projection. As a consequence, it is no longer a matter of a new politics, of historical action based on the projection of the poet and the orienting power of poetry (the new gods which Hegel had designated as ethical '*path*'). It is instead a matter of action which situates the *epoch*, which is legitimated after the analogy of historical activity (*Wirkens*) to poetic 'action'. But a conception of the political can also easily be found in this: namely, the generalization of existentiality in the sense of its intersubjectivity as language and – in combination with a generalization of historicity to history – the conception of complete historicity as event or destiny (*Ereignis oder Geschick*) of Being. Its primary, obvious advantage – the advantage of any theoretical acting as opposed to problems of execution – lies in the nonutility; its disadvantage not least in the utility of the

tendencies of authenticity à la Heidegger II or Heidegger III generated by contemporary Anglo-Saxon Heidegger interpretation.

The beginning and carrying-out of the Hölderlin interpretation contain inexplicability and legitimizable philosophical sense in difficult, more soluble connection. The neuralgic points are unambiguously (if not also completely) designated:

1. The beginning with the later Hölderlin, with the abstention from the politics of the hymns, reduces *poiesis* to interpretive acting.
2. On the basis of this reduction, the poetic existence becomes 'poetic'; but therein it becomes human 'dwelling'; it becomes the primal image (*Urbild*) of authentic historical existence.
3. Human existence is not just interpreted poetically, but rather owes itself to 'art'. The work of art does not indicate any functioning of human beings through art, but instead the functioning of art itself. Heidegger hypostasizes the cultural event (*Ereignis*) (work of art) just like Being as interpretive horizon for human destiny.

2 Interpreting as surrogate for action

It is not without attention to the rigorous distinction between poetizing and thinking, historical interpretation and its reflection in and through philosophy, already familiar from the existential analytic, that Heidegger begins his consideration of Hölderlin. Nevertheless, he denies a strictly defined stipulation of this differentiation between poetizing, thinking and saying. The mysterious ground which is common to all three, language, harbors a structural affinity to the three differences through the fact that it depends less on what is immediately said as on 'what is silent in this saying' (*Höld.* 34/5, p. 41; cf. also 4f., 29f., 150f.). Implicitly, this distinction also affects the difference between poetizing and acting.

Heidegger distinguishes the poetic from the practical or political as 'a saying like the making-manifest which guides' (*Höld.* 34/5, p. 31; cf. p. 127), and thus he articulates a renewed version of the phenomenological principle 'to the things themselves'. The characterization of poetry, always drawn upon and usually sufficient, as poetic in the sense of the 'making, producing of something' (*Höld.* 34/5, p. 29), still appears undifferentiated for Heidegger. In any case, *poiesis* guides in the direction from which the 'knowing about the essence of the "poetic"' can be found. In an etymological exertion of the sort peculiar to him Heidegger then fixes the sphere of the poetic as interpretive performance. *Poien* points to 'the original lexical meaning of *tithon-dicere*. . . . This word is from the same root as the Greek *deikenomi* . . . showing something that can be seen, something that makes manifest . . . on the path of its own

showing' (ibid.). To be sure, this differentiation was typical of the caution, so that Heidegger takes up Hölderlin's poetic conception not with the *Hyperion*, not with the *Empedokles* works. Here the 'undifferentiated' interpretation of the poetic is still preserved. In that case a narrated acting, a speaking which is detached from acting, remains in the grip of the Aristotelian conception of poetics. The poetic conception appears as the thesis of the exemplary nature of human acting which was manifest in beautiful acting and which was realized in good acting. It is different in the hymns, in the restriction of poetizing to the word, the interpretive performance and the 'dialogue', intersubjectivity. Word and dialogue name the holy, the 'beckoning of the gods which is veiled in words', but they name it with reference to a community: 'Poetry is the further working of this beckoning in the people, or seen from this perspective, poetry is: the existence [Dasein] of the people set within the sphere of this beckoning' (*Höld.* 34/5, p. 32; cf. p. 127f.).

Nevertheless, Heidegger further preserves his own careful differentiation in two ways. Poetry, as 'saying in the manner of the making-manifest which guides', is at the same time foundation (*Stiftung*), 'effecting grounding of what lasts' (*Höld.* 34/5, p. 33). Heidegger extends this to historical functioning in the determination of the poet 'in an impoverished time'. This poet, who endures the 'no-longer of the gods who have fled', consequently the loss of the self-evident, living orientation for action (if we follow the conceptions of Hegel and Hölderlin) and the 'not-yet of the coming', 'brings about . . . truth, vicariously and hence truly, for his people' (*EH*, 44). By emphasizing the difference between what is said poetically and what is unfolded by thinking, Heidegger preserves the difference between interpreting and functioning. The poet appears as 'grounder of Being', not just in the dimension of interpretation, but at the same time in the sphere of realization, in historical Dasein. 'While the beckoning of the gods has been built, so to speak, into the ground floor of the language of a people by the poet, without the people perhaps suspecting this to begin with, Being is established in the historical existence [Dasein] of the people, [and] in this Being and behind it a direction and dependency can be found' (*Höld.* 34/5, p. 33).

What perhaps produces a still more irritating effect in view of the initial differentiation are the delimitations of the occurring of poetry itself and of its understanding. For this Heidegger finds all the categories of the engaged-emphatic actions: of struggle.⁹ The successful, historical interpretive performance is indebted to struggle and persistence [over time]: 'Duration and fullness' of time, as opposed to its inadequacy, is 'contended for and kept awaiting a solution' (*Höld.* 34/5, p. 56). Hölderlin's letters to his mother show 'the enormous need of his calling and the true heroism of his existence' (Dasein) (*Höld.* 34/5, p. 35). Hence the poet Hölderlin also demands 'conquering with thought for his poetry'

(*Höld.* 34/5, p. 5), and because he put a stop to the coexecution of interpretation, he demands up to the 'struggle against us' (*Höld.* 34/5, p. 23; cf. also pp. 19, 8). Consequently in his early lecture, Heidegger in a sense circumscribes precisely this understanding fulfillment through categories of acting *so that interpreting as well as understanding become pseudo-actions*. Essential thinking, in a different way than empty philosophy, is existentially (*existentiell*) enthusiastic for the object which is to be laid out from an ontological perspective. The pathos of the thinker misinterprets poetry, interpreting similarly to understanding, as engaged acting. Furthermore, in Heidegger's Hölderlin interpretation art becomes the organon of philosophy: the meaning of *poiesis* between interpreting and acting, the language of the poet and of philosophy are no longer differentiated, but stand for an 'essential acting', realizing the truth of Being itself. Alluding to Schelling, art for Heidegger prepares for thoughtful consideration through an indifference by not-just-perceiving and not-yet(really)-acting (*Noch(Doch)-nicht-Handeln*).

Heidegger himself should have to reject this amalgamation which to him suffuses the fulfillment of its philosophical – now: thoughtful – elucidation. His intention remains the thoughtful occupation with historical interpretation in and through poetry. At the same time to be sure, 'essential' thinking, like 'essential' poetizing, includes an emphatic distinction aside from the philosophical. One could neglect Heidegger's manner of presentation as a problem of philosophical taste, as stylistic clumsiness if he did not voluntarily break further with the advantage of his initial differentiation. What could be transformed by harmless factual constellation, by allegation, to separate sharply philosophy and politics in an historical thinking, Heidegger links with the justification of the political power which he wanted to overcome according to his own testimony through differentiated, critical vision.

3 Poetry and authenticity

Prior to his early interpretation of the hymns 'Germanien' and 'Der Rhein', Heidegger mentions a distinction between historical interpretation of the poet or his work and the direct entering-into Hölderlin's 'work which is still timeless and spaceless, (which) our historical affection has already overcome and which has grounded the beginning of another history'. In the understanding therefore, it serves to bring 'us and the future under the standard of the poet' (*Höld.* 34/5, p. 4), to allow 'our Dasein (to become) the bearer of the life of the power of poetry' (*Höld.* 34/5, p. 19). Understanding of poetry works cathartically, it becomes the activist-moralizing challenge of the 'struggle against us': for in it lies the 'working passage through the poem' (*Höld.* 34/5, p. 23).

Poetry consummates and teaches authentic existence as 'arousal and . . . pulling-together of the authentic essence of the individuals, through which it returns to the ground of its Dasein' (*Höld.* 34/5, p. 8).

Poetry is therefore 'the same as the basic occurring of the historical human Dasein' (*Höld.* 34/5, p. 40).

Here too the manner of Heidegger's circumscribing again oscillates (already critically objecting in opposition to *Being and Time*) between categories of reflection and of presentation. The heightened demand for concreteness of the poet, the 'more alive' historicity, makes a separation of life and concept more difficult. Understanding, as 'working passing through' cannot deny the allusion to the work-world. The results of labor (material) (*Zeug*), poetizing (work), and understanding (truth) prosper in confused proximity because the 'basic structure' of all three is also retrieved in the poetic. That is to say, poetry becomes authentic existence which, according to Heidegger, interprets historically and concretely the basic structure of 'care', and also occasionally for a time, this (care) constituted in its self-evidentness as time. Consequently and by way of example it is called, in Hölderlin's words (borrowed from the *Titanen*): 'Participation and having-been-bound-together thus constitute the necessary condition for the fact that in general it becomes time for us' (*Höld.* 34/5, p. 57f.). Heidegger takes up this interpretation of the historical relevance of poetry in general and sallies forth: 'The participation which the poet means constitutes our Dasein as such; in any case it is our Dasein in which it is generally about Being and non-Being – namely, "care" ' (*Höld.* 34/5, p. 58).

So the poetic *is* at the same time 'basic fabric of historical Dasein' and questionableness of human beings, which is a matter of enduring 'the very short lifetime' (*Höld.* 34/5, p. 59).¹⁰ Poetry, the poetic, becomes the quintessence of 'authentic' existence, the living fulfillment and projection of life upon its sense: historicity. According to Heidegger, the analysis of this authenticity also does not open up psychic or psychological conditions, but rather conditions of the history of Being. Man *is* in the poetic, happening at the same time occasionally on the basis of an historico-concrete projection of sense, on the basis of the constellation of a destiny. In this way, here too authenticity necessarily wins from articulation the ambiguity of relativity which is composed in advance, composed with, and composed spontaneously. Temporality of Dasein no longer endows simply sense, but instead historically determined sense, interpretation and life from content-specific pre-givens: the holy, the divine, God. Heidegger's thesis that the sense of Dasein (Being mediated by means of temporality) was not just constituted through execution is heightened while the moment of composing recedes. The poet reverses the impoverishment of the time, endows history, owing to the fact that it leads up to a new destiny, or leads up anew to an old one – which

applies to all. The interpretive performance itself does not stand within the poet's power, it is not composing. Rather, its succeeding or failing has presuppositions: interpretation, like what is interpreted (authentic existence), is 'destiny'.

In just this way, the possibility of historical human action is reduced to 'corresponding-to'. Sensible existence (*sinnhafte Existenz*), like its condition, does not compose a significant (*sinnvolles*) destiny which delivers (does not deny) sense, but instead it awaits. The exemplary actor, the poet, was already the interpreter. The spontaneous moment of interpreting itself, however, which has an affinity for action, rescinds itself once more on the grounds of the concrete point of departure, in favor of receptivity. 'Composedness' [*'Gelassenheit'*] characterizes authentic existence as genuine acting.¹¹

In a lecture from 1936, Heidegger summarizes it again with regard to language: 'Language is not simply [one bit of] equipment among many others which man also possesses. Rather, language first grants in general the possibility for beings to stand within the openness. Only where there is language is there world, which means: the constantly changing circumference of decision and work, of deed and responsibility, but also of arbitrariness and turmoil, decay and confusion. Only where the world holds sway is there history. Language . . . renders security that as historical, man can *be*. Language is . . . that happening [*Ereignis*] which has at its disposal the highest possibility of human Being [*EH*, 35].' The poet now also remains the 'first child' of language, his saying is 'creative', 'establishing saying' (*EH*, 63), and yet to it he responds only with a destiny.¹²

So interpreted, the 'working pulling-[oneself and the world] together' (*'arbeitende Zusammenriss'*) is confined to a particular creature within the field of historical *interpretation*, not that of acting here again in receptivity, not the spontaneity of *responding* instead of composing [or 'setting in place']. For Heidegger, characterizations of redemption follow from the categories of religious response. Poets in an impoverished time feel 'singing the trace of the gods who have fled' and trace 'the related mortals, the way . . . to the turning point' (*HW*, 250). Of course, as Heidegger shows in later reflections, for all that it is a matter of forgotten Being. Nevertheless the principle ambiguity of an existing which is reduced to responding (analogous to the interpretation-acting) also remains preserved up to this time. In Hölderlin's poetry, Heidegger also finds the justification for this (cf. *Höld.* 34/5, p. 184). In the essence of poetry as 'verbal foundation [*worthafte Stiftung*] of Being' (*EH*, 39), 'human thinking is used in a fixed reference and is placed on a ground'. As such, man 'dwells' 'on this earth'. 'Poetic dwelling' means 'to stand in the presence of the Gods and to be affected by the essential proximity of things'. 'Fundamentally, Dasein is' poetically '— which is to say: as

established (grounded), it is nothing earned, but is rather a gift' (EH, 39).

Still later, Heidegger also determined the function of poetizing analogously to the Greeks. Not only the individual, but also an historical community finds its essence in the poet's word, just as the Greeks won their state and their politics through their beautiful gods. The 'blind singer' as Hölderlin entitled a hymn with fully conscious allusion to Homer, who – as Hegel would have it – had given the Greeks their gods, names the holy and opens up not just itself, but rather a people's destiny, their historical place: homeland. Homecoming in the interpreting of the poet 'is the future of the historical essence of the Germans. They are the people of poetizing and thinking' (EH, 29).

In the discussion of the hymn *Andenken* (1943), Heidegger himself connects poetizing as interpreting which orients with the sweeping category of poetic dwelling. As Heidegger expressly notes (EH, 83), Hölderlin wants to learn in distinction from Greece 'the free use of [what is our] own [des *Eigenen*]'.¹³ But Heidegger himself rewrites this use of (what is our) own in stricter analogy to the Greeks; indeed the Greeks come into the foreign, into the Hesperidian, in a way into their own, the national, which skips over the difference of historical peculiarity to the Germans. Indeed, the art-religion of the Greeks is first recognized for what it is in light of reason which posits rationally: as 'the grounding and building of the *polis* as the essential place of history, determined by the holy'. Indeed, 'the political' is originally determined from the polis; but is it possible as well for the German poet to presuppose a similar effect based on the assumption that contemporary man is again able 'to have a destiny'? For Heidegger this question is determined because man 'dwells poetically, and so receives his culture from a destiny' (EH, 84f.). Hence that means 'the natural has become what is historical in its history'; it has found 'the history of the people in what is its own', and it dwells therein (EH, 84f.).

During all of the preceding, where the *Hyperion* novel and the *Empedokles* poem belong 'in the wanderings' (EH, 121), Hölderlin's hymn *Andenken* should yield this 'ability to remain in what is its own'. Here too Heidegger vacillates. In the first place, poetizing is still reputed to be dialogue, and hence interpretive suggestion. The 'basic law of historicity' appears as a 'law of becoming at home. . . . But this is based in the passage . . . through the Being-not-at-home, and as such a passage it is only suitable for the appropriation of what is its own' (EH, 122f.). At the same time, however, the basic law is 'dwelling'. 'Poetizing is remembrance [*Andenken*]. Remembrance is establishing. The establishing dwelling of the poet shows and consecrates the ground of the poetic dwelling of the mortal' (EH, 143). The remaining in the interpreting, or rather the 'poetic remaining in the essence of the appropriate community

of poets' (EH, 142) – remembrance – shows the ground for their establishment 'in the festive destiny of the future history of the Germans' (EH, 142). 'What remains in the remaining' arises here. Heidegger only gives an interpretation, with regard to its contents, of the reference to destiny as ground for the establishment of history and tradition, for the sedimentation of interpreting to the life form, in referring to the Greek *polis*. There was realized (still unconsciously) what modern poetizing names and what as 'dwelling' must again be allowed to become history in the sense of the tradition. But is Hölderlin the reflective Greek to whom poetry has given his Gods, his ethicality, and consequently his state and his politics? Is the 'remaining' which is established through 'remembrance' poetic, hence 'German', dwelling? Put another way: Does modern man have his destiny (*Geschick*) in the same way that his fate (*Schicksal*) befell the Greek? Or does he only know of this that, as one who is historical, he lives from what has become, but answers for this individually, carries it forward, changes? Seen in this way, the difference between the mere, instinctive awareness of the Greeks, mere substantial ethicality as Hegel defined it, and subjectivity, merely presented destiny, is dissolved: both the conception and its problem. Heidegger does not formulate this difference between the ancient and the modern, which Hölderlin inherited in the hymns' recourse to Schiller's conception of Elysian poetry.¹⁴ He skips over it himself in the philosophical determination of 'Being' from poetry.

Through the inextricability of the poetic projection of history as destiny and of 'what follows' in the historical dwelling which is yielded in destiny, Heidegger's Hölderlin interpretation is premodern in the sense of the 'quarrel between the ancient and the modern'. That is to say, he transplants Hölderlin's poetry into a situation in which the difference between the ancient and the modern which was codiagnosed by the poet himself does not arise, in which the 'modern' differentiation between aesthetic religion and the requirements of reason articulated in the ideal of educating a people is not carried out with it. Poetry, in antiquity the teacher of man, foundation of the gods and of the state, in modernity must become the naming of this grounding dimension. In this way it leads to the experience of the manifold, the dissimilar, but at the same time to historically growing and culturally virulent possibilities of human Being. At the same time, however, poetry – as language – becomes the orientation-intending mediation of such experiences. The new gods shed the unequivocal unconditionality of antiquity in favor of the fictionally possible which likewise dovetails the actual and the actual which is past in the projection of a human and historical human Being. Indeed, in his *Beiträge zur Philosophie* [*Contributions to Philosophy*], a large recently published manuscript from 1936–8 – trans.] Heidegger speaks, in the sense of the prehistorical representations of God, of the detachment of

past dogmatic religions through a 'final God', which could be determinative for our time. So far he appears to take up Hölderlin's conception, and by means of it he mediates between the thought of a mediation by the representation of God which was formulated in the program of the 'mythology of reason', and the historically varying shape, although he himself is occupied not with early Idealism but rather with Nietzsche. But he reveals a philosophical consequence which at the very least runs contrary to the peculiar connection with Hölderlin because he interprets this historical dimension as *destiny*. In this way he preserves an essential moment of the poetico-mythological conception of interpretation as *proton pseudos*, namely the requirement according to reason in the philosophical generalization.

Here Heidegger presents the conception of the poet analogously to the situation of the problem formulated in early Idealism, which was examined based on the account of the consequence of poetic departure as compared to the matter. Schiller, and with him Hegel, Hölderlin and the young Schelling, start from the fact that in the 'world which is torn asunder', and thus in one of those 'troubled times' which occur again and again in history, art is to bring about a humane world. (Perhaps we should retain this model throughout as the structural delimitation of the historical function of art.) The carrying out of this program at first shows great similarities to Heidegger's, but [in fact] it leads to a decisive difference, namely, to the establishment of the fictional character of the interpretive performance which arises from poetic existence. The theory of beautiful appearance¹⁵ offers the link in the mediation between theory and reality, between interpretation and history, just as it separates both from the proposed (fictional) transformation of the empirical carrying-out-anew through poetry. In Heidegger's philosophical interpretation of the poets, a critique of a foundational identification of the aesthetics of enlightenment decisive for early Idealism is lost: namely, the rejection of the structural identification of the artist and statesman in the concept of genius, or rather in the version of this concept which was modified in accordance with the quarrel and which can be found in both Hegel and Hölderlin, the conception of the 'great individual'. By way of example, Hegel repeats Hölderlin's tragic conception in his interpretation of Schiller by means of a critique of the 'great individuals of modernity', the actions of whom should establish a new – if not world-historical then still national – destiny in a pregnant version of the partiality of individual actions under social conditions: in the modern world, the 'great individual' becomes necessary to the 'rogue' (against the society which it wants to shape decently). Hölderlin's reflections like Hegel's are therefore developed as the gradual demolishing of the moments identified in the concept of genius, and both formulate the poetic as well as the philosophical consequences of this critique of enlightenment. The 'great

individual', only as poet, has another meaning which is not distorted: his 'establishing' of a destiny lies in the formative interpretation which indeed can choose to have for its theme the historical actions of the statesman or the poet. The decentralization of the various versions of creative projection in thinking, interpreting and acting remains decisive for this pursuit of the notion of genius.

In contrast to Hölderlin, Heidegger generally rejects the notion of genius, Schelling's as well as Schopenhauer's, taken from the tradition of the *Critique of Judgement*, but he does so in such a sweeping way that he retains essential moments without being able to know or realize it. In this way he again lays out poetizing, strictly interpreted as receptive, as the 'comportment' of authentic existence with categories of action, just as in the analysis of *Dasein* he likewise wanted to have grounded a practical philosophy. The aporias only get worse. In the determination of the poetic, Heidegger then does not retrieve the identification of artist and statesman by itself, without taking into consideration the later differentiation. He supports it philosophically, moreover, through a structural, advance justification: through his new determination of Being as *Ereignis*. In this way he loses not only the difference between art and politics; he again loses sight of the difference between theoretical and practical Philosophy.

The seeing [person], the teacher of wisdom or duty, the poet or philosopher, should not just reflexively consider activities. Rather, he himself becomes the great activity. The deeds of both the reflecting thinker, seer or poet on the one hand and those of the politician on the other are describable with identical categories. Thus the poet who purifies the light of reason, the glance of recognition into the wisdom of the world view, is first of all reputed to be the 'genius', or rather the 'great individual'. At the time of Hölderlin's late hymns, however, Schelling alone held this conception. With the expression of the differentiating considerations of the relationship between artistic appearance and reality, the genius, who – according to Schelling – founds the whole culture (*Bildung*) of his epoch, at the same time generates (a community of) acting because the work of art (the beautiful) provides 'his' world view for an historical people; it universalizes wisdom by means of the artificial result: the beautiful shape. The encroachment by ways of being reasonable, by unobstructed experiences, by the establishment of a new experiential community in the assignment of a destiny, is neither further grounded nor seen in its danger by Heidegger. Hegel and Hölderlin had sought to delimit the task of *poiesis* as the establishment of the spirit of a people, as tradition and renewal of their cultural accomplishments (wisdom). From this wisdom one expects a turning point of the times, certainly in the careful, reserved differentiating between new insight and

new Dasein, new existence. This heading itself permits – insofar as one follows Schiller – a long ‘educational’ process from insight to acting.

Just as Hegel had in the context of his early critique of religion, so Hölderlin outlined a similar model in poetry leading to discerning action, i.e., to action which is consciously ethical and political (corresponding to the ideal of the citizen in the ancient *polis*). Interestingly, this outline subsists on the reinterpretation of a further basic category of Enlightenment aesthetics, namely, the concept of the copy (*Nachahmung*). Copy comes to be personalized into a conception of imitation (*Nachfolge*), of the copy not of what is intuitively given in advance, but rather of an acting person. In this way, for Hölderlin as well as Hegel the conception of genius is definitively formed into a distinctive determination of the great individual: into the ideal of the ‘teacher of virtue’. Thereby it can be shown at the same time that an original aesthetic act, the copy, leads to a pattern of living (the community), and mediating in this way, to action. In the connecting, mediating step of self-interpretation, or rather in the cultivation of a tradition, the pattern of living produces the imitation of individual, consciously-accepted acting in the sense of a living, consummated ideal. This model of education for morality over intersubjectivity, and for praxis which is not only legitimizable but actually legitimated, not only supplies Hegel with the first, principle, but no longer altered determination of the ‘ideal’; at the same time it forms the content for the *Hyperion* novel as well as the nerve of the *Empedokles* poem in the modification up to the tragic conception. In spite of all the need for revision (already thematized by Hegel and Hölderlin themselves), through the connection of the thought of the genius (namely, the conception of the ‘great individual of modernity’ as the ‘teacher of virtue’) with the basic idea of Enlightenment aesthetics (the copy), we attain a differentiated model of the transition from clear, mediating insight (world view) into acting.

For Heidegger, on the other hand, the transition from the establishing of a new insight to the assignment of a people’s destiny must become a vicious circle because philosophical reflection upon history conveys no possibility of differentiating between insight and salvation. Heidegger himself succumbs to his error that one may be able to turn from the wisdom of the times, that the great individual might be able to operate in like manner and convincingly in the sphere of better knowledge of what was to be done as well as in the sphere of acting. He therefore skips over, as does Hölderlin, this ‘practical’ dimension of the establishing of a world view, the ‘orientation function’ the taking over of which would make art assailable.

In poetry – for Heidegger: in the pattern of poetic existence as ‘care’ – Dasein appears on the one hand as *in need of interpretation*. However poetry, i.e., the poet as he who consummates Dasein in exemplary

fashion, does not stop with the need for interpretation but instead begins here with the purpose of interpreting what is interpretable. In any case, as 'poetic poet' he ventures a projection of the time upon the 'divine' as what allows understanding from out of newly experienced history in the sense of what has come to be. Conversation is thus not a matter of the Being of conversation – perhaps this was the reflection of the thinker upon the condition for the possibility of poetic 'acting', or as Heidegger dramatizes it: struggling. Wherever the poet 'struggles and patiently preserves . . . the duration and fullness (of time)' (*Höld.* 34/5, p. 56), he determines time 'in the sense of the original time of the people' (p. 51): this means without characterizing categories of action: he interprets them – and what is more [he interprets them] anew, often in opposition to traditional interpretation and always in opposition to the *prima vista* certainty of everydayness. Poetry, at least as the 'business' of the poet, exists in a *suggestion of an answer*, always time-specific, an interpretation of Dasein. But how does 'authentic Dasein' behave as interpreted if not actively? With regard to the dimension of authentic creating, Heidegger forgot the claim that was decisive for early Idealism: to project a 'regulative total image' ('*regulatives Gesamtbild*') – to use a Nietzschean expression – of the historical situation for the purpose of feeding a new fantasy which reason prepares, but above all to qualify as human acting without grounding (in the sense of the Aristotelian concept of a copy of beautiful acting), as ethical behavior.

The sense of the reference to the Greeks has long been insufficiently determined as Heidegger does not take it in this matter-of-fact function to demonstrate the interplay of poetry and politics upon the concrete image of an historical ideal. The poet establishes the gods, and with them the ethicality of the people and the *polis*, i.e., the principles of human acting together with an institution in accordance with them, a city-state and its politics. The interpretation of the poet here is itself certainly not *practical*, as Heidegger's category of 'creating' suggests, but it takes aim at praxis, acting, and historical activity.

The debate over the role of the 'great individual', to the extent that he acts historically and does not just poetize, consequently leads Hölderlin in the *Empedokles* poem and Hegel in the joining of his discussion with Hölderlin in his *Wallenstein* essay (1801) to the outlining of a world, of a state concretely established. Here as there, the upshot of this is the renunciation of the action of the interpreting, the decentralizing of historical acting by the poet or historical interpretation and the statesman, or rather of the alteration of reality. Beneath the complex conditions of the modern world, art cannot automatically, i.e., not through the power to the fiction of a humanly interpreted world, produce an existence such as its real, historical determination. That happens only with the help of the assumption that interpreting, thinking as quasi acting, exhausts the

determination of the historicity of Dasein. In the (Frankfurt) dialogue between Hölderlin and Hegel, precisely this problem of the becoming 'positive' of the laws of reason in the historical law of the state and in the dogma of the theologians was discussed. If Hölderlin together with Hegel had perhaps still intended with art to permit an 'ideal for the education of a people' to become historically effective, which the superseding of 'positivity' has the power to do, so no later than his hymn *Andenken*, this concept had undergone a decisive modification. Here art can only set possible human experiences – namely intercultural – against fixed relations and must abandon the turning point of the times to the individuals, or rather to those who act.¹⁶ So if Hegel speaks of the character of art as something past, Hölderlin speaks in a different fashion of its mediating character, of the possibility of the establishment of a critically evaluative self-consciousness, but not of a new time or of a new community. In Heidegger's encounter with Hölderlin, this *epochē* is lost.

Heidegger's turn to the 'poet in an impoverished time', initially oft spoken of and full of hope, has thus been seen as neither unique nor consistent. Considered in light of the philosophical tradition, it loses its enigmatic charm, for Heidegger merely retrieves what had already been sought for in connection with the Enlightenment: to allow philosophy to become practical. In light of the aporias we have seen which are inherited from this, the 'salvation' forfeits its sense of achievement to them. For it escapes from the renewed confusion of a concept which is already developed more distinctively with Heidegger's model of Hölderlin; it is owing to the mixture of theoretical concepts or concepts of reflection with categories of action.

4 Artwork as historical work

Already in the Hölderlin lecture concerned with an analysis of the poetic as a 'basic mood of historical Dasein', Heidegger lays the foundation for the next generalization in the philosophical determination of Being.

In contrast to merely historiological truth (*historischen Wahrheit*), historical truth (*geschichtliche Wahrheit*) is disclosed as an analogue to existentiality in a basic determination. In the concretization of the analysis of care which he retrieves, Heidegger interprets poetically-established Dasein as: 'essentially Being-with-another, Being-for-another and Being-in-opposition-to-another' (*Höld.* 34/5, p. 143) from the 'basic determination of holy affliction which is grieving but prepared' (*Höld.* 34/5, p. 146; 223). According to the basic character of Dasein, the Being-with-another of Dasein is historical in itself, and hence is bound to the forces of history and is joined through them' (*Höld.* 34/5, p. 143). In other words, Dasein turns to the collective-individual and his knowledge, and in the

same step to the will, to the ground of acting. 'The truth of a people', namely, what the poet brings forth through the awakening of the determination of ground which he creates, 'is that capacity for Being to be manifest, from out of which a people knows what it wills historically while it wills *itself*, it wills itself to be.' Heidegger once more scrapes together here the structural analogy which guides him. The basic mood – opened through the poet – finds its analogue not just in thinking but also in the 'creating of a state'. The three 'creative powers of historical Dasein' (*Höld.* 34/5, p. 144) together bring about the determinate historical truth of a people. In the equivocal wordplay accompanying the determination of the demigods as 'overmen' or 'undergods' (*Höld.* 34/5, p. 166), Heidegger unfolds the determination of historicity as destiny, which he took up once again in the essay 'Origin of the work of art', to the characterization with regard to its content of the formal elements of historicity which were laid out in the poetic determination of the basic mood. What Hölderlin put into words concerning *physis* was retrieved by Heidegger in his general opposition of Earth and World. He finds his entrée in Hölderlin's poem (*Der Rhein*) about identification: 'Earth and homeland are meant historically' (cf. *Höld.* 34/5, pp. 196, 223), and both experience their interpretation on the basis of this historicity in poetry: on the strength of destiny (*Höld.* 34/5, p. 196).

Although Heidegger expressly denies that 'to this Being which is embodied in the saying of the poet, the robe of a "philosophical" language is still to be hung hastily in another place' (*Höld.* 34/5, p. 150), the original dialogue of thinking with poetry appears as the transformation of the authenticity of an individual people in Being. Hence it is for this reason that 'not only . . . compromises between the poetizing, thinking, and acting forces are to be established; rather their concealed, limiting isolation is to be taken seriously, and therein the mystery of their original belonging-together is to be experienced in a new previously undiscussed structure of Being to be formed originally' (*Höld.* 34/5, p. 184f.). The 'thinking' of the poet is a matter of 'an original, projecting establishing' (p. 226). The philosophical 'penetration [*Ergründung*] to the ground of the Being of poetry', to the extent that it grounds this Being in the 'essence of Being as a whole' (*Höld.* 34/5, p. 237), allows too little of the difference between poetic interpretation and philosophical reflection to be felt (cf. also *Höld.* 34/5, p. 269f.).

The explicit philosophical interpretation of poetry in 'The origin of the work of art'¹⁷ retrieves the characterization of poetizing in any case as just such Being. Truth 'dresses itself in the work' as the strife between earth and world, between lighting and concealing. In poetic projection – [which] furnishes the paradigm for Hölderlin's way through – 'Being-in-the-world' is concretized as Being-on-the-earth.

On the grounding level of philosophy, Heidegger plays with poetic

interpreting as 'creating', as bringing forth not the formed object but its 'unconcealedness' (*Höld.* 34/5, p. 65). Being-created is determined from the 'work-Being of the work' (*Höld.* 34/5, p. 66), which in turn is determined as the 'event' of truth in the sense of a struggle, namely, as the oft-cited 'strife'.¹⁸ Above all Heidegger still stresses here that world-horizon and earth are revealed reciprocally: 'The essence of earth . . . is unveiled . . . only in the projecting [*Hineinragen*] into a world, in the opposition of both' (*Höld.* 34/5, p. 79). As historical truth, art functions in the threefold sense of the establishing as 'giving', 'grounding' and 'beginning', as projection (*Entwurf*) of an historical self-understanding, as the uncovering of one which was previously mentioned, already effective, and as the beginning of both a new self- and world-understanding. To this extent the analysis of the poetic basic tone (*Grundstimmung*) was perhaps to be retranslated even into the existential structure of *Being and Time*.¹⁹

In the unreflected polemic against the cultural philosophy of neo-Kantianism, Heidegger finally closes out a step beyond his goal. Art, which in no case is permitted to be understood as 'cultural performance of man' (*Höld.* 34/5, p. 35), is not just historical; rather, art *is* the origin of the work of art. As 'cultural performance', art may still appear in the temporary, concretizing comprehension of the individual Being-thrown, as Heidegger determines history, namely, as the 'rapture of a people in their offering, as rapture in their giving-with' (*Höld.* 34/5, p. 89). The subsequent determination of the historical – now ontological – character of Being as fourfold, however, uses a surplus of concretization as to its contents which Heidegger brings with him from his exegesis of Hölderlin. While the poet, like poetry, is reputed to be 'projection' – admittedly circumscribed in the categories of action – at one point in the *Rhein* hymn where the poet pretends to think, Heidegger finds a determination of the Being of the demigods. The 'over-men' or 'undergods' also remain no mere conceptual-tasteful slip of the tongue. On the contrary, they serve as the legitimation of the transition from 'care' as the 'basic metaphysical essence of Dasein' (*Höld.* 34/5, p. 281) to the realization of the expanded basic tone and basic determination (*Grundstimmung und Grundbestimmung*) of the poetic. They *are* what the poet *says*: destiny, or rather the 'strife in the midst of Being', which from itself finally mediates Being itself. This destiny, Being as 'conflict between what springs forth and Being-sprung-forth', which is interpreted ontologically as the strife of world and earth, becomes real in the 'actually created', namely, 'on the grounds of the worked-out work' (*Höld.* 34/5, p. 284). Heidegger paraphrases the interrelation of interpretation and historical realization in the first place as follows: The 'Being of the demigods – destiny – is established poetically. This saying is placed amidst the language of the people. Only an historical people is truly a people. It is

only historical, however, if it takes place on the grounds of the center of Being, if the intermediate is there, if the demigods, the creating, bring about occurrence as history' (*Höld.* 34/5, p. 283f.).

Already in 'The origin of the work of art' Heidegger must have 'turned' the perspective of the Hölderlin interpretation into his later philosophy of Being if art suddenly takes over the same onto-ontological function as essence which is the crux of poetizing: to extinguish the hiatus by projection and history. That philosophy itself recognizes the necessity for 'Hölderlin's word to create the hearing'²⁰ in Heidegger's secret major work *Beiträge zur Philosophie*, also remains traceable to the influence of that 'last God', the experience of which now no longer recoins poetry, but philosophy, in an ontological determination, in the determination of Being as *Ereignis*. According to 'The origin of the work of art', no further step is necessary to the determination of Being as *Ereignis*, of history as destiny, other than the ontological clarification of the misunderstanding of poetry, which is not permitted to be a cultural performance because in the historicity of Dasein the moment of subjectivity of 'settling' should be extinguished.

In the lecture treating *Ausgewählte 'Probleme' der 'Logik'* (*Selected 'Problems' of 'Logic'*) from the winter semester 1937/8, Heidegger accepts his assertion that art establishes the artwork, especially once again from the perspective of the determination of Being. The determination of art first becomes possible from the 'other beginning' of thinking, thus from the conversion to historicity as the authenticity of Dasein as it had arisen as modification through Hölderlin's poetry.²¹ In the further grounding, Heidegger himself summons a 'most distant God' who 'makes necessary' (cf. *Grundfragen*, 194), who distinguishes art as 'setting of truth into the work'. The converted line of sight of the other beginning contains problems as well as advantages as opposed to fundamental-ontological analysis. The advantage to such a consideration lies without doubt in the conclusiveness at least of the formal characterization. History culminates in the work; in its truth it *is* authentic work. Without wanting to fall back on Nietzsche's eternal recurrence of the same, Heidegger makes use of the same model. The truth's attachment to work stands for the *conclusiveness* of history. The grounds for the conclusiveness of history as the historicity of Dasein lies analogously in the restrictive interpretation of authenticity as 'corresponding' (*Entsprechen*). Heidegger expressly accents the advantage of this restriction. From the poetically-effected, philosophically-characterized basic tone, the turning point of 'destiny' in the interpretive dimension, now the different-initial thinking, again applies. With this sanitizing of the interpretive dimension it appears – for Heidegger in any case – that actuality is also altered, if not automatically then consequently. By analogy to the poetic, thus by analogy to the conception of a perfectibility of action in history

as 'corresponding to',²² the 'work' indicates (i.e., makes necessary through 'art' the 'farthest God' or 'Being as *Ereignis*') definitiveness, or rather finality of history. That is valid structurally, even if Heidegger himself, for example, wants to set his reference to the 'last god' in the *Beiträge zur Philosophie* directly against the thought of the definitiveness and finality of history. Also a god who works only in the past and not in the determinative present becomes 'destiny' because the experience of god became restricted.

An end of history as turning back to the 'other beginning' is constituted through an activity 'of Being' which is correlative to the receptivity of authenticity (cf. *Grundfragen*, 210; cf. also the supplement to §41: 226f.). Being turns into conclusive actions because – as Heidegger says, because the 'essence of Being' – it can be appropriated in the brightness of the 'Clearing' of Dasein, but also its 'self-concealing' and 'self-denial' is possible and must be accepted. In this way, the forgetfulness of Being is dramatized to become the 'abandonment of Being' (*Grundfragen*, 187). The causal actor is not man who, on the basis of error, misses the dimension of knowledge which is possible to him, and thereby performs falsely. Here as well Being inherits the 'geniality' of the 'great individual', it assumes the part of the authentic and actually powerful actor.

The continuity of the analytic of Dasein construed in the lectures appears to shift the occupation with Hölderlin, the determination of the work of art and of Being as *Ereignis* in continuity with *Being and Time*, deceived about the breaking away. Small causes – minimal emphasis and indifference in the interpretation of Hölderlin, in the generalization from this interpretation of poetry to the determination of the work of art, art and Being – breed great effects.

The 'turn' in the determination of historicity and the generalized turn in the concept of the work of art and its consequence could be viewed as continuity of the development of thinking (as Heidegger's 'path of thinking with Hölderlin'), not yielding aggravating consequences, even in view of the meaning and interpretation of those appropriations (*Ereignisse*) of Being which for Heidegger are manifested in extraordinary forms of Dasein, indeed in towering individuals. Heidegger's neglect of the fact that 'Being' from which one expects a change of epoch is not thinkable without fulfillment, is without justification. It can be found neither in the power of the subject, of Dasein, to bring forth this 'it gives', nor is this dimension of openness, from which salvation, the holy, and the divine can then be expected, to be found in the justification of the subject. Everything is released from the justification which is self-evident with the 'poet in an impoverished time', for whom salvation still remains ungraspable. Whether 'it' gives time, and with it an experience of Being, lies not in the power of the fulfilling individual who eventually just guiltily closed his mind to it, but is in the manner of destiny (*Ge-*

schick), or rather fate (*Schicksal*), that thinking like poetizing is at the mercy of *Ereignis*. But wherever the occurrence of the character of the Being of law is lost which is secured through wanting to recognize or through acting, and wherever it is reduced to the character of pure experiential openness, it appears to be based on evil, to demand justification, the '*logon didonai*' as non-philosophy becomes taboo.

On the other hand, however, the historical power of such exemplary experiencers as the poet and in particular the thinker is still sustained. History, made possible through [the historical power of the exemplary experiencers], and for which 'there is' salvation, the holy, the divine, God, and Being, is utilized at least in the second step: in Heidegger's above-named unfortunate equation of the genius in the political and the poetic work, namely, in his identification of poetic interpretation as the original human experience and acting. Here history becomes, if not history without subject, then history without accountable subject. 'Responding', as form of an interpretation which precedes the acting, as theorizing of praxis, preserves the Categorical Imperative in all its substantial-historical consequences.

In the practical dimension, this combination of new beginning by means of new authenticity of historical subjectivity and the preserving of the thought of subjectivity, of the weakening of fulfillment in the theoretical, leads to Heidegger's noteworthy reaction to the events of 1933 and after. The thinker Heidegger can only avoid the statesman, i.e., the authentic practical-political dimension, in that of interpretation. He picks Hölderlin as the forerunner of this turn in his personal destiny. What must be accomplished in 'impoverished times', however, remains structural, identically so for poetizing and thinking. One could formulate the inverse: error in the political is the result of error in the interpretive performance and its assessment. Moreover with Heidegger, after 1933 it leads to a heightening of this structural weakness, although Heidegger explicitly polemicizes violently against this identification with the tendencies of National Socialism (cf. *Grundfragen*, 53ff., 126, 143). The connection which has been exposed appears not to be stringent, at least from Heidegger's vision, although it is suggested by his philosophical activities. Truth happens through the poetic word or essential thinking, and not, if indeed one follows Heidegger, held-for-true, consequential (action-orienting) worldview, but the appropriation (*Ereignis*) of Being. The quasi-pacifistic conception of the historically creative individual has its necessary response (admittedly, only construed philosophically) in the 'deed' ('*Tun*') of Being. As medium of poetry, language becomes an historical vehicle which, through the steering stroke of the oar, ventures – by cautious adaptation of the world of the adapting navigator (the thinker, the poet) – into the element of steering, of bearing, and is remarkable there as 'capable of bearing'.

A circle which is in fact vicious – from Heidegger's determination of acting as interpreting, i.e., as responding (a more passive activity) and its proving true, meant to be granted only by responding – allows history to appear as prestabilized Harmony, to appear as a nonsubjective, substantial process. Moreover, this process itself again bears the attribute of the 'genius', of the artist as the extraordinary (authentic) historical subject. It is the side of responding, itself personified and complementary, which the interpreting rounds into reality. History and Being themselves become the work of genius; they are therefore interpreted most adequately as works of art.

Here Being itself as 'destiny' or fate moves historicity into the encroaching, quasi-cosmic horizon, which appears in the interpreting of the poet and in the examinations of the thinker to grasp history 'in principle' and at the same time as totality. History is not determined through human action, it is not a construct with the help of which a philosophical characterization of all human actions and their quasi-natural consequence, culture, becomes possible. It becomes, as Hans-Georg Gadamer paraphrases, substantiality, the bearing process in which the subjectivity wanting knowledge is an almost neglectably small moment. From this comprehensive view of a withdrawing and granting occurring, acting and interpreting are in fact leveled in the manner that both remain evenly supplemental, not allowed to alter or change the basic facts. Authentic acting occurs from the comportment of '*Gelassenheit*', from the waiting for granting or withdrawing in the 'clearing' of Dasein; likewise authentic interpreting; and likewise authentic thinking – the projecting of interpreting and acting upon the dimension of their origin.

In this way, Heidegger wins an indifference-point in his philosophizing which complies with an old philosopher's ideal, namely, a uniform point of departure for any fulfillment, and for philosophical reflection which admittedly can no longer be called reflection but responding hearing. Either one charges this construction to the Mystics – with the consequence that philosophy is freed for new questions – or one takes it seriously as philosophy. Then critique becomes necessary which, buoyed by Heidegger's flawed intrahistorical performance, once more has to discuss the question concerning the differentiation of the indifference-point.

How, in Hölderlin's interpretation, is the germ of error situated in an unhistorical assumption of thinking which is historically (*des seinsgeschichtlichen Denkens*)? Not only Heidegger's Hölderlin interpretation, but also the conception of art, is simply 'non-modern'. In the polemic against art as cultural treasure (*Kulturgut*),²³ Heidegger also 'overcomes' the achievement of the post-Enlightenment, the conception of a subject which has come to the age of using reason. Only in this way can he outfit art in the sufficient and – certainly not necessary, but – needed way

to be the organon of essential thinking. In terms of content, Heidegger formulates not only the poetry, but also the thinking of another beginning in the 'new Greece'. The 'other beginning' of thinking is the retrieval of what the Greeks jointly thought of as the future (cf. *Grundfragen*, 124), it is 'relative to the *one* and the first' (*Grundfragen*, 195). 'That the Greeks were the beginning thoughtfully, poetically, politically, for this reason it is hardest to demonstrate that the end at which we stand today is none other than the falling away from that beginning, the growing Being-no-longer-grown [*das wachsende Nichtmehrgewachsensein*]' (*Grundfragen*, 115). Not only in Hölderlin's poetry (cf. *Grundfragen*, 135), but simply in historical existence, the fulfillment of the possibilities (cf. *Grundfragen*, 133) of the first beginning becomes comprehensible and alive; 'what initially radiates as *aletheia* in order immediately to be extinguished again' should 'once upon a time become the *fire glowing on the hearth* of our Dasein' (*Grundfragen*, 140). That is to say, it appears as that 'occurring' of truth 'wherein poetry and pictorial art, the deed which grounds a state and the reverence for the gods first receive their essence, in order then to make that essence exist historically and as history in their words and works, actions and ecstasy, storms and failures' (*Grundfragen*, 147f.).

In the new Greece of the other beginning, the previously named prejudices of Hölderlin interpretation, the decisive arguments for the 'fulfillment' of history, are supplied at the outset. The devaluation of 'appearance' and with it the non-truth of fiction not only leads to the benevolent synchronization of poetizing and thinking under the consideration of permitting historical truth; it also requires the identification of the work of art and the work of the state, or rather of history from 'art', or rather from 'Being'. While poetic projection loses the conceptual in the character of settlement in favor of an apparent becoming-nurtured on the basis of a dimension – from an action of authentic existence and its ontological correlates – with higher guarantee of truth. Man, like the poet, can simply hear it wrong, can be lacking, but can no longer be mistaken or responsibly defended (namely, in the acting which was grounded in error).

Finally, Heidegger actualizes in pure culture the conception of Greek ethicality which Hegel restricted to the aesthetic religion of the Greeks in his theory of tragedy. So Antigone, like the Greeks and modern man, also simply follows a call of destiny, which binds one to that (one's) existence, by that (one's) God. The necessary collision of ethical powers – for Hegel, the aporia of the thematizing of man's historical Being through art – and their reconciliation which is attainable only in faith, to be sure cancel each other out for Heidegger in a preestablished harmony between poetizing, authentic existence as the groundwork for it, and the appropriation (*Ereignis*) or withdrawal of Being. In the

dimension of authenticity, there can only be the collective flaw like the collective corresponding, but which does not deserve to be called 'guilt' because it is destiny. Where Greek tragedy according to Hegel needs at least one other particular, introductory, transsubjective act of reconciliation, actions which are conflicting but indifferent in the dimension of grounding, Heidegger renounces the conflict. Only half of the completeness was mentioned: In the *Hyperion* and the *Empedokles*, Hölderlin submits to this conception in the situation of modernity and relativizes it in the hymns in a way which conforms to Hegel's thesis of the character of art as something past.

Historical reality as a whole is thus for Heidegger no longer the dimension of human interaction, but is the dimension of dialogue. In art, on the other hand – if one follows Hegel as well as Hölderlin – dialogue guides the dimension of the grounding of action (the Greek God, like the Germanic and Oriental Gods) in the field where doubt about *which* historical future man is to attain should be treated. Art thematizes (either in an initial, intuitive way as with Hegel, or in a reflective way as in Hölderlin's hymns) the grounds for the conflict, namely, the underlying ethical *pathē*, which seizes it in the image of the respective historical God. It revolutionizes neither acting nor the world because revolution cannot be a return to the Greek beginning (cf. in contrast Heidegger: *Grundfragen*, 41).

Here we can only suggest that Hölderlin himself projected his poetizing from the consciousness of a situation which may be called an 'impoverished time' to no less an extent than that prognosticated by Heidegger. The situation following the French Revolution, and with it post-Kantian philosophy, was marked to be sure by a fright of another sort. It was a matter of the disillusioned and disillusioning insight that the translation of explanation into reality, of philosophy into life, destroys this, that one exterminates men where the rational law degenerates into the political slogan. New conceptions of the reference of philosophy to life lead to new poetry (Hölderlin), to new religion and new philosophy (Hegel). Thus Hölderlin saw, along with Schiller and Kant, that poetry articulates the playful occasion (fiction) which establishes a culture grounded on morality, reason, and freedom. Religion, as its complement, was the serious occasion for the institution of a way of life from the new insight. For Hölderlin, both go hand in hand at first in the preparation of a new political domain. While Hölderlin's *Hyperion* still presents the moments of such a humanizing in the context of the narrated history of an exemplary community, restricting the hymns of this interpretive performance which were consulted by Heidegger, to be sure already in the sense that only language (which is preparatory for human acting), and the truth in it which is experienceable and sayable, are still content as the vehicle for poetry. History itself appears explicitly in these poems as interpretive

elements, or rather in the element of interpretation for purposes of the exemplary ties of intersubjective communication. One can show this well in the poem *Andenken*, which Heidegger moved to center stage. Immediate action no longer follows from remembrance (*Andenken*); instead, action is prepared for through language. In dialogue, the individual attains the dimension of understanding his action in connection with the 'ethicality of a people'. For Hölderlin, this initial and apparently unremarkable transition from the humanization-story narrated as history to the experience of the poet behaving as interpretation of history as a whole, i.e., from acting as the first to interpretive acting (language) as the genuine content, the decisive step: the step from willing-acting (Being-revolutionary) to compelling-advising (Being-poet). The playful event is no longer disguised as a serious event in this poetizing, but remains in the domain of the worldview-proposal. To be sure, the conscious renunciation of action here at the same time contains the separation of the artistic flash of genius from that of the founder of a state. The interpreter does not found the institutions of the new world, he only prepares them, or rather suggests their establishment through his interpretation.

Similarly, Hegel develops philosophy as the reflection of this historical occurrence. Philosophy as a whole is the 'owl of Minerva' which expressly raises the unity of Idea and reality only in its over-exertion as Logic of absolute knowing, which can merely be presupposed in all willing-to-know as 'requirement of reason'. Likewise, this event of reflection (philosophy) then only becomes historical reality itself if the requirement according to reason as *desiderium naturale*, if Kant's 'metaphysics as natural predisposition' must have been transported at the same time into metaphysics as science, in order to assure the not-unrealizability which is its due. Heidegger and Hegel rally against willing in a philosophizing from theological *certitudo*, where the late Heidegger conceives of thinking as elevation of a destiny of Being, also if Heidegger wants to break ranks on purpose with all metaphysics in paradoxical inversion of the power of the concept in the powerlessness of philosophical knowing.

In the symbiosis between poetizing and interpreting in the dialogue between Hölderlin and Hegel, to which Heidegger does not want to admit, beneath a concern for the historical situation of 'modernity', Heidegger's underlying indifference of poetizing and thinking which results from the involuntary retrieval of the concept of genius from the Enlightenment is preserved. Interpreting (poet) in an impoverished – orientation-poor, or rather needy – time is not acting. Poetic interpretation, philosophical reflection, or rather an art which is projected upon its function in history, contain a multitude of orientation suggestions in the form of an *alternative* (to everydayness), but not thereby (without further verification) already *authentic* world-view. The step from alternative, or rather other, to authentic is only fulfillable philosophically.

For Hölderlin it failed to appear; Hegel sought to fulfill it with the conception of a system of absolute knowledge. Having been forced to relativize the theory of full philosophical grounding, and also final philosophical grounding, a conception of ad hoc philosophical grounding still remains operable in the determination of art, which Heidegger had been able to carry out approximately in the sense and style of his Dasein analysis from *Being and Time*. Unfortunately, he himself withdrew from this conception in the Hölderlin interpretation. That made it possible for him to continue using the explicitly rejected, identificatory conception of the genius: authentic interpreting guides the misappropriation of time (*Zeitenwende*) here. To be sure, Heidegger was not only hampered by this in developing a sufficiently differentiated philosophical theory of historical acting, but it also aggravated coming to terms with his problematic conception of authenticity. That is to say, once we have gone with Heidegger on the path from philosophy which is still metaphysico-mathematical (Philosophy of value reflections) to essential thinking, then the disagreeable episode of misdirected acting from interpreting's exaggerated potentiality unavoidably becomes projecting.

Heidegger's history, which was established through art, is thereby indebted to prejudices which in recourse to its own considerations appear to be eliminable. Just as with 'art', likewise with 'Being' as *Ereignis*, Heidegger's overemphasis of thrownness – formulated from the perspective of *Being and Time* – allows of being questioned. The consequence was another concept of history: history became history of action instead of history of *Ereignis*. By way of suggestion, the problem as well as its avoidance may be characterized. History, or rather its moment of unavailability, must not be determined as destiny (i.e., ultimately religious as the sending of something unavailable which is prudently-acting, i.e., 'ingeniously' conceived), as it was for Heidegger. History could have been taken up just as well as the concept for those traces of human, inner-worldly acting (seen globally) which, as traces of acting, have only been diverted (in the forming of culture or technology) or which are no longer graspable at all. For history to lead back to acting indeed appears banal in comparison with the depth of Heideggerian analyses, but is suggested even so. Because the results and consequences of past action also are largely withdrawn from view and from reach, history seen in this way also remains dependent upon interpretation. Any acting: the altering, the intrahistorical, individual decision as well as the renunciation of alteration, leaves behind traces either in 'nature', in institutions, or in the others. These traces bear their origin in themselves, namely, acting, only it is more or less unrecognizable. Interpretation of destiny is granted therein, to lead the quasi natural back to its origin, namely acting. The philosophical assessment (*Deutung*) of history again appears, as it did for Heidegger, as interpretation (*Auslegung*) of acting

in its temporality, which discloses the transitoriness of the actual setting in place as ground for the sedimentation of acting into quasi nature, into substantiality.

In my opinion there is, from Heidegger's *Being and Time* on, a 'path of thinking' to a philosophy of historical culture which Heidegger himself obstructs. His own 'path of thinking with Hölderlin' appears, on the contrary, as an erroneous path from the perspective of the question concerning the practical dimension and meaning of philosophy. This erroneous path rests to be sure not on Hölderlin's error, but on Heidegger's.

Translated by Richard Taft

Notes

1 I have cited the following works of Heidegger: *Hölderlin's Hymnen 'Germanien' und 'Der Rhein'*, in M. Heidegger, *Gesamtausgabe*, vol. 39 (Frankfurt: 1980) (hereafter cited in the body of the text as *Höld.* 34/5); *Grundfragen der Philosophie: Ausgewählte 'Probleme' der 'Logik'*, in *Gesamtausgabe*, vol. 45 (Frankfurt: 1984) (hereafter: *Grundfragen*); *Erläuterungen zu Hölderlin's Dichtung*, 3rd ed. (Frankfurt: 1963) (hereafter: *EH*); and *Holzwege* (Frankfurt: 1963) (hereafter: *HW*).

The following Heidegger interpretations are cited by name only: J. W. Wahl, *La pensée de Heidegger et la poésie de Hölderlin* (Paris: 1952); B. Allemann, *Hölderlin und Heidegger* (Zurich: 1954; 2nd ed., 1956); O. Pöggeler, 'Heideggers Begegnung mit Hölderlin', *Man and World*, 10 (1977); C. Jamme cites Heidegger's self-interpretation of the reference to Hölderlin, as well as several investigations of the Heidegger-Hölderlin relationship in his 'Dem Dichten Vor Denken', *Zeitschrift für philosophische Forschung*, 38, no. 2 (1984), especially 193f.

2 In opposition to A. Schwan (*Politische Philosophie im Denken M. Heideggers* (Köln: 1985), O. Pöggeler is the first to follow this interpretation: cf. his *Philosophie und Politik bei Heidegger* (Freiburg: 1972). This interpretation was revised in several important areas on the basis of new materials – which depart from Heidegger's self-interpretation – in 'Den Führer führen? Heidegger und kein Ende', *Philosophische Rundschau*, 32 (1985), 26ff.

3 In his contribution, 'Heidegger und das Prinzip der Phänomenologie' (in *Heidegger und das Praktische Philosophie*, ed. O. Pöggeler and A. Gethmann-Siefert (Frankfurt a.M.: Suhrkamp Verlag, 1988), 111), K. Held refers to this consequence from another perspective. He traces the path of Heidegger's thinking as a line of reasoning the zenith of which is to abandon initial, voluntaristic elements in the determination of Being (i.e., all the elements of the fixing or rather the emphasizing of Being are not without execution). This reconstruction also traces the aporia of the superseding of the philosophical argumentation in favor of essential thinking.

4 C. Jamme adds to Pöggeler's thesis that there can be found in Heidegger's critique of technology the 'starting point for a political philosophy' in a sense which the Hölderlin lecture suggests: So 'one would be able to say with

justification that at the core of Heidegger's philosophy of art is a practical, i.e., a *political*, philosophy' ('Dem Dichten Vor-Denken', 210). With this, however, the principal aporia of this conception of the political has been mentioned.

5 Hölderlin's agreement with Hegel deepens in the discussions from their time together in Frankfurt, but has already been quashed by direct reference to Schiller in a fragment from 1797 (written) in Hegel's hand, namely the so-called 'ältesten Systemprogramm des deutschen Idealismus' ('The earliest system program of German Idealism'). The intention of extending Schiller's conception to history with the use of Kantian philosophy is also obvious from Hölderlin's correspondence with Hegel. Cf. *Briefe von und an Hegel*, vol. 1, ed. J. Hoffmeister (Hamburg: 1952), especially 20. Hegel's corresponding point of view can be found in a letter to Schelling (*ibid.*, 25f.).

6 In this connection O. Pöggeler points out only: 'Heidegger . . . does not show how in the dialogue with the philosophy of his time, on the level of the *Hyperion*, Hölderlin set theory and praxis against the experience of beauty, how on the level of the *Empedokles* he thinks of beauty as a tragic occurrence, how he then takes this occurrence as a dimension of the divine, but how in the final poem of the great synopsis the hymn breaks apart' ('Heideggers Begegnung mit Hölderlin', 47). J. Wahl again moves Heidegger on Hölderlin closer to Hegel; H. J. Schrimpf ('Hölderlin, Heidegger und Literaturwissenschaft', *Euphorion*, 51 (1957), 308–23) stresses the symptomatic shifting of interests with which Heidegger first interprets the poems from the transitional period of 1800–1, although he justifies his thoughts on the basis of Hölderlin's late work. In the Hölderlin lecture it becomes clear that Heidegger himself thinks he thereby has the late work in view. If we see the Frankfurt dialogue as a crisis in the early efforts of Hölderlin as well as Hegel, then certainly its consequences are only unambiguously comprehensible if we consider the common starting point as well. From here, the differentiation between poetry and politics, which Heidegger overlooks in Hölderlin because he tailors the hymns from the transitional period too closely to the traditional conception of the *Hyperion*, becomes clear.

7 Heidegger refers us to the *Empedokles* in connection with Hölderlin's madness (*EH*, 41, 42), but without further characterizing the tragic conception as break. Indirectly, a justification can be found for starting with the hymns in Heidegger's reference to the conception of *Hyperion* which was taken up in a different form in *Andenken: EH*, 121. The Hölderlin lecture also emphasizes this correlation; cf. below, note 13.

8 O. Pöggeler, 'Heideggers Begegnung mit Hölderlin', 59; *ibid.* for the following quote.

9 The later interpretations transpose the contested categories less conspicuously in the characterization of poetizing than in historical interpretation, although without abandoning it. The references from the Hölderlin lecture are allowed to multiply, cf. e.g., *Höld.* 34/5, pp. 13, 214, 239ff., 257, 293. From time to time there it revolves around poetry as struggle or freeing of the creature (*Wesens*) from gods and men to its determination, around the sphere of influence for this primal language, around the truth of poetry as strife.

10 For a further interpretation of 'Care', cf. *Heidegger und die Praktische Philosophie*, 207f., 213f.

11 As it does for Heidegger in the essay of the same name.

12 Cf. *Höld.* 34/5, pp. 51, 60, 62, and up to 67: Poetry itself is just 'the outstanding event in the event of language . . . the poetic is the basic texture of historical Dasein and that now means: language as such constitutes the original essence of the historical Being of man'.

13 Cf. in addition B. Allemann, 'Hölderlin zwischen Antike und Moderne', in *Hölderlin-Jahrbuch* (1984–5), esp. 41f., 56. Allemann shows that Hölderlin was concerned with 'the viewpoint from which we have to consider antiquity' (as he explains it in a sketch), to characterize the difference between our development and that of antiquity. Heidegger skips over this difference as well as at other points in his early Hölderlin interpretation in the characterization of the contents of *Germanien*; cf. *Höld.* 34/5, p. 15. Indeed he emphasizes the difference between the Greeks and modern man: to the Greeks the 'dispensation of Being in the seam of the work' is closed off; whereas 'we set the portion of the ability to comprehend into the work in such a way that this comprehending binds and determines and is joined to the seam of Being' (*Höld.* 34/5, p. 293). To be sure, Heidegger stops with the identity of the results 'as we battle the battle of the Greeks, but on the opposite front, we become not Greeks, but Germans' (*Höld.* 34/5, p. 293). But this means that the identity of poetry and politics applies to modernity as well. For this interpretation, there are further annotations to the *Empedokles* (*Höld.* 34/5, p. 258f.), and the retrieved elimination of the concept of appearance as the mediator between fiction and reality (cf. *Höld.* 34/5, p. 217: 'Poetry, as what has been established, is what is actual').

14 Schiller determines 'modern' ideal poetry in connection with the essay *Über naive und sentimentalische Dichtung* ('On naive and sentimental poetry') in a few noteworthy passages. In this regard, cf. A. Gethmann-Siefert, 'Idylle und Utopie', *Schiller-Jahrbuch*, 24 (1980), 32ff. Hölderlin's *Andenken* is also presented in this context as conclusive modification of his 'Ideal of educating a people'; this in 'Die "Poesie als Lehrerin der Menschheit" und das "neue Epos" der modernen Welt. Kontextanalysen zur poetologischen Konzeption in Hölderlins "Andenken"', in *Poetische Autonomie. Zur Wechselwirkung von Dichtung und Philosophie in der Epoche Goethes und Hölderlins*, ed. H. Bachmaier et al. (Stuttgart: 1987), 70ff.

15 For Heidegger, appearance (*Schein*) is explicitly and unequivocally deception, which can only stand in opposition to truth. Cf. *Höld.* 34/5, p. 62; cf. above, note 13.

16 Cf. O. Pöggeler, 'Heideggers Begegnung mit Hölderlin', 14f. Even in his later occupation with Hölderlin (1942), and in the interpretation of *Andenken* or *Heimkunft* (1943), Heidegger simply glosses over important considerations of Hölderlin's – to the detriment of the philosophical interpretation. As one curious fact we could call attention to the following: For Hölderlin the fact that the reference of his own cultural surroundings (*Kulturraum*) to the Orient becomes significant was already noticeable in the hymn *Germanien*, and it could not be overlooked in *Andenken*. Heidegger interprets this philosophico-existentially for itself in terms of the necessity of dialogue with the east Asian beginning. In place of the cultural blending of horizons which Hölderlin's poetry prescribes, the authenticity of individual destiny walks vicariously – that 'compromise between the Western and the east-Asian beginning' documented in Heidegger's conversation with the Japanese. Cf. O. Pöggeler, 'Heideggers Begegnung mit Hölderlin', 60; D. Henrich, *Der Gang des Andenkens. Beobachtungen und Gedanken zu Hölderlins Gedicht* (Stuttgart: 1986), 50f.; A. Gethmann-Siefert, 'Die Poesie als Lehrerin der Menschheit', 89.

17 Cited according to the Reclam edition, Stuttgart, 1967.

18 For the above, *Höld.* 34/5, p. 257. Cf. also the corresponding passage in the 'Work of art' essay: 'Whenever and however this strife breaks out and happens, the opponents, lighting and concealing, move apart because of it. Hence, the open of the place of strife is won' (67) [other editions: *Gesamtausgabe*,

vol. 5, p. 48; *Poetry, Language, Thought*, trans. A. Hofstadter, 61 – trans.]. Nevertheless it is a matter of ‘establishing’ the truth (68; (*Gesamtausgabe*, p. 50; *Poetry, Language, Thought*, 62)), concerning which he says, ‘As this strife of earth and world, truth wills to be established in the work’ (70; (*Gesamtausgabe*, p. 50; *Poetry, Language, Thought*, 62)). Knowing is ‘standing within the strife which the work has fitted into the rift’ (77; (*Gesamtausgabe*, p. 56; *Poetry, Language, Thought*, 68)). The Hölderlin lecture prepares this. Poetry was – but with Hölderlin himself in an insufficient generalization – as an institution, nothing more than the sound of battle of Nature itself, because ‘Being shows as hostility’, so the ontological dimension must also become strife (*Höld.* 34/5, p. 257).

19 Gadamer at least hints at this possibility; cf. the *Nachwort* to the ‘Origin of the work of art’, esp. 108f. [This *Nachwort* by Gadamer appears only in the Reclam edition of ‘Origin’, published as the monograph *Der Ursprung des Kunstwerkes*, Reclams Universal-Bibliothek, # 8446 (2) (Stuttgart: 1960) – trans.] The characterization of the poetizing projection speaks for this interpretation: ‘Truly poetic projection is the opening up of that into which Dasein, as historical, has already been thrown. This is the earth and, for an historical people, its earth, the self-closing ground on which it rests together with everything that it already is, though still concealed from itself. It is, however, its world, which prevails in virtue of the relation of Dasein to the unconcealedness of Being. Hence everything with which man is endowed must, in the projection, be drawn up from the closed ground and expressly set upon this ground’ (86f.; (*Gesamtausgabe*, p. 63; *Poetry, Language, Thought*, 75f.)).

20 Cf. O. Pöggeler, ‘Heideggers Begegnung mit Hölderlin’, 14.

21 Heidegger retrieves, for example, the care distinction (cf. among others, *Höld.* 34/5, p. 141f.); he retrieves in particular Hölderlin’s characterization of the Hesperidian spirit through the ‘Juno-esque emptiness’ in the unfolding ‘basic mood’ as ‘pure emptiness of thinking’, ‘restrainedness’ (*Grundfragen*, 2) as not-from-another-knowing (154f.), and finally as ‘astonishment’ (165ff.). From conversion to discoursing, Heidegger at least suggests then the other beginning is the ‘transformation of the line of vision, the standard and the claim’ (*Grundfragen*, 190).

22 Along the same lines, in the *Grundfragen* Heidegger also juxtaposes poetizing and thinking as hearing, interrogating the original origin (*Höld.* 34/5, pp. 197, 200f.) and the closer discussion as ‘holding one’s ground’ (*Höld.* 34/5, p. 201), the enduring of the first beginning. Cf. pp. 136, 138, 142, 148, 175ff.

23 Cf. also the sharp rejection of the concept of culture in general, *Grundfragen*, 182.

‘The flower of the mouth’: Hölderlin’s hint for Heidegger’s thinking of the essence of language

Friedrich-Wilhelm von Herrmann

I On the metaphysical determination of the sound character of language

In his lecture trilogy ‘The essence of language’¹ Heidegger seeks a thinking experience of the essence of language, directed by the words ‘The essence of language: The language of essence’ (*US*, 176). Taken as a directive, these words function as a guide for the path of thinking – a path which, as such, proceeds in the neighborhood, or nearness, of thinking and poetizing. Their nearness to each other relies on the excellent relation that each has to language and its essence. But, at the same time, this nearness is determined by a ‘delicate, but clear difference’ (*US*, 196), which excludes their blending, or the assimilation of one by the other. The word-directive ‘The essence of language: The language of essence’ contains a directive for thinking. These words are to direct thinking as it experiences and thinks the essence of language.

Taken as a directive, these words have the character of a hinting. ‘A hint hints away from the one toward the other’ (*US*, 202). The hinting which occurs in this word-directive is, therefore, a hinting away from and a hinting towards. This hinting hints thinking *away from* the first phrase, before the colon, hinting *towards* the second phrase, after the colon. Thus, in its hinting away, this hinting initially refers thinking to that from which it hints away. The phrase ‘the essence of language’ articulates the traditional determination of the essence of language – and this determination must first be considered, with regard to its insufficiency. However, such a critical approach is possible only on the basis of a prior understanding of a more originary and root experience of language. This prior understanding is articulated in the second phrase of the word-directive, ‘the language of essence’. But the second phrase of the word-directive hints towards the possibility of an original experience of the essence of language only haltingly. To get thinking involved in

this possibility, thinking must first engage in a critical reflection on the basic traditional representation of language which is expressed in the first phrase. According to the traditional representation we view language as the vocal utterance of inner ideas and thoughts. We grasp the vocal utterance as a phenomenon of the human body which, together with the body as a whole, belongs to the realm of sensibility. What gets expressed in vocal utterances (the *content* of language, its sense and meaning) we take as the spiritual part of language. We then imagine the spoken and written language to be the unity of sensible sound and spiritual meaning.

This basic representation of language harks back to the old and traditional representation of man as *animal rationale*, as the living being who is endowed with reason. As a living being, man belongs to the realm of the sensible, which he shares with all other, nonhuman living beings. As *ratio* man is a thinking, reasoning being and belongs to the realm of the spiritual. Through *ratio* man raises himself above the realm of a merely existing being, differentiating himself from nonhuman living beings. The basic representation of language as the unity of what is vocal, bodily, and sensible with what has a spiritual content or meaning and is expressed therein – this basic representation stems from representing the essence of man as a living being who is endowed with reason.

This essential conception of man seems to be well-founded and untouchable as long as a more original experience of man is not manifest. But this more original experience occurs only when thinking realizes that the traditional determination of the essence of man as *animal rationale* is formed within the horizon of an understanding of being that is developed by looking at an extant being, by *not* viewing man as man. The traditional, metaphysical determination of the essence of man shows itself to be guided by a conception of being which covers over and conceals the most proper way in which man is man. If the traditional, metaphysical representation of language corresponds to the metaphysical determination of the essence of man, this representation of language, too, is formed by that understanding of being which is developed outside the view of man as man.

To what extent is the essential determination of man as *animal rationale* guided by an understanding of being which does not have its origin in man as man? The essential determination '*animal rationale*' is a logical and ontological definition based on *genus proximum* and *differentia specifica*. The *animal* is the genus 'living being', within which various kinds can be distinguished: plants, beasts, and humans. What they have in common is being a living being: that by which they differ from one another is their own particular way of being. What constitutes the specific difference of man as a human living being is *ratio*. Genus and kind are thought as essence in the sense of whatness, or *essentia*. When we think in terms of genus and kind, we are thinking of an aspect which we name by means

of distinguishing characteristics. We distinguish the essence as whatness from that-ness, or being-real. Being as what-ness and being as that-ness articulate the metaphysical concept of being. Metaphysics and ontology extend this ontological pair of concepts to all beings. Accordingly, all beings – stone, plant, beast, and man – are determinable with regard to their differentiated inherent what-ness and their unified way of being-real – in contrast to non-being or merely possible-being. According to the metaphysical determination of the essence of man as *animal rationale*, man belongs to the genus of living beings, differentiating himself from other beings only through his specific way of being. But, considering how man is a real being, he shares the real character of his being with all other beings. Within the horizon of being that is differentiated metaphysically according to what-ness and that-ness, man is a being among other beings.

But this determination of the essence of man covers over man's ownmost being (his ownmost how-ness) as an existence that understands being. This way of being is man's 'ownmost' because it is proper only to man. But this way of being cannot be grasped within the distinction between what-ness and that-ness (*essentia* and *existentia*). On the contrary, the ontological separation of what-ness and being-real is possible only for a being who in its ownmost being understands being. The ontological pair of concepts, *essentia* and *existentia*, unfolds in terms of beings that are on hand and lie before us as handy and as such can be defined in terms of their inherent what-ness. But in order for beings as beings to lie before us and to be determined in terms of their what-ness and being-real, being as such must have disclosed itself in the enactment of ek-sistence of thrown projection. That being which in its being understands being through thrown projection of being cannot be grasped according to those concepts of being which are themselves only possible on the basis of an ek-sistential understanding of being and which are developed according to an ek-sistential understanding of being in view of beings that do *not* understand being. If the distinction between *essentia* and *existentia* is a distinction that applies ontologically to things (because it is based on things that are at hand), then the determination of man's essence as *animal rationale* is also a determination which applies ontologically to things and not to Dasein. The notion of *animal rationale* fails to grasp man as a being that existentially understands being – fails to grasp man as Dasein. But if the basic metaphysical representation of language has its origin in the metaphysical determination of man as *animal rationale*, then this basic representation of language is also formed by a thinking which, ontologically, is concerned only with things.

But if we get a critical distance from the metaphysical determination of language, which takes its departure from the vocal utterance, then we must call into question the notion that the sound aspect of language is sensible and bodily. This representation of language takes the sounding

aspect of language to belong to the sensible and to what is animalistic in the rational animal. Because, as *animal rationale*, man shares his corporeality as well as his being a living being with all nonhuman living beings, he must also share with them the vocal or sounding aspect of language. Thus, along with corporeality and animality, the sounding aspect of language is also interpreted from within the ontological horizon of being as inherent what-ness and as being-real.

What is decisive about the insight into man's ownmost way of being as existence is that existence that understands being does not simply replace *ratio*, as if existence were just another *differentia specifica*. If we view existence in this way, we remain within the metaphysical perspective of *essentia* and *existentia*. If it is only within the metaphysical-ontological horizons of what-ness and that-ness that an essential definition is possible – by indicating the nearest species and the specific difference which constitutes a class within the species – then that means: Man's ownmost essence is not at all comprehensible according to a definition which indicates the character of species and class. If existence which understands being is not developed according to the character of a class derived from the notion of species shared by other beings, then that means: Existence that understands being determines man as a being as a whole, including his corporeality and whatever pertains to it. Man as *Dasein* – existence that understands being – does not share his corporeality with nonhuman living beings. In the *Letter on Humanism* Heidegger writes: 'Thus even what we attribute to man as *animalitas*, on the basis of comparison with the "beast", is itself grounded in the essence of ek-sistence. The human body is something essentially other than an animal organism.'² This does not exclude our investigating our body like an animal organism. But such is possible only because the body and its corporeality already belong to us in a manner that is determined by ek-sistence, which is open to being and the world. The critical distance from the metaphysical determination of the sound character of language prevails over the covering over of the ways of vocal utterance and *Dasein*'s whole corporeality that are determined by ek-sistence.

Therefore Heidegger has us consider whether 'the element of language that pertains to the human body, as well as the sound and written character of language, is adequately experienced' in the basic metaphysical representation of language (*US*, 204). Is it sufficient to relegate 'the sound character of language to the body understood physiologically' and to classify that body within 'the metaphysically intended sphere of sensibility' (*US*, 204–5)? We cannot and should not deny that linguistic utterances can be 'physiologically explained as the generating of audible sounds' (*US*, 205). But the real question here is whether the physiological perspective on vocal utterance, on the sound character of language, and on the body as such constitutes the sole means of access to language –

or whether this perspective is only *one* possible access, preceded by another access, in which Dasein's corporeality and the corporeality of language are determined differently, prior to the representation in terms of physiology. This other manner of access to language is indicated and sketched out in man's ownmost way of being in terms of ek-sistence, which understands being and is open to the world. Only when this initial manner of determining the sound character of language is closed off can the linguistic utterance be taken as the sensible expression of inner thoughts and be scientifically-physiologically thematized. The physiological way of explaining the linguistic utterance does not experience 'what in each case genuinely belongs to the sounds and tones in speech' (US, 205); the physiological approach conceals this characteristic. Looking ahead towards the thinking experience of the essence of language, announced in the second phrase of the word-directive ('the language of essence'), we must now think and experience what properly pertains to sounds and tones in speech – that is, we must hold within our phenomenological gaze what is thus experienced. What genuinely belongs to the sounds of language differs from the sounds produced by animals, which, along with the animal organism, are not determined by the way of being of ek-sistence open to the world.

One would think that one sees what properly belongs to language by focusing on rhythm and melody, which are distinctive of song, and how they also belong to language – so that language is related to song. But this way of looking at it still does not disclose what genuinely belongs to the sound and tone of language, because this way of looking also represents what resounds in melody and rhythm 'from within the perspective of physiology and physics' (US, 205). The physiological and physical representation of what is soundable in language, song, and music leads to correct results, whose correctness cannot be disputed. But 'correct' here means just the determination which is aligned to what has already been explicated or made explicit. And that way of bringing sound into the explicit realm covers over the original manner of determining sound, namely, from out of ek-sistence, which is open to the world. What genuinely belongs to sound can no longer be experienced within the sensible, physiological, and physical perspectives. Sounding, ringing, oscillating, vibrating, and pulsing belong properly to language, just as the spoken word and the conjunction of words have a 'meaning'. But everything depends on whether sound and 'meaning' are viewed and determined in accordance with their essential character. *This* way of determining sound and 'meaning' is constantly threatened by the danger of succumbing to the traditional metaphysical way of representation, which, for its part, has enabled the physiological and physical as well as the scientific-technological manner of explanation. Such a metaphysical way of representation and such a technological manner of explanation

prevent a 'proper reflection' (*US*, 205) on language, on what resounds in speaking and on the meaning 'sounded'. If we pursue a 'proper reflection' instead of a metaphysical-technological explanation, then in this 'reflection' we will be dealing with a thinking that tries to experience and determine language and sounds from within the horizon of ek-sistence which understands the world. If this reflection is to be 'proper', then it should be guided by the phenomenological maxim 'to the things themselves.' The sound character of language should show itself within the horizon of ek-sistence which understands the world. Thinking should take place as a letting be seen, showing what shows itself, in and from itself, as what properly belongs to language's sound and tone.

II Hölderlin's poetic experience with language as a hint for the proper reflection on what genuinely belongs to the sound of language

Heidegger begins the proper reflection on what genuinely belongs to sound by referring to the dialects of a language. These dialects present 'various ways of speaking according to regions' (*US*, 205). We also call these dialects *Mundarten*, 'ways of the mouth', 'kinds of tongue'. Now: How do we differentiate the sounds in the dialects? Usually we answer this question using phonetics and the theories of phonology and voice formation. But phonetics stays within physiological and physical representation and explanation. For phonetics explains the differences in dialects in terms of 'the different ways in which the tools of language move' (*US*, 205). This phonetic-physiological-physical way of explanation is characterized, for its part, by the metaphysical representation of language – and phonetics does not know its metaphysical presuppositions.

In contrast to the phonetic-physiological-physical manner of representation, which is correct within its own realm, Heidegger now suggests, in accordance with the required proper reflection, that in the different dialects and their sounds 'each landscape or region – earth itself – speaks differently' (*US*, 205). Here the fundamental word *earth* is introduced for the first time. This word opens the dimension wherein the sound character of language genuinely belongs. What Heidegger calls 'earth' will soon be shown to be one of the four regions of world, which as world opens itself up in the clearing-concealing freeing and proffering of world (*US*, 200). The world that is opened shows itself in ek-sistence which understands world. But if earth is a region of world and if what genuinely belongs to the sound of language is experienceable and thinkable from out of its relation to earth, then we begin to surmise what it means to determine properly the sound character of language within the horizon of ek-sistence which understands world.

As each dialect sounds differently, so does the region or earth speak

differently in each case. But how does earth 'speak'? What can 'speaking' mean here? Seen from the point of view of phonetics, mouth or tongue is an organ which belongs to the body represented as an organism. As long as we posit the human body as an organism, it is identical with animal organism and as such belongs to the realm that we represent as the animal realm. However, when it is viewed from within the proper reflection as it occurs in the horizon of ek-sistence which understands world, when it is viewed from within the thrown projecting that stands in the clearing of the self-projecting world, then 'body and mouth' are part of 'the flowing and growth of earth' (*US*, 205). The flowing and growth of earth names that which in our understanding of world is disclosed and understood as earth. The intelligibodily sound belongs to the way in which earth gets disclosed. We 'flourish' as 'mortals' (*US*, 205) in that understanding of flowing and growth of earth which belongs to our understanding of world. With this fundamental word for man experienced as *Dasein*, Heidegger in his later philosophy takes up what in *Being and Time* was called the existential ontological character of 'being-towards-death'. The understanding of being and of world proper to ek-sistence is thought here as essential openness to death. That is why Heidegger names 'mortals' as another of the four regions of world.

The earliest indication by Heidegger that the sound character of language pertains to earth as a region of world occurs in terms of Hölderlin. For the thinking experience of world as the unity of the four regions of world, which Heidegger calls the fourfold, and the experience of the relationship of the sound character of language to the world-region of earth take their guiding hint from the encounter with Hölderlin's poetry. Thus Heidegger introduces some of Hölderlin's verses in which language is characterized poetically as 'the flower of the mouth' – but mouth, and along with it the body and bodily utterance, as connected to earth. Now, since the task is to think the sound character of language from out of the essence of language as saying, thinking receives its direction from Hölderlin's poetry, by remembering its own nearness to poetizing. Now the situation is different from that in the first two lectures of the trilogy, where Heidegger was dealing with the poetry of Stefan George. For George's poetical experience with the word does not extend to the relationship of the sound character of language with the earth as world-region. George's experience does not extend into the essential origin of the word, which in his experience is what alone offers being to things. By contrast, Hölderlin's poetic experience with the essence of language is more original, because it reaches deeper into the essence of language.

Altogether Heidegger draws upon excerpts from four of Hölderlin's poems. The first excerpt comes from the fifth stanza of the later hymn 'Germanien'. The eagle of Zeus says to the 'quietest daughter of God':

And secretly, while you dreamed, at noon,
 Departing I left for you a symbol of friendship,
 The flower of the mouth, and you spoke in solitude.
 Yet an abundance of golden words you also sent,
 O fortunate one! with the streams, and they flow
 Inexhaustibly into all regions.³

Here language is poetically experienced as 'the flower of the mouth'. Insofar as the 'golden words . . . flow . . . with the streams' of the earth, a relation of word and earth is poetically named.

The second text, taken from the first stanza of the elegy 'Walk in the country', unfolds the poetic image of 'the flower of the mouth':

Therefore I even hope it may come to pass,
 When we begin what we wish for and our tongue loosens,
 And the word has been found and the heart opened,
 And from ecstatic brow springs a higher reflection,
 That the sky's blooms may blossom even as do our own,
 And the luminous sky open to opened eyes.⁴

Here too the poetic word is addressed. According to its meaning the line 'That the sky's blooms may blossom even as do our own' is to be thought thus: We hope that with our blossoming heaven's blossoming would also begin. With our blossoming, that is to say, with the blossoming of the flower of the mouth, the blossoming of language begins. Hölderlin experiences and poetizes the essence of poetic language as the blooming of the flower of the mouth. With its blooming the earth blossoms towards the blossoming of the heavens. In the blooming of the flower of the mouth, i.e., in the poetic saying of the poetic word, the earth and heavens blossom. When we transpose the poetic experience of Hölderlin from the level of his poetic path into the path of thinking, then we can say: In saying what is uttered as sounding word, earth opens itself up as earth, heaven as heaven. But this happens in such a way that earth blossoms and emerges as earth under sky, and sky blossoms and emerges as sky above the earth. The earth is only the earth of the heavens, just as the heavens are only the heaven of the earth.

Before Heidegger introduces two more excerpts from Hölderlin's poems, he says, with regard to the excerpts already quoted, that in them the essence of language as 'saying', as 'way-making for everything' (*US*, 206) announces itself. What 'makes way for everything' is the clearing-concealing offering of world for ek-sistence which is open to and understands world. What is named the clearing-concealing offering of world is an initial characterization of what is meant in the second phrase of the word-directive: the 'language of essence'. The essence of language

as the essential origin of Stefan George's poetic experience of the being-bestowing word – this essence is the world which lights up, conceals, and offers to ek-sistence which understands world. Now, when Heidegger says that the essence of language announces itself in Hölderlin's poetic experience with language as the flower of the mouth, in whose blooming earth and sky blossom toward each other, and when we realize that way-making for all *is* clearing-concealing offering of world, then Hölderlin's experience sheds light on the manner in which world as world is to be experienced in the offering of world. Accordingly, earth and sky belong to world as regions of the world. In Hölderlin's experience with language, *that* essence of language announces itself which, in light of the second phrase of the word-directive, should be experienced and determined as the language of essence. Hölderlin's experience with language reaches deeper into its essence than George's experience, for whom the poetic word for the essential origin of the being-bestowing word remained hidden.

Nevertheless Heidegger speaks about Hölderlin only in the context of an 'announcement', which means that in Hölderlin's experience with language its essence does not readily show itself. What is needed is to bring to light, through thinking experience, the essence of language, which announces itself in Hölderlin's poetic experience. This must be done in such a manner that this essence of language shows itself in its structural tonality from out of itself by itself. What announces itself in Hölderlin's experience is brought over into thinking, so that the essence of language, which shines *poetically*, shows itself to a thoughtful seeing as something experienced in *thinking*.

The third excerpt from Hölderlin is taken from the fifth stanza of the elegy 'Bread and wine':

Such is man; when the wealth is there, and no less than a god
tends him with gifts, though he remains blind and unaware.
First he must suffer; but now he names his most treasured
possession,
Now, now words for it must emerge like flowers.⁵

The fourth excerpt from Hölderlin is another version of these same lines from 'Bread and wine':

Long and hard is the word of this coming, but
White (light) is the moment. But those who serve the gods
Know the earth well, and their step toward the abyss is
In its youth more human, but still what is in the depths
is old.⁶

Taking both of these excerpts into account, Heidegger states that 'once again', as in both previous excerpts, the word appears in and as the region which allows earth and sky to 'encounter each other' (*US*, 207). He suggests that Hölderlin experiences the word as the region which determines earth and sky to be 'world regions' (*US*, 207). Here, in this lecture trilogy, the word *world-region* surfaces for the first time. But both excerpts name much more. The third excerpt names man, god, and 'words like flowers'. The fourth excerpt names word, 'servant of the gods', and earth. Keeping in mind that later in the text of the third lecture Heidegger thinks the world as a whole and as the unity of the four world regions – and thinks these four as earth and sky, god and mortals – then we may say that in those excerpts, in addition to the world regions of earth and sky, the world regions of 'god' (or: 'the heavenly ones') as well as 'mortals' are also poetically named.

Heidegger emphatically points out that Hölderlin experiences language in the heightened manner of poetic language as 'flower of the mouth', as 'words, like flowers'. Heidegger sums up: Within Hölderlin's experience of the essence of poetic language lies 'the awakening of the deepest view' (*US*, 207). The poet sees language as an essential occurrence. This is the deepest possible view, reaching deeper into the essence of language than Stefan George. It is also deepest in a further sense, namely, insofar as it reaches into the deepest expanse of the opening of the world as it and its regions open up for man in language. Hölderlin's experience with language amounts to an awakening of the deepest way of language, an awakening from a slumber, from the closing-up in which Hölderlin's experience of the essence of language was hidden – the essence of language as that which lets world regions appear.

Hölderlin's experience with the essence of poetic language is the awakening of the deepest view because in this essential experience 'the word is harbored back into its essential source' (*US*, 207). It is here that the word first of all becomes poetic word, in that in its saying and naming it lets what it names come into the manifestness of its being. The word which names and renders manifest, the sounding word whose naming renders things manifest, is experienced out of its essential source, i.e., out of the emergence of world regions. But why does Heidegger say that in Hölderlin's experience the word is 'harbored back'? 'Harboring' here means 'saving' and 'sheltering preserving'. As long as the word is represented as the vocal expression of a meaning content – that is, as long as the word receives its determination from basic metaphysical representations – the word remains unharbored and estranged from its essential source. On the other hand, if we experience its essential source, then it is saved in its essence, or: it is harbored. Insofar as it receives its harboring from its essential source, from which the word was removed

in metaphysical determining, its harboring is a harboring back, i.e., back to the place from where the word has its essence.

Insofar as in Hölderlin's experience the poetic word is harbored back into its essential origin, it is 'brought forth . . . from its origin' (US, 207). Harboring the poetic word back into its essential source is also a 'bringing forth of the word from its origin'. The essential source, the emergence of world and its regions, is the origin where the poetic word begins. This can only be a naming which renders things manifest insofar as its naming begins with the emergence of world. The poetry of Hölderlin is 'the bringing forth' of the word out of its origin, in a twofold sense. When Hölderlin experiences the essence of language and poetizes this experience in the phrase 'words, like flowers', then his poetizing of his experience of this essential word is bringing forth the poetic word out of its origin. That is the first meaning. The second meaning is this: When Hölderlin explicitly experiences and poetizes the essential source and origin of the poetic word, then what comes to pass is not only his poetizing of the poetically experienced essence of language; but – deeper and more essential than that – what takes place in his poetizing as a whole is the poetic bringing forth of the poetic word (poetry as a work of art in language) out of its poetically experienced origin. Simply put, Hölderlin understands his poetic creation as creative emergence of the poetic word out of its origin.

When Hölderlin, in his experience with language, brings forth the poetic word out of its origin, such a bringing forth is only possible as the 'ability to listen' to the essence of language that addresses him in the experience and befalls him (US, 207).

Thus Heidegger characterizes Hölderlin's experience with language in four ways: (a) as an awakening of the deepest view, (b) as a harboring return of the word to its essential source, (c) as a bringing forth of the word out of its origin, and (d) as the ability to listen to the essential source and origin of language.

III The earthbound emergence of the sounding of language from out of saying as resounding, as letting appear of world

The intimate relationship between sounding words and the world regions of earth, which Hölderlin experiences poetically, must now be explicitly brought over into thinking, into that thinking which – with a view to the second phrase of our word-directive, namely, 'the language of essence' – would experience and determine this no-longer-metaphysical essence of language. That is the task of the step in thinking that we now take. The turn towards Hölderlin's poetic experience with language should give thinking a hint and a direction. Thinking receives such a direction

from the poetic word for language as experienced in its essence. This word is: 'flower of the mouth', 'blossom', and 'words, like flowers'. When Hölderlin the poet experiences and names the essence of word and language as the 'flower of the mouth' and as 'blossom' and when – in a hermeneutical dialogue with poetry – thinking turns towards poetic experience thus brought to word, then thinking 'hears the sounding of language rising in an earthbound manner' (US, 208). As hearing, thinking understands what announces itself through poetic words as the essence of language. Here Heidegger speaks about 'rising' in view of 'blossom', whose blossoming and blooming is an emergence out of concealment. The sounding of language rises in an 'earthbound' manner, i.e., it rises as everything that belongs to earth rises. When the sounding of language rises in an earthbound manner, we must ask 'from where' it emerges. The answer is: 'From saying, in which world is allowed to appear' (US, 208). The sounding of language rises in an earthbound manner 'out of saying'. This means: This sounding arises out of saying, out of the unfolding of language in its non-metaphysical essence, out of the way-making that makes way for everything – all of which is indicated in the second phrase of our word-directive. Because the way-making for all as clearing-concealing releasing is what allows the world to appear, we can say that the sounding of language arises in an earthbound manner out of what 'allows world to appear', out of the region of earth which belongs to world. This insight into the emergence of the sounding of word out of the emergence of regions of world as the origin and essential source of word belongs to Hölderlin's experience with language. However, what Hölderlin experiences poetically thinking can experience in *its* own way and bring into the word of thinking, as distinguishable from poetic word. To experience in *thinking* and to determine what has been *poetically* experienced means that thinking can experience *in its own way*, as a phenomenological matter, what the poet experiences in *his* way. The matter which shows itself now as the earthbound rising of the sounding of language out of saying, that allows world to appear, is not something merely poetic – because it is initially experienced by the poet – that thinking can merely re-think. Rather, even though this matter is initially experienced by poetizing, it can be phenomenologically exhibited by thinking in its own way.

After Heidegger experiences the sounding of language phenomenologically, from the earthbound manner of emerging/rising of sounding out of saying as that which allows world to appear, he now shows phenomenologically the 'letting appear of world'. The essential source of the sounding word 'letting appear of world' is characterized as a 'resounding' which 'gathers' the world regions 'by naming' (US, 208). When thought in an initiatory and original manner out of the origin, letting appear of world – that is, lighting, concealing, releasing of world – is an offering

for ek-sistence which understands world. But in the meantime we have seen that the world, which lights up and conceals itself, is the totality of the four world regions. Worldbound relations, which constitute with their web a totality of meaningful relations, manifest as relations within the regions of the world and among these regions as they relate to one another. The releasing which lights up and conceals and allows world to appear is a naming and gathering, insofar as the world regions are gathered in the rising which lights them up in the totality of their being related to one another. This gathering which takes place in the letting appear of world has the fundamental feature of a naming, insofar as the world regions call one another as they emerge and thus allow the sway of their interconnectedness. What lights up as world, as the worldbound totality of relations of the world regions, shows its own active sway. This active sway makes up the relations which light up among the world regions. This sway of the gathering of the world regions as they call one another Heidegger calls 'resounding'. Why does Heidegger choose the word *resounding* (*das Läuten*) for the sway of what allows world to appear as the essential source of the naming word? His choice of words is in part with a view to the activeness that is proper to the gathering which names the regions of the world, but also with reference to the sounding (*das Läuten*) of language. 'The sounding rings out of the resounding' (*US*, 208). The naming which gathers the world regions does not itself sound. However, in its not sounding it is not deprived of its own activeness, which is resounding and as such enables the sounding word which names and makes beings manifest.

In what relation of possibility does the resounding – the gathering which calls world regions – stand to the naming which makes beings manifest? Heidegger responds to this question by saying that resounding, as the calling gathering of the world regions, allows this gathering to appear 'in things' within the open which makes up the world's clearing. This is an essential statement about the relation of world and thing. The lighting, concealing, releasing and extending of world, which allows world to appear, the calling gathering of the interrelated world regions – this occurrence of the clearing of world is essentially a relation to beings as things. World's clearing occurs in relation to things, which are things only because of this relation. As innerworldly things, things are world-gathering. Their inner-worldliness is the manner by which, in their manifestness, they gather world. The respective what-ness and how-ness of things get determined by the manner in which they gather the meaningful relations of the world regions as these light up. They harbor the world's clearing in that they gather world. This harboring belongs essentially to the occurrence of the clearing-concealing emergence of world. The clearing of world occurs originally only when the world which is lit up is also harbored originally in beings and their manifestness. Harboring the truth

of being and the clearing of world are part of the essence of truth when the latter is experienced according to the history of being. Thus this harboring is one of the essential insights into the way in which the question of being gets worked out in the history of being. This issue is treated for the first time and in a fundamental and comprehensive way in *Beiträge zur Philosophie*. What Heidegger thinks in the lecture trilogy as the theme of letting world appear in things and what he thinks in the lecture entitled 'The thing'⁷ as thing's gathering of world is given its groundwork in the part of *Beiträge zur Philosophie* which is entitled 'Die Gründung'.⁸

If sounding of the naming word, which names things, rings out of the resounding as gathering which calls the world regions and if the world which is lit up appears in the world-gathering-things, then letting the world appear in things takes place in the naming of the word. What sounds and transpires in the naming of the word is the manifestness which gathers world, made possible by the clearing of world. These exist only within the space of language, in the context of a naming which has the character of word and in the context of the essential source of this naming which makes things manifest out of a resounding, which is the clearing of world.

If the sounding of language is experienced from the earthbound emergence and if this emergence is experienced in terms of a sounding as the calling gathering to which earth belongs, then the sound character of language is no longer subordinated to the bodily organs alone, as in the metaphysical determination of language. The phenomenological reflection that we have just carried out released the sound character of the voice and of language from the perspective of the physiological-physical explanation, which for its part is metaphysically determined. A proper, phenomenological reflection, when guided by the second phrase of our word-directive, must 'hold the sound of language and its earthiness [. . .] within the attuning, which tunes the regions of the world's jointure, playing them off one another and tuning them to one another' (*US*, 208). Here we are talking about an 'attuning' which tunes the world regions to one another. The world regions do not exist for themselves, but are related to one another – and in such a way that each is tuned to the other. We must rethink what Heidegger says here about tuning and attuning in terms of what he discussed in *Being and Time* (Section 29), in the context of his existential-ontological analysis of Dasein, about the existential-ontological essence of attunement of Dasein in its being-in-the-world. Attunement (*Befindlichkeit*) is the existential-ontological term for the existentiell phenomenon of the attuning and being-attuned of Dasein. In opposition to the metaphysical and psychological explication of being-attuned as an affective, psychic condition, Heidegger shows that attunements are ways in which Dasein is disclosed in the existential,

horizontal disclosedness of its total being-in-the-world. The essence of attunements pertain to the fundamental phenomenon of disclosedness. Attunements are not something merely subjective, which colors external things. Rather attunements factically disclose Dasein in the disclosedness of its complete being-in-the-world. This is never neutral, but is essentially attuned this way or that way and is disclosed according to attunements. Since complete disclosedness of being-in-the-world includes the ecstatic-horizontal disclosedness of world as significance, world and worldly signification are disclosed according to attunement. The world-relations which form the totality of referential signification are in each case unconcealed according to attunement. To be attuned is not something merely subjective and internal. Rather, because world is disclosed for Dasein in the manner of an attunement, moods and attunement of Dasein have world character.

If we want to understand what Heidegger is aiming at when he says that attunement tunes the regions of world to one another, we must bear in mind these ontologically interrelated issues of world, disclosure, and attunement of Dasein, which Heidegger demonstrates through a phenomenological analysis. Just as in *Being and Time* disclosedness of world is disclosed essentially by attunement, so the clearing of the world which is experienced in terms of the history of being – and letting appear of world – is also a matter of attuning. What calls the gathering of world regions is a tuning clearing, which tunes the unconcealed regions of the world to one another in their interrelatedness.

So far Heidegger has addressed the world regions. But now he speaks of the 'regions of the jointure of the world' (*US*, 208). World as wholeness of regions of the world builds a jointure. The joined character of this jointure ensues from the manner in which world regions in the clearing of world call and gather into one another, play off one another, and are tuned to one another. A proper reflection on language has to hold its sounding character – in its belonging to the earth as one of the four world regions – into a core harmony of earth and the other world regions. By contrast, in the metaphysical determination of language and in its physiological-physical phonetic explanation the sounding of language is estranged from its essential source.

Heidegger on metaphor and metaphysics

Joseph J. Kockelmans

I

Over the past 60 years a great number of important treatises on metaphor have appeared, mainly in the Anglo-American world and in France. Ricoeur has given us a truly excellent, critical discussion of the most important insights proposed in these treatises; this discussion places the new ideas that have been developed in this century, in the perspective of our entire Western tradition that reaches back as far as Plato and Aristotle.¹ In this discussion it is made clear that whereas at the beginning the concern with metaphor was concentrated mainly within the domain of rhetoric, in modern times the center of gravity of this concern has shifted from rhetoric to semantics, and still later from semantics to hermeneutics and literary criticism. Finally, this discussion shows that in addition to the 'scientific' interests in the phenomenon of metaphor, there also are a number of typically 'philosophical' treatises in which their authors have tried to explain the precise position and function of metaphor in philosophical discourse as such. These latter treatises were influenced in part by the study of the history of philosophy, but particularly by the ideas in this regard proposed by Hegel and Nietzsche.²

Greisch has suggested to divide the *philosophical* literature on metaphor into three main parts. In his view in philosophy the problem of metaphor may be asked in three different ways; these three ways of asking questions lead to three different theories about metaphor: (1) there is the analysis of its function in Anglo-Saxon philosophy of language; then (2) there is the study concerning its link with the problem of interpretation (hermeneutic approach); finally (3) there is the ontological question of its meaning for philosophy (Heidegger and Derrida). As Greisch sees it the most important contribution in analytic philosophy consisted in the realization that in addition to the classical, rhetorical

theory of the metaphor (Aristotle) which sees in the metaphor a substitution of one word for another, there is a semantic theory of the metaphor in which metaphor is the effect of meaning which comes to the word but has its origin in a contextual activity which brings the semantic fields of several words into interaction with each other. Ricoeur has tried to show that on this basis there appears to be a remarkable parallel between the problem of how to interpret a metaphor and the problem of how to interpret a text, even though metaphors and texts usually differ considerably in length (hermeneutic dimension). In this essay we shall be concerned only with the ontological question of the meaning and function of metaphor in philosophical discourse.³

Heidegger's concern with metaphor occupies a rather peculiar place in this impressive philosophical body of literature on metaphor. And this is so for a number of reasons. First of all, Heidegger has really made only some very brief statements about the relationship between metaphor and metaphysics.⁴ This fact seems to suggest that he did not think the issue of metaphor to be of great philosophical significance. If he would have shared the views of Derrida and Ricoeur he would have devoted an entire lecture course to the problems involved. Furthermore, Heidegger's attitude in regard to metaphor is, at first sight at least, very paradoxical. For, even though he claims that the language of the thinker cannot be interpreted in such a manner that metaphor would appear to be an important element in philosophical discourse, his later philosophy seems to be metaphorical through and through. Heidegger seems to employ in his later works more metaphors than anyone before him, except perhaps Plato, Hegel and Nietzsche. Then, Heidegger's position is rather radical; for he definitely rejects metaphor in philosophical discourse on the ground that metaphor is an intrinsic element of classical metaphysics which is to be overcome. Finally, Heidegger's position appears to be rather offensive to a number of authors in that Heidegger's claims seem to make all philosophical discourse on metaphor to be suspicious.

Several authors have already addressed the issue of metaphor and metaphysics in Heidegger. Particularly the studies by Derrida, Greisch, Bruzina, and Ricoeur must be mentioned here.⁵ In my opinion, these authors have, each in his own way, given us a clear description of the manner in which Heidegger concerned himself with metaphor, both as far as his actual use of 'metaphors' and as far as his explicit claims about the relationship between metaphor and metaphysics are concerned. Furthermore, these authors have placed Heidegger's critical remarks on the relationship between metaphor and metaphysics in their proper philosophical context so that they can be understood correctly.

In light of this state of affairs I have decided in this essay to be rather brief in my exposition of Heidegger's claims about metaphor. I shall, however, say something about his use of metaphor particularly in his

later philosophy. I wish to conclude these reflections with a careful examination of the criticism which one can level at Heidegger's position. In this examination I am guided only by my desire to come to a better understanding of Heidegger's own position. I hope to show there also that if Heidegger's remarks on the relationship between metaphor and metaphysics are understood from the perspective of his own conception of the truth of Being as this has been developed in his later philosophy, his remarks on the relationship between metaphor and metaphysics are not open to the kind of criticism that some authors have raised against it.

II

There are several works in which Heidegger directly or indirectly speaks about the relevance of both metaphor and of a philosophical investigation of metaphor for *philosophical* discourse as such. Two of these passages are usually discussed in the literature in detail, the first is found in *Der Satz vom Grund* (1957) and the second can be found in *On the Way to Language* (1959). Before I turn to the two passages discussed by virtually all 'commentators', I shall first say a few words about some of the other passages, two of which are of much earlier date than the ones just mentioned. But first I wish to make a few general, introductory remarks.

In all relevant passages it is immediately clear that Heidegger's concern with metaphor in its relation to metaphysics moves on a quite different level than that on which rhetorical, semantical, or hermeneutical reflections on metaphor move. If one looks at Heidegger's claims from the perspectives of these three 'classical' approaches to metaphor, then Heidegger's position appears to be somehow beyond the law that holds for people who concern themselves with, and think about, language in a common way.⁶ It is then understandable that one often feels threatened by the position Heidegger seems to promote. Much misunderstanding of Heidegger's conception of metaphor has flowed from the idea that in his later works Heidegger developed a new 'philosophy of language'. Yet one should realize that Heidegger has never been interested in discourse *about* language.⁷ The manner in which Heidegger deals with language is strange, and it is not possible to appoint a place for it among the possible approaches to language with which one is familiar in our Western tradition. According to Greisch, Heidegger's way to language is 'extravagant' and one must learn to understand the specific 'extravagance' of his thinking, if one is to understand his concern with language and metaphor.⁸ Thus one must make a special effort to convince himself that Heidegger's reflections on language and his attitude in regard to metaphor do not fit into the patterns laid down by rhetoric, semantics,

hermeneutics, analytic philosophy, and 'common' philosophy of language. Heidegger's discourse attempts to speak about something that lies 'beyond' the subject matter of the 'classical' forms of discourse on language. Anyone who wishes to understand Heidegger will have to recognize the *place* where his thinking occurs, i.e., the intimate link between the specific stylistic gesture of this philosophy and the thing itself with which as thought it concerns itself, i.e., the intimate link between *Erörterung* and *Ereignis*.⁹

Heidegger has never questioned the correctness and the relevance of the current views on metaphor defended in rhetoric, semantics, hermeneutics, and analytic philosophy. Yet it is true that he questions their 'metaphysical' presuppositions. In Greisch's view, it is not possible to come to a meaningful discourse with Heidegger's conception of language of metaphor, if one is not willing to accept that the modern rhetoric, semantic, hermeneutic, and analytic approaches to language flow from a certain *metaphysical* conception of language, a conception which in these approaches themselves remains unexamined and has to remain unexamined. Heidegger's thinking about language and metaphor does not move in the domain of an 'it is a fact that . . .', but rather in the domain of an original '*es gibt . . .*', and '*it grants . . .*'¹⁰ – Let us now turn to some of the more important places where Heidegger himself explicitly addresses the basic issue of metaphor insofar as this is pertinent to his own way of thinking.

In his reflections on Hölderlin's hymn 'Andenken' (1941–2), Heidegger writes that Hölderlin often speaks about fire, sun, and wind.¹¹ In his view, we tend to take these terms to refer to natural things. We also tend to assume that when Hölderlin employs these words, they usually have another meaning; fire, sun, and wind 'give themselves' first as natural phenomena and then also signify still something else; they are symbols. When we speak in this way, we take it for granted that we are able to know *the* sun and *the* wind in themselves. We take it furthermore for granted that also ancient peoples first got to know *the* sun, *the* moon, and *the* wind, and that they later learned to employ these alleged natural phenomena as images (*Bilder*) for some other world. Yet just the opposite is the case: *the* sun and *the* wind first come to appearance from out of a 'world'; they are what they are only insofar as they are poetized from the perspective of this world.¹²

After pointing out that the same applies to our scientific conception of things Heidegger concludes this brief reflection with the following important observation: 'We must now only note that the main key of all "poetics", namely the doctrine of images (*Bilder*) in poetry, the doctrine of metaphor, does not open one door in the realm of Hölderlin's poetic hymns. . . . It suffices here to consider only that the "things themselves", too, are already poetized in each case before they can become so-called

"symbols". The question only is one of in what essential domain (*Wesensbereich*) and from what truth of poetizing [they have been poetized].¹³

In his elucidation of Hölderlin's hymn 'Der Ister' (1942), Heidegger makes a similar observation about the fact that Hölderlin often speaks about streams.¹⁴ He again remarks there that we tend to take streams to be perceptible things of nature. In poetry these things of nature receive the function of appearances that can be grasped by the senses; they present a view and, thus, they give us an 'image' or picture. Such images present a non-sensible meaning in poetry. The sensible image points to a spiritual content. Under the general heading of sensible image (*Sinnbild*) we usually also subsume allegories, sagas, tales, parables, similes, symbols, metaphors, examples, and even insignia. The only thing that is important in the present context, Heidegger continues, is that we look at what all of these cases have in common, namely the basic distinction between the sensible and the non-sensible. Any time we use these sensible images we take this very distinction always as already effected. The most important articulation of this distinction is found in the philosophy of Plato. There it is made perfectly clear that the nonsensible, i.e., the spiritual, constitutes what one calls genuine reality (*ontōs on*); the sensible is something of a lower order. The sensible can also be called the physical; thus the non-sensible is something that lies beyond and above the physical; it is the meta-physical. The distinction between the sensible (*aisthēton*) and the non-sensible (*noēton*) constitutes the basic structure of what since antiquity has been called *metaphysics*. All Western conceptions and interpretations of the world since Plato have been meta-physical.¹⁵

We must now turn to a passage that is of a later date. In the essay 'The nature of language' (1957-8), which appeared in *On the Way to Language*, Heidegger suggests that there is a close relationship between thinking and poetizing.¹⁶ One obviously will wonder, Heidegger continues, what 'neighborhood' is supposed to mean here. 'A neighbor, as the word itself tells us, is someone who dwells near to and with someone else.' Neighborhood is a relation which results from the fact that people settle face to face in regard to each other. The expression, 'the neighborhood of thinking and poetizing', thus means that these two dwell face to face in regard to each other, that the one has drawn into the other's nearness.

Heidegger then turns to a brief reflection on his own approach to this issue. First he observes that the remark about what constitutes a neighborhood seems to be by way of figurative talk (*bewegt sich in einer bildlichen Redeweise*). Yet, he continues, in saying this are we really saying something that is genuinely to the point? What does 'figurative talk' really mean? One usually turns in these and similar cases to an

explanation of a difficult issue that employs a figurative use of language. Yet one cannot claim to have given a meaningful explanation as long as it remains unclear what is to be understood here by 'talk' and by 'image' (*Bild*), and in what sense language speaks in images, if indeed language does speak in this way at all.¹⁷

In this passage Heidegger thus first suggests that in order to understand the relationship between thinking and poetizing one has to move from the known to the unknown, from the familiar conception of neighborhood to the unfamiliar concept of neighborhood, presupposed in the expression that poetizing and thinking are neighbors. But then Heidegger immediately observes that in so doing one makes assumptions about language and metaphor (figurative talk) that are not, and perhaps even cannot be, justified in that they rest on an unacceptable conception of both language and metaphor.¹⁸ – Let us now turn to the passages usually discussed in the secondary literature.

In *Der Satz vom Grund* (1957), reflecting critically on the classical principle of ground as formulated by Leibniz, Heidegger is at a certain moment led to meditate on a few lines by the German mystic Angelus Silesius, on which both Leibniz and Hegel had already focused attention, also. In the course of his own elucidation of these lines Heidegger dwells on the idea that it often happens that we see things and yet do not fully catch sight of what is closest. We see many things and fully catch sight only of few things. Meditating on this paradox Heidegger then comes to speak about understanding and thinking as forms of seeing and hearing. This finally leads him to a brief remark on metaphor.

One will observe, Heidegger suggests, that thinking can be a seeing and hearing only *in a figurative sense*. It is indeed true, he continues, that what we have seen and heard in thinking cannot be physically perceived by our eyes and ears. When we conceive of thinking as a form of hearing and seeing, sensible hearing and seeing is carried over from the domain of the sensible to that of the supra-sensible. Such a bringing-over, such a transfer, is called in Greek *metapherein*. In our technical language we call such a transference a metaphor. Thus it seems to follow that thinking can be called a seeing and hearing only in a metaphorical sense.¹⁹

Heidegger then shows that in the case of human beings seeing and hearing can never be reduced to a simple sensible 'taking-in'. But if this is so, then it is also not correct to claim that thinking can be called a seeing and hearing only in a metaphorical sense, namely as a carrying-over which carries what allegedly is purely sensible over into the domain of the supra-sensible. Our common conception of such a carrying-over and of metaphor rests on a complete separation of the sensible and the non-sensible as two independent domains, each of which exists by itself independent of the other. Now, Heidegger continues, the making of this

distinction between the sensible and the non-sensible, between the physical and the non-physical, is a basic characteristic of what we call *metaphysics*, and which has determined our Western thinking in a decisive way. Yet the moment one fully understands that the distinction between the sensible and the supra-sensible is inadequate, metaphysics at once loses its rank of being the decisive mode of thinking.²⁰

But, Heidegger concludes these reflections, the moment one realizes that metaphysics is restricted and even very narrow-minded, the idea that metaphor is a decisive element of all philosophical discourse also becomes superfluous and even untenable. For in metaphysics metaphor has been taken to be the measure for our conception of the essence of language. This is also the reason why metaphor is very often used as the means for the elucidation of the meaning of poems and of the meaning of all artistic productions. Yet the metaphorical is found really only within metaphysics.²¹ – After these observations Heidegger immediately returns to the main theme of the lecture course, i.e., to the principle of ground.²²

In *On the Way to Language* (1959) there is another brief reflection on metaphor in connection with an elucidation of poems by Hölderlin. Heidegger tries to transcend there the common, metaphysical conception of language which treats language as expression, as the exteriorization of man's inner life. To facilitate the transition beyond the common conception of language, Heidegger appeals to poems by Hölderlin, where language is called 'the flower of the mouth', and where the poet writes 'words, like flowers . . .'.²³ Heidegger leaves it to the reader to think about these verses, taken from the hymn 'Germania' and the elegy 'Bread and wine', in light of what he has been trying to say in his lectures on the essence of language. He only makes two brief observations before returning to the main theme of his lectures. The first is that one would stay 'bogged down in metaphysics if . . . [one] were to take the name Hölderlin gives here to "words, like flowers" as being just a metaphor'. Secondly, he reproaches Gottfried Benn where he claims that the word 'like' in the expression 'words, like flowers' is a break in the vision, that this 'like' adduces and compares, and that it is not a primary statement; that it is a flagging of the tension of language, and a weakness of creative transformation.²⁴

Before we can make an effort to come to a better understanding of these brief remarks on metaphor we must first turn to a reflection on the fact that Heidegger, more than almost any other philosopher, in his later philosophy seems to make use of metaphors. In so doing I shall paraphrase and comment on some ideas developed by Greisch and Derrida. I shall make a special effort here, following these authors, not only to show that and in what sense Heidegger effectively uses metaphors, but also point to the implications which the use of metaphors in

philosophical discourse has. The question as to whether or not these implications are, indeed, pertinent to Heidegger's philosophy will then be examined in part IV of this essay.

III

Several authors have made the remark that Heidegger makes an effective use of metaphors in his later philosophy and that he does so in a manner which is much more prominent than that which one finds in the works of most other philosophers. This phenomenon has been interpreted by different authors in different ways.²⁵

Greisch, Ricoeur, and Derrida have made a special effort to examine this issue. In their view, 'metaphor' functions obviously everywhere in Heidegger's philosophical discourse; this is true particularly for his later work. Yet it is difficult to give reasons for this presence and this is particularly so because of the critical remarks Heidegger has made on the intimate relationship between metaphor and metaphysics.²⁶

Greisch begins his investigation with an examination of some passages taken from Heidegger's booklet *From the Experience of Thinking*.²⁷ This booklet consists of a series of short epigrams which are divided into two different sets of statements printed on opposite pages facing one another. In each case there is a poetic text and opposite to it a few philosophical reflections which have the form of aphorisms. In his discussion of some of the epigrams²⁸ Greisch focuses mainly on the kind of relation that appears to exist here between the poetic and the philosophical parts of the text. Does one here find a metaphoric statement that then is translated into a set of rather dull philosophical phrases? Or is the poetic statement just an ornament that is to decorate and facilitate the reading of the philosophical propositions? It is clear that both these questions already reflect a particular conception of metaphor. In the first case, metaphor is a semantic deviant form which philosophy must translate into a 'rigorous' text; philosophy thus must change it into a literal transcription of what the metaphorical statement attempts to say. In the second case, the metaphor is just an ornament which does not contain anything to be thought about. Yet according to Greisch, it is obvious that neither one of these interpretations can give us an account of the *experience of thinking* that the text as a whole tries to convey. The relationship between the two parts of the discourse contained in this remarkable booklet rests on a *new experience of thinking* which permits us to state a completely new harmony between thinking and poetizing and, thus, also between metaphor and philosophical discourse.²⁹

A second example which shows the seemingly metaphoric nature of Heidegger's philosophical discourse is taken from the *Letter on Human-*

ism. This example is discussed by Derrida in 'Le retrait de la métaphore'.³⁰ In the *Letter on Humanism* Heidegger writes that thinking builds upon the house of Being (*baut am Haus des Seins*) such, that the jointing (*die Fuge*) of Being can assign and enjoin to man's essence the possibility of living and dwelling in the truth of Being.³¹ In the same paragraph, after a quote from Hölderlin, he continues: 'The talk about the house of Being is no transference [*Übertragung, metaphora*] of the image [*Bild*] "house" to being. But one day we shall, by thinking the coming-to-presence of Being in a way that is appropriate to its matter, more readily be able to think what "house" and "to dwell" are.'³² The expression 'the house of Being' does thus not function here as a metaphor. The common conception of metaphor would transport a familiar predicate (and what is more familiar than house or home?) to a less familiar subject, one that is unfamiliar, *unheimlich*, and that, in this manner, one would like to bring closer and understand better. Heidegger again rejects this common interpretation and in this case it is Being itself that gives us insight into how to think house.

Derrida suggests that one could try to use all kinds of terms and schemas, derived from some kind of meta-rhetoric, in order to conquer the problems in Heidegger's suggestion, in a purely formal manner. In this way one could try to formalize the rhetoric 'inversion' in which in the trope 'the house of Being' the word 'Being' is to say more and is also to be more familiar than the word 'house'. But according to Derrida, such an endeavor would mean that one would miss the genuine meaning of what Heidegger's text tries to say. There is no question here of a metaphor, nor is there question of an inversion. And this is so first of all because the claim made by Heidegger is not a regular statement which tries to posit something about some ontic thing. Secondly, this is so because the claim deals with language as the *element* of what is metaphorical. Thirdly, the claim is about Being itself which is not a thing and which is to be thought here according to the ontological difference which makes metaphoricity precisely possible. Then there is no term here at all that could be said to be used in a proper, usual, or literal sense. This way of speaking by Heidegger is thus neither literal nor metaphorical. Heidegger's conception here is in complete harmony with what he says at the beginning of the essay 'The nature of language': the more one finds metalanguage and metalinguistics, the more one will find the metaphorical and the metaphorical.³³

Another example which I just would like to mention is also discussed by Derrida.³⁴ It is concerned with Heidegger's use of the word 'Riss'; this word is a member of two families of words that regularly cross one another in Heidegger's later works, namely, *ziehen, Zug, Bezug, durchziehen, entziehen*, etc., on the one hand, and the family *reißen, Riss, Aufriss, Umriss, Grundriss*, etc., on the other. As far as the term

'Riss' is concerned, it is taken by Heidegger both in the sense of that which tears (fission) as well as in the sense of the fissure (rift) that the fission opens up. The term is used usually in a context in which Heidegger is concerned with the ontological difference in one of its various modalities. Thus we find the term used in the essay 'Language' (1950), where it is used to characterize the difference, the separation which at the same time is a gathering middle, in whose intimacy the bearing of things and the granting gift of the world pervade one another. The fission or rift of the difference expropriates (*enteignet*) the world into 'doing' what as world it is supposed to do, namely to grant things.³⁵

The term is also used to describe the relation between thinking and poetizing. The *Riss* is described there as the fission that rips open thinking and poetizing and assigns them to be near to one another.³⁶ In the essay 'The way to language' (1959), Heidegger states that the unity of the essence of language should be called the fission that tears open (*auf-reissen*) as well as the primary sketch or outline that results from it (*Aufriss*). Heidegger adds here that the word 'Riss' is now usually employed only in a derivative sense for tear, cleft, crack, etc.

One of the first texts in which Heidegger uses the term 'Riss' as a 'technical' term is his lecture 'The origin of the work of art' (1935-6), where the word is used to characterize the strife between world and earth. The fission draws those which turn against one another (namely, world and earth) into the source of their unity, which flows from their common ground. *Riss* is the drawing together into a unity of *Aufriss*, *Grundriss*, *Durchriss*, and *Umriss*.³⁷

We thus have here again a way of speaking which at first sight is metaphoric through and through. Yet Heidegger continues to maintain his position that the language that tries to respond to Being's address is not and cannot be metaphorical, because it is no longer metaphysical. In other words, this way of speaking appears to correspond again to a completely new form of thinking.

This new manner of thinking is what Heidegger elsewhere calls '*eine Erörterung*', a search for the place (*Ort*, *topos*). This search deliberately seeks the proximity of the poet and, as we have seen already, it is often used in the form of a thinking elucidation (*Erläuterung*) of some carefully chosen poems.³⁸ But this new manner of thinking appears also to include a special concern with the original sources of the relevant words. As Greisch sees it, the problem of metaphor in Heidegger's thinking is intimately bound up with this dual aspect of *Erörterung*. The main issue at stake in both cases is Heidegger's mistrust of ordinary language, in which genuine sayings (*Worte*) become just words (*Wörter*).³⁹

It is this phenomenon in which the 'death' of language consists. This erosion begins when words are represented as 'receptacles' which are to receive a certain content. According to Greisch, one must avoid this

ever threatening degradation of language and go from ordinary language against the stream, so to speak, to the point where one can find the original meaning of words. Heidegger's discourse as a whole, Greisch feels, represents such an effort to reach sources that perhaps can never be found. It is clear that such an attitude often implies a dubious use of etymologies which, as Derrida says, under the pretext of finding the original richness of words, seems to give the priority to diachrony at the cost of the linguistic system.⁴⁰

Greisch is also of the opinion that in Heidegger's later works one can find a certain 'symbolist a priori' which depends on the opposition between dead and living metaphors. It is always possible, under the sedimentations of our ordinary language, to find the 'original source', as long at least as language has not yet suffered its second death, a death which is definitive and irreparable, and which, in Heidegger's opinion, came-to-pass in the merely instrumental use of language commonly used in the sciences. But, Greisch asks, to what degree is Heidegger tricked here by a rather simplistic conception of etymology? Does the return to the forgotten history of some basic words of thinking (*Grundworte des Denkens*) not mean that thought is condemned to being no more than a very problematic commentary on the 'primitive' meaning of certain words? For to find their origin one must concern himself with the history of these words; yet for philosophy the origin does not coincide with the beginning. Heidegger himself has made the claim that the 'primitive' meaning of a word does not have a normative value; it only has an indicative function (*Wink, Hinweise*).⁴¹

At any rate, it seems that this *Erörterung* cannot be dissociated completely from some form of metaphorization; the traces of this process can be found everywhere in Heidegger's philosophical discourse. But what are the basic implications of this process for Heidegger's philosophy as a whole? In Greisch's view, it is here that one must turn to what Heidegger calls '*Ereignis*'. This, too, is a metaphor and, as far as Heidegger's own thought is concerned, it is perhaps even the metaphor of all metaphors. *Ereignis* is perhaps the last instance which guarantees the survival of metaphor in Heidegger's thought; and to some degree it even may perhaps be the survival of philosophical discourse as such.⁴²

According to Greisch, in Heidegger's philosophy there is a close relationship between what he has to say about *Ereignis* and his position in regard to metaphor. The way that in Heidegger's thought leads to *Ereignis* runs via the expression: '*Es gibt . . .*'. It is impossible to grasp Being itself, as long as one understands this '*Es gibt . . .*' merely in terms of a 'There is . . .', regardless of whether this 'There is . . .' is the 'There is . . .' of ordinary language, that of the sciences, that of metaphysics, or even that of thinking. One cannot meaningfully say: 'There is Being'. What one should say is rather: '*Es gibt Sein.*' What

Heidegger calls *Ereignis* is nothing but this mysterious giving that makes us perceive Being as a gift.⁴³ But, Greisch asks again, is this granting not another trick played by metaphor? Does Heidegger here not again appeal to a metaphor which makes it possible to move from the 'There is . . .' to the gift and, thus, also to move from pure dissemination to a first gathering, however neutral and anonymous this gathering still may be? In the final analysis is it not metaphor then which makes it possible to place thought under the sign of the simplicity of the *same* (*das Selbe*)? According to Greisch, *Ereignis* marks the return of the *same* in Heidegger's philosophy, insofar as it contains his answer to the question of identity. What Heidegger calls *Ereignis* reflects the typical manner in which he thinks identity as well as the harmony between identity and difference.⁴⁴ Is this not so because metaphor is in essence built upon resemblance?⁴⁵

Metaphor gathers that which resembles each other. In effect, it constitutes the *same* in its circular form. But if what Heidegger calls *Ereignis* confirms the presence of metaphor in his thought, it also seems to confirm the heliotropic character of his thinking. And if his thought is heliotropic in nature then it also still is some form of onto-theology. Thus all Heidegger's criticism of onto-theology notwithstanding, Heidegger's own thought still is onto-theologic. As a matter of fact, this is the reason, Greisch claims, why Heidegger's discourse is not just a simple rhapsody, and why it does not just fall apart into a set of unrelated aphorisms. His discourse is essentially encyclical; it continues to gravitate around the *same*, around Parmenides' *enkuklios alêtheia*.⁴⁶

In Heidegger's concern with *Ereignis* we also find a fascination with *center* and *light*; note that the German word *Ereignis* is related to the verb *sich ereignen* which originally was spelled *sich eräugnen* or even more originally *sich eräugen*; the latter had the meaning of *erblicken*, to catch sight of, to 'eye'.⁴⁷ What Heidegger calls *das Ereignis* is not just a simple event; thus the word can never be used in the plural. It means the pure lighting emergence and the original clearing of the truth. Heidegger's entire discourse moves within this clearing and is lighted by this light, even there where this light appears to become more important than the sun was for Plato.⁴⁸

For all these reasons, Greisch concludes, Heidegger's effort to go beyond onto-theology, which is effected by means of his reflections on *Ereignis*, a theme that according to Derrida remains the most important and the most difficult clue to Heidegger's later thinking,⁴⁹ remains ambiguous. This philosophical discourse, too, does thus not seem to be capable of escaping from the prestige of the image of light and the seduction of metaphor. This is clear particularly where Heidegger in *das Ereignis* stresses the aspect of 'what is proper', an aspect that reflects itself in the metaphor of gold. According to Heidegger himself *das*

Ereignis appears to dwell in the silence of gold. Speaking about the lighting emergence of the truth of Being which comes-to-pass in *das Ereignis*, Heidegger once wrote the following: 'But the golden gleam of the lighting's invisible shining cannot be grasped, because it is not itself something grasping. Rather, it is the purely appropriating event (*das reine Ereignen*).'⁵⁰

As Greisch sees it, there is a paradox hidden in the manner in which Heidegger tries to explain the richness of what he calls '*das Ereignis*'. The paradox has its origin in the fact that Heidegger moves from *Ereignis* to the metaphor of gold *via* the idea of 'what is proper'. But this would mean that according to Heidegger that which for a thing constitutes what is proper, also makes it really ungraspable. In other words, Greisch argues, as the origin of all belonging to, *Ereignis* is also that which disappropriates.⁵¹ – I do not share Greisch's view here in that in my opinion, even from Greisch's own perspective, the move from *Ereignis* to the metaphor of gold is not mediated by the value character of gold, but rather by its shiny polished surface. Yet this need not occupy us here further.

At this point we must rather ask the question of whether *all* of this, indeed, gives us an accurate description of Heidegger's own conception. One could say first, with Greisch, that the *Ereignis*, as the place of all places, makes it possible to develop a new conception of metaphor, which somehow runs parallel to the metaphysical conception of metaphor that Heidegger has 'destroyed'. Just as *Ereignis* leads to a new conception of Being, language, and man, so it also can lead to a new conception of metaphor. In Greisch's opinion such an effort would be successful only if two basic conditions are met: (1) One must start from Heidegger's new conception of language which reverses the 'domination' of man over language and no longer treats language as an instrument that man just uses.⁵² In the new conception of language the stress must be placed on showing (*Zeige*) not on demonstration (*Ausweisung*); it will then be possible to give a new meaning to polysemy which in that case, from Heidegger's own perspective, no longer appears, in opposition to logical univocity, as a weakness in language but rather as language's strength.⁵³ Thinking must move effectively within this vital element of 'essential' polysemy. Heidegger sometimes distinguishes the 'essential' polysemy which one finds in the works of poets and the thinker's readiness for the unexpected (*Bereitschaft für das Unvermutete*) from the very limited meaning of the univocal opinion of the 'they'. Polysemy does not necessarily lead to vagueness; polysemy is a sign of the richness of meaning.⁵⁴ (2) What is needed also, Greisch feels, is a more careful reflection on the poetic element in Heidegger's later thought and on the relationship between poetizing and thinking. Here one will have to show also that the poetic function cannot possibly consist in the projection of the unreal.⁵⁵

Yet there is also another way that one could follow here. Greisch assumes that Heidegger, indeed, does use metaphors, and thus that some kind of thoughtful 'theory' of metaphor will be necessary. This has to be a *new* conception of metaphor which is to replace the metaphysical one Heidegger tries to overcome. Yet Heidegger himself explicitly denies that what seem to be metaphors, are indeed 'true' metaphors. As far as I know, Derrida is the only one who has taken this alternative seriously.⁵⁶ What is needed in this case, thus, is an explanation of why Heidegger thinks that he legitimately can make this claim, even though it is so obvious that he does use 'metaphors'. It is this latter road I plan to take in section IV. There I hope to show that if one, as Greisch suggests, seriously begins with Heidegger's own conception of language and carefully considers his view on the relationship between poetizing and thinking, it is possible to explain that what seem to be metaphors, indeed are no metaphors at all and that the language 'of philosophical discourse' cannot possibly be metaphorical. Let us see where this road will lead us.

IV

After the many treatises on metaphor written since the time of Aristotle and particularly after the numerous modern publications on metaphor the extremely sparse and negative remarks on metaphor made by Heidegger must seem to be trivial and irrelevant.⁵⁷

Let us say at once that it is not Heidegger's position that one should not concern oneself with metaphor. Obviously one should make a careful study of the leading treatises on metaphor, and one should do so from the perspective of a number of disciplines, such as rhetoric, semantics, hermeneutics, literary criticism, philosophy of language, philosophy of literature, etc. Yet once this enormous task has been completed and once a great number of correct and important insights have been achieved in this manner, then still several important questions are to be answered: Precisely to what extent is strictly philosophical discourse itself metaphorical? To what extent is it the case that all concern with metaphor is intrinsically metaphysical? Could it perhaps be the case that in the realm of thinking there is a form of discourse possible that is neither metaphysical nor metaphorical?

Before we can discuss Heidegger's attempt to answer these questions, we must first try to eliminate some basic sources of possible misunderstanding of his position.

It seems to me that many people who have adopted a negative attitude in regard to Heidegger's thinking as a whole and to his conception of metaphor in particular, have done so because they understood Heidegger's thinking to imply a denial of what they themselves hold to be

important in the domain of their own research in the sciences or in the realm of speculative thinking. I feel that much criticism could have been avoided if one would have stressed more strongly the fact that Heidegger's thinking is indeed *radically different* from the thinking of most philosophers who have preceded him.⁵⁸ Heidegger might in this connection have quoted his teacher Husserl and have said that the kind of thinking he is concerned with 'lies in a completely new dimension',⁵⁹ insofar as it attempts to focus on what in the thinking of the past remained unthought. At any rate, as far as metaphor is concerned, one should begin by realizing that Heidegger's claims about the meaning and function of metaphor *in thinking*, does not at all exclude its meaningful use elsewhere, just as little as his own discourse on metaphor would imply the meaninglessness of the discourse on metaphor by other thinkers. For Heidegger the question is merely one of whether *in the thinking of Being itself*, there is still room for a 'common' use of language, for analogy, for metaphor, for 'syntax' in the usual sense of the term, for the use of strictly predicative statements, and thus also for logic.⁶⁰ In Heidegger's view, the same questions must be asked for 'essential' poetizing.⁶¹

Furthermore, it is also important to observe that Heidegger's rejection of metaphor *in thinking*, on the ground that it is intrinsically metaphysical, does not necessarily entail a negative judgment on the validity and the legitimacy of scientific and philosophical theses about metaphor. In Heidegger's view, many of these theses are correct, even though they often do not yet reveal the truth about what is to be thought here. On the few occasions in which Heidegger made some statements about metaphor, he meant to express only a warning not to interpret *his own efforts in thinking* from some other perspective that he precisely was in the process of overcoming.

One should note also that the expression 'to overcome metaphysics' for Heidegger does not mean to just step outside metaphysics and to simply leave it behind. Heidegger, too, stands in our Western, metaphysical tradition. The expression rather means that one should focus on 'the conditions of its possibility', to use a Kantian expression. Before one can say that any form of discourse is indeed possible, before one can say that science is truly possible, that any form of metaphysics is possible, one must think about the conditions of its possibility. Thus before one meaningfully can speak about beings, one must think about Being itself which grants itself *historically* to a people at a given epoch of its development in the form of a *certain world* which lets these beings be, and lets them be as what, for this people, they properly are in their basic mode of Being. To the 'fact' that Being grants itself in a giving, sending, or hailing that has the character of a finite and inherently temporal and historical event of appropriation, Heidegger refers with the technical term '*das Ereignis*'. As Greisch has correctly observed, it is this

fundamental *Ereignis* with which Heidegger's philosophical *Erörterung* is basically concerned.⁶²

Much confusion also flows from the fact that one does not sufficiently realize that in *On the Way to Language*, Heidegger's basic theme is the *essence* of language, i.e., language insofar as it is *the language of Being*. Heidegger is thus concerned in that work with the language that Being itself 'speaks' in saying something about itself to man as *Dasein*. Furthermore, the issue there is mainly about the 'basic words' that are relevant to such a limited, but fundamental domain of meaning. The issue is there about those basic words that can characterize the coming-to-pass of the truth of Being in this epoch of the history of the West.

Another source of confusion is Heidegger's so-called etymologism. One then attributes to him the participation in a process in which he, *as a thinker*, was never engaged. In their efforts to say what the basic words that Being addresses to thinker and poet really mean, both the thinker and the poet, each in his own way, must try to have first an experience with the words so spoken in and through Being's saying. One must learn to taste these words and to savor them; one must learn to listen to them. Sometimes these words of Being themselves, as they 'just stand there' in a given context, give us to think. That this heeding of these basic words has little to do with common, scientific etymology is obvious.

Yet one may still be inclined to think that Heidegger's break with metaphysics and with the 'classical' metaphysical conception of language seems to reduce his own thinking to some form of hermeticism which carries his etymological games back to the mystification of 'primitive' sense.⁶³ It seems to me that perhaps one should admit that Heidegger indeed engages in *some form of etymology*. Yet this is extremely seldom a scientific, historical, or linguistic etymology, although he never denied the latter's correctness and importance. His own work in 'etymology' is strictly philosophical in character, and is concerned with an effort to let 'basic' philosophical words once again be themselves, i.e., that through which the thinker and the poet let beings be what they properly are, when, in responding to Being's address, they bring about in an 'original' manner the difference between world and thing. Heidegger's etymology is thus concerned with promoting the happening of the truth.⁶⁴

One must thus constantly keep in mind here that Heidegger's 'etymological' efforts cannot properly be understood from the perspective of scientific etymology and, furthermore, that these efforts are limited to 'basic' philosophical words, only. His effort is, indeed, concerned with the 'true' meaning of these words; yet this 'true' meaning is never claimed to be the primitive or historically first meaning of those words. Thus the expression the 'true' meaning of these words does not mean the 'privileged', definitive, or 'absolute' meaning, i.e., the meaning which these

words have in '*rationibus aeternis*'. The expression rather refers to that meaning which for a people during a certain epoch of its history is genuinely revealing.

At any rate, it seems to me that one should limit the entire discussion about metaphor to Heidegger's concern with *the meaning and truth of Being*. I thus suggest that the claims that Heidegger has made about language, words, analogy, and metaphor be restricted to *his own* philosophical discourse about the truth of Being. This discourse obviously also involves a discourse about truth as *a-lētheia*, *logos*, language, time, space, world, beauty, the relation between Being and *Dasein*, etc. Furthermore, as far as the proximity of thinking and poetizing is concerned, I would limit this, too, to Heidegger's own concern with Being and the poet's involvement with the 'holy'. There is evidently much more to be said about poetizing and about the arts, but this lies outside the domain of Heidegger's own *immediate* interest.⁶⁵

Heidegger's opinion is that the 'common' conception of language applies to discourse about beings; so does the 'common' conception of word, analogy, and metaphor. Heidegger's basic thesis seems to be that in strictly philosophical discourse that is concerned with Being, another conception of language and word is necessary so that in that domain of inquiry there is no room for metaphor in the traditional sense of the term. – Let us try to explain this more carefully, focusing mainly on the two fundamental issues, namely Heidegger's conception of the essence of language and his view on the meaning and function of basic (philosophical) words.

Heidegger has made a 'systematic' effort to explain what he takes to be the very essence of language in *On the Way to Language*. In one of the central essays of this rich book Heidegger writes that for him the essence of language is the language of Being. The word 'of' has here the meaning of a subjective and objective genitive. In other words, the issue here is about the language by and about Being. In this language the thinking poetizing of Being becomes articulated (ontological difference).⁶⁶ In an essay entitled 'The saying of Anaximander' Heidegger explains this as follows.

Thinking of Being is the original way of poetizing. Language first comes to word [language], i.e., into its essence, in thinking. Thinking says what the truth of Being dictates: it is the original *dictare*. Thinking is primordial poetizing, prior to all poetry, but also prior to the poietics of art, since art shapes its work within the domain of language. . . . The poetizing mode of Being of thinking preserves the sway of the truth of Being.⁶⁷

The speaking of all members of a people is an effort to respond to

what Being's saying addresses to them by bringing about the primordial differentiation of world (with its typical structure) and things for that people in a given epoch of its history. But among the members of a people poets and thinkers occupy a privileged position in that they respond 'authentically' to Being's address. It is in and by the saying of Being's address and the response to this saying by thinkers and poets that beings begin to be, come to be what they properly are. This happening, thus, is what Heidegger calls *das Ereignis*, the appropriating event.

The original saying of Being's language is in each basic epoch of a people's history a showing that lets what is present appear while it conceals what is absent. This primordial saying is thus *in no way a linguistic expression of something already manifested earlier* that is now merely trotted out; each appearing and disappearing rests precisely on the primordial saying of the language of Being that shows everything in a truly original way. This saying frees what is present in the direction of being abidingly present, just as it fetters what is absent in its being enduringly absent. This saying thus joints (*fügen*) the openness of the clearing (*Lichtung*) for which all manifestation looks and from which all concealing flees. This saying is the gathering together (*logos*) of a manifold pointing, 'jointing' together any appearing and letting what was manifested remain by itself.⁶⁸

The saying of Being thus calls; it brings what is so called closer. However, this bringing closer does not bring what is called nearer in the sense of putting it down in the domain of the immediate. Although this calling calls hither what is called, that which is called remains at a distance where it remains as absent. This saying therefore indeed calls nearer what is called, but it does not withdraw it from the distance where it was and remains. This saying of the language of Being calls something, as it were, back and forth, calling it to become present and nevertheless summoning it to remain absent at the same time. What is called to the fore by this saying is not present in space as tables and chairs are present in a room. Even the place which is co-summoned in this calling, and to which, therefore, what is so summoned is called, has a mode of being present which includes its remaining absent. In the final analysis this place is the world. It is thus to a world that this saying calls the things which are summoned; it invites them as things to 'concern' man. The summoned things gather a world around themselves. The saying of Being summons things and lets them be what they are; but the thing is what it is only as a thing that 'bears', so to speak, a world in which it remains as what it is, a world in which it can appear as meaningful.

Just as the saying of the language of Being summons things, so does it also summon a world. It entrusts a world to things and, at the same time, preserves things in 'the luster of a world'. This world grants things their proper modes of Being, whereas things 'bear' their own world. The

saying of the language of Being therefore speaks; it makes things come to a world and a world to things. Because world and thing can never be independent of one another, these two ways of 'making something come' cannot be separated, either. They penetrate each other, and in so doing they cross, as it were, a middle point in which they are one. However, world and thing do not melt into a unity at this middle point; even there they remain distinct in their closeness. In an 'original' difference the saying of the language of Being, in a manner of speaking, keeps apart from itself a middle point to which and through which world and thing are one toward each other. This saying makes the things be things and the world be world, and thus carries them toward each other. But this saying does not make the things and then the world be present in order to appropriate one to the other in a later phase by connecting them at the middle point. The difference of this saying, as the middle point, mediates world and things in their own and proper modes of Being and thus carries out their belonging together. That which this saying first summons is thus the *difference* between world and things in their essential correlatedness.⁶⁹

In this way the primordial saying of Being makes a world and things be what they are. It makes what is present and what is absent attain their characteristic modes of Being from which they can manifest themselves and abide according to their own characters. It makes world and things achieve what is proper to them by appropriation. What this appropriation, which comes about through the saying of the language of Being, is, cannot be explained by comparing it with the activity of a cause; neither can it be described as some occurrence. In the manifestation of the saying it can be experienced only as that which grants. There is nothing to which this appropriation could be reduced or from which it could be explained. The only thing that can be said of this appropriation is that it appropriates; it lets things and world be what they really are. It lets the world come to the fore and so grants to man an abode in his own proper mode of Being so that he can manifest himself as speaking. The only thing that man as *Dasein* can do in his speaking is to listen to the primordial appropriation which comes about in the saying of the language of Being, and to respond to it in his own speaking.⁷⁰

Before going on to the next issue, a very brief reflection on the meaning of the expression 'basic philosophical words', I would like to make a few brief comments to prevent misunderstanding. First of all, all that has been argued for here in regard to the thinking of Being and for the thinking and the poetizing that authentically respond to this thinking of Being, is obviously true also for Heidegger's own thinking to the degree that it tries to respond to Being's address and attempts to think

the various ways in which Being sends itself in the history of Being and, thus, prepares for a new form of thinking.

Secondly, the expression 'metaphysics as such' (*die Metaphysik, la métaphysique*) can easily be misunderstood. In some sense one could indeed say that metaphysics as such does not exist; it does not exist in the sense in which things exist; nor does it exist in the sense in which common events can be said 'to exist'. It does not exist either as some doctrinaire system. Yet it is not meaningless to speak about metaphysics as such to refer to the large historical epoch in the history of Western thinking between Plato and Nietzsche in which the leading thinkers of the West have tried to think Being in terms of beings. Taken in this sense, the term does not suggest that one can throw all forms of metaphysics together and derive some lowest common denominator of meaning from this conglomerate. The large epoch obviously consists of a number of shorter epochs, and each shorter epoch is to be characterized by the manner in which great thinkers have tried to think the *Being of beings* in terms of some being (a first cause, a first mover, an absolute substance, a transcendental subject, will-to-power, etc.).

Furthermore, when Heidegger speaks about metaphysics he does not mean to refer to a historical movement or process for which some form of closure would be essential. Yet even though Heidegger does not take metaphysics in a Hegelian sense, he nonetheless can still legitimately claim that metaphysics has come to its end. What in Plato began as metaphysics has now run its course; and it came to its end when it made itself superfluous by the positivist interpretation of science and technology which it itself had generated (nihilism).

Also, Heidegger does indeed claim that in each epoch of metaphysics' long history Being itself hides itself. Yet Being itself does not then appear under different guises, such as *eidos*, *idea*, *energeia*, *actualitas*, reality, substance, subject, Spirit, will, will-to-power, objectivity, etc.⁷¹ One should note here that it is only the *Being of the beings*, i.e., *ousia*, that after the withdrawal of Being itself begins to appear in ever new modalities.

There is another point that I would like to discuss here briefly.⁷² This concerns the claim made by several authors to the effect that Heidegger's own philosophical discourse, even though it may not be metaphorical in the usual sense, nonetheless still is metaphorical in another sense. It seems to me that if Heidegger had meant to say this, he would have done so. Instead he continually states that the thinking of Being is not and cannot be metaphorical.⁷³

For Heidegger 'basic texts', i.e., texts that genuinely reflect the thinking of Being and texts that 'result' from original poetizing are not and cannot be metaphorical; for if original poetizing and original thinking truly respond to the originary thinking and poetizing of Being itself, then

their language brings about a difference, or it responds to such a difference, which is to be taken strictly as a *singulare tantum*.⁷⁴ The difference between world and things is in each case unique; it holds apart the middle in and through which world and things are in a completely new manner at one with each other. Thus metaphor has its place *within* a given world; it cannot yet have a meaningful place and function where world and things for the first time come-to-presence. Metaphor has its proper place in ontic discourse, not in discourse that focuses on the ontological condition of all ontic discourse. One could also say that it makes no sense to call the language that tries to articulate the coming-to-pass of the ontological difference metaphoric because this language and this speaking are precisely the conditions of the possibility of metaphoricality.

Note, however, that the discourse of Being is obviously metaphorical, if one looks at it from the perspective of metaphysics, i.e., from the perspective of a 'closed' epoch of Being's history. But if one looks at it from the perspective of Being itself, of the thinking and speaking of Being as language (*logos*), it is not metaphorical and cannot be so simply because it is not concerned with beings, things, events, or even the Being of beings.⁷⁵

One should also note that when Being itself withdraws in one of its concrete forms of sending, metaphoric discourse on things has then been made possible. However, metaphor itself has to withdraw from that form of discourse that authentically tries to respond to the thinking of Being. For this latter thinking tries to show how Being itself became concretized into a particular world, whereas metaphoric discourse is about things and, thus, presupposes that these things have already been made possible as what they are by the particular world to which they belong. – We must now make a few remarks about Heidegger's conception of 'basic' philosophical words, a conception that is essential for a proper understanding of his position in regard to metaphor.

According to Heidegger, the basic assumption in our everyday conception of language as well as in all scientific theories about language is that words are things, namely signs, that can have multiple meanings and 'fixed' characteristics which in the different sciences can be discussed methodically and systematically.⁷⁶ Heidegger does not reject or criticize this conception of the word; this assumption about the word's mode of Being, an assumption that is particularly relevant for our discourse about *beings*, is correct; yet Heidegger himself focuses mainly on the *essential historicity* of the basic philosophical words that function in the discourse about *Being*.

Seen from the perspective of the coming-to-pass of the truth of Being, basic words let beings be present in light of the truth of Being that historically comes-to-pass. Basic words, thus, let beings be in a truly

original manner (*ur-sprünglich*). What is to be understood in each epoch of Being's history by a basic word is not something that an individual thinker can determine. Basic words are the words which Being itself suggests to the thinker and the poet at the proper time. Heidegger has discussed the most important of these basic words in his efforts to retrieve the thinking of past thinkers. Yet it is Being itself that in each epoch dictates what these basic words are and how they let beings be by bringing about for each epoch the difference of Being and beings, world and things.⁷⁷

For Heidegger the most important question with respect to basic philosophical words thus is the problem of how these basic words receive in each case the meaning they actually have in a certain epoch of philosophy's history. It is obviously the case that these words are polysemous; of each of them one can say with Aristotle: *polachōs legetai*. But if one tries to give a philosophical account of these meanings by means of an appeal to the metaphoric use of these words, then one of these meanings will be given a primary, privileged, or 'primitive' function, and all others will receive a justification or explanation on the ground of some relationship between these meanings on the basis of a different but parallel relationship between the 'things' to which these words refer. Among the latter relationships the relation of participation and the causal relation have always played the important parts. Once one has arrived at this point, classical metaphysics and onto-theology have in principle arrived on the scene.

According to Heidegger, the multiple meanings of basic philosophical words are not arbitrary. For they are the 'result' of the 'fact' that Being grants itself to man in different epochs of its history in different ways, in each case bringing about the ontological difference in a new way.

As Heidegger sees it, every time one tries to achieve clarity with respect to such basic words as truth, beauty, Being, art, knowledge, history, and freedom, which recur in each epoch of Being's history, one must always heed two things. First one should realize that the fact that a clarification is necessary in this case has its ground in the *concealment* of the coming-to-pass (*Wesen*) of what is named in such words. Secondly, one must also pay attention to the way in which such basic words vary in meaning.

When one considers this state of affairs in relation to a word such as truth, Heidegger says, one is inclined to say that it has many meanings, meanings that are not sharply distinguished from one another and seem to belong together on the basis of some common ground which we are vaguely aware of, but which we do not yet clearly perceive. The most extreme form in which we encounter the ambiguity surrounding such words is the 'lexical' form. In the dictionary the meanings of these words are enumerated and exhibited for selection. The 'lexical' representation

of the multiplicity of the meanings of such a basic word easily causes one to overlook the fact that all these meanings and the differences among them are *historical* and therefore necessary. Thus it can never be left to an arbitrary choice, which of the word's meanings one chooses in his attempt to grasp the mode of Being named and illuminated in the relevant *basic* word. Every effort of this kind is a historical decision. The leading meaning of such a basic word is nothing evident, even though our being accustomed to it seems to suggest that. Basic words are historical. That does not mean simply that they have various meanings for various epochs; it means rather that they *ground* history, now and in the times to come, in accordance with the interpretation of them that comes to prevail.

Furthermore, basic words continue to vary in meaning. The word 'education' has for Goethe and Hegel a different meaning than it has for us. When Goethe speaks about 'nature' and when Hölderlin employs the same word, different worlds reign. There is nothing arbitrary about this; it is connected with the fact that in the very foundation of our Being, language roots us to the earth and ties us to our world.⁷⁸ – We are now in the position to understand Heidegger's thesis about the relationship between metaphysics and metaphor, the implications of which have been spelled out by Derrida and Greisch.

I think that Heidegger would agree with these authors that indeed there is an intimate connection between metaphysics, metaphor, and 'heliotropism'. In *Der Satz vom Grund* Heidegger writes that in metaphysics the 'classical' conception of metaphor is taken to be the measure of our conception of the essence of language. I take Heidegger in this passage to mean that according to the 'classical' conception of metaphysics and language, metaphor makes metaphysical language possible as such.⁷⁹ In other words, if it were not for the possibility of metaphor, then metaphysics which appeals to a supra-sensible world, would not have been possible at all. Metaphysics does not speak about what is immediately visible; this is the domain of the sciences ('physics'). Metaphysics speaks about what goes beyond this. Classical metaphysics focuses always on beings; it tries to explain their mode of Being (*ousia*). Metaphysics never focuses on being itself which as the 'ultimate transcendental synthesis' makes all meaningful discourse possible and which itself is inherently finite, temporal, and *historical*. Classical metaphysics, which realizes that beings cannot be taken for granted in their immediacy, tries to give an account of them in terms of a source, ground, or cause. This source, ground or cause cannot be one of the 'visible' things, nor can it just be the 'whole' of the visible things; thus there must be something that is beyond the visible things.

Now in view of the fact that between Plato and Nietzsche in the West all thinkers, without exception, in their metaphysical discourse have not

explicitly focused on the *coming-to-pass* of the truth of Being for a people during a given epoch of its history, but have tried to speak about something that in some sense or other is supra-sensible, universal, definitive, eternal, absolute, etc., a speaking which in many instances ultimately implies an explicit reference to God, this form of thinking can be called onto-theo-logical. In such a form of metaphysical discourse there also belongs the 'common' conception of language and word; in that kind of discourse there is also located the concern with analogy and metaphor. In the philosophical discourse about Being itself, taken in Heidegger's sense, however, *this* conception of language and word is not applicable; and the same holds true for reflections on analogy and metaphor.

In Heidegger's view, in the philosophical discourse about Being, i.e., in authentic thinking, the thinker tries to respond to the address of Being; in each epoch of his people's history Being dictates what the thinker is to say in response. This dictation by and about Being and this response by the thinker bring about originally in each case the primary differentiation between Being and beings (ontological difference); once this primary differentiation becomes articulated in language the concretization from Being to world and the differentiation of world and things come-to-pass there, also. This 'speaking of the language of Being' is never ontic in character, but concerns itself always with the condition of the possibility of all ontic speech.

During the same epoch some poets may also respond to the original address of Being which is present to them in the form of the holy, the wholesome. They, too, then participate in their people's response to the process of aboriginal differentiation, dictated by Being itself.

Now it is in these two authentic responses that words can be used as they basically were meant to be employed. They let things be in an '*original*' way. On this level of discourse, thus, words do not yet *have* meaning, just as little as things *have* meaning.⁸⁰ The things now rather begin in a new way to be and to *receive* meaning, because the original word (for this people during this epoch) lets them be what from now on they properly will be; they become now newly appropriated to themselves and appropriated to the world to which they henceforth belong.⁸¹

In conclusion we thus may say that if one reviews all the evidence which is actually available to-date, one must come to the conclusion, I think, that Heidegger indeed legitimately can make the claim that from his own basic conception of Being, truth, language, world and thing it is indeed the case that truly 'philosophical' discourse is not and cannot be metaphorical, just as little as this thinking can make use of analogy.⁸² The reason for this is that the basic words of a strictly philosophical discourse (in Heidegger's sense) are not things that are already supplied with significations before they become an essential part in the thinker's

and the poet's response to the 'original' address of Being itself in which in each epoch of a people's history Being sends and grants itself. These words are not just simple signs that in a given linguistic system have a limited number of significations. Rather these words let things once more be 'originally' what they are in that they in a new way articulate the ontological difference of world and things. In other words, such words are concerned with the 'conditions of the possibility' of the metaphysical and the scientific conceptions of language, word, analogy, and metaphor.

This conception of the non-metaphorical character of 'philosophical' discourse that articulates its basic insights with the help of 'basic words' obviously does not pass a definitive and negative judgment on the metaphysical and scientific theories of metaphor. Yet it is of vital importance to reflect on Heidegger's claims about metaphor. For if Heidegger's conception about the non-metaphorical character of philosophical discourse, taken in the strict and limited sense which he has given to it, were to be unacceptable in principle, then indeed all the implications to which Derrida, Ricoeur, and Greisch have alluded, would indeed follow, I think.

But as it is, philosophy does not need to swim against the stream to undo what ordinary language use has done. What is needed mostly is that one constantly heeds the inherent historicity of all thinking and speaking that responds to the 'gift of Being'.

15 *ibid.*, pp. 17-19. In *Hebel - Der Hausfreund* (Pfullingen, Neske, 1958) Heidegger seems to contradict this conception (cf. *ibid.*, pp. 37-8). Yet it seems to me that the careful reader will discover soon that Heidegger here does not subscribe to the 'common' interpretation of the opposition between the sensible and the spiritual; rather he is concerned here with the relationship between the spoken and written words and that which they mean.

Heidegger and Ryle: two versions of phenomenology

Michael Murray

In an effort to throw light on some issues of recent philosophical history, I propose to examine a cluster of matters common to Ryle's *The Concept of Mind* (1949) and to Heidegger's *Sein und Zeit* (1927). A very pertinent element for such a discussion is Ryle's feature-length review of *Sein und Zeit*, published in 1929;¹ attention also should be drawn, however, to three additional writings: his paper 'Phenomenology' (1932),² a review (1946) of *The Foundation of Phenomenology*,³ and most recently a paper delivered at the Royaumont Conference in 1962, 'Phénoménologie contre *The Concept of Mind*'.⁴ From them one learns something about the development of Ryle's thought, its relation to phenomenology in general and Heidegger in particular.

An alternative title for this discussion might have run: 'Heidegger or *The Concept of Mind*'. Its ambivalence provides a direction. Read in an inclusive or appositional way 'or' has the sense of 'Heidegger revisited', while interpreted exclusively it confronts us with the necessity to choose between two incompatible versions. No one would seriously dispute that there are significant differences in technique, motive, and goal between Heidegger's *Sein und Zeit* and Ryle's *Concept of Mind*, and in their philosophizing generally. Ryle's technique is that of the linguistic portrayal or sentence-frame analysis; his goal is not a science or a clarification of the meaning of Being, but rather a 'theory of mind' or philosophical psychology. His method lies within what may be termed a behaviorist perspective (*CM*, pp. 327–8) and, implicitly, he adopts the verification principle of meaning. The source of the behavioral indicators of 'mind' as well as its measure (i.e., the criterion for true judgments), unlike the source and measure of Skinnerian behaviorism, is provided for by ordinary, cultivated English. In Heidegger's work the appeal to the evidence of ordinary language, the language of everyday being in the world, is also frequent. He often cites linguistic usage for guidance

in his analyses, as for example the passages on the hammer (SZ pp. 73, 154, 360–1), on social inauthenticity (pp. 127–8, 174, 178, 252–8), on temporal expressions (pp. 330, 349, 406–9, 416), and on the grammar of listening and hearing (pp. 163–4, 173–4, 271). At this stage he is not nearly as self-conscious of this method as is Ryle in a later period, although it is consonant with Heidegger's emergent stress on the importance of language. For Heidegger, of course, these analyses of ordinary language are not ends in themselves, because this realm is meant to exhibit certain *a priori* structures of human existence, which he calls the 'existentials' in contradistinction to the 'categories' applicable to things. Furthermore, his interest in these existential clarifications is governed by his contention that they afford a necessary basis for and prelude to ontology, for which reason he designates this endeavor 'fundamental-ontology'. The analysis of being human, consequently, can never, according to Heidegger, be autonomous and self-sufficient, because man's very constitution is meshed (a fact which subjectivism misses) with that of others, things, and instruments, with works of art, thought, and politics, and above all with Being. His analysis also differs in an important way from Ryle's in his view that our understanding of the world is ensnared in the conflicting claims of authentic and inauthentic possibilities for life. As a result, from the outset, ordinary language, the theme to which he later returns in his essays on Hölderlin, represents a threat as well as a rich fund of expression. Lastly, there is nothing in Ryle resembling Heidegger's detailed examination of gossip, hearsay, and curiosity, boredom, fear, and dread, time, freedom, and death.

The notion of a striking contrast and incompatibility between Heidegger and Ryle tends to be taken for granted, and with some good reason as I have indicated. But a second interpretation, which does not cancel out these differences, is possible; and precisely because of the obviousness of the first, it would be more interesting and worthwhile to press the seemingly implausible view that there exists a substantial affinity between their works. At the close and at some intervenient points, I shall return to the connection between the plausible and the implausible interpretations.

According to the implausible interpretation, the various parallels discernible between the two mentioned works show the unmistakable impact of *Sein und Zeit* and its type of phenomenology on Ryle. The same subjects, same forms of argument, same families of concepts and sometimes even examples found in *Sein und Zeit* (which Ryle had read very closely) reappear in *The Concept of Mind*. First among them comes a renewed critique of Cartesian philosophy, a program very conspicuous in *Sein und Zeit*, and defined in detail specifically in part I, division iii, §19–21 on the nature of 'world'. Heidegger entitles section 18b: 'A contrast between

our analysis of worldhood and Descartes's interpretation of world'. There he presents an incisive analysis of Descartes's concepts which he fills out more in later writings. Weighed historically Heidegger's analysis is all the more striking since it appears against the background of the avowed Cartesianism of Husserl, his close friend and teacher. Ryle devoted considerable attention to pre-Heidegger phenomenology and was well aware of this fact as he noted at the time of the review (Rev/SZ, p. 56), although he did not fully appreciate it until much later. Husserl's phenomenology, he then says, 'burgeoned into a full Cartesian metaphysics' (Rev/FP, p. 267). Ryle's own anti-Cartesian design is an underlying theme of *The Concept of Mind* and is introduced in the first chapter: 'Descartes's myth'. Despite this, however, just who gets criticized in the critique of Descartes (CM, p. 8) and even the full content of 'the official doctrine' remain in a kind of twilight land: 'It would not be true to say that [it] derives solely from Descartes's theories . . .' (CM, p. 23; cf. p. 11). In Ryle's version the relation between the legend and history remains less clear than it should, but the general features emerge nonetheless: the mind occupies the place of a ghost inside a machine as the soul is inside of the body. And as a result, theoretical discourse is ruled by a dualism of psychic and mechanistic talk, of inner and outer, internal and external, segregated and estranged from one another; and lastly, this inner self is a transparent consciousness capable of absolute certainty of itself and of complete doubt about the external world, physical and custom-made. Ryle's purpose is to dismantle this doctrine as a mismatch of conceptual frameworks and to substitute a more effective account of mind in its place (CM, chap. 1, et passim). I shall sketch comparatively the consequences of the Cartesian dualism which both attack – such as the intellectualist model of consciousness, the problem of other minds, and language as assertion – but let me indicate first the orientation of Heidegger's criticism. In the Cartesian view, since knowing 'is not some external characteristic [bodily property], it must be "inside" ' (SZ, p. 60), whereas human being-in is conceived as 'the Being-present-at-hand of some corporeal Thing (such as a human body) "in" an entity present-at-hand' (SZ, p. 54; cf. pp. 107–8). Heidegger stresses more than Ryle the underlying ontological suppositions of Descartes and Galilean science: 'The idea of Being as permanent presence-at-hand . . . keeps [Descartes] from bringing Dasein's ways of behaving into view in a way which is ontologically appropriate' (SZ, p. 98). Instructively, Heidegger never uses the word 'consciousness' except within quotation marks, in order to make plain its theory-ladenness. The thesis of the published part of *Sein und Zeit* is a declaration of conceptual independence from the Cartesian and Galilean deformation of the meaning of human existence. Thus 'man's "substance" is not spirit as a synthesis of soul and

body; it is rather *existence*' (SZ, p. 117; see also pp. 62, 119, 205, and passages cited below).

In his review of Heidegger, Ryle criticizes Heidegger's theory of 'being a self in the world' and asserts that scientific knowledge has been smuggled in beneath the primitive situation thus described, 'which knowledge necessitates universals and categories' (Rev/SZ, p. 59). An important point concerning the 'language' of *Sein und Zeit* is raised, one still worth discussion, and as we know, Heidegger himself has acknowledged that this language was not yet wholly emancipated from the language of metaphysics. But Heidegger's reservation goes in the direction opposite Ryle's desire here to argue for the priority of the categories of objects and things over those of persons and events. His claim is not that in *Sein und Zeit* Heidegger's language is insufficiently freed from the grammar of 'mere entities' and thus interferes with its purpose, but rather the more traditional one that, since the logical grammar of science is fundamental, attempts to escape it are misdirected. Such suggests that at this stage in his thinking Ryle himself is too Cartesian to grasp the meaning of the Cartesian critique, a suggestion borne out by another passage: 'For instance the general characterization of our conscious being as a "being-in-the-world" surely implies that *underlying* our other reactions and attitudes there is *knowledge*. We "have" or are "in-the-world" only if we know that at least one "something" exists' (Rev/SZ, p. 63). Ryle fails to recognize that in his very assertion of the necessary priority of knowledge of an object, some sense of the world has been presupposed. At the same time he tacitly promotes the myth of a world-less 'subject' which is the counterpart of the epistemological 'object', prior to the world, revealing in another way Ryle's commitment to both the subject and the object poles of the Cartesian outlook.

World cannot be based on advance 'knowledge' of some *res*, because we never encounter anything except within a context or against a background. The theoretician may ignore or pass over in silence this context but this does not eliminate it. There can be knowledge of the requisite sort only within a world horizon, one which the 'knower' inhabits and lives through. Heidegger's argument is not intended to throw out the concept of knowledge, but rather to distinguish between what we might call knowledge *within* the world and knowledge *of* the world, or in his terms, between the original founding mode of transcendental being-in (constituted by the existential of understanding) and the regional or special areas of things that provide the reflective subject matter of particular sciences (SZ, p. 59). Related to this question is the way that Ryle construes Heidegger as redirecting our attention to the *sum* and the *ego* of the *cogito* and his persistent mistranslation of *Dasein* (human being; lit. 'there-being') as 'I' (Rev/SZ, pp. 58, 59, 60, 62). On this last point Heidegger was quite emphatic and in another way gave voice to his

break with Descartes: 'It is of course misleading to exemplify the aim of our analytic historically in this way. One of our first tasks will be to prove that if we posit an "I" or subject as that which is proximally given, we shall completely miss the phenomenal content of Dasein' (SZ, p. 46; cf. p. 116).

A profound shift has taken place from the Ryle of the Heidegger review to the later-Ryle of *The Concept of Mind*, a shift indicated by his own words: 'The assumptions against which I exhibit most heat are assumptions of which I myself have been a victim. Primarily I am trying to get some disorders out of my own system' (CM, p. 9). Now he maintains that 'during the three centuries of the epoch of natural science the logical categories in terms of which the concepts of mental powers and operations have been coordinated have been wrongly selected' (CM, p. 8; cf. pp. 18–23). More than two decades earlier, Heidegger undertook to demonstrate how traditional ontology had invariably subjected human being to objective categorial structures (*Vorhandensein*), above all 'Nature' as conceived by the natural sciences, and traced this penchant even further back to its roots in Greek thought (SZ, pp. 24–6, 45, 48, 63, 70, 98, 106, 361, 428–9, 437). In his review of *Sein und Zeit* Ryle took explicit note of the fact that Heidegger was trying to penetrate beneath 'the technical terms which science and philosophy in the course of a long development have established' (Rev/SZ, p. 57). To 'categories' as traditionally conceived, Heidegger opposed the 'existentials' or structures of human existence, and substituting the former for the latter would constitute, in Ryle's own terms, 'a category mistake' (CM, p. 16). Ryle's move is a strictly analogous one in the sense that he is attempting to articulate a set of concepts appropriate to an account of mind together with a critique of the inappropriateness of the influential categories of the modern natural sciences.

In this new search Ryle underscores, in a manner reminiscent of his interpretation of Heidegger (Rev/SZ, p. 56), that his positive goal is not some new speculative construction. In *The Concept of Mind* he wants to get at 'the knowledge we already possess' (CM, p. 7). (Elsewhere Ryle states the same thing with regard to Husserl, though he doubts that Husserl was true to his own belief.) Compare this with his quite apt explication of Heidegger: 'He [Heidegger] is simply telling us explicitly what we must have known "in our bones" all the time . . . he is telling us something which we, when told, recognize that we knew implicitly from the start' (Rev/SZ, p. 61). Explicating this osteological sense of things entails the rejection of the traditional accounts of 'other minds' and the related, so-called problem of the 'external world'. To be human is to be in a world actively engaged with others, a given existential structure that Heidegger calls Dasein's being-with (*Mitsein*) (SZ,

pp. 116–30); our relation to others is not that of merely ‘looking at’ an object situated in space (e.g., a body) but is specifically that type of care directed to other human beings called solicitude (*SZ*, p. 121). In the face of the apparent inaccessibility of the other, a theoretical consequence of the Cartesian philosophy and for him a problem most recently revived again by Husserl, Heidegger writes:

Theoretically concocted ‘explanations’ of the Being-present-at-hand of Others urge themselves upon us all too easily; but over against such explanations we must hold fast to the phenomenal facts of the matter . . . namely, that Others are encountered *environmentally*. . . .
(*SZ*, p. 119)

Ryle takes up the same argument against English philosophy, which in this respect shares a more or less common bent with Continental thought, as well as against features of his own previously held position. Summarizing the problem in its most skeptical form, Ryle explains:

Contemporary philosophers have exercised themselves with the problem of our knowledge of other minds. Enmeshed in the dogma of the ghost in the machine, they have found it impossible to discover any logically satisfactory evidence warranting one person in believing that there exist minds other than his own.

(*CM*, p. 60; cf. pp. 13, 15)

The way out of the Robinson Crusoe conclusion (*CM*, p. 13) is simply a superior description of the phenomena to that given by either objectivist mechanism or subjectivist mentalism. ‘I discover’, argues Ryle, ‘that there are other minds in understanding what other people say and do. In making sense of what you say, in appreciating your jokes . . . I am not inferring to the workings of mind, I am following them’ (*CM*, pp. 60–1). While in these formulations there is basic agreement between Heidegger and Ryle, Heidegger does not provide the precedent for Ryle’s extreme and, I think, rightly criticized statement that knowledge of others is at virtual ‘parity’ with self-knowledge and that they differ only in degree (*CM*, pp. 155, 179).⁵ Explaining away rather than explaining our being with others, this solution nearly eliminates the difference between myself and yourself, the disappearance of which is the definition of the social anonymity of the inauthentic One (*das Man*).

According to Ryle there is something mistaken and confused in the entire employment of the inner-outer, mind-matter pairs, which is the assumption behind the problem of the external world (*CM*, p. 22 *passim*). To the metaproblem of this problem Heidegger dedicated the section of *Sein und Zeit* titled ‘Reality as a problem of Being, and whether the

“external world” can be proved’ (sect. 43a). Exposing this extensively debated problematic is an important part of Heidegger’s critical analysis.

When Dasein directs itself towards something and grasps it, it does not somehow first get out of an inner sphere in which it has been proximally encapsulated, but its primary kind of Being is such that it is always ‘outside’ alongside entities which it encounters and which belong to a world already discovered. Nor is any inner sphere abandoned when Dasein dwells alongside the entity to be known, and determines its character. . . . And furthermore, the perceiving of what is known is not a process of returning with one’s booty to the ‘cabinet’ of consciousness after one has gone out and grasped it. . . .

(SZ, p. 62)

For Heidegger is in exact agreement with Ryle (or vice versa) that the very question posed by the traditional, modern model of consciousness is a misprision. ‘The question of whether there is a world at all and whether its Being can be proved makes no sense if it is raised by *Dasein* as Being-in-the-world; and who else would raise it?’ (SZ, p. 202). ‘The “scandal of philosophy”’, Heidegger observes in his critique of Kant and Descartes, ‘is not that this proof has yet to be given, but that *such proofs are expected and attempted again and again*’ (SZ, p. 205).

The later Ryle follows Heidegger in attacking the theoretical prejudice of Western philosophy which treats theorizing as the paradigm of mental acts and the theoretician’s ‘object’ as the solely ‘real thing’. Ryle wants to maintain that, ‘On the contrary, theorizing is one practice among others . . .’ (CM, p. 26; cf. pp. 26–8, 137), and he offers the same explanation as Heidegger of a motive behind the conventional view: theorists have been preoccupied with the task of investigating theoretical cognition. ‘Preoccupation with “theories” has led to ignoring the question what it is for someone to know how to perform tasks’ (CM, p. 28). Heidegger attributes this distortion to the focus on *intuitus* and ‘seeing’ in most conceptions of knowledge (SZ, p. 358). Yet he also emphasizes that theoretical behavior *is* a form of behavior, a way of being in the world, with a *praxis* of its own, determined by a special mood of its own (SZ, pp. 69, 138, 358). This intuitive-sight model is the model of a ‘just looking’ according to a *method* (SZ, p. 69), oriented toward objective uniformities (‘present-at-hand’), which requires the mood of ‘a tranquil tarrying alongside’ (p. 138).

Such a model of knowledge is radically incomplete because it is incapable of self-understanding even its own specialized activities (not to mention others) and research skills – reading off measurements in experiments, making up ‘preparations’ for microscopic observation, doing calculations and writing out theories (SZ, p. 358). Indeed, there is a

rough but quite clear epistemological correspondence between what Ryle calls knowing-that and knowing-how (*CM*, chap. 2, esp. pp. 27–35, 40–2, 59–60) and Heidegger's fundamental distinction between the kind of understanding involved with mere entities and essences (*Vorhandensein*) and the understanding of instruments and signs ready-at-hand (*Zuhandensein*) (*SZ*, pp. 55, 61, 69, 71, 74, 83–4, 87, 183). Understanding a hammer is knowing how to use it in contexts of utility and significance. Heidegger portrays knowing-how in general terms thus: 'As a disclosure, understanding always pertains to the whole basic structure of being-in-the-world . . . that which is ready-to-hand is discovered in its serviceability, its usability, and its detrimentality' (*SZ*, p. 144). Theoretical knowledge, in contrast, is always of a thematic sort, a knowledge that something appears such and such, that such and such is the case. Of this kind of knowing Heidegger says: 'Looking at something in this way [in the way they look, their *eidōs*] is a definite way of taking up a direction toward something – of setting our sights toward what is just there as an entity (present-at-hand)' (*SZ*, p. 61). Ryle aims 'to prove that knowledge-how cannot be defined in terms of knowledge-that, and further, that knowledge-how is a concept logically prior to the concept of knowledge-that'.⁶ Though Heidegger would cast it in the vocabulary of the 'primordial' and the 'derivative', this is a perfect statement of a major intent of *Sein und Zeit*.

Know-how, Ryle tells us, is going by unformulated rules and, although know-how is learned, learning-how is accomplished by practice, not by just knowing the rules of chess or language (*CM*, pp. 41–2) or of being informed of this or that truth (*CM*, p. 27). One can know the grammar of a language without knowing-how to speak it, or know-how to speak it without expressly knowing or even having learned the grammar (*CM*, p. 42). The kind of beings other than men which knowing-how engages is precisely the type Heidegger terms 'equipment', whose nature it is to be ready-at-hand for use. In Ryle's two cases, the equipment is, in the one, the chess pieces and board, and in the other, the linguistic signs whether written or phonetic or both. The sense of things accessible in the mode of knowing-that includes a range of theoretic and thematic awareness but is typified by a proposition like 'The hammer has the property of heaviness' (see analysis below) or by concerns like that of Descartes who asserts that the truth of nonmental reality is extensive magnitude, or *res extensa*. What characterizes in common the 'hammer' or all of physical reality in this mode of knowing is its mere present-at-handness.

Now in fact there are some uses of Ryle's 'knowing-that' which are quite different from the corresponding notion in Heidegger, and there are dialectical objections possible to both their views on this which cannot be taken up here. When Ryle declares that the intellectualist legend

assimilates knowing-how to knowing-that (*CM*, pp. 29, 31, 40f.), he echoes Heidegger's repeated complaint that philosophers have too long overlooked the most everyday and immediate contexts of human life, equating the whole of experience with the theoretician's mode of it.

One particular application of the theoretician's bias is featured in both their accounts of the nature of language. Heidegger in *Sein und Zeit* (pp. 153–60) and only much later, Ryle, in *The Concept of Mind* (pp. 185, 311), attack the all too exclusive dominance assumed by the assertoric proposition. To quote from Heidegger:

Prior to all analysis, logic has already understood 'logically' what it takes as a theme under the heading of the 'categorical statement' – for instance, 'The hammer is heavy.' The unexplained presupposition is that the 'meaning' of this sentence is to be taken as: 'This Thing – a hammer – has the property of heaviness.' In concerned circumspection there are no such assertions 'at first'. But such circumspection has of course its specific ways of interpreting, and then, as compared with the 'theoretical judgment' just mentioned, may take some such form as 'The hammer is too heavy,' or rather just 'Too heavy!', 'Hand me the other hammer!' Interpretation is carried out basically not in a theoretical statement but in action . . . – laying aside the unsuitable tool, or exchanging it, 'without wasting words'.

(*SZ*, p. 157; cf. pp. 360–1)

Ryle observes that 'theorists like to define intellectual operations as operations with propositions' but neglect or camouflage the fact that this is language in the didactic mode of lesson-giving, lesson-taking, and lesson-using activities (*CM*, p. 311). To understand theoretical propositions as presupposing an instructional situation enriches our awareness and supplements the account that Heidegger wants to give.

In discussing Heidegger in his review essay, Ryle correctly noted Heidegger's stress on the importance of examining man in his 'average everydayness', essential yet constantly neglected since it is the closest to us; and Ryle was struck by Heidegger's use of ordinary language instead of a technical metaphysical language. What he does use, Ryle describes as 'the many barrelled compounds of everyday nursery words and phrases' (*Rev/SZ*, p. 57) and uses them, as earlier pointed out, to get beneath 'the technical terms which science and philosophy . . . have established'. Ryle's point here is worth repeating especially because this side of Heidegger has been almost totally submerged in the legend of his metaphysical jargon. At the same time we must not lose sight of the fact that Ryle's pretext for these remarks is that he felt the pathway through ordinary language to be a threat to his own conception of philosophy. Of this pathway, on which he himself later embarks, he then

wrote: 'The hypothesis seems to be a perilous one, for it is at least arguable that it is here, and not in the language of the village and the nursery that mankind has made a partial escape from metaphor' (Rev/SZ, p. 58). Of course, in *Sein und Zeit* the everyday idioms, usage, and metaphors are in the service of phenomenological inquiry; they are valuable only if they serve to disclose the phenomena and if not, new ones must be and are forged. And to be sure many of the concepts by which Heidegger describes Dasein (facticity, existence, temporality, transcendental horizon) plainly are not found in the vocabulary of the village or nursery, even German ones.

In a recent discussion with Urmson, Ryle declared that in his 'Systematically misleading expressions' (1931–2) – written about the same time as his Husserl paper (*P*) – he was under the direct influence of the doctrine of the ideal language (= logical form) and that he now (1962) rejected it as a bad method.⁷ It is not difficult to see and perhaps Ryle would agree that the same 'bad method' held sway in 1929 when he felt the appeal of the tractarian mode (see n. 15) and continued at work in 'Categories' (1938–9).⁸ The question can be raised how completely Ryle in his later writings breaks away from the 'theoretical' conception of language, that is, of language *as* logic (*CM*, pp. 8, 126, 150, 155–6, 171, 194, 198). At one juncture, for instance, Ryle describes his entire book as 'a discussion of the *logical behavior* of some of the cardinal terms' (*CM*, p. 126, italics added), and since for him the problems and mistakes are logical, so must be the solutions. Elsewhere he rejects the claim of Husserl that phenomenology can function as First Philosophy (*erst Philosophie*), because that would assign it priority *even* over logic (*P*, p. 77); the same misgiving runs throughout 'Phénoménologie contre *The Concept of Mind*'.

Nevertheless, there are several significant parallels between the later Ryle and the Heidegger conceptions of language vis à vis a Cartesian orientation. Both are alert to the clear-distinct bias in the image of theorizing as sight (*CM*, p. 303; *SZ*, pp. 171f.). As we have noted, Ryle, like Heidegger, points out the heavy influence of this train of thought upon interpretations of language. The logician's 'either categorical *or* hypothetical is highly misleading' (*CM*, p. 140), and true-false propositions do not all connect up attributes to objects (*CM*, p. 120). According to Heidegger, assertion itself is a derivative variety of interpreting (*SZ*, pp. 153–60) – a mode of interpreting because it represents a particular stance toward what is asserted and expresses itself in a select grammatical emphasis and vocabulary; and derivative rather than original because asserting presupposes as a condition of its possibility an already given and open context of signs, instruments, and speech. Interpretation is the way in which the understanding of the world becomes concrete and actual, and interpretedness should be regarded not as a special local

feature but as deployed throughout the lived world. While assertion is a species of interpretation, not all interpreting is assertive.

Against the traditional insensitivity, encouraged by the supreme importance granted the assertion in theoretical discourse, Ryle calls attention to the sheer variety of talk:

What is said is said either conversationally, or coaxingly or reassuringly, or peremptorily, or entertainingly, or reproachfully, and so forth. Talking in a bargaining way is different from talking in a confessional way, and both are different from talking anecdotally. . . . Even what we write is meant to be read in a special tone of voice, and what we say to ourselves in our heads is not 'said' in a monotone.

(CM, p. 310)

The above passage on language is strikingly similar to one of Heidegger's published in 1927 and studied by Ryle in 1929:

Being-with-one-another is discursive as assenting or refusing, as demanding or warning, as pronouncing, consulting, or interceding, as 'making assertions', and as talking in the way of 'giving' a talk. Talking is always talking about something. . . . Even a command is about something. And so is intercession. . . . What is talked about in talk is always 'talked to' in a definite regard and within certain limits. . . . As being-in-the-world man is already 'outside' when he understands. . . . Being-in and its disposition are made known in discourse and indicated in language by intonation, modulation, the tempo of talking, 'the way of speaking'.

(SZ, p. 162)

Ryle uses 'disposition' in what Heidegger would call both an existential sense as applied to persons, and a categorial sense pertinent to things. His discussion is complex and many of its subtleties are dependent upon special properties of English. Heidegger makes no effort to inventory the wealth of terms and sentences which Ryle does, but is chiefly interested in root characteristics of man, the existential *a priori* which underlies the manifold and variable forms of expression. (The question of the relation thus is whether the linguistic distinctions and nuances become *intelligible*, supposing Heidegger's existentials to be necessary.) While there is no elaborate resemblance between Ryle and Heidegger here, two specific points of contact deserve mention, 'dispositions' and 'feelings'.

Ryle employs 'disposition' as a property concept of certain things, such as the brittleness of glass or the solubility of sugar, which denotes a liability and propensity toward a particular state, such as being broken

or dissolved. Ryle's analysis of the dispositional property of 'hardness' adheres rather closely to an account that Heidegger offers in his critique of Descartes (*SZ*, pp. 91, 97, 209). Ryle concludes that to express it properly we should 'have to produce an infinite series of different hypothetical propositions' (*CM*, p. 44), whereas Heidegger claims that 'hardness' is the experienced resistance of some entity to human effort and as such implicates a context of significant action. The 'discovery of what is resistant to one's endeavor is possible ontologically because of the disclosedness of the world' (*SZ*, p. 211).

These accounts have something in common, although Ryle's strikes me as the more odd, and the reason for its peculiarity appears to be the inadequately developed sense of world in his theory of mind. For Ryle speaks not about what is the case but what *would* be required for its meaning to be made out, where Heidegger speaks of what must already be the case for such an experience – for instance, the oak tree resisting the axe of the lumberman – to take place. In Heidegger's terms the role of the infinitude of propositions is occupied by the temporal transcendence of Dasein. What Ryle does not really explain is the unity of the properties or its contextual supposition which Heidegger's account encompasses, e.g., the experience of the resistant oak. Ryle's analysis could be extended to stipulate that the individual expressions of a language always presuppose a background of other expressions. These other expressions form the local context of an expression's meaningfulness and utilizability. Such a range of reference corresponds to Heidegger's notion of a 'region' (*SZ*, p. 103), an empirical circumstance as is the region of the workshop for the carpenter's utterance, 'Too heavy!' Of course this analysis can and must be extended further, because the local range of utterance itself draws from and delves into the totality of expressions, or language as a whole. If we reflect upon the background of any possible expression, expressibility as such, we are close to Heidegger's existential, transcendental concept of world.

If we turn to 'disposition', as a mental property in the Ryle sense, we can recognize certain comparisons. Ryle's use of 'disposition' as a category of mind to signify its capacities, tendencies, and propensities is expressed in dispositional nouns like 'habit' or dispositional adjectives like 'greedy' and dispositional verbs like 'know', 'believe', and 'aspire' (*CM*, p. 118). This concept group is akin to a family of existential concepts introduced by Heidegger who says that Dasein is its potentiality-for-being (*Seinkönnen*), since its essence is its self-understanding (*Verstehen*), and basic state-of-mind (*Befindlichkeit*), while its being is structured by care for things, self, and others, and is founded in an 'ec-static' temporality. Dasein stands out and stretches itself into future, past, and present. With these positive notions Heidegger seeks to overthrow the

atomistic theory of 'inner states' and modern subjectivism and also the traditional equation of the actual with the present (or Now).

Heidegger and Ryle both give 'disposition' a distinctively temporal meaning and also contrast it with discrete episodes or occurrences (*CM*, p. 118). Disposition traits are essential to an interpretation of man and as early as the Heidegger review, Ryle expressly recognized such a theoretical direction in Heidegger, even so far as noting down the concept of a 'disposition' (*Rev/SZ*, pp. 56, 58). Ryle's statement that know-how is a 'disposition' (*CM*, p. 46) – say the skill of the chess player in Ryle's example or the knack of the craftsman in Heidegger's – conforms to the way Heidegger describes Dasein's involvement in the signifying structures of the ready-to-hand (*Zuhandenes*) with its in-order-to (*um . . . zu . . .*) and that-for-the-sake-of-which (*umwillen*). As Ryle translates it rather well, Dasein in the world is 'a "being-about" (*besorgen*)' (*Rev/SZ*, p. 58), and the *praxis* of man's being-about is not a 'blind' behaving but has its own kind of circumspection (*Umsicht*), which is close to the intent of Ryle's view that 'understanding is a part of knowing-how' (*CM*, p. 54) and to his characterization of practice as intelligent or skilled performance (*CM*, pp. 33, 45, 60).

Ryle's treatment of mental disposition is burdened with a difficulty that Heidegger's is not, similar to his problem with thing-dispositions previously considered, namely the inability to explain the unity and identity of mind. This is a consequence of his view that the nature of mind can only be truthfully articulated by 'an infinite series of propositions' and his rough equation of the mind with 'the topic of sets of testable hypothetical and semi-hypothetical propositions' (*CM*, p. 46). In this regard Ryle has only overthrown Descartes to become, perhaps not surprisingly, the heir of Hume.

In *Sein und Zeit* Heidegger calls for a more thorough-going phenomenology of the 'affects', which he describes as having made little serious progress since Aristotle's *Rhetoric* (*SZ*, p. 138). Ryle's fascinating and intricate studies on this subject can be construed as at least consistent with and at best as a response to this asserted need. Heidegger avoids the concept of 'emotion' because it has gained the popular sense of being the anticorrelate of 'cognition' and he rejects the accepted view of both (*SZ*, pp. 138–9). Ryle is alive to this issue too (*CM*, pp. 104, 258), and in the foreword to his chapter on emotions, he says that the word designates at least three or four different things: 'inclinations', 'moods', 'agitations', and 'feelings' (*CM*, p. 83). Appreciating the importance Heidegger assigns in principle to this topic, Ryle wrote: 'Feelings . . . are at least as directly constitutive of my world as ideas or concepts . . .' (*Rev/FP*, p. 269). Heidegger had worked especially with the notion of 'state-of-mind' or 'disposition' (*Befindlichkeit*) and 'mood' (*Stimmung*) as the concrete attunement (*Bestimmtheit*) of the individual life.

We cannot rehearse the details of Ryle's discussion or review any of Heidegger's significant later thoughts on the problem, but consider for instance Ryle's concept of 'mood' (CM, pp. 98–104), which plays an important role for him and bears an obvious resemblance to Heidegger's concept of *Stimmung*. 'In saying that he is in a certain mood', explains Ryle, 'we are saying something fairly general . . . that he is in the frame of mind to say, to do and feel a wide variety of loosely affiliated things.' And, he goes on, 'Moods monopolize. To say that he is in one mood, is, with reservations for complex moods, to say that he is not in any other' (CM, p. 99). Heidegger makes 'disposition' and 'mood' primary and necessary constituents of existence in the world, and as Ryle himself had properly noted, essential to Dasein's 'being-itself' are 'moods, tensions, and inflections' (Rev/SZ, p. 59). Both agree that moods and feelings must be distinguished, and both agree that these states are not 'subjective' in the popular sense of a merely 'inner' self.

The objection must be met that the clue to the direction, if not the thrust of Ryle's thought might naturally be expected to have derived from the thought of Wittgenstein. Chronologically speaking, we know that when he wrote his feature review of *Sein und Zeit* in 1929, Ryle was unfamiliar with the later Wittgenstein. This is hardly strange if one recalls that Wittgenstein had not returned to Cambridge until early the same year. Wittgenstein states in the 1945 preface to the *Philosophical Investigations* (part 1: 1945; part 2: 1947–9) that the work goes back to 1929. Apart from the fact that Wittgenstein distrusted promulgation of his teachings, the turn of his thinking required a transitional period which has been variably described. Rhees argues convincingly in his introduction to *The Blue and Brown Books* (1933–6) that the latter are rather more in the shadow of the *Tractatus* than in the light of the *Investigations*.⁹ Wittgenstein himself seems to be of the same opinion when he labels the revisionary effort of the *Brown Book* 'worthless'.¹⁰

If Wittgenstein can be said to have taught some of the notions discussed prior to *The Concept of Mind* (just which ones cannot be set forth here), the following facts must be kept in mind: that the second part of the *Investigations* was written contemporaneously with *The Concept of Mind*; that the former work was unavailable in its full published form until *after* the latter; that *still earlier* these notions had been systematically explored by Heidegger; and that Ryle was fully acquainted with Heidegger's work, having called attention to these notions in his review.¹¹ In addition certain general features of *The Concept of Mind* distinguish it conspicuously from the episodic structure of the *Investigations*. *The Concept of Mind* is a book organized around a central concept and problem, and laid out in a fairly systematic manner with conventional forewords,

chapters, and subdivisions. Formally speaking the resemblance is closer to Heidegger's book or to others than to Wittgenstein's.

Ryle later abandons most of the reasons for which he took Heidegger to task in the review, and his new approach involves analyses and concepts comparable in significant regards to ones in *Sein und Zeit*. Even then Ryle declared explicitly that the contemporary 'danger' to phenomenology 'is not necessitated by the idea of Phenomenology, which I regard as good' (Rev/SZ, p. 55). On that occasion his concluding judgment on Heidegger was enormously honorific and open:

He shows himself to be a thinker of real importance by the immense subtlety and searchingness of his examination of consciousness, by the boldness and originality of his methods and conclusion, and by the unflagging energy with which he tries to think beyond the stock categories of orthodox philosophy and psychology.

(Rev/SZ, p. 64)

Evaluated from the angle of Ryle's philosophical aims, the extractable similarities between the two works are rather great. Yet a few years before publishing *The Concept of Mind*, Ryle announced that he had washed his hands of phenomenology and thus contradicted both his word and deed: 'In short, Phenomenology was, from its birth, a bore' (Rev/FP, p. 268). It is still hard to see how his original estimation can have been so completely amiss.¹² On the other hand, one *might* be tempted to construe Ryle's cryptic remark, made barely three years before *The Concept of Mind*, as a kind of advanced notice for his book: 'For it is a part of culture to believe that all culture comes from Paris, so Martin Heidegger's graft upon his former master's [Husserl's] stock is not unlikely before long to be adorning Anglo-Saxon gardens' (Rev/FP, p. 268).

A still further possibility would be that Ryle does not care about the question at all because he does not consider it to be of itself a philosophical question. This possibility implies a thesis about the nature of the relation of philosophical work to history and raises a question that cannot be left unanswered. Among Anglo-American philosophers a belief prevails that the history of philosophy, not to mention history, *is* separate from philosophy proper, that the history of philosophy is rather more the business of historians than of philosophers. The task of philosophers is to analyze or dispell problems and dilemmas. The separatist position, to give it a name, does not make the philosophical demand that one philosopher's estimation of another be a truthful reflection, but imagines itself to be honoring truth in some higher nonhistorical sense. That this position could be regarded as detrimental to philosophical discourse or as a mere form of *divertissement* seems not to occur. A recent case in

point is Ryle's cavalier retort to an altogether justified criticism of his account of Husserl, that he did not care whether or not it was a 'caricature' (*P-CM*, p. 87). Such an attitude indeed more typifies Ryle today than at the time of his *Sein und Zeit* study where he does appear genuinely concerned for an accurate representation of phenomenology. What can a title such as 'Phénoménologie contre *The Concept of Mind*' – or what has been rightly suggested as more appropriate: '*The Concept of Mind* contre Phénoménologie' – mean when its author concedes that his description of the opponent is a caricature? Does that not make the *contre*, the opposition or strife itself a caricature?

When a thinker or his advocate attributes revolutionary significance to a work,¹³ the separatist view runs into an unresolvable impasse. In such a context 'revolution' is necessarily an historical concept; a nonhistorical conception of revolution would imply less the idea of decisive shift or advance than that of mere turning about in circles – its original astronomical meaning. One of those who endorsed the separatist theory of revolution was Wittgenstein when he held that it made no difference to him what others had said (note its family resemblance to his other contention that, whatever it was, it was only mystification), and that he had 'found, on all essential points, the final solution'.¹⁴ Such a standpoint, already hallowed in Descartes's *Discours de la méthode*, continues only slightly impaired in the *Investigations*. Analytical philosophy prides itself on its talent for dissolving and banishing traditional philosophical problems (therapy); and yet often it has not bothered in any careful way to ascertain what *were* and *are* the essential philosophical problems (diagnosis).¹⁵ Quite obviously, good therapy must presuppose thoughtful and perceptive diagnosis. If one is *spoken to*, and the texts of the tradition do speak, one must listen before one can understand and reply. Any other approach is irresponsible or, to continue the medical analogy, quackery. Both the diagnostic and the therapeutic sides are required if *philosophical* work is to be responsible and whole. Precisely because philosophy is concerned with the issue, it is concerned with history, and indeed history in a sense that interests few historians, namely as the life of philosophical truth. Without this concern it becomes impossible to speak meaningfully of advance, revolution, or of setback.

Now we are in a position to underscore the second, exclusive 'or' (the reasons for which have been summarized) and to ask whether Ryle's appropriation of Heidegger does not, in fact and in principle, miss a dimension of genuine revolutionary significance. This can best be understood by considering a key theme in Ryle's criticism that runs through all four papers on phenomenology, namely his repudiation of phenomenology as 'first philosophy' (in Husserl's phrase borrowed from Descartes

and Aristotle) or as 'strict science' (*strenge Wissenschaft*) and Heidegger's related though different interpretation of it as 'fundamental ontology'.

In the review of *Sein und Zeit* Ryle feels that the dangerous move by Husserl occurs when phenomenology 'is given primacy over all other sciences, and is itself presuppositionless . . .' (p. 55) '... a vital ambiguity [is] present in that expanded theory of Phenomenology which makes it the logical "prius" of not only psychology but logic, metaphysics, and the mathematical and natural sciences' (p. 62). Next, in the essay 'Phenomenology', Ryle maintains that phenomenology is a part of philosophy and is a priori, but that it is neither science nor rigorous science nor 'science of sciences' (p. 69). This follows from the view of phenomenology as 'science of the manifestations of consciousness', one equivalent to epistemology (p. 70). In his review of *The Foundation of Phenomenology*, a presentation of Husserl by Marvin Farber, Ryle describes Husserl's best work as that part of the *Logische Untersuchungen* devoted to the reconstruction of epistemology and philosophy of mind. Heidegger, he adds, modifies the representational theory of perception but retains the 'intentionality dogma' (p. 268).¹⁶ Lastly, in 'Phénoménologie contre *The Concept of Mind*' Ryle says that his book may be described as a sustained attempt at phenomenology, not as a contribution to any science whatever, but rather philosophical psychology (pp. 75, 82; cf. *CM*, p. 319). Conceptual research is not a science of sciences; it differs according to type but not hierarchically. Ryle assigns the philosophy of mind no privileged position and, speaking on behalf of British philosophers, states: 'we doubtless incline to say that it is logic which controls and deserves to control the other researches' (p. 68).

In the above line of criticism two things should be observed that are at the heart of the *difference* between Heidegger and Ryle. These are, first of all, the correctness of Ryle's inference and the falseness or question-begging character of his premise. If we accept the reduction of phenomenology to psychology, it follows – as both Husserl and Heidegger would agree – that phenomenology can only provide a regional ontology rather than a foundation for ontology. This is what Ryle does by reading *Sein und Zeit* as a design for a philosophical psychology, albeit a revolutionary one as he argues. The premise of the argument, however, is one that Husserl and Heidegger would both strongly reject. If *Sein und Zeit* is looked upon as another regional ontology (i.e., the region of 'mind'), then what is most important for Heidegger is ignored.

Despite the numerous particular parallels in their attacks on Cartesianism and in their positive concepts, Ryle in his critique and in his own work remains on the plane of traditional ontology rather than fundamental ontology. The aim of fundamental ontology is to lay bare the indispensable relation of man to things in their Being. The existentials are so-called not because they describe the nature of man which might later

be correlated with a general metaphysics, as Ryle seems to think (Rev/SZ, pp. 61, 64); rather they show up Dasein's relation to beings, to others, to its own self as pregnant with a sense of Being and as the questioner of the meaning of Being. Man's understanding of Being affects the what and how of his nature. Heidegger's subsequent working out of the question of the meaning of Being assumes many paths, including a reevaluation of the results of his own earlier work, yet he continues to pursue the same question. (Contemporary linguistic physicians are prone to confuse performing a task wrongly with performing the wrong task.) Heidegger would agree with Ryle that philosophy is not a superscience, but that is because the question of Being is more fundamental than any science or logic.

Ultimately one cannot do full justice to the concrete and close analysis of phenomena – to which Ryle has made signal contributions – in independence of fundamental questions. This fact can be brought home by comparing again Heidegger and Ryle's respective treatments of moods. Heidegger describes and distinguishes the specially revelatory moods of fear, which is object-oriented towards some fearsome thing within the world (SZ, pp. 140–3) and dread (*Angst*) which has no inner-worldly object (SZ, pp. 182–91). Dread is dread in the face of being-in-the-world as such, not of a particular threatening item within it and, in this sense, is dread of 'nothing'. For this very reason the experience of dread casts light across existence as a whole and so discloses the world in its worldliness.

For Ryle there can be no connection of the dread experience with the world, because he does not recognize the phenomenological sense of world as a lived transcendental horizon. Everyday speech busies itself constantly with know-how and things ready-to-hand (SZ, p. 186), hence with items within the world, and this is the primary field of Ryle's attention. 'For, roughly, the mind is', Ryle writes, '... the topic of sets of testable hypothetical and semi-hypothetical propositions' (CM, p. 46). The mind or the world thus defined lacks unity and self-identity like the bundle of Humean impressions which is its ancestor. One might well argue that Ryle lacks the world in the mentioned sense just because he makes no room for the experience of dread. A better guide is Wittgenstein who, some months after the Ryle review, expressed sharp appreciation for Heidegger's notion of dread as that which reveals the limits of existence and points to Being.¹⁷ We can now speak more precisely of two versions of phenomenology to signify the sense in which each thinker is a phenomenologist and each expresses views about the nature of phenomenology. The differences between Heidegger and Ryle include radical ones, and Ryle scarcely concurs in the philosophical program of Heidegger, still less that of Husserl, but acknowledgment of Ryle's substantial debt to Heidegger is overdue.

Note

In his pithily condensed 'Autobiographical', Ryle takes due note of the fact that among the first courses he taught was one dealing with Brentano and Husserl and that his first published things were the reviews of Ingarden and Heidegger. While respectfully, but emphatically, denying that his colleague John Austin had any philosophical influence on him, of his possible youthful indebtedness to Husserl he says 'there is not much truth' in this opinion. About the philosophical proximities to Heidegger (or for that matter the distances), he confines himself to the remark: 'I was amused to find [Husserl's *Phenomenology*], together with Heidegger's Existentialism, becoming the *dernier cri* in France after the Second World War.'¹⁸ More recently, in a letter that greeted the preceding discussion 'with interest and general approval', Ryle indicated his own view about the influence of Heidegger:

I don't suppose in 1928–29 I exchanged a word with anyone about Heidegger. Logical Positivism did capture my colleagues and in good measure me. . . . Of course I have no idea how much *Sein und Zeit* affected me. My anti-psychologism, which expanded into anti-Cartesian dualism later on, was alive and kicking as early as in my first reading of Frege, Husserl, Meinong, and Brentano, when Austrian intentionality-theory partly paralleled Cambridge anti-idealism. But I may well have found in *Sein und Zeit* (not the Meaning/Nonsense theory that I wanted), but anti-dualistic *cum* pro-behavioristic thoughts which were later congenial to me.

I did work hard over my *Sein und Zeit* review; but don't *think* it got as deep under my skin as did some of the other things. But it is not *now* for me to say! I'm pretty sure that I never lent (or refused to lend!) my *Sein und Zeit* to any colleague or pupil. But this could all have been 'cover up' for an indebtedness that I wanted to keep dark.¹⁹

Wittgenstein and Heidegger: language games and life forms

Karl-Otto Apel

1 Thirty years on: a retrospective overview

In this paper, I would like to take up once again and develop still further the comparison between Wittgenstein and Heidegger which I undertook at the beginning of the 1960s in a series of papers.¹ In what follows I shall therefore be concerned with such questions as: what new insights have been opened up since the beginning of the 1960s with regard to the evaluation of Wittgenstein and Heidegger? And what follows therefrom for the critical development of the comparison I made at that time between the two thinkers?

(1) First, it seems to me that my positive evaluation of the epochal significance of both thinkers and of their – at that time still surprising – affinity has been confirmed both by the world-wide influence and by the convergence of their thinking. We no longer – as in my student days in the decade after 1945 – have to contend with the hermetically sealed and starkly opposed fields of (Anglo-Saxon and Scandinavian) *analytical* philosophy and (continental European) *phenomenological* philosophy. Rather, a convergence along the lines of a linguistic-pragmatic, or even a hermeneutical, turn has taken place – right up to (post-Kuhnian) philosophy of science – and this situation is due largely to the historical impact of the convergence between Wittgenstein and Heidegger – whereby American pragmatism functions as the sounding-board and amplifier.

(2) On the other hand, it seems to me that my critique of Heidegger and Wittgenstein – or, more exactly, of both thinkers' inadequately conducted reflection upon the logos (i.e., of discursive language games and their unquestionable presuppositions)² – which was only intended as provisional at the beginning of the 1960s, has, in the meantime, acquired

an increased relevance. Briefly, the reduction of philosophy to self-therapy, a reduction which Wittgenstein's critique of language and meaning linked with the pseudo-problems of traditional metaphysics, was paradoxical from the very beginning; for it represented a negation of Critical philosophy's own claims to meaning and truth. Precisely this tendency created its own disciples. Moreover, in Heidegger's ever more radical 'Destruction' of Western metaphysics (and more completely in Derrida's 'Deconstructivism' and in Lyotard's 'Post Modernism', which refer back to Heidegger and Wittgenstein) this tendency is strengthened to the point of attesting to something like the self-destruction of philosophical reason.³ The opportunity opened up by Wittgenstein and Heidegger of effecting a post-metaphysical transformation and reconstruction of philosophy – from the standpoint of discursive language games containing the conditions of the possibility and validity of a critical hermeneutics and a philosophical critique of language and meaning – seems to have gone to ground in a self-destruction of philosophical discourse through an all too uncritical pursuit of the more problematic suggestions of two of the most prominent thinkers of the century.

The theme of my present paper is already indicated in advance with this ambivalent retrospective view of the historical impact of Wittgenstein and Heidegger.

In the first part of my paper, I would like once again to set out the main points of the convergence of the positive achievements of Wittgenstein and Heidegger in the form of a summary and a supplementation of my previous comparison. Admittedly, and due to the lack of space, this cannot be done with reference to the Wittgenstein and Heidegger editions which have appeared in the meantime. Instead, we shall concentrate upon a selection and a description of what is essential in the historical impact of the two thinkers from the remote perspective of the present.

In the second, critical part of my paper which, in this instance, will carry the most weight, I would like to enter more closely into an argument with Heidegger and Wittgenstein. Finally, I would like to show that neither thinker was fully cognizant of, and so failed to measure up to, the primary requirement of philosophical *logos* or language game, namely, a rigorous reflection, in the medium of public language, upon what is undertaken, believed in and presupposed when philosophical questions are raised and theses developed – or even only suggested. These latter, no matter how self-critical they may turn out to be, must after all claim to consist of statements capable of eliciting assent about how things are in general, that is, about the status of philosophy and its relation to the world.

First of all then, let us proceed with our comparison between the positive achievements of Wittgenstein and Heidegger.

II The linguistic and hermeneutical turn in philosophy

As already indicated, what the achievements of Wittgenstein and Heidegger have in common is the rendering possible of a philosophical critique of language and meaning, on the one hand, and a pragmatic hermeneutic, on the other. What is meant by this? Let us first try to point out the paradigmatic function of the critique of language and meaning with reference to a problematic which plays an exemplary role in modern philosophy.

II.i Wittgenstein's and Heidegger's critique of the mentalism of modern philosophy

The way in which the problem is posed in modern philosophizing might be expressed in the following train of thought:

In reality – and this is the basic assumption – only that is certain which is evident to me in inner experience, therefore not the existence of things and persons in the external world but only that I believe I am perceiving something here and now. Thus my sensational experience or at best my representation of the external world is the only genuine object of my consciousness whilst the things and persons which occupy the external world, including thereunder the common world, are at best a result of justified conclusions drawn on the basis of the data of immanent consciousness. Indeed, even the fact that such conclusions are justified in principle must, in principle, remain doubtful for epistemological philosophy. In the end, everything I take to be real could be something which only appears in my consciousness, for example, could only be my dream. Or, the being of things might only consist in their being perceived, and so on.

With this sketch of a problem, which could always be extended and spun out further, I wanted to point to the paradigmatic presuppositions of modern philosophy, which already figured with Augustine and with the Okhamism of the late middle ages, and which have at least served to determine the problem of consciousness in modern philosophy from Descartes to Husserl. Even today philosophers can be found who take the questions mentioned above to be meaningful and pressing. But one may then be sure that they are thinking in accordance with a pre-Wittgensteinian and a pre-Heideggerian paradigm. The 'intellectual revolution' implied in the critique of meaning which has taken place here can be most effectively illustrated with reference to the 'language games' of late Wittgenstein; more precisely, with reference to the famous thesis

that a 'private language' is impossible, in other words, that 'a solitary individual' cannot follow a rule.⁴

From this standpoint, precisely what, after Okham, and even more so after Descartes, featured as the only certainty of human knowledge – the evidence of my inner experience – became irrelevant in the framework of an intersubjectively valid world and self-understanding.

With this however the *subjective certainty* of inner experience, for example, the certainty that I have pains or the Cartesian certainty that I think or that I have specific representations, is not called in question. What is denied is only that this purely subjective certainty can be distinguished epistemologically and that an (epistemological) primacy can be accorded to it over any intersubjectively valid knowledge of the external world.

The reason why the epistemological primacy of inner experience cannot be legitimately sustained is that our knowledge-claims are bound up with the assumption of a shared language (not only with regard to their possible truth but also with regard to their intelligible meaningfulness) and, to this extent are, in the course of the language game, bound up with a publicly controllable rule-following procedure. In this linguistically-founded assumption of the intersubjectively valid understanding of something as something lies the new paradigm for philosophy. For it follows therefrom that the never certain but still publicly intelligible (and with regard to criteria controllable and correctable) experience of the external world must assume a primacy over the subjectively private certainty of inner experience.

Should the epistemological primacy of inner experience be upheld, it would have to be possible for the epistemological subject to validate the certainties of inner experience (for example, the certainties of pain sensations or of a reflection about thinking or about representations immanent to consciousness), in a private language, that is, in a language which no one else could understand because it would only be characterized by 'private ideas' in John Locke's sense. Such a language is however unthinkable, because its rules – both syntactical and semantical – cannot be learned and taught with reference to rule-following criteria.

If the certainty of inner experience were to furnish the basis for the introduction and application of semantic rules, there would then, according to Wittgenstein, have to be something like a 'dictionary' which would only exist in my mind; that is, its word meanings would have to be established by means of definitions relating to private sensations or representations. And in order to re-identify these sensations and representations one would have to refer the table of meanings in the dictionary to the representations in question. In other words, with a view to justifying the correctness of my application of the semantic rules I would never be able to appeal to anything independent of my consciousness. Rather,

I would have to rely upon memory. According to Wittgenstein, this would be as if I could only decide about the question of 'whether I had correctly noted the departure time of a train' by remembering an image of the page of the timetable and not by testing this memory image with reference to a publicly accessible timetable.⁵ This means however: it is impossible to establish the distinction between right and wrong. For without recourse to an instance independent of my consciousness there could be no distinction between 'following the rule' and 'thinking one is following the rule'.⁶

In fact, the indubitable certainty of inner experience in the post-Cartesian philosophy of modern times exists precisely because the distinction in question between doing and thinking one is doing, i.e., between being and appearing, would be suspended. And this positive paradigm serves to account for the direction of the modern critique of knowledge, namely scepticism. For Descartes' 'problematic Idealism' which was taken so seriously by British empiricism and which Kant accepted as meaningful even if refutable, this doubt fundamental to the modern critique of knowledge rests on the supposition: whatever is not certain in the sense of inner experience, that is, those judgments which are at times true and at times false because they relate to an external world independent of me, these judgments could always be false because there might be no external world, because it might be the case that everything which is taken to be real simply exists as my dream.

At this point, the critique of meaning implicit in the consideration of language games underlying all world and self-understanding will become still clearer than with the destruction of the paradigmatic illusion of the epistemological primacy of 'inner experience'. For it is enough to check the language game with reference to the phrase '*simply* my dream' (i.e., '*simply* in consciousness') in order to recognize the meaninglessness of the statement 'everything . . . could *simply* be my dream' (i.e., could *simply* be in consciousness). For the language game which makes the dramatic meaning of the phrase '*simply* my dream' possible clearly presupposes as a paradigmatic certainty, that not everything is my dream but that a real world exists. For this language game would have to be suspended as a possible language game if everything were simply my dream. But then, in practice, nothing has changed. One has only introduced a new language game of such a kind that in place of what was previously understood by '*simply* my dream' now has to be introduced with the description 'dream'.

In his last book (unpublished in his lifetime) *On Certainty* (*Über Gewissheit* (U.G.)), Wittgenstein brought out even more pointedly the suspension of the language game in question through the Cartesian dream argument. He says there: 'the argument, perhaps I am dreaming is simply devoid of meaning because in that case I would have had to dream the

expression of it, indeed, that these very words are/themselves meaningful' (*U.G.*, 383). The self-suspension of this language game is, in the final analysis, traced back here to the performative contradiction inherent in the argument – a point to which I will return in the second part of my paper.

The arguments brought forward so far might suffice to elucidate the point of the revolution brought about by Wittgenstein's critique of language and meaning. It should also be noted however that Kant's transcendental epistemology is no way immune to what is in question in this critique of meaning. To be sure, Kant tried to refute the primacy accorded to 'inner experience' and, accordingly, to 'subjective Idealism'. And Peter Strawson has undertaken a critical reconstruction of this argument in *The Bounds of Sense*.⁷ But at the same time he also pointed out that the presupposition underlying a 'transcendental Idealism of consciousness', that, namely, of a transcendental realism, of unknowable things in themselves, itself rests upon a metaphysical claim which is undermined by a critique of language and meaning.

It is for example simply not possible to distinguish, along Kantian lines, the concept of 'appearances' or of the 'world of appearances' on the one hand from that of 'mere semblance' – in the sense of the 'empirical reality' of objects of experience while, on the other hand, distinguishing the former from the concept of 'unknowable' but still 'thinkable' things in themselves in the sense of pure appearances.⁸ A language game containing these distinctions – or so Wittgenstein would have said – cannot function because it cannot be learnt. The sense in which the concept of 'pure appearances' can be learnt presupposes the concept 'knowable reality' just as much as it does that of 'mere semblance'. Thus, the reality which we can know cannot be distinguished over again as 'pure appearance' from a 'noumenal' reality. (In fact, Kant took note of the problem of the consistency of this conceptual usage in his *Critique of Judgment*, where he found himself obliged to introduce a 'symbolic use of language' with an 'analogical schematism' to accommodate the epistemological talk about 'things in themselves'.⁹)

It is now time to consider the correspondences and convergences between the 'intellectual revolution' implied by this critique of meaning and the philosophy of Heidegger.

Significantly, a correspondence can be most easily established between Wittgenstein and Heidegger on the basis of the latter's early major work *Being and Time*, even though in this work Heidegger has not yet introduced language as the 'house of being' and as the 'habitation of mankind' as he will later in *The Letter on Humanism*. But even here the pre-linguistic, so to speak, visual-eidetic suppositions of Husserlian phenomenology have already been transcended in favour of the hermeneutic of

a being-in-the-world which has always already been linguistically interpreted, as for example in the following paradigmatic statement:

This everyday way in which things have been interpreted is one into which Dasein has grown up in the first instance, with never a possibility of extrication. In it, out of it, and against it, all genuine understanding, interpreting, and communicating, all re-discovering and appropriating anew, are performed. In no case is a Dasein, untouched and unseparated by this way in which things have been interpreted, set before the open country of a 'world in itself' so that it just beholds what it encounters.¹⁰

It is evident that this passage cannot be fitted into the context of a Wittgensteinian critique of language and meaning without further ado. Rather, it contains the key to a hermeneutic of language and refers to the so-called 'pre-structure of understanding being-in-the-world' and, as such, of an 'already' linguistically disclosed and so pre-figured pre-comprehension of the life-world. In *Being and Time* a dimension of temporality or historicity is therewith already in question, a dimension which, with Wittgenstein, is not articulated in this form. For Wittgenstein concedes that language games are historically engendered and are transformed. But he hardly ever investigates the historical dependence of our thinking upon the tradition of Western philosophy, a tradition which preoccupied Heidegger throughout his life. Wittgenstein prefers to construct functional models of as many simple language games as possible – 'objects of possible comparison', as he likes to call them – which are supposed to facilitate the description of everyday language usage. To this extent, Wittgenstein remains throughout his life a trained aircraft engineer who does not have much feeling for the humanities, while Heidegger continually embodied the *modus vivendi* of a philosophically and historically oriented scholar.

For all that, this distinction, which is certainly relevant, does not prevent the two kinds of analysis, the analysis of the 'everydayness' of understanding being-in-the-world, an analysis drawn from *Being and Time*, and the analysis of 'everyday' language games, bound up as they are with activities, concrete expression and world interpretation and representing as they do 'cross-sections of life-forms', from throwing light upon each other, substantiating and completing each other, at least in part.

In relation to the key points of the hermeneutical stance, cited by us, an even more direct relation between Heidegger and Wittgenstein can be set up. It is for example clear that Wittgenstein emphatically substantiates Heidegger's construction in the sense of an entanglement in the linguistic world interpretation and in the sense of having always already been

seduced by it. He would admittedly have placed less emphasis upon the aspect of a 'concealing-revealing' world disclosure made possible by the foregoing and more upon the aspect of everyday speech patterns and, to this extent, upon the emergence of the *vacuous language games* of philosophy, games which are no longer connected to a meaningful life-praxis.

But it is possible to establish direct correspondences with Heidegger even on the plane of just such a critique of meaning. Such a correspondence is for example to be found in *Being and Time* in the hermeneutical indication that we are only able to understand immanental objectivities made up of sense-data or pure presentations on the assumption that our ordinary understanding of the world assumes the form of being-in-the-world and, to this extent, uncovers the real being itself 'as something' in a 'relationship' or 'meaning context' – the 'roaring car', the 'motor bike' and the 'tapping woodpecker', not the corresponding noises in consciousness.¹¹ If we wanted to try and grasp our being-in-the-world as 'being-alongside' the immanental sounds in consciousness, *qua* sense data, such a 'being-alongside' could only be understood as a 'deficient modus' of being with things themselves – originally disclosed and comprehended as something. (Analytical philosophers would talk here of a parasitic relationship.)

Moreover, Heidegger not only established the Cartesian position with regard to immanental consciousness as a deficient mode of being-in-the-world, but – as an extension of this critique – also that represented by Husserl under the auspices of 'methodological solipsism', that is, the primordial 'solitariness' of the transcendental ego, which now figures as a deficient mode of being-in-the-world under the auspices of being-with-others.¹²

On the basis of this analysis of being-in-the-world and the world-understanding which belongs to it, Heidegger was able to formulate a hermeneutical equivalent to the epistemological critique of Descartes' dream argument in his own critique of Kant's demand for a proof of the 'existence of things outside me'.¹³ He shows that Kant set out from the Cartesian assumption of an 'isolated subject present at hand' and from the primacy of the inner experience of this subject and does not get beyond this assumption even in the proof of a necessary coincidence of the changing and the persisting through time. For this very reason, Kant has to concede that 'problematic Idealism' is both 'reasonable and in accordance with a thorough and philosophical mode of thought', and so 'allows for no decisive judgment until sufficient proof has been found'.¹⁴ Against this position, Heidegger contends that both the distinction and the connection of 'inner' and 'outer' in relation to my consciousness can only be rendered intelligible if the primacy of being-in-the-world as being alongside external entities has already been presupposed. (The corre-

sponding analysis of the way in which language games are learnt arrives at precisely the same result.) In this way Heidegger arrives at his conclusion that the 'scandal of philosophy' against which Kant rails consists not in this, that the proof of the existence of an external world has not yet been provided but in this 'that such proofs are expected and attempted again and again'.¹⁵

It is understandable that Heidegger's analysis of being-in-the-world as being-with should also lead to an equivalent conclusion relative to the traditional problematic of the existence of 'Other Minds'. Heidegger explicitly rejected the theory (represented by middle Dilthey and by Husserl) of the constitution of the other subject on the basis of 'empathy', for example through an analogical inference, because such a conception wrongly presupposes the reflective self-understanding of an isolated 'I' subject.¹⁶ In opposition to such a position Heidegger shows that 'empathy' does not constitute being-with in the first instance but 'is itself first possible on this basis' and 'gets its motivation from the deficiency of the dominant modes of being-with'.¹⁷ Even this phenomenological reference can be strengthened and deepened through a language-game analysis which starts out from possible ways of learning the meaning of personal pronouns, and in such a way that statements by Hegel, Humboldt, G. H. Mead and Rosenstock-Huussy on the equi-primordially and the reciprocity of communication roles thereby become applicable.

II.ii The deconstruction of world understanding and of the idea of truth in Western metaphysics in general

Up to now, the point of departure for my comparison of the positive results of the thinking of Wittgenstein and Heidegger has been the heuristic standpoint of the critique of mentalism and the methodological solipsism which goes along with it. My aim has been to bring out the hermeneutical-phenomenological equivalences in Heidegger. A still broader horizon opens up for the comparison when one sets out from Heidegger's 'destruction' of the ontology of pure 'presence-at-hand' or, in other words, from the standpoint of a hermeneutical-pragmatic analysis of the 'relational' world – more precisely, in Heidegger's sense: from the world as the 'wherein of self-referring understanding', i.e., the 'upon which' of a letting be encountered of entities in the kind of being that belongs to involvements.¹⁸ On one occasion, Heidegger formulates this conception of the pre-theoretical constitution of the life-world in terms of the possible structural pre-stages of any theoretical use of language.

Between the kind of interpretation which is still wholly wrapped up in concerned understanding and the extreme opposite case of a theoretical assertion about something present-at-hand, there are many intermediate gradations: assertions about the happenings in the environment, accounts of the ready-to-hand, reports on the situation, the recording and fixing

of the facts of the matter, the description of a state of affairs, the narration of something that has befallen. We cannot trace back these sentences to theoretical statements themselves, they have their 'source' in circumspective interpretation.¹⁹

It is clear that these passages can be read in the Wittgensteinian sense of a reference to the multiplicity of non-theoretical language games. Even with regard to the Heideggerian point – the founding of 'theoretical statements' about what is present in a pre-theoretical ('circumspective') 'interpretation' of the 'relational-world', it is possible to find a fairly close equivalence in Wittgenstein, namely – as has yet to be shown – in his pragmatically-oriented critique of the traditional absolutizing of that nominative or descriptive function of language in which the latter is referred to objects.²⁰ The basis of comparison which is in question here goes further than the Cartesian critique of meaning in this sense that, with Heidegger, as also with Wittgenstein, it reaches back to the beginnings of Western ontology and philosophy of language in Plato and Aristotle. Let us first consider Heidegger's 'destruction' of the ontological (or objectively theoretical) world understanding.

First of all we need to show that under the assumption of a purely theoretical distancing from beings as simply 'present-at-hand' something like a *de-worlding* has to make its appearance.²¹ This means: the connection of the 'significative-references' inherent in the life-world, in the sense of the relatedness or meaningfulness of entities, is dissolved. In so far as there is now only a 'staring' at the present-at-hand, nothing like a 'hermeneutical synthesis' of 'letting something be as something' is conceivable, and this implies that the basis for a predicative synthesis of the apophantical *logos* also falls away. Putting this together one might conclude: the fact that something is confronted as something standing over against presupposes that beings were encountered previously as something in a pragmatically relational-totality. And, according to Heidegger, this in turn presupposes that human Dasein as being-in-the-world is able to disclose the 'significance' of the world out of the horizon of being-ahead-of-oneself in the mode of 'care', and of 'concernful having to do with'. A purely theoretical consciousness of objects of the kind Husserl assumes is given originally is quite incapable of conferring 'significance' upon the world.²² (This circumstance was not properly thought through by Husserl even with his introduction of the concept of the 'life-world' in *Crisis*, which seeks to respond to Heidegger's *Being and Time*.)

I would however like to note here that this pragmatic conception of the life-world has to be applied even to the constitutional conditions of scientific theorizing and its connection with experimental *praxis*, if one wants to think with Heidegger beyond the Heidegger of *Being and Time*. For the latter cannot be rendered intelligible in terms of Heidegger's purely theoretical limiting case of being-in-the-world, which implies

simply staring at the present-at-hand. For example, the meaning-constitution of the categories of proto-geometry and proto-physics can only be re-constructed under the assumption of a human measuring practice, as Hugo Dingler and Paul Lorenzen and Peter Janich have shown.²³ Something similar is to be found with the category of the causal necessity of the succession of two events, for example, the expectation that, when iron is heated, it expands. This understanding of causal necessity, which differs from mere (Humean) regularity (as is seen in the proposition 'when iron is heated, the earth rotates'), can only be constituted – as G. H. Von Wright has shown²⁴ – on the pragmatic assumption that the experimental praxis of physics (and before that of human labour) is, through our intervention in the course of nature, able to bring about something which, without that intervention, would not have happened.

If one's point of departure is that these pragmatic conditions of the possibility have to be rooted in a world-constitution already presupposed by science, Heidegger's concept of 'de-worlding' can then be supported with a famous example from the history of philosophy, namely, David Hume's conclusion that nothing like a necessary relation between the occurrence of one natural event and a preceding or succeeding event can be discovered. In my view, Hume arrived at this conclusion simply because he conducted his analysis from the standpoint of a purely theoretical remoteness from the world, because he had abstracted altogether from the worldly involvement of experimental *praxis*. His discovery therefore depended upon a *de-worlding*. (I am, like Paul Lorenzen, convinced that even the most abstract relations (those, for instance, of logic and mathematics) would fall to the ground if, through a total abstraction from the life-*praxis*, we effected a de-worlding in Heidegger's sense.)

However, if the above-mentioned conclusions concerning life-worldly constitutional foundations apply equally to science, an important reservation must be voiced against the Heideggerian thesis about the ontological primacy of the relational world of concerned dealings (i.e., everyday being-in-the-world) over any world conception in the sense of *objectivity*, an objectivity founded by Descartes and Kant but already laid down in that understanding of being implicit in Greek ontology (e.g., nature as the being-there of things in so far as they belong together in a law-governed connection). A state of affairs makes itself known which is never taken into consideration in *Being and Time*. Between the existential relational-world, a relational-world which is itself related to a being-in-the-world founded in mineness or ourness and which is, to this extent, subjectively perspectival and historically pre-structured, and the limiting case of de-worlding which arises as the correlate of a simple staring at things (therefore of a complete disengagement from any life-*praxis*), between these two poles which were thematically articulated by

Heidegger, a world-understanding which takes on a destinal significance for the West emerges, that of an objective (and this means at least in principle intersubjectively valid) science. This world-understanding does indeed abstract, and in principle, from any 'purely subjective' (and so also from any collectively subjective) presuppositions but it does not abstract – as does the purely theoretical world-understanding outlined in *Being and Time* – from any practical involvement that, as an epistemological interest, might open up the worldly significance of a referential totality of signs. Rather, it does itself rest upon the quite unique 'discovery' of an objectivity which constitutes itself for every 'consciousness as such' and as that which can be measured and causally explained. That 'existential fore-structure' of the historically-determined world-understanding which first made possible the concrete theoretical constructions of science has not prevented scientific theories and experiments from being intersubjectively reproducible, and to this extent, universally valid.

What I have just pointed out was recognized by later Heidegger to the extent that in his concept of the *Gestell*, scientific world-understanding (an understanding whose roots can be traced back to classical ontology) is explicitly related to a *praxis* which furnishes the a priori conditions for the latter – that of technology.²⁵ But he fails to connect this discovery with any appreciation of the phenomenon of strictly *intersubjective validity*, which requires that scientific statements (as also those of philosophy) be validated through a procedure of argumentative discourse. Still less did he appreciate the circumstance that that objectivity which makes the world available to science does not have to lead to a scientizing conception of the world as absolute – a 'making available' in the sense of an 'enframing' – quite simply because the making-available of the world in the sense of the subject-object relation 'always already' presupposes that complementary communicative-understanding of one's co-subjects which proceeds from the existence of a discursive community. That through this complementarity a definitive success, i.e. an absolutization of methodologically reductive scientism is excluded a priori is even today hardly recognized.

Instead, late Heidegger will conceive of the objectivity of science (and the claim of philosophy itself to the intersubjective validity of its statements) as a merely contingent pre-condition of world-understanding, a pre-condition which is grounded in the 'thrown projection' of being-in-the-world – and, after the *Kehre*, this means in a world-establishing, epochal event in the history of being. I will come back later to this question of the threat represented by the above to the validation of philosophical statements, as also to Heidegger's statements about the historical conditions of the possibility (and validity) of Western science and philosophy. But first I would like to maintain that a peculiar reflective deficiency with regard to the constitution of objectivity (and

connected therewith to the intersubjective criteria of validity for a scientific experience – as Kant had shown) attaches to the genial analysis of the pre-theoretical relational-world in *Being and Time*. Already in *Being and Time* Heidegger had only the following to say about the meaning of the Kantian idealization of the epistemological subject in the sense of a ‘pure ego’ or a ‘consciousness in general’:

Is not such a subject a *fanciful idealization*? With such a conception have we not missed precisely the *a priori* character of that merely ‘factual’ subject Dasein? Is it not an attribute of the *a priori* character of the factual subject (that is, an attribute of Dasein’s facticity) that it is in the truth and in untruth equi-primordially?²⁶

After the turn introduced by Heidegger’s ‘hermeneutical revolution’ no philosopher is going to deny that the world-understanding which comes before the truth of science and which makes it possible has the character of ‘revealing-concealing’. But surely the possibility of the simple intersubjective validity – and of absolute truth in this sense – of the findings of science must therewith also become a questionable issue. Heidegger’s answer to this question in *Being and Time* can be found in the following passage:

There is truth only in so far as Dasein is and as long as Dasein is. Entities are uncovered only when Dasein is; and only as long as Dasein is, are they disclosed. . . . To say that before Newton his laws were neither true nor false, cannot signify that before him there were no such entities as have been uncovered and pointed out by those laws. Through Newton the laws became true; and with them, entities became accessible in themselves to Dasein. . . . That there are ‘eternal truths’ will not be adequately proved until someone has succeeded in demonstrating that Dasein has been and will be for all eternity. . . . Even the ‘universal validity’ of truth is rooted solely in the fact that Dasein can uncover entities in themselves and free them. . . . Why must we presuppose that there is truth? What is ‘presupposing’? What do we have in mind with the ‘must’ and the ‘we’? . . . ‘We’ presuppose truth because ‘we’, being in the kind of being which Dasein possesses, are ‘in the truth’.²⁷

But even this answer to the question posed by us with regard to the possibility of a strictly *intersubjective validity* remains ambiguous. That the truth of ‘propositions’ can no longer – as Thomas Aquinas and even Bolzano held – be regarded as independent of human knowledge on the ground of the creative knowledge of an ‘intellectus divinus’ can be accepted as following from Heidegger’s ‘methodological atheism’. But

that the validity of true statements for any 'epistemological subject in general' has to be regarded as relative to the temporal duration of a world-disclosure which belongs to human Dasein, is already problematic. In his first Kant book Heidegger tried to align his thesis with regard to the dependence of truth in general upon the world-understanding of human Dasein with Kant's transcendental philosophy, more specifically, with the first edition of the *Critique of Pure Reason* and not with the second.²⁸ But after the historico-ontological 'Turn' of his interpretation of human Dasein and its 'disclosiveness' as that of 'thrown-projection', Heidegger radicalized the thesis about the relativity of the truth as the unhiddenness of the world with regard to the temporal-historical Dasein of human being in this sense, that even this relativity can be understood as relative to a specific epoch in ontological history, for example, as the relativity of the concept of the universal validity of scientific and philosophical truth with regard to the epoch of metaphysics which began in Greece and which is coming to an end today. At this point, a difficulty inherent to Heidegger's philosophy can, I suggest, be noted, a difficulty to which we shall have to come back, namely, the *pragmatic contradiction* between the relativity thesis and its own claim to universal validity. For the historico-ontological relativization of the universal validity of truth will itself have to be true, that is universally valid, as an insight into the necessity of this very relativization, and this in a sense which cannot itself be relativized – and that means for any possible epistemological subject in the context of an ideal dialogical community of human beings as potentially rational beings.

Here we see that even the much vaunted *pragmatism* of the Dasein's analyses undertaken in *Being and Time* is ambiguous. It may well be that it displays – as Richard Rorty has suggested²⁹ – an affinity to William James' and John Dewey's reduction of scientific and philosophical truth to practically serviceable aims in the sense of the needs of (individual or collectively individual) human beings who happen to exist in a given world. But it has nothing to do with Peirce's pragmatism, for instance, with what Peirce, in opposition to James and Dewey, later called 'pragmaticism'. To be sure, the latter also interpreted the meaning of any possible true or false statement in terms of a possible life-*praxis*. But he also distinguished the intersubjective validity of experimental procedures and the dialogical *praxis* of an 'unlimited community of scientists' as the only possible regulative context for the pursuit of truth in practice. In distinction from Heidegger, he did not attempt to found the ultimate validity of truth upon the 'factual apriori' of being-in-the-world, but upon the ability of the truth to establish a consensus for all rational human beings, a consensus which is counterfactually anticipated in advance.³⁰

So much for Heidegger's 'destruction' of world-understanding and for

that idea of truth to which Western philosophy and science subscribe. With regard to what has already been said, where are we to locate the correspondence between Wittgenstein's critique of language and meaning and Heidegger's ambition to undertake a comprehensive philosophical destruction?

In the first place, a positive correspondence between language-game analysis and the pragmatically-oriented existential-hermeneutical analysis of the relational-world, together with the transition from world-understanding to the deficient mode of de-worlding (simply staring at what is present-at-hand) can very easily be found. It is to be sought in this, that the privileging of the denominative language game (taken for granted since the founding of ontological philosophy in Greece), a strategy pushed to the limit by Wittgenstein himself in the *Tractatus* through his characterization of objects and states of affairs, is radically called in question in his later language-game analysis. But it is not so much a matter of Wittgenstein completely giving up his earlier conception of name-giving and ostensive definition later on. Rather, he made it clear that a quite special language game operated here, one which always presupposed other language games which for their part were intimately bound up with the practice of a given life-form. The following passages from *Philosophical Investigations* will suffice to bring out these presuppositions.

The ostensive definition explains the use – the meaning – of the word when the overall role of the word in language is clear. . . . One has already to know (or to be able to do) something in order to be capable of asking a thing's name.

(*P.U.*, I, §30)

And:

When one shows someone the king in chess and says: 'This is the king', this does not tell him the use of this piece – unless he already knows the rules of the game up to this last point: the shape of the king. . . . Only someone who already knows how to do something with it can significantly ask a name.

(*P.U.*, I, §31)

A remark by Wittgenstein should also be seen in this connection, a remark which, so to speak, marks the semiotic equivalence with Heidegger's theory of 'de-worlding'. It shows how a self-sufficient theory of meaning-constitution through name-giving, taken out of the pragmatic context of language games bound up with life-forms, exactly corresponds to the transition described by Heidegger from contextual world-understanding over to the deficient mode of simply staring at the present-at-hand. Wittgenstein formulates this as follows:

Naming appears as a queer connexion of a word with an object – And you really get such a *queer* connexion when the philosopher tries to bring out *the* relation between name and thing by staring at an object in front of him and repeating a name or even the word ‘this’ innumerable times. For philosophical problems arise when language *goes on holiday*. And *here* we may indeed fancy naming to be some remarkable act of mind, as it were a baptism of an object.

(*P.U.*, I, §38)

To the Heideggerian limiting case of ‘de-worlding’ (in which what is present-at-hand is simply stared at and so can have no more ‘meaning’ for us), there corresponds, with Wittgenstein, the limiting case in which language ‘goes on holiday’, that is, is no longer bound up with its use in a given *life-praxis*. In this limiting case, it is indeed only possible to substitute a name for the ‘this-there’, a name which no longer carries with it any intelligible meaning. And this naturally implies that under these conditions the constitution of the meaning of linguistic predicates cannot be rendered intelligible.

It is therefore quite impossible to found a universally valid theory of linguistic meaning by the co-ordination of pure ‘sensations’ with ‘logically proper names’ as the elements out of which a given world can be constructed, as Russell, for example, wanted to do. Rather, the naming language game – or even the question concerning the correct way of naming some given entity – already presupposes those very language games in and through which the context of a *life-praxis* determines the possible role of words in the language game and so also, to this extent, their meaning.

We are now in a position to pull together the philosophical achievements of Wittgenstein and Heidegger. I would like to appeal here to the concept of the ‘life-world’ employed by late Husserl and advance the thesis that Wittgenstein and Heidegger each discovered the life-world in their own way and, moreover, that they were able to work out this concept (in opposition to the world-conception of the philosophical tradition) in a much more radical way than Husserl was able to do in *Crisis*.³¹ To be sure, Husserl had seen that the abstract idealizing objectification of European science presupposed the emergence of meaning out of the life-world (and so had to be understood philosophically out of the latter). But, as the last classical representative of the post-Cartesian philosophy of consciousness, he assumed that even the meaning-constitution of the life-world and its intersubjective validity *could* be traced back to the intentional operations of a solipsistically transcendental consciousness, an ‘I think’ and, in the last analysis, *had to be* so understood. That the meaning-constitution of the life-world, as publicly valid, was always dependent upon language and that, to this extent, it was always depen-

dent upon a historical and socio-culturally determined life-form, was something he did not appreciate.

While with Husserl the pre-linguistic intentional operation of an Ego consciousness is supposed to found the meaning-constitution of the life-world, it is this very life-world which, with Heidegger and Wittgenstein, assumes the role of the ultimate bedrock: with Heidegger, in the form of a historically determined 'thrown projection' of 'being-in-the-world' and, with Wittgenstein, in the form of the 'life-forms' which make up the background of those very 'language games' which have already been taken account of. In fact, bound up with the latter we find insights into the quasi-transcendental conditioning of our world and self-understanding, beyond which, at the present time, philosophy cannot go back. Belonging thereto we find, on the one hand, the insights mentioned by me concerning a critique of the meanings involved in metaphysical pseudo-problems, meanings which rest upon the non-reflection upon the linguistic a priori of language games and, on the other side, the corresponding existential-hermeneutical insights into the dependence of our positive understanding of worldly significance upon human being-in-the-world and, in connection therewith, upon the worldly disclosiveness of historical language(s).

With reference to this linguistically and historically conditioned pre-understanding of the life-world, we are no longer able to go back to a null-point of presuppositionless thinking about whatever is present, for example, to the self-givenness of phenomena. This can today be regarded as generally accepted by a philosophizing which has gone through the linguistically pragmatic and hermeneutically-oriented turn introduced by Wittgenstein and Heidegger. That things are like this can also be shown through a complementary turn in the philosophy of science which, since Thomas Kuhn's analysis in *The Structure of Scientific Revolutions*, has also brought out the dependence of scientific thinking and its possible development upon a historically conditioned agreement between a community of scientists.³²

This reference to Kuhn's philosophy of science, in which Wittgensteinian motifs join together with motifs drawn from the hermeneutical philosophy inspired by Heidegger (and Gadamer) is intended to point to the questionable suggestions inherent in Wittgenstein's and Heidegger's thinking: the absolutization of the contingently a priori, the historically conditioned life-world, which does not lend itself to the forming of a consensus because it calls in question the conditions of the possibility of a universal philosophical consensus. I am here deliberately harping upon the pragmatic requirement of philosophical consistency, that is, upon the requirement of avoiding any *performative contradiction* in the argumentation. And I am drawing attention to the fact that, in his *reductio ad absurdum* of the Cartesian dream argument in *On Certainty*, Wittgenstein

himself offered an example of the very self-suspension of a philosophical language game which has to be avoided.

With reference to Heidegger I have already had occasion to point to the danger which results from the inconsistency inherent in his destruction of that idea of truth which underlies Western metaphysics. Let us now take a closer look with reference to Wittgenstein. Consider Wittgenstein's radical critique of the vacuity or the 'disease' of language games. As is well known, in his *Philosophical Investigations* Wittgenstein did not really take back the dictum of 'non-sensicality' expressed in the *Tractatus*, a dictum directed against the propositions of philosophy in general – including those of the *Tractatus* itself – at least, not in the form indicated there. For he did not answer the question of how that critical language game of philosophy, the language game in which one talks about language games in general (their function and dis-function) and so is able to 'show the fly the way out of the fly-bottle', is itself possible and valid. To these questions, he seems only to have given critically therapeutic answers which apply equally to the language game needed to cure the disease and which, at the very least, seem not to recognize that the legitimacy of his characterization of philosophical problems in general as a linguistic disease itself rests upon a specifically philosophical insight which lays claim to universal validity (cf. especially *Philosophical Investigations* (P.I.), I, §§133, 255, 309).

If, as has been shown, the proof of the self-suspension of the philosophical language game through the performative self-contradiction involved turns out to be the most radical form of the critique of language and meaning, it then becomes possible to think with Wittgenstein against Wittgenstein and to conclude that the recommended programme of a *total self-therapy of philosophy as a disease* proves to be defective. It then becomes possible to counter the exaggerated emphasis laid upon the contingently a priori character of the many life-forms, for instance, that of the historically-determined own life-world, with one argument which, in the final analysis, so far from reclaiming a metaphysical standpoint beyond language and the world, simply recognizes the impossibility of getting behind that language game which is philosophy as the legitimate form of reflection with regard to all thinkable language games and life-forms and, to this extent, of any historically conditioned life-world.

And so I come to the second part of my comparison between Wittgenstein and Heidegger.

III Philosophy: self-criticism or self-suspension?

Thomas Kuhn's theory of the 'paradigms' of the history of science can with good reason be taken up as a particularly instructive example for

the convergence of the historical efficiency of the thinking of Wittgenstein and Heidegger. For the concept of a paradigm, a concept which is introduced by Kuhn in the double role of the positive condition of the possibility and of the historical relativization of scientific progress,³³ this central and multi-faceted concept can be elucidated both out of the perspective of Wittgenstein's language games and their paradigms of 'certainty' and out of the perspective of the epochal revealing-concealing establishment of the world in Heidegger's history of being.

Seen from a Wittgensteinian perspective, Kuhn's 'incommensurable' paradigms of science and their possible development appear as illustrations of the idea that language games, as parts of 'life-forms', are 'bound up' with 'activities' and grammatically conditioned a priori valid forms of world-interpretation. To this extent they function as 'norms' for language usage, experimental *praxis* and for any acceptable research findings which can be expected to yield true or false conclusions and which for this reason cannot be called in question by empirical science since they have to be known a priori as conditions of the possibility of the functioning of the scientific language game and the *praxis* which belongs to it. The provocative point of the Kuhnian paradigm concept (both for the traditional linear representation of progress and for the unitary rationality of science) is to be sought along the lines of Wittgenstein's suggestion that one cannot go behind the multiplicity and the variety of language games and the life-forms which support them, that the multiplicity of life-forms, functioning as they do as the background for the different language games, can even make comprehension through the medium of language impossible. Lions, for example, could not be understood by us humans even if they could talk;³⁴ more pertinently, a similar limitation of our understanding must perhaps be assumed for the understanding of foreign human life-forms, i.e., so-called primitive cultures.³⁵

To this primarily synchronous relativism of the Wittgensteinian perspective there now largely corresponds the primarily diachronic relativism of epochal world-clearing which (as has been shown above) with Heidegger emerges out of the historical transformation of a Dasein-related concept of truth as 'disclosure'. Above all it is the following intellectual configuration which seems to correspond to the function of Kuhn's concept of a paradigm. In a later statement in *Zur Sache des Denkens*³⁶ Heidegger conceded on the one hand that it would be 'inappropriate' to interpret his concept of world-clearing (for example, revealing-concealing or *a-lethia*) as the 'original concept of truth'. For the element of correctness, in the sense of a correspondence with something pre-given, is lacking. On the other hand, he emphasized once again that, with the concept of 'lighting', a dimension had been opened up which systematically preceded the traditional concept of truth. For in this instance it

was a question of the condition of the possibility of true or false judgments, i.e., statements about beings.

The connection of this intellectual configuration with the function of the Kuhnian paradigm is clearly to be found in this, that in both cases in which the possibility of an advance in knowledge is in question – including the process of verification and falsification – the latter is, in a one-sided manner, made to appear dependent upon a preceding condition. To Kuhn's normative paradigm there corresponds Heidegger's clearing, a clearing which, as linguistically world-disclosive, first opens up the meaning-horizon for possible scientific questions. And true or false judgments must, as Gadamer has shown, be understood as answers to actual, or at least to possible, questions.³⁷ To this extent it would be true to conclude that the findings of Western science in general are dependent upon paradigmatic meaning or interrogative horizons, horizons which could not be opened up at all in cultures with different linguistic modes of world-disclosure – for example the Hopi Indians of New Mexico.³⁸ At this point the convergence between Heidegger's hermeneutical understanding of language and Wittgenstein's analytical understanding of language games becomes even clearer.

One difference between Heidegger and Kuhn or Wittgenstein seems to consist in this, that the uncovering-covering, meaning-clearing inherent in Heidegger's understanding of Western world history is as a whole quite explicitly characterized by the 'event' of the founding of philosophy as metaphysics by the Greeks. To this extent, the different scientific paradigms which follow therefrom can obviously not be regarded by Heidegger as 'incommensurable' in every respect since they have to be understood as consequences of the founding of metaphysics. The point of Heidegger's supposition is to be found in the thesis that already in the metaphysical uncovering of the meaning of being with Plato – that is, in the so-called 'theory of Ideas' – the mode of uncovering of the world assumes the form of the subject-object relation and therewith also of an 'enframing' of scientific technology, that is, of the technological science of modern Europe.

By comparison with this Heideggerian vision (which corresponds to his life-long attempt at a reconstruction and destruction of Western metaphysics) the Wittgensteinian representation of infinitely many language games and life-forms is, on the one hand, and as we have already noted, marked by an a-historical intellectual model – especially in the transitional period between the *Tractatus* and the *Philosophical Investigations*. On the other hand, it is illustrated in late Wittgenstein along the lines of ethnological examples and, globally, with reference to the idea of a 'natural history'.

These differences do not however make it impossible for us – as the example of Kuhn has already shown – to establish a convergence of the

Heideggerian and the Wittgensteinian perspectives, in the sense, too, of a relativistic and historicistic orientation of Western philosophy in general. Frequently these very characteristics are rejected as a misunderstanding – as the consequence of a way of thinking which is itself metaphysical and which has not learnt how to assimilate the new standpoint ‘beyond relativism and objectivism’. At the end of my paper, I would like to resist precisely this suggestion.

To this end, I would like first to set out what, in my opinion, constitutes the most important philosophical results of the historically effective convergence of the intellectual claims of Wittgenstein and Heidegger. With Heidegger the most important claim consists in this, that meaning-clearing and the truth which, in the final analysis, is dependent upon it, must be thought as a meaning- (or truth-) *event*, that is, in its most radical accentuation. Even the insight – opened up with the philosophical truth claim – that our ability to pose questions is genetically dependent upon the clearing-event of the history of being is clearly, according to Heidegger, itself dependent upon the temporal occurrence of the history of being for its validity. The *logos* of our thinking (for instance, our argumentative procedures) which was above all taken to be independent of time by the Greek founders of philosophy now has to be regarded as dependent upon the ‘other of reason’ – the temporality of being. Nevertheless, it should be possible to frame this insight in the form of a universally valid philosophical thesis about the history of being. Is this claim, a claim which has been carried over from Heidegger into philosophical post-modernism, tenable from the standpoint of a critique of meaning? Or does it not rather lead to a self-suspension of the language game of philosophy?

With a view to answering these questions, we shall have recourse to Wittgenstein’s critique of language and meaning. However, it must be said that Wittgenstein and the Wittgensteinians do not offer much in the way of helpful objections but rather tend to complete and to strengthen the Heideggerian claims. To be sure, Wittgenstein tirelessly traced the disease of seemingly unsolvable philosophical problems back to a misunderstanding of the function of language. And in this sense he did indeed – as shown above – take into consideration the phenomenon of the self-suspension of the philosophical language game. But he never applied these kinds of analyses in a strictly reflective manner to his own, suggestive statements about philosophy as a disease resulting from a misuse of language. Above all (and particularly after the paradoxical self-suspension of the philosophical language game in the *Tractatus*) he never again posed the reflective question concerning the linguistic conditions of the possibility of one’s own language game, that is, the question concerning the presuppositions not of the pseudo-language games of metaphysics which were to be critically resolved by him, but about the

language game involved in his own critically therapeutic philosophy which, clearly, could only 'show the fly the way out of the fly bottle' and cure the sickness through linguistically formulated insights, and not through the dispensing of medicaments.

At this point, we have to take account of the following circumstance. The well-known statements by Wittgenstein on the method of philosophy as, for example, 'we may not advance any kind of theory. . . . We must do away with all explanation, and description alone must take its place' (*P.I.*, I, §109) or 'Philosophy simply put everything before us and neither explains nor deduces anything. Since everything lies open to view there is nothing to explain. For what is hidden, for example, is of no interest to us' (*P.I.*, I, §126). Statements of this kind certainly attest to the originality of his method. But they do not make it clear to what extent they make it possible for Wittgenstein to communicate, through the summoning-up of examples, those insights into the 'workings of our language' (*ibid.*, §109) which should help us to get things 'straight' and which are so complete 'that philosophical problems should completely disappear' (*ibid.*, §133). It is just not enough to simply set out, or to describe, the everyday language games on the one hand and, on the other, the empty language games of philosophy. Rather, it is necessary to at least point out the reasons – that is, the universally valid insights of philosophy – which make it possible to play off the one language game against the others. These reasons are at least suggested by Wittgenstein in his ever-renewed intimations toward philosophical theory-building at the level of a specific philosophical language game in which he, as much as any other philosopher, was obliged to participate.

Here we run up against a *reflective deficiency* which is bound up with his – in many instances helpful – predisposition for the 'pure describing' of examples. Certainly it is possible – as Wittgenstein's work demonstrates – to correct the a priori assumptions and over-hasty generalizations of systematic philosophy with the analysis of examples. But one cannot hope to render intelligible in this way the specific claims to validity of all philosophical statements – even those statements which bear the brunt of the critique of language and meaning. To put it otherwise; one cannot render intelligible the actual function of philosophical language games through language-game analysis in this way; that one presents this language game as just one language game among others or alongside others, which means, embedded in a particular form of life with particular 'conventions', 'uses', or 'customary practices'. For the claim that is raised by the philosophical language games practised by Wittgenstein in the descriptive presentation of particular 'conventions' has to rise above the embedding of all language games in particular life-forms and, to this extent, above the facticity and contingency of all language games and life-forms and so express something that is universally valid. This

unavoidable claim to universality can only be rendered intelligible in the following way, that one seeks to analyse the function of the philosophical language game in strict reflection³⁹ upon what one does and presupposes as a philosopher, with the description of particular language games and life-forms. Such a methodological claim would however, at least for the post-*Tractatus* Wittgenstein, be taboo – as though, for the pragmatic language-game analysis, the view oriented toward the semantics of the statement were still true, the view namely, that any actual reflection upon language has to lead to semantic antinomies.⁴⁰

A radically pragmatic questioning of the semantic paradigm, of the kind introduced by Wittgenstein in his language-game theory, leads however to the conclusion that the pragmatic function of language games must also be analysed, which means suspending the semantically-oriented prohibition against the self-reference of the speech act. Only in this way does one find oneself in a position to recognize the denial of the specifically philosophical claim to universality as a performative contradiction and, to this extent, as the self-suspension of the philosophical language game.⁴¹

As things stand today, Wittgenstein's one-sided and unsatisfactory thematization of the philosophical language game – just like Heidegger's one-sided (forgetfulness of the *logos*) analysis of the facticity of being-in-the-world (as a historically 'thrown projection') has tended to promote a very general confusion concerning the self-understanding of philosophy and to provoke an era of pragmatically inconsistent philosophical statements. I would like to support this with reference to two famous Wittgensteinian theses: the argument against the possibility of a 'private language' and the argument against the possibility of universal doubt in *Über Gewißheit*.

In both cases I am deeply indebted to Wittgenstein's theses. And I would here like to interpret these theses in a transcendently pragmatic fashion – as I have attempted to do elsewhere.⁴² What does this mean?

In the case of the argument against the possibility of a private language, the emphasis should be placed on two points:

(1) It is not possible to talk meaningfully about a person S following a rule – for example, speaking a language – if it is not in principle possible for other subjects – for a community – to control the following of the rule on the basis of public criteria which make it possible for them too to follow the rule, for instance, to enter into communicative relations with the person S.

(2) In addition, the following must also be emphasized. The person S – e.g., the speaker S – must link up with an already existing procedure for rule-following – e.g., an actual language usage. To this extent, one might say, he is in fact subjected to a *factual a priori* and to *historicity*.

These two requirements can be grounded in a pragmatically transcendental manner. Their rejection through arguments which must be capable of eliciting acceptance must lead to a performative contradiction in the argumentative procedure. The latter could not of itself avoid the objection of having, in the course of his argumentative procedure, followed a rule which is in principle private. For in that case he would have suspended the language game of arguing – rather like the one who says (or thinks): ‘Perhaps I am always dreaming.’

So far, so good. But the difficulties with Wittgenstein’s argumentative procedures begin when one asks with him the question who – on the basis of what criterion – decides whether a rule – e.g., addition in arithmetic – has been followed correctly. Two possible answers for Wittgenstein can be distinguished here, even though both will have to be rejected in the end.

(1) The possibility of recurring to the remembered rule-following intentions of individual subjects as the actual states of a possible inner experience. Here Wittgenstein can quite appropriately object that in inner experience no distinction can be established between following the rule correctly and thinking that one has followed the rule correctly. The last of these alternatives can only be subjective, as I have already pointed out earlier.

(2) For Wittgenstein the possibility is also excluded of positing the criterion of validity for following rules with Plato or Frege – or with Karl Popper – as the ideal content of a third world (beyond the material outer world and the subjective world of inner experience). Wittgenstein is always able to object to such a rule-determining Platonism⁴³ that it is by no means clear how the individual subjects of the rule-following procedure are going to relate, or be referred to this ideal criterion without once again recurring to the purely subjective evidence of their inner experience. They cannot have recourse to the ideal rule-following criterion in the same way that one has recourse to a public timetable.

If things are like this however, then what remains of the possible criterion for correct rule-following? Painfully tedious passages in the *Philosophical Investigations* and in the *Remarks on the Foundations of Mathematics* are devoted to thought-experiments which show, over and over again, that a rule – e.g., addition – could be followed quite differently from the way that is normally supposed and that these discrepant rule-following procedures cannot be excluded on the grounds that we would be referred to a mental fact pertaining to the intention to follow a rule. How then is it going to be possible to distinguish between ‘right’ and ‘wrong’?

Wolfgang Stegmüller has characterized the calling in question of ‘rule Platonism’ by Wittgenstein as follows: Wittgenstein rejects even that

objectivity which is recognized by mathematical intuitionism. In Wittgenstein's sense one could say:

that, in so far as we have explained the meaning of a logical expression by means of a convention, we should think that such and such must now be recognized as a logical truth or as a logical inference – *this* is once again simply a new form of the platonic myth. . . . It is the belief in a logical 'must', in a logical necessity which forces us even if only in the form of the binding consequences of specific assertions.⁴⁴

If however we are serious about letting go of these presuppositions what possible meaning can it then have to raise questions about the problem of 'rule Platonism' on the plane of philosophical discourse? Surely, at least on this plane, are we not assuming the 'unconstrained constraint' (Habermas) of arguments as an irradicable element?

As a matter of fact, it seems to me that Wittgenstein's point does not consist in saying that I can decide *ad hoc* that 'this sentence or that relation has to be regarded as irrefutable, so that nothing could count as an objection' (Stegmüller), even though it must be conceded that the non-necessity of the criteria of rule-following can be rendered intelligible in the light of 'rule Platonism' in the sense of decisionism. But then in what, according to Wittgenstein, is the *non-arbitrary* basis of the 'criterion' of rule following – e.g., linguistic usage – supposed to consist?

It seems to me that no other answer can be found in Wittgenstein's work than a reference to actual rule-following customs in actual situations in an actual rule-following community – in the same way as his theory of meaning relies, in the final analysis, upon actual linguistic usages under pragmatically determined circumstances. This is, or so it seems, the sense in which such typically obstinate expressions of later Wittgenstein are to be understood: 'this language game is played' (*P.I.*, I, §654); 'this is simply what I do'; or more explicitly: 'If I have exhausted the justifications I have reached the bedrock, and my spade is turned. Then I am inclined to say: "This is simply what I do." ' (*P.I.*, I, §217). And finally: 'What has to be accepted, the given is – so one could say – forms of life' (*P.I.*, II, p. 226).

If one takes these communications as ultimate answers a whole series of difficult questions immediately arises. What happens with innovations in the rule-following procedure – in the context of scientific progress for instance, or in an ethical or political context? Is it its correspondence with the actually existing usages of a community which provides the criterion for establishing a consensus over the right way to follow a rule or even over which rule or norm should be followed? Charles Peirce called this the 'method of authority', a method which is superseded by philosophy and science.⁴⁵ Or should the answer to our question even lie

in Wittgenstein's talk about learning through a 'training' (or drill) by way of a 'blind' following of rules? It seems to me that this affirmation of Wittgenstein's can only mean that the learning of rules by children cannot begin with an interpretation (and the equivocation which belongs thereto) since the field for possible rule-interpretations is in principle unlimited and therefore does not lend itself to 'usages' which could be adopted along these lines. In my opinion, on the Wittgensteinian assumption of a learning through 'training', it is in turn not explicable how human children, in distinction from animals, are able to develop a capacity for interpreting and reflecting upon rules which manifests itself in a communicative competence that is not tied down to the linguistic competence of using one's mother language, but consists, for example, in an ability to translate out of one language into another.

The following question, a question which moves beyond the conception of the learning of rule-following, in the sense of the following of an already-existing usage, seems to me to be decisive: is it possible for Wittgenstein to argue that an individual (for example, a scientist or a philosopher or a reformer of customary practices) might be right against everyone else and might be capable of convincing them that his own conception of rule-following is the right one in cases where a dispute arises concerning the right way of following a rule or even concerning the right rule? Unless one is going to observe and describe language games behaviouristically from the outside rather than as intelligible components of a cultural reality in which the describer must be capable of participating, the latter must be possible. And then it is going to be necessary to allow for a relation of reciprocity between a rule-following community and an innovator of new rule-following procedures or between the former and the philosopher who describes language games and life-forms. In which case the same problem arises anew: on the basis of what criterion can one or should one arrive at a consensus over the right rule-following procedure?

Faced with this situation I have, with Charles Peirce, J. Royce and G. H. Mead, fallen back upon the normative conception of an ideal consensus to be established within an ideal and unlimited communicative community, that is, upon the conception of a regulative idea regarding the building up of a consensus over rule-following. In this connection the latter also leads to a regulative Idea regarding the normatively correct meaning of concepts (as for example over the simultaneity of two events or over justice or truth) which, in accordance with the 'pragmatic maxim' of Peirce, has to be tried out first in thought-experiments and therefore does not have to be reducible to actually existing linguistic usage even though it has to stand in relation to the latter. So it has to be emphasized that there would also have to be publicly accessible criteria for the establishment of a consensus in any post-conventional situation in which

a consensus had to be established (experimental evidence, logical coherence and incoherence or even requirements or interests which could be transformed into morally valid claims) and this whether we are talking about scientific language-rulings or extensions of knowledge or a matter of the practical founding or application of norms. Such criteria would never be sufficient in themselves to build up a consensus. However, in the context of an experience which could be brought under the regulative principle of an ideal consensus, they could furnish the basis for a preliminary consensus, as also for a calling in question of any actual consensus with a view to arriving at a better solution to relevant problems.⁴⁶

But this transcendently pragmatic way out seems in the end not to be reconcilable with Wittgenstein's suggestions. In any case, this is the impression one gets when one tries to understand the convergence between the historical efficacy of Wittgenstein's thinking and the American neo-pragmatism of our times. Richard Rorty has done us the service of openly drawing all those radically relativistic and historically bound consequences of the thinking of Wittgenstein and Heidegger, which consequences are ordinarily only drawn in a marginal way. I mean such consequences as the denial of all universal (and if possible also transcendently founded) criteria of philosophical discourse and also the ethically relevant thesis with regard to the necessity of falling back upon the only available basis for a consensus, namely, that of a contingent life-form, for example the political and cultural tradition of America.⁴⁷ Fortunately, it is a matter here of a tradition which, in distinction from the politico-cultural tradition of the Nazis in Germany, itself goes back to an institutional foundation which has not betrayed its philosophical legitimation with reference to universally valid principles, those of the rights of man. In this way Rorty is able to avoid the philosophical call to universal criteria of rectitude with reference to a political allegiance to rights already institutionalized in the American constitution; with the result that only the pragmatic inconsistency of the philosophical thesis – itself obviously claiming universal validity – that in a philosophical discussion one can only fall back upon a contingent basis for establishing a consensus remains indicative of the paradox inherent in this understanding of Wittgenstein.

The paradox of an understanding of Wittgenstein which relies upon an actual 'usage', for example a 'life-form', which is even more crass than that of Rorty is to be found in the Norwegian philosopher Viggo Rossvaer. For the latter has advanced the thesis that one can see – in so far as one has been taught to see by Wittgenstein – that in a certain sense even the SS in Auschwitz could have been observing the 'categorical imperative'.⁴⁸ This argument is supported by the claim that Wittgenstein has shown that the concept of a rule only becomes meaningful in conjunction with the appropriate application within the context of an

actual life-form; to elaborate: the meaning of a rule is not given in a *counter-factual anticipation of a possible practice* which can be represented as the correct application of the rule in Peirce's sense.

It is perfectly obvious that the understanding of Wittgenstein illustrated above actually operates a suspension of the good sense of anything that might be called a rule – and especially any meaningful moral norm. For the latter are clearly only there – at least upon the plane of a *post-conventional* human culture – to provide a point of orientation for the practice, and that means: calling forth in advance and legitimizing a comportment in conformity with the rule through an application appropriate to the situation. One often has the impression with Wittgenstein that the post-conventional function of rules and norms has to be traced back to just such conventions and usages which always already preclude any possible explication and justification of the normative meaning of rules. And this fits in well with the conservative and populist tendency (inherent in the idea of a therapeutic philosophy) to suppose that in the life-world prior to philosophical clarification and its artificially constructed and so irresolvable pseudo-problems everything is already in order, both with respect to language usages which are intricately bound up with a *life-praxis* as also with respect to what Hegel would have called 'naively substantialized moral conventions'.⁴⁹

It is admittedly – perhaps – possible to interpret the ultimacy Wittgenstein attributes to language games (or the practice of a life-form which upholds them) in another sense. And this second interpretation can, in particular, be supported by the last writings *On Certainty* where statements can be found such as the following:

Any proof, any validation or invalidation of a claim already takes place within a system. This system is not a more or less arbitrary and dubious starting point for all our reasonings. Rather it belongs to the very essence of what we call an argument. The system is not so much the point of departure as rather the vital element of the argument.

(Aphorism 105)

Here it is once again pertinent to think about a transcendental-pragmatic interpretation of the impossibility of going beyond or behind the language games constitutive of *philosophical argumentation*, and in particular: the paradigmatic certainty of those presuppositions whose denial inevitably leads to the suspension of the philosophical language game. As a matter of fact, interpretations are to be found which do adhere to such a conception.⁵⁰ However, it seems to me today that they cannot be presented as Wittgensteinian interpretations, for the simple reason that Wittgenstein never reflected upon (and indeed never noticed) the difference in principle between those life-forms which are always presented in

the plural and so as already contingently relativized and the discursive language game of philosophy itself in which a relativization of the many contingent life-forms, together with that paradigmatic certainty which belongs to them, can be carried through. It is therefore more plausible to conclude with Peter Strawson that Wittgenstein's argumentative procedure in *On Certainty* is to be understood as 'soft naturalism' and, to this extent, as the de-transcendentalized substitute for the foundational claims of transcendental argumentation.⁵¹ The point would then be the following, that in place of the foundational claims of transcendental philosophy it would become apparent that it is simply unavoidable that certain presuppositions of the argumentative procedure (together with the life-*praxis* that goes along with them) should be presented as certain.

Many people today would be pleased with this. They would like to see an alternative to a transcendently pragmatic foundation for philosophy – even for Ethics. However it does seem to me that, with Strawson (who has given his assent to this view), the decisive objection against such a substitution thesis has been voiced. For any philosophy which adopts a practical standpoint the task remains of distinguishing between the universally valid presuppositions of its critically reflective language game – the argumentative discourse – and the purely contingent, historically conditioned presuppositions which make up the background of the life-world, that is, of the many and various life-forms.

But for those who in a certain sense belong to a given life-form (e.g., a given language game) the latter would also furnish an *ultimate bedrock*. To be sure, it is only in a historically factual sense (in Collingwood's sense) that they are ultimate. On the other hand, since the philosophical enlightenment in Greece and again in modern times, they are already relativized by philosophical discourse as non-ultimate. Only those presuppositions – presuppositions of the entire argumentative procedure – are in a strict and methodologically relevant sense ultimate which function in the self-reflective language game of philosophy as conditions of the possibility of the relativization of all specific life-forms and which, in so far as they must still be presupposed cannot be challenged along with the condemnation of the performative contradiction involved in philosophical argumentation; as, for example, the presupposition that in any argumentative discourse a whole series of claims to validity are always going to make themselves known, and amongst these are the universal claims to validity and consensual legitimacy of certain basic moral norms.⁵²

It is easy to see today that it is no longer possible to found a concrete life-form (e.g., some form of customary morality in Hegel's sense or even any recommendation for the individual realization of the good life) on the basis of such universally valid presuppositions of philosophical discourse alone. The only ultimately founded and universally valid

discursive principles are those which are formal and procedural, which, as such, moreover establish limiting conditions for the complementary task of realizing the good life with respect to concrete, historically-evolved life-forms. On the basis of this complementarity thesis, a tendency inspired by Wittgenstein and/or Heidegger, a tendency shared by so many contemporary philosophers such as P. Winch, late Rawls, Rorty, Williams and MacIntyre, a tendency which consists in understanding moral norms simply as the reflective convictions of a historically contingent life-form, this tendency not merely becomes intelligible but begins to betray its limitations.

What seems to me to be decisive here is the assumption of the unavoidable complementarity of the ultimate presuppositions of philosophical discourse, on the one hand, and the contingent presuppositions which lie at the root of concrete life-forms, on the other. From the standpoint of the philosophical presuppositions of Wittgenstein and Heidegger such an assumption does not seem to me to be possible. In both cases it is obstructed by a certain forgetfulness of the *logos*, that is, a reflective deficiency with regard to their own intellectual and argumentative presuppositions. With Wittgenstein this leads quite obviously to a tendency to confuse his own philosophical language game with the descriptively objectifiable and, at the same time, contingently relativized language games – together with the concrete life-forms which underlie them. With Heidegger it leads to a deliberate overstepping of the philosophically universal validation of his own claims in favour of a hermeneutics of the facticity of understanding being-in-the-world; and this means in *Being and Time*: the temporality and historicity of ‘thrown projection’. In the late work it goes even further in the direction of a total historicism, a reduction of the philosophical *logos* itself to an epochal event in the history of being. As was mentioned earlier, so-called post-modernism latches on at this point to a thinking which starts out from the standpoint of an ‘alternative to reason’.

I hardly need to emphasize that I find in this outcome of the historical impact of two outstanding thinkers of this century the signs of a dangerous crisis in philosophy. Instead of moving towards a critique of meaning and a hermeneutical clarification of the presuppositions of philosophical and scientific thinking that would deepen and complete the previous phases of philosophical enlightenment and critical thinking, we seem to be moving towards a paralysis of post-conventional reason. The reflective concern for the rationality of argumentative discourse, a concern which lies at the root of both philosophy and science and which even today still links them together, this concern is (to the extent that there is any awareness of it left at all) understood to be just a reflex reaction left over from a contingent ‘usage’ or a hangover from a ‘metaphysical’ epoch

in the history of being. 'What people accept as a justification – is shewn by how they think and live' (*P.I.*, I, §325). Indeed!

Baynes *et al.* (eds), *After Philosophy: End or Transformation?*, pp. 26–66. Cf. also my argument with Rorty in K.-O. Apel, *Diskurs und Verantwortung* (Frankfurt: Suhrkamp, 1988) pp. 394ff.

48 Cf. V. Rossvaer, 'Transzendentalpragmatik, transzendente Hermeneutik und die Möglichkeit, Auschwitz zu verstehen', in D. Böhler, T. Nordenstam and G. Skirbekk (eds), *Die pragmatische Wende* (Frankfurt: Suhrkamp, 1986), pp. 187–201.

49 In my paper 'Wittgenstein und das Problem des hermeneutischen Verstehens' (1966), reprinted in *Towards a Transformation of Philosophy* (London: Routledge & Kegan Paul, 1980), I have already advanced the thesis that late Dilthey's distinction between 'pragmatic' and 'methodological-hermeneutical understanding' opened the way for an important critical re-evaluation of Wittgenstein's contribution to the theory of understanding. Today I would want to give this point even greater emphasis, as follows: Wittgenstein's clarification of understanding seems to reach just as far as Dilthey's concept of 'pragmatic understanding', for which Dilthey, just like Wittgenstein, adopted as his criterion of validation factual agreement in a comportmental *praxis* (e.g., in a 'common sphere' of work). According to Dilthey however, the conditions of the possibility and the criteria of validity are precisely not made available in this way for a – I would like to say: post-conventional, e.g., post-traditionalist – 'methodological understanding' of 'hermeneutics', for instance, for the understanding of foreign cultures or documents stemming from one's own culture from which one has become estranged. Here, where the hermeneutical reflection upon post-Enlightenment culture took its start, it is not possible to adopt the factual agreement in comportmental *praxis* as a sufficient criterion for reciprocal understanding (otherwise, it would have to be admitted that the members of a particular community understood each other better in every respect than any researcher could ever possibly do). Worse, it cannot even be assumed that the methodological-hermeneutical understanding of a foreign life-form (at the limit, the quasi-hermeneutical understanding of the behaviour of a pride of lions which does not even assume that the lions are capable of language!) suffices for a clear recognition of any such factual agreement with the comportmental *praxis* of the life-form in question (this would exclude a critical understanding from the very outset). In any case, this post-conventional, critically hermeneutical understanding would have to recognize a counter-factual ideal for the communicative understanding of differing forms of *praxis* in an ideal 'interpretative community' (J. Royce). Moreover, in the course of a hermeneutical discussion with the representatives of other life-forms, it would also have to be assumed that there existed sufficient agreement with regard to the normative conditions for an understanding of the differences implicit in the life-form. Cf. here also K.-O. Apel: 'Szientismus oder transzendental Hermeneutik?', in *Transformation der Philosophie*, Bd. II, pp. 178–219. Also in *Towards a Transformation of Philosophy*.

50 Cf. for example my paper cited under note 42.

51 Cf. Peter Strawson, *Scepticism and Naturalism: Some Varieties* (London: Methuen, 1985); also the excellent work of M. Niquet, *Transzendente Sinnkritik. Untersuchungen zum Problem transzendentaler Argumente* (Frankfurt University: Ph.D. dissertation, 1989, forthcoming with Suhrkamp).

52 Cf. J. Habermas, *Theorie des kommunikativen Handelns* (Frankfurt: Suhrkamp, 1981), Bd. I–III, and also *Moralbewußtsein und kommunikatives Handeln* (Frankfurt: Suhrkamp, 1983). I have to admit I am bothered by the proposal (inspired by Wittgenstein) for a solution to the problem on page 108 of the last-mentioned work. Cf. here K.-O. Apel: 'Normative Begründung der "Kritischen Theorie" durch Rekurs auf lebensweltliche Sittlichkeit? Ein transzendental pragmatisch orientierte Versuch, mit Habermas gegen Habermas zu denken', in A. Honeth (ed.), *Zwischenbetrachtungen. Festschrift für J. Habermas* (Frankfurt: Suhrkamp, 1989), pp. 15–65 (English tr. forthcoming with Cambridge Mass.: MIT Press).

Introduction

Christopher Macann

It is in times of great danger
that philosophers appear.

(Friedrich Nietzsche, *Grossoktavausgabe* X, 112)

The term adopted to christen this fourth and final volume of the four volume set dedicated to the thinking of Martin Heidegger is Janus faced: *Reverberations*. In the double sense of implications, applications, receptions, repercussions, etc., on the one hand, and, on the other linguistic resonances. The dynamic of the word, which is the verb, a work in the world.

Of all four volumes this was the one whose field was least circumscribed in advance and of whose contents I could therefore be least certain. Like Topsy, 'it just grewed' – in response to the priorities of my contributors rather than those of their editor. My original intention was to employ this volume as a general catchment for such less clearly defined parameters of Heidegger's thinking as his aesthetics (Wright/Sallis), his theology – or the theological implications of his philosophy (Kearney O'Leary), his psychology – or the psychological implications of his philosophy (Scott), his ethics – or the ethical implications of his thinking (Kellner/Macann), his impact on science (Kisiel/Chevalley), his reflections on technology (Takeichi), his reception in Japan (Parkes) as well as his political involvement. For reasons which have, no doubt, much to do with the controversy aroused by Farias' book, a controversy which shows no signs of abating, at least for the time being, this fourth volume has become dominated by the political question (Faye/Rockmore/Margolis/Janicaud/Kiss/Feher/Escoubas).

Until quite recently I knew next to nothing about the political side of Heidegger's life and work. And what little I knew (the Spiegel article, the existence of the Farias book, then the Ott response and so on) dic

not prompt me to press the investigation further – but for reasons which are perhaps somewhat unconventional. It has always seemed to me that the debate about ‘Heidegger and politics’ is neither philosophical (Heidegger had little to offer in the way of a political philosophy) nor political (he was by nature and temperament one of the least political of individuals) but *moral*.

And this presents me with a moral dilemma. On the one hand, I would not wish to say anything which might be taken to imply a diminishment, let alone a suspension, of the moral responsibility of a philosopher, either towards himself, towards the discipline which he represents in person, or towards others. However, twenty years of professional life within the framework of the university have led me to the conclusion that morality plays but a small part in the calculations of the professional philosopher. So that a great part of what passes for a moral assessment by philosophers of Heidegger’s political involvement cannot but appear as ‘moralizing’ – in the worst sense of that word.

But that is not the worst of it by any means. For one of the most self-defeating effects of the moral condemnation directed against Heidegger has certainly been to divert attention away from the many ills that abound in the university world, the very ills which give the ‘moralizing’ a hypocritical flavour; with the result that with the ‘Heidegger and politics’ controversy we often seem to be facing a phenomenon of ‘scapegoatism’ (a phenomenon which, I need hardly remind the reader, played a very large part in the rise of the Nazi party) – the tendency to project upon a self-styled adversary qualities one would rather not see in oneself in order precisely that one should not have to come to terms with these same qualities in oneself.

Sartre coined the term ‘bad faith’ to deal with phenomena of this kind. But if anything, this goes further than Sartrean ‘bad faith’. For Sartrean ‘bad faith’ was set up as a ploy adopted to *evade* responsibility. But what we are confronted with here is an *assumption* of responsibility which has become officially legitimized and which can therefore not merely be used to give professional philosophers the *impression* of assuming an ethical stance but do so in such a way that any further discussion about the ethicality of the profession is thereby suspended.

‘Scapegoatism’ of the kind indicated above would be a triple disaster. First, it would postpone the task of *critical self-analysis* and, moreover, would be specifically intended to do so – in short, it would work *against* the spirit of what Heidegger claimed he intended with his Rectoral address: ‘Die Selbstbehauptung der Universität’.¹ Second, it would give contemporary philosophers a feeling of *moral superiority* where in fact there might well be grounds for deploring what often seems to me an unprecedented decline in ethical standards within the university world, explained in part perhaps by the ease with which less qualified persons

were able to slip into the system in the halcyon days of the 1960s. And third, a displaced condemnation of this kind might lead philosophers to overlook not merely the *intellectual* merits of Heidegger's thinking but those other sides of his thinking in which he struggled to evoke the *spiritual* resources which might perhaps suffice to stem a decline of which he was himself well aware. In his *Introduction to Metaphysics*, a text in which we find the supposedly 'notorious' reference to the 'inner truth and greatness' of the National Socialist movement, we also find the following passage: 'The spiritual decline of the earth is so far advanced that the nations are in danger of losing the last bit of spiritual energy that makes it possible to see the decline and to appraise it as such.'²

If the singular case of Martin Heidegger's practical excursion is to bear fruit it can only be from the standpoint of a reflection upon the place of the philosopher in the only world in which the philosopher can be practically effective – the university world. Heidegger's temporary involvement in the political processes of his day cannot even be explained away as professional naivety, since countless other, supposedly far more worldly-wise, authorities were also misled into thinking that they too could 'lead the leader'. When Hitler was made Hindenberg's Chancellor, the exalted eminence of one of Germany's greatest military leaders was supposed to be sufficient to keep the young man under control. Schleicher and Papen grossly underestimated Hitler's political capacities, which included setting each against the other. When the Thyssens and the Krupps made financial deals with Hitler, it was assumed that the young upstart would be no match for the power of Germany's wealthiest industrialists. The Pope signed a Concordat with Hitler, assuming that this would confer some measure of protection upon the Catholic church in Germany. And abroad, when Hitler was appointed to the Chancellorship, the major powers did not hesitate to recognize the legitimacy of his position, as Heidegger himself pointed out in his *Spiegel* interview,³ and indeed *deliberately* turned a blind eye on what was going in Germany right up until the Second World War, and this despite frequent and renewed reports of atrocities. Heidegger's 'error' was an error to which most of those who might have done something to correct the situation, had they acted in time and in concert, seem to have been equally susceptible, and this whether we are talking about Germans or about foreign nationals.

I shall therefore leave it to my contributors to discuss the *philosophy of politics*. I, for my part, should like to use this Introduction to raise a different, though related, question: *the politics of philosophy*.

In a piece on Heidegger and Jaspers which I have not had room to publish, Tom Rockmore writes:

It is reasonable to expect that a philosopher be held to a higher

standard than the average person, for virtually since the inception of the ancient Greek philosophical tradition philosophers have maintained that philosophy offers a deeper, in fact incomparable insight into the nature of reality.⁴

There are indeed good reasons why these kinds of expectations should be entertained. First, a large number of great philosophers have been persons of very considerable moral stature, even when this ethical integrity only manifested itself in a relatively undramatic way. Socrates' personal integrity has been cast in an unforgettably dramatic mould. But the quietist piety of a Descartes, a Spinoza or a Kant, would hardly have attracted much attention at the time even though, at the very least, it does most certainly attest to an impressive rejection of the worldly seductions of wealth, power or influence. More recently, philosophers such as Russell and Sartre have left their readers in no doubt about the political responsibility of the philosopher and have devoted considerable time and energy to defending the political causes in which they believed.

Second, ethics (or what has sometimes been called the 'moral sciences') has, for reasons which relate to the genesis of this discipline, been assigned to philosophy and has come to constitute a specific province of philosophical enquiry – along with logic, epistemology, aesthetics, metaphysics and so on. To be sure, considerable efforts have been made in recent years to reduce the *moral* import of ethics. In the analytic tradition, the tendency to transform ethics into a matter of conceptual clarification or the assessment of the epistemological status of ethical theories has done much to neutralize the *moral* implications of the discipline while, on the continental side, it is not even clear that ethics still constitutes a distinct branch of philosophy, and for reasons which have something to do with the Heideggerian influence. And yet, as Heidegger made perfectly clear in his later deliberations, the species finds itself today at an unprecedentedly critical crossroads, which leads *either* in the direction of technological destruction *or* in the direction of a transformation of our very being-relation. And such a transformation, I would argue, cannot but be ethical in character.

Third, and because ethics has traditionally been regarded as a province of philosophy, it is the philosopher who is called upon to teach the discipline of ethics in the classroom. And not only in the classroom. In America, and elsewhere, ethics is currently becoming a fashionable subject, with a proliferation of new courses on business ethics, medical ethics, sexual ethics, etc., courses which are often sponsored by businesses themselves and offered to their employees on the premises in a desperate attempt to stem the disastrous financial and economic consequences of fraud on a scale never before seen.

In principle this supposition is not unreasonable. In practice however,

it attests to a naive extension of the conventional *technological* conception of the relation of theory and practice – practice as the application of theory. The accomplished student of computer science is indeed the man to employ in the solution of practical computer problems since *knowing* usually does lead to *doing* in a way which is not complicated by extraneous considerations. But in the moral sciences the relation is much more complex. However one may applaud, in principle, the Platonic conception of the relation (whereby ‘knowing the good’ implies ‘doing the good’), it is difficult not to note the difficulties attending such a conception in the actual circumstances of life. First, *knowing the good* may, and indeed usually does, call for action *contrary* to the interests of the agent (and if one is a Kantian, this conflict will precisely attest to the genuinely ethical character of the action in question). It is this ‘price to be paid’ which acts as a deterrent to any effective application of the ‘right’ course of action. Second, so far from it being the case that those most capable of knowing the good actually *do* do the good, it is, in my experience, the simpler and more integral natures who are usually most responsive to the claims of morality, while the ‘cleverer’ and more ‘educated’ natures will always be able to find some ‘good’ reason for evading these claims.

Third, in the ethical sphere, *doing* is bound up with *being* in a way that has no parallel in the technical sphere or the sphere of practical efficacy. It is certainly the business of philosophy to investigate this extremely complex relation with a view to determining how knowledge of the good can be so presented as to result in a transformation of the very being of the one to whom this knowledge is transmitted. For, in the end, doing the good will never be more than a pragmatic maxim unless it emanates from a nature which is good in its very being, that is, in its intrinsic constitution. Precisely because, in the ethical sphere, the relation between knowing, being and doing is extremely complex, the only ultimately convincing proof is *proof by example*.³ It is for this reason that the very least that can be expected from philosophers is that those professionally qualified and duly appointed to *teach* the discipline of ethics exhibit, in their day-to-day behaviour as professionals, *conduct* which meets and matches the principles taught in the classroom. To insist upon this is to do no more than to endorse the time-honoured maxim: *Practice what you preach!*

In the course of twenty years of professional life I have witnessed a range of practices I never thought to see in an academic environment. Most of these practices can be brought under a rubric which forms the topic of the first two books of Plato’s *Republic*, and against which Plato has Socrates strenuously labour throughout this, his longest and most complete, dialogue: *Justice is the interest of the stronger!* Together with its collateral maxims: In a position of institutional weakness, do whatever

the *strong require*. In a position of institutional strength, do whatever you want; in the knowledge that what you want is what you will be able to get, thanks to the overt or covert complicity of the other, 'weaker' members of the institution, who can be counted on to 'know' where their best interests lie. Since, in a normal university framework, weakness turns to strength of its own accord as you climb the steps of the institutional ladder, what this maxim in fact enjoins is the 'worldly wisdom' of initially suppressing any moral scruples you might have with regard to policies adopted by your 'superiors' with a view to soliciting the support of those who can help you to positions of strength in which you yourself will also eventually be able to enjoy the same immunity from scrupulous resistance to your own self-interested action.

In his article on the 'Ethics of authenticity' Kellner summarizes Heidegger's position as follows:

Heidegger claims that in everyday behaviour most people are not aware of their unique potentiality for individuality or of their possible authenticity, and have not chosen their own possibilities. In his [Heidegger's] view, calculating where one stands in the social hierarchy and concern for one's social status puts one in subjection to the other. For in order to maintain one's standing, one must do what *'they'* approve of, praise, command and require, and refrain from socially disapproved or forbidden behaviour. In this way, one submits to an often subtle and unnoticed domination by the norms and conventions of society and forfeits one's own possibilities of thought and action. This submission and bondage to one's social norms, peers and leaders results in an averageness, a levelling down of social behaviour to a certain homogeneity and sameness. In this way, one is disburdened of individuality and responsibility for being-a-self and is accommodated by one's society, rewarded for one's submission. However, 'in these ways of being', Heidegger writes, 'one is in a state of inauthenticity and failure to stand by oneself'.

I have chosen to reproduce this passage at length despite the fact that it does not claim to do more than simply *summarize* the Heideggerian position because it also expresses, to perfection, the kind of behaviour that makes for success in the contemporary academic environment. To make the pertinence of the above-cited summary even more dramatic, it should be noted that where Kellner talks of 'refraining from socially disapproved or forbidden behaviour' he might also have added that this socially disapproved or forbidden behaviour might also be, and often is, behaviour which, by even the most elementary standards, would be ethical in character and its contrary (the socially approved or enjoined) unethical. No doubt it is for this reason that nothing seems to be more

embarrassing to the professional philosopher than the raising of ethical questions in the context of the day-to-day business of academic life.

This unreadiness to let philosophical communication be contaminated by ethical questions belongs to precisely that levelling-down process which Heidegger identified with such perspicuity and attributed to the 'They'. Worse, to the extent that there is an appeal to morality in contemporary Western society at large, it is coming to take on the ever more Heideggerian guise of deliberate, though perhaps not fully self-conscious, concealment. It should not therefore come as a surprise to discover that the very societies who are most outspoken in their defence of the values of law and order, religion, morality, the family, health and sanity and so on and so forth, actually *lead the way* (statistically speaking) in the violation of the very principles they profess to espouse.⁶

Dominique Janicaud in his recent book *L'ombre de cette pensée*,⁷ a chapter of which I am fortunate enough to be able to reproduce in this collection, quite rightly takes Farias and others to task for failing to substantiate the claim that the philosophy of *Being and Time* was in accord with Nazi ideology. I would like to go further and insist that, in my view, few texts have an equivalent power to inspire in the reader resistance to what 'They' require, to call the reader away from lostness in the 'They' and toward an authentic sense of self than those passages of *Being and Time* devoted to an examination of the issue of conscience.

It frequently falls to the lot of a junior professor to be asked to evaluate the work of a colleague in a context in which he 'knows', in advance, what is expected of him by the institution he serves or rather by those who temporarily occupy the leading positions in that institution. He 'knows' that 'They' want negative or positive assessments (depending on whether or not 'They' want to dismiss or retain the individual in question). And he may very well also 'know' that this assessment has little or no bearing on the intrinsic quality of the work under review or even upon the intrinsic quality of the person who did the work. And, if he 'knows' what is good for him, he will not let this 'knowledge' arouse in him anything resembling a moral scruple.

But there is more, much much more that he will also 'know' – in that quite specific way in which knowledge happens in the 'They'. He will also 'know' that if a negative judgment is being solicited from him it will be recorded in such a way that his own identity will be carefully concealed. He will 'know' that the greater the discrepancy between the judgment arrived at and the work on which it is supposed to be based, the greater will be the eventual gratitude of those whose intentions and ambitions he will thereby be advancing and that, consequently, even if, perchance, a discrepancy of this kind is brought to light, he will be able to count upon the co-operation of the vast majority of those in the profession to diminish the impact of the discrepancy and so to divert

responsibility for the discrepancy from specific individuals to, at worst, procedural irregularities.

But this by no means exhausts the 'knowledge' available to him through the 'They'. He will also 'know' that even if he supports those whose intention it is to dismiss a colleague and is in turn appropriately rewarded, his relation with the colleague in question will remain on a better footing than if he had supported the colleague and secured thereby his own eventual downfall – and this no matter whether his earlier action was successful or not. For he will 'know' that, in the final analysis, professional friendships are based not upon a recognition of intrinsic human or intellectual qualities but upon a calculation of extrinsic power-political relations. This means that success in institutional terms (no matter what the means employed to obtain this success) will, in the end, prove self-justifying, whereas failure, in institutional terms, even, and even especially, if it follows from a 'resolute' determination to adhere to morally acceptable principles will, in the end, prove self-defeating. For, from the strategically advantageous position of institutional command, violators are capable of legitimizing the steps that led them to their decisions (even, and even especially, if these decisions were clearly illegitimate) while, from the strategically disadvantageous position of institutional marginalization, the victims of such violation will not only find it impossible to get a hearing but will find their actions (and probably also their very persons) represented in a light which justifies the action taken against them; so that, paradoxically, though in complete accord with that logic of 'ambiguity' which prevails within the 'They', the more *morally impeccable* the action in question, the more *morally suspect* the individual will have to be *made to appear* in order to justify the steps taken to neutralize the moral effect of his action.

In every instance, I have put the word 'know' and 'knowledge' or even 'moral' and 'morality' in quotation marks because, as we all know, this 'knowledge' and this 'morality' is never, and can never be, made explicit as such. For only if it is left *implicit* does it become possible to employ the strategy of 'deniability' (so resolutely adhered to by Nixon's Watergate cabinet) or, at least, to leave room for that range of interpretations which is essential to the critical tactic of evasion and ir-responsibility, a tactic in the absence of which the institutional practices in question could not be sustained. I know of no philosopher who has analysed the phenomenon of the a-, or even the im-, moral impact of social and institutional pressure more effectively than Martin Heidegger.

It might seem to be the case that the prevalence of a 'They' self in the academic community was of no greater (nor less) significance than in any other institutional environment – except that, from the very beginning, as mentioned before, philosophers have conceived of themselves as ethical arbiters and therefore, in a special sense, as persons

exceptionally well qualified to dismantle, or at least to cast suspicion upon the dominion of the 'They'. Is it an accident that three of the greatest thinkers of the last hundred years (Marx, Nietzsche and Freud) have frequently been called 'philosophers of suspicion'?⁸ If not, it cannot but be a matter of especial concern to philosophers to discover that the dominion of the 'They' is *more than averagely* prevalent in their own institutional environment, and for the very simple and sheerly *practical* reason that philosophers are today almost entirely dependent upon the university institution for their very survival. Once the Socratic gadfly has become an institutional parasite, a collapse in ethical standards within the profession is almost inevitable.

As I have tried to show in my paper on 'The ethics of authenticity', I believe that, with appropriate modifications, an ethics can be developed out of the critical theme of 'authenticity'. Of course, we know that Heidegger not only disclaimed any intention to develop an ethics but insisted that ethics was a derivative discipline and that therefore any genuinely fundamental analysis must get back to roots which antecede the very possibility of the emergence of ethics as a distinct discipline. This does not militate against the ethical import of Heidegger's doctrine of authenticity (which many critics have interpreted as an ethics, or at least a proto-ethics). But it does help to explain certain theoretical inadequacies inherent in the doctrine itself – and, in particular, the refusal of the transcendental contribution to ethical theorizing.

In a passage from his *Notizen zu Martin Heidegger* (§157)⁹ Jaspers objects: "'Resoluteness", but with respect to what?' What indeed! It is the vacuousness of the principle which constitutes the problem. Heidegger always resisted any attempt to elicit a specification of concrete forms of behaviour which might be in accordance with the principle of 'resoluteness', as transgressing the legitimate sphere of philosophy. And this rejoinder is, in the main, entirely legitimate. But even though such a specification of *concrete forms of behaviour* might have been out of order, still, *Being and Time* might at least have furnished *criteria for determining*, in any given instance, whether a specific form of behaviour did or did not meet the legitimate requirements of resoluteness.

To put the matter in the most dramatic way possible (and surely this must have been at the back of Jaspers' mind), a way which is for historical reasons entirely pertinent to the discussion of 'Heidegger and politics', nobody could possibly fault Hitler on his 'resoluteness', nor even upon the intimate connection between the causes which Hitler espoused and his very own being (his being-toward-death?). It was not his resolute commitment to certain causes (in which he most probably sincerely believed) which is the issue but the nature of those same causes and the manner in which they were pursued. But any evaluation of the causes in question presumes a suspension of the ethical suspension which

Heidegger himself adopted. To put it in the language of a Lévinas, ethics cannot be subordinated to (still less eliminated by) ontology.

Moreover, a careful reading of the contexts in which Heidegger employs the concept of *Eigentlichkeit* (and its related themes) makes it very difficult to sustain the thesis that this concept is evaluatively neutral and has nothing to say with regard to the ethical viability of the authentic individual. *Eigentlichkeit* is that to which *Being and Time* calls the reader. It is Heidegger's *ethics* in that large sense of ethics which made it possible for Spinoza to call his entire ontology an *Ethics*. As such, *Being and Time* remains, to my way of thinking, and subject to all the necessary qualifications, one of the most impressive contributions to ethical philosophy of this century. And yet, as we know, and as the contributors to this volume have amply demonstrated, rarely has a major philosopher been subject to such extensive moral condemnation as Martin Heidegger.

It would be foolish of me to venture upon territory which has been so thoroughly and carefully cultivated in this volume. But I would like to say a word about a very recent, American, attempt to come to terms with the political issue, Richard Wolin's *The Politics of Being: The Political Thought of Martin Heidegger*.¹⁰ I would like to focus on this one instance not so much for its own sake (though it is a persuasive piece of writing) but because it exhibits many of the characteristic, and characteristically naive, prejudices of our times.

Wolin begins by deriving a political critique from cultural elitism. But what culture worth the name has ever been anything other than elitist, the work of 'aristocrats' in that quite specific, original Greek sense of the word in which by the latter (the *aristoi*) was meant the excellent (morally as well as intellectually)? The difference is that whereas in Greek times culture was (and was expected to be) produced by the few it was not produced for the few but for the *entire citizenry*. Greek culture sought to level up not to level down. It is our contemporary culture, with its populist tendencies, which discourages cultural discrimination and which seeks to make money out of the production, sale and consumption of spiritual goods which is truly contemptuous of the people and, in this sense, utterly undemocratic.

Wolin's critique of the undemocratic character of Heidegger's thinking continues with the by now almost standard confusion of authoritarianism with conformism; this despite Tillich's careful differentiation of the two in *The Courage To Be*.¹¹ The difference between authoritarianism and conformism can be brought out very easily in terms of the concept of responsibility. When the Nazi state assumed 'responsibility' for, among other things, the German university world, it led to an authoritarianism which stifled thought (when it did not destroy the lives of thinkers). In the university world with which I am familiar, the seemingly opposite tactic (passing the responsibility on to someone else) often leads to a very

similar result. Decisions are taken and specific individuals are affected by these decisions, often adversely, and often for reasons which can be shown conclusively to have been wrong. And yet *no one* can be found who actually took the decision, so nothing can ever be done to rectify the situation. It was always 'someone else'. And that 'someone else' can never be identified in person, since they have always already taken refuge – in the 'They'.

No philosopher has done more than Heidegger not just to identify and characterize this kind of conformist irresponsibility (which is never more evident than in our larger and more impersonal institutions) but also to expose its hidden strength, the grounds for its almost universal dominion. 'It "was" always the "they" who did it, and yet it can be said that it has been "no one"' (SZ, S. 127). 'Everyone is the other, and no one is himself' (SZ, S. 128). 'And because the "they" constantly accommodates the particular Dasein by disburdening it of its Being, the "they" retains and enhances its stubborn dominion' (ibid.).

The best defence against conformist irresponsibility is, of course, the contention that the alternative (collectivist authoritarianism) is even less acceptable, conformism and authoritarianism being thereby represented as mutually exclusive and exhaustive alternatives. But between a situation in which *no one* can be found to take responsibility and a situation in which *one* takes responsibility for *everyone* there is surely room for middle ground, a ground, namely, where *everyone* takes responsibility for his or her *own self*. And this does not mean a self-relation which abstracts from the other. Quite the contrary, the very word 'responsibility' means, in English, the ability to respond (to others). In German, the corresponding word *Verantwortung* contains the component *Antwort*, meaning 'answer', therefore, response to a question, therefore, a dialogical relation. Taking responsibility for oneself therefore means responding to others, treating the other as an end in itself. Nor should this middle ground (between *no one* and *one*) be represented as a kind of compromise between two equally unacceptable, because extreme, alternatives. Rather, this *mean* is itself the extreme, the *ideal* extreme, the extreme which, in any given situation, is never going to be more than partially represented but which can at least be pointed out as a *limiting* ideal, a *regulative idea* (to use the Kantian phrase) which can be worked towards and approximated. And if it is an implication of Heidegger's analysis of the 'They' that this situation does not, or does not at present, obtain, then I am very much afraid that Heidegger is more or less right.

It is not given to us philosophers to be rulers of men, captains of industry, even top-level negotiators and administrators. Our sphere is in one sense a limited one, in another, the most extensive of all. Alfred Whitehead's claim that human civilization is, in the end, the history of its thinkers is, in one sense or another, obviously true; very obviously

true in the sense that human civilization is presently the more or less direct outcome of those advances in our scientific and technological culture which are sponsored in our universities, not so obviously true in the sense that human civilization is likely to take a form determined by the basic attitudes which we humans adopt towards the earth, towards other creatures living on the earth and towards one another, which attitudes are both expressed in, and promoted through, our spiritual culture. The danger (and it is a very real and present danger) is that the neutrality, impartiality, valuelessness, in a word, 'objectivity' (and it matters little that objectivity, in the traditional sense, may today be called in question as a theoretical category) of science and technology will bring with it an *indifference* and even an *utter blindness* to the 'inner truth and greatness' of *existence* in general and *human existence* in particular, thereby affording our more atavistic instincts free and untrammelled rein. When Sartre wrote in 1943: 'there are men who die without – save for brief and terrifying flashes of illumination – ever having suspected what the Other is',¹² he was not indulging in rhetorical fancy but simply recording, in sober prose, a conclusion to which his own *contemporary* experience (of the occupation) had led him.

What is truly astonishing about the academic world of today (the world in which the philosopher is more or less obliged to work) is not the widespread closedness to the call of conscience and therefore the unreadiness to do what is right *because it is right* and for no other reason (with all appropriate qualifications) but *how little* it takes to persuade academics to deviate from courses of action which they know to be right, and whose implicit rightness is attested by their very unreadiness even to discuss (that is, to bring out into the clear realm of explicit discourse) the rights or wrongs of the issue in question.

This basic confusion between authoritarianism and conformism leads on endlessly to further dubious 'political' conclusions. 'The gateway to Heideggerianism as a political philosophy', Wolin writes, 'is the category of "resolve" or (as he puts it) "decisiveness".'¹³ Wolin then quite rightly links 'resoluteness' with a suspension of the 'They', prompted by the call of conscience. And he also, to my mind quite rightly, objects to the ambiguity at best, vacuity at worst, not merely of the concept of 'conscience' but also, and as a result, of 'resoluteness'. But from here his analyses make a truly astonishing leap of faith by explicitly connecting 'decisionism' with 'conformism'. 'Not only is decisionism thoroughly unprincipled it is also on this account nakedly opportunistic. And all voluntaristic bluster about "will", "choice" etc., notwithstanding, opportunism in the end reveals itself often enough as a base and simple conformism.'¹⁴ It is this conceptual connection which is then supposed to provide an explanation for Heidegger's mistake. 'The consequences of this decisionistic "ethical vacuity" coupled with the prejudicial nature

of Heidegger's conservative revolutionary degradation of the modern life-world, suggests an undeniable theoretical cogency behind Heidegger's ignominious life choice of 1933.¹⁵

These consequences follow neither in theory nor in practice. If you look at Heidegger's practical impact in the university environment of his day you find, on the one hand, hosts of former students and younger professors who are ready to attest to Heidegger's supportiveness, encouragement, fair-mindedness etc. (not to mention his regard for work of real quality), while, on the other, you find a few cases in which Heidegger certainly does appear to have criticized a candidate for his Americanization or lack of patriotism or left-wing politics or even his Jewishness, though, with regard to the best known cases (Staudinger/Baumgarten/Hevesey/Fränkell), the criticism appears not to have had any terminal consequences for those at which it was directed. Much more serious (because the victims in this instance were relatively powerless) are the stories of students whose studies Heidegger refused to supervise or approve – because they were Jewish (see especially Rockmore's paper). But it seems that at least Heidegger had enough integrity to give his reasons for reacting in this way. Today, if a university wants to get rid of someone because they are homosexual, or Marxist, or female, or black or Jewish or even (and even especially) because their morality is insufficiently flexible to suit their colleagues, 'they' never so much as hint at *this* as the grounds for dismissal. Instead, the much more successful (because more deceitful) ploy is adopted of condemning the scholarly work of the individual in question. And this ploy is adopted even (and even especially) if the work in question threatens to be *so good* as to make that of its self-appointed judges appear inferior by comparison.

That the consequences mentioned above do not follow in theory either can best be brought out with reference to the following sloganistic caricature of Heidegger's position: 'if authentic Dasein is to lead', Wolin writes, 'inauthentic Dasein must follow.' It sounds plausible, just as long as one remembers to 'forget' the short but extremely dense passages in which Heidegger wrote about solicitude, more specifically the distinction between 'leaping in for him' (*für ihn einspringen*) and 'leaping ahead of him' (*ihm vorausspringen*). I prefer to render these virtually untranslatable phrases in the more characteristically English phraseology of (inauthentic) 'standing in for' and (authentic) 'standing up for'. The authentic individual does not 'stand in for' and so take over the existence of the other. The authentic individual 'stands up for' the other – but only in the sense that he gives back to the other his responsibility for himself. Concretely, this means that so far from declaring: Follow me! the authentic individual is committed to impressing upon the other the importance of the radically different precept: Follow yourself! So Wolin's seemingly plausible exegesis comes down to this: the authentic individual is the one

who deals inauthentically with the inauthentic – as an expression, or attestation, of his very authenticity!

But then how did someone whose thinking, in my view, leads in the very reverse direction from that indicated by Nazi ideology come to associate himself with the Nazi party? I leave it to my contributors to seek an answer to this delicate and complex question. As they are themselves only too well aware, the explanatory hypothesis: 'noble thoughts and dirty deeds' is one which has often been voiced by Heideggerian detractors. For my part, I would simply like to point out that this time-honoured tactic is one which is *all too common* in the contemporary university environment. Professors have plenty of time to indulge in the elaboration of 'noble thoughts'. And these 'noble thoughts' are often very badly needed not merely to alleviate the 'bad conscience' of those engaged in 'dirty deeds' but also to divert attention from the deeds in question.

Professors of philosophy work within the context of a university. The university is a 'world within a world'. Within the confines of this world are gathered activities corresponding to the three primary expressions of the being of human being – thought: corresponding to the domain of the mind, art: corresponding to the domain of feeling, and athletics: corresponding to the domain of the body. A university has its theatres and its orchestras and its art exhibitions as well as its scientific and technological courses, its athletic as well as its social life. And within this privileged 'world within a world' one might even venture to suggest that philosophy enjoys an especially privileged place, a world 'within' a 'world within a world', a world wherein these various expressions of the being of human being are gathered together into one comprehensive understanding of human reality.

Moreover, how philosophers in particular, and academics in general, comport themselves within the privileged frame of what has sometimes been called (usually derogatorily, though I think it is time that the more idealistic, if not idyllic, connotations of this expression were revived) the 'Ivory Tower' can have long lasting implications for those for whom they are responsible. When students witness, within the circuit of their professorial role-models, a pale replica of the marital merry-go-round presently operative in our society at large, when students witness the professorial politics which lead to the dismissal of teachers they know from direct experience to be persons of moral integrity and academic excellence, when students' fees are hiked (or grants slashed) with no comparable improvement in the quality of the education afforded, when students are subjected to arbitrary and unsubstantiated evaluations against which no appeal is permitted, they go out into the world with a conception of life which confirms their worst suspicions, and prepares

them for behaviour which will carry their society on still further in the dis-integrative direction it has already assumed.

All of this is only what was foreshadowed from the very beginning in the Socratic conception of philosophy as a dialogue with the young, a dialogue the topical scope of whose address could not be limited in advance, a dialogue whose purpose was *e-ducation* in the original sense of that word, a *leading out* of the spirit of those addressed, a dialogue whose importance could not be underestimated because it was directed to those at that critical turning point in their lives when they turn away from the original, though limited, framework of the family into the derivative, but more extensive sphere of society at large – to found families of their own. And it is surely more than ‘Socratic’ irony that the charge brought against the man who understood, better perhaps than any other teacher, the *moral* responsibility he assumed in *e-educating* the young should have been that of . . . ‘corrupting the young’.

Perhaps one should leave the last word to Nietzsche.

What provokes one to look at all philosophers half suspiciously, half mockingly, is not that one discovers again and again how innocent they are – how often and how easily they make mistakes and go astray; in short their childishness and childlikeness – but that they are not honest enough in their work, although they all make a lot of virtuous noise when the problem of truthfulness is touched even remotely.¹⁶

Notes

1 In the *Spiegel* interview Heidegger claimed that this address was specifically intended to resist the politicization of the University *from without* and to affirm the need for the self-determined responsibility of each university for its own affairs.

5 It is not the *teachings* of the great religious personalities (many of whom either failed to develop such teachings or made little or no attempt to preserve them in the form of writings) which are responsible for the immense influence they have exerted. It is the exemplary quality of their *life*.

6 I have spent several years researching the social problems to which our contemporary, democratic societies are prone – soaring crime rates, sexual abuse rates, divorce rates, drug addiction rates etc. – together with the by now well-publicized infractions of the ‘men of God’ who inveigh most uncompromisingly,

and most successfully (in money terms), against these very developments. The end result is an informative and eminently readable text *Egoism and the Crisis in Western Values* (based mostly on American data) which is apparently unpublishable in the very societies whose citizens are most affected by these developments, and even though the 'moral' positions assumed are almost banally orthodox – my intention being not to write a moral treatise but to point out the practical consequences of certain quite contemporary ways of thinking about being human. I am consequently in the strange position of watching every one of my social predictions becoming ever more sickeningly true with each passing year, while still being unable to reach the public for whom my predictions might have functioned as a warning.

11 In my social ontology, I have extended the Sartrian dialectical degeneration in two basic ways; first, and within the sphere of the 'private', I complement the Sartrian analysis of love (degenerating into sado-masochism) with an examination of the degeneration of friendship into indifference (through mutual utilization); second, and within the sphere of the 'public', I draw a further distinction between 'anonymity' and 'autonomy', the first of which leads to conformism, and the second to authoritarianism. This entire analysis is furthermore englobed within the much more comprehensive context of a general theory of empathic relations which, in the end, and through an elaborate series of detours and deviations, makes possible both 'love' and 'friendship', in the sphere of the private, and 'impartiality' and 'propriety', in the sphere of the public.

Heidegger and the thing

Jean-Pierre Faye

The motivation for action
will no longer be found exclusively,
or preponderantly,
within the domain of fear.

– Jan Patochka

What is the thing? To put it in another way, *when* does Heidegger's *die Frage nach dem Ding* (the 'question concerning the thing') first make its appearance?

We have shown, claimed Heidegger, that the answer to the question 'What is a thing?' can be expressed in the following way: a thing is what supports properties and the truth which corresponds to it is to be found on the side of language – in the proposition as the juncture of a subject with a predicate.¹ This answer is of course only a first approximation which the Heideggerian way will abruptly cast aside.

The question and the answer – or should we say, the encoding of the answer – took place at a definite moment in time. It happens to have been the Winter Seminar of 1935–6, in a course of lectures held at Freiburg University.

This 1935 Winter Seminar follows the path opened up by Heidegger's second great book, *Kant und das Problem der Metaphysik*, published in 1929, which itself elaborates a meditation whose first step brings us back to the 1935–6 Winter Semester.

Following the decennial cycle and the seasonal rhythm, we should listen silently to the Heideggerian move, investigating the Black Forest of being – through the clearing of Being. The two English forms of the verb 'to be' give an approximate translation of the German verbal forms, the infinitive and the present participle: *Seiende* and *Sein* – *ens* and *esse* – *on* and *einai* (ὄν and εἶναι).

Yet we shouldn't forget the event of the Summer Semester. Especially the Summer Semester of 1935. Before the luminous path of the 1935–6 Winter Semester, we shall have to deal with the unique darkness of the 1935 Summer Semester. A startling process awaits us, a process which may very well inflict a fatal wound upon our minds.

Metaphysics vs Nihilism

Curiously enough, it usually passes unnoticed that between the Kant book of 1929 and the Summer Semester of 1935 a deep gap intervenes. Also unnoticed goes the fact that the title given to the 1935 Summer Semester lecture course in 1933 – *Einführung in die Metaphysik* (*Introduction to Metaphysics*) – will mean introducing oneself into an unfathomable abyss (*Abgrund*). The Kant book of 1929 seeks the way to the ground of metaphysics. Its last sequence goes back to *Fundamentalontologie*. *Grund*, *Fundamental* are the main words and also the last words, in §§42–4, of *Kant und das Problem der Metaphysik*. What could have occurred in the meantime?

In 1929 'Metaphysics' means the surpassing of *Seiende*, of beings. In 1935, metaphysics is itself supposed to stick to *Seiende*, to beings as the object of its quest. So metaphysics must itself be surpassed, through *Überwindung*. What happened in the meantime?

The text of the Winter Seminar opens with a tale told by Plato in the *Theaetetus* (174a), about a little Thracian servant girl who laughs at Thales as he falls into a well, while looking at the stars. Thales' well, which features as an introduction to the Winter Semester course, also figures in the Summer Semester as an *Introduction to Metaphysics*, and tells of some kind of fall – *Verfall*. The question for Heidegger is now: whether we stand in History or whether we are not rather only tottering. (Die Frage . . . ob wir in der Geschichte *stehen* oder nur taumeln.) The answer is: 'Metaphysisch gesehen *taumeln* wir' ('Seen from a metaphysical point of view, we *totter*'). What does this tottering step of metaphysics, as articulated here by Heidegger, mean to us today?

A little further, we should notice another tale which has, up to now, remained unnoted. 'We are also tottering . . . when, more recently, one tries to show that this question of Being . . . is Nihilism' ('Wir taumeln auch dann . . . wenn man sich neuerdings sogar bemüht zu zeigen, dieses Frage nach dem Sein . . . sei Nihilismus').² Who is this *one*? Who can this '*man*' be? Let us see if we can discover the one who 'recently', (*neuerdings*), that is before 1935, played the tottering role by interpellating between the two words: '*Metaphysisch*' and '*Nihilismus*'.

The best way to go would be – to listen to the tale. In fact, interviewed

by a French reviewer, Heidegger himself did add a few details,³ speaking about a Nazi aggressor called 'Krieg', 'Kriegh' or 'Kriegk'. . . . It could be said that French philosophers are not concerned with the *problem of names*? So this *one* could simply be christened with the letter K.

In fact, the letter K may bring us to another narration which bears the whole K signature. But the problem which then occurs is how far a 'tale' can be taken into account *inside* a philosophical discourse – not as a break in the discursive network, as the *mythos* breaking the thread of the Platonic *logos* – or the reference to the 'infinite fly' in the Spinoza ethics – but as the arrow of language hitting the core of another language.

The K postulate

The K attack on 'the meaning of Heidegger's philosophy' was to label it as a *metaphysischer Nihilismus*. To assign the predicate 'metaphysical' to the noun phrase 'Nihilism' is to announce the very philosophical problem which remains the 'unthought', the *Ungedacht*, standing in the way of Heidegger's path in the forest. It finds its zero hour at the very moment when what we shall call the K postulate is uttered.

It should now be said straight away that this 'K' is not to be aligned with the Kafka hero. We shall discover his identity as a *völkische*⁴ militant who joined the Nazi party and will become an Obmann of Nazi 'science' – let us say a corporal or a sergeant-major. Later on, an SS Obersturmbannführer. In 1934, he becomes the Rector of Frankfurt University.

But the K postulate involves a corollary. 'Metaphysical Nihilism' says K – 'as it used to be presented to us, mostly by Jewish Literati'⁵ – ('wie es sonst vornehmlich von jüdischen Literaten bei uns vertreten worden war'). The fatal corollary allows Heidegger no reply; in 1934, no one is permitted to raise the question whether or not he deserves to be called a Jew. Yet the tale of K includes a Scolia: Heidegger's so-called 'Nihilism' belongs to a long stream of thought, flowing from Plato, Aristotle and Aquinas: from the 'Greek doctrine of Being' – (*die griechische Seinslehre*). On this basis, Heidegger did build up some kind of an answer to the K attack. It is not the *Seinslehre* but, on the contrary, the 'forgetting of Being' – *die Seinsvergessenheit* – which is the source of all evil, the mother of Nihilism. In this case the corollary may be transformed. There must be no further allusions to 'Jewish *Literaten*'. Even the Greeks, the creators of ontology, have to be rejected,⁶ must no longer be alluded to. From now on, the Heideggerian task will be to prove that the Greeks are already guilty of the so-called 'forgetting' of *Sein* – now considered as the equivalent of 'metaphysics'.

However, 'there's the rub!' – for our Hamlet. In his first great book,

Sein und Zeit, it was clearly stressed that, since the Greeks, the task of philosophy has been *Sein*, beginning with Plato's *Parmenides* and Aristotle's *Metaphysics* Book Z. In *Being and Time* and, at a different level, through the analytics of existence, the oblivion of *Sein* is the fall into 'average everydayness' – *Alltäglichkeit*. This is the *verfallen* of the everyday mode of existence.

Heidegger's new task, after 1934, will have to be the discovery of the 'proof' of the *Fall*, stemming as it does from the Greeks. In other words, the K postulate will have to be transformed into some kind of an H theorem. Nevertheless, such a careful Heideggerian disciple as Jacques Derrida emphasized the method (or the manner) in all sorts of Heideggeriana: no 'argument' or 'refutation' is needed – 'disqualifying' is enough. . . . This kind of strategy will prove to be very efficient in the pursuit of the process we are learning to uncover, as attested by the disciples of the 'discovery'. It is therefore worth investigating with exact attention, for it involves a real inversion of the method of 'investigation', pertaining, as it does, to the surprising Athenian word *philosophia*.

After 1934, the new accent will be placed upon the 'falling out of *Sein*'. No longer an everyday affair, but an original sin, which proceeds further and grows ever worse throughout the entire course of History. This gnostic reinterpretation of the Tora account (the biblical narrative) about the Paradise of the Garden of Eden was handed down through German 'revolutionary conservatism', mainly along the Wagnerian path. For Houston Chamberlain, Wagner's Wagnerian son-in-law and 'thinker' in Bayreuth, *Geschichte als Verfall*⁷ (history as the Fall), is taken for granted. This language appears for the first time in Heideggerian speech during the Summer Semester of 1935, as the first answer to the K denunciation of 1934 – and the first tacit *acceptance* of the K postulate. But making the K postulate *acceptable* will prove to be a long process and will be undertaken with a view to changing it into an H theorem, using for this purpose the strategic means of 'disqualification'.

The first version of the new Heideggerian doctrine, in the 1935 Summer Semester, is quite dramatic. It was abruptly delivered by way of a question: 'does our falling out of Being come from *Sein* itself, from language, or from ourselves?'

'*Dass wir . . . aus dem Sein herausgefallen sind?*'⁸ It is we who have fallen out of Being. And the tale goes on: 'from the beginning on, it has made its way through Western history' ('was von Anfang an durch die abendländische Geschichte zieht'). 'An event', Heidegger goes on, 'which the eyes of historians will never catch sight of' ('ein Geschehnis, zu dem alle Augen aller Historiker nie hinreichen werden'), and yet it is that which was before, is now, and will be hereafter ('und das doch geschieht, vormals, heute und künftig').⁹ This event which no historian could ever grasp is supposed to be the key to the whole of history:

Geschichte of course and not mere *Historie*. As far back as Heroditus himself, the severe linguocentrism of Heidegger's discourse excludes ἱστορίη – the first word in the world's first book of 'history'. Of course, the knowledge that pertains to this kind of 'original' history is *mythology* (Wissen von einer Ur-geschichte . . . ist . . . Mythologie).¹⁰ So we have to direct our investigations towards the new Heideggerian labyrinth of mythology, starting from 1935.

The predicate event

The track left by the 1935 Summer Semester leads us straight on to the *event* of the predicate, as an unhappy ending. To remain in the 'forgetfulness' of Sein (In der Vergessenheit des Seins) . . . 'this is nihilism'.¹¹ We must add: the 'forgetting of Sein' is also the 'simple exercise of Seiende' – and the later process suddenly becomes the new definition of 'Metaphysik'.

In a carefully thought-out essay of 1929, *Vom Wesen des Grundes* (reprinted in 1934 without a change), metaphysics meant precisely the 'surpassing of *Seiende*'. Now *metaphysisch gesehen*¹² is synonymous with a simple exercise and 'enterprise' – *Betrieb* – alongside of *Seiende*. Hereafter 'the first step' will be the 'overcoming of nihilism' ('der erste Schritt . . . zur . . . Überwindung des Nihilismus').¹³ Soon equivalent to the 'overcoming of Metaphysics': 'Überwindung der Metaphysik'¹⁴ – as can be seen from the postscript in 1943 to the 1929 lecture: *What is Metaphysics?*

In the lectures on Nietzsche from 1936 to 1945, later collected in the huge Nietzsche book, a clear light is thrown upon the new topic: '*Die Metaphysik ist . . . der eigentliche Nihilismus*'.¹⁵ During the post-war period, the 1955 homage to Ernst Jünger puts it more and more in spatial terms: 'the essential place of nihilism is shown to be the essence of metaphysics' (als Wesensort des Nihilismus das Wesen der Metaphysik). At the time, the event of the predicate was fulfilled and Heidegger was able to help it through the uneasy moment of the collapse of the Third Reich on 4 November 1945. In his letter to the new Rector of the University of Freiburg, nihilism is no longer referred to *Jüdischen Literaturen*, but is referred hereafter to 'the political form of fascism'.¹⁶

Scheu, Angst – fear and anguish are the words used in the 1943 Postscript¹⁷ – and what could be more fearful than the storm of the *Obersturmbann*? Yet all is forgotten in Winter 1945 when he now talks of a fight against fascism in its 'political form'.

Being and being

When we make use of an English translation of Heidegger's terms which attempts to come to terms with his principal problem, the unavoidable question arises: how to translate the 'essential' *difference* between *Sein* and *Seiende*. Strangely enough, for a language stemming from Saxon sources, this difference is unperceivable in English, since the infinitive 'to be' can hardly be used to translate the infinitive-substantive: *das Sein*/το εἶναι/*essell'*être; and so will usually be replaced with the participle 'being' (with a capital B). Some of the earliest and most daring pioneers in the art of transforming Heideggerian German into English tried to circumvent the difficulty by rendering *Sein* (infinitive) as *Being* and *Seiende* (participle) as *being*.¹⁸ Who would have presumed to ask them, or indeed to ask the master himself, whether the greatest question in the whole of History (*Geschichte*, of course) could be solved by invoking the simple difference between a capital B and a small b? Certainly, the necessity of avoiding the *Verfall* into nihilism – more precisely, into *metaphysischer Nihilismus* – will give us the courage to face such a risk, using as our only weapon the B/b difference. The *Fall* from B to b may then be described as the 'fundamental event', the *Grundgeschehen* in the sense of the Summer Semester Lecture of 1935. Was it really the best way to escape the K attack and the effects of the K postulate? The 'fundamental event' as an answer brings us to the point where a new gnosis has been founded, a new secret doctrine of a Fall throughout History.

Should we then be grateful to the author of the K postulate who enabled us to discover such a measure and thus opened the way to a new salvation through the H theorem? Though *Obmann Kriek*, the scientific sergeant-major, hardly measures up to the criterion of serious philosophical discourse, are we not indebted to his linguistic discovery (or better, his invention): the event of the predicate?

A connoisseur might object: surely the author of the K postulate is really a genuine philosopher who goes by the name of Friedrich Nietzsche? Heidegger's *Nietzsche* book, with its 1500 pages, seems to offer the most convincing proof of this allegation. Unfortunately for this claim, in the finest fragments of Nietzsche's *Nachlass*, a clear distinction is drawn between the time of metaphysics and the time of nihilism, with its three phases – the first phase, the 'extreme' phase and then the phase of 'active' nihilism.¹⁹ The sixteen sequences written on the way to Sils Maria, in Lenzer Heide,²⁰ on 10 June 1887, are developed in the form of a sort of musical refutation of Heidegger's huge *Nietzsche* book. However, the book can in itself be read as a gigantic laboratory in which the future is concocted with a view to pressing the investigation through

to the time of the greatest danger – from 1936 to 1945 – in the uncanny light of the K postulate.

The Heidegger *alagon*

In the space of philosophical discourse, the encounter between the K postulate and the H theorem can remind us of what was said in the Aristotelian *Poietike* about the meeting of Laios and Oedipus outside the narration, the *mytheuma*, which is displayed in the Sophoclean tragedy – *exo tou mytheuma*: this ‘outside’ is described as an *alagon*. The very word *alagon* which is used in Greek geometry, inclusive of Plato’s *Meno*, to describe the incommensurable proportion between the side of a square and its diagonal. In the series of natural numbers, the irrational number means the break in the set of rational numbers: two infinite series of rational fractional numbers approach this *coupure*. Infinite sets of ‘reasons’ bring Oedipus and Laos to the point where they meet face to face. Yet this point is an *alagon*.

The K and H encounter is an *alagon*, in this sense, one which resides inside the language of philosophical discourse. There is no other reported dialogue between K and H at this point in their relationship – in spite of their having been together before, in 1933. For example, both campaigned in the Nazi KADH²¹ organization as Rectors – at the Universities of Frankfurt and Freiburg respectively. The mutual defiance of 1934–5 is never the field of a bilateral recognition. The K aggression is only alluded to by Heidegger, first in the 1935 Summer Semester as ‘*man . . . neuerdings*’ (‘one . . . recently’). Then it is alluded to again in the 1943 Postscript, the so-called Nachwort to *What is Metaphysics?* as ‘blind polemics’ (*verblindete Polemik*). Each time he is dealing with ‘nihilism’ and ‘metaphysics’ and their presupposed relationship.

It is obvious that the two words are often employed as variables in the frame of Nietzsche’s language – but they are not supposed to meet in a predicative relationship. Moreover, they are often very clearly opposed, as in the Lenzer Heide suite: the Nietzsche sonata. The *predicate event* arises through the K and H encounter at the intersection of two series of languages, one of which (the *metaphysische*) comes from the code label inserted by Bicolaos Damaskus as a Scolia concluding the Theophrastos: τὰ μετὰ τὰ φυσικά, ‘the books after the Physics’. This sequence of words is fully preserved in the Cordoban school of Arabic philosophy, mainly by Ibn Rochd (Averroes), as *ba’d al-tabiah*,²² running parallel to ‘*metafisika*’. The Latin translations of Averroes and Aristotle by Michael Scot of Edinburgh, in the thirteenth century, finally introduces the noun phrase ‘*metaphysica*’ into the European lexicon. As for Nihilism, it seems to appear occasionally during the French Revolution,

for instance in a sentence from the German member of the Convention Anacharsis Cloots (it is used there in a 'positive' sense). And later on by Jacobi. But as a lexical term with a specifically 'negative' meaning, it appears abruptly with Turgenyev and Dostoyevsky. There is little to say about what could be common to Michael Scot from Balwearie in the county of Fife, Scotland in his *Metaphysica Nova* or his *Theatrum chemicum* (thirteenth century), on the one hand, and the characters of Bazarov and Verkhovensky in the Russian novel, between 1860 and 1880, on the other. The handling of the two variables by the K and the H postulate or theorem belongs to a questionable *coupure* in language – at the crossroads of a narrative *alolon*, in a sense near to the *Poietike* analysis of the Oedipus *mytheuma*.

Richard Rorty rightly defines as *incommensurable*²³ some kinds of philosophical discourse, among which he places the later Heidegger. We should say, the *alolon* draws its figures outside the *mytheuma*, in the space where K and H meet at the fracture – *à la coupure*. The point of encounter 'outside the narrative' is not outside History as a complex space, *nor is it outside the philosophical Problematic*.

The enigma of the 'later Heidegger' is written here on the edge of the narrative compass. This does not mean that it will not involve a momentous display of what Nietzsche calls the *Machtquantum*. Quite the contrary. The fight for *Macht*, the ferocious struggle for power and the praise of terror – *Schrecken des Ungebändigten*²⁴ (the Terror of the Unbounded) – are here at their climax. At the very moment when the 1935 Summer Semester comes to an end, proclaiming the 'inner truth and greatness' of the Nazi movement (die innere Wahrheit und Grösse dieser Bewegung).²⁵ Then the line of the *alolon* is cut. As incommensurable.

The Terror of the Unbounded

Hazy in many ways is the question concerning the relationship between 'politics and philosophy', a question which was deliberately kept in the dark by Heidegger. The debate always springs up anew: is Heidegger guilty? Should we organize a Heidegger trial? Even the answer can take the form of a question: should we conduct Socrates' trial over again? Does the indicted philosopher need defending? . . .

In my opinion we should try to get out of this *circulus vitiosus*. What is puzzling is the way in which the tumultuous vortex of the historical turmoil penetrates through to the language of thought. The *Confession* of November 1933 – *Bekenntnis zu Adolf Hitler und dem nationalsozialistischen Staat* – describes the new situation: 'Not to shut ourselves out of the Terror²⁶ of the Unbounded and the Chaos of the obscure' (Sich

nicht verschliessen dem Schrecken des Ungebändigten und der Wirrnis des Dunkels). Important is the second phasis, when the *Wirrnis des Dunkels* assails Heidegger himself – indicting him as a ‘Jew’. . . . The result of this story is our problem here; starting from this point in time, how does the Nazi narration about the *Verfall* or the *Untergang* of European history get accepted? The Summer Semester and the *Nietzsche* lectures attest to this protracted moment of rendering acceptable.

The Great Return

Truly the *Bekenntnis* is already a philosophical text. Here we find the key terms of *Sein und Zeit* being used to come to terms with the language of the Nazi movement: *Sein*, *Seiende*, *Dasein*, *Wesen* make friends with *völkisch*, *Volksgenosse*, *Volksgemeinschaft*. . . . And the ‘turning back towards the essence of Being’ (nach dem Wesen des Seins wiederkehren) is described as equivalent to the *nationalsozialistische Revolution*. . . . But the second phase goes further, into the depths of the *Wirrnis*. What is at stake is then the politicizing of the whole process of philosophy, since the Greeks, translated into the Nazi or the ‘revolutionary conservative’ mythology of the Fall, the *Verfall*. The so-called ‘ontological difference’ between *Being* and *being* – to *einai* and to *on/esse* and *ens/être* and *étant/Sein* and *Seiende* – suddenly becomes the clue to the whole of History, right up to the instance of the new *Aufbruch* and by way of the *Wiederkehren* which is brought about by the ‘movement’. Even after 1945, Heidegger admits to having taken a positive stand with regard to the ‘movement’ (not the ‘party’ . . .). The Nazi movement is supposed to initiate the turning around – from being to Being. Thomas Mann described the Great Return, *das grosse Zurück*, as the premonitory symptom of Nazi mythologies.

Perilous is the distortion which this will bring about, even with regard to the mere understanding of philosophical terminology. Aristotle is once again accused – of having ‘forgotten’ *Sein* and privileged *Seiende*. Even though it was he who first clearly and accurately distinguished the two uses of the same verb. In Book Alpha of the so-called *Metaphysics*²⁷ comes the first insisting reference to the verb used as an infinite noun-phrase. ‘In each thing there is as much Being as there is truth.’²⁸ In Book Gamma we find the definition of *to on* (τὸ ὄν): being as the object, no longer Being and the light of truth. *Sein* comes before *Seiende* in the axiomatic books of the ‘foremost philosopher’.

This Athenian clarity then fell into the dark abyss of *Wirrnis* and remained there from 1935 until the ‘testament’ of 1966. This is both the target and the victim of the predicate event of 1934. The *Letter on Humanism*, addressed to Jean Beaufret in 1946 and distributed in French

philosophical circles as a world message, conveys the last word: even 'ethics' are a symptom of *Verfall* and *vergehen*,²⁹ as a result of which the thought of origins falls apart. As a final Act to the Third Reich play, this conclusion, delivered in 1946, would be sheerly ironic were it not for the fact that it was spoken with prophetic earnestness. In French philosophical circles at any rate, this message was taken seriously. For Philippe Lacoue-Labarthe, 'Auschwitz reveals the West'.³⁰ Should we not be thankful – in this case to the Heideggerian clue – for having been taught that the Nazi massacres were the true heirs of the great rational tradition of philosophy from the Greeks down to the time of the Enlightenment? Or to extend the scale still further, 'from Anaximander to Nietzsche'?³¹

Of course, the Nazi ideologues knew perfectly well that their real target was precisely the Western 'heroism of reason' – as Edmund Husserl said in Vienna in 1935, before going back to Freiburg, into the tiger's mouth. But the change of language³² from the K postulate to the H theorem worked well enough to invert responsibility. Since 'Anaximander' – and on the whole since Athens – Heidegger would consequently be the sole philosopher *not* to have been guilty of the Nazi liability! At least if we accept the argument of his epigonal inheritance.

On the eve of 1989, the final revelation in this line of thought emerged: 'totalitarianism, nazism and racism', on the one hand, 'human rights and democracy', on the other, were both masked by a common 'contamination' and 'complicity', since they are both related to the same 'metaphysical gesture'.³³ Seldom has the abyss been so thoroughly vacuous. With Heidegger and his heirs we can now truly explore the *Inferno* of the twentieth century's deepest danger. Provided (since we are still onlookers) that we don't become believers. 'Greatness', if such there be, could *not* pertain to the 'movement', not even to the philosopher himself, notwithstanding his poetical aura. It could only assume the perilous form of the curative power of poison – as a *pharmakon* perhaps.

Not only have the Gods withdrawn, philosophical irony itself – effective from Zeno to Nietzsche – has been obliterated by the K/H postulate.

From danger to deconstruction

'It is in the time of greatest danger that philosophers arrive on the scene.' The *Nietzsche* book opens with this Nietzschean quotation. What does Heidegger mean in 1936 with such a hint? Karl Löwith meets him in Rome, the same year, wearing the Nazi crooked cross, the swastika, on his jacket. In reply to Löwith's question, he confirms that his own philosophy does in fact conform to the National Socialist *Weltanschauung*.

The Nietzschean danger! Nietzsche himself experiments with the

emergence of such a shadow in his own thinking. Against his own 'declaration of war', he foresees a 'party of peace . . . soon to be the Grand party', a 'party of the oppressed'. He denounces the *plump Canaille* and the *Canaille* of the newborn Anti-Semite Party. Not Nietzsche but Martin Heidegger is a convinced ally of the Nazi movement.

So what does the danger mean? Is it *what* the Nazi movement is supposed to heal – as poison carries its own cure within itself? What does Heidegger really mean when he concludes the Summer Semester course of lectures with 'the inner truth and greatness of the movement'. Does his reproducing the sentence in book form in 1953 mean that he still believes in this 'truth and greatness'? Is he still alluding to the same reality? At the time this very question was raised by Jürgen Habermas in *Die Zeit*; a student at that time, his boldness was to cost him dear in the course of his career in the academic establishment.

Confronting the problem, we are obliged to try and carry through some kind of Copernican Revolution. But we shall have to ask the philosopher what he calls the 'outer' danger.

Describing *the danger itself*, we can note *how it questions philosophy as such*. The 'inner side' of its answer assumes the form of a temporal frame through which we can enter the abyss. The Summer Semester, the *Nietzsche* book, even the *Question Concerning the Thing* but mainly the post-war Homage or *Festschrift* dedicated to Ernst Jünger³⁴ would then furnish the rooms in which we might try to decipher the hieroglyph of the European catastrophe.

Among the above, the Jünger *Festschrift*³⁵ provides us with a privileged clue. Speaking about the author of *Total Mobilization*³⁶ and *The Worker*³⁷ – in which a 'total Dictatorship' is both envisaged and announced – Heidegger comes back to the movement which will 'win back the original experience of *Sein*'³⁸ and which will subvert 'Metaphysics' as the *Wesens-ort* (essential locus) of 'Nihilism'.

This is what Heidegger calls *Abbau* and what the French translators and commentators will name deconstruction. Neither the English³⁹ nor the Spanish translators,⁴⁰ for example, seem to have hit upon such an ambiguous monster of non-thought.

Never had the event of the unfolding of the predicate ensnared such a puzzling wonder. Or displayed such a potent weapon. The experience of Being (*Sein*) having to 'win its way back [*zurückgewinnen*] up the slope of being [*Seiende*]' had managed in the meantime to realize the 'reconquest', an event already foreseen in 1945 by a distressed Heidegger. The Deconstruction fable has not only become, according to Tony Wolfe, a fashionable slogan in Manhattan, capable of competing with his own white woollen socks in a TV debate. It also seems to have been the Trojan horse thanks to which the Heideggerian discourse would eventually be permitted entrance to the New World, as a respectable sample

of continental philosophy. Did the 'closedness of metaphysics' open up a new frontier?

It is also likely that the accusations launched against 'metaphysical' language would appear congruent with the empirically oriented Anglo-American tradition – if we forget Whitehead's second philosophy. In the same way, we could see disappointed Marxist/Leninists accepting the destruction/deconstruction of metaphysics . . . regardless of a tragedy whose effect was to consign logical positivism, Marxist–Hegelian dialectic and neo-Kantianism to the purgatory of 'metaphysics' – to which science itself should also be added as the exclusive preoccupation with, or the obsessive pursuit of, *Seiende*.

Poetics and venom

Looking back over our shoulders it is difficult to avoid feeling some sort of regret. Rediscovering the gloss of *Dichter–Denken*, the implication of poetical language in the blooming of philosophical thought from the Ionians to Hölderlin, we have to admit that our thankfulness to Heidegger cannot allow us to forget the long-range venomous effect of the K postulate, lying as it does at the very heart of the predicate event. Deconstruction then turns out to be the second phase of dissimulation. The *Abbau/Verborgenheit* game was actually a winner-take-all, seen through 'spectacles made up out of the scrap metal of 1934–5'.

Predicate or event, wrote Leibniz, quoted here by Deleuze. In the discourse of classical metaphysics, the event itself is implicated in the analytical unfolding of predicative positions, inside the divine understanding. There is certainly no point in going back to the infinite intellect. It is the linguistic effect of a predicative indictment which brings us to the threshold of a new space of investigation. Narration itself, as a cognitive act. Narration is a (*g*)*narus*, and primarily a *gnoscens*, the first glance of knowledge or *gignoskein* glimpsed through the act of reporting action and lighting up – could we say, the glade? – of narration, amid a vibrating universe. This movement of thought finds a field of exploration within the folds of Heidegger's *Stoffwechsel* – if we may use Hölderlin's word.⁴¹ The 'stuff change' in question here is worth investigating.

Hölderlin, Rilke, Trakl, Rimbaud seem to move close to Parmenides and Heraclitus in the Heideggerian track. We have to take these pieces out of the jigsaw puzzle and, in the wink of an eye, listen to the Parmenidean enigma: ἐὼν ἔμμεναι 'to be being'. In Book Alpha of the Aristotelian text, we hear the harmony of a proportion: ὡς ἔχει τοῦ εἶναι, οὕτω καὶ τῆς ἀληθείας.

Vibration and navigation

Not the 'oblivion of Being' but, on the contrary, the first enlightenment of language in the ability to speak that which is; this is the Greek venture, working its way and then travelling on from Ionia to Italy – and so on to Athens. Not a *Vergessenheit* or *vergehen* through a 'Western Fall' but a voyage of thought towards an Eastern heart of the debate, from Harran and Koufa to Boukhara and Farab. In Alfarabi's poetics and work on music – *Kitab al-Musiqā* – the vibration of the voice in poetic song comes to the invention of musical organs, a kind of expansion of the body itself into a first experiment in what will become, between Samos and Croton, the birth of acoustics – the first physics in its first phase. The long way of philosophical *disputatio* is indeed a path of thought, moving from *τό εἶναι* to the Arabic *wujud*, towards *esse* and *Sein*. The Heideggerian mythology of the 'oblivion of *Sein*', is actually the obliteration of the passage by which the working out of thought discovers its horizon through the hazard of history. 'Hazard' happens to be an Arabic word and horizon a Greek vocable. This network of active languages was woven into Greek, Arabic, Hebraic and Latin – long before it came to the Western European pentagon of languages, forgetting none of the five: Italian, Spanish, French, English, German. The Greek/German scheme as a *direct* transmission of the philosophical impulse is a typical *völkish* model, driving away the so-called *Fremdwörter*. The complete omission by Heidegger of the universe of English poetical and philosophical language, as that of a Latin-German tongue, is also very characteristic. Yet is Kant thinkable without the philosophical moment of Hume? No road leads straight from Parmenides to the *Kritik der reinen Vernunft*, the target of detailed commentaries in *Die Frage nach dem Ding*.⁴² The Greek alpha/bet is itself named after two hebraic words, and its system of signs was forged from the time of the sumero/akkadian superimposition. The library of Sippar,⁴³ between Babylon and Baghdad, recently discovered by an English-Iraqi archaeological excavation into the clay of time, stands testimony to such a tangle. Out of which emerges what Athenian philosophy has named the *noos poietikos* (poetic intellect). And through the travelling labour of the Rochd/Michael Scot attempt at a translation of the *subjectum movens*, the name of the *denkende Subjekt* in Kant's *Kritik* is hammered out and inscribed. From Asia and North Africa to Arabian Spain, Scotland, southern Italy and Sicily – through Paris on the Montagne Sainte Geneviève, Oxford, Cologne, Padua, Naples.

The *Irrnis*, the wandering discovery about the *subjectum* through the tale of Being is to be found *here*, in the working space of transformations such as these. As a landmark, the Heideggerian Winter Semester on 'The Thing' could appear as an important and beautiful piece of work –

were it not at the same time a strategic piece in the game play initiated by the K and the H postulate. Indeed the 'little book on the small question' – what is a thing? – deals very cautiously with the background relevant to its inquiry. For it aims at the 'Advent', the 'great beginning of the question among the Greeks',⁴⁴ the historical – or 'historial' – 'position of Kant in the womb of metaphysics'.⁴⁵ The caution expressed in the 1935–6 lectures 'about the Thing' make it a great book, located as it is in the gap between the 1935 Summer Semester and the first 1935 lectures relating to the *Nietzsche* book. At the end of chapter XIII of Part A, Heidegger notes: 'if we don't pay attention to the Danger signal inscribed upon a high voltage electric line, we die; if we turn a deaf ear to the question: what is a thing? nothing happens'.

Precisely, 'that which happened in Europe' – if we bear in mind the words of Adorno's *Minima morali* – did occur when the Danger signal was set off. But the philosopher ignored the signal, or was too obtuse to take note of the thing that manifested itself through language – and within the reality of history – between the years 1933 and 1945.

Existence is not a real predicate for a thing, insisted Kant. A hundred possible thalers are not 'more' than a hundred real thalers. . . . In his *Kants Lehre* book, Heidegger insists on this: Being-present is not a predicate. The same *quidity*, the same *res*, the same *Dingheit* is there for the possible just as well as for the actual thing.

Yet the predicate did itself overturn the 'reality' of the Thing through the predicative event, or better *Advent*, which changed the Nietzschean *antiphrasis* of the Lenzer Heide sonata into the *cataphasis* of the K and the H postulate. If 'occidental-metaphysical' is the predicate of 'Nihilism' – and if 'Nihilism' (forgetting its 1934 equivalence with 'jüdischen Literaturen') becomes the 1945 'political form of fascism' – then even in this extreme case, does it still make sense to say that 'Auschwitz reveals the Occident?' We know that it *was* actually said.⁴⁶ Yet Nazi ideological language in its entirety is a cruel offensive against 'Western' *abendländische* thought, from Descartes to Locke and Rousseau.

But even if it were possible to assert that the whole philosophical ('metaphysical') trend of the West implies the industrial massacre in Auschwitz-Birkenau, this could just as well be a way of saying *either* that this renders the process which leads to Auschwitz 'acceptable' *or* that 'nothing' actually happened at Auschwitz. Moreover it is also possible to find critical expositions which fluctuate between these two positions.⁴⁷ Quite recently, one finds a statement to the effect that 'even if Heidegger had killed ten million people with his own hands, this wouldn't change the true value of his doctrine'.⁴⁸

At this point in time, the story of the historical present is not a simple 'object' which could be investigated by the philosopher. It is the gravi-

tational field of the narrative which itself questions *philosophia* and never ceases to encompass it with questions. At this very moment we may nevertheless hear some sort of signal being given off within the acoustics of the poetical aura and the philosophical strife. That of peril.

Notes

Heidegger's Nazism and the French debate

Tom Rockmore

Any thinker who departs from the previous discussion in a significant manner, who displaces the discussion, for instance through the introduction of different categories, a new approach to a problem in the debate, in practice any important thinker requires a process of reception in order to assimilate and evaluate novel insights. The process of reception required for Heidegger is also necessary for such other important contemporary thinkers as Quine and Wittgenstein, Russell and Husserl. The unprecedented difference with respect to Heidegger is that alone among major thinkers in this century Heidegger was a Nazi.

Heidegger's penchant for Nazism has seriously affected discussion of his thought. It would certainly be interesting to sketch the Heidegger reception in general, in practice an enormous task. Even more than Wittgenstein and Lukács, Heidegger is perhaps the most influential philosopher in this century. His thought has impacted directly and indirectly on an enormous number of writers, in philosophy and in other fields. It would be useful to discuss Heidegger's reception in French thought in general, where he has had a particularly significant following.¹ It would also be interesting to consider the reception of Heidegger's Nazism in general since it became public knowledge in the Rectoral address in 1933. The more limited aim of this paper is to consider the reception of Heidegger's Nazism in the French philosophical discussion. The French discussion is specifically interesting for its length and intensity. It is further interesting as so far the richest source of the main lines of criticism and defence of Heidegger's Nazism. The aim of this paper is to describe the little-known French discussion of Heidegger's Nazism in some detail,² and then to draw some conclusions concerning the reception of Heidegger's theory. In view of the scope of the French discussion, the main stress will be placed on an understanding of the main lines of

the controversy as distinguished from an encyclopedic presentation of all the material.³

1 The French reception of Heidegger's Nazism

The reception of Heidegger's Nazism, although not always under that name, has been underway for several decades, at least since the 1930s.⁴ The first philosophical debate between representatives of different views of Heidegger's Nazism only began about a decade and a half later, in the second half of the 1940s in the pages of the French intellectual journal, *Les Temps modernes*.⁵ Until recently the reception of Heidegger's Nazism developed in a largely desultory fashion, attracting little attention, with occasional bursts of activity. Significantly, as late as the mid-1970s, in a detailed study of Heidegger's political thought, an observer could state that only three books required mention.⁶ Although the reception of Heidegger's Nazism was never as tranquil as ordinary scholarly debate, it was burst asunder, literally transformed, by two publications in the late 1980s: Farias' resolute effort under difficult conditions finally to study Heidegger's Nazism in a wider historical context,⁷ and Ott's historically more careful but even more damning effort towards a Heidegger biography.⁸ Farias' book served as a catalyst for a strident debate virtually across Western Europe, which now gives signs of spreading, in more scholarly, less virulent form, to the United States.⁹ It is a measure of the subversive character of Farias' assault on the Heideggerian establishment that although he lives and teaches in Germany, he was only finally able to publish his book in France.

In order to understand the particular, indeed peculiar, nature of the French reception of Heidegger, it is helpful to provide a brief characterization of the French intellectual context, above all French philosophy. Philosophy in general is not given to rapid changes, since it often takes centuries for problems to be formulated, for ideas to attain wide appeal, for shifts in emphasis to occur. Just the opposite is the case in French thought as viewed on a certain level. In the last two decades, an exceedingly short period by philosophical standards, French philosophy has considered and later discarded options proposed by structuralism, post-structuralism, the *nouveaux philosophes*, hermeneutics, existentialism, semiology, post-modernism, etc. There is obviously no guarantee that the latest mode on the scene, deconstruction, which is better known and more influential in the United States than in France, will survive, or survive more than the proverbial fifteen minutes during which each of us will supposedly be famous.¹⁰

The rapid pace in which the various aspects of French thought come into being and pass away suggests that French philosophy – which gave

rise to the post-modernist theory according to which there is no ground, no overarching single tale which locates all its variants – is itself post-modernist.¹¹ One could easily infer from what by philosophical standards seems to be the nearly instantaneous rise and fall of competing points of view that, to parody Yeats, things have indeed fallen apart since the centre does not hold, in fact fails even to exist.¹² But these appearances are indeed deceiving since to a perhaps unsuspected extent there is an intellectual centre in French intellectual life, which underlies and makes possible the profusion and confusion of swirling ideas as only its various manifestations.

Although French thought may seem to be the philosophical analogue of the Maoist injunction to let a hundred flowers bloom, from a historical point of view it has long been dependent on a single main component. After the French Revolution, which in principle guaranteed fundamental rights, including religious rights, to all, France remained, and still remains, a mainly Roman Catholic country;¹³ to a scarcely lesser extent French thought has been dominated over several hundred years by forms of Cartesianism.¹⁴ It is hard to imagine and difficult to describe the extent of Descartes' influence on French intellectual life, which descends even to the level of a correctly-written paper, the so-called *dissertation*, in the *lycée*. It is not without reason that Sartre has been called the last of the Cartesians and Merleau-Ponty, his younger colleague, has been hailed as the first non-Cartesian French philosopher. For in France over the course of several hundred years, Descartes has played the role of the master philosopher, *le maître penseur*, whose thought furnished the central organizing principle of all intellectual life.

In the period since the 1930s the two main philosophical developments in French thought, namely the attention to Hegel and then to Heidegger, can both be explained in respect to the dominant Cartesianism. The introduction of Hegel in France has been aptly, although not entirely accurately, traced to the influence of Alexandre Kojève's famous seminar on the *Phenomenology* during the late 1930s.¹⁵ Although a brilliant thinker in his own right, a major star in the philosophical firmament, and indeed critical of Descartes, Hegel is also in numerous ways a neo-Cartesian, who perpetuates the well-known Cartesian concerns with certainty, truth in the traditional philosophical sense, metaphysics, first philosophy, etc.¹⁶ The importance of Hegel's influence on French thought in this century should not hide the extent to which, in reacting against Hegel as the *maître du jeu*, the master of the game, later French thinkers were reacting through Hegel to the continued influence of Descartes.¹⁷ This reaction is in part prolonged in the more recent turn to Heidegger, a notorious anti-Cartesian.

Roughly since 1945, and increasingly in recent years, French thought has been dominated by Heidegger.¹⁸ To understand the turn to Heidegger

in French philosophy, two factors are important. First, there is Heidegger's well-known anti-Cartesianism, which conveniently meshes with the continued reaction against the father of French philosophy, in a form of conceptual parricide stretching over more than three centuries. Heidegger's thought is inseparable from its anti-Cartesian bias which only grows deeper in his later turn away from *Dasein* in part in order to expunge any residual Cartesianism.¹⁹ Heidegger's attempt to dismantle modern metaphysics resembles French philosophy itself. The introduction of his thought within the French context as part of the reaction against Hegel, or rather the French form of Marxist Hegelianism, only showed the persistence of the difficult effort to throw off the Cartesian background.

Second, there is the more immediate anti-humanist reaction to the prevailing left-wing Marxist, humanist form of French Marxism, associated with such writers as Kojève in the first place, as well as at various times Camus, Nizan, Sartre, Merleau-Ponty, Garaudy, Foucault, perhaps Lévi-Strauss, Barthes, etc., which bothered, in fact offended, those concerned to maintain the traditional French value-system. Heidegger's self-proclaimed anti-humanism, in fact an effort to found a new humanism surpassing the old variety, provided a convenient way to throw off the yoke of Hegel's influence, which to many seemed merely a stand-in for Marxism, including its political dimension.

Jean Beaufret later played a leading role, but at least initially Jean-Paul Sartre was mainly responsible for creating the French fascination with Heidegger. Sartre's *Being and Nothingness*, which was doubly dependent on both Hegel and Heidegger, focused attention on both thinkers during the Second World War, reinforcing the interest in Hegel and turning attention to Heidegger. Sartre's dual interest in Heidegger and Hegel was seen by many as problematic. The form of Hegelianism current in France, to which Sartre also subscribed, was a left-wing Marxist humanism pioneered by Kojève. Heidegger's own self-described anti-humanism was to begin with perceived as humanism, particularly in the extensive discussion of *Dasein* in *Being and Time*. Heidegger's thought was in part seen as a necessary course correction to what, certainly from a Roman Catholic religious point of view, was perceived as a form of anti-humanism associated with Sartre's atheistic form of existentialism.²⁰ The point is that although Heidegger left the seminary and later the Church, and his link to Nazism was not an expression of humanism in any ordinary sense, his thought was perceived as a *moindre mal*, a lesser evil, by those appalled by Sartre's own form of existentialist humanism.

What is the extent of Heidegger's influence in French philosophy? There is a measure of truth in Heidegger's famous *boutade* that when the French begin to think they think in German.²¹ To an important extent Heidegger's thought now forms the horizon of French philosophy. The dominance of Heidegger in French philosophy can be illustrated by

the startling fact, certainly unprecedented in any other country with a major role in the Western philosophical tradition, that at the present time the three main younger scholars of Aristotle (Rémi Brague), Descartes (Jean-Luc Marion) and Hegel (Dominique Janicaud) in France are all deeply influenced by his thought. French Heideggerianism is a flourishing industry, perhaps the most important contemporary source of studies of Heidegger's thought in the world today. Within France, Heidegger's influence has in the meantime penetrated in other directions as well. It is no exaggeration to say that at present Heidegger and Heidegger alone is the dominant influence, the master thinker of French philosophy, and that his thought is the context in which it takes shape and which limits its extent. It is, then, no wonder that in the recent resurgence of controversy about Heidegger's link to Nazism French philosophy has tended to equate the attack on Heidegger with an attack on French philosophy.

2 Origins of the French discussion of Heidegger's politics

This incomplete account of the source and extent of Heidegger's influence in French philosophy is intended to make possible a closer look at the French discussion of Heidegger's Nazism. This complex discussion, which is still underway, has so far unfolded in three separate moments, or waves. These include a short, initial debate (1946–8) shortly after the end of the Second World War, in which the topic was examined in a cursory manner; a rapid revival of the same debate in the mid-1960s after, indeed partly as a result of, the publication of certain documents calling attention to Heidegger's Nazism; and more recently in the direct, ongoing reaction to the publication in French translation of the Spanish manuscript of Farias' already classical study.

Even before we examine the debate on Heidegger and Nazism in France, we can note in passing three significant features which distinguish it from other portions of a discussion which has by now largely exceeded the limits of a single country or language. First, there is a certain well-known parochialism, long characteristic of French thought of all kinds, which traditionally proceeds as if it formed the entire conceptual universe whose centre and nearly sole focus was Paris. Just as with selected exceptions French thinkers are mainly, even cheerfully, unaware of non-French forms of thought, so the debate on Heidegger's relation to National Socialism has largely occurred without consideration of the discussion underway elsewhere. To be sure, there are occasional references to Hugo Ott, the Freiburg historian, or to Otto Pöggeler, the author of an influential study of Heidegger's thought; but for the most

part, to a degree unusual in the ever-smaller cultural world, the French debate concerns mainly, often only, itself.²²

Second, in contrast to the widespread French cultural and political xenophobia, we can note that a number of the most important participants in the French debate on Heidegger's relation to National Socialism are either foreign-born French, or not French at all, e.g. Farias, Weil, Löwith, Tertulian, Lukács. This extra-French influence, which has throughout tended to calm and to refocus an often wildly passionate, occasionally irrational debate, was present even at the beginning.

Third, there is a particular philosophical focus due to the contingent fact that until several years ago, when a pirated translation of *Being and Time* was published, only the first half of the book was available in French. Even access to this part of the text was severely restricted by the dependence on a single, strategic Heideggerian essay as the way into fundamental ontology.²³ The French reception of Heidegger has for many years been focused through Heidegger's *Letter on Humanism*. This text is Heidegger's response to a letter addressed to him on 10 November 1946, by Jean Beaufret, the French philosopher, who later became the main figure in the introduction of Heidegger's thought in France, a tireless proselytizer for the Heideggerian point of view. Heidegger replied to Beaufret's letter in December 1946, and then reworked his response for publication.

The resultant text is both philosophical and strategic in character. Although this text is a serious philosophical study, it is also a masterly effort by Heidegger to attract attention to his thought in a neighbouring country at a time when he was seriously beleaguered in his native Germany. As an open letter to a figure on the French philosophical scene at a time when Heidegger was in eclipse because of his association with the Nazi regime, there was an obvious strategic value to the claim that there had been a turning (*Kehre*) in his position, by implication a turning away from his earlier view which was also a turning away from Nazism. Understood in this way, the concept of the turning appears as a tacit, even graceful admission of an earlier complicity, combined with a suggestion of a fresh start, untainted by earlier transgressions, and a suggestion to provide a reasonable alternative to Sartre, a perhaps objectionable French guru. These are all characteristics which quickly raised Heidegger's stock in French intellectual thought and may even have been calculated to do so. Significantly, although at the time Heidegger had already moved far from his original position, his *Letter on Humanism* has been described by a French commentator as the best introduction to *Being and Time*.²⁴

In other texts from his later writings, Heidegger continues to insist on the uniqueness of the Germans; but not by accident in the *Letter on Humanism* Heidegger opposes nationalism of any kind as metaphysically

anthropological and subjective.²⁵ His stated opposition here to biologism, a doctrine to which Heidegger seems never to have subscribed, limits the dimensions of Heidegger's admitted political error.²⁶ Heidegger's opposition to Sartrean existentialism and humanism of all sorts as metaphysical²⁷ is balanced by his careful description of his alternative as the only one able to think 'the humanity of man', as an attempt to 'think the essence of man more primordially' in order to restore its original sense, and as a view that 'in no way implies a defence of the inhuman but rather opens other vistas'.²⁸ Heidegger's depiction of his form of non-metaphysical humanism as more meaningful than its better known alternative is clearly stated: 'To think the truth of Being at the same time means to think the humanity of *homo humanus*. What counts is *humanitas* in the service of the truth of Being, but without humanism in the metaphysical sense.'²⁹

The fact that, for contingent reasons, the French reading of Heidegger has largely proceeded from an anti-metaphysical humanist focus explains the relative ease with which Heidegger displaced not only Sartre but Hegel as well in French thought and the violent reaction to the appearance of Farias' book. Beyond his status as an important thinker, Heidegger's implicit claim to be a true humanist smoothed the way for the displacement of views frequently regarded as either anti-humanism or associated with anti-humanism. The shocking revelation that what many had long regarded as essentially humanism in the deepest sense was possibly no more than a false appearance is basic to the French reaction to recent revelations about Heidegger's politics. It is, then, not by chance, that the French discussion of Heidegger's political thought has been so heated since the debate revolves around the essentially political question of whether, as Heidegger and his followers claim, Heidegger's position is a new anti-metaphysical humanism or whether, on the contrary, as others have held, it is a metaphysical form of racism, based on a durable commitment to the superiority of the German people.

In France, the intellectual debate on Heidegger's Nazism began in the pages of *Les Temps modernes*, one of the best known French intellectual journals. This journal was founded by Sartre and his colleagues when France was liberated from the Nazis and later edited by him for many years. The early existentialist Sartre is well known as the author of the view, which to some, including the later Sartre, appeared to ignore the constraints of real life, that we are always and essentially radically free. The initial phase of the debate, which includes texts by Karl Löwith, Alfred de Towarnicki, Eric Weil, Alphonse De Waelhens and Maurice de Gandillac, is preceded by an editorial note. Here, immediately prior to the publication of the famous *Letter on Humanism*, an unnamed editor, in all probability Sartre, draws a comparison between Heidegger and Hegel. Just as the latter's later thought led him to compromise with

Prussia, so Heidegger the man and Heidegger the political actor are one and the same; and his political choice follows from his existential thought. In the same way as an analysis of Hegel's position removes any suspicion with respect to dialectical thought, the writer suggests that a similar analysis will do the same for Heidegger, in fact will demonstrate that an existential view of politics is at the antipodes of Nazism.³⁰

3 The first wave

With respect to the later debate on Heidegger's Nazism, the initial phase of the French discussion is important in setting out the main criticism, and two of the main defences of Heidegger against criticism based on his Nazi turning. Löwith argues that Heidegger's Nazism follows from his philosophy, a point which recurs in the later discussion, most recently in writings by Janicaud, Zimmerman and Wolin. De Waelhens counters with two of the main defences, due ultimately to Heidegger himself,³¹ which have since been belaboured by some of Heidegger's closest students. On the one hand, Heidegger the man and Heidegger the philosopher are unrelated so that Heidegger's political engagement is insignificant with respect to his philosophy, a view later advanced by Fédier and Aubenque in the French discussion, as well as by a host of others outside it. On the other hand, Heidegger's critics are uninformed, so that at the limit only someone who has totally accepted Heidegger's position, in effect a true believer, can possibly criticize it. Beside Fédier, the main current proponent of this idea in the French discussion is Derrida, and in the German discussion, Vietta.³² At present, the American phase of the discussion is just beginning, but already the idea has been voiced that it is a mistake to understand Heidegger's philosophy in terms of his politics³³ and a reading of the Rectoral address has appeared which 'brackets' the available discussion in order to follow Heidegger's own view of it as a mere defence of the German university.³⁴

The initial phase of the French discussion comports no less than three sub-phases, including articles by Karl Löwith, Maurice de Gandillac, and Alfred de Towarnicki, followed some time later by articles by Eric Weil and Alphonse De Waelhens; and ending with responses by Löwith and De Waelhens. Gandillac, who was apparently the first French philosopher to come in contact with Heidegger after the war, went on to an important career as a professor at the Sorbonne. Löwith is a former student, later colleague of Heidegger, who spent the war in exile. He is well known for his own work as well as for an interesting study of Heidegger which attempted to understand why and how Heidegger achieved such philosophical importance.³⁵ Weil, a Jew who was the assistant of Cassirer, himself a Jew, emigrated early to France where he achieved prominence

as an original thinker, above all for an important analysis of philosophical categories.³⁶ De Waelhens was a well known Belgian scholar of phenomenology and existentialism, the author of important studies of Heidegger, Husserl, Merleau-Ponty, etc. Towarnicki is a journalist who is still active.

Here, as in the later debate, it is instructive to regard the discussion as a series of dialectically interrelated analyses of the same phenomenon from diverse points of view. Both Gandillac and Towarnicki embroider various themes of the 'official' view of Heidegger's Nazism, due finally to Heidegger himself. Gandillac provides a short account of a visit to Heidegger's home which from the present perspective makes two interesting points.³⁷ On the one hand, he presents with sympathy Heidegger's view that Hitlerism was the historic manifestation of a so-called structural disease of human being as such. It is significant, since Heidegger later insists on the misunderstood essence of Nazism, that in Gandillac's account he refuses to incriminate the fall of the Germanic community whose true sense of liberty he still desires to awaken. On the other hand, several times in the article we are told that Heidegger was seduced like a child by the exterior aspects of Hitlerism, that he was induced to enrol in the Nazi party by his children, etc. Taken together, these two points tend to indicate that Heidegger was unaware of the consequences of, and hence not responsible for, his political actions, while holding open the possibility, which he later never renounced, of the true gathering of the metaphysical *Volk*.

Towarnicki's version of the official view is at least partly false.³⁸ He suggests that Heidegger was unanimously elected Rector, although that is now known to be untrue. Towarnicki quotes Heidegger to the effect that the death of Röhm opened his eyes to the true nature of Nazism, which he later criticized in his courses on Nietzsche; but we know that Heidegger continued to affirm his belief in an authentic form of National Socialism. The article ends with an affirmation, in the form of a direct quotation, of Heidegger's emotional proclamation of the spiritual importance of France to the world. When we recall that Heidegger also justified his turn to Nazism through the concern with the spiritual welfare of the German people, this remark appears less uplifting.

Löwith's discussion, which was written outside Germany in 1939, hence at the beginning of the war which was to devastate Europe, is still surprisingly complete.³⁹ It mentions topics which continue to occur and recur in the later debate such as the link between Heidegger's turn towards Nazism and his famous description of resoluteness in paragraph 74 of *Being and Time*, an analysis of the *Rektorsrede*, Heidegger's praise of Schlageter, Heidegger's relation to the students of Freiburg, the role of E. Jünger, etc. Löwith's analysis can be summarized as follows: in the final analysis *Being and Time* represents a theory of historical existence. It was only possible for Heidegger to turn towards

Nazism on this basis since an interpretation of his thought in this sense was possible. Further, Heidegger's turn to National Socialism follows from his prior philosophy, in fact is squarely based on a main principle of his thought: existence reduced to itself reposes only on itself in the face of nothing. Finally, this principle expresses the identification of Heidegger's thought with the radical political situation in which it arose.

Löwith's analysis is a clear attempt to understand Heidegger's Nazism as following from Heidegger's position, and his position as the expression of the historical situation, in Hegelian terms as the times comprehended in thought. Löwith contradicts two points maintained by all subsequent defenders of Heidegger: Löwith denies that Heidegger's philosophy can be understood other than through its social and political context. Accordingly, he contradicts in advance the well-known 'textualist' approach, especially prevalent in French circles, to Heidegger's writings without reference to the wider social, political and historical context in which they arose. He further denies the 'official' view of Heidegger's National Socialism – most prominently represented in the French debate by Fédier and Aubenque, and from a different perspective by Derrida and Lacoue-Labarthe – which tends to minimize, even to excuse, Heidegger's turn towards Nazism as unfortunate, temporary and above all contingent with respect to Heidegger's thought.

At the outset of the French debate, the opposition between Löwith on the one hand and De Gandillac and Towarnicki on the other already symbolizes the two basic alternatives in their respective readings of Heidegger's Nazism as either necessary or contingent. All other later debate, both within and without the French context, only varies, but does not fundamentally modify, these two main options. Obviously, these two extremes are incompatible. Since Löwith traces Heidegger's actions to his thought and Heidegger's thought to the historical context, Löwith disputes Towarnicki, who regards Heidegger's link to National Socialism as temporary, regrettable and unmotivated by the underlying position; and Löwith disputes as well De Gandillac's assertion that Heidegger was unaware of what he did.

The disagreement gave rise to a debate. In the debate Weil, who correctly qualifies Towarnicki's article as a plea for Heidegger, intervenes against the necessitarian thesis, whereas De Waelhens defends the contingency view. Weil criticizes Heidegger for a supposed failure to assume responsibility for his acts and as the sole important philosopher who took up Hitler's cause.⁴⁰ But he denies the necessitarian thesis on the grounds that even by Heideggerian standards the link between Heidegger's thought and National Socialism is illegitimate. According to Weil, what he incorrectly calls Heideggerian existentialism is intrinsically defective since it leads to a decision in general, but not to any particular decision. From this perspective, Weil claims that Heidegger has falsified his own

thought in merely pretending *a contrario* that a political decision could be derived from his apolitical thought. Although it is correct to point to the open-ended quality of Heidegger's view of resoluteness, this does not impede the derivation of a political consequence from another aspect of Heidegger's position, such as his conception of authenticity.

This effort to deconstruct the necessitarian reading is peculiar – not because of the amalgam between Heideggerian phenomenology and existentialism, which Heidegger took pains to deny in the *Letter on Humanism*, nor in virtue of the denial that Heidegger is a privileged interpreter of his own thought, since there is no need to accord him this interpretative privilege – because it fails to address the claim that a clear political decision follows from Heidegger's view of authenticity. Now Alphonse De Waelhens – who also identifies Heidegger's thought as an existential phenomenology – suggests, through an attack on the necessitarian thesis, that the theme of Heidegger's fidelity to his own position is less significant than its possibly intrinsic relation to National Socialism.⁴¹

De Waelhens' attack on the necessitarian thesis is remarkable for two reasons. On the one hand, he raises the issue of who really understands Heidegger as a precondition for the critique of the latter's thought. Later in the discussion, even when the defenders of Heidegger are led to acknowledge that Nazism is central to his position, Derrida and others, including numerous writers outside the French debate, continue to insist that only someone deeply steeped in Heidegger's thought, by inference an unconditional adherent, is possibly competent to measure its defects. On the other hand, De Waelhens formulates a kind of transcendental argument meant to demonstrate that Heidegger's political turning could not have followed from his philosophy. According to De Waelhens, who has obviously been contradicted by history, an analysis of Heidegger's conception of historicity shows that its author could not accept fascism, a doctrine incompatible with the ideas of *Being and Time*. And he disposes of Löwith's version of the necessitarian thesis through a rapid, but unconvincing effort to demonstrate that Heidegger's former colleague did not always possess a sufficient grasp of the master's texts.

When we compare the views of Weil and De Waelhens, we see at once that since both deny that Heidegger's thought bears an intrinsic relation to Nazism, each is obliged to interpret what Heidegger thought and did as an instance of Heidegger's infidelity to Heidegger's own position. De Waelhens is more radical than Weil since he does not assert that Heidegger misunderstood his own thought, but rather claims – a point widely asserted in the later discussion – that the action of the individual Heidegger is without philosophical interest. Perhaps for that reason, he drew a response by Löwith, who does not take up the issue of who is capable of judging Heidegger.⁴² This omission is important, since it is always possible to claim that a criticism, any criticism at all,

is based on an insufficient awareness of the position. Rather, Löwith restates his own conviction that Heidegger's relation to Nazism is a necessary consequence of Heidegger's philosophy of existence. He further affirms that it is curious to defend Heidegger against Heidegger's own voluntary political engagement. In his rejoinder⁴³ De Waelhens insists that his attempt to show that Heidegger's political action did not, and cannot, follow from the latter's philosophy is only a specific instance of the more general claim that one cannot deduce a particular political stance from a philosophy.

De Waelhens' rejoinder invokes a principle, which, if followed, would effectively suppress the possibility of analysing the relation between thought and action. His principle, which contradicts the entire ethical tradition, whose unexpressed premise is that reasons can be causes, is false for at least two reasons: first, throughout history, at present in Eastern Europe, millions of people have been motivated to political action on behalf of ideas. This is a point De Waelhens can accommodate only on pain of denying that such ideas are philosophical. Second, De Waelhens calls on us to abandon the political act of an analysis of the link between Heidegger's philosophy and politics, which precisely assumes the political efficacy of philosophy he is concerned to deny.

4 The second wave

The initial phase of the debate presents a clear opposition between Heidegger's critics, who argue that his Nazism 'necessarily' follows from his thought, and his defenders who maintain that his Nazism is merely a contingent fact. The opposition between necessitarian and contingent readings of Heidegger's Nazism sets the stage for all later discussion of this theme in France and elsewhere. The second phase of the French debate differed in numerous ways from its predecessor. To begin with, it is less compact, and for that reason more difficult to delimit. It occurred over a number of years, roughly from 1948, when the first French edition of Lukács' book appeared, to the publication of Jean-Michel Palmier's study in 1968, the year of the French student uprising. It further includes articles by François Fédier, Jean-Paul Faye, François Bondy, Alfred Grosser, Robert Minder, Aimé Patri, etc., and journals such as *Méditations* and *Critique*. Another difference is the increasingly international character of the second phase of the debate, which makes greater reference to materials published in languages other than French. Further, the discussion now takes on an increasingly heated, often overheated, on occasion even strident, character, which surpasses the generally polite nature of traditional scholarly discussion. One can specu-

late that the excited character of the debate indicates the political stakes of the critique or defence of Heidegger's form of National Socialism.

The remarkable change in tone is arguably due to a variety of factors. On the one hand, in the initial phase of the discussion a number of those who took part, including Löwith and Weil, were not native French, but those who intervene in the next stage of the debate are mainly of French origin. It is a fact that debate in French intellectual circles tends to be noisier and more strident than elsewhere. On the other hand, in the meantime, the full effect of Heidegger's *Letter on Humanism* had begun to be felt. As a result, Heidegger had already begun to acquire a commanding presence in French intellectual life, whose horizon was increasingly constituted by his thought. The greater identification of French thought with Heidegger even as his position displaced Hegel's in the role of the master thinker meant that French scholars on occasion tended to act if they were as much engaged in defending French thought as in defending Heidegger's position. Further, the appearance in the meantime of Guido Schneeberger's collection of relevant documents, as well as other studies, such as those due to Adorno and Huhnerfeld, meant that Heidegger's philosophy, and not only his personal reputation, was now at risk. Finally, France was then approaching a political crisis which would nearly paralyse the country for a number of months beginning in March 1968.

Although in his *Letter* Heidegger implicitly admits his culpability in his stated desire to turn over a new leaf, Beaufret took a more extreme line, which developed only slowly. As early as 1945, when he was close to Marxism, he described Heidegger's adhesion to National Socialism as the result of a naivety linked to a bourgeois character.⁴⁴ But Beaufret rapidly abandoned his youthful flirting, common in France at least until 1968, with revolutionary thought. In his letter to Heidegger, he mentions his concern with the relation of ontology to the possibility of an ethics. Beaufret later provided a curious answer to his own concern in two ways: through the denial of a more than casual relation between Heidegger and National Socialism, itself a form of the contingency thesis,⁴⁵ but above all in his own later turn to a form of revisionist history in which he simply denied the existence of Nazi concentration camps!⁴⁶ Taken to its extremes, the result is to deny that there could be a problem in the link between Heidegger and National Socialism, which, on Beaufret's demonstrably false reading of history, was intrinsically unproblematic. In a word, Nazism was not Nazism! This is surely the most extreme possible form of the deconstruction of the necessitarian thesis, since from this angle of vision it is fully possible to accept that Heidegger was led by his thought to Nazism but to deny that the acceptance of Nazism is problematic.

We can deal separately with the works by Georg Lukács and Jean-

Michel Palmier. Lukács, the important Marxist philosopher and literary critic, is the author of *History and Class Consciousness*, a celebrated book which almost alone created the Hegelian approach to Marxism widely influential in later Marxist discussion.⁴⁷ His study of Marxism and existentialism, written during his Stalinist phase, was a consciously polemical intervention in the debate, intended to dismiss existentialism from an orthodox Marxist perspective.⁴⁸ Here, he applied Engels' depiction of the relation between thought and being as the watershed question of all philosophy to oppose the possibility of a putative third way, supposedly sought by existentialism, between idealism and materialism. According to Lukács, existentialism is merely a form of subjective idealism linked to the defence of bourgeois class interests. In passing, he specifically attacks Heidegger's position as pre-fascist. He developed this criticism at length in an appendix, 'Anhang; Heidegger Redivivus' – in direct response to the publication of Heidegger's *Letter on Humanism*, the same document which cemented Heidegger's relation to French philosophy – added to the German edition of his book.⁴⁹

Lukács' book seems to have affected the French discussion of Heidegger only marginally, mainly through its influence on Merleau-Ponty and Sartre. Lukács was in part later answered by Merleau-Ponty who, in a famous discussion, identified Lukács as the founder of so-called Western Marxism.⁵⁰ And Lukács clearly influenced Sartre's later turn to Marxism. Writing two decades later, Palmier, a careful student of Heidegger, casts himself in the role of a defender of the master against the various attacks which, for perhaps the first time in the French discussion, he attempts to parry through detailed textual analysis. Palmier's study, which appeared at the close of the sharp exchange between Fédier and Faye, is intended by its author as an initial approach to Heidegger's writings from April 1933 to February 1934, that is during his period as Rector.⁵¹ But by casting his net so narrowly, Palmier perhaps unintentionally takes this period, which he recognizes as belonging to Heidegger's *oeuvre*, out of context, since he renders it exceedingly difficult to grasp the degree of continuity between it and the later evolution of Heidegger's thought. Perhaps for this reason, despite the serious nature of Palmier's study, it seems not to have attracted attention in the later debate.⁵²

In order to characterize the second phase of the discussion, whose conceptual and chronological limits fall between the books by Lukács and Palmier, we do well to turn to the polemic between Fédier and Faye. Unlike the initial phase of the discussion, which began with a defence of Heidegger, the opening shot was fired by an attacker who was met after a short interval by a committed defender, determined to repulse any assault on the house of Being. This phase of the attack, in fact the second battle of the conceptual war concerning Heidegger, was launched by Jean-Paul Faye in 1961⁵³ through the publication of the

French translation of certain Heideggerian texts, notably the *Rektorsrede* and the homage to Schlageter. In a short presentation preceding the texts, Faye notes the violence of Heidegger's revolutionary language, particularly in the Rectoral speech, and its link to Nazi terminology. In a further article⁵⁴ in the same journal, Faye reproduces the famous passage on the essence of authentic Nazism from *An Introduction to Metaphysics*, as well as Heidegger's endorsement – in a letter to *Die Zeit* dated 24 September 1953 – of the effort by Christian E. Lewalter to explain away Heidegger's apparent concern with Nazism – published in the same journal on 13 August. Here, Faye develops his earlier discussion by insisting on the relation between Heidegger's views and those of Ernst Krieck. Faye also took the occasion, prodded by Aimé Patri, to correct his earlier translation of Heideggerian texts.

In retrospect, Faye's articles did not break new ground. His main contribution was to make available material which tended to cast doubt on the contingency analysis. The initial intervention by François Fédier, after Beaufret's death Heidegger's most ardent defender in the French philosophical discussion, only occurred some five years after Faye's articles. Even then, Fédier's ire was mainly directed towards other targets. Fédier only turns to Faye when the latter dared to respond to his impassioned defence of Heidegger against all comers. Since that time, Fédier has maintained his visible role – which now after the death of Beaufret, his former teacher, is nearly his alone – as the self-appointed, official spokesman for the contingency thesis, determined to deconstruct any and all forms of the necessitarian analysis. With the exception of Aubenque, at present no other prominent French defender of Heidegger argues that the link between Heidegger's philosophy and politics is merely contingent.

Fédier's initial article⁵⁵ was prompted by his perception of attacks on Heidegger by Guido Schneeberger, Theodor Adorno and Paul Hühnerfeld. Instead of a response to a polemic, the author describes his intent as an examination of the presuppositions of so-called hostile arguments. In each case, Fédier shows to his satisfaction that the writer in question is methodologically incapable of comprehending Heidegger's Nazism before describing what he calls reality through a simple statement of the 'main facts' of the case. According to Fédier, who does not examine other, later evidence, with the exception of the *Spiegel* interview, an analysis of Heidegger's courses between 1934 and 1944 suffices to perceive the exact meaning of Heidegger's opposition to Nazism and, for the same reason, to understand why he desired in 1933 to contribute to the realization of something other than what Nazism became.

It is noteworthy that none of the works to which Fédier responds here is due to a French author or published in French. Fédier's discussion, which is a form of the contingency thesis, specifically a further version

of the claim that the critics of Heidegger are insufficiently familiar with the object of their criticism, is only innovative as an early attempt within the French context to respond to foreign criticism of Heidegger. Although Fédier's *défense tous azimuts* did not even consider the nascent French effort to come to grips with the problem, it is not surprising that he was quickly answered by three French writers, including Patri, Minder and Faye, which in turn evoked a rapid rejoinder from Fédier.

Fédier is defended by Patri. In his short paper, he argues in support of Fédier and against Faye that – on linguistic grounds alone – one cannot identify a relation between Heidegger and Nazism, since the adjective 'völkisch' was already used by Fichte who was not an SS.⁵⁶ This version of the attack on the necessitarian thesis because the critic is allegedly misinformed was immediately contradicted in another short paper by Minder, who asserts that even a cursory examination of Heidegger's language supposes an acceptance of some fundamental principles of the Third Reich.⁵⁷ He further notes, as Farias and especially Ott later argue in detail, that Heidegger was strongly influenced by a certain rustic, but politically reactionary form of Roman Catholicism.

The latter point is a form of the necessitarian thesis interpreted in a historicist manner directly counter to the evolution of Heidegger's thought after the famous turning. For the claim that anyone, including the author of fundamental ontology, is *not* in part a product of the surrounding environment precisely contradicts Heidegger's own claim that we are all determined by the modern world, by technology, ultimately by metaphysics, even by Being. In his response, Faye returns to the attack with a perceptive comment on nascent right-wing Heideggerianism.⁵⁸ He notes in an ironic remark that there is at present a Parisian sect devoted to protecting its masters in the way that the RSPCA is devoted to protecting animals! He provides a discussion of the history of the term 'völkisch' and its relation to racism, in particular anti-semitism, later developed by Bourdieu, before turning his critical gaze on the difference, crucial in his eyes, between being in the world and transforming it.

Faye's article could only have been perceived as it was in part intended: as a provocation. In his article, Faye commits a strategic error, since he attempts to show that he has the appropriate knowledge which Fédier accuses him of lacking. The argument cannot be won on such terms, since it is always possible to maintain that the critic knew some things but not others, and the other things are relevant, indeed crucial. In short, it is always possible to claim and in effect to make out the claim that one who opposes a doctrine, any doctrine, is not sufficiently informed. This insight was not lost on Fédier, who quickly responded in this way in order to show that *après tout* Faye was uninformed, in any case not sufficiently informed to criticize such a difficult thinker as

Heidegger, since he did not know German sufficiently well. This is a technique which Fédier has continued to employ with frequency in his now numerous attempts to defend the 'sacred' cause.⁵⁹

In his response, Fédier concedes that Heidegger did use certain incriminating expressions over a ten-month period, but he denies that as a result Heidegger's thought is compromised in any way. In the course of a veritable demonstration of why no translation is safe from 'deconstruction', which anticipates Derrida's use of this method in his best days, Fédier goes so far as to say that a 'real' translation (sic!) of the Rectoral address will remove the vestiges of Nazism which Faye has 'injected' into it. He further advances a claim – which he later developed at length in a book – that although Heidegger was mistaken in 1933 in his allegiance to Hitler at the time it was impossible to understand what Hitler would become. He closes with a triple criticism of Heidegger's failure: to foresee the consequences of Nazism, to measure the powerlessness of thought with respect to Nazism and to grasp that thought could not modify what was underway. The latter two points are different versions of the same idea of the weakness of thought, which represent an application of Heidegger's own later view, in the *Letter on Humanism* and elsewhere, of thought as different from and opposed to philosophy.

For present purposes, Fédier's argument is interesting as the basic statement of the contingentist attack on the necessitarian analysis. More than twenty years later, one can no longer in good faith doubt the existence of a form of right-wing Heideggerianism determined to save Heidegger at all costs, even if to do so on occasion requires one to deny the apparently evident. At this early stage, with the exception of Beaufret, Gandillac and De Waelhens, and to a lesser extent such secondary figures as Patri, Fédier was virtually isolated as the keeper of the grail of Being. But as early as his first skirmish, he identified the basic form of his response to any form of the necessitarian argument.

Fédier's strategy is obviously dependent on that of such pioneer defenders of Heidegger in the French-language discussion as De Waelhens, who formulated the initial version of the attack on the necessitarian thesis for insufficient evidence. Now De Waelhens' version of this gambit was unconvincing since it was no more than the claim, which can always be made, that the critic is uninformed. Yet this claim was unconvincing, or at least not convincing, certainly not sufficiently convincing to be acceptable with respect to such a truly knowledgeable observer as Löwith. Yet if he does not perfect this strategy, Fédier at least takes it much further by developing it into a coherent defence, much as in chess the difference between an isolated move and a viable defence consists in the articulation of the various elements. Fédier's counter consists in the following elements, all calculated to make it difficult, even impossible to make out a claim for a durable, or even a transitory, link

between Heidegger and Nazism: the assertion that Heidegger was naive, but not culpable since he did not, or could not, know the nature of Nazism; the intimation that the critic is inadequately informed, for instance about Heidegger, as concerns the German language, etc.; and the pretension that a simple statement of the 'facts', including a look at the statements of others who were there and hence by implication know the 'real' story is sufficient to separate the 'real' Heidegger from the mythic figure who is the target of his critics. Combined in different ways, all of these elements later return in the third phase of the French debate on Heidegger and National Socialism.

5 The onset of the third wave

The third, most recent phase of the French debate began when Farias' study burst onto the intellectual scene in the fall of 1987. Any account of this phase needs to distinguish between the immediate reaction to Farias' book in French circles and the more measured, but often still heated discussion which followed and at the present time is still underway. The immediate French reaction to Farias' book was part of a rapid response which, it is fair to say, swept over Western Europe. The major newspapers and many magazines in all the major European countries carried articles concerning this study, often with a kind of concealed amusement directed at the French reception of the work.

Two examples from the West German press and one from an Italian newspaper are typical. In an article in a well-known liberal German daily, the author, apparently unaware of the preceding discussion, comments that the question of the negative influence on Heidegger's thought will henceforth be raised in France as well as in Germany.⁶⁰ In a respected intellectual German weekly, another writer concludes that Heidegger's letter to Jean Beaufret did not remain without a response, since it led to French post-modernism, although none of the post-modernists, who are all staunchly anti-totalitarian, can be simply assimilated to Heidegger in a political manner.⁶¹ Both of these articles are cautious and, in the best German sense, *sachlich*, concerned more to report than to pass judgment.

We find a much sharper, less journalistic reaction in an Italian daily newspaper which counterposes articles by two well-known Italian philosophers: Roberto Maggiori, an anti-Heideggerian; and Gianna Vattimo, a well-known Heideggerian. Responding to an earlier review by Vattimo of the Farias book, Maggiori criticizes Vattimo's view that the whole 'affaire Heidegger' is an operation directed against certain Parisian thinkers. In a sharp response, which recalls Beaufret's estimate of Heidegger as a conceptual giant among pygmies, Vattimo dismisses Farias' work as of little historical consequence.⁶²

The sharp exchange between Maggiori and Vattimo is similar in content, but not in tone, to the often much sharper character of the French discussion. The immediate reaction, what in French is aptly called the *réaction à chaud* was precisely that, namely heated, in fact overheated to a degree unusual even in French intellectual circles. This phase of the controversy, which was more symptomatic of the depth of feeling than insight into the problem, was uncharacteristically played out in the pages of the daily papers, the weekly magazines, in art and literary journals, on television, etc., in short through forms of communication not often associated with the measured tread of philosophical debate. It involved such well-known figures on the French intellectual scene as Derrida, Finkielkraut, E. de Fontenay, Baudrillard, Lévinas, Aubenque, Blanchot, Bourdieu, Renaut, Ferry, Daix, etc., as well as a large number of less well-known figures, all of whom felt called upon to comment on the situation; it involved as well foreign scholars imported for the occasion such as Gadamer. What had earlier been a philosophical debate, a disagreement between scholars on a theme concerning a well-known, but obscure German thinker, quickly became a kind of intellectual free-for-all in which opinions, even frank accusations, were voiced in rapid fashion. The result was to guarantee a *succès de scandale* for a book which rapidly became a *cause célèbre*.

One way to indicate the amplitude of the immediate reaction, which lasted for weeks in certain cases, is by a simple list, in no particular order, of some of the newspapers and journals which ran articles, sometimes numerous articles, on the topic: *Art Press*, *La Quinzaine Littéraire*, *Le Monde*, *Le Matin*, *Libération*, *La Croix*, *Le Quotidien de Paris*, *Le Figaro*, *Le Magazine Littéraire*, *Le Canard Enchaîné*, etc. The tone of the debate to follow was given by the opening shot, fired by Christian Jambet, a former *nouveau philosophe*, in his preface to the French edition of Farias' work. His sharply-worded preface begins with a reference to the traditional belief in the virtue of philosophy for life, before building to remarks on the manner in which Heidegger allegedly identifies authentic existence with a mere semblance, itself representative of the politics of extermination. Jambet ends with a statement intended to sum up Heidegger's thought in a reference to a well-known film, *Night and Fog* (*Nuit et brouillard*) on the Nazi concentration camps:

Heidegger has the merit of making ontology the question of our time. But how can we accept that philosophy, born of Socrates' trial for leading a just life, ends in the twilight where Heidegger wanted to see the end of the gods, but which was only the time of Night and Fog?⁶³

In his preface, Jambet raises the question of the specific difference which opposes, or seems to oppose, Heidegger to the entire philosophical

tradition through the relation between his own thought and absolute evil. Yet Jambet does not raise the other theme, highly relevant in the French context, of the specific link between Heidegger's philosophy and French thought. Certainly, the latter topic is partially responsible for the inflamed, passionate character of the immediate French reaction. Perhaps Hugo Ott, the Freiburg historian, caught the mood best in the opening comment of his review of Farias' book: 'In France a sky has fallen in – the sky of the philosophers.'⁶⁴

Even a small selection will communicate the sheer breadth of opinion in the immediate response to Farias' study in French circles. In a sober article, Roger-Pol Droit states that as a result of his study Farias has dismantled the 'official' view of Heidegger's merely contingent relation with National Socialism, long maintained by Beaufret and other friends.⁶⁵ According to Droit, who clearly denies De Waelhen's claim, in the future it will be impossible to separate Heidegger the philosopher from Heidegger the man, and it will be necessary to think the link which unites them. Georges-Arthur Goldschmidt, a French refugee from German Nazism, welcomes Farias' study for swelling the meagre ranks of those bothered by Heidegger's Nazi past; he regards Farias' book as a means to impede the normal business of the Parisian Heideggerians, henceforth obliged to confront the issues.⁶⁶ In a response, Emmanuel Martineau, the author of the pirated translation of *Being and Time*, a friend and student of Beaufret, admits that the latter became part of Heideggerian fascism, which he regards as matched by an hysterical anti-Heideggerian fascism. He accuses Goldschmidt of falling prey, not to the hate of Nazi cruelty, but purely and simply to the hatred of thought.⁶⁷

Alain Finkielkraut complains that in noting the connection between *Being and Time* and *Mein Kampf*, there is a concealed risk of promoting a kind of fascist reaction against philosophy.⁶⁸ In a response to Finkielkraut, Goldschmidt suggests that in France there is little real knowledge of Nazism; there is further an incapacity to see that a kind of Nazism rooted in German thought since Fichte is central to Heidegger's thought.⁶⁹ Jean Baudrillard observes that the so-called necrological discussion concerning Heidegger has no intrinsic philosophical meaning. He maintains that this discussion only betrays a transition from the stage of history to the stage of myth in which events, which we cannot grasp on the plane of reality, give rise to a convulsion indicative of a loss of reality.⁷⁰

Martineau's version of the lack of critical competence, already in evidence in earlier discussions, is further developed by Jacques Derrida in an interview.⁷¹ According to Derrida, then on the point of publishing a book coincidentally concerned with Heidegger and politics, the so-called facts discovered by Farias are not new for anyone seriously interested in Heidegger; and the interpretation of their relation to the master's thought

is so insufficient as to raise the question of whether Farias has devoted more than an hour to reading Heidegger. Yet Derrida also concedes the need to show the deep link between Heidegger's thought and actions to the possibility and reality of what he calls all the Nazisms.

In the face of Derrida's claim that Farias is not a competent reader of Heidegger's texts, Farias' enumeration, in his response, of a list of facts, supposedly brought to the attention of scholars for the first time, seems vaguely unsatisfactory.⁷² A still more radical response is furnished by Pierre Aubenque, the well-known Aristotle scholar, who, in a bitter article⁷³ simply denies all the relevant points, including the relevance of Farias' book, the intellectual honesty of his analysis, the need for a study of this kind and the lack of a significant connection between Heidegger's thought and Nazism. Aubenque's analysis is supported by Pascal David, who ends a review of Farias' study with a quotation from Abraham a Santa Clara – the Augustinian anti-Semite whom Farias regards as influential on Heidegger – to the effect that God loves fools, not foolishness.⁷⁴

In his article, Aubenque refers approvingly to Derrida, but the difference between their respective readings of Heidegger's Nazism places them in different camps. Although infinitely more clever than Fédier in his avowal of a version of the contingency thesis, Aubenque is finally close to Fédier's wholly unyielding defence, which simply denies that there is a problem worthy of consideration. In comparison, Derrida's response is more innovative in 'deconstructing' the opposition between representatives of the necessitarian and contingentist analyses. In essence, Derrida proposes that we can acknowledge the intrinsic link between Heidegger and Nazism, although he continues to insist that only the anointed few can comprehend it in the correct manner.

The result is to concede the main point of the necessitarian approach, but to restrict its development by continuing to insist, as the contingentists have all along, that only the 'orthodox', or more precisely the 'orthodox' critic of Heidegger, can measure the problem. An appropriate analogy is the claim made by a former Stalinist that only Stalin's victims can legitimately judge his crimes. This new standard of criticism, which couples an admission of the problem – which can no longer be denied, and is in fact no longer denied in any straightforward fashion by any observer with the clear exception of Fédier and Aubenque, who continue to represent the original form of the contingentist view – with the insistence on expert knowledge of Heidegger's thought as a precondition for valid discussion of Heidegger's Nazism, represents a significant evolution in the scholarly French discussion of this theme. As a result, the gap between the discussants has narrowed considerably since the point at issue is no longer whether there was a real and durable link between Heidegger and Nazism – something perhaps only Aubenque among the more significant French intellectuals still denies – but rather how to

understand this link, in particular how to understand its significance for his philosophy.

In philosophy, because of the length of the gestation period, the debate normally unfolds rather slowly, over a period measured at best in years and more often in decades or centuries. Now in French circles, where the half-life of a theory is very short, the debate usually unfolds more quickly, since to publish slowly would be to run the risk of being able to comment on a topic only as it was in the process of disappearing from the intellectual scene. Until recently, that is until the publication of Farias' work, with the exception of Palmier's study, no books wholly, or even mainly, centred on the theme of Heidegger and Nazism had appeared. This lacuna, if it is one, was now rapidly corrected, at a speed extraordinary even by the standards of the French intellectual discussion. Farias' book was published in October 1987. From that period until the following May, even as a steady, but steadily diminishing, stream of articles devoted to the topic continued to pour out, in an extraordinary burst of scholarly creativity no less than six studies devoted to this theme appeared.⁷⁵ Not surprisingly, in most cases they reflected the new consensus that there was a problem, although they differed widely on its description and analysis.

6 The third wave

Let us discuss these books in the order in which they appeared, which corresponds at least roughly to the order of their composition. We can begin with three rather different studies by Pierre Bourdieu, by Jean-François Lyotard, one of the main representatives of the post-modern tendency in French philosophy, and by Fédier. Bourdieu's discussion of what he, following Heidegger's concern with Being, calls Heidegger's political ontology, is the second edition of a text originally published in 1975, rewritten and adapted to recent revelations about Heidegger. Lyotard's study is the apparent result of the desire, or at least felt need, of every well-known Parisian intellectual, who desires to avoid regression to the state of mere anonymity, to comment rapidly on any major topic. Fédier's work is a further example of his continued effort, which in the meantime has lost any semblance of scholarly credibility, to maintain the contingentist thesis in its original, but now outmoded form. These three disparate works nicely illustrate the range of the next strand in the scholarly discussion by those whose relation to Heidegger is either tangential or, if the relation is on the contrary close, at least tangential to the further evolution of the Heidegger debate.

In a short introduction to his short study, Bourdieu, a well-known Marxist sociologist, indicates that his analysis of methodology has been

updated in the footnotes and by placing at the end three chapters concerning the analysis of Heideggerian language.⁷⁶ In an evident reference to the first edition of his book, he remarks – with a certain self-approval – that, despite the image of sociology, a close reading of Heidegger's work already revealed such themes as: anti-Semitism, his refusal to break with Nazism, his ultra-revolutionary conservative tendencies, as well as his disappointment in the lack of recognition of his revolutionary aspirations as the philosophical *Führer*.⁷⁷ In a clear allusion to the prior debate on Heidegger and politics, Bourdieu states that the failure to understand what has occurred was aided by Heidegger's erection of a wall between anthropology and ontology,⁷⁸ although we need now to examine the intrinsic blindness of these 'professionals of lucidity'.⁷⁹

Bourdieu is prescient in his allusion to Heidegger's anti-Semitism which has only recently been established.⁸⁰ His comments are significant in raising the second-order question of how so-called professionals of lucidity are able to respond to a situation of this kind. He provides an answer as to how one ought to proceed in a manner which reveals the politically conservative thrust of purely textual analysis, favoured most prominently in the current French discussion by Derrida and other so-called deconstructionists. According to Bourdieu, even the most determined adversaries of Heidegger have missed some of the signs concerning his Nazism since they unfortunately accept the form of immanent textual hermeneutics on which others, that is, Heidegger's epigones, insist. An approach of this kind, even its most radical form, can at best be partially successful since it concerns certain presuppositions only.⁸¹ In fact, this sort of approach is dangerous since when rigorously applied it has the effect not only of sanitizing what is unsavoury but of turning attention away from the political dimension to which the texts in question, even by their failure to state their aim, none the less refer. A striking example provided by Bourdieu concerns the manner in which a variety of participants in the French discussion, e.g., Beaufret, Lefebvre, Châtelet and Axelos – in fact those who accept Heidegger's own effort in the *Letter on Humanism* to measure his thought in terms of Marx's – see a convergence between Heidegger and Marx.⁸²

Bourdieu insists that we must abandon the separation between a political and a philosophical interpretation in order to institute a double reading (*lecture double*) which is both political and philosophical for Heideggerian texts characterized by an intrinsic ambiguity.⁸³ His aim is to break out of the circle formed by an exclusively immanent reading of the text, doubly confined within the text and to professionals, such as professional philosophers, or even confined to those philosophers who profess allegiance to Heidegger.⁸⁴ He regards Heidegger as representative of extremely conservative revolutionary tendencies which arose in Germany between the two World Wars. And he agrees in part with the

tendency of French defenders of Heidegger to discern two basically different stages in his thought. According to Bourdieu, Heidegger II constitutes a series of commentaries on Heidegger I in which, as the master himself notes, nothing is abandoned but, in Bourdieu's words, the celebrated author now absolutizes his practical choices in philosophical language.⁸⁵ He regards Heidegger's denial of a relation between his and any other position as an exercise in negative political ontology.⁸⁶ In Bourdieu's view, only those sensitive to the situation beyond the internal approach to the reading of the text can finally decode it.⁸⁷

Bourdieu is in part correct that Heidegger refused to explain his relation to Nazism since to do so would have been to admit that the essential thought never thought the essential, since Heidegger did not and could not grasp Nazism on the basis of his thought of Being. Bourdieu's error, which reveals a problem in his methodology, is to trivialize Heidegger's position by reducing it merely to an unconscious component which it supposedly later erects as a philosophical standard. Yet when we consider Heidegger's texts, not only in the context of his thought, but his thought in the context of the social and political context, we clearly have access to a dimension not accessible if we limit ourselves to a more immanent textual approach. Bourdieu's point tends to undermine various forms of immanent hermeneutics, including the celebrated view of intertextuality. It further reveals a conscious or unconscious strategy on the part of some right-wing Heideggerians, the reason for its relative success, and the way in which, as Bourdieu's own essay demonstrates, one can surpass its limits.

Bourdieu's book is a significant effort, altogether too rare in the discussion, to come to grips with the political dimension of Heidegger's thought against the historical background. The limitation of his account is that he mainly relies on an essay already in hand with only minor changes to react to more recent discussion. Although both Lyotard and Fédier make greater efforts to confront the latest research, their books are less impressive. Like Bourdieu, Lyotard also refuses to amalgamate Heidegger's thought and his politics.⁸⁸ Yet in comparison with Bourdieu's book and his own earlier writing, Lyotard's essay appears hasty and unsatisfactory. Bourdieu's work is saturated with references to English and German discussion, and is particularly rich in allusions to the constitution of the Weimar ethos against the nineteenth-century German background. Bourdieu's analysis of the relation between Heidegger's thought and the historical, cultural and political background, are still unsurpassed in the French discussion. With the exception of the obligatory tipping of the hat to Freud and Kant, Lyotard is exclusively concerned with French sources, something unsurprising since he holds that the 'problem' is essentially French.

Despite Habermas' effort⁸⁹ to portray him and his colleagues as crypto-

conservatives, Lyotard's approach reveals a fashionable, post-modernist form of liberalism. The term 'Jews' (*les 'juifs'*) in the title refers not only to the Jews, but to all those who in Europe have always been assimilated to them. This slight volume is divided into two chapters, respectively titled 'The "Jews"' and 'Heidegger'. According to Lyotard, who seems to like quotation marks, what he refers to as the Heidegger problem is a 'French' problem.⁹⁰ He holds that 'the Jews', those 'outcasts' of society, demonstrate that man's misery is constitutive of his being.⁹¹ Lyotard insists on the need to think the Heidegger problem⁹² without accepting the modish view that Nazism can either be deduced from *Being and Time* or that this book arose from an ethos which was already Nazi or pre-Nazi.⁹³ After stating that both Farias and Derrida are correct, Lyotard asserts that there is, however, something unforgettable but still forgotten, and which constitutes the real problem, that is that Heidegger could possibly have thought that in and through his collaboration with the Nazi party a real opportunity existed.⁹⁴

Lyotard is close to Bourdieu with respect to the famous turning, which he describes in difficult language as 'the amnesiac meditation of what will occur in Heideggerian "politics"'.⁹⁵ He suggests that *Being and Time* makes possible, but does not require, Heidegger's political engagement,⁹⁶ as witness the political reading Heidegger gave of his own thought during the Rectoral episode.⁹⁷ The remainder of the book consists in a serial critique of the views of other French commentators, including Derrida, Lacoue-Labarthe and Nancy. For Lyotard, all of them fail to grasp that – as Lyotard notes in a comment on Heidegger's 'Essence of truth' – in Heidegger's turn towards Being and by inference away from the Jews, or 'Jews', Heidegger's thought commits a cardinal 'fault' since it is still the hostage of the Law (*la Loi*).⁹⁸

This discussion is perhaps most enlightening as an undeveloped, but correct suggestion: although not an overtly political book, *Being and Time* could be and in fact was read by Heidegger in a political sense as the basis of his turn towards Nazism.⁹⁹ The suggestion that the basic flaw in Heidegger's thought resides in its relation to the Law, perhaps by extension in its dependency on the non-differentiated other, or other than itself, calls attention to a possible relation to the German Idealist tradition; but it is unfortunately too vague to state clearly, much less to evaluate. This is not the defect of Fédier's work, which could hardly be clearer in its intent or weaker in its arguments.

Fédier's book¹⁰⁰ is the latest, hopefully final expression of his unremitting faith as an orthodox Heideggerian unswayed, or even chastened, by new information or the intervening debate. He displays this point of view in his study with increased ardour even as he becomes the most prominent and certainly most persistent representative of this angle of vision, a sort of living dinosaur. Like the mythical author in Camus' *La*

Peste, the entire bibliography of certain writers is wholly composed of multiple versions of a single text, which they write again and again in different forms. Fédier's scenario follows in detail the meanders of his initial defence of the master in articles published more than two decades ago. The relevant difference is that here the *rappel des faits*, meant to exonerate Heidegger, is not due to Fédier and does not follow, but precedes the discussion. In a 'bibliographical essay' ('essai bibliographique') which begins the work, and which opens and closes with comments on the tranquil little city of Messkirch where Heidegger was born and is buried, François Vezin declares that the period of the Rectorate is no more than a parenthesis in Heidegger's life.¹⁰¹

Like the earliest forms of the contingentist analysis, Fédier's book is intended to defend Heidegger by attacking his detractors, in particular Farias. In the course of a difficult defence, the author is compelled to take extreme measures. Two examples worth noting are the tortured distinction introduced between anti-Judaism and anti-Semitism,¹⁰² and the defence of the German bishops for their 1933 decision to remove the interdiction which prevented Roman Catholics from adhering to National Socialism. In his Introduction, Fédier indicates that his book is meant as an apology in a supposed Socratic sense in order to dispose of the charges.¹⁰³ Like a good defence lawyer, he begins by exaggerating the 'crime' in order to show that his client could not possibly be guilty of it. According to Fédier, who perhaps had Adorno in mind, Farias holds that Heidegger never said nor thought essentially anything other than Nazism, a charge which Fédier affirms to be a calumny.¹⁰⁴

This attempted defence is problematic, since neither Farias nor anyone else has ever criticized Heidegger as broadly as Fédier pretends. Although he is concerned to refute all the charges brought against Heidegger, Fédier mainly concentrates on the Rectoral period. He claims that whereas it is permissible to accuse Heidegger of adhesion to Nazism in 1933–4, it is slanderous to describe the adhesion as total, since he never adhered to biological racism, etc.¹⁰⁵ But, then, by this standard there never were many total adherents of Nazism, especially among German academics, since few wholly accepted all aspects of the doctrine. Fédier's main argument consists in a perverse form of scepticism, according to which in 1933 it was not possible to foresee the future of National Socialism.¹⁰⁶ He even asserts that the definitive form of Nazism was not known prior to 1 September 1939.¹⁰⁷ But although many aspects of what would occur were indeed unclear in 1933, and by definition the future is what has not yet happened, the situation was already sufficiently clear then, well before the outbreak of the war, for many, including numerous Jewish philosophers, such as Cassirer, Marcuse, Weil, Benjamin, Löwith, etc., to choose exile. In fact, even Fédier is not convinced by his argument, since he also concedes that when Heidegger took up the cause of

National Socialism it already carried with it the signs of an essential perversity.¹⁰⁸

The first part of Fédier's discussion, entitled 'Un pseudo-événement', is a long attack on Farias' book because of its allegedly: inquisitorial tone,¹⁰⁹ obfuscation,¹¹⁰ unconscious appeal to Freudian mechanisms of condensation and displacement,¹¹¹ failure to respect the rules of honest scientific procedure,¹¹² etc. Alone at this late date, when so much is known, indeed when even such *croyants* as Derrida claim incorrectly that everything is known, Fédier explains the existence of Farias' study as a sheer invention (*montage*) of which almost no page resists serious study.¹¹³ In the second part of the discussion, entitled 'Heidegger et la politique', having disposed of Farias to his satisfaction, Fédier provides his own analysis of the problem raised by the Rectoral period, which he attributes to Heidegger's impatience.¹¹⁴

In the course of his defence, Fédier makes the following controversial points: the Rectoral address does not show an acceptance of Nazism but only a concern to defend academic science in the university,¹¹⁵ Heidegger later distinguished himself in his opposition to Nazism,¹¹⁶ the source of his action lies in a philosophical error leading to a need to modify the position¹¹⁷ and Heidegger's later silence is to be respected after the martyrdom (sic!) he endured.¹¹⁸ Yet unfortunately the Rectoral address not only shows an interest in the defence of science, but an explicit concern, which Heidegger underlines here and specifically admits in the article on the Rectorate, to utilize the university to attain a common goal shared with the Nazis: the destiny of the German people; and Heidegger's silence is neither honourable nor acceptable. And examination of Heidegger's texts refutes Heidegger's own claim to have confronted Nazism in his later writings.

Fédier's most interesting point is his claim in passing that a philosophical error necessitates a modification of the position, which suggests, reasoning *modus tollens*, that if a position leads to an incorrect form of action there is something mistaken in its very heart. In different ways this theme is developed in three further books on Heidegger and politics, due to Jacques Derrida, Philippe Lacoue-Labarthe and Luc Ferry and Alain Renault. Derrida requires no introduction. Lacoue-Labarthe, Derrida's former student, is a well-known Heidegger specialist, who has worked closely in the past with Jean-Luc Nancy, another of Derrida's close associates.¹¹⁹ Ferry and Renault are two young anti-establishment philosophers who have collaborated on several other works. Derrida's book, which coincidentally appeared almost immediately after Farias' study, caused a stir in Heideggerian circles. Lacoue-Labarthe's work is an effort to think through the problem in a manner related to, but also significantly different from, Derrida's analysis, itself apparently dependent on Lacoue-Labarthe's earlier writing. The study by Ferry and

Renaut is an attack on French right-wing Heideggerianism as a form of anti-humanism due ultimately to Heidegger.

Derrida is an important thinker as well as presently the leading Heideggerian in France. His thought is deeply marked by, in fact inconceivable without, the encounter with Heidegger; he has also commented on Heidegger's position in numerous writings.¹²⁰ His influential but unorthodox Heideggerianism is itself an important form of Heideggerian 'orthodoxy', especially in France.¹²¹ Derrida's study, which can be viewed as a long meditation on Heidegger, is thoroughly Heideggerian since it proposes to thematize the concept of spirit, something Heidegger never does, in fact avoids. It can be read from at least two perspectives: as a Heideggerian analysis of Heidegger; and as an indirect, but pointed response to the theme of Heidegger and politics.¹²²

Derrida's defence of Heidegger, like so much of the French discussion of Heidegger, rests on a creative use of the *Letter on Humanism*. Derrida applies Heidegger's remark that humanism is metaphysical to characterize Heidegger's own Nazism as a metaphysical humanism which, in his later writings, he supposedly overcomes in a non-metaphysical, deeper form of humanism announced in this text. This analysis presupposes on the one hand that the later Heidegger, but not the early Heidegger, is anti-metaphysical, or more precisely beyond metaphysics in any ordinary sense – precisely what Heidegger himself claimed in his later writings, such as the *Beiträge* – and on the other hand that there is a break between the early and later phases of Heidegger's thought.

As a defence of the importance of Heidegger's thought while acknowledging the clear, undeniable link to Nazism, Derrida's strategy is reminiscent of a form of 'orthodox' Marxism, most clearly represented by Althusser and his associates, which argued for a break situated within Marx's thought. On this reading – already foreshadowed in Marx's view of the break between pre-history and human history in the transition from capitalism to communism – Marx's thought allegedly decomposes into two chronologically separable positions, the first of which can be described as philosophy but not yet as science, and the second of which breaks with philosophy in order to assume the form of science which is supposedly beyond philosophy. Althusser, who was obliged by the tardy publication of Marx's early writings to acknowledge the philosophical tenor of the early position, sought to defend the non-philosophical, allegedly scientific character of the later theory, that is, the supposedly mature form taken by Marx's theory after it broke with philosophy. In a similar manner, apparently relying on the concept of the turning in Heidegger's thought, which he does not, however, discuss, Derrida correlates the initial Heideggerian critique of metaphysics with Heidegger's supposedly still metaphysical philosophy, which then later gives way to what Heidegger later describes as an anti-metaphysical view of thinking beyond philo-

sophy. According to Derrida, in his still metaphysical phase Heidegger turned to Nazism, which he renounced in his later move away from metaphysics and beyond philosophy.

Derrida's Heidegger interpretation takes shape as a meditation on the terms *Geist*, *geistig* and *geistlich* in Heidegger's thought.¹²³ He points out that in *Being and Time* Heidegger warns against the use of *Geist*, which he puts in quotation marks; but twenty-five years later in an essay on Trakl¹²⁴ he speaks freely of the same term, which he now employs without quotation marks.¹²⁵ Derrida's hypothesis is that for Heidegger this term refers to such supposedly metaphysical concepts as unity (*l'Un*) and gathering (*Versammlung*).¹²⁶ According to Derrida, for Heidegger spirit is neither *pneuma* nor *spiritus*, but finally a flame more originary than either the Christian or the Platonic-metaphysical concepts.¹²⁷ He maintains that even in 1933, for instance in the Rectoral address, Heidegger rejected the reduction of spirit to reason¹²⁸ in order to spiritualize Nazism,¹²⁹ as can be seen in the role of spirit in the Rectoral address.¹³⁰ It follows, then, that Heidegger's Nazism was metaphysical, and that he overcame it when he overcame the metaphysical element in his own thought.

This attempted defence is problematic for various reasons. To begin with, in his self-described Heideggerian effort to think the unthought Derrida exaggerates the importance of a concept which Heidegger never thematizes precisely because it is not fundamental but ancillary to or even insignificant in his position. Derrida is unconvincing in his claim that spirit is central to Heidegger's thought, in which this concept seems at best a minor concern. Derrida unfortunately trivializes Heidegger's commitment to Nazism as following from a residually metaphysical turn of mind, in effect by reducing a practical political engagement to a philosophical commitment from which it apparently followed but to which it cannot reasonably be equated. A form of thought which makes it possible to accept a particular political approach, no matter of what kind, must not be conflated with its consequence. Obviously, metaphysics as such does not necessarily lead to Nazism, since there are many metaphysicians who did not become Nazis. Yet when Heidegger renounced metaphysics after the turning in his thought, he did not give up Nazism. Further, Derrida is obviously incorrect if he means to suggest that when Heidegger employs the term *Geist* without quotation marks in the 1953 article on Trakl Heidegger has overcome both metaphysics and Nazism. For in the same year he republished *An Introduction to Metaphysics* in which he publicly reaffirmed his commitment to a form of Nazism present, in Heideggerian terminology, under the mode of absence. At most, Heidegger turned away from Nazism as it was, although there is no evidence that he ever accepted it without reservations, but he never turned away from it as he still desired it to be. Finally, the interpretation

of the turning in Heidegger's thought, on which Derrida's defence of Heidegger rests, is basically mistaken if judged by Heidegger's texts. As the *Beiträge zur Philosophie* shows in detail, the turning is intended, not to indicate a break or discontinuity between phases of Heidegger's thought; rather, it is intended to point to further progress from a first beginning to another, deeper beginning more originary than, and a condition of, his initial, but more superficial starting point. Since there is, then, no break in Heidegger's thought, his position cannot fairly be defended in this way.

Lacoue-Labarthe presents a clearer, even more extreme, less acceptable form of a similar argument. Lacoue-Labarthe's consideration of 'la question' antedated Farias' book. In a recent collection¹³¹ he includes two earlier papers concerning Heidegger and politics which preceded and obviously influenced both his and Derrida's later discussions of Heidegger and politics: 'La transcendance finie/dans la politique' from 1981, and 'Poétique et politique' from 1984. In the former, he poses the question of the possibility of a politics which takes into account Heidegger's thought. Here, he examines the Rectoral speech in order to show its link to the destruction of the history of ontology and, by extension, to the effort to rethink the problem of the meaning of Being. In this paper, he makes two points: the Rectoral speech is not an occasional document, but a reflection on science, which is metaphysics as such; and this speech is intended as a philosophical foundation of the political. According to Lacoue-Labarthe, Heidegger's political engagement in 1933 was metaphysical and its basic result is the collapse of Heidegger's fundamental ontology. In the latter paper, in an examination of the question why the poetical dimension arose within political discourse, he argues that Heidegger's effort at the leadership (*Führung*) of National Socialism was essentially spiritual.¹³²

There is an obvious, striking continuity between the views of Derrida and Lacoue-Labarthe in their joint insistence on the metaphysical nature of Heidegger's turning towards Nazism and the spiritual component of Heidegger's view of politics. But there is an even more important difference in Lacoue-Labarthe's stress on the link between the political and the philosophical in Heidegger's thought, in virtue of which Heidegger's original philosophical project is compromised by the political action to which it led. The assertion that Heidegger's effort at fundamental ontology was irreparably compromised by his turn to Nazism derives from the recognition – now rarely denied, and explicitly affirmed by Heidegger – that at least his initial enthusiasm for National Socialism followed from his position. This insight is significant for an understanding of the link between Heidegger's thought and Nazism. It leads to a conclusion which Lacoue-Labarthe does not draw, and which Heidegger means to deny in his description of the Rectoral episode as meaningless

(*beudeutungslos*): the later evolution of the Heideggerian position, perhaps even the famous turning in his thought, must be understood, in fact cannot be understood otherwise than in relation to Heidegger's Nazism.

I stress this unstated, but important consequence of Lacoue-Labarthe's article since he mainly develops other themes from his earlier analysis of the relation of poetry and politics, less menacing for the faith of a Heideggerian, in his later treatment of the political as fiction.¹³³ Unlike some others in the French discussion, who are concerned mainly, or even solely, to defend Heidegger at all costs, and hence unconcerned to present a full record, Lacoue-Labarthe does not hesitate to mention items rarely evoked in the French debate, such as the problem of anti-Semitism, the comments by Löwith and Jaspers, Heidegger's denunciation of Baumgarten, Heidegger's meditation on the nature of the holocaust, etc. It is especially significant, in view of the author's obvious identification with Heidegger as incontestably the best thinker of our time,¹³⁴ that he does not hesitate clearly to denounce Heidegger's failure to descry the holocaust which, from Heidegger's conception of history as the unfolding of metaphysics, supposedly constitutes a metaphysical event.¹³⁵

In his book, Lacoue-Labarthe modifies his earlier analysis. According to Lacoue-Labarthe, Heidegger's political engagement in 1933 was based on the idea of the hegemony of the spiritual and the philosophical over the political¹³⁶ – a stance in obvious continuity with *Being and Time*¹³⁷ and coherent with all his earlier thought¹³⁸ – which cannot be explained as an error¹³⁹ but must be viewed as a consequence.¹⁴⁰ Now abandoning his earlier insistence on the significance of the Rectoral speech, Lacoue-Labarthe argues for a caesura (*césure*) in the sense of Hölderlin.¹⁴¹ Heidegger's understanding of the political does not lie in his texts from 1933, including the Rectoral address, but in writings after the break with Nazism, specifically those on technology. In this respect, Lacoue-Labarthe makes two important points: on the one hand, he suggests that there is a beginning of the *Verwindung* of nihilism in the poet's thought,¹⁴² since for Heidegger art opens the possibility of the historicity of Dasein;¹⁴³ on the other hand, he maintains that Heidegger's discourse on art throws light on the essence of Nazism as a national-aestheticism.¹⁴⁴

These suggestions are independent of each other and must be discussed separately. Lacoue-Labarthe is certainly correct that Heidegger never abandoned his concern to seize the destiny of the German people, and that he later linked this possibility to an interest in the alethic qualities of poetry. Yet this point is inconsistent in two ways with his own analysis. For whereas he insists on a break in Heidegger's position, this point requires an acknowledgement of the essential continuity of Heidegger's thought over time as concerns the destiny of the Dasein. And, as a

further, direct consequence, it requires an acknowledgement of a conceptual kinship with Nazism, which Lacoue-Labarthe strongly denies in his critique of Adorno's well-known claim that Heidegger's thought was Nazi to its core.¹⁴⁵ It is further inaccurate to regard Heidegger's discussion of art or technology as illuminating the essence of Nazism. One can concede a certain perverse aestheticism in Nazi ideology, for instance in the writings of Albert Speer, the Nazi architect. But one must resist the idea that the massive political phenomenon of German fascism is solely, or even mainly, or essentially aesthetic.

The usefulness of Lacoue-Labarthe's book is limited by the depth of his own commitment to Heidegger's thought. As a result of his basic acceptance of Heidegger's position, Lacoue-Labarthe is unable to draw the consequences of his own critique of it. For instance, Lacoue-Labarthe cites a passage from an unpublished conference on technology, already cited above, where Heidegger likens agricultural technology to the Nazi gas chambers.¹⁴⁶ Despite his criticism of the patent inadequacy of Heidegger's dreadful comparison, Lacoue-Labarthe, the Heideggerian, is unable to perceive the full implication of Heidegger's statement in at least two ways: in his quasi-Heideggerian claim that this phenomenon somehow reveals the essence of the West,¹⁴⁷ which Heidegger allegedly failed to perceive, which in turn supposes the Heideggerian view that technology is the extension of metaphysics; and in his inability to draw the obvious consequence of his own indictment of Heidegger's failure, due to the inadequacy of fundamental ontology, to grasp the essence of the Nazi phenomenon.

Lacoue-Labarthe's analysis – patient, sober, careful, informed, considerate of other points of view – exhibits virtues unsurpassed in the present French Heidegger debate. This comprehension and tolerance gives way in Ferry and Renault's work to an accusatory, pamphletary, confrontational style, more characteristic of recent French philosophy. In their attack on the separations between various forms of French Heideggerianism as in effect distinctions without a difference – which they paradoxically represent as an effort to surpass mere polemics¹⁴⁸ – they deny the shared assumption, common to Derrida and Lacoue-Labarthe, of a break in Heidegger's thought. Their book is the successor of their earlier work on contemporary anti-humanism, centred mainly on French varieties of Heideggerianism.¹⁴⁹

Ferry and Renault are most original in their effort to develop Lyotard's suggestion of the link between the defence of Heidegger and French philosophy. They draw attention to the parallel between the French controversy about Marxist anti-humanism in the 1970s and the current Heidegger controversy.¹⁵⁰ Their aim is to diagnose a link between Heidegger's anti-humanism, which they comprehend as the rejection of modernity¹⁵¹ and the supposed *erreur par excellence* of contemporary French

philosophy.¹⁵² They illustrate this error by Lacoue-Labarthe's strange, even wild comment, in the course of his attempt to differentiate the later Heidegger from the earlier Nazi enthusiast, that 'Nazism is a humanism'.¹⁵³

After some remarks on the significance of Farias' book in the context of the French debate, Ferry and Renault develop their indictment of contemporary French philosophy through the identification of the common thread of various forms of French Heideggerianism. They isolate three variants: the so-called zero degree, represented by Beaufret, which simply denies any relation between Heidegger and Nazism; Heideggerian orthodoxy, which admits, by playing Heidegger II off against Heidegger I, that in 1933 the master was not yet free of the metaphysics of subjectivity; and Derridean, or unorthodox, Heideggerianism, which relies on Heidegger's purported later deconstruction of the concept of spirit. According to Ferry and Renault, in the final analysis there is no difference between Derridean and orthodox Heideggerianism since at best the Derridean approach innovates on a strategical plane only.¹⁵⁴

Other than through their remarks on Farias' work, the main contribution of Ferry and Renault lies in their survey of various factions of the French debate about Heidegger's politics. They are most helpful in their suggestion of a relation between French post-modernism, or anti-humanism, and Heidegger's own Nazi proclivities. They usefully relate Heidegger's well-known reading of modernity as the reign of technology to his view that democracy and totalitarianism are similar in their domination by subjectivity, and his further adherence to the possibility of a good form of National Socialism¹⁵⁵ as by inference post-modernist and anti-modernist.¹⁵⁶ They criticize Heidegger's general incapacity to think subjectivity¹⁵⁷ because of: an inability to think humanism in a non-metaphysical manner,¹⁵⁸ an inattention to the plural character of modernity,¹⁵⁹ and the inconsistency in his rejection of a humanist vision of man in his view of Dasein in terms of Being. And they invoke a certain humanism in his view of man as transcendental in order to criticize Nazi biologism and racism.¹⁶⁰

These criticisms are well taken in virtue of Heidegger's identification of humanism with metaphysics. The relation of post-modernism and 'anti-humanism' in the work of recent French thinkers such as Derrida, Lyotard, Foucault and Lévi-Strauss among others is too well known to require detailed commentary. The most original point is insistence on Heidegger's supposed inability to differentiate the various forms of modernity while implying the point, clearly articulated only by Lacoue-Labarthe among Heidegger's French disciples, that Nazism is humanism of a different, supposedly acceptable kind. Beyond its indictment of the French identification with the Heideggerian rejection of Cartesian subjectivity – manifest in the ongoing effort to decentre the subject –

the most important result of this work is to question Heidegger's conception of the subject as transcendence, a theme present throughout his writings from his dissertation on Duns Scotus onwards.¹⁶¹

7 After the third wave

The French discussion of Heidegger's relation to politics is still underway. Its most recent phase includes a debate between Fédier and Nicolas Tertulian, the well-known Lukács specialist,¹⁶² Janicaud's sober, insightful discussion of the intrinsic link between Heidegger's conception of Being and Heidegger's Nazism,¹⁶³ and Meschonnic's remarks on Heidegger's politics in the context of a discussion of Heidegger's language.¹⁶⁴ Tertulian, who is one of the sharpest critics of Heidegger's political engagement, has so far developed his point of view only through a series of polemical articles. Janicaud's contribution is especially important for two reasons. On the one hand, he shows not only insight, but considerable courage, in the context of the highly inbred context of French philosophy, in now taking a more nuanced view of Heidegger's thought.¹⁶⁵ Janicaud's fidelity to the truth above philosophical friendship is as important as it is rare in the discussion of Heidegger's Nazism. On the other hand, Janicaud now clearly insists on the link between Heidegger's thought of Being, what he calls Heidegger's '*historialisme destinal*'¹⁶⁶ and Heidegger's Nazism while also underlining the irreducibility of Heidegger's thought merely to Nazism. In the French debate, Janicaud provides the most developed form of the effort, initiated by Löwith more than four decades ago, to comprehend Heidegger's Nazi turning as by no means contingent but as rooted in his philosophical position. This point, which has been urged with increasing frequency recently, and which I believe to be correct, will probably be the eventual verdict of history.¹⁶⁷

One lesson of this review of the French debate on Heidegger's Nazism concerns the delicate relation between thought and the context in which it arises. We do not know how a philosophical theory takes shape; but we do know that it can neither be reduced to nor separated from the context in which it emerges, including the social, historical and political context on the one hand and the network of competing views against which it strives on the other. Heidegger's position – despite his repeated, but apparently strategical claims, clearly meant to create his own legend, to accept a positive relation of his position to pre-Socratic thought only – needs to be understood against the complex background of theology, German neo-Kantianism, particularly Lask, and Kant's thought, medieval Aristotelianism as well as the social, political and historical situation in Germany between the two World Wars. Heidegger insisted throughout his writings on the crucial difference between philosophy and a mere

Weltanschauung, but his own 'philosophy' is in some respects the best counterexample.¹⁶⁸ For his theory of Being is also clearly a *Weltanschauung* which reflects, in fact incorporates, the 'philosophy' of the Weimar Republic.

The French debate offers a particularly interesting example of the delicate relation between thought and its context. With the exceptions noted, it is distinguished by its concern even now to defuse the problematic relation between Heidegger's thought and politics by arguing for a discontinuity between Heidegger's early and later position in order to 'save' his thought and – in so far as the French discussion is dependent on Heidegger's theory – itself. Yet Heidegger only turned against one form of Nazism, not Nazism as such. To fail to see this point, to conflate his withdrawal from the historical form of National Socialism with an unproven rejection of the essence of a movement Heidegger continued to embrace, is to overlook the emperor's new clothes.

Now French philosophers are not less intelligent or well-informed than those elsewhere. How can we explain their reluctance to see that the emperor has no clothes on? I believe that the reason lies in a persistent, unhealthy degree of identification of contemporary French philosophy with Heidegger's position, which literally forms its horizon. We can formulate what is clearly an existential predicament in the form of a paradox: to the extent that the horizon of contemporary French philosophy is constituted by Heidegger's thought, it cannot examine Heidegger's link to Nazism without putting itself into question, that is without simultaneously criticizing the Heideggerian position. In a word, Heidegger's French connection prevents, or impedes, the French thinkers from perceiving that the emperor has no clothes.

The French example is unusual for the extent to which Heidegger's thought dominates French philosophy. The result of this domination is to remain attentive to the unthought in Heidegger's position, at the cost of obstructing any attempt to place the Heideggerian horizon into question. This consequence is useful to the extent that French philosophy remains within the Heideggerian orbit, but also philosophically dangerous. For at least since Plato philosophy has consisted in the refusal to accept undemonstrated assumptions, in the constant effort to clarify, demonstrate or eliminate what it merely presupposed, in order to progress through an examination of its presuppositions.

The recent effort of some dissident French thinkers, especially Bourdieu, Janicaud, Tertulian and from another angle of vision Ferry and Renaut to examine the roots of French Heideggerianism, to reflect on the so-called French problem, is a healthy sign. Despite Heidegger's oft-cited claim that when French philosophers begin to think they think in German – or by implication think about Heidegger, or even within the ambit of Heidegger's thought – it indicates that French thought will be

even more robust, and accordingly able to grow in new and different ways, when it has finally examined its own Heideggerianism. For to the extent that Heidegger still forms the horizon of French philosophy, to appreciate the limits of his thought is to go beyond Heidegger and hence beyond French philosophy. But this move beyond Heidegger is, however, necessary if French thought is to advance beyond its present level.

The French discussion is an extreme example of the problem posed by the reception of Heidegger's Nazism. For a variety of reasons, philosophers in general, not just Heideggerians, have been slow in confronting Heidegger's Nazism. Yet Heidegger's Nazism is deeply rooted in, indeed basic to his philosophy, which cannot be comprehended in isolation from his political turning. At least since De Waelhens, a number of Heideggerians, particularly in France, although elsewhere as well, have insisted that the link between Heidegger's philosophy and politics can be understood only by someone so deeply versed in Heidegger's thought as to be a follower of the master. If we accept this claim, then the result is still another paradox, which can be formulated as follows: only a Heideggerian can grasp Heidegger's thought, including the relation between Heidegger's Nazism and his philosophy; but as our discussion of the French debate illustrates, the link between Heidegger's Nazism and his philosophy can only be grasped from a vantage point located outside of Heidegger's position. It follows, then, on this Heideggerian hypothesis for the understanding of Heidegger's thought, that Heidegger's political engagement is literally beyond criticism: for either it can only be understood by Heideggerians, who cannot confront the problem within the framework of Heidegger's own theory, to which they are committed, or it must be understood by non-Heideggerians who, according to the Heideggerian claim about understanding Heidegger, also cannot understand it. The result, then, of the Heideggerian view of Heidegger is to render this aspect of Heidegger's thought strictly unknowable, a kind of thing in itself, a theory about which anything can be believed but nothing can be known.

The Heideggerian approach to Heidegger suggests that in the final analysis a careful, responsible, but critical reception of the complex issues raised by Heidegger's turning on the basis of his thought to National Socialism is impossible. Yet this inference is unacceptable since we need to understand his Nazism as part of the process of reception of Heidegger's novel position. I am convinced that we can best, and perhaps only, understand Heidegger's theory, including his Nazism, if we are informed about his view but also not committed to it as in principle correct. The discussion has shown that Heidegger's Nazism, and, hence, his thought, cannot finally be comprehended by someone unconditionally committed to the truth of his thought. I conclude that Heidegger's theory, including

his Nazism, like the theories of other thinkers, is finally best understood, by someone committed not to the truth of his position but to the truth.

Notes

1 For a recent, short discussion of the French reception of Heidegger, see Jürg Altwegg, 'Heidegger in Frankreich – und zurück?', in Jürg Altwegg (Frankfurt: Athenäum, 1988), pp. 14–25. See also *Cahier de l'Herne, Martin Heidegger*, edited by Michel Haar (Paris: Cahier de l'Herne, 1983) and *Magazine Littéraire*, 235 (novembre 1986). It is significant that as late as this period, in a special issue containing a 'dossier' specifically devoted to 'Martin Heidegger, l'être et le temps', there was only a brief discussion of the problem of politics. See François Fédier, 'La question politique', pp. 51–2.

2 For an account from a different perspective, see Richard Wolin, 'The French Heidegger debate', in *New German Critique*, 45 (Fall 1988), pp. 135–60.

3 The texts omitted include Georges Friedmann, in *Cahiers de Sociologie*, xvi, 1954, and *Mélanges Lucien Febvre*, 1954; Robert Minder, 'Hegel and Heidegger. Lumières et obscurantisme', in *Utopies et Institutions au XVIII^e Siècle*, ed. P. Francastel (Paris-The Hague: Mouton, 1963), and 'Heidegger und Hegel oder die Sprache von Meßkirch', in Robert Minder, *Dichter in der Gesellschaft* (Frankfurt: Insel Verlag, 1966), pp. 210–64; and Alexandre Koyré, 'L'évolution philosophique de Heidegger', in *Critique*, 1 (1946), pp. 73–82, and *Critique*, 2 (1946), pp. 161–83.

4 For a brief introduction, see Richard Wolin, 'Introduction to "Martin Heidegger and politics: a dossier"', *The New German Critique*, 45 (Fall 1988), pp. 91–5. Wolin regards the problem as concerning Heidegger and politics, whereas in fact it more narrowly concerns Heidegger and Nazism.

5 With the exception of a version of Löwith's contribution, this debate is still not available in English. See Karl Löwith, 'Political implications of Heidegger's existentialism', *New German Critique*, 45 (Fall 1988), pp. 117–34.

6 See Karsten Harries, 'Heidegger as a political thinker', *The Review of Metaphysics*, 24 (June 1976), reprinted in Michael Murray (ed.), *Heidegger and Modern Philosophy* (New Haven and London: Yale University Press, 1978), pp. 306–7, n. 10.

7 See Victor Farias, *Heidegger et le nazisme* (Paris: Editions Verdier, 1987).

8 See Hugo Ott, *Martin Heidegger. Unterwegs zu einer Biographie*.

9 See particularly Michael E. Zimmermann, *Heidegger's Confrontation with Modernity: Technology, Politics, Art* (Bloomington and Indianapolis: Indiana University Press, 1990) and Richard Wolin, *The Politics of Being: The Political Thought of Martin Heidegger* (New York: Columbia University Press, 1990).

10 Despite the 'violence' of the recent French reception of Heidegger's Nazism, interest in the discussion seems now to have significantly waned. Significantly, the recent publication of a French translation of Ott's book has attracted little attention. For a review in the best academic style, written by Thomas Ferenczi, see 'Douze ans dans la vie de Heidegger. L'historien allemand Hugo Ott confirme que, de 1933 à 1945, le philosophe est resté fidèle au régime hitlérien', *Le Monde*, vendredi 16 novembre 1990, p. 26.

11 For a classic French study of post-modernism, see François Lyotard, *La condition postmoderne* (Paris: Les Editions de Minuit, 1979).

12 It has been suggested that the rapid pace of change in French thought

indicates that it is in crisis. See Paul de Man, *Blindness and Insight: Essays in the Rhetoric of Contemporary Criticism*, Introduction by Wlad Godzich (Minneapolis: University of Minnesota Press, 1983), pp. 3–5.

13 The tenth article of the 'Déclaration des droits de l'homme et du citoyen', promulgated by the Assemblée nationale in August 1789, reads: 'Nul ne doit être inquiété pour ses opinions, même religieuses, pourvu que leur manifestation ne trouble pas l'ordre public établi par la loi.'

14 For a recent example, see André Glucksmann, *Descartes, c'est la France* (Paris: Flammarion, 1987).

15 See Alexandre Kojève, *Introduction to the Reading of Hegel*, ed. Allan Bloom, tr. James H. Nichols, Jr. (New York: Basic Books, 1969).

16 For an analysis of Hegel's residual Cartesianism, see Tom Rockmore, *Hegel's Circular Epistemology* (Bloomington and London: Indiana University Press, 1986), chap. 6, esp. pp. 142–54.

17 In his otherwise excellent study of Hegel as the central thinker in recent French philosophy, Descombes fails to appreciate the sense in which his role in French thought was in part dependent on his relation to Descartes. See Vincent Descombes, *Le même et l'autre. Quarante-cinq ans de philosophie française (1933–1978)* (Paris: Les Editions de Minuit, 1979).

18 For a recent analysis of the role of Heidegger in French philosophy, see Alain Badiou, *Manifeste pour la philosophie* (Paris: Editions du Seuil, 1989), chap. 4: 'Heidegger envisagé comme lieu commun', pp. 27–32.

19 For Heidegger's later criticism of philosophical anthropology as deriving from Descartes, see 'The age of the world picture', in Martin Heidegger, *The Question Concerning Technology and Other Essays*, tr. and with an Introduction by William Lovitt (New York: Harper & Row, 1977), pp. 115–54.

20 Sartre's basic statement of the humanist thrust of his existentialism is contained in his popular lecture, 'Existentialism is a humanism', tr. Philip Mairet (London: Methuen, 1948). Heidegger's rejection of humanism as a metaphysical concept is developed in his *Letter on Humanism*, in Martin Heidegger, *Basic Writings*, edited by David Farrell Krell (New York: Harper & Row, 1977).

21 See 'Only a god can save us: *Der Spiegel's* interview with Martin Heidegger', *Philosophy Today* (Winter 1976), p. 282.

22 The main exception to this tendency in the French discussion is the work of Bourdieu. See Pierre Bourdieu, *L'ontologie politique de Martin Heidegger* (Paris: Les Editions de Minuit, 1988).

23 For a representative sample of how *Being and Time* is received in the French discussion, see 'Dossier: Martin Heidegger', in *Magazine littéraire*, 235 (novembre 1986), pp. 16–58.

24 See Martin Heidegger, *Lettre sur l'humanisme*, translated with an Introduction by Roger Munier (Paris: Aubier, 1964), p. 7.

25 See Martin Heidegger, *Letter on Humanism*, p. 221.

26 See Heidegger, *Basic Writings*, p. 231.

27 See Heidegger, *Basic Writings*, p. 202.

28 See Heidegger, *Basic Writings*, pp. 221, 224, 227.

29 Heidegger, *Basic Writings*, p. 231; Heidegger's emphases.

30 See 'Deux documents sur Heidegger', *Les Temps Modernes*, 1(4) (janvier 1946), N.D.L.R., p. 713.

31 For Heidegger's self-serving view that in the Rectoral address he was engaged only in defending the German university, see Martin Heidegger, 'The Rectorate 1933/34: facts and thoughts', in 'The self-assertion of the German university: address, delivered on the solemn assumption of the Rectorate of the

University Freiburg. The Rectorate 1933/34: facts and thoughts', tr. with an introduction by Karsten Harries, *Review of Metaphysics*, 38 (March 1985), pp. 467–502.

32 See Silvio Vietta, *Heideggers Kritik am Nationalsozialismus und an der Technik* (Tübingen: Niemeyer, 1989).

33 For Sallis' claim that we have to let Heidegger's texts speak to us without any interference due to consideration of his political transgressions, see John Sallis, *Echoes: After Heidegger* (Bloomington and Indianapolis: Indiana University Press, 1990), p. 11.

34 For a reading of the Rectoral address which mainly follows Heidegger's own self-serving view of it, see Charles Scott, *The Question of Ethics: Nietzsche, Foucault, Heidegger*, 'These violent passions: the Rector's address', pp. 148–72.

35 See Karl Löwith, *Heidegger. Denker in dürftiger Zeit: Zur Stellung der Philosophie im 20. Jahrhundert* (Stuttgart: J. B. Metzler, 1984).

36 See Eric Weil, *Logique de la philosophie* (Paris: Vrin, 1950).

37 See Maurice de Gandillac, 'Entretien avec Martin Heidegger', *Les Temps Modernes*, 1(4) (janvier 1946), pp. 713–16.

38 See Alfred de Towarnicki, 'Visite à Martin Heidegger', *Les Temps Modernes*, 1(4) (janvier 1946), pp. 717–24.

39 See Karl Löwith, 'Les implications politiques de la philosophie de l'existence chez Heidegger', *Les Temps Modernes*, 2 (14) (1946), pp. 343–60.

40 See Eric Weil, 'Le cas Heidegger', *Les Temps Modernes* (juillet 1947), pp. 128–38.

41 See Alphonse de Waelhens, 'La philosophie de Heidegger et le nazisme', *Les Temps Modernes*, 3 (1947), pp. 115–27.

42 See Karl Löwith, 'Réponse à M. de Waelhens', *Les Temps Modernes*, 35 (août 1948), pp. 370–3.

43 See Alphonse de Waelhens, 'Réponse à cette réponse', *Les Temps Modernes* (août 1948), pp. 374–7.

44 See Jean Beaufret, *Introduction aux philosophies de l'existence*, série Médiations (Paris: Denoël/Gonthier), p. 30, reprinted as *De l'existentialisme à Heidegger* (Paris: Vrin, 1986), p. 25.

45 See, e.g., his article, 'En chemin avec Heidegger', in Michel Haar (ed.), *Cahiers de L'Herne. Heidegger* (Paris: L'Herne, 1983), pp. 205–33; see also his statement in J. Beaufret, *Entretien avec F. de Towarnicki* (Paris: Presses universitaires de France, 1984), p. 87: 'Heidegger n'a jamais rien fait qui ait pu motiver les allégations formulées contre lui' and the examination of his philosophy from a political perspective represents 'la conspiration des médiocres au nom de la médiocrité'. Essentially the same defence is offered later by Vattimo in his claim that Heidegger's thought is more important than that of his accusers.

46 See *Annales d'histoire révisionniste*, 3 (automne–hiver 1987), pp. 204–5; for a discussion of the link between Beaufret and Robert Faurisson, see Michel Kajman, *Le Monde*, vendredi 22 janvier 1988, pp. 1, 18. The following passage (cited in Jean-François Lyotard, *The Differend: Phrases in Dispute*, tr. Georges Van Den Abbeele (Minneapolis: University of Minnesota Press, 1988), p. 3) provides an idea of Faurisson's view: 'I have analyzed thousands of documents. I have tirelessly pursued specialists and historians with my questions. I have tried in vain to find a single former deportee capable of proving to me that he had really seen, with his own eyes, a gas chamber.' This form of historical revisionism is fundamentally different from the more benign discussion in German intellectual circles where the controversy does not concern the existence, but rather the interpretation of, the so-called final solution. See 'Historikerstreit'. Die

Dokumentation der Kontroverse um die Einzigartigkeit der national-sozialistischen Juden vernichtung (Zürich/Munich: Piper Verlag, 1987). For a philosophical reaction to Faurisson, see Jean-François Lyotard, *The Differend: Phrases in Dispute*, pp. 3–4.

47 For a good recent survey of his thought, see Werner Jung, *Georg Lukács* (Stuttgart: J. B. Metzler, 1989).

48 See Georg Lukács, *Existentialisme ou Marxisme?* (Paris: Nagel, 1948).

49 See Georg Lukács, *Existentialismus oder Marxismus?* (Berlin: Aufbau Verlag, 1951).

50 See Maurice Merleau-Ponty, *Les aventures de la dialectique* (Paris: Gallimard, 1955), chap. 2: 'Le Marxisme "occidental"', pp. 43–80.

51 See Jean-Michel Palmier, *Les écrits politiques de Heidegger* (Paris: L'Herne, 1968).

52 Palmier argues that Heidegger made two basic mistakes: he thought that through the Nazi party he could realize an intuition he perceived in Ernst Jünger's book, *Der Arbeiter*; and he thought that within Nazism he could develop a philosophical dimension since he deluded himself into perceiving within it a spiritual potentiality. For a statement of his view, see Jean-Michel Palmier, 'Heidegger et le national-socialisme', in M. Haar (ed.), *Cahier de l'Herne. Heidegger* (Paris: L'Herne, 1983), pp. 409–46. For a summary of Palmier's criticism, see *ibid.*, pp. 443–4.

53 See Jean-Pierre Faye, 'Heidegger et la révolution', *Médiations*, 3 (automne 1961), pp. 151–9. Faye has continued to develop his critique of Heidegger. For its most recent form, see Jean-Pierre Faye, *La raison narrative* (Balland, 1990).

54 See Jean-Pierre Faye, 'Attaques Nazies contre Heidegger', *Médiations*, 5 (été 1962), pp. 137–51.

55 See François Fédier, 'Trois Attaques contre Heidegger', *Critique*, 234 (novembre 1966), pp. 883–904. The discussion begun by Fédier including a series of responses and rejoinders, ended with contributions by Bondy and Fédier. See François Bondy, 'Une lettre de Heidegger à François Bondy', *Critique* (1968), pp. 433–5, and François Fédier, 'Le Point', *Critique* (1968), pp. 435–7.

119 Among the French Heideggerians, Lacoue-Labarthe has been most persistent in pursuing the problem raised by Heidegger's Nazism in all its many variations. Heidegger's later view of the role of poetry in the disclosure of truth led to his encounter with Paul Celan. For a recent effort to study the role of poetry based on that encounter, see Philippe Lacoue-Labarthe, *La poésie comme expérience* (Paris: Christian Bourgois, 1986).

120 A short list of his writings on or about Heidegger includes *La vérité en peinture*, *Ousia*, *Grammé*, 'Geschlecht. Différence sexuelle, différence ontologique', 'La main de Heidegger (Geschlecht II)', etc. His writings on Heidegger have recently been brought together in a single volume. See Jacques Derrida, *Heidegger et la question* (Paris: Flammarion, 1990).

121 For denial of the importance of the distinction or distinctions between the Derridean approach and so-called orthodox Heideggerianism in France, see Luc Ferry and Alain Renaut, *Heidegger et les modernes* (Paris: Grasset, 1988), pp. 99ff.

122 The latter aspect has not been lost on orthodox, or Derridean, Heideggerians. It is significant that his study has in fact been praised by Heideggerians for its Heideggerian quality. For instance, David Krell, in a long review in part intended to defend Heidegger against Farias' criticism, makes this point. See David Farrell Krell, 'Spiriting Heidegger. A discussion of *De l'esprit: Heidegger et la question*, by Jacques Derrida', in *Research in Phenomenology*, 18 (1988), pp. 205-30.

164 See Henri Meschonnic, *Le langage Heidegger* (Paris: Presses universitaires de France, 1990).

165 For Janicaud's earlier view of Heidegger, see Dominique Janicaud and

Jean-François Mattéi, *La métaphysique à la limite. Cinq études sur Heidegger* (Paris: Presses universitaires de France, 1983).

166 See Janicaud, *L'ombre de cette pensée*, p. 49.

167 For other versions of this argument see Michael Zimmerman, *Heidegger's Confrontation with Modernity, Technology, Politics, Art* (Bloomington and Indianapolis: Indiana University Press, 1990) and Richard Wolin, *The Politics of Being: The Political Thought of Martin Heidegger* (New York: Columbia University Press, 1990). See also Tom Rockmore, *On Heidegger's Nazism and Philosophy* (Los Angeles, Berkeley and London: University of California Press – forthcoming).

168 This insistence is present in his writings as early as the initial lecture series. See Martin Heidegger, 'Die Idee der Philosophie und das Weltanschauungsproblem', in Martin Heidegger, 'Zur Bestimmung der Philosophie', *Frühe Freiburger Vorlesungen Kriegsnotsemester 1919 und Sommersemester 1919*, ed. Bernd Heimbüchel (Frankfurt: Vittorio Klostermann, 1987). It is restated in his review of Jaspers' *Psychologie der Weltanschauungen* in *The Basic Problems of Phenomenology*, and in numerous other writings.

Philosophy and politics: by way of Martin Heidegger

Joseph Margolis

There are two quite different issues regarding philosophy and politics that Martin Heidegger's career as a professional philosopher poses that we cannot ignore. One concerns the question whether Heidegger's philosophy is inseparable, in whole or in part, from his political commitment as a Nazi; and, more generally, whether there is a principled distinction between philosophical and political convictions that can be made out just where the analysis of the human condition is at stake. The other concerns the question whether (and if so, how) Heidegger's original inquiries decisively affect *our* sense of the constraints under which moral and political legitimation henceforth obtains.

It is easy to see that if the answer to the second question is significant in an affirmative way, then we cannot deny that Heidegger's philosophy must bear on the viability and validity of inquiries that do not share his own political convictions, whether or not we find it possible to disjoin philosophy and politics altogether. Since there can be no doubt that the answer to the second question *is* in the affirmative, it cannot be the case that Heidegger's philosophy can be completely or largely rejected simply because, as he worked out his own views, he did so to a significant degree, perhaps largely, possibly even essentially, as a proto-Nazi, a public Nazi, a deviant Nazi, a utopian Nazi in defeat.

Now, it does also appear that Heidegger *did* produce his philosophy chiefly as all those sorts of Nazi. The entire direction of the analysis of his work, both early and late, for instance the analysis of the hitherto largely unknown *Beiträge*,¹ confirms more and more compellingly (and dishearteningly) that Heidegger was indeed extraordinarily singleminded philosophically from the very beginning of his career,² and that the nerve of his entire endeavour really concerned the indissolubility, in the largest sense, of philosophy and politics. In fact, given the truth of this judgment, it is much less surprising that Michel Foucault confesses in a pointed

way, in what seems to have been his own last interview, that Heidegger was a most important influence in his own work³ – despite the fact that Foucault never discusses Heidegger's actual theories and despite the plausible sense (contestable in a deep way, it must also be admitted⁴) in which Foucault was radically opposed to the moral and political convictions Heidegger represented.

In any case, the discussion of Heidegger is particularly arresting, intellectually. Just because he was a Nazi, his philosophy organically involves his Nazi proclivities and convictions. It was a theorizing influence throughout a large part of the twentieth century both in philosophy and beyond philosophy *and* among opponents and would-be opponents of Nazism; *and* (so) *we*, despite our failing to disjoin his philosophy and his politics, cannot quite manage to dismiss Heidegger's philosophy altogether, or to give up using or debating its findings and claims in a featured way in inquiries that are clearly opposed to anything like Heidegger's Nazism. We obviously do not feel bound to treat Heidegger merely as a Nazi. There can be no doubt that the situation is a unique one.

I

There are two closely related themes that span Heidegger's *Being and Time* and the Marburg lectures of 1927 (translated as *The Basic Problems of Phenomenology*) that bear directly on the connection between philosophy and politics: the first concerns Heidegger's repudiation of canonical philosophy from, say, Aristotle to Kant; the second, Heidegger's radical distinction between 'scientific philosophy' and philosophy as *Weltanschauung*. Both themes betray certain doubtful features of Heidegger's own line of argument: they *could*, certainly, have been formed to serve quite deliberately Heidegger's Nazism. But they confirm in a wider sense the close conceptual connection Heidegger acknowledged between philosophy and politics; and, what is more interesting, both are marred on philosophical grounds and both are redeemable on philosophical grounds, in ways that continue to confirm the strong connection between philosophy and politics – without implicating Nazism at all.

It is here, of course, that Heidegger's more permanent contribution may be discerned; for, ironically, the correction of his *philosophical* mistakes are themselves informed, at least in part or at least by parallel speculations, by a more rigorous application of his own insights into the puzzles of the connection between philosophy and politics. Grasping that, we are led to the conclusion originally broached, namely, that Heidegger's intellectual importance in the twentieth century can be justified well beyond the local link between his philosophy and his use of it (even his

opportunistic reshaping of it again and again) as a Nazi of the various stripes already mentioned. No doubt the admission is a disturbing one. But honesty at this late date is a political act – as well as a philosophical one. It must be so, on the argument being mounted.

In *Being and Time*, Heidegger charges philosophy with 'the task of destroying the history of ontology' (*Destruktion, destruieren*).⁵ Heidegger did not mean, here, to destroy ontology or metaphysics in the usual sense of 'destroy', that is, to eliminate it altogether, to cause it to cease to exist or to cease to be able to be recovered. He meant, rather, what he took to be the phenomenological project of 'deconstructing' or 'de-structuring' the accumulating (and misleading) history of ontology, so that whatever *it could recover* would no longer be read erroneously in terms of the false privilege of the canon but now in terms of his own deeper understanding of the relation between ontic and ontological inquiry:

We understand [the fundamental] task [of philosophy] as one in which by taking *the question of Being as our clue*, we are to *destroy* the traditional content of ancient ontology until we arrive at those primordial experiences in which we achieved our first ways of determining the nature of Being – the ways which have guided us ever since.⁶

Clearly, Heidegger meant to *recover* what he thought could be recovered of ontology, by way of the new clue that 'destroys' the tradition. He actually says elsewhere, somewhat more perspicuously:

our way of exhibiting the constitution of Dasein's Being remains only *one way* which we may take. Our *aim* is to work out the question of Being in general. The *thematic* analysis of existence, however, first needs the light of the idea of Being in general, which must be clarified beforehand. This holds particularly if we adhere to the principle which we expressed in our introduction as one by which any philosophical investigation may be gauged: that philosophy 'is universal phenomenological ontology, and takes its departure from the hermeneutics of Dasein, which, as an analytic of *existence*, has made fast the guiding-line for all philosophical inquiry at the point where it *arises* and to which it *returns*'. This thesis, of course, is to be regarded not as a dogma, but rather as a formulation of a problem of principle which still remains 'veiled': can one provide *ontological* grounds for ontology, or does it require an ontical foundation? and *which* entity must take over the function of providing this foundation?⁷

The offending canon, which Heidegger traces incisively in Aristotle, Descartes and Kant, fails, he believes, to understand the full meaning

of the fact that 'the central problematic of all ontology is rooted in the phenomenon of time', which the analysis of Being (*Sein*), 'rightly seen and rightly explained', would show. Correspondingly, he holds, 'temporality [*Zeitlichkeit*] [is] the meaning of the Being of that entity which we call "Dasein"'. What Heidegger means is that the analysis of Being (a fortiori, the Being of *Dasein* itself) proceeds by way of analysing the 'average everydayness' (*Alltäglichkeit*) of 'factual *Dasein*'; but in doing that, it merely achieves a 'provisional' and 'incomplete' anthropology of *Dasein*; it cannot rightly 'interpret . . . its meaning' (which, of course, requires a grasp of its 'ontological' (in one sense, its temporal nature) and not merely its 'ontical' structure (in particular, whatever temporal structure may be derivatively ascribed to distributed objects – including 'factual *Dasein*' – by virtue of the temporal structures of *Dasein*'s subjectivity). As Heidegger puts it: 'Dasein has a pre-ontological being as its ontically constitutive state. Dasein is in such a way as to be something which understands something like Being.' *Dasein* does so

with time as its standpoint. Time [he says] must be brought to light – and genuinely conceived – as the horizon for all understanding of Being and for any way of interpreting it. In order for us to discern this, time needs to be explicated *primordially as the horizon for the understanding of Being, and in terms of temporality as the Being of Dasein, which understands Being*.⁸

The novel and difficult theme, here, is that *Dasein*'s temporality, which is the ontological import of its ontic (or its ordinary discursible) structure, is essential to its pre-ontological disposition and capacity for understanding Being (which cannot be ontically analysed at all): that constitutive condition accounts for its (equally ontological) disposition of 'historicality' (*Geschichtlichkeit*) in virtue of which, *ontically*, it construes its ('objective') world by 'historizing' it discursively (*geschehen*). As a result, the 'elemental historicity of *Dasein* may remain hidden from *Dasein* itself'. It *may* discover it by way of 'discover[ing] tradition. . . . But historiography – or more precisely historicity [*Historizität*] – is possible as a kind of Being which the inquiring *Dasein* may possess, only because historicity is a determining characteristic for *Dasein* in the very basis of its Being.⁹ So *Dasein*'s grasp of its own (ontological) nature is achieved by reversing the order of capacitation by and in the order of inquiry – provided it eventually comes to understand that what it is discovering is *not* explicable in terms of the discursive categories of the early (ontic) phase of its characteristic work. Furthermore, on Heidegger's view, this is only one possible way of proceeding. One might even imagine that something like the *Kehre* of the *Letter on Humanism* is

already adumbrated here.¹⁰ Whether or not this is so, we cannot fail to remark, in hindsight, the easy *passage* from the one stage to the other.

Heidegger immediately follows this analysis, in *Being and Time*, by charging Kant with having prolonged the Cartesian (the canonical) error in a double way: first, by utterly neglecting 'the problem of Being'; and second, by failing to bring 'the phenomenon of time back into the subject again' (that is, into *Dasein*, construed 'phenomenologically'). Kant failed, therefore, to perceive that there was even a problem in 'the decisive connection between time and the "I think"'.¹¹

II

The strenuous and rather baffling nature of all this is more apparent than real. What Heidegger is claiming is, first of all, that *Being* (*Sein*) rather than plural, individuated things or 'beings' (*Seiende*) is the proper, even essential concern of philosophy; second, that whatever may be said regarding *Seiende* must be construed as pertinent to the possibilities that *Sein* 'first' provides; third, that that defines the inherent conceptual dependence of ontic distinctions on, and its subordination to, ontological discoveries; fourth, that there is no true universality that can be assigned to the merely ontic but only to the ontological; and fifth, that our understanding of this relationship (that is, our human understanding) is made possible (perhaps not exclusively) by the dawning of *Dasein*'s self-understanding (our understanding as 'ontico-ontological' incarnations of *Dasein*¹²) of its being ontologically structured as it is. In the *Phenomenology*, Heidegger explicitly says: '*Being is the proper and sole theme of philosophy*';¹³ and, in *Being and Time*, he says: '*Understanding of Being is itself a definite characteristic of Dasein's Being*. *Dasein* is ontically distinctive in that it is ontological.'¹⁴ This fifth theme is contested, of course, in Heidegger's papers following the *Kehre*. (We shall consider the matter, below.)

Effectively, this means that *all* discourse that proceeds by way of categories, conceptual distinctions addressed to *plural, numbered, individuated, ontic entities*, depends for its relevance and validity on its issuing from the peculiar *ontological* encounter between a certain uniquely endowed ontic *Seiendes* (*Dasein*, or 'factual *Dasein*') and *Sein* itself, which is utterly numberless and utterly structureless. That is, *Sein* cannot be made to conform to the referential and predicative devices (and categories) of enunciative discourse; but it is not (on Heidegger's view) therefore impossible to determine 'its meaning', it is intelligible:

'Being' cannot have the character of an entity. Thus we cannot apply to Being the concept of 'definition' as presented in traditional logic,

which itself has its foundations in ancient ontology and which, within certain limits, provides a justifiable way of characterizing 'entities'. The indefinability of Being does not eliminate the question of its meaning; it demands that we look that question in the face.¹⁵

This means, of course, that both theoretical and practical discourse – which inescapably involve numbered, individuated entities – depend on a 'ground' (the postulated phenomenological encounter between *Dasein* and *Sein*) that precludes, by way of its ('higher') temporality, any privileged invariance or necessity regarding such entities: either by way of an escape, from their provisionality, to changeless discoveries governing such plural entities; or by way of generalizing among them to such invariances.¹⁶

Therein lies the failed presumption of classical Greek philosophy and its most celebrated progeny, particularly in Plato's, Aristotle's, medieval, Descartes', Kant's, and Hegel's philosophies (all succinctly condemned in the space of a few pages). But the new philosophical orientation Heidegger offers is not without its own difficulties. For, first of all, it itself *depends* for its validity on discoveries accessible to *us* as historical instantiations of *that Dasein* that is putatively in a certain privileged, ontologically receptive role *vis-à-vis* numberless *Sein*; and second, *that* very discovery – the discovery about the nature of such discoveries – is also a discovery of particular entities in historical time. For example, it is some 'factual *Dasein*', some philosopher, in effect – Heidegger says – that discerns that 'Being is always the Being of an entity'.¹⁷

The lesson to be drawn is uniform for theoretical and practical inquiry (science and politics, for instance). It is simply this: no science and no morality discursively addressed to plural *Seiende* can take a necessary, invariant, universal, transhistorical or suprahistorical, categorically normative, or transcendently validated form as such. All ontic discourse is provisional, partial, historically transient, subject to change under conditions that ontic discourse cannot fathom, radically contingent: to adhere to its findings merely as such is rationally indefensible. 'Inquiry', says Heidegger, 'as a kind of seeking, must be guided beforehand by what is sought. So the meaning of Being must already be available to us in some way . . . we always conduct our activities in an understanding of Being.'¹⁸ Hence, since 'Being is always the Being of an entity',

the totality of entities can, in accordance with its various domains, become a field for laying bare and delimiting certain definite areas of subject-matter. These areas, on their part (for instance, history, Nature, space, life, *Dasein*, language, and the like), can serve as objects which corresponding scientific investigations may take as their respective themes. Scientific research accomplishes, roughly and

naively, the demarcation and initial fixing of the areas of subject-matter. The basic structures of any such area have already been worked out after a fashion in our pre-scientific ways of experiencing and interpreting that domain of Being in which the area of the subject-matter is itself confined. The 'basic concepts' which thus arise remain our proximal clues for disclosing this area concretely for the first time. And although research may always lean towards this positive approach, its real progress comes not so much from collecting results and storing them away in 'manuals' as from inquiring into the ways in which each particular area is basically constituted [*Grundverfassung*] – an inquiry to which we have been driven mostly by reacting against just such an increase in information.¹⁹

Narrowly construed, Heidegger is here opposing *every* form of foundationalism and cognitive privilege. He himself draws attention to the fact that he is attacking the foundationalism of mathematics and the sciences. In this he is still very close to his mentor, Husserl.²⁰ But he goes on, of course, as did Husserl himself in a *radically* different way, to discuss the 'ontological' (or phenomenological) *foundations* of those sciences:

The question of Being aims . . . at ascertaining the *a priori* condition not only for the possibility of the sciences which examine entities as entities of such and such a type, and in so doing, already operate with an understanding of Being, but also for the possibility of those ontologies themselves which are prior to the ontical sciences and which provide their foundations. *Basically, all ontology, no matter how rich and firmly compacted a system of categories it has at its disposal, remains blind and perverted from its ownmost aim, if it has not first adequately clarified the meaning of Being, and conceived this clarification as its fundamental task.*²¹

In short, Heidegger, like Husserl, moves in the direction of the phenomenologically apodictic with respect to the use of the categories of the understanding applied to the distributed things of our everyday world. In this regard, both are Kantian and both are opponents of Kant. But there the similarity ceases. For Husserl attempts to determine the inherent invariant structure of the concepts with which we (as Transcendental Ego) first 'constitute', phenomenologically, the (*already experientially given*) world in which we live; and Heidegger treats the givenness of the world itself as a late, transient and potentially replaceable artefact of the 'prior' encounter of *Dasein* and *Sein* that *cannot* itself be analysed in either Kant's or Husserl's way.

So Husserl's interest in the invariant structure of our concepts is con-

trolled by the efforts of a postulated ideal rational intelligence (the Transcendental Ego) to determine whether and in what way those concepts, the concepts we employ in our sciences, mathematics and elsewhere are subject to limitations of change when applied to the *Lebenswelt* we inhabit.²² To put the point in a somewhat vulgar way, Husserl is a super-Descartes or a super-Kant; but Heidegger repudiates Descartes and Kant – and Husserl, ultimately. For Heidegger's certitude regarding foundations is thoroughly *noumenal*, in the Kantian sense; whereas Husserl heroically treats his own phenomenology as the most inclusive and ultimate form possible of *phenomenally*-governed transcendental reflection.

III

If Heidegger is right in emphasizing the radical contingency of the historical and artefactual nature of *our concepts*, then Husserl is off on the wrong track altogether as far as any asymptotic approximation to the invariance of our concepts is concerned; although a phenomenologically more labile review of the structure of our concepts, within the terms of a historicized critique, would still be useful.²³ But in the attempt to understand Heidegger's linking of philosophy and politics, we cannot rightly rest with this quite plausible criticism. Husserl genuinely retreated from what should have been his effort (through the acknowledged influence of Max Weber) to come to terms with historicity and social construction, in writing the *Crisis* volume. In any case, the contingency of our concepts in ordinary use cannot fail to infect their phenomenological review as well: there cannot, on Kantian-like grounds, be a hierarchy of cognitive resources. The same weakness must infect the entire canon Heidegger discloses.

Heidegger appears only occasionally to have pursued in a detailed way anything like an 'ontologically' privileged science. It is certainly clear that, in general, particularly during the rectorate at Freiburg and afterwards (even when he became disillusioned with Hitler), he conceived the sciences as rightly informed by what rightly informed the political and moral orientation of the German world.²⁴ The supreme expression of this conviction is, without question, Heidegger's rectoral address on assuming the post, 27 May 1933, at the University of Freiburg. There, addressing the question of 'the spiritual *leadership* of this university', Heidegger remarks that the question is rightly answered 'only and above all when the leaders [*Führer*] are first led themselves – led by the relentlessness of that spiritual order that expresses its history through the fate of the German nation'. 'Has this essence [*Wesen*]', Heidegger asks, 'real

power to put a stamp onto our existence [*Dasein*]? Only if we wholeheartedly *want* this spirit.' Hence,

the self-determination of the German university is the original common will to its essence. . . . To will the essence of the German university is to will that science [German science] to be informed by the historical spiritual mission of the German people. Science and German fate must *above all* gain power in the will to essence [*Wesenwillen*].²⁵

Here, the crucial complications begin to surface in a legible way. For, on this thesis, Heidegger no longer restricts himself to a merely phenomenological (his own phenomenological) reading of the fateful mistake of the Western *ontic* canon that, contrary to the de-privileging, negative function of *Zeitlichkeit*, presumes to discern the conceptual necessities of, say, Aristotle, or Descartes, or Kant or Husserl; he now claims a positive, cognitively superior, prescriptive – in fact, *noumenal* – instruction directing the work of science and political morality.

Husserl had been mistaken in attenuating, as far as he could, the resources of a *phenomenally grounded transcendental or critical reflection*. On Heidegger's view, the argument against Kant must ultimately be effective against Husserl as well. But the instruction of the *Rektorsrede* is apparently drawn from the *phenomenological* powers of *Dasein* – a collective *Dasein*, the *Dasein* of the German nation that individual persons may share only by a decisive act of will; and yet, it affords a pronouncement that bears directly on the *ontically* regularized and individuated lives and commitments of particular persons. On a strict Kantian reading, it would be illicit to derive determinately valid findings or directives regarding empirical science or historical commitment from *any* noumenal sources: for, such sources are not discursible at all (though, on Kant's view: again, dubiously), we *are* entitled to *treat* ourselves as if we were noumenally competent agents.

Hence, Heidegger is committed, certainly in the *Rektorsrede*, perhaps already in *Being and Time*, certainly in the *Letter on Humanism* and 'The question concerning technology', to an utterly illicit inverted Platonism of historical destiny construed as a disclosure of the *essence* of the 'ontico-ontological' existence of *Dasein* (taken aggregatively and collectively). What, for instance, can we make of that remarkable passage in *Being and Time* that, read forward to the *Rektorsrede* and beyond, declares:

if fateful *Dasein*, as Being-in-the-world, exists essentially in Being-with-Others, its historizing is a co-historizing and is determinative for it as *destiny* [*Geschick*]. This is how we designate the historizing of the community, of a people. Destiny is not something that puts itself together out of individual fates, any more than Being-with-one-another

can be conceived as the occurring together of several Subjects. Our fates have already been guided in advance, in our Being with one another in the same world and in our resoluteness for definite possibilities. Only in communicating and in struggling does the power of destiny become free. Dasein's fateful destiny in and with its 'generation' goes to make up the full authentic historizing of Dasein. . . . *Only authentic temporality which is at the same time finite, makes possible something like fate – that is to say, authentic historicity.*²⁶

It seems quite impossible to construe this pronouncement in any other way than as a noumenally privileged utterance: an utterance that, escaping the contingencies of mere ontic (phenomenal) discourse, discerns an essentially valid instruction *about* our historical existence (that is, the existence of the German nation) that, depending on 'authentic temporality', is phenomenologically prescriptive (noumenally prescriptive, by some monstrous Platonist/historized mixture) *for* our individuated lives. The pronouncement is utterly arbitrary, indefensible on any pertinent grounds at all, completely incompatible with the *Kantian* cast of Heidegger's own work – that is, with his own severe correction of Kant's tendency to impose illicit noumenal constraints on his own transcendental reflections.

This is perhaps the import of Heidegger's having brought Kant's famous three questions (in 'the canon of pure reason'), in the *Critique of Pure Reason*,²⁷ to rest 'in the fourth [question] "What is man?" For the determination of the final ends of human reason results from the explanation of what man is. It is to these ends that philosophy in the academic sense also must relate.'²⁸ In effect, theoretical and practical concerns must be joined (as the *Rektoratsrede* makes clear). Hence, philosophy and politics are joined in joining science and political morality in the phenomenologically disclosed destiny of the German people – *in* the ontically determinate moments of the historical time they share.

But the argument is entirely illicit. Ironically, the usual criticism of Heidegger's *ontologically* oriented account of the empirical sciences is plausibly pursued on the grounds that, there, he imports too much from the 'theory-dominant [*ontic*] prejudices' of the traditional view of science, notably along the lines favoured by Husserl.²⁹ The deeper 'Platonism' is treated, then, as more atmospheric than not, if it is broached at all. But regarding practical life in the narrower and more conventional sense, Heidegger can, with justice, only be said to have mounted a strong argument against: (1) any noumenal intrusions into phenomenal or historical life that would claim *ontic* credentials of a prescriptive sort (whether by way of Kant's objectivism or by way of Hegel's historicism or by way of Husserl's phenomenology); and (2) any self-legitimizing or

normatively universal or invariant rules of phenomenal or historical life itself.

Furthermore, if the foregoing argument is compelling, then, by default (*only*), contrary to his own intention, Heidegger also 'demonstrates' that: (3) there cannot be any viable noumenal intrusions of an *ontological* sort either (phenomenological, on his own account, or 'hermeneutic' or 'transcendental'³⁰) by which determinate direction may be given to our 'ontic' or 'ontico-ontological' life. The reason is simply this: on Heidegger's own theory, these 'higher' discoveries are accessible to 'factual *Dasein*', which is first individuated and characterized in the discursive terms of the canon Heidegger wishes to 'destroy' or supersede. It does no good claiming that *that* individuated entity (a *Seiendes* among others) possesses as well an 'ontological' nature that cannot be grasped in terms of ontic categories, though it is indeed intelligible. For, it is *of* that individuated *Dasein* that *that* nature *is* predicated. The very intelligibility of what is thus claimed – particularly, its being predicatively pertinent *in this or that case* – presupposes the competence of *Dasein*'s ordinary categories. It is idle to quarrel about whether there is any discernible (not: demonstrable!) difference between the ontic and the ontological, for the pertinence of the ontological is, on the argument, entirely dependent upon, and subject to the cognitive validity of, *Dasein*'s *ontic* pronouncements. And of course, Heidegger himself came to be profoundly dissatisfied with his own failure, in *Being and Time*, to 'destroy' the traditional history of ontology. He found that he had simply given it (unintentionally) another inning.

Here, we may also observe (parenthetically) that the recent extravagances of post-structuralist thought (in Jean-François Lyotard for instance) and the immense confusions of Emmanuel Levinas' speculations (which are certainly one of the principal sources of the post-structuralist insistence on *l'autre* or *l'Autrui*, that either utterly escapes referential and predicative discourse altogether or, self-contradictorily, is both initially accessible to it and ultimately escapes it) are the proper progeny of Heidegger's line of argument under review here.³¹ And, of course, it goes without saying that any attempt to link philosophy and the moral or political by way of the self-legitimizing powers of *sittlich* practices, now so much favoured in the thin Hegelianism of a great deal of contemporary American and British moral theory, is defeated out of hand by the leaner critique of the traditional canon we must share with Heidegger (objection (2), above), *without subscribing to Heidegger's strange phenomenological prophecies* – a fortiori, without sharing his Nazism.³²

There you have the clue as to how to salvage Heidegger's philosophy from Heidegger's own use of it, without disconnecting philosophy and politics at all.

IV

We have now answered the first of our original questions. We must turn to the second.

In the 1927 Marburg lectures (the *Phenomenology*), Heidegger very trimly connects philosophy and politics:

what is meant by [world-view: *Weltanschauung*] is not only a conception of the contexture of natural things but at the same time an interpretation of the sense and purpose of the human Dasein and hence of history. A world-view always includes a view of life. A world-view grows out of an all-inclusive reflection on the world and the human Dasein, and this again happens in different ways, explicitly and consciously in individuals or by appropriating an already prevalent world-view. We grow up within such a world-view and gradually become accustomed to it. Our world-view is determined by environment – people, race, class, developmental stages of culture. . . . A world-view is not a matter of theoretical knowledge, either in respect of its origin or in relation to its use. It is not simply retained in memory like a parcel of cognitive property. Rather, it is a matter of a collective conviction which determines the current affairs of life more or less expressly and directly. A world-view is related in its meaning to the particular Dasein at any given time.³³

This is *not* to say that *Weltanschauung* is philosophy. Of course, for Heidegger, it is not. But it is the view of Karl Jaspers, in his *Psychologie der Weltanschauungen*, which Heidegger ridicules and holds up as an example of an utterly untenable view: 'the notion of a world-view philosophy', he says, 'is simply inconceivable . . . an absurdity'.³⁴

Weltanschauung is very close to what, by freeing the term from its original Marxist sense, we now usually mean by 'ideology': the abstract unity of a set of historically formed and collectively effective practices, beliefs and norms that integrate a society's largely tacit understanding of nature, its own objectives and the improvisational possibilities of aggregated behaviour by which they may be achieved – within the context of divergent such ideologies viewed both diachronically and synchronically.³⁵ Since philosophy presupposes something very much like *Weltanschauung*, in Heidegger's view, without actually being identical with it, since it presupposes *Weltanschauung* in a sense analogous to (but also profoundly different from) the Kantian sense in which transcendental considerations have application ultimately only to the phenomenal world they serve to organize conceptually, *Weltanschauung* also *presupposes* philosophy in a deeper sense (a sense in which its very origination and ultimate legitimization require the priority of the philosophical mission). One might almost

say (with some caution) that, for Heidegger, phenomenology without *Weltanschauung* is empty and *Weltanschauung* without phenomenology is blind; and, of course, that philosophy, equated with the phenomenology of Being, constitutes a cognitive source that is foundational in the order of understanding, the findings of which cannot be formulated in terms of conceptual categories suited to discourse about distributed entities. Heidegger construes philosophy, therefore, in that it is 'ontological' rather than 'ontical', as being never in violation of the Kantian injunction against discourse about the noumenal world. Nevertheless, by bifurcating the very nature of intelligible discourse, he claims to recover universal truths *at* what is effectively the noumenal level without either breaching that injunction or endorsing the failed Kantian conception of a scientific philosophy of beings – which, though not a mere *Weltanschauung*, shares with it the same 'incomplete condition':

We assert now that being is the proper and sole theme of philosophy. . . . Negatively, this means that philosophy is not a science of beings but of *being* or, as the Greek expression goes, ontology. We take this expression in the widest possible sense [Heidegger's own phenomenological sense, that pursues ontology beyond the 'ontic'] and not in the narrower one it has, say, in Scholasticism or in modern philosophy in Descartes and Leibniz. . . . Philosophy is the theoretical conceptual interpretation of being, of being's structures and its possibilities. Philosophy is ontological. In contrast, a world-view is a positing knowledge of beings and a positing attitude toward beings; it is not ontological but ontical. The formation of a world-view falls outside the range of philosophy's tasks, but not because philosophy is in an incomplete condition and does not yet suffice to give a unanimous and universally cogent answer to the questions pertinent to world-views; rather, the formation of a world-view falls outside the range of philosophy's tasks because philosophy in principle does not relate to beings. It is not because of a defect that philosophy renounces the task of forming a world-view but because of a distinctive priority: it deals with what every positing of beings, even the positing done by a world-view, must already *presuppose* essentially.³⁶

Heidegger affirms that 'all the great philosophers since antiquity' have pursued ontology in the sense he here formulates; but, as he has also demonstrated (in his lectures of the Summer semester 1926 and the Winter semester 1926–7), as he reminds his auditors, 'they [notably, the tradition from Thomas Aquinas to Kant] had to fail'. For, of course, as they did not realize and as Heidegger urges his auditors, 'Philosophy must legitimate by its own resources its claim to be universal ontology'.³⁷

We cannot fail to see here the correct way to integrate the lessons

of *Being and Time* and the *Phenomenology*. But the entire effort is brokenbacked, quite impossible – and, on Heidegger's own grounds. For, it cannot be true that philosophy 'in principle does not relate to beings'. It cannot be true, because the very science of being, ontology (in the sense that goes beyond the 'ontical'), is the work of a particular being (a *Seiendes*), namely, *Dasein*, whose *ontic* structure (according to Heidegger) is 'ontological' (in the special phenomenological sense he favours).

It is not merely that *some* discursively apt agent pursues philosophy. That itself poses a puzzle that needs to be examined – for instance in the way Descartes, Kant and Husserl do. And indeed, it is a puzzle Heidegger never rightly clarified in the period following the *Kehre*, when *Dasein* was denied the midwife role it plays in *Being and Time* and the *Phenomenology*. But never mind that complication for the moment. The additional point needs to be made that the 'science' of Being, in the period we are considering, is a science that implicates the special role of *Dasein*, *Dasein's* special relationship to *Sein*. This means that the disclosures of ontology (of *Sein tout court*) presuppose (and entail) the universal validity of whatever is ontically true of individuated *Dasein*; and if that is so, then there cannot be a viable bifurcation of the ontic and the ontological, of the phenomenal and the noumenal, of the *Weltanschaulich* and the philosophical, of the categorical and the existential-hermeneutic, of the Kantian and the Heideggerian. And, of course, if that is so, then Heidegger cannot but have utterly failed in his own undertaking. This difficulty signals the extraordinary conceptual pressure within Heidegger's own system leading to the desperate moment of the *Kehre* – which, of course, had its political motivation as well.

There is no being, Heidegger says, but the being of *beings*: 'Being is always the Being of an entity'. (We have already taken note of the fact.) The science of Being is the science of 'its possibilities', the *Phenomenology* says; and its possibilities are the structured plural entities that 'it' may be manifest in. So Heidegger's phenomenology is dependent on the *ontic* articulation of a world every bit as much as it is in Kant's and Husserl's philosophies, and what he now says is arbitrary and conceptually incoherent and intrinsically incompatible with his own view of things.

But it also helps to locate the privilege Heidegger presumes to assign to the 'higher' noumenal prophecy of the *Rektorsrede* and, much later, to the monstrous possibility of the self-disclosure of Being bypassing the full mediating role originally assigned *Dasein*. The first of these manoeuvres confirms Heidegger's desperate effort to improve the sense in which he could, in the early period following the *Phenomenology*, present himself to the National Socialists as capable of delivering a pertinent, fully articulated political programme grounded in his philosophy; and the second confirms Heidegger's equally desperate effort to

free himself, *at almost any cost*, from the deep inconsistency of the earlier philosophical position. In a word, in the first, Heidegger chooses utter arbitrariness and opportunism, for political reasons, at the price of coherence; and in the second, he chooses befuddlement (plain incoherence) in order to eliminate a palpable, a devastating, an ineliminable philosophical inconsistency.

But *all* of his alternatives are tarred with the same noumenal brush, and it is only by its privilege that Heidegger *is able at all* to bring philosophy and politics together *in his own terms*. Philosophy and politics remain indissoluble in a larger sense, of course, simply because the 'science of Being' can justify no bifurcation among the plural 'possibilities' (the *Seiende*), over which it reigns supreme. This is the obvious message of the *Rektorsrede*. It is also the clear (the milder) instruction of the *Phenomenology*:

We must understand actuality, reality, validity, existentiality, constancy in order to be able to comport ourselves positively toward specifically actual, real, living, existing, constant beings. We must understand being so that we may be able to be given over to a world that is, so that we can exist in it and be our own Dasein itself as a being. We must be able to understand actuality *before* all factual experience of actual beings. This understanding of actuality or of being in the widest sense as over against the experience of beings is in a certain sense *earlier* than the experience of beings.³⁸

In this 'plain' sense, philosophy *is* politics as well as science: it provides the noumenal discovery on which politics and science depend (in an ontological sense of priority that goes beyond mere logical priority); and philosophy itself has no other function but to orient us, among the actual entities of politics and science, *to this condition*.

V

One sees at once the threatening sense in which Heidegger's philosophy risks being utterly vacuous with regard to historical content, historical direction, historical application. Heidegger has no option, therefore: to be relevant, he *must* invoke, however illicitly, *some determinate instruction regarding plural Seiende*. Hence, the extravagant historicized Platonism of the *Rektorsrede* points to a constant *philosophical* need in Heidegger's system, even if (surely) the specifically National Socialist themes are not actually required. There you have the essential thread linking philosophy and politics that runs through all the stages of Heidegger's work.

The lesson is also more than that. It puts *us* on our mettle as well. For Heidegger saw in an unblinkingly clear way that, without the saving fixity of his noumenal prophecies, there could be no way of resisting relativism, historicism, the triumph of technology and social *praxis*, *on the essential thesis he himself advanced*. That is, once give up the *ontic* canon (ranging, say, from Plato to Husserl), once admit the historicity of philosophy and science and politics, and legitimation in terms of universal invariances becomes utterly impossible. Unless, that is, there is a saving noumenal (ontological) privilege (as Heidegger believed).

In a way, there are two sorts of motivation internal to the series of changes through which Heidegger's philosophy moves. In the one, Heidegger saw that he must give locally convincing evidence of the political pertinence of his otherwise too abstract and seemingly irrelevant metaphysics. In achieving this objective rather brilliantly – in fact, altogether surprisingly – in the *Rektorsrede* and in his numerous speeches to Nazi student cadres and university-centred audiences, he obviously more than annoyed Ernst Krieck and Alfred Rosenberg.³⁹ He actually made a serious bid to become the educational *Führer* of the Third Reich. But of course he ultimately failed in this; knew that he had failed, retreated from what he took to be the misguided brand of National Socialism that eventually won out; and so turned, still convinced by his own utopian message, to the peculiar political quietism of the late essays. In the other, he saw that he must give a philosophically cogent account of just how he could claim to have restored philosophy to its original intuition (among the pre-Socratics), to have worked through and to have replaced the classical canon that culminated in the work of Kant and Husserl, and to have secured nevertheless, despite the inconsistencies of time and history, a sense of legitimating universalities, conceptual necessities, essential invariances that escaped the *Weltanschaulich* particularities of mere ontic categories. In achieving that, through the period of *Being and Time* and the *Phenomenology*, Heidegger realized that he must eliminate the central inconsistency of *Dasein*'s role, without disturbing the congruence among his other concepts. The required transition moves from *Entschlossenheit* to *Gelassenheit*: which is to say, from the resolute midwifery of *Dasein* to the initial passivity of *Dasein*'s reception of the prophetic self-disclosures of *Sein*.

The remarkable thing is that both of these lines of development converge in one supreme economical manoeuvre: the *Kehre*. With it, philosophy and politics, as indissolubly intertwined as ever, lead to the pessimism of the imminent victory of technology – which, again, is both philosophically and politically decisive.⁴⁰ 'Each epoch of philosophy', Heidegger says,

has its own necessity. We simply have to acknowledge the fact that a

philosophy is the way it is. It is not for us to prefer one to the other, as can be the case with regard to various *Weltanschauungen*.

In this historically *pluralized* ('disclosed') sense, philosophies come to their 'end'. That is, 'The end of philosophy is the place, that place in which the whole of philosophy's history is gathered in its most extreme possibility. End as completion means this gathering.'

'Philosophy [Heidegger holds] is metaphysics', and 'Metaphysics is Platonism'. Heidegger's meaning here is that philosophy *thinks* Being,

the ground . . . from which beings as such are what they are in their becoming, perishing, and persisting as something that can be known, handled, and worked upon. As [that] ground, Being brings beings to their actual presencing . . . the transcendental making possible of the objectivity of objects.⁴¹

So, *necessities*, in philosophy – a fortiori, in politics – are epochal *and* noumenal. It is for that reason that philosophy does not fall back to Kant's or Hegel's or Husserl's solutions. This is of course also why Heidegger had to eliminate the disturbing role of *Dasein* as it functioned in the earlier phases of his philosophy. It is also why he feels more secure philosophically, why he reaches in a more extreme way politically, why he is ultimately more discouraged in both regards, in writing his last papers regarding the terrible ease with which

philosophy turns into the empirical science of man, of all of what can become for man the experiential object of his technology, the technology by which he establishes himself in the world by working on it in the manifold modes of making and shaping.⁴²

If it were possible – but Heidegger doubts that it is, in our epoch: the opportunity has been lost, the utopian vision of National Socialism Heidegger espoused has been denied in Germany itself and overwhelmed by American pragmatism and Russian Bolshevism – 'the [correct] answer [to the question of our epoch] would consist in a *transformation of thinking*, not in a *propositional statement about a matter at stake*'.⁴³ A 'transformation of thinking', of course, signifies a recovery of the priority of the noumenal inspection of Being.

What we may draw from this is that the force of Heidegger's critical work, as opposed to his peculiar form of Platonist redemption, confirms that, *henceforth*, the constraints on science and political morality are obliged either to conform to what we have previously numbered as Heidegger's arguments (1) and (2) (against certain legitimitative presumptions) as well as to *our* argument (3) against Heidegger's own legitimitative

presumption, or else to counter these same objections effectively. In this, Heidegger certainly leads us to see (against his own intention) the utter bankruptcy of pretending to pull some noumenal legitimation or prescription out of his hat, and the impossibility of securing any legitimation of a strictly universalized sort for either science or politics.

The upshot is breathtakingly simple – but disturbing: if they are eligible at all, second-order legitimative ('transcendental', 'critical', 'pragmatic' or similar) arguments need not be necessary, synthetic a priori, universal or universally presupposed, essential, invariant or anything of the kind; and, they cannot be such if they are cast (as they must be) in ontic, *weltanschaulich*, historicized, praxical or similarly encumbered terms.

So the game has been worth the candle. Heidegger's extravagance, pursued in the extraordinarily tenacious and inventive way he had, closes the door as securely as we are ever likely to be able to do, on the pretensions of *noumenal philosophy*. The short truth is: there is no such philosophy. This is just as true of Jaspers' more appealing and more humane use of the inexhaustibility and/or ineffability of noumenal *Existenz* and transcendence as it is of Heidegger's ultimately anti-humanist recovery of noumena.⁴⁴

VI

We need, before closing this account, to fix as clearly as possible – for the period after the 'turning' – the final version of Heidegger's preposterous solution of the would-be noumenal direction of science, philosophy, politics, morality and art. The master clue appears at the beginning of the notorious *Letter on Humanism*. It speaks in a quintessentially Heideggerian voice:

We are still far from pondering the essence of action decisively enough. We view action only as causing an effect. . . . But the essence of action is accomplishment. To accomplish means to unfold something into the fullness of its essence, to lead it forth into this fullness – *producere*. Therefore only what already is can really be accomplished. But what 'is' above all is Being. Thinking accomplishes the relation of Being to the essence of man. It does not make or cause the relation. Thinking brings this relation to Being solely as something handed over to it from Being. Such offering consists in the fact that in thinking Being comes to language. Language is the house of Being. In its home man dwells.⁴⁵

This extraordinary opening paragraph must be read as a contorted reinterpretation of *Being and Time*. It very nearly ensorcelles us into

bewildered acquiescence. It zaps us. But it is an enormous conceptual fraud. Notice particularly the analysis of 'accomplishment': 'only what already is can really be accomplished.' What does that really mean? It should by rights mean only that Being, to which we can assign no intelligible structure at all, really *has* no structures – except (negatively and figuratively) as the undifferentiated source of all that *is* (in the pluralized, structured sense in which, as Heidegger also says, 'Being is always the Being of an entity'). But now it means not merely that, but, since '*accomplishment*' (whatever it is) must *be* the prefigured 'essence' of *some* determinate action, also the noumenally determinate form of *that* particular being that *is* phenomenally or ontically effectuated in historical time.

That, now, proves to be utterly incoherent, utterly ruled out, utterly contrary to the corrected Kantian theme Heidegger imposes on Kant's own (reverse) presumption. That is, Kant, read metonymically as the voice of the entire Western canon of philosophy, illegitimately presumes the self-legitimizing powers of ontic discourse: Heidegger's phenomenology exposes the presumption. (There you have the clue to Heidegger's permanent contribution to philosophy and politics.) For his own part, however, Heidegger had, in *Being and Time*, mistakenly read the lesson of the temporality of *Dasein* and the historical contingency of the conceptual analysis of plural beings (the 'ontological' contribution) as (somehow) permitting a determinate destinal interpretation (from that ontological vantage) of the ontically deployed phenomena of any given existentially encountered epoch. Now, correcting the obvious inconsistency of *Dasein's* indissolubly particularized function straddling both 'levels' at once, Heidegger opts for the deeper incoherence of retaining, separately, the ontological dispensation first marked only *within* the constitutively original ontic function of ('factual') *Dasein*. He keeps the discursive intelligibility of the phenomenological intrusion in our lives and destiny, but he no longer bothers to account *for the origination of that intelligibility itself*. There you have the absurdity of the famous *Kehre*: the strange doctrine of intelligibility's or essence's or legibility's or discursible structure's being 'handed over to [human or *Dasein's* thinking] *from* Being'. That last notion should be a purely heuristic device if it is to have any function at all. But, alas, it is intended as a serious form of determinate prophecy from a privileged source.

So the entire mystery of the *Letter*, both in terms of science and politics, is probably meant quite deliberately to obscure the hocus pocus by which, first, a determinate instruction is assigned human life *from* noumenal sources (that require a poet, a sage, a *Führer*, a Hölderlin); and, second, that instruction comes directly *from* Being, is said to be 'brought to' language but not 'made' or 'caused' by *Dasein's* languaging Being (so to say) – by acting as Being's midwife.

The doctrine is more than a little puzzling, you must admit. It is, of course, Heidegger's last mystery. One cannot appreciate the brilliance and slyness of Heidegger's resolution here – its reaffirmation of the unity of philosophy and politics even (or especially) in Germany's defeat, its consistency with the Platonism of the *Rektoratsrede* but (now) no longer with the specific instruction of that address: the epoch, you see, has changed! – unless one reads it as a radical rereading of *Being and Time*. Allow it a few more lines, therefore:

Thinking acts in so far as it thinks. Such action is presumably the simplest and at the same time the highest, because it concerns the relation of Being to man. But all working or effecting lies in Being and is directed toward beings. Thinking, in contrast, lets itself be claimed by Being so that it can be the truth of Being. Thinking accomplishes this letting. Thinking is *l'engagement par l'Être pour l'Être*. . . . Thinking is not merely *l'engagement dans l'action* for and by beings, in the sense of the actuality of the present situation. Thinking is *l'engagement* by and for the truth of Being. The history of Being is never past but stands ever before; it sustains and defines every *condition et situation humaine*. In order to learn how to experience the aforementioned essence of thinking purely, and that means at the same time to carry it through, we must free ourselves from the technical interpretation of thinking. . . . Philosophy is hounded by the fear that it loses prestige and validity if it is not a science. Not to be a science is taken as a failing which is equivalent to being unscientific. [But] Being, as the element of thinking, is abandoned by the technical interpretation of thinking.⁴⁶

Now, this *could* have meant no more than what might summarize Heidegger's entire diatribe against the philosophical canon that suicidally restricts itself to ontic resources. If it were merely that, it would simply recover, unaltered – toward the end of his life – the message of Heidegger's earliest productive period. But it must also, now, resolve the philosophical and political inconsistencies Heidegger himself discerned in the interim. The surprising trick is this: *language* is not rightly a human *instrument* at all, it does not belong primarily to *Dasein*. It is 'essentially', after all, 'the house of the truth of Being'. In the merely 'technological' view of language, 'language surrenders itself to our mere willing and trafficking as an instrument of domination over beings'.⁴⁷ So the choice (according to Heidegger) is the following: either *Dasein* (in effect: the members of human societies) prepares itself to *receive* the 'utterance' of Being's language (whatever that may be supposed to be) or else it employs its own (derivative) natural language (shall we say) to *dominate* *Seiende* (the entities of nature and human societies thereby revealed).

There are no other options; the two are disjunctive, and both are philosophically and politically significant.

Heidegger would have us believe that language *already* belongs (in some sense) to Being; whereas, in *Being and Time*, it is precisely the mediating, symbiotizing function of *Dasein's* unique *relation* to *Sein*. If the latter doctrine were permitted to stand, then language would be inseparable from *Dasein's* mode of functioning; and if that obtained, then language would be tethered to 'subjectivity' – and, thence, to technological domination. Extraordinary! Since, therefore, Heidegger regards the defeat of Germany as the victory of technology (or, better, the victory of the technological philosophy of language and thought that permeated the politics of Germany's enemies), the conception must be corrected *for the future*.

Fortunately, the trick may be turned at a stroke, and in a way that erases (or perhaps merely obscures) the disturbing inconsistency of the earlier period. Merely change the role of *Dasein* in the noumenal/phenomenal equation. That's all. Merely make it out that Being is the supreme *care* of *Dasein* – that in virtue of which man's humanity is realized. Then, man may still be said to be *related* to Being all right – but no longer in that way in which beings are first *constituted* as the entities they are. *There* is the essential equivocation: in *Being and Time*, plural *Seiende* are what they are *only* in virtue of *Dasein's* internal relation to *Sein*; in the *Letter on Humanism* (after the *Kehre*, that is), what *Seiende* are depends only on what Being 'permits' to be 'handed over to [*Dasein*, or to man, or to man's care] from Being'. In the first, both the ontic structure of beings and the ontico-ontological import of *that* structure as well as the essence of *Dasein* are constitutively dependent on *Dasein's* reflexive function: in the second, only the *care* of those matters entails a strong relation between *Dasein* and *Sein*.

So Heidegger speaks of 'the word's primordial belongingness to Being'. 'This relation', he warns, 'remains concealed beneath the dominance of subjectivity that presents itself as the public realm.'⁴⁸ So he comes to his final formula, at once superb and preposterous: 'In its essence language is not the utterance of an organism; nor is it the expression of a living thing. . . . Language is the lightning concealing advent of Being itself.' 'This indicates', he explains,

that 'essence' is now being defined from neither *esse essentiae* nor *esse existentiae* [against Sartre, finally] but rather from the ek-static character of *Dasein*. As ek-sisting, man sustains *Da-sein* in that he takes the *Da*, the lightning of Being, into 'care'. But *Da-sein* itself occurs essentially as 'thrown'. It unfolds essentially in the throw of Being as the fateful sending.⁴⁹

What Heidegger accomplishes here – necromantically – is the dethroning of man or *Dasein* as (in the Kantian sense) the *constituting* site of the conceptually legible structures of all that is real. The latter seemed to be the theme (the improved Kantian-like theme) of the *Phenomenology* and *Being and Time*. Now Heidegger replaces it with the theme of man's 'thrownness' (*Geworfenheit*), which signifies his initially completely receptive role with regard to the fulgurating 'utterances' that originate from Being *itself*: 'what is Being? It is It itself', he says. 'Man is the shepherd of Being [not the 'lord of being']': 'he . . . guard[s] the truth of Being, in order that beings might appear in the light of Being as the beings they are.'⁵⁰

This is now offered as a clarification of the crucial passages of *Being and Time* (p. 42 particularly) in which the Being of beings (both of *Dasein* and of other entities) *seemed* to be such only, *constitutively*, in being such *for* *Dasein* (or, such-for-*Dasein*). Now, in the *Kehre* here intended, 'Man is rather "thrown" from Being itself into the truth of Being':⁵¹ he plays no role in the 'constituting' of beings; he is a witness or a shepherd of the way in which they are epochally disclosed from Being itself. What is conceptually monstrous, here, what is incoherent in the strictest sense, is the double claim: first, that the determinate structures of plural beings, discernible (somehow) by human thought and language, can be said to issue meaningfully from a 'source' (Being) that is indiscursible as such; and, second, that those structures are in some sense constituted linguistically but in a way that is utterly alien and prior to any merely human language. Recall Heidegger's formula: 'in thinking Being comes to language. Language is the house of Being. In its home man dwells.' Unbelievably cunning.

So thinking and 'linguaging' are more than human, more than science or philosophy. They are certainly that in virtue of which man 'comes home' to Being.⁵² They are that in virtue of which Heidegger eclipses mere humanism (the humanism of Sartre's existentialism, for instance), since such an existentialism 'does not set the *humanitas* of man high enough'. The humanism needed 'thinks the humanity of man from nearness to Being . . . a humanism in which not man but man's historical essence is at stake in its provenance from the truth of Being'.⁵³

VII

All this needs to be said with great care to be believed: to believe that Heidegger did say these things and to understand what he meant by them. It is in their sheer extravagance and desperate arbitrariness that they are defeated. The irony remains, therefore, that, by their self-defeat, we are led to grasp the plausible sense in which philosophy and

politics remain indissolubly linked, the sense in which (therefore) this holds true of Heidegger's work as well, *and* the sense (yet) in which his own philosophy contributes a saving theme that cannot be merely equated with his own fantastic use of it as an aspirant proto-Nazi, as an enthusiastic and visionary Nazi, as a defeated but still prophetic Nazi.

Two final lessons. First of all, the recovery of what deserves to be saved in Heidegger's philosophy radically reduces the importance of a very large part of his own work. The damning themes, at once philosophico-political in the complex Nazi sense we have been labouring to isolate, are surely utterly worthless, except perhaps as warning specimens of how the mind can be derailed. Notice, however, that in dismissing Heidegger's notions of noumenal destiny's descending into the ontic world that is itself contingently formed from a historically similar *alētheia*,⁵⁴ we are not dismissing the essential connection between philosophy and politics. On the contrary, the theme is actually enhanced by discerning the outrageous use Heidegger makes *of* the conceptual bond between the two entailed *in* his own phenomenological critique of the purely ontic tradition he exposes.

This is precisely the same theme discovered and alternatively formulated in Hegel, Marx, Nietzsche, Foucault, Derrida and the post-structuralists. It is not similarly formulated in the views of all these thinkers, to be sure; but it remains constant nevertheless. It is simply the implication of acknowledging *the incapacity of any human conceptual scheme to capture the essential, invariant, universal, necessary, or totalized structure of all that is real*: the consequence of that incapacity concerns the contingency, inevitable opportunism and advantage in the distribution of power associated with the spontaneous use of any conceptual scheme or of any social process that would replace any given such scheme by another.

The second lesson is more inclusive than the first. For Heidegger's Nazism is, on his own say-so, a historicized form of Platonism: a body of normatively legitimated disclosures of collective destiny yielded by Being itself. It is, therefore, an extravagant version of an extravagance. It is a *noumenal* pretension. It would be the same whether it was Nazi or not, and it would be illicit for the same reasons. The second lesson, therefore, erases an even wider swath of Heidegger's philosophy than the first; but, once again, with the exception of collecting specimens of how the mind can be derailed.

The trouble is that Western philosophy has, to a greater extent than it would care to admit, actually *been* committed to similar noumenal pretensions embedded in its own 'phenomenal' resources. Indeed, the entire bewitchment that is philosophy is largely occupied with illicitly exceeding the limits of discursive thought, once we admit that there is no cognitive hierarchy to be had. (In Heidegger's terms, after all, it is

factical *Dasein* that discovers that it has 'ontological' resources beyond its 'ontical' ones.)

From this point of view, Heidegger represents one of the clearest appreciations of the peculiarly transient nature of ordinary conceptual schemes. Construe all such resources as 'phenomenal' – addressed to individuated, numbered, plural things (Kantian, in *that* sense; where the 'noumenal' signifies that whereof one cannot speak at all; *not*, of course, the mere concept of the noumenal).

So seen, the lesson is a remarkably simple one: we must reclaim all philosophical problems under the constraint of *never* intruding a noumenal advantage and of admitting, *everywhere*, the horzonal limitation of the phenomenal presence of our world and our understanding of our world, symbiotized in the same apparent history. Heidegger may then prove to have been the last of the great philosophical pretenders who fully grasped this second lesson and still elected to deny it. There *is*, after all, no developed philosophy that has ever had the courage to embrace that very large constraint and still afford a plausible system of great scope and power. That is surely what is needed – and what will be seen to be needed in the next century. But it will not, indeed it could not, deny the ineluctable link between philosophy and politics.

Notes

1 The first sustained analysis in English is to appear shortly in a book-length study of Heidegger by Tom Rockmore, *On Heidegger's Nazism and Philosophy*, to be published by the University of California Press.

2 The point has been pressed in a telling way by Theodore J. Kisiel, 'The genesis of *Being and Time*', first presented at a meeting of the Society for Phenomenology and Existential Philosophy, Villanova University, Villanova, Pennsylvania, 20 October 1990.

3 See 'The return of morality', an interview between Foucault and Gilles Barbadette and André Scala, in Michel Foucault, *Politics, Philosophy, Culture: Interviews and Other Writings 1977–1984*, ed. Lawrence D. Kritzman, tr. Alan Sheridan and others (London: Routledge, Chapman and Hall, 1988): 'For me [says Foucault] Heidegger has always been the essential philosopher' (p. 250).

4 See, for instance, J. R. Merquior, *From Prague to Paris* (London: Verso, 1986), chap. 5.

The shadow of this thinking

Dominique Janicaud

Part I The undiscoverable politics

Le plus grand défaut de la pénétration n'est pas de n'aller point jusqu'au but, c'est de le passer.

– La Rochefoucauld

Whoever relies only on the recent polemics launched by Victor Farias's *Heidegger et le nazisme*¹ will find it extremely difficult not only to weigh fundamental philosophical questions but even to form an idea of Heidegger's thought that is not a caricature. Heaping up unevenly relevant facts and hastily solicited testimonies, the debate runs the risk of limiting itself to expatiate on Heidegger's 'Nazism' and to issue moral condemnations intended to be final. But which Heidegger is being judged? Is it the character who, during the summer of 1933, 'wore knee-length pants'?² Or is it the author of the most decisive interpretation of Nietzsche's thought put forth to this day? Farias makes the most out of the first and downplays the second.³ Made unrecognizable, Heidegger's thought is reduced to a vague pathos of pseudoheroic existentiality, provincial attachment to the *Heimat*, and, especially, a petit-bourgeois reactionary spirit.

The need to reverse this perspective, blurred by sensationalism as well as by the desire to purchase a clean conscience cheaply, is urgent. Critical and responsible minds in the present and the future must start again from what interests them (whether positively or negatively, or both positively and negatively, or even if it is undecidable) in a philosopher whose many books and published lecture notes are – until there is proof to the contrary – the only authentic repositories of his thought. To do

just that with respect to the question of politics is my aim in this paper,⁴ without ignoring, however, a serious and perhaps crippling difficulty: a heedful and sustained reading of Heidegger's work does not easily discern in it the question of the political *as such*. Are we then faced with an indeterminable politics? May we even go so far as to contend that there is *no link* between the philosophy of *Being and Time* and Heidegger's political commitment of the years 1933 and 1934? According to this latter view, Heidegger is a fundamentally apolitical thinker. Owing to dramatic historical circumstances, he encountered politics only against his will. Once in the political realm, he ran up against the worst misunderstandings and finally saw his loftiest thoughts disfigured into their grinning opposites. That thesis will be examined first. It will be discussed on the basis of *Being and Time* and then on the basis of a reading of the Rectorial Address.

Even if a connecting thread – no matter how tenuous and even negative – can be discerned between the ontological quest and the political concern ('which deals with public affairs', as the Littré dictionary has it), does it form an 'ontological politics', and, when such a politics ends in failure, does it turn into a denial of politics? These are questions which must make their way through Heidegger's self-critique (which is also a self-reinterpretation) in order to reach the level of a genuinely critical revaluation of the relations between ontology and politics.

The broken thread

To what extent is the thesis of the absence of a link between the philosophical work prior to 1933 and the commitment of '33 defensible? It seems corroborated by the attacks launched by the Nazi camp. Ernst Krieck, indeed, reproached the author of *Being and Time* with having a philosophy that was incompatible with National Socialism: 'There is nothing in it that speaks of the people and the State, of race and of all the values characterizing our National Socialist worldview.'⁵ Pierre Aubenque, who cites these lines, gives an answer that is formally identical, albeit one that is issued from a completely different point of view: '*Being and Time* is obviously an apolitical work.'⁶ Given that Heidegger puts forth a 'formal description' of human existence in that book, he does not, according to Aubenque, offer 'any criterion [that would be] of practical use' to form the basis of a politically determinate authenticity. From that, Aubenque concludes that there is no 'essential dependency' between Heidegger's philosophy and his 1933 commitment. He even goes so far as to affirm that 'Heidegger's initial adherence to the "movement" is not a philosophical act.'

This thesis must be examined with the utmost care, for the continuation

of the discussion depends, to a large extent, upon its degree of validity. What argues in its favor is obvious: at no time do either *Being and Time* or the works of the following years present themselves politically. Neither the fundamental project (the reformulation and elaboration of the question of being⁸) nor the unfolding of the enterprise in its different phases (the theme of the analytic of *Dasein*, the distinction among existentials, the critique of everydayness, the disclosure of a new sense of temporality, etc.) lead to any 'program' of political reform or revolution – nor, incidentally, to a conservative one. Not only is Heidegger in dialogue, from beginning to end of *Being and Time*, with metaphysical and not political authors (even if these 'great' representatives of metaphysical thinking, beginning with Plato and Aristotle, also had political philosophies), but, as Pierre Aubenque rightly reminds us, the method is essentially *formal* (the 'formal structure' of the question of being is emphasized as early as subsection 2 of the book). In this respect, Heidegger remains entirely faithful to the demand for neutrality made by the phenomenological *epoché* – this holding true of his analysis of resoluteness (*Entschlossenheit*) as well. To these considerations, which in principle are already sufficient, another may be added that points out the fragility, if not the absurdity, of the attempts at an ideological assimilation of *Being and Time* to Nazism. This last position is epitomized by Georges-Arthur Goldschmidt in *Le Monde*: 'Both stylistically and lexically, *Being and Time*, from its second section onwards, is unfortunately quite close to *Mein Kampf*.' This bold comparison, which is not supported by any examples, is more circumscribed than appears at first sight: it is restricted to the second section and abstracts from the content. Duly noted. Nonetheless, even if we keep to the vocabulary, we seek in vain in *Being and Time*, even in its second section, for the *völkisch* phraseology (i.e., the phraseology about the essence of the people) attacking the *Judentum* (Jewry) and the 'Anglo-Saxon plutocracy' on every page of *Mein Kampf*, the whole vulgar arsenal of the frantic propaganda surrounding the National Socialist *Weltanschauung*. In it, neither a *Weltanschauung* nor, still less, propaganda or the party are at stake! Conversely, it is impossible to credit *Mein Kampf* with the concepts that make up the hermeneutic wealth of *Being and Time*, including its second section: think of *Sorge* (care), *Gewissen* (conscience), *Schuld* (guilt), and lastly of the understanding of an ec-static temporality and historicity.¹⁰ Will the excessive character of the comparison be attenuated by Goldschmidt's conceding that 'one cannot judge in French'? This is a curious polemical reversal of the preeminence of German, which was so violently attacked by Farias.¹¹ Not only were Hitler and Heidegger born the same year, but both spoke German! Would prolonged sessions of oral declamation allow us to grasp as quite close (stylistically?) this sentence penned by Hitler: 'Dass man ein Volk nicht durch Beten freimacht, weiss man

im allgemeinen' (Everyone knows that a people does not free itself by praying)¹² and the following one by Heidegger: 'Das Ziel ist die Ausarbeitung der Seinsfrage überhaupt' (The goal is the elaboration of the question of being)?¹³ If abstraction is made from content, by what rule are we expected to carry out these 'comparisons'? Does it suffice to refer to Adorno and his *Jargon der Eigentlichkeit*? Does this not amount to forgetting, to Heidegger's sole detriment, that National Socialism's pseudoauthenticity has retroactively polluted many great German texts in which the vocabulary of *Eigentlichkeit* (authenticity) and even of *Entschlossenheit* (resoluteness) occurs – for example, the writings of Eckhart, Luther, Hölderlin, Nietzsche? Is it not saddening – and contrary to the good cause that one claims to defend – to give Hitler's hate-filled and verbose phraseology the honor of becoming in short, the truth of an ontological discourse to which finally one denies any dignity of its own? The same Goldschmidt has written elsewhere a telling sentence whose gravity perhaps eluded him: 'Heidegger's "thought" is only the shadow of Auschwitz.'¹⁴ We now understand why Goldschmidt confined himself to the style: Heidegger's thought does not exist. Q.E.D.

In a sense, Farias is somewhat more serious (hardly, however, since he devotes only a few of his 305 pages to the philosopher's major work): he envisages 'correspondences' whose thematic content foreruns Heidegger's 'political preferences'.¹⁵ He recognizes that it does not suffice to question the 'destruction' of an objectifiable concept of truth carried out in favor of a prepredicative horizon (in reference to subsection 44).¹⁶ He writes: 'To go further, one would have to exhibit the veritable moments in *Being and Time* that may effectively be considered to be forerunners of Heidegger's subsequent evolution.'¹⁷ Does Farias really do that? On the basis of a sound remark (authenticity is not solipsistic), he directly passes over to considering subsection 74. This enables him to give the impression of being relatively precise, while arrogantly ignoring the quasi totality of a work of which he will state, in conclusion, that it 'positively sets into place properly fascist elements. . . .'¹⁸ What are these elements?

Farias attempts firstly to support the claim that tradition founds authentic existence. He does so with a quotation from subsection 74 of *Being and Time*,¹⁹ on which he does not even comment and which he does not seek to understand, since he claims that 'tradition and heritage' are 'forms of another reality which founds them . . . : namely, the people. . . .'²⁰ In this, he is completely mistaken: according to Heidegger, tradition is not an 'archetype'. All Farias needed to do was to read the line immediately following the citation in order to note that '[r]ecapitulation is explicit handing down, i.e., going back to the possibilities of the *Dasein* that has been there'.²¹ On the other hand, recapitulation cannot be 'founded' upon tradition, since it is a mode of resoluteness

(*Entschlossenheit*). The *Dasein* is indeed 'futural in its being' (*in seinem Sein zukünftig*).²² We have a sentence here that could have embarrassed Farias if he had wondered about Heidegger's innovative understanding of temporality. As he does not care about it nor about its ontological sense, he gets out of trouble by appealing to a 'conservative/revolutionary' scheme: 'In the future, the people must be that which the heroes have represented within the tradition.'²³ According to Farias, recapitulation consists in recovering an identical (ontical) content. Heidegger says the contrary. On his way, Farias further mutilates the text on several essential points. He has the reader believe that the only act constitutive of decision is combat. We read, however: 'Only in communication and in battle does the power of destiny become free.'²⁴ Communication (*Mitteilung*) has simply been ignored! Must we be reminded to what extent the ontological solidarity expressed by the *Mitsein* (being-with) excludes battle's being the sole constitutive relation with others? That is one of the points over which Sartre had disagreed with Heidegger: 'The essence of relations among consciousnesses is not the *Mitsein*, but conflict.'²⁵

Secondly, Farias would have us believe that the agent of decision is directly the community of the people. It is true that Heidegger restates that *Dasein* is 'being-with' and that, for that reason, 'its occurrence is occurrence-with and is determined as *destiny*'.²⁶ But the subject described in those pages is a Self, existing, free for its death, and taking over its anguished choice (it is by no means dissolved into the community).

Thirdly – this misrepresentation being doubtless the least innocent of the three – whereas Heidegger says that in authentic recapitulation '*Dasein* may choose its heroes',²⁷ Farias manages, on two occasions, to change this plural to a singular (in one of the two passages, we even encounter the word *Führer*!).²⁸

So many distortions in so few pages! If Farias's thesis could be supported, would it not find a precise argumentative basis more easily? Instead, we note that it ends up contradicting itself. Four lines apart, we read that Heidegger's ideal in 1927 is 'a kind of revolutionary-traditionalist communalism' and that his political preferences 'exhibit themselves with complete clarity'.²⁹ 'A kind of . . .': that is the opposite of a clear model! Moreover, the word 'communalism' is thoroughly inadequate.

To conclude this topic, we note that Farias went from a relatively flexible formulation of his thesis (which solicits the reader's approval) to an unbending conclusion (which tends to put pressure on the reader). According to the first formulation, *Being and Time* presents 'a philosophico-political horizon which . . . included the possibility of the subsequent choice in favor of National Socialism' (among other choices?). According to the second one, the book 'positively sets into place properly fascist elements'.³⁰ We have just seen that this last thesis treats the text

of *Being and Time* with few scruples. It is more reasonable and more in conformity with the truth to state with George Steiner that no one would have taken it into one's head to look retrospectively for politically suspicious 'traces' on the basis of the sole text of *Being and Time*.³¹ In it, we have a book which is philosophically overdetermined and of uncommon hermeneutic wealth. It is the *working drawing* for the structures of ec-sistence. As a matter of fact, over the last sixty years, many readings have been put forth: in France, the success of the Sartrian interpretation has occluded the medical approach (that of the Swiss psychiatrist and longtime friend of Heidegger, Medard Boss) or the theological one (that of Rudolf Bultmann). The resoluteness itself has more often been understood in an Augustinian or a Kierkegaardian sense than in relation to the political situation of the last years of the Weimar Republic. One could also claim (this would not be the most absurd claim, although these are painful examples) that poets such as Trakl and Celan attest to what the resoluteness of poetic existence may be. In any case, the 'political' reading certainly is not the only possible one, and it runs the risk of being particularly unfruitful if it becomes exclusive of other readings.

Having set aside the extreme thesis of a unilaterally political reading of *Being and Time*, must we accept the opposite view, introduced at the outset, which understands the work to be utterly apolitical? If we look at the matter more closely, even Pierre Aubenque does not claim that there is *no link at all* between *Being and Time* and the political commitment of 1933: '*Being and Time* is obviously an apolitical work. This very apolitical character of the book makes it negatively responsible for Heidegger's political commitment, in the sense that it was not able to hold him back.'³²

We already see in what respect Aubenque is right. Since there is no positive and determinate political philosophy in *Being and Time*, since even the 'few fascist elements' allegedly isolated by Farias manifest themselves as such only at the cost of considerably off-handed simplifications, Heidegger could not have 'derived' his adherence to National Socialism from it. We are, thus, left with the much more likely hypothesis of there being a solely *negative* link between the masterpiece of 1927 and the commitment of 1933. According to this view, Heidegger's enormous error has a philosophical origin *by default* only. It is precisely the absence of a political philosophy – and perhaps even of an ethics – which made him considerably more vulnerable.

The difficulty appearing now is not negligible, however: the absence itself of a *political* philosophy in Heidegger's philosophy has a philosophical significance. This want is not a lack that is external to thought: it is attributable to it. It must therefore be explained in one way or another, but without abstracting from the thought that indeed constitutes the

horizon within which his choice was made (even if nonphilosophical circumstances and motivations were also at play in it). The term 'apolitical' is besmirched, and it is not devoid of ambiguities. If it turns out to be an appropriate qualification for the author of *Being and Time*, it will be so in a philosophical sense that must at all costs be specified.

A reconnected thread: the a-politics of *Being and Time*

Our thesis is taking shape: if there is no politics in *Being and Time*, there is an 'a-politics'. This term must be understood in an ontological sense: *Dasein* is *apolis*. Originally, being-there (*Da-sein*) is defined neither as *animal rationale* nor as a political animal (the two go hand in hand in Aristotle). Although Heidegger does not explicitly treat the question of politicization and apoliticism, it is within the logic of his discourse to consider that these attitudes are complementary and susceptible of passing into each other according to circumstances. The 'they' is in the habit of undergoing such reversals. Apoliticism as a lack of differentiation is an attitude that is itself ensnared (*verfallend*), neither appropriated nor taken over. It excludes neither idle talk, nor curiosity, nor ambiguity, all characteristic traits of the 'they'.

To clarify what has been put forth, it must be recalled that the existential analytic aims in the first place at 'destroying' the definition of man as *animal rationale*. After reminding us that 'the person is not a thing, not a substance, not an object',³³ Heidegger proposes a radical critique of both ancient and Christian anthropology. The ancient understanding of man, as *zōon logon echon*, is quite briefly (and expeditiously) criticized, insofar as it strengthens the forgetfulness of being: 'The kind of being of the *zōon*, however, is understood here in the sense of being objectively present and occurring.'³⁴ The definition of man as a living thing is ontical. As for the *logos*, it constitutes 'a higher endowment whose kind of being remains as obscure as that of the being so pieced together'.³⁵

On the one hand, then, there is the forgetfulness of being in its distinctive difference (the ontological difference, i.e., that between being and beings). On the other, there is an obscurity (i.e., a lack of thought) concerning the operative notions. These are the two traits which the existential analytic not only wants to correct but aims at eradicating with its elucidation of the ontico-ontological preeminence of *Dasein*. The existential analytic brings together, under the sign of the ontological difference, the care of existence (which appropriately recovers that which 'animality' concealed) and existence's project of understanding (which thinks very closely what the 'natural' *logos* occluded). Now, if we turn to the beginning of Aristotle's *Politics*, we read that 'man is by nature

a political animal'.³⁶ The definition of man as 'rational being endowed with speech' cannot be dissociated from his condition as a 'political animal'. Because man can speak, he can 'make known what is beneficial or harmful, and so what is just and unjust'.³⁷ The utterance emitted within the space of the City allows man to unfold his rational potentialities, his virtues, and to realize the Good toward which he tends by nature. If he claims to elude it by either lack or excess of being, he is 'either a brute or a God'.³⁸ The chain of relations linking the human to the rational, city-dwelling, and political constitutes the natural metaphysics with which Heidegger takes issue throughout *Being and Time*, down to his deconstruction of the 'vulgar concept' of time.

It is therefore obvious that Heidegger here meets the political question, even though he does not say a word about it. He encounters it only in order to subordinate it to the ontological question. What is henceforth of consequence to the *Dasein* is that which is *daseinsmässig*, that is, truly characteristic of *Dasein*, suited to its fundamental difference. This requirement implies a complete structural-transcendental redistribution aiming at the appropriation of this radical difference. *De facto*, in *Being and Time*, the *Dasein* is thought of as *apolis*, or, in Aristotle's terms, as equally capable of being a brute or a god. The existential analytic takes the measure of the standardlessness of that being.

However, among the possibilities available to the *Dasein*, there is 'initially and for the most part' (an extremely frequent expression in *Being and Time*) that of being with others in the mode of the 'they'. The ontological field defined by falling away from authentic self and falling prey to the 'world',³⁹ which, according to Heidegger, is all too accessible, does correspond to the dimension (founded in nature) where rationality, speech, and life become articulated within a political community. In other words, the field on which Aristotle builds an economics and a politics and with respect to which Heidegger takes a radical ontological step back is *the same*: it is that of everydayness and *doxa*. But Aristotle is not content with establishing the general conditions of man's existence in a community regulated by the search for the common interest. Basing himself on the (ideal) principle that 'the state is an association of freemen',⁴⁰ he undertakes a methodical and structural study of the respective advantages of the three correct constitutions (monarchy, aristocracy, and republic) as well as of the disadvantages of the regimes straying from them (tyranny, oligarchy, and democracy). This investigation is itself guided by a consideration of the just mean (*mesotēs*).

This reminder is not meant to reproach Heidegger with the absence of such analyses in *Being and Time*, for they do not at all constitute the explicit goal of the existential analytic. It enables us, however, to understand that Heidegger's ontological radicalism no longer offers a foundation for a *possible* structural and critical study of forms of sovereignty.

This is so because the everyday social space, shot through as it is with ambiguity, idle talk, and curiosity, is unsuited to becoming the vector of positive ontological determinations. Although Heidegger never acknowledges it, the negative characteristics attributed to the 'they' overlap, at bottom, with the Platonic depreciation of *doxa*. Is not this anonymous, unstable, novelty-seeking existence, the one that was led in the agora, always exposed to the bright and vivid appearances? Far from being able to give occasion to a just (and better) social environment, it seems to secrete nothing but mediocrity.

To this, Heidegger would object that he does not have a *pejorative* conception of the 'they', and that, on the contrary, he recognizes it as an unavoidable structure of existence,⁴¹ the ensnarement (*Verfallen*) being our everyday lot and having to be thought as such. These denials are frequent in *Being and Time*: for example, '[t]he expression "idle talk" will not be used here in a disparaging sense. Terminologically, it means a positive phenomenon which constitutes the mode of being of the understanding and interpretation of everyday *Dasein*.'⁴² All the same, the entire motion of the *Dasein* toward appropriated-existence (*Eigentlichkeit*) will go against the grain of the 'they' and will imply its critique (for example, the inability of the 'they' to choose⁴³). And it cannot be said that the connotations of 'idle talk' are particularly favorable, since the reciprocity between listening and speaking, which makes an existential out of *Rede* (discourse), is absent from idle talk. Furthermore, it is interesting to note that the vocabulary applied to the 'they' is not only unfavorable but often, intentionally or not, *political*: Heidegger speaks of the 'dictatorship' and the 'authoritarian' character of the 'they'.⁴⁴

In *Being and Time*, there is thus an especially negative phenomenology of being-with, which at no point issues in a positive phenomenology of political sociability. The fundamentally ontological turn given by Heidegger to the phenomenological project, as early as subsection 7, reduces the rational, city-dwelling, and political space to the 'they' and only leaves open to the *Dasein* concerned with its possibilities, an a-politics, that is to say, an indeterminate and – as Hegel would say – abstract authentic sociability. The self, which is led toward the most extreme appropriation of its ec-sistence, is called to its own-most, most faithful possibility. Now, the criterion of this appropriation is neither tradition nor a fusion with the people, as Farias claims, but the mineness: 'The two kinds of being of appropriated existence [*Eigentlichkeit*] and unappropriated existence [*Uneigentlichkeit*] – these expressions are terminologically chosen in the strictest sense of the word – are based on the fact that *Dasein* is in general determined by mineness [*Jemeinigkeit*].'⁴⁵

The properly political problem (that of knowing how the ontologically sovereign *Daseins*, albeit always at risk of relapsing into the 'they', are to live together – according to which distribution of authority, which

rules of government, which civil laws, and which economic constraints, etc.) remains entirely open. The subsection devoted to discourse (*Rede*), which connects the immediate existential of attunement and the mediate existential of understanding-interpretation, affords the best sketch of an 'authentic sociability'. In it, we discern that Heidegger seeks a being-with freed from the demands of constant presence, a being-with (*Mitsein*) which – as Sartre had seen – is existentially experienced in the workshop or the sports team.⁴⁶ In sharing an activity together, we understand each other without words: dialogue becomes shared in its very suspension.

In this, there is nothing politically determinate. This is attested to by the fact that on the basis of this ontological radicality and this search for authenticity at all cost, the most opposed political attitudes are possible (the Maoist cultural revolution, as well as the fateful choice of 1933), but also nonpolitical attitudes (e.g., the evangelical conversion of Saint Augustine, who inspires Heidegger so much in *Being and Time*, or the most decided exposure to poetic or artistic illumination, as with Hölderlin, Van Gogh, Trakl, or Celan).

Apoliticism often results from indifference. On the contrary, the a-politics of *Being and Time* derives from an exacerbated concern for difference, from the extreme appropriation of *my* mortal condition, which sets me apart from the City's everydayness to leave me only with the poise and self-assurance of others in communication or battle. Such is my condition in quest of the futural temporalization of a beginning.

Did the ontological radicalism of this a-politics contain a danger? Yes, the one to which Heidegger succumbed. This danger may also be characterized as the will to constitute *directly* an authentic, existential-ontological politics, as the will to found a politics anew on the ontological *difference* alone. This amounts to a wager, since the rational, city-dwelling, and political space has literally been deserted, emptied of all its positive determinations (while truth as rigor in adequation, as well as any ethical ideal, have also been deconstructed)! But this desertion or this withdrawal could have been temporary, if Heidegger had not given in to the temptation – perhaps due to the unexpected repercussion of the book – to turn *Being and Time* into the cornerstone of a new radical *foundation* (which amounted to his repeating the metaphysical gesture, while denying that he was doing precisely that).

Curiously, Heidegger did not realize that the Aristotelian rationality which he was then setting aside was not at all that of the *mathēsis universalis* (universally dominating the 'world' and reducing it to a *res extensa*), but rather that of the crafts, a poietic and prudent rationality whose full ontological scope was, however, experienced by Heidegger at the level of handiness (*Zuhandenheit*) and its sleights of hand – a rationality indeed precious in a realm exposed to all manner of errancy, as politics is.

Part II The last circle

Denn das Schickliche bestimmt das Geschick und dieses die Geschichte.
 – Martin Heidegger

From 1945, Heidegger had not simply developed a 'low profile' personal strategy of defense (the theme of the 'six months'); he had above all followed his own intellectual itinerary in a non-repetitive fashion by taking up a distance with regard to what remained 'metaphysical' in *Being and Time* by patiently constructing a second work. It would be reasonable to surmise that the strategy was conceived with a view to protecting this work, unreasonable to reduce the work to a sort of *trompe-l'oeil* of purely circumstantial requirements.

Heidegger always claimed that he gave the priority to thinking, even during his most active engagement (if one takes this claim at its face value, the set-back with the rectorate is due less to impossible compromises than to the pitiless manifestation of a de-stabilization of the thinking itself). We have seen that he claimed that the refusal to publish the *Spiegel* interview during his lifetime was intended to protect his work. We have no reason to doubt the sincerity of this claim. As to its legitimacy, that's another matter. But there can be no doubt that the publication by Heidegger of a self-critical statement concerning the Nazi period (however radical it might have been) would have focused public and academic attention on this question and would have opened a series of intense debates comparable to those we have known recently.

In addition Heidegger – working in the first instance for those 'in the know' – certainly thought that the development and the deepening of his work would throw a retrospective light upon the limits and the presuppositions of the labors and of the positions assumed decades earlier. Here again, it is necessary to draw distinctions. To criticize him in this respect for his 'elitism' or his 'aristocratic stance' (and a fortiori to confuse these with his Nazism) is not in good faith. It amounts to ignoring the specificity of his philosophical work and not permitting him to be zealous (and to be it in his own fashion). A meanness of spirit which can lead to a form of intellectual terrorism. It is infinitely more interesting to determine whether the later works after the famous 'turn' make it possible to disentangle the imbroglio of his historical 'politics'.

We are going to raise the question once again from the standpoint of the Heideggerian interpretation of the history of being by undertaking a critique of his radical 'historicism'. Does the thinking of 'Heidegger II' allow one to raise the principal difficulties supposedly aroused by the

philosophy of 'Heidegger I'? In this regard, Ferry and Renaut are right to put us on our guard: 'Heidegger II' cannot be played off against 'Heidegger I'; the limits common to both have to be thought through. However, if it is going to be fruitful, this line of inquiry should not ignore the fact that a creative enterprise is on the way with 'Heidegger II', which is not to be reduced to a retrospective 'stylization' of the work of 'Heidegger I'. The hermeneutical situation which we are going to confront is therefore still more complicated than was suggested by Habermas, whose critique – let us admit it – deserves a double credit: it puts us on guard against the establishment of an excessively narrow relation between the work and the person and it criticizes the 'essentializing' abstraction which allows 'Heidegger II' to disconnect ontological history from politico-historical events.⁴⁷ Habermas' critique itself gets stuck half way: entirely preoccupied in passing judgment on the Heideggerian itinerary in ideological terms it reduces the destinal historicism to a banal and irrational fatalism. Thus one risks losing sight of the fact that Heidegger's defensive system would not have been so effective if it had not been attached to a serious (which does not mean indisputable) philosophical re-interpretation. It is therefore the latter which will not have to be reexamined.

Re-tying the knot: the a-political stance *vis-à-vis* history

It has already been shown that Heidegger's engagement of 1933 plunged him into the imbroglia of a direct ontologization of politics. Did Heidegger really get out of this imbroglia later on? In one sense, the ever-increasing distance adopted with regard to *Being and Time* (and to the 'philosophical complex' that Richardson called 'Heidegger I') is impressive. With the possible exception of Schelling, there is no other example in the history of philosophy of an author taking so great a step back with regard to his major work. To disengage the question of being as such from the limits of the analytic of existence, to make these limits appear as inherent in the metaphysics of subjectivity in the framework of a general reinterpretation of metaphysics as the history of being, to try to find a new way of questioning, a new language which will make it possible to re-turn fundamental questions to their un-thought site and, at the same time, to outline the signs of a 'reference' different from (thought more originary than) that of metaphysics: this immense labor is indeed a prodigious intellectual advance which has no equivalent in the West and which seems to sweep away the petty objections inspired by the political and existential adventures of the years 1933–4. Reproducing this line of argument does not mean hiding behind academic dignity or behind the subtlety and the hermeneutical complexities of this

entire work undertaken since 1935 (the richness of which, especially in the case of the *Beiträge*, has not yet been assessed by the critics). One has to bear in mind that Heidegger has offered a self-interpretation which also institutes a self-criticism while proposing, at the same time, a 'self-defense' or, more exactly, a re-situation or re-distribution of personal destinies based upon a holistic articulation of the relation between the political (or a-political) and the intellectual.

This self-interpretation (an expression due to von Herrmann but taken up again more critically by Pöggeler)⁴⁸ is well known and is already itself over-interpreted. The great difficulty here is to stick to the essentials in what concerns the political question. The principal difference apparently characterizing the thinking of the 'second Heidegger' on this question slides, through a seemingly negligible displacement, in an a-political direction, not simply by default but by virtue of a deliberate plan. The meditation upon the history of being (and of Nietzsche's thinking as the last figure in the latter) assigns the field of modern politics to the will to will. But this political field is by no means that of a *polis*. As Hannah Arendt has shown in her own way,⁴⁹ it is that of a planetary technology which commands the cycle of production and consumption and which both agglomerates and atomizes society at the same time. Faced with the deployment of this technical apparatus, Heidegger will henceforward maintain the view that there is (fundamentally) nothing to be done except wait for a destinal reversal. The thinker recommends an a-political patience. The 'truth' of the planetary deviation becomes the endurance of thinking, a relinquishment (*Gelassenheit*) which is both too near and too far for any specific commitment.

This explicitly 'a-political' attitude, which has nothing to do with any indifference towards politics or with the 'apolitical' attitude of *Being and Time* is based upon a reinterpretation of the world situation as a function of his reading of the history of metaphysics. Just as metaphysics culminates in cybernetics (in the broadest sense), so 'classical' politics (the deliberate calculation of an equilibrium of forces and powers) yields to a technical formulation of all problems, including political problems. Instead of 'pretending' to influence events (the derisory ambition of the leaders, parties, the media), would it not be better to think about the destinal dimension of this situation, in order to safeguard what still remains possible?

The heart of the debate: a destinal thinking (integral historicity) which separates (from an ontological point of view, henceforward displaced toward the 'event') what does not depend on us (the course of the world) from what does depend on us (thinking). A highly stoical division which is not to be despised but from whose elevated point of view formidable difficulties are overlooked (or avoided).

To put it in a nutshell, here are the difficulties (we will have to

disentangle them later): isn't this all going to lead to – even if it is denied – a new philosophy of history (more negative than positive) whose qualities and defects will have to be assessed as a function of the kind of objection that any philosophy of history encounters today? Does this destinal vision really work out the questions as persistently as it claims? It settles the question of responsibility (human, all too human) with one step, a negative one – or rather in accordance with a putatively authoritative assignment: thinking and everything else. Finally, and above all, does it recognize or does it not rather ignore the status of the political and of politics today?

Major questions which will have to be patiently examined; they will lead us to a *dénouement* which is not that proposed by Heidegger: not an integrally destinal division, but – let us anticipate brutally – the dissolution of the Heideggerian conjunction of appropriation and historicity (or destination). An appropriation open to a destination in suspense? The perspective of this kind of thinking, a thinking referred to the Nazi question, will permit us to apply the retrograde movement of truth, but in a hermeneutical sense: if Heidegger had untied the knot in this way would he not have been able to throw light upon this 'past which won't go away?'⁵⁰ But the knot remains tied, the imbroglío has been displaced, loosened – but not untied. It has been tied up again in a (destinal) way which could not but obscure the specific, but vital issue of the status of Nazism and of the sense (or nonsense) of the Extermination. It does not fall to me here to determine whether this obscurantism was, from beginning to end, deliberate. The knot is philosophical in character: the analysis of the texts (including the one which bears upon the 'internal truth and the greatness' of the National Socialist movement) confirms it.

Heidegger did not lack the courage (though perhaps the critical lucidity) to take up so profoundly tangled a thinking. Only on the basis of a debate carried to the very heart of this thinking will it be possible to extract, if not the rationale, at least the motives which lie at the root of the acquiescence, of the non-condemnation, of the silence. Which is why this knot will only be untied, if at all, by a critically rational labor which will set limits to Heidegger's integral historicism.

Destinal historicalism

This is how the thinking which claims that 'everything is destinal dispensation' (*Alles ist Schickung*)⁵¹ has to be named. Not only is there not for Heidegger any superior instance (theological or normative), history itself is dispensation and destiny (*Geschick*) and before all else this is valid of metaphysics as the history of being. But from the moment being is

understood as the name for presence it no longer functions as the last instance: written in the old form (*Seyn*), then barred, it is finally 'replaced' by a trans-epochal instance, the event. Already, in *Being and Time*, the destruction of the history of ontology led to the understanding of being as time in an ekstastic sense and essentially out of the future. Later, in *Time and Being* for example, temporalization is expressly referred to the fourth dimension of time: the gift itself. We are therefore entirely delivered over or exposed to historicity. This is our lot, our 'thrown being' in its most radical form. And the fact of being exposed to the technical enframing (*Gestell*) is only the ultimate version, provisionally unsurpassable.

Let us dwell on this statement: 'Everything is dispensation'. It bears fully and completely upon being in totality and, from this point of view, it remains metaphysical – in the sense of general metaphysics. Objection: it is no longer a question of *justifying* being in general in the manner of onto-theology. Reply, in the form of a question: but doesn't it lead nevertheless to an inversion (hidden, displaced) of every *foundational* justification, that is, of any theodicy? Consider the first of Leibniz' twenty-four theses which (quite rightly) fascinated Heidegger: *Ratio est in natura cur aliquid existat quam nihil*⁵². As the reverse of this universal ordering principle, the sentence 'everything is dispensation' is a challenge to any unified necessity, one which is expressed as the accommodation of givens which are always singular. Historicity itself becomes the irreducible horizon of all phenomenality. Strange offering without anyone either sending or receiving, secretly related to what is fitting and anticipating an event of appropriation.⁵³ 'Everything is destinal dispensation' is the hall-mark of Heidegger's fundamental thinking, slipping sometimes into a more circumspect mode of expression (for example, 'destiny tests itself against the destinal'⁵⁴).

Is Heidegger still engaged in an inquiry when he writes: 'everything is dispensation'? He affirms, he pronounces, he confirms; and he closes history down on its finitude, reducing the humanity of man to the latter. Is it the case then that radical historicalism still remains a thinking about destinal dispensation and the event, a thinking which aspires to be definitive? The 'piety of the thinking' makes itself known henceforward on the basis of a network of presuppositions, redistributed admittedly (the possibility of taking stock of metaphysics as such, of distancing oneself from it historically). It was never very different with any great metaphysics, fixing the fundamental presuppositions which determine a possible view of the world (radical scepticism was almost always marginalized, rejected with suspicion and even ridiculed).

If Heidegger's historicalism started out linked up with this metaphysics (which he tries to transform), his calling in question also has to bring with it a calling in question of the presupposition of the completion of

the said metaphysics. Is it going to be necessary to suspend rationality in favor of the historicity of its dispensation, as Heidegger seeks to do? It has just been suggested that Heidegger does not escape altogether from a logic which orients and governs the most authentic metaphysical breakthroughs. Ambivalent praise: for the recognition thus accorded to Heidegger's understanding of metaphysics is not exactly what was claimed by him.

How can historicalism be thought as the metaphysical new deal? According to Heidegger, historicity is referred to a more secret instance, namely the destinal, which is not to be reduced to the inevitability of what comes about. The Heideggerian 'dispensation' is not to be identified with a fatality which strikes you as one might receive a blow on the head without being able to identify its origin. It's a *moira*, an allotment which one discovers as one's own and which one appropriates in order to take over the possibilities and impossibilities which it imposes: a destination which opens up a world. This thinking is already, and quite explicitly presented in *Being and Time*: 'Dasein's fateful destiny in and with its "generation" goes to make up the full authentic historizing of Dasein.'⁵⁵ Destiny does not deliver Dasein over to an indiscernible or undecidable dissemination, but to a recuperation of its possible and shared meaning. The epoch, the generation offers a possibility which can become mine (within a community). Probably a Hegelian feature; for it assumes a unity of epochal meaning in world history. But also a supplementary metaphysical feature; for it presupposes that, in addition to the thinking which closes down the meaning of being in totality, there arises a recourse to, a collection of the possible – and all this still within the perspective of world history. That 'repetition' which makes up both the initial and the final theme of *Being and Time* announces perhaps – subject to (and in spite of) the denials, beyond the challenge of the Platonico-Christian, onto-theological element – the re-sumption of the originary in metaphysics, the repetition of the metaphysical foundation. Such is the scope of this 'mimicology' that Lacoue-Labarthe analyzes in *The Fiction of Politics*.⁵⁶ a mimicology with regard to which what is at stake is easier to grasp than the game itself (for the latter operates without any more pregnant archetype than the destinal appropriation itself). Destinal historicalism stands therefore in a relation to the unsurpassable element of metaphysics which is both tense and extremely intimate. Its destiny is still metaphysical but as though it were turned back against what made up its dominant development, glimpsing an origin which is still to come – and which is perhaps mythical.

To be sure, this historicalism no longer has anything to do with a simple historicism. On the one hand, because it arises out of an ontological (and, it is now evident, also metaphysical) concern which is in no way ontic, anecdotal or historiographical. On the other hand, because it

is sufficiently well advised to avoid any imprudent projection upon the future other than that which results from its fundamental presupposition (the anticipation of a destinal turning). As for the philosophy of history, it is excluded in the classical sense; and Heidegger does everything he can to avoid its return, even in the apparent guise of a reappearance. However, from the moment when his vision of history is set out in accordance with the referential axis of the history of being, from the moment when the latter is understood as a function of a fundamental thinking which, as we have seen, affirms the definitively destinal character of being, it is not itself able to escape this destiny. And then it is taken over by what has been called elsewhere 'rationality as allotment'⁵⁷ with regard to which it has not been adequately emphasized that it enforces a suspension of all historicalist dogmaticism.

What one now has to try to understand better is the internal articulation of this destinal historicity and the point from which it becomes excessive. A reexamination of the 'explanation' with reference to Nietzsche will help us. In the case of a thinking which exposes itself to the errant (*Irre*), the political danger is not the only one – even if it is the most salient. Ceaselessly, thinking is exposed to the possibility of finding itself on a path which leads nowhere (*a Holzweg*), a risk which must not be allowed to paralyze the spirit of the research. The 'turn' allowed Heidegger to achieve an intellectual attitude which is nonactivist, non-voluntarist and which excludes any engagement comparable to that of 1933. In this regard, the thinking of 'Heidegger II' relaxes the imbroglia of a politics which is directly ontological. But a thinking which is henceforward both responsive and anticipatory is still just as defenseless against the possible articulation of public life and its rational determinations. Since the circle of an integral historicity has not been broken, its exclusive presupposition prevents it from operating a dia-critical disjunction with respect to the permanent requirements of rationality.

The 'historicalist singularity'

Once again in 1942, Heidegger raises National Socialism to this literally fatal height while severely attacking its ideological catch-all.⁵⁸ It is evident that in purely representative (in the Hegelian sense) terms it is very difficult to understand the almost schizophrenic juxtaposition of recognition and condemnation, allegiance and reserve; what is more, a chronological reading will allow us to discern a clear change of tone between the writings of 1933–5 and those which come later than 1936, in particular, the *Beiträge*: from enthusiasm to disillusionment, from mobilization to critical analysis. Even the 1942 lecture course on Hölderlin ends in the most questioning fashion (and no longer with a call to action): 'Are

there any norms left on earth?'⁵⁹ But we still have to interpret this radical modification. Let us agree that it has nothing to do with a rejection, in the sense in which we might have wished to see such a rejection emerge. 'The moral indignation of those who still do not know the facts is often turned against the arbitrariness and the dominating pretension of the Guides – the most fatal form of that appreciation which continues to be offered them'.⁶⁰

Let us leave Heidegger with the responsibility for this declaration and simply apply the interpretative network which he offers us himself. Instead of limiting ourselves to diagnosing an ever more antagonistic attitude within the regime, which makes sense only within the limits of the most well-worn political categories, let us take a more radical approach and watch his dis-discovery of the epochal essence of the will to power, interpreted as the culmination of metaphysics. Dis-discovery which covers – if it does not recover – at least three semantic fields: metaphysics as such, the internal logic of the philosophy of Nietzsche and the historical conjuncture which singularizes Germany. It was not at all evident that these three fields would overlap, and at this point; with the lapse of time (this is a lesson to remember) it is becoming clear that it was and still remains extremely hazardous to decide, on the spot, that this event (or series of events) was destinal. Otherwise expressed, it is not illegitimate in itself to account for a conjuncture on the basis of a philosophy and the latter on the basis of the essence of metaphysics; this methodological approach stands to the credit of Heidegger. But what is difficult to accept (an extreme audacious and questionable gesture) is the short-circuiting of these three fields, and in such a way that metaphysical depth is impeded by the conjuncture at least as much as it illuminates it. Strange reversal of the historical which does not escape the historicist caricature, in spite of everything: to interpret the defeat of France in 1940 in the terms cited above is full-blown 'fatalism'; and if there is then a resurgence of Hegelianism, it is hardly the best aspects of the latter which survive.

But however critical one is tempted to be with regard to this destinal historicity, it has to be admitted that the fundamental feature of the Heideggerian evolution during the years 1935–45 becomes clear: the Nietzschean system with its five interconnecting fundamental terms (will to power, nihilism, eternal return, overman, justice) is the metaphysical motor (or the 'truth') of that active nihilism which finds expression in Germany in National Socialism. In this regard, the Nazi will to power cannot be distinguished – unless it is by virtue of its 'sincerity' – from the other forms (Americanism, Communism) across which the 'machinations' of the universal struggle for power are deployed. Therefore, a correspondence with the ultra-modern (and not the post-modern as Ferry and Renaut think): such is the dominant face of the Germanic fate. Let

us take a look at what Heidegger thought Germany was entitled to in 1934–5: 'the acquisitive power, the preparation and planification of different domains, and calculation, a readiness to deploy "organization"'.⁶¹ This corresponds well to the efficacy of that active nihilism that Heidegger considers inevitable.

On this basis one can understand the disappearance of enthusiasm from 1936–7, the contrary impact of distress – if not of despair (in 'Overcoming metaphysics'), for, according to Hölderlin:

Nothing is more hateful
To a ruminative God
Than an untimely growth.⁶²

The theme of waiting for God makes its appearance in the *Beiträge*: a waiting to which the rest of his work assigns no end. The National Socialist 'possibility' is diminished until it is no more than an empty form on the horizon. There remains an anterior future or rather an unreal conditionality of the past. But Heidegger will refuse to settle whether it is still too much to admit.

One sees to what an extent the 1942 allusion to the 'historicalist singularity' of National Socialism is a significant key. In its structure, the development of the lecture on the 'Ister' reproduces the rhetorical and intellectual bifurcation of the declaration of 1935 on 'the internal truth and the greatness' of the National Socialist movement. There is a pretence of adopting a point of view above any open and banal political commitments. And it is precisely this 'lordly' tone together with its anti-ideological bent which prevents one from according – without further ado – a stamp of approval to the interpretation which results from this retrospective justification: opposition to Nazi ideology. On the one hand because if the latter is not purely theoretical, the 'movement' is even less monolithic; on the other hand, for the following, much more fundamental, reason: if the importance of the 'movement' is recognized – nobody would wish to deny it – the latter is only comprehensible on the basis of a thematic core closely linked to the thinking of Heidegger (the destinal significance of Hölderlin, in constant tension with the reinterpretation of efficacy). So it is Heidegger himself who obliges us to track back to this theme and to investigate it at a level where ideologies and opinions are circumvented, surpassed, but where more subtle elective affinities nevertheless make their appearance under the cover of a veritable law of history: 'The law of history situates historical man in such a way that what is fitting is furthest removed and the way to the most fitting is the longest and most difficult way.'⁶³

Nietzsche: discord without *dénouement*

One of the most remarkable paradoxes of the Heideggerian reinterpretation of Western history as the history of being is that – while pretending not to be Hegelian (since it no longer recognizes anything like a transcendent rational necessity) – it finishes up in fact by admitting a necessity (if not a destinal ‘inevitability’) at least as implacable as the judgment of the tribunal of universal Reason. Nietzsche serves here as a counter-attack against Hegel but in a way which is never either simple or innocent or devoid of solicitations. To attempt to storm the gigantomania Heidegger–Nietzsche in a few pages is to assume a risk. Explaining Heidegger by way of his ‘most intimate adversary’ is complicated; it calls for – from 1935 to the 1950s – interpretative variations and levels which we cannot analyze here.⁶⁴

In his ‘Letter to the Rectorate of the University of Freiburg’ (1945), Heidegger writes:

From 1936, I undertook a series of lectures and conferences on Nietzsche, continued up to 1945, which constitute both an attempt to come to terms with [*Auseinandersetzung*] Nietzsche and a spiritual resistance. In truth, it would be wrong to associate Nietzsche with National Socialism, an assimilation which, regardless of anything more fundamental, is already forbidden by his hostility to anti-semitism and his positive attitude towards Russia. But, at a higher level, the debate over Nietzsche’s metaphysics is a debate over nihilism, inasmuch as it makes itself known ever more clearly in the form of a politics of fascism.⁶⁵

This declaration should be taken very seriously. It is based on a number of incontestable facts and is to be located at the very center of the debate which interests us here, by linking indissolubly this debate with Nietzsche and his ‘resistance’ towards National Socialism. It is impossible to understand fully the extraordinary attention given to Nietzsche by Heidegger outside the political context of the years 1935–6 on. How would it have been possible to ignore the shameless utilization of Nietzsche by the Nazi regime, his elevation to the rank of official master thinker, but at the cost of innumerable deletions of his texts and of gross schematizations? From an external standpoint, giving lectures on Nietzsche could not but be well viewed by the authorities (in this respect, Heidegger is without ‘merit’); but it is evident that the content of Heidegger’s lectures marks them off radically from the ideological speeches of the time, not simply by virtue of his knowledge of the texts but by his refusal to resort to the new ‘values’, to biologicalism and to the activism of the will to power. That there is a ‘spiritual resistance’ to Nazi ideology

is indisputable. The purely metaphysical reading of Nietzsche's work – done so systematically and so sublimely – attest to a radical break and even a contempt for the short-sighted exploitation of Nietzsche for propaganda purposes and for 'promotion'. So what Heidegger has to say on this subject in 1945 is not altogether off the mark. However, the very date of his declaration should draw our attention to the fact that he is undoubtedly engaged in self-justification. In fact, Heidegger never associated fascism with nihilism as closely as in this text written under the constraint of a procedure of 'de-nazification'. The allusions to what is going on at the time of the lectures held during this period (which, for the most part, have only been made known quite recently) hardly reveal any resistance on the part of Heidegger to the regime.

What is in question here is not that Nietzsche's thought is interpreted as metaphysics and that it is thought to revolve around the tension between the will to power and eternal return, playing respectively the roles of the *essentia* and the *existentia* (this Heideggerian option has already been heatedly discussed and remains one of the controversies of present-day philosophy), it is the historical status of this metaphysics (a status condensed into the following phrase: 'the history of being is being itself and nothing but the latter'⁶⁶). He could have contented himself with thinking about the modernity of Nietzsche – which would not have been a small task. He goes much, much further. He makes of Nietzsche the thinker of nihilism, that is, of the metaphysics which is on the way in an age which devalues the supersensible by inverting it. The historical role of 'Nietzsche's thought' is only intelligible within the schema of the history of being as the destiny of Platonism (a schema which implies that 'metaphysics' possesses a unity, that this unity is ontological and that it is ushered in by 'Platonism'). The expression 'historical role' is too feeble to characterize the direct and integral historicalization of metaphysics. An interpretative frame which presupposes in advance the juncture of being and historicity or better still: that being is itself fundamentally historicity (the hermeneutical breakthrough of *Being and Time* is then wholly integrated within the hermeneutical horizon of Nietzsche). 'What is, is what comes about' Heidegger insinuates at the end of the most audacious and the most disconcerting chapter of the second volume of his Nietzsche.⁶⁷ But he adds immediately thereafter: 'What comes about has already come about'.⁶⁸ An apparently negligible nuance which confronts us with a sort of ontological *fait accompli* (which, from the first, goes beyond the facts). What has already come about, not in the sense of a purely chronological anteriority but in the sense of a freedom of the possible, is the metaphysical revelation of being as the presence of the present, reoriented (in the modern version) as the unconditional domination of subjectivity (since Descartes).

If it is true that no 'external' necessity has ever been attributed to the

thinking of Nietzsche, then its degree of necessity has not been determined. But this thinking has been integrated (as a function of its internal structure) at the very heart of the schema for the historicalization of metaphysics – towards which we find ourselves carried along by this inescapable ‘fact’: we are the descendants of both Platonism and its modern Cartesian reorientation. It is not surprising that a destinal thinking does not arise on the basis of principles but radically subverts every principle by coming about (or by affirming what has come about through it). What Heidegger imposes as ‘self-evident’ is more than just one inheritance among others but assumes the form of what he calls the unconditional domination (*Herrschaft*) of the metaphysics of subjectivity (up to Nietzsche). The continually surprising feature of these pages lies in the *mélange*, in Heidegger, of an extremely lucid consciousness of the difficulties of his procedure (which cannot dispense with the ‘clubs and the crutches’ of metaphysics)⁶⁹ with a disingenuous intrepidity which sweeps away all obstacles with a view to imposing a new language – precisely that of the *Notwendigkeit* of nihilism.

Notwendigkeit: necessity. Are we going to allow ourselves to be held up by translational preliminaries, the impatient reader might object, exasperated by the Heideggerian procedure, which consists in substituting attention to an etymology or to a linguistic peculiarity for the reasoned resolution of an a priori? Since every objection has to be translated back into Heideggerian ‘language’, it surely thereby loses its edge and even its legitimacy. Let us try to reduce this kind of preliminary to the minimum by paying attention to the wordplay (which Klossowski fails to appreciate) as between *das Un-ablässige* (the necessary in the sense of that which does not let go of us) and *das Brauchende* (the necessary in the sense of someone ‘who is in need’).⁷⁰ Being necessitates in a sense which is both dual and unique because it is at one and the same time both imperiously inevitable and (in silent neediness) the manager of *our* being. Being imposes and awaits; constrains and accommodates. Its countenance is imperious: the domination of metaphysics as nihilism; its face reserved: the accommodation of neediness (*Not*) by a thinking which outlines metaphysics’ step back.⁷¹

The Janus face of historical being? Such a reference is hardly satisfying, for the ‘economy’ of the two aspects is neither symmetrical nor complementary but the play of one and the same step back. If the latter is mystified, being is taken for nothing by the ‘dictatorship’ of the will to will being. If the step back of being appears as such, then its neediness makes itself known, our neediness (and the secret need for the absence of need). What separates active nihilism from the thinking which ‘overcomes’, appears highly fragile. It is this moving limit which Ernst Jünger names ‘the line’ and to which Heidegger devotes a well-known text.⁷²

Several lessons can be drawn from the rereading of the end of chapter

VII of Nietzsche,⁷³ lessons which bear on the status of Heidegger's language, its political 'results' and finally, the ultimate consequence of destinal historicity.

Nietzsche himself? Let us admit that he disappears completely here in favor of his extraordinary metaphysico-historical elevation as thinker of the will to power and prophet of the Overman (interpreted by Heidegger as Man dedicated to a total mobilization for the mastery of the earth: technician-worker-soldier). His historicalist 'placing in perspective' reduces the ambiguities in favor of the destinal meaning. To the thrusts of the Nazi ideologues Heidegger replies with an infinitely more subtle thrust: instead of refuting the thinking on the basis of values he brings to light both the historicalist necessity and its limitation; the 'un-thought' of Nietzsche eliminates many of the moves intrinsic to his thinking. With Nietzsche, discord becomes the very Discord of the nihilistic age. Is this an exacerbation of the will to power or simply an historical turning point?

Heideggerian discourse becomes stranger still. From the shelter of the authority of his chair he presents a monumental interpretation of the most celebrated philosopher of the Nazi regime. But this discourse is doubly odd. It comprises a continual critique of official ideology and it is presented in a language which becomes ever more personal and even esoteric – and which nevertheless claims to be the truth, the unveiling of what comes about through the history of the twentieth century. A discourse which is both irrelevant (by virtue of its extreme elevation) and extremely relevant (by virtue of a continual 'diagnosis' referring to the world situation). A discourse which purports to be beyond both pessimism and optimism but which claims not to entertain any illusions, exposed as it is to an almost apocalyptic suffering. 'Unlimited and measureless suffering openly, though tacitly, announce a universal situation overflowing with distress'.⁷⁴ Terrible words about which one has to ask how they could have been pronounced in a lecture, that is, in public.

The political consequences are considerable. But they can in no way be deduced from political requirements proper to politics considered as an autonomous sphere. Politics, in Heidegger's eyes, is entirely delivered over to technique (itself determined by the essence of nihilism). The *polis* in the Greek sense has become impossible precisely because the city can no longer be for us a habitation, even a questionable habitation.⁷⁵ Henceforward, politics is withdrawn from all questioning and no longer offers any recourse since it has been handed over to a total calculability for the domination of the earth (no matter what the constitution of the regime officially in place).

Let us go over the evidence. Destinal historicity leads Heidegger to a purely epochal interpretation of Nazism. This does not come down to saying that everything is necessary but that the fundamental feature of

the epoch is its inevitability. Destiny which, for Hegel, was only the still indecipherable constraint of rational necessity⁷⁶ only refers here to the 'closure' of being. It is not less brutal but, on the contrary, still more insufferable, no longer subjected to any higher resolution, implacably exposed to the retreat of being, awaiting protection.

More precisely, this destinal historicalism leads Heidegger well beyond the illusions of 1933–4 concerning a direct and immediate revolution, well beyond his voluntarism and his relative 'activism', also beyond his faith in Hölderlin, at least to the extent that for several years he had been perceived as truly capable of touching the people. Heidegger does not seem to entertain any further illusions about the possibility for Germany of escaping the planetary destiny. One should also not hide the other side of this point of view. On the historical field, nothing is fundamentally opposed to active nihilism nor can it be opposed by anything. It is henceforward evident (which confirms from within the declaration of 1945) that Nazism is understood as a form (doubtless the most bare-faced) of this active nihilism.⁷⁷ Even if Heidegger's whole intellectual effort consists in differentiating another intellectual horizon, nevertheless his practical stance takes on (and has effectively taken on) the appearance of a fatalistic acceptance of the ineluctable. 'Historical Man' has no other way out but to experience the danger and the suffering, to go in a certain sense ahead of the retreat of being and so to pave the way for a reception (of this retreat) which will not be nihilistic.

The gravest consequence of this destinal historicity proves to be the ontological justification of this active nihilism, including thereunder the reduction of *ratio* to *animalitas* – to which we shall return later. By justification, we do not mean primarily a personal allegiance nor a subjective approbation but this form – quite peculiar to Heidegger – of a posteriori assignment of necessity to Western history reinterpreted on the basis of its metaphysical axis. It's a justification in the sense of a recognition of justice (*die Gerechtigkeit*), a theme which, with Nietzsche, is supposed to set its stamp upon the institution of the will to power as transvaluation (inverted subjectivity).⁷⁸ The more one raises the question to what an extent this feature can determine the interpretation of the West today, the more disputable it becomes – to say the least – to include an historically extremely localized characteristic in a comprehensive historical schema (whose necessity has been presupposed) – biologism, racism – which thereby also acquires *de facto* a historical status. Read these lines from *Holzwege*, lines which remain totally enigmatic if one does not insert them into the frame of that destinal historicity which Heidegger puts in place:

Man as the reasonable being of the age of enlightenment is no less a subject than the Man who conceives of himself as a nation, who

cultivates his racial being and finally who increases his power to become master of the planet.⁷⁹

Far from being approved, these different 'fundamental positions' of subjectivity are certainly heavily criticized. But, in spite of everything, racism is assigned the 'fundamental position' and slides to the center of a process which is regarded as world-historical and in consequence, inevitable – and into a proximity with such notions as 'people' and 'nation' as does not seem accidental. If the reign of subjectivity is unconditional it is evident that it no longer spares Nazism. On this point the Heideggerian critique is penetrating. But what is less so is the dissolution of the specificity of Nazism into an active nihilism (common to the technical era) and, at the same time, the attribution of a decisively planetary dimension to the biological conditioning.

The Man who has become the rational animal, which means today the one who works, can do no more than wander across the deserts of the ravaged earth. . . . The total liberation of the Under-man goes along with the full power accorded to the Overman. Animal impulse and human reason become identical.⁸⁰

Certainly one can lay stress upon the fact that, in this way, Heidegger is trying to think the metaphysical presupposition of conditionings and of threats which surpass the problem of racism and which, more recently, Foucault has for his part identified under the name of 'bio-power'; but the generality of Heidegger's proposal is such that, adjoined to destinal historicity, it lends itself to this 'factualism' which Nietzsche made fun of with reference to the Hegelians:

Take a look at the religion of historical power. Watch these priests of the mythology of ideas and their scorched knees! Can't you see the virtues themselves marching along behind this new belief? Is it really an act of abnegation when historical Man lets himself be levelled down to the status of an objective mirror? What magnanimity – to renounce all the powers of heaven and earth because, in all these powers, one adores power in itself [*die Gewalt an sich*]⁸¹

Even if these lines cannot be applied *as is* to Heidegger they nevertheless retain a corrosive force – and this for two reasons. First, because it is pertinent to recall the strangeness of an interpretation which employs Nietzsche to recover *one* necessity (even a posteriori) in history, an idea foreign to Nietzsche for whom life defies all necessity. Then, because in Heidegger's own conception of metaphysical domination there is certainly a 'power in itself', to the extent that something religious survives – or

so it seems – in the thought that being, of its own accord, harbors a shelter or safeguard. The power of being, the power of God in history: almost substitutable terms. Being is almost substantialized, accorded a quasi-reflectivity. A Nietzschean critique is undertaken to put into effect a historical schema which, in the name of being, endorses as necessary what is not known to be so in reality (but which one hopes is so, to avoid critical questioning?). A historical schema which, by denying to Man the least hold upon the fatal course of things, forbids all *effective* resistance.⁸²

Critical epilogue

What is most fundamentally susceptible to criticism is not the accent placed upon historicity but its exclusive and unconditioned character, which leads correlatively to a conception of planetary nihilism which is too global. This extremism concerning nihilism (then technology) constrains Heidegger to think of totalitarianism as inevitable, as the political system which corresponds to the essence of technology and which – at the very least – responds most directly to its requirements for command, production and control. This slip explains the error of judgment regarding Nazism but should not be understood uniquely on the basis of the latter. For it is implicated in any determinate and positive approach to the rationality (always relative) of political phenomena. The philosophical root of this decisive suspicion is the direct and exclusive juncture of being with historical deviation, in the form in which he articulates it – most evidently in the ‘Saying of Anaximander’ where the recollection of the closure (and withdrawal) of being into beings (a theme which is only intelligible on the basis of a rereading of *The Essence of Truth*)⁸³ leads abruptly to a thinking about history which is essentialist and ontological. Heidegger goes as far as to write: ‘Error is the essential domain of history’.⁸⁴ This statement is on the face of it absurd. However, *Irrtum*, anterior to the subject, does not strictly speaking mean error but more fundamentally – a hardly translatable word-play – the reign of the errant. Heidegger will explain, immediately afterwards, that this *Irrtum* is the epoch understood as an epoch of being, that is, the enlightening reservation of the latter. ‘Every epoch of world history is an errant epoch’. A later indication situates this deviance within the horizon of time. Historical deviance is ‘ek-static’, conceived in the image of what is essential in temporality.

It is not difficult to formulate a critique of a thinking about originary time which goes directly over into a philosophy of history. Our objection here aims to catch Heidegger at that minimal but decisive turning point where a transcendental meditation upon the essence of truth passes over

into an essential determination of history. We find here an intellectual audacity, a *tour de force*, which has no equivalent in the history of the West. One should be as cautious about this conjunction of being and history as about the Hegelian correspondence of Spirit and history. The one arises on the basis of the withdrawal of being, the other as a function of the development of rationality. In both cases, significantly, we find an appeal – oblique or frontal – to necessity. From the standpoint of rationality, it attributes a meaning to history. From a destinal standpoint, it imposes a constraint and exerts an enigmatic attraction.⁸⁵

This *tour de force* of destinal historicalism is not to be found in this text alone. With a view to a systematic recuperation of its various occurrences, let us quote two more notable examples. In his book *Schelling, Being and Time* is said to put into effect a turn in being itself,⁸⁶ in the remark added in 1954 to *On the Essence of Truth*, Heidegger's 'turn' is presented as 'the dictum of a turn at the heart of the history of being'.⁸⁷ Being, history of being, (ontological) history of the world, these terms are not equivalent but they do authorize certain tendencies and are perhaps the sign of so many preparations for a destinal historicalism as the new (and negative) philosophy – of history. In this regard Hans Jonas is perhaps right when he says that the second Heidegger, with his metaphorical conception of being, abandons any strict respect for the ontological difference (the sense of being in the infinitive, it should be added).⁸⁸ Such a perspective would call for a critical rereading of the 'turn' which would bring out the fact that the recoil of the *Schritt zurück* should not mask what is not only not in question but is on the contrary continually recovered by the second Heidegger: what authorizes thinking to pass from the transcendental plane to that of the worldly historical? What price must be paid for this veritable transgression of finitude? What kind of pretension does it arouse despite the apparent modesty of its 'remission' of metaphysics? So many question which our own itinerary has already covered but which will have to be taken up again.

For the time being it is enough to note that the Heideggerian recoil was not so radical as to represent an 'auto-critique' of his earlier ontologization of politics, then his destinal historicalism. Historicalism paralyzes political rationality, just as it suspends rationality in general. By becoming exclusive, historicalism neutralizes both the political field and rational possibility. It gets stuck between the a-political and the 'a-rational'. Heidegger, so lucid in other respects, only confirmed the internal limitation of his thinking, this intimate commitment to finitude contained in his destinal historicalism. One should not overlook the exceptional density of this obscure circle where being presupposes its historicity, its collectively assumed temporality. This secret habitation is certainly the ek-static character of time, a character which Heidegger hopes to recover in the epochal.

But it is one thing to plunge to the very heart of time, quite another to pursue an irrepressible determination to unify the intellect with the real – even if only on the basis of the hypothesis of the retreat of being. Can one have one without the other? Can what sets Heidegger apart from metaphysics (even from within his Nietzsche interpretation) be suspended? Metaphysics does not let go of its own as easily as this, especially if, as is the case with Heidegger, one is neither content to deconstruct it, nor yet capable of ever surmounting it. Certainly, ‘no one can leap over his own shadow’.⁸⁹

14 Georges-Arthur Goldschmidt, *La quinzaine littéraire*, November, 1987.

15 Farias, *Heidegger*, pp. 75–6: ‘Thus in the context of the problems raised in *Being and Time* – namely, of ontological concerns – Heidegger's political preferences become quite visible, and show themselves to be tied to a general model of political society: Heidegger relies on citations from Count Yorck von Wartenburg and asserts that any explanation of historicity will have to conform to his doctrine and to that of Dilthey’ (subsection 76).

16 See *ibid.*, p. 73: ‘Karl Löwith and Ernst Tugendhat have rightly observed

that Heidegger's connection to National Socialism would not have been possible outside a conception of truth already stated in *Being and Time*. By making the questioning about being the prepredicative horizon within which the "disclosing" of what is takes place [subsections 7 and 44], he removes from reflection any possibility of finding verifiable or falsifiable criteria of judgment at the level of an effectively realizable intersubjective rationality. . . . However, it seems to us that something is lacking here: albeit exact, these remarks do not allow one to grasp the properly positive aspect of Heidegger's positions around 1933.'

17 *ibid.*, p. 73.

18 *ibid.*, p. 76.

19 See *ibid.*, p. 74. The text quoted by Farias is as follows (*Sein und Zeit*, p. 385): 'It is not necessary that resoluteness *explicitly* knows of the origin of its possibilities upon which it projects itself. However, in the temporality of *Dasein*, and only in it, lies the possibility of fetching the existentiell potentiality of being upon which it projects itself *explicitly* from the traditional understanding of *Dasein*. Resoluteness that comes back to itself and hands itself down then becomes the *recapitulation* of a possibility of existence that has been handed down.'

Heidegger's Nietzsche and the Third Reich

Endre Kiss

The points of view adopted in our title which, on the one hand seeks to thematize Martin Heidegger's 'role' and, on the other hand, his 'fate' in the Third Reich, deliberately play on the ambivalence of Heidegger's own attitude. Was his 'role' in this time period the decisive issue? Did he in fact play a 'role' in the Third Reich? Or did he play a 'role' which diverged markedly from the one he really wanted to play? If however he did not play a 'role' then was he not rather subjected to a fate, a fate which he had to suffer, like many others? Many important investigations have recently appeared which seek to clarify the question whether he played a role or was simply subjected to a fate in Adolf Hitler's German state. None of these recent and thoroughly competent studies pays much attention to Heidegger's Nietzsche lectures. This is both comprehensible and incomprehensible at the same time. It is comprehensible in the sense that the philosophical opportunity of 'reconstructing' Heidegger's Nietzsche lectures has not yet been taken, either in the context of an academic discussion, or in that of Heideggerian apologetics, so that it readily came to appear as though the Nietzsche lectures were not necessary for arriving at a decision on the question concerning Heidegger's attitude toward the Third Reich. It is incomprehensible at the same time because Heidegger himself, in a 'preface' to the Nietzsche lectures, written in 1961, described the Nietzsche text as his *Denkweg*, a *Denkweg* which was certainly more important than anything that came before it or which followed after it.¹ It is also incomprehensible because, in a very obvious way, Nietzsche's philosophy represented the secret centre of the 'ideological' discussion in the Third Reich and this not only in a philosophical but also in a political sense. So that, for this reason alone, Heidegger, in the course of his extensive and intensive involvement with Nietzsche, had to take up a position with reference to the political realities of his time. What is incomprehensible does not become

any the more comprehensible if one takes into consideration the extent to which research into the fascist Nietzsche interpretation was delayed and indeed has still not been brought to completion. So it has to be admitted that, up till now, and in this specific connection, the Heidegger discussion has received little help from the Nietzsche research.

In order to arrive at an adequate conceptual and historical framework for assessing Heidegger's Nietzsche interpretation, a reconstruction of the relation of Heidegger to Alfred Baeumler is unavoidable. There are two reasons why Baeumler features as the key to an understanding of Heidegger's attitude toward the Third Reich. The first is the need to evaluate the close personal relationship between Heidegger and Baeumler and precisely in the time period immediately preceding the National Socialist takeover. The second reason is based upon the need to make a comparison of Baeumler's Nietzsche interpretation (especially, *Friedrich Nietzsche, the Philosopher and the Politician* (Leipzig, 1931)) with that of Heidegger. The interpretation of Nietzsche now remains the only material capable of demonstrating Heidegger's philosophical attitude toward the Third Reich concretely rather than apologetically. In this case the emphasis lies on the word 'philosophical'. In this aspect of the discussion about Heidegger, it is well known that whereas the question concerning the rectoral speech appears to be more or less settled, so that one is almost in a position to talk about a consensus, it is still being claimed that the episode with the rectorate has nothing to do with the philosophical substance of his work.

It is necessary however that we raise questions concerning what was specifically ideological in the Third Reich. In this field we find the most varied opinions. At one extreme, the position is adopted that the Hitler State had no 'genuine' and systematically worked out ideology. Everything that was said in this field was in the final analysis nothing but the meaningless and incoherent rhetoric of a self-assuming power. At the other extreme, we find opinions which talk about a coherent ideology of the Third Reich. The greatest problem encountered so far is that, hitherto, this comprehensive ideology has been described with concepts which have proved to be unsatisfactory instruments with which to describe this spiritually doctrinaire reality. In our opinion, this quest for a comprehensive ideologically integrating conception should not be given up – especially since, as we hope to show, Heidegger's philosophy is inseparably bound up with such a conception of National Socialism.

The quasi-philosophical, ideologically oriented picture which did in reality play the role of just such an integrating and all-encompassing ideology was that of Alfred Baeumler's Nietzsche interpretation. It is important to note that Baeumler's Nietzsche interpretation could only become the all-embracing ideological doctrine of the Third Reich because

it was able to confer a certain legitimacy upon this Reich. Dieter Grimm portrayed the situation as follows:

The older generation of Jurists who decided for National Socialism after 1933 could, in the last phase of the Weimar Republic, only represent the new state as a legitimate state with an independent judiciary. The younger supporters of a total state had already given up this position and justified themselves with reference to Carl Schmitt. For him the legal system was advisory – in striking contrast to the legality of a truly effective will. The latter was however no longer to be justified along the lines of a constitutional legalization. Schmitt claimed that legality as a thought form historically linked to the parliamentary law-giving state had become obsolete with the collapse of the latter in 1930. Therewith the state won its freedom from the bonds of legitimacy.²

This example relates to juridicial legitimation. But it goes without saying that the compass of legitimation is broader than 'just' the field of law. Alfred Baeumler's Nietzsche interpretation fulfilled the function of legitimizing the Third Reich. The core of his view of things related to the very difficult, indeed unsolvable, problem of legitimacy. If one holds that the will to power is metaphysical, in the sense intended by Baeumler, then it is possible to conclude that the Third Reich is legitimate. It can be so because, for all practical purposes, Baeumler identified a concept of the will to power drawn from Nietzsche with numerous features of the National Socialist movement (later, with the National Socialist state). Baeumler's Nietzsche interpretation turned out to be the most effective legitimation of the Third Reich not only for immanent reasons (connected with the content and systematic coherence of the doctrine) but also because its author, from 1933, took up that very position within the Nazi hierarchy which legitimized and authorized him. With regard to his position in the Third Reich, Baeumler was the man whose views on legitimacy were supported by the entire weight of the party, for example, by being widely distributed. To this it should be added that Baeumler was well known, at least in philosophical circles, as the man who conferred legitimacy upon the Third Reich.

It is this threefold qualification of Baeumler's Nietzsche interpretation as a direct and effective political legitimation of the Third Reich which defines the conceptual framework in which both Heidegger's Nietzsche interpretation and his personal relationship with Baeumler have to be investigated with appropriate care. In the light of these facts, the collaborative commitment, not to mention the friendship between Heidegger and Baeumler, cannot be seen as just an accidental personal relation. Hugo Ott compares Baeumler and Heidegger with two athletes in their

blocks, waiting for a good start in the new Reich. In my opinion, it is not so much a matter of individual athletes in their starting blocks as rather of a basketball team trying to gain the advantage by passing the ball to each other. The high point of this connection can be seen in the rift of 1934 when, in the final analysis, Baeumler, in conjunction with Heidegger, was unable to get a grip on the German university system and to permit his friend to play a leading role.

After this description of Baeumler's position in the Hitler state, it might seem as though we could go over to a comparison between Baeumler's and Heidegger's Nietzsche interpretation without further preparation. However, it would be impossible to do this and for a reason which is neither purely historico-political nor purely philosophico-systematic. This reason has to do first and foremost with the sociology of knowledge and is based upon the ideological quality of that Nietzsche interpretation through which Alfred Baeumler hoped to legitimize the Third Reich. Baeumler brought a new sociological quality to thinking which I have called Positive Political Metaphysics, especially in my study: 'On the concept of positive political metaphysics'.³ Our presentation only becomes complete with this recognition of a positive political metaphysics. On the basis of a distorted, and at times simply false, Nietzsche interpretation, Baeumler created a positive political metaphysics while, at least until 1945, Heidegger remained in the frame of the above-mentioned sociology of knowledge. It is not a matter of Heidegger 'only' taking over Baeumler's interpretation and so offering a new Nietzsche interpretation of purely academic interest. The critical question bears not so much upon the many similarities between two Nietzsche interpretations which perforce had to be advanced in a political context under specific historical conditions. The critical question concerns the fact that Baeumler inaugurated a way of thinking by means of which he not only sought to legitimize the archaic intellectual edifice of a positive political metaphysics with reference to Nietzsche but also succeeded in promoting it to high intellectual rank. It goes without saying that Baeumler's legitimization project is rooted in a positive political metaphysics. If, therefore, we are going to assess Heidegger's taking over of Baeumler's Nietzsche interpretation, we have to take into consideration a variety of factors: behind this 'philosophical' interpretation there stands, on the one hand, a positive political metaphysics which, though fundamentally archaic, had been raised to full philosophical rank. On the other hand, this construction sought to accomplish the almost impossible task of legitimizing the Third Reich.

The politically actualized positive metaphysics is a clearly distinguishable way of thinking about the sociology of knowledge. It carried through the task of legitimizing the Third Reich and thereby brought to it a world-historical significance which even today has not been recognized

with sufficient clarity. Further attempts to explain this way of thinking, for example, with reference to 'irrationalism', as Georg Lukács has done in his 'Destruction of reason' with historically catastrophic results, can be refuted without difficulty through a simple comparison with this positive political metaphysics.

Undoubtedly, the most important qualifying characteristic of positive political metaphysics is *this-sidedness* (*Diesseitigkeit*). This means that the basis of a metaphysical construction is not transcendent, that is, not 'other-sided', as it is in most religiously coloured metaphysics and metaphorical, that is, no longer to be taken quite literally, as it still was in the great thought-constructions of classical German Idealism. A positive metaphysics is *political* when the basis of the metaphysical construction is taken from the sphere of the this-sided and is, in a broad sense, politically applied. The most important positive metaphysics for the modern philosophical tradition, Arthur Schopenhauer's metaphysics of the will, is an example of a supremely positive metaphysics which is not at all politically applicable.

The second, equally qualifying feature of positive political metaphysics is that it is thought as a *comprehensive law of being* (*Seinsgesetz*). It is from this trait that the destinally archaic, even atavistic character of positive political metaphysics can be most exactly derived. In the context of modern rationality and post-Kantian criticism, the very existence of such a thought-structure speaks for itself. The threefold negative attitudes of positive political metaphysics arise in part out of the previously named characteristics, in part from other reasons. It is *anti-historical*; it is *anti-scientific* and it is dedicated to the *elimination of the political* in favour of the supremacy of metaphysical laws of being. This last feature of positive political metaphysics proved to be the most important since it read an affirmation of the positive metaphysics of the will to power into every political (and *mutatis mutandis*: historical or scientific) event. It meant however that the political (historical, scientific, etc.) quality of these events was actually eliminated. All that remained over was the metaphysics.

Heidegger's Nietzsche interpretation also satisfies the strictest criteria of a positive political metaphysics defined in this way. Just like Baeumler, he interprets Nietzsche as a philosopher of the will to power and understands him as offering a this-sided, positive foundation for a law of being. He also understands the will to power (in its all-embracing compass) in a political sense. That is, he deliberately takes the extension of positive metaphysics in a political direction. Furthermore, he understands the this-sidedness of the will to power as a law of being, or, as it is often expressed, as the 'truth of being'. Martin Heidegger's Nietzsche lectures satisfy the above-mentioned negative criteria of positive, political metaphysics just as completely. The *anti-historical* feature finds expression

very frequently. What really takes place, the historical, normally acquires its significance by way of a metaphysical comparison with the law of being. The anti-scientific character of the Nietzsche lectures appears to be many-layered, most noticeably however on the destinal plane of Nietzsche philology. That it is the political terrain in which what is metaphysical in these texts is completely absorbed goes without saying. The struggle for world dominion, to take only one example, appears not as a political but as a metaphysical affair, governed by the law of being.

It is worth noting that Jean Wahl shows an astonishing sensitivity for the deep connection between the metaphysical and the political attitudes in the Third Reich. 'It [Heidegger's Germanic nature] allowed him to believe that, in the final analysis, everything depended upon the metaphysically distinctive people who, at the same time, were the people in the middle of Europe.'⁴ Despite its terminological variations we take this insight of Wahl's to be theoretically well-founded. But our question remains, how this author (Wahl) can see this metaphysics of a philosophical people as so unproblematic that he can simply 'set this question aside'?

With this introduction and clarification of the concept of a positive political metaphysics we are already in a position to pull our earlier thesis together:

- (1) Alfred Baeumler's Nietzsche interpretation articulates a conception of the will to power as a law of being which proves to be the very political ideology through which the Third Reich seeks to legitimize itself.
- (2) This conception should not be taken as a 'simple' academic interpretation. In it we find articulated a clearly definable 'mental representation', a system of thought which can only be adequately interpreted along the lines of a sociology of knowledge.
- (3) At the beginning of the 1930s, Martin Heidegger stood in a friendly relation with Alfred Baeumler and this proved to be decisive in the first phase of Hitler's dictatorship.
- (4) Martin Heidegger's Nietzsche lectures, which in 1961 he singled out as his true *Denkweg*, is rooted in the paradigm of Baeumler's conception of the will to power as a law of being.

Our last point is already directed towards a 'purely' philosophical content. The question of where the National Socialist commitment makes itself known in Heidegger's philosophy answers itself. The presentation of a metaphysical principle of the will to power as a law of being does not in itself amount to a philosophical National Socialism. It can be regarded either as an archaic, pre-critical and to a certain extent therefore also 'dangerous' conception or, on the other hand, and from a historico-philological standpoint, as a false interpretation of Nietzsche. But when

one bears in mind that this conception emanates from what was at that time the leading ideologue of the Third Reich and was sanctioned as such, as also that it was this conception which was employed to legitimize the Third Reich, it then becomes necessary to reassess one's views as to how Heidegger's interpretation of Nietzsche's will to power as a law of being is to be judged. To act as though it was only an accident (both 'personal' as well as intellectual) that this interpretation comes close to Baeumler's is to succumb to a naivety which belongs neither to reason nor to morality – still less to a moral assessment of reason. Right up to the very end of the Third Reich, Heidegger's Nietzsche interpretation falls under the rubric of Baeumler's theses. This is the position upon which we have wished to lay the greatest stress. However, we do not mean by that to deny that there might have been several, for the most part minor, modifications *within* this paradigm. The working out of these modifications does therefore, in the final analysis, serve to reflect the changes in Heidegger's philosophy and world view over the period in question.

'Introduction to metaphysics', written in 1935, speaks against the theory that Heidegger withdrew into the province of pure philosophy after 1933–4, that is, after becoming aware of his mistake over the rectorate. Indeed, he seeks here to prove that the 'fate of a people' can hardly be determined without the help of philosophy. What is most important about the philosophical significance of this work, and what touches Nietzsche most closely, can again only be presented in terms of the Baeumler paradigm. He is perfectly aware of the anti-metaphysical dimension of the young Nietzsche (above all on the basis of 'On truth and lies in the extra-moral sense') but neutralizes these tendencies in order to be in a position, to put it simplistically, to defend the metaphysical claims of positive political metaphysics against the anti-metaphysical approach of Nietzsche himself. The full force of this work for Heidegger's Nietzsche reconstruction (in truth the betrayal of Nietzsche implied therein) consists in this, that Heidegger turned out to be someone who took full cognizance of the anti-metaphysical Nietzsche. There can therefore be no question of his positive metaphysical interpretation of Nietzsche being derived *directly* from his Nietzsche reading.

The Nietzsche lectures from the years 1936 and 1937 still remain within the paradigm of the will to power as a law of being. These years also however attest to positions opposed to those of Baeumler. One such position is to be found in Heidegger's emphasis upon Eternal Return (*Die Ewige Wiederkehr*), which is largely underestimated by Baeumler. Another is to be found in the thematization of aesthetics in the context of Nietzsche's philosophy. These positions are to be understood as an explicit distancing from Baeumler, even though there is nothing like an overcoming of the metaphysical paradigm. One example in support of

the last claim is that the introduction of Eternal Return takes on a clearly metaphysical, that is, an ontologically regulated, character, so that for Heidegger there arises a new problem, that of determining the relation between these two kinds of metaphysics. This does not mean – and this has to be emphasized with regard to these years of revolt against Baeumler – that he himself managed to move beyond the paradigm in question.

In 1939, the will to power as law of being again dominates Heidegger's Nietzsche lectures. This is accompanied by a noticeable regression to the positions of the years 1933–5. At the same time he makes known his withdrawal from the significance accorded earlier to the thinking about the Eternal Return. The latter is now made to depend upon external historical events. Insight into this idea is now supposed to be determinative for 'future decisions'. And the will to power is now nominated Nietzsche's 'unique thought'. In this same year he identifies his acceptance of the thinking about the will to power with world war and emphasizes that 'the history of being' is decisive. As a result of his fidelity to the Baeumler paradigm, Heidegger is repeatedly forced to return to the legitimation of the *status quo*, in this case, to war – and this not only for personal but also for deeper structural and philosophical reasons. Though only on the surface and with certain hermeneutical difficulties, Heidegger clearly identifies 'legitimacy' with the will to power as a law of being, an identification which is entirely characteristic for two reasons. On the one hand, the identification of the will to power as a law of being with legitimacy does, as a matter of fact, fully confirm the concrete content of the will to power. To put it plainly, whatever takes place in the Third Reich is 'legitimate'. On the other hand, this expression acquires an additional relevance. With the onset of world war, Heidegger argues that the manifestation of the metaphysical principle has proved to be 'correct'. No other option remains open but to participate in the war and, in this way, to allow the law of being to prevail through one's own activity.

In the Nietzsche lectures of the year 1940, 'nihilism' emerges as possibly the most important new component. This nihilism is articulated in a way which is relatively independent of the complex of positive political metaphysics and is designed to found an attitude which will help to make the war, portrayed as metaphysical, more bearable. War is admittedly still presented as metaphysical. This insight is necessary in order that it should be reflectively conducted. Once again metaphysics legitimizes the *status quo*. The goal of a deliberately conducted war once again betrays the complicity of those philosophers who identify with the regime. This insight into the metaphysical reality of war brings with it the already mentioned, and wilfully coloured, nihilism, since the warmongers no longer believe in any highest values. At first sight this assessment appears both sober and objective – this war does not reflect any humanitarian features and can hardly be reconciled with the positing of highest values.

In fact, the 'valuelessness' of war equips the listener with an insight which permits him to participate in the war *nevertheless*, since it is in effect a metaphysical matter. Hence the necessity of emphasizing its wilful character.

The struggle for world dominion and the exposition of the supporting metaphysics brings to fulfilment an epoch of world history and of historical man; for here we find realized the most extreme possibilities of world domination and of the attempt, undertaken by man, to determine his essence from out of himself alone.⁵

So what has to be done is to 'determine one's essence from out of oneself alone', in other words, to struggle for 'the most extreme possibility of world dominion' without even possessing a valid world view. In other words again: one has to struggle for world dominion even if the latter cannot be brought into connection with any positive world view (hence the nihilistic element), because this struggle is determined by the will to power as a law of being. It would certainly be forcing matters to interpret this expression – and it is only one single example – as a sign of an 'inner resistance and an inner revolt' against the Third Reich. Besides, 1940 is the year in which Heidegger himself changes his concept of truth as *alethea* and, moreover, in favour of a hardening of the thinking about the will to power. As a symptom it is therefore a further confirmation of Heidegger's return to the positions of the years 1933–5.

In 1941 the new emphasis of existential ontology made its appearance in the Nietzsche lectures. Even the term 'existence' is new in this context. In as much as the law of being takes on Christian traits, Christian elements make their appearance as well. This year marks Heidegger's dissociation from any strong programme of the will to power as a law of being, which latter features as the index of his identification with the Third Reich.

Between 1944 and 1946 the picture changes again. Out of the nihilism stemming from the World War problems like those of language and technology appear as central moments of the two-thousand-year tradition of Western philosophy in the place of the positive political metaphysics of the will to power as a law of being. The scope of the principle of the will to power as a law of being was initially and self-evidently restricted to Germany and the Third Reich. Heidegger's shift to the West is therefore an all too evident sign of his new appreciation of the situation. Furthermore, the will to power is no longer a law of being which operates in a, so to speak, 'valueless' and objective fashion and so, on occasions, also leads to nihilism. Now being appears in essence as a value category and it is the occasional absence of values which attests to nihilism. Being is brought under the rubric of value categories – precisely in 1944–6!

One might add: the world is for him once again brought under the rubric of value categories. If one relates the modifications in these philosophical positions to what was then still the recent past, the fundamental shift in Heidegger's viewpoint becomes clear again. But that this shift set in spontaneously and had nothing to do with the military defeat of the Third Reich, is difficult to believe. The reality of the Third Reich is no longer conceived, or rather interpreted, as the consequence of a two-thousand-year history of the West. The very basis of metaphysics is changed. It has become 'Western'. A further indication of this shift is undoubtedly the fact that, in these years, Heidegger frequently attempts explicitly to connect elements of the Nietzsche interpretation with his main work *Being and Time* in order, in this way, to be able to demonstrate the continuity of his path of thought.

In the introduction we spoke about the 'role' and the 'fate' of Martin Heidegger in the Third Reich. At the beginning he played a considerable role while aspiring to play an even larger role. All this was built on the contents and the structure of positive political metaphysics. Later he did not so much play a 'role' in the Third Reich as rather submit to a 'fate'. But even in his accommodation to this fate he did not separate himself conclusively from the metaphysics of the will to power as positive political metaphysics.

Heidegger and the Imperial question

Eliane Escoubas

In the *Parmenides* (lecture course of 1942–3),¹ Heidegger writes: ‘We think the political in a Roman, that is to say imperial, fashion’ (p. 63). Later he writes: ‘Since the imperial epoch, the Greek word “politics” means something Roman. As for the Greek, only the word remains’ (p. 67).

For Heidegger, then, it is a matter of marking a rupture between ‘Greek’ and ‘Roman’. Moreover it is a matter of remarking that our experience of the political is a thoroughly Roman and imperial experience, that the Roman and imperial experience extends its empire over all of modernity. The *Parmenides* exposes the foundation of this motive. This foundation obtains in what Heidegger calls the ‘mutation of the essence of truth’: the translation/interpretation of the Greek *aletheia* into the Latin *veritas*. Translation/interpretation means: radical displacement of the ‘domain of experience’ of truth and Being. Between the Greek domain of experience and the Roman domain of experience there is a rift: this rift inaugurates modernity. Modernity that, none the less, for Heidegger, does not seem homogeneous – we find an indication of this when Heidegger, speaking of the German words *falsch* and *wahr*, says that these are ‘un-German words’ (*undeutschen Wörter*) which have an ‘un-German meaning’ (*undeutsche Bedeutung*): these are words of Latin origin (*falsum*, *verum*). Within the German language something was taking place comparable to the displacement that took place historically between the Greek language and the Latin language: German, a double language, a ‘conquered’ language. Similarly, political modernity would be in the mode of *division*, supporting and transporting a rupture comparable to the displacement sustained in history between the Greek ‘domain of experience’ and the Roman ‘domain of experience’.

This theme is banal enough and at first glance only reproduces a well-known German tradition: that of rejecting Latinity. Furthermore,

Heidegger borrows the expression *undeutschen Wörter* (to qualify *falsch* and *wahr*) from the Grimm dictionary. As for knowing how the *Roman world* is thought in the German tradition, it will suffice to read Hegel in the 'Philosophy of history': Rome 'goes beyond' the Greek world by founding the abstract State, the aim of which is 'domination of the earth'. Certainly, in Hegel, the *negative* is always 'sublated', but Hegel's tone here remains extremely pejorative.

But is it sufficient to see in the 'Roman theme' of the *Parmenides* the pure and simple resumption of the German tradition? A term will detain us here: Heidegger designates the 'mutation of the essence of truth' as *das eigentliche Ereignis* ('the event/advent proper'). What does *das eigentliche Ereignis* mean? Event of the history of Being, advent of the 'political' – of Roman politics – upon the scene of history, 'the event proper' is an integral part of the *interrogation* of *Geschichte* in Heidegger's texts. But, and this will be my hypothesis, the interrogation of *Geschichte* is doubled by a properly Heideggerian scenario – the scenario of the 'turn', the *Kehre*. The Heideggerian 'turn' is not just a Germanic response to the Roman displacement-turn, but rather more an 'explanation' (*Auseinandersetzung*) of the Roman displacement-turn by way of the contemporary figure: *National Socialism*. One could say that twice, for Heidegger, history appeared on its proper scene, twice it is 'the same old story': in a word, *nihilism*. But, it seems to me, it is still more complex than this: for the three themes (the 'event proper', *die Geschichte*, the 'turn') are linked and so bound up together that each one is explained by way of the others. In a sense, Heidegger's 'explanation' of National Socialism is inseparable from his 'explanation' of these three themes.

In order to follow this double 'explanation', we will use three textual markers, all three from after 1933 and taken up in the following order: the *Parmenides* (1942–3); the *Introduction to Metaphysics* (1935); *Nietzsche I* (1937) and *Nietzsche II* (1939–41).

Our guiding thread will be the analysis of Hannah Arendt² which, on one hand, situates the Heideggerian 'turn' *between Nietzsche I and Nietzsche II*, and, on the other hand, notes that Heidegger himself performed a 'reinterpretation' of the 'turn' in the *Letter on Humanism* (1946) – a reinterpretation in which the accent is no longer placed on the *will* (as in the two *Nietzsche* volumes), but on the relation between *Being* and *Man* (here Heidegger himself places the accent on the *continuity* of his thought, making *Sein und Zeit* appear as if it were preparation for the 'turn' itself). Now it seems to me that the *Parmenides* is precisely the textual hinge where once *again* a 'before' of reinterpretation (*already* itself a reinterpretation), is exposed.

The *Parmenides* (1942–3)

Concerning the 'mutation of the essence of truth' or 'the event proper', the *Parmenides* puts the Platonic moment on the second level and places the Roman moment, contrarily, on the first. Thus the opposition, which is that of two 'domains of experience' and which takes the name 'translation', is situated not so much within the Greek world as between the Greek and the Roman. Thus nihilism (dealt with earlier in the *Nietzsche* volumes) finds its *beginning* in history: a Roman beginning. Again, it is necessary to determine the 'domain of experience' where European nihilism takes root. The major part of the *Parmenides* is devoted to this determination, notably paragraph 3: 'Clarification of the mutation of *aletheia*.'

Here the domain of experience proper to the *imperium romanum* finds its essential determination in the notion of *commandment* (*Befehl*), which is therefore the domain of experience of the Latin *veritas* (whereas the domain of experience of Greek *aletheia* is that of *bringing-to-appearance*, of *unconcealment*: *Unverborgenheit*). It is in this notion of *commandment* that Heidegger found *the reversal of history*, a reversal in which the rupture or division of a world takes root: its mutation (*Wandlung*).

Let us hold on to three strands of the Heideggerian text where this belonging together of the *imperium romanum* and the *commandment* is exposed:

(1) The word *imperium*. *Imperare*, *im-parare*, which Heidegger says means to install, to prepare, to dispose in advance, to dispose of something and thus to be master of it: 'The commandment [*Befehl*] is therefore the essential ground of domination [*Herrschaft*]; and not a contingent form of it.

(2) *The Roman gods*: whereas the essence of Greek 'divinity' obtains in the domain of *aletheia* (Greek gods are gods that 'reveal', that 'give signs'), the essence of the Roman gods manifests itself in *numen*, which is commandment and will (Heidegger adds that the God of the Old Testament is himself 'a god that commands', the *numen* is the imperative: 'Thou shalt', 'Thou shalt not'. To this the Greek gods are utter strangers).

(3) *Roman law* also takes up again the determination of sovereignty as commandment ('to have the right', 'to be within one's rights'). Whence a radical separation of Roman *justitia* and Greek *dikē* (which consists in the experience of *aletheia*). And Heidegger will connect 'justice' (*Gerechtigkeit*) back to *justitia* as Nietzsche enunciated it and in whose work it is of the order of *will* as *will to power*.

Let us take up again, therefore, the terms in which the domain of experience of the *imperium romanum* and the *commandment* is enunciated:

- (1) Domination, 'super-elevation', 'being superior' (*Obensein*),
- (2) Surveillance, control: 'overseeing' (*Übersehen*), 'on the lookout' (*Auf-der-Lauen-liegen*),
- (3) The *actio* of the *actus* (which substitutes for Greek *energeia*), the consequence of which is Caesarean 'conquest',
- (4) The felling (*Zum Fall bringen*) of other peoples; and this is the domain of the *falsum* (*fallere*: to fall, to cause to fall). The *falsum* is what 'falls', what runs aground (whereas the *pseudos* is inscribed in the experience of dissimulation and not at all in that of felling – and it is here that we encounter the theme of translation,³
 - (a) Felling takes two forms: either direct repression (war) or the indirect form (the trap that snatches by surprise) – deception as trickery,
 - (b) Indirect 'bringing to a fall' allows one to *fix* to the ground what one has grounded, what one has run aground. To fix in Latin is *pango*: the *pax romana* is the accomplished form of *felling*.

Therefore: *imperium romanum* = *pax romana* = *falsum/verum*.

These three notions designate the same 'domain of experience', that of the *commandment* (where the Latin *veritas* and the will to power come together). Let us note that Heidegger finds these features in the *Roman Church* where the imperial is given in the mode of *curacy*, the accomplished form of which is the Spanish Inquisition.

So the question is: can we assert that, in 1942–3, Heidegger considered the Roman Empire the historical figure in which National Socialist politics should be read? Heidegger did not make this claim himself.

Let us open a parenthesis in order to test (briefly and independently of the Heideggerian text) a possible Roman Empire–National Socialism confrontation.

We will engage three texts (among others):

- (1) *Rudolph Otto: The Sacred (Das Heilige)*, 1917. Otto determines the sacred by way of the notion of *numen* (*Das Numinöse*) and, symptomatically, he determines the 'numinous' by way of the very characteristics of Roman political form and in Latin terms: *tremendum* (the frightening), *majestas* (the *magnum*, power and political power), active force (*vis activa* or *actus*). And he finds these three characteristics joined in the term *Augustus* (*August* – imperial). The *numen* then, would be at one and the same time the feature of god, *imperator* . . . and perhaps later of the *Führer*.
- (2) *Simone Weil*; texts from 1940,⁴ where the confrontation of the Roman Empire and Hitlerism is organized around the notion of terror. Simone Weil also takes up the constant deception of the Romans

with respect to other peoples. (We find the same argument in Montesquieu, though in a somewhat more ambiguous fashion).

- (3) *Franz Neumann: Behemoth – Structure and Practice of National Socialism – 1933–1944.*⁵ Neumann's analyses, which bear exclusively on National Socialism, allow the similarities and differences with respect to the Roman Empire to appear. They are organized, it seems to me, around two features:

- (a) Roman colonial expansion and German expansion, with the notion of *Grossdeutsche Reich* and *Lebensraum* (living space). We will note, in particular, the theory developed by Ratzel: *the law of spatial growth* and the notion of *frontier*, which, writes Neumann, 'is not an arbitrarily fixed line, but a strip or band marking the meeting between a movement and a counter-movement'. Nevertheless, there is an important difference: the founding principle of National Socialism is the principle of 'a racial people'. Neumann shows that racism supplants nationalism, that sovereignty no longer resides in the State but rather in race ('ascent takes precedence over citizenship'). Hence, it seems to me, Roman imperialism is entirely different from that of National Socialism, and two Nazi theoreticians state this precisely – Carl Schmitt insists on the difference between 'Roman totality' and 'Germanic totality'. The first is said to be quantitative, the second qualitative. Alfred Rosenberg writes: 'Today we must choose [1927] between Crusade politics and territorial politics; between world imperialism and the racial will of the state; between Barbarossa and Henry the Lion; between the Stresemann-League of Nations and the racial National Socialist Germanic state' (for Rosenberg it is a matter of breaking free from English imperialism). *Mittel Europa*, therefore, is opposed to 'Roman totality'.
- (b) The concentration of power in the Roman Empire and the concentration of power in National Socialism: elimination of the distinction between the legislative and administrative functions (*Gleichhaltung*: the law of synchronization, that is, control from above – and also the Enabling Act of 24 March 1934 which conferred all legislative powers on the government). Comparable also are the figure of the *Führer* as 'charismatic leader' and that of *imperator* (cf. the *numen*). However, Neumann shows convincingly that the notion of the *totalitarian state* is very quickly abandoned in favour of that of the *Party* (after 30 June 1934). And again it is Rosenberg who writes in 1934 that 'the abstract totalitarian State belongs to the liberal phase . . . henceforth it is the party that matters'. Now the Party is not an organ of the State; it is an extremely hierarchical mass organization. Evidently we have nothing of this sort in the Roman Empire.

Apparently, then, the comparison between the Roman Empire and National Socialism encounters at least two limits: *racism* and *the Party*.

Introduction to Metaphysics (1935)

Let us pose the following hypothesis: the *Introduction to Metaphysics* (where an allusion is made, very equivocally, to National Socialism and where an allusion is also made to the Rectoral Address of 1933) contains absolutely no 'explanation' of National Socialism, but it does expose the elements of a 'launching' of a theoretical explanation in the figure of *Greek tragedy* that Heidegger does not touch on again and which will take place in the courses on Nietzsche. Why speak of the 'launching' of an explanation? Because *Greek tragedy* will serve as the 'inverted mirror' of National Socialism – or, rather, it will serve as a *counter-proof*, *before* the proof itself of the explanation: thus the counter-proof *precedes* the proof.

Three motifs concerning Greek tragedy in the *Introduction to Metaphysics*⁶ will detain us here:

(1) The figure of Sophocles' *Oedipus*:

Let us consider the *Oedipus Rex* of Sophocles. At the beginning *Oedipus* is the saviour and lord of the state, living in an aura of glory and divine favour. He is hurled out of this appearance, which is not merely his subjective view of himself but the medium in which his being-there appears; his being as murderer of his father and desecrator of his mother is raised to unconcealment. The way from the radiant beginning to the gruesome end is one struggle between appearance (concealment and distortion) and unconcealment (being). The city is beset with the secret of the murderer of Laius, the former king. With the passion of a man who stands in the manifestness of glory and is a Greek, *Oedipus* sets out to reveal this secret.⁷

Oedipus Rex: 'tragedy of unveiling' – tragedy of the passion for unveiling, the passion for *aletheia*. By *anticipation*, therefore, *counter-proof* of another 'tragedy' that we will designate, for the moment, as a tragedy of power.

(2) The *deinotaton* of the first chorus in Sophocles' *Antigone*:

Much is monstrous [*Unheimliche*],
But nothing is more monstrous than man.

Around the *deinotaton* a constellation takes shape: that of the 'terrible'

[*Furchtbare*], of violence [*Gewalt*], of dreadful panic [*panische Schrecken*].

(3) It is here that the Heideggerian determination of the *polis* intervenes:

Polis is usually translated as city or city-state. This does not capture the full meaning. *Polis* means, rather, the place, the there, wherein and as which historical being-there is. The *polis* is the historical place, the there *in* which, *out of* which, and *for* which history happens. To this place and scene of history belong the gods, the temples, the priests, the festivities, the games, the poets, the thinkers, the ruler, the council of elders, the assembly of the people, the army and the fleet. All this does not first belong to the *polis*, does not become political by entering into a relation with a statesman and a general and the business of the state. No, it is political, i.e., at the site of history, provided there be (for example) poets *alone*, but then really poets, priests *alone*, but then really priests, rulers *alone*, but then really rulers. *Be*, but this means: as violent men to use power, to become pre-eminent in historical being as creators, as men of action. Pre-eminent in the historical place, they become at the same time *apolis*, without city and place, lonely, strange, and alien, without issue amid the essent as a whole, at the same time without statute and limit, without structure and order, because they themselves *as* creators must first create all this.⁸

Let us note that 'violence' is here the mode common to *techne* and *physis*.

These three motifs from the *Introduction to Metaphysics* converge in the Greek 'domain of experience': *aletheia*. Thus a quasi-'homologous' relation is woven between *Geschichte* and *aletheia*; thus the importance of *Geschichte* grows in the Heideggerian text:

for us history is not synonymous with the past; for the past is precisely what is no longer happening. And much less is history the merely contemporary, which never happens but merely 'passes', comes and goes by. History as happening is an acting and being acted upon which passes through the *present*, which is determined from out of the future, and which takes over the past. It is precisely the present that vanishes in happening.⁹

Two remarks: (1) the mutation of *aletheia* is enunciated in the *Introduction to Metaphysics* as a passage from *aletheia* to correctness, and this is the Platonic moment: the passage from *physis* to *idea*. The Roman 'event' is like a previously unperceived horizon. (2) The question of nihilism is presented as follows:

To forget being and cultivate only the essence – that is nihilism. Nihilism thus understood is the ground of the nihilism which Nietzsche exposed in the first book of *The Will to Power*.¹⁰

Nietzsche I (1937) and Nietzsche II (1939–41)

Let us suppose that the 'turn' contains Heidegger's 'explanation' of National Socialism – that around the 'turn' Heidegger 'explains himself' with respect to National Socialism.

Let us recall the argument of Hannah Arendt. Hannah Arendt locates the 'turn' between *Nietzsche I* and *Nietzsche II*; what the 'turn' (accomplished in *Nietzsche II* but not in *Nietzsche I*) summons is the *will* in its culmination as *will to power*; what is implicated in the explanation of National Socialism is the will to power: Hannah Arendt asserts that this 'taking to task' of the will to power constitutes the settling of accounts with the 'event' of 1933. None the less, with the *Letter on Humanism* (1946) a reinterpretation of the 'turn' becomes manifest: for quite a while the will had not constituted Heidegger's focus of interrogation, but rather 'the whole of history, from the Greeks down to our day, understood in terms of the relation between *Being* and *man*'.

Hence, several questions: this reinterpretation of the 'turn' in 1946 by Heidegger himself involves, on the one hand, a retreat, a distance taken up in relation to the 'event' of 1933; but does this not also involve, on the other hand, a distance taken up in relation to the 'explanation' of National Socialism? Does this mean that Heidegger no longer feels the need to 'explain himself' with respect to National Socialism? Or has the 'explanation' taken on a whole new *dimension*? Could it be that for Heidegger it is not at all a matter of 'defending himself' by exhibiting 'proof to the contrary' (as will again be the case in the *Spiegel* interview), not even a matter of 'explaining his relation to' National Socialism or even of explaining National Socialism in itself? That the 'explanation' is taken up in an *entirely different questioning*? And perhaps history itself drew out, produced, this 'explanation' in the defeat of National Socialism? Has history thus itself become, at a certain moment, *aletheic*, itself the 'unveiling', itself presenting somehow the 'explanation'? It is in the *Parmenides* that the connection between *Geschichte* and *aletheia* is put to work most flagrantly.¹¹

Let us first try to bring to light the steps Heidegger will take to arrive at this point – that is to say, pass through *Nietzsche I* and *Nietzsche II* and wind up at the *Parmenides*. My hypothesis is the following: the steps Heidegger takes represent the *end* of the 'explanation of his relation to' National Socialism, that is, its culmination as an 'explaining away' and

its inclusion within another dimension of questioning (that which sustains the reinterpretation of 1946).

*Nietzsche I (1937)*¹¹

Heidegger's thesis consists in the following: the relation between the *will to power* and the *eternal return of the same* denotes, in Nietzsche's work, *ontological difference*: 'The fundamental character of being as such [*des Seienden als solchen*] is "will to power". Being [*Das Sein*] is "eternal return of the same" ' (p. 35).

Now *power* is the essence of the will: 'He who says will says power, he who says power says will' (p. 52); the will to power is also 'will to will'.

The characteristic of will is the *commandment* (*Befehl*); the characteristic of power is the will to growth (the 'desire-to-be-always-more'). Consequently the accomplishment of will to power – which is 'will to will' – is nihilism: Heidegger repeats after Nietzsche: 'The will prefers to desire nothing rather than not to desire at all.' And *art* constitutes the counter-movement to nihilism: 'pure and simple metaphysical activity', art is 'will to appearance', therefore, 'anti-Christian movement', 'anti-nihilist' *par excellence*. The eternal return, which is the characteristic of Being, therefore escapes nihilism: it is the 'overcoming of nihilism' (*Überwindung des Nihilismus*) (p. 432) which is presupposed as the characteristic of being.

So, for Heidegger, Nietzsche's ambivalent terminology bears the mark of the ontological difference and ascribes nihilism to being as being.

Nietzsche II (1939–41)

Henceforth Heidegger poses the essential unity of the *will to power* and the *eternal return* in Nietzsche's work: Nietzsche is no longer the thinker of ontological difference (the difference *will to power/eternal return*) but the thinker of *the end of history* (*endgeschichtlich*) (p. 13). Nietzsche's two thoughts think the same thing, the end of history, and together they are 'the last word of metaphysics' (p. 17). The 'turn', if it is effected here, is located at the moment where the theme of 'the end of history' takes the place of the theme of ontological difference in Heidegger's interpretation of Nietzsche.

Let us underscore the following points:

(1) In *Nietzsche II*, as in *Nietzsche I*, 'power' is self-intensification, self-aggrandizement. As in *Nietzsche I* the will to power is 'the supreme form

of domination and organization', it is commandment: 'man is destined to be the measure of being', and Heidegger speaks of 'the organized conquest of the earth' and of a 'centralization, which is the most general effect of the machine'.

(2) Nietzsche brings metaphysics to its culmination in that the transvaluation-devaluation he poses is destructive (*Zerstörerisch*) (p. 339). Destructive because, as in *Nietzsche I*, 'the will prefers to desire nothing rather than not to desire at all'. Destructive because it is 'destructive' of ontological difference: Nietzsche folds Being back into being. 'Nothing is said with respect to Being' (p. 339). Nietzsche's metaphysics is the culmination of the forgetting of Being: the *nihil*. Nietzsche's metaphysics is not an 'overcoming' (*Überwindung*) of nihilism but rather its 'accomplishment' (*Vollendung*). Destruction (*Zerstörung*), as the unique modality of Nietzsche's metaphysics, of *European nihilism*, sweeps out what, in *Nietzsche I*, was still determined as *anti-nihilism* under the name of *art*.

Consequently we have, on the one hand, the *Introduction to Metaphysics* and *Nietzsche I*, and, on the other hand, *Nietzsche II*. Between the two: the 'turn'. The 'turn': now Heidegger will no longer distinguish the thought of eternal return from that of the will to power in Nietzsche's work; now the character of the will to power (*nihilism*) invades everything – and now in Nietzsche's work, according to Heidegger, but also possibly in Heidegger's own work, the theme of ontological difference is effaced.

(3) Possibly in Heidegger's own work, for we will find in *Nietzsche II* an indication of another questioning. This indication is given to us by a term: the term *Machenschaft*. It is announced in the first text of *Nietzsche II* (1939) that 'the era of the absence of sense' which is the 'absence of the truth [*Lichtung*] of Being': that is to say, now truth is determined as *adequatio* and Being is swept out into being. Heidegger writes then: 'Die Vormacht des Seins in *dieser* Wesensgestalt heisse die *Machenschaft*' ('the pre-power of Being in *this* figure is called: *Machenschaft*') (p. 21).¹²

Now, we already find the term *Machenschaft* in the *Introduction to Metaphysics*. However, the clarifying text is the penultimate text of *Nietzsche II*: 'Projects for the history of being' (1941) where he writes: 'die *Machenschaft* (das Ge-stell)' (p. 471). *Machenschaft* says the same things as *Gestell*. Is this not the outline of another questioning: the injunction to question starting from *Gestell*?¹³

So, starting from *Nietzsche II*, I can enunciate again – and otherwise – my hypothesis. I will say that the end of Heidegger's 'explanation' of National Socialism will be the moment where he will have finished with the thought of the *end of history* as 'the last word of metaphysics'. In *Nietzsche II*, from the 'tragedy of unveiling' that it was in Greek times, history becomes the tragedy of planetary domination. But it is a misunderstanding to continue to speak of tragedy: tragedy took 'place' in the

domain of the experience of *aletheia* – it is necessary to speak of modernity in terms other than those of ‘tragedy’. The opposition sustained by *Nietzsche II* is therefore that of the *tragic* (Greek) and of *nihilism* (European). We can find an expression of this opposition in a course from the period where the ‘turn’ commences: *Grundfragen der Philosophie* (1937–8),¹⁴ where the opposition of *astonishment* [*Erstaunen*] and *terror* [*Schrecken*] is enunciated:

In a-stonishment, the basic mood of the first beginning, beings are first brought to a standstill in a formal configuration. In terror, the basic mood of the other beginning, the dark vacuity of aimlessness and the weakening of resolve lies concealed behind every kind of progress and domination of beings.¹⁵

Thus we can come back to the *Parmenides*.

Heidegger’s verdict is clear: Nietzsche is ‘un-Greek’ [*schlechthin ungrisch*] – ‘purely and simply un-Greek’ (p. 139). He is ‘Roman’, he thinks Greece in a Roman way: ‘Even for Nietzsche the true is the correct, the just. . . . Roman *veritas* has become the *Gerechtigkeit* of the will to power’ (pp. 77–8). ‘Jacob Burckhardt has contributed much to the idea that Nietzsche thinks the essence of Hellenism and its *polis* in a Roman manner. . . . Burckhardt thinks the whole of history according to three powers: State, religion, culture’ (p. 134).¹⁶ ‘Nietzsche, Rilke, and psycho-analytic doctrine know nothing of *aletheia*’ (p. 231). That is why this transformation of Hellenism by Romanism is ‘an event [*Ereignis*] that touches on our historical *Dasein* most profoundly’ (p. 66).

We find Spengler on the same side as Nietzsche: in *The Decline of the West* ‘Spengler speaks nowhere, says nothing about, history [*Geschichte*]’ (p. 168). ‘If he really thinks, he thinks history [*Geschichte*] un-historically [*geschichtlos*]’ (ibid.).

How are we to understand *geschichtlos*?

What *geschichtlos* means is indicated starting from the determination of *Geschichte*: ‘it is the event [*Ereignis*] of the essential decision of the essence of truth, an event that is always the “yet to come” and never the past. But, in forgetting, we have submitted ourselves most severely to the past’ (p. 168). It is also manifest now that Nietzsche and Spengler think history starting from the past. Now there is only history as ‘thought starting from the yet to come’.

It is here, it seems to me, that the subsequent Heideggerian reinterpretation of the ‘turn’ justifies itself (*Letter on Humanism* – 1946): where the ‘turn’ is reinterpreted in terms of *continuity*. In fact, the theme of *Geschichte*, as *thought that thinks starting from the yet to come*, has been present throughout: since *Sein und Zeit*. But it does not take on its interpretative charge until now, after having passed through *Nietzsche I*,

Nietzsche II and the *Parmenides*, where it ceases to be a 'partial' theme and becomes a 'domain of experience' homologous to that of *aletheia*.

We find a recurrence of the theme of nihilism *ten years afterward*: it will be in *Was heisst Denken?* (1951–2) – where the fact that a course on Nietzsche is followed by a course on *Parmenides* no longer comes as a surprise. The course on Nietzsche *Was heisst Denken?* interrogates the saying of Zarathustra: 'the desert grows' [*die Wüste wächst*]. Heidegger comments:

'The wasteland grows'. It means, the devastation is growing wider. Devastation is more than destruction. Devastation is more unearthly than destruction. Destruction only sweeps aside all that has grown up or been built up so far; but devastation blocks all future growth and prevents all building. Devastation is more unearthly than mere destruction.¹⁷

This theme is not entirely new, since we already find *Verwüstung* (desertification) in *Beyond Metaphysics*. But here it has a particular resonance, for it is consonant with the theme of *Geschichte*. In fact Heidegger distinguishes here between *destruction* (*die Zerstörung*), which bears on the past, and desolation/desertification (*die Verwüstung*), which bears on the future. If *Geschichte* is thought that thinks/thinks itself starting from the yet to come, what desertification makes disappear is, then, *the very thought of history, of Geschichte* – not just the historical past, but the very historicity of history, the historic essence of history.

Two remarks then:

(1) If Nietzsche, even though he asserts the 'desert' through the voice of Zarathustra, thinks un-historically, it must be that he thinks the desert starting from the past: he does not think the desert but the *destruction*. In what sense does Nietzsche think the desert starting from the past? In the sense that he has not 'gotten beyond' Platonism but has merely 'inverted' it.

(2) So, is it not with this notion of desolation/desertification that the encounter of imperial Rome and National Socialism takes place? Is this how imperial Rome becomes the very figure of National Socialism? If so, must we not recognize that Heidegger's 'explanation' of National Socialism finds its accomplished theoretical form in the *Parmenides*? Must we not also recognize that the desolation/desertification of imperial Rome and of National Socialism is not just an 'end of history' in the nihilist, that is to say, metaphysical sense of the term. Rather: the form taken by 'catastrophe' in what one could call the Heideggerian 'vision' of history is something like the *entry into the un-thought*.

Here, again, it is Hannah Arendt who can shed some light. In *The*

Life of the Mind, volume I, in the chapter entitled 'The Roman answer', Hannah Arendt opposes Greek *thaumazein*, astonishment, and Stoic *nil admirari*, the 'do not be astonished by anything'. With Rome, writes Arendt, 'philosophy becomes the opposite of what it had been in Greece'. While the Greek experience is the experience of '*coming-to-presence*', of *unveiling*, the Roman-Stoic one is, writes Arendt, 'that of making disappear and rendering *absent* that which is present in reality' (it is the 'not wanting to see', the 'not wanting to know'). The catastrophe would be, then, when we can no longer be astonished by anything.

It seems to me, therefore, that Heidegger's assertion in the *Parmenides* must be understood in this context: 'We think the political in a Roman, that is to say, imperial fashion. . . . As for the Greek, only the word remains.'

Translated by Philip A. Leider

Fundamental ontology and political interlude: Heidegger as Rector of the University of Freiburg

István Fehér

In April 1933 Heidegger assumed the rectorate of the University of Freiburg. The months following constitute the only period of his life – one which did not abound in dramatic events or spectacular changes – which gave rise to vehement reactions and sharp criticisms for reasons other than the philosophical views which Heidegger put forward. A university professor's getting elected rector is, to be sure, not an event which requires special attention: it is well within the limits of a normal academic career. It was, however, at an extremely delicate moment, a few months after Hitler's appointment as chancellor, that Heidegger took over this office – and this, of course, is not without importance. What are the reasons which led Heidegger to assume this office, and what prior judgments about the era underlie his decision? And more akin to the concerns of this book, is this decision connected with his philosophy, and if so, how?

In what follows, an attempt will be made, first, to sketch Heidegger's basic philosophical outlook leading up to, and as elaborated in, *Being and Time*, concentrating on those tenets which can be shown to have some bearing upon his political involvement. This preliminary analysis will be followed by a reconstruction of Heidegger's conduct during his period as rector. I think that his activity as rector should be explored against the background of his philosophical outlook and of concrete historical circumstances, rather than stripped of (both philosophical and historical) context and judged by extrinsic criteria – that is, mainly by reference to what the social movement (national socialism) to which he temporarily committed himself subsequently became.

I Heidegger's philosophical outlook by the end of the 1920s

I.i

One might briefly characterize Heidegger's fundamental philosophical efforts leading up, after more than ten years' silence, to the publication of *Being and Time* in 1927 – as found, e.g., in his lectures of the period, now gradually appearing in the *Gesamtausgabe* – as an attempt to unify the so-called irrationalistic or 'existentialist' or 'historicist' problematic which permeated post-war European culture (and was represented by thinkers like Kierkegaard, Nietzsche, Jaspers, Spengler, Dilthey, and Simmel) with the Husserlian ideal of 'philosophy as strict science' (and, thereby, through Husserl, with the whole epistemological-metaphysical tradition going back to Aristotle and the Greeks).

Brought up in the scholastic tradition, but extremely responsive to the contemporary logical-epistemological ways of philosophizing represented by neo-Kantianism and phenomenology, Heidegger had as early as his doctoral dissertation and his *Habilitationsschrift* (published in 1914 and 1916, respectively) hoped to pose the Being-question, viz., to renew the metaphysical tradition.¹ His appropriation of the modern logical-epistemological tradition is conditioned from the very beginning by his endeavor to arrive at metaphysical conclusions; doing pure logic, epistemology or methodology, indispensable though it may be as a preparatory step, is seen by him as futile when conceived as an aim in itself.² His gradually deepening acquaintance with Husserl's phenomenological method provides him, in addition to theoretical insights, with a new access to classical philosophical texts, especially those of Aristotle and the Greeks.³ His intense studies of the philosophical tradition as well as of modern philosophical trends thus become fused within a perspective which does not separate systematic and historical points of view. From this perspective, traditional doctrines no longer appear as mere relics worthy of only antiquarian interest, as opposed to the theoretical validity possessed by contemporary doctrines. Rather, traditional tenets are seen both as illuminating modern theories and as illuminated by them, and contemporary positions as proceeding from earlier ones.⁴ Historical interest, in this sense, is strictly connected to systematic interest – indeed is at the service of it. Only if history is not 'pure history' – that is, a heap of past and dead facts – will the history of philosophy regain its relevance for systematic thinking (cf. GA 1: 195ff., and later GA 61: 110f., GA 24: 31f.).

This point is important for our present purposes, not only because it sheds light on some of the presuppositions of Heidegger's first philosophical attempts, but because we need to realize that the *systematic* positing and working out of the Being-question proposed in *Being and Time*⁵ rests upon a preliminary confrontation with the tradition. This point has

become clearer since the publication of some of Heidegger's Marburg lectures. Further, Heidegger's way of approaching the history of philosophy already contains a conception of history implicitly – one to be thematized explicitly in *Being and Time*, and particularly relevant to his engagement with politics. Studying modern logical or epistemological theories in order to use them for metaphysical purposes meant, for Heidegger, recognizing the fact that such theories are not exempt from metaphysical presuppositions.⁶ Nor, inversely, can metaphysical or ontological theories be exempt from logical or epistemological presuppositions; that is, from more or less explicit assumptions concerning human thinking or knowing – in short, from a theory of man as a rational animal (see e.g., *GA* 20: 174). The insights into the metaphysic-ladenness of the logical-epistemological tradition and into the logic-ladenness of traditional ontology may be said to be the two basic, and reciprocal, results of Heidegger's early confrontation with, and appropriation of, Western philosophy. The necessity of positing the Being-question as the question to be asked first and foremost is derived, for Heidegger, from the highly paradoxical result of his confrontation with Husserl's phenomenology (the most advanced transcendently oriented epistemology of the day). Indeed, Husserl, though claiming to suspend or bracket 'assertions concerning being', cannot help committing himself to certain prior ontological distinctions, in particular, that between Being as consciousness and transcendent being – which Husserl himself called, symptomatically, 'the most radical of all distinctions of Being' (Husserl 1976: 159). This prior commitment is left completely unthematized, having been antiphenomenologically (that is, dogmatically) assumed (see *GA* 20: 157f., 178). If the claim to dispense with the Being-question is thus shown to be a pure illusion, necessarily presupposing a dogmatic prior answer to it, exempt from and unsusceptible to any kind of critical examination (or, in other words, if dispensing with it turns out to be equivalent to answering it without first posing it), then the situation seems simple enough: what is needed is to explicitly pose or thematize this first and foremost question of all philosophy. In the light of the recognition, however, that traditional ontology is from its very beginning grounded in, or centered around, the doctrine of *logos*, i.e. logic,⁷ an uncritical natural recourse to any kind of traditional ontological perspective must be out of the question. It even remains uncertain if the Being-question, lacking a prior ground in which to be embedded, can be posed at all.⁸

The way out of this impasse was suggested to Heidegger by his insight into the strict correlation between being and *logos* in Western philosophy – more concretely, by an ontological thematization of logic, of the theoretical-cognitive attitude or comportment (*Einstellung*) in the broadest sense. Heidegger's starting points were (1) the correlation of being and *logos* in the history of philosophy; (2) the functioning of the *logos* of

the 'subject' as the 'ground' or 'place' of the ontological problematic properly so-called; and (3) logic as the theoretical comportment *par excellence*. Thus he was able to thematize the *being* of the subject in a deeper way than that provided by the tradition – one capable of showing the very epistemological comportment as a derived mode of being. This offered a possible operative basis for the positing and working out of the Being-question. The metaphysical tradition from Aristotle onward had gained its access to Being from within the conceptual horizon provided by the theoretical attitude, giving thereby rise to theories of Being in terms of objective presence. That this comportment was far from being *the* original mode of being of human existence was, however, an insight which required the prior unification of the Husserlian perspective of philosophy 'as strict science' with the 'anti-metaphysical', 'existentialist' tradition.⁹ Contrary, however, to the tendency of thinkers like Pascal, Kierkegaard, Dilthey, and Nietzsche to combine a turning to factual-historical human existence with a turning *away from* metaphysics, and thus totally to reject systematic thinking, Heidegger's appropriation of the problematic of factual-historical life was conceived from the very beginning as a starting point *for* the renewal of metaphysics. The posing and working out of the Being-question pertains to what Heidegger calls fundamental ontology. As the above considerations suggest, this becomes embedded in, and begins with, a thematization of the *being* of the subject – a discipline named existential analytic.¹⁰ The immanent critique and internal radicalization of phenomenology and epistemology, and the attempt at a radical re-examination of the whole metaphysical tradition through the assimilation of the 'irrationalistic' problematic, are fused in Heidegger's effort to gain a new ground for the Being-question.¹¹

I.ii

Man's¹² fundamental mode of being, Heidegger claims in *Being and Time*, is Being-in-the-world. His original relation to things emerging in his environment is one of using, handling, employing, arranging rather than 'knowing' them. These are modes which presuppose antecedent acquaintance, familiarity, with the world. Even 'knowing' things is one way of having to do with or caring about the world – a comportment which comes about as a modification of man's original relating himself to things. A phenomenological description of man's primary way of being should, therefore, suspend, i.e., 'put into brackets', scientific or epistemological concepts and strategies of description. Only thus will it be sufficiently original, sufficiently unaffected by traditional theories concerning the issue, and able to *derive* scientific comportment from man's primordial way of relating himself to his world. If, apart from and prior to any kind of self-description such as 'the totality of foundational connections of true statements',¹³ science is primarily one of man's modes

of being – ‘not the only and not the first possible mode of being’ at that (SZ 11) – then existential analytic must not resort to the conceptual framework provided by science. To do so would imply losing the possibility of gaining a perspective upon it.

Without going into the details of Heidegger’s description of Being-in-the-world, it may be relevant to see how the epistemological problematic, with which Heidegger had first engaged himself on his way to *Being and Time* and whose insufficiencies led him to assume an explicit ontological standpoint, is treated within the framework of the new ontological perspective.

Given his thesis that man’s primordial mode of being is Being-in-the-world, Heidegger’s treatment of the epistemological tradition from Descartes on has two major aspects: a negative, or polemic, one and a positive, or ‘integrating’, one. As to the first, he shows that the epistemological perspective properly so-called (with its typical questions concerning the relation of the subject to the object, of mind to the world, the way the knower can acquire knowledge about the object) is not meaningful without a prior ontological dualism such that knower and known, subjects and objects are assumed to be two separate entities, their relation being one of mutual exclusion (subject is what is not object and vice versa). However, if man and world are not two independent entities, and human *Dasein* is not the worldless (*weltlos*) ‘subject’ characteristic of modern philosophy, but is in itself worldly (*weltlich*), having always already committed itself to the world, then the ontological ground underlying the epistemological perspective becomes untenable.¹⁴ Heidegger’s attitude is negative or polemic in that he elaborates his concept of *Dasein* and Being-in-the-world by opposing them to, and challenging, the traditional concepts of ‘subject’ and ‘object’. He insists that Being-in-the-world, as *Dasein*’s fundamental mode of being, must not be conceived of as an epistemological relation between subject and object.

Having developed his concept of Being-in-the-world through a contrast with the subject-object relation, he is in a position to show how, in virtue of what modifications of Being-in-the-world as an all-encompassing phenomenon, man’s *knowing* relation to the world springs. This may be called the positive, or integrating, aspect. Heidegger shows, in a series of analyses, that in order for a thing to become an object of knowledge or scientific research, our preliminary access to it, that is, our way of having to do with it, must have undergone a specific modification. Only as a result of this will the thing as tool originally made use of, or handled, reveal itself as a neutral substance, simply ‘out there’, susceptible of being determined by what traditional philosophical theories have come to call ‘qualities’ and ‘properties’.

Heidegger illustrates his point with critiques of Descartes’s conception of the world and of Kant’s Refutation of Idealism. He shows that

Descartes's definition of world in terms of *res extensa*, that is, a neutral, indifferent space filled up with equally neutral, homogeneous substances, fails, in the light of Heidegger's own analyses of 'world', to do justice to the genuine phenomenon of world met with in everyday experience – indeed, is based upon losing sight of and forgetting it. This is the negative aspect of his treatment of Descartes. However, that definition of world reflects a theoretical-intellectual comportment to the world (itself one way of Being-in-the-world), one which presupposes that what the glance characteristic of mathematical knowledge discovers in things constitutes their *real* being (see SZ 95f.). This is the positive, or integrating, aspect.

As far as Kant's Refutation of Idealism is concerned, Heidegger first shows some of the inconsistencies inherent in Kant's proof of the existence of the outer world. Then, more significantly, he proceeds to undercut the very bases of Kant's undertaking, insisting that the quest for a proof of this sort is not meaningful unless one assumes the Cartesian standpoint of the isolated subject. Indeed, once man is assumed to be basically Being-in-the-world, the question of how a knowing subject can get out of its interiority in order to ascertain the existence of, and establish a contact with, the outside world – the major epistemological problem of modern philosophy – loses its legitimacy. Attempts to demonstrate the 'reality' of the outer world, or, for lack of such a demonstration, the mere 'belief' in or presupposition of such a world (comportments which are themselves definite ways of Being-in-the-world), do not make sense without the prior assumption of a subject closed in itself – a subject which, uncertain about its world, should begin by acquiring certainty about it. The question of whether or not there is a world, and whether its being can be proven, Heidegger remarks significantly, is without sense for human *Dasein* conceived as Being-in-the-world – and who else could pose it (SZ 202)? If there is a legitimate question, it concerns rather the reasons why *Dasein* as Being-in-the-world tends to sink, *erkenntnistheoretisch*, the 'reality' of the outer world into nothing in order to produce, after splitting up the unified phenomenon, infinite hopeless attempts to put together the two wrecks left: the isolated subject and the outer 'world' (SZ 206).¹⁵

The aspects of Heidegger's existential analytic singled out thus far show how Heidegger's own ontological perspective enables him to make visible the implicit ontological framework latent in traditional epistemological-metaphysical thinking. Traditional ontologies are shown to be rooted in *Dasein*'s ways of relating itself to its world. The analytic of *Dasein*, by proposing to illuminate deeper and more original dimensions of *Dasein*'s being, both criticizes or dismisses *and* integrates or 'justifies' them (in the specific sense of revealing their condition of possibility).

I.iii

What remains to be seen is the way in which the irrationalistic or existentialist or historicist problematic, accompanied by a strong anti-metaphysical bias in the thinkers who gave rise to and defended it, joins in, and becomes an integral part of, Heidegger's systematic ontological perspective.

The question of how Heidegger's ontological treatment of the epistemological perspective within a neutral analysis of *Dasein* relates to a Kierkegaardian problematic of authenticity is not easy to answer. Arguing along the lines elaborated by Richard Rorty (see Rorty 1979: Ch. 8, especially 360ff.), it might be claimed that knowing the world is just one among many human projects of edification (not the primary one, Heidegger would add). It might then be suggested that it is because the project of knowing the world has traditionally been assumed to be *the* proper path to authenticity (an assumption congruent with the prevailing conception of man as a rational animal¹⁶) that authenticity, for the epistemological-metaphysical tradition from Descartes on, was not, and could not be, a problem. (It became a problem, symptomatically, only for non-metaphysical thinkers like Kierkegaard.) Because Heidegger sets out to get behind the view of man as a rational animal, it is natural that the problem of authenticity will become an explicit problem for him, one distinct from the problematic concerned with knowing. We might also say, using the terms of our previous description of Heidegger's way to the Being-question, that the neglect of the question of authenticity by the epistemological-metaphysical tradition is a matter of answering it without first having posed it.

The question concerning *Dasein*'s inclination to dissolve the outer world into nothing is answered by Heidegger by reference to man's basic tendency to *Verfallen*. This is an encompassing concept of inauthenticity, characterizing a tendency inherent in everyday *Dasein* to interpret the world and itself within the horizon of what turns up *within* the world, thus taking itself to be one among the entities existing alongside others in the world (cf. SZ 58). The possibility of *Verfallen* lies in the fact that *Dasein* as Being-in-the-world is always already alongside (bei) beings in the world. Indeed, because, as early as the Greeks, Being was interpreted in terms of beings in the world (cf. SZ 44), the concept of inauthenticity provides what we have been calling an integrating aspect. It does so by accounting for the failure of traditional ontologies to seize upon the ontological problematic proper – a major reason why Heidegger names his investigation 'fundamental ontology'.

Considerations concerning authenticity emerge basically in connection with the concept of *Being-with* (Mitsein). The 'existence' of other human beings is for Heidegger as unquestionable as that of the 'outer' world.

Dasein's way of relating itself to others is called (parallel with, and contrary to, man's *Besorgen* with the things of his environment) *Fürsorge*, care for. This has, apart from the deficient and negative modes characteristic of everyday Being-with, two positive modes: 'leaping in' and 'leaping ahead' (Einspringen, Vorausspringen). The first is characterized by taking the 'care' over and away from the other, 'leaping in' for him in order to do what constitutes the other's concern *for* him. The other may thereby become dependent and dominated. The second, by contrast, does not refer to the other's *Besorgen* with things. One 'leaps ahead', not in order to disburden the other, but rather to give him back his authentic and primordial care, that is, his existence, thereby helping the other to become conscious of it and free for it (cf. SZ 122; for a fuller analysis see Elliston 1978: 66ff.). Everyday Being-with, however, is characterized by *Dasein's* losing itself in the faceless amorphous anonymity of the 'One' (das Man). Only therefrom can it pass to the authentic way of existing.

The full concept of authenticity is developed in the second division of *Being and Time*. Living originally in an inauthentic way, *Dasein* can reach authenticity only in Being-toward-death (Sein zum Tode) and resoluteness (Entschlossenheit). The concept of authentic existence is often explained very crudely as something denoting an aristocratic detachment from, and a scornful contempt of, everyday life. A closer examination of the Heideggerian texts lets one dismiss this reading as wholly unfounded. Deriving as it does from inauthenticity, authentic existence remains forever bound to it: it is but the constant transition or passage from the inauthentic existence to the authentic, and not a kind of independent realm opposed to it. Authenticity, to put it briefly, consists in consciously setting a limit to one's manifold possibilities – seeing them against the background of one's ultimate possibility, that is, death. This resolution, once taken, is capable of transforming one's life into a whole and giving oneself selfhood (Ganzheit, Selbstheit). The authentic project of Being-toward-death is then confirmed, on the part of the factually existing *Dasein*, by the phenomenon of conscience. *Dasein's* proper response to the call is, first, to make itself ready for it, that is, to-want-to-have-conscience (Gewissen-haben-wollen), and second, resoluteness. Rather than eluding death by escaping into the anonymity of everydayness, authentic *Dasein* anticipates it; rather than averting the call of conscience, thereby precluding becoming *itself* and being responsible for what it is, *Dasein* resolutely assumes it. Both ways enable *Dasein* to be authentic (eigentlich), that is, to appropriate the being it already is. On a closer look, resolution turns out to be not only compatible with, but even requires, authentic Being-toward-death. If resolution arbitrarily varied, without a view to death as *Dasein's* ultimate possibility, there could be no question of resolution being authentic (SZ 302, 305ff.; see Gelven

1970: 176; Demske 1963: 48f.; Ugazio 1976: 48). The unified concept of authenticity is therefore anticipatory resoluteness (*vorlaufende Entschlossenheit*). Resoluteness in its turn gives rise to 'situation'. The latter does not mean a set of conditions given in advance, but rather being revealed and disclosed only by and in resolute *Dasein* (cf. SZ 299f.). Authentic *Dasein* should nevertheless not persist rigidly in any one situation; it has to leave itself open for the possible, and indeed necessary, re-appropriation of itself. Since the relapse into the existential irresolution of *das Man* remains a constant possibility, it is only in repeating, retrieving itself that resolution is what it is (SZ 307f.).

For the full concept of authenticity to be arrived at, however, a further addition is needed. The question of what should fill in the 'content' of resolution is, Heidegger repeatedly claims, no part of the existential analytic. It may be answered only by resolution itself. However, it is legitimate to ask whence such possibilities may arise (SZ 294, 383). This origin is history. Resolute *Dasein* opens up its possibilities by taking upon itself a given heritage of the past – a heritage in which it resolutely hands itself down. Grasping its innermost finitude in anticipating death, *Dasein* is driven back to itself. In handing itself resolutely down in a freely chosen tradition, it acquires destiny (*Schicksal*). Seen from the perspective of Being-with, authentic historicity reveals itself as the common destiny of a community (*Geschick*) – a community in which the destinies of individuals are preliminarily assigned their role (SZ 384). It is not necessary, Heidegger remarks, that *Dasein* should explicitly be aware of the origins of the possibilities upon which it projects itself. But there lies in it the possibility to derive its project (the 'content' of its resolution) explicitly from a tradition. Resoluteness, coming back upon itself from fallenness and handing itself down consciously, becomes then the repetition, or retrieval (*Wiederholung*) of an inherited possibility of existence.¹⁷ To 'repeat' in this sense does not amount to 'make a piece of the past actual again', 'bringing it back', but rather 'retorting', 'replying' to a past possibility of existence (SZ 385f.).

II Heidegger the Rector and his philosophy

This short sketch of Heidegger's philosophical development, together with a quick survey of the basic philosophical outlook of *Being and Time*,¹⁸ puts us in a position to proceed to our proper theme. We can now set about answering our initial questions – above all, the question of how Heidegger's assuming the office of the rectorate can be connected to his philosophy. In doing so, we shall return to and single out some of the themes previously touched upon, and occasionally thematize them in more detail.

II.i

Authentic existence, as we have seen, was explained in *Being and Time* in terms of anticipatory resoluteness. Coming back upon itself from the world of inauthenticity characterized by the anonymity of *das Man*, resolute *Dasein* does not become detached from the world. This would be impossible, for *Dasein* is and remains Being-in-the-world all along (cf. SZ 298). Resoluteness implies, on the contrary, entering fully into the world, opening up and projecting oneself upon the (finite) possibilities which offer themselves in a given situation. It is in anticipating death, in becoming aware of what it means *not* to be, that the awareness of what it means to be becomes accessible. Although in anticipation and conscience *Dasein* becomes isolated, deprived of all its (inauthentic) links (that is, it becomes precisely its own self), nevertheless, in choosing itself, *Dasein* not only chooses itself 'out of' the world (to use Kierkegaard's illuminating terms), but at the same time and in the fullest sense, chooses itself 'back into' it (cf. Kierkegaard 1957: 265; see Chiodi 1965: 107; Guignon 1984: 337f.). It is also resoluteness that makes authentic Being-with possible, permitting *Dasein* to let the others 'be' in and for their own being. Once free for its own possibilities, *Dasein* is both free of the danger (inherent in its tendency to fallenness) of losing sight of or ignoring others' possibilities – possibilities which may supersede its own – and of the temptation to reduce them to, and thus take them to be identical with, its own.¹⁹ 'Leaping ahead', as the authentic positive form of Being-with, gains its full concreteness only in and by resoluteness. As opposed to inauthentic *Dasein's* tendency to disburdening (Entlastung), only the willingness-to-have-conscience, the assumption of one's own being, makes responsibility for oneself and others possible. Only resolute *Dasein* can become the 'conscience' of others (cf. SZ 122, 127f., 288, 298; see also Demske, 1963: 66). The thesis that *Dasein* is always its own, that it exists for its own sake, Heidegger says, does not imply egoism; the concept of *Dasein* is not equivalent to that of the isolated, egoistic subject. Because only in relating to itself can *Dasein* understand something like 'self' (selbst), only thereby can it listen to a 'you-self' (Du-selbst), and thus make something like human community (Gemeinschaft) possible (GA 26: 244f.).

Anticipatory resoluteness, therefore, points to something like social activity, or engagement. However, the analysis of authenticity is not yet complete. The concept of resoluteness, as we have seen, attains its ultimate form as a result of the analysis of historicity. If resoluteness, at an earlier level, meant keeping itself free to *retrieve* itself (Wiederholen), then authentic existence appears now, at the level of historicity, as the retrieval of a historical heritage that has been both handed down and freely assumed – a heritage in which *Dasein* hands itself over (SZ 308,

383ff.). By freely and resolutely taking over a historical heritage, authentic existence acquires its destiny (Schicksal). Authentic Being-with thereby becomes, at the level of history, a common fate (Geschick), a community of authentic people (SZ 384f.). It may even be said that it is only in and by *Wiederholung* that its own history reveals itself to *Dasein* (SZ 386).

II.ii

If the existential analytic (moving, according to its hermeneutic character, in a circle) is guided by a 'presupposed' idea of existence, and if philosophy, for Heidegger, must not deny its own 'presuppositions', but rather elaborate them together with that for which they are presuppositions (SZ 310), then it seems legitimate to examine whether, and to what extent, such an idea may be brought to bear upon the author of *Being and Time* himself.

If authentic existence consists in retrieving a historical heritage, then the philosopher's activity as one possible human activity, one way among others to relate oneself to the world, is authentic insofar as it aims at retrieving his own historical heritage – that is, the tradition of philosophy itself. It is easy to see that *Being and Time* should be understood from its very first pages in terms of an explicit attempt at bringing back the most original of all the traditions of philosophy, that is, the Being-question. (This retrieval of ontology – the latter being at the time a 'condemned term' (SD 47) – is also a retrieval of Kant's *Critique of Pure Reason*.)²⁰ *Being and Time* tries to retrieve, to revive, the Being-question (or since the question itself has long sunk into oblivion, 'awaken' an understanding of its meaning (SZ 1)) by inquiring into the horizon of traditional philosophies' access to Being (time, presence), and by showing this access to be rooted in and dependent upon *Dasein*'s theoretical comportment. Authentic retrieval is, therefore, not a blind attachment to the tradition, but rather the unfolding of a horizon within which the re-appropriation of traditional concepts becomes possible; the ontological transformation of phenomenology claims to be nothing less than 'the retrieval . . . of the origins of our scientific philosophy' (cf. GA 20: 184, 187f.). When the early Heidegger speaks of the oblivion of the Being-question, of the forgottenness of being, what he has in mind is not the claim that the history of philosophy has completely ignored this most original of all its questions, but rather the contention that the tradition blindly took over and tied itself to the Greeks, taking up their concepts and then building them into petrified systems. These concepts were conserved and dragged along through the centuries without any effort at an original re-appropriation or renewal – concepts whose roots in lived experience (from which they once emerged) have indeed long withered away. The 'destruction' proclaimed by Heidegger does not propose to

set the tradition aside, to rule it out, but rather to re-appropriate it into a conceptual framework able to respond to today's lived experience.²¹

A retrieval or revival of the tradition must go back as far as the Greeks because the perspective of modern philosophy appears, taken by itself, rootless. Heidegger does not see modern philosophy as having brought about a decisive change or development, for its basic concepts are wholly penetrated by the structural elements of the traditional Greek-Christian outlook – an outlook that itself had by then become rootless (see e.g., *SZ* 22, 93, 96; *GA* 20: 179; *GA* 21: 13; *GA* 29/30: 52f., 64). These 'presuppositions' underlying Heidegger's access to the history of philosophy, and his fundamental problem, are hardly conceivable without resting upon his direct experience of the ever more intensifying crisis of European culture and civilization.²² The initial contention of *Being and Time* that traditional metaphysical concepts of man like 'subject', 'ego', 'reason', 'spirit', and 'person' are ontologically unthematized and thus obscure (*SZ* 22) implies that these concepts have become vacant for everyday life, worn out and empty. Indeed, the concept of an 'ideal subject', characteristic of transcendently oriented epistemologies, is, as Heidegger unequivocally says later in the book, a '*phantastically idealized* subject'. Such a subject fails to do justice to nothing less than the 'a priori' of the "factual" subject', that is, *Dasein* (*SZ* 229).²³ We are not, to be sure, provided with anything that might properly be called Heidegger's 'criticism of society'. Nevertheless, his occasional remarks, in the course of lectures, about the culture and philosophy of the age – remarks often amounting to informal quips – are very effective. It is worthwhile to dwell upon them in some detail.²⁴

II.iii

First of all, as far as developments in German culture and philosophy during the second half of the nineteenth century are concerned, Heidegger is highly critical of the epistemological-*wissenschaftstheoretisch* turn typified by neo-Kantianism, considering it to be a sign of going astray, of perplexity and, in a sense, even of decadence (see *GA* 20: 17f., 20f.). The same judgment is expressed in even stronger terms during his debate with Cassirer in Davos, when he remarks that the genesis of neo-Kantianism is to be sought only 'in the perplexity of philosophy concerning the question of what it properly is that in the whole of knowledge has been left for it' (*KPM* 246). After the human and natural sciences, around 1850, had monopolized the totality of what can be known (*die Allheit des Erkennbaren*), all that was left for philosophy was knowledge of science, not of beings. Neo-Kantianism then re-interpreted Kant too, transforming him into an epistemologist of the mathematical-physical sciences, and 'between 1900 and 1910 Husserl himself in a certain sense fell victim to Neo-Kantianism' (*KPM* 247). The breakdown of German

Idealism is considered by Heidegger to be an undisputable fact; but, as he puts it in 1935, the very expression 'breakdown' (*Zusammenbruch*) amounts to a kind of shield, behind which the rise of superficiality (*die schon anbrechende Geistlosigkeit*) and the dissolution of the original spiritual forces are taking shelter. For it is not so much German Idealism that broke down, but rather it was the age that was no more able to be equal to the greatness and originality of its predecessors' achievements (*EM* 34f.; see also *GA* 32: 57; *SA* 7).

The following excursus in Heidegger's 1925–6 lectures is characteristic. When neo-Kantianism, taking up Lotze's obscure and incoherent notion of validity (*Geltung*),²⁵ became a philosophy of values (*Wertphilosophie*),

it was soon discovered that Kant had written three Critiques, which were supposed to have discussed the theoretical, the practical, and the aesthetic attitudes, and to refer respectively to these three kinds of values. Kant had, of course, had something to say about religion too, but unfortunately not in the form of a Critique; nevertheless, religion must also be secured a place within the system, so the value of the 'sacred' was discovered. This, for Windelband, is of course no autonomous value; to put forward a claim of this sort *circa* 1900 would be too risky. As the world, however, has become very religious since the war, and as with international associations of chemists and meteorologists, even world congresses are being organized, one might now run the risk of claiming that religion is also a value. Or, since it is impossible to leave it at that (the insights presumably grow deeper and deeper), one must say that God is also a value, and, for that matter the highest one. The latter thesis is an obvious blasphemy, surely not mitigated by the fact that theologians assert it as an utmost truth. All this would be highly comical, were it not deeply sad, showing as it does that philosophy no longer reflects upon the things and problems themselves [*man nicht mehr aus den Sachen philosophiert*], but upon the books of colleagues.²⁶

It is not difficult to see that this cultural decadence and shallowness affected Heidegger deeply. Someone committed to the appropriation and creative transformation of the problems of the philosophical tradition would naturally be repelled by the 'self-conceited modernity, fallen into barbarity', which pretends that Plato's questions 'are settled' once for all (*GA* 24: 157; see also *GA* 29/30: 48). Husserl had already complained about 'the sort of pseudo-philosophical literature [*philosophische Scheinliteratur*] . . . which nowadays pullulates so abundantly' (Husserl 1965: 47). He had also described the extent to which the social changes taking place in the late nineteenth and the early twentieth century, and

the consequent prevalence of positivistic culture, were transforming the framework of academic life:

The natural science departments of the philosophical faculties – he wrote in 1910 – are now very persistent in their efforts to acquire professorships in philosophy for researchers who may perhaps be very eminent in their own fields, but have no more sense of philosophy than, say, chemists or physicists.

(Husserl 1965: 47)

The idea of renewing philosophy emerged in connection with considerations pertaining to *Weltanschauung* as early as Heidegger's *Habilitationschrift* (cf. *GA* 1: 406ff.). Although the term 'Weltanschauung', because of abuse made of it at that time, does not turn up in his vocabulary,²⁷ it is clear that, from the 1920s onward, his retrieval and reformulation of the Being-question acquired its specific outlines against the background of more or less explicit expectations of a social-spiritual regeneration. Husserl's observations had shown the extent to which the development of science and philosophy cannot be viewed as a simple linear unfolding of their allegedly intrinsic character and potentialities, but is, instead, dependent upon extrinsic circumstances, rooted in the historical-intellectual climate of the age. Heidegger, much more susceptible to the central importance of historicity than Husserl, had already remarked in the 1920s: 'each philosophy and each science has its own destiny, and it would be petty-minded (*kleinlich und bürgerlich*) to think that we can abstract from the conditions which direct the questions . . . of philosophy' (*GA* 21: 53; see also 280 and *GA* 20: 182). Awakening the Being-question in an attempt to retrieve the philosophical tradition and to clarify the meaning of the question itself was however just a preparatory step, and Heidegger was very early aware of its limited (finite) possibilities.

In the inaugural lecture at Freiburg in 1929 Heidegger explicitly formulated his view of the situation of the sciences:

The fields of the sciences lie far apart. Their ways of treating their objects are fundamentally different. This disintegrated multiplicity of disciplines is held together only by the technical organization of universities and faculties, and through the practical direction of the disciplines. . . . The roots of the sciences in their essential ground have, however, withered away.

(*WM* in *GA* 9: 104)

II.iv

Heidegger's taking over the rectorate in 1933 must thus be seen as connected to his hope of finding a way out of the spiritual decadence, the deep crisis convulsing the whole country. (It may be sufficient to think of the economic crisis between 1929 and 1932, and of the masses of unemployed whose number increased from two to six million during these years). He hoped for a popular-national revival, perhaps giving rise to a philosophical renewal, that of the Being-question. Such a renewal would open up a new historical epoch, no longer characterized by the forgottenness of being. Was not such a hope unfounded, and indeed illusory? This (slightly pedantic) question – to adopt a Heideggerian phrase – arrives too late. That certain features of the renewal were from the very beginning critically assessed by Heidegger is, as will immediately be seen, beyond doubt. As soon as these features gain momentum and prove to have the upper hand, Heidegger will resign, and finally pass into opposition.²⁸

For many different sorts of intellectuals who had been critical of developments in Germany during the nineteenth and twentieth centuries – such as the malignant growth of industrial-technological civilization, the springing into being of big cities with their slums, as well as the growing commercialization, fragmentation, and instrumentalization of science and culture – the idea of 'national socialism' was pregnant with significance.²⁹ Since Germany's decadence could well be seen partly as a result of its being fitted into 'international capitalism', the structure created in Europe by the Versailles pact (the source of a continuous sense of national humiliation in Germany), the attempt to find a national solution of the crisis was coupled, for good reasons, with strong anticapitalist feelings. 'If Heidegger' – writes Bernard Willms –

had made more public his political attitude before 1933 . . . he would sooner and more unambiguously have been considered as a representative of the kind of thinking which may be defined as that of the 'Conservative revolution'. . . . This reference to the 'Conservative revolution' is of course meaningful only if it is taken to mean something different from the 'preparation of National Socialism'. . . . It was no less typical of the 'Conservative revolution' that its representatives, for a short time and with hesitation, joined the National Socialists, than that the latter, simultaneously or very soon, pushed them aside, and finally even persecuted them.

(Willms 1977: 17f.)³⁰

II.v

In April 1933, after holding office for less than one week, Rector Wilhelm von Möllendorf, professor of anatomy and a Social Democrat, resigned. Immediately after, he and other colleagues approached Heidegger, urging him to be a candidate in the new election. After some hesitation Heidegger gave his consent to his election – mainly because of the danger that otherwise a functionary would be named rector. One of his first measures as rector, taken a few days after having been elected by the university senate, was to prohibit the hanging of the so-called Jewish poster in the university – a prohibition which, in spite of repeated urgings put through from Berlin, he did not cancel later. He also forbade the book burning planned by Nazi students, seeing to it personally that the University Library remained untouched (cf. Fédier 1966: 899ff.; Allemann 1969: 252f.; Palmier 1968: 74f.; Moehling 1981: 33; *GR* 193ff.; *SUR* 23, 31f.).

These were but defensive steps. As for his constructive ideas, Heidegger repeatedly pointed to the above-quoted passage of his inaugural lecture in 1929 – namely, to his view of the situation of the sciences and the university (see *GR* 196; *SUR* 22). Heidegger's ideas about a cultural renewal, when reconstructed on the basis of his activity as a rector, may be summed up as having centered around the reciprocal coming together of the university (science) and the folk or nation (*Volk*). On the level of concrete measures, as will be seen, they took the form of accommodating students' lives to that of the nation or folk, on the one hand, and attempting to raise the *Volk* to science (university), on the other. But how is the awakening to take place? Who is to direct whom – should science lead the people or vice versa?

Given the premise that the decline of science and philosophy was but a reflection of a general social disintegration ensuing in the late nineteenth and the early twentieth century, and the idea that even science and philosophy have their own destinies, it is obvious that spiritual life could not be revived from and by itself. A comprehensive social renewal was required. Heidegger was well aware of this, as is shown by his quips connecting neo-Kantianism, and the state of German philosophy in general, to all-encompassing social developments. But there can be no question of the university and the sciences being renewed from 'outside', as it were. For the university would then run the risk of total subjection (a possibility that was to become painfully true later) – a risk that the renewal will *not* be a *spiritual* one. Heidegger's rectorial address treated the theme of the *self-assertion* of the university (a title no other rectorial address bore at the time) because he wanted to actively anticipate the possibility that the reshaping of the university would be determined by social transformations from 'above'. At the same time, he was attempting to re-define and give a new sense to the concept of learning and its role

in social renewal (see *GR* 193, 196, 198; *SUR* 25f.; Moehling 1981: 33). Inconceivable as the renewal of the university may be without an overall social awakening, still, the renewing of the university must nevertheless be carried through and achieved by the university itself – specifically, by way of a radical rethinking of its essence and tasks, a reappropriation and a retrieval of the original meaning of science and of its vocation. Were *that* to come about, science would have been re-united with and accommodated to the nation's life, not by some external force, but by itself (for as we know from *Being and Time*, science is but one of man's modes of being, and not the primary one (cf. *SZ* 11; *SU* 7). It is thus no mere accident – although it might well have seemed somewhat strange at the moment – that Heidegger should have begun his rectorial address in May with an analysis of the notion of science, and that, after tracing it back to the Greeks, should have linked it to the historical destiny of a people, claiming: 'a spiritual world alone is the guarantee of the greatness of the people' (*SU* 13).³¹

A new aspect of the notion of retrieval thus comes to the fore. The Being-question, the original meaning of philosophy. Heidegger says at the beginning of his address, was rooted in the Greek people's historical-national existence (*Dasein*); science was not for them a so-called cultural good, nor was it pure contemplation, that is, 'theory' conceived in opposition to 'praxis'. On the contrary, it was 'the highest realization of authentic praxis', a force encompassing the whole of their existence as a state and as a folk (cf. *SU* 9f.). If science was the Greeks' original mode of being, toward which all their efforts pointed, then it is very much a question of retrieving *that* world, of '*re-cuperating* [*wieder-holen*] the origin of our historical spiritual *Dasein*' (*EM* 29).³²

But how is the relation between leaders and followers within the university to be reshaped, once the university re-appropriated its original essence? What are the implications of the retrieval of the original notion of science? What difference will its rootedness in the historical-spiritual world of the people make for the task, mission, and internal life of the university? When we hear Heidegger saying at one point that 'the much celebrated "academic freedom" is driven out of the German university' (a statement that was to raise no little astonishment in decades to come), we should be aware of the precise context of this statement. The essence of the university, Heidegger says at the beginning of the address, is usually found in its 'self-direction', but that is a purely formal way of putting the matter. If 'self-direction' is taken to mean simply exemption from external influences and interventions, there will be a danger of increasing isolation, fragmentation, and disintegration. This would compromise the very notion of science, for, pushing this logic to its extremes, science is no longer science if any one university, faculty, or individual scholar can pursue, as it were, a science all on its (or his)

own. If one calls an arrangement for the interconnection of the various disciplines (Fachwissenschaften) a 'university' – Heidegger says in 1935 – then 'university' becomes an empty name. 'It no longer signifies a primordially unificatory and authoritative spiritual force' (EM 37). Such putative self-direction can be seen, in the light of Heidegger's diagnosis of Germany's spiritual decline, to be no more than 'the *Verkapselung* of the sciences into isolated branches [Fächer]',³³ 'an unhindered and senseless dispersion' (SU 12), a boundless activity of research which – as he formulates it in another lecture – 'hid its own uncertainty under [the mask of] the idea of an [alleged] international progress of sciences' (Schneeberger 1962: 74). If this 'much celebrated "academic freedom"' is now rejected by Heidegger, the reason is given by the words immediately following, namely, that 'being merely negative, this freedom was inauthentic', because 'it meant predominantly lack of concern, arbitrariness of aims and inclinations, licence [Ungebundenheit] in acting and not acting' (SU 15; see also GR 196).³⁴

Heidegger, however, as we have seen, is concerned with retaining the idea of a university's self-direction, and with doing so precisely by attempting to explore its deeper dimensions. A closer reflection upon the idea of self-direction, that is, of autonomy, freedom, shows it to mean 'giving the law to oneself' – a very Kantian view. The university is, accordingly, 'the place of spiritual legislation' (SU 15, 21).³⁵ If self-direction is possible only on the basis of reflection upon or awareness of what one is (Selbstbesinnung, SU 6), and if science's gaining awareness of itself consists in retrieving its original sense, meaning, and roots, by committing itself to shaping and reshaping the spiritual world of a people, then the task of the university cannot be confined to a 'dull and quick schooling [of the students] for an "elegant" profession' (SU 16). Such a conception of the university's task is, in Heidegger's eyes, the correlate of an otherwise unconstrained academic freedom; both are interpretations of the university imposed upon it from 'outside'. The university may not aim at providing whatever specialized professional training may be asked for. Rather, it is because the different professions of 'the statesman and the teacher, the physician and the judge, the priest and the architect lead and guard the existence of the people as a state [das volklich-staatliche Dasein]' that education in these professions is the task of the university. That the university is to shape the spiritual world of a people cannot imply domination over the nation, but rather that those educated and released by it will take care of and enrich the whole people's knowledge of its *Dasein* (SU 17).

The relation of leaders and followers is described by Heidegger in terms of *authentic existence*. Self-direction (Selbstverwaltung) based upon prior awareness of one's self (Selbstbesinnung) presupposes *resoluteness*, and the latter presupposes autonomy. What matters in leadership is not

so much the will to lead the way (Vorangehen) as the strength to walk alone (Alleingehenkönnen) (SU 14). The leaders should concede autonomous initiatives to the followers, and, conversely, the latter should not blindly yield to the leaders. 'Every following carries resistance with it. This essential tension inherent in leading and following must not be obscured, let alone eliminated' (SU 21; cf. De Waele 1947: 119; Harries 1976: 654; Guzzoni 1986: 76f.). Only thus will self-awareness be turned by self-assertion into authentic self-direction (SU 21).

Autonomy, as giving the law to oneself, is for Heidegger not so much obedience to the authority of pure reason, unaffected by sensibility, as it is rootedness in an effort to retrieve a historical heritage freely and resolutely assumed. If science for the Greeks meant taking a stand in the midst of beings which are constantly hiding themselves, this persistence is nevertheless well aware of its powerlessness in face of destiny. Indeed, this amounts to what may be called the 'creative powerlessness of knowledge' (SU 9f.).³⁶ For resoluteness, striving for the retrieval of the tradition, the future is open and indefinite. Taking over a heritage can never be compelled, but only free.³⁷ It is never unconditionally necessary that science as such should *be* at all, Heidegger says at the beginning of the address. In his conclusion he restates the same point. It is up to us, he says there, whether and how intensely we dedicate ourselves to the work of the renewal, whether we commit ourselves entirely to it, or merely change old rules and measures, replacing them by new ones. Nobody will prevent us from doing the latter. But neither will anybody ask about our approval or disapproval, if Western culture, well on its way to decline, ultimately collapses, thereby sweeping everything into confusion and madness. Whether that will come about or not is solely a question of whether we as a historical-spiritual people still want to be ourselves – but the young forces of our people have already taken their decision. 'The greatness and splendor of the renewal', he says in the last words of the address, 'will however be fully understood only if we assume that . . . soberness which the old Greek wisdom expressed this way: "Every greatness stands in the storm" ' (SU 21f.; Plato, *The Republic*, 497d, 9).³⁸

II.vi

The rectorial address may, in the last analysis, be seen as a dramatic call for the rescue of a declining culture, for the building up of a new spiritual world. However, not only the concluding words, but also the remarks about the powerlessness of knowledge warned against an ardent zeal and excessive enthusiasm. The breakdown of a culture makes the building up of a new world no more than possible – and *that* requires long and patient work. If the Greeks needed three centuries – Heidegger significantly said – in order merely to formulate meaningfully the very

question of what knowledge was, then we must not expect the complete clarification and realization of the German university to be carried out during the present or the following semester (*SU* 19f.). That Heidegger entertained few illusions about the tempo of the renewal becomes clear from a remark of his, made during the 1925/6 semester. Aristotle's logic has but one single child of the same rank, Hegel's, Heidegger said. No other descendants are possible; what is required is a new species.

When that species will come into existence cannot be known, but we, men of today, are certainly not of that species . . . our efforts may only be directed toward effecting the transition: what we can do [here Heidegger changes his tone] is no more than making the past alive for a future for which we yearn, but we shall not reach.

(*GA* 21: 14)

In keeping with his claim that real progress in science and philosophy is brought about only in and by a revision of fundamental concepts, a change in our access to the object or area of research,³⁹ Heidegger envisaged the renewal of the metaphysical tradition, the new elaboration of the Being-question, as attainable only after a laborious and careful re-appropriation of the basic metaphysical concepts of Western philosophy. (The previous quotation may help explain why external pressure was needed to make Heidegger publish *Being and Time*.)⁴⁰ So it is no accident that he saw European culture and civilization, the development of which had underlain the unfolding of Western philosophy and which was now in a deep crisis, as something not to be renewed overnight.

Heidegger's recognition that the renewal, both of the philosophical tradition and of the social-national framework, is a long process requiring the refoundation of the bases may shed new light upon a statement he made in his debate with Cassirer in Davos – a statement which has an odd ring: 'philosophy has the task . . . to push man back into the hardness of his destiny' (*KPM* 263; see also *GA* 29/30: 248). And if in his lectures in 1935 Heidegger once more emphasizes that 'philosophy, according to its essence, never makes things easier, but only harder' (*EM* 9), his underlying view is not a gloomy pessimism, but rather the conviction that the recovery from the decline, the creation of a new world, is dependent primarily upon a full and inexorable awareness of the extent, depth, and scope of the crisis. To suggest quick and random solutions is to mask the real character of the crisis. If the *Selbstbesinnung* remains blocked half-way, only pseudo-solutions will emerge, thus deepening the crisis even further.⁴¹

Given that his critical appraisal of *international* liberalism and its culture had left Heidegger susceptible to the idea of *national* socialism, does it follow that he remained insensitive to the condition of other nations,

or that he thought Europe's spiritual reorganization should be performed under German hegemony? That Heidegger approved of Germany's withdrawal from the League of Nations in November 1933 cannot, in the light of what we have said above, be a surprise. But it is important that in the very address in which he defended this step he emphasized:

Our will to the self-responsibility of the nation [völkische Selbstverantwortung] wills that each nation [Volk] shall find and guard the greatness and truth of its own determination. This will is the highest guarantee for peace among the nations, for it is tied to the fundamental law of manly respect and unconditional honor.

(Schneeberger 1962: 150)

And in another address he put it even more clearly: 'The will to build a genuine community of nations [Völkergemeinschaft] is equally far from the desire for a lame and unconcerned world-fraternity [Weltverbrüderung] and from the desire for a blind despotism. That will is operative at a higher level than this contrast' (Schneeberger 1962: 145).⁴²

Further, in 1937, long after he had detached himself from political developments in Germany and had retreated from public activity into inner emigration and nearly complete silence, he once again took up this theme – presumably because of the ever more aggressive and military character which nazism had adopted. 'A genuine reciprocal understanding between the nations', he wrote, 'may be achieved only in that creative dialogue in which each nation commits itself to gaining full awareness of its historical endowments and of the possibilities that history assigns it.' The rescue of European culture may be carried out only if each nation gathers itself unto a responsibility for its own historical traditions and heritage. Renewal must be effected by each nation one by one. 'Understanding in the genuine sense is possible only . . . through acknowledgment of what belongs properly to the other from out of an all-encompassing necessity' – its traditions and tasks. 'Genuine reciprocal understanding is not reciprocal reassurance [Beruhigung]⁴³ which soon leads to mutual indifference, but rather a constant and intensive questioning of each other [die Unruhe des gegenseitigen Sich-in-die-Frage-Stellens] – a questioning that springs out of concern for common historical tasks. . . . One of the most German thinkers of all, Leibniz', Heidegger observes, 'was inspired throughout his philosophical effort by a confrontation with Descartes.' The renewal of the spiritual world has, from this point of view, two necessary conditions: 'the persistent will to listen to or hear the other, and the resolute fidelity [der verhaltene Mut] to one's own determination' (WA in DE 15ff.). A creative historical commitment – he says in his lectures on Nietzsche in 1936/7 – 'cannot be limited either to particular groups, classes or sects, nor even to particular states and

nations, but must be at least European in scope.' The fact that this commitment must be accomplished by each nation separately does not imply 'separation from the other nations or, still less, their oppression', but rather the rise of the nations through and in a confrontation in which they develop, each by itself, the strength of rising one above the other (*N 1*: 185). The question of who man really is (the main problem of Europe in the present and the next century) 'may only find an answer in an exemplary . . . history-shaping [Geschichtsgestaltung] brought about by the nations competing with each other' (*N 1*: 361).

Heidegger's attempt at an original renewal of the essence of the university, or science, trying to tie these to and root them in a people's historical existence, was only one aspect of his activity. On the level of concrete measures, as we have said, there was the problem, not only of reconciling the students with, and making them participate in, the life and work of the people, but also, and of equal importance, of raising the people up to science. The program of national awakening included the project of procuring the unemployed not only work but also education. So we should look at the address that Heidegger gave to several hundred unemployed people who had been admitted to Freiburg University.

Heidegger spoke as rector in the assembly hall of the university. His speech starts out from the thesis that the end of unemployment should not be understood purely as the fact that one has now finally a job to do and is able to improve one's conditions of living. One should view it also as entering into the national community. Those given a job now belong to the whole of the nation, and are molding its future. It is from out of this lived experience that the formerly unemployed are supposed to recover their dignity *for themselves*, as well as appropriate security and resoluteness in relating themselves *to others*. Supplying with work is also supplying with knowledge [Arbeitsbeschaffung, Wissenbeschaffung]. If younger colleagues are ready now to transmit knowledge, Heidegger points out, it is not as 'learned' men belonging to the 'upper' classes, or as 'educated' people over against a stratum (a 'lower stratum') of the 'uneducated'. Rather, they do so as comrades, as members of the same national community (Schneeberger 1962: 200). The new common will is directed toward bridging the gap between manual and intellectual workers, and this bridge building (Brückenschlagen) is today no mere illusion.⁴⁴ For science is, he goes on to say, not the privileged property of the bourgeoisie to be utilized for the exploitation of the laboring people. Rather, it is a more rigorous and more responsible form of that knowledge which the whole German nation requires and seeks for its historical-national existence (assuming that this nation is to secure and guard its life and greatness at all). 'Knowledge had by genuine science is essentially no different from knowledge had by peasants, woodmen,

navvies, miners. . . . For to know means: *to know one's way* [sich auskennen] in the world, in which we all and each find ourselves'; to know means to master the situation, to be equal to it, to come up to the task. 'We do not make a distinction between those "educated" and those "uneducated" . . . not because there is no difference, but because our evaluation does not depend upon this distinction. Genuine knowledge is possessed by the peasant and the manual worker, each in his own way and in his own field.' A learned man may, for all his learning, go astray with his pseudo-knowledge (Scheinwissen). Not only the concept of science, but also that of labor is to be transformed. Spiritual labor is not exclusively that done by scholars: 'every labor *as* labor is something spiritual', for it is based upon competence, freely appropriated skills, and an intelligent understanding of the rules to come by – that is, upon authentic knowledge. The performance of the navvy is fundamentally no less spiritual than the achievement of the scholar. There is no real contrast between the 'workers' and those having knowledge peculiar to the sciences. 'Every worker, each in his own way, is a knower, and it is as a knower that he can work at all' (Schneeberger 1962: 201f.). Such an understanding of knowledge and of labor is the condition of the possibility of a 'bridge building' which is no longer extrinsic and artificial.⁴⁵

II.vii

It was thus within the framework of a general spiritual awakening that the National Socialist revolution was meaningful for Heidegger. What mattered was not to 'politicize' science and university but rather to lend spiritual content to society and politics – that is, to help shape an already existing movement, a movement born out of crisis, into a force capable of creating a genuine spiritual world.⁴⁶ Insofar as a renewal basing itself upon self-awareness presupposes resolute retrieval of and rootedness in one's own being, such a renewal is opposed to a radical subversion of factual conditions. (Philosophy, it may be remembered, has precisely the task of pushing men back into the hardness of their destiny). The universities' gaining awareness of their original meaning and mission by bringing themselves back to the national-historical community does not, therefore, imply in the least that the universities should, as it were, 'march into' the sphere of politics, taking over the role of the politicians. This mistake would lead, indirectly, to the same 'politicizing' of the university against which its *self-assertion* had tried to defend it. Its own 'political' function may be performed by the university only *as* university, that is, as a given, bounded domain within the national-historical community.⁴⁷ These considerations, which are in keeping with the main line of thought found in *Being and Time*, and with Heidegger's whole outlook, may account for the fact that Heidegger wanted to partake in the revival precisely

from his own place. He did not desire to assume another, perhaps higher, position.

He might, however, have had a chance to do so. In September 1933, as the German press of the day reported in detail, Heidegger was offered the chair of philosophy at the University of Berlin, upon an initiative of the Prussian minister of culture. Scarcely one month later, the Bavarian minister of culture invited him to accept the premier chair of philosophy at the University of Munich. In neither of the cases did the newspapers leave much doubt that the calls carried no little political weight with them.⁴⁸ However, Heidegger refused both calls. The reasons for his refusal are made explicit, and put in a particular light, in a radio lecture Heidegger gave in the autumn of 1933 – a lecture bearing the title ‘Why do we stay in the provinces?’ It offers no plausible arguments, but, once again, a meditation.

On the steep slope of a wide mountain valley in the Southern Black Forest [Heidegger begins the lecture] there stands a small ski hut; scattered throughout the base of the valley lie farmhouses, higher up the slope the meadows lead to woods with fir trees. This is my world. When the young farmboy drags his heavy sledge up the slope and guides it, piled high with beech logs, down to his house, when the herdsman drives his cattle up the slope, when the farmer in his shed gets the shingles ready for his roof, my work is of the same sort. A city-dweller thinks that in condescending to have a longer conversation with a peasant, he has gone ‘out among the people’. But when in the evening during a work-break I sit with the peasants at the chimney-corner, we mostly do not speak at all. We just smoke our pipes in silence. City-dwellers are ‘livened up’ by a so-called ‘outing in the country’. My work is however sustained and guided by the world of the mountains and peasants – a work of which I am not at all the master. City-dwellers are often amazed by such long monotonous periods of loneliness. But in large cities one can easily be lonelier than anywhere else. In the public world one can be made a ‘celebrity’ overnight by the newspapers and journals. That is the surest way to have one’s intentions misinterpreted and quickly forgotten. In contrast, the memory of the peasant has its simple fidelity which never forgets. Recently an old peasant woman died up there. She used to chat with me frequently, telling me many old stories of the village. Even in the past year, with her eighty-three years, she would still come climbing up the slope to see whether I was still there or whether ‘someone’ had stolen me off. The night of her death, not long before the end, she sent one more greeting to the ‘Professor’. Such a memory is worth incomparably more than the most astute ‘report’ of any international newspaper about my alleged philosophy. – Lately a very loud and

active obtrusiveness has been emerging, passing itself off as a concern for the world of the peasant. Men of letters chatter about 'folk-character' and 'rootedness in the soil'. What the peasant wants is however no such citified officiousness, but solely quiet reserve with regard to his own way of being. – Recently I got a second invitation to teach at the University of Berlin. On that occasion I left the city, and withdrew to the hut, where I listened to what the mountains, the forests and the farmlands were saying. I went to see my old friend, a seventy-five-year-old peasant. What would he say? He had read about the call in the newspapers. Slowly he fixed the sure gaze of his eyes on mine. Keeping his mouth tightly shut, he thoughtfully put his hand on my shoulder – and ever so slightly shook his head. That means: inexorably no!⁴⁹

II.viii

The hope for a spiritual reorganization of the nation, for the university's self-renewal and for its becoming rooted in an organic national community was soon to become untenable, thanks to the ever faster and wilder politicization of the society, the conversion of efforts to control the anarchy into those making for a totalitarian system, and the consequent solidification of a state-ideology, namely, racism. In the second half of 1933 Heidegger was already facing increasing difficulties. His ideas concerning renewal met pronounced resistance on the part of both 'the old' and 'the new'. The 'new' was represented by the idea of 'politicized' science – an idea that Heidegger looked upon as a falsification of the essence of truth. The 'old', by contrast, was the idea that everybody should be concerned with his own discipline and its progress – thereby dismissing general philosophical reflection upon fundamentals as mere 'abstraction', or admitting them as, at best, extrinsic ornaments (cf. *SUR* 22f.; *GR* 196).

In the winter semester of 1933/4 Heidegger intended to nominate outstanding young scholars as deans of the faculties, without any regard to their relation to the Nazi party (cf. *GR* 201; *SUR* 35).⁵⁰ By Christmas it had become clear that his planned renewal could not be carried through. Within the university there emerged objections to his idea of introducing students into responsible positions in the administration of the university. At the 'Todtnauberg camp', held by Heidegger to discuss impending tasks for the winter semester and to explain his ideas about science and about the university, some government functionaries, as well as some visitors from Heidelberg, introduced the theme of racial thought, thereby attempting to exercise pressure upon Heidegger and upon Freiburg University. In October 1933 the German rectors held a conference in Berlin to establish the new legal framework for subordinating the universities to the state. Freiburg University boycotted this conference:

Heidegger did not go, nor did he send a representative. In February 1934 Heidegger was called to Karlsruhe by the minister, who demanded that he dismiss, and replace with colleagues more acceptable to the party, Wilhelm von Möllendorf, dean of the Faculty of Medicine, and Erik Wolf, dean of the Faculty of Law. Heidegger refused the request, and offered his resignation, should the minister persist in his demand. This is precisely what happened. At the end of the winter semester 1933/4 Heidegger resigned. He tendered his resignation about a year after assuming office, and several months before the concentration of all power, subsequent to the death of President Hindenburg in August, in the hands of Hitler.⁵¹

In 1934 the orthodox Nazis started an open attack against the 'Jacobinical', plebeian wing of national socialism. At the end of June Hitler destroyed the faction of the party which was demanding fulfillment of its social promises. There would be no more talk about the 'spiritual revolution' of the workers, no more use of other ideas inspired by German Idealism. Their place would inexorably be taken over by a concept of the people defined in terms of race. By the time this new course prevailed, Heidegger had withdrawn from the movement.⁵²

The certainty peculiar to resoluteness – we read in *Being and Time* – must open itself to what is disclosed in resolution. That means: it may not stiffen itself in the situation, but should rather keep itself open for the possible, and indeed from time to time necessary, re-appropriation of itself. Resoluteness as fidelity to one's self, as destiny, is freedom for the *giving up* of a particular resolution – a giving up required by the possible situation (SZ 307f., 391).

Acknowledgments

I am grateful to the editors for their comments and suggestions. I also wish to thank Richard Rorty for reading a first draft of this chapter, for commenting upon it, and – last but not least – for helping improve my style.

Notes

1 Cf. GA 1: 186f., 406, 410f. Heidegger's reading, at the age of eighteen, of Brentano's dissertation *Von der mannigfachen Bedeutung des Seienden nach Aristoteles* may be considered to be the first and decisive incitement to formulate the Being-question. Cf. his Preface to Richardson 1963: xi; and GA 1: 56.

2 'The constant sharpening of the knife', Heidegger quotes significantly Lotze in his *Habilitationsschrift*, 'is boring if one has nothing to cut with it' (GA 1:

200). In a review written in 1912 on recent developments in logic, Heidegger even mentions Russell and Whitehead's *Principia Mathematica* (see GA 1: 42).

3 Cf. SD 87. For the presence of Aristotle in the formation of the young Heidegger's thought see Sheehan 1975, and Volpi 1984b, chapters 1-3.

4 An example may be the *Habilitationsschrift* itself, in which Husserlian phenomenology is utilized to illuminate, and thus show the theoretical significance of, Scotus's thought – an accomplishment which enables Heidegger, conversely, to situate Husserlian phenomenology historically as a continuation of a traditional problematic.

5 To pose and elaborate (work out) a question means for Heidegger primordially to clarify the prior ground or horizon which lends meaning to the terms in question. To put it roughly, so as to be able to answer any question, we must have already understood its meaning (to the question, e.g., 'What color is the table?' the answer: 'Square' would fail to understand the *direction* of the question); that is, any question implies or carries with itself a pre-conceptual or – as Heidegger puts it – 'pre-ontological' understanding of its meaning. We are able to *take up* the Being-question, J. Sallis comments upon the first paragraphs of *Sein und Zeit*, 'only to the extent that we can *pose* it; to pose it appropriately . . . is to let the structure which belongs to the question unfold from the question itself' (Sallis 1978: 28f.). See SZ par. 2, 32; Gadamer 1975: 250ff.; Herrmann 1987: 51ff.

6 The metaphysic-ladenness of epistemological or logical theories is, however, of a peculiar sort – one which those moving within the theory cannot become aware of. Incapable of being thematized, it is not susceptible of critical discussion or examination. See e.g., Heidegger's discussion of the latent, 'dogmatic' metaphysical presuppositions inherent in Husserlian phenomenology (GA 20: 140ff., in particular 147, 155, 158, 178). Concerning Heidegger's confrontation with Husserl, see Volpi, 1984a; for the concept of phenomenology in Husserl and Heidegger see Herrmann 1981, in particular, 37ff.

7 Cf. GA 20: 200f.; GA 24: 103f., 154f., 172, 444; GA 25: 167; GA 26: 19ff., 109; SZ 154, 183, 212; later e.g., EM 78. In Heidegger's perspective it is no mere accident that Hegel's ontology, as the offspring of a long development, is symptomatically called *Logic* (cf. GA 25: 167; see also GA 21: 311).

8 For Heidegger's discussion of the logic of questioning in his dissertation, see GA 1: 160.

9 I borrow the term 'anti-metaphysical' from Otto Pöggeler (1963: 28).

10 Existential analytic might be seen as a polemic radicalization of Kant's replacement for traditional ontology, namely, a transcendental analytic of the pure intellect ('blosse Analytik des reinen Verstandes': *Critique of Pure Reason* A 304 = B 247). Heidegger, writes Richardson, 'shifts the emphasis from an investigation of man's reason . . . to an investigation of man in his totality' (Richardson 1963: 31).

11 Existential analytic, so conceived, is not anthropology. For to elaborate a theory of man as one being among others already presupposes a prior clarification of the different domains of Being – a task not to be accomplished until after the Being-question is answered; cf. SZ 17, 45ff.; KPM 202ff., 227.

12 The term used by Heidegger for man is *Dasein*, which will be left untranslated in the text. The reason why Heidegger does not use the term 'man' is, negatively, that this term is laden with traditional metaphysical presuppositions, suggesting as it does a 'rational animal', a being 'endowed with reason' (a conception Heidegger intends to criticize). The positive reason is that man, for Heidegger, has an intrinsic relation to *Sein*, and possesses a pre-conceptual

understanding of Being. Man is indeed the very being which poses the Being-question. The term *Dasein* is apt to suggest all these connections with *Sein*. Concerning the term *Dasein* see King 1964: 65ff.; Richardson 1963: 44ff.; W. Marx 1961: 209ff.; Fell 1979: 31f.; Pöggeler 1983: 93; Biemel 1978: 111ff.

13 'Das Ganze eines Begründungszusammenhanges wahrer Sätze' (SZ 11). For the term 'Begründungszusammenhang' see Husserl 1980. What Husserl means by this central term of his *Wissenschaftslehre* is that *Wissenschaft* (as opposed to mere *Wissen*) consists not only in one's *knowing* particular perceptions, or having isolated knowing acts. Rather, it requires, if it is to be worthy of its name, some 'systematic connection in theoretical sense', that is, 'the founding of knowledge' (Begründung des Wissens) (cf. Husserl 1980: 15, 230ff.).

14 Concerning parallels between Heidegger's ontological refutation of the epistemological standpoint and the perspective of German Idealism see Gadamer 1976: 140f.

15 Heidegger's argument may be seen as amounting to a kind of 'refutation of skepticism'. Insofar as it shows that some prior knowledge must by necessity precede or underlie all sorts of doubt, rendering doubt possible, his strategy is analogous to that of the later Wittgenstein (see Wittgenstein 1984: 141, 143 (pars. 105, 111)).

16 This may be one of the reasons why Heidegger rejects the application of traditional categories to man (e.g., 'subject', 'ego', 'reason', 'spirit', etc.; see SZ 22). One can say, Gadamer writes, that 'it is *Dasein's* inauthenticity from which metaphysics as the ontology of *Vorhandensein* developed itself' (Gadamer 1985: 19).

17 Cf. SZ 383f. For the variety of meanings and implications of the term *Wiederholung* see Caputo 1982: 343ff.

18 I should note that some basic issues – above all Heidegger's discussion of truth and time – have been neglected. Also the *vexata questio* of the incompleteness of *Sein und Zeit* cannot be discussed in the present context.

19 Cf. SZ 264, 298. Since finitude is the basic character of *Dasein*, gaining awareness of it by anticipating death helps it become conscious both of what possibilities are uniquely its own (that is, not the others'), and, vice versa, of those possibilities of others which are not – and perhaps necessarily cannot be – its own. Demske rightly speaks in this sense of a 'social aspect' of the anticipation of death (Demske 1963: 38).

20 The term 'Wiederholung' appears as early as the title of the first section ('Die Notwendigkeit einer ausdrücklichen Wiederholung der Frage nach dem Sein': SZ 2; see also KPM 232; Richardson 1963: 93). The notion of 'retrieval' is thus present and operative long before the analyses of authenticity are provided (for this notion in the young Heidegger see GA 61: 80). From another perspective, Heidegger intended to 'retrieve' the whole existential analytic from within the elaborated horizon of the Being-question. Because of the incompleteness of the work, this did not come about. But nevertheless the 'second' Heidegger may pertinently be held to be a retrieval of the 'first' Heidegger (cf. Richardson 1963: 625; Fehér 1984: 146). – All such attempts at retrieval must, however, be conscious of taking their starting points *from within* history (see SZ 20f.). So when Heidegger says in his lectures that his investigations too are determined by the historical situation, and thereby conditioned by traditional philosophies' access (Zugang) to beings (cf. GA 24: 31), this situation both characterizes *extrinsically* the moment of his positing the Being-question and emerges *intrinsically* as one of the main tenets of *Being and Time*: namely, that authenticity is only an existential modification of inauthenticity, always preceded by the latter, and that

Dasein can never remain unaffected by inherited everyday opinions (alltägliche Ausgelegtheit). It is in these opinions, for them and against them, that all genuine understanding, interpretation, communication, discourse and re-appropriation take place. It is likewise in them, against them, and at the same time for them, that resolute *Dasein* projects itself upon the chosen possibility (cf. *SZ* 169, 383). This view helps us understand why and how the history of philosophy constitutes an integral part of systematic philosophy.

21 Cf. *GA* 61: 21; *GA* 20: 179, 188; *GA* 21: 13f.; *GA* 26: 101, 196f.; *SZ* 21ff.; *GA* 29/30: 53ff.; *EM* 10. As to 'blind' traditionalism, see his critique of Husserl, his remarks upon Descartes's 'dogmatism', present also in Kant, and his observations on Descartes's own inauthentic traditionalism: *GA* 20: 147; *GA* 21: 291; *GA* 29/30: 30, 64, 84; *GA* 32: 196.

22 The point that the cultural crisis in Europe was felt most intensively in Germany is made in a lively and convincing manner by Gadamer (see Gadamer 1983: 9f.).

23 I do not, of course, wish to claim that in his critique of traditional notions of man, Heidegger did not employ eminently *theoretical* arguments. (Indeed, I attempt to show some of these above). What I do suggest is that, whatever the particular 'psychology of discovery' may have been, the starting intuitions of such a critique must have been provided by factual experience of life. (We do know that one of his early lectures bore the title 'Hermeneutik der Faktizität' [cf. Pöggeler 1963: 29 and the forthcoming *GA* 63; see also Gadamer 1986/7: 16].) Put in another way, the starting point of such a criticism must have been a prior dissatisfaction with commonly accepted notions of man.

24 We may refer first of all to his *Habilitationsschrift*, and in particular to those passages which offer critical reflections on the culture of the day (see *GA* 1: 200, 408f.).

25 Plato is claimed by Lotze to have remained captive to incoherence; however, Heidegger remarks, it is only in his interpreters that Plato turns out to be senseless (*GA* 21: 71).

26 *GA* 21: 83f. (The above passage is a close paraphrase rather than a translation.) – Not only has the Kant literature, he says on another occasion, become more important than Kant himself, but its effect will be that nobody will be able to get access to the thing (*Sache*) (*GA* 32: 41). To appropriate intentionality, he observes on yet another occasion, what one needs is not sharp intelligence (*Scharfsinn*), but only refraining from prejudice, concentration upon and disciplined description of what one has before one's eyes. Objectivity (*Sachlichkeit*) concerning what is evident, he adds, is nevertheless the most difficult thing one can achieve, for man is naturally at home in what is artificial, deceptive, what he picks up from idle talk with others (*GA* 20: 37). Finally, consider one last, interesting, series of observations, made in 1925: 'Today people decide about metaphysics or even higher things at congresses. Nowadays there are conferences to decide every question – that is, people come together, and keep coming together, and everybody expects the other to tell him what to do. If he is not told, it is also of no importance, for what really matters is that one has spoken [hat sich ja nun ausgesprochen]. Though all the speakers may have little understanding of the thing in question, nevertheless it is believed that some understanding *will* finally be derived from the accumulation of non-understanding [Unverstehen]. So there are people today who travel from one conference to the other, and get the feeling that something is really happening, as if they had been really doing something. But in fact they have just relieved themselves from work, and have tried to conceal their own helplessness under the cover of idle talk. . . . So

finally people think that everything is all right, and one should be present at every congress' (GA 20: 376f.). 'It is clear', he adds somewhat later, 'that research and science are also *Dasein's* possibilities, and are, therefore, susceptible to the modifications of *Dasein's* being . . . , and in particular to fallenness . . . : so philosophy contains, always and necessarily, a bit of sophistry' (GA 20: 416f.; see also GA 32: 41).

27 For a critique of the philosophy of *Weltanschauung*, see Husserl 1965, and Heidegger's analogous considerations in GA 24: 5ff., especially 13, and GA 61: 44. For Heidegger, however, the insistence upon 'scientific' philosophy in contrast to the philosophy of *Weltanschauung*, viz., rationalism in contrast to irrationalism, is simply beside the point. Cf. GA 1: 410; SZ 136; EM 136; N 2: 372, 531; BH in GA 9: 349; GA 32: 143; GA 52: 133; SD 79. See also Hogemann 1986/7: 56, 62; Kisiel 1986/7: 106f.; Rodi 1986/7: 168.

28 Heidegger, Karl A. Moehling writes, 'was both attracted to and repelled by Nazism. He was put in what he called a "middle position" of believing in the social and national ideas of the movement while rejecting the essential racism' (Moehling 1981: 36). At that time, Jaspers admits in his notes, 'neither he nor any of us could know what was going to become of it all' (Jaspers 1978: 180). For Adorno's analogous misinterpretation of the situation, see Pöggeler (1985: 28).

29 The idea goes some decades back. The attempt to bring together the two major intellectual trends of the past century, nationalism and socialism, dates as far back as the 1890s. Friedrich Meinecke, the great German historian, shows this convincingly in his memoirs, written immediately after World War II (see Meinecke 1949: 33ff.). There was first of all Friedrich Naumann's attempt, in the early 1890s, to fuse the nationalistic and the socialist trends (the former supported mainly by the middle class, the latter by workers). Naumann tried to quell the hostility between the two classes so as to mitigate the extremely anti-nationalist (that is, internationalistic) faith of the socialists by attending to the workers' material and spiritual needs. Had Naumann's attempt succeeded (an attempt Meinecke calls 'one of the noblest dreams of German history'), Meinecke thinks, Hitler could never have risen to power (Meinecke 1949: 34). It is significant that Naumann's name is mentioned by Heidegger in a positive sense in the *Spiegel*-Interview (GR 196; see also Pöggeler 1988: 27). As to differences between the forms of early national socialism and the subsequent totalitarian regime, see also Palmier 1968: 193; Pöggeler 1983: 392; Pöggeler 1984: 234.

30 Hermann Rauschning, a Conservative and one of the founding members of the Nazi party, who in 1934 went into exile and became a bitter enemy of the regime, spoke in 1938 about the 'National Socialist usurpation' of the idea of the Third Reich. This was originally 'a slogan of the Young Conservatives, the title of a book published in 1922 by Moeller van den Bruck', - an idea which in its author's 'original conception was not a German idea', but 'a political idea of European scope'. 'In spite of its manifest defects', writes Rauschning, 'National Socialism offered opportunities of pursuing initiatives in which the Young Conservatives were interested. . . . Many conservatives . . . found their way into the ranks of National Socialism from the very best of motives and in perfect good faith.' ' . . . ten years before the National Socialist seizure of power, the Young Conservatives of Germany had a home and foreign policy immeasurably superior to that of the present regime of violence, and envisaged Germany's recovery only in connexion with a universal idea of right, with a "European solution". Nothing was more horrifying to the Conservatives than the gradual recognition that the "national rising", with which they had associated themselves to that

end, was in reality a cynical nihilist revolution, the negation of their own ideals.' (Rauschnig 1939: 121, 119, 309; see Stern 1984: 12ff., 18). Heide Gerstenberger characterizes revolutionary Conservatives by the attempt 'to revolutionize spiritually the society [Gesellschaft] by transforming it into a community of the people [Volksgemeinschaft]' (Gerstenberger 1972: 343). That conservative thinkers cannot be taken as simple precursors of nazism is also stressed by Palmier (1968: 172; see also Pöggeler 1974: 109). For a sense of the general historical atmosphere, Alan Bullock's analyses are useful: '1933, like other revolutionary years, produced great hopes, a sense of new possibilities, the end of frustration, the beginning of action, a feeling of exhilaration and anticipation after years of hopelessness. Hitler recognized this mood when he told the German people to hold up their heads and re-discover their old pride and self-confidence. Germany, united and strong, would end the crippling divisions which had held her back, and recover the place that was her due in the world. Many people believed this in 1933 and thought that a new era had begun. Hitler succeeded in releasing pent-up energies in the nation, and in creating a belief in the future of the German people. It is wrong to lay stress only on the element of coercion, and to ignore the degree to which Hitler commanded a genuine popular support in Germany' (Bullock 1952: 253; concerning the last statement, see also Picht's memoir of Felix Jacoby, quoted in note 46, *infra*).

31 It is not without significance that at this point Heidegger makes use of the term *Geist*, which he had primarily put in quotation marks and treated as an ontologically obscure concept. The fact that he takes it up now by re-defining it in terms of his own notion of authenticity ('Spirit is primordially attuned, knowing resolution towards the essence of being' (*SU* 14)) supports the assumption that retrieval of the philosophical tradition was for Heidegger not a merely intellectual project, and that his objections to traditional ontological concepts should be seen in the context of his dissatisfaction with lived experience which was linked to those concepts. 'Heidegger's insistence on the autonomy of the university', writes Karsten Harries, 'challenged those who wanted to make it into a tool of the movement and reduce it to a vocational school, while his emphasis on the spiritual opposed Rosenberg's subordination of spirit to race and biology.' ('For Heidegger', writes Lucien Goldmann, 'anti-semitism must have been but a serious and unfortunate error, for the biological has no place in ontology, and can, therefore, neither limit, nor increase *Dasein's* possibilities of choice between the authentic and the inauthentic.') 'This is not to suggest', Harries goes on, 'that Heidegger's commitment to the Nazis was less than genuine. He appears to have been convinced at the time that in spite of the threat posed by party functionaries and ideologues, the engagement of people like himself could help to shape the Nazi movement in such a way that it would become a force which could rescue Germany from crisis and confusion' (Harries 1976: 653; Goldmann 1973: 78; see also Palmier 1968: 63). 'Fatal though the impression of some Heideggerian texts of the time may be upon us today', writes Hermann Mörchen, 'it is equally remarkable that in those very texts no concessions to anti-semitism can be found' (Mörchen 1981: 254; see also to the same effect Ott 1984b: 122; Pöggeler 1985: 62, 44). Moehling rightly makes the point that the rectorial address 'was a revolutionary appeal in that he argued that the time had come in German history when an examination of the relationship between the university and the nation was not only desirable but an absolute necessity. He urged the re-assertion of the university and learning in the life of the nation so that pressing and urgent spiritual issues could be confronted' (Moehling 1981: 33f.).

32 Heidegger, writes Harries, 'calls for a thinking which, no longer content

with the splintering of science into sciences, will help to establish the "spiritual world" of the German people and thus help to overcome the disintegrating tendencies of the age' (Harries 1976: 654). 'Clearly', writes Moehling, 'Heidegger's thinking in 1933 on learning and the German university demonstrates a serious departure from the Nazis' understanding of the University as a place for training a racial elite subservient to the state' (Moehling 1981: 34; see also Richardson 1963: 257; the title of the rectorial address, as Michael E. Zimmermann points out, was 'a daring title during the time when Hitler expected the universities to submit to what he asserted to be the demand of *das Volk*' (Zimmermann, 1981: 171). Seen in the context of other rectorial addresses of the time, writes Bernd Martin, Heidegger's was an exception; it was not at all in line with what the Nazis had expected (Martin 1986: 52; see also Schmidt 1986: 88). Obviously, this departure could not remain hidden. As Heidegger recorded in his recently published memoir, Minister Wacker immediately let him know his view of the rectorial address. In the minister's judgment, the address represented a sort of 'private National Socialism', which circumvented the perspectives of the party program, failed to be based upon 'racial thought', and rejected the idea of the 'politicized science' (cf. *SUR* 30f.).

33 The expression 'Verkapselung' is applied also technically by Heidegger to denote the 'worldless' subject characteristic of modern philosophy (see *SZ* 62).

34 Heidegger's rejection of 'academic freedom', writes Palmier, is not equivalent to the repudiation of the liberty of teaching or of the expression of thought (cf. Palmier 1968: 83). 'In Heidegger's understanding', Moehling writes, 'academic freedom in the modern age had come to mean academic specialization and the fragmentation of learning into distinct and isolated areas. It was the modern trend towards specialization, relativism, and irrelevancy which molded the university into a corporate entity which took pride in its autonomy but failed to recognize its isolation from the spiritual needs of the nation' (Moehling 1981: 34). That *Gebundenheit* in the positive sense is not synonymous with lack of freedom or subjection is a point made already in Heidegger's *Habilitationsschrift* (cf. *GA* 1: 199; see also *SZ* 122: 'Authentic Verbundenheit alone renders proper objectivity [*Sachlichkeit*] possible'; and *WW* in *GA* 9: 189: 'Freedom is not the *Ungebundenheit des Tun- und Nichttunkönnens*').

35 Concerning the Kantian concept of freedom as *Selbstgesetzgebung* see *GA* 31: 24 (where it is called 'the positive concept of freedom') and *passim*. The notion of the university as 'the place of spiritual legislation' shows many parallels with similar views characteristic of German Idealism (see Moehling 1981: 35). The most relevant text in the writings of German Idealists is perhaps Schelling's *Vorlesungen über die Methode des akademischen Studiums* (1802). See Schelling 1977: 251, 254, 257 (Universities are defined here as 'Verbindungen für die Wissenschaften', and Heidegger claims, in like manner, that the commitment to the essence of the university is the commitment to science (*SU* 7: 281f., 284, 299, 304f; see also Fichte 1971: 110)). Here we touch upon a further aspect of the concept of *Wiederholung* – namely, in the sense of a retrieval of German Idealism's understanding of the cultural role of philosophy in the national awakening, and in the nation's life in general (see also Hegel 1970: 402ff.). It must be added that one of Heidegger's constant philosophical concerns was the *essence of the university*: he repeatedly gave lecture courses on it, the first as early as 1919 (see Richardson 1963: 663, 666; Pöggeler 1988: 21f.; see also *GA* 61: 62ff.).

36 See also the remark, quoted in section II.iii, on the destiny of science and philosophy.

37 For a Kantian parallel, cf. Kant 1982: 704.

38 Werner Jäger, who was soon to leave Germany because of his Jewish wife, had the intention of publishing the rectorial address in the review *Die Antike*, for he held it to be an outstanding example of how the classical heritage was alive in the present (see Petzet 1983: 34). Karl Jaspers wrote to Heidegger on Sept. 23, 1933, that the rectorial address 'is up to now the only document of a present academic will . . . that will be lasting [bisher einzige Dokument eines gegenwärtigen akademischen Willens . . . , das bleiben wird]' (Jaspers 1978: 13).

39 A view which has significant parallels with Kuhn's. See GA 1: 419; GA 20: 4; GA 21: 16f.; GA 25: 30ff.; SZ 9ff.; FD 50ff.

40 Cf. SD 87f. For the details of the publication of Heidegger's *magnum opus* see Sheehan 1981: 15; Sheehan 1984: 181ff.

41 Heidegger's critique of Nazism from 1934 on will be based upon the insight that Nazism, instead of offering a genuine solution to Europe's spiritual crisis, is, with its racial ideology, rather a continuation, and indeed a consummation, of the decline of the West, predicted by Spengler (see e.g., his critique of Rosenberg and Kolbenheyer in his lectures of 1934/5 (GA 39: 27f.; see also Schmidt 1986: 86). It is only too natural that those who were offering such pseudo-solutions were the first to accuse him of 'pessimism' and 'nihilism'. 'The meaning of this philosophy' – we can read in the journal *Volk im Werden* in 1934 – 'is outspoken atheism and metaphysical nihilism, as it formerly had been primarily represented by Jewish authors in Germany; therefore, a ferment of decay and dissolution for the German people. In *Being and Time* Heidegger philosophizes consciously and deliberately about "everydayness" – there is nothing in it about nation, state, race, and all the values of our National Socialist world-view' (Kriek 1934: 247, reprinted in Schneeberger 1962: 225; see Moehling 1981: 36f., whose translation, with slight modifications, I adopted).

42 It is important to see that Heidegger's description of the passage from inauthenticity is now transposed to the level of history: just as *Dasein*, in effecting the passage, first becomes isolated by anticipating death and harkening to the call of conscience, in order to open itself newly and genuinely for the world, and to render authentic Being-with possible, a nation is now seen as stripping itself of the inauthentic international *Mitsein*, conceived of in terms of *das Man*, in order to set an example for other nations' possible retrieval of themselves, and to open up for them, in authentic 'leaping ahead', their own and genuine care (the term 'Verbrüderung' is characteristically adopted in *Being and Time* to denote inauthentic *Mitsein* [SZ 298]).

43 The term 'Beruhigung' also denotes inauthenticity: it is in fact a category of fallenness (see SZ 177).

44 It should be noted that the expression *Brückenschlagen* is also part of Heidegger's philosophical vocabulary, denoting as it does the (mostly hopeless) attempts made by modern philosophy to mediate between the subject-object dualism, viz., the self-autonomous egos (cf. SZ 124; GA 21: 91ff.). Heidegger's application of the term in a different context should not, I think, be taken as a mere extrinsic analogy. It should rather be seen as an aspect of the previously mentioned connection between the renewal of the Being-question, of the meta-physical tradition (of which the subject-object dualism is, after Descartes, an integral part), and the reshaping of the historical-factual grounds underlying the tradition. A new access to Being is, after all, not a purely intellectual operation. Heidegger may legitimately be said to have expected the national awakening to provide a new experience of Being (for hints to this effect see SU 10, 14; GA 26: 23).

45 The notion that labor is not equivalent to physical labor – a notion that

goes back to Hegel and was elaborated in detail by Ernst Jünger in his *Der Arbeiter*, published in 1932 (see Jünger 1959: 74, 84, 223, 283, *et passim*) – is stressed by Heidegger on other occasions too. He explains thereby why animals, properly speaking, cannot *work* (see Schneeberger 1962: 180; on Jünger's influence upon Heidegger cf. Petzet 1983: 37f.; concerning Jünger's rejection of racism see e.g., Jünger 1959: 160; on Jünger's becoming an opponent of the regime see Krockow 1958: 112, who mentions that Jünger's *Auf den Marmorklippen*, published in 1939, was generally understood as a *Widerstandsschrift*). Given this conception of labor and knowledge, the students' *Arbeitsdienst* can no longer be seen as 'condescension' from a higher world to a lower one. 'The so-called "spiritual work" is not such because it concerns "higher spiritual things", but because *as work* it reaches deeper into the necessity of a people's historical *Dasein*' (Schneeberger 1962: 181; see Schwan 1965: 182).

46 Cf. *SU* 8, 14; *GR* 198; *SUR* 23; Schmidt 1986: 90. Concerning the way Heidegger conceived of the revival of the university, and particularly of what should *not* be part of the revival, Georg Picht relates an interesting story. To give the first lecture within the framework of 'political education' – a measure introduced at the German universities by the Nazis – Heidegger invited a man, Victor von Weizsäcker, who was known not to be a Nazi. After interrupting abruptly the introductory words on national socialist revolution, pronounced by the leader of philosophy students, Heidegger let von Weizsäcker speak about Freud. Picht also relates the words with which Felix Jacoby opened his university lectures on Horace in Kiel, in 1933. It is perhaps worthwhile to quote them, to illustrate the general atmosphere of the day: 'As a Jew, I find myself in a difficult position. But as a historian, I have learnt that historical events are not to be assessed from a personal perspective. From 1927 onwards I have made my option for Adolf Hitler, and consider it an honor to be able, in the year of the nation's rise, to lecture on Augustus' poet. For Augustus is the only figure of world history whom one can compare to Adolf Hitler.' Jacoby, as Picht writes, later emigrated to Oxford (Picht 1977: 198ff.; see also Petzet 1983: 37; Stern 1984: 39f.).

47 Heidegger did not elaborate anything like a 'political theory', for, as will have become clear by now, the 'theoretical-practical' distinction was one of the traditional metaphysical distinctions he wanted to overcome (see e.g., *SZ* 193; *SU* 10). The elaboration of a 'political theory' requires conceding some autonomy to the political sphere – a concession which, given his critical attitude toward the fragmentation characteristic of modern societies, Heidegger obviously could not make (see Pöggeler's objection to this effect in Pöggeler 1982: 50). Nevertheless, it may be said that Heidegger's philosophy, in a certain precise sense, is very political – namely, in a sense of the term associated with the Greek *polis* (cf. Palmier 1968: 159). The rejection of the autonomy of the 'political', and the consequent lack of a 'political philosophy' in his thought is explicit in his lectures in 1943. Commenting upon Heraclitus, Heidegger asks: 'And what, if, thought in the manner of the Greeks, the concern for the emerging presence [Anwesenheit] of the Gods were the highest concern for the *polis*? . . . If such is the case, then . . . the thinker, in his concern for the essential proximity of the Gods, is the authentically "political" man' (*GA* 55: 11f.).

48 Cf. Schneeberger 1962: 123, 132f. Heidegger received a previous call to Berlin in 1930 (Schneeberger 1962: 12).

49 'Warum bleiben wir in der Provinz?' *Der Alemanne*, 2 March 1934, reprinted in *DE* 9ff. English translation by Thomas Sheehan (see Sheehan 1981: 27ff.). I adopted this translation, with slight modifications, in the above paraphrase.

50 Heidegger himself was by then a member of the party. He entered on May 1, 1933, in order primarily to facilitate his relations with the ministry, and to be thus in a better position to put his ideas through – that is, as he wrote in a letter to the de-Nazification committee at Freiburg University after the war, ‘to attempt from *within* National Socialism and while having a point of reference to it, to bring about a spiritual change in its development’. But it caused no little astonishment in the ministry that none of the deans appointed by him in the autumn were party members (Heidegger’s letter is quoted by Moehling (1981: 33); see also Fédier 1966: 900; Allemann 1969: 252; Palmier 1968: 9, 89; Pöggeler 1974: 18f.; *SUR* 33, 37). Erik Wolf, dean of the Faculty of Law, later to become a bitter enemy of the regime, wrote in 1945 that what he found fascinating in Heidegger’s ideas was the hope in a ‘regeneration of the university’ (see Hollerbach 1986: 39f.).

51 Cf. *GR* 201; *SUR* 37; Fédier 1966: 901; Allemann 1969: 253; Moehling 1981: 37; Palmier 1968: 159; Martin 1986: 67. His successor was appointed by the ministry, and Heidegger refused to be present at the public celebration of his successor’s assumption of office (see also Wisser 1977: 264). The final events took place at the end of April (see Ott 1984a: 357). Although Ott is critical of Heidegger, he admits that ‘the accord between National Socialism and Heidegger could not last long, provided that Heidegger was to remain true to his own convictions, and the Nazis to theirs’ (Ott 1984a: 353).

52 Cf. Youssef Ishaghpour’s Introduction in Goldmann 1973: 44f. See also Picht 1977: 198. The tendency to overlook such changes in the concrete historical situation surrounding Heidegger’s activities as rector is illustrated by Farias (1987), a book which appeared after the completion of this paper. A critic with strong anti-Heideggerian inclinations admitted that from Farias’s book ‘nothing decisively new had come to light’ (Augstein 1987: 215). It remains to be seen whether the German edition of this book, now in preparation, will contain substantive documentary support for its claims, as urged, among others, by Aubenque (1988) and Rorty (1988: 32). Some like Aubenque (1988) and Rorty (1988: 32) urged for more substantive documentary support. For more detailed remarks on the recent discussion raised by Farias’s and Ott’s books, together with a critical evaluation of the a priori notions inherent in them as well as an attempt to enlarge the context of those approaches, see now my paper ‘Fakten und Apriori in der neueren Beschäftigung mit Heideggers politischem Engagement’ in *Zur philosophischen Aktualität Heideggers. Symposium der Alexander von Humboldt-Stiftung vom 24–8. April 1989 in Bonn-Bad Godesberg*, ed. by D. Papenfuss and O. Pöggeler, vol. 1: *Philosophie und Politik* (Frankfurt: Klostermann, 1991), 380–408.

Authenticity and Heidegger's challenge to ethical theory

Douglas Kellner

Martin Heidegger's concept of authenticity in *Sein und Zeit*¹ offers a series of interpretive problems and challenges. Heidegger claims that his existential analytic is purely ontological and disclaims that his analyses have ethical import. Yet generations of readers, including some of the century's most prominent philosophers,² have been convinced that Heidegger has offered an ethical doctrine. Indeed there is a lively controversy as to whether Heidegger is nihilist who has devaluated traditional values and offered little or nothing in their place,³ or whether Heidegger has provided a liberating doctrine of an authentic existence that is the foundation of an existentialist ethics.⁴ In this paper I wish to sort these claims out and to inquire what relevance, if any, Heidegger's doctrine has for contemporary ethical theory. I shall argue that Heidegger's analyses contain a critique of ethical prescriptivism and put into radical question one of the hallowed dogmas of empiricism: the distinction between fact and value and normative and descriptive statements. Heidegger, we shall see, also provides an interesting contribution to the is-ought controversy and to our understanding of the relations between ethics and ontology. It could be possible that current discussions of ethics could profit from the study of a philosopher who is taboo in many analytical circles. Indeed, one of the benefits in reading Heidegger is his putting into question and offering alternatives to many of our dominant philosophical prejudices and our complacent commonsensical view of both our philosophical practice and everyday ways of being.

An obstacle to the appropriation of Heidegger into the English-speaking world is the work of Heidegger's interpreters and camp followers and their misleading and obscure renditions of his philosophy. His interpreters are for the most part mystifiers, or simplifiers. The majority are more obscure than Heidegger and heavy-handedly repeat his jargon without his originative philosophical talent, his vision, his prolonged

meditation on the problems he handles.⁵ There has been, however, some promising recent work on Heidegger's philosophy that discloses the positive contribution his work could make to the English-speaking philosophical world. It is in this spirit of communicating Heidegger's philosophical contributions that the present essay was composed. My critique of Heidegger has been published elsewhere.⁶

In this paper I shall first discuss Heidegger's distinction between an authentic and inauthentic existence and shall discuss the sense in which he is, or is not, offering a normative doctrine and engaging in social critique. This discussion will raise the question of the normative-descriptive distinction and the linguistic status of Heidegger's concept of authenticity. I shall then discuss the transition from an inauthentic to an authentic existence in Heidegger's account and shall elucidate his concept of authenticity. Finally, I shall raise the issue of the ethical implications of Heidegger's work and his contributions to contemporary ethical theory.

I

Our starting point in the search for authenticity will be Heidegger's inquiry into average everydayness and the everyday self. Average everydayness describes how most people, most of the time, behave in the work world (*Umwelt*) and social world (*Mitwelt*). Heidegger claims that in everyday behavior most people are not aware of their unique potentiality for individuality (*Jemeinigkeit*), or of their possible authenticity, and have not chosen their own possibilities. He is calling attention to the conformity and other-directedness that prevails in everyday behavior. In his view, calculating where one stands in the social hierarchy and concern for one's social status (*Abständigkeit*; SZ 126) puts one in *subjection* to the other. For in order to maintain one's standing, one must do what *they* approve of, praise, command, and require, and refrain from socially disapproved or forbidden behavior. In this way, one submits to an often subtle and unnoticed domination by the norms and conventions of society and forfeits one's own possibilities of thought and action. This submission and bondage to one's social norms, peers, and leaders results in an averageness, a leveling down of social behavior to a certain homogeneity and sameness. In this way, one is disburdened (*entlastet*) of individuality and responsibility for being-a-self and is accommodated by one's society, rewarded for one's submission. However, 'in these ways of being', Heidegger writes, 'one is in a state of inauthenticity and failure to stand by oneself' (SZ 128).

We see that Heidegger characterizes the prevalent behavior of everyday existence as 'inauthentic'. This term, and Heidegger's analyses, would seem to imply that Heidegger is engaging in a type of social

critique, that he is using 'inauthenticity' and its family of explicative concepts in a pejorative sense to condemn blameworthy mediocrity, conformity, and forfeiture of individuality. Thus it seems that Heidegger has developed a negative evaluation of social forms of everyday behavior. But this interpretation is put into question by Heidegger's claim that he is not engaged in a 'moralizing critique of everyday Dasein' and his counter claim that he is doing 'pure ontology'

It may not be superfluous to remark that our interpretation has a purely ontological intention, and is far removed from any moralizing critique of everyday Dasein and from the aspirations of 'culture philosophy'.

(SZ 167)⁷

This disclaimer raises extremely difficult problems which are central to the question of interpreting Heidegger's concept of authenticity. For the question arises as to whether authenticity-inauthenticity are *evaluative* or *descriptive* categories. Although it seems that these categories are evaluative, Heidegger claims that his intentions (and thus categories) are purely ontological, which might lead one to conclude that Heidegger's categories are purely descriptive. In fact, this is exactly what interpreters of Heidegger's SZ who took into consideration the problem of the status of the language of authenticity have concluded. Löwith, for instance, in an early article (1930) stressed the neutrality of Heidegger's 'formal ontological assertions', which are completely 'neutral' and 'indifferent' to all valuational claims,⁸ thus sharply ruling out the possibility of a normative dimension in Heidegger's text. This interpretation was later proclaimed by Vietta who argued that Heidegger's language of authenticity was purely descriptive (*reine Beschreibungslehre*).⁹ But despite the disclaimers of Heidegger and his interpreters, there are good reasons to put into question the dubious claim that Heidegger's distinction between authenticity and inauthenticity has no evaluative aspects.

First, his concepts do have an evaluative connotation if one takes them in their ordinary signification, or their philosophical usages, i.e., inauthenticity, alienation, averageness and leveling down, idle chatter, etc., have a pejorative tone both in their everyday uses and in the works of Kierkegaard, Nietzsche, Simmel, Scheler, and the other philosophers from whom Heidegger borrowed his terms. Moreover, a careful reading of Heidegger's description of inauthenticity on SZ 126-30, which we have briefly examined, and his description of the 'fall' away from one's self and into inauthentic ways of being (SZ 167-80) discloses a rather thoroughgoing condemnation of inauthentic everydayness. For he describes an inauthentic existence as an 'absorption' in the everyday routine, a 'dispersion' into inauthentic ways of being such as idle chatter,

a constant search for diversion (*Neugier*), and a spurious, non-committal surmising about things to do and changes to make without really ever carrying through or changing anything (*Zweideutigkeit*). Surely, Heidegger's description of these inauthentic ways of talking, understanding, acting, etc., is disparaging, critical, and contains a negative evaluation. For example, idle chatter is described as a 'perversion' of the act of communicating which builds a false understanding. 'Curiosity' and 'ambiguity' are described as uprooted, alienated forms of 'groundless floating'. The whole process of getting entangled in an inauthentic existence is described as a 'downward plunge' (*Absturz*) into 'the groundlessness and nullity of inauthentic everydayness' (SZ 178). Thus Heidegger's own formulations of his concepts seem to be strikingly evaluative. In fact, when Heidegger characterizes his concept of authenticity, he admits that an ideal of existence underlies his interpretation (SZ 310), indicating that authenticity is an *ideal* for Heidegger which he is recommending as a modification of inauthenticity. Hence Heidegger's contrast between inauthenticity and authenticity indicates he is maintaining an *axiological dualism* which he dialectically develops, spelling out oppositions and differences between authentic and inauthentic ways of being. This interpretation would suggest that Heidegger's analysis of an inauthentic existence contains a negative evaluation of everyday behavior, whereas the concept of authenticity contains an ideal of being human.

I do not want to imply here, however, that Heidegger's doctrine of authenticity is merely 'evaluative' in a pejorative emotivist, non-cognitivist sense. Indeed we shall see that one of the novel characteristics of his doctrine of authenticity is that his contrast between an authentic and inauthentic existence contains *both* an evaluative and descriptive dimension and thus *undercuts* and puts into question a strict descriptive-evaluative distinction. Thus I suggest that Heidegger offers a new type of evaluative language that is grounded in a descriptive ontology. In this interpretation, Heidegger's concept of authenticity would replace traditional ethical theories which would be shown to be deficient in a yet unspecified sense.

Finally, I would suggest that Heidegger's concepts and distinction between authenticity and inauthenticity have the same *function* as traditional ethical language (i.e., to condemn, criticize, elicit change, recommend modifications, guide action, propose alternatives, etc.). Heidegger's analysis of inauthenticity provides a new way of looking at our everyday life and brings to attention some usually overlooked blameworthy characteristics and tendencies which he describes as 'inauthentic' ways of being. Crucially, these ways of being are *to be modified*. To be authentic one must change one's life:

Authentic being-oneself does not rest upon an exceptional condition

of the subject, a condition that has been detached from *das Man*; it is rather an *existentiell* modification of *das Man*.

(SZ 130)

Heidegger's theory helps in this process of self-transformation by forcing us to put into question some of our everyday habits and tendencies (and ways of doing philosophy) and attempts to provide an authentic disclosure of everyday being-in-the-world and its higher alternative (authenticity): 'this disclosure of human being (*Dasein*) is always accomplished as a clearing away of concealments and obscurities, as a breaking up of the disguises with which the individual bars its own way' (SZ 129). The breakthrough to an authentic existence is accomplished, Heidegger tells us, through a process of extrication and individuation in which one goes through the experiences of anxiety (anxiety from leading a meaningless existence, from failing to realize one's authentic potentialities; SZ 40); experiences of one's impending death which makes one aware of one's unique selfhood and the finite amount of time at one's disposal (SZ 46–53); and a call of conscience which informs one that one is guilty of living inauthentically, of running away from oneself, and that summons one to choose to become authentic, to resolutely take responsibility for one's choices (SZ 54–60). To be authentic one must choose and commit oneself to authentic possibilities. One must take over one's freedom, uniqueness, finitude, and failures and resolutely engage in the authentic projects through which one creates an authentic self.

The key to this process is Heidegger's concept of *resoluteness* (SZ 60, 62 and 74). To be authentic one must resolutely choose to liberate oneself from domination by social conventions and inauthentic ways of being and liberate oneself for one's own projects and self-determination. Choosing to be authentic 'in the light of the projected field of one's self-chosen potentiality-for-being, the resolute individual frees itself for its world' (SZ 298).

Heidegger is re-interpreting here, I suggest, the themes of self-determination and constitution. He rejects the Kantian model of 'pure reason' forever struggling to control and defeat 'empirical' passion, and utilizes a model of the individual struggling against society (*das Man*). The issue here concerns the determination of one's choice and the constitution of one's life. An inauthentic person does not determine itself, for it either blindly follows social convention, evades decisive choice by losing itself in distraction, or ineffectually surmising what it should do. Heidegger calls this forfeiture of self-determination *irresoluteness*. An irresolute person surrenders to the way things have been publicly interpreted and falls into the ways of being that are socially prescribed and recommended. An authentic person, on the other hand, resolutely rejects the authority

and domination of society and other people and takes over its freedom and responsibility to constitute its own *situation*.¹⁰

On Heidegger's account, only by resolving on some project or choosing a set of possibilities as one's authentic resolve does one constitute one's own situation, hence 'the situation has its foundation in resoluteness' (SZ 299). 'Situation' thus seems to signify the resolute individual's choice of its own possibilities, commitments, context of meanings and life-style – one's own distinct way of being-in-the-world. Heidegger is here, I believe, re-working the notion of 'constitution'. On Heidegger's analysis what the self constitutes is not the entire 'not I' (Fichte), or the phenomenal world (Kant), or the object of consciousness (Husserl), but rather it constitutes its own situation. Thus Heidegger modifies the idealist notion of the self constituting the world through his analysis of the authentic self constituting its own situation through its projects and resolves.

For Heidegger the authentic self is a self-made project. Heidegger's analysis here can be contrasted with Sartre's doctrine that 'man is what he makes himself to be'. For whereas Sartre argues that one's continuous making of oneself is a resultant of natural and spontaneous self-creation, Heidegger claims that one's creation of an authentic self is a state that is only attained by a *project* of self-being, implying that most people do not make themselves but are 'made' by their social environment and socialization. The claim that authenticity consists in a project of self-transformation calls for an explication of Heidegger's concept of project (*Entwurf*). The primary function of the understanding is, in Heidegger's account, to project possibilities. But *Entwurf* does not merely signify throwing oneself into something (as Sartre's *project*), but rather signifies designing, sketching, and planning, for the German term *Entwurf* literally means 'design, plan, project, scheme, blueprint'. These connotations suggest that the primary function of the human understanding is to sketch and project possibilities, to choose projects and weigh alternatives, to conceive what is possible for one, to decide how one can best carry out one's resolves. Thus the clear connection with autonomy which presupposes an ability to conceive and choose between alternative possibilities and a capacity for creative choice. What is constituted in an authentic project is an authentic self. The authentic self is the creation of a resolute individual who chooses to become authentic and to carry through authentic possibilities. To be a self is thus an achievement on this view characterized by resoluteness, autonomy, individuality, responsibility, loyalty and commitment. The criterion of an authentic self is *Selbständigkeit*, a steadfast standing loyal to one's authentic projects and remaining true to oneself.

Although Heidegger leaves open what possibilities an authentic person resolves upon (SZ 298), he does indicate the sort of choice he has in

mind and the *how* of authentic choice in his discussion of choosing one's authentic possibilities from one's heritage (SZ 74).¹¹ Section 74 of the chapter on 'Temporality and historicity' contains the key, I believe, to Heidegger's concept of an authentic existence. Those many interpreters who claim that authenticity is solely a way of being toward death have overlooked the importance of this late chapter for Heidegger's concept of authenticity and thus have omitted the most important aspects of his concept of authenticity and existential ontology. For in a key passage he describes the resolute choice of one's authentic possibilities as a *repetition* (*Wiederholung*) of authentic possibilities from one's heritage:

The resoluteness which comes back to itself and hands itself down, then becomes the repetition of a possibility for existence that has come down to us. *Repetition is the explicit handing-down*, that is, the going back into the possibilities of the human beings that have been. The authentic repetition of a past possibility of existence, the choosing of one's hero, is grounded in advancing resoluteness; for in resoluteness one first chooses the choice that makes one free for the struggle of loyalty and the struggling succession of the repeatable possibility. (SZ 385)

'Choosing one's hero' from the heritage can be explicated as the choice of one's vocation, or the choice of models to guide one in one's projects. This choice of one's hero has some similarity to Sartre's concept of the fundamental project, but with the requirement that one consciously and resolutely makes one's choices out of the heritage of possibilities. For example, after a careful consideration of one's own potentialities and possibilities ('what one is capable of' and 'what is open to one'), one can choose, say, philosophy as one's authentic possibility, and can choose past philosophers as, for example, Aristotle, or Marx, or Nietzsche as one's models. Or one could choose Christianity or revolutionary socialism, taking Jesus or Lenin as one's 'hero'.

The choice of one's authentic possibilities leads to a 'struggle for loyalty', referring to the repetition of one's choices in the present situation, so that one is true to one's resolve in standing by and remaining steadfast to one's projection of authenticity. The criterion for loyalty is *Selbständigkeit* which refers to the authentic person's autonomy, self-determination, and self-constancy. This criterion applies only to an authentic person for only the individual that has chosen authentic possibilities and constantly repeats its choice has achieved the 'steadiness' and 'steadfastness' of self-constancy. Seizing on a definite possibility and loyally standing by it refers to an activity of *commitment*.

This loyal repetition of one's possibilities can be contrasted with the irresoluteness which hops from possibility to possibility without ever

committing itself to anything (*Neugier*), and which covers over its irresoluteness with ambiguous idle talk. Thus, Heidegger's suggested way of transforming a dispersed, alienated existence is the resolute repetition of authentic possibilities, followed by a struggle for loyalty in which one remains true to one's choice against social pressures and the ever present possibility of backsliding.

Our interpretation suggests that Heidegger's concept of authenticity yields notions of self-determination, autonomy, responsibility, commitment, loyalty and a concept of the authentic self. Only an authentic person, Heidegger argues, has the essential characteristics of selfhood (individuality, identity, unity, substantiality and personality), hence he claims that his concept of authenticity provides an ontological grounding of what are taken to be traditional features of selfhood. Hence Heidegger corrects the idealist-transcendentalist account of the self of such people as Descartes, Kant, and Husserl.¹² Moreover, one could argue that Heidegger's distinction between an authentic and inauthentic existence also provides an ontological grounding of some of the fundamental concepts of ethics. Although we have but roughly sketched out Heidegger's concept of authenticity here,¹³ rather than further spelling out and developing these ideas, I would like to now show the relevance of Heidegger's concept of authenticity to contemporary ethical theory.

II

Let us begin with a passage that indicates a positive relation of Heidegger's existential analysis to ethics. In indicating the relation of his existential-ontological analysis of guilt to moral guilt Heidegger writes:

This essential being-guilty is equiprimordially the existential condition for the possibility of the 'morally' good and the 'morally' evil – that is, for morality in general and for the possible forms which this may take factically. The primordial 'being guilty' cannot be defined by morality, since morality already presupposes it for itself.

(SZ 286)

This passage suggests both a possible connection between Heidegger's ontology and ethics, and a general notion of the relationship between ethics and ontology. For Heidegger implies here that ontology is the foundation of ethics, and that it is illegitimate for ethics to define such concepts as guilt, 'since morality already presupposes it for itself' (SZ 286). If it is the task of philosophy to 'work out its presuppositions with more and more penetration', as Heidegger states on SZ 310, then it follows that the presuppositions of ethics must be analyzed, grounded,

and delimited in an ontological analysis. This would imply that ethical theory must be aware of its presuppositions and be sure they are adequately grounded in an ontology of human being – indicating that ethics requires existential–ontological clarification and understanding. This notion is repeated in another context on SZ 293:

Even the theory of value, whether it is regarded formally or materially, has as its unexpressed ontological presupposition a ‘metaphysic of morals’ – that is, an ontology of Dasein and existence.

What is clear from the passage cited is that Heidegger claims that ethics (1) has ‘unexpressed ontological presuppositions’ (SZ 293), and (2) cannot define its own presuppositions (SZ 286). These statements suggest a superordinate position in regard to ethics for ontology, and suggest that one of the tasks of ontology in relation to ethics is to work out the presuppositions of ethics, and thus to provide a grounding of its basic concepts. Following this argument, it could be suggested that ontology functions as a court of jurisdiction that validates or criticizes ethical theories, according to whether they are in accord with the being that is in question, as disclosed by the analysis of a well-grounded ontology, such as Heidegger claims to provide in SZ. That is, the ought must be shown to be grounded in the is, in much the same way that Heidegger holds that the ontological must be grounded in the ontic. Those philosophers who advocate the ‘autonomy’ of ethics, and hold that the ‘ought’ is an ideal that is far removed from the ‘is’ (which is human being and doing), must, I believe, answer the questions Heidegger raises and defend their enterprise by showing that their theory is based on an adequate foundation, that they have secured and clarified their presuppositions, and that they have a penetrating understanding of the subject matter of ethics – human being-in-the-world. Thus I believe that part of the ethical import of SZ rests upon the questions it raises for ethical theory and the challenge it presents to existing theories.

What is at stake is the question of the conditions of the possibility of ethics. Before, on this analysis, one can define such concepts as ‘good’, ‘guilt’, ‘responsible’, and so on, one should be clear as to the conditions of the possibility of being-good, being-guilty, being-responsible. That is, what kind of a being can ‘be good’ and what does this mean? What kind of a being can assume moral guilt? can be blamed? praised? held responsible? obligated? This type of questioning, if developed, would, I believe, lead to a powerful critique of existing ethical theory. Moreover, I believe that these considerations also illuminate Heidegger’s own position in regard to ethics. For his seeming rejection of ethical analysis as a separate, specialized mode of inquiry is an implicit critique of the fragmentation of philosophical analysis that considers questions of the

good, right, or ought without having adequately secured a conceptual understanding of human being. By not securing an adequate foundation for its theories and imperatives, ethics is condemned to be merely prescriptive or emotive, confessional (or trivial, apologetic, and conformist, as in the case of much 'ordinary language' ethics). Thus if ethics is to be a philosophically respectable discipline it must become aware of its presuppositions, and build its theories on the firm foundation of an ontology of human being, or some general theory of human nature. Such are the considerations suggested by Heidegger's remarks concerning the relations between ethics and ontology.

Heidegger is a great enemy of philosophical dualisms which he believes are the source of much philosophical error. For example, he opposes dividing philosophy into theoretical and practical disciplines (and into dividing human behavior into theoretical and practical categories; SZ 300-1). Hence his analyses combine subject matter traditionally separated into ethics and ontology. In this regard, it would be a mistake to try to characterize Heidegger's concept of authenticity as either purely descriptive ontology or an evaluative ethics, for his project cuts beneath this distinction. The interconnection of what is usually separated into normative and descriptive disciplines and statements is thus a distinctive feature of Heidegger's concept of authenticity. In fact, it could be that the upshot of this problem of interpreting the propositional status of authenticity forces us to reconsider our often rigidly maintained dichotomy between evaluative and descriptive statements, value and fact, normative and descriptive disciplines. I have proposed that Heidegger's concept of authenticity contains both a descriptive and normative dimension, neither of which can be eradicated without distorting and restricting the scope, depth, and import of Heidegger's work. Further, I propose that Heidegger's undercutting the descriptive-normative dichotomy *corrects* a dubious methodological procedure that results in a restricted or one-sided analysis which, intentionally or not, omits considerations that do not fall within the prescribed-delimited domain of inquiry (I am thinking of much American social science, pure phenomenology, linguistic analysis and other disciplines that maintain a strict fact-value, descriptive-evaluative distinction, and that claim to exclude all value judgments, evaluative presuppositions, and ethical claims). We encounter here a Heideggerian procedure that puts into radical question established practices, methodological presuppositions, and theoretical commitments prevalent in the Anglo-American philosophical world. This problem in the area of hermeneutics (or methodology) has its analogue in the ethical problem of the relation between 'is' and 'ought' in which Heidegger again puts our current dogma into question. This challenge to our current philosophical conventions is one of the valuable contributions which SZ offers the English-speaking philosophical world.

In regard to the normative–descriptive distinction, I suggest that a radical questioning of this distinction and a careful study of the language of authenticity in *SZ* can contribute to an elimination of what I believe to be a superficial foundational dogma of an outworn empiricism. The origin of this dichotomy in twentieth-century positivism utilized the distinction for the most part as a corrosive tool; i.e., ethical statements or ‘value judgments’ are on this model merely expressions of an attitude or ‘feelings’, and thus have an inferior cognitive status, since they cannot be verified by empirical observation statements. But this whole model rests on a questionable and largely discredited empiricist theory of verification, evidence, and a propositional cognitive hierarchy that divided our language into two exclusive classes of statements, in which evaluative statements are rated cognitively inferior, since they are not capable of objective or factual verification, and are therefore subjective, emotive, non-cognitive.¹⁴ But both the simplistic dichotomy between normative and descriptive and an explication of normative–evaluative statements as cognitively inferior are highly questionable notions which demand serious criticism and re-thinking.¹⁵ I believe that Heidegger’s language of authenticity puts the distinction and its positivist explication into question by undercutting the dichotomy and by offering a vocabulary that has both a descriptive and evaluative dimension.

In conclusion, I would like to suggest that Heidegger’s concept of authenticity contains two further criticisms of traditional ethical theories that are worth considering. He claims that traditional ethical theories presuppose an ‘ontology of the present-at-hand’ (the view that everything that *is* must be something present-at-hand, *Vorhanden*). That is, traditional ethical theories, he claims, characterize their ethical predicates such as ‘good’ or ‘value’ as something present-at-hand interpreted as a property or predicate of a thing or state of affairs. This ontological presupposition that everything that *is* must be something present-at-hand (and thus an observable, describable entity) is, according to Heidegger, the source of much bad philosophical thinking. Speaking of the concept guilt, Heidegger writes:

Least of all can we come any closer to the existential phenomenon of guilt by taking our orientation from the idea of evil, the *malum* as *privatio boni*. Just as the *bonum* and its *privatio* have the same ontological origin in the ontology of the *present-at-hand*, this ontology also applies to the idea of ‘value’ which has been ‘abstracted’ from these.

(*SZ* 286)

The passage suggests the extent to which ethical thinking has been dominated by the ontological model of the *Vorhanden*. Philosophers have traditionally taken values as something present-at-hand, either in a

Platonic world of Ideas, in an intelligible realm of consciousness, or in the 'objective' structure of reality. On this model of the *Vorhanden*, 'good' too must be something, a property, an entity, something intuitable. This ontological prejudice, then, is the source of the controversy over ethical naturalism (and the so-called naturalistic fallacy), over ethical intuitionism (which was honest enough to confess that they couldn't find 'good' or any ethical property in the world, but which was so stubbornly dominated by the metaphysics of the present-at-hand that they were forced into mystification to defend their enterprise), and over the question of the being (or 'logical status') of 'value'. The advocates of the linguistic 'revolution' in philosophy will agree with Heidegger that much ethical thinking has been dominated by bad metaphysics without seeing that they too are dominated by this ontological presupposition in their belief that ethical concepts can be reduced to (or explicated as) linguistic usage, speech acts, or social conventions: good solid factual data that one can set before him and analyze in a clear cut (if trivial) way. To these believers in *ordinary* usage, *common* sense, and social *conventions*, Heidegger could scornfully note that they are merely making explicit the social conventions of their (inauthentic) society and in submitting without criticism to these conventions are no better than 'slaves of Pharisaism' (SZ 293).

Heidegger's argument against the type of ethics that takes ethical concepts to denote entities present-at-hand could be that this enterprise is inadequate to the phenomena in question and must be replaced by a new vocabulary that is rooted in an authentic understanding of existence and a new way of thinking that does not become trapped in traditional presuppositions and inadequate thinking. Such an ontology Heidegger could claim to offer in SZ, and he claims that his existential ontology explicates the being of a being who is qualitatively other than the something present-at-hand explicated by the categories of traditional metaphysics (and ethics). One application of this thesis for ethics is its suggestion that ethicists should not waste their time searching for properties to which they can apply their ethical predicates, or sorting out different senses of the language of ethics, but should rather see into the ontological dubiousness of their procedure, and the need to ground their ethical analysis in an adequate ontology of human being.

Further, Heidegger puts into radical question the very possibility of a prescriptive ethics in his remarks concerning the ontological horizon of ethics. For Heidegger, any theory that interprets human being as a being who is to be evaluated according to its capacity and performance in either 'actualizing values' or 'satisfying norms' (or moral principles) operates within the horizon of everyday calculative concern and thus falls prey to an ontologically dubious practice. From this standpoint, ' "Life" is a business, whether or not it covers its costs' (SZ 289). That is, human

being is pictured as a household or business that is run according to some conventionally established procedure, and is judged and evaluated in terms of how it measures up to that standard. Heidegger suggests that most ethical theories operate in the sphere of everyday concern and calculation in which they presuppose certain standards, moral principles, or norms, and then measure human being according to whether it meets the mark or satisfies the demand in question. For example, he suggests that Kant, with his representation of conscience as a 'court of justice', has fallen prey to the horizon of concern and calculation, for his interpretation was guided by the idea of satisfying or transgressing the 'moral law' (SZ 293).

What is objectionable here is not only a crude, mechanical way of thinking, but also the ontologically unclear and questionable nature of the moral principles, laws, imperatives, and so forth that are used as the norms controlling the act of judging. In particular, Heidegger puts into question the notion of a moral law and *ought*, and the demand or requirement (*Forderung*) made that is supposedly *binding* or *obligatory* (*verbindlich*). In reference to guilt, Heidegger writes:

This kind of lacking is a failure to satisfy some requirement which applies to one's existent being with others.

It remains undecided how such requirements arise and in what way their character as requirements and laws must be conceived on the basis of their having this source. . . . The idea of guilt must not only be raised above the domain of that concern in which we reckon things up, but it must also be detached from relationship to any law or ought such that by failing to comply with it one loads himself with guilt.

(SZ 282, 283)

These remarks implicitly raise many difficult questions. For what is the source of obligation, moral law, ethical imperatives? Why *must* I do xyz, and *not* do abc? The ontological dubiousness of the concept of ought (moral law, prescriptives) thus throws into question the whole moral practice of calculating, judging, and condemning in relation to fulfilling, failing to fulfill or transgressing a moral law or ought. Heidegger's most critical remarks throwing into question the 'ought' or a binding, obligatory imperative are found in a neglected passage, SZ 156. In speaking of the phenomenon of validity (*Geltung*), he distinguishes three essential predicates: ideality, objectivity, bindingness (*Verbindlichkeit*). He argues that these 'significations' are 'not only opaque in themselves but constantly get confused with one another. Methodological fore-sight demands that we do not choose such unstable concepts as clues to interpretation' (SZ 156). These criticisms are directed against an analysis

of the 'theory of judgment', but I believe they also apply to ethical judgments, for the characteristics in question are generally taken to be essential constituents of ethical judgments.¹⁶ This means that the concept of 'bindingness' or 'obligatoriness' (*Verbindlichkeit*) is a dubious one for Heidegger, who would thus be forced by his own philosophical reflections from prescribing authentic possibilities that would be obligatory or binding (at least until the 'ontological opaqueness' and confusion surrounding these 'unstable' concepts is dissolved).

These remarks suggest a criticism of ethical prescriptivism: the claim of most ethical theories to lay down universally valid, binding, obligatory laws that provide a strict regulation of human behavior. The force of Heidegger's analysis is that he puts into question the two most important types of ethical theories in his tradition: Kantian *Moralität* whose prescriptivism has been thrown into question, and Hegelian *Sittlichkeit* whose social ethics are equated by Heidegger with inauthentic social conventions that are an obstacle to individual authenticity. On Heidegger's account, one who takes over the moral values, imperatives, customs, and attitudes that are transmitted to one through one's socialization, and who acts as if these human posits had an unquestionable validity and authority and were therefore to be taken over, followed, and actualized exemplifies the inauthentic way of being. It is this surrender of autonomy, discrimination, and evaluation that Heidegger is criticizing in his characterization of the fall into an inauthentic existence. His claim is that by disburdening oneself of the need to choose, evaluate, and resolve for oneself, one becomes an indistinguishable one-among-many, and loses one's ownmost potentiality-for-being in herd-being.

Thus, although Heidegger thoroughly rejects the prevalent ethical theories of his day, it would be a mistake to simply label him a nihilist for we have seen that he has strong *philosophical* objections against traditional ethical theories. Furthermore, we have seen that he lays at least the foundation for a new type of ethical theory grounded in a well-secured philosophical anthropology (whether Heidegger's anthropology does provide an adequate basis for a philosophical ethics is not an issue here). In fact, Heidegger suggests in a passage, that I shall cite in conclusion, that the task of developing a philosophical ethics and projecting a set of authentic ethical possibilities remains a task yet to be fulfilled by a 'thematic existential anthropology':

To present the factual *existentiell* possibilities in their chief features and interconnections, and to interpret them according to their existential structure, falls among the tasks of a thematic existential anthropology.

(SZ 301)

This passage suggests that the crucial philosophical tasks of ethical theory remain to be fulfilled.

Notes

1 *Sein und Zeit* (Tübingen: 1963). Hereafter *Sein und Zeit* shall be referred to as *SZ*; page references will be to the German edition and translations will be my own. The English translation is by Macquarrie and Robinson: *Being and Time* (New York: 1962). I shall limit my discussion of Heidegger's concept of authenticity and critique of ethics to an analysis of the doctrine in *Sein und Zeit*, thus avoiding the complicated and thorny issue of the relation between the early and the later Heidegger.

2 For example, Sartre in *Being and Nothingness* (New York: 1956); Ricoeur in *Heidegger and the Quest for Truth* (Chicago: 1968); Buber in *Between Man and Man* (New York: 1962); Adorno in *The Jargon of Authenticity* (Evanston: 1973); and Marcuse in 'Beiträge zu einer Phänomenologie des Historischen Materialismus', *Philosophische Hefte*, 1 (Berlin: 1928).

3 De Waelelens, *La Philosophie de Martin Heidegger* (Louvain: 1942); Körner, 'Heideggers Privatreligion', *Eckhart* 25, 1955; and Rosen, *Nihilism* (New Haven: 1970).

4 Wild, *The Challenge of Existentialism* (Bloomington: 1959) and Olafson, *Persons and Principles* (Baltimore: 1967).

5 The two most misleading types of interpretation are, first, those which interpret *Sein und Zeit* and the concept of authenticity from the perspective of the later Heidegger and often read into the text a questionable interpretation of the concept of authenticity. For example, Richardson defines authenticity as a 'transcendence unto Being which is proper to itself' (p. 83) and defines the constitution of an authentic self as a 'transcending beings to Being' (p. 50), which requires a recollection of the 'ontological dimension' (p. 51). William Richardson, *Martin Heidegger: Through Phenomenology to Thought* (Den Haag: 1964). A second sort of dubious interpretation simplistically equates Heidegger's concept of authenticity with a way of being toward death, as if Heidegger had a death ethic. This interpretation is maintained by Sartre, op. cit., Ricoeur, op. cit., Löwith, *Heidegger: Denker in dürftiger Zeit* (Göttingen: 1965), Demske, *Being, Man, and Death* (Lexington, KY: 1970), de Waelelens, op. cit., and many others.

6 I am thinking of such works as Macomber's *The Anatomy of Disillusion* (Evanston: 1967), Schmitt's *Martin Heidegger on Being Human* (New York: 1968), and Olafson's *Persons and Principles*, op. cit. See also my review of Adorno's *Jargon of Authenticity in Telos* 19 (Spring, 1974). I should note that the present article was written in 1972 before my study of Adorno and consequent assumption of a more critical position towards Heidegger.

7 Further, he claims that his term 'fallenness' 'expresses no negative evaluation' (*SZ* 175), that his notion of 'idle chatter' does not have a 'disparaging signification' (*SZ* 167), and that his claim that one exists in a state of 'untruth' in the condition of inauthenticity excludes any 'negative evaluation' (*SZ* 222).

8 Löwith, Karl. *Theologische Rundschau*, N.F. II (1930), Heft 1, p. 60.

9 Vietta, Egon. *Die Seinsfrage bei Martin Heidegger* (Stuttgart: 1950), p. 46.

10 I should point out that 'situation' is a technical term for Heidegger that describes the result of a project of choosing authenticity and does not merely

refer to what is generally taken to be a 'situation' in ordinary language and in such philosophers as Dewey and Sartre.

11 Heidegger's analysis of historicity (*Geschicklichkeit*) is of crucial importance for his philosophical project and for his concept of authenticity.

12 Heidegger's concept of the self is inextricably interconnected with his concept of authenticity, thus providing another example of how Heidegger combines what is usually separated into theoretical-ontological and practical-ethical thematics. It is not that Heidegger endows the acting or ethical self with a primacy over the theoretical self as is sometimes argued. Rather, Heidegger combines characteristics of the knowing and acting self into a unitary concept of selfhood that accounts for both the ontological features of selfhood and the features of an authentic self.

13 I more fully develop the concepts and ideas sketched out here in my 1973 Columbia University Dissertation *Heidegger's Concept of Authenticity*.

14 The inadequacies of this model are well known and several papers criticizing its application to ethical analysis can be found in *Theories of Ethics*, Philippa Foot, editor (London: Oxford, 1967). Cf., especially Foot's 'Introduction', her essay on 'moral beliefs', Searle's essay 'How to derive "ought" from "is"', and John Austin's remark that, 'the familiar contrast of "normative-evaluative" as opposed to the factual is in need, like so many dichotomies, of elimination', op. cit., p. 13.

15 Limitations of space and time make it impossible to further develop the problems involved in the normative-descriptive distinction within the bounds of this study. The problem has produced a vast but inconclusive literature in the world of analytic philosophy (some references cited in note 4), and is a central philosophical issue in Europe where 'critical rationalists' (i.e., Popper and Hans Albert) defend the old positivist distinction against the attacks of 'Neo-Marxists' and others (i.e., Adorno, Habermas, Marcuse). The question is also an important one for social scientists, since the day of Max Weber's distinction between fact and value, and his notion of a value-free science.

16 The properties of a normative-ethical judgment are often taken to be 'ideality' (or in the Anglo-American philosophical world 'non-naturalness'), 'objectivity' (or 'universalizability'), and 'bindingness' (or 'prescriptivity'). Thus Heidegger's critical remarks can apply to certain features of ethical language, which he could claim are ontologically (or 'conceptually') unclarified, ungrounded, and confused.

Who is Dasein? Towards an ethics of authenticity

Christopher Macann

In his *Letter on Humanism*, Heidegger cites, without mentioning by name, a statement made by Jean Beaufret: 'Ce que je cherche à faire, depuis très longtemps déjà, c'est préciser le rapport de l'ontologie avec une éthique possible.'¹ Notoriously however, Heidegger not only never developed anything like an explicit Ethics, he repeatedly rejected any such possibility.² In the *Letter on Humanism*, Heidegger gives as his reason the derivative character of Ethics. Ethics, he tells us, arose along with Logic and Physics in the school philosophy of Plato. By that time thinking had been converted into Philosophy, Philosophy into Science and Science into an affair of the Schools.³

A second objection bears upon the impossibility of tacking on an Ethics to fill out a theoretical philosophy on the practical side. This objection is voiced in *Being and Time*⁴ where it is clearly directed against Kant. And yet, who would wish philosophy to be deprived of the Kantian Ethics? Moreover if, as Heidegger insists, the *Critique* is to be interpreted as a proto-ontology, then Kant's practical philosophy actually becomes an Ethics doubly grounded in ontology; first, in that the practical philosophy is already founded in the theoretical (now interpreted as ontology) and second, in that Heidegger, like Fichte before him, recommends a reversal of this very order of priority – with the Practical Critique grounding the Theoretical.

But perhaps the crucial complaint can best be captured in a metaphor which Heidegger does not hesitate to employ at the very end of his *Introduction to Metaphysics* ('Being and the ought'), the metaphor of the distinction between an 'upward' and a 'downward' direction. There, Heidegger makes use of a diagram whose nodal point is being. Along the horizontal axis, you find becoming, on the one side, and appearance, on the other while, along the vertical axis, you find the Ought, on the up side and Thinking, on the down side. 'The distinction between being

and thinking', Heidegger tells us, 'is downward. . . . The differentiation between being and the ought, on the other hand, is upward.'⁵ This, in the end, is why the ought defies being, because it lifts itself off from being (and so denies itself the grounding in being) and then, to make matters even worse, tries to give itself a pseudo-being, *qua* validity. 'As being itself becomes fixated as idea, it strives to make good the resulting degradation of being. But by now this is possible only if something is set *above* being, something that being never is but always *ought* to be.'⁶

But what if human being were, in its very being, not yet what it ought to be? And what if the very task of philosophy were nothing other than that of drawing attention to an ethical (in Spinoza's broad sense of that word) potential, inherent in the very being of human being, which it might not yet have realized but still could realize effectively – the 'possibility' which elsewhere Heidegger will say stands 'above actuality'? What if the entire saga of philosophy – beginning not with the Greeks but with a much, much older philosophical tradition, that of the Vedanta – were to be interpreted as a repeated attempt to help human being along the way to a self-overcoming which would realize that very 'ought' which, for the time being, human being is not? That Heidegger will not countenance any such suggestion is due to his refusal of anything like an *upward* orientation of consciousness, and this despite his explicit acceptance of its opposite, the *downward* orientation. That, especially in his critique of transcendental philosophy, Heidegger repeatedly effects a quite naive conversion (or inversion) of upward into downward should not blind us to the ethical blindness which must needs follow upon such a refusal of the upward implications of the motif of self-overcoming – and this from a philosopher who goes a long way with the Nietzschean prophecy of an Overman!

But although, for the reasons given above, nothing like an *explicit* Ethics is to be found in Heidegger, something like an *implicit* Ethics can be traced back to his thinking about authenticity in *Being and Time*. That such a connection is indeed appropriate is confirmed by the ethical significance accorded to the theme of authenticity by such French existentialist thinkers as Sartre and Camus.⁷ In his intellectually unsatisfactory but popular lecture 'Existentialism is a humanism', the ethical import of the slogan: 'Existence precedes essence' (a slogan which Heidegger specifically criticizes in his *Letter on Humanism*,⁸) becomes clear when Sartre borrows from Kant a universalizability thesis (when I choose, I choose for all mankind, i.e., absolute responsibility) which it is difficult to reconcile with his own existential commitment to authenticity (I make myself be through my choices, i.e., absolute freedom), and which he himself took over from Kant with a view to refuting the objection of egoism. Hence, not only must the question of an ethics of authenticity

remain an open question, it is doubtful whether, as yet, it has been settled satisfactorily.

I would like to argue that the theme of authenticity *can* serve as the basis for a possible Ethics and one which *is* rooted in an ontology, that Heidegger's own ontology *does* come close to laying the foundations for such an ethics but that the difficulty of carrying such a project through with regard to *Being and Time* has to be attributed to the inadequacy (bordering on inconsistency) of the existential categories Heidegger employs to set up his ontology. Rather than dismissing Ethics as an ontologically improper topic, I would like to suggest a revision of the existential categories Heidegger himself employs to characterize Dasein, a revision which might make just such an Ethics possible.

Just like a building, a philosophy can be no more stable or extensive than its foundations allow. The use of an architectural metaphor is not at all inappropriate in connection with Heidegger, since he himself repeatedly uses the concept of 'ground' with that ambiguity which characterizes the term in the German – ground as reason or cause, ground as foundation.⁹ For example, in the Kant book he has this to say about the expression 'to lay the foundation of . . .'. 'It's meaning', he claims, 'is best illustrated within the field of architecture. . . . Laying the foundation is the projection of the building plan itself in such a way as to indicate on what and how the structure will be grounded.'¹⁰ If I am right in thinking that a revision of Heidegger's existential categories is called for if an Ethics of authenticity is to be possible, clearly, this revision will have repercussions which extend far beyond the confines of an Ethics.

Our starting point must be a preliminary identification of the existential categories employed in *Being and Time*. Heidegger introduces the notion of existential categories in his Introduction.

All *explicata* to which the analytic of Dasein gives rise are obtained by considering Dasein's existence-structure. Because Dasein's characters of Being are defined in terms of existentiality, we call them '*existentialia*'. These are to be sharply distinguished from what we call '*categories*' – characteristics of Being for entities whose character is not that of Dasein.¹¹

That Heidegger postpones the detailed examination of the *existentialia* is due to the organization of the first part of *Being and Time* into three heads, 'World' (and the worldhood of the world), the 'Who' and 'Being-in' as such. For it is only in the conclusive context of being-in as such that the *existentialia* can be explicitly addressed.

In the fifth chapter devoted to Being-in as such, we do find a fourfold specification of the existential structures: State of Mind, Understanding, Discourse and Falling. But precisely because the existential category of

Falling is, and can only be, introduced to account for the inauthenticity of Dasein, the question of authenticity cannot itself be addressed until later, and is indeed saved up for the second part of *Being and Time* devoted to the problematic of time, where it is discussed under the head of a further existential possibility, namely individualization, which reverses the tendency inherent in Falling.

Before we begin our detailed analysis, there are two things to note. First, there can be no doubt about the importance of the theme of authenticity. It dominates the first three chapters of Division II, that is, takes up half of the space left to the second division. No other theme, with the possible exception of temporality, looms so large on the canvas of *Being and Time*. Second, since the issue of authenticity bears upon the being of the self, the very attempt to establish the basis for an ethics of authenticity will depend upon the way in which the self is conceived. Hence the question: Who is Dasein?

1 The existential structure of Falling

Falling means fallenness into *das Man* – the ‘They’. The concept of *das Man* is introduced in chapter IV, devoted to being-with and being-one’s-self, therefore in a context which, from the very beginning, raises the critical question of being-one’s-self. *Mit-sein*, or being-with, is a way of being of Dasein in so far as it is in the world. Being-with and being-in-the-world are equi-primordial structures. Hence, the world is always one that I share with Others. At the same time, as a being who shares a world with others, I have a mode of being of my own, which Heidegger calls *Mit-Dasein*. My very being-self is characterized by being with Others. ‘In this kind of being’, Heidegger tells us, ‘is grounded the mode of everyday Being-one’s-Self [*Selbstsein*].’¹² This recognition of being-Self is both significant and paradoxical, significant in that it implies a concern with what it means for Dasein to be itself, paradoxical, because the aim of this chapter is to demonstrate that, proximally and for the most part, Dasein is precisely *not itself*. ‘Dasein is in each case mine, and this is its constitution; but what if this should be the very reason why, proximally and for the most part, Dasein is *not itself*?’ (Heidegger’s italics).¹³ The primacy of not-being-self is the reason why Heidegger has to take pains to point out that ‘the “not-I” is by no means tantamount to an entity which essentially lacks “I-hood” but is rather a definite kind of Being which the “I” itself possesses, such as having lost itself.’¹⁴

That Dasein is itself primarily in the mode of not-being-self is then further explained in terms of Dasein’s understanding itself out of the world in which it finds itself and in terms of those entities which it encounters in the world which, if they are not actually entities whose

mode of being is not that of a self, are at least persons whose mode of being can always be, and usually is, interpreted as that of a person-thing present at hand in the world. Thus, 'the Being of those entities which *are there with us*, gets conceived as presence-at-hand'.¹⁵ And yet, at the end of the section on the 'They', it becomes clear that Heidegger does not want to let go of the possibility that authentic being-self remains a real possibility. He does this by insisting that authentic being-self does not represent a suspension of the basic conception of being-with (which is that of not-being-self) but only a modification of the former. 'Authentic being-one's-self does not rest upon an exceptional condition of the subject, a condition that has been detached from the "They"; it is rather an existentiell modification of the "They" – of the "They" as an essential existentiale.'¹⁶

Notice Heidegger says 'existentiell' not 'existential' modification. In fact he cannot say 'existential', since the category of Falling (which is an existential category) will commit him to an existential analysis of inauthenticity. Thus by 'existentiell' Heidegger must mean a possibility which is actually available to Dasein but to which Dasein is not necessarily committed, indeed, is unlikely to ever realize. Hence his conclusion that there is an 'ontological gap' separating the self-sameness of the authentically existing Self from the identity of that 'I' which maintains itself throughout its manifold Experiences.¹⁷ Clearly Heidegger believes that this gap can be bridged. It will be our task to show that, as matters stand, this ontological gap cannot be bridged.

The investigation of the four existential structures is reserved for chapter 5 on being-in as such. But although the correct procedure would seem to be to begin with an examination of the three *existentialia* which operate at the level of experience and to proceed on from there to an examination of their expression in and through language, this is not how Heidegger does actually proceed. Rather, State-of-mind and Understanding are examined first, as ontologically equi-primordial structures in which the Being of the 'there' maintains itself. Interpretation is then derived as an extreme form of Understanding. And from interpretation, the analysis moves on into an exposition of Discourse, before coming back to an examination of Falling as the everyday being of the 'there'. In other words, under the head (A) of 'The existential constitution of the "there"', State-of-mind, Understanding and Discourse are investigated first, while Falling is only explicitly introduced under the head (B) of 'The everyday Being of the "there" '.

In fact, the displacement of the existential structure of Falling is even more radical than might appear from this division into the two heads A and B. For the initial introduction of the concept of Falling is only preliminary. It is succeeded by a description of concrete forms in which language has already fallen, namely, idle talk, curiosity and ambiguity.

Only then is Falling presented *explicitly* as a basic kind of Being which belongs to everydayness. Implied therein is a thesis to the effect that language itself plays a large part in the phenomenon of Falling.

The question that arises from this organization of the material is the following: is Falling really an existential structure or, at least, an existential structure on a par with State-of-mind and Understanding?¹⁸ Or should it not rather be regarded as an existentiell structure, one grounded perhaps in other, more fundamental structures? Why, for example, does Heidegger never say that Falling is ontologically equi-primordial with State-of-mind, Understanding and Discourse? To be sure, he does say that '*Falling* is a definite existential characteristic of Dasein itself.'¹⁹ Or again, that '*Falling* reveals an essential ontological structure of Dasein itself'.²⁰ But it is noticeable that he does not use the concept of equi-primordiality. Understanding is explicitly said to be equi-primordial with State-of-mind.²¹ Again, he says quite unequivocally: '*Discourse* is existentially equi-primordial with *State-of-mind* and *Understanding*.'²² No such statement qualifies the presentation of Falling.

Given the order in which the *existentialia* are presented, it might seem as though language constitutes the specific moment in which being-self is diverted into not-being-self. Not only does language form the bridge between Understanding and Falling, Falling is itself understood out of inauthentic forms of Discourse. But then, not only does Heidegger recognize authentic modes of Discourse, the inauthentic are *specifically derived* as de-formations of the former. The analysis of idle talk, curiosity and ambiguity is itself preceded by an investigation of assertion or propositional language. Not only is the apophantical 'as' of assertion contrasted with the 'as' of an interpretation which understands circumspectively, the former is always seen as a derivation from the latter. Indeed it must be so seen, since it is described in terms of a deformation of that very 'as' structure which is definitive of hermeneutical understanding. Thus, Heidegger asserts, 'assertion cannot disown its ontological origin from an interpretation which understands'.²³ In other words, the inauthentic Understanding, expressed in assertion, is derived from authentic Understanding, as a deficient mode of the former.

It is for this reason that, in the section on 'Being-there as Understanding', Heidegger will say: 'Understanding is the existential Being of Dasein's own potentiality-for-being; and it is so in such a way that this being discloses in itself what its being is capable of.'²⁴ That 'potentiality-for-being' has the meaning of being-self rather than not-being-self becomes even clearer when potentiality-for-being is itself understood in terms of the structure of 'projection' and when the structure of projection is laid out in such a way that, in projecting, Dasein is said to '*not yet*' be what it has in it to be.

Only because the being of the 'there' receives its constitution through Understanding and through the character of Understanding as projection, only because it *is* what it becomes (or alternatively, does not become), can it say to itself 'Become what you are', and say this with understanding.²⁵

That authentic self-understanding is *at least* as primordial as the inauthentic is confirmed in the very next paragraph. Heidegger tells us that Understanding can devote itself primarily to the disclosedness of the world, in which case it understands itself inauthentically in terms of the world. But Understanding can also throw itself primarily into the 'for the sake of which'. This means that 'Dasein exists as itself'. Hence 'Understanding is either authentic, arising out of one's self as such or inauthentic'²⁶ – presumably because it does not arise out of self as such. Only a little later we find a passage in which authentic being-self definitely appears to be accorded the priority over inauthentic not-being-self. Heidegger tells us that 'transparency' (*Durchsichtigkeit*) is the term he proposes to use to designate 'knowledge of the self' (*Selbsterkenntnis*). Transparency is 'the sight which is related primarily and on the whole to existence'.²⁷ He goes on to contrast this *Selbsterkenntnis* with the *Sichkennen* encountered earlier in the course of everyday being-with²⁸ in a context where solicitude is described as dwelling proximally and for the most part in 'deficient or at least Indifferent modes'. To be sure, Heidegger does distinguish two kinds of solicitude, the inauthentic kind that *leaps in for* the other and *takes away* his care and the authentic kind that *leaps ahead of him to give his care back* to him. But this only makes it that much more urgent to determine which is the original form and which the derivative.

The same question arises with the same ambiguity in relation to the first of the existential structures, State-of-mind. For State-of-mind is analysed in terms of 'thrownness' and 'facticity'. Thrownness is not an incidental but an essential characteristic of Dasein and the same goes for facticity. '*Facticity is not the factuality of the factum brutum of something present-at-hand, but a characteristic of Dasein's being*'.²⁹ Mood is nothing but the disclosure of that as which one is given over to being. In disclosive understanding of Mood, Dasein is itself, comes to terms with what it is. But Heidegger hastens to add that, proximally and for the most part, states of mind disclose Dasein 'in the manner of an evasive turning-away'.³⁰ Rather than seeking itself, Dasein tends to evade itself by fleeing from that very self as which it is delivered over to being. But even here it is intimated that Dasein could not flee itself if it did not have some (pre-ontological) understanding of that very self which it was seeking to evade.

One is bound at this point to ask: could either facticity or thrownness

(or both) not have been presented as the basic *existentialia*, thereby leaving open the question whether Dasein comes to terms with or evades that as which it is delivered over to being? If Falling turns out in the end to be a falling away from, or an evasion of, self then the more primordial structure would seem to be that as which Dasein is delivered over to being – its very own self as revealed in facticity. Falling could then have been introduced as an *existentiell* modification which would explain why, for the most part, self-disclosure takes the form of a fleeing from self rather than a seeking for self.

The critical question can perhaps be better formulated in other terms, terms which do not beg the ontological question from the outset. Is Falling a *primary* or a *secondary* phenomenon? Three alternatives seem to suggest themselves. First, Being-self could be presented as the ontologically primary phenomenon, from which not-being-self would accordingly be derived, perhaps incidentally and occasionally but also perhaps essentially, and for the most part. In this case Falling would be secondary. Second, not-being-self could be presented as the primary phenomenon from which, accordingly, being-self has to be derived as an *existentiell* modification but only at the risk of making the issue of authenticity one of Dasein's *merely ontic* affairs. In this case Falling remains primary. Third, Being-self and Not-being-self could be presented as equi-primordial – Falling following from *being-self* in the mode of absorption in the world. In this case, no decision could be arrived at with regard to the primacy of Falling. Though Heidegger tends to waver between the second and the third of these alternatives, it will be our task to show that the theory of authenticity holds up, as a theory, only if the first of these possibilities is adopted.

Falling is presented as fallenness into the average everydayness of *das Man*, the 'They'. The way in which the 'They' understands and interprets is, of course, non-ontological. Average everydayness conceals from the self its own ontological constitution and so exposes Dasein to that understanding of itself which comes to it from the world. 'Dasein understands itself proximally and for the most part in terms of its world.'³¹ The Who calls itself an 'I' but is nothing less than something individual. 'The "who" is not this one, not that one, not oneself, not some people, and not the sum of them all. The "who" is the neuter, *the "They"*'.³² Because the 'They' constantly accommodates itself to the others, its understanding is nothing better than public opinion. 'Distantiality, averageness, and levelling down, as ways of Being for the "They", constitute what we know as "publicness".'³³

But if, as a result of Falling, Dasein has ceased to be itself, it would seem that Falling could remain an ontological structure *only if* it was presented as a Falling away from a more primary state in which Dasein was itself. That into which Dasein falls would then be something

secondary while that from which it falls would be *primary*. However, the structure which motivated the 'fall' might still be an ontological structure, if it enforced the passage or transition from the primary to the secondary. If, on the other hand, no such primary state is acknowledged then Fallenness into the 'They' must itself be envisaged as something primary. And then we are in difficulty.

Here we find ourselves faced with an equivocation of which Heidegger hardly seems to be aware. On the one hand, Heidegger specifically excludes the possibility that Falling might be a 'fall' from a purer and higher 'primal status'.³⁴ Or again: 'So neither must we take the fallenness of Dasein as a "fall" from a purer and higher "primal status"'.³⁵ This might be taken as an anti-Platonic move, refusing any interpretation of Falling as a Falling away from some more primary, and for this reason *higher*, state. And yet, just a little later he tells us: 'In Falling, Dasein *itself* as factual Being-in-the-world is something from which it has already fallen away.' In other words, being-self is here presented as something from which Dasein *has* fallen away when it falls into the world. Can this difficulty be resolved by distinguishing between a 'higher' and a 'lower' primal state? Dasein does not fall from a purer and 'higher' status because the self from which it falls away is actually a 'lower', less developed state of itself. But this still implies that there is a 'lower', more primal self from which Dasein falls away. Heidegger's objection that everydayness does not coincide with primitiveness³⁶ is no counter-example because, in this passage, he is contrasting developed with primitive cultures – which also have an everydayness of their own. So what sense does it make to say that Dasein, as fallen, is not itself, unless being-self is presented as an original possibility from which Dasein can fall away when it falls into the 'They'?

Or again, (in Falling) 'Dasein is said to plunge out of itself into itself, into the groundlessness and nullity of inauthentic everydayness'.³⁷ But if this downward plunge (*Absturz*), motivated by Falling, is a plunge into groundlessness then how can Falling be an ontological structure, since the function of an ontological structure is to furnish grounds, to lay the ground. Unless, of course, the ground (*Grund*) were an abyss (*Abgrund*). Could it be said that Dasein is so *grounded* that groundlessness, or the absence of grounds (nullity), arises, and this with necessity? This seems to be the gist of what he is driving at. But the question remains whether it is consistent with his concept of the self.

The difficulty could be presented another way. *In general*, being-in-the-world is supposed to be the original ontological condition which is lost sight of. Heidegger's analysis of the transformation of the ready-to-hand way of dealing with things encountered in a world into the present-at-hand representation of such things pursues this itinerary of forgetfulness. An ontological investigation is required to bring out the

groundlessness of the present-at-hand way of envisaging things and to ground the latter in the more fundamental, because more primordial, condition captured by the structure of being-in-the-world. In so far as Dasein is *in* the world, the being of Dasein is characterized by certain existential structures. State-of-mind is the disclosedness of the 'there' and, as such, brings Dasein before its self, *even if* Dasein is also able to evade its self. Understanding is the projective interpretation of the world in terms of the self and as such lets things be seen as they are 'there' for Dasein, *even if* Dasein is always able to transform this primordial fore-sight into the sightlessness of assertive understanding. Discourse articulates understanding and so is available to articulate a genuinely primordial understanding, *even if* Dasein, proximally and for the most part, lapses into degenerate forms of expression. In every one of the above-mentioned cases, the 'even if' expresses a possibility which is by no means a necessity and which, if it arises, is in any case a derivative possibility which, as such, depends upon the more primordial condition, indeed arises as a modification of the latter. And yet there is a tendency to reverse these ontological priorities, to make of the original something derivative, and to make of the derivative something original. And nowhere is this tendency more pronounced than with respect to the theme of authenticity, which is always presented as a step back out of the inauthenticity of *das Man*. The structure that is introduced to account for this otherwise inconsistent reversal is the structure of Falling. That the structure of Falling accomplishes this reversal is beyond question. What is questionable is whether it does not do so by way of an artificial contrivance and, much more seriously, whether this contrivance does not bring the basic ontological structures of *Being and Time* into contradiction with themselves.

To put it another way again: the reason 'world' takes Dasein away from itself is surely because the concept of 'world' in question is that false concept of world, fostered by Descartes, and enshrined in the everyday thinking of adults in advanced industrialized societies. But then, from the standpoint of *this* concept of world, being-in-the-world, in the ontologically proper sense, has already been lost. The findings of child psychology, of anthropology, of mythology etc., all confirm that there is a more original being-in-the-world for which 'world' is precisely the field for the *realization* of the self, in so far as the self projectively interprets and is affected by that which is projectively *there* for it. It is the loss of this more original concept of 'world', or the transformation of this 'world' into a matrix of objective relations which results in the self losing its primordial sense of self by, for example, coming to think of its self as something subjective. In order to accommodate such an insight, it would however be necessary to differentiate between the original 'world' and a derivative concept of, say, the *universe*.³⁸

There can be no doubt that Heidegger is aware of this difficulty. For he addresses it explicitly in a section in which he discusses the relation of Falling and thrownness. 'Can Dasein be conceived as an entity for which, in its Being, its potentiality-for-being is an *issue*, if this entity, in its very everydayness, *has lost itself* and in Falling, "lives" away from itself?'³⁹ Heidegger answers:

But Falling into the world would be phenomenal 'evidence' against the existentiality of Dasein only if Dasein were regarded as an isolated 'I' or subject, as a self-point from which it moves away. In that case, the world would be an Object.

But his answer begs the question. Certainly, there could be no *existential* analysis of Falling if the world in which Dasein found itself were envisaged, from the first, as an objective universe. But by prefacing the subject-object relation with a more primordial way of being, it does become possible to talk of Falling as a falling away from that primordial involvement which characterizes Dasein originally. And this does imply that Dasein cannot have 'fallen' from the very beginning, or that, if it has, fallenness is originally a way of being-in-the-world which is anything but inauthentic (i.e., thrownness).

Just as serious is the following difficulty. If Dasein is, in reality, its 'there' in such a way that a potentiality for being itself is always available to it, then it is precisely as being-self, that is, as being-in-the-world, that it ceases to be itself, since the world is that into which it has fallen, by which it has been taken away from itself in the form, primarily, of being-with. But if it is *as itself* that it ceases to *be itself* then how can it ever *become itself* in the manner required by the theory of authenticity? Indeed, one can go further and ask: how can it ever even *cease* to be itself, since it has lost itself from the very beginning, and so has *never* been able to be itself?

A way to resolve the difficulty would be to disconnect the subsidiary structures of thrownness and facticity from that of Falling, to confer upon the former a genuinely ontological status and to see Falling as a secondary derivative. Here is a passage in which Heidegger defines thrownness. 'The expression "thrownness" is meant to suggest the *facticity of its being delivered over*.'⁴⁰ This reference back to facticity requires that we also consider how Heidegger defines the latter.

Whenever Dasein is, it is as a Fact; and the factuality of such a Fact is what we shall call Dasein's 'facticity'. The concept of 'facticity' implies that an entity 'within the world' has Being in the world in such a way that it can understand itself as bound up in its destiny

with the Being of those entities which it encounters within its own world.⁴¹

Facticity rather than thrownness or Falling is the concept with which such existential successors of Heidegger as Jean-Paul Sartre tend to operate. And in the light of their analyses we can perhaps give a more concrete sense to Heidegger's rather vague descriptions. Facticity means that I do not choose to be or choose who I am to be but simply find myself already in the world as given to be a specific someone. There is no necessity to my existing or to my existing as *this* person. It simply happens that I find myself as that very person who I am and thrown into a world which is not of my choosing. It is this factual happening which then serves as the foundation for everything I am to make of myself. This was what Sartre meant when he used that apparently contradictory phrase 'necessary contingency'. That I am is a purely contingent fact. But this fact is the necessary foundation of my existence as an appropriation of thrown being in the world.

In fact, facticity and thrownness are really two sides of the same primary structure. Facticity focuses on the fact of being a self (that I am) while thrownness focuses upon that in which I find myself as already existing, namely, the world. They are the existential counterparts of the ontological phenomena of the 'Who' and the 'World' which, of course, belong together in the unitary configuration being-in-the-world.

Strictly speaking, there is nothing secondary about either facticity or thrownness. From the very first, Dasein finds itself delivered over to itself as already existing in a world. Whether Dasein is born into an 'advanced' industrial society or whether it is brought into a 'primitive' world, it exists, factically, as thrown being in a world. Indeed, one might almost say, animals too exist as thrown being in a world, the world of the domestic pet, the world of animal husbandry, the untamed jungle. To be sure, awareness of factual existence in a world may never come to animals and may only come later on with humans. To borrow a phrase from Bishop Berkeley, if consciousness of existence is taken as that characteristic which distinguishes Man from the Beasts, many of those who pass for Men might have to be counted amongst the latter kind. This disparity between an ontological structure and conscious awareness of that structure, as a definite and determining characteristic of Dasein, is however already allowed for by Heidegger with his talk about a pre-ontological way of being. So far from it being the case that unawareness of the fundamental structures of existence militates against the ontological character of the being whose existence is in question, awareness of existence, when it comes, is most likely to be an existentially false awareness, an awareness of self out of and by means of categories which

are appropriate not to Dasein but to beings which do not have the mode of being of Dasein.

Unlike the structure of Falling however, that of facticity (or thrownness) does not carry with it the implication of not-being-self. Facticity and thrownness simply mean that I cannot *choose* that as which I am delivered over to being. But I can *be* it all the same. On the other hand, 'Falling Being-in-the-world', Heidegger tells us, 'is not only tempting and tranquillizing; it is at the same time alienating'.⁴² This latter characteristic is of especial interest since Heidegger concedes that 'alienation *closes off* from Dasein its authenticity'.⁴³ This suggests that, as factically existing in a world, Dasein is initially disclosed to itself as that very being which it is. The alienation of Falling, on the other hand, closes Dasein off from a being which it is actually given over to being by virtue of facticity and thrownness. So understood, Falling *could* be presented as a secondary modification of the more primordial structure of facticity. *Were* it to be so understood, the difficulties encountered above would be resolved.

These revisions are not arbitrarily recommended nor are they proposed with a view to forcing Heidegger's thinking into an alien mould. Rather, they are required in order to make Heidegger consistent with himself. To be sure, there are passages where even thrownness takes on the negative characteristics of not-being-self. 'Is not Dasein, as thrown Being-in-the-world, thrown proximally [*zunächst*] right into the publicness of the "they"?'⁴⁴ Heidegger asks. The answer is that, at the very most, only *adult* Dasein is proximally and for the most part thrown into the 'They' in the way Heidegger describes. This is not an incidental objection. When, in *Truth and Method*, Gadamer considers the problem of understanding and interpretation in *Being and Time*,⁴⁵ he specifically takes account of the problem of animals and children and admits that there are open questions still to be faced here. Perhaps it is in order to close off such questions that Heidegger himself devoted a section to 'The existential analytic and the interpretation of primitive Dasein'. Primitive Dasein, Heidegger concedes (and the same would go for children), can throw light upon human nature because '“primitive phenomena” are often less concealed', because primitive Dasein 'often speak to us more directly'.⁴⁶ He nevertheless still insists that 'everydayness does not coincide with primitiveness', the reason being that primitive Dasein has an everyday being of its own. But even if this is admitted, surely, the everydayness of primitive Dasein is so far removed from that of the 'Man' Heidegger has in mind that a comparison of the two would make it difficult to sustain the thesis of an original lostness in the 'They'. Surely animals, primitives and even children, do live in some primary accord with themselves and with nature, an accord which it is the very task of society to level down in such a way as to make them fit for (as being fitted into) being with one another. And possibly this levelling down is

not as negative as Heidegger makes it appear. Perhaps it even meets an ethical requirement, assuming, that is, that a relation *can* be established between ontology and a possible Ethics. But before we pursue this question further let us first turn to an examination of the procedure of individualization.

2 The procedure of individualization

Individualization reverses the tendency inherent in Falling. The self which says 'I' of itself has been shown, proximally and for the most part, *not* to be itself. Individualization reverses the tendency on the part of the self to evade its self, to flee from itself, to let itself be absorbed in *das Man*, by bringing the self face to face with itself, that is, before its ownmost potentiality for being itself.

Of course, if Falling is an ontological characteristic and, as such, one which determines the being of Dasein from the very beginning, the very possibility of being-self becomes eminently problematic, as we have seen. It is noteworthy therefore that Heidegger addresses this quite specific difficulty in the very section (§40) in which he introduces the concept of individualization.

From an existentiell point of view, the authenticity of being-one's-Self has of course been closed off and thrust aside in Falling; but to be thus closed off is merely the privation of a disclosedness which manifests itself phenomenally in the fact that Dasein's fleeing is a fleeing in the face of itself.⁴⁷

The force of Heidegger's response rests here upon the notion of a 'privative' mode.

Privative modes are a familiar item in Heidegger's analyses and are employed to indicate the derivative character of what is so described. The present-at-hand is a privative modification of the ready-to-hand. Space as an abstract system of relations (or as a container) is a privative mode of the primordial spatiality of de-severance and directionality. The ordinary conception of time is a privative mode of primordial temporality. Assertion is a privative mode of hermeneutical understanding. But elsewhere, when Heidegger describes privative modes, he first lays out the basic structures of the primordial mode in question, the ready-to-hand as such, primordial spatiality, primordial temporality, the hermeneutical 'as'. In this critical case, not only does he not do so, he *cannot* do so, due to the ontological character of Falling. Precisely there, where you would most expect an analysis of authentic being-self, prior

to the privative derivation of inauthentic not-being-self, you find the privative mode accorded the primary role.

Heidegger is aware of this difficulty and tries ingeniously to circumvent it by arguing that self-evasion is only possible in so far as the self is, in some sense, aware of that from which it flees. 'Only to the extent that Dasein has been brought before itself in an ontologically essential manner through whatever disclosedness belongs to it, can it flee in the face of that in the face of which it flees.'⁴⁸ The critically ambiguous phrase is 'whatever disclosedness'. Heidegger might have said that there is a pre-ontological comprehension of the self, from which the self is diverted when it falls into the 'They'. But then the structure of Falling, which is called in to account for this diversion, could not be an ontological but rather only an ontical, or at best an ontico-ontological structure. This option seems to be one which he accepts when he claims: 'This existentiell-ontical turning-away, by reason of its character as a disclosure, makes it phenomenally possible to grasp existential-ontologically that in the face of which Dasein flees, and to grasp it as such.'⁴⁹ The 'turning-away' in question is surely nothing but Falling, which is here characterized as something existentiell-ontical (even though Falling is supposed to be an existential structure), in order that Dasein itself should be grasped existential-ontologically in its very being; and this is given as the reason why 'in orienting our analysis by the phenomenon of Falling, we are not in principle condemned to be without any prospect of learning something ontologically about the Dasein disclosed in that phenomenon'.⁵⁰

Of course, we are familiar with analyses which begin upon the ontic plane to find there the phenomenal basis for an inquiry back into the ground. Indeed, this is the standard procedure adopted throughout *Being and Time*. But the phenomenal evidence here is not 'having already fallen', from which it might be possible to inquire back into a more primordial condition where Dasein had 'not yet fallen', which latter might then be presented as that *from which* Dasein falls when it falls away. Rather, 'having always already fallen' is implied by the ontological structure of Falling which, as such, precludes the very possibility of 'not yet having fallen'.

Thus the theory of individualization is much more complicated than it appears on the surface. On the surface, individualization looks like a turning away from that not-being-self which results from Falling which, as such, can be presented as a turning back toward that very being-self from which Dasein has fallen away. But if there is no being-self from which Dasein can fall away, then it becomes questionable whether Dasein can ever actually individualize itself.

The analysis of individualization arises in relation to four problematics, *anxiety*, *death*, *conscience* and *resoluteness*. The first of these is dealt with in division one, and in connection with the structure of care, the

other three in division two. We shall examine each of these in turn before returning to the structure of the *self*.

Anxiety

That in the face of which Dasein flees must have the character of the threatening. But what threatens Dasein is nothing definite, nor does it proceed from any particular region. As such it is not something of which Dasein can be afraid. Contrasting *anxiety* with *fear* not only has the function of bringing out the indefinite character of anxiety; much more important, it throws into relief its reflective character, though without appealing to structures which might be identified as 'reflective' in the traditional sense. That in the face of which Dasein shrinks back has the same character of being as the one shrinking back. But this self-sameness brings with it nothing like a reversion to self. Rather the contrary; that which Dasein is anxious about is its being-in-the-world in so far as the latter is the domain in which, and in which alone, Dasein is capable of working out its potentiality for being itself. The 'They' gives Dasein reasons for being which are not commensurate with its potentiality for becoming itself. Thus Dasein must first turn away from that turning *away* from self which characterizes Falling in order to be able to turn *toward* itself as that from which it originally turned away.

It is therefore no accident that Heidegger first introduces individualization in connection with solipsism. 'Anxiety individualizes Dasein and thus discloses it as "solus ipse".'⁵¹ But the solipsism in question is the very opposite of that which features in the traditional literature. So far from bringing Dasein *to* itself by bringing it *away* from the world, indeed cutting it off entirely from the world, Dasein is now brought face to face *with* itself as being-in-the-world.

Death

Part One of *Being and Time* ends with the examination of a phenomenon (care) whose function it is to ensure the wholeness of Dasein. Part Two opens with a reaffirmation of the theme of wholeness, this time in connection with the problematic of Time. Rather than moving right away into an examination of time however, Heidegger focuses instead upon the phenomenon of death. Existence presupposes life which, as such, is still not yet at an end. Death is the end of any further possibility of existing and, as such, confers a wholeness upon life itself, provided that Dasein is able to comport itself towards its end in an appropriate manner. Heidegger begins by outlining inauthentic attitudes towards death before fastening upon three characteristics which distinguish death as a genuine possibility of being and which consequently individualize Dasein down to its ownmost potentiality for being itself.

Heidegger does not explicitly mention individualization in connection

with the first of these characteristics. But the characteristic of being an ownmost possibility obviously brings with it the implication of uniqueness. The only death which I can 'anticipate' is my own, and this ownness characteristic already implies a wrenching away from *das Man*. It is the non-relational character of death which is used to reintroduce the theme of individualization. 'The non-relational character of death, as understood in anticipation, individualizes Dasein down to itself'.⁵² The connection is also made with regard to the third characteristic, the *unüberholbarkeit* of Dasein, translated as 'not to be outstripped'. 'As the non-relational possibility, death individualizes – but only in such a manner that, as the possibility which is not to be outstripped, it makes Dasein, as being-with, have some understanding of the potentiality-for-being of Others.'⁵³ The third characteristic serves not only to shatter the tenacious hold upon existence which Dasein may ordinarily exhibit, it releases the latter for an understanding of the existence-possibilities of Others. Thus the three characteristics seem to represent three steps along the way to authentic being-toward-death, first, a wrenching away from the 'They', second, a return to self and third, a release from self for authentic being-with.

Thus being-toward-death both reveals the fallen character of Dasein, as lost in the They, and brings it face to face with the possibility of being-itself. However, being-itself as implied by being-toward-death is still only a possibility, though admittedly an ontological possibility. In being-toward-death, the possibility which I anticipate is still not an actuality and can never be so since, as an actuality, it is the impossibility of any further possibility of being. Hence the need for some phenomenon in which Dasein's ownmost potentiality for being is attested concretely. It is this shift from an ontological possibility to an ontic potentiality for being which can be phenomenally attested which then leads the way into the analysis of conscience.

Conscience

Conscience, according to Heidegger, is that by means of which authentic being-one's-self is attested. As such, it is not an original phenomenon but manifests itself as an existentiell modification of the 'They'. 'Authentic Being-one's-Self takes the definite form of an existentiell modification of the "They".'⁵⁴ But if Dasein is originally *not* itself, then what is it that Dasein is restored *to* when it is restored to *itself*? How can Dasein ever be restored to its ownmost being-self when the existential structure of Falling precludes the possibility of an original being-self from which the self might have fallen away? Before we even attempt to answer these questions, let us first confirm that conscience is effectively a calling to self and that this calling to self is one which individualizes.

Conscience, Heidegger claims, is a mode of discourse⁵⁵ and it is this

existential assignment which justifies him in talking about conscience as a 'voice' and as a 'call'. Who calls? Obviously, Dasein. And to whom is the call addressed? Again, Dasein itself.⁵⁶ To what is one called by the voice of conscience. 'To one's *own Self*.'⁵⁷ In other words, in the call of conscience, Dasein is called *to* itself *by* itself *to be* its self. In order to avoid the 'metaphysical' implications of the reflectivity of conscience, Heidegger hastens to add that the self which is so called is not a subject and is therefore not turned inward upon itself when it is called but rather is called to be itself as being-in-the-world.⁵⁸

The derivative character of the individualization which emerges as a result of the call of conscience is reinforced by two further features. First, Heidegger recognizes the call as coming from over and beyond. 'The call comes *from* me and yet from *beyond me and over me*.'⁵⁹ This over and beyond is of course not explained with reference to God or to any internalized authority but is referred back to Dasein itself. That self which has lost itself in the 'They' can only experience its own self as something alien to it. 'What could be more alien to the "They", lost in the manifold "world" of its concern, than the Self which has been individualized down to itself in uncanniness and been thrown into the "nothing"?'⁶⁰ Due to lostness in the 'They', the alien appears own, the own alien and it is the alienness of its ownmost self which is supposed to account for the call appearing to come from over and beyond the self.

Second, so far from stressing the positivity of being-self, Heidegger goes out of his way to emphasize its negative character. Dasein is not so much called back to itself as called away from the 'They' and this by hearing the warning of conscience which addresses Dasein as Guilty! Guilty, namely, of *not* being its self. Thus, 'in the idea of "Guilty!" there lies the character of the "not"'.⁶¹ Dasein is not nor can it ever become the basis of its being. But it can and must be the being of its basis – which is itself a nullity. 'Not only is the projection, as one that has been thrown, determined by the nullity of being-a-basis; as *projection* it is itself essentially *nul*.'⁶² Not only is the calling to self a calling away from not-being-self, the self to which Dasein is called is itself a nullity. This way of analysing the self to which Dasein is called is imposed by the primordially of Falling. And yet it leads to difficulties which can only be resolved by a species of dialectical jugglery which requires that a positive character be ascribed to negativity itself – to the point indeed, that Heidegger ends up asking a question which it is not at all typical of *Being and Time* – though it may be taken to define the entire Sartrean project in *Being and Nothingness*. 'Has anyone ever made a problem of the ontological source of notness, or, prior to that, even sought the mere conditions on the basis of which the problem of the "not" and its notness and the possibility of that notness can be raised?'⁶³

Resoluteness

If there is a positive response to the call of conscience, it is to be found in resoluteness. Resoluteness is a mode of disclosedness which is attested in conscience. 'This reticent self-projection upon one's ownmost being-guilty, in which one is ready for anxiety – we call "resoluteness"'.⁶⁴ The components of this definition already attest to the negativity of resoluteness. And yet it is often presented in positive terms. 'Resoluteness, as authentic being-one's-Self, does not detach Dasein from its world, nor does it isolate it so that it becomes a free-floating "I"'.⁶⁵ The being-self which is referred to here is then developed in such a way that only by being itself does it become possible for Dasein to be with others authentically. 'Dasein's resoluteness towards itself is what first makes it possible to let the Others who are with it "be" in their ownmost potentiality-for-being, and to co-disclose this potentiality in the solicitude which leaps forth and liberates'.⁶⁶

And yet this preliminary analysis of resoluteness is only existentiell. 'Dasein's authentic potentiality-for-being, in its existentiell attestation, has been exhibited, and at the same time existentially interpreted, as *resoluteness*'.⁶⁷ As such, it points forward to a more fundamental analysis which would be existential. The transition from an existentiell to an existential interpretation of resoluteness is effected with reference to the structure of anticipation. In effect, anticipation brings with it a host of considerations already dealt with previously, the wholeness of Dasein in being-towards-death, the temporality of Dasein, the nullity of Dasein. Anticipatory resoluteness brings these considerations together in an existential analysis by uniting them in the structure of care. The reappearance of the structure of care in turn makes it possible to consider the unity of the self as a unity of the totality of Dasein's structural whole.

Care and selfhood

It is no accident that the question of the unity of self reappears in connection with that of the structure of care at the very end of the entire theory of individualization and just before the final plunge into the theory of temporality which concludes the entire work. For, as Heidegger admits, despite the continual reference to the self, to being-self as well as to not-being-self, 'the question of the ontological constitution of Selfhood has remained unanswered'.⁶⁸ To some extent this critical section provides an opportunity for resuming the themes presented earlier. The connection between selfhood and care, selfhood and the wholeness of Dasein encountered in being-toward-death, are reproduced. More important, Heidegger reiterates the connection between inauthentic not-being-self and Falling. But he does so in a way which calls in question the existential character of Falling. For Falling is conceived here, quite

explicitly, as a modification of authentic being-self. 'It has been shown that proximally and for the most part Dasein is not itself but is lost in the They-self, which is an existentiell modification of the authentic Self.'⁶⁹ Here, the assignments are clear, an existential analysis of the authentic self and an existentiell analysis of the inauthentic self, as a modification of the former. This is of course only what one would expect. But it is in direct conflict with the ontological character of Falling. If the self is fallen from the very outset, which is the implication behind the existential character of Falling, then the inauthentic self cannot be a modification, whether existentiell or existential, of the authentic self. Rather the contrary, it is the authentic self which must be a modification of the inauthentic self.

How such a modification might indeed be possible is indicated in the substitution of the category of constancy for the traditional categories of identity, simplicity, substantiality, etc. The constancy of the self is presented as 'the authentic counter-possibility to the non-self-constancy which is characteristic of irresolute Falling'.⁷⁰ The implication is that Dasein lifts itself out of irresolute Falling into the 'They', not by conceiving of itself as an identical substance but by holding to whatever projects represent ownmost possibilities of being for the self. The self-identical substance self would be one which actually drifts from one mode of being to another, one way of thinking to another, and so becomes something shifting and transitory, despite its seeming self-sameness. The view of the authentic self which emerges from the characteristic of constancy as a counter-possibility to irresolute Falling, is closely related to the Sartrean view of the self as a nothingness which makes itself be by holding to those possibilities of being which it deems to be ownmost possibilities of being. There are of course elements in Heidegger's thinking which lend themselves to such an interpretation, especially the analysis of the thrown basis as a nullity. But it is entirely inconsistent with the characterization of the inauthentic self as an existentiell modification of a more primordial being-self.

So here, in this critical and conclusive chapter on the self, all the difficulties of the Heideggerian position emerge with full force. Both anticipatory resoluteness and Falling are existential structures, and yet they lead to contrary characteristics; constancy, on the one hand, and inconstancy on the other.

We have considered two solutions to this problem so far. First, due to Falling, the inauthentic self might be regarded as ontologically primary; in which case, authentic selfhood would emerge as an existentiell modification of the former. In so much as this route is adopted, the Sartrean position recommends itself. Because there is nothing like an original being-self, the self can only make itself be authentically on the basis of the nothingness of itself. Second, both authentic and inauthentic

modes of being could be ascribed to the self originally, the first clearly and explicitly, the second obscurely and implicitly. Authentic selfhood would then demand a shift of attention from the way in which the self is most readily and obviously conceived to that other way of conceiving of the self through which alone the self can come to conceive of itself authentically. No doubt this is why, earlier, Heidegger affirms the essential complementarity of resoluteness and irresoluteness. 'In anticipatory resoluteness, Dasein holds itself open for its constant lostness in the irresoluteness of the "They" – a lostness which is possible from the basis of its own Being. As a constant possibility of Dasein, irresoluteness is co-certain.'⁷¹

That neither of these two options are in fact satisfactory becomes especially clear when we encounter, once again, the problem of the hermeneutical circle. The circularity of the hermeneutical situation reappears, as a methodological issue, just prior to the investigation into selfhood, at ¶63, and it is re-introduced in the same way in which it was first introduced long ago in the Introduction: *'the entity which in every case we ourselves are, is ontologically that which is farthest'*.⁷² The objective of an ontological Interpretation of Dasein must be to articulate a way of being which is that of Dasein, prior to the covering up which results from Falling. *'Dasein's kind of Being thus demands that any ontological Interpretation which sets itself the goal of exhibiting the phenomena in their primordiality, should capture the being of this entity, in spite of this entity's own tendency to cover things up.'*⁷³ That Heidegger has in mind here not only a pre-ontological way of understanding one's self but one which is definitely linked with the way of being of pre-rational Man is indicated in a curious passage where he seems to defy his own prohibition against anthropological interpretations by exemplifying this pre-ontological understanding with reference to myth and magic.⁷⁴ But if it follows therefrom that an ontological investigation moves in a circle, the circularity of this procedure would only be effective in bringing to light Dasein's authentic being-self if such a way of being characterized the being of human being originally, no matter how indefinite and obscure this self-relation might be. Indeed, the very indefiniteness and obscurity of Dasein's own original self-understanding would then provide an exemplary motive for the kind of existential analyses in which Heidegger engages.

By the hermeneutical circle is meant a way of understanding for which the goal is effectively the ground, which, in moving forward toward an explicit laying out (*Auslegung*) actually only moves back toward what was already presupposed from the very beginning. But there are two *quite different ways* in which this circularity might be envisaged, one which starts upon the ontic place, moves back to the ontological ground and then forward again to the ontic; the other which starts with a pre-

ontological way of being of Dasein, moves forward to the ontic plane and then back again to a fully ontological clarification of this pre-ontological mode of being. We shall link the former with what we shall call the method of a 'regressive genesis'. We shall want to contend not only that the method of a regressive genesis fails to do justice to the radicality with which Heidegger poses the question of the being of Dasein, but that any effective resolution of the difficulties which it raises must depend upon the substitution, for this procedure, of an alternative procedure which might be called that of a 'progressive genesis'.

4 Progressive versus regressive genesis

Typically, Heidegger begins his investigations in *Being and Time* upon the ontic plane, and with a description of phenomenon which are readily accessible in so far as they characterize the average everydayness of Dasein. From here, the analysis moves back to an inquiry into the ground of what has been taken for granted. Finally, in so far as a ground has been disclosed, this same ground can then be investigated in its grounding capacity, that is, as giving rise to the very phenomenon which formed the point of departure for the entire analysis. There is a circularity here. But, in as much as the analysis both departs from, and terminates upon, the ontic plane, the circularity in question might be called 'ontic' rather than 'ontological'. In so far as Heidegger employs such a method, his analyses still operate within a Husserlian configuration, to the point that as acute a critic as Tugendhat is able to call the ontological investigation of *Being and Time* a radicalized transcendental phenomenology.

Such a conception of Heidegger's ontological phenomenology (as a sort of inverted transcendental phenomenology) finds some support in *Grundprobleme der Phänomenologie*,⁷⁵ where Heidegger contrasts the Husserlian reduction with his own 'step back' from the ontic into the ontological realm. But it does not do justice to the radicality of Heidegger's procedure. For first, Heidegger's existential analyses are much more radically opposed to that way of understanding beings which is operative upon the ontic plane than are Husserl's epistemological analyses. For the most part, Husserl only wants to provide a transcendental foundation for those regions of being which are naively taken for granted in the natural attitude. The relative legitimacy of science and common sense is not called in question, only its naivety with regard to foundations. Second, by recommending his move back to a transcendental subjectivity, Husserl is only intensifying an epistemological subjectivity which he already admits. Heidegger's aim is much more radical, nothing short of an 'overcoming' of the entire metaphysics of subjectivity, consciousness, interiority, etc. It is for this reason that the ontic plane cannot provide

an unambiguous point of departure for ontological analyses. Even if the working out of the discipline of ontology comes last, a pre-ontological insight is necessary, from the very outset, as that which it is the task of an ontological investigation to bring to explicit awareness, and which guides the movement back from the very beginning. Indeed, it is only if this pre-ontological way of being is taken as the interpretative clue that the circularity of an ontological investigation can assume its proper form as a conclusive disclosure of what is initially only obscurely and indefinitely projected.

Hence the question: is there some other procedure which Heidegger might have adopted which would have avoided the difficulties which we have had to confront and which would, in consequence, confer upon his analyses a consistency which, as it stands, they lack? An answer already springs to mind in so far as it is one which has been suggested before. Beginning with a pre-ontological mode of being of Dasein which, if not fully authentic, is at least not yet committed to fallenness in the 'They', one could then envisage the latter as an *existentiell* modification. Indeed, provided one meant by 'existential modification' an *unavoidable transformation* of the very being of Dasein and not a way of being operative from the very beginning, fallenness into the 'They' could even be presented as an *existential* modification. This would, in turn, prepare the way for an account of individualization as the return to an original being-self out of the fallen condition. Such a revision would demand that we shift the emphasis from Falling to *facticity* and *thrownness* and that the latter be interpreted in such a way as to be free, at least in principle, from any commitment to inauthenticity.

The key to such a re-interpretation of the hermeneutical circle (no longer ontic–ontological–ontic but pre-ontological–ontic–ontological) lies in the notion of a pre-ontological way of being. In the Introduction, this notion is presented in connection with the metaphors of 'closeness' and 'farness'. 'Ontically Dasein is not only close to us – even that which is closest: we *are* it, each of us, we ourselves. In spite of this, or rather just for this reason, it is ontologically that which is farthest.'⁷⁶ Or again, 'Dasein is ontically "closest" to itself and ontologically farthest; but pre-ontologically it is surely not a stranger'.⁷⁷ The difficulty concealed in this somewhat mysteriously worded paradox becomes much clearer in the light of a genetic analysis. The difficulty lies in the characterization of both the ontical and the pre-ontological as 'close'. In the first citation, the difficulty is avoided simply because no mention is made of the pre-ontological. In the second however, it is avoided by the dubious strategy of a wording sufficiently ambiguous to circumvent the confusion that would otherwise arise with the double meaning of 'closest', as both pre-ontologically, and as ontically, close.

A little later, Heidegger makes another and much more satisfactory

attempt to differentiate the pre-ontological from the ontological. He presents the distinction in terms of a distinction between a way of being of Dasein and a way of thinking about this same way of being, a way of thinking enshrined in the discipline of ontology.

Here, 'Being-ontological' is not yet tantamount to 'developing an ontology'. So if we should reserve the term 'ontology' for that theoretical inquiry which is explicitly devoted to the meaning of entities, then what we have had in mind in speaking of Dasein's 'Being-ontological' is to be designated as something 'pre-ontological'.⁷⁸

The further qualification which Heidegger is careful to make is specifically intended to disqualify any interpretation of the 'pre-ontological' as something ontic. 'It does not signify simply being-ontical however, but rather being in such a way that one has an understanding of being.'⁷⁹

By taking the distinction between a pre-ontological way of being and the discipline of ontology more seriously than Heidegger takes it himself, we shall find ourselves in a position to develop a progressive genesis in the context of which many of Heidegger's difficulties are resolved. In particular, the theory of individualization can now be rendered more consistent with itself by representing the possibility of authentic being-self as a recuperation of a primordial possibility inherent in Dasein. The turning away from the 'They' motivated by anxiety, being-toward-death, conscience and resoluteness would, at the same time, be a turning back toward the self in its original ontological constitution.

But an even more challenging possibility can be envisaged, one which is more in line with the development of a genetic ethics and which would have the merit of *including* rather than *excluding* transcendental philosophy from the purview of a phenomenological investigation of ethical phenomena. This more challenging possibility refers to the possibility not merely of substituting a progressive for a regressive genesis but of transforming the progressive genesis in question from a *two-stage* into a *three-stage* genesis (pre-ontological-ontic-transcendental-ontological).

We have already considered two objections Heidegger brings against the working out of an (ontological) Ethics; that it is a derivative development which, as such, should be traced back to the ontological ground in which it needs to be rooted, and that it is not possible to tack on an Ethics as a sort of practical supplement. There is a third objection which bears more specifically upon the attempt to develop a *genetic* Ethics. In the context of an existential interpretation of conscience, Heidegger warns us that even the attempt to advance a material as opposed to a (Kantian) formal Ethics must fail because 'the call of conscience fails to give any such "practical" injunctions, solely because it summons Dasein to existence, to its ownmost potentiality-for-Being-its-Self'.⁸⁰ This is a

very strange, and highly off-hand, dismissal of Scheler's achievement. Although Scheler, like Sartre, makes it his business to offer concrete examples of the way in which his principles are instantiated, such examples only serve as clarifications. They have no paradigmatic value and the conclusions drawn can always be questioned with reference to the principles laid out in the Ethics. Essentially, what Scheler does in his major work (*Formalism in Ethics and Non-formal Ethics of Value*), is to lay out a hierarchy of values and to found these different orders of value in correspondingly fundamental ways of envisaging the being of human being. Corresponding to the material, the vital, the spiritual and the religious dimension of human being, Scheler finds value configurations whose essential characteristics can be specified and, moreover, ordered in a logically necessary sequence.⁸¹

And surely this is not so very far from the Heideggerian project with its differentiation of the ontological from the ontic plane. There are two main differences; first, Scheler recognizes the relative legitimacy of each of the planes so distinguished, in the sense that he does not try to reduce the higher to the lower, and second, that he offers a more discriminating range of value configurations, in as much as he distinguishes four rather than two planes of being. Moreover, if, as I hope to show in my 'genetic' ethics, one reverses the order of priority established by Scheler and makes the vital configuration primary, then the material value order becomes the plane upon which an inauthentic accommodation to commonly accepted standards first becomes apparent. The spiritual and the religious value configurations then pick up the thrust of a movement away which finally brings the self back to the origin again.

With a view to laying the foundation for such a *genetic* Ethics, let us see if the resources of phenomenological philosophy do in fact permit a differentiation and a specification of the requisite planes.

First and originally, the being of human being is so constituted that it simply affirms itself as being what it is. This is the being-self the existence of which Heidegger will sometimes confirm even though, for the most part, the theoretical exigencies of the category of Falling make it difficult, or impossible, for him to recognize such an original way of being. At this level, being-self and being-in-the-world would have to be recognized as reciprocal and mutually confirming structures. As that very being which it is, the self projects possibilities of being and so finds itself in a world through which alone such possibilities can be effectively realized. But if the realization of ownmost possibilities of being is the 'ethical' goal, then, with this revision, surely we run the risk of locating the goal at the very *outset* and so of precluding the very process by which the self comes to be itself, becomes itself, as the *outcome* of the procedure of individualization?

At the risk of losing the philosophical thread, it is worth mentioning

en passant that any parent who has supervised the upbringing of a child knows full well the two-sided significance of just such an elementary self-affirmation. The charm of children is their spontaneity, the naturalness of their being-self. But the behaviour of most children at some time (and some children most of the time) is directed toward getting their way, to imposing themselves (for instance upon their siblings). This is so familiar a phenomenon it is not worth labouring. The Ethics that belongs to such a primordial self-affirmation is, by its very nature, not only an affirmation of the self but often also a negation of the other. It is for this reason that the child has to be taught to recognize the legitimate, even if rival, claims of the other. Adolescence represents yet another stage in life at which human being strives to realize its ownmost being self, frequently in the form of a defiance of social rules. Where this defiance takes the form of long hair, loud parties and a penchant for sex and drugs, society tends to turn a blind eye since it recognizes in these traits the symptoms of a by no means dishonourable struggle for self-realization. When it takes the form of hooliganism, on the other hand, society tries to put a stop to it. Where, in other words, self-affirmation does not imply a negation of the other, it is tolerated, where it does, it is suppressed.

Precisely because an Ethics of self-affirmation exhibits a partiality which makes of the self an absolute, the movement from this primary to a secondary plane cannot be portrayed in a purely negative light. There is a rationale to the construction of the 'They' self and that construction has an *ethical* legitimacy, the substance of which is contained in the principle of an essential accommodation to the *legitimate* wants and needs of the other. To be sure, there is a self-negation at work here too, a self-negation which leads in the direction of Heideggerian inauthenticity. But this self-negation brings with it, as its essential complement, an affirmation of the other, or rather, a freeing of the other from the absolutist claims of the self.

In my view, the Utilitarian Ethics is nothing but an elaborate working out of the implications of this self-negation which is, at the same time, an affirmation, or at least a recognition, of the legitimate claims of the other. Each is required to regard himself as one, on a par with every other. Each is required to recognize that the pleasure derived from a given quantum of goods must also be measured against the deprivation which the other suffers when those goods are assigned to himself, rather than to someone else. Each is therefore enjoined to act in such a way that the 'greatest happiness of the greatest number' is promoted. Whether or not one is prepared to go so far as to subscribe to Nietzsche's contemptuous dismissal: Man does not pursue happiness; only the Englishman does that, nevertheless, inherent in the Utilitarian Ethics we do find a principle which functions as a cautionary corrective against the excesses of self-affirming integrity. Indeed, it is only in so far as a certain *relative*

legitimacy is accorded to the 'They' and to the kind of self-discipline which the 'They' enjoins does it then become possible to raise the question of how authenticity can be recovered without surrendering that recognition of the respective claims of the other which is enshrined in the Utilitarian Ethics.

To my way of thinking, the Kantian Ethics makes a major step in the right direction by undercutting the very foundations of the Utilitarian Ethic, the attempt to found normative principles upon the naturalistic concept of happiness. For Kant, Ethics begins where the self has succeeded in so overcoming its self (its needs and its wants) that its actions are no longer motivated by considerations of personal interest or satisfaction but by a simple reflection upon the right and a determination to do what is right because it is right *and for no other reason*. If, as has been suggested, the 'They' self, when it acknowledges an ethical dimension, operates, for the most part, along Utilitarian lines, then the Kantian Ethics represents a demolition of the 'They' self. It is no longer enough simply to do *what* 'They' deem right (for instance, honesty or patriotism) since doing what is right (from the standpoint of the 'They') might actually be, and most often is, either to the advantage of the self or the community. Rather, the self has first to learn to *know* the right (by dint of rational reflection) and then to *do* the right *because* it is right, even if, in doing right, the self acts *against* its interests and finds itself at odds with everyone else. However strenuously Heidegger might resist such a connection, the theory of conscience does perform this function of leading the self back to an evaluation which is, at the very least, self engendered (rather than engendered by the 'They') and which calls the self away from what 'They' would have it be.

The difficulty with the Kantian Ethics as a paradigm of self overcoming (strictly speaking, the *second* self-overcoming since a certain self-overcoming already pertains to the self negation characteristic of the accommodation to the commonality of *das Man*) is that the connection with the being of human being is not only lost but has to be given up as a necessary condition of the self placing itself upon the requisite plane, that plane, namely, where a certain universalization of the (noumenal) self makes possible a recognition of the legitimacy of the kind of universal principles upon which the Kantian Ethics is founded. In becoming the kind of being capable of implementing the Kantian Ethics human being has first to lose the sense of itself as a concrete human being with quite specific wants and needs – or so it would seem. We know how long and how hard Kant himself struggled with this problem of what might be called the ontological evisceration of the self, to the point of admitting such barely consistent (with his own position) motivational factors as *ethical feelings*. But this only brings out that much more convincingly the need for something like a restoration of the original mode of being of

human being, a restoration which can be nothing less than a repetition, since a simple repetition would be a denial of the entire development undertaken up to that point.

The same point can be made along more Husserlian lines. If being-with (in our case existence on the objective plane) is characterized by fallenness into the 'They', then the first step toward the recovery of self must surely be *not-being-with*, holding the other at a distance, *not* letting oneself get involved with others, i.e., transcendental solipsism. To be sure, for Husserl, it is the epistemological implications of transcendental solipsism which are of interest. But if transcendental solipsism is re-interpreted along existential lines it can then be understood in the light of that relatively familiar mode of being which we call that of the 'recluse'. In the context of a genetic Ethics the implication is that at some point the individual must go through some such procedure of self-isolation if it is to win itself against the levelling tendencies inherent in the 'They'. Husserl made little attempt, in his published writings, to develop the ethical implications of transcendental phenomenology but they are certainly to be found in Scheler's own laying out of the Husserlian position.⁸²

The same point can be made in yet another way. The reduction brings with it a self-suspension of the phenomenologist. The dis-interestedness inherent in such a self-suspension can also be envisaged as a self-detachment of the Kantian kind, that is, a detachment which makes it possible for the self to place its self upon a par with every other self and so to acknowledge the legitimacy of the principle: 'Treat every self as an end in itself'. The importance of the reflective detour as an alternative way back to the origin cannot be overestimated. It is not just that it permits us to include rather than exclude the contributions of transcendental philosophy to the discipline of Ethics; much more important than this purely *theoretical* consideration, it keeps alive the *practical* ideal of a 'higher consciousness' capable of resolving the conflicts which necessarily abound upon a more primordial plane. The 'Kingdom of Ends' may be nothing more than a Regulative Idea, but as an ethical vision, or pre-vision, it can hardly be improved upon. At the very least it serves a critical function, bringing to light the extent to which human conflict is the product of a failure to conform to the universal requirements of Reason.

However, to the self-suspension characteristic of the placement of the self upon a reflective plane something in the order of a self-realization or self-actualization must needs respond if the principle in question is to become practically effective. Nietzsche himself provided many indications as to how such a conclusive self-realization might be effected. When he recognized the artist, the philosopher and the saint as the three ideal types of human being, it was surely because these three types necessarily

subject themselves to a self-suspension, but a self-suspension of a kind which, in turn, leads on to a new kind of self-realization, a self-realization which not only does not imply a negation of the other but actually confirms and promotes an equivalent self-realization in the other.

And here we catch a glimpse of a possible *philosophical* ground for Heidegger's major historical error. For surely, whatever else he might have failed to do, Hitler did succeed in realizing his ownmost potentiality for being. A social non-entity by origin, he became the supreme head of the German state. A non-commissioned soldier, he became the head of the German army. An uneducated artist whose talent was so little appreciated that he failed to get into the Vienna school of art, he played out the artistry of his life upon the stage of world politics – with devastating consequences for the world. To very few has it been given to realize their own (no doubt sincerely held) convictions as fully and completely as Hitler. However, in realizing his own potentiality for being, he severely curtailed, when he did not annihilate altogether, the potentiality for being of others.

This is surely the point of Jaspers' comment in his *Notizen zu Martin Heidegger* (§157) where he objects: '“Resoluteness”, but with respect to what?'⁸³ It is the vacuousness of the principle which constitutes the problem. Heidegger could be excused for not having specified concrete forms of behaviour as exemplary instances of resoluteness but he might at least have furnished *criteria* for determining, in any given instance, whether a specific form of behaviour did or did not meet the legitimate requirements of resoluteness. The defence that Heidegger was offering an evaluatively neutral account of resoluteness simply does not stand up to a close examination of the numerous passages in which the concept figures. The supposedly neutral descriptions are undoubtedly evaluative recommendations and were intended as such. But if an ethics of authenticity is implied it becomes absolutely crucial to provide criteria for assessing the viability of that toward which resoluteness is directed.

As we have seen, the difficulty with an Ethics of Authenticity is not that it calls the self back to its ownmost being-self but that there can be nothing like a direct regression to such an original way of being. For any attempt to effect such an 'ontic regression' cannot but bring with it 'primitive' implications – in the worst sense of that word. In place of such an 'ontic regression' we have therefore sought to recommend something in the order of a 'reflective detour', a detour which first takes human being even further *away* from its self (and from others) in order, *on that basis*, to be able, eventually, to bring human being back to itself again in a *genuinely* authentic way.

The difference between an 'objective regression' and the 'reflective detour' can be brought out as follows: in as much as the placement of the self upon an ontic plane (fallenness in the 'They') represents a split

within the self, or a negation of the self by itself (as fallen, the self is *not* itself; 'not-being-itself' being precisely what 'They' want the self to be), the 'objective regression' heals the split in the most straightforward way. The self simply steps back out of this state of self-alienation and so is restored to itself again. The 'reflective detour', on the other hand, requires that the self first aggravate the split within itself, carry this division to the ultimate limit of a 'solipsistic' self-universalization and then, having done so, go on to *overcome* this very same abstraction of itself from itself – so that the movement of return which, in one sense, restores the self to itself again, in another, merely takes the self ever farther from itself by reversing the progressive dynamic of the entire genesis.⁸⁴

Nothing is more problematic in existential philosophy than the question of authenticity – and nothing is more important. In defence of an ethics of authenticity we have tried to show first, that without some original concept of being-self, the entire project is vitiated from the very outset; second, that the positing of such an original being-self calls for a progressive analysis of Fallenness into the 'They'; and third, that the eventual regression to being-self is one which has to include a 'reflective detour' if it is to avoid the 'primitive' implications of an 'ontic' or 'objective' regression. The long, indeed very long, detour which we have tried to outline in the name of a 'genetic ethics' is indeed a laborious alternative to the sweet simplicity of the Heideggerian directive. But in philosophy, as in life itself, the more indirect the way, the more certain it is that it will arrive at the desired goal, and this not just because the *goal is the way* but because the goal is the (way to the) ground and the ground, the (way to the) goal.

Notes

- 81 In his *Der Formalismus in der Ethik und die materielle Wertethik* (tr. as *Formalism in Ethics and Non-formal Ethics of Value* (Evanston: Northwestern University Press, 1973)), Scheler not only lays out a hierarchy of values but ties these value configurations (physical, vital, spiritual and religious) down to the intrinsic constitution of human being itself. Given Heidegger's regressive methodology he would only have been able to follow Scheler a very short way along this path, had he even been prepared to contemplate a line of thought following the Schelerian directive. More specifically, one might say that his explicit

dismissal of the ontic dimension represents an implicit critique of physical values and the ethics to which they lead (Utilitarianism) in favour of vital values (a hypothesis which partly explains his fascination with the thinking of a Nietzsche). But the spirit of Scheler's enterprise moves in the opposite direction (and disregarding for the moment the, in my view, misplaced fundamentality accorded to the physical as opposed to the vital stratum), from the lower to the higher, from the physical and the vital toward the spiritual and the religious, and this without any disconnection or disjunction of the order of values from the being who posits such values as expressive of dimensions of its very own being. In other words, for Scheler, and for those who, like myself, would like to follow in Scheler's footsteps, there can be the 'higher' value orders only because these orders already 'exist' as constitutive of the very being of that being which projects such a value order, a being for whom, consequently, the ethical domain arises necessarily as a legitimate way of conceiving of, and, more important, of working out and developing, a distinctively human existence.

82 Alois Roth's *Edmund Husserls Ethische Untersuchungen, Phaenomenologica* (The Hague: Nijhoff) brings out the connection between Husserl's lectures on Ethics and the ethical philosophy developed by Scheler himself.

83 Karl Jaspers, *Notizen zu Martin Heidegger* (München/Zurich: Piper, 1989), p. 176.

84 What can only be outlined in a few words here forms the topic of my genetic theory of inter-personal relations, which is itself grounded in the several stages of the ontological genesis of human being. More specifically, the first and originary stage is developed under the rubric of a theory of *Empathy*, the second and objective stage, under the rubric of a theory of *Alienation*, the third and reflective stage, under the rubric of a theory of *Isolation* and the fourth and conclusive stage, under the rubric of a theory of *Sympathy*. Sympathetic inter-personal relations thereby assume the form of a recuperation of empathic relations, subject however to the detour through *alienation* and *isolation*. However long and complicated the presentation of such a movement must necessarily be, the underlying principle is very simple: becoming-self cannot be accomplished in any simple and straightforward way (and if such a way is adopted it will have 'primitive' implications – in the worst sense of that word) but has to assume the laborious form of a massive detour, a detour which necessarily includes moments which seem to be self-defeating, in the sense that they *seem* to take the self farther away from, rather than closer to, its self.

The place of the work of art in the age of technology

Kathleen Wright

But where danger threatens
That which saves from it also grows.

Hölderlin, 'Patmos'¹

For Heidegger the question of the essence of technology (*Technik*) is intimately related to the question of the essence of art. And yet he claims that 'the more questioningly we ponder the essence of technology, the more mysterious [*geheimnisvoller*] the essence of art becomes'.² What is the relation between art and technology? It is Hölderlin's poem, 'Patmos', that reveals to Heidegger the way to understand the relation between art and technology. Art grows out of the 'danger' of technology as a 'saving power'. Thus art is related to, yet distinct from, technology as a saving power is related to, yet distinct from, the danger from which it saves us. Yet why does Heidegger then claim that the essence of art becomes 'more mysterious [*geheimnisvoller*]'? Does Heidegger mean that even if we undertake to think what is dangerous in the essence of technology, in the end what can rescue us from this danger will not only remain a mystery but also become more mysterious? If this is what Heidegger means, why should we even begin to question technology? What does this claim mean?

For Heidegger technology is 'planetary' and its danger 'homelessness' (*Heimatlosigkeit*). Given this danger, what has been translated as 'mysterious', the German word 'geheimnisvoll', can assume the opposite meaning, 'filled with the familiar, the home-like' (*geheim, heimlich, heimisch*). 'Geheimnisvoll' can indeed mean both the familiar and the mysterious,³ and if Heidegger is right, that 'homelessness is coming to be the destiny of the world',⁴ then it will be precisely the familiar that is mysterious. In light of this reading of the word, 'geheimnisvoll', Heidegger's claim is the following: the more we question the homelessness of

technology, the more we find in art a dwelling. But can this claim be justified? Does it not presuppose that the realm of art is safe from the danger of technology? Why should works of art be free from homelessness?

To clarify Heidegger's claim, I shall explore in this paper how Heidegger would respond to an issue raised by Walter Benjamin's essay, 'The work of art in the age of mechanical reproduction' (1936). Heidegger could not have read this work when he wrote 'The origin of the work of art' in 1935. Although what Heidegger says in 'The age of the world picture' (1938) might well be in response to Benjamin's essay, this is unlikely. Rather it seems that both Benjamin's essay and Heidegger's two works respond to the same short piece by Paul Valéry, 'The conquest of ubiquity'. Benjamin begins with this piece, and Heidegger, who corresponded with Valéry, speaks in 'The age of the world picture' of 'the conquest of the world as picture [*Bild*]'.⁵

I shall limit my discussion to the issue of the *place* of the work of art in the age of technology. First I shall draw on Valéry and Benjamin to pose the question of place in terms of the alternatives of *cult site* or *exhibition setting*. I shall argue that what Heidegger calls in 'Art and space' (1969) the *place (Ort)*⁵ of the work of art in the age of technology can no longer be the cult site. Next I shall consider the second alternative within the context of the larger set of questions raised by Heidegger about modern science, metaphysics, and technology. While acknowledging that the exhibition setting does indeed replace the cult site, I shall argue that for Heidegger the exhibition setting displaces the work of art, and that this displacement or homelessness of the work of art discloses in an exemplary way the essence of the modern age of technology. Finally I shall examine three of Heidegger's discussions of particular works of art: in 'Art and space', the anonymous work of sculpture; and in 'The origin of the work of art', the Van Gogh painting of the peasant shoes, and the temple. I shall argue that for Heidegger it is within and out of the displacement of the work of art in the age of technology that an alternative to place as cult site or exhibition setting emerges, an alternative which exemplifies what is for Heidegger the saving power of art. In 'Art and space', Heidegger says that there is as yet no name to distinguish this new conception of place. I shall however draw on Heidegger's frequent use of a line from Hölderlin's 'In lovely blueness . . .': 'Full of acquirements, but poetically, man dwells on this earth',⁶ and shall call this place (*Ort*) a *dwelling place*.

Benjamin's essay is introduced by and comments on the following statement from Valéry's 'The conquest of ubiquity':

Our fine arts were developed, their types and uses were established, in times very different from the present, by men whose power of

action upon things was insignificant in comparison with ours. But the amazing growth of our techniques, the adaptability and precision they have attained, the ideas and habits they are creating, make it a certainty that profound changes are impending in the ancient craft of the Beautiful. In all the arts there is a physical component which can no longer be considered or treated as it used to be, which cannot remain unaffected by our modern knowledge and power. For the last twenty years neither matter nor space nor time has been what it was from time immemorial. We must expect great innovations to transform the entire technique of the arts, thereby affecting artistic invention itself and perhaps even bringing about an amazing change in our very notion of art.⁷

Where Valéry attributes both the actual transformation of the 'entire technique of the arts' and the potential change of 'our very notion of art' to the revolutionary interpretation of matter, space, and time by quantum and relativity theory, Benjamin attributes the actual transformation of our notion of art to the 'first truly revolutionary means of reproduction, photography'. Valéry's piece is concerned with the 'immemorial alliance' between music and physics, and therefore concentrates on music as the 'first to be transformed in its methods of transmission, reproduction, and even production'. He notes that the control of visual phenomena, although not yet so advanced, will soon follow and predicts finally that 'works of art will acquire a kind of ubiquity'. Here 'ubiquity' means that no matter when, no matter where, the reproduced works of art can privately accompany 'men and women who are very much alone'.⁸

Benjamin, like Valéry, greets the technical transformation of the transmission, reproduction, and production of works of art, together with its consequence, the ubiquity of works of art, enthusiastically. While acknowledging the phenomenon of recording, Benjamin is above all concerned with the 'revolutionary' means of mechanical reproduction, photography, including silent and sound filming. In contrast to other means of reproduction (stamping, woodcutting, engraving, etching, lithographing, even printing), photography is 'revolutionary' not because now *all* visible works of art are in principle reproducible, but rather because the increased quantity of reproductions of each individual work of art brings with it a revolutionary change in 'the quality of the presence of the authentic art work', which Benjamin calls the 'aura'. Let us examine Benjamin's claim further for it is this claim – that the quality of the original work of art is diminished, not the quality of the reproduction – that might seem to challenge Heidegger's understanding of how the art work 'works', that is, discloses Being, in 'The origin of the work of art'

as well as his claim that art can be a saving power in the age of modern technology.

Benjamin defines the *aura*, the quality of the presence of an authentic work of art, in the following way: '*the unique phenomenon of a distance, however close it may be*.'⁹ According to Benjamin, the aura of an authentic work of art originates from its 'cult value', that is, from its use within a ritual, be this magical, religious, or more recently secular (the cult of the beautiful).¹⁰ The authenticity of the original work of art depends on its '*presence in time and space, its unique existence [sein einmaliges Dasein] at the place [Ort] where it happens to be*'.¹¹ While Benjamin makes authenticity just as dependent on presence in time as presence in space, I am concerned here with 'place' and how the 'place', the presence in a position in space, ultimately *secures* the authentic work's aura, 'the unique phenomenon of *distance*, however *close* it [the work of art] is'. Benjamin observes that in the age of mechanical reproduction initiated by the invention of photography, the authentic work of art loses its aura, the how or the quality of its presence. Benjamin attributes this loss to 'the technique of reproduction [which] detaches the reproduced object [the authentic art work] from the domain of tradition. By making many reproductions it substitutes a plurality of copies for a unique existence.'¹² Given the 'tremendous shattering of tradition' which Benjamin ascribes to mechanical reproduction by photography, the authentic work of art belongs *nowhere*.

To distinguish Benjamin's conclusion from that of Valéry, we can say that ubiquity has conquered the uniquely existing work of art. The ubiquity of the technical reproductions, that they can be exhibited and viewed anywhere and everywhere, transforms the 'place' of the uniquely existent work of art into *no place*, literally, *ou-topos*. Its cult site becomes *utopian*.¹³ Thus we may conclude that for Benjamin, ubiquity does not merely add to but instead *displaces* and *replaces* the 'unique existence at the place where it [the original work of art] happens to be'. The place of the work of art in reproduction is ubiquitous; it can be set up on exhibition anywhere and everywhere.

Instead of cult value, art works gain, Benjamin says, 'exhibition value'. Like film, which is created for reproduction and exhibition, art works will be designed for and evaluated in terms of their reproducibility, not their uniqueness. In contrast to Valéry, for whom the ubiquity of reproduced works was a private matter of individual choice, for Benjamin their ubiquity becomes a public matter and a social force. Benjamin concludes that the 'total function of art is reversed. Instead of being based on ritual, it begins to be based on another practice-politics'.¹⁴ Thus the technology of reproduction (photography, including film) transforms both the function of art and the very notion of an art work. In respect

to the question of place, Benjamin's essay suggests as the only alternative to the cult site the ubiquitous setting of exhibition.

Heidegger, like Valéry and Benjamin, acknowledges the need to question anew 'our very notion of art' in the age of modern technology. Like Benjamin, he recognizes the inadequacy of aesthetics, which takes works of art to be 'objects of an aesthetic experience'. Moreover he would agree with Benjamin's explanation of the social causes for the ubiquity of reproduced art works: 'the desire of contemporary masses to bring things "closer" spatially and humanly, which is just as ardent as their bent toward overcoming the uniqueness of every reality [here, original work of art] by accepting its reproduction'.¹⁵ Heidegger, however, would question whether works of art can be brought 'closer' *humanly* if, in being brought 'closer' *spatially*, their uniqueness is overcome.

In 'The origin of the work of art', the uniqueness of a work plays an important role. There it is one of the two ways to distinguish ontologically between a work of art and a tool (a piece of equipment). According to Heidegger, the createdness (*Geschaffensein*) of an art work differs from the readiness (*Fertigkeit*, better-finishedness) of a tool by 'the uniqueness of the fact that it [the work of art] is rather than is not'.¹⁶ On the basis of 'The work of art in the age of mechanical reproduction', it might seem that this uniqueness cannot be sustained after photography, that this therefore cannot distinguish work from tool, and that ultimately Heidegger's distinction between art and technology cannot be maintained.

It is easy to confuse 'the uniqueness of the fact that it [the original work of art] is rather than is not' discussed by Heidegger with 'the unique existence at the place where it [the original work of art] happens to be' discussed by Benjamin, and therefore to mistake what Heidegger proposes for a return to what Benjamin has described as the cult value of the work of art complete with aura. Moreover his choice of a temple in 'The origin of the work of art', together with his statement that the presence of the god defines the precinct (*Bezirk*) of the temple as a holy precinct, encourages such a confusion. While it is true that Heidegger ultimately holds that 'only a god can save us',¹⁷ he also recognizes, in the words of Hölderlin's 'Patmos', that 'Near is/and difficult to grasp, the God'.¹⁸ Thus for Heidegger, the flight or loss of the god(s) (*Entgötterung*),¹⁹ that is, secularization, is a phenomenon essential to an understanding both of the modern age, the age of technology, and of the saving power of the work of art in this age.

In his discussion of the *displacement* (*Versetzung*) of art works when collected, exhibited, or even at their 'own site', Heidegger shows that he already agrees with Benjamin that the quality of the presence of authentic works of art has decayed. Moreover Heidegger concludes that: 'World-withdrawal and world-decay can never be undone.' Thus when

Heidegger raises as a question, 'Where does a work belong?', and maintains that: 'The work belongs, as work, uniquely within the realm [*Be-reich*] that is opened up by itself,'²⁰ he cannot be advocating that the 'place' of a work of art is the site of a cult. This, he would agree with Benjamin, has become utopian. Nor is he, however, advocating that the only 'place' remaining for the work of art in the age of technology is the ubiquitous exhibition setting, a 'place' which remains basically the same whether it be used for public and political or private and aesthetic purposes.

To understand why Heidegger claims for the work of art in the age of technology a 'place' other than the ubiquitous setting of exhibition and to clarify further his claim that the work of art opens up a dwelling place, we can ask how Heidegger would account for the revolutionary event described by Benjamin. To begin with, Heidegger would not agree with Benjamin that the cause of the decay of the aura, of the world of the original work of art is that photography replaces unique creations, works of art, through reproduction. Rather Heidegger would argue that the cause of this decay is modern science which replaces the world as a unique *ens creatum* through representation (*Vorstellen*). Accordingly, the 'revolution' which Benjamin attributes to the invention of photography would be for Heidegger only a special case, although an extreme case, of the 'revolution' that took place with the discovery of modern science. It would be an extreme case inasmuch as it brings to completion and thus discloses the limits of this revolution. In what sense would Heidegger understand the revolution described by Benjamin to be only a special case of the modern scientific revolution?

In 'The age of the world picture', as well as in his 1935-6 university lecture, 'Basic questions of metaphysics', Heidegger discusses the essence of the mathematical project of Galileo and Newton, of *representation* as the '*mente concipere*' ('I conceive in my mind') and its foundation in the metaphysics of Descartes and Kant. In *Being and Time*, Heidegger had already analyzed the distinctive kind of 'making-present' that goes together with representation. We are concerned now with the distinctive kind of taking of 'place' that goes together with this 'setting' of an object before and for a subject. Heidegger points out that in Aristotelian physics, there was 'an essential difference between the motion of celestial bodies and earthly bodies. The domains of these motions are different. How a body moves depends upon its species and the place to which it belongs. The *where* determines the *how* of its being. . . .'²¹ With modern physics, in the words of Alexandre Koyré, what was conceived of as 'a differentiated set of innerworldly places' becomes geometrized, yielding the 'essentially infinite and homogeneous extension'²² called space. This new concept of space is related in turn to new concepts of body (all bodies are essentially the same), of motion (motion is rectilinear; circular

motion is a special case of rectilinear motion), and finally of *place*. The new concept of position (*locus*) replaces Aristotle's concept of place (*topos*).

The mathematical project of modern natural science discovers a 'new world', one where 'every place is equal to every other'. Nowhere is there a 'where', a 'place', which determines the how, the quality, of something's being. Everywhere there is position; nowhere is there place. To use our former distinction, position is ubiquitous; place becomes utopian. The metaphysics of Descartes and Kant provide the philosophical foundation for this new concept of position in space. Neither philosopher questions the geometrization of space and the concept of position that belongs together with space so conceived. For both geometrized space is *a priori*. They differ from one another, however, in their account of the *a priori* – here the geometrized form of the representation of space. For Descartes, it is human thinking grounded transcendently in God's thinking; for Kant, it is human thinking grounded transcendently in itself that accounts for the *a priori*.

With Descartes, the mind which is non-spatial is removed from the world which is extended. Yet as a thinking thing, the human mind can represent to itself the idea of what is extended, space, as well as ideas of what are extended in space, bodies, including its own. Space, as 'I conceive in my mind', is geometrized. So too is position and extension, the relation between two positions (or locations) in space.²³ For Descartes, God ultimately guarantees that what the mind represents to itself clearly and distinctly does represent the extended world and the bodies included in it. Not only is God not a deceiver. God is also a geometrician. The Book of Nature is a book of geometry.

With Kant, the existence of God is indemonstrable; thus God is not an available concept to insure that space, position in space, and extension are as I conceive them to be. A different and more complex explanation is required. Kant makes a distinction between the outer and the inner sense: 'By means of the outer sense, a property of our mind, we represent to ourselves objects *as* outside us, and all without exception in space.'²⁴ The inner sense, in contrast, has the form of time. Kant maintains that 'since the outer sense gives us nothing but mere relations, this sense can contain in its representation *only the relation of an object to a subject*, and not the inner properties of the object in itself.'²⁵ Here he is arguing not only that the objects which we know do not represent the 'things in themselves', but also that the relations, for example, 'of locations [*Orte*] in an intuition (extension)' and 'of change of location [*Ort*] (motion)',²⁶ are not 'in themselves', but *are only insofar as they are related to, that is, represented by a subject*. The geometrized form of space and the concepts of position (location) and extension that go together with it are

'objectively valid' insofar as it is only in conformity with this form that something is an object for the subject.

For Descartes, the mind is 'the mirror of nature'.²⁷ What the mind represents to itself 'pictures' something 'outside' itself, the original world space (and time), along with the bodies and events within it. The 'original' world space, however, still exists independently of its 'representation', of its being conceived. As an *ens creatum*, it depends only on God for its being. Kant, however, reaches a different conclusion: 'It is, therefore, solely from the human standpoint that we can speak of space, of extended things, etc. If we depart from the subjective condition under which alone we can have outer intuition . . . the representation of space stands for nothing whatsoever.'²⁸ There is no 'original' world space apart from its 'representation' by the subject. World space is conceived to be and exists only from the human standpoint. It is in this sense that Heidegger speaks of the modern age as one in which the world and its space is ultimately conquered *as representation, as picture*. With Kant's 'Copernican revolution', the 'conquest of the world as picture' initiated by modern science reaches its metaphysical completion.

I have said that the technical revolution of photography which Benjamin holds responsible for the decay of the aura of original works of art would be for Heidegger only a special case of the revolution in science and metaphysics described above. I have shown that for Benjamin the aura – the quality of the presence – of the authentic art work depends on the work's 'unique existence at the place [*Ort*] where it happens to be'. Benjamin argues that what is revolutionary about photography is that it first makes possible the removal of works of art into the exhibition setting. Heidegger would agree, as I have argued, that works of art are everywhere replaced by their pictorial representation, by the photograph, the film (including television), the slide, the book plate, the print, the postcard, and even the postage stamp (in Italy). Moreover Heidegger would agree with Benjamin that the exhibition setting has everywhere replaced the cult site. But Heidegger would disagree with Benjamin's account of how the exhibition setting replaces the cult site.

Benjamin has argued that because photography makes possible many exhibition settings, the cult site loses its privileged position. For Benjamin, 'cult site' is conceived of as the same kind of place as 'exhibition setting'. It differs from an exhibition setting only in that it is one where the latter is many and ubiquitous. Benjamin conceives of the 'place' of the work of art before and in the age of technology solely as 'position' (*locus*). Heidegger would argue instead that 'cult site' is a different kind of place from 'exhibition setting'. A cult site is a *topos*, a 'where' that determines the 'how' of something's being. An exhibition setting is a *locus*, a position in space equal to any other position. Heidegger would explain the fact that exhibition setting replaces cult site as the displace-

ment of *topos* and the replacement of *topos* by *locus*. This displacement and replacement occurs independently of whether the *topos* or site is the work's 'original place' or its place in the museum, the site of the cult of the beautiful.

Heidegger would conclude that the technical revolution described by Benjamin is ultimately to be explained as a special case of the revolution initiated by modern science. The modern concept of position in space, victorious in the domain of the natural world, now conquers the domain of the non-natural, the realm of art. Moreover Heidegger would have also to conclude that the technical conquest of the original work of art 'as photograph' completes 'the conquest of the world', the original *ens creatum*, 'as picture'. These two conclusions, however, would seem to deny to art a saving power given the homelessness which Heidegger finds to be the *danger* of modern technology. Heidegger would grant that works of art are not *exempt* from homelessness. Whether collected privately, exhibited publicly, or visited at their own site, works of art are displaced in their 'exhibition setting'. Given that Heidegger has said that 'World-withdrawal and world decay can never be undone', if art is to be a *saving power*, art must *grow into* a saving power. Art grows into a saving power *first*, by warning us *in an exemplary way* of the essence of modern technology and its danger, homelessness, and *second*, by disclosing an altogether different conception of place, of a *dwelling place*. The remainder of this paper will be devoted to these two issues and to Heidegger's claim that art grows into a saving power.

First, how does the displacement of the work of art and its attendant loss of aura in the age of the technology of photography serve to warn us of the essence of modern technology and its danger? In the 'Age of the world picture', Heidegger maintains that: 'The world picture does not change from an earlier medieval one into a modern one, but rather the fact that the world becomes a picture at all is what distinguishes the essence of the modern age.'²⁹ While it is this fact that *distinguishes* the modern age, it is Enframing, *Gestell*, which Heidegger *identifies* with the essence of the modern age. Even though modern machine technology emerges later than modern science, Heidegger claims that the essence of modern technology governs both modern science and its philosophical foundation. The age of the world picture is the age of Enframing, of the essence of technology. What does Heidegger mean by the essence of technology and why does he call it Enframing, *Gestell*?

In ordinary usage, *Gestell* refers to some kind of framework or apparatus. However, Heidegger's name for the essence of modern technology is not this collective noun used for what is common to many kinds of technical apparatus: 'The essence of technology is by no means anything technological.'³⁰ By the 'essence' (*Wesen*) of technology, Heidegger does not mean what it is (*quidditas*). Instead Heidegger claims that 'It is

technology itself that makes the demand on us to think in another way what is usually understood by “essence”’.³¹ By ‘essence’ of technology, Heidegger means the way technology is present and reigns (*wesen*, a verb). The essence of ‘technology’ names a way of presencing that *masters* and *secures* all that comes to presence as an object for a subject. According to Heidegger, *Gestell* is deeply connected to the modern concept of representation (*Vorstellen*), which he characterizes as follows: ‘[O]f oneself to set [*stellen*] something before oneself and to make secure [*sicherstellen*] what has been set in place [*das Gestellte*], as something set in place.’³² Heidegger uses *Gestell* in a new way to gather together the ordinary language use of the *stellen* verbs, roughly equivalent in English to the verbs of ‘setting’. I am concerned here with how ‘place’ is taken in the ‘setting in place’ of technology.

In ‘The question concerning technology’, Heidegger describes one case of the ‘setting in place’ of technology:

The hydroelectric plant is set [*gestellt*] into the current of the Rhine. It sets [*stellt*] the Rhine to supplying its hydraulic pressure, which then sets [*stellt*] the turbines turning. This turning sets those machines in motion whose thrust sets going [*herstellt*] the electric current for which the long-distance power station and its network of cables are set up [*bestellt*] to dispatch electricity.³³

By the essence of technology, *Gestell*, Heidegger does not mean what is set in place, the assembly of machines described here that constitute the physical plant. Nor does he mean the network of interlocking ‘causal’ relations that takes place once the physical plant is set in place: that the plant causes the Rhine river to supply hydraulic pressure, that the hydraulic pressure then causes the generation of electricity, which finally causes the power station to supply electricity long distances. Technology is present and reigns before the functioning of the hydroelectric plant, and even before the constructing and setting into place of the plant. Before these can be set up and set in motion, technology is present and reigns in the *take over* of the ‘place’, the Rhine river, to be the ‘setting’ for a hydroelectric plant. Furthermore, technology continues to be present and to reign even at those ‘places’ where the river is not set to work. As set up by the tourist industry, the ‘place’ of the Rhine river is *taken over* as a ‘setting’ for sight-seeing and leisure activities. *Taken over* and *conquered* as a ‘setting’ or ‘place for us’, the Rhine river is then set upon and set to supplying our needs, whether for work or for play. The essence or reign of technology *takes over and occupies places*. It *conquers* the world.

Heidegger comments that the essence of technology, Enframing, is ‘in a lofty sense ambiguous’.³⁴ As long as ‘place’, the world we are in, is

taken over and conquered as a 'setting for us', we are always already 'in the picture'. Yet the more we secure and control the world we are in as a setting for us, the more we are threatened by the danger of modern technology, by homelessness. In 'The thing', Heidegger describes this danger:

All distances in time and space are shrinking. . . .

Man puts the longest distances behind him in the shortest time. He puts the greatest distances behind himself and thus puts everything before himself at the shortest range.

Yet the frantic abolition of all distances brings no nearness; for nearness does not consist in shortness of distance. What is least remote from us in point of distance, by virtue of its picture on film or its sound on the radio, can remain far from us. What is incalculably far from us in point of distance can be near to us. Short distance is not itself nearness. Nor is great distance remoteness.³⁵

With our conquest of distance, with our setting of everything before and for ourselves, we are threatened with the loss of nearness, and with it of the loss of remoteness. The distant has been brought spatially close, but it has not yet been brought humanly near. To use the words of Clifford Geertz, we are 'experience-distant'.³⁶ The danger, homelessness, that Heidegger finds threatening us in the modern age of technology is the loss of a human sense, a humane sense, of being in the world as a dwelling place. Just as photography makes it possible for a work of art to be everywhere and anywhere and to belong nowhere, so our modern technology makes it possible for us to be everywhere and anywhere and to belong nowhere. Like the work of art which has lost its aura, being in the world in the age of modern technology has lost its aura, the quality of its presence: 'the unique phenomenon of a distance, however close it may be.' The displacement of the work of art warns us of our own impending homelessness. Can the work of art do more than warn? Can it grow into a saving power?

The setting of a work of art on view, on exhibition, shows how art can grow to be a saving power. I have argued that this 'setting' exemplifies Enframing and 'the conquest of the world as picture'. Thus the issue is not, as for Benjamin, whether what is on view is authentic or a reproduction. Nor is the issue whether the work is actually framed, as is Van Gogh's painting of the peasant shoes, or free-standing, as is the temple at Paestum. Finally the issue is not whether the work of art is or is not on its 'own site'. For the temple at Paestum is just as much displaced as the temple of Pergamon. And yet, according to Heidegger, it is out of this displacement, the homelessness of the exhibition setting,

that a work of art 'works', that is, originates being in the world as a *place for dwelling*.

Of Heidegger's many discussions of individual works of art I shall examine three: the work of sculpture treated in 'Art and space', the painting by Van Gogh of the peasant shoes, and the temple. In 'Art and space', Heidegger explicitly questions whether the physical-technical interpretation of space (as uniform extension within which every position is equal to any other) can remain valid as the 'only true space'.³⁷ On the basis of space so understood, both the 'space' of art works as well as the 'space' of our daily actions and interactions in the world are understood to be 'subjectively conditioned', that is, to be mere preformations (*Vorformen*) or at most transformations (*Abwandlungen*) of the one 'objective' cosmic space.³⁸ In 'Art and space', Heidegger's response to this question is that it is the 'space' of the work of art that alone enables us to understand the 'space' of our daily actions and interactions, and that it is more truly 'space' than the one 'objective' cosmic space. This same question is implicit in Heidegger's earlier discussion of the place of the work of art in 'The origin of the work of art'. There he maintains that: 'The work of art belongs, as work, uniquely within the realm [*Bereich*] that is opened up by itself.' This *realm* and the *place* (*Ort*) of the work of art in the age of technology is what I will call the world on earth as a 'dwelling place'.

In 'Art and space', Heidegger questions the 'space' of an anonymous work of sculpture. The work, he first remarks, is present in cosmic space. Its location in space can be fixed and its form of spatial figure can be geometrically described. Its form or figure determines a space within and space without. As a spatial configuration, the work of sculpture occupies a shape of space. These remarks, however accurate, fail to capture what is distinctive about the work of sculpture, namely, that it is a work of art and not a mere object. A work of sculpture, no mere object, is instead a product of a human artistic activity. To produce a work of sculpture, technical mastery is required. The work is thus a product of techniques and technologies. Does a work of sculpture 'occupy' space and a place in the same way a product of technology, for example, the hydroelectric plant set up on the Rhine, 'occupies' space and a place? We have seen that a product of technology occupies space by taking over and possession of (*Besitzergreifung*) a place, by conquering and mastering (*Beherrschung*) a place. A work of sculpture as a work of art, however, is more than a product of techniques and technology. As a work of art it does more than 'occupy' a place in space. According to Heidegger, it works as a *work of art* insofar as it 'embodies' (*Verkörperung*) a place.³⁹

How does a *work* of sculpture 'work', that is, be present and take place as a work of art? Heidegger argues that the work of sculpture does

not work *in* space but *as* space. A work of sculpture works and takes place as a work not by 'occupying' space (*Raum*) and a place (*Ort*), but by making room or space (*räumen*, a verb) for a place (*Ort*).⁴⁰ A work of sculpture 'embodies' space and place not by taking over and possessing a place in space but by emancipating and releasing (*Freigabe*) a place for space; it 'works' not by conquering and mastering space and a place but instead by letting them be free (*Freigabe*). Thus the work of sculpture works not in or at a place, but takes place as a place. It is 'in' the work of sculpture that place 'takes place'. Heidegger characterizes works of sculpture as follows: '[T]he embodiment of places [*Orten*] which by opening and protecting a region [*Gegend*] hold gathered together around themselves a free space [*ein Freies*]. This free space preserves a dwelling [*Verweilen*], a place to stay for things, and a dwelling place [*Wohnen*] for human beings amidst things.'⁴¹ In 'Art and space', Heidegger argues that a work of sculpture takes place in that it embodies a place. This embodied place makes possible and thus frees a free space which preserves a dwelling place for human beings amidst things.

The question of whether the physical-technical interpretation of space is to remain the privileged interpretation of space is explicit in the short essay, 'Art and space'. Heidegger shows how the work of sculpture as a work of art works, that is, makes room and makes space (*räumen*). In the work of sculpture, a place takes place which enriches (*bereichern*) space. The place embodied in the work of sculpture preserves and hence *saves* an enriched space (*Bereich*) for human dwelling amidst things in their nearness and remoteness. Given the danger of technology, the loss of the quality of the presence, the aura of being in the world, the place embodied in the work of sculpture grows into a saving power in the age of technology.

But is this saving power not specific to works of sculpture and to the way place and an enrichment of the world space that we dwell in takes place in such works? Or can other kinds of works of art also grow into a saving power? In 'The origin of the work of art', Heidegger does not deal directly with the question of the space of the work of art and cosmic space. Nor does he focus on the question of the place of the work of art in the age of technology as we have done in light of Benjamin's perceptive observations. Nonetheless by returning to the painting and the temple discussed in this early work, we find that in both cases the place of the work of art embodies and opens up a dwelling place that transcends the exhibition setting.

Van Gogh's painting, a pictorial representation, is presumed to be on exhibition. The shoes painted by Van Gogh are not shoes in use. They are represented as only standing there before us to be viewed. The shoes standing there before us to be viewed are 'in' the painting which is itself standing there before us to be viewed 'in' some sort of exhibition setting.

Let us note first what the place of the shoes, the space occupied by the shoes represented in this painting, tells us about the place of that which is set up on exhibition. Heidegger remarks that 'From Van Gogh's painting we cannot even tell where these shoes stand. There is nothing surrounding the pair of shoes in or to which they might belong – only an undefined space.'⁴² Standing there before us in the painting, the peasant shoes occupy an undefined space. They stand no place. Belonging nowhere, they are displaced and homeless. The undefined space represented 'in the painting' tells us of the displacement and homelessness which is the place of whatever is 'in' an exhibition setting. This 'pictorial representation', the painting by Van Gogh, does not appear at first to embody a place or to open up a dwelling place. Rather it seems instead to present the displacement and homelessness not only of a piece of equipment but also of a work of art in the age of technology.

But is the only place 'in' the painting the space which the pair of shoes occupy? Is there not also place 'in' the painting embodied 'in' the shoes themselves, a place which is more than the spatial form or figure of the shoes pictorially represented by Van Gogh? What does the place embodied 'in' the peasant shoes tell us first about the place of a piece of equipment, and second, about the place of a work of art in the age of technology? Heidegger describes the place 'in' the painting embodied 'in' the peasant shoes as follows:

From the dark opening of the worn insides of the shoes – the toilsome tread of the worker stands forth. In the stiffly rugged heaviness of the shoes there is the accumulated tenacity of her slow trudge through the far-spreading and ever-uniform furrows of the field swept by a raw wind. On the leather lie the dampness and richness of the soil. Under the soles vibrates the silent call of the earth, the quiet gift of the ripening grain and its unexplained self-refusal in the fallow desolation of the wintry field. This equipment is pervaded by uncomplaining anxiety as to the certainty of bread, the wordless joy of having once more withstood want, the trembling before the impending child-bed and shivering at the surrounding menace of death.⁴³

The place 'in' the painting embodied 'in' the peasant shoes discloses *the place which belongs to the shoes*. Equipment, here the pair of peasant shoes, is that which is reliable. Its place is a dwelling place, the world on earth. This place, a dwelling place between birth and death, is a place filled with anxiety and joy. Van Gogh's painting 'works' as a work of art in that it embodies a dwelling place. Its own place, the place which it embodies, is the world on earth as a dwelling place. It does not represent but rather opens up this place, our own dwelling place, as a

place not to be conquered and occupied by us but instead as a place for us to dwell.

Let us look at Heidegger's discussion of a third work of art, a temple, presumed to be on site. Unlike the painting, the temple does not pictorially represent anything: 'It simply stands there in the middle of a rock-cleft valley.'⁴⁴ Does it too embody a place which opens up a dwelling place or does it stand there in its setting to be viewed like the painting at the exhibition? The temple which stands there is located at a particular, although we note unspecified, location in space. It is more than simply a configuration of space, a shape of space filled with matter. As a building, it structures the space within and the space without. As a temple building, moreover, the space within and the space without were once determined by the presence of the god. Heidegger notes that as a temple:

The building encloses the figure of the god, and in this concealment lets it stand out into the holy precinct [*Bezirk*] through the open portico. By means of the temple, the god is present in the temple. This presence of the god is itself the extension and delimitation of the precinct as a holy precinct. The temple and its precinct, however, do not fade away into the indefinite.⁴⁵

The temple that 'simply stands there' was once, as the site of a cult, 'in' a holy precinct. Its 'where', the holy precinct, determined the 'how' of its being, its being a *temple* building. But for us the space within and the space without, while structured by the temple, are no longer defined as a holy precinct (*Bezirk*). Insofar as the world which included the god of this cult has withdrawn and decayed, the cult site has become no different from an exhibition setting. The temple is present for us now only as a work of art. Yet as a work of art it does not appear at first to embody a place which opens up a dwelling place. Rather it appears instead simply to stand there on view 'in the middle of a rock-cleft valley'.

Does the temple simply stand there 'in' its setting to be viewed? Is the only place there its place 'in' this setting? As a work of art, is there not also a place embodied 'in' the temple? Heidegger first describes the place embodied 'in' this temple:

[T]he temple-work . . . first fits together and at the same time gathers around itself the unity of those paths and relations in which birth and death, disaster and blessing, victory and disgrace, endurance and decline acquire the shape of destiny for human being. The all-governing expanse of this open relational context is the world of this historical people.⁴⁶

The place embodied 'in' the temple is *the world of an historical people*, the world which ranges between birth and death. Between birth and death, life takes place within the extremes of disaster and blessing, of victory and disgrace, and of endurance and decline. The work of art, the temple, embodies this place, its own place, as a place that takes place on earth. Heidegger next describes how the place embodied 'in' the temple lets the *earth* take place:

Standing there, the building rests on the rocky ground. This resting of the work draws out of the rock the mystery of that rock's clumsy yet spontaneous support. Standing there, the building holds its ground against the storm raging above it and so first makes the storm itself manifest in its violence. The luster and the gleam of the stone, though itself apparently glowing only by the grace of the sun, yet first brings to light the light of the day, the breadth of the sky, the darkness of the night. The temple's firm towering makes visible the invisible space of air. The steadfastness of the work contrasts with the surge of the surf, and its own repose brings out the raging of the sea.⁴⁷

The temple as a work of art 'works' in that it embodies a dwelling place. Its own place, which it embodies, is the world on earth as a dwelling place. Like the work of sculpture, and the painting, it does not represent but rather opens up this place, our own dwelling place.

In 'Art and space', Heidegger comments that we must learn to think the place that is in things rather than to continue to think that things, including works of art, are in a place, a position in space.⁴⁸ In his discussion of three works of art, he shows how the place of the work of art opens up the world on earth as a different place, a dwelling place. As the 'ever-nonobjective' and thus not the world as picture, this world discloses the limits of the world as picture. This world 'worlds'; it is not 'a merely imagined framework' (*ein nur eingebildeter . . . vorgestellter Rahmen*) but 'more fully in being than the tangible and perceptible realm in which we believe ourselves to be at home'.⁴⁹ The homelessness of where 'we believe ourselves to be at home' emerges as the world opened up by the work of art transforms the ordinary, the earth, into the extraordinary: 'The rock comes to bear and rest, so first becomes rock; metals come to glitter and shimmer, colors to glow, tones to sing, the word to speak'.⁵⁰ The place embodied in the work of art in the age of modern technology does not *represent* the world endangered by technology and threatened by the loss of its aura. Rather it *brings forth* or *originates* the world in which we dwell on this earth. The place in the work of art embodies and opens up *the world on earth as a place* not to be conquered as picture and by technology but rather as *a place for*

dwelling. Art grows into a saving power by embodying places which preserve and hence save a place for dwelling.

Heidegger is saying more than that the world disclosed in the work of art, for example, in Van Gogh's painting the world of the peasant woman, ultimately eludes representation so that the meaning of a work of art is inexhaustible. Rather, he is saying that the work of art discloses *the world which we are in*, and that the meaning and truth of being in the world on earth as a dwelling place cannot be conquered through a thinking that is only representation. Finally he is saying that 'the uniqueness of the fact that it' – the world in which we dwell on this earth – 'is rather than is not' calls for and calls forth a thinking which, like the work of art, is poetic.

In exploring the meaning of Heidegger's claim that 'the more questioningly we ponder the essence of technology, the more mysterious (home-like) the essence of art becomes', I began by showing that works of art are not *exempt* from the homelessness that is for Heidegger the danger of technology. Benjamin and Heidegger, I have argued, are in agreement that the 'place' of the work of art in the age of technology is no longer the 'cult site' which has become utopian but instead the 'exhibition setting' which is ubiquitous. Heidegger, however, would differ from Benjamin in his account of the displacement of the work of art in the age of technology. For Heidegger, this displacement is not due to the 'revolutionary event' of photography but instead a special case of the displacement that occurs to all that is with the advent of the modern scientific revolution. Heidegger, however, also claims that art grows out of the danger of technology as a saving power. In exploring this claim, I have shown that a work of art in its displacement discloses *in an exemplary way* the essence of technology and its danger. Finally, I have shown how for Heidegger a work of art serves as an *exemplar* for the overcoming of homelessness, by disclosing the world *viewed* to be more, to be a *dwelling place*. What I have not explored in this paper, however, is Heidegger's further claim, the claim that, for example, Hölderlin's poem, 'The Rhine', embodies a place, the Rhine. Although beyond the scope of this paper, it remains to be shown how the embodiment of place also occurs in literary works of art.

Benjamin comments that the discussion of whether photography is an art ignores 'the primary question – whether the very invention of photography had not transformed the entire nature of art'.⁵¹ To this, I have argued, Heidegger would respond that there is an even more primary question – whether the discovery of the essence of technology does not make manifest in a new way the essence of art.

16 Martin Heidegger, 'The origin of the work of art', in *Poetry, Language, Thought*, trans. Albert Hofstadter (New York: Harper and Row, 1971), p. 66. The distinction in question here is not the same as the distinction between a real work of art and kitsch. This essay is not a 'critique of judgment' and thus does not address the question of how we know what counts as a work of art. Instead Heidegger presupposes that 'works of art are familiar to everyone' (p. 18). Moreover to insure this starting point, he states that 'great art . . . and only such is under consideration' (p. 40). In thinking about art as the origin of the work of art, he acknowledges that hermeneutical circularity is inevitable: 'Not only is the main step from work to art a circle like the step from art to work, but every step that we attempt circles in this circle' (p. 18). Heidegger's main concern is how we can enter into this circle and can 'preserve' the great works of art with which we are familiar and their truth. Thus his essay begins and ends with a

question which is directed to us: 'is art still an essential and necessary way in which that truth happens which is decisive for our historical existence, or is art no longer of this character?' (p. 80).

27 See Richard Rorty, *Philosophy and the Mirror of Nature* (Princeton: Princeton Univ. Press, 1979) for his discussion of the modern concept of representation. In my presentation of Heidegger's account of representation, I have not treated the association of representation with picture (*Bild*) as a matter merely of metaphor. Thus I am arguing that Heidegger would not agree with Rorty's solution: 'We must get the visual, in particular the mirroring, *metaphors* out of our speech altogether' (p. 371, emphasis added). Rather I am suggesting that the issue for Heidegger is one of another way of seeing, a new or renewed sensibility.

Heidegger's poetics: the question of mimesis

John Sallis

Poetics.

The title translates – or, rather, reinscribes – the title of the text by Aristotle: *Περὶ Ποιητικῆς*.

Poetics would be, then, a discourse concerning poetry. Or, rather, in the case of Aristotle it would concern a series of forms which, though gathered under *ποιητική*, correspond only quite roughly to what one would today call poetry. Indeed, Aristotle's list cannot but seem somewhat heterogeneous: epic poetry, tragedy, comedy, dithyrambic poetry, most flute-playing and harp-playing (1447 a 13–16). A rather odd assortment from the standpoint of modern aesthetics: a bit of poetry, a bit of drama, a bit of music. Also, perhaps, a warning against too easily assimilating poetics (first of all, Aristotle's) to aesthetics, a mark of their heterogeneity.

Heidegger will radicalize a connection already evident in Aristotle's enumeration: the connection with language, quite direct except in the musical forms. Not only poetics but also poetry is a form of discourse, so that poetics would be a discourse on discourse, language folded back upon itself, added to itself. To the extent that poetry is essentially narrative, bound to a story, a plot (*μῦθος*) – the most essential element in the constitution of tragedy, according to Aristotle (1450 a 38–9) – poetics would be a *λόγος* concerning *μῦθος*, a mythology. It would be a theoretical discourse (*θεωρία*) concerning poetical discourse, a theory of poetry.

Heidegger will radicalize also the question of such addition of discourse to discourse. He will ask: What occurs in the space between these two discourses? What is the relation of thinking to poetry? He will radicalize these questions beyond the closure of aesthetics, at a limit where the very determination of thinking as theory and, hence, of poetics as theory of poetry can no longer remain simply intact. Poetics will no longer be

bound to recover a sighting in advance, proceeding thus to an essence of poetry that would be had in common by all poetry, essence as τὸ κοινόν; rather, it will attend to such essence as is poetized when, as with Hölderlin, the poet poetizes the essence of poetry. Effacing itself before the poem, poetics would listen and respond to what speaks in the poem, to the speaking of language in which it is said what poetry is.

For Aristotle, too, it is a matter of saying what poetry is. Poetics is a discourse concerning poetry itself (the first words of Aristotle's text: περὶ ποιητικῆς αὐτῆς); poetics is to say what poetry itself is, before then going on to speak of its various forms (τε καὶ τῶν εἰδῶν αὐτῆς). Indeed, this is how Aristotle's text begins, according to nature (κατὰ φύσιν), taking first things first, saying, first of all, what poetry itself is, saying what not only is common to all those forms enumerated but also constitutes them as poetry, determining them and in that sense preceding them, the *a priori* of poetry.

Aristotle's text says it in one word: μέμνηται.

This word, too, comes to be reinscribed, the name carried on. As such, it names that determination that has come to govern the theory of poetry and of art in general ever since Aristotle. Not that opposition cannot be found. Not that this determination is just emptily and dogmatically repeated in the history of the theory of art. And yet, even where the mimetic determination of art is most vigorously opposed, it is almost invariably a matter of rejecting a false mimesis for the sake of recovering genuine mimesis in its art-determining form. This gesture assumes one of its most subtle and complex – though still unmistakable – forms in the *Critique of Judgment*. For example, in rethinking art as the product of genius, Kant writes: 'Everyone is agreed that genius is to be wholly opposed to the *spirit of imitation* [*Nachahmungsgeiste*].'¹ And yet, in the same context he also writes: 'Nature is beautiful if it also looks like art; and art can only be called beautiful if we are conscious of it as art while yet it looks like nature [*als Natur aussieht*].'²

The relation between Heidegger's poetics and the determination of art as mimesis will prove to be at least equally complex. Heidegger's opposition is explicit, for instance in 'The origin of the work of art'³ where he speaks of the 'opinion, which has fortunately been overcome, that art is an imitation and depiction of reality [*eine Nachahmung und Abschilderung des Wirklichen*]' (GA 5: 22). His opposition to mimesis is equally explicit in deed: at a strategic point in this same text he takes a Greek temple as his example of a work of art – chooses it, as he says, intentionally (*mit Absicht*) – precisely because it is not mimetic, or at least not representational (*nicht zur darstellenden Kunst gerechnet wird*) (GA 5: 27). The question will be whether there is also in play in Heidegger's poetics a more originary sense of mimesis. Is Heidegger's opposition to mimesis in its traditional forms also matched by a recovery of a more

originary mimesis? Or rather, since Heidegger does not thematize any such recovery, can his opposition to mimesis be shown to have as its other side an unmarked recovery of mimesis? Can Heidegger's poetics carry on the name *mimesis*? Can one hear an echo of mimesis rebounding from that limit that marks the end of metaphysics and of aesthetics.

A trace of the gesture that I have just sketched can be discerned in the circling with which 'The origin of the work of art' begins. The first of the circles joins artist and work of art: on the one side, the work of art is ordinarily taken to arise through the activity of the artist, so that the artist would be the origin of the work; yet, on the other side, the artist is what he is only by virtue of the work, so that the work would be equally the origin of the artist as artist. Hence: 'The artist is the origin of the work. The work is the origin of the artist' (GA 5: 1).

Heidegger's first intervention is to open this circle: 'Nevertheless, neither is the sole support of the other.' Specifically, then, the work of art is not such as to be completely, essentially determined by its relation to the activity of the artist, not even if, in turn, determining the artist as artist. In a work of art there is essentially something more than its being produced by a certain kind of activity, something more than its correlation with the productive artist, an excess that opens the circle.

One way of determining this excess would be to refer to the mimetic character of the work of art, taking this character as an opening toward an other, which by imitation of the other would serve to disclose that other. Hence, the very beginning of 'The origin of the work of art' may be regarded as opening what could be (and traditionally would be) determined as a space of mimesis, an opening by virtue of which the work of art, mimetically disclosing an other, would essentially exceed the circle of production.

And yet, Heidegger does not move to such a determination, resisting it even at the risk of moving instead within mere tautology, merely compounding the system of circles. For what he calls the excess, both on the side of the work of art and on that of the artist, is simply *art*:

In themselves and in their correlation [*Wechselbezug*] artist and work *are* by virtue of a third thing, which is the first, namely, that which gives artist and work of art their names – art.

(GA 5: 1)

The question is whether there remains a trace of mimesis in this opening. Can mimesis be recovered within the tautological origination of the work of art?

Heidegger's initial move is to enter the system of circles: He begins with the work of art and proposes to move toward the discovery of what art, the excessive origin, is. 'The origin of the work of art' will continue

throughout to circle within this circle joining art and work of art; even when, in the final section of the text, the turn is made from the work of art to the artist, it turns out to lead almost immediately back to the work of art, back into the circling between work of art and art. And it is a matter not just of moving within this great circle but of circling within it: 'Not only is the main step from work to art, as the step from art to work, a circle, but every particular step that we attempt circles in this circle' (GA 5: 3).

There can be no question here of reconstituting this circling in all its compoundings and intricacies. Instead, I shall attempt to move as economically as possible to that complex of turns within which I shall propose a certain reinscription of mimesis, a reinscription that will follow the lines of a trace of mimesis discernible in those turns in Heidegger's text.

Beginning with the work of art, moving through the traditional concepts by which the work's thingly substratum would be interpreted and yet also obstructed, turning then to a description, without theory, of a pair of peasant shoes, or rather, to the shoes as depicted in Van Gogh's painting, Heidegger shows that the painting serves to disclose what the shoes are in truth. Thus, the work of art is shown to involve a happening of truth. Art is, then, to be determined as: truth's putting itself (in)to (the) work (*das Sich-ins-Werk-Setzen der Wahrheit*) – that is, to bring out the double sense: truth's putting itself to work in putting itself into the work of art.

Heidegger poses immediately the possibility of recovering mimesis in this determination of art as the happening of truth; yet he poses it ironically, characterizing the mimetic theory of art as 'that opinion, which has fortunately been overcome'. If art is a matter of truth and if truth means, as it has since Aristotle, correspondence with reality, then one might suppose art to be an imitation or depiction of reality. But does Van Gogh's painting simply depict some particular actual pair of shoes, doubling in the artistic imitation something actually existing? Heidegger is emphatic: 'By no means.'

And yet, as Aristotle recognized in differentiating between the poet and the historian (1451 a 36–1452 b 7), artistic mimesis need not pertain to particular, actually existing things. Thus, Heidegger continues, his irony slightly more veiled: 'In the work, therefore, it is not a matter of the reproduction [*Wiedergabe*] of some actually present particular being, but, on the contrary, a matter of the reproduction of the universal essence of the thing' (GA 5: 22). Art would be put forth as mimesis of essence or of universal truth, were not essence, universality, and truth so utterly in question. Heidegger invokes this questionableness: 'But then where and how is this universal essence, so that works of art are able to correspond to it? To what essence of what thing should a Greek

temple correspond?' (GA 5: 22). Here, then, it is a matter of opposing the determination of art as happening of truth to the mimetic determination, displacing the latter for the sake of the former. And yet, is it a matter of simple opposition, of simple displacement? Or do the opposition and the displacement perhaps inevitably retain a trace of that which would be opposed and displaced, a trace that would hold open the possibility of a recovery of mimesis. If truth happens in art and if it is – to borrow the phrase from von Herrmann⁴ – a matter of an ontological happening, in distinction from all interaction among beings, a matter of a happening in which, in Heidegger's words, 'the Being of beings comes into the steadiness of its shining [*das Sein des Seienden kommt in das Ständige seines Scheinens*]' (GA 5: 21), then can art simply no longer be determined as mimetic? Or is it possible to think mimesis ontologically? Can art be determined as mimesis of the happening of Being? Can art even always have been, beneath the interpretations given it by aesthetics, determinable as mimesis of the clearing in which Being can shine forth, as mimesis of truth as ἀλήθεια?

Indeed, truth and its happening are rethought in 'The origin of the work of art' as, ἀλήθεια, as that happening of clearing and concealing that first makes it possible for beings to come to presence; this text thus appropriates all the resources that are released by the crossing of the essence of truth and the truth of essence that is most rigorously developed in 'On the essence of truth.' Art is, then, one of the ways in which truth – as the strife of clearing and concealing – can happen. It is a way in which truth puts itself to work, becomes effective, comes into play. In art truth happens as the strife of world and earth. This is, then, precisely what Heidegger sets out to think: the artwork (its *Insichstehen*) in its relation to world, to earth, and to the strife of world and earth.

Let me attempt to sketch as economically as possible the main lines of this complex.

World, neither a totality of things nor a framework cast over them, is not anything that could come to presence in such a way that one might intuit it. It is, rather, that which first lets things be, lets them come to presence: 'By the opening up of a world, all things gain their lingering and hastening, their remoteness and nearness, their scope and limits' (GA 5: 31). World is, in Heidegger's phrase, *die waltende Weite der offenen Bezüge* (GA 5: 28): the governing expanse of the open relational complex, the expanse of the connections that hold sway for a historical people. As such, world so exceeds all beings that Heidegger will say, not that it *is*, but rather that *world worlds* (*Welt weltet*), thus again venturing tautology in the domain of the excessive and originary.

Earth, on the other hand, is thought in relation φύσις; it is thought as that which harbors such things as come forth in that emergence (*Aufgehen*) that the Greeks experienced as φύσις. Earth is that which

harbors such things in such a way as to secure and conceal them. As such, earth shatters every attempt to penetrate it, withdraws from all efforts to disclose it. It is essentially undisclosable, self-secluding, closed off.

In the relation of the work of art both to world and to earth there is operative a certain reciprocity. The Greek temple belongs to a world, is set within it; while, on the other hand, it also opens up a world, lets the expanse of its connections hold sway. Heidegger thinks this reciprocal relation more precisely as *Aufstellen* (setting up). The work of art is *set up* within a world; it is set up, not in the sense of 'a bare placing', but rather 'in the sense of erecting a building, raising a statue, presenting a tragedy at a holy festival' (GA 5: 29–30). And yet, thus set up within a world, the work of art itself sets up that world, opens and sustains it: 'Towering up within itself, the work opens up a *world* and keeps it abidingly in force' (GA 5: 30). The Greek temple does not just occupy a space but, belonging to the Greek world, opens and sustains that world: 'It is the temple-work that first fits together [*fügt*] and at the same time gathers [*sammelt*] around itself the unity of those paths and connections in which birth and death, disaster and blessing, victory and disgrace, endurance and decline acquire the shape of destiny [*die Gestalt seines Geschickes*] for human beings' (GA 5: 27–8).

The similarly reciprocal relation between the work of art and earth Heidegger thinks as *Herstellen* (producing, setting forth). The work of art is, as we say, *made out* of some earthy material such as stone, wood, or color; it is thus set forth, produced, from earth. But in the work of art the material is not assimilated to a function or use, as with equipment, but rather is allowed to show itself as material: 'By contrast, the temple-work, in setting up a world, does not cause the material to disappear, but rather causes it to come forth for the very first time and to come into the open of the work's world' (GA 5: 32). Thus, in being set forth from earth, the work of art is set back into earth in such a way as to set forth earth, that is, in such a way as to bring the earth into the open, the clearing, while still preserving its character as self-secluding, undisclosable. By its way of being made out of an earthy material, of being *set forth* from earth, the work of art, in turn, *sets forth* earth, brings it into the open precisely as undisclosable.

The work of art can, then, be described as involving two essential features or connections (*Wesensbezüge*): the setting up of world and the setting forth of earth, each taken in its essentially reciprocal character. These connections belong together in the work of art, and it is precisely their unity that constitutes the *Insichstehen* of the work. But how do world and earth belong together such that the setting up of world and the setting forth of earth can belong together in the unity of the work?

Heidegger's answer is decisive: world and earth belong together *in opposition*.

The world, in resting upon the earth, strives to surmount it. As self-opening it cannot endure anything closed. The earth, however, as sheltering [*als die Bergende*] tends always to draw the world into itself and keep it there. The opposition of world and earth is a strife [*Streit*].
(GA 5: 35)

The opposition is a strife (πόλεμος), not in the sense of mere discord and disorder, but rather in the sense of what Heidegger calls essential strife, that is, a strife in which each draws the other forth into the very fulfillment of that other's essence. Thus world can be as world only in its opposition, its strife, with earth, and vice versa. The work of art, setting up a world and setting forth earth, instigates such strife, lets happen such a happening of truth.

The work of art thus lets truth put itself to work. And yet, as *das Sich-ins-Werk-Setzen der Wahrheit*, art involves also another moment: truth puts itself to work in putting itself *into* the work of art. The happening of truth that is instigated by art takes place *in* the work of art. The question thus comes into focus: How is it that truth can (and, in art, must) happen in something like a work, in a being that is brought forth, created, by an artist? In Heidegger's more precise formulation: 'To what extent does truth, on the basis of its essence [*aus dem Grunde ihres Wesens*] have an impulse to the work [*Zug zum Werk*]' (GA 5: 48). It is a question, then, of the *Zug zum Werk*: a question of how truth is drawn toward the work; a question of how it is so aligned as to be inclined toward the work in which it will put itself to work; a question of how truth is trained on the work (as one trains one's gaze on something) and indeed even pulled toward putting itself into the work.

In a sense this is the pivotal question of Heidegger's poetics. Its development will gather up all the resources that 'The origin of the work of art' has prepared and will open upon Heidegger's thinking of poetry, also upon that trace of mimesis that I have proposed to mark. And yet, in the development of this question, it will not be a matter simply of arriving at an answer with which everything will then be settled. For the question is essentially unsettling, in Heidegger's term *ein Rätsel*. In approaching it nothing could be more appropriate than to incant the opening words of the Afterword to 'The origin of the work of art':

The foregoing reflections are concerned with the riddle [*Rätsel*] of art, the riddle that art itself is. They are far from claiming to solve the riddle. The task is to see the riddle.

(GA 5: 67)

To see it, first, in the establishing of truth in the open. It is a question of the site of truth, of the open space in which the strife of clearing and concealing can take place:

The openness of this open, that is, truth, can be what it is, namely, *this* openness, only if and as long as it establishes [*einrichtet*] itself in its open. Hence, there must always be in this open a being in which the openness takes its stand and attains its constancy [*ihren Stand und ihre Ständigkeit nimmt*]. In occupying the open, the openness holds open the open and sustains it.

(GA 5: 48)

Truth requires the open; it must be established *in the open* in order to be the openness it is. But to be established in the open is to take a stand *in a being*, in which, then, truth sustains the open. This need for coming to stand in the open is, in the case of art, the *Zug zum Werk*. Yet, how does this *Zug* arise from the essence of truth? One may say, as Heidegger does, that openness can be what it is only by establishing itself in the open, that there is need for truth to have a site, an open space, a *Da*. But this is only to reiterate the riddle: that the essence of truth prescribes, in the case of art, the *Zug zum Werk*, the establishing of truth in a being. To attempt to see further into the riddle at this level would require showing how the connection with a being is essential to the essence of truth – that is, how there belongs to the essence of truth another counter-essence (*Gegenwesen*) like the turn into errancy,⁵ but one which in closing the difference would – in a way that errancy does not – serve to reopen and sustain it. Such a turn to beings would be such as to reopen the difference within a being, even though it could not but always risk falling into complicity with errancy – which is to say that art and truth would always have to be thought in connection with art and error.

Heidegger does not extend the question in this direction. In any case, it remains questionable whether such an extension would really extend toward anything that could be characterized as an answer or whether it would not again come face to face with the riddle that art is, compounding the latter with the riddle of a truth to which manifold untruth essentially belongs. Remaining still within tautology.

But there is another step that Heidegger does venture toward the riddle. It is a kind of step back, a step that retracts an order that the initial step would seem to have posited. What has to be taken back is the apparent priority that truth would have with respect to the establishing of that truth at a site, in a being. In other words, it is not as though there were first a truth in itself which then only subsequently would come to

be established in a being. Rather, truth and its establishment in a being *belong together*:

But truth is not in itself present beforehand, somewhere among the stars, only later to descend elsewhere among beings. . . . Clearing of openness and establishment in the open belong together. They are the same one essence of the happening of truth.

(GA 5: 49)

It is not a matter of truth's going over into a being that it stands over against in advance; rather, truth is nothing apart from its coming to be established in a being. It is not as though there is, first, difference, which then comes to be mediated; rather, difference first occurs precisely at the site of the happening of truth.

The work of art is such a site, a being that is brought forth so as to establish truth, so as to bring about truth as the strife of world and earth. Such bringing-forth (*Hervorbringen*) is a form of *ποίησις*. Heidegger identifies it as that creating that is properly artistic, though he insists, on the other hand, that it not be construed merely as an activity of a subject. For here too it remains a matter of excess, of art's exceeding the circle of production so decisively that all creating must remain also receptive.

It is, then, in the work of art that the riddle – the riddle that art is – is to be seen. The work of art is the being in which truth, occurring as the strife of world and earth, is to have its site. This strife is not to be resolved in the work of art nor even just housed there. Rather, it is precisely there that the strife is to be opened, instigated. But the work of art can itself release the strife only if it embodies it: 'This being must therefore have in itself the essential features [or lines – *Wesenszüge*] of the strife' (GA 5: 50).

What, then, is the strife? What are its *Wesenszüge*? Heidegger says that the strife is a *Riss* and stresses by this word that the strife is not a matter simply of opposition but rather is such that the opponents belong to one another in their very opposition. He draws this out especially in the words *Grundriss*, *Umriss*, *Aufriss*, drawing, as it were, the essential lines of the strife. The opponents belong together by having a certain common ground or origin – that is, strife as *Riss* is *Grundriss*. Also, they belong together by virtue of a certain operation of measure or limit by which they are brought into an outline – that is, strife as *Riss* is *Umriss*. But as opposed they open the space of the emergence (*Aufgehen*, *φύσις*) of things – that is, strife as *Riss* is *Aufriss*.⁶

These essential lines of the strife must be embodied in the created being brought forth as work of art. More precisely, the strife (as *Riss* – one could say: rift) must be *set into* that being; it must be established,

set firmly (*festgestellt*) into the being that is thus to be a work of art. The question is: How does this setting (*Stellen*) occur? How does it come about? Heidegger's answer gathers up virtually all the resources that have been prepared by 'The origin of the work of art': truth can establish itself in such a being only if 'the strife opens up in this being, i.e., this being is itself brought into the rift [*Riss*]' (*GA* 5: 51). What appears here to be merely an equation is not such at all but, instead, is the hinge on which the entire matter turns: the strife (rift) is set into the being (work of art)/the being is itself brought (set) into the rift (strife). It is not that these two moments are identical; nor is one the ground of the other. Rather, it is a matter of gathering up those reciprocal connections that, earlier in the text, have been thought as *Aufstellen* (being set up in a world/setting up a world) and as *Herstellen* (being set forth out of earth/setting forth earth). Now it is a matter of thinking these together, of thinking the reciprocity that joins the work of art and the strife of world and earth: the strife set into the work of art/the work of art set into the strife. It is not a matter of explaining these settings (*Stellen*), nor of explaining one setting by means of another. The point is not to secure the settings but rather to discern and preserve their reciprocity, thus to see a bit further into the riddle that art is.

The issue of such reciprocal *Stellen* Heidegger names *Gestalt*. It is imperative not to surrender the word to its ordinary senses (for instance, by translating it immediately and without reserve as *shape* or *figure*) but rather to understand it, first of all, from its connection to *Stellen*, to understand it as what issues from that reciprocal *Stellen* by which strife is set into a being and that being, in turn, is set into strife. Such *Stellen* is, says Heidegger, a *Feststellen*. In the *Addendum* to 'The origin of the work of art', he proposes to interpret *Stellen* as θέσις, as bringing-forth,⁷ hence, as a form of ποιήσις. He proposes also to interpret the *Fest-* of *Feststellen* as: outlined, admitted into the limit, into the boundary in the sense of πέρας. Interpreted in this sense, limit is not such as simply to exclude and block out but rather gathers in such a way as to let something be brought forth, to let it shine forth; for example, 'by its contour [*Umriss*] in the Greek light the mountain stands in its towering and repose' (*GA* 5: 71).

It is, then, as *Gestalt* that the rift occurs within a being (the work of art) that is also, in turn, set into the rift. Hence: 'The createdness of the work means: truth's being set in outline [*Festgestelltsein*] in the figure [*Gestalt*]' (*GA* 5: 51). The *Gestalt* that issues from the reciprocal *Stellen* as *Feststellen*, this figure of truth, is also the place of the shining of truth – that is, of the beautiful:

Beauty does not occur alongside and apart from this truth. When truth sets itself into the work, it appears [*erscheint*]. The appearing

[*Erscheinen*] – as this Being of truth in the work and as work – is beauty. Thus the beautiful belongs to the self-eventuation [*Sichereignis*] of truth.

(GA 5: 69)

Rethought in its Platonic determination, the beautiful is τὸ ἐκφανέσ-
τατον.

Truth happens, shining forth as the beautiful, when a being is brought forth in such a way that truth (as strife, as rift) is set into that being and that being is set into truth. Such setting issues in the *Gestalt*. Through such bringing-forth, truth is set in outline, set within its limit (πέρας), in the *Gestalt*. It is not, however, as though a being were first brought forth, only then to be made object of the reciprocal setting, becoming the setting for truth and being itself set into truth. Rather, the bringing-forth and the setting are one and the same: in being brought forth, the work is set into truth and becomes the setting for truth; and, conversely, in undergoing the reciprocal setting and thus issuing in the *Gestalt*, the work is brought forth. Bringing-forth (*Hervorbringen*) is – that is, is Heidegger's translation of – ποίησις. That ποίησις that is the same as the θέσις of truth Heidegger calls *Dichtung*. It may also be called – reinscribing Aristotle's title once again – *poetry* in an ordinary sense. *Truth happens in art as poetry*: 'All art, as letting the advent of the truth of beings happen, is as such *essentially poetry* [*Dichtung*]' (GA 5: 59). Correspondingly, all philosophy of art – to say nothing of aesthetics – must become a thinking of poetry, that is, *poetics*.

Poetic thus reinscribed could also reinscribe *mimesis*. Of course, it could not be, any more than in Aristotle, a matter of simple imitation, as though the work of art were an image simply reproducing within certain limits some actually existing beings. But also it could not be a matter of imitating something universal, or representing within an individual being some universal form or truth by which being would, in the classical sense, be determined. The work of art does not imitate any being, whether individual or universal; it does not imitate anything that would simply *be* prior to the imitation, that would be set over against the imitation, which, then, would only double something already subsisting in itself. Indeed, one could say that the work of art *imitates nothing*, though one would need to regard such imitation of nothing, not as dissolving the riddle of mimesis (relegating it perhaps to some previous thinking of art that is now overcome), but rather as posing that riddle in the most unsettling way. Need it be said, after Heidegger, that the nothing is nothing simple? Indeed, one could say even that truth is nothing as long as it has not found a setting; and even in its setting, differentiated in the manifold reciprocity from the being in which it is set, it is (as differentiated from beings) still nothing.

It is, then, in the relation of the work of art to truth that a trace of mimesis is to be discerned: art as mimesis of truth. It would be a mimesis not preceded by truth, a mimesis that would take place precisely in giving place to truth, in that setting of truth into the work that is also a setting of the work into truth, that setting of truth into its limit. It would be a mimesis that would take place in and as the *Gestalt* in which truth would be set into the work, placed there, without having preceded the work and yet in such a way as to be doubled in the play of reciprocity between the work of art and the strife of world and earth. It is in this doubling – by which the Greek temple once brought into play the strife of world and earth into which it was, in turn, set – that mimesis can be rethought and reinscribed within Heidegger's poetics.

Heidegger, madness and well-being

Charles E. Scott

Any theory or description of Being that tells us nothing about human health and sickness remains irrelevantly abstract. Both Plato and Aristotle, as well as many of their predecessors and their successors, saw clearly that when one reflects on the meaning of 'is' he is asking about what human being is rightfully to be. Classically, knowledge issues into wisdom when one is able to decide, plan, remember, and relate to other people and to nonhuman beings in light of what is 'really real', i.e., when he *becomes* harmonious with being. Medieval scholastic philosophy characteristically culminates in worship of God and obedience to Him, because the full meaning (the living health) of human being is seen to occur as the creature affirms in a feeling, thinking, willing way his place within the divinely ordained scheme of things.

Counterwise, any understanding of human well-being assumes an idea of how man is in the world, whether or not that understanding is brought to thematic awareness. The assumption, for example, that physical illness is solely a matter of physical malfunctioning, that health is fully restored when an 'ill' part of a physical structure begins to function properly, assumes that the human body is best understood in totally objective, materialistic terms. Yet, health is a way of being, as is illness, not something that we possess as secondary to our existence. We *are* healthy or ill. How are we to understand this *are*? If we are like machines, how are we to understand the immediate event of being that way?

Heidegger's reflections, both early and late, also make claims about the fulfillment and injury of human being. Until one discovers the full import for human well-being and illness of his understanding of being as nonsubstantial, nonsubjectivistic, and nonintentional event, the meaning of being human, on his terms, is not adequately interpreted. His thinking – or better, the center of his thought – finds its fulfillment in an individual's release to his own responsive openness with the claiming

disclosures of beings. The purpose of this paper is to understand aspects of this last phrase, 'release to his own responsive openness with the claiming disclosures of beings', by dealing with two approaches to schizophrenia. I shall focus my remarks in the work of Ludwig Binswanger and Medard Boss, each of whom developed an understanding of psychopathology and health out of his own psychotherapeutic work, informed principally by Freud, and by his interpretation of Heidegger's thought.

We philosophers are usually spared, in our professions, dealing with insanity. Madness is more like a shadow for the enlightened and familiar realm of ideological connections. We challenge popular and everyday thought with its unchecked and unclarified values and assumptions. We take pride in mental freedom, the well-stated insight, the coherence of our thoughts. We are, however, fundamentally indebted to our patron, who found his wisdom by virtue of his ignorance. In spite of most schools' attempts to refashion Socrates in their own intelligence, he is above all else the man who asked questions because of what he did not know and who was led by an *eros* that often makes our work seem rather more clever than passionate. His capacity to bring into the light of ignorance the learning and intelligence of his time remains as the soul of philosophy.

Schizophrenia is a phenomenon of human illness in which the shadows of philosophy – disconnection, exaggeration, disorder, fantasy, radical dependence, withdrawn silence, hiddenness – make up the individual's particular way of being. Even the type of illness designated by this name is subject to no sufficient definition and is utterly vague as to what, exactly, it designates. In confronting what is called by the name, we encounter not just people who have 'lost touch with reality' in subtle as well as in frightening ways, we also encounter human being in ways that allow us to recognize aspects of our own existence in what we call madness. As philosophers, when we turn to madness, we join two remarkable human possibilities: the one, to be with things in a clarifying way, and the other, to be with things in the world as though logic were irrelevant for what we experience as real.

When madness is taken as a phenomenon, as a way human being is presented, we are less inclined to explain it or to provide conceptual analyses of the word's usage than we are to see human being as it happens in these certain ways. We allow it to be as it is, to show itself forth as we say, to cast its light on our learning and beliefs. And by confronting it, we confront the ignorance or shadow of philosophy. We come to see the openness of our own being which in no way finds its horizons in rational good sense or in steady, logical clarity. As a phenomenon, schizophrenia shows us at once how we may stand open in the presence of beings, falling utterly prey to *them* and suffering misery in a denial of *our* being, which we as philosophers may describe, but never,

as describers and clarifiers, bring to its own fulfillment. We are again cast into the light of philosophy's ignorance and may hope thereby to discover some measure of wisdom that is withheld as long as we try to live primarily in the clarity of our conceptual visions. By thinking in the light of human being gone mad, we are able to see part of the meaning of conceptualization: that it culminates in questions because conceptual activity does not happen as the fulfillment or completion of its subject matter. Madness occurs as the deprivation of human being, which no amount of description can restore, and as the disclosure of human being as a part of which conceptualization also occurs.

By virtue of conceptualization, however, we are able to interpret how we are to be, and our interpretations incline us toward certain directions of investigation, certain questions, particular ways of being, and the ideals in light of which we make our decisions and give cultural direction for ourselves. On these directions depend what we esteem and despise and to what extent we are able to look for what can, in fact, provide human fulfillment. Mental health has been interpreted largely as though human being did not occur, and the ideals for mental health have been developed as though man were best understood as an investigated object: the history of psychological and psychotherapeutic theory forms a large and important section in our cultural text of ontological forgetfulness. The result has been that sciences about man, but not a descriptive understanding of human being, have been the principal interpreters of what madness and health mean. Our conceptual task is consequently twofold: to call attention to the relevance of ontological descriptions for reconsidering the meaning of 'mental disease' (the task of this paper) and to structure a new approach to human misery and health that makes as the center of its focus the way human being happens.

I Claim, answer, and openness

The position which I shall describe for our purposes, but shall not attempt to found, is that human existence happens at once as claim and as answer. 'Claim and answer' describe something about what 'standing responsively in the open' means, i.e., the phrase elucidates Heidegger's understanding of *Ek-stasis*. *Claim* has the sense of 'to cry out' or 'to call' in its Old French heritage. 'Answer', coming from the Anglo-Saxon *and*, against, with *swerian*, to swear, can mean 'to be in conformity', 'to be adequate', 'giving attention', 'to act in response'. 'Attention', which shall also help in our discussion, means, for our purposes, 'state of giving heed' and 'readiness for what is given'. Human existence is a state of giving heed in the immediate presence of beings. The question of human

health has to do with how one attends to the claims and the responsiveness that make up his being in the world.

A being, some particular thing, happens as something that can be named, but does not come about by virtue of being designated.¹ It happens immediately as available for appropriation or designation: it happens *as* something, as meaningful. The stress falls on the happening of the thing. It takes place and is a place, not outside of our existence, but as immediately composing or constituting our existence, i.e., human being 'stands out' with beings and is worldwide in its scope. One might think of human existence as an 'inner' region, out of which one moves into an 'outside' region where things are, and in which things on the 'outside' are imagined. The claim that we are working with, to the contrary, is based on the observation that human existence happens as openness with the immediate presence of beings. Beings are not inaccessible and brute objects. They are given availabilities that mean something immediately in the way they occur, and which, in their occurring, bestow meaning, i.e., compose meanings, in existence.

When one takes an explanatory approach and sees things in terms of explanations, he may well ask, 'Yes, but isn't all this founded on such material conditions as brains, sensations, *a priori* structures, and so on? What are the *causes* of meaningful beings?' The nonexplanatory and descriptive way of seeing responds: 'Regardless what the conditions are and regardless what causes one hypothesizes, human existence does not happen as a condition or as a cause. "Condition" and "cause" have their meaning in explanatory interests. Human existence *is* not an explanation, nor are the happenings that we name and describe explanations. They are occurrences, here in certain ways, which compose the living event of being human. Our explanatory interests always idealize those things by placing them into a context of meaning which is imposed on their fundamental happening. That can issue in helpful beliefs and knowledge, but it always issues in confusion when one assumes that by explanation he describes the way things *are*.'

When something occurs it says itself in the sense that it occurs as something. We are always immediately imbued with a sense for what something is or is not, such that we *can* shut the door or pick up the pen, and such that we *can* be uncertain about a thing and feel the need to examine it further. 'What is that thing?' means, 'How is something that is present happening?'

Although the meaning of *claim* in the sense of 'to cry out' sounds rather too explosive or dramatic, the sense of 'saying itself' or 'to call' is helpful in interpreting how a being happens. It is present as something, never as nothing at all, and as something a being occasions an immediate range of possibilities for affirmation, negation, indifference, modification, explanation, appreciation. It happens as an address. *Dress*, in its French

derivation, meant to straighten or arrange. A being happens as a given composition or arrangement, *something* simply there, but not inertly there. 'There' as a saying, as coming forth, as a claim, as an event with which I am immediately in the possibilities that it occasions.

The immediate complement of 'claim' is 'answer'. Human existence says itself. That means that it is present always as someone. To be someone is to be a state of giving heed in the presence of beings. Even when I refuse a claim and turn away from it, I am attending to it, and I am in conformity with it in the sense that I respond with it, hear it, and answer. Whether or not I am conceptually self-aware, I am an attentive state as I pick up these things, avoid those, seek out others, et cetera. Answering need not be deliberate, then, but is my being 'this' way with 'these' claims. Meanings and being one's own event (i.e., *Eigenstaendigkeit*) are thus found to be nonreducible in human existence.

The genre of madness called schizophrenia within the *Dasein's* analytical approach has to do with the encroachment and constriction of the human capacity to answer and with a consequent domination by immediate claims. We need now to emphasize that being *at once* claim and answer, human existence is responsively open with the claiming disclosures of beings. It stands open in the availability of what immediately happens. Its hearing is the answered presence of what comes forth. The vulnerability of human existence is frequently remarked, and man's fear of his own state of being is frequently discussed. We are remarkably undefended in the immediacy of our being. We are constituted by givennesses which have at once the character of gift and threat because immediacy is neither deserved nor avoidable. When we answer by backing away from our own state of givenness, from what is given, and from the inevitability of answering, we literally refuse our own being, a refusal that immediately countenances what we refuse. This deep contradiction is lived as injury and misery, self-encroachment in the most profound sense, because in this case we are open (i.e., disclosive) in the disclosure of what is present by denying both our responsiveness and the meaningful presences. The at-onceness of claim and answer is elucidated by Boss's concept of perceptive world-openness.² Perceptive world-openness provides a basis for understanding what happens in schizophrenia. I interpret the term to name the happening of man and beings inseparably, the wholeness of human existence in which, primordially, there is neither subject nor object, but an answering presence in the composing presence of what is. *Compose*, a word I am using to interpret the immediacy of beings with human beings, but a word which Boss, Binswanger, and Heidegger do not use, has the interesting overtones of both 'to make up' and 'to be harmonious'. (I do not have in mind the transitive and agent-oriented sense of 'to put together'.³) It has the root of *poser*, to place, and with the *com* can mean 'in place with', i.e., free of

disturbance, fully appropriate. So 'composure' may be taken as an arrangement that is internally appropriate to itself. *Repose* is formed from the Latin *pausare*, to pause. It can mean both 'composure of manner' and 'state of rest'. These words help us to state how the living part-whole relation of human existence happens: human existence is rightfully to be a repose in its composure; it comes to bear as a way of preserving the claims that constitute it in the ways it answers them. Human existence is primordially a composure. It is being in the world – an ex-sisting out in the uncoveredness of beings. But a person may live contrary to his composure. He may be unable to tolerate his own world-openness in a free and open way. He is then not at peace in his relations in the world. The world happens for him in agitation – quite the opposite of being reposed in one's particular openness in the world. Human existence finds fulfillment when beings, which make up immediately its particular concrete moment, and its own possibilities for hearing and responding, which make up its given world-openness with beings, are borne or allowed or affirmed consonant with the way they are primordially together. The overtone of such statements is that when human being gives pause to the claims of beings in a way that is consonant with its own possibilities for hearing, i.e., its immediate openness, and with the beings themselves, a repose occurs that is a state of appropriateness vis-à-vis the particular disclosure and the disclosiveness or openness of the whole. The person then lives as a way of preserving the openness of being and beings, as a release to openness, as a profound repose with his being. One is then free to allow, choose, limit, and direct without denying the claiming, responding world-openness that he is as he allows, chooses, et cetera.

II Binswanger: world-design and transcendence

Binswanger has termed his reading of Heidegger a productive misunderstanding. I shall focus on one element of his misunderstanding in order to highlight the significance of Heidegger's work for our comprehension of human madness and well-being. We begin with ontological references, because both Binswanger and Boss have learned from Heidegger that human madness and well-being have to do with the ontological characteristics of being-in-the-world. The effort is to interpret human being so as to see the way a particular person is to be, i.e., so as to understand what sickness and health mean by reference to how human being occurs in all cases.

For our purposes, the most important element in Heidegger's way of seeing is his radically nonsubjectivistic comprehension of human being. By virtue of seeing this way, he has enabled us to approach health and

healing by reference to our primordial presence in the presence of beings. Traditionally, people have responded to the pervasiveness and primordially of being with theories about 'the unconscious', a realm taken to 'transcend' man's rational, clarifying, and volitional consciousness and to be constituted by the dark, nonappearing preconscious or unconscious aspects of his psyche. But the entire framework of consciousness, unconsciousness, and symbolic mediation between them falls away as unnecessary when one begins to see human being as openness with the disclosure of beings, as distinct to a subjective structure that is 'bordered' or 'fenced in' by an imaginative structure for the reception of things on the other side of it. Binswanger pointed out 'the fatal dichotomy of world in subject and object'. He saw with elegant insight that traditional psychology and psychiatry reduced human being 'to a mere subject, to a worldless rump subject in which all sorts of happenings, events, and functions occur . . . without anybody, however, being able to say . . . how the subjects can ever meet an object and can communicate and arrive at an understanding with other subjects'.⁴ But he himself was still captured by the subject-oriented approach to human being and was not able to make purchase of Heidegger's most important contribution to an interpretation of human well-being.

Binswanger read *Being and Time* as a study of the structural unity of human existence and interpreted it as an investigation of transcendental subjectivity. The 'existentials' are thus rendered by him as a transcendental, *a priori* structure that gives meaning to what occurs. Heidegger's work is 'an extremely consistent development and extension of fundamental philosophical theories, namely Kant's theory about the conditions and possibilities of experience (in the natural-scientific sense) on the one hand, and of Husserl's theory of transcendental phenomenology on the other'.⁵ Heidegger has 'elucidated the structure of subjectivity as transcendence'.⁶

Consequent to this interpretation, he understands Care, for example, as 'being in the world for the sake of myself', as the meaning of inward subjectivity, instead of as the meaning of standing *open* in the world with the uncoveredness of beings.⁷ He renders Thrownness as naming the given determinations of human existence, such as instinct and heredity. *Thrownness* names that dimension of human being which a person is without consent, and it functions as an explanatory, *a priori* structure which is taken to be ontologically prior to the disclosure of beings. The individual is 'enclosed, possessed, and compelled' in his Thrownness.⁸ Care, on this reading, has the sense of self-enclosed self-concern, and Binswanger finds need to develop the supplementary idea of 'being beyond the world', which he calls love. He found this further move necessary because he did not see the full meaning of Care as openness with beings. He knew that the self is worldly in its structures, but he

did not attend to the open eventfulness of being *in* the world in which self-concern, only one aspect of Care, happens as openness with the disclosures of beings. There is no 'sphere' out of which one needs to 'transcend,' unless self-concern be taken as an *enclosed* transcendental dimension instead of a way in which beings come forth. Thrownness has the sense of blind necessity, and Binswanger deals with Thrownness as human powerlessness, i.e., in quasi-volitional terms, until one chooses his Thrownness and achieves, by his limiting choice, power. Thrownness is thus taken by him as closedness over against the world, as 'having an environment like an animal',⁹ and that involves him immediately in a split within man of the human and nonhuman. Man, on this counting, transcends worldliness, which is a contradiction in terms when one defines man as being-in-the-world.

The emphasis on self-enclosure and volitional self-transcendence in both cases occurs because he has failed to see that Care and Thrownness, as well as all other ontological elements, do not in fact name *a priori* elements of transcendental subjectivity, but ways in which man is immediately with beings, i.e., ways human being is open *in* the openness of the world. And being open in the openness of the world is the polar opposite to self-*enclosed* self-concern and to *blind* (i.e., meaningless) determinism prior to choice. In both cases, Binswanger has adopted an approach that assumes that 'one has to start at transcendental subjectivity'¹⁰ instead of with Ek-stasis or openness in the openness of the world. Viewed in the latter emphasis, concern for oneself or the experience of given determination happen as ways of being *with* beings, and these two existentials, like the others, have their meaning *in the particular ways in which worldly relations occur, never in a trans-worldly, a priori dimension reached by inferential thought*. Loving is a way of relating caringly with beings, and being determined is a way beings appear. Neither Care nor Thrownness name for Heidegger a dimension apart from the disclosiveness of world-relations.

'World-design' is the term that stands at the center of Binswanger's approach to human being. The temporal, transcendental ego constitutes itself by 'directing itself' toward things. How a particular human existence is may be discovered by how it has designed its world. How it has misunderstood itself in its particular world-design may be discovered by reference to the transcendental, *a priori* structure of human subjectivity, which is the grounds or possibility for all world-designs. Binswanger found, for example, that manics have similar world-designs and are thus subject to general description and classification. He found, further, that when a world-design is founded in only a few of the fundamental possibilities of human subjectivity, one must constantly retreat from the worldly presences that he has systematically ruled out of his world, that 'in mental diseases we face modifications of the fundamental or essential

structure and of the structural links of being-in-the-world as transcendence'.¹¹ 'Thus, doing existential analysis in the area of psychiatry means to examine and describe how the various forms of the mentally ill, and each one from himself, designs the world, establishes their self, and, in the widest sense, act and love.'¹² The structure of being-in-the-world 'places a norm at our disposal and so enables us to determine deviations from this norm in the manner of the exact sciences'.¹³ And the structure of the specific world-design allows us to understand the way he relates to persons and things.

This conjunction of subjective transcendence and particular world-designs allows Binswanger to describe schizophrenic illness, for example, with regard to Extravagance, Rigidity, Covering, and Retreat. Schizophrenia is an 'ontological disorder', lived as the 'inconsistency of experience' that happens as one designs his world in a way that denies elements of *Dasein's* transcendental 'structural order'.¹⁴ Instead of being able to allow things to appear as they are according to his fundamental structure of experience, the sick person tries to enforce a certain restricting order onto things. He may flee the uncertainty of existence, its mundanity, its quality of constant change, his answerableness for what he chooses. Consequently his ideal of unbroken continuity, for example, constantly comes up against change, beginning and ending, absence, loss, growth, and decay. He seeks to escape this inconsistency of experience by ever more extravagant ideals and actions designed to deny or destroy the threat intrinsic in the relation of his inadequate world-design to the structures of his existence. His own design, though quite consistent within itself, 'has all the earmarks of the larger inconsistency'.¹⁵ He responds to this hard and fast stance by his impossible expectations and intentions. So, much of the world as it is constituted by his transcendental structure of experience denies the limits of his design, and he lives always with the threat that his world will be destroyed by forces impinging 'from the outside'. Everything in his world witnesses to a pervasive deficiency, and he is driven to cover over the threatening elements that deny the design on which he has staked his life. This futile project of covering what is intrinsic to his own being-in-the-world wears him away until he is forced to retreat and renounce the struggle by the fatigue caused by the impossibly burdening scheme. The culmination of this process is the autism characteristic of schizophrenic psychosis. One has been 'overwhelmed by a certain world-design', which is the opposite of letting the world occur according to the inevitabilities of being-in-the-world.¹⁶

Binswanger thus conceives of things encroaching on the schizophrenic because his world-design has refused central aspects of his transcendental subjectivity. The encroachment of beings and the consequent withdrawal and paranoia have their meaning in the overly limited world-design of the patient in relation to his *a priori* transcendental structure.

This understanding of madness develops out of a theory of intentionality founded in a structure of finitude. Binswanger says that Heidegger has shown 'how the intentionality of consciousness is grounded in the temporality of human existence, in *Dasein*. Intentionality in general is only possible on the basis of "transcendence" and is thus neither identical with it nor, conversely, does it make transcendence possible.'¹⁷ *Because* intentionality is not identical with 'transcendence' *can* an illness like schizophrenia occur, i.e., my world-design is able to be a refusal of parts of its own grounds. Or put again into Binswanger's language, 'the transcendental ego' is 'included' in the 'actual ego',¹⁸ and thus how I live can be a denial of how my being occurs.

But Binswanger describes the world-process by reference to something that he cannot, in principle, see, viz., a structure that transcends the world-occurrences and cannot be found in the purity that he posits for it. He thinks of being-in-the-world as a transcendental/worldly set of necessary categories: transcendence, he says, 'strides and swings' toward the world, as well as withdraws from the world and limits it. By choosing, i.e., limiting, one gains power 'over the world'. He has thus described worldly occurrence by reference to a ground reached by inference, i.e., by an idealization, and he has conceived this transcendental ground, which is termed being-in-the-world, as not being in the world, but as the apodictic necessity for world-occurrences. That is, he has conceived of human being as trans-worldly, and in that sense as an enclosed subjectivity. Heidegger's overcoming of that very way of thinking, his effort to describe how beings come forth *in* their disclosiveness (not in what is not disclosed – a transcending realm), lies at the heart of his interpretation of being. He describes how something comes forth *in* its coming forth. He describes its disclosure, its happening, and that means that one attends to a being in its occurrence. In contrast to Binswanger, for whom the grounds of description are not subject to direct description, Heidegger finds the grounds of description only in the occurrence of what comes forth. For Binswanger, the meaning of *is* is to be found by inferential thought, because he begins with the assumption that transcendental subjectivity is the basis for what occurs. Heidegger finds no basis for that assumption. Rather, when one begins with what does not come forth, he diverts himself away from how something happens and also keeps a subjective orientation toward phenomena. That, in effect, is an instance of covering the phenomena and of forgetting the disclosive openness of being.

By pointing out Binswanger's departure from Heidegger, my purpose has been to note an understanding of mental illness, and by implication, well-being, which is ontologically founded, but which has not taken account of the world-openness and immediate disclosiveness of being-in-the-world. The full import of Heidegger's thought for being ill and well

cannot be seen until we have struggled beyond all assumptions founded on the primacy of subjectivity and have come to see that being human is a worldwide event in which the *openness* of being-in-the-world can be encroached upon or fulfilled, not by virtue of world-designs founded in some third, transcendental power, but by virtue of our allowing and refusing the immediacy of being-in-the-world. In this instance, the forthcoming of what appears is the focus of attention, not a posited transcendental subjectivity, which functions as an explanatory principle, but not as a description of what is given.

III Boss: answering world-openness

The basis for Binswanger's understanding of schizophrenia as well as for human existence in general is, as we have seen, an acceptance of the hypothesis that human awareness is intentional and transcendental in nature. The transcendental basis is clearly hypothetically rather than descriptively discussed, as witnessed by his assumption of the 'fact' that the structure of seeing is itself not subject to direct description. The foundation of world-designs is to be taken on Binswanger's terms as not directly describable, but rather as induced in order to explain what is describable. In form the position is close to Freud's early observation that the doctrines about instincts are 'our myth', although this myth later gained a status, within his thought, closer to fact as he based more and more of his observations on it. The describable, for Binswanger, is to be understood by reference to the hypothetical, and he understands the structure of being-in-the-world not to be a direct description of the immediacy of being-in, but to be a highly promising hypothesis that becomes believable as we apply it to phenomena and lucidate them by it.

This position is profoundly different from Heidegger's descriptions of disclosiveness in which he gives an account of the immediacy of coming-forth. What Binswanger thinks not to be directly describable – the ontological foundations of what comes forth – is what Heidegger describes. This difference happens because Heidegger gave up the assumption of transcendental subjectivity from the beginning and attended solely to how phenomena are immediately present.

Boss has made this description on Heidegger's part the basis of his understanding of human well-being and illness. The schizophrenic, for example, is not primarily trapped by a self-defeating world-design, but is a person who is *open* in the world in a way that denies significant aspects of his world-openness. He lives a denial of how immediacy, in part, occurs, a denial of his perceptive world-openness. For Boss, the claims of beings are not products of human volition or of *a priori*

intentional structures, and are consequently not to be taken as aspects of a world-design. Mental illness *happens* fundamentally in the immediate presence of beings, in the way beings come forth such that one can have designs involving them. Human being is found to be composed of nonintentional ways of being open, *not* for contents that come to it, but *in* the immediate happening of beings. There is no effort on Boss's or Heidegger's part to explain why human being happens the way that it does. The effort, rather, is to describe how it happens. The link to health and illness is that how a human being is open with the disclosures of beings is the living moment of a person, that health and illness are how a person is immediately with beings.

The burden of Heidegger's descriptions is to show the structure of world-openness, and his radicalness within the phenomenological tradition is that this structure is found not to be *a priori* in any way analogous to Kant's Categories of the Understanding. It is found, rather, to be the structure of immediate givenness, of being *in* the world immediately. He is describing world-openness, the presence together at once of man and beings. We seem to be in the world in common ways and to share a world significantly common in spite of variety and difference. Nights and days, the past, present, and future, meanings, limitations, groundedness, freedom, appear commonly. And the basis of this common world-openness is not an external attribute of man, but is his being in common with what happens in particular. This commonness composes his event, his happening, the way he is.

We may say in this context that schizophrenic illness happens as an encroachment on a person's world-openness. *Encroach* has the meaning of 'to enter by stealth into the possessions or rights of another', 'to trespass', 'to advance beyond desirable or normal limits'. As we turn now to Boss's description of schizophrenia, we are dealing with a way in which a person experiences the encroachment of the immediate claims of beings, i.e., we are dealing with the weakness of one's responsiveness with the claims of beings that compose his own particular being-in-the-world. The task of Section One of this paper was to indicate that beings happen as immediate claims with the responsiveness of man, that human being is at once answering openness with the disclosures of beings. That means that bearing or preserving what occurs is man's answering presence with what comes forth claimingly (i.e., meaningfully). When one finds himself unable to answer, a deep confusion of human being occurs. Not only is the basis of continuity deeply disturbed.¹⁹ Beings themselves happen as unborne or as unpreserved, as an unanswered helter-skelter with which one finds himself absorbed as though *he* were hardly there.

'When seen from a daseinsanalytic or phenomenological viewpoint, the schizophrenic stands revealed as a human who is essentially and characteristically, in a specific way, no longer able to ek-sist, i.e., to bear

and maintain this being-open according to the norms [that are the human being's way of standing in the openness with what comes forth]. They are less able than all other existing people to maintain a free, open stance to what encounters them, to what, together with them, is manifest to all waking fellow humans in their surroundings.' 'There is no loosening of some postulated thought processes or associations. Rather, the whole existing of the schizophrenic, i.e., the whole spanning-the-world, as a free openness of perceiving and understanding of what is present is disturbed. . . .' The schizophrenic 'is in an especially high degree unable to open himself freely to the address of the realities of his world, to commit himself freely in his response to them, and yet preserve the independence of himself'. Rather, the schizophrenic in varying degrees, 'falls helplessly unfree under the spell of the address of what he encounters'.²⁰

Specifically, the schizophrenic process, in its beginning phases, may be seen by reference to a patient who found himself ensnared by everything he saw. The chair compelled him to sit on it. A spot on the wall forced him to consider and consider it. Everything he encountered threatened to 'snatch him under its sway'. 'Things', he said, 'give me no peace, and I cannot leave them in peace.'

As this inability to answer the address of beings grows, one finds himself increasingly 'benumbed by what he observes' so that 'he no longer has any distance from it, no longer has anything confronting him'. He 'loses the thread to himself'. This more advanced development is exemplified in a man who sees a clock on the wall and finds that the clock becomes dispersed so that the parts do not fit into a whole, but are scattered and random. As long as he could see the clock as a particular thing distinct from him he found himself differentiated and to a degree independent of the clock. But his relation to the clock becomes entirely different as the clock becomes fragmented. He finds himself in the observation engulfed into the observed. 'I am lost when I watch the clock on the wall', he says. 'It runs away out of itself. I am volatile, and I'm no longer present. I only know: the clock jumps around with many hands and cannot be brought together properly.' 'I am myself clock', he says. He has fallen prey to the clock, which has become, in the changed relationship, an *overpowering* claim, an event in which significance and place are lost as he becomes utterly mute in its presence. Rather than finding himself 'surrendered' over to something left out of his intentional design, he is engulfed by a claim that, in his dissolved responsiveness, loses its difference in its event with him, and he lives with it in its taking over his world-openness. This event does not happen with an object outside his existence. He and the wall and the clock occur with each other, and the sickness happens as the way they are together. His injured

responsiveness is his inability to be with the wall clock in its presence without finding himself in the possession of the appearing occurrence.

By attending to the way this world-relation happened, Boss has provided a description of the illness without appealing to a nonappearing superstructure or to a presumed isolated inwardness. The wall clock and the man were together in a particular way that need not be covered over by explanatory hypotheses in order to understand the way the schizophrenic episode occurred. The emphasis falls, rather, on this man's relation to the particular clock and not to time in general or to clocks in general. The focus is on how he and the clock happened together, how the clock addresses him. He finds himself in a decreasing relation with the clock as he becomes more absorbed in it. Under the circumstances, he may either, given enough strength, refocus the clock so that he again occurs as answering, as finding the clock an option for attention among other options, finding that he may respond to it in a variety of ways. Or he may withdraw from the encroachment on him, narrowing down his world-relations as much as possible so as to avoid being arrested and taken over by any claims whatsoever. He would then ward off and back away from all claims in order to avoid his being engulfed by what shows itself.

As a final example, we shall consider a patient termed the 'sun-man'. This lonely man lost contact with his only friend and shortly thereafter experienced the sun on the wall on his bedroom. It was at night, and the sun traversed the wall in an arching pattern during a several-hour period. Underneath the sun (which he saw as a small disc) was the figure of a man sleeping. The patient was awake during the event and in a state of extreme anxiety. Afterwards he was hospitalized in a mute, psychotic state. The episode was past after a few weeks of treatment, and the man returned to his life of working in a factory and living with his family. In a follow-up interview a year later he said, 'Through my illness it has become clear to me that one is dependent on the others. If one neglects the relationship to the other, he does not get anywhere and has no direction any more'. He said also, 'The sun was for me the supreme power from which all life and all growth proceeds'.

For our purposes we need to note that the patient experienced a dissolution into sheer light and power when his primary, concrete relation to another person failed. 'The collapse of his previous, narrowly confined world-relation changed suddenly to an unprecedented expansion beyond the old limitations of the openness of this existence.' Like the man-figure sleeping in the hallucination, he found himself at once devoid of nourishing human contact and wakeful responsiveness. He was threatened by dissolution into 'the supreme power from which all life and all growth proceeds'. He felt in extreme danger of total annihilation in the presence of that power, given the collapse of his one 'reliable

relation' that provided for him the focus of his world-relations. 'An unlimited incandescence . . . took the place of the once easily and joyfully born warmth of a concrete, limited relationship, to a friend, to a fellow human. He, in his radically weakened world relationships, experienced a radical threat of dissolution into his being.'

Boss describes this occurrence as a 'psychotic, unbounded being-in-the-world' in which the 'sun' 'disclosed something of the most hidden nature of that which holds sovereign sway behind everything'. 'The psychotic disruption of the boundaries of *Da-sein*, the widening of the being-open of an existence, often seems to go hand in hand with a "super-human" penetrability for the address of what is not observable in the everyday, but yet is the foundation of the everyday. . . . Nevertheless, schizophrenically ill patients prove to be people who are not equal to their supersensitivity. If they could stand firm in the face of what they perceived, they would not be sick, but would become and remain a visionary with genius, a philosopher, or a poet. So the bursting of the limits of the *Dasein* of schizophrenically ill people is not accompanied by a greater freedom, but by a serious encroachment on the freedom of their existing.'²¹

The basis of the methodological and theoretical differences between Boss and Binswanger is clear: Boss has made directly accessible *Ek-sistenz* and its encroachment the foundation for his understanding of human illness and well-being, whereas Binswanger has made intentional consciousness and a deduced transcendence his points of primary theoretical reference. In both cases they have found that human being, although quite differently interpreted, is the source for an adequate thematic grasp of sickness and health. Otherwise, they find, we are at the prey of assumptions which give direction for our efforts to be self-fulfilled, assumptions in relation to which we abnegate our responsibility because we have no clear grasp of who we are in our being. Human being, often taken as a mere abstraction, we find to be the deciding factor for the most concrete of human experiences: misery and well-being.

IV Well-being

Being well and ill inevitably raises the question of the meaning of being here as we are. People have always looked for norms because they experience fulfillment and deprivation. The difference between the two is remarkably great, and we all try to find the deciding factors, the demands to be met. Whether people fed virgins to the gods or tried to discover the 'nature' of things, they have done what they did, in significant measure, because of the experiences of suffering and well-being.

But soothing angry gods by sacrifice and treating ourselves as objects of investigation both ignore the significance of our happening as a temporal immediacy that is aware – the strangest phenomenon of all, the strangeness of which is intensified yet more when this event, this ‘species’, considers its own place within the seemingly infinite range of what it finds stretched out before it. Or when it confronts its own kind that are so odd, so sick, or so limited that it finds itself distorted terribly in the image it faces. Or when it finds madness as one of its own possibilities, along with the possibilities of joy and purpose.

The task is first to find where to look for the ‘norms’. Characteristically, in our tradition we have looked toward what we do not see, but which we think is necessary for what we do see, or we have looked at things with methods of looking that cannot take account of the immediacy of what is happening. In both approaches the immediacy of our own happening is lost or ignored. In the case of human being, that means that our norms for health and illness have not been focused on how man is with beings immediately. The psychotherapeutic appropriation of Heidegger makes apparent that the immediacy of being in the world is both nonsubstantial and aware, a fully historical event: we are such a happening, and health and illness are lived as nonsubstantial, temporal events of awareness. That is ‘where’ we must look in order to interpret our possibilities for being well and ill.

Heidegger has taken the temporal immediacy of awareness with unsurpassed seriousness. The judgment of many philosophers that his thought is elusive and vague has arisen because our standards for correctness and clarity have been so limited as virtually to ignore how human being happens, as distinct to accounting for the composition of many of the conditions necessary for the happening. We have looked away from the disclosive happening of human being by means of hypothetical and empirical investigations into what has to be present in order for man to be. When the necessary conditions are disturbed, man is surely disturbed. But the *meaning* of human being is to be found in how man’s worldly presence occurs. And by understanding the being of man, we understand how madness and well-being occur and what constitutes the fulfillment and injury of us in our uniqueness. At least a direction for developing this thought can be pointed out by recalling aspects of Heidegger’s theory of truth.

He has shown, with unsurpassed clarity, the limits of the idea that truth is correspondence, with its assumption of a *separated* agency and the option of truth as disclosure.²² Human being happens as a ‘region for relating’, a standing open in the occurrence of beings, a letting be of what comes forth. Being free, in this context, is being open for beings. Human being is a granting occurrence in the sense that it allows the opening forth of beings. Being free is fundamentally the same as Ek-

stasis, an 'admitting of the uncoveredness of beings', 'a standing out in the uncoveredness of beings'.²³ In particular, when a person does not resist the disclosive immediacy of being, when he 'openly welcomes the uncoveredness of beings', he is 'free for his own freedom'. That is, he responds openly in his own world-openness. He grants his own exposure in the disclosiveness of what occurs and *there-by* 'stands with' his 'possibilities for choice' in the givennesses, the beings, of his existence. This positive and individual attunement to the openness of being-in-the-world is the key to well-being. Its opposite, denying or refusing one's fundamental allowance of what comes forth, constitutes in a variety of ways what we call mental illness. This refusal is also a rejection of the chance to choose, because one then refuses or is unable to countenance the possibilities and presences which found the choice.

Given this fundamental understanding of truth and well-being, Boss has rejected the classical psychoanalytical notion that healing occurs as one releases a tension that has developed between 'unconscious and conscious' elements of the psyche. The traditional notion in effect begins by treating human awareness as though it were an enclosed phenomenon that is world-related only because of physical sense relations to the 'outside' world and symbolic representatives of what is separated from him. Madness is interpreted as a radical form of self-violation, and 'self' is assumed from the outset to be an interior, instinctual, imaginal realm, multi-dimensional, and basically isolated. 'Interior' patterns of association are taken to be more concrete than the way things happen. In Binswanger's phrase, cited above, 'a worldless rump subject' functions with axiomatic power in this conceptuality.

Yet Binswanger understood insanity as a destructive tension between a person's world-design and his transcendental subjectivity, whereas mental health is taken to be a fundamental harmony between world-design and transcendence.²⁴ Boss, on the other hand, conceives of madness as a *privation* of fundamental human possibilities found in world-openness. Mental disturbances occur as a person lives a denial of his fundamental world-openness and is unable to respond fully with the disclosures that make up his worldly presence. Healing happens with a profound countenancing of his 'truth', his standing out in the uncoveredness of beings, and of the claims that make up his particular way of being. Well-being occurs as a fulfillment of 'possibilities for world-relation' which in either a deprived or fulfilled state occur as the structure of world-openness, as the ways in which beings come forth and compose the concreteness of an individual's life. His understanding is founded by the occurrence of human being and not by an analysis of 'person' or 'self'. And while his therapeutic method is psychoanalytic, he has utilized an understanding of human being that obviates the subjectivistic, volitionally oriented psychoanalytic theories of consciousness and unconsciousness, which lead

inevitably to viewing man as an encapsulated event contained by an external world. One of the differences this emphasis makes therapeutically is that nonconceptual opening to one's openness in the world – compare the above discussion of Heidegger's understanding of truth and freedom – receives much more stress than rational acknowledgment and appropriation of previously unrecognized psychological characteristics.

The meaning of these claims is that being well and ill is a way of *being* and that human being is the source for an adequate understanding of human health. Anything short of an understanding of the openness of man with the disclosures of beings, i.e., of perceptive world-openness, promises to reflect a pathology of human thought in which the theoretician has not yet fulfilled the possibilities of his own temporal, immediate awareness which grounds his interpretations. In such a case, the equally dangerous madness of ignorance in the guise of intelligence will dominate, a domination in which the person repeatedly falls prey to his own interpretive creations and suffers, as a result, a *closure* from the world in the way he makes his interpretations of the world. *Madness* then reflects us to ourselves and fulfills the Socratic function of teaching us something about the ignorance of our best enlightenment.

Notes

1 In this discussion, the way beings are, how they come forth in their particularity, is one major point of focus. The difficulty of expression centers on how to elaborate 'beings' and not to imply objects of subjective action or surd-like things that are taken to be nondisclosed, but somehow present. How, in a word, are we to understand beings as claiming events? I have used the phrase 'disclosiveness of beings' and occasionally 'openness of beings' in order to elaborate 'claim'. Neither Heidegger nor Boss nor Binswanger uses the word *openness* to apply to nonhuman beings, although Heidegger places emphasis on the 'unhiddenness' of beings in *Vom Wesen der Wahrheit*. Heidegger and Boss reserve the specific word *openness* for reference to *Dasein*. *Dasein* is a realm of openness that allows the entrance, the forthcoming of beings. But beings happen fundamentally as meaningful availabilities, as particular and meaningful possibilities for specific reference, amalgamation, and appropriation. The '*openness* of beings' underscores their being given as *available* in the allowance of *Dasein* for further disclosures. They are not subjective events that do something we call self-showing. They are given *possibilities* for specific reference which have intrinsic and immediate reference to the allowing openness of *Dasein*. As such they are open, i.e., they are the concrete and particular ways in which *Dasein* is world-related and specifically open to what has gone before and is up-coming. When Heidegger says that 'the posture [or comportment: *Verhalten*] of man is pervasively tuned by the openness of the being in the whole' (*Vom Wesen der Wahrheit*, p. 18), he may be taken to mean in the context of the statement that man is temporally open in the ways things come forth. Beings are how man is particularly and temporally open. If beings, as unhidden, are not understood as opennesses in the openness of *Dasein*, the immediacy of the ontic (this particular way of being

open) and the ontological (the openness of *Dasein*) in human existence will be prone to be compromised and the historical meaning of beings will be more difficult to understand.

2 To develop this term adequately one would need also to deal with the full ontological structure of *Dasein*, with which perceptive world-openness is synonymous. That is too extensive a task for this discussion.

3 A being immediately constitutes or composes a particular human existence. Heidegger says in *Vom Wesen der Wahrheit* (p. 11) that 'jeder Offenständige Bezug ist Verhalten'. The 'Offenständigkeit' of man is ontically differentiated according to the different ways the *Verhalten* occur. As beings are allowed to come forth, one stands open in various *Verhalten* or postures. So we may say that a being makes a difference in how it enters in or occurs in the *Bezirk* of *Dasein*. How it happens is a particular ontic event and its making a difference is its claim. A being, as claim, composes a particular aspect of a person's existence.

19 Continuity is found, not in steady *a priori* structures, but in the finite claiming and answering event of man, when 'answering and claiming' are understood as historical and linguistic in nature. I believe that this concept of continuity is best explicated by Gadamer's analysis of tradition and language in *Wahrheit und Methode*, in which he shows that continuity occurs as an historical event of transmission. His description is helpfully confirmed in instances of psychotic breakdown in which one's linkage with the past is thoroughly interrupted and the person loses the threads of meaningful continuity. On this understanding, the psychotic interruption is to be understood as an injury of the temporality of occurrences, not as a 'sealing off' of *a priori* categories.

20 Unless otherwise indicated, all quotes and references in this section are taken from *Grundriss der Medizin*, Hans Huber, 1971, Part III, Chap. II, Section d, pp. 483-511. In the direct quotes I have used an unpublished translation of this section by Dr. Brian Kenny. This book was written in close association with Heidegger and reflects some twenty-five years of conversations and jointly taught seminars by Boss and Heidegger.

21 By contrast, note the following statement by an Indian sage to Boss: 'But how should a person who does not trust his own basis and does not dare yield to it have the calmness and strength to give aid to others who need it? . . . [I am speaking of] the primordial trust in what is inconceivable by conceptual understanding, incalculable by all calculations, in which all things are rooted.

Even though all this is still a deeply veiled mystery to you, it will one day dawn on your intellect as that great beginning which, though incalculable, is never just the contrary of a calculable order, merely chaos, but is always what sustains all chaos and order together.' *A Psychiatrist Discovers India* (London: Oswald Wolff: 1965), p. 190.

22 *Vom Wesen der Wahrheit*, Klostermann, third ed., 1954.

23 Emphasis mine.

24 Transcendental subjectivity is not, for him, synonymous with the Unconscious, but the model of sickness as tension is nonetheless a fundamental characteristic of his thought, and conscious-unconscious tensions are a part of his larger scheme. 'Needless to say, I have never managed without the Unconscious: either in psychotherapeutic practice, which indeed is impossible without using Freud's concept of the Unconscious, or in "theory."' But after I turned to phenomenology and existential analysis, I conceived the Unconscious in a different way. The problem it presented became broader and deeper, as it became less and less defined as merely the opposite of the "conscious", whereas in psychoanalysis it is still seen largely in terms of simple opposition. Heidegger's existential analysis, as contrasted with Sartre, taken as its point of departure not consciousness, but existence as conceived as being-in-the-world; accordingly the opposition in question recedes into the background in favor of a description of the various phenomenologically demonstrable modes and structures of being-in-the-world.' L. Binswanger, *Sigmund Freud: Reminiscences of a Friendship* (Grune and Stratton, 1957), p. 64.

Heidegger, the possible and God

Richard Kearney

In the introduction to *Being and Time* (1927), Martin Heidegger announces his project of 'overcoming' metaphysics. One of the most salient features of this overcoming (*Überwindung*) is the subversion of the traditional metaphysical priority of actuality over possibility. From the point of view of a post-metaphysical or phenomenological ontology – of which *Being and Time* is to be the first sample – the possible is considered 'higher' than the actual.¹ But what precisely does Heidegger mean by 'the possible' and to what extent can a re-interpretation of the traditional meaning of this term contribute to the task of overcoming metaphysics? This is the main question, hitherto much neglected by Heidegger's commentators, I propose to reflect on in this study. And, as a corollary, I wish to explore some of the implications of Heidegger's thinking on the possible for a critical re-thinking of the concept of the divine.

It must be remarked, at the outset, that 'the possible' is not an unequivocal notion in Heidegger's philosophy. His understanding of this term alters and develops in tandem with the overall movement of his thought. Thus, borrowing the celebrated distinction between Heidegger I and II (first outlined by W. J. Richardson in his *Heidegger* and approved by Heidegger himself in an introduction to this work) I would say that the 'turning' (*Kehre*) from the early to the later Heidegger, in the thirties and forties, is evinced in a parallel 'turn' in his understanding of the possible. I shall attempt, therefore, to analyse Heidegger's post-metaphysical comprehension of the possible on the basis of his distinction between: (a) the possible understood as a mode of human existence, *Dasein* (Heidegger I), and (b) the possible understood as a mode of Being itself, *Sein* (Heidegger II). The understanding of the possible in *Being and Time* – as *Möglichkeit/Seinkönnen/Ermöglichen* – will serve as representative of Heidegger I; the understanding of 'the possible' in the

Letter on Humanism (1945) – as *Vermögen* – will represent the thought of Heidegger II. It is on the basis of the latter that I will sketch out an alternative post-metaphysical conception of god as *posse*, in the second part of this study.

Part I: Heidegger and the possible

The possible is one of the key – if largely overlooked – terms of the existential analysis of *Being and Time*. Heidegger's understanding of this term is threefold: (a) *Möglichkeit* (possibility); (b) *Seinkönnen* (potentiality-to-be); (c) *Ermöglichen* (to render possible). I will take each of these in turn.

(a) *Möglichkeit*/Possibility: in *Being and Time* Heidegger argues that human being is neither a worldless subject nor an object among others but a 'being in the world'. Phenomenologically considered, being is no longer reducible to a simple presence – whether this be the idealist notion of a subject present to itself, or the realist notion of an object given to us in its substantive presence. Heidegger maintains that phenomenology enables us to consider our being as a possibility rather than a simple actuality. He reveals that we are beings who exist beyond our present selves, always extending ourselves along ever expanding temporal horizons. We discover ourselves as beings in time, continually moving beyond the actual givens of the present towards the future and the past: those dimensions of ourselves which we possess only as absences, as *possibilities*. Phenomenology is therefore the first philosophy which permits us to 'overcome' the traditional hegemony of presence characteristic of all metaphysical systems. Thus, Heidegger founds his distinction between authentic and inauthentic existence on this primordial difference between presence and possibility.² More precisely, I am authentic when I understand my 'existence *qua* actuality' *on the basis* of my 'existence *qua* possibility' and not vice-versa.

This manner of understanding the being of human existence (*Da-Sein*) as possibility rather than presence goes against the whole metaphysical tradition. Aristotle accorded an absolute priority to act (*entelecheia*) over potency (*dunamis*).³ Faithful to this priority classical metaphysics designated the Divine Being as a pure and eternal *actus* over and above all transitory and material *potentia*. Hence St Thomas' definition of God in the *Summa*: 'Deus est Actus purus, non habens aliquid de potentialitate.'⁴ Even Leibniz who appeared to vindicate the possible in some measure, finished by reducing it to a mere represented *possibilitas* in the mind of a God perfectly actualized in His own Being.

By contrast, Heidegger sees the possible (*das Mögliche*) as the trans-

cidental horizon of *Dasein*. The possible is nothing less than that horizon of transcendence which makes possible both the individual historicity (*Geschichtlichkeit*) of each individual and the general history (*Geschichte*) of humankind. Historicity and history are grounded on a fundamental human experience of openness towards time. By time Heidegger understands here, in *Being and Time*, the temporal horizons which extend the present towards the possible worlds of past and future thus endowing it with meaning. Time is an 'ex-static' horizon of possibility into which I step when I step outside of (*ex-stasis*) my present existence, i.e. my existence considered as simple presence. Heidegger argues that traditional metaphysics treated the human subject solely in terms of the simple presence of its being (*Seiende*) and thereby ignored the very Being (*Sein*) of this being-present. This Being of being reveals itself as the non-present possibility of *Dasein*. Heidegger can thus conclude that Being-there (*Da-Sein*) is my existence as *possibility*.⁵

In contrast to classical metaphysics which, since Aristotle, viewed time as an addition of present movements, Heidegger proposes a 'fundamental' ontology which will reveal time as an horizon of possibilities which possibilizes and grounds (*gründen*) the present.⁶ So doing, he will enable us to question the very Being of our being-present, that absence which grounds our presence and appears to us, phenomenologically, as possibility. By thus defining our 'fundamental' way of being-in-the-world (*in-der-Welt-sein*) as possibility, Heidegger intends to 'overcome' the standard metaphysical definitions of existence in terms of presence: *Ousia*, *Existentia*, *Substantia*, *Res Cogitans*, *Gegenstand*, *Gegenwärtigung*, *Vorhandenheit*, etc.⁷

But Heidegger does not suggest that human existence is only possibility. More exactly, he describes it as both actuality and possibility, stressing the fact that the latter is the site of the former. I am a being-there (*Da-sein*) who has been 'thrown' into existence and who can do nothing to alter this 'fact'. But the very 'meaning' (*Bedeutung*) of my thrownness (*Geworfenheit*) and facticity (*Faktizität*) as a being who *actually* exists, can only be comprehended from the more fundamental perspective of possibility. My comprehension of myself as 'thrown' (*geworfen*) into this actual world is only meaningful on the basis of my understanding of myself as a being who is always 'projected' (*ent-werfen*) towards the world as possibility. But we must not misunderstand this to mean that we inhabit two worlds. There is only one world which, like *Dasein*, is both actual and possible, both present and future. The possible is the horizon of the world; and the world is the horizon of *Dasein*. Possibility is that world-horizon towards which (*Woraufhin*) I direct myself in that temporalizing transcendence which alone gives meaning to our actual world.⁸

But if Heidegger maintains that an understanding of our existence as

'possibility' is the very meaning and ground of our actual existence, he does not deny that such an understanding may sometimes be inauthentic. Possibility is inauthentic when it is apprehended as a state of objectifiable givenness (*Seiende als Vorhandenheit*) rather than of the 'Being' of our being-present. All 'logical', 'factual', 'existentiell' or 'ontical' possibilities as outlined by Heidegger in *Being and Time* are inauthentic in so far as they construe the possible on the basis of 'presence', thereby masking its *authentic* role as the basis of 'presence'.⁹ Authenticity is used here as an ontological rather than a moral term. In short, possibility is authentic when it is understood as an expression of the *Sein* of our existence and inauthentic when it is understood as an expression of our existence as *Seiende*, i.e. as an entity of ontic givenness.¹⁰

But Heidegger goes further. He states that our inauthentic possibilities only have 'meaning' to the extent that they are recognized as ultimately 'grounded' in our authentic (*eigentlich*) possibilities, i.e. those possibilities which are acknowledged as the ownmost (*eigenst*) modalities of our being-in-the world.

I begin to exist authentically as soon as I cease to experience my life, and my life-world, as given actualities of presence and unveil that horizon of possibilities which is the hidden significance of this presence. The horizon of the possible is always covered over by the anonymous crowd (*das Man*) which reduces life to the uniform, compelling the past and future to conform to the one form of an insular present. The Crowd hides the possible because it threatens to expose the mediocrity and inertia of our daily life. The Crowd protects its subscribers from the responsibility of having to choose their actual manner of existence from a host of possibilities. It isolates the present from the unsettling dimensions of past and future. It assures us that all that is is well and could not be otherwise. The discovery of the possible, which alone renders our lives authentic, shatters this myth of anonymous presence and compels each individual to face up to his/her responsibility. The disclosure of the horizon of possibility which grounds our actual existence makes us respond to the past which made us and the future which calls us. This disclosure fills us with anguish (*Angst*): we realize that our sovereign limiting possibility is the possibility of death.

Death is our ultimate possibility. It is the fundamental project which founds all other projects. Thus Heidegger concludes that the horizon of our world – be it the *Umwelt* of serviceable and referential objects (*Dienlichkeit* and *Verweisungsganzkeit*) or the *Mitwelt* of interrelating subjects (*Miteinandersein*) – is finite. The temporal horizon of our existence is a transcendental horizon which leads from our present to our open future of possibilities. But the openness of the future is not infinite; it terminates in death, the end of all our possibilities. Heidegger defines us as temporalizing beings always transcending the reality of the present

towards the possibility of the future, and ultimately towards our most future possibility, death. Death is the possibility which it is impossible to go beyond. I am free to the extent that I experience my life as possibility; I am only authentically free, however, when I experience my death as my ultimate possibility, the impossibility of further possibility, the end of my time.

To acknowledge death as the supreme project of my existence is to discover that the world is always *mine* in so far as it is an horizon of possibilities limited by *my* death. Death represents the finitude of *my* temporalization; it cannot belong to another. In order to live our life, as a 'being towards death', authentically we must live it as our *own*, as individuals over and against the collective 'they'. In thus authentically experiencing death as *my* supreme possibility, I experience the possibility of the impossibility (*Unmöglichkeit*) of my existence, the possibility of being-no-longer-able-to-be (*das Möglichkeit der Nicht-mehr-Dasein-könnens*).¹¹ Death is the end (*Umwillen/Umzu*) of all our possibilities. I exist authentically when I live my possibilities *towards* my death.

It seems clear, then, that the Heideggerian notion of the possible as *Möglichkeit* cannot be understood metaphysically as either the represented *possibilities* nor the immanent *potentia* of some being considered as 'presence'. *Möglichkeit* for Heidegger in *Being and Time* is the horizon of *Dasein* which transcends all actual presence. It represents a post-metaphysical understanding of the possible which shatters the notion of being as a solid and substantial self-presence exposing it to the temporalizing projects of *Dasein*. I am a being who is always transcending my being as presence towards my being as possibility, because I am a being who exists in time. Metaphysics hid the truth of being in hiding this fundamental rapport between being and time.

(b) *Seinkönnen*: In addition to *Möglichkeit*, Heidegger employs two other key terms in *Being and Time* to express his understanding of the possible. *Seinkönnen*, translated by Macquarrie and Robinson as 'potentiality-for-being'; and *Ermöglichen* or the power of rendering possible, of possibilizing.

Potentiality-for-being (*Seinkönnen*) signifies *Dasein*'s ability to project in the first place. It is the *sine qua non* of every projection of possibility. And every projection is a projection of the possible to the extent that it is a surpassing of the present. We can only project ourselves towards our possibilities because we have the potentiality to do so, i.e. to *be* our possibilities. *Seinkönnen* means that it is possible to reach out towards the possible. To say, as Heidegger does, that *Dasein* exists as possibility is to presuppose that *Dasein* *can* project its possibilities, *can* exist as potentiality-for-being. To be able to project that which is able to be I must first be a being who is able to be.¹² More exactly, all our projection,

comprehension or realization of possibilities issues from our *potentiality-to-be* projection, comprehension or realization.

Seinkönnen, like *Möglichkeit*, may be either authentic or inauthentic, ontical, factual or existentiell.¹³ Whereas, for example, *Möglichkeiten* can refer to both the 'possibilities' of *things* (i.e. cultural, technical, linguistic or perceptual objects) and of *human existence*, *Seinkönnen* is attributable to human existence alone.¹⁴ If *Möglichkeiten* are the projects of *Dasein*, *Seinkönnen* is *Dasein*'s prerequisite power of projection. Similarly, if the former are extended along the temporal horizon of *Dasein*, the latter is *Dasein*'s very capacity to temporalize this horizon. Thus, while the 'possibilities' of *Dasein* may be said to be variable, its potentiality-to-be is constant. We may, for example, consciously project many possibilities which we simply don't have the potentiality-to-be, the possibility of being a bird or a god. And contrariwise, even though we are invariably potentiality-for-being-towards-death we are not always projectively aware of this as our most sovereign possibility. It is on the basis of this distinction between two modes of living the possible, that Heidegger speaks of a conscience (*Gewissen*) which calls each one of us to choose, from amidst the multiple possibilities of his/her horizon, the singularly authentic possibility of acknowledging oneself as a potentiality-for-being-towards-death.¹⁵ As Heidegger puts it: 'Being-towards-death is the anticipation of a potentiality-for-being of that entity (i.e. man) whose kind of Being is anticipation itself. . . . Death is *Dasein*'s *ownmost* possibility [*Möglichkeit*]; and being towards this possibility discloses to *Dasein* its *ownmost* potentiality-for-being [*Seinkönnen eigenst*].'¹⁶

Death is the limit of the possible both as our *ownmost* possibility and *ownmost* potentiality-for-being. But death limits us in different ways. As the limit of possibility it is that 'towards which' *Dasein* projects itself; as the limit of potentiality-for-being it is that 'for which' *Dasein* projects itself. To apprehend death as our sovereign possibility is to recognize *Dasein* as our potentiality-for-Being-in-its-totality (*Ganzseinkönnen*). This apprehension of our Being in the totality of its possibility presupposes that we recognize ourselves as temporal ekstases stretched between past and future. To recognize our *Ganzseinkönnen* thus is to gainsay the prefabricated opinions of the Crowd (*das Man*) which reduce us to a part of ourselves in reducing us to what we are exclusively now in the present, or to the illusion of a permanent undying 'presence'.¹⁷ To recognize our *Ganzseinkönnen* is to simultaneously recognize our *Selbstseinkönnen*, that potentiality-for-being-one's-self denied us by the Crowd.¹⁸ All the other potentialities-for-being, i.e. the potentiality to be someone who works, speaks, feels anguished, guilty or at issue, are ultimately derivative of our *ownmost* potentiality-for-being-towards-death which is at once our *Ganzseinkönnen* and our *Selbstseinkönnen*. Death is the potentiality-to-be one's whole self which in turn totalizes and individual-

izes all other *Seinkönnen*.¹⁹ Heidegger concludes accordingly: 'The certain possibility of death discloses Dasein as a possibility, but does so only in such a way that, in anticipating this possibility, Dasein possibilizes [*ermöglicht*] this possibility [*Möglichen*] for itself as its ownmost potentiality-for-being [*Seinkönnen*].'²⁰

(c) *Ermöglichen*: This last quotation underlines the difference between *Möglichkeit*, *Seinkönnen* and the third key term for the possible in *Being and Time* – *ermöglichen*. In this and other passages, the verb *ermöglichen*, meaning to 'make or render possible' is used to designate the most fundamental existential activity of *Dasein*, that is, the activity by which it deploys itself as a potentiality-for-being which projects its own possibilities of existence.

However, at several junctures during the concluding chapters of *Being and Time*, Heidegger seems to suggest that the subject of the verb *ermöglichen* may be other than *Dasein* itself. This enigmatic switch of subject is scarcely perceptible but is, none the less, of profound importance for the subsequent development of Heidegger's thought. In section 65, for example, Heidegger defines the 'meaning' (*Sinn*) of *Dasein* as 'that onto which' (*Woraufhin*) *Dasein* projects itself, a *Woraufhin* which for its part 'renders possible' (*ermöglicht*) all of *Dasein*'s projects. I cite in German, as this twofold meaning is lost in translation: '*Das Woraufhin eines Entwurfs freilegen, besagt, das erschliessen, was das Entworfenen ermöglicht*.'²¹ This sentence is ambivalent in that *das Entworfenen* (that which is projected) may be understood as either the subject or the object of the verb *ermöglicht* (to 'render possible'). If it is *subject*, then the *woraufhin* (the 'that onto which' *Dasein* projects itself which in turn 'renders possible' this projection) is nothing other than the projection of *Dasein* itself. In this case, the 'rendering possible' of *Dasein* constitutes a self-projecting, solipsistic circle. If *das Entworfenen* is *object* of the sentence, however, then it would seem that the *Woraufhin* which 'renders possible' *Dasein*'s projection is something radically *other* than this projection itself. The ambiguity is, I submit, intentional.

Macquarrie and Robinson offer the following translation here: 'To lay bare the "upon-which" of a projection, amounts to disclosing that which makes possible what has been projected.' The translators' choice here of the second of the two possible meanings is in line with my suggestion that the general movement of Heidegger's treatment of the possible in *Being and Time* is progressively away from a metaphysical interpretation which would see the possible as a dimension (*potentia* or *possibilitas*) immanent in the being of things towards a post-metaphysical interpretation which recognizes possibility as a transcendent dimension, emerging from beyond things (*Seiendes*), from that Being (*Sein*) which renders

things possible in the first place. The sentences which follow Heidegger's enigmatic phrase appear to confirm this reading:

What has been projected is the Being of Dasein, and it is disclosed in what constitutes that Being as an authentic potentiality-for-Being-a-whole. That upon which [*Woraufhin*] the Being which has been disclosed and is thus constituted has been projected is that which makes possible this constitution of Being as care.²²

In section 71, we find an equally puzzling and ambivalent passage in which Heidegger suggests that the fact that 'temporality . . . is rendered possible by the "*Being*" of Dasein [*die Zeitlichkeit . . . das Sein des Daseins ermöglicht*]' can only be genuinely understood on the basis of an understanding of the meaning of Being in general [*Sinn des Seins überhaupt*].²³ Is there not here the suggestion that the '*Being* of Dasein' (*Being* underlined by Heidegger himself) which 'renders possible' temporality, refers ultimately to 'Being in general' which, as we know from Heidegger's later writings, is fundamentally 'different' from *Dasein* itself? As Heidegger puts it elsewhere, 'whereas Being in general may be [*weset*] without Dasein, Dasein may never be without Being'.²⁴

Heidegger corroborates this suggestion in section 76, when he makes mention of 'the quiet power of the possible' (*die stille Krafte des Möglichen*) which 'renders possible' both our history and our comprehension of history.²⁵ He goes on to identify this 'quiet power of the possible' with the futural 'towards-which' of all our temporal projections. Moreover, in the concluding sentences of *Being and Time*, this circular manner of referring possibility to temporality and temporality to possibility reconfirms our hypothesis that it is ultimately Being itself which 'renders possible' the projections of *Dasein*:

The existential-ontological constitution of Dasein's totality is grounded in temporality. Hence the ecstatic projection of Being must be made possible [*ermöglicht*] by some primordial way in which ecstatic temporality temporalizes. How is this mode of the temporalizing of temporality to be interpreted? Is there a way which leads from primordial *time* to the meaning of *Being*? Does *time* itself manifest itself as the horizon of Being?²⁶

The final suggestion would seem to be that it is Being which 'renders possible' (*ermöglicht*) time. Or more exactly, it is Being itself which 'renders possible' the temporality of *Dasein* as a potentiality-for-being which projects its own possibilities. But within the compass of *Being and Time* this reading remains no more than a suggestion; the overall perspec-

tive of the possible in this work appears to be based more on *Dasein* – on the Being of *human* existence – than on Being itself (*Sein als Sein*).

To summarize this analysis of the possible in *Being and Time*, we might say that just as our understanding of *Möglichkeit* referred us to an understanding of *Seinkönnen*, so in turn our understanding of *Seinkönnen* led to an understanding of *ermöglichen*. This movement from a nominal to a verbal notion of the possible, reflects in some fashion the progressive movement in Heidegger's thought away from being as a being-present (*Seiende als Anwesenheit*) who lives its possibilities only secondarily and accidentally, towards being as a Being-there (*Da-Sein*) whose temporalizing 'renders possible' and, more remarkable still, is 'rendered possible' by it. Heidegger himself does not at any time explicitly allude to this terminological progression. But as I hope to have shown he does not have to – the text speaks for itself. The important point is that with his original analysis of the possible in *Being and Time*, Heidegger has already taken the decisive step beyond a metaphysics of presence.

Before concluding this first part of our analysis some brief reference must be made to Heidegger's allusions to 'the possible' in two other works written before the 'turning' (*Kehre*) of his thought. In *Nietzsches Wort: 'Gott ist Tod'* (a resumé of lectures given between 1936 and 1940), there is a curious passage where Heidegger observes that for Nietzsche 'the essence of art is the creation of *possibilities* for the will, on the basis of which the will to power liberates itself for itself for the first time'.²⁷ Art reveals the essence of all willing to be a perpetual self-creation which goes beyond our given nature by appropriating other 'possible' experiences. A propos of this reading Heidegger cites the following sentence from Nietzsche's *Will to Power* (aph.796): 'The world like a work of art gives birth to itself.' Art is, as Heidegger comments, primarily a *value* for Nietzsche, the willing of *more* power: 'A perspectival direction towards possibilities . . . which are given only through a penetrating forward look that belongs to the essence of the will to power.'²⁸ It seems that here, as in *Being and Time*, Heidegger interprets the notion of possibility as an horizational projection of the Being of one human being, that is, of *Dasein*. The work of art constitutes a world of the possible. It unfolds as an horizon of valorizing human projection. Thus we recognize that just as the 'worldhood of the world' in chapter 3 of *Being and Time* was understood on the basis of 'readiness-to-hand' (*Zuhandenheit* as the totality of the referential valorization, *Verweisung*, and orientation, *Ausrichtung*, of *Dasein*'s projects), so also art as conceived by Nietzsche is a world of unfettered human valorizing. In short, in art the 'meaning' of the will to power is revealed as a valorizing projection of human being towards the possible.

It is in a similar perspective that Heidegger interprets the notion of possibility in part three of *Kant und das Problem der Metaphysik* (1929).²⁹ Here Heidegger defines possibility as the auto-affective horizon of human temporality grounded in the 'transcendental imagination'. With Kant the possible emerges, for the first time in the history of metaphysics, as the field of temporality. The possible is the temporal horizon of human imagination which renders possible the unity of understanding and sensibility.³⁰ For Kant in the first edition of the *Critique of Pure Reason*, as for Heidegger in *Being and Time*, the possible is that anticipative-projective structure (*Vor-haben*, *Vor-stellung*, *Vor-bildung*) which grounds human temporality. Thus when Kant says that the human self is a being who temporalizes by 'imaginatively' transcending the present towards the possible (i.e. non-present horizon of the past and future), he is anticipating Heidegger's claim in *Being and Time* that *Dasein* gives itself a world by projecting itself temporally toward a transcendental horizon of possibility. Heidegger fully acknowledges, moreover, that Kant's insight into the temporalizing nature of the transcendental imagination was the precursor to his own understanding of *Dasein*.³¹ Indeed Kant's attempt to think being in terms of time, and presence in terms of possibility, was one of the earliest challenges to the traditional metaphysical claim that Being be understood as 'presence' rather than temporality. But as Heidegger goes to great lengths to point out, Kant was so disturbed by the implications of this challenge that he suppressed his analysis of imagination as the temporalizing pass-over from presence to possibility in the second edition of the *Critique*.³² Not until the publication of *Being and Time* some 140 years later would this omission be redressed. We must bear in mind, nonetheless, that we are dealing here with Heidegger's *interpretation* of Kant's theory of imagination (as of Nietzsche's theory of will) rather than with the original theory itself.³³

In the two works cited, therefore, Heidegger's analysis of the possible shows itself to be perfectly consistent with his novel definition of this term in *Being and Time* as a temporalizing-projecting-valorizing horizon of *Dasein*. Heidegger I (Heidegger before the 'turning') thus leads us to think the being of the world less as a permanent substance or subsistence and more as *Dasein*'s transcendental horizon of possibility. But even if Heidegger I raises our understanding of Being from presence (*Vorhandenheit*) to possibility (*Möglichkeit*), he does so largely within the limits of transcendental subjectivity. In short, his analysis of the possible emerges from his original (i.e. post-metaphysical) disclosure of the Being of *Dasein* as temporality, rather than from an even more fundamental disclosure of Being as Being (*Sein als Sein*). This second disclosure was to be the prerogative of Heidegger II.

In the forties there occurred the famous 'turning' (*Kehre*) in Heidegger's

thought. This 'turning' is clearly manifest in his approach to the notion of the possible. Now the possible is thought in terms of Being itself rather than in terms of the Being of *Dasein* or a transcendental subject. As Heidegger makes quite clear in his introduction to Richardson's commentary, however, there is no question here of a philosophical *volte-face*. The thought of Heidegger II is to be understood as a deepening of, rather than a deviation from, Heidegger I. The two say the same thing but from different perspectives. The possible which is thought about in both instances remains the same, the only difference being that in Heidegger II it is approached from the perspective of Being as Being rather than Being as being-there. This point will become clearer when we show how the later Heidegger's interpretation of the possible as *Vermögen* already exists in germinal form in the early Heidegger's notion of *ermöglichen*.

The 'turning' in Heidegger's thought on the possible is best expressed, I believe, in the following key passage from *Eine Brief Über den Humanismus* (1947).

Being as the element is the 'quiet power' of the loving potency [*Vermögens*], i.e. of the possible [*des Möglichen*]. Our words 'possible' and 'possibility' are, under the domination of 'logic' and 'metaphysics', taken only in contrast to 'actuality', i.e. they are conceived with reference to a determined – viz. the metaphysical – interpretation of Being as *actus* and *potentia*, the distinction of which is identified with that of *existentia* and *essentia*. When I speak of the 'quiet power of the possible', I do not mean the possible of a merely represented *possibilitas*, nor the *potentia* as *essentia* of an *actus* of the *existentia*, but Being itself, which in its loving potency [*das Mögend*] possibilizes [*vermag*] thought and thus also the essence of man, which means in turn his relationship to Being. To possibilize [*vermögen*] something is to sustain it in its essence, to retain it in its element.³⁴

The first thing to be remarked here is that the repetition of the portentous phrase from *Being and Time* (i.e. 'the quiet power of the possible'), in hyphenated form, signals Heidegger's intention to rehearse and develop its original meaning. As we observed in our analysis of the term *ermöglichen* in *Being and Time*, the notion of 'possibilizing' was frequently used ambiguously to refer to either of two different subjects – Being as human being (*Dasein*) or Being as Being (*Sein als Sein*).³⁵ Here in the *Letter on Humanism*, Heidegger replaces *ermöglichen* by *vermögen* thereby unambiguously identifying the fundamental power of possibilizing with Being itself.

Whereas *ermöglichen* could be either authentic or inauthentic, *vermögen* is always authentic. To put it in another way: *vermögen* (which I

translate as 'possibilization' or 'possibilizing' since the author uses it as both verb and noun) is to be correctly understood as the exclusively authentic essence of *ermöglichen* (to render possible). It is *ermöglichen* viewed from the point of view of Being in general (*Sein überhaupt*) rather than of human being in particular. As Heidegger explains:

It is on the strength of this loving potency or possibilization of love [*Das Vermögen des Mögens*], that something is possibilized [*vermag*] in its authentic [*eigentlich*] being. This possibilization [*Vermögen*] is the authentic 'possible' [*das eigentlich 'mögliche'*], that whose essence rests on loving [*Mögen*].³⁶

'Possibilization' (*Vermögen*) is thus identified with Being itself to the extent that it possibilizes what is most proper (*eigenst*) and authentic (*eigentlich*) for human being, i.e. thought. Correlatively, thought is that which cares for Being, shows care (*Sorge*) for what is most proper (*eigenst*) to it. Heidegger exploits here the hidden resources of the term *Vermögen*, notably its root, *mögen*, meaning 'to love'. To care for Being is consequently to love it in taking care of its essence as it manifests itself in all things: 'Thought is . . . to concern oneself about the essence of a "thing" or a "person", that means to like or to love them.'³⁷ Possibilization is, quite simply, the love of Being; and love of Being is to be understood as both a subjective and objective genitive, that is, both as *Dasein's* love for Being and Being's love for *Dasein* which possibilizes (*vermag*) *Dasein's* loving – thinking – in the first place.

Thus we may say that thinking is *Dasein's* most proper and authentic possibility (*eigenst und eigentlich Möglich*). Thinking is that which is possibilized by the 'loving possibilization' of Being itself so that it may, in turn, lovingly possibilize the coming to be (*wesen*) of all beings. Being possibilizes thought which in turn possibilizes the Being of things. This ontological reciprocity is ingeniously captured by the untranslatable accusative/nominative duplexity of the German *das*: '*Aus diesem Mögen vermag das Sein das Denken.*' Lohner's translation of this sentence as 'Being is capable of thought' is incorrect because it is one-sided. For it is not merely a question of Being being capable of thought, but also of Being making thought capable of Being, i.e. of thinking Being. Within a space of ten lines Lohner uses three different terms to translate *vermögen* ('potency', 'to be capable of', and to 'command'); and without the slightest indication to the reader that we are in all cases concerned with the *same* term. Our alternative rendition of *vermögen* as 'possibilizing' (meaning both 'to possibilize/possibilization') seeks to capture its complex double role as noun and verb. Accordingly, we render the German '*Aus diesem mögen vermag das Sein das Denken*' as 'Being possibilizes thought which possibilizes Being'. This version is confirmed, it seems to me, in

the sentences which immediately follow: '*Jenes ermöglicht dieses. Das Sein als das Vermögend-Mögende ist das "Mög-liche"*' – 'The one renders the other possible. Being as the loving-possibilizing is the "*posse-ible*"'.

There are three crucial points to be made about this telling statement (the entire second sentence of which Lohner omits to translate!). The first is that the juxtaposing here of *ermöglichen* (Heidegger I's term for the possible in *Being and Time*) with *Vermögen* (Heidegger II's word for the possible) shows how both terms refer to the *same* truth of the possible without denying the difference of their respective perspectives (that is, *ermöglichen* as the possible seen from the perspective of *Dasein*, *Vermögen* as the possible seen from the perspective of Being). In this movement from the *ermöglichen* of Heidegger I to the *Vermögen* of Heidegger II the ambiguity which we remarked above is shown to be – in its essence (i.e. from the point of view of Being as Being) – the very truth of Being itself as a reciprocity of loving and thinking.

The second point concerns the use of the term '*Vermögend-Mögende*' to describe Being. This particular grammatical usage means that Being is at one and the same time a possibilizing and a loving: it loves because it possibilizes and possibilizes because it loves.

Third, the direct equation of Being with '*das Mög-liche*' shows that the root of both loving (*Mögend*) and possibilizing (*Vermögend*) is the same, namely, *Mög*. It is impossible to render this two-in-one meaning of *Mög-liche* in English. But by translating '*Mög-liche*' as '*posse-ible*' we hope at least to have communicated one of the fundamental meanings, that is, Being as *posse*: to be possible, being-possible, possibilizing. Whatever about the impossibility of an adequate or elegant translation, however, it is abundantly clear that Lohner's omission of this pivotal sentence makes Heidegger's revolutionary identification of Being as *Vermögen* incomprehensible to the English reader.

In this cardinal yet much neglected passage from *The Letter on Humanism*, Heidegger goes so far as to describe Being itself as a 'loving possibilization' (*Mögende Vermögen*). In so doing he reveals the implicit truth of the three preceding notions of the possible – i.e. possibility (*Möglichkeit*), potentiality-for-being (*Seinkönnen*), and making possible (*ermöglichen*) – to be nothing less than the possibilizing (*Vermögen*) of Being itself.

Possibilizing is Being itself to the extent that it possibilizes (*vermag*) beings out of love for their essence. But there is another more literal meaning to the term *Vermögen* which might be immediately obvious to the German reader and which cannot be ignored in this context. Curious as it may seem, the current meaning of *Vermögen* is 'power' or 'property'. Used as a verb it can signify to have power or influence on persons or things. Though this alternative meaning of *Vermögen* appears in stark contrast to Heidegger's etymological rendition as a 'loving possibilizing', it is by no means accidental. Several critics, notably Emmanuel Lévinas

and Martin Buber, have attacked Heidegger's notion of Being as an anonymous Totality which reduces beings to the measure of its self-identical power.³⁸ Moreover, one of Lohner's three alternative translations for *Vermögen* was, as we noted, 'to command'. (His version runs as follows: 'When I speak of the "quiet power" [*kraft*] of the "possible" [I mean]. . . . Being itself, which in its loving potency [*Vermögen*] commands [*vermag*] thought and thus also the essence of man, which means in turn his relationship to Being.') Heidegger's hyphenated singularization of the term *Kraft*, meaning 'force', as a virtual synonym of *Vermögen* could be seen as further endorsing the 'power' signification of this term. It is not my intention, however, to assess the validity of the interpretation of Being as 'power'. Suffice it to say that the identification of Being with *Vermögen* can mean that Being is either a 'loving-possibilizing' or a 'power' which appropriates and commands, or even both at once. Indeed, it is just such an identity of Being as *both* 'possibility' and 'power' – which appropriates (*ereignen*) that which is most appropriate (*eignet*) and authentically proper (*eigentlich eigenst*) to beings – which emerges in Heidegger II's ultimate term for Being: *das Er-eignis*. *Vermögen* and *Ereignis* may both be translated as 'appropriation'.³⁹

In 'Time and being' (the projected third part of *Being and Time* which was rethought by Heidegger II and withheld from publication until 1969), the author renders the enigmatic '*esti gar einai*' of Parmenides as 'the possibility of Being'.⁴⁰ The *esti* here must, Heidegger states, be understood as the *es Gibt*, the giving of Being. The giving of Being is also, identically and simultaneously, a giving of time; and is not therefore to be confused with the metaphysical notion of Being as permanent presence. This reaffirmation of the identity of Being and time in this crucial late text shows how Heidegger II remains in direct continuity with Heidegger I's initial exhortation in *Being and Time* to think Being in terms of temporality which absences (into future and past) even as it presences (in the actual moment) rather than a metaphysics of simple substantified presence.⁴¹ As the giving of Being, *esti* is to be understood as that which 'is capable of Being' – the 'power' or 'possibility' of Being. The French translation here as *pouvoir-être* captures this double sense with felicitous ease. Being is thus identified as the 'possibility of Being' in the sense of 'that which *can be*'. And it is this very designation of Being as 'possibility of Being' which leads directly to Heidegger's celebrated definition of Being as *Ereignis* in this same work.

In a closely related text, 'The end of philosophy', Heidegger affirms that 'the end of philosophy is the place in which the whole of philosophy's history is gathered in its most ultimate possibility'.⁴² And he goes on to suggest that this 'ultimate possibility' is also the 'first possibility' from which all genuine thought originates. It is, in other words, an eschatological possibility which holds sway beyond *Dasein*'s power of determination,

'a possibility whose contour remains obscure, whose coming remains uncertain'.⁴³ It would seem that this 'ultimate possibility' is nothing other than the *Ereignis* of Being itself, the 'appropriation' of thought by Being whose final coming remains beyond our choice or control. Is this not what Heidegger is thinking of in the *Der Spiegel* interview when he declares that 'Only a god can save us now'?

Conclusion

Heidegger's complex thinking on the 'possible' represents a radical departure from traditional metaphysical theories on the subject. Whereas such theories tended to regard the 'possible' as a lack of presence or a mental re-presentation of presence, Heidegger proclaims it to be that which gives – i.e. possibilizes – all presence. No longer considered merely as a representational *possibilitas* of the subjective mind, or a *potentia* of objective reality, the possible (*das Möglich*) emerges as a 'loving power' which possibilizes all presence, be it represented or real. The possible, in short, is Being itself in so far as it gives and appropriates.

Whereas this identification of Being and the possible remains implicit in Heidegger I – where it is understood primarily in terms of the temporal horizon of human existence (i.e. as that 'onto which' *Dasein* projects itself in giving itself a world) – in Heidegger II the identification is clear and explicit. The 'turn' in Heidegger's thinking on the possible takes place, as we saw, in his *Letter on Humanism*. But more important perhaps than the internal development of Heidegger's thought on the possible is the degree to which his thought as a whole fulfils the programme of 'overcoming' metaphysics. This fulfilment is witnessed to a lesser degree in Heidegger I's threefold treatment of the 'possible' (*Möglichkeit*, *Seinkönnen* and *ermöglichen*) than in Heidegger II's identification of the possible with Being itself as *Vermögen* – and its cognates, *esti*, *es gibt* and *Ereignis*. But it is fair to say that in *both* Heideggers the 'possible' is thought of in a post-metaphysical fashion; that is, no longer as an accidental characteristic of the presence of beings, but rather as that temporality which is Being itself in its absencing-presencing, giving-withholding, loving-appropriating. May we not logically assume then that the task of overcoming metaphysics is nothing less than the task of thinking Being as possibility instead of simply as presence?

Part II: Heidegger and God

In the final part of this study I will outline some of the implications of Heidegger's rethinking of the possible for an understanding of the question of God.

The history of Western metaphysics is, for Heidegger, the history of

onto-theology. It is, in other words, an *epoche* where being manifests itself as the highest divine entity (*theos*) or the most general grounding entity (*on*). The list of onto-theological formulations of being as substantified presence include: the Platonic concept of *eidos* as timeless and immutable oneness; the Aristotelian concept of *telos* as self-thinking thought; the Augustinian concept of divine being as self-loving love (*amor quo deus se ipsum amat*); the Thomistic/Scholastic concept of divine being as permanent subsistence (*ipsum esse subsistens*); the Cartesian and Spinozist concept of the *res cogitans* as a self-sufficient substance echoing the divine self-causing cause (*ens causa sui*); or the modern rationalist concepts of objectivity (*Gegenwärtigung*), representation (*Repräsentanz*) and presence (*Vorhandenheit*).

Heidegger's project of overcoming metaphysics poses a challenge, as we saw above, to the traditional onto-theological priority of actuality over possibility. The implications of this for an alternative – i.e. post-metaphysical – understanding of God are radical. At its most basic, it implies that God is no longer to be thought of as some atemporal, static *esse* but rather as a temporalizing, empowering *posse*.

The God of onto-theology was a God devoid of possibility. As *sumмум ens*, *ultima ratio* or *causa prima et essendi*, God was precisely that being which needed no other being to fulfil it. Thomas Aquinas was quite explicit on this decisive point, as we noted above, writing in the *Summa I*, paras Q.3–4 that '*deus est actus purus non habens aliquid de potentialitate*'. Heidegger's impassioned response to this God of ontotheology is significant. 'Before such a God', he affirms,

man cannot pray or offer a sacrifice. It is not possible for men to kneel, sing or dance before the *causa sui*. Indeed, a thinking which has abandoned the notion of God as *causa sui* is perhaps more faithful and more open to the truly divine God than onto-theological metaphysics would like to admit.⁴⁴

Heidegger himself was reticent, for diverse reasons, to explore the possible consequences of the overcoming of the metaphysics of presence for a different thinking about God. His own reservations notwithstanding however, I shall briefly endeavour to suggest what some such consequences might entail. The post-metaphysical concept of God as *posse* I call the 'eschatological'.

First, it could be argued that the eschatological notion of *posse* better enables us to understand God according to the original scriptural notion of *kenosis*. Recalling Heidegger's own suggestive etymological linkage between the German terms *vermögen* (to possibilize) and *mögen* (to love), it would appear at least conceivable that the eschatological notion of God as possibilization approximates more accurately to the biblical

notion of divine *kenosis* (as self-emptying love) than to the ontological concept of a self-sufficient self-love. If divine love is that which grants the promise of a Kingdom to come, is it not more appropriate to interpret this love as *possibilizing* this Kingdom on earth – in giving itself to human beings as a possibility to be freely and creatively realized – rather than as a Kingdom already self-realized elsewhere irrespective of human freedom? Is the eschatological Kingdom not more true to its word as dialogical possibilization than as monological actualization? Indeed, is not such a view of things the only way to surmount the age-old onto-theological antinomy between divine omnipotence and human freedom? To understand God as *posse* – which I choose to render as *May-Be* – is to appreciate that we are entirely free to realize, or not to realize, the Kingdom possibilized by God. God's love is *kenosis* precisely because it is the gift of that which is most proper and precious to Christ – his life with the Father – in order to liberate his creatures by possibilizing a divine Kingdom in 'a new heaven and a new earth'.

Second, the eschatological interpretation of God as *posse* offers a way out of the traditional antinomy concerning the compatibility of God's goodness with the existence of evil. The historical scandal of theodicies and theocracies may be overcome if we acknowledge the *posse* as an ongoing dialogue between a divine love which possibilizes itself out of itself and a human *praxis* which strives to realize this possibilizing love. In this context, evil can now be understood as the consequence of the absence of such dialogue (in a revised form of the *privatio boni* argument). The evil in our world is not due to God but to us human beings to the extent that we refuse to realize the divine *posse* in our everyday existence. Evil results from our own unchecked expression of the will to dominate and possess (*libido dominandi*), from our closure to the gift of *other* possibilities of being from beyond ourselves. The eschatological God of the bible is not an Emperor of the World, as onto-theology proposed, but a 'voice crying in the wilderness', a voice which cannot be spoken until we hear it and speak for it.

Third, the eschatological concept of *posse* enables us to surmount another antinomy in the metaphysical understanding of God – namely, that he exists for himself and for others (*per se et per alio*) as a love of self and of others. Aristotle had no illusions about the onto-theological implications of the definition of God as Unmoved Mover. This meant that the Divine as pure actuality could motivate others to desire but could not itself desire others. The Divine *qua* self-thinking-thought is utterly without potentiality (*dunamis*) and so has no motivation in itself to seek actualization outside of itself. God is pure self-sufficient act. Anselm reiterates this onto-theological view when he defines God as *aseitas* – *a se esse*, a being unto himself. And Aquinas is working from a similar metaphysical framework when he concedes that '*necesse est*

quod deus primo et principaliter suam bonitatem et seipsum amet'. It was from just such a definition of God as self-loving love moreover that arose the substantialist notion of the Trinity as a *commercium* or *nexus amoris* in which Father, Son and Spirit exult in their self-regarding 'common possession' of each other. A far cry from the voice crying in the wilderness! The polar opposite of *kenosis*.

To understand God as kenotic *posse* is to see his love as a vulnerable and generous desire to be made fully incarnate in the eschatological kingdom – a kingdom possibilized by God but only realizable if and when we, human creatures, freely choose to respond to the divine call in word and action. Is this not the God of Abraham, Isaac and the Prophets whom Pascal contrasts with the God of the philosophers? Is this not a God before whom, in Heidegger's words, we could dance and kneel and pray – like David in the bible? Is this not the God who reveals himself, as Lévinas claims, in the naked and vulnerable face of the widow, orphan or famine victim – a God who created man because '*on est mieux à deux*'? Or whom Kierkegaard signalled when he wrote that 'Jesus Christ, even though he was one with the Father and the Spirit, still felt the need to love and be loved by man', adding 'If one denies this one can spiritualize God to the abstract point where he becomes cruelty itself'?

The eschatological God announced in the Old and New Testaments can now be recognized as a *deus adventurus* rather than a *deus absconditus* – as a God who *is not* but *may be*. Here is a God, in short, who negates and transcends all metaphysical conceptualizations of the divine in terms of a self-accomplished and self-adequate *esse* in order to reveal God as a *posse* whose Kingdom may yet come and whose will may yet be done on earth.

This brings us to the fourth and final point introduced by an eschatology of the possible – the relation of divine revelation to history. Traditional metaphysics could not convincingly account for the fact that God was at once timeless and temporal, at once transcendent of history and manifest in the world. In contradistinction to onto-theology, which tended to define God as a *nunc aeternum* residing outside of historical time, the post-metaphysical concept of *posse* suggests how God (as transcendent possibility) can give himself to human beings (as enactors of this possibility) through the adventure of history. The divine *posse* remains other not because it possesses an *esse* over and above the phenomenological being of our world. Its otherness takes the form of a radical transcendence of *possibility* which depends for its *actualization* on the historical actions of prophecy, covenant and salvation. The divine *posse* is not an 'other being' but an 'otherwise than being'. As Emmanuel Lévinas observes:

Man is indispensable to God's plan or, to be more exact, man is nothing other than the divine plans within being. . . . Man can do what he must do; he can master the hostile forces of history by helping to bring about a messianic reign, a reign of justice foretold by the prophets. The waiting for the Messiah marks the very duration of time.

(‘Judaism’ in *The Lévinas Reader*, ed. S. Hand (Blackwell, 1989), p. 252)

The God of transcendence revealed to us in the Bible is not the God of ontology (i.e. of the philosophers) but the God of eschatology (i.e. of Abraham, Isaac and the prophets). To rethink God according to the Heideggerian analogy of *Vermögen* is to recognize new options for appreciating the religious belief in a God who may be *at* the end, and *as* the end of history. It opens a way to understanding God not as a *topos* of being but as a *utopos* other than being.

While Heidegger does not explore these options himself, he does make it clear that any theological interpretations of his own philosophical deconstructions of metaphysics – such as the metaphysical concept of the possible – must observe the critical procedures of an analogy of proper proportionality. This means that instead of grafting God directly onto being, or rather a deconstructive re-thinking of being, we must observe the hermeneutic difference between the presuppositions of religious faith and revelation, on the one hand, and the philosophical questioning of being, on the other. The analogy of proper proportionality recommended by Heidegger reads as follows: *Dasein* is to *Sein* what the religious thinker is to God. So that what we are exploring in the concluding section of this study is not – if we are to be true to Heidegger – an identification of God and Being as *Vermögen/Posse* but rather a properly proportionate analogizing of two parallel post-metaphysical concepts of the possible: the one as applied to being, the other as applied to God. And such analogies inevitably carry differences as well as similarities.

If being as *Vermögen* discloses itself to *Dasein* as a wonder that things exist (*thaumazein*), a care for being (*Sorge*) and a questioning of being (*Seinsfrage*), the eschatological *posse* reveals itself to believers as a call to faith and to ethical *praxis*. Heidegger's notion of *Vermögen* as a ‘possibilizing love’ which cares for (*sorgen*) and watches over (*wahren*) the *topos* of being is, we have been suggesting, closely analogous to the eschatological notion of ‘possibilizing love’ as kenotic charity. However, the love of being is very much a guarding over beings in their topological being-there as things of the world; whereas the eschatological love of God is strictly (or at least scripturally) speaking *not* ‘of this world’. As Heidegger explains in the *Letter on Humanism*: ‘*Etwas vermögen bedeutet hier: es in seinem wesen wahren*’. Indeed, even when we are dealing with

the guarding over of what Heidegger calls a 'sacred' place – e.g. a temple, shrine, cathedral, holy mountain – we are, from an ontological point of view, dealing with one of the fourfold divisions of being (the sacred, mortals, sky and earth), and not with the revelation of a divine kenotic love *per se*. The latter implies an act of faith which reads the sacred in terms of eschatological revelation. So that it would seem fair to say that the phenomenological disclosure of the sacred serves as a necessary but not sufficient condition for the eschatological revelation of God.

A phenomenology of sacred places, rituals or symbols – as practised by the later Heidegger or Eliade for example – can teach us about the ways in which the divine manifests itself in and through the phenomenological horizon of our being-in-the-world. The eschatological *posse*, by contrast, while revealing itself phenomenologically through sacred places, rituals and symbols remains radically transcendent and other. For a phenomenology of the sacred, Christ and Apollo are brothers. And it is only if or when we adopt a hermeneutic of faith that we privilege one of these – e.g. the privileging of Christ in the Christian hermeneutic – as a unique incarnation of the eschatological *posse*. In this example, the God of Christian faith is not identical with a phenomenological concept of the sacred which is by definition polytheistic. For although the Christian God does, of course, reveal itself through icons of incarnation – ranging from the prophets and Christ to the saints, holy scripture and other places and objects of worship – it does so in a way that bears witness to a radical distance between the divine Other as vertical possibilization and being as a finite horizontal possibilization (*Vermögen*). This significant disparity between the infinite otherness of eschatological divinity and the finite being-there of the phenomenologically sacred is keenly preserved by the analogy of proper proportionality which enables us to both compare and contrast these two orders of possibilization. And the difference is ultimately a matter of belief.

Let us tease out some consequences of this difference. As that which *may be* the eschatological *posse* is also that which *should be*. Or to put it another way, while the ontological *posse* expresses itself as a *sein-können*, or capacity to be, the eschatological *posse* reveals itself as a *seinsollen*, or duty to be. It is this ethical exigency of the divine *posse* which Dostoyevsky alludes to when he declares that if God is dead all is permitted. From the point of view of an ontology of *Vermögen*, all is permitted. But this does not mean that ontology is immoral. It simply means that it is a-moral, or if one prefers, non-moral. Heidegger's fundamental ontology attempts to surpass the metaphysical framework which, since Plato, identified being and the good. Unlike Platonism which defined the highest Idea as the *Agathon*, or Thomism which declared that *ens et bonum convertuntur*, Heidegger affirms that the questioning

of being is a strictly phenomenological activity which describes beings as they appear, as phenomena – without judging morally as to whether they should or should not appear. Genuine ontology, Heidegger insists, is phenomenological description not ethical prescription. And he is equally reticent and non-committal with respect to theology, making no claims about which manifestations of the holy are true or false (e.g. as appearances of one true God).

This does not mean that Heidegger is either anti-ethical or anti-religious. It is simply a matter of recognizing the gap separating a phenomenology of finite being from an ethico-religious concern with that which is transcendent *vis-à-vis* the phenomenological horizon of Dasein's historicity. Heidegger is not concerned with God's existence or inexistence but with his phenomenological absence or presence. He does not deny the possibility of a transcendent deity; he merely acknowledges that such questions surpass the finite limits of a phenomenological ontology. And this is in keeping with Heidegger's admission to Herman Noack in 1954 that the divine which he invoked in the *Letter on Humanism* is the divine of poetic experience (e.g. of Hölderlin and Rilke) rather than the God of biblical revelation *per se*.

Where Heidegger and the poets speak of the contemporary 'lack' or 'absence' of the gods as a phenomenological event in the history of being, an eschatology of the possible might read this absence as a lack of human fidelity to the ethical exigencies of the New and Old Testaments – e.g. as a moral failure to realize the divine *posse* of social justice. Eschatologically viewed, the promised return of God is not just something which *may* happen but *must* happen, something believers have an ethical duty to bring about in this world through their historical actions. Heidegger's ontological approach to the return of the divine – as in the *Der Spiegel* claim that 'only a God can save us now' – has no such connotations of moral exigency. It is a *warten* rather than an *erwarten*, a will-less waiting rather than an urgent expectancy or hope for the coming of a kingdom which impells us to moral and social action. The ontological *Vermögen*, unlike the eschatological *posse*, does not depend on human intervention for its advent or return. The *Ereignis* of being *can be* independently of human action because it is, by Heidegger's own admission, a 'decree of being itself'. But the eschaton of God, by contrast, *may be* realized in history only if and when humans respond to the ethical call of revelation.

Whereas being and God can both be analogously described in terms of Heidegger's notion of 'loving possible' (*vermögend-mögende*), there are notable differences to be respected. And the most important of these may be expressed, in resumé, as follows: the eschatological view of the possible departs from the ontological in viewing mortals as beings who

transcend being toward what is other than being, towards the eschatological possibility of a kingdom yet to come.

Notes

1 Martin Heidegger, *Sein und Zeit* (Max Verlag, Tübingen, 1927), translated by J. Macquarrie and E. Robinson (Basil Blackwell, Oxford, 1962). Henceforth the German shall be referred to as *SZ* and the English as *BT*. The statement concerning the primacy of possibility is to be found in *BT*, 63; *SZ*, 38.

2 *BT* sections 25–38, especially 32.

3 Aristotle, *Metaphysics*, 9.8.1059.

4 Thomas Aquinas, *Summa Theologica*, I pars. qu. 3, a. 4, c. Thus as the Supreme Being, God (*Summum Ens*) becomes an omnipresence (*Omnipraesentia*) in all beings in so far as He is the cause of their Being (*causa essendi*); *STh*, I, 8, a. 3. For a full development of Heidegger's critique of the scholastic notion of God as metaphysical presence, see his *Identität und Differenz* (1957). For most comprehensive commentaries on the subject see B. Welte, *La Métaphysique de St. Thomas d'Aquin et la Pensée de l'Etre chez Heidegger* (RSPT, Oct. 1966) and Bertrand Rioux, *l'Etre et la Vérité chez Heidegger et St. Thomas d'Aquin* (PUF, Paris, 1963). We should also add that even though Aquinas and the transcendental Thomists of today – Rahner, Lonergan etc. – consider man as a being who transcends himself in quest of an always more absolute knowledge, they still continue to understand man primarily as a *substance*, whose being, even as it transcends itself, remains a permanently identical presence. Furthermore, even such metaphysicians acknowledge a role for possibility or potency in their notion of knowledge as conative and transcending, they ultimately subordinate this possibility to the final presence which is achieved when the knower reaches what is known, i.e. Aristotle's *Noesis Noeseos* or the Thomist notion of absolute knowledge as an absolute identity and transparency of Being to itself. It is only with Descartes and the German Idealists that man is explicitly defined as a substance which is a 'self-presence'. It must be admitted that in points of detail, Heidegger's critique of the metaphysics of presence and substance leaves much to be desired. But the overall intention of his critique is clear enough.

5 *SZ*, 42f., 143–5, 188, 248f., 259.

6 We do not wish to make any claims here for the unconditional validity of Heidegger's interpretation of Aristotle's notion of time in book *V* of the *Physics*. Nor is it sure that all subsequent theories of time follow this interpretation. Augustine's understanding of time in *Confessions*, *XI*, would certainly seem to be an exception. But our purpose here is not so much to dispute the validity of Heidegger's interpretation as to state it; see note 41 below.

7 All of these metaphysical words for Being as presence share the common character of 'permanent subsistence' (*character des Ständige verbleibs*) such that the Being of a being is considered to be 'that which it always is', i.e., its subsistence in permanence. This is why in *BT* truth is no longer defined in terms of Being as 'permanent-subsistence' (*das Vorhandene*) but on the basis of the temporality of *Dasein* (i.e. as revelation and openness (*Erschlossenheit*)). For best examples of Heidegger's discussion of the priority of Being as presence *vis-à-vis* Being as possibility in the history of metaphysics see his *Die Physik Bei Aristoteles* (1958) and *Entwurf zur Geschichte des Seins als Metaphysik*, 458–80 (*Nietzsche*, Vol. II). As a good secondary source see Ysabel de Andia's *Présence*

et Eschatologie dans la Pensée de Heidegger (Editions Universitaires, 1975) particularly 150–90.

8 *BT* 271f.

9 *SZ* existentiell possibilities, 267; factual possibilities, 264; logical possibilities, 143; ontical possibilities, 312.

10 *BT* 250.

11 To express this idea Heidegger calls death the ultimate end (*Umwillen/Umzu* and *Wofur*) of all our possibilities, *ibid.* 93f, 109, 467.

12 On rapport between *Verstehen* and *Seinkönnen*, see *BT* sections 58, 68a, 73.

13 On authentic and inauthentic 'potentiality-for-Being' see *SZ* 233–5, 267–302. On three modes of inauthentic 'potentiality-for-Being' see: *SZ* existentiell, 260; factual, 341; ontical, 260.

14 The only critics to have stressed the importance of this distinction are, to my knowledge, the translators themselves, Macquarrie and Robinson, in a note 558, *BT*.

15 *SZ* 263, 268.

16 *ibid.* 263.

17 *ibid.* 267–8.

18 *ibid.* 267–9, 273–5, 298, 312.

19 *ibid.* 267.

20 *ibid.* 264: 'Die gewisse *Möglichkeit* des todes erschliesst das Dasein aber als *Möglichkeit* nur so, dass es vorlaufend zu ihr diese *Möglichkeit* als eigenstens *Seinkönnen* für sich ermöglicht.'

21 *SZ* 324; *BT* 271 – Macquarrie and Robinson offer the following translation here: 'To lay bare the upon which of a projection, amounts to disclosing that which *makes possible* what has been projected.' The translators' choice here of the second possibility of understanding this phrase is in line with my suggestion that the general movement of the approach to the possible in *BT* is progressively away from a metaphysical interpretation which would see the possible as a dimension (*protentia* or *possibilitas*) contained in the Being of man or things, towards a post-metaphysical interpretation (i.e. of fundamental ontology) which would see possibility as a dimension emerging towards man and things from that Being as Being (*Sein als Sein/Sein Uberhaupt*) which renders both man and things possible in the first place. Of course, Being cannot be understood here as residing in some Platonic otherworld before it comes to us; it is not *separate* from man and things but it is *different*: see the famous 'ontological difference' in *Identität und Differenz* (1957).

22 *BT* 371.

23 *ibid.* section 71, 423.

24 See *Was ist Metaphysik?* (1943 edition): 'Das Sein wohl west ohne das Seiende, niemals aber ein Seiendes ist ohne das Sein.' In *Identität und Differenz* (1957) develops this notion of the ontological difference between Being and being (or man as the highest form of being) at great length.

25 *BT* 446; *SZ* 394.

26 *BT* 488; *SZ* 437. We must point out here that there is nearly always an ambiguity in this work as to whether Being refers to the Being of Dasein or Being itself (as *Sein Uberhaupt*) or both at once!

27 See p. 85 in the English translation by William Lovitt, entitled *The Word of Nietzsche*, printed in the collection of Heidegger essays, *The Question concerning Technology and other Essays* (Harper and Row, 1977).

28 *ibid.* 85.

29 Translated by James Churchill as *Kant and the Problem of Metaphysics* (Indiana University Press, 1962).

30 *ibid.* 120f, 141f, 161f.

31 *ibid.* sections 34, 39–45, in particular p. 251: ‘Kant’s laying of the foundation of metaphysics, which for the first time subjects the internal possibility of the overtness of the Being of the essent to a decisive examination, must necessarily encounter time as the basic determination of finite transcendence, if indeed, it is true that the comprehension of Being in Dasein spontaneously projects Being on time.’

32 *ibid.* 252: ‘If the essence of transcendence is based on pure imagination, i.e., originally on time, then the idea of a “transcendental logic” becomes non-sensical, especially if, contrary to Kant’s original intention, it is treated as an autonomous and absolute discipline. Kant must have had an intimation of this collapse of the primacy of logic in metaphysics when, speaking of the fundamental characteristics of Being, “possibility” (what-being) and “reality” (which Kant termed “existence”), he said: “So long as the definition of possibility, existence and necessity is sought solely in pure understanding, they cannot be explained save through an obvious tautology”. And yet, in the second edition of the *Critique* did not Kant re-establish the supremacy of the understanding? And as a result did not metaphysics with Hegel, come to be identified with “logic” more radically than ever before?’

33 Heidegger himself makes this point in his conclusion to part 3 of this work, *ibid.* 207: ‘It is true that in order to wrest from the actual words that which these words “intend to say”, every interpretation must necessarily resort to violence. This violence, however, should not be confused with an action that is wholly arbitrary. The interpretation must be animated and guided by the power of an illuminative idea. Only through the power of this idea can an interpretation risk that which is always audacious, namely, entrusting itself to the secret élan of a work, in order by this élan to get through to the unsaid and attempt to find an expression for it. The directive idea itself is confirmed by its own power of illumination.’ In the light of this claim we can perhaps understand, if not necessarily agree with, Ernst Cassirer’s description of Heidegger’s interpretation as ‘a usurpation of the text rather than a commentary’ – ‘Bemerkungen zu Martin Heideggers Kant-Interpretation’, *Kant Studien*, xxxvi, No. 1/2 (1931) 17. To further appreciate the singular nature of this reading we must recall Heidegger’s acknowledgement in the preface to this book on Kant, that this entire study was originally intended as a section of the projected part 2 of *BT*, to be entitled: ‘The fundamental characteristics of a phenomenological destruction of the history of ontology under the guidance of the problematic of temporality.’

34 English translation by Edgar Lohner entitled *Letter on Humanism*, and published in *Phenomenology and Existentialism* (ed. R. Zaner and D. Ihde, Capricorn Books, NY, 1973) 147–81. I have made one important alteration in the Lohner translation (*ibid.* 150) in rendering ‘*Vermögen*’ as ‘possibilizing’ rather than ‘commanding’. Literally, *Vermögen* means to be able or to enable, i.e., to be or to make possible. Lohner’s rendition as ‘command’ as well as ‘potentiality’ and ‘is capable of’ – without an indication that it is the same word *Vermögen* which is being translated – makes little sense out of the German original. As this is the most crucial text in our commentary I cite the original passage in its entirety: *Das Denken ist – dies sagt: das Sein hat sich je geschicklich seines Wesens Angenommen. Sich einer ‘Sache’ oder einer ‘Person’ in ihrem Wesen annehmen, das heisst: sie lieben: sie mögen. Dies Mögen bedeutet, ursprünglicher gedacht: das Wesen schenken. Solches Mögen ist das eigentliche Wesen des Vermögens,*

dans nicht nur dieses oder jenes leisten, sondern etwas in seiner Herkunft 'wesen', das heisst sein lassen kann. Das Vermögen des Mögens ist es, 'kraft' dessen etwas eigentlich zu sein vermag. Dieses Vermögen ist das eigentlich 'Mögliche', jenes, dessen Wesen im Mögen beruht. Aus diesem Mögen vermag das Sein das Denken, Jenes ermöglicht dieses. Das Sein als das Vermögend-Mögende ist das 'Mög-liche'. Das Sein als das Element ist die 'stille Kraft' des mögenden Vermögens, das heisst des Möglichen. Unsere Wörter 'möglich' und 'Möglich' und 'Möglichkeit' werden freilich unter der Herrschaft der 'Logik' und 'Metaphysik' nur gedacht im Unterschied zu 'Wirklichkeit', das heisst aus einer bestimmten – der metaphysischen – Interpretation des Seins als *actus* und *potentia*, welche Unterscheidung identifiziert wird mit der von *existentia* und *essentia*, Wenn ich von der 'stillen Kraft des Möglichen' spreche, meine ich nicht das *possibile* einer nur vorgestellten *possibilitas*, nicht die *potentia* als *essentia* eines *actus* der *existentia*, sondern das Sein selbst, das mögend über das Denken und so über das Wesen des Menschen und das heisst über dessen Bezug zum Sein vermag. Etwas vermögen bedeutet hier: es in seinem Wesen wahren, in seinem Element einbehalten.

The identification of *vermögen* and *wahren* in this last sentence is very significant, for Heidegger sees *Wahren* (to guard or care for) as the root meaning of *wahrheit* (truth). Thus we see how easily Heidegger was able to identify 'possibilizing' as the 'truth of Being' (and later as *es gibt, esti, Ereignis*).

35 In fact, the two Beings in question here refer to the *Same* Being but differ in the way we think about this Being, i.e., as it reveals itself to man or as it is in itself. This duplicity in our thinking about Being is what Heidegger, in his later writings, referred to as the 'Januscope' (i.e., the double-glance).

36 Here I offer my own translation. The original German reads, as above: '*Das Vermögen des Mögens ist es "Kraft" dessen etwas eigentlich zu sein vermag. Dieses Vermögen ist das eigentlich "Mögliche", jenes, dessen Wesen im Mögen beruht.*' For Lohner's inadequate translation see *op. cit.* 150.

37 The original reads, as above: '*Das Denken ist, sich einer "Sache" oder einer "person" in Wesen annehmen, das heisst: sie lieben: sie mögen.*' For Lohner's translation see *op. cit.*, 151–2.

38 See Emmanuel Lévinas, *Totalité et Infini* (The Hague, Nijhoff, 1961): *Autrement qu'être* (The Hague, Nijhoff, 1974) and Martin Buber, *Between Man and Man* (trans. R. Smith, Fontana, 1947) 119–20.

39 The standard English translation of *Ereignis* is 'Appropriation', see Joan Stambaugh's translation of *Zeit un Sein* in *On Time and Being* (Harper and Row, 1972) 19–24. We must not overlook the significance of the fact that just as *Vermögen* can refer to wealth or power in the sense of 'property', so too *Ereignis* carries this sense of 'appropriation' as 'possession' or 'property' (as its etymological rapport with *Eigen-tum* suggests also). See Heidegger's play on this meaning in the following sentences from *On Time and Being*, for example, 22: 'Being proves to be destiny's gift of presence, the gift granted by the giving of time. The gift of presence is the property of appropriating'. ('Presence' here – *Answering* – is not to be confused with 'presence' in its metaphysical determinations – *ousia*, *substantia*, *actualitas*, *Vorhandenheit* – discussed earlier!). Or again 23: 'Because Being and Time are there only in appropriating [*Ereignis*], appropriating has the peculiar property of bringing man into his own [*eigenst*] as the being who perceives Being by standing within true [*eigentlich*] time. Thus appropriated, man belongs to appropriation.' As Heidegger goes on to say, to the extent that man is 'appropriated' and 'assimilated' by Being he is to be considered its 'belonging', as its property: that which is most proper to it.

40 See Stambaugh's translation, *op. cit.* 8.

41 This essential link between 'possibility' on the one hand, and 'Being-understood-as-time-which-absences-as-it-presences' (i.e. as *Es gibt, Esti, Ereignis*) on the other, is clearly manifest in the following passages from a letter which Heidegger wrote to a young student called Buchner in 1950 (printed pp. 183–6 of *Poetry, Language, Thought*, trans. A. Hofstadter, Harper and Row, 1971): 'Being is in no way identical with reality or with a precisely determined actuality (i.e. simple, substantified presence). Nor is Being in any way opposed to being-no-longer and being-not-yet, these two belong themselves to the essential nature of Being. Even metaphysics already had, to a certain extent, an intimation of this fact in its doctrine of the modalities – which, to be sure, has hardly been understood, according to which possibility belongs to Being just as much as do actuality and necessity'. (. . .) 'The default of god and the divinitas is absence, but absence is not nothing; rather it is precisely the coming-into-presence [*Anwesen*], which must first be appropriated [*ereignen*], of the hidden fullness and wealth of what has been and what, thus gathered, is presencing [*anwesende*] of the divine in the world of the Greeks, in prophetic Judaism, in the preaching of Jesus. This no-longer is itself a not-yet of the veiled coming-appropriation [*Ereignis*] of its inexhaustible nature. Since Being is never the merely precisely actual, to guard Being is vigilance, watchfulness for the has-been and future destiny of Being. (. . .) The step back from the representational thinking of metaphysics . . . is necessarily part of thinking the thing, a thinking that thinks about the *possible advent* [*Ereignis mögliche*] of world.' Once again we stress that this notion of Being as an absence which presences (*Anwesen–Abwesen/Abwesen–Anwesende*) is not to be confused with the metaphysical notion of presence as something actual or actualized, as re-presentation or, in its highest form, as some eternal presence (*Ipsum Esse subsistens* or *Nunc Aeternans*). This 'overcoming' of the notion of presence as enduring substance in favour of a notion of 'presencing' (*Anwesen*) as a possibilizing (*Vermögen*) which presences as it absences, is what we have tried to highlight in this article. We have avoided using the presence-presencing contrast because in English this double-use of the same term 'presence' loses the sharp distinction of the German where two *different* terms are always used, i.e., *Vorhandenheit* (*ousia, substantia, actualitas*, etc.) on the one hand, and *Anwesen* on the other. The presence–possibility contrast expresses this difference very clearly, even in English.

42 This text was originally presented for Jean Beaufret's *Kierkegaard Vivant* (Gallimard, Paris, 1964) 164f. It appears as a complementary text to *On Time and Being* in Staumbaugh's translation of this text, *ibid.* 54.

43 *ibid.* 59–60.

44 For this and subsequent references in this final section see my earlier version of this argument, 'Heidegger, le possible et Dieu' in *Heidegger et la Question de Dieu* (ed. R. Kearney and J. S. O'Leary), Gallimard, Paris, 1980, 125–68.

Heidegger and the new images of science

Theodore Kisiel

Heidegger and science? To some, the combination undoubtedly still sounds strange and unlikely, let alone fruitful and worthy of extended consideration. What could we possibly expect to learn about the inner workings of science from a thinker singularly and almost monotonously concerned with the time-honored and now grandiose question of Being? In the words of one astute commentator: 'On the longest day he ever lived, Heidegger could never be called a philosopher of science.'¹ And yet, those intimately acquainted with Heidegger's entire career can easily point to just such a day, and it must have been a long day indeed. For on July 27, 1915, the young Dr Heidegger (age 25) held his inaugural lecture before the philosophical faculty at the University of Freiburg in order to obtain his *venia legendi*, the privilege to teach in the German university system, conceiving the lecture precisely as a logical-epistemological examination of the concept of time in natural science and in historical science.²

True. But after all, it must also be granted that this was long before Heidegger became *Heidegger*, by achieving international notoriety as a philosopher of existence practically overnight in 1927 with the publication of *Being and Time*. And *Being and Time* is manifestly a philosophy of being and existence and not a philosophy of science. But the examination of existential phenomena in this *magnum opus* also includes reflections on an existential conception of science, distinct from his earlier logical conception, with a promise of a thorough-going interpretation of science as a positive mode of existence to be incorporated in the as-yet-unpublished³ Third Division of the First Part of the project. Instead, science appears in a less positive light in the Second Part of the Heideggerian project, the part entitled 'the phenomenological destruction of the history of ontology' and later elaborated under the rubric of 'overcoming metaphysics'. This third approach to science can be labelled the 'metaphysical'

or 'epochal' conception of science, inasmuch as modern science is seen as a terminal epoch in the long history of metaphysics now coming to its end in the planetary dominion of technology. Note that metaphysics here does not refer to an abstract academic discipline but rather to the prevailing presuppositions and concrete interpretation of reality which uniquely stamp an age, for example, in the institutions and attitudes which that age accepts as a matter of course. In this vein, Heidegger's latest statements – two letters to conferences on his thought in this country and the interview on German television on the occasion of his 80th birthday⁴ – make it clear that the present concretion of the question of Being is nothing less than the question of science and technology, insofar as the institutions and the attitudes they have provoked permeate the fabric of 20th century existence and thus indelibly mark the way we now live, move and have our being. In short, the question of Being now reads: What does it mean to be in a scientific-technological age?

Science and Being? The juxtaposition sounds even more ambitious and diffuse than the thematic combination Science and Society, to which increasing attention is being devoted by a number of disciplines, including the philosophy of science. Indeed, it is difficult to think of a reflection on science more far-reaching than Heidegger's, for whom science and technology are the culmination and fulfillment of the destiny of several millenia of Western philosophy. Moreover, inasmuch as they are taken to be the mortal gasps of a tradition of metaphysics which Heidegger is striving to overcome, science and technology appear in such a negative light that some have accused Heidegger of being a reactionary romantic and even a neo-Luddite. Recall his most notorious pronouncement in this vein: 'Science itself does not think.'⁵ The adversary relationship which has over the decades developed between Heidegger and more scientifically-oriented philosophers perhaps finds its epitome in Rudolf Carnap's debunking of what he considers to be Heidegger's 'pseudo-statements', statements like 'Nothing itself nothings', which have become the stock examples of meaningless metaphysical statements still circulating in neo-positivist circles. Parenthetically, it is interesting to note that Carnap's critique, which appeared in the journal *Erkenntnis* in 1913, is entitled 'Overcoming of metaphysics through logical analysis of language',⁶ antedating by several years Heidegger's own adoption of the phrase 'Overcoming of metaphysics'.

Heidegger's response to such critiques is characteristically sweeping. For him, the linguistic standards of clarity, formal exactness and univocity adopted by logical positivism find their natural place in the history of metaphysics in the spirit of modernity, in which (1) truth is certainty, (2) reality is objectivity, and (3) rationality finds its model in a *mathesis universalis*.⁷ And when Heidegger asserts that science does not think, he is in fact referring to the positivistic image of science, in which logic and

scientific method reign supreme over scientific content, where even the certifications of confirmation are made subservient to the so-called hypothetico-deductive method. Heidegger thus seems to make unholy alliance with his worst enemies, the positivists, in accepting their image as the ultimate upshot of modern science.

His broad historical perspective thus devolves upon an image of science oriented towards logic and the positive fact, which from the perspective of contemporary philosophy of science is now considered to be far too narrow. For the last decade or so has witnessed an anti-positivist revolt of major proportions in the philosophy of science which has challenged the positivist image of science on each of the three scores named above and, moreover, has shifted the locus of the essence of science in a direction which appears quite amenable to the direction suggested by Heidegger's existential conception of science.⁸ Instead of a logical analysis of the theoretical products of science, the new philosophies of science rely more heavily on historical case studies of the actual process of science. As a result of this shift in approach, Anglo-American philosophy now definitively reflects a wholesale overhaul of the positivistic treatment of science in terms of idealized formal systems mapping empirical data. The more historical image now views science as ongoing *research* in a changing *problem-situation* which is *interpreted* and resolved according to the resources of a particular *historical* and *conceptual context*.

By way of an initial guide to what follows, permit me to underscore once again the operative terms of this new image of science and to suggest in advance the different view of truth, objectivity and rationality which this new image implies. Note first that it does not particularly mention 'theory', 'fact', or 'method', which stood in the forefront of the positivistic image. The operative dimensions are rather (1) research or discovery, (2) the interrogative mood of a problem-situation, (3) the process of interpretation in a finite context, (4) which is a conceptual context or, more directly and simply put, a language. Finally, all of these dimensions are essentially pervaded by historical movement. Accordingly, the emphasis falls on the *dynamis* of truth *in via* rather than the *stasis* of truth once and for all, and on the holistic context rather than on an atomic objectivity. Consideration of the contextual process rather than the finished results of science suggests a more pragmatic and less syntactic and formal rationality, and, in view of the priority of the interrogative mood over the declarative mood, a more chiaroscuro and less clear and distinct rationality, more a finite sense of truth rather than the security of eternal verities.

One is immediately reminded here of Heidegger's efforts to shift the locus of truth from the proposition to the existentially rooted question, in order to view the finalization of truth against the background of the origin of truth, a background which Heidegger considers to be the more

original truth. The same reversal of orientation is strikingly evident in the new philosophies of science. By tracing the termination of the scientific process, finalized in the form of theoretical and observational statements, back to its most obscure origins in the problem-situation, the new approaches bring out the inseparable unity and reciprocal interplay of the 'context of justification' with the 'context of discovery' to the point of insisting that judicative verification must serve the interrogative demands of discovery. This reversal of the positivist stress on the truth of verification tends to be borne out by the culture of science as it is manifested in the attitudes of scientists, who are trained and conditioned to seek new discoveries, whose professional prestige hinges on just such inventiveness, who compete vehemently to be the first to solve the most current problems of their fields, who thus become involved in the numerous bitter disputes over the priority and independence of their discoveries. And nowhere is it more evident how truncated the positivists' image was than in their attitude to the problem of scientific discovery, which they systematically excluded from any consideration whatsoever by the strategy of relegating it to the 'waste basket' of 'mere' psychology. According to this positivist view, discovery is a matter of intuition, strokes of genius, the workings of the unconscious and other such imponderables and therefore not a fit subject for logical minds. This most important dimension of scientific activity was thus left unexplained and accordingly left to the raconteurs of those fascinating and at once obfuscating anecdotes of discoveries made as if by 'accident', and of illuminations that come from a magical 'nowhere': Archimedes' bath, Newton's apple, Kekulé's dream of the dancing serpents, Poincaré's step onto an omnibus, to name only some of the better-known. A narrow area of methodological rationality populated by secure results is thus sharply demarcated from a vast enveloping jungle constituting the irrationality of creativity, which is unceremoniously dispatched to the limbo of the non-science of science.

Even the narrow realm of logically secured results, demarcated as science proper by positivism, soon proved to be a paper-thin substitute for the thick situation in which science actually takes place. The bifocal view of positivism stratifies the structure of science into a formal calculus governed by the stable laws of logic over against an independent world of fixed observations. Science proper is thus made to move in a split-level universe defined by the eternal poles of logic and fact. The time-honored metaphysical quest for stability and security thus reasserts itself in the world of science as portrayed by positivism, in spite of its loudly professed anti-metaphysical stance, now in the modern guise of a methodological subject coupling with an empirical object. Despite its reputed anti-metaphysical stance, positivism betrays its metaphysical vestiges by proclaiming both poles of its universe to be uncorrupted by becoming

and change. In more epistemological terms, both formal and empirical levels are viewed as essentially uninterpreted, and interpretation becomes the act of the match maker who couples two virgins and brings them into a state of cohabitation. This is officiously executed by means of so-called 'correspondence rules', 'coordinating definitions', 'bridge principles', or 'rules of interpretation'. Feigl's description of this scientific situation is particularly graphic: The postulate system of the formal calculus is like a free-floating balloon hovering over the earth of empirical facts, which must be anchored to the soil of experience and filled with empirical meaning by means of connecting tubes, which permit an 'upward seepage of the empirical juice' of observational meaning to be pumped into the unvisualizable theoretical terms, thereby investing them with a partial interpretation. Interpretation is thus a matter of filling the theoretical forms of a parade of blimps by a one-way capillary pumping action skyward from the earth. This has come to be known as the Capillary Model of meaning and interpretation.⁹

In order to develop this theory of interpretation and meaning, the efforts of the logical positivists inevitably turned to linguistic reform. In the spirit of clarity and distinction aimed at expunging all vestiges of metaphysical obfuscation from the language of science, they sought to extricate from ordinary language two very non-ordinary languages, (1) an ideal language purified according to the demands of mathematical logic and (2) a neutral observation language based on the ontology of phenomenism. But decades of effort have not yielded anything like a satisfactorily neutral observation language and it soon became apparent that only a small part of science in its most advanced theoretical efforts even approached the high degree of formality demanded by mathematical logic. Recently, not only the possibility but even the desirability of these linguistic reforms for the philosophy of science have been challenged by old-timers like Carl Hempel as well as by the new upstarts, on the grounds that they constitute a ruthless abstraction from the complex reality of scientific theorizing, in which observation is *always already* theory-laden and formal algorithms are always '*already* rich with meaning, charged with structural representations of phenomena'.¹⁰ The two extremes which positivism sought to purify out of scientific practice are *in practice* never so pristine pure, but have all along been co-habiting on the sly, in an alliance which is not only not unholy but in fact the very source of the fertility of science. To separate the two extremes and to attempt to 'purify' them only serves to remove science from the profound and comprehensive reality with which it has come in contact in its formulations. Purification would mean sterilization. Science finds its proper element not in the thin clarity of extremes sifted out by the misplaced discreteness of logical positivism but in the already interpreted, conceptually organized context cultivated for science by a historical

tradition which has been transmitted to it largely in and through the usages of ordinary language, in which theory and observation already correspond with one another in the reality about which they speak.

Explicit and formalized rules of correspondence are accordingly by and large unnecessary in scientific theorizing. It is therefore not surprising that they have been notoriously difficult to pinpoint. Instead of explicit rules bridging the chasm between formal and empirical levels, actual practice suggests more of a tacit process of mutual interpretation of a theory by its particulars and of particulars by their comprehensive theory in terms of the cues of the problem-situation to which they are addressed. The process can be described in terms of what the philological tradition has called the 'hermeneutic circle', which cannot be construed as a vicious circle because it is ultimately not only logical but also and primarily ontological. For the spiral movement thus generated incessantly wends its way down toward the non-verbal frontiers of a verbally structured problem-situation, which in turn is *always already* understood according to the usages of ordinary language as well as being invested with the meanings developed by the tradition of the discipline in question. Ordinary language as well as scientific language thus always articulates the problem-situation, and solving the problem involves the ability to see the scientific linguistics of the problem *in* and *through* the ordinary language in which it is always couched. Recall the famous example of Eddington's elephant, a problem which is expeditiously solved if one knows how to translate it into the terms of the standard inclined-plane problem of physics. Viewed in this way, interpretation now is the direct perception of family resemblances between problem-situations, one already solved and the other in need of solution, without the aid of intermediate correspondence rules. If the function of correspondence rules is to correlate scientific expressions with nature, then this function is now served by these exemplar problem-solutions which one finds at the end of chapters in physics and chemistry books. One does not master his science until he 'gets the knack' of how to use and apply these prototype problem-solutions,¹¹ which are notably expressed in the language of models and metaphors, of waves, particles, hydraulic models for the flow of electric current, and the like.

This dimension of scientific language, which was forced to the periphery by positivism and downgraded to a 'mere' heuristic function, now comes to the fore in the new image of science and emerges front and center as the operative language in interpretation and discovery. In the words of Heidegger, one might accordingly say that the new image of science assumes 'a transformed relation to the essence of language'. For the operative language is now viewed as a cultural storehouse of metaphors latent with untold possibilities for adaptation to the shifting demands of the changing problematic of science. The leading edge of

scientific change is now situated in the interaction of the old language with a new situation which evokes surprising aspects from the old language not previously seen in it. The metaphoric shift ensuing from the translation of the scientific language from one problem-situation to another may at times shift the very bases of a scientific discipline, by making a hitherto peripheral metaphor into a root metaphor and thus reweaving the fabric of fundamental concepts of the scientific domain, producing as it were a re-edition of the Book of Nature. This ability of language to adapt to the changing demands of the scientific problematic constitutes a more diachronic sense of scientific rationality as compared to the synchronic concern for the form and validity of finished logical systems. This new notion of scientific rationality sees change and rationality as not only not incompatible but in fact essential to one another. In the face of a historically changing world, the most rational thing to do is to change with it.

Instead of the hermeneutic model, which focuses on the dynamics of the linguistic change which takes place in interpretation, an evolutionary model of 'variation and selective perpetuation' of concepts and hypotheses is more commonly used among philosophers of science to comprehend the rationality of scientific change. Thus, Toulmin speaks of the 'ecological demands' of an 'intellectual environment' imposing a 'selective pressure' on the available pool of conceptual variants in order to filter out the most adaptable for perpetuation.¹² In a similar vein, the hermeneutic model underscores the importance of sensitivity to contextual determinants as guides to the appropriate interpretation of texts. The same applies to discovery. As we search for the appropriate word for a particular context, we are acutely aware that the context 'demands' the recalcitrant word and no other, 'rejects' the ones we do pose to it and instead 'suggests' other directions of interrogation. The situation 'asks' to be straightened out in certain ways while it screens out others, and we must be responsive to these interrogative solicitations and salient vectors if we are to come to an appropriate solution. Such attempts to describe the selection process seem to attribute a much more active role to the context than a more positivistic mentality, wary of anthropomorphism, would allow. But it is in fact an attempt to establish a new and more holistic sense of 'objectivity' – *Sachlichkeit und nicht Objektivität* – oriented to the Gestalt complex of the problematic situation. Both the hermeneutic and the evolutionary model converge remarkably on such a demand-response 'logic' of selection imposed by the situation itself, and in fact take us to the threshold of a reversal after the fashion of the later Heidegger, where what is said and what is talked about now not only talks back to us but even decides for us! Thus, in his meditation on the nature of thinking in *Was heisst Denken?*, Heidegger culminates in a form of this question which he formulates variously as 'What calls

us to thought?', 'what invites (appeals to, demands, instructs, directs) us to think?' and hence 'What gives directions to thought?'¹³ Whence the hermeneutic maxim to which Ricoeur sometimes alludes: The context decides, and we are led to decide accordingly, as we use all available contextual determinants in order to expose the most appropriate sense of a message charged with a fluid potential of meanings. Consider, by way of example, the sentences 'Man is a wolf', 'Juliet is the sun', 'The world is my oyster', in which the action of the context excludes the literal sense by way of its absurdity and then directs us to more metaphorical senses. It is in terms of this interplay between restrictions and latitudes that one ultimately acknowledges that meaning is interpreted by its context, i.e., in terms of what the context permits.

But the context not only determines which interpretations are appropriate and thus provide an adequate solution to our problems but also, and perhaps more importantly, which problems are appropriate, in terms of both the importance of the problem and the readiness of the field to handle it. The researcher must take his cues from his historical situation in exercising 'good judgment' with regard to the most promising problems as well as their adequate solutions. Prior to the right solution comes the much more subtle – and risky – decision of asking the right question, and in the right way, under pain of squandering years in a fruitless search for the resolution of a problem which simply will not yield. A scientific problem quite often must await its opportune time before scientific developments provide it with the resources that make it veritably 'ripe' for solution. After a long incubation period, there comes a time when the potential of the field is such that the discovery of an outstanding solution cannot be postponed for long. Sometimes, precipitous events may suddenly turn a 'fruitless' search into a time to 'cultivate' new theoretical possibilities in order to 'reap' the benefits of a recent intellectual 'harvest' of 'seminal' ideas from a neighboring 'field'.¹⁴ When the opportune time for a problem comes, then the direction of its solution practically forces itself as 'the obvious guess'¹⁵ on the researcher steeped in his field, perhaps even leading to its simultaneous discovery by independent workers in the field. Consider, for example, the discovery of the double helical structure of DNA, prompted most proximately by the discovery of the α helical structure of a protein molecule and supported by the opportune confluence of efforts in the disciplines of bacterial genetics, crystallographic physics and organic chemistry. The genesis and rapid blossoming of molecular biology can be specifically located at the intersection of these three domains, whose fusion was brought about by Watson and Crick's discovery, which in turn provided the key insight into the plethora of problems surrounding the genetic code or, in more popular jargon, 'the secret of life'. Molecular biology is just one example of a minor and peripheral specialty which suddenly and dramatically

takes over the vanguard in the history of science and unfolds a new subject matter in a creative surge which makes it grow by geometric leaps and bounds from a handful of specialists to a dominant field populated by a sizable number of distinguished scientists. Other examples are x-ray crystallography and spectroscopy which played just such key roles at the turn of the century in the development of quantum physics. Such historical experiences suggest that it would be disastrous to distribute funds equitably to all fields; the task of the allocators is to play midwife to these spontaneous surges in burgeoning new fields of discovery, which are opening up at the expense of older fields in the process of being exhausted.

The unevenness of the internal history of science, with its surprising turns of events and unexpected surges in forward progress through conceptual explosions which intersperse long incubation periods of gradual development, suggests the Heideggerian model for historicity in terms of the intermittent rhythms of unconcealment and concealment, truth and error. With all the continuing emphasis on the winners of the Nobel sweepstakes, there is now also a growing recognition of the important, even essential, role of the genial error in the history of science. There comes a time when a promising idea must be followed through to an ill-fated dead-end and thus shown to be a blind alley, a *Holzwege*. Such failures may well merit the name of science just as much as those endeavors for which the Nobel prizes are awarded. Shapere suggests, for example, that Justus Liebig's search, in the early days of organic chemistry, for a mathematizable 'vital force' operative in organisms, analogous to the attractive forces of matter, was just such an enterprise.¹⁶ Of course, even the successes in science pick their way through a gauntlet of wrong turns and dead-ends. For instance, the initial steps toward the DNA discovery were marked by wrong decisions on both of the initial questions concerning the helical model, namely, the number of strands and the nature of the chemical bonding between the strands. Popper in particular has emphasized the trial-and-error character of scientific procedure and the significant role played by falsifiability in the logic of science. And Polanyi points to another kind of unavoidable error interwoven into the history of science, citing his own scientific work on physical adsorption as an example of a discovery not immediately accepted by the scientific community because it was an idea too much out of season with the reigning paradigm of physical chemistry at the time of its initial publication.¹⁷

The erratic course of the history of science is directly tied to the unspecifiability inherent in the process of scientific discovery. As noted above, the desire to eradicate this erratic dimension from science has found its extreme expression in the truncated image which equates science with the methodically controllable and verifiable and

consequently excludes any consideration of the dimension of discovery. But if one refuses to exclude discovery from the essence of science and at the same time considers discovery at its fundament to outstrip all method and logic, then, for such a one, science would not be science without its profound roots in the unspecifiable, and therefore cannot be explained in terms of wholly explicit, wholly formalizable knowledge. What is to be called science would then include, for example, the unspecifiable art of 'good judgment' by the scientific administrator groping in the dark in making his educated guesses on the most promising lines of research impending in his field.

Among the new philosophers of science, Michael Polanyi in particular has pursued this direction of thinking to the point of outlining the ultimately ontological character of this dimension of the unspecifiable as it makes its presence felt in every phase of the scientific endeavor. Under the rubric of 'personal knowledge', he stresses the central role of a kind of intimacy between the scientist and nature, an indwelling in its harmonies by means of theoretical patterns through which the discoverer senses the presence of the hidden truth which has yet to be revealed. The scientist acquires this intimacy by entering into the inherited interpretive framework of science and passionately committing himself to learning its ways. As they say in the vernacular, it is a matter of 'getting a feel for' nature in the way science currently comes in contact with it. This tacit knowledge can only be conveyed by practice and from practicing scientists, through whom the novice assimilates the subliminal premises of his science. These premises weave the framework within which all of his scientific assertions are made, and yet, for this very reason, they themselves cannot be asserted. But despite its inarticulate state, this network is known intimately as his own interpretative framework, in which he dwells 'as in the garment of [his] own skin'.¹⁸ Out of this background comes the particular but unspecifiable clues which guide the researcher from surmise to surmise, as well as providing intimations of being on the right track and drawing nearer and nearer to a solution. Even the resulting theory is more than explicit knowledge; it is a foreknowledge of things yet unknown, unforeseeable, and perhaps even inconceivable at present, and it is in anticipation of these implications that the scientist passionately commits himself to this theory. For he believes himself to have come in contact with a reality whose inexhaustible depth, independence and power will permit it to manifest itself through his theory in ways even beyond his ken. He believes his theory is true, even without confirmations, but also and primarily because of the indeterminate range of future discoveries that he expects will issue from it.

Thus Polanyi sees the entire process of discovery, from initial investiture through the explanatory phase to the final commitment to its outcome, under the sway of what he calls the 'ineffable domain',¹⁹ which

could readily be one of Heidegger's more topological names for Being. Polanyi himself explicitly acknowledges the kinship between the pretheoretical know-how that he calls 'personal knowledge' and Heidegger's conception of *Seinsverständnis*.²⁰ Moreover, he after a fashion performs a Heideggerian kind of reversal when he espies, in and through the tacit skills, a tacit dimension of reality operative as the alpha and omega of science.

In Polanyi's account, the locus of science is clearly displaced from the image of science as method to that of science as a craft skill, an intellectual 'savvy' and tacit judgment which cannot be supplanted by method, precedes and grounds it, and provides it with its viability. Put most starkly, science viewed from this side of its coin is no longer a science at all but rather an art, a *techne* in the best Greek sense of an artistic know-how capable of evoking (bringing forth, producing) truth in and through an artwork. The scientist is made a kin to the artisan-craftsman steeped in his art, responsive to his material as he attunes himself to it through his tools, and sensitive to how they relate to human existence. This emphasis provides a profound concretization to the few remarks in *Being and Time* (section 69b) on the roots of theoretical behavior in praxis, which fundamentally constitute Heidegger's existential conception of science, i.e. science as an authentic mode of Being-in-the-world.

Moreover, Polanyi's account also serves to counteract Heidegger's harsh and bleak metaphysical conception of modern science as 'the absolute priority of method over its possible objects'.²¹ But Heidegger himself promotes a similar move in his lecture of 1954 entitled 'Science and deliberation', which I believe can be read with great profit in the light of Polanyi's exposition of the tacit dimension of science.²² For the aim of this lecture is to promote a deliberation on a certain 'inconspicuous state of affairs' latent in the heart of the matter of science. This incipient state of affairs which pervades the essence of the sciences is however by and large ignored and passed over in silence by them, since their natural orientation is more toward certified results and further progress in knowledge. Yet no matter how far removed the sciences seem to be from this incipient core, it is indispensable to them. They inevitably reside in it as a stream in its hidden source. Accordingly, the most profound way of thinking of science would seek to attune itself to this subliminal mooring in the facticity in which the sciences find their home. But such a 'grass-roots' thinking in proximity to the source would involve a violent reversal of the normal movement of scientific progress. Indeed, it would constitute a regress from the sciences to their presuppositional underpinning. Because of their orientation away from their source, and the momentum of their progressive movement, the sciences of their own power cannot make this leap back to the source from which they have sprung.²³ This is the task of foundational thinking.

Even more worthy of attention in the present situation is that the very spirit of modernity, seduced by the spell of certitude, guaranteed truth and assured progress, which encourages us to view science as a panacea, radically militates against such a reversal. More and more, scientific progress assumes the character of a forward project without a grounding facticity. Kant²⁴ thus captured the essence of modern science when he noted that 'a light broke upon all students of nature' when they realized that nature is best understood according to a project (*Entwurf*) of one's own making. Rather than subjecting ourselves to 'nature's leading-strings', we must force nature to answer questions of our own choosing. In this vein, Einstein spoke of the 'free-inventions' of hypothesizing and Galileo readily admitted that fictional idealizations such as 'freely falling body' and 'frictionless plane' constituted a veritable 'rape of the senses'.

Yet both saw the adventures of hypothesizing counterbalanced by the security and control of method. Among the new philosophers of science, Feyerabend has reacted so violently against the image of science as method and of its truth as a security blanket that he highlights the heady willfulness of science to the point of arbitrariness. He thus proposes an anarchistic image of science based on the single methodological principle of 'anything goes' (short of murder). In practice, this entails 'scientific' opposition to everything which is now accepted by the scientific establishment. In short, currently accepted facts must constantly be opposed by counterinductions from experience and accepted theories countered by the proliferation of alternative theories inconsistent with the accepted point of view, whereby one not only learns by his mistakes (as Popper maintains) but also deliberately proves all rules by seeking their exceptions. In as much as Feyerabend concedes the need for a certain measure of tenacity to already established theories, his recipe stops just short of the nihilistic extreme of turning scientific change into a Dionysian frenzy of activism. Though at times it may approach slapstick pandemonium, when the active interplay between tenacity and proliferation becomes pitched to its most tumultuous, so that the thick of the action appears 'unreasonable, nonsensical, mad, immoral . . . when seen from the point of view of a contemporary'.²⁵ Feyerabend's irreverent recipe of calculated willfulness and recalcitrance aims to turn science into the carefree abandon of a frolic. Against the image of the scientist as *l'homme sérieux* hard at work in the solemn and even sacred task of 'the search for truth', Feyerabend would locate the sources of scientific discovery as much in spontaneous play as in reasoned planning. Whence his 'plea for hedonism' which would change science 'from a stern and demanding mistress into an attractive and yielding courtesan who tries to anticipate every wish of her lover'.²⁶

But Heidegger espies a similar frenetic character to science precisely within the secure confines of its method. Willful projects continue to

proliferate through the fissioning of scientific disciplines into specializations, each of whom are in turn prolific in the production of results. Each specialty imposes severe limits upon itself and the kinds of questions it wishes to pose, thereby cutting itself off all the more from an awareness of its enabling ground. The advantage of this strategy of minimizing thinking is to maximize results, so that the overall effect of the multiplication of specialties is the accumulation of a vast store of detailed, technically useful information. Here we encounter the narrower technocratic image of science as research and discovery which is wholly compatible with what Nietzsche termed the triumph of scientific method over science. 'Research' in this sense is now Big Business. The proliferation in recent decades of the 'think tanks' of research institutions for various and sundry purposes suggests to what extent the 'knowledge industry' has replaced manual and machine labor as the most important productive force today. That the businesslike pursuit of knowledge is virtually open-ended while at the same time remaining systematic indicates how the security of method and the adventure of research can be interlocked in their progressive drift toward rootlessness. To paraphrase Victor Hugo, technical science has long sought a perpetual motion machine. It has finally found it . . . in itself.

This total mobilization of human talent as well as natural resources finds its most intense expression in the uninhibited will to power toward planetary domination through technology. By means of the power of technology, nature has been provoked into revealing hitherto unsuspected sources of electrical and nuclear energy. Recently, even outer space has been placed at our disposal as another resource to be exploited. So sure were our planners of the power of technology that the question was never whether we would land on the moon, only how soon and by what means. The new cybernetic sciences appear to know no bounds in the possibilities of planetary planning and the capacity to work our will upon the entire earth. It appears that man is now in a position to assume the role of unequivocal lord and master exercising dominion over the earth.

But is the technological will really a freedom without limits? The ecology and the energy crisis dramatically testify to the contrary. And there is science-fiction's recurring nightmare of the giant computer turning the tables and overpowering its masters. In numerous ways, the technological matrix is impelled by a will to total efficiency which factors in man himself to the point of total absorption, who is after all also a natural resource to be exploited for its energy and distributed to its most effective stations in the 'manpower' grid. Technology thereby takes revenge on man himself.

But in the Heideggerian perspective, all of these are but symptoms of a more radical limit to our freedom, a fundamental non-willing latent in the very will to will of the technological project. To acknowledge this

most extreme limit is to take the first resolute step toward displacing this seemingly free-floating project back to its most factitious roots. For we can always ask: What demands that we demand to the point of excess in the technological mode of existence? What provokes us to provoke nature resourcefully to the point of including our own resourceful selves? Perhaps we will then see that the thoughtless willfulness of exploitation is basically not of our own will. Our changing of the face of the earth is ultimately not of our own doing. We have long ago been led to the historical destiny of technology and can no longer turn back. No International Planning Commission or Committee of Scientists have done so, nor can they really hope to do so.

But we can turn our thoughtless willfulness around by first acknowledging the oblivion of its rootedness, as well as the oblivion of this oblivion, so that we might then come to terms with the flow of our current historical situation, what is taking place in it, the leeway it grants us and what we can start with it. This orientation of questioning thus aims to bring us 'to experience the call of a more original revelation' within and through the truth of technology, to espy the harbingers of a new setting in and through the scientific-technological world, to find new roots for life in such a world, to find ways of making ourselves at home in this world, so that, in one of Heidegger's favorite expressions, we may once again learn 'to dwell poetically upon this earth'. Accordingly, Heidegger clearly hopes that the backtrack into and through the metaphysical conception of science and technology will be propaedeutic to a more poetic conception.

One of its central tasks would be to elaborate a new sense of the naturality of nature in and through the artifacts of science and technology, 'to recast and recover the calculability and technicality of nature in the open mystery of a newly experienced naturality of nature'.²⁷ And perhaps the time is not so far off for such a development. The ecology crisis and energy crisis suggest certain limits to our sense of nature as universally manipulable, whether as a scientifically calculable system of forces or as a technological fund of resources, and accordingly evoke the need to let it be, to cultivate, conserve, foster and cherish the *Dasein* of our planet in a more responsive manner. One might also hope for a measure of a poetic sense of science and technology from the more explicitly artistic endeavors to use their materials – Heidegger might call these the 'earth' of science and technology – in the mobiles of constructivism, technological sculpture, film, perhaps even cybernetic music. Perhaps some day we may well learn to view, for example, synthesized plastics as no less natural than things found more directly in nature. Then there is the poetic-mystical strain in the Marxist tradition which sees the progressive naturalization of man through technology in mutual coordination with a progressive humanization of nature. Among others

in this tradition, Marcuse, an old student of Heidegger, looks toward the emergence of a New Science and New Technology in which nature and man would no longer be related in the mutual exploitation of master and slave but rather in the mutual liberation of communicating partners, precisely to the degree that technology pacified the forces of nature by liberating them from the brutality, ferocity and blindness which has made nature our antagonist from time immemorial.²⁸ Astounding as it may sound to our positivistically conditioned ears wary of all anthropomorphisms, this kind of suggestion is being seriously entertained by thinkers of the most diverse philosophical perspectives. For example, Mary B. Hesse's quest for a new form of objectivity for science prompts her to consider a more internal relationship between man and at least biological nature than an epistemology based on the subject-object relationship would normally allow.²⁹ Others have suggested that such an intimate indwelling in wholly new dimensions of nature is acquired in our habituation to the instrumental complexes of experimental science.

So there is no lack of signs of a vigorous quest for a new habitat for man in a new, more ecological sense of the naturalness of nature, a more historical and topological form of objectivity (*Sachlichkeit*), a less mathematical and more hermeneutical notion of rationality.³⁰ Even though science has been rendered thoughtless by the positivistic image of science, there appears to be no dearth of thinkers, scientists included, seeking to provide us with more imaginative images of a science more responsive to the most profound exigencies of the human situation. I have tried to suggest that Heidegger has blazed a trail which helps us to see how this proliferation of new images converges on the simple heart of the matter in which we live, move and are.

Notes

1 William J. Richardson, 'Heidegger's critique of science', *New Scholasticism* xlii (1968) 511–36. But this opening sentence of the article is moderated by a concluding paragraph suggesting how a philosophy of science could be elaborated within a Heideggerian framework.

2 This early lecture, 'Der Zeitbegriff in der Geschichtswissenschaft', is now readily available in the collection of Heidegger's major works from the period 1914–16. Cf. Martin Heidegger, *Frühe Schriften* (Frankfurt: Klostermann, 1972) pp. 355–75. This early lecture marks the high point of what I have called Heidegger's logical conception of science, as distinguished from his later existential and metaphysical conceptions. Cf. my essay, 'On the dimensions of a phenomenology of science in Husserl and the young Dr. Heidegger', *Journal of the British Society for Phenomenology* iv (1973) 217–34.

3 This is no longer quite accurate in view of the recent publication of the lecture course of 1927, in which philosophy itself is taken as the 'science of

being'. Cf. Martin Heidegger, *Die Grundprobleme der Phänomenologie*, volume 24 of the *Gesamtausgabe* (Frankfurt: Klostermann, 1975), pp. 15ff.

Heidegger and the physical sciences¹

Catherine Chevalley

Mathematical physics holds an important place in the corpus of Heidegger's writings. Though this is especially evident in the course of lectures he gave in 1935, which were published as *Die Frage nach dem Ding*, it also emerges from many other pieces. However, Heidegger never expressed his concern with physics otherwise than through remarks, hints that are more or less extended promises to come back to the topic on some other occasion, or through elliptical judgments and paradoxes. On the other hand, it is well known that from 1938 on, Heidegger emphasized that one should be aware that the crucial problem was the problem of the essence of technology. Science, in as much as it is characteristic of modern times, rests on the foundation of technology, provided one means by technology something other than applied science or mechanization. Rather, technology means the very project of representing the thing as that which perdures through change in order to subject it to calculation. At first sight it would seem that Heidegger never mentions mathematical physics in any other context than the one delineated by such an identification of science with the essence of technology.

Nevertheless, I would like to suggest here that the way in which Heidegger chose to question mathematical physics before 1938 provides a clue to the privilege he conferred afterwards upon technology and that it also explains certain surprising features of relevant passages in the lectures he gave in the year 1950. This interpretation is however based on the assumption that Heidegger changed his mind about the meaning of the natural sciences.

I shall start indirectly by pointing out a difficulty which seems to be purely circumstantial. The difficulty arises when Heidegger refers to a sharp difference between two periods of modern science. Heidegger hints at such a difference throughout all his works, starting from 1927 – when this difference actually emerges in the development of physics – up to

the 'Seminaires du Thor'. There is no need to comment upon each occurrence and it will be enough to quote the following section of the 1953 lecture, entitled 'Wissenschaft und Besinnung'.

This summary reference (it concerns the preceding pages) to the difference which separates the two epochs in modern physics makes it possible to see clearly where the change from one to the other is to be located: in the apprehension and the determination of the kind of objectivity through which nature lets itself be known. But, in the course of this transition from classical, geometrical physics to atomic and field theory physics what does *not* change is the fact that nature is assumed in advance to be responsive to the demands made of it, demands which are laid out in theoretical terms. In the most recent phase of atomic physics however, the object itself also disappears, with the result that both the subject and the object come to be subordinated to the subject-object relation which thereby becomes the determining factor: This is however an issue which we cannot pursue here in greater detail.²

One can find here three distinct assertions and my goal in this paper will be to elucidate the link between them. The first assertion is the simple statement that there is a difference between two periods of modern science. To identify them is an easy task since Heidegger makes it explicit on many occasions that he means the difference between classical physics, which was born in the sixteenth and seventeenth centuries and contemporary atomic physics, namely quantum mechanics, which appeared in 1925–7. However it is more difficult, and somewhat surprising, to read what Heidegger has to say about the nature of this difference: how are we to understand the modification of the 'objectivity through which nature is presented' and the way 'object and subject disappear' in atomic physics? Finally, it is even more surprising to notice that Heidegger, having stressed the fundamental significance of the difference, states that the difference itself vanishes in the face of something more important: that requisitioning of nature through which modernity receives its determination.

I shall therefore consider each of these three statements one after the other. My first assumption will be that the aim of the course of lectures which Heidegger gave during the Winter of 1935–6 under the title of *Grundfragen der Metaphysik* was to introduce the existence of such a difference between two specific kinds of mathematical physics. This entails a slightly unusual viewpoint which calls for justification. I will attempt therefore to show that the notion that a profound change occurred in the fundamental concepts of physics begins to act upon Heidegger's works precisely in 1935 and to such an extent that it becomes

the starting point of these lectures. This happens because Heidegger puts forward the question of a clarification of the foundation of classical physics as a necessity for the present time. We must be able to take the measure of our own continuing dependence upon these foundations in order to understand the change in our basic position with regard to what is.

I The positing of the difference: the question of the thing and the situation intrinsic to the natural sciences

The text of the 1935 lectures is divided into two parts, one of which is much longer than the other. The first part is called: 'Various ways of questioning about the thing' and serves as a kind of extensive introduction while the second part is devoted to 'Kant's manner of asking about the thing' and proceeds to analyse 'the philosophical determination of the thingness of the thing which Kant has opened up'.³ It has therefore been considered quite normal to take the 1935 lectures as a course on Kant. Even if attention is paid to Heidegger's insistence on the first law of motion and his much developed analysis of Galileo and Newton, this is interpreted as a consequence of the fact that the lectures address the 'Analytic of principles' in the *Critique of Pure Reason*.⁴

A closer examination of the Introduction reveals however that Heidegger actually proceeds the other way around, and that the decision to comment on Kant's doctrine of objectivity is governed much more directly by the guiding question formulated in the introduction and not with a view to simply completing his exegesis of the *Critique*.

What is this question? It is the 'question of the thing'. The Introduction assembled a number of different attempts to clarify the meaning of this question until a threefold discovery was made in §IX. On the one hand, when, on the basis of immediate experience, we ask 'what is a thing?', the answer runs in terms of a thing as the nucleus around which (or a substratum upon which) many changing qualities are grouped and we regard this as the foundation of our 'natural conception of the world [*natürliche Weltauffassung*]'.⁵ On the other hand, when we turn to philosophy, we see that this is what philosophy has been saying all along, at least since Plato 'and above all since Aristotle'.⁶ Notwithstanding the difference, it is also what Kant stated as a principle: 'all appearance (namely all things for us) contain the permanent (substance) as the object itself and the changeable as its mere determination, that is, the way in which the object exists'.⁷ And finally, we see that this conception of the thing yields the essence of truth provided one affirms, as has always been the case, that truth consists in the adequation of words to things, in the conformity of a predicate to a subject. But having made this threefold

discovery on a seemingly sound basis, Heidegger shifts to an entirely new kind of perspective, starting with a simple remark which consists in pointing out that what presents itself as 'natural' is always historical, and that therefore this essential determination of the thing has not been such for all time. There has been a discovery of the thing – a discovery which may have been made at the same time as the discovery of the proposition – and our task is now to question this historical tradition. From the recognition of the task there follows the choice of a 'middle way',⁸ represented by the Kantian determination, whose examination is therefore subordinated to the question posed in the Introduction.

But we still have not touched upon the reason why the question of the thing ought to be asked anew. At this point we have to pay attention to two successive indications offered by Heidegger.

In the first place, Heidegger links the *taking up* again of the question of the thing with a 'decision which has to be *taken*': 'We want to contribute to the preparation of a decision which may be formulated as follows: is science the measure of all knowledge or is there a knowledge in which the ground and limit of science and thus its genuine effectiveness are determined?'⁹

Is science the measure of all knowledge? This question is responsible for many characteristic features of the text. Let us mention just two.

It is responsible first of all for the restricted meaning Heidegger accords to the word 'thing'. A thing is 'that which can be touched, reached or seen, that is, what is present-at-hand [*das Vorhandene*]'.¹⁰ The reason why the 1935 lectures privilege this restricted meaning to the exclusion of any other ('In asking "what is a thing?", we shall adhere to the first meaning'¹¹) is that science pretends to be true knowledge about what is present at hand. For Heidegger, *Vorhandenheit* is the name we give to the 'mode of being of natural things'.¹²

In the second place, and more importantly, the question mentioned above is responsible for the way Heidegger introduces certain fundamental themes. I shall take the one example of the 'distinction between subject and object', a distinction which may be, as Heidegger points out, 'highly questionable'.¹³ The 1935 lectures take up this theme by bringing to light the inner breakdown of classical science's pretence at capturing the essence of the thing. The whole of the aporetic argument in the Introduction is pervaded with the description of this failure; the hopelessness of Cartesian ontology is demonstrated and this demonstration is conducted in the style of Pascal. 'Where are we to get a foothold? The ground slips away from under us'.¹⁴ Why does the ground slip away? Let us suppose that we want to go right to things. Things are always particular. However some things are exactly alike; in this case one can still distinguish them from each other with reference to place and time: 'the essential determination of the thingness of the thing to be this one

[*je dieses*] is grounded in the essence of space and time'.¹⁵ But then what are space and time and how are they linked together? 'Are space and time only a frame for the things, a system of coordinates which we lay out in order to reach sufficiently exact statements about things, or are space and time something else again (cf. Descartes)'?'¹⁶ In other words, what does physical science teach us concerning the thingness of the thing when it gets hold of it analytically by means of space-time co-ordinates? Nothing at all: one is left with the impression that 'space and time are only derivative realms, indifferent towards the things themselves but useful in assigning every thing to its space-time position'.¹⁷ But if the scientific object does not give me the thing, would it be conceivable to find it in the subject, in the ostensivity of the 'this'? However, even on this side we are not be able to learn anything about the kind of truth in which the thing maintains itself.¹⁸ Finally, the reason why I do not get to the thing either through the object or through the subject is because the distinction between subject and object is itself highly questionable, even though it has been a 'generally favoured sphere of retreat for philosophy'.¹⁹ Thus, by way of the internal disintegration of the traditional scientific apprehension of the thing, Heidegger arrives at his fundamental theme regarding the breakdown of the distinction between subject and object.²⁰

But why? Why should it be necessary to question the kind of knowledge which science claims to give us since we have long been aware of the difference between the positive sciences and philosophy?

Heidegger now tells us why it will prove necessary to pose this question again even though it appears to have been resolved both by science (the spatio-temporality of the object) and by philosophy (the truth of the thing as the conformity of the predicate to it). It is, as we have seen, because what is 'natural' is also 'and in a special sense, something historical'.²¹ To see the thing as the bearer of properties is to be the heirs of an ancient tradition. 'But why not leave this history alone?' since we feel at ease with this tradition and since, in any case, it is not going to make any difference to the functioning of electric trains. Why? For a quite specific reason.

If, for example, we make the effort to think through the inner state of today's natural sciences, non-biological as well as biological; if we also think through the relations which obtain between mechanics and technology to our own existence (*Dasein*), then it becomes clear that knowledge and questioning have reached their limits, limits which demonstrate that, as a matter of fact, an original reference to things is missing.²²

The decision to take up again the question of the thing in its historicity

(*Geschichtlichkeit*) thus seems to be related to 'the inner state of today's natural sciences'. What is at stake here is clearly something quite different from sheer curiosity about this state of affairs. Rather the question touches upon a change actually taking place in our basic position within the relation to what is. Or rather, says Heidegger 'more cautiously', it touches upon the 'beginning of a transformation', upon a 'change in our ways of questioning and evaluating, of seeing and deciding'. What are we to do? 'To determine the changing basic position within the relation to what is, that is the task of an entire historical period'.²³ Certainly, but at least we should take account of 'what holds us captive and makes us unfree in our experience and determination of things'.²⁴ What is it that ultimately holds us captive? It is the fact that some fundamental features of modern natural science have become 'a universal way of thinking'. Therefore, we must inquire about our basic relation to nature and, more specifically, about this fact, that a definite conception of the thing has attained 'a unique preeminence', namely, the thing as a 'material concentration of mass in motion within the pure space-time order'.²⁵ The historical question of the thing leads to suspicions concerning the unshattered pre-eminence of the 'determination of the thing as matter present-at-hand'.²⁶

It is thus possible to assume that the 1935 lectures were written in order to stress the need to elucidate the historical character of the determination of the thing which natural science generates when it claims to provide us thereby with a true knowledge of things themselves. Objectivation of the thing in the form of being present-at-hand has made us blind as has also the belief that the scientific *Weltbild* was universal. But which science? It is crucial to note that Heidegger speaks about a decision to be made *because* a fundamental transformation in our position with regard to what is, is making itself known today as a result of what is going on in the natural sciences.

In support of this interpretation of the 1935 lectures it is worth recalling that, some years before, Heidegger had already mentioned the connection between the dissolution of our basic position with regard to what is and the internal state of physics. Let us quote two passages, one from the book on the *Fundamental Problems of Phenomenology* (1927) and the other from the 1930 lectures *On the Essence of Freedom*.

In *Grundprobleme der Phänomenologie*, Heidegger stated clearly that there was a far-reaching contrast between philosophy and the positive sciences. Within the realm of the positivist experience of being, the ontological constitution of being is not accessible nor does it 'reach the level of conceptualization'. For this reason, the positive sciences can only 'dream about being'. They are not cognizant of what makes beings what they are, namely, the being relation, even though they do catch a glimpse of all this (without which there could be nothing like unveiling).

Heidegger recalls here the difference Plato saw between geometry and philosophy and he adds the further remark:

The history of all the positive sciences shows that only from time to time do they wake up and open their eyes to the Being of the very beings which they take as the object of their investigations. Today we are in just such a situation. The fundamental concepts of the positive sciences are undergoing a change. In the course of revising them, scientists have been obliged to go back to the original sources from which they were drawn.²⁷

The second passage I would like to cite is taken from the 1930 lectures *On the Essence of Freedom*. These lectures are also devoted to Kant, and especially to the connection which Kant establishes between causality and freedom. Section 15 offers a preliminary exposition of what is in question with the problem of causality in the sciences. Heidegger tells us yet again that 'the natural sciences and history have become more problematic than ever in their internal essence' and that 'there has never been a greater disproportion between the results regularly obtained and the uncertainty and obscurity which surrounds both the most fundamental and the most simple concepts and questions'.²⁸ Heidegger supports this statement with a discussion of causality in the 'new physical theories', a discussion founded on quotations from P. Jordan and M. Born, from which it transpires that 'the processional character of material processes has become problematic'.²⁹ In other words, the time of physics is no longer what it was. And here again one finds a reference to 'a shattering and an effective displacement of our entire being' with regard to which we

do not have the right (as philosophers) to neglect the new way of raising questions in contemporary physics by reducing them to an empirical material. For it could well be that this material gives us an indication of a novel and essential determination of *nature as such*.³⁰

What is the meaning of these two passages? It is that we are caught up in a transformation and a shattering of our basic position within being such that we cannot overlook the new determination of nature in the natural sciences – and that the natural sciences themselves have opened their eyes to the nature of the beings with which they are concerned. The 1927 and 1930 lectures thus anticipate the 1935 way of questioning: *what are we to make of the transformation of the thing into an object now that physics seems to call for a totally new way of determining nature?*

These two passages make it easier to understand why mathematical physics is given so much importance in the 1935 lectures, especially in

§V from the second part of the book where we find the Heideggerian version of §9 of the second part of *Krisis* (written about the same time). Heidegger uses very strong language to describe the decisive character he ascribes to the rise of modern science: 'a mutation of our *Dasein*', 'a unique passion . . . which finds its like only among the Greeks', 'a capacity to 'hold out in this mode of questioning',³¹ 'a liberation', 'a new experience and formation of freedom itself'.³² The greatness and superiority' of natural science in the sixteenth and seventeenth centuries, says Heidegger, was due to the fact that all the scientists were philosophers. Similarly today,

where genuine and creative research is being done, the situation is no different from that of three hundred years ago. . . . Niels Bohr and Heisenberg think in a thoroughly philosophical way, thanks to which they are capable of initiating new ways of questioning and, above all, of holding out in the questionable.³³

In other words, contemporary atomic physics could represent something of the same order as that which took place with the birth of modern natural science. It would engender, or reflect, a mutation of our *Dasein*. Provided that this 'same order' is not a simple continuation but rather proceeds from a more subtle analogy, the analogy which pertains between two fundamental ways of questioning about the mode of being of entities. The sciences awaken from their dream.

But since what is repeated is in reality, as we have seen, quite different, what is required by contemporary physics is in no way a new *Critique of Pure Reason*. Heidegger's intention in writing the 1935 lectures was certainly not to promote, even for the future, the need to take up again the Kantian question: *quid juris*. How then are we to understand his remarks if we concede that they do not proceed from simple curiosity and therefore do not represent the prolegomena for a foundational programme? I shall temporarily avoid this difficulty by contenting myself with a comparison: Heidegger's position here can be compared with that of Aristotle.

Aristotle – as we read in §19 of *Grundprobleme* – was the last of the great philosophers who was capable of vision and, even more important, who possessed the strength and patience needed to compel research to go back to the phenomena, to what is visibly given in the phenomena, by entirely disregarding wild and empty speculations, no matter how popular they might be.³⁴

II The modification of objectivity in contemporary atomic physics

Let us then concede that Heidegger possesses Aristotle's strength and patience. What was he likely to find by 'going back to the phenomena' and by questioning 'the inner state of natural science?' My second assumption will be that, in the early 1930s, Heidegger becomes aware of the fact that quantum physics is very different from the kind of physics which he has dealt with in his *Habilitationsschrift* in 1915, even though it comes out of the latter. For quantum physics involves a wholly new conception of the relation between time and motion. It is precisely this difference that Heidegger will call a 'transformation of the objectivity through which nature manifests itself'.

Shortly before 1935, Heidegger's attention was most probably drawn by a paper published by Werner Heisenberg in 1934 in the journal *Die Naturwissenschaften* under the title of 'Wandlungen der Grundlagen der exakten Naturwissenschaft in jungster Zeit'.³⁵ This paper had aroused wide interest – due also to the fact that Heisenberg had just received the Nobel prize – and was to provide the title of Heisenberg's first collection of non-technical papers.³⁶ Heidegger also met Heisenberg in the fall of 1935. As Carl Friedrich von Weizsäcker recalls: 'Someone suggested that Viktor von Weizsäcker and Werner Heisenberg should discuss the question of the introduction of the subject into the natural sciences in the presence of Heidegger; so we became Heidegger's guests for a few days'.³⁷ As Viktor, who was Carl Friedrich's uncle, was a biologist, it seems plausible to assume that this conversation was the occasion for the phrase quoted above: 'the inner state of the natural sciences, non-biological as well as biological'.

In many respects, Heisenberg's paper prepares the way for the 1935 lectures.

In the first place, Heisenberg affirms the difference between classical physics and quantum mechanics by stressing the fact that classical physics was a physics of the thing:

Classical physics was built on some fundamental presuppositions, which seemed to provide a self-evident starting point for all exact natural science and which therefore did not require any demonstration: physics dealt with the behaviour of things in space and with their evolution in time.

From there, one was led to the tacit assumption that there was 'an objective course of events in space and time independent of observation', and indeed still further on to the concept of an 'objective reality' based upon the interpretation of space and time as an immutable arrangement of things. Finally, the ultimate consequence of such a tacit universaliz-

ation of a region of experience (*Erfahrungsbereich*) was the construction of a scientific image of the world (*naturwissenschaftliche Weltbild*).

Heisenberg goes on to say that the primary consequence of the theory of Relativity and, even more so, of quantum mechanics, has been the breakdown of these presuppositions. The radical transformation of these space-time concepts and of the concept of motion has thus provided a 'new possibility for thought'. The question is whether physicists 'ought to renounce the very idea of an objective time-scale'. Heisenberg answers this question in the affirmative and mentions that, in consequence, the very notion of 'objective spatio-temporal processes' has become meaningless. What this means is that one now has to call in question the very way in which classical physics used to identify the thing with the object. The fact that quantum mechanics does not deal with objective spatio-temporal processes amounts to the recognition that it is no longer possible to perceive a phenomenon along the lines of what used formerly to be called 'objectivity', that is, the phenomenon as it lies there in front of me, undisturbed by observation and such that I, the knowing subject, have the ability to construct a representation of it in ordinary space and time.

This failure of the basic presuppositions of classical physics leads, in Heisenberg's view, to the paradoxical consequence that it is now impossible to develop a *Weltbild* or a *Weltanschauung* based on the kind of knowledge furnished by physical science. If we consider how these new dispositions impact upon 'the human situation', we have to conclude that we must 'replace the twentieth century *Weltbild* with something different'.³⁸ In other words, we must now leave the Cartesian *cogito* to adopt the itinerant stance of a Columbus. We have to 'have the courage to abandon entirely the lands we have known up to now'.

Turning to the meaning of such a transformation from the viewpoint of a 'theory of knowledge', Heisenberg stresses the need to clarify the a priori character of the Kantian forms of intuition and the categories. By changing the structure of physical theory, contemporary physics has undoubtedly overturned the very basis of this comprehension. However, 'the question of determining how to judge to what an extent this idea still remains fruitful in those more extended spheres which were essential to Kant has not yet been thoroughly discussed from within this new perspective'.

With this brief description of the main arguments contained in Heisenberg's paper, one can get some insight into the profound affinity which prevails between Heisenberg's question and the perspective adopted by the 1935 lectures. In particular, the connection between the impossible *Weltanschauung* and the suggestion that Kantian criticism has become problematic in a new way is especially important. If one recalls that, from Heilmholtz to Planck, the 'philosophically-minded physics' in

Germany has been essentially and explicitly Kantian in inspiration, it becomes clear that any German physics would interpret as a conceptual revolution the suggestion that the foundations of Kant's theory of knowledge ought to be re-examined.³⁹ The 1935 lectures take up this very suggestion, since Heidegger attempts to establish a connection between a critical examination of the Kantian doctrine of objectivity and an historical evaluation of the universalization of forms of thought derived from natural science.

For Heidegger, the meeting with Heisenberg certainly involved coming to terms with an extremely powerful, though aporetic, conception of the transformation of objectivity, and of the perception of Nature in atomic physics. Before moving on to the most fundamental level of this confrontation, the questioning of the essence of motion, I shall introduce a point of comparison by referring to a text which Heidegger had written long before, namely his *Habilitationsschrift* of 1915 'Der Zeitbegriff in der Geschichtswissenschaft',⁴⁰ a text which is hardly 'Heideggerian' in as much as it antecedes by quite some time the discovery of that temporality which belongs to Dasein, but whose influence pervades many of Heidegger's works thereafter in a variety of ways.

Though this is not apparent from the title, in the first part of this text Heidegger deals with the concept of time in the *physical* sciences. The central question is that of defining 'along what path we may most surely obtain knowledge of the logical structure of the concept of time in the historical sciences' and proceeding from there of the concept of 'time in general'. This path has to be a regressive one. One must go back from 'the structure of the concept of time in history to its function in the history of science' and this function must be rendered intelligible on the basis of what the 'history of science aims at'. Heidegger tells us that we should start from the 'science of history as a fact and study there the function of the concept of time, and on that basis go on to determine its logical structure'. But in order to render this clarification still more precise, it would be as well to follow this path in the first place with the case of natural science. In other words, it behoves us to determine first the objectives of natural science, then the function of the concept of time, before finishing up with the structure of physical time.

With regard to the aim of natural science, Heidegger asks: what is that fundamental tendency in physics which has revealed itself ever more significantly from Galileo up to the present time? This fundamental tendency was already exhibited in the new method which consisted in uniting a multiplicity of phenomena by way of a law.⁴¹ But 'modern physics did more'. In the course of its further development it accomplished another essential move in the direction of a unification of the objects of physics,⁴² with the result that we now find ourselves confronting only two main branches of physical science: mechanics, as the

theory of matter, and electrodynamics, as the theory of ether. This division also, according to Heidegger, created a 'deep conflict' between the 'mechanical *Weltanschauung*' and the 'electrodynamical *Weltanschauung*'. However, in Planck's view – and Heidegger quotes extensively from Planck's book of 1910⁴³ – the concepts of space, time and substance which serve as the fundamental concepts for mechanics are just as essential in electrodynamics, and therefore it is possible to hope for a reconciliation of these two branches of physics within a general dynamics. Heidegger tells us that this indicates very clearly what the aim of physical science might be. 'This aim is the unity of the physical *Weltbild*,⁴⁴ the reduction of all phenomena to the fundamental mathematical laws of a general dynamics, to the laws of motion of a definable mass-point.'

But now, what function does the concept of time have in this physics? Since it is the aim of physics to exhibit the law-like character of motion with the utmost generality and since motion takes place 'in' time – whatever this 'in' actually means – motion and time have to 'cohere' together in some way or other. They have to display that 'affinity' which Galileo used to talk about. Such an affinity appears through the essential part played by the process of measurement. In order to measure the position of a mass-point in space one has to assume that there is a fixed point and then one has to set up three co-ordinate axes. In order to analyse the motion of a point along a curb it is necessary to associate each second marked off on the clock with three measures, that is, three numbers which give the position of point *P* at instant *t*. 'Let us now give *t* all subsequent values; in as much as they are continuous functions of *t*, the co-ordinates will provide complete knowledge of all the positions. This knowledge of all the successive positions we call movement.' The intuited qualities of phenomena are thus deleted (*ausgelöscht*) and transformed (*gehoben*) into the mathematical. The function of the time concept is to allow for such a process by making possible the very act of measurement.

Thus the structure of the time concept becomes visible. Time acts in physics as an independent variable which guarantees the uniform flux of continuous motion. The only relation that exists between time points is that they are arranged in a successive order which coagulates time itself and makes it something which can be measured in the same way as a surface. 'Time has been turned into a homogeneous arrangement of positions, into a scale, into a parameter.' Time has been thought in terms of space.

By comparison, Heidegger finds a widely different view of the situation when he reads papers by Born or Jordan or when he talks to Heisenberg.⁴⁵ The new view breaks with the essential features mentioned above concerning both the aim of physics and the function of the concept of time. Consequently, in the 1935 lectures, Heidegger follows Heisenberg

in stating that 'it is no longer possible to find a foundational unity in the sciences and that such a unity is neither needed nor even in question'.⁴⁶ And so when Heidegger takes up again, with a view to developing further than in 1915, his analysis of the first law of motion, he takes care to specify that he is talking about 'Newtonian physics'⁴⁷ – whereas the 1915 *Habilitationsschrift* referred to physics in general.

Why? Why has the emergence of quantum theory transformed the fundamental concepts of physics to such an extent that Heisenberg is bound to say that an atom can no longer be described as a material thing situated in space with a definite evolution in time, and moreover that objective space and time no longer exist and that the very idea of a *Weltbild* has become anachronistic?

Many different aspects of quantum theory ought to be taken into consideration at this point, like the disappearance of the independence of the object, the non-neutrality of the subject or the way classical physics, the physics of the thing, is retroactively referred to ordinary language. Many of these features are consonant with the 1935 lectures; we may mention for instance the fundamental iconoclasm of physics, its renunciation of images; or the fact that, from 1925 on, quantum mechanics identifies 'classical' physics with an extrapolation of the intuitions incorporated in ordinary language (in Heidegger's words: the thing is defined through the essence of the proposition), while the quantum object itself remains inexpressible in this language; or finally the fact that the Copenhagen interpretation comments quite directly on the disappearance of the mirror relationship between subject and object. However, I shall restrict myself here to one feature which seems to be the most fundamental, namely, the requisitioning of the traditional determination of the essence of motion.

Quantum mechanics only emerged once physicists abandoned the classical concept of motion and went back to the more basic level of kinematics. No science forsakes a fundamental concept without being forced to do so. Therefore it took twenty-five years for physicists to admit that it was impossible to maintain the classical concept of motion. In 1924–5, that is, at the end of just such a twenty-five-year period, atomic physics was characterized by an absolute conceptual gap between the new data and classical concepts, and it became clear that the most primitive concepts would have to be redefined. Thus in July 1925 Pauli wrote to Bohr that 'it is not the concept of energy that has to be transformed first of all but rather the concepts of motion and force'.⁴⁸ Bohr also confided to the experimentalist H. Geiger that 'the difficulties we are encountering make it entirely impossible to maintain the ordinary spatio-temporal description of phenomena'.⁴⁹

In 1925, the quantum mechanics created by Heisenberg, Born, Jordan, Pauli and Bohr might be briefly described as a theory which provided a

law for the motion of an electron in the hydrogen atom,⁵⁰ the algebraic formulation of which established a correspondence between infinite matrices and those classical quantities which were a function of time. In addition it was also necessary to give up applying such classical concepts as position, velocity, trajectory, energy and causality⁵¹ to the electron. The 'three-man paper' by Heisenberg, Born and Jordan, entitled 'Zur Quantenmechanik II', states that 'the motions of electrons cannot be described in terms of ordinary concepts of space and time; a characteristic feature of the new theory is the modification it imposes upon kinematics as well as upon mechanics'.⁵²

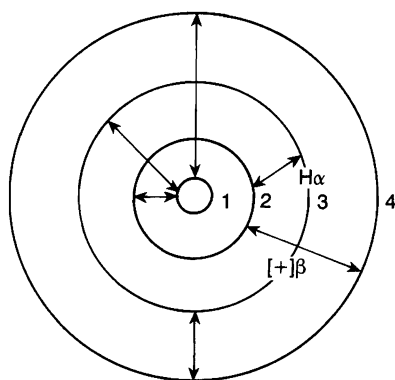

Why was such an abandonment of the classical concepts necessary?

In the first place, as indicated in Planck's statements, quoted by Heidegger in 1915, atomic physics sought to unite mechanics and electrodynamics. The crucial problem was to understand the inner constitution of the atom, once it was admitted that this constitution was essentially electric, i.e., the atom was composed of a definite number of electrons.⁵³ The idea was to give an account of the existing knowledge about the atom, its chemical and physical properties, which would be based on a mechanical law of motion for electrons, namely on an electrodynamics. Ideally, one would obtain a planetary atomic model. Thus the unification of sky and earth, already accomplished by modern physics in the seventeenth century would be achieved over again on the side of the other infinite.

In 1913, the so-called Bohr atom already illustrated the failure of such a hope and demonstrated that it was impossible to establish a unique lawfulness for all motions. The Bohr atom was like a drawing that repudiated its own striving toward figurative representation.

The Bohr model for the atom brought about a recognition and synthesis of a given number of restrictive conditions: (a) the electron contradicted electromagnetism since the atom was not constantly losing energy (in spite of the accelerated motion of the electron); (b) the electron contradicted mechanics since, though there obviously existed a nucleus and therefore some gravitational structure, the atom was nevertheless stable within collisions (there was a fundamental state). Consequently: (c) the only thing that one could write down was an equation for discontinuous energy transfer. One could have no knowledge whatsoever of what actually 'happened' between two stationary states. The very notion of an evolution of the motion of the electron was deprived of meaning.

Finally, 'in desperation', Bohr was led in 1924 to renounce any kind of representation of atomic phenomena in space and time. Matrix mechanics was able to give a partial solution to these difficulties only because Heisenberg, as Bohr used to say, 'got rid of the classical determinations of motion'.⁵⁴ The classical analytic conception of motion, as the description of a continuous curb in the space of ordinary geometry, was

Bohr model for hydrogen atoms in simplified form
(with circles instead of ellipses)

Diagram taken from H. A. Kramers and H. Holst, *Das Atom und die Bohrsche Theorie seines Baues* (Berlin: Springer, 1925). Bohr for his part was opposed to any figurative representation of his atomic model.

Numbers 1, 2, 3 and 4: correspond to the stationary states of the atom. Arrows represent the spectral rays of the hydrogen atom. Circles, or stationary orbits, indicate the discontinuous series of the values given by the energy of the atomic system. Between orbits, the electron makes a transition or a 'quantum leap', which cannot be determined.

replaced by a quite different formalism and one had to let go of the notion of a trajectory. The concept of an object changing places also turned into an empty concept, since one could only calculate the probability that a given physical system would be found in a certain state in the spatial configuration.

Given the situation of physical science as Heidegger discovers it between 1927 and 1935, phenomena cannot be thought any more along the lines of the fundamental concepts of traditional ontology: permanence, continuity, substantiality, distinguishability. . . . Heidegger acknowledges this fundamental transformation and he cannot but view it against the background of the history of Western metaphysics. The fact that quantum mechanics conceives of 'nature' otherwise than through an underlying presence has to lead to a questioning of the Aristotelian *Problemstellung* of οὐσία, closely connected with the determination of time as the measure of motion.

Indeed, since Aristotle, the 'paradigmatic mode of being for ontology', namely, the kind of being which serves to 'decipher the meaning of being as such' was Nature, as an underlying being-present.⁵⁵ With regard to the essence of motion, 'philosophy has not progressed one single step since Aristotle'⁵⁶ and with regard to the question of the Being of being, the so-called 'return to the Ego' in modern philosophy has only led to the reinforcement of this same interpretation, since Dasein was thought

of as *res cogitans* on the model of *res extensa*. Even Kant, though he understands perfectly well that it is impossible to conceive of the 'I' along these lines,⁵⁷ maintains the privilege of an underlying being to such an extent that he always defines nature as the object of mathematical physics and that his concept of the thing-in-itself implicitly reasserts the 'traditional ontology of an underlying presence'.⁵⁸ Kant 'fails to question the thingness of the thing'.⁵⁹ Is it not precisely Heidegger's own discovery to have found in this kind of being that we ourselves are a mode of being which is that of existence and not of an underlying presence? But if such is the case would it not be plausible to find a 'parallel' discovery on the side of physics – of a physics which keeps its eyes open and which questions the essence of motion and therefore also the essence of Being – a discovery which would lead us to determine nature otherwise than as the set of subsisting entities? How are we to think the apparently final repudiation (obvious 'in the most recent developments in atomic physics') of the connection between permanence, *extensio* and substance?

III The difference vanishes: atomic physics and modernity

Heidegger does not however ask this question. For him, the difference between 'classical' physics and 'contemporary' physics is certainly decisive and touches upon the 'objectivity which manifests itself in nature' because it promotes a new conception of time. Still, this difference vanishes. Its suppression is easily seen in the style of most of the passages in which it is mentioned, passages which mark a contrast between the decisive character of the difference and the assertion that, for all that, it counts for nothing in the face of something even more essential. Why?

At this point it seems obvious that Heidegger, who was dealing in 1935 with a 'decision to be taken', makes his decision in the 1938 lecture, 'Die Zeit des Weltbildes', in which he analyses the meaning of the expression 'modern times'.

What is modernity? Heidegger enumerates five essential features of modernity but he only pays attention to the first: 'we shall restrict the question to the first phenomenon mentioned, namely science' – though Heidegger actually only takes mathematical physics into consideration. He then states that it is his aim to 'touch upon the metaphysical foundations of science in as much as it is *modern science*'.⁶⁰

What, then, is modern science? It is characterized in the first place by the fact that research (*Forschung*) fastens upon one specific region of being. Here Heidegger takes up his former remarks about the mathematical project of classical physics: nature is defined as the set of spatio-temporal motions of various centres of gravity, where motion means change of place. Modern science is also characterized by the fact that

its method seeks to fix variations within a framework of constant changes, i.e., by furnishing scientific laws governing processes. Here the 1938 lecture makes extensive use of the 1915 *Habilitationsschrift*. Finally, a third feature of modern science consists in the organization of research in institutes and the birth of a new type of man, 'the researcher engaged in research programmes' rather than in questioning.

What conception of being is proper to this modern conception of science? Being has to become an object. Nature has to be 'forced' and History has to stand 'still'.⁶¹ Also, the search for objectivity obeys a conception of truth which identifies truth with the certainty of representation. In other words, following Descartes, man must become the subject. What follows from these two transformations? The formation of a *Weltbild*. 'With the triumph of the *Weltbild*, there follows a decisive assignment with respect to being in totality. The being of being is henceforward sought and discovered in the being-represented of being'.⁶² Instead of talking about the philosophical conceptions of modernity, it would be better to say that modernity is defined by the invention of new conceptions of the world. 'Now the world as such becomes a mental construction. This is what characterizes and distinguishes the reign of modernity'.⁶³

Let us return to what was said earlier about the specificity of atomic physics in Heidegger's view. The object disappears, the subject disappears, and what emerges is the question of their relation. It follows therefrom that it is no longer possible to form a *Weltbild* based on atomic physics. Being is no longer conceived in accordance with laws governing change within a spatio-temporal process. Strictly speaking, *if modernity is what Heidegger said it was in 1938, quantum physics does not belong to modern physics*. This is not however the conclusion Heidegger draws when he repeatedly confirms that nuclear physics, or particle physics, remains within the realm of modern physics.

But perhaps this contradiction is only apparent. If quantum physics remains within modern science, this has to be because a crucial issue remains unchanged, despite the revision in the fundamental concepts and in the essence of motion. This crucial issue is the problem of technique, namely, the problem of the calculative projection of nature. There are at least three reasons why Heidegger wanted to insist upon this point and therefore decided to retain atomic physics within the realm of modernity.

A first reason can readily be seen in the very interpretation which Bohr and Heisenberg tried to work out. The major thesis characteristic of this interpretation is that in quantum physics one had to make use of classical concepts because there are no specific quantum concepts that might represent the essence of the object. No quantum concepts means: no ontology in the traditional manner, no transparency of the 'quantons' relative to ordinary language. All the same, one has to do physics and

to communicate the results of experiments (traces of electrons in a cloud chamber, impacts on photographic plates, etc.). But one should be aware that concepts such as these only serve as metaphors. Consequently, the situation remains unchanged. Language is employed to fix the variation of representations and remains within the sphere of the calculable.

A second reason has to do with Heidegger's pessimism concerning the readiness of science to stay the course. Already in 1927 Heidegger wrote that the awakening of natural science would not last: The sciences have begun to dream again. . . . One cannot but be ill at ease, seated on a powder barrel and knowing that the fundamental concepts in question are only worn-out opinions and that everyone wants peace and quiet'.⁶⁴ This was in 1927; and indeed as soon as the fundamental problems of quantum mechanics had been solved, the only physicists to remain seated 'on the powder barrels' were the founders of the theory. Other physicists went on operating as in 'modern physics', looking for ultimate components, breaking up, dividing, confident that they would find the things themselves, calculating, constructing an image of the world. Today, more than ever before, we find theories proposing some 'grand unification', theories striving for the unity of a physical *Weltbild*.

The third reason is that Heidegger himself certainly wanted to take seriously the question: how are we to think through the present situation in the natural sciences? I said before, apropos of the 1935 lectures, that Heidegger refers the difference between the two physics to a transformation of our basic position within what is. How are we to determine what is essential? Many roads are open and still remain so even today, provided one pays special attention to the locus where the most violent conflicts over quantum mechanics still abound. Should we look for an ontology which would be the contemporary equivalent of the Cartesian ontology? Or should we not rather turn our attention to theories of knowledge, in the manner of the neo-Kantians? Or should we be primarily concerned with what affects us most directly, that is to say, modern science, a science which, ever more in the 'atomic age', is directed toward the ideal of an appropriation of Nature and of man? By addressing the question of technology, in as much as technology already formed the essence of modern science at the time of the emergence of mathematical physics, Heidegger chooses the third road. Between the seventeenth century and Heisenberg's physics what disappears in fact is the 'Cartesian' ontology, not the examination of being from the standpoint of calculation. Therefore, whatever the force of our questioning with regard to the objectivity of nature, this questioning (assuming always that it remains alive) is less *urgent* for Heidegger than that which bears upon the persistence of modernity in our life.

And so we bring to an end the detour announced at the beginning, that is, the detour involved in the analysis of interpretative problems

connected with those passages in which Heidegger discusses the difference between classical physics and atomic physics. This detour has allowed us to suggest that one of the most important motives underlying the composition of the lectures of 1935 was the need to bring to light the Kantian objectification of the thing in order that we should be in a position to know what it is exactly that we now have to give up. Heidegger regarded the difference between the two physics as of decisive importance in the history of metaphysics since he interpreted it as a modification of the objectivity of nature which was previously conceived along the lines of subsisting being. At about the same time, Cassirer, the Vienna Circle, even Husserl himself also tried to understand the philosophical significance of quantum mechanics. However, Heidegger went further by abolishing the very difference which he had at first considered so decisive. My hypothesis is that the predominance of technology in Heidegger's work dates from the moment when he decides to say that physics, no longer capable of producing an ontology in the traditional sense, now leaves us completely free to decide what we want to make of nature. From the standpoint of any attempt to comprehend Heidegger's work, this hypothesis has the advantage of possibly resuscitating – and this is all I have tried to do – an angle on the genesis of this decision which has not hitherto been closely examined. This may not only help us to clarify the genesis of Heidegger's own approach but, more importantly, it may help us to understand those philosophical aspects of quantum theory which are linked to the collapse of the very foundations of classical physics.

4 The tendency to see the 1935 lectures as a course 'on' Kant with a general introduction added at the beginning seems to be associated with the idea that the lectures which Heidegger had formerly given on Kant exhibited an essential deficiency since they did not comment on the 'Analytic of principles'; instead, Heidegger had privileged the 'Transcendental aesthetics' and the 'Schematism' and he had stubbornly refused to admit that the *Critique of Pure Reason* could be a theory of knowledge. In fact however, a new perspective on Kant cannot be found in the 1935 lectures. Heidegger repeats himself frequently and repetitions are even to be found in a comparison of the 1935 lectures with the 1930 book on the essence of freedom, where we already find an analysis of the 'Analogies of experience'. Moreover, and this is the critical point, the confrontation with the 'metaphysical centre' of Kant's work is constantly referred by Heidegger to the leading question of the Introduction. For similar reasons it seems unsatisfactory to account for the 1935 lectures on the basis of a more or less explicit competition with Husserl who had been concerned with these issues not only in the *Ideen* but also at the beginning of the 1930s. Certainly, a comparison would be most fruitful. For instance the lectures given by Husserl in Belgrade in 1936 (also *Krisis*, 1–27) deal with the interpretation of the beginnings of modern science and modern philosophy and with the meaning of Kant's philosophy from the standpoint of an 'historical and critical regressive meditation' intended to 'prepare the way for a decision.' However, Heidegger does not, in my opinion, concentrate on these themes simply on account of his confrontation with Husserl but also in virtue of his own interpretation of the contemporary situation in the natural sciences in as much as this situation invites a reassessment of certain questions which he had already taken into consideration in the 1935 lectures.

10 FD, 4.

11 FD, 5. Heidegger distinguishes between different meanings of the word 'thing'. One can think of something in general 'every affair or transaction, something that is in this or that condition, the things that happen in the world, occurrences, events'. Or one can use the word 'thing' as in philosophy, having in mind, for instance, the Kantian distinction between the 'thing-in-itself' and the 'thing-for-us' or more generally thinking of anything that is a something and not nothing. Or one can just point to the meaning of the word in ordinary language. A thing is a piece of wood, a rock, a knife, an apple, spruce, lizard, wasp . . . it can be small or big, inanimate or animate, useful or just something to be looked at. But it will not be a number, or a word. It will not be said that the number 5 is a thing and everyone distinguishes between the word 'house' and the thing house. This last meaning is the restricted meaning which Heidegger takes into consideration.

16 *FD*, 13. Here we have again the piece of chalk already mentioned by Heidegger on other occasions and especially in the 1930 lectures on the essence of freedom, relative to his commentary of Book Θ of Aristotle's *Metaphysics*. Indeed the piece of chalk features here like a pastiche of the Cartesian piece of wax: let us break the chalk, Heidegger says, let us dissolve the chalk. Where is matter? Space is not in the chalk nor is it outside the chalk. And where is time to be found on the clock?

17 *FD*, 13.

18 Heidegger does not emphasize the problem of the subject here. One also notes his elimination of any analysis of instrumentality. The standpoint of Dasein certainly does not dominate. It is worth recalling that the 'turning point' in 1929 amounted to a decision to account directly for the historicity of Being. However, I would also like to emphasize the way in which Heidegger gets rid of the perspective of the analytic of Dasein to the benefit of a critical examination of the traditional metaphysical foundations of science.

19 *FD*, 21.

20 Heidegger frequently states that his approach in the 1935 lectures is independent of any presuppositions either about science or about philosophy. He 'forgets' all his former conceptions of what metaphysics might be and simply defines metaphysics as this procedure which entails falling into a well, a procedure which allows him to bring to light a 'pure' question: what is the thingness of the thing?

35 *Die Naturwissenschaften*, 22 (1934), 669-75.

36 Up till then, Heisenberg had addressed a more restricted audience, namely, the physicists who were immediately concerned with the problem of the interpretation of quantum theory. Heidegger does not quote this 1934 paper by Heisenberg in the 1935 lectures but he frequently refers to it in later writings.

37 C. F. von Weizsäcker, 'Rencontres sur quatre décennies' in *Martin Heidegger* (Paris: Ed. de l'Herne, 1983), 156.

38 At this point in his argument Heisenberg pays considerable attention to the historical analysis of the gradual rigidification of the image-of-the-world which followed the liberation represented by the discovery in the sixteenth century of

a new realm of reality (*Wirklichkeit*) and by the establishment in the seventeenth century of deductive philosophical systems like those of Descartes and Spinoza. From the very first, he adds, these systems forgot that any knowledge of Nature as a machine was itself a product of man's representative power. Later this way of thinking became extended universally on the basis of the limited sphere of rationality proper to classical physics. This entailed a separation between science and the other aspects of life and we have now become prisoners of such a division.

39 Far from being strict Kantians, Helmholtz, Hertz or Boltzmann considered various local transformations of the concept of representation (*Vorstellung*) and of its different specifications. But the touchstone of criticism had remained, namely, the programme of a metaphysics of nature based on universal laws of thought which were partly derived from the 'universality and necessity' of the laws of nature exhibited in Newtonian physics.

40 *FS*, 355.

41 Heidegger exemplifies this by a thorough examination of the law of gravitation in Galileo's work and he emphasizes the fact that this approach abstracts from any considerations relative to specific bodies.

42 On the one hand, says Heidegger, physics incorporated acoustics and the theory of heat into mechanics. On the other hand, it incorporated optics, magnetism and the theory of thermal radiation into electrical theory (Fourier-Boltzmann and Maxwell-Planck). It is worth recalling that Planck's 'theory of thermal radiation' (1900) was the occasion for the introduction into physics of the idea of a discontinuity in the exchange of energy – even though this was not Planck's intention. This move is always represented as the birth of quantum mechanics.

43 Max Planck, *Acht Vorlesungen über theoretische Physik* (Leipzig: S. Hirzel, 1910). At this time Planck was desperately trying to resist the growing tendency to introduce discontinuity into the structure of radiation, to the point of proposing 'Planck's second theory' in accordance with which only the mechanism for the absorption of radiation by the atom is to be regarded as a discontinuous process, the emission itself being treated as continuous.

44 This expression is the very title of a famous paper by Planck, 'Die Einheit des physikalischen Weltbildes', *Physikalische Zeitschrift*, 10 (1909), 62–75, in which Planck sharply criticizes the ideas of Ernst Mach.

45 This might seem surprising, first, since in 1915 Heidegger adopts Planck's position and also quotes Einstein. However, it should be mentioned that in many respects quantum mechanics was developed in opposition to Planck's views whereas Relativity theory, for its part, remained a 'classical' theory from the standpoint of the description of phenomena. In 1930, Heisenberg remarks in his Chicago lectures that 'Relativity theory still meets the traditional demands of science since it allows us to divide the world into subject and object and to apply the principle of causality'.

50 Hydrogen has only one electron. All attempts to formulate laws of motion for atoms of more than one electron failed up to the 1927 synthesis of matrix mechanics (Heisenberg-Born-Jordan) and wave mechanics (Schrödinger).

51 Causality is here defined in connection with the formalism of differential

equations as the possibility of linking together, by means of continuous laws, a set of numbers describing the initial conditions of a system and another set of numbers describing its final conditions.

52 M. Born, W. Heisenberg and P. Jordan, 'Zur Quantenmechanik II', *Zeitschrift für Physik*, 35 (1926), 558.

53 Since the 1890s, the atom lost the legitimacy of its Greek name since it was now discovered to be divisible. Moreover, the inner structure of the atom was thought to be electrical. In other words, it was assumed that the atom was pervaded by positive and negative electricity. Physicists possessed three kinds of data about atoms: data relating to the chemical and mechanical stability of the atom, and spectroscopic data, that is, photographs of the radiation emitted by atoms in an excited state. The question was, how to derive this data from a law of motion of the constitutive components of the atom, that is, the electrons. Electromagnetic theory was expected to provide a dynamic which would make it possible to account for all the new experimental data.

54 Quantum mechanics was essentially worked out in the course of three years – 1925, 1926, 1927. In 1927, Bohr suggested the formulation of new conditions for the description of phenomena in physical space. While classical physics went on connecting representations in space and time with the principle of causality, quantum mechanics was forced to disjoin them. In other words, if the conditions for the definition of a system were fixed by describing its initial state (with the help of the ψ function) any possibility of representing the final state in space and time (there will only be a probability of any such representation) had to be given up. On the other hand, if it was the conditions for the observation of the system which were fixed, then the indeterminacy conditions forbade any simultaneous knowledge of the classical parameters (for instance, position and momentum) – which would then make it impossible to apply the principle of causality. The choice is thus between 'deterministic' equations which do not attempt to describe the actual reality of the system and conditions for actual observation of the system which have to forego any deterministic description. Nothing of this kind is to be found in ordinary space and time.

On the origin of nihilism – in view of the problem of technology and karma

Akihiro Takeichi

I

The fundamental form of European philosophy is metaphysics, which Aristotle called 'first philosophy'. First philosophy is 'the study of being as such' as well as a 'theoretical investigation of the primary origin and cause'. It would seem that these two different definitions are merged by positing the eternal unmoved mover which, as pure form, is the purpose of all beings and their movements. In this regard, God *qua* eternal unmoved mover is not simply the highest being (*das Seiendste*), but can serve as the primary origin of all beings by being the ultimate purpose and thereby the good. That is, because this being assumed the characteristic of the good, Aristotle was able to unify two definitions, 'the study of being as such' and 'the theoretical investigation of the primary origin and cause', by positing the Divine which is after all only a being in spite of being the highest.

However, this notion had already been established as a central feature of Western metaphysics when Plato sought the ultimate source of being in the idea of the good, which is the idea of all ideas. This character became all the more dominant from the medieval age onward when the Christian God with its ethico-religious character of love and justice was introduced into philosophy.

II

Consequently, when Nietzsche exclaimed 'God is dead', this did not simply mean the death of the Christian God. It also meant a collapse of the god of metaphysics, that is, the ultimate good posited as beyond all beings and as bestowing purpose and order to the totality of beings.

Nietzsche refers to this death of God by saying, 'The ultimate value is deprived of its value'. This, he claims, is the essence of European nihilism. According to this interpretation, the death of God as the collapse of the metaphysical world is interpreted in terms of value, which is a modern perspective. As a result, prior to his death God is already deprived of his beingness (*Seiendheit*) as the highest being, and thus he becomes simply a 'value' which is appropriate for something.

Two important problems emerge from this. One is that God is relativized by the interpretation in terms of value, as we have just seen. Value is value insofar as it bears a value for something in a given circumstance. This 'something', as in 'for something', is generally speaking a human subject. To use Nietzsche's expression, it is 'life' or 'will'. Consequently, God came to be regarded as a value for life, that is, a condition for the will. A condition is appropriate as a condition only in a given circumstance. Therefore, God cannot but die in a circumstance where the condition, God, is inappropriate and valueless for life.

What is the circumstance that has rendered the condition, God, valueless for life? It is the invasion of nihilism. But to respond in this manner is tautological insofar as we interpret the essence of nihilism as the death of God and the devaluation of the highest value. Thus, in seeking the origin of nihilism the answer to this question should be sought by determining the intrinsic cause of life itself which has rendered God, the condition for life, valueless.

But is this kind of search not already a thinking within a nihilistic circumstance? For insofar as we question the intrinsic cause of the appropriateness or inappropriateness of God regarded as the condition of life, God is not regarded as necessary for the life in essence. Therefore, life becomes primary, and God becomes a secondary being whose existence or non-existence does not in the final analysis matter. However, to disclose life as the principle of positing God means that the Western metaphysical system in which the highest good was regarded as the origin of Being collapsed in Nietzsche. Moreover, it means that the principle supportive of such a system is laid bare. That is, the essence of Being itself was presented for the first time by Nietzsche in terms of will, which posited the highest value as God and so itself transcends the perspective of value. This means that Aristotle's 'study of being as such' came to be carried out for the first time in its true sense.

III

Because 'the will to power' is a principle for positing values, it can also be a principle for overthrowing old values. This overthrowing leads old values to valuelessness. This means nihilism. To use Nietzsche's words,

it is a 'most extreme nihilism'. However, this 'most extreme nihilism', so long as its transvaluation is executed consciously with the principle for positing new values, is at the same time no longer nihilism. The will to power posits all beings as beings which are newly valued. Accordingly, beings are no longer nothingness, and therefore nihilism is overcome.

It is said that nihilism is overcome in Nietzsche. But has it really been overcome? Passive nihilism which is the deprivation of all values can at the same time be transformed into active nihilism. This is simply because it gains a principle for positing new values while overthrowing all old ones. Insofar as the will to power as this principle is the essence of Being, nihilism is after all nothing but a phenomenal fact; it is only a superficial, negative, and temporal aspect of 'life' (will) which develops as a whole while repeating the process of generation-extinction. But is nihilism nothing but a phenomenon to this extent? Can life or will, conceived of as the basis of this phenomenon, remain indifferent to nihilism without being subverted by it? Why does will have to posit value at all? We said that will or life, but not God, is presupposed as the primary Being in Nietzsche. But on what ground is this presupposition established?

Will constantly posits value, and by positing the condition for itself, will secures itself. This means that for will to be will it needs to posit itself (and thereby it maintains and enhances itself) by constantly positing an object. That is to say, to secure itself in this manner is the essence of will. The positing of an object for will is at the same time the giving of a ground for will's independent existence. Will, insofar as it is will, always needs to ground itself by positing a thing other than itself. This means that will itself lacks a ground; the basis of will is groundless. That its ground is nothing urges will toward positing values constantly.

We said earlier that Nietzsche regarded God as value prior to killing him, and that this was nothing other than nihilism. Now we must consider 'nothingness' as the 'origin of nihilism' which thrust this thought of Nietzsche's from its depth. This 'nothingness' lurks as the base of the will to power, which is itself the principle for the positing of all new values and so for overcoming nihilism. It would seem that this nothingness lurking at the base of the will to power was experienced by Nietzsche as the abyss of the eternal recurrence. But, since nothingness was experienced as that very eternal recurrence, this nothingness was incorporated within the will to power by the will to power itself in the manner of 'I willed! I will! And I shall will!' Thereby, nothingness is affirmed and is transformed into an objective being for will. Conversely, the will to power, which lacks a ground and hence must be constantly securing itself, comes to be endowed by means of the eternal recurrence with a ground that is eternity and necessity. Consequently, the nothingness lurking in the will to power (though such a nothingness is primordial

nothingness as the ground of the world, insofar as the will to power is the essence of Being) was not thoroughly thought out in Nietzsche in its relation to the nothingness of nihilism as the essential form of history.

To get a little ahead of ourselves, we could say that nothingness, as the ground of the world, is in this respect, the nothingness of the 'original nihilism' which Heidegger considered the essence of nihilism. Therefore, from this point on, we should like to reflect upon Heidegger's definition of nihilism and then move on to consider whether or not his definition can really reach the 'origin' of nihilism.

IV

The essay which best shows Heidegger's thinking on nihilism is 'The determination of nihilism in terms of the history of being' ('Die seinsgeschichtliche Bestimmung des Nihilismus'), which is contained in the second volume of *Nietzsche*. The title straightforwardly expresses the character of Heidegger's interpretation of nihilism. That is, nihilism has to do with nothing (*nihil-ism*), and he intends to determine it in terms of the history of Being.

First, to determine nihilism by way of the history of Being is to determine it in relation to the history of metaphysics, insofar as 'metaphysics has so far been the sole history of Being which can be surveyed'. That is, it does not mean to determine nihilism as a psychological phenomenon, nor to analyze it politically or sociologically, nor to deal with it ethically as a problematic of morality. But rather this approach thinks of nihilism as a phenomenon bearing the essence of metaphysics as 'the study of being as such'.

Secondly, if, judging from the above, metaphysics has an essential bearing on nihilism, we might say that the question that questions being as such in metaphysics, that is, the question about the Being of beings, is shown to have an essential bearing on nothingness.

Heidegger asserts in many places that the question of Being in metaphysics is the question about the Being of beings, and furthermore, it is a question questioning Being from the viewpoint of beings. In such a questioning the truth of Being itself, says Heidegger, is left out, and with respect to Being itself it is nothing (*es ist mit dem Sein nichts*). In contrast, Heidegger insists that his own questioning of Being is the question of Being itself, that is, the question about the truth of Being.

One might very well object that this sort of distinction, in which Being itself is nothing in the question of metaphysics while Heidegger questions Being itself, is meaningless unless the substance of each question is shown. In response to such an objection one needs to point out, as Heidegger has done, the fundamental structure of the oblivion of Being

throughout the history of Western metaphysics, so that it can be demonstrated that the content of the metaphysical question is questioned in the absence of the truth of Being itself. But even if one carries out the questioning as Heidegger actually did, that is, if one criticizes Western philosophical thinking as the oblivion of Being, placing Heidegger's standpoint of the thinking of Being itself on one side and Western philosophy as the standpoint of the oblivion of Being on the other, this would simply be in the end an external critique of traditional Western philosophy. Most criticisms of Heidegger defend the position of traditional philosophy, interpreting Heidegger's position in this manner.

However, an understanding of Heidegger's thought (with respect to his critique of metaphysics), which criticisms like this involve, in fact betrays a fundamental misunderstanding of Heidegger's thinking. Such a view assumes that something like Being itself is or can be thought in its pure form in Heidegger's thinking, while on the other hand Being itself is absent from metaphysical thinking. This sort of scheme of understanding is in the final analysis nothing but the method of cognition of metaphysics, which has not changed since ancient times. It is the method of placing on the one hand a pure thinking of the truth of the absolute and on the other hand an incomplete knowledge of the finite world.

But if we look at Heidegger's own thinking without distorting it through this sort of schema of traditional metaphysics, it is actually quite different. There is no denying that Being itself is questioned in his thinking, but this Being itself is nothing like an absolute or *causa sui*. Rather 'that it belongs to the truth of Being that Being never essentially presents itself without beings'.¹ That is, Being discloses itself (*lichtet sich*) in beings and it is nothing other than this disclosure. Accordingly, although metaphysics is endowed with the truth of beings and Being itself is absent in this openness (*Offenheit*) of beings, we must recognize that Being itself is essentially present as that very absence in metaphysics. The openness of Being is at the same time the concealment (*Verborg-enheit*) of Being, and the truth of Being emerges only as the untruth (*Unwahrheit*) of Being.

Therefore, if we designate as 'nihilism' the essence of metaphysics which is opened up as the truth of the Being of beings, and in which the truth of Being itself is 'nothing' (*nihil*), then this nothingness of nihilism is not simply derived from the knowledge of finite beings, but it belongs to the essence of Being itself. Conversely, we must grant that Being as absence must be the essence of nihilism.²

V

All nihilistic phenomena, or nihilism in the ordinary sense, are derived from the essence of nihilism which we have just discussed. Metaphysics seeks the Being of beings, that is, beingness (*Seiendheit*), in place of Being itself *qua* absence, and 'only beings' exercise 'sole authority'. For example, all the beings in the world of today are brought into the destiny of Being which is 'modern technology' appearing in the final perfected stage of the history of Being, and they are set up as that which is useful. The world is replete with these 'useful' beings.

However, since a being is recognized as a being only insofar as it is useful, it cannot maintain its own steady beingness through itself. Once it loses its usefulness, it will be thrown away. Not only that, if people get tired of it after a certain passage of time, it will be re-made even though it may still be useful. People do not expect a work of architecture to have an everlasting solidity. A building is constructed in such a way that it can be easily demolished in the future. To be 'built and scrapped' is the destiny of beings in the contemporary age. That something is a being is only a provisional, temporary appearance.

So, the contemporary world is replete everywhere with beings, and, no doubt, beings are exercising sole authority, but actually this fact itself is realized on the basis of the essential nihility of beings. We must recognize that the origin of the flood of beings in the contemporary world is nothing but this nihility of beings itself. For this reason, the various nihilistic phenomena in the contemporary world are the other side of the inundation of beings. (For example, we can think of the excess of commercial art in contrast to the absence of essential art.)

Thus, beings, to the degree that they exist in the contemporary age, are supported by nihility, but Being which has been concealed through the flood of beings is presented in this very nihility as concealed Being. That is, the essence of 'original nihilism', that is, the absence of Being itself, is disclosed in the nihility that negates beings unlimitedly and in their basis.

It would seem that the preceding is Heidegger's definition by way of the 'history of Being' which is given to the essence of nihilism and to the nihilistic phenomena derived therefrom. Going one step further, we must ask what is the 'origin' from which the essence of nihilism is derived. To respond to this question, we must think out further the absence of Being, which Heidegger has thought of as the essence of nihilism.

VI

As has been noted, absence belongs to the essence of Being itself, and since nihilism is *the* essential mode of the history of Being, 'the truth of Being has remained hidden from metaphysics throughout its history from Anaximander to Nietzsche'.³ But this can be restated by saying that the truth of Being has been kept essentially concealed, and for this reason metaphysics from Anaximander to Nietzsche was able to blossom. That is, the absence of the truth of Being and the blossoming of the truth of beings which is metaphysics are two sides of the same thing. The oblivion of the truth of Being is not a result of a deficiency in metaphysical thinking, but was an essential and necessary consequence for metaphysics, which is the truth of beings, the revealing (*Entbergung*) and the unconcealment (*Unverborgenheit*) of beings.

Accordingly, it would seem that one of the ways to investigate the origin from which the essence of nihilism as the absence or concealment of Being is derived is to inquire into how the revealing of beings, inseparable from the absence of Being, is realized. No doubt, one can think of investigating the origin of concealment (*Verborgenheit*) from the concealment itself, but insofar as it is an investigation by means of language whose essence is to express, such an alternative is not viable. Rather, the path we should follow lies nowhere else than in guarding (*wahren*) to the end the concealment *qua* concealment. Thus it should not end up that 'in the emerging of unconcealment what is essential to it, namely concealment, be lost, and moreover in favor of that which is unconcealed, which appears as what is'.⁴ In guarding the concealment, we must clarify how the unconcealment is realized, that is, how the unconcealment breaks through the concealment, thereby disclosing beings and (at the same time) concealing the concealment itself. That is, we must clarify how the truth of beings brings about the oblivion of Being and the oblivion of this oblivion.

If the unconcealment of beings and the essence of nihilism, which is the concealment of Being, are two sides of the same thing, then the destiny of Being as the essence of technology, in which nihilism culminates, is also the time when beings are completely revealed. In fact, all beings, as has been seen, are exposed in the world of contemporary technology in broad daylight throughout the world. And what are thereby exposed are taken up one after another as that which is useful in some manner or another. However, the destiny of technology, or to use Heidegger's terminology, 'enframing' (*Gestell*), is not the destiny of Being which has just now started, but 'has been dominant, though in a concealed form, from ancient times'.⁵ The function of setting up in 'enframing' (*Gestell*) is derived from the function of setting up in *poiēsis* in ancient times. The functions of these settings up are essentially related,

because they are both revealing (*Entbergung*).⁶ Moreover, the meaning of *thesis* (setting up) functions in a concealed way in the term *phusis*, which is the primordial word expressing Being.⁷ Heidegger characterizes it as follows: '*Phusis* is *thesis*: to lay something before one, to place it, to produce and bring it forth, namely into presence [*Anwesen*].'⁸

Seen in this manner, insofar as Being is Being, or insofar as Being is the revealing, it essentially has the function of 'setting up'. Therefore, the destiny of Being as 'enframing' is the destiny originally determined insofar as Being is Being. 'Enframing is the Being itself'.⁹ When 'enframing' can be traced back to the primordial essence of Being, the concealment of Being itself, which is inseparable from the derivation of 'enframing', is traced back to the primordial essence of Being also. However, from where are derived the functions of 'setting up' and 'revealing' which are 'the same'¹⁰ as the concealment?

'Enframing' is referred to as 'making' (*Machenschaft*) in the lectures of Heidegger's middle period¹¹ and indicates the gathered totality of human creation and doing. If we interpret the function of 'setting up' as the original sense of revealing, it corresponds to the 'projection of world' (*Weltenwurf*) in *Being and Time* which makes it possible in advance for beings to be. However, Heidegger does not question why 'projection of world', 'making', and 'revealing' emerge. Insofar as one remains within the standpoint of phenomenological description, one cannot go beyond asserting that Being always is only as revealing and that man is that which constantly acts and carries out the projection of world. This is nothing other than the fundamental fact of Being and man. If the unconcealment of beings is fundamental, then the concealment of Being, which is inseparable from it and which is the essence of nihilism, also turns out to be a fundamental fact. Consequently, it seems that one can only assert that nihilism is a fact of experience in the most profound sense.

If the essence of nihilism is manifest in the contemporary world as the fundamental nihility of beings, the contemporary period is the age when the oblivion of the truth of Being is thoroughly complete. And at the same time, it is also the age when the concealment of the truth of Being is exposed without any longer being obscured by the unconcealment of beings. When the concealment is experienced as concealment, it becomes possible to question the way to mitigate in some manner the violence of the destiny of technology which is the extreme form of the revealing of beings.

Incidentally, the fundamental nihility of beings in light of Buddhism is 'all that is, is transitory' (*shogyō mujō*). Buddhism teaches that 'all that is, is transitory' is the true aspect of the world and claims that the enlightened awareness of this is transformed immediately into Nirvanic awareness of tranquillity. In contrast, if we think of enlightened awareness in Heidegger or in the destiny of Western metaphysics, it must be

thought to be achieved through the process of history, and moreover, at the very time when the oblivion of Being, though preventing such an awareness, reaches its maximum limit. At this moment the oblivion of Being turns round.

However, there must also be in Buddhism an ideal that one is prevented from this enlightened awareness, with his eyes enchanted only by beings rather than by the truth of Being. This brings us to the idea of *gō* (karma), the discussion of which will shed some light on the question with which we have been concerned, that is, the origin of the revealing, and thus, the origin of nihilism.

VII

The term *gō* is a Japanese translation of the Sanskrit word *karma* and means 'making' (*zōsa*). That is, it means to 'make and act' (*gyō*; *saṃskāra*). If it is correct to understand *gyō*, which is the second element of the formula of twelve-fold causation (*engi*; *pratītya-samutpāda*), as *karma*,¹² then it means to 'make by gathering'. 'Gathering' is a gathering of all indirect and direct causes (*innen*; *hetu-pratyaya*). All things are realized by virtue of various harmonious combinations of direct and indirect causes. This requires something to gather all the direct and indirect causes: this is *gō*, or karma. The substance of karma is understood in early Buddhism to be 'intention' (*shi*), the 'function of will'.¹³ Seen in this manner, karma can be understood as the function of will that gathers all things in order for beings to be. This corresponds to what Heidegger called the revealing of beings, although the former is formed with a volitional aspect.

Where does karma thus understood come from? The origin of karma is the concealment of truth, as it is said that 'to make and act' (*gyō*; *saṃskāra*) is due to 'absolute ignorance' (*mumyō*; *avidyā*). Just as the concealment of Being engenders the revealing of beings in Heidegger, so the concealment of truth which is absolute ignorance emerges outwardly as karma. According to early Buddhist sutras, absolute ignorance is always juxtaposed with craving (*katsuai*). Craving is insatiable 'ego-desire', as in, for example, a thirsty person ceaselessly drinking water. Consequently, karma generated by absolute ignorance, that is, the essence of the function of will that reveals beings, can be understood as ceaseless ego-desire.

The idea of karma is further deepened in Mahayana Buddhism, especially in the thought of Shinran (1173–1262) in Japan. We have just said that the essence of karma is ego-desire. However, this does not mean that the 'I' performs karmic action. Whether the present 'I' does good or evil is dependent upon past karma (*shukugō*; *pūrva-karma*).¹⁴

The moral standpoint based upon the self-power (*jiriki*) is completely denied in the statement that 'it is not because my mind (heart) is good that I do not kill'. This means that all of one's existence is dependent upon past karma, that past karma determines all of one's present and future actions. However, the past, in which everything is determined beforehand, is no longer an aspect of time which is past, but is eternal. Past karma is an eternal fact without beginning or end. That is, past karma exists along with ignorance in an inseparable oneness with the existence of man. Past karma and absolute ignorance are, as it were, the fundamental fact for human existence. This corresponds to the very same fundamental fact that both the concealment of Being and the revealing of beings are equipurimordial.

As seen in the foregoing, past karma has ego-desire as its essence. Accordingly, if past karma is the fundamental fact for human existence, it means that we must carry on our shoulders ego-desire as the essence of our self, even though we have not chosen it ourselves. We must always live according to it. We are endlessly driven by our ego-desire, through which we constantly end up committing ourselves to something. This is our life. However, whatever we commit ourselves to, whether good or evil, is not our doing. It is brought about by our past karma, which is ego-desire.

Heidegger's investigation of the essence of technology does not attempt to define technology by placing man in the center in such a way as to regard technology either as a means for an end or as a tool for man's action. Rather, he regards the essence of technology as the function of truth that reveals beings, and through which all beings including man are set up. Consequently, the essence of technology thus conceived is not that which is 'made by man',¹⁵ that is, it is not technical. Rather, it has 'a transcendental character' which is unmanipulatable by man, tools, or machines produced by man. It claims man and thereby controls him. Because man always listens to the calling of this claim, he goes around ceaselessly so as to set up all beings as useful.

Seen in this manner, we must recognize that karma and the essence of technology are fundamentally functions of the same thing. In other words, karma or technology means ceaseless human action without beginning or end. An action in this sense has emanated from eons ago up to the present through the fountain of absolute ignorance (the concealment of Being) accompanying the flood of (essentially nihilistic) beings, and thereby has formed the essence of history. This I take to be the ultimate origin of nihilism.

VIII

Finally, I would like to offer briefly my thoughts concerning how we should deal with the destiny of nihilism. As we have observed, the revealing of beings (Enframing) or karma has generated history *qua* nihilism. However, insofar as revealing and karma are the eternal essence of human life and Being, their denial is a rejection of life and Being as such. That is, the origin of nihilism is Being and life as such. But if we do not somehow reject nihilism, it leads to the destruction of Being and life. Either alternative means death. This is, no doubt, an inescapable predicament. How do we break through it?

One must shatter the delusion of beings which dominates the contemporary period by seeing thoroughly into the fundamental nihility which runs at the bottom of the stream of beings. Thereby one must bring karma, which brought forth this stream of beings, to self-awareness (*jikaku*) as 'one's own sin of karmic action' which originated in the beginningless past. One must existentially bring to self-awareness the fact that Being is immediately 'danger' and life is immediately 'sin'. The origin of ignorance or nihilism will not be transformed fundamentally until each of us carries out this 'self-awareness'. Only then, it would seem, can the 'Enframing' and 'karma' be housed within a quiet and calm light. However, the self-awareness that would bring about a transformation of world history cannot be attained through a half-hearted reflection on sin. Every one in his or her own self-awareness must realize that he or she is the most sinful being in the world. The phrase expressing such a self-awareness is 'When I carefully consider the Vow (*gan, seigan*) which Amida brought forth after five kalpas' contemplation (*goko shiyui*), I find that it was solely for me, Shinran, alone!'

Heidegger and Japanese thought: how much did he know and when did he know it?

Graham Parkes

One branch of the burgeoning literature on Heidegger has remained relatively stunted – that concerning the relations of his thinking to Asian thought. And while the occasional comparative study has appeared over the past decade or two, discussions of the *influence* of Asian ideas on the development of Heidegger's thinking have been especially rare.¹ It may still be too early to form an adequate picture of the influences on Heidegger's thinking from East-Asian sources, and a thorough treatment would require extensive research in Germany and Japan.² But given the enormous impact of Heidegger's ideas on twentieth-century thought, and since the possibility of considerable influence on his thinking from non-Western sources has not been entertained in the Anglo-American scholarship, the amount at stake for the history of ideas calls for a provisional discussion in the meantime. All the more so since the answer to the question in the subtitle above would appear to be: 'Quite a bit, and early on' – and because the evidence suggests that during the 1920s and 1930s Heidegger may have appropriated a number of ideas from Chinese and Japanese philosophy into the central development of his own thought. Ultimately, the probability that Heidegger's thinking was influenced in its formative stages by ideas from the East-Asian tradition surely calls for some different readings of the Heideggerian text in future.

1 Three thinkers from the Orient

It was in 1921, when Heidegger was a *Dozent* working under the imposing presence of Husserl at Freiburg, that the first of several eminent (or, at the beginning, imminently eminent) philosophers from Japan made what came to be known as 'the Freiburg pilgrimage' to study with Heidegger. His name was Yamanouchi Tokuryû.³ The same age as

Heidegger, Yamanouchi was a scholar of broad range who went on to found the Department of Greek Philosophy at Kyoto University and at the same time was one of the first thinkers to introduce phenomenology to Japan. He was also a younger colleague of Nishida Kitarô, a philosopher at Kyoto University whose epoch-making work *Zen no kenkyû* (*An Inquiry into the Good*) of 1911 is regarded as the first masterwork of modern Japanese philosophical thought.⁴ Later, during the 1930s, Yamanouchi was to become one of the few thinkers of sufficient stature to challenge Nishida's formidable philosophical system.⁵

The following year two more visitors – men destined to become major figures in modern Japanese philosophy – arrived in Germany: Tanabe Hajime and Miki Kiyoshi. Again, both were younger colleagues of 'the Master', Nishida Kitarô. Tanabe first went to Berlin to study with Alois Riehl, and from there he moved to Freiburg to study with Husserl. In Freiburg he was introduced to Heidegger, who, though four years his junior, impressed him as brilliant. Miki went first to Heidelberg to work with Heinrich Rickert, and then on to Marburg – where Heidegger had just moved – to study with the thinker whose thought subsequent generations of Japanese philosophers would find so congenial.⁶ There being less to say about Miki in relation to our present concerns, let us consider his case first.

Miki Kiyoshi had studied philosophy at Kyoto with Nishida and another major figure in the 'Kyoto School' of philosophy, Hatano Seiichi, as well as with Tanabe. After a year at Heidelberg, he was induced by Heidegger's reputation to follow him to Marburg when he moved there in 1924. Deeply impressed by the 'postwar anxiety' that pervaded German society, Miki felt that this 'existential' atmosphere informed the development of Heidegger's thinking and contributed to his growing popularity as a teacher. Miki's first book, published in Japan in 1926 after a subsequent period of study in Paris, dealt with Pascal's conception of the human being by way of an application of Heidegger's hermeneutic analysis of *Dasein*. Since *Sein und Zeit* was not to appear until the following year, one assumes that Miki gained his understanding of Heidegger's method through conversations during his year at Marburg. Ohashi Ryôsuke has suggested that Miki's reading of Pascal, in which he emphasizes concern with death as the decisive element in our consciousness of time, is evidence of his appropriation of ideas Heidegger was developing at the time Miki had worked with him.⁷

Although after his return to Japan Miki became more and more concerned with social and political philosophy, being deeply influenced by Marx, the existential basis of his thinking endured, as is evidenced by his continuing concern with the idea of nothingness. He had been acquainted since his student days with the 'Pure Land' Buddhism of the thirteenth-century thinker Shinran, and on arriving in Europe, he was

intrigued to find how prevalent the idea of nothingness was there – albeit in the quite different context of European nihilism. Ohashi suggests (*JH*, pp. 27–8) that Miki's engagement with *das Nichts* in Heidegger proceeds from a basis in the Buddhist conception of nothingness (*mu*). At any rate, the idea of nothingness is at the basis of what many regard as his philosophical masterpiece, *Kôshôryoku no ronri* (*The Logic of the Power of Imagination*), which was clearly influenced by Heidegger's discussion of the transcendental imagination in his 1929 book on Kant. But to appreciate the significance of the fact that the topics of death and nothingness come up in Miki's engagement with Heidegger's thinking, it will help to step back for a moment before considering the more complex case of Tanabe Hajime.

If one were to characterize in the broadest strokes the major difference between the philosophy of the so-called Kyoto School (of which the thinkers mentioned so far were the founding fathers), and the mainstream of the Western philosophical tradition, one could concur with the judgment often advanced by the Japanese that whereas Western philosophies have tended to be philosophies of life based upon inquiry into the nature of being, East-Asian philosophies in general (and that of the Kyoto School in particular) have tended to focus much more on the topics of death and nothingness. Now, much of what makes Heidegger's *Sein und Zeit* such a revolutionary work is the central role played by the idea of *das Nichts* and his existential conception of death – as confirmed by the part they play in Heidegger's subsequent pursuit of the *Seinsfrage*. A pertinent question, then, concerns the extent to which Heidegger had already developed his ideas on nothingness and death by the time of his first contact with the ideas of the Kyoto School thinkers.

A definitive answer to this question will be possible only when Heidegger's complete *Nachlass* from the period up to 1922 has been published. However, a perusal of the currently available materials does not provide any evidence that Heidegger engaged the ideas of death and nothingness on an existential or ontological level before the treatment in *Prolegomena zur Geschichte des Zeitbegriffes* in 1925.⁸ There is a brief discussion of *das Nichts* in Heidegger's lectures of the Winter semester 1921/2 at Freiburg (shortly before Tanabe and Miki arrived); but the nothing in question is very much a 'relative nothing', relative to the kind of negation involved, or else is 'the nothing of factual life'.⁹ And while there is a very brief mention in the lectures from the Summer semester of 1923 of such themes as *das Man* and *Angst*, there is no discussion of death or nothingness.¹⁰ Our question, then – whether Heidegger may have been prompted by his conversations with the Kyoto School philosophers to elaborate the idea of *das Nichts* at the level of fundamental ontology or develop his existential conception of death – remains interestingly open.

Tanabe Hajime is widely regarded as being the second greatest figure (after Nishida) in modern Japanese philosophy.¹¹ His personal and philosophical relationship with Heidegger was much closer and more enduring than Miki's, who became sharply critical of Heidegger after the events of 1933. It was in part because of Nishida's interest in phenomenology that Tanabe had gone to Freiburg to study with Husserl. Whether it was disappointment with Husserl and original phenomenology, or else enthusiasm over the new turn the method was taking at the hands of the younger thinker, Tanabe politely bowed out of Husserl's classes in order to attend the lecture course Heidegger gave in the Summer semester of 1923 under the title *Ontology: Hermeneutics of Facticity*. Heidegger had, in turn, ample occasion to be impressed by the visitor from Japan, having gladly agreed to Tanabe's request for private tutorials in German philosophy. Over the ensuing decades the two men remained on cordial terms, and when Tanabe was awarded (*in absentia*) an honorary doctorate by the University of Freiburg, Heidegger sent him a congratulatory copy of the limited edition of his *Gespräch mit Hebel* furnished with a recent photograph.¹²

An appraisal of the nature of the philosophical interchange between Tanabe and Heidegger is made difficult by the almost complete silence the latter maintained about his Japanese colleagues and their ideas. And while Tanabe continued to make reference to Heidegger's works throughout his career, he appears to have been a very reticent man, and relatively little of his correspondence has survived. However, approaching from the side of Tanabe's references to Heidegger, let us see what reconstruction of their philosophical relationship is possible – with respect first to the topic of death and then to the idea of nothingness.

After his return to Japan in 1924, Tanabe published an essay entitled 'The new turn in phenomenology: Heidegger's phenomenology of life'.¹³ Disregarding some book reviews that appeared between 1917 and 1919, this essay has the distinction of being the first substantial commentary on Heidegger's thought to have been published in any language. The essay is of particular interest since its concluding section gives us an idea of how Heidegger's 1923 lecture course ended. (The transcript published in the *Gesamtausgabe* is said by the editor to be lacking the last page or two: 'it breaks off suddenly in the middle of the train of thought'.¹⁴) It is interesting that a breach in the Heideggerian text should be fillable only on the basis of Tanabe's account – the ultimate topic of which is death.

Missing from the transcript of the lectures in the *Gesamtausgabe* – but prominent in the conclusion of Tanabe's discussion of Heidegger's phenomenology of life – is an account of the role played by the confrontation with death. Since the following passage apparently provides the

closest access to Heidegger's first words on the topic of death, it is worth citing at some length:

Just as life is not merely a passage [of time], so death is not the mere termination or breaking off of such a passage. Rather death stands before *Dasein*, as something inevitable. One can even say that it is precisely in the way life regards death and deals with it in its concern that life displays its way of being. If it flees from the death that stands before it as something inevitable, and wants to conceal and forget it in its concern with the world of relations, this is the flight of life itself in the face of itself – which means precisely that the ultimate possibility-of-being of life becomes an impossibility-of-being. On such a basis, to grasp *Dasein* in its primordial way of being is ultimately impossible. Because the way in which *Dasein* is concerned with death – from which it would like to flee but cannot – informs its very way of being, one must rather emphasize that it is just there, where life voluntarily opens itself to certain death, that it is truly manifest to itself.

(*JH*, pp. 107–8)

When translated into German this passage, written by Tanabe in 1924, sounds uncannily like the Heidegger of *Sein und Zeit*. The passage is all the more significant since Heidegger may not have written on the topic of death previously. In the event that he did not, then the fact that the first evidence of his interest in the topic comes from Tanabe is significant – since it suggests that Heidegger may have been encouraged to engage this issue, so central to the existential analytic and the theory of temporality presented in *Sein und Zeit*, precisely by his encounter with his Japanese colleague.¹⁵

This speculation is encouraged by some statements of Tanabe's that appear in his contribution to the *Festschrift* for Heidegger's seventieth birthday.¹⁶ The essay is a translation of the second half of a monograph published the previous year, in 1958, entitled 'Sei no sonzaigaku ka shi no benshōhō ka?' ('Ontology of life or dialectics of death?') – the original version of which bore the subtitle 'A polemical engagement with Heideggerian ontology'. Ohashi Ryōsuke points out that the first half of the monograph, which was not translated for the *Festschrift*, contains some quite vehement criticism of Heidegger's 'ontology of life' (*JH*, p. 26). Tanabe begins his contribution to the *Festschrift* by contrasting the general orientation toward philosophies of life in the Western tradition with the more death-oriented approach characteristic of East-Asian philosophies. For thinkers in the Buddhist tradition, 'in thinking of the enigmatic inevitability of death, the ephemerality and fragility of life pervades us to the very marrow' (pp. 93–4). For this reason, Tanabe continues,

he had always been dissatisfied in his studies of Western philosophy – until he went to Freiburg in 1922.

He goes on to recall how deeply impressed he was to discover, on first attending Heidegger's lectures, 'that in his thinking a meditation on death had become central to philosophy and supported it from the ground up. I could not help feeling that I had now found a way to the philosophy I had been seeking.' The impression these remarks may give of Tanabe's having come upon a fully developed Heideggerian philosophy of death is misleading. Tanabe was an exceedingly modest man – even in the context of a general tendency of the Japanese toward (by Western standards) extreme self-effacement – and these remarks constituted the introduction to his contribution to the *Festschrift* for the seventieth birthday of the man regarded by the Japanese as the greatest living philosopher.

Given that Tanabe's scholarly output prior to his trip to Germany had been largely in the fields of science and mathematics (his first two books, published in 1915 and 1918, were on the natural sciences), it seems as if the encounter with Heidegger helped him to connect his academic work with a deeper level of his existence. This deeper level had to do with Tanabe's lifelong concern with philosophy of religion: Christianity had interested him intensely during his school days, and he devoted most of his later career to religious philosophy, undertaking numerous comparisons between Christianity and Japanese Buddhism. It is reasonable to suppose that at the time of his meeting Heidegger Tanabe was himself deeply concerned with the existential problem of death, and the discovery that Heidegger was working a number of existential concerns into his 'phenomenology of life' showed him that such topics could be engaged philosophically as well as on a personal level.

Another factor that is relevant here will bring us to the related issue of nothingness. For several years prior to his visit to Freiburg Tanabe had been a junior colleague of Nishida's at Kyoto. While Nishida was well acquainted with German thought – the mystical tradition, German Idealism, and neo-Kantianism in particular – the philosophy he had begun to elaborate in his masterwork of 1911 was experientially based on the practice of Zen Buddhism and to a large extent turned on the Buddhist conception of nothingness (*mu*).¹⁷ Tanabe himself was to make the idea of *zettai mu* (absolute nothingness) central to the philosophy of religion he elaborated in his mature thought – even though his different understanding of the idea was a major point of contention in his subsequent philosophical disagreements with Nishida.¹⁸

Not long after his arrival in Freiburg, Tanabe was invited to give a presentation on Nishida's philosophy to a select group of German philosophers – including Heidegger – at Husserl's home.¹⁹ They could not have found a speaker more qualified, since Tanabe had been following the development of Nishida's thought for the previous ten years. Unless

some record of Tanabe's presentation is discovered, one can only speculate on its content. But since Nishida had been developing his idea of 'absolute nothingness' since 1911, and Tanabe was at the time the best interpreter of his mentor's thinking, his talk must have dealt with Nishida's conception of nothingness (especially since the idea of *mu* was to become so central to Tanabe's own thinking).

At the conclusion of a chapter of *An Inquiry into the Good* entitled 'The phenomena of consciousness as the sole reality', Nishida argues that – in contrast to the situation in the physical world under the law of causality – in consciousness something *can* arise out of nothing (chap. 7). In a chapter dealing with his conception of God as the ground of reality, Nishida follows the *via negativa* of Nicholas of Cusa and the idea of God as total negation: 'From this standpoint, God is absolute nothingness.' He goes on to say that 'precisely because He is able to be nothingness, there is no place whatsoever where he is not present, no place where he is not at work'.²⁰ And in the context of a later invocation of Nicholas of Cusa and Jakob Boehme, Nishida writes:

Nothingness separated from being is not true nothingness; the one separated from the all is not the true one; equality separated from distinction is not true equality. In the same way that if there is no God there is no world, if there is no world there is no God.²¹

The possibility that Nishida's thought is behind Heidegger's conception of nothingness deserves serious consideration – even though there are, of course, earlier prefigurations in the Western tradition. One thinks of the conceptions of 'nothingness' in such thinkers as Meister Eckhart, Nicholas of Cusa and Jakob Boehme, with whom Heidegger was familiar (if perhaps not as familiar as Nishida was at the time), as well as in the idealism of Hegel and Schelling. It is interesting that Hegel, in the context of his well-known formulation in Book I of the *Wissenschaft der Logik*: 'Pure Being and pure Nothing are the same', refers to Buddhist thought: 'In oriental systems, and especially in Buddhism, *nothingness* or the void [*das Leere*], is the absolute principle.'²² Just as interesting is the fact that Schelling (on whom Heidegger gave many lectures) mentions Lao Zi's notion of nothingness in a passage in *The Philosophy of Mythology*:

The great art or wisdom of life consists precisely in attaining this pure potential, which is nothing and yet at the same time all. The entire *Dao de jing* is concerned with showing, through a great variety of the most pregnant tropes, the great and insuperable power of non-being.²³

An immediate (though generally unremarked) precursor with respect

to a radical notion of nothingness is Max Scheler, whom Heidegger refers to often in his lectures from the 1920s, as well as in the text of *Sein und Zeit*. In his essay 'Vom Wesen der Philosophie' of 1917, Scheler proposed as the fundamental basis of philosophical activity the insight 'that *there is anything at all* or, put more precisely, that "*there is not nothing*" (whereby the word "nothing" . . . means *absolute nothing* . . .)'.²⁴ After a discussion of how the circumstance that 'there isn't nothing' prompts philosophical wonderment, Scheler goes on to say: 'Whoever has not looked into the *abyss of absolute nothing* in this way will also completely overlook the eminently positive nature of the content of the insight that there is anything at all and not rather nothing.' This phrasing will be familiar to those acquainted with Heidegger's discourses on nothing published at the end of the 1920s.

In a discussion of religious activity in the essay 'Problems of religion' from 1920, Scheler returned to the topic of absolute nothing:

To believe in 'nothing' is something quite different from not believing. It is – as evidenced by the powerful emotional impact that the thought of 'nothing' exercises on our soul – a highly positive state of the spirit. *Absolute nothing* is to be sharply distinguished from every merely relative nothing as a phenomenon. Absolute nothing is not-being-something and not-existing in one, in utter unity and simplicity.²⁵

In a footnote at this point Scheler says that this unity distinguishes absolute nothing from the Buddhist idea of nirvana, which he understands (mistakenly) as 'merely freedom and redemption from the actual world'. Although Scheler's enterprise is more explicitly religious than Heidegger's, his talk later in the same paragraph of 'metaphysical *Angst*' and 'religious *Schauder* in the face of absolute nothing' is a striking anticipation of Heidegger's formulations several years later.

Assuming that Tanabe and Heidegger did talk about nothingness, it is probable that the precursor in the East-Asian philosophical tradition of the Japanese notion of *mu* was also a topic of conversation: the Chinese notion of *wu*, which figures prominently in the classical Daoist texts attributed to Lao Zi and Zhuang Zi. In his only reference to Tanabe in his published works, in the 1954 dialogue between a Japanese and an Inquirer, Heidegger has the Japanese say: 'Professor Tanabe often came back to the question you once addressed to him of why we Japanese didn't reflect upon the venerable beginnings of our own thinking instead of greedily chasing after the latest new things in European philosophy.'²⁶ The 'venerable beginnings' of Japanese Zen certainly include philosophical ideas from classical Daoism, and Heidegger knew this when he wrote the dialogue. As we shall see shortly, the relevant Daoist texts had been available in German since 1912, and so if Tanabe had referred

to them in their conversations Heidegger would have had access to the translations.

The influences on Heidegger's developing conception of *das Nichts* are multiple and complex, and deserve detailed study when all the relevant manuscripts have been published. The question is of course complicated by the fact that Nishida, Tanabe, *et al.*, were conversant not only with the German mystical tradition but also with the Idealists' understandings of 'absolute nothingness' – a familiarity that no doubt affected the development of their own, essentially Buddhist elaborations of the idea. But for the time being one can say that it is highly probable that Heidegger was introduced to the East-Asian conception of nothingness before he began to develop his own radical thinking on the topic of *das Nichts*.

Back in 1921 another Japanese philosopher had arrived in Europe who was to spend eight years of study there: Kuki Shūzō, often known as 'Count Kuki' because of his aristocratic origins. One year older than Heidegger, Kuki had been one of the co-participants with Miki in Rickert's seminar in Heidelberg in 1923. After three years in Paris studying French philosophy, Kuki returned to Germany in the spring of 1927 in order to work with Husserl in Freiburg.²⁷ After meeting Heidegger at Husserl's home, however, Kuki was sufficiently impressed by the younger philosopher that he moved to Marburg later that year in order to attend Heidegger's lectures. Apparently Kuki was already acquainted with Heidegger's philosophy, since it is mentioned in the first draft of his manuscript on the idea of *iki*, which he had completed in Paris the previous year.²⁸ His book *Haideggah no tetsugaku* (*The Philosophy of Heidegger*) of 1933 would be the first book-length study of Heidegger's thought to be published in any language.

Kuki was not only a brilliant philosopher but a man of supremely refined culture, and among the Japanese thinkers who visited Heidegger in the 1920s he seems to have made the greatest impression on the host. Kuki and his ideas play a major role in Heidegger's dialogue 'Aus einem Gespräch von der Sprache' – indeed one quite disproportional to their presence in the actual conversation on which the dialogue was based.²⁹ While the dialogue in general bears only a tenuous relation to the original conversation, being for the most part Heidegger's free invention, the Inquirer's opening statement – 'To Count Kuki belongs my enduring remembrance' – is surely a genuine expression of the author's feelings. It also rings true when the Inquirer remarks that his conversations with Kuki, 'unfolded freely and spontaneously [*wie ein freies Spiel*] in our home, where Count Kuki sometimes came with his wife, who would wear traditional Japanese dress' – and that 'the East-Asian world would thereby shine more radiantly' (*US*, p. 89/4).

The Inquirer goes on to say that his conversations with Kuki concerned

the latter's notion of *iki* and, more broadly, 'the essential nature of *East-Asian* art and poetry'. Since Kuki had completed a first draft of his seminal work on *iki* in Paris in 1926, one can well imagine its being a topical theme in his conversations with Heidegger.³⁰ In fact we can probably gain a better sense of the content of these conversations from Kuki's side than from Heidegger's poetically processed recollections of some twenty-five years later. After his year at Marburg Kuki went back to France, and in August of 1928 he delivered two lectures in French at a colloquium at Pontigny under the title 'Propos sur le temps'.³¹

It is not unreasonable to suppose that Kuki was working on the ideas expressed in these lectures (and the subsequent book) while he was in Marburg and that he discussed them with Heidegger – especially since the second talk, entitled 'The expression of the infinite in Japanese art', deals precisely with what Heidegger's Inquirer would later refer to as 'the essential nature of *East-Asian* art and poetry'. In the first talk, 'The notion of time and repetition in Oriental time', Kuki deals mainly with Hindu and Buddhist ideas of temporality, but he also makes some interesting remarks about *bushidô*, the 'way of the samurai'. In view of his keen interest in *bushidô*, it is likely that Kuki's conversations with Heidegger touched upon the ethical code of the samurai – one of the major tenets of which is summed up in the maxim: 'The way of the samurai is death'. Heidegger would have been struck by the remarkable similarity between the attitude advocated by *bushidô* toward death and the ideal of *vorlaufende Entschlossenheit* he had just presented in *Sein und Zeit* (1927).

Kuki's second set of *propos* opens with a reference to the Japanese critic and philosopher of art Okakura Kakuzô, who introduced some of the theoretical background of Japanese art to the West with the publication in English of *The Ideals of the East* in 1903. If Kuki and Heidegger talked about Japanese art, then the former – who knew Okakura personally – must have recommended Okakura's books. Incidentally, a contemporary Japanese philosopher has pointed out that the earliest use of the term *In-der-Welt-sein* (resplendent with hyphens) occurs not in *Sein und Zeit* but in a German translation of Okakura's *The Book of Tea* published in 1919.³² If Heidegger did read Okakura, he would have learned a great deal about Daoism and the Zen-inspired arts of Japan, such as Noh drama and *tanka* and *haiku* poetry (with which he was certainly acquainted by the time he wrote the dialogue with the Japanese visitor). He would in any case have been introduced to these things by Kuki, since they figure prominently in the text of his talk about Japanese art.³³

In this second talk, Kuki quotes from no fewer than nine chapters of the *Dao de jing* by Lao Zi and also refers to the other major classic of philosophical Daoism, the *Zhuang Zi*. It is possible that Heidegger was already acquainted with these texts, there being several German trans-

lations available at the time. A translation of the *Lao Zi* with introduction and commentary had been published by Victor Von Strauss in 1870.³⁴ An edition of Zhuang Zi edited by Martin Buber had appeared in 1910 – with which we know Heidegger was familiar at least by 1930.³⁵ The following two years saw the publication of translations of both the *Lao Zi* and the *Zhuang Zi* by Richard Wilhelm which, like the Buber edition, have been in print more or less continuously since then.³⁶ And so, assuming Kuki did quote the classical Daoist thinkers in his discussions with Heidegger, the latter would have had to go no farther than the university library or bookshop in Marburg to find German editions of the relevant texts. And in view of Heidegger's acquaintance with the Buber edition of Zhuang Zi by 1930, it is more than likely that he discovered that text during the period of his conversations with Kuki in 1927/8 (if he had not come across it earlier).

The conclusion to be drawn from the account so far is that by the time *Sein und Zeit* was published, Heidegger had engaged in philosophical dialogue with three of the greatest thinkers of twentieth-century Japan, whose formidable intellects covered a range of fields: philosophy of science and religion (Tanabe), social and political thought (Miki) and metaphysics and aesthetics (Kuki).

2 Tracing the signs in the texts

The foregoing considerations should prompt us to view Heidegger's texts from the late 1920s on in a somewhat different light. Reinhard May has documented a number of significant similarities between formulations in Heidegger's texts and German translations of Daoist and Zen works which predate the respective writings by Heidegger. Limitations of space necessitate a restriction of the scope of what follows here to a few texts from Heidegger's 'middle period' (1929–35). Let us begin with the 1929 essay 'Was ist Metaphysik?', the main aim of which is to pose and respond to the question of 'how it stands with *nothing*'.

In a sense this essay is a reiteration and amplification of the discussion of *das Nichts* in *Sein und Zeit*. In both texts the basic mood of *Angst* plays a major role in revealing *das Nichts*, but there is a discernible change of tone. In *Sein und Zeit* there is something 'threatening' (*das Drohende*) that is so close 'that it constricts and takes one's breath away' (SZ, pp. 186, 343 (*Bedrohung*)). In anxiety 'it feels eerie [*unheimlich*]' and there is an unpleasant sense of being 'not at home [*un-zu-Hause*]' in the world (SZ, p. 188). When *Angst* arises, 'what is present . . . [shows itself] in an empty mercilessness', and with all meaning drained out of the environment one is left clutching 'at the nothing of the world [*ins Nichts der Welt*]' (SZ, p. 343). The confrontation with *das Nichts* is a

shattering experience, and one quite distant from the *Angst*-free attitude one finds toward nothingness and death in the texts of the Daoists.

By 1929, however, the feeling tone of anxiety has changed. Heidegger begins by remarking that anxiety stops any kind of confusion arising and is rather 'pervaded by a special kind of peace' (*eine eigentümliche Ruhe*).³⁷ He goes on to say that there is a certain 'retreating' in anxiety 'that is no longer a fleeing, but rather a spellbound peace' (p. 34). There is a certain equanimity now as *Dasein* watches beings in their totality 'glide away' – as if the thinker were familiar with the line in the *Lao Zi* that says 'Being and non-being give birth to one another',³⁸ or had been reading those magnificent passages in the *Zhuang Zi* that convey the serenity with which the Daoist sage participates in the cyclical interchanges between *yin* and *yang* that drive the transformations we call birth and death. And in view of the ineffability of the encounter with nothing – 'Anxiety deprives us of speech' (p. 32) – and of the way the *dao* steers all things yet is itself no thing, the following remarks of Lao Zi's about the Way come to mind: 'Tao is empty'; 'It is an abyss, like the ancestor of all things'; 'Always it is nameless and reverts to non-being'.³⁹

A related difference between the two texts concerns the pronounced emphasis in the latter upon the *unity* of *das Nichts* and *das Seiende im Ganzen*: 'Nothingness is encountered together with [*in eins mit*] beings in totality', and 'Nothingness announces itself precisely with and in what-is [*mit und an dem Seienden*] as it glides away as a whole' (pp. 33–4). This formulation is strikingly reminiscent of the central insight of Mahayana Buddhism (on which Zen is based), which is that nothingness or emptiness (*sunyatā*) is not beyond, or different from, the things of the phenomenal world. In the best-known formulation of the *Prajñāpāramitā Sūtra*: 'Form is not different from emptiness; emptiness is not different from form.' Heidegger himself refers to this formulation in the 'Gespräch von der Sprache', when he has the Japanese say 'We say: Without *Iro* [colour . . . and more than whatever is perceivable by the senses], no *Ku* [emptiness and the open]' (*US*, pp. 102/14–15).

The first translation of any work of Heidegger's was the translation into Japanese of 'Was ist Metaphysik?', which was published in Japan the year after the original appeared, in 1930. The essay was translated by Yuasa Seinosuke, who had come to Germany in 1926 and was to stay until the late 1930s. After studying with Karl Jaspers for a year in Heidelberg, he had gone to Freiburg in 1929 to study with Heidegger. In view of the parallels we have noted between Heidegger's conception of *das Nichts* in that essay and East-Asian conceptions of nothingness, some remarks Heidegger made about the Japanese translation of the essay some thirty years later are revealing.

A philosopher by the name of Kojima Takehiko, who had studied

with Nishida and Tanabe in Kyoto, had visited Heidegger at his home in Messkirch in 1955. In 1963 he wrote a long letter to Heidegger which was subsequently published together with a lengthy reply as a pair of 'open letters' in both Japanese and German. Kojima starts out by saying that when an outline of Heidegger's *Gelassenheit* was published in a Japanese newspaper, 'it almost seemed to us as if you, Herr Professor, were directly addressing us Japanese' (*JH*, p. 216). (Hardly surprising, in view of the allusions in that text to both Zen and Daoism.) At one point in his reply Heidegger refers to 'What is metaphysics?':

That essay, which was translated into Japanese as early as 1930, was understood immediately in your country, in contrast with the nihilistic misunderstanding of what was said which is prevalent to this day in Europe. The nothing that is talked about there means that which in relation to what-is is never any kind of being, and 'is' thus nothing, but which nevertheless determines what-is as such and is therefore called Being.

(*JH*, p. 225)

Hardly surprising, again, that Heidegger appears not to have been so surprised at the immediacy of the understanding on the part of an apparently quite alien culture. The second sentence is significant in so far as it makes explicit the fact that Heidegger's concern to elaborate an original conception of nothing that is non-nihilistic is of a piece with the issue that drives his philosophical enterprise from beginning to end: the concern to reopen the question of Being.⁴⁰

In 1930 Heidegger delivered a public lecture 'On the essence of truth', which he would give frequently over the years until its publication in 1943. If this has often been regarded as one of the most enigmatic of his texts, one factor may be that it was written at a time when Heidegger was working to assimilate ideas from Daoism. In the interests of narrative continuity, it will be helpful to look briefly at this text even though it requires temporarily expanding our focus to include Chinese thought.⁴¹ It may be more than simple coincidence that it was after one of the earlier presentations of this lecture, in October 1930 in Bremen, that Heidegger gave the first recorded public reading of a Daoist text: the story of the exchange between Zhuang Zi and Hui Shih on the joy of the fishes.⁴² Petzet remarks that the occasion for Heidegger's asking his host to fetch his copy of the *Zhuang Zi* was a discussion of the question of whether it is possible to put oneself in the place of another. Petzet does not say how the discussion came out, but simply remarks that in Heidegger's reading 'the profound story put all those present under its spell'.

Heidegger had in fact been concerned with the question of putting oneself into another's place in his lecture course of the previous semester. He appears to have devoted several sessions to a discussion of the extent to which it is possible for human beings to transpose themselves into other people, animals and even stones. (Plants are not considered in this section, though there had been some talk about the vegetal realm earlier in the course). Heidegger's conclusion is that we can't transpose ourselves into stones because the stone doesn't have a world – is *weltlos*; but that we can transpose ourselves into animals since the animal does have a world – *weltarm* though it may be. He doesn't think the question should even arise in the case of other human beings, since human being is essentially 'being with [*Mitsein mit*] others' and 'being transposed [*Ver-setztsein*] into other human beings'. He even leaves open the possibility of such transposition into inanimate things – at least where human existence is attuned by *myth* and also in the case of *art*, which he characterizes as 'fundamentally different *kinds* of possible *truth*'. In view of how little reference is made to animals in the enormous Heideggerian corpus, it is significant that the only extended discussion of the animal realm should occur in these lectures from the time Heidegger was apparently involved with the *Zhuang Zi*.⁴³

In saying all this, Heidegger could just as well be giving an interpretation of Zhuang Zi's story of the philosophers and the fishes – or indeed of the *Zhuang Zi* as a whole. One of the most striking features of that text is the remarkable number of anecdotes about animals, fishes, birds and plants (trees especially) that aim to jolt the reader out of his or her anthropocentrism and into an experiential appreciation of the perspectives of other denizens of the realm between heaven and earth. The *Zhuang Zi* is a text highly prized by the great Zen thinkers, and Heidegger could equally well be giving a reading of a text by Dôgen (or one of his successors) on the topic of the 'Buddha nature' of all living things.⁴⁴ It is possible, too, that Heidegger heard his Japanese visitors ascribe similar views to Nishida, who argues that in order to know something one has to *become* it. In chapter 13 of *An Inquiry into the Good*, Nishida writes:

That we know a thing means simply that the self coincides with the thing. In seeing a flower, the self becomes that flower. To study a flower and illumine its nature means letting go of subjective conjecture to coincide with the nature of that flower.⁴⁵

To return to the essay 'On the essence of truth': it is here that Heidegger gives the first definitive formulation of an opposition that was to remain central to the subsequent development of his thinking: that between the *Stellen* (setting, placing, putting) of *Vorstellen* (representing)

and the *Lassen* (letting) of the kinds of *Denken* he proposes as preferable to the representative and calculative modes of modern European thinking. There is, in other words, a move away from the projection (*Entwurf*) of a world of potential *Zuhandenheit* to a more open stance that holds back from dictating to things in advance how they are to appear.⁴⁶ The consequences of such a move will be seen later in the use of terms like *Gelassenheit* and statements to the effect that it is *Sein* itself, rather than *Dasein*, that effects the historical projection of worlds.⁴⁷ The shift is adumbrated in the somewhat gnomic pronouncement from the beginning of the fourth section:

Freedom for what is manifest from an Open [*zum Offenbaren eines Offenens*] lets the being in question be the being that it is [*lässt das jeweilige Seiende das Seiende sein, das es ist*]. Freedom now reveals itself as letting beings be [*das Seinlassen von Seiendem*].

By a nice turn of etymological development, both the German *lassen* and the English 'let' are well suited in their ambiguity between 'allowing' and 'ordering' (letting something happen as opposed to making it happen) to translating the central Daoist notion of *wu wei* or 'nondisruptive activity'. According to the *Dao de jing*, the Daoist sage 'dwells in effecting without acting'.

Whoever acts in Dao reduces day by day;
reduces and reduces to arrive at not-doing.
He does not act, and yet he is not inactive.⁴⁸

In the next section of 'On the essence of truth', we learn that letting-be always involves a concealing. Speaking of 'the openness of beings in totality', Heidegger writes that, 'although it constantly attunes everything, it itself remains the indeterminate, the indeterminable. . . . What attunes here is, however, not nothing, but a concealment of beings in totality.' The first chapter of the *Lao Zi* reads (translated from Wilhelm):

'Non-being' I call the beginning of heaven and earth.
'Being' I call the mother of individual things. . . .
In [their] unity it is called the mystery [*das Geheimnis*].
The yet deeper mystery of the mystery
is the gate through which all wonders issue forth.

And chapter 25:

There is a thing, completed in undifferentiation.

Before heaven and earth it was already there,
so still, so alone. . . .

At the beginning of section 6 of his essay Heidegger writes that

the concealment of beings in totality . . . is older than any manifestation of this or that being . . . and older than letting-be itself. . . . What preserves letting-be in this relation to concealing? Nothing less than the concealment of what is concealed in totality . . . the mystery [*das Geheimnis*].

The final thrust of Heidegger's essay has the essence of truth (*das Wesen der Wahrheit*) turn into the truth of Being (*die Wahrheit des Wesens*), which in turn turns on 'the simultaneity of revealing and concealing' (sect. 7) – an idea that is central to the Daoist understanding of the reciprocal powers of *yin* and *yang* (and that also figures prominently in Nietzsche's thought). And when the essay's concluding note says that truth means 'clearing protecting [*lichtendes Bergen*]' as a basic trait of Being', it echoes a basic trait of the *dao*.

A striking feature of the *Lao Zi* is the poetry of its language, a fair amount of which can come across in translation – even though, to borrow an image from a Ming dynasty writer (quoted by Okakura), a translation is like the reverse side of a brocade: all the threads are there, but without the subtlety of the colours or the design. Indeed the texts of the *Lao Zi* and the *Zhuang Zi* are regarded by many to be among the most poetical ever written in classical Chinese (a language distinguished by the beauty of its poetry), and they are certainly two of the most poetic works of philosophy in any language. Heidegger's encounter with these texts appears to have a twofold effect on his thinking. For one thing his prose begins to change from the uncompromisingly functional language of *Sein und Zeit* to the more poetic evocations of 'On the essence of truth', and for another, he will soon begin to develop one of the major themes of his mature thinking – concerning the closeness of philosophical thought and poetry.⁴⁹

In his lectures on metaphysics from the summer of 1935, Heidegger remarks that the only thing that is of the same order as philosophy and its thinking is *Dichtung*. Though they are not the same, he continues, the only people other than philosophers who are able to talk about *das Nichts* are poets. In a pronouncement that could have issued from the brush of a commentator on the thinker-poet Bashô (in whose work Heidegger developed a keen interest), he writes: 'In the poetizing of the poet and the thinking of the thinker, there is always so much world-space bestowed that in it any thing whatsoever – a tree, a mountain, a house, a bird-call – completely loses its indifference and ordinariness.'⁵⁰

Heidegger's *Einführung in die Metaphysik* contains what may be the first published references to the Japanese, but they appear simply in lists of examples of *Seiendes*. But when it comes to a discussion of philosophies that have 'inquired about the ground of the things that are', no mention is made of the East-Asian traditions with which Heidegger was by that time familiar: only thinkers who think in the medium of Greek or German, 'the most powerful and spiritual language[s] with regard to the possibility of thinking'.⁵¹

The essay 'The origin of the work of art' (1936) constitutes Heidegger's first and longest meditation on the topic of art and is, as such, another manifestation of a shift in the direction of his thinking. The original stimulus for his engagement with this topic may well have been his conversations about art with Kuki Shûzô in 1927 and 1928; this essay at any rate shows the most influence from East-Asian thought among the works of the middle period. A shorthand way of showing this is to recommend a reading of my 'Thoughts on the way' – part of which was intended as an excursus on resonances between Heidegger's texts of 1935/6 and Daoist philosophical ideas – as a catalogue of the *influences* of Daoism on Heidegger's thinking of the mid-1930s.⁵² On the assumption that Heidegger had read the Richard Wilhelm translation of the *I jing* (published in 1923), one can see his idea of truth as the *Riss* denoting the interplay of *Welt* and *Erde* as an adaptation of the notion of the *dao* as the common root of the cyclical forces of *yang/chian* and *yin/kun*.⁵³

In the light of the discussion earlier of Kuki Shûzô's influence on Heidegger, an obscure but central passage in 'The origin of the work of art' becomes clearer. In the course of a discussion of truth as the unconcealment produced by the struggle of world and earth, Heidegger says more about the *Lichtung*, the illuminated clearing that in *Sein und Zeit* had been equated with *Dasein* and which now appears coextensive with *Sein* itself and *das Nichts*.

Beings stand in Being [*Das Seiende steht im Sein*] . . .

And yet, beyond beings – though not away from them but this side of them – something Other is happening. Amidst beings in totality there is an open space. A clearing is there. From the perspective of beings it is 'being-er' than beings [*seiender als das Seiende*]. The open middle is thus not surrounded by beings, but the central illumining clearing itself encircles – like the Nothing we hardly know – all that is.⁵⁴

Here, complementary to the Daoist ideas, is the Zen Buddhist idea of nothingness: *mu*, or *kû* – emptiness, distinct but not different from form. Heidegger's *Lichtung* may be seen as the German version of Nishida's

mu no basho, or *topos* of nothingness. Around the time Kuki was in Freiburg, Nishida was using a striking image to express the way the *topos* of absolute nothingness envelops all the other spheres of human activity and thought: *urazukeru*, 'to be lined' (as with the lining of a garment). One could well imagine an evening at Heidegger's home, with Madame Kuki sitting resplendent by her husband's side as he talks about Zen art with the great philosopher, her ceremonial kimono allowing the East-Asian world to shine – as Heidegger himself said – 'more brightly' in the dusky environs of the Black Forest. Heidegger would be questioning his guest, once again, about the Japanese conception of nothingness. An illustration occurs to the Count, who responds in his impeccable German:

Professor Nishida uses an expression in his latest essay, 'The Intelligible World', that could perhaps help in this context. He speaks of the way nothingness 'lines' the concentric spheres of our existence, just as the kimono my wife is wearing is lined by a precious silk lining that one hardly sees, since it shows only at the ends – and which in a way envelops the kimono as a whole.⁵⁵

Heidegger himself drops an enigmatic allusion to the source of 'The origin of the work of art' in a *Zusatz* he added to the essay in 1956, the year after his dialogue between the Japanese and the Inquirer. (The editor of the new edition of *Holzwege*, in which the supplement is included after the *Nachwort*, remarks that 'Heidegger repeatedly emphasized the importance of this "supplement" in conversation'.⁵⁶) The *Zusatz* is concerned mainly with resolving the apparent opposition between the 'establishing of truth' (in the work of art) and a 'letting the advent of truth occur', and emphasizes that 'this *Lassen* is not any kind of passivity but' – just like *wu wei* – 'the highest kind of doing'. It is the last paragraph that is remarkable:

It remains an inevitable and distressing difficulty that the reader, who naturally comes upon the essay from the outside, immediately and in the long run thinks of and interprets its content *not from the secret source of what is to be thought* [*nicht aus dem verschwiegene[n] Quellbereich des Zudenkenden*]. For the author himself there remains the difficulty of speaking of the various stations on the way each in precisely the appropriate language. (Emphasis added)

One wonders why the source of what is to be thought should be so secret – if only because *Quelle* was the term Heidegger used the previous year in discussing the possible basis for dialogue between Western and East-Asian thought (*US*, pp. 94/8, 115/24; discussed below).

At the end of this highly productive period from 1935–6 another visitor

from Japan arrived, Nishitani Keiji, a pupil of Nishida's with an intense interest in Nietzsche. Nishitani was to stay in Germany until 1938, attending Heidegger's seminars in Freiburg and having many informal conversations with him at his home.⁵⁷ Nishitani has written about how in 1938 he presented Heidegger with a copy of the first volume of D. T. Suzuki's *Essays in Zen Buddhism*, only to find that he had already read the book and was eager to discuss it. Nishitani also reports that at that time Heidegger read an anthology of Zen texts entitled *Zen: Der lebendige Buddhismus in Japan*.⁵⁸ In conversation in Kyoto in 1989, Professor Nishitani recounted how not long after his arrival in Freiburg Heidegger gave him 'a standing invitation' to come to his house on Saturday afternoons to talk about Zen. Heidegger was apparently most interested in the striking imagery that characterizes so many of the traditional Zen texts, and Nishitani concurs with other East-Asian interlocutors in saying that Heidegger was always a keen and insightful questioner when it came to the topic of Asian thought.⁵⁹

3 Oblique presentations and prognostications

In view of the amount of contact Heidegger had with East-Asian thinkers, the fact of his acquaintance with philosophical texts from that tradition, and the keen intensity with which he used to question his Japanese and Chinese interlocutors about those texts, the references to East-Asian ideas in his published works are remarkably few. There are only four instances, occurring between 1954 and 1958.

The first is the only extended discussion of East-Asian ideas in the entire Heideggerian corpus: the dialogue between the Japanese and the Inquirer, written over thirty years after the first contact with thinkers from Japan. This text itself deserves an extended discussion as a simultaneous revelation and concealment of the East-Asian influences on Heidegger's thought.⁶⁰ For now it will suffice to draw attention to a remark that becomes significant in the context of our discussion so far. At one point the Inquirer says to the Japanese that his visit is especially welcome since his experience in translating German literature (and Heidegger's essays on Hölderlin) into Japanese will have given him 'a keener ear for the questions that I addressed to your compatriots almost thirty-five years ago' – and adds in his next speech the understatement: 'and yet I think that in the meantime I have learned a thing or two [*einiges*] to help me inquire better than several decades ago' (*US*, p. 94/8; emphasis added). This dialogue contains the only references to Japanese ideas in Heidegger's works published in the West.

Three years later, in a discussion of the term *Ereignis* in 'Der Satz der Identität' (1957), Heidegger writes that the word 'can no more be

translated than the Greek word *logos* or the Chinese *Tao*'.⁶¹ At the time, probably no more than one reader of the essay would have known that Heidegger was speaking from experience – having spent a summer, ten years earlier, working with a Chinese philosopher on translating chapters of the *Lao Zi* containing the word *dao*.⁶² In 1958 Heidegger completed the essay 'Das Wesen der Sprache', in which two paragraphs on *Tao*, 'the key word in the poetic thinking of Laotse' (*US*, p. 198/92), shed light on Heidegger's frequent use of the key word *Weg* in his writings before and since. Finally, an essay 'Grundsätze des Denkens', published in a journal the same year – and not included in any subsequent edition of Heidegger's works – cites the line from the *Lao Zi*: 'Whoever knows his brightness veils himself in his darkness.'⁶³ If the jaded reader takes this as an ironical comment on Heidegger's attitude toward Light from the East, the less cynical commentator will still have to judge these few mentions of Daoist and Japanese thought as significant in their grudging paucity.

As if to supplement these scant references to Asian thought, Heidegger allows himself the occasional discussion of the possibility of dialogue between the Western and East-Asian philosophical traditions. Given his reticence concerning how much of his own thinking has appropriated from East-Asian thought, it is not surprising that one finds considerable vacillation in his position on the issue of inter-tradition dialogue.

In the essay 'Wissenschaft und Besinnung' (1953) Heidegger emphasizes that every meditation on the present situation must be rooted in 'our historical *Dasein*' by way of 'a dialogue with the Greek thinkers and their language' – and laments that such a dialogue has not yet begun.⁶⁴ He then adds, almost in passing: '[This dialogue] has hardly even been prepared yet, and remains in turn the precondition for our inevitable dialogue with the East-Asian world.' Despite its putative inevitability, doubts as to the very possibility of such a dialogue – based on the consideration that if language is the house of Being, 'we Europeans presumably inhabit a quite different house from the East-Asians' (*US*, p. 90/5) – are expressed by the Inquirer in the dialogue of 1954:

I do not yet see whether what I am trying to think as the essential nature [*Wesen*] of language is *also* adequate to the nature of East-Asian language – whether in the end, which would at the same time be the beginning, thinking experience can be reached by an essence of language that would ensure that Western European and East-Asian saying can enter into dialogue in such a way that there sings something that wells up from a single source [*Quelle*].

(*US*, p. 94/8)

Later in the conversation the Inquirer appears to be more sure that 'for East-Asian and European peoples the essential nature of language [*Sprachwesen*] remains quite different' (*US*, p. 113/23). The Japanese visitor, however, seems decidedly more sanguine. In talking about his experience of translating Heidegger's essay on Hölderlin's *Heimkunft* and some poems by Kleist, he says:

In the course of the translating it often seemed as if I were wandering back and forth between two different language-essences, and yet in such a way that every now and then something shone forth that made me think that the essential source [*Wesensquell*] of fundamentally different languages might be the same.

(*US*, p. 115/24)

Since 'the Japanese' in this dialogue is at least 90 per cent Heidegger, we can understand this discrepancy as representing ambivalence on the part of the author rather than a burst of objective reportage or a sudden ability to write dramatic dialogue.

The following year, in the context of a discussion of the possibility of 'planetary thinking' in 'Zur Seinsfrage', Heidegger remarks that neither side is equal yet to the encounters that the cultivation of planetary thinking will require: 'This holds equally for the European and East-Asian languages, and above all for the realm of their possible dialogue. Neither of them can by itself open up and ground this realm' (*Wegmarken*, p. 252). A hint of how this realm might begin to be opened up is given in a passage from the 1959 essay 'Hölderlins Erde und Himmel', where Heidegger speaks in vatic tones of the 'great beginning' of Western thought.

There can of course be no going back to it. Present as something waiting over against us, the great beginning becomes something small. But nor can this small something remain any longer in its Western isolation. It is opening itself to the few other great beginnings that belong with their Own to the Same of the beginning of the infinite relationship, in which the earth is included.⁶⁵

The opening anticipated here must at the very least be an opening to the 'great beginning' of East-Asian thought, wherever one locates it.

There is more talk of beginnings in the open letter of 1963 to Kojima Takehiko, where Heidegger writes of the necessity for a 'step back' (*der Schritt zurück*) if human beings are to escape the domination of *das Stellen* and find the way by which they can come into their own:

The step back does not mean a flight of thinking into bygone ages,

and least of all a reanimation of the beginnings of Western philosophy. . . . The step back is rather the step out of the track in which the progress and regress of *Bestellen* take place.

(*JH*, p. 224)

It is in the next paragraph of this letter that Heidegger talks about the immediate comprehension in Japan of his discussion of nothingness in 'What is metaphysics?' – which suggests that the step out of the progress–regress opposition that might be accomplished by our opening up to another great beginning could take us into the realm of nothingness as emptiness. This surmise is confirmed by a comment at the end of the letter, where he alludes to the possibility of a contemplative reconciliation with 'the still hidden mystery of the power of *Stellen*', which 'is no longer to be accomplished by Western European philosophy up till now, but also not without it – that is, not unless its newly appropriated tradition is brought on to the appropriate path' (*JH*, p. 226). Again the implication is that the reappropriation of the Western philosophical tradition will require a preliminary move out of it, optimally by way of a tradition untouched by the metaphysical ideas that gave rise to the modern Western world view.

Heidegger's next move with respect to this issue seems to be something of a *Schritt zurück*. In the 1966 interview that was posthumously published in *Der Spiegel*, his posture toward possible East–West philosophical dialogue appears negative and hints at a Eurocentric isolationism:

I am convinced that it is only from the same part of the world in which the world of modern technology arose that a reversal can come about, and that it cannot happen by way of an adoption of Zen Buddhism or any other oriental experience of the world. In order to think differently we need the help of the European tradition and a reappropriation of it. Thinking is only transformed by a thinking that is of the same descent and provenance.⁶⁶

The rejection of a wholesale substitution of Eastern wisdom for Western thinking is clearly unobjectionable. Nevertheless, quite apart from the question of how much Heidegger himself had 'adopted' from Zen Buddhism, the talk of a unilateral reappropriation of the European tradition rings somewhat hollow in view of the preceding pronouncements concerning the *unfeasibility* of precisely that – and the desirability of a bilateral approach involving East-Asian thought. One could have hoped for a more charitable attitude toward the possibility of our learning *something* from the Zen Buddhist tradition.

Suspicion that Heidegger may be speaking differently to a domestic audience and to the Japanese are confirmed by a passage written in 1968,

which appears to be his last remark on the topic. He is again optimistic about the possibility of opening up a realm for thinking dialogue between the cultures. In the foreword to the Japanese translation of his lecture 'Zur Frage nach der Bestimmung der Sache des Denkens', he writes:

By thinking the clearing and characterizing it adequately, we reach a realm that can perhaps make it possible to bring a transformed European thinking into a fruitful engagement with East-Asian 'thinking'. Such an engagement could help with the task of saving the essential nature of human being from the threat of an extreme technological reduction and manipulation of human *Dasein*.⁶⁷

Given the importance of that task, and Heidegger's dialogue with Japanese philosophers over a period of forty years, one would like to read the quotation marks around the second 'thinking' not as indicative of second-rate thoughts but as acknowledging a difference between equals – so that we could take this last word on the topic as definitive.

What are we to make of all this? In the course of putting together *Heidegger and Asian Thought*, I had the opportunity for a conversation with H.-G. Gadamer. I asked him why, in view of Heidegger's long-term acquaintance with and enthusiasm for Daoist thought (the question and response apply equally well to the case of Zen), there were so few mentions of Daoism in his published texts. He replied that a scholar of Heidegger's generation and calibre would be reluctant to write anything about a philosophy if he were unable to read the relevant texts in the original language. In view of the foregoing exposition, this response may seem disingenuous. It is, of course, possible to understand Heidegger's reticence as stemming from an intellectual modesty, from his being unsure whether he really understands these ideas from an alien tradition couched in a language he doesn't know. But on the other hand, he did have numerous opportunities (which he apparently seized with alacrity) to question several of the greatest Japanese thinkers of the century precisely about the basic philosophical ideas of the East-Asian tradition.

As mentioned at the outset, more research needs to be done in order to flesh out that part of the evidence that is at present circumstantial. In view of the success with which Heidegger's translation work on the *Lao Zi* was kept secret, little of substance is to be expected from his *Nachlass*, though records of books checked out from university libraries might provide pertinent information – as could, on the Japanese side, a perusal of diaries and letters written by the earlier Japanese visitors. It would be interesting, too, to learn the reactions of contemporary Heidegger scholars in Japan to the suggestion that the sympathetic resonances – so often remarked upon there – between Heidegger's thought and ideas

from the Japanese tradition may be due in part to his having been influenced by such ideas. If this possibility has not been seriously entertained in Japan, it is because of the awe in which Heidegger has traditionally been held there – and the thinker's guarded silence on the matter.

None of this preliminary presentation is intended to deny that Heidegger produced what may be the most profound, complex and influential philosophy of the twentieth century: the question is whether the provenance of that philosophy is as exclusively Graeco-Teutonic as its author would have us believe. Even at this stage of the investigation, the conclusion is unavoidable that Heidegger was less than generous in acknowledging how much he learned from the East-Asian (and especially the Japanese) tradition.⁶⁸ But what is most important here are the implications for how we read Heidegger's texts – especially as more and more comparative studies are undertaken, but also in the context of the Western tradition *simpliciter*. The possibility that he may have absorbed a considerable amount from a philosophical tradition that is relentlessly *unmetaphysical* prompts at the very least the adoption of a different perspective on Heidegger's claims – however justified they may be – to have overcome or subverted the tradition of Western metaphysics.

Notes

1 A notable treatment of the topic is Otto Pöggeler, 'West-East dialogue: Heidegger and Lao-tzu', in Graham Parkes (ed.), *Heidegger and Asian Thought* (Honolulu, 1987 – henceforth abbreviated as *HAT*), pp. 47–78, the range of which is considerably broader than the subtitle might suggest. The only extended study to have appeared so far is Reinhard May, *Ex oriente lux: Heideggers Werk unter ostasiatischem Einfluss* (Wiesbaden, 1989 – hereafter *EOL*). As the subtitle suggests, the book is restricted to the influence of *East-Asian* (Chinese and Japanese) ideas on Heidegger's thought; but then Heidegger appears to have had relatively little interest in Indian philosophy. Though some might find a few of its conclusions overdrawn, May's study is required reading for anyone interested in the sources of Heidegger's thinking. Since the main weight of this work is on the Chinese side, the present essay will place complementary emphasis on Japanese thought.

2 This is suggested by Hartmut Buchner in the introductory essay to his anthology *Japan und Heidegger* (Sigmaringen, 1989 – henceforth *JH*). This collection is an invaluable source on the relations between Heidegger and Japanese philosophers. Translations from this and other German texts will be my own.

3 Japanese and Chinese names will be given in the East-Asian order: family name first. Yamanouchi is cited as the first Japanese to study with Heidegger by one of his later students, Tsujimura Kôichi, in his speech on the occasion of Heidegger's sixtieth birthday (reprinted in *JH*, pp. 159–65).

4 There are now two English translations of this text, which will be referred to shortly: *A Study of Good*, tr. Valdo Viglielmo (Tokyo, 1960), and *An Inquiry into the Good*, tr. Masao Abe and Christopher Ives (New Haven and London, 1990). It may be fair to say that Nishida is the only major figure in Japanese

philosophy of the first half of the twentieth century *not* to have been deeply influenced by Heidegger (perhaps in part because he was twenty years Heidegger's senior).

5 See the discussion of Yamanouchi's critique in Nishitani Keiji, *Nishida Kitarô*, tr. Yamamoto Seisaku and James W. Heisig (Berkeley, Los Angeles, Oxford, 1991), pp. 198–205.

6 A brief account of Miki's relations with Heidegger can be found in Yuasa Yasuo, 'Modern Japanese philosophy and Heidegger', in *HAT*, pp. 155–74.

7 Ohashi Ryôsuke, 'Die frühe Heidegger-Rezeption in Japan', in *JH*, pp. 23–37, 27.

8 See Martin Heidegger, *Gesamtausgabe (GA)* 20 (Frankfurt, 1979), p. 403. Here the nothingness of *die Welt* is related, by way of the revelatory phenomenon of *Angst*, to the absolute nothingness of death in a way that prefigures the classic treatment in *Sein und Zeit* (§§49, 53, 57, 68b).

9 Heidegger, *GA* 61, pp. 143–8.

10 *GA* 63, pp. 31–2.

11 The only book of Tanabe's available in English translation is *Philosophy as Metanoetics*, tr. Takeuchi Yoshinori with Valdo Viglielmo and James W. Heisig (Berkeley, Los Angeles, London, 1986). A good collection of essays on one aspect of his multi-faceted thought is Taitetsu Unno and James W. Heisig (eds), *The Religious Philosophy of Tanabe Hajime: The Metanoetic Imperative* (Berkeley, 1990).

12 See *JH*, pp. 181–8. Yuasa (in *HAT*) discusses Tanabe only briefly, and his judgment that the influence of Heidegger on Tanabe is 'relatively small' may understate the case. Tsujimura Kôichi's claim that Tanabe maintained 'a thinking dialogue with Heidegger's thought until his [Tanabe's] death in 1962' (*JH*, p. 159) seems closer to the mark. See, for example, the references to Heidegger in Tanabe, *Philosophy as Metanoetics*, and also the brief discussion of Heidegger's influence on Tanabe by Ohashi in *JH*, pp. 25–6.

13 'Benshōgaku ni okeru atarashiki tenkō: Haideggah no sei no genshōgaku', *Shisō* (Tokyo), October 1924. A German translation of this essay can be found in *JH*, pp. 89–108.

14 Heidegger, *GA* 63, p. 114.

15 My friend Charles Guignon has made the very plausible suggestion that Heidegger's taking up the issue of death may also have been prompted by his reading of Luther around this period. Given Tanabe's interest in Christianity, this consideration would make it all the more likely that the two thinkers would spark one another's interest in the topic of death.

16 Tanabe Hajime, 'Todesdialektik', in *Martin Heidegger zum siebzigsten Geburtstag: Festschrift* (Pfullingen, 1959), pp. 93–133.

17 See Hans Waldenfels, *Absolute Nothingness*, tr. J. W. Heisig (New York, 1980), pp. 37–9. Nishida practised Zen meditation regularly during the ten years leading up to the publication of *An Inquiry into the Good* – although he apparently gave up formal sitting as he began to develop his own philosophy. The characterization of his enterprise as the attempt to work out a new philosophy of Zen Buddhism in Western philosophical terms is perhaps too simple, but it is not misleading.

18 See Nishitani, *Nishida Kitarô*, chap. 9, 'The philosophy of Nishida and Tanabe'.

19 See the foreword by James Heisig to Tanabe, *Philosophy as Metanoetics*, p. xi.

20 Nishida, *An Inquiry into the Good*, chap. 14 (James Heisig's translation in Waldenfels, *Absolute Nothingness*, pp. 40–1).

21 Nishida, *An Inquiry into the Good*, chap. 31 (Heisig translation, p. 41). Nishida's understanding of God, conditioned as it is by the Buddhist idea of *mu*, is one Heidegger would not have found uncongenial.

22 G. W. F. Hegel, *Wissenschaft der Logik*, Book I, sect. 1, chap. 1, C. *Werden*, 1. 'Einheit des Seins und Nichts', and *Anmerkung* 1. Heidegger quotes the first sentence with approval, though not without qualification, near the end of the essay 'Was ist Metaphysik?'

23 Quoted by May in *EOL*, p. 45. May also points out that Martin Buber writes in his edition of *Zhuang Zi* that Lao Zi 'overcomes the official wisdom [of his age] with his doctrine of "non-being"' (*Reden und Gleichnisse des Tschuang-Tse*, deutsche Auswahl von Martin Buber (Zürich, 1951), p. 185).

24 Max Scheler, 'Vom Wesen der Philosophie', in *Vom Ewigen im Menschen*, in *Gesammelte Werke* (Bern, 1954), vol. 5, p. 93.

25 Scheler, 'Probleme der Religion', in *Vom Ewigen im Menschen*, pp. 263–4.

26 Heidegger, *Unterwegs zur Sprache* (Pfullingen, 1959), p. 131; *On the Way to Language*, tr. Peter D. Hertz (New York, 1971), p. 37 (hereafter abbreviated as *US* followed by the page numbers of the German original and the English translation). The Inquirer says earlier (*US*, pp. 87/3) that he often discussed this question with Kuki Shūzō – whom we are about to meet.

27 Kuki then went back to Paris, and it was then that he came to know the young Jean-Paul Sartre. On this relationship, and other information about Kuki, see Stephen Light, *Shūzō Kuki and Jean-Paul Sartre* (Carbondale and Edwardsville, 1987 – hereafter *KS*), which also contains translations of some of Kuki's brief essays from the period just before he met Heidegger.

28 This acquaintance came at least in part from Tanabe's 1924 essay on Heidegger. See Ohashi in *JH*, p. 29.

29 According to the account of the original interlocutor, Professor Tezuka of Tokyo University, while Heidegger spoke of Kuki in the warmest terms, they spoke of him only briefly at the beginning of their talk – and Kuki's notion of *iki* was not a topic of conversation at all. Although Heidegger (in the *Hinweise in Unterwegs zur Sprache*) gives the date of composition of the dialogue as 1953/4, Tezuka's visit actually took place at the end of March 1954. Tezuka's account of the conversation, 'Haideggah to no ichi jikan' ('An hour with Heidegger'), is reprinted in the original Japanese with a German translation in *EOL*, pp. 81–99, and a different German translation is included in *JH*, pp. 173–80. Stephen Light cites a report to the effect that in 1957 Heidegger expressed (to Tsujimura Kōichi) his desire to write a preface to an anticipated German translation of one of Kuki's books – a significant desire when one considers that by that time Heidegger can hardly have been casting around for books to write prefaces for.

30 The final version of Kuki's best known work, '*Iki*' no *kōzō* (*The Structure of 'Iki'*), was first published in the journal *Shisō* in early 1929 and issued as a book the following year.

31 The texts of these lectures were published as a book, *Propos sur le temps*, in Paris in 1928; English translations can be found in *KS*, pp. 43–67. Kuki's mention of Heidegger's theory of temporality at the beginning of the first talk constitutes one of the earliest introductions of Heidegger's ideas in France – the discussion of which was later to become a major industry.

32 Imamichi Tomonobu, *Betrachtungen über das Eine* (Tokyo, 1968), p. 154. Okakura uses the term with reference to Daoism, calling it 'the art of being in the world' (see the chapter 'Taoism and Zennism' in *The Book of Tea*). Heinrich

Petzet quotes Okakura in the context of a discussion of Heidegger's acquaintance with Asian thought, though he does not say explicitly that Heidegger was acquainted with his writings; see Heinrich Wiegand Petzet, *Auf einen Stern zugehen: Begegnungen mit Martin Heidegger 1929–76* (Frankfurt, 1983), p. 177. Petzet does make it clear that Heidegger came to be very interested in Chinese and Japanese art, and he relates how, when he (Petzet) had to write a review of a large exhibition of Zen paintings and drawings, Heidegger 'brought [his] attention to the literature on the subject that seemed to him important' (*ibid.*, pp. 178–9).

33 The discussion in the dialogue with the Japanese about the pregnant gestures of Noh drama, where the Japanese demonstrates a gesture evoking a mountain landscape (*US*, pp. 107–18), echoes a line in Kuki's *propos* on Japanese theatre: 'Hands shading the eyes will make one think of a mountain landscape' (*KS*, p. 75 – Kuki is actually quoting from a French commentary: Albert Maybon, *Le théâtre japonais* (Paris, 1925)).

34 *Lao-Tse's Tao Te King*, translated from the Chinese, with Introduction and Commentary by Victor Von Strauss (Leipzig, 1870). Heidegger actually refers to this translation in an article published in a journal in 1958; see below, note 63. This edition, by the way, is probably the textual basis for Nietzsche's occasional remarks about Lao Zi. On the topic of Nietzsche and Asian thought, see Graham Parkes (ed.), *Nietzsche and Asian Thought* (Chicago, 1991).

35 *Reden und Gleichnisse des Tschuang-Tse*, tr. Buber (Leipzig, 1910). On Heidegger's familiarity with this text, see Petzet, *Auf einem Stern zugehen*, pp. 23–4; and also the discussions by Pöggeler and Parkes in *HAT*, pp. 52–6 and 105ff.

36 *Laotse, Tao te king: Das Buch des Alten vom Sinn und Leben*, translated from the Chinese with comments by Richard Wilhelm (Jena, 1911); *Dschuang Dsi: Das wahre Buch vom südlichen Blütenland*, translated from the Chinese with comments by Richard Wilhelm (Jena, 1912). Petzet, *Auf einem Stern zugehen* (p. 183) reports Heidegger's admitting to being a reader of Lao Zi and that he only knew the text through the mediation of Richard Wilhelm.

37 *Was ist Metaphysik?* (Frankfurt, 1969), p. 32. Page references in the next two paragraphs will be to this (tenth) edition.

38 Von Strauss translates: 'Denn/Seyn und Nichtseyn einander gebären', and Wilhelm: 'Denn Sein und Nichtsein erzeugen einander'; see, especially, Buber's *Reden*, pp. 62–71.

39 *Dao de jing*, chap. 4 (Von Strauss); chap. 4 (Wilhelm); chap. 14 (Von Strauss).

40 Both these themes are adumbrated in the dialogue with the Japanese, which was written the year before Kojima's visit. After a discussion of the emptiness (*Leere*) of the stage used in Noh drama, there is the following exchange:

Inquirer: The emptiness is then the same as nothingness, that Being [*jenes Wesende*] which we try to think as the Other to all presence and absence.

Japanese: Certainly. That is why we in Japan immediately understood the lecture 'What is Metaphysics?' when it reached us in translation in 1930. . . .

We are still amazed that the Europeans could misinterpret the nothingness discussed in that lecture in a nihilistic way. For us emptiness is the highest name for that which you would like to speak of with the word 'Being' . . .

41 It is important to bear in mind that Daoist ideas are an important element

in the development of Zen thought, in so far as Zen has its roots in Chinese (Chan) Buddhism and the Chinese assimilation of Indian Buddhism involved the incorporation of ideas from the indigenous philosophy. A consideration of Daoism at this point will also serve to fill out the picture given by May in *EOL*.

42 *Zhuang Zi*, chap. 17, in Buber, *Reden*, 'Die Freude der Fische', pp. 124–5. The best English translation, philosophically speaking, is A. C. Graham, *Chuang-tzu: The Inner Chapters* (London, 1981), p. 123. For a first-hand account of Heidegger's recitation of the text, see Petzet, *Auf einem Stern zugehen*, p. 24.

43 Heidegger, *Die Grundbegriffe der Metaphysik* (GA 29/30), pp. 295–310 (quotations from pp. 300 and 301). The discussion of the animal realm ranges from pp. 261–388. My colleague Ronald Bontekoe has pointed out that there are, of course, two thinkers from the German tradition who had dealt similarly with the question of the transposition of awareness: Wilhelm Dilthey and Max Scheler (with both of whose work Heidegger was familiar at this time). As in the cases of death and nothingness, I would like to suggest that influence from the Western tradition was complemented by East-Asian sources.

44 For a comparison of some ideas in Heidegger and Dögen, see Graham Parkes, 'Dögen/Heidegger/Dögen', *Philosophy East and West*, 37 (1987), pp. 437–54.

45 Nishitani, *Nishida Kitarō*, p. 116. The context of Nishitani's discussion of this passage in Nishida is interesting for the parallels it suggests with Heidegger.

46 There are very few uses of the verb *lassen* in *Sein und Zeit*, and most of those are in the compound *bewendenlassen* which refers to situating things in a context of *Zuhandenheit*.

47 *Brief über den Humanismus*, in *Wegmarken* (Frankfurt, 1967), pp. 168, 180.

48 *Dao de jing*, chap. 2 (tr. from Wilhelm) and chap. 48 (Von Strauss). The term *wu wei* occurs in eight other chapters of the *Dao de jing*: 3, 10, 37, 38, 43, 57, 63, 64.

49 It is also around this time, in the mid-1930s, that Heidegger turns his attention to the poetry of Hölderlin – the first of several German poets whose work will inspire his philosophical thinking. Later, in the *Letter on Humanism*, he writes: 'We have hardly begun to think the mysterious relations to the East that have been given voice in Hölderlin's poetry' (*Wegmarken*, p. 169). My colleague Manfred Henningsen has suggested that Heidegger's turn to Hölderlin was in part a reaction against the events of 1933–4 and a defence against the subsequent co-option of his work by the National Socialists. See, also, Otto Pöggeler's discussion of Heidegger's interest in the poets in the light of his acquaintance with Daoism (*HAT*, pp. 62–8).

50 Heidegger, *Einführung in die Metaphysik* (Tübingen, 1966), p. 20; *An Introduction to Metaphysics*, tr. Ralph Manheim (New Haven, 1953), p. 26. Heidegger's keen interest in Bashō is attested by Tezuka Tomio (*JH*, pp. 174, 179) and Tsujimura Kōichi (*JH*, p. 265). See also the discussion of Bashō in a Heideggerian context in Michiko Yoneda, *Gespräch und Dichtung: Ein Auseinandersetzungsvorversuch der Sprachauffassung Heideggers mit einem japanischem Sagen* (Frankfurt, 1984), pp. 186–225.

51 Heidegger, *Einführung in die Metaphysik*, pp. 58, 29, 43; *An Introduction to Metaphysics*, pp. 76, 38, 57. For further discussion of this topic, see Graham Parkes, 'From nationalism to nomadism: wondering about the languages of philosophy', in Eliot Deutsch (ed.), *Culture and Modernity: East and West* (Honolulu: University of Hawaii Press, 1991), pp. 455–67.

52 Graham Parkes, 'Thoughts on the Way: *Being and Time* via Lao-Chuang',

in *HAT*, pp. 105–44, especially the ‘Epilogue’. Footnote 9 stands in need of revision: as Reinhard May has pointed out, the Buber edition of the *Zhuang Zi* was first published in 1910, not 1921; and so there was ample time for Heidegger to discover the text (perhaps as a result of his talks with Kuki Shūzō) and assimilate its ideas by the time he wrote his own texts of the mid-1930s.

53 See Richard Wilhelm, *I Ging: Das Buch der Wandlungen* (Düsseldorf, 1970), pp. 14–16, 25, 30, 272–6. The assumption that Heidegger had read the *I jing* is not necessary: he could have gleaned an adequate sense of the ideas in question from his readings of the other Daoist classics, and especially from the commentaries of the translators or editors.

54 ‘Der Ursprung des Kunstwerkes’, in *Holzwege* (Frankfurt, 1972), p. 41; *Poetry, Language, Thought*, tr. Albert Hofstadter (New York, 1975), p. 53.

55 See ‘lining’ in the glossary of Robert Schinzinger’s translation of Kitarō Nishida: *Intelligibility and the Philosophy of Nothingness* (Honolulu, 1966), which includes a translation of the 1928 essay ‘Eichiteki sekai’ where this expression occurs. Since Kuki mentions Nishida several times in his *propos* of 1928 – in ‘Bergson in Japan’ (*KS*, p. 72) and at the end of ‘General characteristics of French philosophy’ (*KS*, p. 97) – he surely discussed Nishida in his talks with Heidegger. D. T. Suzuki reports that in a conversation with Heidegger in 1953 he asked him what he thought of Nishida’s philosophy; Heidegger’s response was: ‘Nishida is Western’ (‘Erinnerung an einen Besuch bei Martin Heidegger’, in *JH*, pp. 169–72). Since only four essays by Nishida had appeared in German at the time – three of them in a well-nigh unintelligible translation – this judgment of Heidegger’s was probably based on conversations about Nishida with his Japanese visitors.

56 Heidegger, *GA* 5, pp. 70–4; editor’s note, p. 377. I am grateful to a correspondent, Holger Krüger of Essen, for bringing the following remark from the *Zusatz* to my attention.

57 Two of Nishitani’s works containing some discussion of Heidegger have been translated: *Religion and Nothingness*, tr. Jan Van Bragt (Berkeley and London, 1982), and *The Self-Overcoming of Nihilism*, tr. Graham Parkes with Setsuko Aihara (Albany, 1990). This latter text devotes an entire chapter to Heidegger’s thought, although – written a dozen or so years earlier than *Religion and Nothingness* – the Heidegger in it appears comparatively ‘undigested’.

58 *Zen: Der lebendige Buddhismus in Japan*, ausgewählte Stücke des Zen-Textes, tr. Schuej Ohasama (Ohazama Shuei), ed. August Faust, with a foreword by Rudolf Otto (Gotha/Stuttgart, 1925). See also Parkes, ‘Introduction’ in *HAT*, pp. 9–10.

59 In an appendix to the Japanese translation of ‘Aus einem Gespräch von der Sprache’, Tezuka Tomio recalls how during his meeting with Heidegger in 1954, the latter brought the conversation around to a *haiku* by Bashō he had read in translation:

He asked me about the poem in Japanese and posed a number of perspicacious questions about the special nature of Japanese thought as it manifests in language and in art. During my rather inept explanations it seemed as if various thoughts occurred in rapid succession to this prominent thinker. He took notes with great zeal.

(*JH*, p. 179)

See also the remarks by Paul Shih-yi Hsiao in *HAT*, p. 98.

60 See May’s discussion in *EOL*, especially pp. 25–36; also Yoneda, pp. 88–96.

As mentioned earlier, Tezuka Tomio's account of the conversation is indispensable for an informed reading of Heidegger's dialogue. Yoneda (p. 91) cites a note appended by Tezuka to his Japanese translation of the text, in which Tezuka says that he did not know Kuki personally or attend his lectures, that he himself was actually not very conversant with Heidegger's writings, and that he could not have uttered many of the things ascribed to the visitor from Japan.

61 *Identität und Differenz* (Pfullingen, 1957), p. 25; *Identity and Difference* (New York, 1969), p. 36.

62 See Paul Shih-yi Hsiao, 'Heidegger and our translation of the *Tao Te Ching*', in *HAT*, pp. 93–104. On how well kept a secret this translation work was until Heidegger's death, see *EOL*, p. 19, n. 37. This secrecy may account for the fact – strange in view of how much of Heidegger's *Nachlass* has been preserved – that no written record of his summer's work with Professor Hsiao has been found.

63 'Grundsätze des Denkens', *Jahrbuch für Psychologie und Psychotherapie*, 6 (1958), pp. 33–41. Heidegger cites chap. XVIII of the Victor von Strauss translation, but the lines in question occur in chap. XXVIII.

64 *Vorträge und Aufsätze* (Pfullingen, 1967), I, p. 39; 'Science and reflection', in *The Question concerning Technology and Other Essays*, tr. William Lovitt (New York, 1977), p. 158.

65 'Hölderlins Erde und Himmel', *Hölderlin-Jahrbuch*, 11 (1958–60), p. 36; quoted in *EOL*, p. 68.

66 'Nur noch ein Gott kann uns retten' (1966), reprinted in G. Neske (ed.), *Antwort: Martin Heidegger im Gespräch* (Pfullingen, 1988), p. 107.

67 *Kôza-Zen*, 8 (Tokyo, 1968), pp. 321f.; reprinted in *JH*, pp. 230–1.

68 Hans A. Fischer-Barnicol reports that Heidegger once said to him, after remarking that from early on he had worked with Japanese philosophers, that 'he had nevertheless learned more from Chinese [visitors]' (*Erinnerung an Martin Heidegger*, ed. Günther Neske (Pfullingen, 1977), p. 102). This is an extraordinary remark for Heidegger to have made – and perhaps a revealing one – in view of the fact that none of his Chinese visitors came close, as philosophers, to the calibre of Tanabe, Miki, Kuki or Nishitani.

Does the saving power also grow? Heidegger's last paths

Otto Pöggeler

The one hundredth anniversary of Martin Heidegger's birth is also a conspicuous reminder that Heidegger's life slips ever more deeply into the past. In order for Heidegger's thought to have an influence, the tasks towards which he sought an approach must first be more clearly understood. Through his publications Heidegger exerted an influence upon people who never had personal contact with him. The force of the appeal lay in the concentrated earnest with which he forced himself and fellow philosophers into the decisive questions of human life. The systematic elaborations remained fragments; the confrontation with the history of thinking was the contrary of historical erudition, but also often an overlooking of concrete historical reality. Yet Heidegger's effect was due to the impetus he stimulated and he thereby elicited significant accomplishments from others: work as various as the new theological approach of the Bultmann school and Oskar Becker's philosophy of mathematics or the work on the metaphysical tradition and the relation to a painter like Cézanne. In the conversations which extended beyond the preliminaries of the first hours, Heidegger tried to steer his interlocutor towards his own path. For that reason the best encounters with Heidegger perhaps have been such conversations.

Each person takes from these conversations that which corresponds to his or her own horizon of expectations. Conversations across several days in Freiburg in 1959 and 1961 helped me of course above all to prepare the presentation which then appeared in 1963 as *Der Denkweg Martin Heideggers*.¹ Since this presentation was originally supposed to contain also a second part with confrontations on several exemplary topics, I submitted for discussion for example (each time after consulting with Oskar Becker in Bonn) the question of whether Heidegger did not overlook the achievements of mathematics and thereby also portray technology in a skewed light. Heidegger was so interested by these questions

that he sought out Becker in Bonn for a personal conversation.² In terms of art, Heidegger above all commented on Paul Klee in our conversations, and I in turn alluded to the lyric poetry of Paul Celan. However, my question concerning certain formulations in Hölderlin's hymn 'Der Einzige' made it clear for me that Heidegger did not follow Hölderlin's last steps. During a return visit (which was enriched by the presence of Keji Nishitani) Heidegger read us his 1964 lecture 'Das Ende der Philosophie und die Aufgabe des Denkens';³ the visit concluded with Heidegger reading the 'Eisgeschichte' from Stifter's story 'Die Mappe meines Urgroßvaters'.⁴ The celebration of Heidegger's eightieth birthday in the Heidelberg Akademie took place (after Heidegger suffered a serious illness) at a time which had lost contact with Heidegger's questions, and therefore placed academic discussions in the foreground. The conversational openness was again present in the last personal meeting in the Spring of 1972. Because of American experiences, but also due to German initiatives, I raised the question of whether the scientific-technical world by its own constitution could come to a test of the necessary and the dangerous; Heidegger's resolute exhortation was to position oneself immediately in the confrontation with this world – without the detour into digressive and deferring discussions of the 'history of Being'. The liveliest attention and agreement centred on considerations of the relationship of Paul Celan to Friedrich Hölderlin. Heidegger was contemplating undertaking an edition of his works. Was Heidegger not exterior to the impetus of the times? Shortly before his death, I thought I'd bid him farewell in an appropriate fashion with a greeting from Delphi.

When Heidegger edited his Nietzsche lectures and texts,⁵ he finally gave up the attempt to produce the documented path of his thinking in a larger introduction. With that it was clear that it wasn't Heidegger's concern to comprehend retrospectively the path of his thought and to relate it to the themes and questions of the present. Rather he sought to develop further his thought in the immediate confrontation with the specific questions already posed. In 1959–60 the 70-year-old philosopher left no doubt that his task lay before him: to provide that essential main work, for which he had collected all his thoughts, but for which he lacked a language. The lecture 'Der Weg zur Sprache' of 1959⁶ says of Wilhelm Humboldt that he worked on his study of the diversity of human language, according to his brother, 'alone, in the vicinity of a grave' until his own death. Humboldt was able to find a popular influence through his letters to a friend and through his sonnets; yet the pioneering treatise always lay ahead. Are we lacking Heidegger's last work? Seminar protocols and occasional writings indicate yet another modification of approach; moreover Heidegger left behind him a wealth of drafts and notes. Yet is that an *opus posthumous*? We cannot yet know the answer.

In his first forays, Heidegger had combined the metaphysics of med-

ieval Aristotelianism with Kant and Hegel. However, by the First World War he was already concerned with a hermeneutic of factual experience of life and wanted to develop it by means of a remodelling of phenomenological philosophy. Aristotle could be a teacher in a new way, since, in the sixth book of the *Nicomachean Ethics*, he also ascribed to the situational orientation here under the changing moon an *aletheuein* and therefore a particular *logos*. Could a formal-indicative hermeneutic, an existential conceptuality, provide access to the situation, even to the liminal situation (*Grenzsituation*) and the unavailable *kairos*? With this the question of Being and time was raised anew. Yet in 1929 Heidegger earnestly proposed that the guiding sense (*Sinn*) of Being in Aristotle must not be defined as *ousia* (as Brentano maintained), but rather as *energeia*, which bears in it potential and therefore is a being-at-work (*Am-Werk-sein*). Doesn't this being-at-work assert itself as unbridled technology, as the total mobilization of all energies, as Ernst Jünger suggested? Does man touch the mythical, which gives his life meaning, perhaps only still in art, which has not shed its cultic rootedness? Heraclitus, so imputes Heidegger, posed the question of a Being, which (somewhat as the linguistic root indicates, in that it still bears the 'I am') is also at once a Becoming – namely that *physis* to which the *aletheia* belongs. Nietzsche alluded to this dimension when he conceived of that which is particularly Greek as the antagonism between the Dionysian and the Apollonian, i.e. when he wanted to wrest the forms of Being from Becoming itself. Hölderlin developed this approach more purely, in that he comprehended the eternity of the divine as the 'stride past' (*Vorbeigang*), which always has its own respective place and hour, and therefore cannot be opposed to time. When the struggle of the great totalitarianisms for world domination openly took the stage in the Second World War, Heidegger in the Nietzsche lectures of 1940 no longer analysed 'Idealism' as the failure of truth, but rather 'Nihilism'. The 'seinsgeschichtliche Bestimmung des Nihilismus'⁷ from the sombre years of 1944–6 appears to combine Nothing and Being in an almost mystical fashion. What 'mystical' might mean here Heidegger clarified for himself when he began to translate Lao-Tzu in 1946–7. And thus from the Bremen lectures of 1949⁸ onward he could interpret the world in its contemporary constellations from the antagonism of 'enframing' (*Gestell*) and 'the fourfold' (*Geviert*). Is that which is here called *Gestell* still conceptualized from that disposal (*Verfügung*) of being (*das Seiende*) in the representing (*Vorstellen*) and delivering (*Zustellen*) of Being, which Husserl treated as the original foundation of philosophy through Plato and Descartes? How can the co-presence of the divine and the mortal in the fourfold today indicate the saving power (*das Rettende*)? Obviously Heidegger felt himself called upon by the age to rethink yet again his

philosophical approach, namely to juxtapose art to world civilization and its technology or 'artificial intelligence' in a new way.

Though it remains today still premature to say anything completely reliable about the paths taken by Heidegger in the last twelve years of his life, this paper will briefly consider two texts from this period: the *Spiegel* interview of 1966 and the Athens speech of 1967. With all the provisionality rightly reserved for the genre of the discussion, these texts will be used to put a question to Heidegger's thought: does the care (*Sorge*) for the proper (*das Eigene*) and the authentic (*das Eigentliche*) not lead to the premature rejection of the contemporary world as a closed structure (*Verschlossenheitszusammenhang*), and thereby as well to an inappropriate definition of the co-operation (*Miteinander*) of art and technology? When Heidegger used the fame which *Being and Time* brought him to break out of academic philosophy, this question of art and technology as a decisive one had fallen to him. The following reflections should make clear that Heidegger even on his final path yet again thought through this question anew.

I Two late texts

On 23 September 1966, three days before his seventy-seventh birthday, Heidegger was interviewed by the news-magazine *Der Spiegel*. According to the agreement the text was to be published only after the philosopher's death; at that time it had a worldwide echo as scarcely any other text.⁹ A passage from the discussion's minutes, which was replaced by a less personal formulation at Heidegger's request, portrayed the aged philosopher at work, endeavouring to introduce his fellow-thinkers into the essential questions, and thus to bring them onto his path of thought: 'I believe I am on the path, though I don't know whether I will complete it.' Heidegger elucidated what provoked him to his work when in May 1976, a few days before his death, he sent the *Spiegel* editor Georg Wolff his manuscript 'Modern natural science and modern technology' ('Neuzeitliche Naturwissenschaft und moderne Technik') with the dedication: 'A question as of yet unthought' (*Eine noch nicht bedachte Frage*).¹⁰ The confrontation with the 'unbridled beast' (as Heidegger put it in his last Marburg lecture) had at least since the crisis Winter of 1929–30 pushed Heidegger in a direction which also made possible the temporary alliance with the National Socialist Revolution. That Nietzscheanism, which at once both joined and juxtaposed life and spirit (*Geist*) to each other, seemed to conceptualize the constellation of the time: a new transfigured figure (*Gestalt*) for the pain of becoming (*das Werden*) was to be wrested out of the antagonism of the Dionysian and the Apollonian. However, with the young Nietzsche's thoughts on art,

Heidegger sought not only an historical greatness in a world reconfigured by myths; he also accepted how the later Nietzsche juxtaposed Dionysus against the world-negating Christian eschatology, yet nevertheless proclaimed the death of traditional God. Ernst Jünger at that time gave this Nietzscheanism the final edge: in the total mobilization of all energies was to be won that contact with the 'mythical' which also through death in the *matériel* battle was to enable the experiencing of the identification with a meaning-giving and surviving figure (*Gestalt*): the soldier and the worker.¹¹ When Heidegger broke off his direct political engagement, he saw the constellation of the times more validly addressed in Hölderlin's discourse of the truth, which eventuates (*sich ereignet*) despite the 'long' time. The Germans, this restless and threatened people (*Volk*) in the endangered midst of Europe, appeared called upon to find a new future from its relationship to the Greeks. Yet even before National Socialism openly trod the path of struggle for world domination, Heidegger, in the lecture course *Einführung in die Metaphysik* from Summer 1935,¹² posited the retrograde tie (*Rückbindung*) of the still only mechanical mobilization and organization to the question of race alongside the retrograde tie of Bolshevism to the notion of 'class', although also in tandem with the collusion of groups in Western liberalism. Heidegger labelled all of these externalized formations of a common life as being completely oblivious to the actual task at hand. The *Spiegel* interview of 1966 repeats this view of things: National Socialism, as it were, had 'gone in the direction', of searching for a relationship to the essence of technology; 'these people, however, were far too unreflective in thinking to attain a truly explicit relationship to that which today happens and which is underway for the last three centuries'.

In a famous annotation to the lecture course from Summer 1935 Heidegger contrasted the actual National Socialism with its 'inner truth and greatness', namely the attempted confrontation with modern technology; the *Spiegel* interview still claimed an 'inner truth' for the confrontation of poetry and thought (*Dichten und Denken*) with the destiny (*Geschick*) which determines our time. The universal scientific-technical grasp (*Zugriff*) of what is (including the human being), should be shown its limits; in the Being of beings the withdrawal (*Entzug*) should be found, which withdraws the assigned (*das Zugewiesene*) from disposal (*das Verfügung*) and thereby allows to flash up that which grants meaning and binds, which is named the holy and the divine. Metaphysics, which found its culmination in a philosophical theology,¹³ is dismissed as an illusion. Thus Heidegger maintains that philosophy and in general 'all the merely human musings and endeavours' on their own cannot bring about a direct transformation of the present state of the world.

Only a god can yet save us. The single possibility remaining for us is

in thinking and in poetry to prepare a readiness for the appearance of god or for the absence of god in the downfall; that we go down in the face of the absent god.

Heidegger says only 'a' god, but that means: a 'god' such as showed itself high over the city of Athens in the meaning-bestowing form of Athena of the Parthenon and who orientated the entire life of the *polis*. Thus art as a counterforce to the technological disposal (*Verfügung*) comes into play, an art which still or once again possesses a cultic significance for life. The question remains of whether we are vouchsafed such an art, which allows the saving power to appear or which wakens a preparedness for it. Does Heidegger in the cited sentence mean that the 'appearance of god' (*Erscheinung des Gottes*) could save, but the 'absence of god' (*Abwesenheit des Gottes*) is ensnared in a downfall, which after the self-destruction of Europe as the former centre of the world also distorts the essence of man itself there? A few sections later Heidegger speaks of the 'preparation for the readiness of one's self-exposure for the arrival or the absence of god' (*Vorbereitung der Bereitschaft des Sich-Offen-Haltens für die Ankunft oder das Ausbleiben des Gottes*): 'Also the experience of this absence is not nothing, rather a liberation of man from that which in *Being and Time* I called the deterioration to being [*das Seiende*]'. In any case this indicates that one cannot reckon history according to happy or unhappy peoples or periods. He who flounders can also learn what he should have lived by, and towards which task his life was actually oriented. In its very downfall Europe can teach the world something! The Greeks knew that the downfall of a tragic figure is no mere loss: in her downfall Antigone showed a new experience of the divine, through which another time could be born (at least in Hölderlin's translation and reinterpretation of this tragedy, which was definitive for Heidegger).¹⁴

Half a year after the *Spiegel* interview, on 4 April 1967, Heidegger took his leave from public activity before the Academy of Sciences and Arts. His speech 'The provenance of art and the determination of thinking' ('Die Herkunft der Kunst und die Bestimmung des Denkens')¹⁵ reminds the age of the sciences and technology that the Greeks founded as the beginning for the Western European sciences and arts. The inception (*Anfang*) of a destiny (*Geschick*) however is the greatest power, which prevails before all belated followers and also awaits us as the future. Athena, 'the erstwhile protectress of the city and the country', is to accompany the lecture. The first step of the speech asks: what does the goddess say of the provenance of art? Athena is she who advises in manifold ways (in Homer, in the metope of the temple to Zeus in Olympia). For that reason she could assist those who weren't yet technicians but also not mere craftsmen (*Handwerker*), that is, the artists.

Besides the *techne* the *technites* needed a knowledge (*Wissen*) which looks ahead toward the standard-rendering invisible power (*das maßgebende Unsichtbare*). Athena can bestow counsel because she has the shining bright eye that also penetrates the night and renders the invisible visible. She who gives counsel and illuminates at once is also the meditating one (*die Sinnende*). She gazes at the border stone (as in the holy relief in the Acropolis museum). Only from the border does that, which is, find its essence: the mountain and the island, the glistening olive tree as the goddess's gift to her country. The *techne* belongs to the rising (*das Aufgehen*) and the abiding (*das Verweilen*), that is, to the *physis*. In order for *physis* and *techne* to come together, an element is needed, which even archaic Greece only cautiously touched on: the lightning of Zeus, which directs everything. According to Aeschylus, Athena guarded the key to the house in which this lightning lies locked and sealed.¹⁶ Thus could art earn its provenance from the rule of this goddess.

In a second step of the speech Heidegger needs to prove that the gods have fled: 'Delphi slumbers' (*Delphi schummert*). Art is no longer work (*Werk*) in the sense of Heidegger's artwork essay.¹⁷ Art no longer provides through its works the orientation to 'a world of the folkish and the national' (*eine Welt des Volkhaften und Nationalen*); rather art now belongs with the sciences and technologies in a 'world civilization'. In the world of this civilization science itself, to speak with Nietzsche, has been conquered by method, namely by the secured disposal (*Verfügung*) of all that is. Method unfolds as cybernetics. As futurology, cybernetics also draws into the programmable the single possibility of interference, the apparently free human action. The presupposition of these cybernetic-futurological graspings is the society which, relying exclusively on itself and its power of disposal (*Verfügungsmacht*), posits itself as an industrial society above its institutions as the constructed spheres of the lived world. In a third step Heidegger asks from where in this world a thinking might come which can reflect upon the provenance of art. Cybernetics encloses the human being and his relations to the world in the most extensive feedback control system of inter-relation between human and world; the futurology brings that captivity into the programmable, and the industrial society exists only 'on the basis of its incarceration within its own construct' (*auf dem Grunde der Eingeschlossenheit in ihr eigenes Gemächte*). Does modern art as well fall prey to the self-regulating artistic process? In that case, the claim, from which it lives, comes from the scientific-technological world; art too becomes an autonomous (perhaps compensatory) feedback of information in the feedback control system of industrial society. Heidegger searches for another path. Indeed he must ask whether the hope, as it is posited by Ernst Bloch as a principle,¹⁸ is 'not the unconditional selfishness of human subjectivity'. But even Heidegger does not want to renounce world civilization, rather he wishes to take a

step back from it; and from the distance gained he wants to perceive it as a destiny (*Geschick*), without being pulled back into its tendency towards its self-enclosedness (*Sichverschließen*). For that reason he recalls the inceptive (*das Anfängliche*), that from which art could become art, yet also that from which thinking (*das Denken*) is claimed, if it accepts that which was foretold, yet which remained unthought. The Greek light, which sets everything within its borders, indicates a concealment (*Verborgenheit*), which conceals, in that it reveals (*entbirgt*) at the borders. The temporal period of this unconcealment is a clearing (*Lichtung*); yet this clearing is not only light (*Licht*) (as the metaphysics of light and reason intended), but also at the same time darkness; one can also stride through darkness. The word *aletheia* points in this direction, yet this indication in the age of nuclear physics, genetic technology and astronautics must remain something slight and inconspicuous. Heidegger however can end his discourse with a verse of Pindar: the word determines life further in time than the deeds, if language brings it up out of the depths of the meditating heart.¹⁹

II Technology and politics

Heidegger's thought struck a chord, because it was not learned discussion, specialized analysis or hasty actualization, but because with concentrated seriousness it led to first and last questions, and thus from the point of view of the one and only question of Being problematized the possibility of philosophy itself. Under a certain necessity Heidegger was led to return to the beginnings of philosophy in the tragic age of the Greeks; he saw this beginning of thinking in close proximity to poetry (*Dichtung*), especially tragedy. One notices in Heidegger's Athens speech that it addresses the Greeks as the founders of our science and arts, but then does not speak of the philosophy and sciences of the Greeks, rather it elucidates the definition of thinking from the provenance (*Herkunft*) of art. Heidegger proceeded in this way, because he increasingly tended to the conviction that the beginning of thought was unable to incorporate its inceptiveness (*Anfänglichkeit*) into itself and therefore was unable to comprehend itself from out of the event (*Ereignis*) of truth. Thus philosophy was able to become the metaphysical grasp of being (*das Seiende*); it was of itself and with the sciences defined as 'technical' (*technisch*). Plato's doctrine of ideas is seen in this way in the light of Nietzsche's reflections on the history of nihilism, even though Nietzsche himself thereby becomes more and more hopelessly entangled in the metaphysical viewpoint. Thereby thinking (*das Denken*) itself cannot wish to remain 'Greek', but rather must lead its inception, which forgot its inceptiveness, to another inception. One of the last achievements of

bourgeois culture, tourism by ship, made it possible for Heidegger at an advanced age to visit the sites of the erstwhile Greek life, for example, on the first trip in April 1962, to walk through the lion's alley (*Löwenalle*) in Delos. Yet his very visits to Greece led Heidegger to revise his endeavours to think the beginning of thought: in the last of his four *Seminare* (1973 in Zähringen)²⁰ Heidegger made it known that he had again changed his interpretation of Parmenides. In Parmenides too there was no trace of the concealing (*Verbergung*) in the unconcealment (*Unverborgenheit*) and thus no trace of the essence of *aletheia*! That was a revocation of the approach with which Heidegger in his 1932 lecture course on the beginning of Western philosophy had articulated a new passage in this path of thought; without any support from the earliest obliterated traces Heidegger had to develop his theme, the clearing for the self-concealing (*Lichtung für das Sichverbergen*). Was not thereby the uni-linear drama of the history of Being also given up, which saw this history of thought yet again 'substantially', that is, solely from the vantage point of the single posited and failed task (of thinking)? For Heidegger's thesis, that the modern natural sciences are already technical in their very approach, one can also adduce parallel reflections in Max Scheler and the neo-Marxists. The development of the nuclear sciences and technologies especially is a convincing example that the scientists are, to a large extent, powerless and helpless, caught in the net of political and economical forces. One can find an early intimation of the victory of method over science in the conclusion of Hegel's *Logic*, where method is absolutized into the development of one logical relationship.²¹ The young Marx related the self-sufficient industrial society to a utopian goal, when in his Paris manuscripts for the public ownership of production and a humanized nature he proclaimed even the ontological proof of God.²² None the less the question arises of whether the first thesis of the victory of method over science is too undifferentiated and thereby finally false. When Heidegger locates the technical approach in modern natural sciences in its mathematicalization, then it must be noted that the Greeks had already made the move to pure mathematics and that Hellenistic astronomy created a mathematical natural science that is not a technical grasp. In point of fact the modern scientific approach is characterized by the analytical experiment which, for instance in the case of motion, abstracts the effective forces of resistance (such as friction) and thus through a methodological abstraction arrives at 'pure' phenomena and their laws. The methodology relativizes scientific labour towards the conceptualization of delimited and abstracted characteristics of reality; for this reason as well Heisenberg's later endeavours will be misunderstood, if they are characterized in a vulgar fashion as a struggle for a totalized 'universal formula'. In his lecture 'The question concerning technology',²³ Heidegger imputes to Heisenberg the thesis that in a

physics which takes account of the physicist and his experimental structure, man only encounters himself. Heisenberg however had to contradict this radicalization: physics, in its methodological abstraction and in the critical knowledge of its own boundaries, only interprets certain aspects of our being-in-the-world; the Platonic doctrine of ideas and the correctly understood mathematicalization have abiding validity for this comprehension of reality and exist on good terms with the interpretation of reality by artistic productions.

Being and Time in its confrontation with the Greeks sought to elaborate philosophically a 'science of Being', and thus to make possible a logical and existential differentiation between sciences such as physics, history and theology. Later Heidegger conceived of scientific labour as a single unified process which, as a grasping of the world in itself, is technical and thus inextricably linked with technology. Yet when the essay 'Die Frage nach der Technik' attempts to discuss and situate technology in its 'essence', then technology is interpreted not anthropologically or instrumentally, but ontologically. Technology (*die Technik*) is a disclosure (*Erschließung*) of being (*das Seiende*) according to its Being and therefore indicates the constellation of the truth of Being itself. The modern science of atomic energy would be impossible without nuclear technology; it is bound up with the dangers of military and industrial uses of this technology, yet it also discloses unfamiliar underlying dimensions of reality itself. However, such an articulated knowledge remains here limited to certain aspects of our being-in-the-world, and only this methodological abstraction leads to the disclosure of reality its scientific character. The uncanniness of the newly disclosed dimension of reality reminds man drastically of his powerlessness and finitude; the struggle against the dangers made possible by this new technology indicates that this human finitude has its practical dimension.

When Heidegger speaks of cybernetics, then he is indirectly recalling that the mathematical physics cannot sustain unchallenged the role of a paradigmatic science, as it was earlier believed. If biology has received a new significance, then genetic technology indeed demonstrates the advance of mechanistic ways of thinking; yet along with these tendencies in microbiology can be found the holistic characteristics of macrobiology, which on the other hand speaks of the uniqueness and the unavailability (*Unverfügbarkeit*) of life and its 'niches'. Astronautics as well reminds man of the limits of his expansion into space and of the openness and inexplicability of his situation (if there were a conversation, indeed an encounter with other intelligent beings in the universe, then the situation of humanity would drastically change). In the *Spiegel* interview Heidegger finds terrifying the televised view of the earth from the moon, and sees it as an indication of the deracination of man; but doesn't this image also show how improbable and how full of beauty, though also full of

dangers is this niche of life on this small blue planet? Nowhere is the concrete technology the unfolding of a single will to power which, eternally recurring, wills itself and thereby demands from humanity its self-sufficient 'industrial society'. This totalizing discourse of society perhaps conceptualizes a tendency in contemporary humanity; but a critical analysis of society must proceed with greater differentiation and can then relinquish such discourse to the vulgar beliefs, which have nothing more to do with science.

Nietzsche saw in the philosophers of the tragic age of the Greeks the testimony that philosophy could also exist among a 'healthy' people. Philosophy in this sense however presupposes the unitary style of a culture. Such a unitary style Heidegger finds only in the negative characteristics of a world civilization. Politics becomes meaningful only when it makes possible through its guaranteeing of delimited life-spheres a disruption of this disastrous universal network. Before the question therefore, of how the present world is apportioned into various dominions, is the question, for instance, of how the opposition of technology and art is vouchsafed a necessary scope of action. The *Spiegel* interview does not want to decide whether one day in China and Russia 'ancient traditions' (*uralte Überlieferungen*) will not contribute to 'making it possible for man to have a free relationship to the technical world'; it is significant that the hopes for the USA are more subdued. Heidegger, who in 1937 in the last public gesture of communication in a newspaper article had called for 'paths towards discussion' (*Wege zur Aussprache*)²⁴ with France, worked further toward a German-French encounter after the self-destruction of Europe; admittedly Heidegger, who in *Being and Time* still constructed the central concepts of the 'temporal interpretation' with words derived from Latin, wanted to oblige Romance language philosophy to a thinking in the original Greek and its echoed articulation in German. The resistance to the 'unbridled beast' of technology can be formulated with words of Heidegger's friend, the French poet René Char, the 'poet and resistance fighter', who let Hölderlin echo in the pathos of his poems and who united his native Provence with the Mediterranean realm and with Greece:

In Provence rocket bases are now being built, and the country is being devastated in an inconceivable fashion. The poet, who certainly is not to be suspected of sentimentality or a glorification of the idyllic, told me, the deracination of man, which there is taking place, is the end, if poetry and thought do not once again come to non-violent power.

The question remains, whether this 'contra' (*Gegen*) can be translated into a reasonable political *praxis*. In the *Spiegel* interview Heidegger maintains: 'It is a decisive question for me today how a – and which –

political system can be related to the technological age. I have no answer to this question.' The next clause is indeed fearful: 'I am not convinced that it is democracy.' Heidegger, who at least supported his students in their endeavours to create a new relationship between philosophy and politics, had for himself as well not completely ruled out political activity. Thus, despite the abstinence he imposed upon himself in the political realm after his aberration (*Verirrung*) in 1933, Heidegger joined a people's referendum in late 1975, which demanded a moratorium on nuclear reactor construction.

The decisive question remains of whether the totalitarianism of National Socialism should be seen as a prelude to a perhaps more terrifying future and whether it should be ascribed to a trivialization (that is, determined by the supremacy of instrumental reason, as the Frankfurt School exegesis, similarly to Heidegger, would have it). Is the 'inner truth', through which poetry and thought seek to answer a destiny (in a rupture or in the subversive endeavour to locate inconspicuous beginnings), really only the antithesis to totalitarianisms or rather often a tendency of them? The French Revolution and, more than a hundred years later, the October Revolution wanted to help humanity to achieve a better life; the conviction that history must lead to something absolutely new soon led to the view that in such an exceptional situation every form of terror is permitted, even necessary. This tendency may also have had its role to play in the National Socialist Revolution; a philosophizing, which knew itself committed to the hour and the historical upheaval, could join with the very first uncertain departure. In the *Spiegel* interview Heidegger claims that his lecture course of 1951–2 *Was heißt Denken?* strives for the inner truth of poetry and thought (*Dichten und Denken*), and yet for that reason is so little appreciated. Yet in this lecture course does not the inner truth turn suddenly and without mediation into a perverted triviality, when with Nietzsche and with a glance at the example of old Russia those institutions are recommended which could still be 'anti-liberal' 'to the point of malice'? Hölderlin's short ode is quoted, in which Socrates favours Alcibiades, that is, which portrays the union of wisdom with youthful and fervent beauty.²⁵ Hölderlin's point of departure is the *Symposium*, but he then conceives of beauty as a tragic process. But Thucydides can instruct us how the youth of Athens brought their city to ruin through their military adventure in Sicily, and how Alcibiades himself could offer his political art first to the Athenian, then to the Spartan and Persian, then finally to the Athenian faction again. Even Hölderlin's political dreams came to an end in that he would have been brought to trial and charged with high treason by Sinclair, had the poet's mental collapse not protected him. The appeal to Hölderlin's verse would be mere palliation, if one overlooks this crass reality and doesn't take it as an admonition for the path through the twentieth century.

III Art and the saving power

The Greek light (*Licht*), as Heidegger says in his Athens speech, places the simple within its borders: the island, the mountain, the olive tree. Can this light also lead us to the clearing (*die Lichtung*), as Heidegger conceives of it from its meaning as a demarcated woodland clearing? Heidegger relates the Greek light to the lightning of Zeus which directs everything. In the Heraclitus seminar which Heidegger held with Eugen Fink²⁶ he remembers one afternoon of his sojourn on the island of Aegina: 'Suddenly I heard [sic] a single stroke of lightning. My thought was: Zeus.' The key to the lightning, which directs the emergence of the Greek world, is in the safe keeping of Athena; yet if anything, art and not thinking remained close to this mystery (*Geheimnis*). Thus the beginning, which the Greeks made for history, is to be related to the actually posited task only through another beginning of thinking. The question arises where at all in Greek history one is to establish this beginning. A goddess such as Pallas Athena who comes to us from temple reliefs and archaic poetry exhibits murky beginnings, no doubt pre-Socratic: the tutelary spirit of cities, the aid in battle only gradually took on its later form, after the Indo-Europeans came to the Aegean Sea four thousand years ago. That Athena sprang fully armed from the head of Zeus, or that she safeguards the secret of his lightning, these are beliefs that were attributed to the goddess only much later. She first received her name from the Boetian and later Attic Athens and thus demonstrates how the gods of myths and epics were only retroactively associated with definite locales and regions. Is there at all anything simple and inceptive (*ein Einfaches und Anfängliches*) in this history, which one can hold onto and that can still give us an orientation?

On the one hand the Mediterranean peninsulas and islands must have seemed to the various groups of migrating Greeks like the land of Phaeacians, who hosted and fêted Odysseus; on the other hand they must have been overpowering with blazing sun and storm, and ever-surfing sea and earthquakes, and the elemental forces of nature. The emigrant newcomers brought with them their supreme sky-god, who also safeguards the lightning; this god had to join with the earth and mother divinities already present there. In these conjunctions the simple and the inconspicuous could have played its role. For instance one of the oldest shrines, the Temple of Hera at Samos, lay not only in the fertile plain; the divinity for it was also found in the lygeum (or esparto) bush, which even today protects fertility (without such hormonal assistance many children would not be born). Perhaps Zeus came to this goddess as a cuckoo, which might well mean: with the call of spring. In any case the Samian Hera is not simply the Hera of Argos; the Artemis of Ephesos is not (as Heidegger assumes in his Heraclitus lectures²⁷) the Artemis of

Delos and sister of Apollo. These figures of Greek divinity were in constant transformation; they existed only in a diversity, which in turn entailed confrontations: even Athena first had to wrest the Attic land from Poseidon, the sea-god and earth-shaker. The Greeks remained exposed to this diverse and conflictual multitude of divine powers in their small cities, which for their part were likewise in continual struggles with each other and thus equally exposed to downfall and arduous rebuilding. When the Age of Goethe sought a new art and literature for its new life-experiences, it wanted to draw its orientation from Greece; can we today assume this orientation, after Nietzsche has lent it a tragic intensity?

When Nietzsche spoke of the Dionysian and the Apollonian, he assumed that Schopenhauer had interpreted the view of Greece and aesthetics in general through the overturning of the metaphysical tradition: it is music which discloses the *an sich*, the ideal forms are finally only an illusion, which makes bearable the pain of becoming. Yet can epic and sculpture really be ascribed simply to the Apollonian, and can tragedy then be interpreted as the mediation of these elements with Dionysian music? Only heroic battle and death counted for Homer's heroes; what happened *in* death was irrelevant. Yet later the graves of heroes and the remembrance of the founding figures were again cultivated and the gods again united with the country; thus could all those tendencies appear anew, including the Dionysian. Nevertheless the Dionysian tragedy began – in the *Oresteia* of Aeschylus – with the invocation of Zeus. When Heidegger in the Winter of 1929–30 enlisted Nietzsche's antagonism to the interpretation of the argument about 'life and spirit' (*Leben und Geist*), he also took up Nietzsche's late slogan 'Dionysus contra the Crucified'. Nietzsche's friend Overbeck had impressed him with the 'world-denying' element of Christian eschatology; therefore with Hölderlin Heidegger inquired after the gods of the earth and the homeland (*die Heimat*) and after the demi-god, who like the Rhine makes an entire land fertile and habitable.

When the catastrophe which had occurred long ago finally became manifest in the Second World War, the saving power remained only as the slightness of inconspicuous beginnings; finally Hölderlin was heard from the echo which he had found in Trakl. If Trakl has him, who is called into the downfall (*Untergang*), encounter the spiritual blueness of the sacred (*die geistliche Bläue des Heiligen*),²⁸ then Cézanne 'realizes' in the autonomous medium of art as nature does, in that he allows inconspicuous things to emerge out of the blue shadows. The artist, who confined himself to Provence, found his theme not in the disquiet of Paris nor in the contrast between the poverty in the coal-mining region and the solitude of Bretagne, but rather in the peaceful Montagne St Victoire. When Heidegger spoke of Provence as the bridge to Greece,

then one wonders to what extent he saw Greece and the inceptiveness of its hills, islands and olive trees with Cézanne's eyes. One should not search out a place in the many centuries for that which is inceptive (*das Anfängliche*) in Greek history, in which for example Athena first becomes the figure we encounter in the temple pediments and the literary texts. The inceptiveness lies rather in that modest area, in which *mythos* and *logos*, *Dichten* and *Denken* separate from each other, yet according to Heidegger always remain in the vicinity of a common striving for a native (*heimatlich*) dwelling on this earth. However, perhaps thought in the tragic age of the Greeks was also more various than Heidegger wants to perceive it, yet always marked by a colonial push for world conquest, which must be separated from the traditional embeddedness in *mythos*. Thus Plato's doctrine of ideas in a genuine way might continue 'Greek' motifs, which for us today have a practical relevance. Philosophizing incidentally is related not only to poetry (*Dichtung*) and to a cultic form of art; it has its beginnings also in its diverging from other life-spheres. Therefore there can be no single beginning of philosophy at all. When work for everyone grows scarce and leisure time becomes problematical in an industrial society, then art for its part cannot be so intertwined with the active life, as once may have been the case in the Greek dawn.

Heidegger tried to remove Athens from its contiguity with Jerusalem, Carthage and Rome; thus he had to overlook how Hölderlin in the final phase of his creativity relativized the relation of German to Greek and the hope for an immediate return of the divine. In 1939–40 Heidegger put aside the problematic of the hymn 'Wenn am Feiertag' with Norbert von Hellingrath by deleting the fragmentary conclusion of the poem; in 1959 he simply omitted the thematically more complete early version of the late draft for the hymn 'Griechenland'. Yet that version shows that by then for Hölderlin the *mythos* of the Greeks had become only one of the guises of God and that the poet's concern was rather the transition over the Alps, indeed the Hesperian festivals such as the wedding of the heir to the Württemberg duchy in London. Thus the verses of 'Patmos' that speak of the danger, in which the saving power also grows, are reversed by Heidegger: the verses no longer warn against seeking a rupture and breakthrough to the divine at any cost, rather they refer to the nihilism in which every trace of the divine is gone. According to the Patmos hymn, however, the danger lies in the fact that the peaks of time (*Gipfel der Zeit*) are distressingly near. These peaks, which remain separate from each other, are those above which the eagle flies in the hymn 'Germanien': the mountains of Asia, where patriarchs and prophets encountered their god, the sacred mountains of Greece and Italy, the Alps, which led to Northern Europe and its history. Only the faithfulness, which keeps the one and the other and which mediates all that is bestowed, furthers the growth of the saving power. For that reason

Hölderlin flies with the Genius not only to Taurus in Asia, but also returns to the Aegean: above the shadowless straits of the sea, which are familiar to the sailor, he finds among the beloved Greek islands near Samos and Delos also Patmos, the island monastery. There Saint John, in a cave on the precipice of a mountain, underwent and recounted that revelation, which teaches endurance in dark times.

With Hölderlin's elegy 'Brot und Wein' Heidegger charged poets with the task of bringing back to mortals the trace of the absent gods. But he never considered how Hölderlin spoke of the trace in the hymn 'Der Einzige': in the desert as the place of temptation toward hubris Christ preserves 'the trace of a word' (*die Spur eines Wortes*), namely that of law, which is already written but once again is becoming a mere trace. The Hesperian especially, who perforce stands in an open history, should not reject the helpful trace. However, in 1942–3, when Heidegger in his lecture course *Parmenides*²⁹ tried to dissolve the opposition of *mythos* and *logos* and to regain a tragic experience of god, he was only concerned with Sophocles and the Greeks; the poet who placed Shakespeare next to Sophocles is depicted thus: 'Goethe is a disaster' (*Goethe ist ein Verhängnis*). According to Heidegger humanism mixed together that which is incomparable and made Greek antiquity 'completely' inaccessible. Certainly one needn't think immediately of Shakespeare's persiflage of the Greeks in *Troilus and Cressida*; but Shakespeare and Goethe belong to us. And in fact from the 1950s onward one sees Heidegger again and again presenting the path to that which is simple with a citation from Goethe, yet the gesture of rejection and the retreat to a proper and authentic (*ein Eigenes und Eigentliches*) remained. Thus can Heidegger, who none the less introduced 'deconstruction' (*die 'Destrucktion'*) into phenomenological philosophy, speak of contemporary literature in the *Spiegel* interview only as 'largely destructive'. When Heidegger was in Bremen once he made a rare visit to the theatre and there saw Lorca's *Dona Rosita*, in which the old professor Don Martin is mocked cruelly by his students and only the old housekeeper finds his question, 'What is an idea?' still meaningful. At this point Heidegger whispered to his companion, 'Yes, that's me'. Thereby he seemed to interpret himself – 'with an expression of composed sadness', as Lorca's stage directions put it. Yet only with difficulty could the critic of humanism have adopted the humanity of Molière, who has the extravagant Sganarelle in *L'escole des maris* say that it is 'better to belong to the multitude of fools than to be wise and stand alone against all the rest'. It is inconceivable that Heidegger could have recognized the grotesquerie of those statements from his *Parmenides* lecture course, which in the sombre winter of 1942–3 after the establishment of the 'Final Solution' and in the face of Stalin-grad yet portrayed the Germans as 'invincible', if only they would repeat

the Greek inception (*Anfang*) and remain 'the nation of poets and thinkers' (*Volk der Dichter und Denker*).

In his 'Rektoratsrede'³⁰ of 1933 Heidegger repeated the old legend of the Greeks, that Prometheus was the first philosopher; with reference to the *Prometheus* of Aeschylus Heidegger claimed that all knowing (*Wissen*) remained exposed to the predominance of fate (*Schicksal*). In the meantime man in another Promethean feat had acquired atomic fire, but also the atomic constituents of life itself, which is now threatened in its entirety, world-wide. Because of this humanity is now forced into a new solidarity and responsibility, and thus Heidegger's discourse on 'the planetary nature' (*das Planetarische*) of world civilization can be taken not only negatively as a reference to deracination. Out of the very dangers now arisen must man not bring his new intellectual and practical abilities to bear on prospects which Heidegger himself in 1927–8 with Max Scheler in a fully positive way had called 'metaphysical' or 'meta-ontological'? In this dimension philosophizing might enter into a new proximity to art; this proximity signifies however neither an overtaking of the mythical through *logos* nor the presupposition of an absolute inceptiveness (*Anfängliche*) in art. Hegel's discourse on 'the end of art' is qualifiably correct, in so far as art and poetry (*Dichtung*) constitute only one particular human pursuit alongside others (for instance the scientific-technical). Sometimes it seems as if in his final years Heidegger in his reflections on his companion in misfortune, Cézanne, had forgotten Paul Klee, from the perspective of whose theoretical writings Heidegger had wanted in 1959 to write a 'pendant' to his artwork essay.³¹ With all the inclination to the lyrical, the phantastic and also the farcical, Klee developed an art which consciously constructs and composes its figures out of the simplest elements. Thus in his art Klee incorporates the technological (*das Technische*), so as finally to induce from it the acceptance of finitude and fatefulness (for example the acceptance of one's own death in the last picture *Tod und Feuer* (*Death and Fire*), which Heidegger included with Trakl's poems and Heisenberg's formulae in his foreword to *Being and Time*³²). The saving power can grow only when humanity as a whole assumes responsibility for an always precarious and always finite and limited life on this concrete planet. The future name of the divine must derive its meaning from this adoption of a fateful finitude. The simple and the initial can only be found from within the overarching situation. For that reason Paul Celan in a poem, which at first was to be a poem of Hiroshima, also related the simpleness of the cherry blossom to that 'here', which remains determined by Hiroshima: 'Here – where the cherry blossom wants to be darker than there'.³³

Notes

1 Translator's Note (hereafter T.N.): *Der Denkweg Martin Heideggers* (Pfullingen: Neske, 1963); *Martin Heidegger's Path of Thinking*, tr. Daniel Magurshak and Sigmund Barber (Atlantic Highlands, NJ: Humanities Press International, 1987).

2 Cf. the Afterword to the second edition of *Der Denkweg Martin Heideggers* (Pfullingen: Neske, 1983), p. 355. The latter account in *Heidegger und die hermeneutische Philosophie* (Freiburg/München: Verlag Karl Alber, 1983) continues the thought of the first book with the attempt to reincorporate Heidegger's themes into a hermeneutical philosophy.

Schendler, *Graduate Faculty Philosophy Journal*, 6 (1977), pp. 5–27; '“Only a god can save us”: *Der Spiegel's* interview with Martin Heidegger', tr. M. P. Alter and J. D. Caputo, *Philosophy Today*, 20 (1976), pp. 267–84.

10 *Der Spiegel*, 31 May 1976, pp. 193ff.; 30 August 1976, p. 3. On the question, to what extent a practical or political philosophy might adjoin Heidegger's reflections on the significance of technology, see the controversy between A. Schwan and myself: cf. the Afterword to the second edition of Otto Pöggeler, *Philosophie und Politik bei Heidegger* (Freiburg/München, 1974), pp. 155ff. Cf. also Otto Pöggeler, 'Heideggers politisches Selbstverständnis' in Annemarie Gethmann-Siefert and Otto Pöggeler (eds), *Heidegger und die praktische Philosophie* (Frankfurt: Suhrkamp, 1987).

11 T.N.: Pöggeler is referring to two texts by Ernst Jünger; *Der Arbeiter* (1932) and *Totale Mobilmachung* (1934). Cf. Heidegger's response to Jünger in 'Zur Seinsfrage', in *Wegmarken* (Frankfurt: Klostermann, 1967), pp. 379–420; *The Question of Being*, tr. with Introduction by William Kluback and Jean T. Wilde (New York: Twayne, 1958). On Heidegger and Jünger see Michael E. Zimmerman, *Heidegger's Confrontation with Modernity: Technology, Politics and Art* (Bloomington, Ind.: Indiana University Press, 1990).

12 T.N.: *Einführung in die Metaphysik* (Tübingen: Max Niemeyer, 1976); *An Introduction to Metaphysics*, tr. R. Manheim (New Haven: Yale University Press, 1955).

13 T.N.: On this point cf. for example 'Die onto-theo-logische Verfassung der Metaphysik' in *Identität und Differenz* (Pfullingen: Neske, 1957), pp. 31–68; *Identity and Difference*, tr. Joan Stambaugh (New York: Harper & Row, 1969).

14 T.N.: On Heidegger and Antigone cf.: George Steiner, *Antigones* (Oxford: Clarendon Press, 1986), pp. 131–5, 174–7.

15 In *Distanz und Nähe. Reflexionen und Analysen zur Kunst der Gegenwart* (Festschrift für W. Biemel), ed. Petra Jaeger und Rudolf Lütke (Würzburg, 1983). T.N.: to my knowledge no English translation of this text exists.

16 T.N.: cf. Aeschylus, *Eumenides* ll. 824–6.

17 T.N.: ‘Der Ursprung des Kunstwerks’, in *Holzwege* (Frankfurt: Vittorio Klostermann, 1950), pp. 1–72; ‘The origin of the work of art’, in *Basic Writings*, ed. David Farrell Krell (New York: Harper & Row, 1977), pp. 143–88.

18 T.N.: Ernst Bloch, *Das Prinzip Hoffnung*, now in Bloch’s *Werkausgabe* (Frankfurt: Suhrkamp, 1985); *The Principle of Hope*, tr. Neville Plaice, Stephen Plaice and Paul Knight (Cambridge, Mass.: MIT Press, 1986).

19 T.N.: Heidegger at the conclusion of the Athens speech cites Pindar’s Fourth Nemean Ode, ll. 6–8:

ῥῆμα ὃ ἐργμάτων χρονιώτερον βιοτεύει,
ὅτι κε σὺν Χαρίτων τύχη
γλώσσα φρένος ἐξέλοι βαθείας.

(‘Longer than deeds liveth the word, whatsoever it be that the tongue, by the favour of the Graces, draweth forth from the depth of the mind’. Sir John Sandys, *The Odes of Pindar*, Loeb Classics (Cambridge, Mass.: Harvard University Press, 1968), p. 347.)

Heidegger translates the passage as:

Das Wort aber weiter hinaus in die Zeit als die Taten bestimmt es das Leben,
wenn nur mit der Charitinnen Gunst
die Sprache es herausholt aus der Tiefe des sinnenden Herzens.

20 T.N.: *Wer Seminare*, GA 15, ed. Curd Ochswadt (Frankfurt: V. Klostermann, 1986).

21 T.N.: cf. the final chapter of Hegel’s *Wissenschaft der Logik*, ‘The absolute idea’:

More exactly, the absolute Idea itself has for its content merely this, that the form determination is its own completed totality, the pure Notion. Now the determinateness of the Idea and the entire course followed by this determinateness has constituted the subject matter of the science of logic, from which course the absolute Idea itself has issued into *an existence of its own*; but the nature of this its existence has shown itself to be this, that determinateness does not have the shape of a *content*, but exists wholly as *form*, and that accordingly the Idea is the absolutely *universal Idea*. Therefore what remains to be considered here is not a content as such, but the universal aspect of its form – that is, the *method*.

Hegel’s Science of Logic, tr. A. V. Miller (Atlantic Highlands, NJ: Humanities Press International, 1969), p. 825.

22 T.N.: cf. Karl Marx, *Economic and Philosophical Manuscripts* (1844).

23 T.N.: ‘Die Frage nach der Technik’, in *Vorträge und Aufsätze* (Pfullingen: Neske, 1954), pp. 9–40; ‘The question concerning technology’, in *The Question Concerning Technology and Other Essays*, tr. with introduction by William Lovitt (New York: Harper & Row, 1977), pp. 3–35.

25 T.N.: *Was heißt Denken?* (Tübingen: Max Niemeyer Verlag, 1954), p. 9; *What is Called Thinking?*, tr. Fred D. Wieck and J. Glenn Gray (New York: Harper & Row, 1968), p. 20. The poem there reads:

Socrates and Alcibiades

'Why, holy Socrates, must you always adore
This young man? Is there nothing greater than he?
Why do you look on him
Lovingly, as on a god?'

'Who has most deeply thought, loves what is most alive,
Who has looked at the world, understands youth at its height,
And wise men in the end
Often incline to beauty.'

26 T.N.: *Heraklit* (Seminar with Eugen Fink) (Frankfurt: V. Klostermann, 1970); *Heraclitus Seminar 1966/67*, tr. C. H. Seibert (Alabama: University of Alabama Press, 1979).

27 T.N.: *Heraklit*, GA 55, ed. Manfred S. Frings (Frankfurt: V. Klostermann, 1987).

28 T.N.: Reference to Heidegger's reading of selected poems of Georg Trakl in 'Die Sprache im Gedicht,' in *Unterwegs zur Sprache* (Pfullingen: Neske, 1959), pp. 35-82; 'Language in the poem: a discussion of George Trakl's poetic work', in *On the Way to Language*, tr. Peter D. Hertz (New York: Harper & Row, 1971), pp. 159-98.
